DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS, 1963

MONDAY, FEBRUARY 26, 1962

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met, pursuant to call, at 9:30 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Bible, Byrd, Young, Mundt, and Dworshak.

DEPARTMENT OF THE INTERIOR

OPENING STATEMENT BY THE CHAIRMAN

Chairman HAYDEN. The committee will be in order.

The committee today is beginning consideration of the 1963 budget estimates for the Department of the Interior and related agencies. This bill includes funds for all bureaus and agencies of the Department except the Bureau of Reclamation, the Southwestern Power Administration, the Southeastern Power Administration, and the Bonneville Power Administration. All of the latter are contained in the public works appropriations bill, to which consideration will be given at a later date.

In addition, there are made available in this particular appropriation bill funds for the U.S. Forest Service, the Indian Claims Commission, the Commission of Fine Arts, the Federal Coal Mine Safety Board of Review, the Civil War Centennial Commission, the Smithsonian Institution, the National Gallery of Art, the National Capital Planning Commission, the National Capital Transportation Agency, transitional grants to Alaska, the Virgin Islands Corporation, and the Indian health activities of the Public Health Service.

The total appropriations for these agencies during fiscal year 1962 was $795,791,650, which includes $10 million in borrowing authority and $11,181,000 in indefinite appropriations of receipts.

For fiscal year 1963 there is requested an overall appropriation of $930,494,000, an increase of $134,702,350 over the prior year. This sum includes $20 million in borrowing authority and $11,503,000 in indefinite appropriations of receipts.

COMPARATIVE APPROPRIATIONS, 1962–63

I shall place in the record a comparative statement of the appropriations for fiscal year 1962 and the budget estimates for the fiscal year 1963.

(The information referred to follows:)

Comparative statement of the appropriations for fiscal year 1962, and the estimates for fiscal year 1963

Item	Appropriations, 1962 (to date)	Budget estimates, 1963	Budget estimates, 1963, compared with appropriations, 1962
TITLE I—DEPARTMENT OF THE INTERIOR			
PUBLIC LAND MANAGEMENT			
BUREAU OF LAND MANAGEMENT			
Management of lands and resources	[1] $33,750,000	$41,552,000	+$7,802,000
Construction	850,000	1,000,000	+150,000
Oregon and California grant lands (indefinite appropriation of receipts)	(7,750,000)	(7,750,000)	
Range improvements (indefinite appropriation of receipts)	(740,000)	(1,045,000)	(+305,000)
Total, Bureau of Land Management	34,600,000	42,552,000	+7,952,000
BUREAU OF INDIAN AFFAIRS			
Education and welfare services	[2] 71,750,000	82,827,000	+11,077,000
Resources management	29,075,000	34,417,000	+5,342,000
Revolving fund for loans	[3] 4,000,000	4,000,000	
Construction	39,561,000	54,765,000	+15,204,000
Road construction (liquidation of contract authorization)	16,000,000	17,000,000	+1,000,000
General administrative expenses	3,967,000	4,372,000	+405,000
Liquidation of Klamath and Menominee Agencies	31,000		−31,000
Total, Bureau of Indian Affairs, exclusive of tribal funds	164,384,000	197,381,000	+32,997,000
Tribal funds (not included in totals of this tabulation)	(3,000,000)	(3,000,000)	
NATIONAL PARK SERVICE			
Management and protection	[4] 21,811,500	27,240,000	+5,428,500
Maintenance and rehabilitation of physical facilities	17,869,000	20,000,000	+2,131,000
Construction	[5] 36,726,000	44,000,000	+7,274,000
Construction (liquidation of contract authorization)	30,000,000	30,000,000	
General administrative expenses	1,581,000	2,100,000	+519,000
Total, National Park Service	107,987,500	123,340,000	+15,352,500
OFFICE OF TERRITORIES			
Administration of territories	[6] 10,334,000	[7] 15,478,000	+5,144,000
Trust Territories of the Pacific Islands	[8] 6,304,000	10,000,000	+3,696,000
Alaska public works	([9])		
Total, Office of Territories	16,638,000	25,478,000	+8,840,000
Total, Public Land Management	323,609,500	388,751,000	+65,141,500
MINERAL RESOURCES			
GEOLOGICAL SURVEY			
Surveys, investigations, and research	[10] 49,820,000	59,900,000	+10,080,000
BUREAU OF MINES			
Conservation and development of mineral resources	24,800,000	[11] 27,000,000	+2,200,000
Health and safety	7,200,000	[11] 8,158,000	+958,000
Construction	835,000	1,000,000	+165,000
General administrative expenses	1,290,000	1,333,000	+43,000
Development and operation of helium properties [borrowing authorization]	[10,000,000]	[20,000,000]	[+10,000,000]
Total, Bureau of Mines	34,125,000	37,491,000	+3,366,000
OFFICE OF COAL RESEARCH

[1] Includes $1,250,000 appropriated in the Supplemental Appropriation Act, 1962.
[2] Includes $750,000 appropriated in the Supplemental Appropriation Act, 1962.
[3] Appropriated in the Supplemental Appropriation Act, 1962.
[4] Includes $25,000 appropriated in the Supplemental Appropriation Act, 1962.
[5] Includes $2,250,000 appropriated in the Supplemental Appropriation Act, 1962.
[6] Includes $4,500,000 appropriated in the Supplemental Appropriation Act, 1962.
[7] Includes $2,579,000 in H. Doc. 333, 87th Cong.
[8] Includes $200,000 appropriated in the Supplemental Appropriation Act, 1962.
[9] Act continues available $108,000 of prior appropriations.
[10] Includes $100,000 appropriated in the Supplemental Appropriation Act, 1962.
[11] Reflects transfer in the estimates of $267,000 from "Conservation and development of mineral resources" to "Health and safety."
[12] Includes $200,000 for activities previously carried under "Civil defense and defense mobilization functions of Federal agencies," Office of Emergency Planning.
[13] Includes $400,000 appropriated in the Supplemental Appropriation Act, 1962.
[14] Includes $35,000 for an activity previously carried under "Grain for migratory waterfowl."
[15] Includes $3,500,000 appropriated in the Supplemental Appropriation Act, 1962.
[16] For activities previously carried under "Construction, operation, and maintenance, Office of Saline Water."
[17] Includes $200,000 appropriated in the Supplemental Appropriation Act, 1962.
[18] Includes $106,000 for activities previously carried under "Civil defense and defense mobilization functions of Federal agencies," Office of Emergency Planning.
[19] Includes $85,000 appropriated in the Supplemental Appropriation Act, 1962.
[20] Appropriated in the Supplemental Appropriation Act, 1962.
[21] Appropriation language provides for a grant to the Corporation of $669,000 to be derived by transfer from internal revenue collections appropriated to the Virgin Islands government.

Chairman HAYDEN. The committee will be glad to hear from you, Mr. Secretary.

Senator YOUNG. Mr. Chairman, may I say I will have to leave in a few minutes to hear Secretary of Agriculture Freeman in another committee, so I want the Secretary to know why I have to leave.

Senator MUNDT. I have the same problem, plus the fact that the Corps of Engineers are coming to my office at 10:15.

Senator BIBLE. I am going to stay as long as I can, but we have 75 witnesses starting at 10, so I will have to be forgiven if I have to leave early.

Chairman HAYDEN. I will be here to hear you at any rate.

DEPARTMENT OF THE INTERIOR

OFFICE OF THE SECRETARY

STATEMENT OF HON. STEWART L. UDALL, SECRETARY OF THE INTERIOR, ACCOMPANIED BY JAMES K. CARR, UNDER SECRETARY OF INTERIOR; D. OTIS BEASLEY, ADMINISTRATIVE ASSISTANT SECRETARY, AND SIDNEY D. LARSON, DIRECTOR OF BUDGET AND FINANCE, U.S. DEPARTMENT OF THE INTERIOR

PREPARED STATEMENT

Secretary UDALL. I will try to be brief, gentlemen.

I have with me this morning my Under Secretary, Mr. Carr, Secretary Beasley, and Mr. Larson. I wanted them to participate with us this morning.

I have a statement which you have before you. I would just like to hit the highlights.

Chairman HAYDEN. It may be included in full in the record.

(The statement referred to follows:)

Mr. Chairman and members of the committee, I wish to pay the highest tribute to you, Mr. Chairman, and to your committee, for the enduring contribution you have made over the years to the conservation programs of the Nation. Without your understanding support these programs would not have advanced as they most certainly have, over many years. And I wish to underscore this fact at the outset of my remarks today.

I appreciate the opportunity to present these programs of the Department of the Interior, and the appropriation requirements to carry them out, for fiscal year 1963. With your permission, I propose to confine my remarks to program objectives. The representatives of the various bureaus will present in detail the estimates of necessary appropriations.

During the early history of this country the wealth of our natural resources lulled us into the belief that those resources were limitless. So we moved across our new land—plowing her soils, cutting her timber, and taking from the earth without restraint. For a hundred years and more we plowed and logged indiscriminately, and the land and her resources deteriorated.

At the turn of the century men with vision and of bold resolve foresaw possible disaster to the Nation from indiscriminate use of our great wealth of resources. The conservation measures introduced at that time, as you well know, were not without severe criticism and antagonism from those who wished to use resources without restraint. Nevertheless, as a result of these measures, widespread resource exploitation was arrested, many acres of prime lands and forests were set aside for wise use and public enjoyment, and the stage was set to bring science and technology increasingly into play as instruments for achieving longrun, wise use and development of resources for widespread public benefit.

We, of this generation and of generations yet to come, have been rewarded by the actions of, not only the men of courage who founded the conservation movement but also the great host of dedicated scientists, technologists, and other men and women who have wrought the conservation achievements of this century.

Economic growth has been achieved at such a rate over the last half century that today the gross national product exceeds one-half trillion dollars. In the same period, population has doubled.

Natural resources have been called upon to supply the raw material to achieve this growth. Also, they have been needed to provide the material strength to defend our way of life. In this process, our resources have been consumed in great quantities. Yet today we can still call for use of resources with confidence that they are available generally without substantial increase in real cost. Knowledge gained over the half century has made possible this achievement through application of improved soil, water, and forest conservation practices, development of new techniques to extract and use mineral wealth that otherwise would have been uneconomic to use, and by many other means.

Today, and on into the future, we should continue these public programs of research—to increase our knowledge; and of action—using that knowledge.

But today, also, we must face squarely—more than ever in the past—the problems of the environment in which we live.

The Nation's economic growth, accompanied by expanding population, has meant more space occupied by industry, housing, and transportation facilities. Increasingly, large land areas in, around, and between large metropolitan centers have been so occupied. Only one-quarter of our people live in rural areas today and three-quarters in urban communities. At the turn of the century the reverse was true.

The challenge of today is twofold: to develop and conserve our resources for continued growth, and at the same time to conserve the face and character of outdoor America. If, for the most part, our people are to live crowded in cities, we must provide the means for their recreation through appreciation of America as beautiful, spacious, and as a nation respectful of its unique natural, historical, and cultural heritage. We must continue to have close contact with the out-of-doors, with the fully natural, and last—but of parallel importance—through many exhilarating forms of recreation—boating, swimming, fishing, hunting, hiking, horseback riding, mountain climbing, and skiing.

Public concern for the out-of-doors in America is not new. New York's Central Park was created in 1857, and other big city parks followed. Yosemite, first created as a State park in 1864, became a national park in 1890. Yellowstone, the first national park, dates from 1872, and our first national forest reserves were established in 1891. And paralleling this development has been public concern with conservation of fish and wildlife.

Administrations of Theodore Roosevelt, Woodrow Wilson, and Franklin Roosevelt, particularly, gave great impetus—at all levels of government—to preservation of outdoor America. A new great national effort—an expanded program—is needed.

Last month the Outdoor Recreation Resources Review Commission delivered its report to the President and to the Congress, outlining proposals to meet the needs of the Nation for outdoor recreation.

The administration is developing new programs to fulfill the Federal responsibility in outdoor recreation and the conservation of our land. With these new programs, we will also propose new revenues for their financial support—I am sure this will be of particular interest to this committee.

The budget before you is designed to accomplish important progress in the development of our resources to keep pace with the economic growth of the Nation, and includes increased appropriations for the Department's programs. However, this budget does not reflect the new programs which we will be presenting to you in the future and which we believe are necessary if we are to meet the conservation challenge of the sixties.

PUBLIC LAND MANAGEMENT

Our public lands are a basic source of the Nation's forage, timber, and minerals. Sound management of these resources requires full knowledge of their capacity to supply the country's present and future needs. We must, therefore, have a more adequate inventory of these important assets than is now available if we are to meet the needs of an increasing population.

The budget for the Bureau of Land Management provides for a substantial expansion in the resource management program on the public domain and forest lands including inventory and classification work. This expansion is essential to keep current with the demand for public domain lands. Progress is being made in reducing the backlog of cases. The moratorium, which has been in effect for a year, has been lifted in Montana, North Dakota, and South Dakota.

Increases are provided for improved management, soil and moisture conservation, and reforestation.

The budget for the National Park Service provides increases in all appropriations to meet the mounting demands on its facilities. It is estimated that visitors to units of the system will reach 81 million in fiscal year 1963.

This budget represents continuance and expansion of existing programs. It does not reflect new objectives embracing the whole field of outdoor recreation now under consideration by this administration, but is consistent with them.

Additional facilities, and increases in funds for management, protection, and rehabilitation are necessary to keep pace with growing recreation needs.

A program to make additions to our park system is of paramount importance. Existing areas are being subjected to ever-increasing visitor loads, and we must acquire additional lands to meet the present and future needs of our people before the cost of these lands becomes excessive. We propose to step up vigorously our national park planning, and the cooperative work with the States to develop an expanded system of park areas.

In the development of our Indian programs, we are concerned not only with natural resources but also with people—with the stimulation, growth, and development of their human potentialities and capabilities.

The Indian people of this Nation have moved from a condition of almost total hopelessness, apathy, and dependence on Federal bounty to one of growing self-sufficiency and mounting expectations. Our goal in the Department of the Interior is to eliminate gradually the many complex handicaps that still keep far too many of them mired in substandard living conditions, and to give them the same opportunities for economic betterment and personal development that are enjoyed by their fellow Americans. We must keep everlastingly at it until this goal is fully achieved.

New emphasis in the budget for the Bureau of Indian Affairs is being placed on the development of Indian reservation resources. Development programs at the reservation level are planned in recognition of the importance of improving the economic condition of Indians. These programs are designed to utilize more fully the resources available to Indians, and to provide additional employment and increased income to Indians.

Major effort is being placed on the education of Indian children and adults. Expansion of the school construction program is proposed to provide necessary facilities for Indian children. It is estimated that the budget for fiscal year 1963 will provide for 53,898 children, an increase of 4,103 over the present fiscal year.

The Federal Government's responsibility in the territories and Trust Territory of the Pacific Islands requires greater attention than has been given to these areas in the past. People of these areas look to us for leadership and assistance.

It is important, therefore, that we assist them in achieving economic, political, and social development through adequate education, improved health programs, and assistance in developing the economic resources of these areas. The budget has been amended to provide for an accelerated program for education for American Samoa by the use of television. Programs have been stepped up severalfold to meet the need for prompt improvement.

MINERAL RESOURCES

The continued economic growth of the Nation depends upon knowledge gained of the occurrence and efficient use of our mineral, water, and fuel resources.

The budget estimate for the Geological Survey provides for an increase in basic information on topography, geology, quantity, and quality of water, and geologic data. In this connection, we propose to undertake and give emphasis to studies of submarine geology and marine minerals and the effects of river dispersion into the ocean.

In keeping with the critical importance of our water resources, as emphasized by the recent report of the Senate Select Committee on Water Resources, we propose to establish an institute of water research to collect and correlate scientific knowledge of the occurrence, wise use, and sound development of our water supplies. This institute should go far to assure that we will have adequate basic knowledge in this field.

The budget for the Bureau of Mines provides for additional research for improved recovery and utilization of coal and other minerals, and further development of scientific data to form a basis for an oil shale industry. The budget also covers programs to develop improved methods for the beneficiation and extraction of minerals and, at the same time, to develop safer means to accomplish these objectives.

Intensified research is required to protect the worker against hazardous conditions and to develop safety conditions and procedures in coal mines. Provision is also made in the budget for initiating studies to alleviate and prevent injuries and health hazards in metal and nonmetallic mines.

The program is moving forward with regard to the conservation of helium. It is proposed during fiscal year 1963 to complete contracts for extraction of this important resource now being wasted.

The program to stabilize prices of lead and zinc mined by small domestic producers was authorized by the 1st session of the 87th Congress. Funds are included in this budget to carry out the purposes of the act.

FISH AND WILDLIFE SERVICE

The budget for the Bureau of Commercial Fisheries provides for an expansion in oceanographic research as part of the Government's oceanographic program. More knowledge of the wealth within the oceans is essential to the best utilization of these resources for food and industrial raw material.

The construction program for the Bureau of Commercial Fisheries provides for additional laboratories as well as fishing vessels in order to obtain scientific knowledge of occurrence and utilization of the ocean resources.

The importance of the salmon fisheries to the Pacific Northwest requires accelerating the fish research program related to the development of high dams on the Columbia River, and this is reflected in the budget.

Continued heavy pressures on our wild game, waterfowl, and fishery resources warrants expanding the program for the Bureau of Sport Fisheries and Wildlife. Expansion of the fish hatchery program and wildlife research facilities are proposed to obtain better knowledge needed to offset the heavy pressures of hunting and fishing as well as diminishing habitat.

Funds are also included for a more aggressive program in the acquisition of the wetlands for migratory birds.

To accomplish the basic objectives of the Department's programs, we are requesting appropriations for interior activities to be considered by this committee, exclusive of reclamation and power, in the amount of $600,004,000, an increase of $110,503,552 over fiscal year 1962. I have been advised that the program for the Office of Minerals Mobilization and certain items for the White House will be considered by another committee. During fiscal year 1963, it is estimated that the Department will collect $493,858,150 in revenues excluding receipts from reclamation and power marketing agencies, an increase of $93,635,831 above 1962.

To accomplish our program objectives, it will, of course, require the hiring of additional employees. This increase is essential if needs are to be met. I wish to assure the committee that our purpose is to achieve results, and that it will be accomplished with a minimum of manpower.

I have more detailed statements regarding the programs of the Department which, in the interest of saving time, I would like to file for the record at this point.

ANALYSIS OF BUDGET ESTIMATE, 1963

Public Land Management

Public land management responsibilities of the Department of the Interior are carried forward through the Bureau of Land Management, Bureau of Indian Affairs, National Park Service, and the Office of Territories.

The estimate for 1963 in the amount of $388,751,000 is an increase of $65,589,876 above the $323,161,124 available in fiscal year 1962.

The increases proposed represent planned and forward looking programs designed to meet national requirements for management of the public lands and park areas and to assist the Indian and territorial peoples achieve self-sufficiency.

Major program increases are set forth below.

Bureau of Land Management

The budget for the Bureau of Land Management for fiscal year 1963 is $42,552,000 compared with $34,322,129 for 1962. This includes $41,552,000 for "Management of lands and resources," and $1,000,000 for "Construction." In addition, $7,750,000 is provided for the Oregon and California grant lands with the provision that this amount is reimbursable to the Treasury from receipts from these lands.

The operating appropriation for the Bureau is increased in the budget by $8,079,871. Additional funds are provided for the increased workload in the

land offices in the Western States and Alaska and for acceleration of the comprehensive inventory of the public lands. Increases also are provided for improved management of grazing lands, and added soil and moisture conservation work on public range areas. Furthermore, increased funds are provided for forest management and reforestation programs to enable the Bureau to increase sales of timber in keeping with the maximum sustained yield concept and related conservation practices. Additional funds also are provided for cadastral surveys, including the surveys in Alaska that are necessary before the State can receive title to selected lands. Increased funds are provided for fire presuppression activities in the Western States and Alaska as well as to cover increased costs for contractual fire protection services.

An increase of $150,000 in construction is provided for access to public domain lands, including roads for marketing timber, and for buildings necessary to the fire control program in Alaska and for storage buildings and other facilities necessary to the resource management programs in the Western States.

The operations of the Bureau of Land Management bring revenues to the U.S. Treasury and to States and counties. Receipts for 1963 are estimated at $383 million, of which $59 million will be paid to States and counties in which the public lands are located.

Bureau of Indian Affairs

The budget estimate for the Bureau of Indian Affairs for fiscal year 1963 is $197,381,000 which is an increase of $33,139,348 over the amount of $164,241,652 available in 1962.

For "Education and welfare services," the estimate is $82,827,000 as compared to $71,418,697 in fiscal year 1962. Added funds are included for increased enrollment and additional costs to public schools educating children under Johnson-O'Malley plans; operation of Federal facilities; adult education; increased welfare caseload; and expansion of law enforcement programs where most urgently needed. The estimate will allow for education of 53,898 Indian children, an increase of 4,103 over the current fiscal year.

The estimate for "Resources management" is $34,417,000 as compared to $29,310,138 in fiscal year 1962. The major increase in this estimate is for economic development. It will provide the funds needed to develop new sources of income and employment opportunities for Indians and will enable the Department to employ the technical staff required to help Indians to help themselves in the field of economic development. Increases are also included for timber sales, range development and conservation, management of trust property, and the maintenance of additional Federal facilities.

The estimate for "Construction" is $54,765,000 as compared with $39,559,989 in fiscal year 1962. The funds will be used to construct and rehabilitate buildings, and utility and irrigation systems required for Bureau programs, primarily school projects. The program will include construction of 34 new school projects, 11 additions to existing schools, and rehabilitation of 2 schools.

The estimate for "Road construction" is $17 million in fiscal year 1963; this compares with $16 million for fiscal year 1962. These funds will be used to liquidate obligations incurred under authority of the Federal Highway Act and, also, to liquidate obligations incurred for Routes 1 and 3 on the Navajo and Hopi Reservations, as authorized by Public Law 85–470.

The estimate also includes $4,372,000, an increase of $450,172 for administrative services. These funds will be used to establish an executive training program and provide additional services to the various programs, such as personnel, procurement, budget, and fiscal management.

The estimate includes $4 million for the revolving loan fund. These funds will be used to make loans to Indians and Indian organizations to promote their economic development.

National Park Service

The 1963 budget estimate provides $123,340,000 for the National Park Service. This is an increase of $15,380,657 over the amount available for 1962. The increase includes $5,456,657 for "Management and protection"; $2,131,000 for "Maintenance and rehabilitation of physical facilities"; $519,000 for "General administrative expenses"; all of which finance operating programs; and $7,274,000 for the capital programs financed under the "Construction" appropriation.

The increases requested in the "Management and protection and maintenance and rehabilitation of physical facilities" appropriation items provide $5,693,000 for the direct benefit of park operating programs; $787,000 for the indirect benefit

of park operating programs; and $1,108,000 for important programs other than those concerned with the operation of park areas.

The increases for the direct benefit of park operating programs include $2,443,000 for the operation and maintenance of new buildings, utilities, campgrounds, roads, trails, et cetera, provided under the Mission 66 construction programs; $1,659,000 for additional staffing, park informational publications, and general expense items to meet requirements incident to increased park visitor use; $128,000 for the leasing of commercial communication facilities in the parks and for the conversion of existing radio systems to narrow-band frequencies; $340,000 for commencement of operations in 3 newly authorized areas; $480,000 for 62 additional park police positions for the National Capital Parks system in the Nation's Capital, plus additional general expense fund requirements for existing force; $94,000 for soil and moisture conservation; $367,000 to meet increased wage-rate costs; and $182,000 to intensify the training program for uniformed employees. Most of these purposes for which the increases are requested are ones for which increases have been sought and obtained during the past several years and with which the committee is already familiar. The three new areas for which funds are requested are Cape Cod National Seashore, Mass.; Fort Davis National Historic Site, Tex.; and Fort Smith National Historic Site, Ark. The budget contemplates that visitation to the parks will reach 81 million in 1963 as compared to about 78 million in 1961 and an estimate of 79 million for 1962.

The increases for the indirect benefit of park operating programs include $275,000 for additional staffing and general expense items for ranger services and interpretive functions in the Washington and regional offices; $200,000 for land use and water resources studies functions which are carried on in the Washington and regional offices; $12,000 for concession management and audit functions; and $300,000 to initiate a comprehensive history and natural history research program.

The increase of $1,107,785 requested for important programs not concerned with park operations includes $815,680 for nationwide recreation planning, national park system planning, and cooperation with States and other agencies in their park and recreation planning work, for which $1,609,320 is provided in the 1962 appropriation; $160,800 for archeological investigations and salvage, for which the 1962 appropriation provides $589,200; $75,825 for the Historic American Buildings Survey, for which $134,175 is available in 1962; and $55,480 for the Historic Sites Survey, for which $144,520 is available in 1962. These are all going programs which must be accelerated in the light of the President's special message to the Congress of February 23, 1961, on natural resources and if the programs are to be prosecuted at a rate reasonably commensurate with Mission 66 objectives.

The increase of $519,000 requested for general administrative expenses provides for the salaries and expenses of certain staffs in the Washington and regional offices which are now proper for financing under the "General administrative expenses" appropriation, but which are being financed from construction funds and for additional positions in the Washington and regional offices that are essential for meeting the increased administrative workload that has taken place since the commencement of Mission 66.

The construction estimate provides for the following:

Buildings, utilities and other facilities	$31, 153, 000
Acquisition of lands and water rights	12, 500, 000
Executive Mansion and Grounds	347, 000
Total	44, 000, 000

The estimate provides $1,980,600 for important projects in areas commemorating the historic events of the Civil War in preparation for the centennial observances; $510,000 for continuing to completion work on the Jefferson National Expansion Memorial, St. Louis, Mo.; $2,000,000 for continuing work in the Independence National Historical Park, Pa.; and $1,141,800 for continuing work commenced in fiscal 1962 in the New York City areas. It also includes $690,000 for initial developments for the three new parks mentioned in the foregoing and $1,400,000 to carry out the Theodore Roosevelt Memorial project in the National Capital pursuant to congressional authorization. The program provides $23,430,600 for buildings and utilities projects in other park areas.

Of the total estimate for acquisition of lands and water rights, $1,400,000 is for Civil War area lands; $4 million for Cape Cod National Seashore, Mass.,

lands; $1,500,000 for Minute Man National Historical Park, Mass., lands; $937,000 for lands to be added to National Capital Parks system as authorized by Public Law 87-362; $434,000 for lands for the newly authorized Fort Davis and Fort Smith national historic sites in Texas and Arkansas, respectively $162,000 for acquisition of lands within extended boundaries of certain areas as authorized by legislation enacted during the first session of the 87th Congress; and $365,000 for acquisition of water rights; leaving $3,702,000 for acquisition of inholdings in other park areas throughout the Service. The estimate provides for a realistic land acquisition program looking toward overcoming many long-standing problems incident to the existence of inholdings within the park areas.

The contract authorization programs for parkways and roads and trails construction are in the amounts of $16 million and $18 million, respectively, as provided for in the Federal Highway Act of 1960. The budget estimate provides for an appropriation of $30 million to liquidate obligations to be incurred under this contract authorization and obligations incurred and to be incurred under similar prior year contract authorization.

Office of Territories

The budget estimate for the Office of Territories is $25,478,000, an increase of $8,840,000 over 1962. It will provide $14,754,000 for American Samoa and $10 million for the Trust Territory of the Pacific Islands. The remaining $724,000 is for various Federal responsibilities such as the Offices of the Governors of Guam and the Virgin Islands, the Office of the Government Comptroller of the Virgin Islands and the Office of Territories. These small offices assist the territorial governments in their operations and assist the Secretary in carrying out his general supervisory responsibility for the territories.

This greatly increased budget emphasizes the goal of this administration to accelerate the economic, political, and social development of our territories; both those that are a part of this Government and that territory for which we have trusteeship responsibilities, so that they more closely approximate our American standard for progress and also so that they parallel this present Government's efforts to accelerate the development of other undeveloped areas of the world.

The fiscal year 1963 estimate of $14,754,000 for American Samoa is an increase of $5,148,600 over the current year. The bulk of the money, $14,517,400, is in the form of grants to the American Samoa Government. All construction items amount to approximately $10,737,000. Of this amount almost $2.5 million will be devoted to building and equipping 20 consolidated village school units together with teacher housing. The new consolidated schools will replace some 54 small village schools and are to be built on a cooperative basis with the villages providing labor and the Samoan Government providing materials, supervision, design and special technical skills. During the current year two new high school buildings have been substantially completed and work on a third has been commenced. A fourth high school building is included in the 1963 school construction request. Now, there will be sufficient classroom space so that all elementary school graduates can attend high school if they so desire; heretofore only one-third of the elementary school graduates could find space and facilities for high school education. The estimate includes $2,579,000 for installation of an educational television system to meet the need for educational opportunity. Funds for medical facilities total $272,000 and include funds for two new dispensaries in the Manu'a Islands and architects' services for the design of a new 200-bed hospital to replace the present dilapidated hospital building. Utilities construction money amounts to about $2,774,000 and includes installation of the second phase of the powerplant now under construction and the complete electrification of the main island of Tutuila with approximately 32.4 miles of transmission and distribution lines. An electrification project for the Manu'a Islands will also be undertaken. The largest item of $1,581,700 of the remainder of the grant funds is for education. Approximately one-third of the territory's population will be enrolled in the public schools and the funds requested are necessary to provide adequate school staffs, to upgrade educational levels, and to provide additional training for Samoan teachers. The Department of Medical Services needs $909,200 to hire additional personnel, to upgrade medical services, and to finance a scholarship program providing medical and dental training as well as specialized nurses training in the United States.

The amount being requested for the Trust Territory is $3,696,000 more than was appropriated for the current fiscal year. The fiscal year 1962 appropriation totaled $6,304,000. Construction items will be increased by $2,149,000. These increases over fiscal year 1962 are allocated among hospitals, schools, utilities, economic development projects, and the improvement of airports, harbors and

other transportation facilities. Schools and hospitals account for $421,500 of the construction increase while airfield, harbor and other transportation facilities and buildings and quarters are for the remainder. In recognition of the growing population of the trust territory and the urgent need to upgrade educational services, the 1963 request for education amounts to $975,000 as compared to the $474,000 appropriated for the current year. The funds provide for establishment of 2-year teacher graduate work at the Pacific Islands Central School, and for the start of secondary schools at Palau and Truk offering high school level training. At all levels greatly improved education reaching more students is planned. The public health request of $700,000 will provide expanded health services in all districts and for staffing the hospitals now under construction. A new feature of the health program is the proposed acquisition of a ship to be used by health, education, and economic development teams in providing services to outlying islands. With the trust territory currently dependent upon copra as its chief cash crop, economic development is being emphasized in order to diversify sources of income and to provide greater employment opportunities to Micronesians; $836,000, as compared to $497,000 in 1962, are budgeted for this activity which includes agriculture and fisheries activities and land and claims work.

Mineral Resources

The wise conservation, production, and utilization of our mineral resources is essential to the advancement of our Nation. There is an ever-increasing need for added research and application of better methods of discovery in the fields of solid fuels and oil and gas. Expansion of topographic and geologic surveys and mapping must be undertaken. Water research and investigations must be vigorously pursued if we are to meet the phenomenal growth in our use of it.

The mineral resource programs of the Department are developed through the Geological Survey, Bureau of Mines, and the Offices of Coal Research, Minerals Exploration, and Oil and Gas.

The estimate of $126,022,000 for 1963 represents an increase of $29,683,000 over the $96,339,000 available in fiscal year 1962.

Geological Survey

The Geological Survey's budget estimate for 1963 is $59,900,000. This amount includes an increase of $3,800,000 to initiate two programs that will have far-reaching influence on the future status of our mineral and water resources. The budget for the first of these programs is $2,800,000 for the establishment of an Institute for Water Research. Water research by the Institute will improve the scientific foundation that is so important for wise development and sound management of the Nation's water supplies. A second program, budgeted for $1 million, is designed to place proper emphasis on marine geology and hydrology. Studies of submarine geology and marine minerals, and the effects of river dispersion into the oceans will provide valuable and helpful information on the occurrence, distribution, and origin of petroleum and mineral deposits.

The Institute for Water Research and the program of oceanography are timely extensions of support of the Survey's responsibility to provide this Nation with scientific information on its mineral and water resources.

Topographic mapping activities in the amount of $19,500,000 of the Survey are proposed for 1963 at a pace somewhat accelerated over that of 1962. The increase of $2,590,000 reflects the need for increased coverage of the Nation by adequate topographic maps especially to meet the requirements of many Federal agencies and State and local governments for modern maps at scales suitable for defense, industrial and transportation planning, and resources developments.

Geologic and mineral resources surveys are proposed in the amount of $15,020,000, increased rate of $1,600,000 commensurate with our need to look ahead to the maintenance of a resource base for our economy. The proposed 1963 budget not only provides support for this basic Survey activity but provides the means to expand and accelerate research into rare elements and nonferrous mineral resources critical to today's and tomorrow's electronics, space, and nuclear reactor problems. Increased urban and highway construction press also for more geologic information and landslides and the engineering properties of earth materials.

Water resources investigations proposed in the 1963 budget at $14,530,000 are responsive to the Nation's needs as defined by the Senate Select Committee on National Water Resources. The Nation's goal in the field of water, as defined by the Committee, is to meet growing demands on water resources in the most efficient manner consistent with accepted public aims. Attainment of these goals

requires the continued collection of basic records, together with extensive research on the occurrence, characteristics, and movement of water. In the Institute for Water Research we expect to bring the best talent in this country to bear on this subject. Basic data will be obtained by continuation and modest expansion of the network of streamflow measuring stations, ground water observation wells, and sites where water samples are obtained for chemical, radiological, and sediment determinations.

A moderate increase of $341,000 for 1963 is requested to continue supervision of the development of oil and gas and other minerals on Federal and Indian lands in the United States. Proper management of these resources is of great importance, not only as a conservation measure, but also because of the very significant revenue in royalties.

Funds in the amount of $1,100,000 are also included in the estimate for the construction of a radiation laboratory at Denver, Colo.

Bureau of Mines

The estimate of $57,491,000 in an increase of $13,368,000 over 1962 and will permit increased emphasis in Bureau of Mines research and development work on the minerals and mineral fuels so vital to the Nation's expanding economy, and provide for greater conservation of essential helium.

Conservation and development of mineral resources

The 1963 budget estimate for the "Conservation and development of mineral resources" appropriation is $27 million, an increase of $2,467,000 over 1962.

The broad purposes and objectives of the Bureau's research stress more complete utilization and conservation of the country's mineral and fuel resources. The correlation of technologic and economic studies on the techniques of mining and treating mineral raw materials and the development of new uses for such resources will be emphasized.

Bituminous coal, $7,214,000

Scientific research and engineering investigations are aimed at determining the chemical and physical properties of coal, and improving its mining, preparation, combustion, carbonization, and gasification.

The estimate includes an increase of $350,000 to conduct experiments to demonstrate the possibility that the displacement of coke in a blast furnace by injecting powdered coal as a supplemental fuel is more economical than injecting either gas or oil. Successful experiments with coal injection will answer the competitive threat and stem further decreases in the coal market.

Anthracite coal, $1,042,000

Research is aimed at developing new and improving present uses for anthracite, obtaining basic economic data on both a national and international basis, and the fostering of conservation of a valuable natural resource.

The estimate includes a nominal increase of $50,000 to cover microfilming of maps relating to abandoned mines and for testing lower bulk-density anthracite metallurgical briquets.

Petroleum, natural gas, and oil shale, $3,458,000

Programs under this activity are aimed at conservation through improvement of the processes of recovery and utilization. Economic information is analyzed to provide a factual base for industry operations and Government policy.

The estimate includes an increase of $187,000 to carry out research aimed at providing scientific bases that will be needed in establishing and efficiently conducting an eventual oil-shale industry.

Minerals and metals, $14,786,000

This program is aimed at maintaining a strong national supply base despite the ever-increasing demands of an expanding industrial economy and international scientific competition. Latent resources will be investigated to delineate new domestic sources of supply. Mining research and metallurgical research will be conducted to make submarginal deposits commercially useful. Properties of mineral substances will be studied to discover special characteristics and to intensify known attributes through the techniques of chemistry, physical metallurgy, and other advanced scientific methods. In addition investigations of mineral resources will be made for the purpose of determining their location, quality, quntity, and geologic environment.

The estimate includes the following increases:

$776,000 will be used to intensify the mining research program involving research on artificial support, engineering principles, rock disintegration concerned with physical processes of drilling and blasting, water control, rock mechanics, and physics of rocks and rock structures.

$970,000 for accelerating processing and utilization research on domestic mineral resources will be used principally for the replacement of obsolete and the acquisition of new scientific research equipment needed in accelerated programs on process research and on properties of metals, alloys, and materials.

Foreign mineral activities, $500,000

This program is designed to satisfy the needs of Government and industry for current information on mineral developments in foreign lands that affect the mineral economy of the United States.

The increase of $134,000 will be used to obtain more complete statistics on world mineral production, consumption, and trade; and more analytical appraisals of mineral developments in foreign countries.

Health and safety

The 1963 budget estimate for the "Health and safety" appropriation is $8,158,000, and increase of $693,000 over 1962.

The prime objective of the Bureau's health and safety activities are to prevent accidents and injuries in the mineral industries, safeguard the lives and health of those employed in these industries, and extinguish or control fires in inactive coal deposits.

Inspections, investigations, and rescue work, $6,253,000

The ultimate objective under this heading is to prevent accidents and injuries, and by so doing protect the lives and health of workers in the mineral industries. Mine inspection, safety investigations, accident-prevention education, ventilation investigations, and occupational health and working environment studies are all designed to accomplish this objective.

The estimate includes an increase of $282,000, primarily to initiate a study of the causes and prevention of injuries and health hazards in metal and nonmetallic mines in accordance with the provisions of the recently enacted Public Law 87-300.

Control of fires in coal deposits, $377,000

The purpose of this program is twofold: to prevent destruction of valuable coal resources by fire and to protect the lives and health of persons living in proximity to such fires.

Health and safety research, $1,528,000

Under this program, research is conducted on the support of mine roof and control of overburden, ventilation of mines, methods of allaying harmful airborne dusts, prevention of underground fires, and the design and testing of machines and protective devices used in mines.

The estimate includes an increase of $364,000, primarily to (1) expand research on and testing of respiratory-protective equipment, and extending Bureau approval coverage to hazardous industrial uses not presently covered; and (2) to expand the diesel-powered equipment research and testing to keep abreast of modern mining and tunneling requirements and to meet increasing industry requests for the development of safety procedures covering use of such equipment.

Construction

Laboratory facilities, $1 million.—The estimate will provide for the design and preparation of detailed engineering plans and specifications in connection with the relocation of fuels and health and safety functions from Pittsburgh to Bruceton, Pa.; and planning for establishment of a new materials research center at Frederick, Md.

General administrative expenses

The 1963 budget estimate for the "General administrative expenses" appropriation is $1,333,000, an increase of $43,000 over the amount appropriated for 1962. This nominal increase will cover procurement of accounting equipment, expansion of the Bureau's internal audit staff, and within-grade salary increases.

Development and operation of helium properties.

The 1963 budget estimate under this heading is $20 million (borrowing authority), an increase of $10 million over the amount authorized for 1962. This fund is used for the production, conservation, purchase, and sale of helium;

research to discover helium supplies and improve methods of production and utilization; and development of helium properties and reserves.

Office of Coal Research	$2, 000, 000
Office of Minerals Exploration	5, 900, 000
Office of Oil and Gas	731, 000
Total estimate, 1963	8, 631, 000

The total estimate of $8, 631, 000 for these offices is an increase of $6,235,000 above the $2,396,000 available in 1962.

The major increase is in the Office of Minerals Exploration in the amount of $5,150,000. This will provide for stabilization payments to small domestic producers of lead and zinc ores authorized by the act of October 3, 1961, and for financial assistance for exploration of certain minerals.

There is also an increase of $1 million for the Office of Coal Research. Although there is an increase above the amount appropriated for 1962, the program will remain at the 1962 level since in 1962 approximately $1 million was available from prior-year appropriations in addition to the $1 million appropriated for that year.

Fish and Wildlife Service

The Fish and Wildlife Service is responsible for the conduct of research and management programs to conserve fish and wildlife resources for recreational and commercial use and for assistance to the fishing industry.

The estimate of $64,646,000 for 1963 is an increase of $12,259,176 over the amount of $52,386,824 available for fiscal year 1962.

Bureau of Commercial Fisheries

The estimates for the Bureau of Commercial Fisheries for 1963 total $25,293,000, an increase of $2,938,983 over the amount available for 1962. An additional $1,998,000, to be derived from the Pribilof Islands fund, is being requested for "Administration of the Pribilof Islands."

The estimate for "Management and investigations of resources" totals $15,213,000. This represents an increase of $2,637,318 over 1962.

An addition of nearly $1 million is included for expansion of oceanographic research as part of the National oceanographic program, endorsed by President Kennedy. Research in the tropical Atlantic, an area of growing importance to U.S. fisherman, and a source of protein food for the undernourished peoples of developing African nations, will be intensified. Increased knowledge of the living resources of the sea off the east coast of Latin America also will strengthen the alliance for progress.

The Columbia River salmon runs are a vital portion of the highly important and valuable Pacific coast salmon fishery. The Department has recommended against further extensive hydroelectric development in the Middle Snake River salmon production stronghold until a research program can be conducted to ascertain methods for protecting the fish runs. An additional sum of $1,075,000 is budgeted for this emergency program.

Of equal importance is the Federal-State Columbia River fishery development program to offset losses to salmon and steelhead runs resulting from Federal water-use developments in the Columbia River Basin. Some damages have been mitigated through construction and operation of hatcheries, fish screens, fish ladders, and stream clearance. The $1,635,000 budgeted for construction and the $2,100,000 for operation and maintenance of facilities will enable the Bureau to maintain this progress which is so necessary.

The estimate of $300,000 for "Special foreign currency program" is the same as the 1962 appropriation. It provides for the use of foreign currencies for the prosecution of research which will benefit the United States through investigation of the fundamental, long-range aspects of biological and technological problems confronting domestic fisheries, which will increase the fund of basic knowledge upon which intelligent fishery management programs can be based.

The estimate for "Construction" is $8,414,000. At Seattle, the base for research on salmon of the North Pacific Ocean and the Columbia River, an overcrowded building will be replaced with a modern laboratory at a cost of $2,257,000.

At Ann Arbor, Mich., where research is conducted on control of the sea lamprey, which has destroyed valuable Great Lakes trout fisheries, a new fireproof building will be constructed at a cost of $1,448,000 to provide headquarters for research on fisheries of the Great Lakes region.

At Beaufort, N.C., the present radiobiological laboratory, frequently flooded by hurricanes and coastal storms, will be replaced at a cost of $394,000.

At La Jolla, Calif., the converted schooner *Black Douglas*, built in 1928, will be replaced with a modern research vessel equipped for biological and physical oceanographic research. This ship, which will cost $2,500,000, will be used in studies on sardines and other parts of the national oceanographic program. Also included are $150,000 for the design of a fishery research vessel for use in the North Pacific and Bering Sea; $30,000 for the rehabilitation of the warehouse and dock facilities at St. Simons Island Lighthouse Station, Ga.; and $1,635,000 for Columbia River fishery facilities.

The estimate of $616,000 for "General administrative expenses" represents an increase of $134,000 for the establishment of an internal audit staff and to provide for more effective and efficient general administration of the Bureau.

The estimate of $750,000 for "Construction of fishing vessels" is the same as the 1962 appropriation. It provides for payment of the cost differential on fishing vessels to assist certain segments of the fishing industry to construct modern fishing vessels and thus enable them to better meet foreign competition.

Bureau of Sport Fisheries and Wildlife

The estimates for this Bureau for 1963 total $38,989,000, and increase or $9,320,193 over the amount available for 1962.

The estimate for "Management and investigations of resources" is $26,572,000, an increase or $3,231,693, including $473,500 for operation of new hatchery facilities and improved maintenance of all hatcheries; $255,000 for expansion of fishery research in the fields of trout liver cancer, Pacific marine sport fisheries, and fish-pesticide relationships; $916,000 for operation of new refuge facilities and improved maintenance of all refuges; $572,000 for strengthening migratory bird management and enforcement by additional staffing and allowance of premium pay for extra duty of agents; $390,000 for expansion of wildlife research in the fields of waterfowl data analysis and wildlife-pesticide realtionships and for studies of bird hazards to aircraft; $497,000 for a more adequate program of soil and moisture conservation work in the refuge system; and $125,193 for review of applications for drainage assistance which affect waterfowl habitat.

The "Construction" estimate is $4,086,000. It provides $654,000 for continuation of construction of five new hatcheries and improvement of one; $325,000 for continuation of construction of two fishery research laboratories and planning for a new fish-pesticide relationships laboratory; $2,928,000 for the refuge development program and $179,000 for wildlife research facilities and a start on the Northern Great Plains Wildlife Research Station.

The estimate for the "General administrative expenses" appropriation is $1,331,000, an increase of $260,000 over 1962, which is needed for taking on the additional workload and better servicing of expanded operating programs.

Included in the estimates is $7 million for the migratory bird conservation account representing the first installment on an amount of $105 million authorized to be appropriated over a 7-year period by Public Law 87-383, approved October 4, 1961, for the expanded wetlands acquisition program. Amounts so appropriated will be repaid from future receipts from the sale of migratory bird hunting stamps.

Water Development

OFFICE OF SALINE WATER

The total budget estimate for the Office or Saline Water amounts to $9,785,000. This consists of $7,700,000 for the research and development program and $2,085,000 for the operation and maintenance of demonstration plants. The estimate for research represents an increase of $2,445,000 over the appropriation for fiscal year 1962. The estimate for operation and maintenance of demonstration plants is an increase of $1,085,000 over 1962.

Construction funds for five saline water conversion demonstration plants authorized by Public Law 85-883 have already been appropriated. In fiscal year 1963 three demonstration plants will be in operation and two will be completed and in operation during part of the year.

Emphasis during the coming years will be placed on expanding and accelerating the basic and applied research aspects of the program. Public Law 87-295 authorizes $75 million for this work during fiscal years 1962 to 1967, inclusive. There is scientific agreement that more effective and economical means of saline water conversion may yet be discovered and that the foundation of an effective

program is a continuous program of basic and applied research. The general activities to be pursued include exploratory research, extraction and use of by-products, use of atomic energy in conversion, small conversion units, pilot plant construction, and special equipment components.

SECRETARIAL OFFICES

OFFICE OF THE SOLICITOR

The budget estimate for the Office of the Solicitor is $3,747,000, an increase of $255,000 over the amount of $3,492,000 appropriated for fiscal year 1962.

The increase will allow for a modest addition to the existing staff. There is an urgent need to render timely and competent legal services.

OFFICE OF THE SECRETARY

The estimate of $3,568,000 for the Office of the Secretary represents an increase of $132,500 over the amount available in fiscal year 1962. The major part of the increase would be applied to streghthening the information activities of the Department. Minor increases are also included for additional staff and expenses for program direction, coordination, and management activities.

VIRGIN ISLANDS CORPORATION

The estimate for the Virgin Islands Corporation is $3,485,000, an increase of $2,604,000 above the amount available in 1962. The principal need for increased funds results from the rapid growth in the demand for electric power in the islands. The estimate will provide for the installation of a 5,000-kilowatt steam turbine and a 3,000-kilowatt diesel generator on the island of St. Thomas, and a 3,000-kilowatt diesel generator on the island of St. Croix.

IMPORTANCE OF ITEMS

Secretary UDALL. In the first place, I think the members of this committee know far better than I do the importance to the whole country of the items and programs included in the appropriation request in this area. The President feels, as I do, that these investments—and that is what they are—in the resources and development of resources, are the very best appropriations, although they are not really appropriations, because they are investments that can be made. It is his feeling that the time has come for us in this country to begin talking again in terms of conservation and conservation programs.

I am very pleased to say on Wednesday the President will send to the Congress a conservation message covering the whole conservation of resources program, some of which are not in this appropriation bill, but many of which are.

I am glad to have it put in this focus, because I think ever since Teddy Roosevelt's time this has been the most laudable word in the American public life. Therefore, you will find the conservation theme, Mr. Chairman, very strongly in our statement.

VALUE OF NATION'S RESOURCES

I think our strength as a country rests ultimately on the raw materials that this country has and the ability to conserve them wisely. From my trips to other parts of the world this past year, the one thing that always struck me first—and I am sure that Senators who have made trips will agree with me—is that the ultimate power and strength of the country is determined by what resources it has. Our country is most fortunate. Yet we know we have to be good husbandmen. We have to use what we have wisely as we go long. I think, to

single out some of the things that I should like to comment on the most, one would be the increasing contribution that science can make and is making in the conservation field. Deciding how to renew a resource, deciding how to stretch it and make it go further, this is the function of science.

EMPHASIS ON SCIENCE

This is the celebration day of the triumph of science in outer space. There have been a lot of significant triumphs in the resource field. It has meant that our country has been strengthened. You will find that emphasis throughout, and this committee has supported in recent years the strengthening of scientific efforts made in this field. We will have to make more in my opinion.

Senator MUNDT. Mr. Chairman, I would say I thoroughly agree with that, and would like to add a plug for my favorite theme, and that is if we are ever going to solve the agriculture problem, we will have to find some new uses for farm products. I think science does hold the key to the future.

Secretary UDALL. I could not agree more, Senator. I think science can be a great servant if we will let it do that.

OUTDOOR RECREATION RESOURCES COMMISSION

Another item that the committee will find mentioned—and this will come in for perhaps more attention this session on the legislative side—relates to the recent report of the Outdoor Recreation Resources Commission. This Commission has, I think, turned in a very fine report. I think at least one of the members of the committee here served on the Commission. It is underscoring again the importance of the American outdoors and the resources we have in this area. I know one of the things that has bothered the Congress in recent years—and this has been one of the things in my opinion that has prevented us from expanding our national park system, from rounding out acquisition of holdings in our national forests—in other words, land acquisition—has been that we have had the feeling that with all the other responsibilities we have as a Nation, defense and other fields, this was a good thing to do but we could not afford to do it quite yet. We are hoping to come up with, and it will be announced very shortly, an answer to this problem that will create a land conservation fund that we hope the legislative committees will authorize, so that we can set up a means of financing expansion programs in forest and wildlife refuges and parks and enable us also with all these wonderful fresh water reservoirs we create to acquire enough land and to do the job right.

This is something that you will hear more about and we hope that next year when we come up that this fund will be in existence, and it will be part of the appropriation picture.

We are not proposing, Mr. Chairman, to go outside the normal appropriations process for this program.

PUBLIC LANDS MANAGEMENT

In the field of public land management, management of these lands is important. The committee gave us increased appropriations last year for improved soil and moisture conservation, and reforestation programs. There are additional requests this year.

We have made, Mr. Chairman, we think, significant progress last year in reducing the backlog of cases of work in Bureau of Land Management. A few days ago the moratorium was lifted in North Dakota, South Dakota, and Montana, and we hope to get the program current.

Senator BIBLE. Do you have any timetable as to when the moratorium would be lifted in the State of Nevada?

Secretary UDALL. We are trying as soon as our goals are reached. We will lift it as soon as we can. All I can say to you, I don't happen to have the Nevada figure at my fingertips.

Senator BIBLE. You can supply that at a later date?

Secretary UDALL. Our general goal is in the next 6 months to get them all current, and then we will be open for land office business.

PROBLEM IN NEVADA

Senator BIBLE. I might say that, if there is any one problem that is causing me difficulty in my State of Nevada, it is the public land BLM problem. You have cleared up the backlog by rejecting all the applications, which is a very fast way of accomplishing it. It poses some problems on my level as well as the State level. I would hope you could check that and see when we might have the moratorium cleared and get back in business in Nevada.

Secretary UDALL. I will give you an indication before the day is out.

MORATORIUM IN NORTH DAKOTA

Senator YOUNG. How would the lifting of the moratorium affect North Dakota?

Secretary UDALL. We have lifted it. For purposes of accepting applications, nonmineral applications, we just shut the doors and said we had such a big backlog that we were going to dispose of and work our way out of the backlog, and we would not accept new applications until we had taken care of all pending applications. As far as your State is concerned, we are back in business in a complete way. This never did affect the mineral applications. It was in the nonmineral area we were so far behind in some instances. It was a tremendous backlog.

Senator YOUNG. Thank you.

DEPLETION OF GRAZING LANDS

Secretary UDALL. There are two other points. Those of us in the West all know the extent to which our grazing lands have been depleted and need to be restored. We have recently proposed to grazing advisory boards in the West at their meeting in Albuquerque last week—and this is possible under the law—we all know the grazing fees on the Federal lands have always been much below State lands, railroad lands, private lands—we have indicated to these people as far as we were concerned if they wanted to go along with fee increases that we would plow all of the increase back into range improvement programs. If as a major conservation step this Congress sees fit, as I hope it does, to authorize a youth conservation program, we would

have a real workhorse there to get a lot done, and make a real dent in this area of conservation activity.

FEE INCREASES

Senator DWORSHAK. When do you plan to make those fee increases effective?

Secretary UDALL. Our proposal to the grazing advisory boards is that we wanted them to consider this. We wanted them to come up with a solution to this. We have indicated that we will go along if they will go along with increases. We will go along with plowing the increases back into the range.

Senator BIBLE. Mr. Secretary, haven't you also indicated that there would be no increases in fees in this calendar year 1962?

Secretary UDALL. We are pointing ahead.

Senator BIBLE. I think you have already said that through your Under Secretary, John Carr.

Secretary UDALL. Yes.

Senator BIBLE. You have also said that in addition the advisory boards would have to June 1 of this year to make a study and come back to you with recommendations. You are using the advisory boards as the catalyst to try to work out this very complex problem.

Secretary UDALL. That is correct. We are trying to bring them into the decision-making process, and to help them make some decisions with us. The thing that I am forecasting here is: "Can we come up with a future program?" As far as the current year is concerned, we are not contemplating making increases.

Senator BIBLE. That is a calendar year and not a fiscal year?

RESOURCES DEVELOPMENT

Secretary UDALL. That is correct. One of the other programs where resource development, development of our human resources that is very important, is the Indian Bureau programs. This committee over the past several years has supported strengthening the educational program. I believe this is one of the very finest things that has been done. I commend the committee for it. We are moving forward very nicely with these programs.

The theme of our Indian program at the present time is the development of the human potential, development of the resources of these Indian reservations. We are trying both with money that Indian tribes realize from these judgment funds from the Indian Claims Commission, and with the appropriations this committee makes available to the revolving loan fund, through area redevelopment, to draw industry to the reservations.

EXAMPLE OF SOUTH DAKOTA

We point, Senator Mundt, to what has been done in South Dakota, which is one of the finest examples of how we can build up the economy and give these people a chance. We do hope that the committee will continue to support these investments because we know that where we can create jobs for the long haul, and create payrolls and get these people to work, this enables us or will enable us in the

long run to solve the problem of giving these people the opportunity we want them to have to compete with the rest of us in our society.

Senator MUNDT. Mr. Chairman, I would like to confirm the fact that Pine Ridge industrial experiment has worked out better than anybody anticipated. We also have one at McLaughlin, a blanket factory. I am sure that this committee will continue to support the development of economic opportunity on the reservation.

I would also at this point like to say that as far as I am concerned, these steps should not be considered as end goals, but as a bridge by which we train people and equip them to move off the reservation so they can be fully assimilated into the economy of the country. I think at best reservation life is a life of limited opportunity. If our goal is to keep people just happily employed on the reservation, we deny the Indians the opportunity to become lawyers and doctors and dentists and to participate in life as full-fledged Americans.

As the Secretary knows, we have a good friend of his, Ben Reifel, a Sioux Indian, who is a colleague in the Congress. I think we should keep in mind that the Indian has a full American right to aspire and to achieve full equality of opportunity, assimilated in the white man's community or in the all-American community. I don't want us to think in terms of developing resources that tend to hold people on the reservation. I think we should keep in mind always to equip them on the reservation to move off and become fully productive. If the Secretary disagrees with that concept, I would like to have him express himself.

OBJECTIVE OF INDIAN PROGRAM

Secretary UDALL. Of course, Senator, our objective is what you have described, to get our Indian people in the mainstream of American life. I think the best way to do that is to give them adequate educational opportunity, to help them develop their resources. I think as at Pine Ridge when you get industrial development started, this means jobs, this has meant a housing project, and from that juvenile delinquency will go down, more of these people will have the type of opportunity that will enable them to move off the reservation as they desire.

Senator MUNDT. I would hope we would keep active in conjunction with that program a collateral program. I have forgotten the exact title, placement off the reservation or something like that, that helps them find jobs, gives them counsel in a new community, of their choice, and they can vacate these reservation jobs so that others can fill them and become trained for off-reservation employment. I think if we are to continue to keep people walking across that bridge, we have to upgrade the educational opportunity for the Indian and emphasize something on which the chairman has demonstrated positively through the years, and that is additional vocational training for Indian youth and for Indian adults as well.

Secretary UDALL. The vocational training program has been a very fine one.

SIZE OF APPROPRIATIONS

Senator DWORSHAK. Mr. Secretary, you know that during the past year I have been very critical of the Bureau of Indian Affairs, and also for several years in the previous administration. Like you, I have

been interested in this Indian program for many years, and I can recall back 15 years in the House when I think it was Congressman Steger, the full-blooded Indian from Oklahoma, was serving, and he used to make speech after speech on the floor of the House emphasizing that the more money that was appropriated for the Bureau of Indian Affairs, it seemed less and less progress was being made in improving the status of your Indians on the reservations.

I am somewhat shocked by the budgetary request for $38 million increase this year. Is that correct? That is covering the health activities along with the regular Indian Bureau program. This is the equivalent of the entire appropriations for the Bureau in 1948. In the current year the total appropriation amounts to $650 per capita. In your budget if you have the full amount, it will be $700 for every Indian man, woman, and child on the reservation. This verifies the complaints I have been making for many years.

FORT HALL RESERVATION

For instance, on the Fort Hall Reservation, with only 3,500 Indians, the other day the press reported that 1,900 of them were in line receiving surplus food commodities—a recent development because of the widespread starvation on the Fort Hall Reservation. Yet this year $650 per capita and the Indians may be well to do in South Dakota—I know the Senator has been very solicitous about them, and I have said on many occasions that the Senator from South Dakota has done a marvelous job and possibly that might mean that the Senator from Idaho has not been doing so well for his Fort Hall Indians. Is that figure correct?

Secretary UDALL. The figure I have here is a $33 million increase and of that approximately $25 million is for education. It is getting these kids in schools that are not in school.

SCHOOL EXPENDITURES

Senator DWORSHAK. In public schools or reservation schools?

Secretary UDALL. Both. This is the main thrust of the increase. I welcome the Senator putting our people under the closest kind of scrutiny when they come up on the detail.

Senator DWORSHAK. I think they should welcome that.

Secretary UDALL. I think—and I went over this very closely with them—that this is a program that is helping people to help themselves. At a time when we are finding it in the national interest to invest around the globe in helping people to help themselves, I certainly think this would be a bad time to cut our own people.

HISTORY OF INDIAN BUREAU

Senator DWORSHAK. I don't want to cut down materially but the Bureau was organized nearly a century and a half ago for the specific purpose you outlined, to make the Indians as self-sufficient, to become full-fledged American citizens, and yet after the century and a half, spending hundreds of millions of dollars, the record shows—not only during the past year, I can't be too critical of this administration, I was of the previous administration and the previous administration because there has been no change in the trend. If you really mean

KANSAS STATE UNIVERSITY LIBRARY
MAY 16 1962
MANHATTAN KANSAS

what you say, that you want to help the Indians, I hope the record will show in a few years that we have not just been spending more money which obviously does not reach the intended beneficiaries. That is the record. That is the record in my State.

We don't have as many Indians as you do in Arizona or Senator Mundt has in South Dakota. But the record is not good. I know that you, having had experience directly and personally with the Indian program in Arizona, probably are better qualified to deal with these problems than some of your predecessors.

Secretary UDALL. Senator, I think that some of the points you make with regard to past programs certainly have merit. I think we are moving in the right direction. I think if the Senator would look at Pine Ridge and some of the reservations in Arizona, like White Mountain Apache and Navajo——

Senator DWORSHAK. Fort Hall.

Secretary UDALL. If you could have gone with a group of us and seen these young Indians with a high school education, many of them, as workmen building an $8 million sawmill with the latest modern equipment, almost 97 percent Indian labor, and doing a really efficient job of it, you would realize there is progress. It just seems to me that one of the things that has been wrong in the past in some areas, that we have gone along with a caretaker program, and as we know, from a welfare program. If you have a caretaker program, you don't make progress. Maybe we have needed in some ways to spend more and invest more.

Senator DWORSHAK. It is rather tragic, you will admit, I am sure that 1,000 Indians living on the Fort Hall Reservation are forced to accept surplus food because of their dire financial circumstances.

Secretary UDALL. Yes, I would agree.

Senator MUNDT. Mr. Chairman, my office has sent me a note that General Shuler is there, so I have to leave. I would like to ask one further question, if I may. This does not have anything to do, Mr. Secretary, with your statement per se, because you are going to have representatives before pretty much this same team of Senators in the Public Works Committee dealing with the Bureau of Reclamation. But you yourself might not be appearing then, so I would like to ask one question to straighten out a situation so at least my correspondence to my constituents will be factual. It is this:

PARTNERSHIP IN ELECTRICAL DEVELOPMENT

One of your distinguished assistants has been quoted widely on a statement which he may or may not have made that when the new administration came into power, the partnership concept of electrical development died. You have been quoted in the press also widely on a statement which you may or may not have made that that is not the case. I am not trying to put you on the spot as to what statements were made and which were not made but I wish you would dilate at this point as to what is the policy in that connection.

Secretary UDALL. I hope I can help you on that, Senator. What came to be called the partnership policy in the previous administration, which was exemplified to my way of thinking by the proposals made by the Pacific Gas & Electric Co. to install the turbines and in effect purchase falling water at the Trinity project in California, if

that is or was partnership. My colleague, my Assistant Secretary, was quite right and I concur with him in saying that type of partnership is no longer policy.

I think the decision—very basic decision—my Department made a week ago on the Upper Colorado project, which is an area where for the first time we are getting a whole grid established, is an indication that we are interested in working out cooperative arrangements with private utilities that will strengthen their systems, strengthen our systems, and that will in some instances effect a saving all the way around. We came up with a result in this instance.

Senator MUNDT. I noticed that. From that I concluded what I would consider to be a partnership concept was still prevailing in the Department, and that is you are not dedicated to a doctrinaire position of pressing for public power regardless of the situation you confront, but that you are interested in harnessing together the best resources of private power and public power to give a community the best possible electrical service at the least cost to the taxpayer. I would consider that a partnership program. I didn't ever relate the partnership program just specifically to one project out in California.

PATTERN RATHER THAN POLICY

Secretary UDALL. It was not one project; it was a policy. I think if that was a policy it is no longer the policy as far as the administration is concerned. But I do think that what we did last week—and I have taken criticism for it—was the best thing for everybody concerned. I think it was a good solution. I don't know of a single Congressman or Senator who wants to come to me, whether he is a Republican, Democrat, or conservative or liberal, in the whole basin, who does not believe that this was a good result. It is a pattern of cooperation. It means more efficiency. It is going to mean that we have a stronger system. It means also that the rights of the traditional preference people are afforded full protection. I think this is something that we can take some satisfaction in.

Senator MUNDT. I believe I saw you quoted in the paper that it would save X million dollars to the taxpayers.

SAVINGS UNDER COOPERATION AGREEMENT

Secretary UDALL. There will be very substantial savings to the basin fund, which is a saving to all the people that live in the whole basin. As far as the money that we will have to ask the Appropriations Committee, the other committee that you gentlemen sit on, there will be a saving in the investments that we will have to make in that area.

Senator MUNDT. About how much?

Secretary UDALL. $27 million, according to the plans at the moment. This would be that amount that we won't have to ask the committees for.

Senator DWORSHAK. Mr. Chairman, I think far more important than the actual money saving, which is vital, is the fact that you are making an all-out effort to preserve full cooperation among all of the interests in the basin. If you succeed in doing that, you will have accomplished a great deal in the future development of the entire basin project.

Secretary UDALL. I think this is going to be a very significant result, and it will be good for that whole area in the West. This is my hope at the present time.

TERRITORIAL RESPONSIBILITIES

Mr. Chairman, with regard to our territorial responsibilities I would like to make a few general comments. There are some favorable things taking place. We like the way that the people of these areas are reaching out for self-government and are ready to take more responsibility, particularly with the Virgin Islands. There is one problem that the committee will be particularly interested in. There has been in existence now for more than 25 years——

Chairman HAYDEN. And very expensive.

VIRGIN ISLANDS CORPORATION

Secretary UDALL. The Virgin Islands Corporation. I am sure the chairman is very familiar with it. We voted a couple of months ago to recommend that Congress dissolve this Corporation and turn its assets over to the local government.

We are also going to recommend that these people elect their own Governor. This is in the Caribbean area where the image that the United States presents of democracy in action is very important. We think these people are ready to go. We hope that the legislative committees will take action on the Virgin Islands Corporation, and that it will no longer be necessary for this committee to have any dealings with it.

I think here is an example where we are moving. People are getting on their own. They can take care of their own expenses through their own tax system. I think this is a real step forward.

SAMOAN SITUATION

This committee has authorized, and I think this is again a very wise step—it is the type of thing I have been talking about where if we invest enough and do it in a timely way, we can improve the economy of these people just as with our Indian people and enable them to make significant progress—I refer particularly to Samoa. The Samoans have been just crippling along in the past. Their society is much like that of our Indian peoples. They are rather slow to progress sometimes. And yet, due to the increased appropriations for education and health and other programs, significant progress is being made. One of the most important things that is happening down there, and will happen shortly, is the fact that there will be completed a jet airport. They will then be on the main line. They will be just a few hours away from San Francisco or Los Angeles or Honolulu, and this is going to open up in this area great new economic opportunities for the development of resort facilities.

We want to see that it is done the right way. This will offer economic opportunities that have not been present.

One special item that I want to call this committee's attention to is this: As you find in talking with Gov. Rex Lee, it is not a revolutionary proposal. It is a little new. I hope it is not startling to everyone.

But it is an example of using the latest scientific methods to accomplish a purpose and thereby saving tremendous sums of money.

EDUCATIONAL SYSTEM IN SAMOA

The educational system there is far worse in terms of the type of teachers and the type of facilities than anything we have in this country, including those for the Indian people. The proposal that has been made—and this has been studied by the best people in this country—is that this committee authorize money to set up an educational television network down there.

The Governor will describe this to the committee at length. This will mean that by a relatively modest investment we can educate these young people and give them a much higher quality of education, without having to hire a large number of trained teachers stateside and ship them down there in order to carry out the program.

This is something new. The Governor has gone into this very deeply. He has had two studies made. I hope you will listen carefully to his presentation, because we consider this a real opportunity to show the rest of the world what can be done using TV latest techniques. Some of the committee members may have read the article that appeared 3 or 4 weeks ago in the New York Times about our present responsibilities in the Trust Territory of the Pacific Islands. Here, again, these people who are spread on these islands, hundreds and thousands of miles apart, are a responsibility of this Government. This is a trust under the United Nations. We are on trial in this area. We are making new headway.

The committee gave us additional appropriations last year. I think I should say, that to move forward and do the type of job that we are going to need to do, that we are going to have to ask for additional programs of investment.

I know the committee will want to give special attention to the trust territories because we feel the burden on us and the responsibility upon us is heavier and heavier all the time.

MINERAL RESOURCES

In the field of mineral resources, Mr. Chairman, again this is a field where research is making the main contribution. One of the programs I want to single out for comment because it is a new item and I hope you will discuss at length with Mr. Nolan, Director of Geological Survey. This program was worked out with the President's concurrence, with the Federal Committee on Science, Dr. Wiesner, the President's science adviser, and my own science adviser. This carries out one of the main recommendations of the Kerr Committee on National Water Resources. This would set up within the Geological Survey an Institute for Water Research. This is for basic water research and does not, as some have indicated, trespass upon the field of water research closely related to water and soil. This is basic water research in trying to understand the behavior of and the properties of water, and what this water resource is. We think that this is a very modest program, and yet a very important one to accelerate our research activity.

FISH AND WILDLIFE SERVICE

Again in the Fish and Wildlife Service, our oceanographic research, this tremendous fish resource we have, is extremely important.

One other new program authorized by Congress last year, Mr. Chairman, I should like to comment on, and that is the so-called wetlands program for acquiring adequate habitat for migratory birds. This is a long-range program. The first appropriation is a loan program. The money will be repaid from duck stamp revenues. This is the type of program where we have a goal. We reach it and we have accomplished the purpose. The purpose, of course, is to acquire an adequate refuge system on all of our flyways for migratory birds. This will require the acquisition of about 4,500,000 acres of marshlands and refuge habitat. This we think is a sound program. Again we hope the committee will support it.

RECEIPTS OF DEPARTMENT

Let me make one final comment, Mr. Chairman. It has always been a matter of great satisfaction to my Department, and I am sure to this committee, that this is one of the few departments that has receipts that at times come fairly close to covering or cover a larger percentage of the amounts that are appropriated. As you may have read in the press recently, we are having a very large bidding, 3-million-acre bidding on the Continental Shelf, that may bring in next month an amount that is as large as the total amount that we are requesting for appropriations.

Here again is an example in the statement that I made earlier that in resource management, if we manage our resources properly, if we develop them properly, what money is invested comes back to us manyfold. We think that the budget we have prepared this year has been soundly considered by us. We have given it great attention. We know that the committee will give it their usual careful scrutiny and we hope you can support almost all the items.

Chairman HAYDEN. We thank you very much, Mr. Secretary, for your appearance. I am sure we will have an adequate understanding of your problem before the hearing is over. Thank you, sir.

Secretary UDALL. Thank you, Mr. Chairman.

RANGE APPRAISAL

Chairman HAYDEN. Last year the Senate committee included in its report on this bill a directive to you and the Secretary of Agriculture to initiate a trial program of range appraisal within the existing resources of the two Departments. Please inform the committee just how you are going about this appraisal, and the results which are indicated. The committee would also like to know, if it is available, the cost to the Department thus far.

STATUS OF PUBLIC LAND RANGE APPRAISAL

Secretary UDALL. The field reports in regard to the public land range appraisal being conducted by the Bureau of Land Management and the Forest Service now have been completed. The three areas in which the trial studies were conducted were located in Colorado, Montana, and Oregon. The Bureau of Land Management and the Forest Service today will begin to review the three State reports

and prepare the final report to Congress. A representative from the Bureau of Land Management and the Forest Service for each study area has been detailed to Washington to assist in preparing the final report. It is planned to have the report available for Congress early this spring.

FUNDS FOR NATIONAL ACADEMY OF SCIENCE

Chairman HAYDEN. In the supplemental appropriations bill 1962 there was appropriated to the Secretary $200,000 out of a $500,000 request to be transferred to the National Academy of Sciences for the purpose of preparing a comprehensive study of research relating to conservation and development of natural resources of the United States. No funds at all are asked for this purpose during the coming fiscal year. Would you indicate whether the survey is continuing? If so, what financial provision is made for it; and if not, why has it been decided that the survey is either not necessary or is undesirable? Of what value is the work which has been carried on with the $200,000 appropriated this year?

STATUS OF STUDY BY NATURAL RESOURCES COMMITTEE OF THE NATIONAL ACADEMY OF SCIENCES

Secretary UDALL. In response to a request from President Kennedy, the National Academy of Sciences began last summer the study of the scientific aspects of problems of natural resources. This study is being supported by the Department of the Interior with funds received from Congress in a supplemental appropriation.

The President of the National Academy, Dr. Detlev W. Bronk, appointed a 13-man Committee representing universities, industries and private foundations to conduct the study. The Committee membership includes such men as Sumner Pike, former AEC and SEC Commissioner; Abel Wolman, a world authority on water resources problems; J. G. Harrar, president of the Rockefeller Foundation; Gilbert White, former president of Haverford College and Vice Chairman of the President's Water Policy Commission; Frank Notestein, president of the Population Council; Athelstan Spilhaus, dean of the institute of technology at the University of Minnesota, and Dr. Bronk himself. Other members are Dean Frasché, King Hubbart, Profs. Edwin Gilliland, Philip Morse, and Paul Weiss, and Roger Revelle, science adviser to the Secretary of the Interior.

The Committee has held a series of 2- to 3-day meetings at monthly intervals. At each meeting, a panel of specialists has reviewed with members of the Committee the present state of knowledge, the implications for public policy, and the research needs in a specific resource field. These reviews have included fossil fuels and energy, minerals, food and fiber, marine resources, water resources, the total environment as a resource, problems of waste, and economic and social aspects of resource problems. The Committee staff and members are now making more detailed studies of the questions raised by the panels of specialists preparatory to writing their final coordinated report during the coming summer. This report will be issued during the fall of 1962. It is proposed to complete the study within the $200,000 appropriated.

Chairman HAYDEN. The Bureau of Land Management will appear at 3 o'clock.

(At 10:25 a.m., a recess was taken until 3 p.m., the same day.)

(AFTERNOON SESSION, MONDAY, FEBRUARY 26, 1962)

BUREAU OF LAND MANAGEMENT

STATEMENTS OF KARL S. LANDSTROM, DIRECTOR; HAROLD R. HOCHMUTH, ASSOCIATE DIRECTOR; JAMES P. BEIRNE, ASSISTANT DIRECTOR, ADMINISTRATION; GERALD M. KERR, ASSISTANT DIRECTOR, RANGE AND FORESTRY; JERRY A. O'CALLAGHAN, ASSISTANT DIRECTOR, LANDS AND MINERALS; MARK B. WELT, BUDGET AND FINANCE OFFICER; EUGENE V. ZUMWALT, CHIEF, DIVISION OF FORESTRY; AND CHARLES E. REMINGTON, CHIEF, DIVISION OF ENGINEERING; ALL DEPARTMENT OF THE INTERIOR

RECEIPTS TO STATES AND COUNTIES FOR FISCAL YEAR 1961 BY SOURCES

Chairman HAYDEN. Three o'clock having arrived, the committee will be in order.

As we begin consideration of the 1963 budget estimate for the Bureau of Land Management, I wish to place in the record a table showing the Bureau's receipts by sources, and another showing distribution of receipts to the States and counties for fiscal year 1961.

(The table referred to follows:)

The following table shows actual receipts of the Bureau of Land Management for fiscal years 1959, 1960, and 1961, and the estimated receipts for 1962 and 1963.

	1959	1960	1961	1962	1963
Sales, public lands and materials	$4,239,230	$5,101,297	$4,250,000	$4,820,000	$4,950,000
Fees and commissions	1,265,544	1,798,817	2,476,549	2,058,000	2,260,000
Mineral leasing	92,464,918	94,561,469	109,677,284	111,127,000	113,930,000
Mineral leasing, Outer Continental Shelf	3,412,204	229,456,819	7,304,687	140,000,000	[1]220,000,000
Grazing fees	3,228,332	3,487,992	2,982,188	4,180,000	6,120,000
Right-of-way leases	127,211	169,263	209,724	150,000	175,000
Oregon and California and Coos Bay timber sales	28,960,105	33,828,162	29,866,075	32,200,000	32,200,000
Other timber sales	2,790,755	2,531,175	2,259,682	2,500,000	2,900,000
Miscellaneous receipts	232,572	132,873	219,968	729,000	732,000
Total	136,720,871	371,067,867	159,246,157	297,764,000	383,267,000

[1] Includes $70,000,000 expected to be released from $356,000,000 now impounded.

Distribution of receipts to States and counties, fiscal year 1961

State or territory	Sales of public lands and timber	Mineral leases and permits	Taylor grazing leases	Taylor grazing districts	Total
Alabama	$167	$866			$1,033
Alaska	14,091	3,555,417			[1] 3,573,919
Arkansas	176	48,385			48,561
Arizona	16,191	172,006	$24,690	$10,697	223,584
California	94,206	2,942,415	41,084	6,440	3,084,145
Colorado	9,191	3,326,454	8,633	12,614	3,356,892
Florida	1,340	250			1,590
Idaho	14,025	283,532	7,351	20,999	325,907
Illinois	176				176
Kansas		154,847			154,847
Louisiana	381	139,197			139,578
Michigan	135	4,010			4,145
Minnesota	1,012				1,012
Mississippi	216	2,601			2,817
Missouri	6				6
Montana	6,946	1,658,061	22,707	15,738	[2] 1,762,075
Nebraska	54	7,955	123		8,132
Nevada	37,887	193,559	7,123	40,374	278,943
New Mexico	10,034	8,092,044	6,350	32,474	[3] 8,143,139
North Dakota	33	87,893	1,583		89,509
Oklahoma	722	61,225	267		62,214
Oregon	40,884	11,523	12,303	18,068	[3] 14,537,451
South Dakota	127	45,765	11,751		57,643
Utah	2,553	2,927,015		32,490	2,962,058
Washington	6,393	2,155	4,521		13,069
Wisconsin	108				108
Wyoming	2,846	13,019,773	52,225	28,494	13,103,338
Total	259,900	36,736,948	200,711	218,388	51,935,891

[1] Includes $4,411 for Alaska school lands.
[2] Includes under Executive Order 10787 of Nov. 6, 1958, Montana, $58,623 and New Mexico, $2,237, from grazing.
[3] Includes $14,454,673 on account of O. & C.

Management of Lands and Resources

JUSTIFICATION

I will also place in the record the justifications of the budget estimate for "Management of lands and resources." This amounts to $41,552,000, an increase of $8,079,871 over the amount available for fiscal year 1962.

(The justification referred to follows:)

The budget for the Bureau of Land Management for 1963 reflects substantial expansion in the many resource management programs conducted by the Bureau. This expanded effort in public land management is in direct response to the President's message on natural resources of a year ago which directed needed attention to the status of our public lands. It is notable that this is the year in which the Nation will commemorate the 100th anniversary of the Homestead Act, the 100th anniversary of the Land Grant Colleges and Universities Act, and the 150th anniversary of the General Land Office. While paying heed to the heritage of the past, immediate action is essential to improve and preserve the public lands and their resources in keeping with present and future national needs.

The Bureau of Land Management administers 477 million acres of public land primarily located in 11 Western States and in Alaska, including the forest, forage, and mineral resources of the lands. These resources are managed and conserved for the benefit of the Nation as a whole, while at the same time they are made available within proper conservation limits to the public and industry.

Fiscal year 1961 was a year of change and adjustment in the prosecution of the Bureau's programs. Some of the major accomplishments were—

1. The Bureau was reorganized in order to effect a more efficient and productive organizational structure. After extensive study and review it was determined that certain organizational shifts involving the consolidation of similar services and functions at the area and State levels would be in the best interest of good management. This was accomplished by grouping certain technical functions at the State level. By thus strengthening the technical and operating staffs at State headquarters, the intermediate area level was eliminated and a more efficient and streamlined organization effected.

2. In February 1961, an 18-month moratorium was ordered on the filing of applications for the lease or sale of public lands for purposes other than grazing, minerals, and the sale of materials. The moratorium is permitting the Bureau to process on an orderly basis the backlog of pending applications. It is expected that the backlog will be cleared up by the end of fiscal year 1962. During the moratorium, the Bureau is classifying and opening areas of the public lands for various uses by private and governmental organizations and individual citizens.

3. The Congress provided supplemental funds ($1,425,000) for the rehabilitation of burned over forest and range lands so that damage to the resources by fire could be minimized and the lands restored to productivity. Fiscal year 1961 was the first year in which fire rehabilitation work was performed on any major scale. The program has proved so successful that similar funds were appropriated in 1962.

4. Approximately 1 billion board feet of timber again was sold from the Oregon and California grant lands.

5. Projected survey protraction diagrams were completed and accepted covering some 6,700,000 acres in Montana and 6,500,000 acres in Utah; a total of 1,151,000 acres of cadastral surveys and resurveys were accepted and, in addition, 1,367,000 acres of surveys and special surveys in the Western States were completed on the ground.

The current fiscal year to date is notable for increased effort in all major programs, made possible by increased appropriations for 1962 and new developments and approaches to the work of the Bureau. The Bureau has developed and adopted a master unit classification system. This system was designed to provide an orderly and systematic means for study of public and private land needs in areas containing public lands; to identify what land tenure adjustments are required to satisfy these needs, consistent with the public interest; and to accomplish the tenure adjustments so identified.

Representation on State and national advisory boards for public lands has been expanded to reflect multiple interests in the national land reserve. The advisory boards in the 10 western public land States, and the National Advisory Board Council will include representatives such as the forest products industry, minerals industry, soil conservation, outdoor recreation, urban and suburban development, and county and State government, as well as livestock and wildlife. Broadened representation will strengthen multiple-use management of the national land reserve.

A joint trial study of public land range appraisal is being conducted by this Bureau and the Forest Service. The study is planned to make an analysis that will give a realistic estimate of the present condition of public range lands, current production, potential or capabilities of the range, and improvements and conservation practices required to bring about the full productive potential of these lands. Three pilot studies are being conducted.

A review of known needs for soil and moisture conservation work has been completed. This review indicates that the soil and moisture conservation requirements are considerably greater than previous estimates had indicated. In fact, at present levels of activity it would take 100 years to meet present needs. Consequently a substantial increase is requested for the soil and moisture program in 1963.

The budget for fiscal year 1963 under the operating appropriation, "Management of lands and resources," provides for significant increases in several major programs. A comparison of the 1962 and 1963 total programs appears below:

Appropriation, 1962	$32, 500, 000
Supplemental appropriation, 1962	1, 250, 000
Total appropriation, 1962	33, 750, 000
Transferred to General Services Administration	277, 871
Total amount available, 1962	33, 472, 129
Increase, 1963	8, 079, 871
Total program, 1963	41, 552, 000

The amounts shown above for fiscal years 1962 and 1963 are exclusive of supplemental appropriations for fire suppression costs which will be proposed during each year as required.

The increase of a little over $8 million will be applied to the following major tasks:

1. Acceleration of the comprehensive inventory on the public lands called for by the President, prompt action on applications for title or lease, improved record service to the public, recreation planning, and increased trespass control in the management of land and mineral resources;
2. Acceleration of range resource inventory and the range adjudication program, intensified range use supervision, and increased attention to multiple-use management of public range lands;
3. Expansion of the fire presuppression program to provide for quicker and more adequate action in the fighting of fires on or threatening the public lands;
4. Improved management and protection and increased reforestation of forest lands;
5. Additional cadastral surveys in support of expanding resource management programs and in connection with the State selection program in Alaska;
6. Acceleration of the soil and moisture conservation program including the rehabilitation of currently burned-over forests and range lands. For the last 2 years the Congress has appropriated supplemental amounts for the rehabilitation of burned-over lands. The budget for 1963 proposes to handle fire rehabilitation as a regular program.

The Bureau of Land Management is a producer of substantial revenue to the U.S. Treasury and to States and counties. Receipts for 1963 are estimated at $383 million, of which $59 million will be paid to States and counties in which the public lands are located. Thus, receipts continue to be several times the amount of investment in the resource management and development programs conducted by the Bureau.

Management of lands and resources

Appropriation, 1961	$25, 950, 000
Second supplemental appropriation, 1961	1, 425, 000
Third supplemental appropriation, 1961	4, 696, 000
Total amount available, 1961	32, 071, 000
Appropriation, 1962	32, 500, 000
Supplemental appropriation, 1962	1, 250, 000
Total appropriation, 1962	33, 750, 000
Transferred to "Operating expenses, Public Buildings Service" (75 Stat. 353)	−277, 871
Total amount available, 1962	33, 472, 129

Summary of increases and decreases, 1963

Lease and disposal of land and mineral resources: To provide for acceleration of comprehensive inventory of the public lands, prompt action on applications for title or lease, improved records service to the public, recreation planning and increased trespass control	+$1, 842, 254
Management of grazing lands: The requested increase will accelerate the conduct of resource inventories and the range adjudication program, increase attention to multiple-use management of the public lands, and expand the fire presuppression program	+1, 564, 348
Forestry: To provide for improved management and development of forest resources and for increased fire protection in Alaska	+1, 697, 949
Cadastral surveys: To provide for additional surveys in support of expanding resource management programs in Western States and in connection with State selection program in Alaska	+814, 600
Soil and moisture conservation: To accelerate the soil and moisture conservation program and to provide for the rehabilitation of currently burned-over forest and range lands	+2, 111, 470
General administration: To provide more adequate staffing for administrative activities consistent with the expansion of resource programs	+49, 250
Net change, 1963	+8, 079, 871
Budget estimate, 1963	41, 552, 000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increases
1. Lease and disposal of land and mineral resources	$8, 144, 357	$8, 992, 746	$10, 835, 000	$1, 842, 254
2. Management of grazing lands	3, 097, 342	4, 035, 652	5, 600, 000	1, 564, 348
3. Forestry	6, 001, 758	7, 102, 051	8, 800, 000	1, 697, 949
4. Cadastral surveys	2, 863, 809	3, 675, 400	4, 490, 000	814, 600
5. Soil and moisture conservation	5, 116, 877	6, 413, 530	8, 525, 000	2, 111, 470
6. Fire suppression	4, 081, 065	400, 000	400, 000	
7. Maintenance of physical facilities	46, 980	178, 000	178, 000	
8. Maintenance of access roads		25, 000	25, 000	
9. Weed control	797, 383	909, 000	909, 000	
10. General administration	1, 640, 361	1, 740, 750	1, 790, 000	49, 250
Unobligated balance lapsing	281, 068			
Total	32, 071, 000	33, 472, 129	41, 552, 000	8, 079, 871

1. Lease and disposal of lands and mineral resources

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Title, lease, and records service	$5, 390, 560	$5, 425, 283	$6, 000, 000	+$574, 717
(b) Field examination and classification	2, 206, 707	2, 849, 000	4, 100, 000	+1, 251, 000
(c) Records improvement	547, 090	718, 463	735, 000	+16, 537
Total	8, 144, 357	8, 992, 746	10, 835, 000	+1, 842, 254

(a) Title, lease, and records service

The former title "Adjudication of Applications" has been superseded by the present title which more accurately describes the broad variety of work that is involved. Emphasis is being placed on all those functions necessary to the proper management of land and mineral resources of the public lands, with full regard for present and future public requirements. The estimate of $6 million represents an increase of $574,717 over the funds for fiscal year 1962. The addition is programed as follows:

(1) An increase of $496,717 to cope adequately with the more than 12,000 simultaneous oil and gas lease offers being filed monthly and with the increasing workloads in Federal-aid highway and other rights-of-way and, to meet the necessary record, adjudicative and other service requirements to support a stepped-up program of Bureau-motion sales, leases, permits, and exchanges attendant to active rather than passive management of the national land reserve.

(2) An increase of $25,000 for recording, processing, and adjudicating intensified State selection activity in the States of Alaska and Utah.

(3) An increase of $53,000 to meet an increased adjudication workload resulting from expanded enforcement of the trespass laws.

Need for increase.—Simultaneous filing procedures for terminated oil and gas leases have resulted in increased case closures and revenues of over $120,000 a month. However, additional manpower needs also have been created to avoid disruption to other urgent work, particularly in those State offices where from 3,000 to 9,000 filings must be processed each month. Additional funds would end the monthly "crises" of overtime and details. These funds would permit processing of these mass filings on an orderly basis and insure maintenance of other minerals processing on a current basis.

In a little over a year, applications for rights-of-way have doubled. This increase in workload is attributable largely to increased Federal-aid highway construction, with new filings now exceeding 250 a month. More attention to the adjudication of these complex applications must be provided if we are to keep pace with State and National highway-building programs.

As an essential partner to the master unit classification program described in the "Field Examination and Classification" portion of this narrative, programs in title, lease, and records service must be expanded. Sales and other title transfers must be planned to meet public and private needs consistent with national interest. Preliminary studies indicate that at least 7,000 tracts involving 100,000 acres will be required to meet minimum demands in fiscal year 1963. Securing of desirable lands, "blocking up" of Bureau management areas, and adjustment of boundaries also will be required, involving an intensified program of exchanges initiated by the Bureau on its own motion. An estimated 500,000 acres would be involved in such exchanges in 1963. In addition, immediate attention must be given to securing tenure on lands chiefly valuable for public recreation and/or sustained Federal management programs if present and future national needs are to be met adequately.

The State of Alaska is selecting lands each year to fulfill the various grants provided or confirmed by the act which gave it statehood. Nearly 11 million acres have been selected to date out of the 103,350,000 acres allowed. Utah has embarked upon a program of selections whereby some 100 applications (in 640-acre units) are being filed monthly, a pace that will continue until the remainder of its grants, about 700,000 acres, has been satisfied. Additional funds are necessary to keep pace with these intensified State programs.

The biggest administrative problem in the mining law field arises from the use of mining claims for nonmineral purposes. Every year thousands of mining claims are located for every conceivable use other than mining. Claims are commonly used as homesites, summer cabin sites, hunting camps, restaurants, filling stations, motels, farms, and other uses. It is estimated that there are at least 10,000 such cases on lands administered by the Bureau. Without an active and effective program of enforcement, abuse will not only continue, but grow.

The growing interest in public lands also is resulting in an increasing volume of inquiries for information on public land laws, regulations, and procedures. Requests to examine case files for copies of maps and documents and for land status reports are increasing each year. The activities of land locators or promoters and mineral brokers have compelled us to increase our efforts to inform the public of the requirements of the land and mineral laws and regulations to the extent that this phase requires 20 to 40 percent of the time of some offices.

Plan of work.—The moratorium on certain types of lands cases, which extends from February 1961 to September 1962, will result in a reduction in incoming lands cases during that period. It is estimated that by the end of fiscal year 1962 cases pending will represent a pipeline of current adjudication work. The status of lands and minerals adjudication workloads is summarized as follows:

	1960 actual	1961 actual	1962 estimated	1963 estimated
Cases pending, start of year	100,675	105,246	94,252	89,000
New and reactivated cases	259,107	316,007	320,000	380,000
Cases closed	254,536	327,001	325,252	384,000
Cases pending, end of year	105,246	94,252	89,000	85,000

It should be noted that the above table includes the figures for both lands and minerals adjudication, and that simultaneous oil and gas filings account for the preponderance of the totals. In lands, for example, it is expected that adjudicative backlogs will be reduced from over 41,000 to approximately 11,000 during fiscal year 1962 as a result of the moratorium and increased attention to the meeting of public demands through Bureau-motion sales.

(b) *Field examination and classification*

The estimate of $4,100,000 is an increase of $1,251,000 consisting of—

(1) An increase of $678,000 to complete the initial inventory and preliminary analysis of lands administered by the Bureau and to initiate detailed land and mineral analysis, evaluation, tenure adjustment, appraisal, and land disposal where there is demonstrated need.

(2) An increase of $380,000 to secure greater enforcement of the trespass laws.

(3) An increase of $143,000 to provide for recreation inventory, classification, tenure adjustment, and site planning.

(4) An increase of $50,000 to improve the professional competency of the appraisal staff in order to assure the sufficiency of Bureau of Land Management appraisals.

Need for increase.—Inventory and analysis of the public domain referred to as master unit classification and initiated in fiscal year 1962 should be intensified and expanded.

Under this program the Bureau will—

(1) Take an inventory of the public domain lands.

(2) Divide these lands into geographic units and examine each to determine the type and extent of its natural resources and its present and potential contribution to the national welfare.

(3) Analyze public and private needs in areas containing these lands and determine what tenure arrangements, including lease and title transfer, can accommodate those needs, consistent with the public interest.

This program will provide an adequate basis for the determination of proper land tenure arrangements on the public lands that are consistent with both present and future needs. Initial analysis and inventory of approximately 30 percent of the public lands are programed in 1962. With the increase requested, the entire initial analysis and inventory can be completed during fiscal year 1963 and work started toward intensive, or detailed land and mineral analysis.

Some 300,000 acres of detailed classification studies will be completed in 1962. An additional 300,000 acres are programed for detailed classification work in 1963 so that lands can be made available for the minimum residential, industrial, commercial, recreational needs during the fiscal year.

There are an estimated 10,000 cases of unauthorized use on the public lands. If adequate resource management is to be attained and full returns for property received, there must be a concentrated effort to control such actions. The requested funds will permit a substantial start on a program of land and resource protection.

Increased use of the recreation and wildlife resources of the Western States already has had a significant impact on the public lands. Recreation visits to primary sites on the public lands reached an estimated 2.3 million visits in 1960 and are expected to increase. Action is required immediately to identify, plan for, and insure tenure on those portions of the lands best suited to public recreation.

Increased emphasis upon the resource appraisal responsibilities of the Bureau is needed if the Government is to receive full return for its property. A staff of highly trained, professionally qualified and recognized appraisers must be developed and professional appraisal standards must be maintained.

Plan of work.—The master unit classification program, increased enforcement of the existing laws, increased attention to recreation needs, and added emphasis on the caliber of Bureau appraisals represent activities which are programed for

implementation in fiscal year 1963. In addition, the traditional work associated with this function of field investigations in connection with mineral patents, title transfers, and use permits will be maintained on a current basis.

The following table illustrates the status of the field examination and classification caseload, anticipated backlog reduction, and expected maintenance of "pipeline," i.e., current, operations:

	1960 actual	1961 actual	1962 estimated	1963 estimated
Cases pending, start of year	49,183	41,248	28,899	21,000
New and reactivated cases	39,335	32,267	22,000	25,000
Cases closed	47,270	44,616	29,899	27,000
Cases pending, end of year	41,248	28,899	21,000	19,000

(c) *Records improvement*

The estimate of $735,000 is an increase of $16,537 over the amount available for fiscal year 1962. It will provide for the continuation of the records improvement project by the construction and installation of the revised records system for 1,500 townships in South Dakota, records of which are maintained in the Montana land office, and complete revision of records in the Nevada land office.

Plan of work.—It was originally programed that funds available for 1962 would be utilized to construct new records for all of Montana and only 1,500 townships in North and South Dakota. Current interest in lands and resources of the Dakotas requires a total conversion by the new records of 1,500 townships in each of the 2 States. Thus, 1,500 townships in North Dakota will be completed in fiscal year 1962 and 1,500 township records for South Dakota will be completed in fiscal year 1963. This will complete the installation of the revised records system in the Montana land office. In fiscal year 1963 the new land and resources status records will be constructed and installed in the Nevada land office. This program will be continued by force account.

2. Management of grazing lands

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Administration of grazing lands	$2,835,861	$3,376,652	$4,400,000	+$1,023,348
(b) Fire presuppression	261,481	659,000	1,200,000	+541,000
Total	3,097,342	4,035,652	5,600,000	+1,564,348

(a) *Administration of grazing lands*

The estimate of $4,400,000 is an increase of $1,023,348 consisting of—

(1) An increase of $385,000 to accelerate range resource inventories and dependent property surveys which are basic to completion of the range adjudication program.

(2) An increase of $400,000 to provide adequate progress in range adjudication and apportionment of grazing privileges to remain on schedule with the longstanding objective of completing the adjudication program by July 1, 1967.

(3) An increase of $100,000 to expand range studies and cooperative research as a basis for sound long-term range management programs.

(4) An increase of $138,348 to intensify supervision of range use to assure compliance with licenses and permits, prevent grazing trespass, followup on use adjustments, and protect rehabilitated areas.

Need for increase.—The proposed increase will provide for much needed expansion and acceleration of all phases of the grazing administration program. The increase will be used for improved management, protection, conservation, and development of range and related resources on 178 million acres of public rangelands in the Western United States and an estimated 100 million acres of usable livestock and big game range in Alaska.

The grazing administration program directly involves the grazing operations of approximately 30,000 licensees, permittees, and lessees. Involved also are the

communities and local governments of the Western United States which service and are dependent upon the livestock industry. The public lands in these States supply approximately 17 million animal unit months of forage to 8,350,000 head of domestic stock. Approximately 1,280,000 big game animals consume an additional 1,600,000 animal unit months of forage, excluding Alaska.

In addition to general improvement in the administration of grazing lands, major accomplishments programed for 1963 within this estimate are as follows:

(1) Range resource inventories on 20 million acres of the 54 million acres of public lands not yet inventoried in the Western United States. Dependent property surveys will be completed on 2,000 of the 6,600 ranch units yet to be surveyed. These phases are basic to the completion of the range adjudication program.

(2) To assure proper use and management of the public rangelands, range adjudication and apportionment of grazing privileges will be pressed to accomplish a goal of 200 of the remaining 750 public land grazing units remaining to be adjudicated and 2,000 of the 6,600 remaining ranch units or range livestock operations.

(3) To more adequately base long-term range management programs, range studies will be continued to accurately determine range condition and trend, to collect data on actual range use, to obtain facts concerning the proper degree and season of use of native rangelands for both livestock and big game, and studies will be undertaken to determine the forage production potentials of the public range. Cooperative research projects with the land-grant colleges and other Federal agencies will be continued. Range studies and inventories will be initiated in Alaska as a basis for sound management of the public lands presently grazed by livestock and the development of a grazing industry on the remaining lands suitable for livestock production. Studies are programed for management of reindeer ranges and public lands used primarily by wildlife.

(4) Range-use supervision will be strengthened to assure compliance with licenses and permits issued, the prevention of grazing trespass, and conformance with established range management programs. Intensive management will be applied on depleted ranges to curb further deterioration of soil, water, and forage resources, and to establish a trend toward improvement. Necessary followup management will be increased on areas for which range adjudications have been completed to assure the effectiveness of range-use adjustments and improved range-use practices. Special attention will be given to the protection and management of areas treated under the soil and moisture conservation program over the years.

The key to efficient grazing administration is adequate staffing. Based on the increases proposed for 1963, there will be over half a million acres of Federal range administered by the Bureau of Land Management for each range manager position available, exclusive of Alaska.

Plan of work.—Reliable basic data obtained from range resource inventories, surveys, and studies provides the foundation for proper management and development of the public range. More and higher quality basic information is necessary to adequately supply the needs for range adjudication and allotments, decisions regarding long-term management requirements, and day-to-day supervision and direction of grazing use on the public range.

Resource appraisals and studies of the public grazing lands will include in addition to forage production estimates, determination of range site potentials for forage production and development, inventories of available stock waters, range condition and trend observations, forage utilization and actual use studies, inventories of needed range-use facilities, and special investigations of wildlife habitat and methods and practices for its improvement on the public lands. Cooperative research with State and other Federal agencies will be continued to perfect improved management and land-use techniques.

The range adjudication program requires intensive inventories of the range resources on about 54 million acres not previously covered by such surveys and an additional 25 million acres previously covered by extensive surveys are in need of reexamination. Required also is the completion of dependent property surveys on 6,600 ranch units varying in size from a few acres to several thousand acres. The increased program for 1963 will permit acceleration and progress on these basic work requirements.

Completion of the entire range surveys and adjudication program by July 1, 1967, is a Bureau of Land Management objective of long standing. It also is basic to the establishment of long-range conservation and management programs

designed to stop further deterioration of the public range and assure progressive rehabilitation and sustained economic use of this valuable public resource.

To insure sound management of the public grazing lands following adjudication, individual and group allotments and demonstration pastures will be established to provide for controlled grazing and the application of proven range management techniques. Intensive management requires increased and continuous range-use supervision to insure compliance with regulations and established administrative practices.

The range management program in Alaska will be expanded to assure the application of sound range management practices to approximately 2 million acres of public lands presently held under livestock grazing lease, and to systematically classify and establish good conservation practices on the remaining 8 million acres believed suitable for livestock production as the industry expands. Reindeer grazing permits will be issued for existing commercial herds and investigations made as needed to establish divisions or allotments and to assure the best practical management of reindeer ranges. Game ranges will be examined to determine the need for adjustments in game use and to provide information for future management programs.

(*b*) *Fire presuppression*

The estimate of $1,200,000 is an increase of $541,000 consisting of—

(1) An increase of $161,000 for accelerated hazard reduction.

(2) An increase of $130,000 for the expansion of detection systems.

(3) An increase of $250,000 for the replacement and expansion of equipment complement.

Need for increase.—Substantial expansion of presuppression functions is necessary to the conduct of a more effective fire suppression program including reduction of damage to the resources.

Wild fires on public lands are a constant threat to the conservation of the natural resources of the public lands. The frequency of fires continues to increase with accelerated public use of the lands. Nearly 60 percent of all range fires are man caused.

In view of the growing fire danger to the public lands, presuppression activities need to be expanded to the level required to properly organize, train and equip an adequate fire control organization. Inadequacy of this phase of the program can create safety hazards, threaten life and investments, and almost invariably results in increased costs of individual fire suppression as well as in the loss of surface resources.

Plan of work.—Disposal of flash fuels and snag felling are planned on 3,800 acres of public lands. Development and maintenance of over 1,700 miles of firebreaks and truck trails are planned to alleviate fire hazards and risk of fires spreading from roadways and railroad rights-of-way, and to break up large areas of continuous flammable fuels. These measures also will provide access to presently inaccessible areas for more prompt suppression. The accelerated program for development of fire lanes and truck trails is an increase of nearly 65 percent over the 1962 program.

In cooperation with other fire protection agencies public education will be strengthened to reduce man-caused fires and to develop public awareness of the devastating effects of fire. Accelerated investigation and prosecution of violators for setting fires will be undertaken.

The funds requested will provide orderly expansion and replacement of equipment, tools and supplies resulting in more prompt suppression, reducing fire losses toward a practicable minimum.

Planned expansion of the VHF radio communication system in areas where communications are unavailable will provide direct communications between the detection system and the suppression organization. Leased teletypewriter facilities are planned in areas of high fire incidence to receive and relay fire weather data and forecasts from weather forecasting offices. These facilities will make available current weather information to better enable the fire control organization to attack fires with complements of force consistent with the prevailing fire weather conditions.

Plans are to improve the detection system to cover high risk and hazard areas to provide for early detection of all fires. Plans are to extend truck trails and fire breaks to some of the more inaccessible and remote areas to curb fire spread and to provide rapid access for early fire suppression action.

Present obsolete and hazardous equipment will be replaced with modernized units and facilities for more effective fire control. Effective and timely fire

suppression will be enhanced by aerial application of fire retardants and by the modernization and expansion of the current detection system.

3. Forestry

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Oregon and California grant lands	$3,199,228	$3,501,802	$4,100,000	+$598,198
(*b*) Public domain	2,802,531	3,600,249	4,700,000	+1,099,751
Total	6,001,758	7,102,051	8,800,000	+1,697,949

(*a*) *Oregon and California grant lands*

The estimate of $4,100,000 is an increase of $598,198 consisting of—

(1) An increase of $363,000 to expand forest management activities for a more complete utilization of the resource potential and better control of depletions of resource inventory.

(2) An increase of $49,000 for contractual fire protection as a result of increased costs and for the improvement of existing methods of protection.

(3) An increase of $186,198 for reforestation to restore nonproductive timberlands to full production by fiscal year 1965.

Need for increase.—The depletion of private timber holdings, coupled with industry's improved, more complete standards of utilization, place a heavy management burden on the intermingled O. & C. forest lands. In past years the larger, highly valued, and more accessible timber was sold and cut. Greater demands by the public as well as the timber operators for fuller use of the resource requires complex, detailed planning to insure a balanced, multiple-use program. Developing a timber drainage for harvesting and restoring a sawtimber crop is no longer adequate. All management plans must take full cognizance of the land potential. Roads must be designed to serve the recreational public as well as the timber industry. Timber cutting practices must be established that protect the soil and watershed values, that consider wildlife habitat, and that preserve scenic values. At the same time these cutting practices must provide for efficient timber harvesting and for conditions which are conducive to the establishment of the next genetically superior crop.

The specific phases of this program which require additional funds and effort in fiscal year 1963 are: (*a*) intensification of management planning to permit full recovery of resource benefits; (*b*) expansion of sales of thinnings and salvage; (*c*) additional contractual fire protection primarily reflecting increased costs; (*d*) expansion in snag felling operations in order to reduce the existing area requiring such treatment; (*e*) acquisition of easements and rights-of-way; (*f*) expansion in contract administration because of set-aside sales in cooperation with the Small Business Administration; (*g*) acceleration in the closure of timber trespass cases to offset the backlog of cases which has increased rapidly in the last 2 years; and, (*h*) substantial expansion of the reforestation program to preclude reduction of the annual allowable cut.

Plan of work.—Forestry activities conducted on the Oregon and California grant lands include the three major functions of forest management, forest development, and forest protection as described below:

(1) Forest management: The estimate includes $3,200,000 for this function which is an increase of $363,000 over the amount available for fiscal year 1962. This function encompasses all work directly related to the production and sale of O. & C. timber under a sustained yield program with full recognition of all compatible uses of the resource to maximize long-term local and national benefits. Forest products harvested annually from O. & C. lands are renewable resources. With adequate protection and competent management vital timber crops can be harvested at a price considerably in excess of the basic costs of managing these resources.

The volume, sale price, and receipts for O. & C. and CBWR timber sold during 1958–61 and estimated receipts for fiscal years 1962 and 1963 are as follows:

Fiscal year	BLM sales		Receipts	
	Volume sold [1]	Sale price	BLM	Forest Service
1958	760,737	$19,041,340	[2] $19,521,384	[3] $3,580,332
1959	901,862	29,421,660	25,863,966	3,096,139
1960	1,005,897	34,387,039	29,521,537	4,306,625
1961	991,842	26,261,765	26,424,830	3,441,245
1962 (estimated)	1,000,000	28,500,000	28,200,000	4,000,000
1963 (estimated)	1,000,000	30,000,000	28,200,000	4,000,000

[1] Thousands of board feet.
[2] Includes receipts from sale of Coos Bay wagon road grant lands timber.
[3] Includes $800,000 transferred by the Forest Service from prior year collections.

While the depressed lumber market has affected total receipts since fiscal year 1960, it is noteworthy that approximately 1 billion board feet has been offered and sold to industry yearly since the end of fiscal year 1959.

Management of O. & C. timber in fiscal year 1963 is expected to be more difficult than in previous years for the following reasons: (*a*) development plans must be more detailed and exact because of heavy demand for different uses by various segments of the public; (*b*) cruise and appraisal of timber for cutting is becoming more complicated because of industry's utilization standard changes; (*c*) timber sale offerings are being pushed back into more remote, rugged, and less accessible terrain; (*d*) individual sales are becoming smaller in size and are requiring closer, detailed supervision because of contractual requirements including reforestation, soil and streamflow protection, fire hazard reduction and SBA road loans; (*e*) greater extraction of marginal, defective, and thinning material is planned; (*f*) increased private cutting adjoining O. & C. lands, as a result of anticipated improvement in the lumber market, will cause more inadvertent trespass; and (*g*) access into the more remote areas will be harder to acquire because of absentee ownership and lack of immediate private need for reciprocal access agreements.

(2) Forest development: The estimates include $250,000 for this function which is $186,198 over the amount available for fiscal year 1962. This amount represents the Government's direct contribution to the reforestation of the O. & C. lands; $700,000 also is made available for this program under the receipt limitation appropriation "Oregon and California grant lands." During the period 1950–61 approximately 314,000 acres have been cut over and 148,000 acres have been artificially seeded or planted. It is estimated the existing backlog, including nonreforested areas, areas of unsuccessful projects, and inadequately stocked areas, will total 100,000 acres at the beginning of 1963. Estimated "growth losses" on these partially productive or nonproductive areas total 50 million board feet valued at current market prices at about $1,350,000. This material could provide 600 man-years of labor annually and, converted into returns to the Nation's economy as an end product, would be valued at about $27 million.

(3) Forest protection: The estimates include $650,000 for this function which is $49,000 over the amount available in fiscal year 1962. The increase is due to rising contract and service costs as well as a need to remove standing unmerchantable dead trees which form a fire hazard. Contracts for fire protection are negotiated with the State of Oregon and the U.S. Forest Service on a rate per acre that is based on their cost experience. Through these contractual arrangements BLM avoids duplicating existing fire organizations. The Bureau contributes to presuppression and control measures by removal of snags, slash disposal, and development of fire trails. The program for fiscal year 1963 is as follows:

Contract protection	$558,000
Snag felling, slash disposal, and fire trails	62,000
Supervision and inspection	30,000
Total	650,000

(*b*) *Public domain*

The estimate of $4,700,000 is an increase of $1,099,751 consisting of—

(1) An increase of $469,889 to accelerate inventory, management planning, access development, and sales offerings.

(2) An increase of $151,000 for increased cost of contract protection and to complete studies of fire protection cost in Western States.

(3) An increase of $178,862 for increased cost of services plus an expansion of the Alaskan fire protection system.

(4) An increase of $300,000 for reforestation of an additional 2,500 acres and the initiation of survey work for planned backlog reduction.

Need for increase.—A recognition of the vast acreage of public domain forest lands and their potential contribution to the Nation's developmental needs, demands a substantial acceleration of this function in order to raise forest productivity and these lands above existing substandard levels. Among the specific activities which require additional funds and efforts in 1963 are those necessary to: (*a*) increase the inventory program to obtain the basic data for sound resource management; (*b*) increase the reforestation program from approximately 3,500 acres in fiscal year 1962 to 6,000 acres in fiscal year 1963 and provide surveys and seed for an expanded program; (*c*) substantially expand advanced planning for access roads, timber sales and related activities including needed easements and rights-of-way; and (*d*) increase the volume of timber to be offered for sale to 200 million board feet as compared to 159 million offered in 1961 and and estimated offering of 190 million in fiscal year 1962.

Plan of work.—Forestry activities conducted on the public domain include the three major functions of forest management, forest development, and forest protection as described below:

(1) Forest management: The estimates include $2,200,000 for this function which is an increase of $469,889 over the amount available for fiscal year 1962. This function includes all work directly related to production and sale of timber from the public domain forest lands on a sustained yield basis and compatible use of other resources for maximum long-term local and national benefits. Forest products and many of the related resources which are harvested annually from the public domain forest lands are renewable resources. With appropriate protection and management successive crops can be harvested each year in perpetuity. Under such management this program can be maintained on a revenue producing basis for the foreseeable future.

Like the O. & C. diminishing supplies of available timber from non-Federal sources and expansion of timber processing facilities due to enlarged markets, as well as a steadily increasing demand for use of public domain forest lands for other purposes, now make it essential to develop comprehensive plans for managing the timber and related resources. Planning effort will be expanded materially in fiscal year 1963.

With the funds requested for fiscal year 1963, 200 million board feet can be offered for sale resulting in eventual receipts estimated in excess of $3,400,000. The volume and receipts for public domain timber sold for fiscal years 1958–61 and estimated volumes and receipts for fiscal years 1962 and 1963 are as follows:

Fiscal year	Volume sold [1]	Sales price	Receipts
1958	138,282	$1,896,461	$1,555,505
1959	184,170	2,977,699	2,790,755
1960	193,265	3,290,511	2,531,175
1961	141,288	2,305,100	2,259,682
1962 (established)	190,000	3,500,000	2,500,000
1963 (established)	200,000	3,400,000	2,900,000

[1] Thousand board feet.

(2) Forest development: The estimates include $500,000 for this function which is an increase of $300,000 over the amount available for fiscal year 1962.

During the period 1950–61 an estimated 190,000 acres have been cut over, of which 9,000 acres have been reforested by BLM. While large areas of public domain cutover land has reforested naturally, approximately one-half or 100,000 acres will require treatment by the end of 1963. This figure is an estimate, but the best that can be given prior to completion of a survey.

The annual "growth loss" is estimated to be 20 million board feet annually valued at $340,000. The annual end product value to the Nation's economy

of a loss of this volume is estimated to be $6,800,000 requiring 240 man-years of labor.

The reforestation program for fiscal year 1963 follows:

	Acres	Dollars
Surveys and plans	47,500	$50,000
Site preparation	1,500	60,000
Planting and seeding	6,000	180,000
Seed, 1,500 pounds		30,000
Planting stock, 4,500,000 seedlings		90,000
Stand improvement	1,000	15,000
Planning, supervision and equipment		75,000
Total		500,000

(3) Forest protection, Western States: The estimates include $850,000 for this function which is an increase of $151,000 over fiscal year 1962. This function provides for fire protection on more than 3 million acres of public domain forest lands by means of contracts with public agencies having established fire control organizations and facilities. Some contracts are based on experience during only the past year, while others are based on an average of several prior years. In view of the severe fire season just past, especially in California, the negotiation of some of these contracts may involve amounts considerably in excess of those used in preparing this estimate. The program for fiscal year 1963, by State, acreage protected and estimated cost, follows:

State	Acres, 1963	Estimated cost, 1963
California	1,759,729	$520,000
Idaho	489,058	65,000
New Mexico	56,540	5,000
Minnesota	35,000	2,000
Montana	219,445	35,000
Oregon	615,000	145,000
Washington	208,000	40,000
Supervision		38,000
Total	3,382,772	850,000

Included in the above costs are funds for felling snags on 4,150 acres entailing $30,000 in local labor by contract.

(4) Forest protection, Alaska: The estimates include $1,150,000 for this function which is an increase of $178,862 over fiscal year 1962.

Alaska's development during the postwar years has been rapid. Its population has trebled. Its highway system has been extended several hundred miles, opening to settlement and travel heretofore remote country; its new, 10-year Federal highway program will greatly increase this development. Tourist and recreation travel has increased considerably and continued increase is expected. Industrial and mineral development is beginning. Military activity is found throughout Alaska. All of these developments in Alaska increase fire risks over a widening area of the forested land, because man-caused fires comprise 75 percent of fire occurrences in Alaska.

As Alaska develops, greater economic value accrues to her forests as sources of wood fiber for the expanding needs of the United States. Such use is expected within the next 10 to 50 years—too soon to grow new forests; the present ones must be protected. Wildlife, migratory fowl, and game ranges are becoming increasingly important as hunting and tourist pressures increase. Increased use and value of the natural resources dictate need for more intensive protection from fires.

Alaska has a 5-to 6-month fire season characterized by long daylight hours, low humidities and rainfall, high temperatures, and 30 to 60 days of heavy lightning storms which sweep across all of central Alaska. Lightning fires are typically in areas remote from access, except by air, and when left unchecked have attained sizes of 1 to 2 million acres. Fires spread rapidly and the key to effective suppression and low losses is early detection and action as immediate as possible by firefighting crews. The Bureau's goal is to reduce the burn loss an-

nually to a minimum. The program: (1) to maintain or improve on current loss levels from man-caused fires by increases in protection forces that are comparable to increases in fire risk resulting from development; and (2) to reduce losses from lightning fires through use of the most modern and rapid firefighting techniques.

The additional funds are needed to: (*a*) Expand the fire protection organization to approach a more reasonable operational level under present conditions, and (*b*) extend the effective area of intensive protection needed due to increasing tourists, settlement, exploration, and development which have been accelerated as a result of statehood for Alaska.

There is no place in Alaska where fires should be allowed to burn without control efforts. However, because of the differences in values being protected, differences in fuel types and demands on personnel, some fires may have to be allowed to burn without adequate suppression effort. Other fires, because of high resource value, will be attacked with all available resources in men and equipment. In all areas involving high values, BLM will continue to exert positive suppression action to achieve minimum loss from fires consistent with the costs of suppression.

4. Cadastral Surveys

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Public land States, except Alaska	$1,735,680	$2,092,000	$2,550,000	+$458,000
(*b*) Alaska	1,128,129	1,583,400	1,940,000	+356,600
Total	2,863,809	3,675,400	4,490,000	+814,600

(*a*) *Public land States, except Alaska*

The estimate of $2,550,000 is an increase of $458,000 which will provide for the completion of approximately 320,000 additional acres of surveys, resurveys, special surveys, and small tract and townsite surveys.

Need for increase.—It is necessary to substantially increase cadastral surveys in support of the major resources inventory and multiple use programs of the Bureau. The 1963 program will emphasize surveys, resurveys, special surveys, and small tract surveys needed for: (1) Development of mineral resources, particularly through oil and gas leasing; (2) management of timberlands and settlement of timber trespass cases, the identification of tracts for timber sales, timber salvage operations, and reforestation; (3) reestablishment of selected corners marking the boundaries of the public lands; (4) population and industrial expansion of western towns and cities.

A comparison of surveys accomplished and programed follows:

	Acres
1961	1,367,000
1962	1,748,000
1963	2,068,000

Plan of work.—A summary of the 1963 program is presented below:

1963 cadastral survey program, Western States

Purpose of surveys	Approximate area in acres	Field party [1] (days)
1. Forest management	725,000	3,177
2. Range, minerals, and multiple-use programs	951,000	2,023
3. Small tracts and school transfers	392,000	1,515
4. Miscellaneous surveys and reestablishment	(2)	505
Total	2,068,000	7,220

[1] For purpose of definition a field party normally consists of a chief of party and 5 subordinate survey aids.

[2] Not measurable in acres.

It is anticipated that the majority of the surveys will be accomplished by ordinary ground methods. However, the use of electronic measuring devices and photogrammetric methods will be adopted wherever feasible. Wherever it is found more economical, survey crews operating in rugged or undeveloped areas will be transported by helicopter. The program of extending the public land surveys over those areas yet unsurveyed by means of protraction diagrams will be vigorously pursued. It has been found that these protraction surveys serve an extremely useful purpose short of conveyance of title.

(*b*) *Alaska*

The estimate of $1,940,000 is an increase of $356,600 which will provide for the survey of 371,000 additional acres of land selected under the Statehood Enabling Act and 16,000 additional acres of land representing smaller areas.

Need for increase.—The State of Alaska has selected about 11 million acres of the total of 103,350,000 acres it may select by 1983. The Alaska Statehood Enabling Act of July 7, 1958, provides "that the Secretary of the Interior shall survey the exterior boundaries of the area requested * * *." The act places on this Bureau the great responsibility for the survey of the boundaries of the lands so selected in order that title thereto may be transferred to the State as promptly as possible. By the close of fiscal year 1962, cadastral surveys will approximate 4 million acres, or 36 percent of current State selections. The total program for 1963 contemplates a survey of 2.9 million acres, or about 26 percent of the total acreage selected to date. At the end of the 1963 program, about 63 percent of the total area presently selected will be surveyed. The extent of further selections that may be made in the meantime is not known but will reduce the ratio of the area surveyed. The cadastral survey program in Alaska also must provide adequately for the survey of smaller areas. Approximately 41,000 acres of land for lesser tracts is to be surveyed in 1963. The rapidly expanding economy of Alaska requires prompt action on surveys on homesites, homesteads, mineral claims, and trade and manufacturing sites. In many cases, smaller areas already covered by valid rights are frequently found within the boundaries of selected lands. As these lands cannot be selected by the State, they must be surveyed and eliminated from the selected list. Because of this, the survey of small areas is important, both to the claimant and to the State. In order to keep pace with the growing need and demand for surveys in Alaska, acceleration of the cadastral program is essential.

Plan of Work.—A summary of the 1963 program follows:

1963 cadastral survey program, Alaska

Purpose of surveys	Approximate area in acres	Approximate miles of survey line	Field party days
1. State selections	2,900,000	2,500	6,010
2. Smaller areas	41,000	(1)	233

[1] Not measurable in miles.

Survey work in Alaska is characterized by the adoption of new concepts, methods and equipment, especially in the State selection program where Congress has authorized departure from the established method of surveying and disposing of the public land. The use of electronic measuring devices, photogrammetry, and the adequate monumentation now employed are some of the ways the Bureau is providing for the survey of exterior boundaries of State selections on a rapid and economical basis. The development of protraction diagrams of the yet unsurveyed areas of Alaska, which are only an interim measure awaiting the final completion of survey and monumentation on the ground, have proved very helpful to many land identification needs. Adequate time for further development of this project, as required, has been reserved in the 1963 program.

Oil and gas applications have been filed for water-covered areas along the coast of Alaska. A determination will have to be made as to whether such areas are part of the Outer Continental Shelf or part of the inland waters of Alaska. If these areas are found to be part of the Outer Continental Shelf, leasing maps will be prepared in order to delineate individual tracts.

5. Soil and moisture conservation

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase
Soil and moisture conservation	$5,116,877	$6,413,530	$8,525,000	$2,111,470

The estimate of $8,525,000 is an increase of $2,111,470 consisting of—

(1) An increase of $1,861,470 to provide for substantial acceleration in the rehabilitation of the public lands; and

(2) An increase of $250,000 to provide for the rehabilitation of burned-over lands as the terminal phase of fire suppression (total provided $1,500,000). This program, included in the regular estimates for 1963, is similar to that being performed with the $1,250,000 provided by supplemental action in 1962.

Need for increase.—A substantial increase for soil and moisture conservation is dictated by the drastic upward revision of total requirements to rehabilitate the public lands which has resulted from recent reevaluation of needs.

Reviews of conservation needs since the departmental 20-year program was first announced, in the light of determinations based on current and projected increases in the cost of salaries, materials, and operations, have made it obvious that this figure could not provide for the total required program. Current estimates indicate that to restore the public lands to their full capacity for production, to protect existing investments in conservation improvements and to provide proper measures of protection against soil and water losses would require approximately $700 million. In addition, substantial contributions to the program for range improvements will be accomplished through the contributions of money, materials, and labor from private cooperators and from other funds available to the Bureau.

Plan of work.—The 1963 program contemplates the application of several major conservation practices which are compared in the following table with major practices accomplished in 1961 and planned for accomplishment in 1962:

Soil and moisture conservation program, by major practices

Conservation practice	1961 accomplishments	1962 planned program	1963 program		
			Regular program	Fire rehabilitation	Total program
Amount	[1] $5,116,877	[2] $6,413,530	$7,025,000	$1,500,000	$8,525,000
Brush control ... acres	110,375	123,000	260,000	5,000	265,000
Range seeding ... do	237,289	237,000	140,000	150,000	290,000
Erosion control structures ... number	2,906	2,500	5,200	300	5,500
Water developments ... do	471	565	1,100	20	1,120
Pitting, furrowing, and deep tillage ... acres	19,359	31,000	32,850	3,000	35,850
Fencing ... miles	576	1,175	1,300	720	2,020
Tree planting ... acres	4,140	6,000	740	8,000	8,740

[1] Includes $1,425,000 supplemental for rehabilitation of burned-over areas.
[2] Includes $1,250,000 supplemental for rehabilitation of burned-over areas.

In addition to those conservation practices listed in the preceding table, the 1963 program will include waterspreading, dune control, bank protection, range use facilities, and other practices designed to conserve and develop soil, water, and other related land resources. The 1963 program is designed to accelerate accomplishments which contribute greatest to the earliest possible achievement of the total program objectives in order that the potential economic effect resulting from the deterioration of resources may be minimized.

Soil and moisture conservation funds are distributed to those areas most urgently requiring treatment. The following table illustrates estimated obligations by States for the fiscal year 1963 program.

Soil and moisture conservation program by States for fiscal year 1963

Arizona	$545, 000	Oregon	$922, 000
California	414, 000	Utah	648, 000
Colorado	720, 000	Wyoming	662, 000
Idaho	610, 000	Program direction	214, 000
Montana	630, 000	Fire rehabilitation	[1] 1, 500, 000
Nevada	933, 000		
New Mexico	727, 000	Total	8, 525, 000

[1] To be distrributed based upon fire damage.

6. Fire suppression

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Fire suppression	$4, 081, 065	$400, 000	$400, 000	

This estimate is for the same amount as 1962 and represents a continuation of the practice of requesting a token appropriation to be followed with a supplemental request to cover the actual cost of fire suppression.

Plan of work.—Under this activity the Bureau will continue to suppress fires on or threatening lands under its jurisdiction except those protected under contract with States or other Federal agencies (see items "Forest protection, Oregon and California grant lands" and "Forest protection, Western States" under the activity "Forestry").

The Bureau cooperates with States and other Federal agencies in its efforts to reduce heavy losses from fires. Use is made of all modern firefighting techniques. The fire danger rating system, begun in 1958, has proved a valuable facility by use of which crews can be alerted. It is an aid to quick getaway and early action. The use of chemical fire retardants dropped from airplanes has proved very effective in gaining control over going fires. The use of aircraft for spotting fires, and helicopters for transporting men to the fireline is another example of means used to conserve resources by reducing the number of acres burned. The use of smokejumpers in Alaska is another advance in the Bureau's determination to hold fire losses to a minimum. Regular salaries of permanent employees used on an emergency basis in fire suppression are not included in this estimate.

7. Maintenance of physical facilities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Maintenance of physical facilities	$46, 980	$178, 000	$178, 000	

The estimate of $178,000 is the same amount as is available in fiscal year 1962.

Plan of work.—The extremes of temperature between extended winters and hot dry summers with sand carrying winds make an annual and nearly year round maintenance program a requirement. Water systems, building heating plants, and exterior surfaces require work each year on both new and older construction. Repair work and alteration of buildings to meet the needs of changing use also are included in this program.

8. Maintenance of access roads

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Maintenance of access roads	$0	$25, 000	$25, 000	

80391—62——4

This estimate of $25,000 is the same amount as is available for fiscal year 1962.

Plan of work.—The 1963 program contemplates performance of only the most urgent road maintenance work. Maintenance planned for 1963 involves minimum work on approximately 250 miles of road, and replacement or repair of about 25 culverts.

9. Weed control

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Weed control	$797,383	$909,000	$909,000	

The estimate of $909,000 is the same amount available for 1962.

Plan of work.—Treatments carried out under the weed control program will consist primarily of forage improvement through brush control, seeding, and land treatment, facilitating the distribution and management of livestock through fencing, stockwater developments and other range improvements, and the eradication of spot infestation of undesirable plants with chemicals. Emphasis on practices will vary according to existing weed problems and prevailing conditions in each State. The following table sets forth major practices planned for accomplishment compared with accomplishments in 1961 and 1962:

Weed control program by major practices

Practices	Unit	Accomplished, 1961 ($797,383)	Planned program	
			1962 ($909,000)	1963 ($909,000)
Range seeding	Acre	43,456	57,310	50,000
Brush control	do	11,025	15,530	20,000
Stockwater development	Number	7	16	10
Fencing	Mile	232	200	250
Chemical weed control	Acre	12,117	20,600	20,000

Major emphasis in California will be placed on forage improvement through the chemical control of brush and the eradication of spot infestations of camelthorn, halogeton, and medusa rye. In Oregon, detection surveys will be intensified along with chemical control of isolated halogeton infestation, and forage improvement through range seeding of infested areas. A full-time cooperative research project for medusa rye control also is contemplated with Oregon State College.

The program in Idaho will be devoted largely to halogeton, beet leafhopper, and medusa rye control by the improvement of forage through range seeding and brush control. Halogeton control will be emphasized in Nevada with minor concern given to larkspur and white top. Both Nevada and Utah will feature range forage improvement through seeding and brush control as a major practice. Fencing will be emphasized in Utah on ranges unsuitable to conventional seeding methods. All three of these States will continue cooperative research and studies with their respective universities and experiment stations.

Montana's program will be devoted largely to halogeton control in the Big Horn Basin and to the control of wyethia and leafy spurge in the western portion of the State. Wyoming with a quarter million acres of halogeton-infested lands will utilize a combination of all practices, although seeding and brush control are limited by rainfall and soil conditions. The existing cooperative research program with the University of Wyoming will be continued. The halogeton infestation in Colorado of 2,100 acres will be attacked with herbicides and soil sterilants with the objective of eventual complete eradication. New Mexico and Arizona will continue detection surveys for alfrombrilla and other poisonous and noxious plants with some chemical control of cockleburr and snakeweed in New Mexico.

Weed control program by States for fiscal year 1963

Arizona	$2,500	Oregon	$23,000
California	32,000	Utah	170,000
Colorado	32,000	Wyoming	61,000
Idaho	295,000	Program direction	66,000
Montana	22,500		
Nevada	200,000	Total	909,000
New Mexico	5,000		

10. General administration

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
General administration	$1,640,361	$1,740,750	$1,790,000	+49,250

The estimate of $1,790,000 is an increase of $49,250 to provide for minimum necessary additions to administrative programs in support of the expanding resource management programs of the Bureau.

Need for increase.—Appropriations to the Bureau of Land Management for general administration have not kept pace with the expanding management of lands and resources programs over the years. During the past 12 years, 1951 through 1962, the Bureau's operating appropriation has increased in size almost six times while the general administration activity has increased only about 1.8 times. In 1951 general administration amounted to 14.2 percent of the total operating appropriation; by 1962 the ratio is down to 4.9 percent. The 1963 estimates further reduce the ratio to 4.3 percent.

The substantial increases in resource programs will place strenuous demands on Bureau administration. Recruitment, personnel processing, training, and other aspects of personnel management will require strengthened staffs for adequate performance. Similarly, the volume of procurement actions, accounting transactions, and other administrative processes will substantially increase, thereby requiring additional administrative personnel. Delays in performance of these administrative workloads could hamper and to a degree could preclude full performance of the resource programs.

Plan of work.—With the small increase provided, emphasis will be placed upon the performance of administrative work which directly supports and helps implement the acceleration of resource management programs. However, mandatory procedures of central agencies which are applicable to all Federal agencies must be met regardless of the urgency for administrative action in connection with Bureau internal needs. Efforts will be concentrated on full utilization of already thin staffs and to the prevention of breakdown in internal controls, especially financial controls.

Common services provided to the other Bureau appropriations by this activity will continue to be charged to the benefiting appropriations at the rate of 5 percent.

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+), decrease (−)
Program and financing:				
Total obligations	$31,789,932	$33,472,129	$41,552,000	+$8,079,871
Transferred to "Operating expenses, Public Buildings Service" (75 Stat. 353)		277,871		−277,871
Unobligated balance lapsing	281,068			
Appropriation	32,071,000	33,750,000	41,552,000	+7,802,000
Obligations by objects:				
11 Personnel compensation	19,059,639	19,741,246	22,583,000	+2,841,754
12 Personnel benefits	1,245,437	1,475,000	1,686,000	+211,000
21 Travel and transportation of persons	1,648,375	2,085,000	2,360,000	+275,000
22 Transportation of things	720,536	560,000	601,000	+41,000
23 Rent, communications, and utilities	674,132	489,642	762,000	+272,358
24 Printing and reproduction	235,343	336,000	353,000	+17,000
25 Other services	4,454,201	5,040,000	8,052,000	+3,012,000
26 Supplies and materials	2,661,140	2,578,000	3,280,000	+702,000
31 Equipment	1,062,166	1,191,000	1,900,000	+709,000
32 Lands and structures	4,872			
42 Insurance, claims, and indemnities	45,106			
44 Refunds	497			
Subtotal	31,811,444	33,495,888	41,577,000	+8,081,112
Deduct quarters and subsistence charges	−21,512	−23,759	−25,000	−1,241
Total obligations	31,789,932	33,472,129	41,552,000	+8,079,871

PREPARED STATEMENT

Chairman HAYDEN. I would appreciate your discussing the items which account for the $8 million increase over your last year's funds.

Mr. LANDSTROM. Mr. Chairman, it is a pleasure for us to be here. We need not tell you with your long years of experience here the importance of public land to Arizona and the other Western States and the importance of their proper administration.

There have been some changes in the past year worthy of note. I will not read the statement, Mr. Chairman, but I will highlight it very briefly.

Chairman HAYDEN. All right. We will place it in the record.

(The statement referred to follows:)

Mr. Chairman and members of the committee, I appreciate this opportunity to appear before you to discuss the programs of the Bureau of Land Management and to present a request for funds for the fiscal year 1963.

Over 477 million acres of public lands including those in Alaska are managed by this Bureau. These public lands and the Outer Continental Shelf are the source of a significant part of the Nation's annual output of petroleum products and other minerals. Forage for over 9.6 million head of livestock and game animals is made available for part of their annual requirements. Approximately 1.2 billion board-feet of timber and other forest and woodland products will be made available to western markets in 1963. Use of these lands for recreation is increasing steadily. In 1960 there were an estimated 15 million recreational visits by the public on lands under the jurisdiction of this Bureau. The resources of these lands must be administered so that widest use may be made of them, while at the same time protecting them for future benefit to the country.

The budget for the Bureau of Land Management for 1963 reflects the substantial progress which has been made and provides for expansion in the many resource management programs conducted by the Bureau. This expanded effort in public land management is in direct response to the President's message on natural resources of a year ago which directed needed attention to the status of public lands. It is notable that this is the year in which the Nation will commemorate the 100th anniversary of the Homestead Act, the 100th anniversary of the Land Grant Colleges and Universities Act and the 150th anniversary of the General Land Office. While paying heed to the heritage of the past, immediate

action is essential to improve and preserve the public lands and their resources in keeping with present and future national needs.

The estimate for 1963 for the appropriation "Management of lands and resources" is $41,552,000, an increase of $8,079,871 over the amount available for 1962 of $33,472,129.

The moratorium on certain types of lands cases, which was announced a year ago, is permitting the Bureau to process on an orderly basis the backlog of pending applications. It is expected that the backlog will be practically cleared up by the end of fiscal year 1962. Then, the creation of a new backlog must be avoided by having the capability to process applications on a current basis. In addition, simultaneous filings for terminated oil and gas leases continue to increase. The 1963 estimates provide for improved staffing of the land offices so that they can handle the increasing volume of work on a current basis. 1963 also is the second year in the inventory program to provide data upon which basic land tenure decisions can be intelligently reached. This inventory is an essential first step in the development of a more intensive and effective resource management program, so that lands can be made available to meet yarious purposes consistent with present and future needs. In addition, increased attention will be devoted to the trespass situation, especially the use of mining claims for nonmineral purposes. The growing use of the public lands for recreation requires acceleration of recreation inventory, classification, tenure adjustment and site planning. An increase of $1,842,254 is needed for the conduct of all phases of lands and minerals resource management in 1963.

The proposed increase of $1,319,087 for forest management and reforestation functions within the forestry activity is to provide for substantially improved management of forested areas. Particular emphasis will be given to forest inventory, trespass control, easement acquisition, and adequate advance planning to integrate the development of access, timber sales, and related activities. Reforestation, including seeding and planting under timber sale contracts, will be expanded. The Bureau will offer approximately a billion board-feet of O. & C. timber and 200 million board feet of public domain timber in 1963. Timber receipts for 1963 are estimated at over $35 million.

The 1963 program for soil and moisture conservation represents an increase of $2,111,470 over the program for 1962. Nearly all of the increase is for additional planning, construction and maintenance of regular soil stabilizing and water development projects. The total program includes up to $1,500,000 for the emergency rehabilitation of burned over range and forest lands administered by this Bureau. This program is similar to the rehabilitation work performed in fiscal years 1961 and 1962 with supplemental funds and is included in our regular request as suggested last year by this committee. The need for soil and moisture conservation funds perhaps is best indicated by the fact that present estimates of requirements for such work are so great that it would take decades to accomplish required work at requested levels of appropriation. An increase of $1,023,348 also is included for the administration of grazing lands. This increase will be applied to range resource inventories, dependent property surveys, range studies and cooperative research and related management practices.

Fires on public range and forested lands continue to be a major problem. This Bureau shares this committee's interest and concern that adequate protective measures and firefighting capacity be provided. The 1963 program includes the following increases for protective measures: $541,000 for all phases of fire presuppression activities, especially accelerated hazard reduction, expanded detection coverage and improved equipment complement; $49,000 for contractual fire protection on the Oregon and California grant lands; $151,000 to cover increased costs of contractual fire protection on public domain lands; and $178,862 for expansion of the Alaska fire protection organization. It is anticipated that fiscal year 1962 fire suppression costs will be approximately $2,160,000 and a request for $1,760,000 in supplemental funds has been made. Continued emphasis on improved and intensified fire protection and prevention programs is necessary in order to reduce fire losses of valuable natural resources.

An increase of $814,600 is proposed for the cadastral surveying program to provide for additional surveys, resurveys and special surveys. In Alaska, surveys are essential to the State's selection of Federal lands. The Enabling Act granted Alaska over 103 million acres to be selected within 25 years. Title to selected lands cannot pass to the State until exterior boundary surveys are m .de. In the public land States, these survey are a neccessary support of the resource inventory and management programs of the Bureau and other agencies.

The estimate for 1963 for the "Construction" appropriation is $1 million, an increase of $150,000 over 1962. The estimate for construction of access roads provides for acquisition and construction of roads necessary to forest management and timber sales, range management, and fire protection programs. They also increase public access to the lands for recreational use. The building facilities construction program is at the same level as 1962 and will provide for needed maintenance, storage, and administrative space as well as fire lookouts in certain areas of high fire incidence.

The estimate for 1963 of receipts to be available under the "Oregon and California grant lands" appropriation is $7,750,000. This amount is the same as the current estimate for 1962 and includes $1 million for transfer to the Forest Service for road and recreational construction. This appropriation will continue the access road, reforestation, recreational facilities and road maintenance programs to assist development and management of the resources on public lands in the Oregon and Callfornia counties.

The current estimate for 1963 of receipts to be available under the "Range improvements" appropriation is $804,750 or $240,000 less than the original estimate of $1,044,750 in the President's budget. The Department of the Interior announced recently that the present fees for grazing on the national land reserve will be continued until March 1, 1963. The receipts collected in fiscal year 1962 are the basis for the fiscal year 1963 amount for this appropriation. The revised estimate of 1962 grazing fee receipts is $3,220,000, or $960,000 less than the original estimate of $4,180,000 in the President's budget.

Receipts for 1963 are estimated at $382 million, of which $59 million will be paid to States and counties in which the public lands are located. Thus, receipts continue to reflect the favorable ratio to investment in the resource management and development programs conducted by the Bureau.

INCREASE IN RECREATIONAL LAND USE

Mr. LANDSTROM. One of the things is that recreation is increasing as a use of public land and the report of the Outdoor Recreation Resources Review Commission is being studied very carefully by the Department and by our Bureau to make sure that we take advantage of that report.

As you have indicated, Mr. Chairman, the estimate has been increased by $8,079,871 over the past year. This will permit the continuation and increase of the proper administration of these lands as required.

I would like to state, Mr. Chairman, that, in line with the question asked Secretary Udall this morning, the moratorium on certain kinds of land applications is serving a very effective purpose and has permitted the land offices to get themselves in better shape to serve the public.

We think that this will be brought into proper shape so that about the 1st of July in most States, and I hope Arizona is in that list——

Chairman HAYDEN. I do, too.

Mr. LANDSTROM (continuing). It will be possible then to resume proper filing of applications. We sincerely trust, Mr. Chairman, that the people will realize the difficulties of the past and that many of the types of applications that are not sound will be looked at very carefully by the people themselves before they file, and our offices are going to be equipped in a better form than heretofore to give information to the people so as to help avoid some of the types of applications that have caused the trouble in the past.

These 1963 estimates which involve the increase provide for improved staffing in the land offices so that they can handle the volume of work that we now have and which we expect will continue after the 1st of July.

COMPLAINT REGARDING LACK OF PROPER STAFF

Chairman HAYDEN. There has been a complaint about lack of proper staff in the various land offices which resulted in this congestion.

Mr. LANDSTROM. That is true, yes, sir. Mr. Chairman, applications for lands, which was stopped temporarily by the moratorium, together with the oil and gas leasing and all other phases of the mining law administration, come under our heading of "Lands and minerals management" and an increase is asked for next year of $1,842,254 to carry on that activity.

FOREST MANAGEMENT AND REFORESTATION

The second item to mention is forest management and reforestation functions, which are very important to the national resources in the Western States.

Chairman HAYDEN. Are you cooperating with the Forest Service in methods and means of doing these things?

Mr. LANDSTROM. Yes, sir. We have a progress report there. During the past year the Forest Service and the Bureau of Land Management, together with other Interior Department bureaus, have cooperated very actively.

One of those cooperative activities was a joint report and program of timber sales administration, primarily related to sales in the Pacific Northwest; but it is distributed in the other States for the information of our foresters.

Another item is improved cooperation of all these bureaus in fire control, fire suppression, and fire presuppression activities. One of the elements there is increased use of air transportation in order to permit earlier detection and transportation of the men and materials to the scene of the fire quicker than heretofore.

TYPE OF FIRE FIGHTING ORGANIZATION

Chairman HAYDEN. What type of organization do you have to fight fires?

Mr. LANDSTROM. I am going to call on our Chief Forester, Mr. Chairman, Mr. Eugene Zumwalt, to tell you that.

Mr. ZUMWALT. Mr. Chairman, much of our land in the western United States is protected by contract either with the Forest Service or with State or private cooperative fire protection agencies.

We have also a program of force account fire control including prevention, presuppression, and suppression activities where we use our own personnel on the fires and hire additional firefighters; and in Alaska we have a large fire control organization whereby we handle all of the fire control in Alaska, that is, on public domain lands.

We also now are protecting the lands which are selected by the State of Alaska through a contract with the State because they have no fire protection organization at the present time.

MEANS OF COMMUNICATION

Chairman HAYDEN. What means and methods do you have of quickly gathering firefighters in addition to your own men?

Mr. ZUMWALT. We have a radio communications network and we have dispatchers who are notified as soon as a fire is detected. The

detection system is by lookout, or by air detection, either from our own planes or from airlines, military planes, or people traveling the highway.

The dispatcher then immediately has available, which is gathered together beforehand, a list of the firefighters and their location availability, and then they are contacted immediately and are transported to a central location.

Chairman HAYDEN. Do you have enough of them?

Mr. ZUMWALT. We have no difficulty in hiring the general firefighters. There seems to be a sufficient number of those.

Chairman HAYDEN. Thank you.

Mr. LANDSTROM. Mr. Chairman, for the forest management and reforestation functions within the forestry activity, the increase proposed is $1,319,087, and this will permit particular emphasis to be given to forest inventory, trespass control, acquisition of rights-of-way, and advance planning for timber sales and related activities.

Next, Mr. Chairman, I would like to mention soil and moisture conservation.

FUNDS FOR ACCESS ROADS CONSTRUCTION

Chairman HAYDEN. Do you have any money for the construction of access roads?

Mr. LANDSTROM. Yes, sir. There is very little in the regular funds. There is some in the Oregon and California land-grant fund. Mr. Beirne can give you the figures on that.

Mr. BEIRNE. We have requested $725,000 for 1963, which is an increase of $150,000 over the amount available in 1962, on public domain lands.

Chairman HAYDEN. That is what I wanted to know.

SOIL AND MOISTURE CONSERVATION

Mr. LANDSTROM. With respect to soil and moisture conservation, this is a long standing and important program of the Government through the Department of Agriculture and the Department of the Interior. During the past year the Secretary of the Interior has announced that he will carry out a vigorous and forceful soil and moisture conservation program, and this was also stated later by the Assistant Secretary, John A. Carver, Jr., at Salt Lake City last October 6. The Assistant Secretary called attention to the need for quick action to combat fast spreading deterioration of grazing lands and other areas in the Western States administered by the Department.

The Secretary has called upon the National Advisory Board Council, which advises him on public lands and which just met last week in Albuquerque, N. Mex., to recommend ways to accomplish this from their point of view.

He has also sought the assistance of the National Association of Soil Conservation Districts. The vice chairman of that association, Mr. Bill Williams, of Santa Fe, N. Mex., gave us a report last week at Albuquerque of an inventory of the needs for conservation work that the association is making to assist both Departments; so we believe that this is the time to take stock and step out at a higher rate of accomplishment than has been the case for some years.

Therefore, Mr. Chairman, the 1963 program under soil and moisture conservation represents an increase of $2,111,470 over the present year's program. An increase of $1,023,348 is for administration of grazing lands; which, of course, Mr. Chairman, you understand is very important in the proper administration of the grazing districts.

Chairman HAYDEN. Yes, sir.

FIRES ON PUBLIC RANGE AND FORESTED LANDS

Mr. LANDSTROM. Mr. Chairman, the fires on public range and forested lands continue to be a major problem. The 1963 program includes increases for protective measures as follows: $541,000 for fire presuppression activities; $49,000 for contractual fire protection on the O. & C. lands; $151,000 for increased costs of contractual fire protection on public domain lands; and $178,862 for expansion of the Alaska fire protection organization.

INCREASE IN ESTIMATE FOR FIREFIGHTING

Chairman HAYDEN. In the Third Supplemental Appropriation Act approved on the last day of last March, there was appropriated an additional $3,700,000 for firefighting. This sort of a supplemental appropriation has been made frequently in past years.

This year you are requesting again only $400,000, which we realize is a token request. What, if any, consideration has been given to increasing this estimate so that it may sometimes be not necessary to return to Congress in the spring of the year for additional funds?

Mr. LANDSTROM. I will ask Mr. Beirne to advise you, Mr. Chairman.

Mr. BEIRNE. That has been considered, but to take the average for the past several years it would be considerably less than it has been in the immediate past. We usually work on about 5-year average and within the total ceiling this was not quite possible without sacrificing conservation or other measures.

We have included in our request $1½ million, which was also a matter of supplemental for the last 2 years to reseed areas which have been burned over during the fire season. This provision has been made and its included in our present budget request.

CADASTRAL SURVEYS

Mr. LANDSTROM. Mr. Chairman, next comes the cadastral survey program for which an increase is asked of $814,600. A good deal of this is for the purpose of surveying Alaska, essential to the grant of lands to that State acquired under the Statehood Act. It also provides for necessary surveys in other States, and this services the Forest Service in the Department of Agriculture and many other bureaus in addition to our own.

CONSTRUCTION

Now under "Construction," the estimate is $1 million, an increase of $150,000 over 1962, and Mr. Beirne has also advised you as to the construction of access roads.

OREGON AND CALIFORNIA GRANT LANDS

Now, when we come to the special fund for Oregon and California grant lands, this is based upon the estimated receipts. A portion of the receipts, as you know, Mr. Chairman, is ordinarily appropriated each year by Congress for investment in the future of these lands.

Chairman HAYDEN. Can you make an accurate guess in view of the fact that lumber prices are down?

Mr. LANDSTROM. Our foresters have made estimates which we believe are reliable, Mr. Chairman, and the amount is $7,750,000 for this portion of the receipts. Mr. Beirne, would you give the chairman the overall total receipts of last year and those expected next year?

Mr. BEIRNE. While the prices of lumber have been down, still the cutting has been up and our receipts are actually exceeding last year's, about a million and a half dollars ahead of this time last year on O. & C. lands, so that we believe that our estimate of $31 million for both the current and next fiscal year will be good. For the first 6 months it was up almost $1.5 million.

Chairman HAYDEN. There has been a complaint that lumber prices are down due to competition from plastics, and roofing materials, and things like that, and that they do not need as much lumber immediately as they used to. I do not know whether that is true or not.

Mr. LANDSTROM. I would ask our forester, Mr. Zumwalt, again to advise you, Mr. Chairman. Would you please, Mr. Zumwalt?

Mr. ZUMWALT. Mr. Chairman, you are no doubt aware that there has been a very soft lumber market recently and a number of the mills that are just on the margin, you might say, at a time like that are bound to cease production, at least temporarily. Some of them, of course, never do get back into the swing of things.

But, by and large, the progressive mills that have been in operation for a number of years are able to continue operation and we have not seen any indication that there is a slack off in demand for lumber.

Chairman HAYDEN. You make an appraisal when you are going to make a sale, and there are bids on that. Are the bids higher than the appraisals as a rule?

Mr. ZUMWALT. Yes, sir; they are. Our statistics indicate that for the year 1961 our sales ran 34 percent above the appraised prices; that is, the bid prices were 34 percent above the appraised prices.

Chairman HAYDEN. Thank you.

ESTIMATED RECEIPTS

Mr. LANDSTROM. Mr. Chairman, as to receipts which are expected, as you know, the Bureau of Land Management is a bureau through which very large receipts accrue to the Federal Treasury and much of this is passed on to the individual States and the receipts are far larger than the total appropriations of the Bureau.

This relationship will continue in 1963, we are very confident. As to the receipts from grazing fees, that part of it allocated to range improvements will probably be less than we had originally estimated. Also, the ordinary grazing use fee receipts will be less than we origin-

ally estimated because at one time it had been estimated that the grazing fees might be increased before the next fiscal year is over.

At the present time, however, that does not appear to be the case because the Department last week stated that there will be no increase in the grazing fee on the Federal range, at least prior to March 1, which is the next fee year, March 1, 1963.

Therefore, those estimates have been reduced somewhat, as shown in the prepared statement. The overall receipts are estimated at $382 million, of which $59 million is expected to be paid to the various States and counties.

I would say, Mr. Chairman, it is a very conservative estimate. Recent events indicate that the receipts will be larger than that no doubt. There will be bonus bidding lease sale of the Outer Continental Shelf land off the shores of Texas and Louisiana, to occur in New Orleans next month and, depending on the outcome of that sale, we will be in a better position to estimate the receipts for the full year.

Chairman HAYDEN. In other years you have derived substantial income from that source.

Mr. LANDSTROM. Yes, and we think it will be a tremendous source of future wealth and income and we are hopeful that the development will extend to the west coast. There are signs that west coast offshore operations will get underway this coming year, or the year following, and may be a very heavy beneficial source of income to the country in future years.

That completes the remarks that I have, Mr. Chairman. I would be happy to answer any further questions.

STATUS OF TRIAL PROGRAM OF RANGE APPRAISAL

Chairman HAYDEN. Last year the Senate committee included in its report on this bill a directive to the Secretary of the Interior and the Secretary of Agriculture to initiate a trial program of range appraisal within the existing resources of the two Departments. Please inform the committee just how you are going about this appraisal, the areas in which range appraisals are being made, and the results which are indicated. The committee would also like to know, if it is available, the cost to the Department thus far.

Mr. LANDSTROM. Mr. Chairman, we are very happy to have had the opportunity given to us by your committee to make this trial range appraisal study as an indication of the procedure that might be followed and the costs in a full-fledged inventory if authorized.

The field reports in regard to the public land range appraisal being conducted by the Bureau of Land Management and the Forest Service now have been completed. The three areas in which the trial studies were conducted were located in Colorado, Montana, and Oregon. The Bureau of Land Management and the Forest Service will begin to review the three State reports and prepare the final report to Congress.

A representative from the Bureau of Land Management and the Forest Service for each study area has been detailed to Washington to assist in preparing the final report. It is planned to have the report available for Congress early this spring.

COST OF WORK TO DATE

Mr. Chairman, you asked about the cost of the work to date. I think Mr. Kerr, who is Assistant Director for Range and Forest Management, will be able to advise you on that. Mr. Kerr.

Mr. KERR. I do not believe I have that.

Chairman HAYDEN. All right, then. You may supply it for the record.

Mr. LANDSTROM. We will furnish it to you, Mr. Chairman.

The cost has not been large. We have operated thus far on a low-cost basis.

(The information referred to follows.)

The range appraisal study has cost approximately $32,000 to date. It is estimated the remaining work to complete the study will require an additional $10,000.

BUDGET ESTIMATE FOR CONSTRUCTION

JUSTIFICATION

Chairman HAYDEN. The justification for the budget estimate for "construction" will be placed in the record. The 1963 request is for $1 million, an increase of $150,000 over the amount appropriated in fiscal year 1962; $725,000 is for access roads and $275,000 is for necessary buildings and facilities.

(The material referred to follows:)

CONSTRUCTION

Appropriation, 1962		$850, 000
Unobligated balance from prior years		299, 006
Total available for obligation		1, 149, 006
Decreases:		
Access roads on public domain lands	$853, 714	
Buildings	295, 292	
		1, 149, 006
Subtotal		
Increases:		
Access roads on public domain lands	725, 000	
Buildings	275, 000	
		1, 000, 000
Total available for obligation (budget estimate, 1963)		1, 000, 000

Analysis by activities

	Amount available, 1962	Fiscal year 1963			Total available 1963 compared to total available 1962
		Unobligated balance from prior years	Budget estimate	Estimated total available	
1. Access roads	$853, 714		$725, 000	$725, 000	−$128, 714
2. Buildings	295, 292		275, 000	275, 000	−20, 292
Total	1, 149, 006		1, 000, 000	1, 000, 000	−149, 006

1. ACCESS ROADS, $725,000

The estimate of $725,000 is an increase of $150,000 over funds appropriated in 1962, exclusive of $278,714 in carryover funds which also are available in that year.

This program for access roads reflects the needs of the resource management program for the public lands. Road networks are essential to the proper conduct of grazing, forestry, recreation, wildlife, protection, watershed, and minerals management programs. Often, road construction is a prerequisite which allows, for the first time, implementation of a comprehensive resource management program on portions of the public lands. While any one of the projects listed below could be justified from its importance to only one program, all are multipurpose roads and will serve other needs of the Bureau and the using public.

The forestry program and the sale of timber from the public lands, under that program, presupposes an adequate system of access roads, which will penetrate large areas of untapped stands of overripe timber. While some of the smaller, more accessible areas may be reached by roads constructed as a requirement of the sales contract, it is economically unsound and in many cases economically impossible for the potential timber purchasers to construct the large, higher standard roads to the more remote stands. The proposed roads will enlarge the present system of Government access roads, permitting extension of the demand and competition for Government timber into rich areas previously economically inaccessible.

Without these roads a resource loss to the Government will occur through delay in the sale of mature timber with a corresponding revenue loss to the Treasury of the United States and in addition private industry and the communities semidependent on the public timber will continue to suffer an economic and productivity loss.

The range management program will be facilitated and application of badly needed but hitherto unavailable management practices will be made possible through construction of the necessary roads. Necessary stock control through salting and herding by the permittees, trespass control by the Bureau, and range improvement practices can be accomplished on large areas with the necessary access.

Implementation of the access road program will aid in fire protection of the natural resources. The elapsed time between detection and arrival of firefighting crews quite frequently determines the final size of the fire, the extent of suppression effort required, and the resulting damage to the land base and its resource potential. Roads provide quick access for fire suppression crews and their equipment.

Incidental public use benefits also will be obtained and will permit increased recreational use of public lands to hunters, fishermen, and the general public.

Details of the 1963 access roads construction program are set forth in the following table. Project listing should be considered an indication of the types and general locations of roads to be constructed and a reflection of current Bureau plans; however, emergency requirements occasionally may require some adjustment on project priorities.

State	Project	Item	Cost
Colorado	Trident Mesa	10 miles, grading	$43,000
	Sheep Horn Mountain	5 miles, grading	17,000
Idaho	Herd Creek	13 miles, grading, bridge	57,000
	Dempsey Meadows	8 miles, grading	32,000
Nevada	Mount Wilson	7.5 miles, grading	23,000
Oregon	Steens Mountain	19 miles, grading	79,000
	Stinking Water	13 miles, grading	66,000
	Kilches River	5 miles, grading	195,000
	Lookout Mountain	4 miles, grading	16,000
	Cottonwood Mountain	4 miles, grading	16,000
Wyoming	Shirley Mountain	5.5 miles, grading	36,000
Survey, design, supervision			125,000
Acquisition			20,000
Total, access roads			725,000

2. BUILDINGS, $275,000

The estimated level of $275,000 is the same as the funds available to this program in 1962, exclusive of $20,292 in carryover funds which also are available in that year.

The construction program level is necessary to meet certain minimum facility requirements of the Bureau of Land Management for fiscal year 1963. Emphasis is being placed upon the construction of fire lookout facilities and quarters to assure prompt fire detection upon which a well organized fire protection organization is based. Construction of other buildings and appurtenant facilities is indicated as present facilities are below minimum standards or do not exist. Such buildings and facilities in the Western States are needed to store supplies and equipment which will be used in the forest management, range management, soil and moisture, weed control, and range improvement programs. Supplies and equipment must be adequately stored to prevent loss and deterioration and to prevent excessive maintenance. Present buildings and facilities for the purpose of housing and protecting these types of stores and equipment are not adequate. The funds requested for the two district offices will permit completion of the facilities of those locations.

Of the 178 million acres of public land in the Western United States which are protected from fire by BLM personnel, few permanent lookout installations exist. Several temporary 14 by 14 foot buildings plus temporary platforms having no overhead protection are in use. Approximately 3.7 million acres will be placed under surveillance through the construction of lookouts as proposed in the 1963 program. This will assure more rapid, accurate, and comprehensive detection of, and action on, fires which may occur within that area.

Details of the 1963 buildings construction program are set forth below. Project listing should be considered an indication of the types of buildings to be constructed and a reflection of current Bureau plans; however, emergency requirements occasionally may require some adjustment of project priorities.

Details of the 1963 building construction program are set forth in the following table:

Alaska:	
Cantwell: Fire control station	$16,000
Fairbanks: Complete heating and water system	66,000
Arizona: Arizona strip district, St. George, Utah: Warehouse and equipment storage	23,000
Idaho:	
East Butte: Fire lookout and quarters	8,000
High Five: Fire lookout and quarters	8,000
South Mountain: Fire lookout and quarters	8,000
Nevada:	
Battle Mountain: Warehouse, equipment storage, district office	60,000
Winnemucca: District office	26,000
Oregon:	
Cottonwood Mountain: Fire lookout	7,000
Lookout Mountain: Fire lookout and quarters	10,000
Utah: Price: Warehouse	26,000
Wyoming: Pinedale: Warehouse	17,000
Total, buildings	275,000

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$364,017	$1,149,006	$1,000,000	−$149,006
Unobligated balance brought forward	−4,066,433	−299,006		+299,006
Unobligated balance transferred to "Oregon and California grant lands, Bureau of Land Management"	3,752,268			
Unobligated balance carried forward	299,006			
Unobligated balance lapsing	1,142			
Appropriation	350,000	850,000	1,000,000	+150,000
Obligations by objects:				
11 Personnel compensation	50,895	181,006	173,000	−8,006
12 Personnel benefits	2,267	7,000	6,000	−1,000
21 Travel and transportation of persons	8,800	22,000	16,000	−6,000

32 Lands and structures	172,036	390,000	305,000	−85,000
44 Refunds		15,000		−15,000
Total obligations	364,017	1,149,006	1,000,000	−149,006

IMPORTANCE OF ACCESS ROADS

Chairman HAYDEN. If you have any comment to make on this, you may do so.

Mr. LANDSTROM. No further comment at this time, Mr. Chairman, except to reemphasize the importance of the access roads on the public domain, which has been long neglected in my opinion.

Chairman HAYDEN. Does that help in selling timber?

Mr. LANDSTROM. Yes, sir; it will also help in public access for recreation for many of the people and also for exploration for mining and other users of these roads.

Chairman HAYDEN. It has been the experience of the Forest Service that by the building of access roads and then opening the area for bidding they got more for the stumpage because the lumber company does not have to build the road and in that way they really pay for themselves very promptly.

Mr. LANDSTROM. That is certainly correct and that is a method that is being used in the Bureau of Land Management, to the extent appropriations will allow.

DECREASE IN ESTIMATE

Chairman HAYDEN. The estimate for construction, reforestation, and operation and maintenance on the Oregon and California grant lands for fiscal year 1963 is $7,750,000, a decrease of almost $1,900,000. The justification for this request will be included in the record.

(The material referred to follows:)

OREGON AND CALIFORNIA GRANT LANDS

Appropriation, 1962	$7,750,000
Unobligated balance from prior years	1,822,214
Total available for obligation	9,572,214
Decreases:	
Construction and acquisition of access roads	8,092,543
Reforestation and improvements	1,141,217
Operation and maintenance	338,454
Subtotal	9,572,214
Increases:	
Construction and acquisition of access roads	6,200,000
Reforestation and improvements	1,150,000
Operation and maintenance	400,000
Budget estimate, 1963	7,750,000

Analysis by activities

Activity	Amount available, 1962	Fiscal year 1963			Total available 1963 compared to total available 1962
		Unobligated balance from prior years	Budget estimate	Estimated total available	
1. Construction and acquisition	$8,092,543		$6,200,000	$6,200,000	−$1,892,543
2. Reforestation and improvements	1,141,217		1,150,000	1,150,000	+8,783
3. Operation and maintenance	338,454		400,000	400,000	+61,546
Total	9,572,214		7,750,000	7,750,000	−1,822,214

Under this title, 25 percent of the gross receipts from sales of timber and other products on the revested Oregon and California railroad grant lands is appropriated, bringing together under one appropriation all reimbursable charges against the Oregon and California land-grant fund.

It provides for the construction, acquisition, operation, and maintenance of access roads and improvements and for reforestation on the revested Oregon and California railroad grant lands and on other Federal lands in the Oregon and California land-grant counties of Oregon.

Existing legislation provides that the O. & C. counties shall receive, in lieu of tax payments, up to 75 percent of the gross revenues from these lands. The Association of O. & C. Counties has recommended that one-third of the amount due from receipts, or 25 percent of the total gross receipts, be appropriated for access road construction and maintenance, reforestation, and improvements and be reimbursed to the Treasury from funds otherwise payable to the counties.

1. CONSTRUCTION AND ACQUISITION OF ACCESS ROADS, $6,200,000

This estimate is for construction of access roads on the Oregon and California railroad grant lands. It represents a decrease of $1,892,543 from the amount available for fiscal year 1962, which is the result primarily of the availability in 1962 of $1,752,543 in carryover funds. It covers reconnaissance and surveys of potential routes to O. & C. timber, negotiation, survey, appraisal, and acquisition of easements, rights-of way, and roads and improvement or construction of roads across, on, or adjacent to O. & C. lands (including 462,697 acres of O. & C. lands administered by the Forest Service pursuant to Public Law 426).

More than 7,000 separate parcels of O. & C. land are intermingled with or in the vicinity of approximately 10 million acres of lands in other ownership (mostly private).

To fully implement the timber-cutting plan it is imperative that remotely located old growth, decadent stands be depleted in the initial part of the cutting

sequence. Failure to build adequate access roads into these inaccessible areas forces the cutting of more thrifty rotation-age material. In some instances delicately balanced cutting plans can be seriously disrupted and reserved cuttings, being retained to provide firebreaks and supplemental seed sources, are cut prematurely because undeveloped drainages cannot be penetrated.

A total of 210 separate easements need to be acquired for planned road construction. Approximately 45 miles of existing roads should be purchased. The scheduling of sales of old growth and salvage timber hinges on adequate area development of new road construction and existing road acquisition. In recent years the large increase in allowable cuts has brought presently accessible areas under heavy pressure. The proposed construction and acquisition program for 1963 will provide access to critical drainage areas containing more decadent materials which should be removed first in a sound forestry management program. At the end of fiscal year 1961, 231 miles of mainline access roads had been completed and 153.1 miles were under construction. This estimate provides for grading 29.9 miles, surfacing of 86.7 miles, construction of necessary bridges, and production of rock for road surfacing.

An adequate system of access roads is essential to the offering of the full allowable cut each year. Recently completed access roads have permitted movement of O. & C. timber to communities and industries which might otherwise have suffered acute economic distress. Because of these roads competitive interest has been extended and has provided bidding opportunities for prospective purchasers who heretofore have been unable to bid for the timber. These roads also provide ready access to the O. & C. and other lands for fire protection, recreation, and other uses, including transportation of privately owned timber. When privately owned timber is transported over these roads, road use fees are collected.

Details of the program are given in the following tables:

Status of appropriation, fiscal years 1951–61

Amount appropriated		$38, 411, 229
Transferred to Bureau of Public Roads	$32, 884, 729	
Available to Bureau of Land Management	5, 526, 500

2. REFORESTATION AND IMPROVEMENTS, $1,150,000

(*a*) *Reforestation.*—The estimate of $700,000 is the same amount as that available in fiscal year 1962, exclusive of carryover funds. Details of this program are discussed in the O. & C. grant lands section of the forestry activity under the appropriation, "Management of lands and resources."

(*b*) *Recreational facilities.*—The estimate of $450,000 is an increase of $40,000 over the amount available in fiscal year 1962, exclusive of carryover funds; $250,000 is programed for facilities to be developed by the Bureau while $200,000 is programed for facilities to be developed by the Forest Service on lands in the O. & C. counties that are administered by that agency.

Construction of public recreational facilities, including provision of necessary access thereto, in the O. & C. area of Oregon began in fiscal year 1961. The public demand for recreational facilities in western Oregon has mushroomed dramatically in the last 3 years. The BLM timber access roads have opened many areas highly suitable for recreational use. Currently, recreational use of many scenic spots adjacent to the access roads is unregulated. Hazards both to the resources and to the public health and safety already are evident. These hazards can be minimized or eliminated with development of needed facilities.

3. OPERATION AND MAINTENANCE, $400,000

This estimate provides for maintenance of constructed and acquired access roads and recreation facilities. The increase of $100,000 over the amount available in fiscal year 1962, exclusive of carryover funds, is necessary because of the greater mileage of roads requiring maintenance and the development of additional recreation facilities.

In many of the O. & C. areas close adherence to a maintenance schedule is essential to prevent subgrade deterioration and consequent costly loss of road segments. Replacement costs of washout portions can be materially greater than initial construction and often entails considerable relocations of adjacent undamaged segments of the affected road. An economic side effect is the hardship worked on timber purchasers in their inability to replenish their depleted mill log inventory during the critical spring months.

In addition to maintenance performed with appropriated funds, fees for road maintenance are paid by purchasers of Government timber as a condition of timber sale contracts and by timber haulers using the roads under permits.

Sixteen thousand dollars is included in this estimate for maintenance of recreation facilities.

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)

32 Lands and structures	6,169,674	6,067,214	4,357,000	−1,710,214
44 Refunds		238,000	200,000	−38,000
Total obligations	8,947,648	9,572,214	7,750,000	−1,822,214

Chairman HAYDEN. How do you account for the decrease?

Mr. LANDSTROM. Mr. Chairman, the decrease of almost $1,900,000 between fiscal years 1962 and 1963 is caused by the inclusion of prior year carryover funds in the amount available for fiscal year 1962. Insofar as new funds are concerned, the programs for fiscal years 1962 and 1963 are at the same level.

JUSTIFICATION

Chairman HAYDEN. I will also place in the record the justification for range improvements and for public land administration expenses. Each of these is an indefinite appropriation out of receipts and forfeitures.

(The justification referred to follows:)

	Appropriation, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Range improvements (receipt limitation)	$863,070	$739,842	$1,044,750	+$304,908

Need for increase.—This estimate in the amount of $1,044,750 is an increase of approximately $305,000 over 1962, and reflects an anticipated increase in grazing fee receipts. This is an annual indefinite appropriation derived from grazing fee receipts in accordance with sections 3 and 10 of the Taylor Grazing Act (48 Stat. 1269), as amended. Included also are receipts from Bankhead-Jones Farm Tenant Act lands transferred from the Department of Agriculture by Executive Order 10787, dated November 6, 1958.

Plan of work.—Approximately 178 million acres of public grazing lands which include over 2 million acres of Bankhead-Jones lands will require range improvements to preserve the forage resources. Twenty-five percent of grazing fee receipts from both public lands and Bankhead-Jones lands are designated as a range improvement fund which are applied to improvements on the range. Receipts in fiscal year 1963 are estimated at $6,120,000, which includes the sum of $340,000 from Bankhead-Jones lands.

The appropriation is distributed as follows:

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase
Public lands	$785,877	$678,982	$962,250	$283,268
Farm Tenant Act lands	77,193	60,860	82,500	21,640
Total	863,070	739,842	1,044,750	304,908

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$755,341	$940,828	$1,029,683	+$88,855
Unobligated balance brought forward	−181,890	−289,619	−88,633	+200,986
Unobligated balance carried forward	289,619	88,633	103,700	+15,067
Appropriation	863,070	739,842	1,044,750	+304,908
Obligations by objects:				
11 Personnel compensation	262,705	240,067	275,000	+34,933
12 Personnel benefits	13,139	11,775	14,000	+2,225
21 Travel and transportation of persons	28,201	35,047	40,000	+4,953
22 Transportation of things	45,595	28,827	30,000	+1,173

Total obligations	755,341	940,828	1,029,683	+88,855

EXPENSES, PUBLIC LAND ADMINISTRATION ACT

This account was a current indefinite appropriation in 1961. No amount is shown for 1962 or 1963 as this appropriation is being considered as a permanent indefinite appropriation in those years.

Justification

Section 301 of Public Law 86–649, approved July 14, 1960, authorizes the appropriation of moneys received as a result of forfeitures by timber sale contractors for failure to restore areas damaged by cutting operations and other amounts received in settlement of damage to timberlands. Section 302 of the act authorizes the appropriation of moneys received from road users for road maintenance. The amounts appropriated are to remain available until expended. Any amounts in excess of the cost of doing the work authorized are required to be transferred to miscellaneous receipts (74 Stat. 507–508).

PURCHASE OF VEHICLES

Chairman HAYDEN. In addition, I will have printed your request for authority to purchase passenger motor vehicles and an airplane.

(The request referred to follows:)

ADMINISTRATIVE PROVISIONS

PASSENGER MOTOR VEHICLES

Authorization is requested for purchase of nine passenger vehicles for replacement only. All of the vehicles to be replaced will have met the standards as to age or mileage.

These vehicles are for use by field personnel in the administration of public grazing lands, forest management and fire suppression in widely scattered areas, by field examiners and surveyors in the performance of investigations and surveys, and by supervisory personnel.

Two station wagons are included in the request. They will be used principally by cadastral engineers where the job requirements involve extensive driving and the hauling of personnel, scientific instruments, and field equipment.

Vehicles to be purchased:	
Number	9
Gross cost	$14,400
Old vehicles to be exchanged:	
Number	9
Allowance	$2,100
Net cost	$12,300

AIRCRAFT

Authorization also is requested for the purchase of one additional aircraft.

Aircraft are used by the Bureau only in Alaska. They are necessary for photogrammetric surveys, fire patrol, and for transporting smokejumpers, firefighters, and equipment. The enlarged program for cadastral surveys and fire protection in Alaska requires an additional airplane.

Aircraft to be purchased:	
Number	1
Gross cost	$22,000

INCREASE FOR GENERAL ADMINISTRATION

Mr. BEIRNE. Mr. Chairman, may I point out one thing in our regular appropriations? Under "General administration," we request an increase of $49,000. That actually is an increase of $149,000 when it is considered that last year the Congress gave us $100,000 to purchase equipment.

However, we are to embark on a cost accounting system beginning July 1, so that the cost of equipment will be offset by increased cost of operating the cost system itself and servicing the expanded programs. The total increase is actually $149,000.

Thank you.

Chairman HAYDEN. If the Senators present have no further questions, we will adjourn.

Mr. LANDSTROM. Mr. Chairman, we appreciate always the chance to come down and talk with you and if we can be of any help please let us know.

Chairman HAYDEN. Thank you. We stand in recess until Tuesday, February 27, when we will then take up the appropriations for the Bureau of Indian Affairs.

(Whereupon, at 3:30 p.m., Monday, February 26, 1962, the subcommittee was recessed, to be reconvened the following day, Tuesday, February 27, 1962.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS, 1963

TUESDAY, FEBRUARY 27, 1962

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met, pursuant to recess, at 10 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Byrd, McGee, Young, Mundt, and Dworshak.

DEPARTMENT OF THE INTERIOR

BUREAU OF INDIAN AFFAIRS

STATEMENTS OF PHILLEO NASH, COMMISSIONER; JOHN O. CROW, DEPUTY COMMISSIONER; JAMES E. OFFICER, ASSISTANT TO THE COMMISSIONER; ROBERT E. VAUGHN, ASSISTANT TO THE COMMISSIONER; FRED H. MASSEY, ASSISTANT COMMISSIONER, ADMINISTRATION; SELENE GIFFORD, ASSISTANT COMMISSIONER, COMMUNITY SERVICES; E. REESEMAN FRYER, ASSISTANT COMMISSIONER, RESOURCES; HILDEGARD THOMPSON, CHIEF, BRANCH OF EDUCATION; DELBERT H. BRUCE, CHIEF, BRANCH OF REALTY; GEORGE S. KEPHART, CHIEF, BRANCH OF FORESTRY; REGINALD W. QUINN, TRIBAL PROGRAMS OFFICER, BRANCH OF TRIBAL PROGRAMS; J. LEONARD NORWOOD, CHIEF, BRANCH OF BUDGET AND FINANCE; ARTHUR ALLEN, ENGINEERING ADVISER, ADMINISTRATION; AND ROBERT TRIER, CHIEF, ROADS BRANCH; BUREAU OF INDIAN AFFAIRS, DEPARTMENT OF THE INTERIOR

BUDGET ESTIMATES

Chairman HAYDEN. The committee will be in order.

We will place in the record a comparative statement of fiscal year 1962 appropriations and fiscal year 1963 budget estimates for the Bureau of Indian Affairs. This shows an increase of $33,139,348 requested for fiscal year 1963.

(The statement referred to follows:)

Comparative statement of 1962 appropriations and 1963 budget estimates

Appropriations and activities	Revised appropriations 1962	Estimates, 1963	Increase or (−) decrease
Education and welfare services:			
1. Educational assistance, facilities and services	$58,575,571	$68,369,000	$9,793,429
2. Welfare and guidance services	8,379,126	9,348,000	968,874
3. Relocation services	[1] 2,815,000	2,815,000

Total	[1] 71,418,697	82,827,000	11,408,303
Resources management:			
1. Forest and range lands	3,510,247	4,300,000	789,753
2. Fire suppression	140,000	140,000	
3. Agricultural and industrial assistance	[2] 3,182,959	5,395,000	2,212,041
4. Soil and moisture conservation	5,166,692	5,352,000	185,308
5. Maintenance of roads	2,849,500	2,850,000	500
6. Development of Indian arts and crafts	202,200	300,000	97,800
7. Management of Indian trust property	4,638,048	5,268,000	629,952
8. Repair and maintenance of buildings and utilities	8,532,692	9,562,000	1,029,308
9. Operation, repair, and maintenance of Indian irrigation systems	1,087,800	1,250,000	162,200
Total	[2] 29,310,138	34,417,000	5,106,862
Construction:			
1. Buildings and utilities	35,861,000	50,483,000	14,622,000
2. Irrigation systems	3,698,989	4,282,000	583,011
Total	39,559,989	54,765,000	15,205,011
Road construction (liquidation of contract authorization):			
1. Federal-aid highway roads	11,000,000	12,000,000	1,000,000
2. Navajo-Hopi roads	5,000,000	5,000,000	
Total	16,000,000	17,000,000	1,000,000
General administrative expenses:			
1. Departmental office	1,082,000	1,202,000	120,000
2. Field offices	2,839,828	3,170,000	330,172
Total	3,921,828	4,372,000	450,172
Liquidation of Klamath and Menominee agencies	31,000		−31,000
Revolving fund for loans	4,000,000	4,000,000	
Grand total	164,241,652	197,381,000	33,139,348

[1] For comparative purposes excludes $285,000 included in the justification under "Resources management."
[2] For comparative purposes includes $285,000 appropriated under "Education and welfare services."

Education and Welfare Services

Chairman Hayden. There also will be included in the record the justifications for the 1963 estimate for "Education and welfare services." The amount of this estimate is $82,827,000, an increase of $11,408,303 over the amount available during the past fiscal year.

(The information referred to follows:)

Bureau of Indian Affairs, Education and Welfare Services

HIGHLIGHT STATEMENT

The Bureau provides services and assists the States in furnishing services to Indians in the United States including the natives of Alaska in the fields of education, welfare, relocation, and law and order. Progress in education is basic to successful achievement of overall Bureau programs.

Education provides the base of understanding and skills that facilitates Indian acceptance of ideas and programs leading them to full assumption of citizenship responsibilities. In the last few years the education program has been broadened to include adults as well as children of school age. Indian children attend public, Federal, private, and mission schools. In 1961 there were 112,746 Indian pupils, age 6 to 18 inclusive, enrolled in school, an increase of 3 percent over the year before. In addition, 8,092 Indian pupils, under 6 and over 18, were enrolled in school. Funds are requested for fiscal year 1963 to provide educational services for 2,528 additional pupils in boarding schools, approximately 1,200 additional pupils in 40 additional day school units and for the Federal Government's share of the increased costs and increased pupil load in public schools enrolling Indian children.

Wherever facilities are available Indians are enrolled in local public schools. The Bureau assists in financing some districts enrolling Indian pupils eligible for payment under the Johnson-O'Malley Act. When school districts educating Indian children are eligible for Federal aid under Public Law 874, 81st Congress (64 Stat. 1100), as amended, supplemental aid under the Johnson-O'Malley program is limited to meeting educational problems under extraordinary or exceptional circumstances.

When public school opportunities are not available, the Bureau operates schools for Indian children. In 1961 the Bureau operated 270 schools, enrolling 41,729 pupils and 19 dormitories, housing 3,953 pupils attending public schools. The primary objective of the schools operated for Indian children is to prepare them for successful living. In Federal schools the children develop basic academic skills, acquire an understanding of the social and economic world, learn improved standards of living, follow practices which assure optimum health, acquire vocational training to qualify for gainful employment, and obtain sufficient education to enter special schools and institutions of higher learning. The schools provided by the Federal Government for Indian children meet the instructional standards required by the States in which they operate and all secondary schools are accredited so that graduates may enter college on the same basis as public school graduates. In addition to the operation of Federal schools for eligible Indian children, the Bureau conducts a limited educational program for adult reservation Indians. In 1961, 107 communities were served by this program. Courses are planned to meet specific needs of individuals and community groups and range from the most elementary reading and writing to practical and business skills and citizenship training.

The act of August 3, 1956 (70 Stat. 986), as amended, authorizes a program of adult vocational training and education in the amount of $7,500,000 annually. This program was initiated in 1958 on a limited basis. For 1963, we are requesting $5,500,000, which will provide for approximately 1,900 institutional trainees and 1,000 on-the-job trainees.

The Bureau provides general relief, child welfare, and miscellaneous services to Indians who do not qualify for similar services offered under Federal, State, or county welfare programs. An average monthly caseload of 14,820, an increase of 620 over 1962, for general relief is contemplated in 1963; and foster care for 2,780 children, an increase of 80 over 1962.

The relocation program assists Indians from reservations to settle and secure permanent employment in non-Indian communities, and assists in a program of industrial development on or near reservations to provide local job opportunities. In 1962, 4,400 relocatees will be furnished aid and in 1963, 4,600.

Police services and tribal court operations are financed on Indian reservations, and special officers direct enforcement of Federal law. Failure or lack of a program to maintain order on the reservations jeopardizes or renders impossible the accomplishment of other Bureau programs.

Education and welfare services

Appropriation, 1961	$63, 669, 000

(a) *Assistance to pupils in non-Federal schools*

The estimate of $7,954,000 is an increase of $1,100,000 over 1962.

Need for increase.—The increase of $1,100,000 covers $700,000 for the Bureau's share under State Johnson-O'Malley plans for the increased enrollment and additional costs in public schools, and $400,000 for higher education grants.

Plan of work.—This item covers subactivities as follows:

(1) Public schools: This item provides for the Johnson-O'Malley program under which the Bureau cooperates with local public schools by compensating districts for impacts of Indian children from tax-free Indian lands and resulting financial problems in educating Indian children State and/or district plans are agreed upon and at contracting time funds are adjusted to meet the exact amounts needed to finance such plans. Prior to 1959 local public schools participating under a State or district plan financed from Johnson-O'Malley funds were ineligible for entitlement for Indian pupils under Public Law 874, 81st Congress (64 Stat 1100) administered by the Health, Education, and Welfare Department. The act of August 12, 1958, amended Public Law 874 so that school districts educating Indian children may receive payments for Indian children on the same basis as other federally affected children. Bureau efforts are carefully coordinated with the Office of Education in the Department of Health, Education, and Welfare to insure that there is no duplication of assistance for the same service.

Although Public Law 874 applies to Indian children on the same basis as non-Indian children, not all public schools on Indian reservations have an adequate tax base to provide education at acceptable State standards without additional assistance over and above their entitlement under Public Law 874 which requires a 3-percent impact and a minimum average daily attendance of 10 federally connected children to qualify for financial assistance. Some schools enrolling Indian children do not qualify because of this requirement. Johnson-O'Malley aid is provided in such instances. It is limited entirely to Indian-impacted districts not qualifying for Public Law 874 aid and to meeting needs under extraordinary and exceptional circumstances when the district is eligible for Public Law 874 funds

Increased enrollment and increased education costs account for increased need of assistance from the Bureau under the Johnson-O'Malley program. Enrollments of Indian children in public schools increased approximately from 1,500 to 4,000 annually over the past 5 years. Public school costs are increasing on an average of from 5 to 7 percent annually according to published information of the National Education Association. The Bureau must be in a position to meet justifiable assistance to public schools enrolling Indian children to insure the continued enrollment and adjustment of Indian children in public schools. Otherwise many Indian children may be faced with no facilities or with attendance at a Federal school facility already overcrowded.

The Bureau meets the full per capita costs for the education of Navajo pupils domiciled in Federal dormitories and attending out-of-district public schools.

In 1961 the public schools enrolled 64,987 Indian children. Of this number over half attended public schools receiving financial assistance under the Bureau's Johnson-O'Malley contract program. (The decrease in total public school enrollment from 84,650 in 1960 to 64,987 in 1961 is due to the dropping from the school census report of Indian schoolchildren those residing in the States of California, Idaho, Michigan, Minnesota, Nebraska, Oregon (except Warm Springs Agency), Texas, Washington, and Wisconsin, where the Indian schoolchildren are now enrolled in public schools. After adjusting the 1960 census report to reflect this change, there was an increase in total public school enrollment of 1,449 pupils from 1960 to 1961.)

The following tables list the Johnson-O'Malley education contracts:

(2) Special aids: This item provides lunches for Seminole children in Florida.

(3) Higher education: This item provides for grants to 1,025 students in universities, colleges, and institutions of higher learning and increases the average grant from $385 to $640 per student above the high school level in 1962. The number is expected to increase annually because of the large number graduating from Federal and public high schools and because of the growing interest of the Indian people in having their children receive education at the higher levels. The Federal grant funds, with the funds provided by private and public organizations, various schools, some States, tribal groups, and Federal and tribal loans, will assist many Indian young people who would otherwise be unable to attend schools of higher learning. The amount of grant funds provided by various Indian tribes for higher education is increasing each year as tribal resources permit and as other tribes establish grant funds for this use. However, many

tribes are without resources to provide for the higher education needs of their youth, and rapidly rising costs make it necessary for the Bureau to provide assistance in larger amounts. An analysis of the item by area follows:

Area	1961		1962		1963	
	Number of grants	Amount	Number of grants	Amount	Number of grants	Amount
Aberdeen	135	$55,991	150	$53,000	270	$171,000

(*b*) *Federal facilities*

The estimate of $53,980,600 is an increase of $7,132,884 over 1962.

Need for increase.—The increase of $7,132,884 consists of—

(1) $4,912,876 in boarding schools representing $3,155,000 for increased enrollment of 2,528 pupils; $339,876 to raise instructional standards; $700,000 for summer programs; $390,000 for reclassification of positions in compliance with civil service standards; $97,000 for turn-around leave for employees in Alaska; $131,000 for a special demonstration school; and $100,000 for a special orientation and training program for school employees.

(2) $2,092,808 in day schools representing $674,300 for increased enrollment in 40 additional day school units; $188,408 to raise instructional standards; $270,000 for reclassification of positions in compliance with civil service standards; $50,400 for turn-around leave for employees in Alaska; $395,000 for a school lunch program in Bureau schools in Alaska, on the basis of $0.50 per pupil per meal; $320,000 for increased costs in the operation of one-room day schools at $5,000 per unit; and $194,700 for a high school correspondence course in Alaska.

(3) $127,200 in special services representing $125,000 for off-reservation transportation; and $2,200 for turn-around leave in Alaska

Plan of work.—An analysis of the item by subactivity follows:

	1961		1962		1963		Increase	
	Number of pupils	Amount	Number of pupils	Amount	Number of pupils	Amount	Number of pupils	Amount
(1) Boarding schools	29,930	$34,953,347	31,565	$35,508,124	34,093	$40,421,000	2,528	$4,912,876

Instructional aid classroom	4	4	125	5	150	5	----------
Navajo trailer schools	14	21	541	22	530	22	----------
Hospital classrooms	5	9	345	8	300	8	----------
Total	193	566	15,752	586	17,580	626	40

(3) Special services: (*a*) Program direction: This item provides for the salaries and expenses of the education employees rendering field supervisory service as well as the education personnel in the central office. These education specialists plan the overall academic and vocational program for Federal Indian schools and in cooperation with State and local officials develop plans for increased enrollment of Indian pupils in the public school system.

(*b*) Museum: The item provides for the operation of the Blackfeet Museum at Browning, Mont.

(*c*) Alaska and Navajo off-reservation transportation: The item provides for plane, bus, and rail fares and incidental expenses of transporting pupils in Alaska and on the Navajo Reservation from their homes to and from off-reservation schools.

(*c*) *Adult education and training program*

The estimate of $6,434,000 is an increase of $1,560,545 over 1962.

Need for increase.—The increase of $1,560,545 consists of—

(1) $304,400 in adult education to provide 32 additional on-reservation units in 9 areas in 1963. Although the program has been provided only on request by Indian groups, the Bureau has never kept current with demands.

(2) $1,256,145 in adult vocational training to provide funds to serve the large number of applicants that could not be entered into training because of insufficient funds under the former limitation of $3,500,000. There are approximately 1,200 applicants on record and awaiting entrance into training. In addition, field staffs estimate that they expect 3,450 new applicants to apply for this service if funds are available.

Plan of work.—The item covers subactivities as follows:

Program	1961	1962	1963	Increase
(1) Adult education	$577,833	$530,000	$934,400	+$304,400
(2) Adult vocational training	3,440,276	4,243,855	5,500,000	+1,256,145
Total	4,018,109	4,873,855	6,434,400	+1,560,545

(1) Adult education: This program offers general education instruction to adults where the need is especially acute because the Indians have missed the advantage of education in their youth. It provides a type of training which meets the needs and abilities of the individual Indians involved, to help them earn a livelihood, conduct their own affairs, and assume responsibilities as citizens. The program ranges in nature from instruction in basic numerical and English

language skills to continuation of elementary and high school education, improvement of employment opportunities, strengthening of home and family life, and greater civic participation. By such means, the educational cultural gap between Indians and non-Indians may be closed and Indian adults may be enabled to enjoy the benefits which most Americans take for granted.

(2) Adult vocational training: Institutional training—With $5,500,000 available for adult vocational training, service can be provided to 1,200 institutional training units who are expected to be in training at the end of fiscal year 1962 and who will carry over into fiscal year 1963. In addition, these funds will enable 700 new institutional enrollees to start training during the year, providing a total service program to 1,900 units during the year.

On-the-job training—Of the $5,500,000 available for adult vocational training, $600,000 will be used to provide on-the-job-training for 1,000 units in plants established on or near the reservation areas through the Bureau's industrial development program.

2. Welfare and guidance services

Subactivity	Case-load	Amount available, 1961	Case-load	Amount available, 1962	Case-load	Estimate, 1963	Increase	
							Case-load	Amount
(a) General assistance	12,749	$3,694,272	14,200	$4,347,600	14,820	$4,801,600	+620	+$454,000
(b) Other welfare assistance		1,323,795		1,853,200		1,993,200		+140,000
(1) Child welfare	2,300	(1,280,820)	2,700	(1,806,640)	2,780	(1,928,290)	+80	+(121,650)
(2) Miscellaneous assistance		(42,975)		(46,560)		(64,910)		+(18,350)
(c) Social services		1,841,221		2,178,326		2,553,200		+374,874
Total		6,859,288		8,379,126		9,348,000		+968,874

(a) *General assistance*

The estimate of $4,801,600 is an increase of $454,000 over 1962.

Need for increase.—It is estimated that the average monthly caseload will increase from 14,200 persons in 1962 to 14,820 persons in 1963, with a range, in a seasonal pattern, from approximately 9,840 persons per month to approximately 22,000 persons per month. There is a continuing decrease in employment opportunities for unskilled labor and this trend is expected to continue. Many unskilled Indians accustomed to seasonal agricultural work find it difficult to adjust to other employment. Resident populations are increasing despite outmigration. It is expected also that it will be necessary to provide assistance for additional Indians on certain reservations who are now being assisted by tribal funds, but which funds are expected to be inadequate for this purpose. Assistance grants continue to increase gradually reflecting increased living costs and some improvements in living standards. The increase in general assistance funds for 1963 will raise the average monthly grant to approximately $27, per person.

(b) *Other welfare assistance*

The estimate of $1,993,200 is an increase of $140,000 over 1962.

(1) *Child welfare.*—The estimate of $1,928,290 is an increase of $121,650 over 1962.

Need for increase: The increase will provide for institutional or foster home care, for all or part of the year, for an additional 80 children, and for the increased costs of institutional and foster home care for other children now being provided for. The number of neglected, dependent, and handicapped children coming to the Bureau's attention continues to increase, due largely to better case finding and greater awareness of the Bureau's child welfare services by tribal officials and individual Indians. It will be necessary also for the Bureau to provide for foster care for Indian children in certain additional States because of unavailability of or recognized inadequacies of State services.

Plan of work: Child welfare services will be provided for Indian children on reservations when such services are not available from established child welfare agencies, including arrangements for the protection and care of dependent or neglected children, planning for adoption, and securing appropriate institutional care.

80391—62——6

(2) *Miscellaneous assistance.*—The estimate of $64,910 is an increase of $18,350.

Need for increase: This estimate provides funds necessary to meet costs of burials and miscellaneous assistance costs not provided for otherwise.

(c) *Social services*

The estimate of $2,553,200 is an increase of $374,874 over 1962.

Need for increase.—The increase will provide for an additional 48 positions (26 social workers, 22 clerical employees) and for increased costs for travel and other administrative expense, including equipment. The Bureau's welfare program is called upon increasingly to provide social services, not only in connection with administering financial assistance, but also services not directly related to financial assistance, for Indian families and children who are unable to cope with the problems confronting them. Such services are necessary to avoid further demoralization and to promote progress toward independence. The additional positions are necessary: to administer properly the increased assistance program without promoting dependency, to provide more adequate attention and services for the needs of dependent, neglected, and handicapped children; to meet the increased requests for consultation from tribal courts and judges in connection with social problems brought before the courts; to provide more adequately guidance and counseling to families and children regarding serious social problems, and counsel and supervision when necessary over expenditure of funds belonging to minors and to adults determined to be in need of assistance in managing their affairs.

3. Relocation services

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Relocation services	$2,889,451	$2,815,000	$2,815,000	

The estimate for this activity for 1963 is $2,815,000, the same as for fiscal year 1962.

Plan of work.—This item provides for service and financial assistance to 4,000 persons (2,000 units) to relocate and accept employment in industrial areas where field relocation offices have been established. It will also provide funds to assist 550 persons (275 units) to obtain direct employment within their State of residence near the reservation on which they now reside.

4. Maintaining law and order

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Maintaining law and order	$1,275,343	$1,649,000	$2,295,000	+$646,000

The estimate for this activity for 1963 is $2,295,000, an increase of $646,000.

Need for increase.—An increase of $646,000 is requested to enable the Bureau to assume its responsibility for the prevention and enforcement programs on Indian reservations within its law and order jurisdiction. Some staff is required to discuss with tribes and States the assumption on a piecemeal basis of law and order functions as suggested in the task force report. Also in a few places where law and order staffs were withdrawn, some staffs will be used to reestablish working relationships by the tribes and local law and order enforcement organizations. A total of 95 new positions will be required, which will include the necessary enforcement, judicial, prevention, juvenile, and clerical staff. In addition, the increase includes funds for operation of municipal centers, care and feeding additional prisoner loads, purchase, repair and operation of necessary motor vehicles, and the attendent increased administrative services.

Plan of work.—The Congress of the United States has enacted legislation (67 Stat. 588) investing several States with jurisdiction including a clause enabling any State to assume jurisdiction provided the necessary State legislation is enacted to implement the Federal law. A number of States have not taken the necessary action to enable them to assume jurisdiction on Indian reservations.

Generally, therefore, the States lack jurisdiction to prosecute Indians for offenses committed on their reservations. Federal laws are limited in their application to Indians, as they are generally limited to major offenses.

The great field of crime, outside of the few major offenses, is within the jurisdiction of Indian tribes themselves. Many tribes have acted to establish codes of laws to regulate the conduct of tribal members but they are generally unable financially to carry on an adequate law enforcement program. In many other instances where there are no tribal laws, the law and order regulations of the Department of the Interior are the sole basis for maintaining law and order on the reservation.

PREPARED STATEMENT

Chairman HAYDEN. You may proceed with your statement.

Mr. NASH. Yes, sir. Mr. Chairman, I am Philleo Nash, Commissioner of Indian Affairs. We have prepared a statement for the record which has already been submitted and which is, I think, too long to take up your time.

Chairman HAYDEN. You may highlight your statement.

(The statement referred to follows:)

STATEMENT OF PHILLEO NASH, COMMISSIONER OF INDIAN AFFAIRS

Mr. Chairman and members of the committee, I appreciate the opportunity to present to you the request of the Bureau of Indian Affairs for appropriations for fiscal year 1963 and to comment briefly on the major programs for which we are seeking funds.

I have been Commissioner for only 6 months so that I am still orienting myself to the widely varied activities of the Bureau of Indian Affairs. The details of our operations are extensive and I have brought more than the usual number of branch chiefs and division heads, who will explain better than I the fiscal affairs of the Indian Bureau.

The budget before you was prepared largely by my predecessors; but it was modified after I became Commissioner so as to provide for greater emphasis on programs of resource and human development as proposed by the Secretary's Task Force on Indian Affairs, of which I was a member.

We are asking for fiscal year 1963 the sum of $197,381,000. This is an increase of $33,139,348 over the adjusted appropriation of $164,241,652 for fiscal year 1962

This is not only a large sum of money, it is a substantial increase over the previous fiscal year. Let me say at the outset that the increase consists primarily of additional amounts for the education of Indian children. We are asking for an increase of $14.6 million to build classrooms for Indian children who are not able to attend school because no facilities ever have been provided. These classrooms will be built primarily on the Navajo Reservation and in Alaska. This program is intended to bring the Indian School population and classroom facilities into balance by fiscal year 1966, 4 years from next July.

The second biggest increase is also in the field of education and consists of $8.5 million for educational services. Many improvements in our educational system will be possible with this increase; but it provides principally for an increased enrollment of 2,500 pupils in our boarding schools and the operation of 40 additional day school units. The Indian school-age population is increasing by more than 4 percent each year, so we must anticipate increased costs in the operation of our educational system for the foreseeable future.

We are seeking an increase of $1.2 million for the adult vocational training program. The Congress increased the amount authorized for this program last year, and it has been one of our most successful programs of human development.

Welfare and guidance services and improved law enforcement will be possible with proposed increases of $0.9 and $0.6 million, respectively.

We are requesting an increase of $2 million for economic development. This will enable us to reactivate the division of economic development which was formerly a staff division in the Washington office. We propose to recreate this division in such form as to provide direct service to the Indians on the reservation so as to make better use of their natural resources, to attract industry, to stimulate employment, and raise the standard of living.

We are combining with this a request to appropriate $4 million for the revolving loan fund. This is the same amount as was appropriated in fiscal year 1962 and will leave a balance of $2 million of the amount authorized by the Congress for this purpose. This fund is highly important to our economic development program. The tribes use the revolving loan fund for tribal enterprise and for relending to their members. The repayment rate is excellent. As Indian tribes and individuals become accustomed to the use of Government credit for business purposes, they also increase their use of credit from private lending agencies. The general effect is to stimulate Indian participation in the economic life of the communities of which they are a part.

We are also asking for an increase of $1 million for the repair and maintenance of buildings and utilities. The concentration of our building effort on school facilities for Indian children has caused us to neglect the construction of much needed other type facilities in our field installations. Consequently, the cost of repair and maintenance increases as the rate of obsolescence rises. Eventually the cost of repair will reach a level that is so uneconomical that we will have to turn to construction or abandonment.

We are also asking for an increase of $1 million to liquidate obligations incurred under contract authority for road construction. Modernization of the road system on the reservations is essential both to the proper development of natural resources and to the education of Indian children. As we build schools in isolated areas it is necessary at the same time to construct access roads. It is also important that the road systems of the reservations should tie in with the Federal-State highway system. This year will see the completion of Routes 1 and 3 of the Navajo-Hopi system.

All other increases are for sums of less than a million dollars. The items I have enumerated and the programs I have described account for $29.8 million of the increase. I will leave the details of the individual appropriation items and their justification to my associates who are with me today.

With your permission I should like to review for the record at this point a tabulation of the appropriations we are requesting for fiscal year 1963 analyzed by the broad categories of service we expect to perform.

Bureau of Indian Affairs appropriation request, fiscal year 1963, by programs

[Dollars in millions]

Programs	Requests	Percent
Community services	$142.9	72.4
Resources management	42.1	21.3
Economic development	8.0	4.1
General administration	4.3	[1] 2.2
Total	197.3	100.0

[1] Excludes $3,000,000 representing the share of administrative costs allocated to participating program activities.
(Total administrative expense (requests) $7,300,000; 3.7 percent.)

With your permission, I should now like to comment briefly on the general purposes for which we are seeking these funds and the need for strengthening certain of our programs. The long-range objectives of the Bureau of Indian Affairs are restated from time to time as new Commissioners take office. During my administration we hope to concentrate primarily on economic development. The task force proposed, and the Secretary of the Interior has accepted, the general outlines of our report which emphasized three goals:

1. Maximum Indian economic self-sufficiency.
2. Full participation of Indians in American life.
3. Equal citizenship privileges and responsibilities for Indians.

To reach these goals we rely on programs of classroom education, of practical training, and of individual and group development. Some Indian people have had the opportunity of early education in a school environment, but others have not been so fortunate. They must depend upon social services, adult education, vocational training, and community living for their personal development. Parents who are not aware of the values of education or who do not themselves have family stability, cannot, alone and unaided, bring up children with the personality and character we desire for all Americans. Where stable family life does not exist a tragic cycle of dependency begins: First, a premature dropout from school; next, unemployment because of a lack of vocational skill; third, a new welfare client; fourth, lowered morale, and the personal and family disorganization which go with it; fifth, a home environment again unsuitable for the rearing of children. As long as these realities exist we have no alternative to the allocation of large portions of our budget to programs designed for maximum education, training, and development opportunities to Indian children during their youth; and to reach out even further to meet the basic needs for counseling and education of adults who have lacked opportunity during their own youth.

For these reasons of our total requested budget of $197.3 million, $82.8 million is for the programs I have just described. In addition, $50.5 million and $9.6 million are needed, principally for school construction and for the repair and maintenance of schools.

All these items, taken together represent 72 percent of our total budget, and it is this portion that deals primarily with the existing human potential of all ages. Over 62 percent of the total budget is required for the support of programs directly related to the education of Indian children.

These are not small sums, but the problem is very large. I would also point out, as, perhaps, my predecessors have done before me, that these sums must be spent by some unit of government in accord with our established American principle that every child is entitled to education at public expense, regardless of where he lives, no matter how remote or isolated his home. Since education is largely a local matter, it is apparent that the 62 percent of our total budget which is used primarily to support programs directly relating to the education of Indian children is a direct assistance to the States, to the school districts, and to the units of local government would otherwise be obliged to spend these same sums for the same purposes.

The outmigration from the reservations has reached substantial proportions. The census of 1960 showed approximately 360,000 Indians living on reservations but another 160,000 Indians not living on reservations. It is apparent that relocation alone, whether voluntary or assisted, will not in itself relieve the pressure on the reservations. Nearly half as many Indians are living off reservations as on them; yet our reservation population is increasing and is doing so at a faster rate than the population of the country as a whole.

Education without economic opportunity is a mockery. The present adult Indian population is sorely in need of further development. The reservation children now in Government schools, mission schools, and in public schools will need massive development of the natural resources on their reservations if they are not to live out their lives in poverty and idleness.

Fortunately, we have enough experience with economic development on Indian reservations to know that such conditions are not necessary. The cattle enterprise of the Florida Seminoles, the recreation enterprises at the Eastern Cherokee Reservation in North Carolina and among the White Mountain Apaches in Arizona; the successful handling of the Osage oil and gas resource; the fishing tackle factory at the Pine Ridge Reservation in South Dakota; and the recent tribal development programs of the Navajos and other tribes in the Four Corners area, all point to a way out for those Indians who wish to remain on reservations.

With technical assistance from the Bureau, cooperation with private industry, investment money, stable tribal government, good relations with the surrounding community, and above all, the determination to use their own resources to advance their own standard of living, a measure of success has been achieved in every part of the country among many different tribes under widely varying conditions.

Development of the full economic potential of the reservation has two facets. One is the proper management of land, timber, water, range, livestock, minerals, and other resources. The Bureau of Indian Affairs as trustee has the responsibility for seeing to it that these Indian-owned natural resources are prudently managed so as to generate income.

As a branch of the Department of Government principally concerned with conservation, this Bureau has an added responsibility to see to it that these resources are utilized with due regard for coming generations and the Nation's future. The Bureau of Indian Affairs is proud of its record in this respect. The very first irrigation project in the United States was an Indian project. It was begun in 1867 on the lower Colorado River. But, to our regret, this and other projects in succeeding years have never been completed in the sense that all usable land has been subjugated and all available water has been put to use.

Our programs for the long-range improvement of natural resources on the reservation, their management for income producing purposes, their protection from fire, drought, and disease, together with the construction and maintenance of roads and irrigation systems will total $42.1 million if the present request is granted. This, as indicated in the table above represents 21.3 percent of our total requested appropriation.

The other facet of our activity by which we hope to move toward the long-range objectives of the Bureau is a program of economic development. By this, we mean full use of all the resources of a given reservation for maximum productivity. In the West, outside the Indian reservations, a hundred years and more have brought together land, people, and capital to make effective contributions to the national welfare, bringing a high standard of living to the whole area. It is in the sense that this process is only beginning, or has never taken place at all, that Indian reservations are largely undeveloped. In this respect they resemble underdeveloped countries elsewhere in the world.

Such economic development as has already taken place tends to be rather one sided. Until recently the trust status of Indian lands has prevented the Indians from obtaining credit with which to develop them. Lands are leased which could be more profitably operated by the Indians themselves and so the full income potential is not realized to the Indians. Since 1867, not one irrigation project has ever been completed. With few exceptions the possibility of tourism is untapped. Small commercial enterprise and service establishments are nonexistent, or feebly developed.

Over the years the Bureau of Indian Affairs has struggled to fill the economic gap. We have brought much technical skill and small amounts of credit to the reservations; but frontier conditions still prevail with respect to transportation; communications; housing; availability of power; and the supply of community domestic and industrial water.

The standard of living on Indian reservations is not likely to be significantly improved until these conditions have been corrected. To take the first step is the purpose of the proposed Division of Economic Development.

There is a growing awareness among Indians themselves of the economic potential in the fuller use by themselves of their own resources. Increasingly tribal councils are seeking assistance for tribal enterprise or for credit to aid individual enterprise. Recreation, tourist attraction, native arts and crafts, land consolidation and industrial development are the programs that seem especially

attractive to them. They are also showing intense interest in housing, particularly in the low rent public housing. For the next few years we plan to offer maximum encouragement to the tribes' interest in economic development. The programs we propose to emphasize are those of vocational training, industrial development, credit, arts and crafts, the tourist industry, and housing. To meet the demands of these programs many of the tribal governments will need to be strengthened with respect to their organization, constitution, and bylaws. Research and planning are essential to success in the economic development field and much counseling and assistance needs to be given to both individuals and tribal governments. At the focus of the new Division's attention will be reservation development programs formulated by the tribes themselves to be implemented by them with our technical assistance. The combined programs of credit, industrial development, tribal affairs, and economic analysis which we are reconstituting as the Division of Economic Development is estimated at $4 million or 2.1 percent of the total sum we are now seeking. Of this amount $2.1 million is new money; the balance is provided for in existing resource programs. The new money will enable the services of credit, tribal affairs, and business counseling to be supplied directly to the reservations where the need is greatest.

To guide these programs we are seeking a modest increase in general administrative expense of $450,000. Our present general administrative expense is approximately 2½ percent of our total budget. The proposed general administrative budget would be 2¼ percent of the total sum we are now requesting. Additional administrative costs are carried by the program appropriations to the extent of $3 million, making our overall administrative cost $7.4 million, or 3.7 percent of the total.

During the trips of the task force in the Indian country and my own travels before I became Commissioner, I was greatly impressed by the evidence of effectiveness of the management training program. It is quite clear that those superintendents who have had the good fortune to come through such training programs are better equipped in overall planning, in their awareness of programs, in their ability to work with the tribal councils, and in their understanding of the general function of the superintendent. The increase in general administrative expenses will provide for a small expansion of our management training program which I mention, not because of its size, but because of its importance to the general administration of the Bureau.

In conclusion I would like to tell the committee that during the past year as a member of the task force and later as Commissioner I have found a Bureau which consists in the main of capable and dedicated technical experts. It has a long and honorable history that goes back before the Republic itself. In recent years its morale has suffered because of uncertainties as to the direction its affairs were to take. The goals proposed by the task force are goals the Indian people themselves helped to formulate. In the ensuing months they were very carefully checked out with the Bureau itself. They are supported and endorsed by most of the Bureau personnel. With this new sense of direction and improved morale it is my belief that the Bureau can move ahead with increased efficiency, effectiveness in service, and improved performance of its true function: guided acculturation looking toward the integration of Indian communities in the larger society that is America.

General Statement

Mr. Nash. If I may, I will highlight it and read a few selected paragraphs.

Chairman Hayden. All right.

Mr. Nash. Mr. Chairman, first may I say on behalf of myself and my associates that we are very appreciative of the opportunity to present to you the request of the Bureau of Indian Affairs for appropriations for fiscal 1963 and have the opportunity to comment briefly on the major programs for which we are seeking funds.

AMOUNTS REQUESTED

We are asking, Mr. Chairman, for fiscal year 1963, the sum of $197,381,000, an increase of $33,139,348 over the adjusted appropriations of $164,241,652 for fiscal year 1962.

We are very well aware of the fact, Mr. Chairman, that this is a large sum of money and is a substantial increase over the previous fiscal year. This is fundamentally, sir, an increase which is based on programs of education and of expanded economic development in order that the American Indian population may take its rightful place in our American society.

BROAD PROGRAM ANALYSIS

We have prepared as part of our submission an analysis of the broad programs for which we are seeking appropriations.

Thus, the community services programs taken in their entirety, such as the education of children, the operation of Federal schools, the use of Johnson-O'Malley funds, the construction of schools for children for whom there are no facilities at the present time, total $142,900,000, or 72 percent of the total sum which we are asking.

In the resources management field, which includes the management of the Indian estate: their irrigation, their forestry, the industrial development program, looking toward the wage employment of Indians on reservations, and many other programs, which will, if they are effective, increase the Indian standard of living and increase the productivity of Indian resources; a total of $42.1 million, or 21.3 percent of the total.

For our new programs of economic development providing credit and assistance at the reservation levels in the fields of industrial and resource development, we are seeking $8 million, or 4.1 percent of the total.

ADMINISTRATIVE EXPENSES

Our overall administrative expenses in the general administrative account are only 2.2 percent of the total

We are asking for an additional $3 million to come out of program money for the cost of administering the programs; but even including these amounts our administrative expense will still be only 3.7 percent of the total that we ask.

Mr. Chairman, with your permission I should like to comment briefly on the general purposes for which we are seeking these funds and the need for strengthening certain of our programs.

LONG-RANGE OBJECTIVES

The long-range objectives of the Bureau of Indian Affairs are restated from time to time as new Commissioners take office, and there have been a great many during your long tenure, sir.

During my administration we hope to concentrate primarily on economic development. The task force proposed, and the Secretary of the Interior last year accepted, the general outlines of our report which emphasized three goals: First, maximum Indian economic self-sufficiency; second, full participation of Indians in American life; and, third, equal citizenship privileges and responsibilities for Indians.

To reach these goals, we rely on programs of classroom education, of practical training, and of individual and group development. Some Indian people have had the opportunity of early education in a school environment, but others have not been so fortunate. They must

depend upon social services, upon adult education, upon vocational training, and improved community living for their personal development.

SCHOOL ATTENDANCE

Chairman HAYDEN. As to the future, is it going to be possible for every Indian child that becomes of school age to go to school?

Mr. NASH. In the near future, but not in this year. The money that we are asking now for construction will, we believe, if all our estimates are accurate, bring the school age population seeking education and the school facilities into balance in fiscal year 1966.

We are attempting, if I may say so, to be more conservative in our estimate than in the past because we think there is some hope and optimism that was expressed in those predictions that we do not feel.

The Indian population is increasing very rapidly, and the improved health services are giving babies a chance to live who, in the short space of 6 years, present themselves at school for elementary education, and this is why our very large construction program does not immediately and automatically catch up with our backlog.

NEED FOR MAXIMUM EDUCATION PROGRAMS

Parents who are not aware of the values of education, or who do not themselves have family stability cannot, alone and unaided, bring up children with the personality and character we desire for all Americans. Where stable family life does not exist, a tragic cycle of dependency begins: First, premature dropout from school; next, unemployment because of a lack of vocational skill; third, a new welfare client; fourth, lower morale, and the personal and family disorganization that go with it; fifth, a home environment again unsuitable for the rearing of children.

As long as these realities exist, Mr. Chairman, we have no alternative to the allocation of large portions of our budget to programs designed for maximum education, training, and development opportunities to Indian children during their youth; and to reach out even further to meet the basic needs for counseling and education of adults who themselves lacked opportunity during their youth.

BREAKDOWN OF BUDGET REQUESTS

For these reasons, of our total requested budget of $197.3 million, $82.8 million is for the programs I have just described; plus $50.5 million and $9.6 million, principally for school construction and for the repair and maintenance of unsafe and unsanitary school facilities which are already in existence.

All these items, sir, taken together, represent 72 percent of our total budget, and it is this portion that deals primarily with the existing human potential of all ages. Of this amount, 62 percent of the total budget that we ask is required for the support of programs directly related to the formal education of Indian children.

These are not small problems and the sums are not small. I would point out, as I am sure my predecessors have done before me, that these sums must be spent by some unit of government in accord with our established American principle that every child is entitled to education at public expense, regardless of where he lives, no matter

how remote or how isolated his home; and since education is largely a local matter, it is apparent that the 62 percent of our total budget which is used primarily to support programs for the education of Indian children is in fact a direct assistance to the States, to the school districts, and to the units of local government which would otherwise be obliged to spend these same sums for the same purposes.

Mr. Chairman, education without economic opportunity is a mockery. The present adult Indian population is sorely in need of further development. The reservation children now in government schools, in mission schools, and in public schools will need massive development of the natural resources on their reservations if they are not to live out their lives in poverty and idleness.

Our programs for the long-range improvement of natural resources on the reservation, their management for income-producing purposes, their protection from fire, from drought, and disease, together with the construction and maintenance of roads and irrigation systems, will total $42.1 million if the present request is granted; and, as indicated in the table I cited above, this would be 21.3 percent of our total request.

The other facet of our activity by which we hope to move toward the long-range objectives of the Bureau is a program of economic development. By this we mean the full use of all the resources of a given reservation for maximum productivity.

DEVELOPMENT OF RESERVATION ECONOMIC POTENTIAL

In the West, outside the Indian reservations, the West with which you, sir, have been very closely connected in its development, a hundred years and more have brought together land, people, and capital to make effective contributions to the national welfare and bringing an ever-higher standard of living to the entire area.

In this sense the process on Indian reservations is only beginning, or has never taken place at all, and thus Indian reservations to a large extent remain undeveloped, and in this respect they resemble underdeveloped areas elsewhere in the world.

I am happy to report that there is a growing awareness among Indians themselves of the economic potential in the fuller use by themselves of their own resources. Increasingly, tribal counsels are seeking assistance for tribal enterprise or for credit to aid individual enterprise.

Recreation, tourist attractions, native arts and crafts, land consolidation, and industrial development are the programs that seem especially attractive to them. They are also showing intense interest in housing, particularly in low-rent public housing.

ENCOURAGEMENT TO TRIBAL GROUPS

For the next few years we plan to offer maximum encouragement to the tribes' own interest in economic development. The programs we should should like to emphasize are those of vocational training, of industrial development, of credit, of arts and crafts, of the tourist industry, and housing.

To meet the demands of these programs many of the tribal governments will need to be strengthened with respect to their organization, their constitutions, and their bylaws. Furthermore, research and planning are essential to success in the economic development field

and much counseling and much assistance needs to be given to both individuals and tribal governments.

TRIBAL RESERVATION DEVELOPMENT PROGRAMS

At the focus of the attention of the new division which we are proposing to create will be reservation development programs formulated by the tribes themselves to be implemented by them with our technical assistance. The combined programs of credit, industrial development, tribal affairs, and economic analysis which we are proposing to reconstitute as the Division of Economic Development are estimated at $4 million or 2.1 percent of the total sum we are now seeking.

Of this amount, $2.1 million is new money and the balance is provided for in existing resource programs. The new money will enable the services of credit, of tribal affairs, and business counseling to be supplied directly to the reservations where the need is greatest.

In conclusion, Mr. Chairman, I would like to tell the committee that during the past year as a member of the task force, and later as Commissioner, I have found a Bureau which consists of dedicated technical experts. It has a long and honorable history that goes back before the Republic, itself.

In recent years its morale has suffered because of uncertainties as to the direction its affairs were to take. The goals proposed by the task force are goals the Indian people themselves helped to formulate. In the ensuing months they were very carefully checked out with the Bureau itself. These goals are supported and endorsed by most of the Bureau personnel.

With this new sense of direction and improved morale, it is my belief that the Bureau of Indian Affairs can move ahead with increased efficiency, effectiveness in service, and improved performance in the exercise of its true function: guided acculturation looking toward the integration of Indian communities in the larger society that is America.

That completes my highlight statement, Mr. Chairman.

Chairman HAYDEN. I wish you well in your planning.

Mr. NASH. Thank you, sir.

JOHNSON-O'MALLEY CONTRACTS FOR OFF-RESERVATION SCHOOLS

Chairman HAYDEN. In your Johnson-O'Malley contracts for education of Indian children in off-reservation public schools, who determines the per capita costs which your justifications state are paid? Do you accept the per capita cost figure set forth by the State educational agency?

Mr. NASH. I would like to answer that generally, Mr. Chairman, and then ask our experts here to answer in detail. Our Johnson-O'Malley contracts are not on a per capita basis but are worked out by negotiations in a separate contract with each State, in which the purpose of the Johnson-O'Malley authority, as provided in the act that created it, is to supplement the States' ability to meet their responsibilities for the education of all children, so that in each State there is a different basis and it is negotiated between the States and a representative of our office.

Chairman HAYDEN. No two of them are exactly alike?

Mr. NASH. No, sir.

NON-INDIAN CHILDREN IN INDIAN SCHOOLS

Chairman HAYDEN. Are federally constructed and operated Indian schools on Indian reservations available for the education of non-Indian children, either the children of Government employees, or other children who may be in the area?

Mr. NASH. Here, again, I would like to ask others to reply in detail. We have no policy which requires that these schools only be open to Indian children. Mrs. Thompson, do you care to enlarge on that?

Mrs. THOMPSON. Mr. Chairman, if there is no other school available to the non-Indian children, they may attend a Federal school with a payment of tuition. In some areas, in the Dakotas, for example, the Federal Government and the local public schools operate what is called a merged school; in other words, they consolidate their staff and their funds and operate as one single school, so it is in effect a public school and a Federal school operating as one.

Chairman HAYDEN. Which is the best way to do it?

Mrs. THOMPSON. Well, different States feel differently about it. In the Dakotas by State law they are permitted this kind of an operation. Because of the number of Indian children in the community and the relatively few non-Indian children, they wanted the Federal Government to operate the schools and they would make their share of the contribution in that way.

Chairman HAYDEN. Have the Bureau of Indian Affairs and the State of Arizona agreed on criteria to be applied in determining availability of Johnson-O'Malley funds to Arizona in fiscal year 1963?

Mrs. THOMPSON. Mr. Chairman, we have been working with the State of Arizona, as you know, over a long period of time. We have worked with them to try to get a satisfactory State plan which would be the basis for the contract in Arizona. At this point we feel that we have reached an area of agreement on an interim plan that the State authorities have agreed will operate in their State and we have agreed will operate, and it will be tried out this coming year.

SCHOOL FUNDS FOR ARIZONA

Chairman HAYDEN. What is the amount of funds to be allocated to Arizona?

Mrs. THOMPSON. $2,397,000 are provided for in this budget. Now, of course in all States these funds may be adjusted at contracting time in terms of what the plans require, and the number of children, and the needs, and so on at that time.

Chairman HAYDEN. I ask these questions because there was some issue raised in the State legislature with regard to whether the State was paying more than its share. I suppose that this matter has been considered.

Mrs. THOMPSON. I think, Mr. Chairman, we have an area of agreement now. One of the major problems in Arizona is the high cost districts on Indian reservations, and the only three funds primarily that apply are: the State aids, the 874 funds, and the Bureau fund; and the needs are great in those districts.

There is not the usual procedure in governing budgets; in other words, taxpayer control on the budget, so the problem is to get an understanding of just what is reasonable in terms of school programs

and the related costs in those districts; but I really believe that we have over a period of 3 or 4 years through consultation and negotiations with them come to an area of agreement now that will allow us to go forward. At least I hope so.

CONTRACT AGREEMENT NEAR

Mr. NASH. It was reported to me, Mr. Chairman, that on about the 15th of December our representative who works with the States on the Johnson-O'Malley contracts reported a very favorable and friendly settlement of the issues between the State of Arizona and the Bureau of Indian Affairs.

I was greatly encouraged by that statement. I wanted to be certain that that was entered in the record.

GRADE 9 TEACHING POSITIONS

Chairman HAYDEN. I notice you ask for funds for some grade 9 teaching positions. Would you please explain the need for these funds? What is your present highest grade level for teachers?

Mrs. THOMPSON. Mr. Chairman, our present highest grade level is a grade 7. This grade 9 which is provided for now in the civil service standards will permit those teachers who have reached a level of excellence that is above the average performance of teachers to receive merit pay for that excellence, so that they can stay in the teaching profession, rather than going in some other direction for an increase in salary.

Sometimes teachers are promoted to small administrative jobs and start going the administrative way, when they would rather stay in the teaching field and are much better suited for the teaching field than the administrative field, and this allows some recognition of that kind of teaching performance.

NEW DORMITORIES AT CONCHO, OKLA.

Chairman HAYDEN. You are asking for funds for two new cottage-type dormitories in Oklahoma. Is there a school there now, or is this for additional space?

Mr. NASH. May I address myself to that, Mr. Chairman?

Chairman HAYDEN. Yes.

Mr. NASH. We have been very much distressed over the years by the difference between the dropout rate among Indian children in high schools and the dropout rate generally. Our dropout rate is around 60 percent, as compared with about 40 percent for high school students generally; so we are very anxious to begin a research and study program that would give us some understanding of the causes of this excessive dropout so that we might begin to correct it.

If I understand your question correctly, it relates to the proposed facilities where we will study the question of educational dropouts, high school dropouts.

Chairman HAYDEN. You think the establishment of these cottage-type dormitories will be helpful in that regard?

Mr. NASH. This is the one at Concho, Okla., is it not?

Mrs. THOMPSON. This is the Concho, Okla., school, and these are two cottage-type dormitories that were built just before the war when

the intention was to replace this whole school. The school was never replaced. These dormitories are about a mile from any other installation and they are separate units and for the last 3 or 4 years they have been vacant.

We will merely reactivate those two dormitories and use them for this purpose.

TEACHER ORIENTATION AND INSERVICE TRAINING

Chairman HAYDEN. What will be your program if you receive the funds you are asking for orientation and inservice training for teachers?

Mr. NASH. Mrs. Thompson?

Mrs. THOMPSON. Our teacher turnover, Mr. Chairman, is higher than the average teacher turnover in the country. I think that is understandable because many of our teachers have never dealt with the problem of teaching bilingual children before they meet the children.

Chairman HAYDEN. Also they are in out-of-way places.

Mrs. THOMPSON. And isolation is also a factor. We have carried on locally limited orientation that we feel has really paid off. This will provide us with an opportunity to give orientation for all new teachers who come in and in that group we will find some, say, within 2 weeks' time, we know will have the security and confidence with which under supervision they can go on to the job.

There will be others who perhaps we will have to work with longer in order to develop the understanding of the cultural differences that they will have to deal with and the language problem, so this would permit us to provide for 240 teachers on an average of a month's orientation.

Some will be shorter, some will be longer. However, the average cost would be a little bit over $400 a teacher, and it costs us more than that to recruit and bring teachers in, so if we can reduce teacher turnover, it will pay off in the long run.

GRANTS FOR HIGHER EDUCATION

Chairman HAYDEN. There is a question with regard to the money that is available for grants for higher education. Is it being used to advantage?

Mrs. THOMPSON. Your question is: Is it being used to advantage?

Chairman HAYDEN. Yes.

Mrs. THOMPSON. Very much so, Mr. Chairman.

Chairman HAYDEN. Will you be able to use all you are asking for?

Mrs. THOMPSON. Yes. We are getting a larger number of high school graduates and I think in some of the testimony in prior years we have said that the time would come when we would have more Indian youngsters completing high school and therefore we would have more need for higher education funds.

We are reaching that time and it is going to increase as years go on. This amount that is in here is not all of the funds that go into higher education. The tribes themselves contribute, organizations, and some of the States have State scholarship programs, so the total in all is $1,237,000 that is now going into higher education.

My feeling is by 1970 that perhaps that total ought to be tripled or quadrupled. This will increase our share in that, but even so the Federal share is not nearly the amount that goes into higher education.

TRIBAL CONTRIBUTIONS

Chairman HAYDEN. Who puts up the most? The Federal Government, or the tribes and others?

Mrs. THOMPSON. The tribes themselves. They put up about $750,000.

Mr. NASH. May I comment on that, Mr. Chairman?

Chairman HAYDEN. Yes.

Mr. NASH. Of the $1,200,000 that went into aid for higher education for Indian children last year, the tribes put in more than half again as much as the Federal Government; so that there is actually more Indian money in higher education for Indians than there is Federal money.

OTHER CONTRIBUTIONS

In addition to that, colleges and universities put up some. The churches and foundations put up nearly 25 percent as much as the entire Federal Government. The States put up a very substantial amount themselves, so that the total effort that is going into the higher education of Indian youngsters is very big and the Federal Government's portion of it is only about one-third.

Mrs. THOMPSON. I think this is an interesting fact, too, Mr. Chairman. I was really surprised when we made a study of the dropout of Indian students from colleges to find that it averages only 13 percent per year. I thought it would be higher than 13 percent, because we consider our dropouts in colleges and our dropouts in high school too great, but I do not know what the national average is.

Chairman HAYDEN. I was going to ask what is the national average of dropouts.

Mrs. THOMPSON. I do not know that figure, Mr. Chairman. I will do some investigating.

Chairman HAYDEN. If it is obtainable, I wish you would put it in the record.

Mrs. THOMPSON. I will try to find out.

(The information referred to follows:)

COLLEGE DROPOUTS

Comparable figures are not available. In 1960–61, 13 percent of the Indian college students receiving Bureau grants dropped out during the school year. According to information received informally from the Department of Health, Education, and Welfare, Office of Education, over a period of years approximately 60 percent of the students who enrolled in college graduated; 40 percent dropped out.

SITUATION IN ADULT EDUCATION

Chairman HAYDEN. What is the situation on adult education? I do not mean vocational training, but education for the parents of youngsters now in school, those people who will be remaining on the reservation? Are you doing as much as you should to aid them in this line?

Mr. NASH. Mr. Chairman, we are rather far behind in our program of adult education, because it is one that started rather late. The

older people, who did not have the advantage of formal schooling in their youth, need language training, training in the responsibilities of citizenship. They are now turning more than they used to to the Bureau for help and our present level of adult education activity and the additional activity that we would be able to engage in if we received these 32 additional positions for adult education teachers, would exactly meet the demand for adult education services which is coming from the Indians themselves.

It would seem to me it is important not to get too far out in front of the Indians because then you have a program that they do not really seek, but we are keeping up to what they want to do.

Senator MUNDT. Mr. Chairman, are you talking about adult vocational education?

Chairman HAYDEN. Do you have any questions?

Senator MUNDT. Are you talking about vocational education in that question?

Chairman HAYDEN. No, I was asking a question about adult education.

Senator MUNDT. I have a couple of questions.

Chairman HAYDEN. Go ahead.

VOCATIONAL EDUCATION FOR ADULTS

Senator MUNDT. Mr. Nash, following up that vocational education program for adults, you are requesting $5½ million which is $2 million below the authorized maximum for the program. In my area of the country certainly there has been a great demand for this program which is very popular, and I would be interested in knowing why you have not requested the full amount authorized?

Do you feel that what you have requested will supply all the demand for all the reservations for this kind of program?

Mr. NASH. Let me say, Senator, that my response to the chairman's question related to the adult classroom, not to the adult vocational. Responding to your question, sir, this is the amount for on-the-job training, for the institutional vocational training of eligible adults, that we and the Bureau of the Budget together think can reasonably be absorbed by our organization in the forthcoming 12 months.

The Congress, as you know better than I, authorized an additional amount and made a supplemental appropriation last spring with which we were able to expand our program in time to take advantage of the Wright-McGill interest at Pine Ridge. We are very happy about that. We hope that you are.

Senator MUNDT. It worked out very well, and based on my observation of what happened there and what is developing at McLaughlin factory, I just wanted to be sure that we had adequate funds to meet the needs of the trainees in those areas and also on other reservations with similar opportunities.

I would hate to see this program curtailed by lack of funds. If you have money to meet the needs, fine; but I just wanted to be sure you have the funds.

DEMAND FOR VOCATIONAL TRAINING

Mr. NASH. This is a conservative estimate of what we think we can handle. It is a very popular program. There is a very big back-

log of demand on it. I can assure you that we will find a way to make a wise use of whatever moneys the Congress sees fit to give us.

Senator MUNDT. If I understand, if we use the language the same way, when you say there is a backlog of demand, that would indicate to me that you are not going to have enough money to meet the demand. That is the way I use the phrase. Maybe you use it differently.

AMOUNT OF BACKLOG OF DEMAND

Mr. NASH. This is correct, sir. There will still be unmet demands. The Assistant Commissioner who handles this matter is here today and with your permission I would like to ask her to tell us what the backlog is.

Senator MUNDT. I would like to have it.

Mr. NASH. Would you answer them, please, Miss Gifford?

Miss GIFFORD. I do not know what the present backlog is, Senator Mundt. We got the supplemental and we have started putting as many of them as possible into training. I can give you for the record what the backlog is at the moment, but I do not have the figure in my mind.

Senator MUNDT. Yes; put it in the record.

(The information referred to follows:)

Exact information on the backlog of applicants for adult vocational training under Public Law 959 is not available. Approximately 1 year ago, there was an estimated backlog of 3,450 eligible applicants who would enroll for this training if the opportunity were provided. The supplemental appropriation of $750,000 during fiscal year 1962 enabled us to enroll approximately 400 applicants into institutional and on-the-job training. We now have on hand approximately 500 completed applications for institutional training. Each of these applicants will receive an average of approximately 11 months of training. In addition, at each location where industrial plants provide on-the-job training, there are more applicants for this type of employment than there are jobs available. The total backlog is effected by the several hundred persons who become eligible for this service each year, upon reaching their 18th birthday.

In this program we make every effort to adjust the number of training opportunities and the staff assigned at each training location to fit the number of employment opportunities available upon completion of training. Therefore, although we estimate that there is a backlog of at least 2,500 potential applicants for institutional and on-the-job training, we recommend a gradual increase in this program, resulting in more effective service and less administrative cost.

SUPPORT FOR PROGRAM

Senator MUNDT. I know the chairman is very much interested in this. He has been a knight on the white horse charging down the road to get this program in pretty good shape, and if there is a backlog, old age creeps up on these people before they get trained. If you are ever going to utilize it for specific Indians you have to do it at the time you are still able to utilize their talent.

It is a little different from building quarters for teachers, or new office buildings, or something of that type, because you are dealing with human beings here who get older every year and you lose the opportunity forever if it is not implemented at the right time.

CONTRIBUTION TO TRAINEES' WAGES

Under this phase of the program, and, Mr. Nash, if you have somebody else to answer just tell me, what are the minimum and the

maximum periods for which you contribute to the payment of the trainees' wages?

Mr. NASH. Senator, this is worked out on the basis of an individual contract with each manufacturer who decides to relocate a plant on a reservation. We have no fixed amount. It is negotiated with him in terms of the usual practice in the industry and the capability of the Indians to start with their experience in wage work.

Senator MUNDT. In terms of your plan then, you are fluid enough to adjust it to the need of the particular kind of training; is that right?

Mr. NASH. Yes, sir; very much.

TRAINEE OPPORTUNITY IN PRINTING

Senator MUNDT. The reason I raise that question is this: We have discovered rather recently out in South Dakota a genuine new opportunity for Indians to do on-the-job training; and it is a problem which I am sure exists in other areas, and that is with our weekly newspapers, many of which are having quite a struggle to keep going these days.

Among their problems is an inability to get available printers, and linotype operators, and folks who can work in the back end of a weekly newspaper plant.

The fellow who is pretty well trained and knows the job likes to go to the bigger cities. Small newspapers will sometimes train a printer, get him well equipped, and off he goes. Several of them have tried, at my suggestion, taking on some Indian trainees and giving them an opportunity to learn the printing trade on the job in the back end of a newspaper plant.

It has worked out rather successfully. The problem is that it takes a little time to train somebody to be the kind of a roustabout printer that you have to be in the back end of a country newspaper shop.

My question is: Would it be possible to provide a wage contribution for a period of 18 to 24 months for this type of on-the-job training because it takes about that long if you find a good prospect to really equip him so he becomes worth a legitimate pay scale.

Mr. NASH. Yes, sir. Certainly the trades to which we are already contributing on-the-job training run as high as 24 months. This is not the average, but I know that there are some that long.

Senator MUNDT. Question number two: Would you look with favor upon this kind of an experiment out in South Dakota and are you asking for enough funds so that if a printer finds an Indian you can sign the paycheck?

Mr. NASH. Yes, sir. This is not to say that we will not happily apply funds over the amount that we are seeking if the Senate and the House together should see fit to give them to us.

Senator MUNDT. I have some other questions, Mr. Chairman, but you finish yours and I will come back to mine. I just wanted to get this one in on vocational training because it fit in with this line of questioning.

Chairman HAYDEN. Any questions, Senator Dworshak?

Senator DWORSHAK. Has Mr. Nash completed his statement?

Chairman HAYDEN. He was just talking about Indian education and I have other subjects I want to ask him about.

Senator DWORSHAK. Yes, Mr. Chairman. I regret I only have four meetings this morning and I cannot participate as much as I would like to in this hearing.

COST OF INDIAN PROGRAM

Mr. Nash, you recall that I have been quite a severe critic of the Indian Bureau, but I must admit that you are making good progress. You are only asking for about a $35 million increase in your budget this year, are you not?

Mr. NASH. Yes, sir.

Senator DWORSHAK. That brings it to a point where it will average about $700 per capita for every Indian man, woman, and child on the reservations?

Mr. NASH. Including the Health, Education, and Welfare appropriation.

Senator DWORSHAK. Yes, I am including that. What are the two figures? What is the Bureau figure and then give me the other one separately.

Mr. NASH. The Bureau total is $197.3 million.

Senator DWORSHAK. What is the other one on health?

Mr. NASH. The Public Health figure is $64.6 million.

Senator DWORSHAK. This is about $262 million total?

Mr. NASH. Yes, sir.

Senator DWORSHAK. I am not going to be too critical. Maybe you have some laudable objectives. I have just been reading your statement where you say that each new Commissioner outlines objectives, and yours happen to be:

(1) Maximum Indian economic self-sufficiency.
(2) Full participation of Indians in American life.
(3) Equal citizenship privileges and responsibilities for Indians.

Now, no one can quarrel with those objectives. They are very desirable and probably if you can attain those you will achieve a record which has not been achieved in a century and a half of operations of the Bureau of Indian Affairs; but I am a little disturbed by one thing.

INDIAN CHILDREN IN PUBLIC SCHOOLS

You may be a specialist with your staff, and I do concede that you have been living with these problems, but I understood during the past decade, or even more, that the primary objective was to close down reservation schools and to do one thing which everybody would recognize as being very essential in developing self-sufficiency of our Indians, and that is to make it possible for the Indian children to attend our American public schools, to rub elbows with the students, and to feel that they are on an equal basis with the white children.

It would seem that for some reason or other the trend has been reversed. Has it?

Mr. NASH. No, sir.

Senator DWORSHAK. It has not?

Mr. NASH. No, sir.

USE OF REQUESTED FUNDS

Senator DWORSHAK. Then what are you doing with all this additional money for education?

Mr. NASH. This is for the construction of schools in areas, Senator, which are so remote and isolated that there are no public school districts. In fact, up to now there have been no school facilities of any kind in many of these areas so that in these isolated portions of the Navajo Reservation and of Alaska, which is what this money is largely for, we are building schools in places where you cannot talk about a public school district, or talk about going to school with non-Indian children because there are only Indian children in the neighborhood.

One of these schools on the Navajo Reservation is over a hundred miles from a railroad. Others that we are building in Alaska are so far north of the Arctic Circle that the teacher team, the husband and wife team, that go up there have to be supplied with all their personal needs and all their school needs by ship once a year.

Chairman HAYDEN. Might I remark that the Navajo Reservation is a little bit larger than the whole State of West Virginia.

Senator DWORSHAK. Does it have as many problems? Well, I know, Mr. Chairman, that I am a lone voice in the wilderness on this. I have been frustrated and disillusioned because I observe, at least in my own State, the Indians are in worse condition now than they ever were.

FORT HALL INDIAN RESERVATION

Yesterday, I called to the attention of Secretary Udall that on the Fort Hall Indian Reservation—I do not know whether you ever visited it—with a population of not over 2,500 Indians, 1,900 of them are lining up once a week to receive surplus food commodities. They cannot go to school because these Indians have not had enough to provide clothing for the Indian children so they can attend schools.

The Bureau closed down, 20 years ago, a school on the reservation. I am not going to belabor this point, but it seems to me the more money we appropriate the worse the plight of the Indians gets; and the increase that you are asking for this year is almost as large as the entire budget of the Bureau in 1948. Think of that, an increase in 1 year.

I know that you have good ideas and programs and I am going to watch them with keen interest and I am going to check carefully. If you and I are around here for 3 years, at least during this administration, I can assure you that I am going to turn the spotlight on what you are doing down there; not because I have any desire to be severe with you or with your staff, because I carried on this same campaign of criticism throughout the 8 years of the Eisenhower administration.

The more money and the more employees we give to the Bureau of Indian Affairs, the worse becomes the plight of our American Indians. I do not think anybody can deny that, and I think that we do a great disservice to our Indian population and that actually we are not making any progress in qualifying them to assume the full responsibilities of American citizenship.

EXTENT OF CONGRESSIONAL HELP

If you can deny that by what you accomplish during your term, I will be happy; but the record has been that, and I am fearful that we are continuing to go in that same direction. People throughout my State, and throughout the country, are critical. They say Con-

gress is parsimonious; we do not provide the funds; we are neglecting the American Indian.

They do not know that we are appropriating this current year $650 per capita for our Indians. Think of that. That would mean that an average family of five—mother, father, and three children—would get over $3,000. If they did that they would be better off than lining up to receive these surplus commodities.

I know that in Idaho, with the exception of the Nez Perce Indian Reservation in North Idaho, it is a pitiful and tragic situation that we find the Indians in.

One of the Assistant Secretaries, John Carver, is from Idaho, and I think he is trying to give personal attention to the Indian situation and the problems out there; but again I say that I am going to be extremely critical of what is done, hoping that you will get out of the groove that has been followed for probably a century whereby the plight of the Indian is becoming more tragic with the passing of the years.

That is not dealing with details in your program. You will probably come up with this money. Next year you will come in and ask for $20 or $25 million more. Ten years from now, whoever is here holding your job—maybe you will have it, I do not know—will come in here and ask for more millions.

We will probably be giving the Indians about $300 or $350 million a year, and the Indians will be less qualified to assume their responsibilities as American citizens. That is my appeal to you.

Mr. NASH. We welcome the spotlight that you place on us, sir, and we hope to stand up under it.

Senator DWORSHAK. Thank you, Mr. Chairman.

Senator MUNDT. I have more questions on education.

Chairman HAYDEN. Go ahead.

FUNDS FOR NEW QUARTERS

Senator MUNDT. I notice $5,218,000 is suggested or recommended for five new school construction projects in New Mexico alone; and each of these projects includes new quarters for employees.

I am a lot more interested in providing schools for Indian children than I am quarters for employees. Would you provide a cost estimate for these employee quarters with a breakdown to reflect the per unit cost?

Mr. NASH. Yes, sir. I cannot do that myself at the moment. We will provide it for the record. These are, of course, isolated locations.

(The information referred to follows:)

Following is the breakdown of estimated cost per housing unit for the various sizes of quarters to be provided at the five New Mexico locations. Unit costs include construction of the building, utilities, site work and design work.

Quarters sizes

	3 bedroom	2 bedroom	1 bedroom
Crownpoint	$19,319	$16,798	$10,428
Crystal	19,672	17,151	11,160
Lake Valley	19,622	17,101	10,731
Tohatchi	19,571	17,050	10,680
White Horse	19,622	17,101	10,731

Total cost of quarters

Crownpoint	$599,982
Crystal	186,763
Lake Valley	187,295
Tohatchi	507,842
White Horse	224,018

NEED FOR HELP TO INDIANS

Senator MUNDT. I know that, but in line with what Senator Dworshak has pointed out, we have to direct a greater percentage, it seems to me, of our expenditures actually to assisting Indians, or helping them. I do not quarrel with Mrs. Thompson when she wants to have some intraining programs for teachers. Maybe that is necessary. Maybe that is good.

However, you are still not helping Indians. That is why I am so interested in stepping up this vocational training program for adult Indians. You let the backlog continue there; but you worry more about the backlog that involves employees' quarters, and helping Indian employees to be better Indian employees, and better teachers, all of which may have merit, but the big, immediate job is to help Indians.

It always is a source of great embarrassment for me when I go to these Indian reservations, I guess I can say without exception, I have gone to most of the Indian reservations in this country—I cannot think of anyplace I have left where I have not felt embarrassed by a comparison of the quarters in which the employees live as compared with the miserable housing in which the Indians live.

We get farther apart. I can assure you that the disparity between the conditions in which Indians live and the conditions in which the employees live each year. I want to see the Indian employees live well and have good quarters, since it is in an isolated spot; but we do not seem to bring the Indians along with us. We are putting the white man farther out ahead of him all the time.

There is a lot of validity to what Senator Dworshak says. For a century we have wrestled with the problem and I cannot see that it is much closer to solution now than when we started. You have some good programs. You have this vocational training which I think is of tremendous importance.

These little economic units that you mentioned at Pine Ridge are certainly a great step forward. You have a program which I think was a tremendous leap forward when you had this off-reservation placement and training program, because in the ultimate we are going to have to get rid of the concentration-camp concept of taking care of Indians; and the reservation gets pretty close to a concentration camp in many aspects.

NEED FOR NEW IDEAS

We are a nation dedicated to integration of every race, color, and creed except Indians, and there we seem to accept segregation as the rule, which certainly is improper, so we have to do some creative thinking and I am hopeful with your background of experience and your wisdom that you will do it.

I made a personal plea both to Secretary Seaton, whom I knew as a former colleague, and Secretary Udall, whom I knew as a former

colleague, and tried to get a gleam in their eye to do something about the Indian. Their eyes quivered a bit, but I did not get any gleam, and certainly no result.

I do not believe this is an impossible problem to solve. After a hundred years if we cannot make better progress I think we should admit it is a shameful record and a terrible record for a hundred years and that includes Republicans, Democrats, and anybody else who may have been in charge.

Everybody has tried, but he has been so busy keeping the old programs going he has not had time to think of anything new; so I do get concerned when I see all this money proposed in New Mexico, for example, and it happens elsewhere, for employee quarters.

NAVAJO EMERGENCY PROGRAM

Take the one at the Crystal School. You have a facility scheduled for the Crystal School, and this is to supplement a dormitory facility built in 1954 as part of the Navajo emergency education program. Can you refresh my memory on this program from the standpoint of providing for the record a general description of the Navajo emergency education program and an itemized schedule of the expenditures made under this program in New Mexico for construction and other major aspects of the program; and how much was for dormitories, how much for schools, and how much for employees' housing?

Mr. NASH. Yes, sir; we will put that in the record.

(The information referred to follows:)

The Navajo emergency education program (NEEP) was designed to provide educational opportunities on a "crash" basis for out-of-school Navajo children. The program consisted of (1) the construction of new minimum-type school facilities and the remodeling and rehabilitation of existing school plants on the reservation, (2) installation of trailer-type schools at 36 locations on the reservation, (3) construction of dormitory buildings and dining halls at border town locations to permit enrollment in public schools, (4) enrollment of additional overage children in off-reservation boarding schools, and (5) construction of public schools on the reservation under Public Law 815.

In New Mexico this Bureau made a total expenditure of $1,363,884 for constructing and equipping new schools, trailer schools, and border town dormitories under the NEEP. The breakdown of this total expenditure is as follows:

Dormitories	$432, 790
Schools	171, 932
Housing	309, 649
Utilities and site work	336, 970
Furniture and equipment	112, 543
Total	1, 363, 884

HIGHER EDUCATION FOR NAVAJOS

Senator MUNDT. How are we doing with our higher education program there, Mrs. Thompson?

Mrs. THOMPSON. We feel, Senator, that we are doing quite well. As I think we testified before, the time would come when we would need additional funds for higher education, and we are requesting those additional funds.

Senator MUNDT. How much additional?

Mrs. THOMPSON. $400,000.

Senator MUNDT. Which would make a total of how much?

Mrs. THOMPSON. $650,000.

Senator MUNDT. Is that a revolving fund? Is that a grant, or scholarship loan, or what?

Mrs. THOMPSON. Those are for grants, Senator Mundt, and this will permit an increase in the number of grants and an increase in the average grant because, as we all know, college costs have increased rather rapidly; so this will permit an increase in the grant which is needed at this time.

Senator MUNDT. Will the $600,000 be enough to do the job, to meet the requests?

Mrs. THOMPSON. We feel at this time that this will allow us to meet the need for this coming year. We are keeping a very careful check on this. The number enrolled in college has doubled in the last 4 or 5 years. I think that is going to accelerate even at a greater rate in the next 4 or 5 years, and so we are watching and projecting it year by year so that we keep up with the needs.

Senator MUNDT. That is very good because money invested there is money invested in decreasing the size of the Indian problem.

WORK AT FLANDREAU SCHOOL

I ran into a situation I did not know existed when I went over to the Flandreau Indian school to see how the new construction program was coming and to meet the new superintendent who had been installed there. During my visit, we got to talking about education, and a new problem was brought to my attention.

I do not know whether this $600,000 can help in this area, or whether there is any money anywhere, but he said, "This is quite a problem, and it involves primarily children from broken homes." Many times children from broken homes are brought to the school. A lot of them do not get much parental support.

I said, "How is the program getting along?" He said, "Fine. We can provide them with education and housing but there is one weakness I do not know how to overcome." He said, "Many of these kids just do not have any spending money at all. They do not have 50 cents in their pocket to go downtown to buy a Coca Cola or, if they have a girl, to take her to the movies. They just do not have any money. We try to get them little jobs to help out with that, but we cannot do it."

He has organized, I think among the employees, which is wonderful if that is correct, a kind of little fund that they contribute to at Christmas time. I think he said it was for exchanging Christmas cards, or some fund made available to such children.

Have you heard of that problem before? Is that a unique problem there?

NEED FOR FUNDS FOR CONTINGENT PUPIL EXPENSES

Mrs. THOMPSON. No, Senator; that is not a unique problem at Flandreau. That is a problem in most of our schools. We are starting one program which we feel will help the youngsters to meet this problem and that is during the summertime we are, in cooperation with the plant management people, providing at our Indian schools work programs for the young people. They are employed during the summer and then they are counseled on how to conserve their cash that they earn during the summer so that they can buy some of their clothing and they can have some of this for spending money.

We feel in the programs that we have carried out in the last year or two that this has helped a great deal with that particular problem. In some of the schools they are fortunate to be nearer a larger town where they can help the youngsters get Saturday employment and that has helped.

STUDENT EARNINGS

For example, in our Phoenix school, I cannot quote the amount off-hand, but I think it is somewhere in the neighborhood of $30,000 or $40,000, that the youngsters in the Phoenix school earn on Saturdays through Saturday employment.

Senator MUNDT. Very good.

Mrs. THOMPSON. So each school is trying to meet the problem, some of them in different ways, in terms of the resources they have.

Senator MUNDT. I am glad to hear of that. I did not have any solution to it. I think, instead of handing out charity, you ought to give them a chance to earn money and maintain their self respect.

REHABILITATION OF FLANDREAU SCHOOL

Speaking of Flandreau, what is the next step toward the construction and rehabilitation of the school system there?

Mr. ALLEN. We have the school building in this present request.

Senator MUNDT. Will that be the classroom building?

Mr. ALLEN. That is correct.

Senator MUNDT. And your second dormitory will be finished very soon?

Mr. ALLEN. That is correct. They expect to have the dormitories finished in June. The school building is being planned at the present time under our advance planning money. We hope to get the school completed by July 1963.

Senator MUNDT. That is in this budget?

Mr. ALLEN. That is correct.

Senator MUNDT. Thank you, Mr. Chairman.

Chairman HAYDEN. Senator Young?

SUMMER PROGRAM

Mr. MASSEY. Mrs. Thompson, the summer program will fit into Senator Mundt's question here. You might like to tell about the summer program and how that also will help the children in obtaining some funds on their trips.

Senator MUNDT. I would like to hear it.

Mrs. THOMPSON. We are requesting, Senator Mundt, in this budget $700,000 for summer programs.

Senator MUNDT. Is this a new program now?

Mrs. THOMPSON. On a limited basis we have tried it out. For example, at Flandreau we had one of these work programs last summer on a very limited scale because of the limited resources we had. At Wahpeton, I think Senator Young will recall that they had a summer program there for those elementary children where they broadened their experiences by getting them out away from the school and letting them see some of the things that they had never seen before, which brought meaning back into their schoolwork the next year.

So we are requesting in this budget the amount of $700,000 which will permit us to carry on jointly with other branches, like plant management and forestry, and with Indian tribes, work programs for the youngsters to earn money; academic programs in certain places where the youngsters want to make up schoolwork, or they want to get ahead in their schoolwork; and programs to provide them with experiences similar to the Wahpeton experiment where they get out and see things that they have never seen before. In other words, enlarging their background of experience.

WAHPETON EXPERIMENT

Senator MUNDT. You and Mr. Young know all about that Wahpeton experiment. The rest of us know nothing. Will you tell us something about it; either one of you?

Senator YOUNG. I would be glad to say a few words about it. When I visited the school, and I believe it was 2 years ago, the students presented me with an album that cost them quite a few dollars that they paid for on the meager earnings of their own.

In this were pictures of these trips that they had taken to various places; I think it was a wonderful program. In fact, this is one of the finest schools that you can find anywhere and it is in a city that welcomes these Indian children. These are children coming from broken homes or, as you say, no homes at all.

I think this is one of the ideal programs that we have for the Indians. It is one of the great hopes of doing something for them. I think you could tell more about this program than I.

TYPE OF WORK DONE BY STUDENTS

Senator MUNDT. I still have not found out what they do to earn their money. That is what I want to find out.

Mrs. THOMPSON. These were smaller children and in that place, in Wahpeton, some of the employees give the children work after school hours, and on Saturdays, and so on, so that they earn a little cash. Of course, Senator Young, most of that they made themselves. They had to buy the materials, the book and so on. They put that together with the help of their teachers.

Senator Mundt, the program was that the teachers and the counsellors permitted these children to take trips during the summer and they went with them. They took short trips and they took one that was rather long, so that they got a glimpse of, for example, the mining industry.

They stayed in good motels, they ate in good average restaurants, and they had the experiences that the normal American child would get just in living with his family. While they were on that trip they wrote several of us in the Bureau post cards all the way along the trip, and they have been writing and talking about that trip all year long.

That is why I say the summer experience brings a great deal of meaning to their schoolwork; which before was just perhaps reading so many words.

Senator MUNDT. In other words, the whole $700,000 would be devoted to that type of activity?

EMPHASIS ON SUMMER PROGRAM

Mrs. THOMPSON. No, Senator Mundt. We are placing emphasis on the work-type programs which will allow the children to earn money and the academic programs which will accelerate their schooling or allow them to make up work; but the Wahpeton children must stay at that school all year long. They are elementary children and this is a situation a little bit different from other schools.

Senator MUNDT. Would the $700,000 fund be flexible enough, for example, so that if at Wahpeton—you talk about a school not quite as high up in the echelon as Flandreau for the moment—there would be a need to do some work on the campus of the school, reap grass, or something like that. They could pay the Indian for that and use the part of the $700,000 for that, too, so that they could develop bank accounts of their own?

Mrs. THOMPSON. That is the purpose of the work program, Senator Mundt, and jointly with the branch of plant management, which must maintain these campuses, and the buildings, and so on. They hire the children and we provide the care, and we develop a joint program so the youngster can earn some money. Education provides the care and counselling, so that is the purpose of it.

Senator MUNDT. It sounds like a very constructive program.

Mrs. THOMPSON. Thank you.

Senator YOUNG. Mr. Chairman, may I ask a question?

Chairman HAYDEN. Certainly.

NEED FOR WAHPETON DORMITORIES

Senator YOUNG. We completed a new school at Wahpeton and now we badly need to have new dormitories. Do I understand there is $793,000 in the budget for the two dormitories at Wahpeton?

Mrs. THOMPSON. Yes, the Wahpeton dormitories are in the budget.

Senator YOUNG. I noticed a story in the North Dakota papers last week indicating that the contract would be let for dormitories in April at a cost of over $500,000.

Mr. NASH. Mr. Allen, would you comment on the status of those Wahpeton contracts?

Mr. ALLEN. The building is being designed now and we plan to request bids in the spring when the weather breaks, so they can start construction soon after July 1. I did not see the article, but of course the total amount appropriated includes all costs, including equipment, supervision, and things like that.

The figure you have apparently just related to the cost of the buildings.

Senator YOUNG. And the money that would be used for that is out of existing construction funds?

Mr. ALLEN. No; we are designing it under our advance planning authority and the money for the construction is in this appropriation pending here.

TIME SCHEDULE ON WAHPETON WORK

Senator YOUNG. How can you award the contract before you get the money, though?

Mr. ALLEN. We will not award the contract until the money is available. We will have the plans ready and have the bids in and

will be ready to award the contract as soon as the money is appropriated after July 1.

Senator YOUNG. The Superintendent told the press out there they were awarding the contract in April. I was wondering how you were going to do that.

Mr. NASH. Is this the architectural engineering contract?

Mr. ALLEN. No; the architectural engineering contract has been awarded and the planning work is underway. They are talking apparently about the construction contract; but I do not know where they got the information.

Senator MUNDT. Will you yield?

Senator YOUNG. Yes.

LIST OF FUTURE PROJECTS

Senator MUNDT. In the budget I think $500,000 has been requested for advance planning of future projects. Would you provide for the record a listing of the future projects which are presently under consideration?

Mr. ALLEN. Yes.

Mr. NASH. Yes, sir.

(The information referred to follows:)

Following is the tentative advance planning program for fiscal year 1963.

Rosebud (Mission) School, South Dakota.
Lower Brule School, South Dakota.
Pierre School facilities, South Dakota.
Haskell Institute vocational shops, Kansas.
Chilocco School, dormitories, Oklahoma.
Fort Peck office, Montana.
Twin Lakes School, Arizona.
Baca School, New Mexico.
Coyote Canyon School, Arizona.
Aneth School, Utah.
Chilchinbeto School, Arizona.
Sanostee School facilities, New Mexico.
Phoenix School, kitchen and dining hall, Arizona.
Sherman Institute, School, California.

Senator MUNDT. Thank you.

FACILITIES AT BELCOURT

Senator YOUNG. I understand there is $553,000 for additional facilities at Belcourt; is that correct? If so, what facilities?

Mr. NASH. That is correct, and, Mr. Allen, do you want to speak on exactly what is proposed there?

Mr. ALLEN. This will finish up the program. As you know, in 1960 fiscal year, the money was provided for the new school building. In 1961 we had money provided for quarters, office building, and remodeling of the old school building. This present request for funds includes construction of 18 houses for employees, garages, a fire station, improvements to the streets, and a new athletic field for the school.

Senator YOUNG. This is the present program initiated about 3 years ago?

Mr. ALLEN. Correct.

Senator YOUNG. Then you have $915,000 for an elementary school, at Ft. Yates, is that correct?

Mr. ALLEN. Correct.

Senator YOUNG. When do you expect the contract can be awarded for this?

Mr. ALLEN. It will probably be sometime after July. The plans are being prepared at the present time.

MANDAREE PROJECT

Senator YOUNG. You have $495,000 for expansion of the school at Mandaree?

Mr. ALLEN. Yes; we haven't started the plans on that project at the present time. We expect to get started on it soon. In fact we have requested the General Services Administration for authority to go ahead and negotiate a contract for the architectural and engineering services. We will probably get started in about 30 days.

Senator YOUNG. The plans would have to be completed? We have not done any work on the plans?

Mr. ALLEN. That is right.

Senator YOUNG. Has any architectural work been done?

Mr. ALLEN. It has not been done on Mandaree. We have not started.

Senator YOUNG. When do you expect to start work?

Mr. ALLEN. In about 30 days.

Senator YOUNG. And when will you make the award of the contract for construction?

Mr. ALLEN. Probably August.

Senator YOUNG. You are moving fast.

Mr. ALLEN. Very fast on this program, primarily because of advance planning money. We have about 15 projects in advance planning and as soon as the money is appropriated we will be ready to start construction on most of them. This will give us a jump on the program rather than having to wait until after July 1, when the money for construction is appropriated. We can proceed with the construction rather than start the planning.

Senator YOUNG. $493,000 is $150,000 or $200,000 less than the amount that was considered a year ago, is that right?

Mr. ALLEN. I do not recall what the figure was last year.

Mr. NASH. My note indicates $650,000.

HARD SURFACING RESERVATION ROAD

Senator YOUNG. One other small project, but a very important one, is with respect to the hard surface road on the Ft. Totten reservation to the St. Michael Mission. I understand this road is not hard surface. It should be. It is traveled a lot especially by the mission school bus.

Mr. NASH. Senator, I am going to ask the Chief of our Road Branch to reply in detail to that question. Mr. Trier.

Mr. TRIER. This project is included in the 1963 program for the Fort Totten Agency. It is project 9, 3 miles of grading and aggregate surfacing to cost $36,000.

CEDAR CREEK ROAD, LOWER BRULE

Senator MUNDT. Mr. Chairman, while we have the Chief of the Road Branch, I have a couple of questions. This is just a question for information. In the Bureau's explanation of proposed construc-

tion at Cedar Creek Road located on Lower Brule Reservation I note that the western segment of this project, 7 7/10 miles, is the subject of negotiation between the Bureau and the Corps of Engineers and it is stated in this little justification sheet that this lies within taking the area of the Big Bend project. Since the Lower Brule Reservation sits on the west side of the Missouri River, I wonder if it is not a mistake and if it is not the eastern portion rather than the western portion of the Cedar Creek Road which is involved in the Big Bend project.

Mr. TRIER. No; the statement is correct.

Senator MUNDT. To what do you credit this?

Mr. TRIER. The end of the road, as it leaves Brule, climbs up on a bench. It stays up and then it drops down into Medicine Creek Valley and the Medicine Valley becomes part of the taking area.

Senator MUNDT. All right. I just did not want to get something written into the law which does not make sense. I see the topography runs that way.

Mr. TRIER. Yes.

NAVAJO-HOPI ROADS 1 AND 3

Senator MUNDT. As I recall, you requested $4 million for the Navajo-Hopi Roads 1 and 3. Will these funds complete the construction of those two routes?

Mr. TRIER. Yes.

Senator MUNDT. Will you provide for the record the total cost of the two roads?

Mr. TRIER. Yes, we will.

(The information referred to follows:)

Route 1 is 183.4 miles long; 149.8 miles have been completed or are under contract at a cost of $12,451,000. The remaining 33.6 miles are covered in the 1963 program to cost $1,525,000. This will complete the entire project.

Route 3 is 163.5 miles long; 96.7 miles have been constructed or are under contract at a cost of $3,549,000. The remaining 66.8 miles are programed for construction for fiscal year 1963 at a cost of $2,475,000. This will complete the entire project. The total cost for both routes has been estimated at $20 million.

AUTHORIZATION FOR FUNDS

Senator MUNDT. Are they special road fund allocations or authorized under the Navajo-Hopi rehabilitation program?

Mr. TRIER. These funds were authorized under an amendment to the Navajo-Hopi Rehabilitation Act.

Senator MUNDT. In addition thereto?

Mr. TRIER. Yes, in addition to the 1950 original authorization.

Senator MUNDT. Could you familiarize the committee with the act as amended, with the various aspects now involved in this rather substantial Navajo-Hopi rehabilitation program? Will you provide for the record a schedule of expenditures which have been made to date in carrying out the program, with the cost segregated wherever possible by the State?

Mr. TRIER. Yes.

(The information referred to follows:)

Navajo and Hopi rehabilitation program, fiscal years 1951 through 1962

	Rehabilitation authorization, Public Law 474, 81st Cong.	Appropriated funds applied to authorization	Balance available under authorization
1. Soil and moisture conservation and range improvement work	$10,000,000	$7,097,175	$2,902,825
2. Construction, irrigation projects on Navajo	9,000,000	6,616,775	2,383,225
3. Surveys and studies of timber, coal minerals, etc	500,000	436,895	63,105
4. Development of industrial and business enterprises	1,000,000	238,000	762,000
5. Off-reservation employment	3,500,000	194,600	3,305,400
6. Relocation and resettlement of Navajo-Hopi Indians (Colorado River irrigation)	5,750,000	3,449,750	2,300,250
7. Roads and trails	40,000,000	35,000,000	5,000,000
8. Telephone and radio communication systems	250,000	250,000	
9. Agency, institutional and domestic water supply	2,500,000	1,356,670	1,143,330
10. Revolving land fund	5,000,000	1,800,000	3,200,000
11. Hospital and health facilities [1]	4,750,000	4,750,000	
12. Educational facilities [1]	25,000,000	24,997,295	2,705
13. Housing and necessary facilities and equipment	820,000	26,300	793,700
14. Common service facilities	500,000	495,100	4,900
Total	108,570,000	86,708,560	21,861,440

[1] For construction of facilities.

Resources Management

Mr. Mundt. That is all I have.

Chairman Hayden. Are there any further questions?

Senator Mundt. Do you mean on any Bureau or just roads?

Chairman Hayden. No, I want to go on and clean up the record.

Senator Mundt. You go ahead.

Chairman Hayden. There will be placed in the record the justifications for the 1963 budget estimate for resources management of $34,417,000. This amount is $5,106,862 more than was made available in fiscal year 1962.

(The justification follows:)

Bureau of Indian Affairs—Resources Management

HIGHLIGHT STATEMENT

The purpose of this appropriation is to promote the economic advancement of the Indians in the continental United States including natives of Alaska through the utilization of their resources.

To carry out this purpose the Bureau of Indian Affairs is responsible for the management, development, improvement, and protection of resources and appurtenant facilities of Indians under the jurisdiction of the Bureau.

The long-range program objective is to improve the economic and social conditions among Indians to the point where Federal financing will no longer be required to develop and utilize their resources.

During the last fiscal year the Bureau carried out this objective through active management programs which were aimed toward increased Indian participation in the management of Indian-owned resources.

For fiscal year 1963 emphasis is being placed on the development phase of Indian resources while at the same time carrying on the custodial-type activities necessary for the protection and preservation of such resources.

RESOURCES MANAGEMENT

Appropriation, 1961	$23, 084, 000
Supplemental appropriation, 1961	1, 777, 000
Total appropriation, 1961	24, 861, 000
Appropriation, 1962	29, 075, 000
Transferred from "Education and welfare services"	285, 000
Transferred to General Services Administration (75 Stat. 353)	−49, 862
Amount available, 1962	29, 310, 138

SUMMARY OF INCREASES AND DECREASES, 1963

Forest and range lands: To provide funds for increased timber sales, forest administration, forest protection, and improved range management	+789, 753
Agricultural and industrial assistance: To expand economic development functions and to provide for additional agricultural extension work by the Bureau	+2, 212, 041
Soil and moisture conservation: To provide funds to meet increased costs in labor and materials	+185, 308
Maintenance of roads: To round figures to even thousands	+500
Development of Indian arts and crafts: To provide funds for the strengthening of the overall arts and crafts program	+97, 800
Management of Indian trust property: To provide funds for increased work on the land records program, increased appraisal staff and expenses for the realty program, for positions and expenses now being financed from Indian moneys, proceeds of labor, and for the payment of employee compensation benefits	+629, 952
Repair and maintenance of buildings and utilities: To provide funds for the maintenance of new facilities and the correction of unsafe and unsanitary conditions	+1, 029, 308
Operation, repair, and maintenance of Indian irrigation systems: To provide funds for increased operation and maintenance costs	+162, 200
Net change, 1963	5, 106, 862
Budget estimate, 1963	34, 417, 000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Forest and range-lands	$3, 222, 550	$3, 510, 247	$4, 300, 000	+$789, 753
2. Fire suppression	1, 221, 228	140, 000	140, 000	
3. Agricultural and industrial assistance	2, 049, 512	3, 182, 959	5, 395, 000	+2, 212, 041
4. Soil and moisture conservation	5, 119, 264	5, 166, 692	5, 352, 000	+185, 308
5. Maintenance of roads	2, 775, 578	2, 849, 500	2, 850, 000	+500
6. Development of Indian arts and crafts	126, 523	202, 200	300, 000	+97, 800
7. Management of Indian trust property	4, 462, 269	4, 638, 048	5, 268, 000	+629, 952
8. Repair and maintenance of buildings and utilities	4, 822, 970	8, 532, 692	9, 562, 000	+1, 029, 308
9. Operation, repair, and maintenance of Indian irrigation systems	940, 521	1, 087, 800	1, 250, 000	+162, 200
Unobligated balance	120, 585			
Total	24, 861, 000	29, 310, 138	34, 417, 000	+5, 106, 862

1. *Forest and range lands*

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Forestry	$1,921,816	$2,190,800	$2,729,200	+$538,400
(*b*) Range lands	1,300,734	1,319,447	1,570,800	+251,353
Total	3,222,550	3,510,247	4,300,000	+789,753

(*a*) *Forestry*

The estimate of $2,729,200 is an increase of $538,400, which is distributed to the three principal forest program features as follows:

Activity	1962 program	1963 program	Increase
Forest administration	$329,500	$357,000	$27,500
Timber sales	1,346,300	1,607,200	260,900
Forest protection	515,000	765,000	250,000
Total	2,190,800	2,729,200	538,400

Need for increase.—Forest administration: The increase of $27,500 for this activity will provide funds for a very modest program of thinning, pruning, and other forest culture work. It will be done in conjunction with Branch of Education activities to provide summer work for high school students. This pilot program will not only supply a small amount of needed work on timber stand improvement, but will also provide some opportunity for summer employment of Indian youth.

Timber sales: Almost 60 percent of the $260,900 increase for this activity will be used to increase the volume of timber sales. It will permit the employment of 25 additional professional and subprofessional foresters, who are needed to handle the increased volume of sales and to provide adequate supervision of existing timber sales. The unit cost of timber sale administration (cost per thousand board feet of sales) has increased. This is partly because of the general increase in unit costs of personnel, equipment and supplies. The high stumpage values being received today require more careful supervision than was formerly required.

There is a strong demand, by the Indian owners and by potential purchasers of Indian timber, for an increase in the volume of sales. Sales volume cannot be increased, however, without the proposed increase in funds for timber sale administration.

Forest protection: The increase of $250,000 for this activity will provide a more effective protection organization, including the employment of an additional 50 seasonal fire control aids. This activity involves the protection of forest and range lands from fire, and protection of the forest lands from insects, disease, and other destructive agencies. It also involves the prosecution of fire trespass cases. At most reservations, the Bureau of Indian Affairs maintains a fire protection organization. At others, the protection is provided by contract or agreement with adjoining forest protection agencies.

Recreational use of Indian forests is developing rapidly, with a corresponding increase in the possibility of man-caused fires. It is therefore essential that the Bureau's protection organization be modernized and strengthened.

Plan of work.—Forest management covers the use and protection of 13 million acres of Indian forest lands, and the protection from fire of an additional 46 million acres of Indian range and intermixed non-Indian land. The objective is to manage Indian forests according to sustained-yield principles, under the multiple-use concept, for the benefit of the Indian owners. Objectives include the production and use of forest products to the full growing capacity of the lands, the prevention of soil erosion, and the preservation of watershed, grazing, recreation, and other forest values. The timber harvest is sometimes used by tribal forest products enterprises; the more important of which are the tribal sawmill enterprises at the Red Lake Reservation in Minnesota, the Navajo Reservation in Arizona-New Mexico, and the Fort Apache Reservation in Arizona. The two former enterprises use the entire commercial harvest of timber from

these reservations. The Fort Apache enterprise uses only a part of the harvest. A tribal logging enterprise has recently been organized on the Blackfeet Reservation in Montana, which plans to log and sell about 5 million board feet of logs annually. Aside from these enterprises, most sales of standing timber are made in the open competitive market.

Importance to the Indian economy.—At many reservations, receipts from timber sales are a principal source of income to the tribes and the individual tribal members. Of even greater importance, the timber harvest provides substantial employment opportunities and contributes to the stabilization of local communities. It is estimated that every million board feet of Indian timber sold creates from 8 to 12 man-years of employment on or near the reservation, and generates a payroll of $35,000 to $50,000 annually.

(*b*) *Rangelands*

The estimate of $1,570,800 is an increase of $251,353 which provides improved management of Indian rangelands.

Need for increase.—The increase will provide funds for better management of Indian range units under permit. Additional technical personnel are needed to guide the Indians in the proper use of their range resources through development and refinement of range management plans. More detailed range use studies are needed as the basis for adjustments in stocking rates, changes in range unit boundaries, locations of needed range improvements, and improvements in range use practices to obtain better use of the range resources. The increase will also provide for a limited increase in range water developments primarily on lands added to several pueblos in New Mexico. These lands, totaling nearly 70,000 acres of former public lands added to these pueblos by Public Law 87-231 (75 Stat. 500), do not have adequate range water facilities.

Plan of work.—The estimate provides for continuing and improving the program for conservation and utilization of nearly 41 million acres of Indian trust lands. Range management plans are developed for each reservation. These plans provide for the division of the range into economic units, determination of proper stocking and season of use, and for range improvement and betterment programs to obtain full use of the forage balanced with sustained production. Range management includes work incident to the sale of grazing privileges under permit, assistance to Indian tribes in the allocation of grazing privileges to their members, making field inspections, and working with range users to obtain satisfactory range use. Range condition and trend studies and utilization checks are made as the basis for adjustments in stocking rates, season of use, unit boundaries, and the location of range water development and other facilities. Technical guidance is furnished Indian users for improvement of grazing practices as a means of obtaining the best use of their range. Technical advice is provided for the development of livestock water, water spreading, reseeding, and other improvements and practices which increase forage production. Provision is made for uniform distribution of the livestock on the range to insure proper utilization and to prevent its destruction through overgrazing. Range water is provided through the development of deep wells, paved catchment basins, and pipelines in the arid Southwest in support of the range management program.

Most Indian reservations are located in principal watershed areas of the Western United States. Proper use of the Indian range in units is, therefore, important to irrigation and other water using facilities dependent upon watershed management. In addition, a material contribution is made to a stabilized livestock industry by furnishing grazing for nearly 758,000 cattle units of livestock annually. These watersheds, in addition to providing grazing to livestock, are used for fishing, hunting, and recreation. The range lands of Indian reservations offer excellent opportunities for recreational development of material economic value. Lack of adequate conservation practices would diminish these recreational opportunities.

In addition to range-work, assistance and advice is given to Indian tribes in the development of plans and ordinances for the rehabilitation and wise use of fish and wildlife resources.

2. Fire suppression

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Fire suppression	$1,221,228	$140,000	$140,000	

Plan of work.—The estimate of $140,000 is the same as for 1962. Funds under this activity, together with available tribal funds, provide for the payment of the cost of suppression and emergency prevention of fires on or threatening forest and range-lands of Indian reservations.

Status of program

	Calendar years					5-year average
	1960	1959	1958	1957	1956	
Number of fires	1,467	1,309	1,424	828	1,274	1,260
Average acres per fire	94	80	125	66	82	89
Total area burned (acres)	138,610	105,024	178,055	54,797	104,975	115,292
Includes brush and grasslands (acres)	(113,033)	(82,623)	(165,060)	(44,300)	(88,113)	(98,626)
Estimated damage	$552,325	$2,172,803	$364,276	$158,910	$288,400	$707,343

Area requiring protection is 59,458,009 acres (includes 11,575,673 acres of State and private lands within protection area).

The great increase in estimated damage resulting from fires during calendar year 1959 was largely accountable to a disastrous fire on the Klamath Indian Reservation, Oreg.

Causes of fire

[In percent]

	1960	1959	1958
(a) Man	51	50	47
(b) Lightning	49	50	53

The obligations for each of the last 3 fiscal years are:

1961	$1,221,228
1960	432,109
1959	520,306

About half of the cost for fiscal year 1961 was incurred in connection with serious fires on the Flathead Reservation in Montana.

3. Agricultural and industrial assistance

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Agricultural extension	$1,198,962	$1,242,904	$1,374,600	+$131,696
(b) Credit operations	291,884	1,100,400	1,100,400	
(c) Economic development	558,666	839,655	2,920,000	+2,080,345
Total	2,049,512	3,182,959	5,395,000	+2,212,041

(a) *Agricultural extension*

The estimate of $1,374,600 is an increase of $131,696, which provides for additional work by Bureau of Indian Affairs.

Need for increase.—The increase of $131,696 will provide for additional personnel, increased costs of supplies, materials, equipment, and travel expenses in order to provide better and more adequate extension services to the Indian people by this Bureau.

Plan of work.—State extension contracts: The estimate of $753,400 will allow continuance of Johnson-O'Malley contracts with 15 State extension organizations of the land-grant colleges. Extension agents counsel with individuals and families, and also develop organized educational programs with Indians, through which they demonstrate and influence acceptable practices in all types of agricultural endeavors, home management, and youth training through 4-H clubs. The States have employed approximately 90 professionally trained extension

agents in the 15-contract States where special emphasis is given to including Indians into community, county, and statewide extension programs and services. The extension program is carried on through farm and home visitations, meetings, short courses, demonstrations, farm tours to show improved practices, bulletins, 4–H clubs, achievement days and exhibits. To accomplish this requires extensive traveling to isolated and widely scattered Indian homes and farms, to organize community groups to observe what people are doing in other places and encourage them to adopt similar practices and programs, and to conduct the home and agricultural demonstrations. Through these organized educational methods Indians are encouraged to recognize their opportunities for social and economic improvement. During fiscal year 1962, contractual agreement with New Mexico was amended to provide extension services to Indians of the Mescalero Reservation,

The following table shows how the funds are programed to States under contract.

State	Actual 1961 contract amount	1962 contract amount	Estimated 1963 contract amount
Colorado	$11,000	$13,200	$13,200
Florida	18,300	21,200	21,200
Idaho	32,500	33,500	33,500
Minnesota	18,300	19,500	19,500
Montana	97,698	101,640	101,640
Nevada	45,085	46,885	46,885
New Mexico	62,951	67,050	67,050
North Carolina	18,000	18,300	18,300
North Dakota	41,000	43,000	43,000
Oklahoma	129,366	133,565	133,565
Oregon	22,000	23,960	23,960
South Dakota	127,000	131,000	131,000
Utah	18,000	18,300	18,300
Washington	54,000	55,500	55,500
Wyoming	23,800	26,800	26,800
Total	719,000	753,400	753,400

Noncontractual work.—Until the State extension services in Alaska, Mississippi, and Arizona become receptive to providing extension services under contractual arrangement, the Bureau continues to provide extension assistance to Indians in these States. The Bureau has been successful in working out contracts with New Mexico for extension services to Indians residing in McKinley, Rio Arriba, and Dona Ana Counties. However, in the States not yet under contract, the Bureau extension personnel are working closely with local county agents and State college specialists in carrying on their work. Examples are joint demonstrations held by Bureau and State extension personnel on topics such as wool grading, livestock marketing, and livestock parasite control. Bureau extension personnel will plan continuance of educational assistance to Indian families in community improvement, home economics, management of farm and home enterprises and training of youth through 4–H Club activities. The amount of $554,126 will be programed as follows:

Alaska	$33,966
Arizona	233,280
Mississippi	20,000
New Mexico	266,880
Total	554,126

Agreement with U.S. Department of Agriculture: The estimate for this item is $67,074. These funds will provide for a small supervisory staff to coordinate extension work on Indian reservations with the U.S. Department of Agriculture and State extension service staffs. An amount of $30,150 is programed for this work. The Federal Extension Service, by agreement provides guidance with leadership to State extension services in planning extension programs in States under contract with the Bureau of Indian Affairs. The Federal Extension Service also consults and advises with Bureau representatives on suitable extension programs for Indians in those States where contracts have not yet been negotiated. An amount of $36,924 is programed for these services.

(b) *Credit operations*

The estimate of $1,100,400 is the same amount that was appropriated in 1962 for salaries and operating expenses for the following credit staff, which represents no increase over the 1960, 1961, or 1962 staffing:

	Positions	Amount
Aberdeen	27	$209,537
Anadarko	7	49,170
Billings	10	77,640
Gallup	7	62,682
Juneau	19	245,125
Minneapolis	(1)	2,034
Muskogee	5	50,500
Phoenix	17	130,927
Portland	8	83,690
Washington office	14	156,852
Seminole Agency	2	20,000
Cherokee Agency	2	12,243
Total	118	1,100,400

[1] Part-time position.

Plan of work.—The objective of the credit program is to help improve economic and social conditions among Indians through proper development and utilization of their resources. The work is planned with this objective in view. Indians need capital to utilize and develop their resources, both physical and human. Many are without the necessary capital. It has to be borrowed. The credit program is designed to help them obtain capital. Primary emphasis is placed upon helping them borrow money from the same sources that furnish capital to other citizens. Where, because of the trust status of their property, lack of security, low economic status, or for other reasons, Indians are unable to obtain capital from customary sources, loans are made, directly or indirectly, through the Bureau.

(c) *Economic development*

The estimate of $2,920,000 is an increase of $2,080,345. This estimate combines functions previously budgeted under the subactivity economic development under this appropriation and the industrial development program under the relocation activity of the appropriation for education and welfare services. An amount of $285,000 is included in the estimate for this subactivity representing the amount previously carried in the education and welfare services appropriation.

Need for increase.—The additional funds are needed for increased economic development personnel at all levels, but primarily at agency and area offices, and also for contractual services in connection with the evaluation of economic development possibilities on Indian reservations. The Bureau is now embarking on a concerted program directed toward fuller economic development of reservation areas to provide greater income and employment opportunities for Indian people.

A great deal of information has been gathered about the physical resources available to Indian people. Nevertheless, there is a dearth of information about the current economic status of Indian people and their potential for self-improvement; about the present-day developmental potential of agricultural and mineral resources, and the rapidly developing but comparatively unexplored lines of tourism, commercial enterprises, and manufacturing.

To promote economic growth in a sound and orderly way, it is necessary to obtain and appraise this needed information, to work with the Indians in formulating comprehensive plans for development on a reservation-by-reservation basis, and to initiate specific developmental projects.

This increase will provide for the establishment of 99 additional positions at the agency level, 41 at the area level, and 14 in the central office.

Plan of work.—The principal functions to be carried out under this activity are:

1. Obtaining additional information on the economic condition and capabilities of Indian people and on those resources which have hitherto not been fully developed.
2. Preparing comprehensive plans, in collaboration with the Indians, for the economic development of all major reservation areas
3. Seeking out and negotiating with private corporations in an effort to establish industry on reservation areas

4. Developing economic studies of the feasibility of locating selected industries in particular areas and evaluating the financial soundness of proposed developmental ventures to be undertaken by Indian organizations or by private corporations with investment of tribal or private funds

5. Working with neighboring non-Indian communities to encourage their participation with Indians in local economic development programs.

6. Working with Indian groups to assist them in developing and revising organic documents and organizing the management of their affairs so as to facilitate economic development, prepare Indian communities for the social changes which accompany such development, and provide assistance in the promotion of housing and other community programs that must go hand in hand with economic development

7. Planning programs for the use of judgment funds, as they become available, so that they may provide maximum long-range benefits to the recipients There are still before the Indian Claims Commission and the Court of Claims about 678 Indian claims Settlement of the pending claims is expected to take place at a greatly accelerated rate

8. Evaluating present Bureau programs and activities to shift emphasis to developmental activities as distinguished from the Bureau's conservator role

9. Contracting with private consulting organizations and educational institutions which have specialized technical competence for:

(*a*) Studies of economic feasibility of establishing industries on Indian reservations to make the most beneficial use of the human and physical resources.

(*b*) Analyses of crop potentials of irrigated land designed to achieve the highest return from such lands by the Indian owners.

(*c*) Forest products studies and market analyses to increase employment and Indian income through milling and the manufacture of end-use products.

(*d*) Studies to determine the economic feasibility of developing tribal properties with high income and employment potentials resulting from public recreational uses.

(*e*) Research into methods of beneficiation of minerals known to exist on reservations to obtain commercial utilization of such minerals by private and/or tribal enterprise.

(*f*) Analysis of the crucially important human resources; (1) to ascertain its present capabilities in relation to economic development of the community and (2) to devise means for its social and economic growth.

4. Soil and moisture conservation

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Soil and moisture conservation	$5,119,264	$5,166,692	$5,352,000	+$185,308

The estimate of $5,352,000 is an increase of $185,308.

Need for increase.—The $185,308 is needed to meet increased costs in labor and materials in order to maintain the program at about its present level.

Plan of work.—The soil and moisture conservation program plans and develops cultural and tillage measures designed to fit each soil, slope, and erosion condition to: (1) correct ravages of erosion and depletion, (2) protect still productive land against erosion and depletion and (3) improve productivity of all Indian lands.

The estimate of $5,352,000 will provide funds for the following major program features:

1. Land use investigations and planning	$1,636,000
2. Application of measures	2,872,000
(*a*) Soil stabilization and improvement	1,402,000
(*b*) Water management	1,470,000
3. Operation and maintenance	844,000
Total	5,352,000

This will represent a slight increase in all three of the major program features; $55,000 of the increase is for land use investigations and planning. During 1963 this program will continue to provide additional farm, ranch, watershed, and reservation plans for the utilization and development of Indian soil, water, and forage resources. These plans will be based on information provided by soil and range inventories being made as a part of this program. To date, the Bureau has completed inventories on approximately 47.5 percent of the open Indian land to be mapped. Data of this kind make possible accurate planning of new areas and the revision of older plans. It is anticipated that inventories will be completed on Indian lands by 1967, if the present rate of inventories is maintained.

Within the application of measures program, an increase of $88,000 is requested. With 50 percent of the total increase going into this phase of the program, it will assure more conservation practices on the ground. Increased emphasis will be placed on increasing the productive capacity of Indian resources through application of planned conservation measures. Results of a combination of pasture improvement drainage, irrigation, and herd improvement work with the Seminole Indians in Florida show what development and use of resources will do. The average value of all cattle sold during fiscal year 1960 on the Big Cypress Reservation, where improved pastures are available for grazing, was $98.39 per head; on the Brighton Reservations, where improved pastures were not available for grazing, the average value was $66.77 per head. This difference in value of $31.62 per animal was due primarily to applied conservation.

An increase of $42,308 is being requested for the operation and maintenance program. This will provide for closer compliance checks to assure application of planned conservation measures resulting from the expenditure of soil and moisture conservation funds.

The estimated budget needs for 1963 represent approximately 5.5 percent of the revised 20-year program of soil and moisture conservation

TABLE I.—*Soil and moisture conservation program by program features, Bureau of Indian Affairs*

Program features	Soil and moisture conservation expenditures			Cooperators expenditures		
	Actual, 1961	Estimate, 1962	Estimate, 1963	Actual, 1961	Estimate, 1962	Estimate, 1963
Land use investigations and planning	$1,631,505	$1,507,619	$1,636,000	$1,412,122	$1,468,000	$1,512,000
Application of measures:						
Soil stabilization and improvement	1,372,082	1,355,576	1,402,000	14,600,539	15,184,000	15,639,000
Water management	1,478,525	1,715,636	1,470,000	4,807,712	5,000,000	5,150,000
Operation and maintenance	637,152	596,369	844,000	998,713	1,038,000	1,069,000
Total	5,119,264	5,175,200	5,352,000	21,819,086	22,690,000	23,370,000

5. Maintenance of roads

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Maintenance of roads	$2,775,578	$2,849,500	$2,850,000	+$500

The total estimate for 1963 is $2,850,000, an increase of $500. The $2,850,000 is required to keep Indian reservation roads and bridges open to traffic. Such activities as farming, logging, mining, education, health, welfare, law and order, and others are absolutely dependent on road transportation.

The estimate provides $262 per mile per year for regular maintenance of the 7,328 miles of the most heavily traveled road. An average amount of $73 per mile per year is allowed for 8,229 miles of road carrying lighter traffic. The estimate provides $183,000 for heavy repairs to roads and bridges; and $140,000 for repair of damages caused by floods and blizzards.

There are five flight strips in isolated locations that are used for emergency medical evacuations and other air transportation; $7,000 is provided to maintain these strips in a reasonably safe condition.

Plan of work.—An area budget classification breakdown of the plan of work for 1963 follows:

Area	Total funds	Miles heavy traffic	Amount regular maintenance	Miles light traffic	Occasional maintenance	Amount heavy maintenance	Amount special maintenance	Amount airstrip maintenance
Aberdeen	$465,000	1,349	$405,000	597	$30,000	$10,000	$20,000	----------
Anadarko	90,000	143	35,000	416	35,000	10,000	10,000	----------
Billings	290,000	444	165,000	1,332	100,000	15,000	10,000	----------
Gallup	635,000	2,109	450,000	1,867	140,000	20,000	20,000	$5,000
Minneapolis	165,000	351	130,000	240	15,000	10,000	10,000	----------
Muskogee	100,000	272	65,000	0	0	25,000	10,000	----------
Phoenix	520,000	1,715	340,000	2,064	140,000	18,000	20,000	2,000
Portland	410,000	708	240,000	1,578	120,000	30,000	20,000	----------
Sacramento	90,000	174	60,000	61	5,000	15,000	10,000	----------
Washington	85,000	63	30,000	74	15,000	30,000	10,000	----------
Total	2,850,000	7,328	1,920,000	8,229	600,000	183,000	140,000	7,000

(*a*) Regular maintenance: 7,328 miles of heavy traffic roads, $1,920,000; this sum provides for surface repair, blading, snow removal, ditch cleaning, removing rock, trees, weeds, and maintaining bridges and culverts.

(*b*) Occasional maintenance: 8,229 miles of light traffic roads, $600,000; this sum provides for work required to keep secondary roads and trails open to travel, such as blading, removing slides, filling washouts, removing trees, and occasional shaping.

(*c*) Heavy maintenance (major restoration): $183,000; this sum provides for reshaping roadbed, resurfacing, seal coats, and major repairs to bridges and culverts.

(*d*) Special maintenance: $140,000; this sum provides for the repair of major damage caused by storms, fires, floods, etc.

(*e*) Flight strip maintenance: $7,000; this sum provides for surface blading of flight strips which have been constructed in areas not adequately served by roads, or for emergency air transportation.

6. Development of Indian arts and crafts

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Development of Indian arts and crafts	$126,523	$202,200	$300,000	+$97,800

Need for increase.—An increase of $97,800 is being requested. This increase would permit a strengthening of the overall program and give the Indian Arts and Crafts Board an opportunity to assist in other areas where such assistance is badly needed.

At the present time there is practically no assistance being given in the Portland area. Occasionally it is possible for the arts and crafts specialist in the Billings area to visit reservations in Washington and Oregon where the people are interested in developing arts and crafts programs, but a full-time arts and crafts specialist is needed in the area.

A full-time arts and crafts specialist is needed on the Papago Reservation. Basketry is the principal traditional craft of the Papagos. In recent years both the quantity and quality of their work has declined and they need the assistance of a full-time specialist to help them get a good production-sales program in operation.

Even though there has been some expansion in the Alaskan program, the size of the area to be covered is tremendous and at least one additional arts and crafts specialist is needed for specific duty in the Nome area. The craftspeople in this area are experts in so-called skin sewing—that is, the making of parkas and other wearing apparel from the fur of animals native to the region. The potential for a thriving arts and crafts organization is there, but assistance is needed particularly in the field of sound business practices.

Most of the Indian crafts organizations have very limited capital with which to operate. In some instances, members of the organization donate their time on a rotation basis to the day-to-day operation of their craft shops. In other instances, organization members are hired either as salespeople or as managers, and they of necessity are paid very low salaries. This in turn cuts down on the already limited operating capital and makes it very difficult for these groups to be successful financially. The Indian Arts and Crafts Board envisions the possibility of being able to set up manager positions which in reality would be on-the-job training for Indian people. They would work under the direct supervision of the arts and crafts specialist and in due time be able to take over the business management of the craft organization. The additional funds which the Indian Arts and Crafts Board is requesting would permit at least five of these training positions to be established.

In rounding out its program, the Indian Arts and Crafts Board need additional funds for supplies for experimental production work, exhibits, and purchase awards, and purchase of traditional craft specimens for the two Indian museums which are under its supervision. For a successful program, crafts production must not be allowed to become static and, in order to meet the changing needs of consumers and current market trends, experimental production work is necessary; and, of course, supplies are needed for such work. With regard to purchase awards, this is a means of offering encouragement and incentive to artists and craftsmen, which in turn strengthens the overall program. This will result in increasing the production of high-quality crafts and expanding the market therefor and thus augment the income of the Indian craftspeople.

Plan of work.—The act of August 27, 1935, created the Indian Arts and Crafts Board, prescribed its duties, and authorized the promotion and development of Indian arts and crafts, with the attendant expansion of markets for Indian products.

The Board consists of five members who serve without compensation. The act authorized payment of their travel and other expenses incurred as properly incidental to the performance of their official duties as members of the Board.

It is the duty of the Board to stimulate, encourage, and promote the development and expansion of Indian arts and crafts so as to increase the revenue from this source, to the end that arts and crafts may become a larger factor in the self-support and economic development of Indian people.

There are 15 employees, 13 of whom are in the field working directly with the Indian craftspeople. The work program is carried through by arts and crafts specialists who are located in strategic areas. While the advice and assistance of these arts and crafts specialists is available to individual Indian artists and craftsmen, experience has proven that is through the organization of Indian owned and operated production-sales associations or guilds that the greater number of craftsmen are benefited and the most successful programs developed. The ultimate goal is for these Indian crafts groups to become self-sufficient in the operation and management of their crafts organization. The Board assists these groups in developing sound business practices, including all phases of production, marketing, publicity, and advertising, and in emphasizing the necessity of maintaining high standards of workmanship and design.

7. Management of Indian trust property

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Land management	$3,549,882	$3,714,734	$4,256,000	+$541,266
(*b*) General trustee services	912,387	923,314	993,000	+69,686
(*c*) Employee compensation payments			19,000	+19,000
Total	4,462,269	4,638,048	5,268,000	+629,952

(*a*) *Land management*

The estimate of $4,256,000 is an increase of $541,266 to cover the following items:

1. For the land records improvement program $50,000. This is a 5-year program planned to reach peak activity in its third year of operation, 1963. Title plants have been established in the Aberdeen, Billings, Gallup, and Portland area offices. The major emphasis in 1963 will be on the preparation of reservation

land indexes and current title status report in those areas, with preliminary studies of the extent of the workload in the remaining areas of the Bureau to determine the desirability of constructing additional title plants or handling the remaining work through consolidated title plants.

2. $491,266 to provide additional evaluation and economic investigative analysis services, including additional personnel as follows:

3 GS–12 minerals evaluation engineers.
9 GS–11 journeymen real estate appraisers.
2 GS– 9 real estate appraisers.
24 GS– 7 trainees in real estate appraising.
15 GS– 4 clerical and stenographic supporting staff.

The balance to be expended for contract services in special problem categories to supplement the Bureau's program function.

Need for increases.—At the present time the existing appraisal staff is unable to meet the demands for professionally prepared estimates of value in approximately 65 percent of the realty transactions being processed in the Bureau. Over and above the need to meet this workload in the day-to-day realty caseload is the need to plan ahead and to anticipate problems and be prepared for opportunities in the administration of the Federal Government's trust responsibility for management of 52,495,353 acres of land in the Indian trust estate.

In a report, prepared for the Interior Department, dealing with the activities relating to the management and use of natural resources, the staff of Resources for the Future Inc., summarized the long-range view as follows:

"The pace of development in this country is rapid. Population increased from 75 million in 1900 to 180 million in 1960; by 2000 there may well be 330 million. The national economy has grown from about $80 billion in 1900 to $500 billion in 1960. By 2000, it may increase by more than four times to a total in excess of $2,000 billion.

"Supporting national growth are the basic natural resources and raw materials, and the services derived from them. * * * On an annual basis fuel consumption may rise from 46 to 130 quadrillion B.t.u.'s; iron ore consumption from 130 to 300 million tons; timber consumption from 11 to 36 billion cubic feet; fertilizer from 8 to 42 million tons of nutrients; use of parks, recreation, and natural areas, not counting city parks and playgrounds, from 600 million to 9,800 million visits. These rough estimates assume an overall rate of economic growth of about 3.7 per cent per year. If the annual growth rate should turn out to be 4 or 5 percent, as many believe possible, then the future requirements for most natural resources and raw materials would be considerably larger than the estimates just given."

It is significant that the Indian reservation areas of the West include vast acreages of relatively unexplored and unexploited natural resources and that the explosively accelerating demand for these resources will manifestly have a greater impact in many Indian reservations than in other federally managed areas. At this moment great interest is being displayed in the mineral potential of vast untouched areas of the Navajo Reservation in Arizona, and the demand for leases on areas potentially attractive for recreational development is widespread throughout Indian country.

Although we are here immediately facing the job to be done in 1963, the work must be accomplished with the next quarter of a century and more in view. The realty cases presently being processed under long-term lease authorities, for both surface and mineral interests, are shaping the economy of Indian people so far as it is based on income from their land resources, which constitute a significant percentage of the Federal Government's responsibility in the resources field. Contracts for use of lands with 25- or 50-year terms, and longer where specially authorized, will live long after those now administering them. The degree of competence with which these contracts are presently formulated will be reflected well into the 21st century. The time is past when we should have had available to guide Indian land administration the most comprehensive analysis of the economic potential of the Indian lands and the most thorough and well-documented studies of their yield, dollarwise, presently and prospectively, to assure that plans for development achieve the object of optimum use and maximization of income. Recognizing these immediate needs, this budget request includes provision for staff, trained and in training, to furnish competent, technical guidance to achieve these objectives.

Plan of work.—The Bureau will continue to meet the need of the Indian landowners for realty transactions consistent with the Federal Government's trust responsibility involving "traditional" realty activities, leases of the surface and of mineral interests, exchanges, partitions, sales, and acquisitions of which there

were in fiscal 1961 a total of 33,694 transactions. There is a rapidly accelerating demand for the development of Indian lands suitable for recreational, industrial, and residential purposes. There is a continuing steady demand for the use of Indian lands for agricultural purposes under leases and permits. Mineral leasing activities, including the development of oil and gas, continues steadily in the developed areas and is the subject of an acute interest in previously unexplored areas.

Basic to all of these real estate functions is the requirement of determining the values involved and preparation of appraisals of fair market value to guide the Indian landowners and the Bureau's administrators in forming enlightened judgment on management objectives, and to form a realistic economic background for real estate development, to achieve optimum use and maximization of income, in committing Indian lands to that use which will, over a period of time, return the greatest net to the Indian land.

The plan of work also includes the expenditure of $125,000 for new surveys of Indian lands and relocating boundaries of Indian lands now in dispute. It is expected that Bureau of Land Management will make a major part of the surveys, but much of the need will be met by contract with qualified engineers locally. In addition to continuing to resolve disputed boundaries and to make initial surveys in previously unsurveyed areas along the Colorado River and elsewhere in the Southwest, there is need for a substantial survey program in defining the boundaries of reserves for the natives and for administrative purposes in Alaska, and to continue with estimated completion, in 1963, the location and monumenting of individual assigned holdings in the Cherokee Reservation, N.C.

(*b*) *General trustee services*

The estimate of $993,000 is an increase of $69,686.

Need for increase.—The increase of $69,686 will primarily provide funds for positions and expenses currently being financed from Indian moneys, proceeds of labor, agencies, schools, etc., which will no longer be available for supplementation and for increased cost for travel, supplies, and services required in carrying out the functions of this program.

Plan of work.—The Bureau is charged by various laws and regulations with the trust responsibility of accounting for and disbursing individual Indian monies which come into the custody of Bureau officials as a result of administering trust or restricted properties of individual Indians, through per capita payments, judgments, awards, and claims. Indian Service special disbursing agents are designated to carry out these responsibilities.

In addition, trustee management is required for minors and those Indians who are unable to manage their affairs because of the lack of training in business affairs and the difficulties of communication due to inability to speak English. Such management includes the disbursement of funds under a planned program for the care of minors, with portions set aside for investment purposes for future use.

This subactivity also finances positions of field representatives who serve as contact representatives with the Indians at the reservation level and who perform work connected with the activities concerned with administration of trust properties.

The realty, forestry, irrigation, credit, welfare, and other activities of the Bureau and the Geological Survey and Bureau of Land Management are directly affected by the management and operation of Indian money banks.

(*c*) *Employee compensation payments*

The increase of $19,000 will provide for funds to reimburse the employees' compensation fund for payments made on account of the injury or death of employees under the jurisdiction of this agency as required in section 209 of Public Law 86–767.

8. Repair and maintenance of buildings and utilities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Repair and maintenance of buildings and utilities	$4,822,970	$8,532,692	$9,562,000	+$1,029,308

Need for increase.—The program increase of $1,029,308 is to provide funds to repair and maintain buildings and utilities constructed in fiscal year 1962 for which funds have not previously been appropriated and to continue efforts to eliminate a backlog of deficiencies contributing to unsafe and unsanitary facilities. There has been constructed in fiscal year 1962 approximately 1,649,000 square feet of buildings and 280 individual utility systems. It is imperative that a reasonable level of maintenance be retained, and the increase requested will enable the Bureau to provide an essential repair and maintenance program commensurate with sound engineering principles to insure continued operation of its plants and facilities on an economical basis.

Plan of work.—The repair and maintenance of buildings and utilities is a continuing program. Funds requested are used to provide normal maintenance and repairs to Bureau physical plant facilities located throughout the continental United States and Alaska. These facilities include 8,515 individual buildings having a total floor area of 25,949,000 square feet and approximately 8,800 separate utility systems. These include (1) 457 water systems comprising 520 water storage tanks having a capacity of 11,300,000 gallons; 468 wells with pneumatic systems, chlorinators, filters, clarifiers, water softeners, sump and settling tanks, sprinkler irrigation systems, fire hydrants and mains, and more than 4,200,000 linear feet of water distribution systems; (2) 461 sewerage systems comprising 480 septic and Imhoff tanks having a capacity of 3½ million gallons; 430 individual sewage ponds and disposal fields with a capacity of 400 million gallons, storm sewers, filter beds, lift stations, sumps and pumps, cesspools and 1,620,000 linear feet of sewer systems, 86,800 plumbing fixtures including water closets, urinals, showers, tubs, lavatories, sinks, fountains, etc.; (3) 2,750 fuel systems comprising 1,200 liquid petroleum gas systems, with a capacity of 700,000 gallons and 500,000 linear feet of distribution lines; approximately 1,300 oil storage tanks with a capacity of 3 million gallons and 60,000 linear feet of distribution lines; 250 coal storage bunkers with a capacity of over 150,000 tons; (4) 326 electric systems with 400 electric generators (diesel, gas, steam) with a capacity of 17,000 kilowatts, distribution systems approximating 350 miles in length; (5) 273 communications systems, comprised of 25 telephone systems having 1,300 switchboards and 4,000 miles of telephone lines and 248 radio systems with some 750 radio receivers and transmitters having an output of more than 130,000 watts; (6) 2,764 heating systems, including 700 heating plants (oil fired, gas fired, high pressure) having a capacity of 35,000 horsepower, and some 2,064 individual low-pressure heating systems; (7) miscellaneous systems including 200 walk-in refrigeration units of 150,000 cubic feet capacity, 200 air-conditioning systems totaling 1,200-ton capacity; more than 400 individual locations having in excess of 40,000 acres of ground, 10,000 acres of lawns, 2 million linear feet of sidewalks, curbs, and gutters, 3 million linear feet of fencing, and items such as garbage dumps, land fills, air compressors, gasoline storage tanks, railroad sidings, docks, windmills, fire lookout towers, etc.

In most locations no commercial facilities are available and the Bureau must provide complete services for each of the installations, including all utilities required to operate schools, dormitories, kitchen and dining halls, office buildings, quarters, shops, garages, educational and recreational facilities, et cetera, which are required in the execution of the Bureau's various programs.

Utilities maintained at most locations are equivalent to those of an average community and in many locations are much more extensive due to central plants which provide electrical power, hot water, steam, et cetera. In addition to normal operating requirements these systems must be maintained on an uninterrupted 24-hour basis to insure the health and safety of Indian school children and Bureau personnel. Occupancy of most Bureau facilities on a 24-hour basis places increased loads on plants which accelerates deterioration and requires more than normal time and expenditures to keep the buildings and utilities in operating condition. Boarding schools where young children are housed 24 hours a day are subjected to more than normal wear and the incidence of breakage and damage to glass, paint, fixtures, et cetera, is many times that usually encountered in normal building occupancy. The repair and maintenance of the Bureau's plants and facilities are further aggravated as a result of substantial increases in wage rates and material cost during the past 3 years and the completion of new construction which materially increased the area of building space and number of other plant facilities to be maintained.

Repair and maintenance of buildings and utilities

	Actual, fiscal year 1961			Programed, fiscal year 1962			Estimated, fiscal year 1963

9. Operation, repair and maintenance of Indian irrigation systems

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Operation, repair and maintenance of Indian irrigation systems	$940,521	$1,087,800	$1,250,000	+$162,200

The estimate of $1,250,000 represents a net increase of $162,200 over the amount made available for this activity for the fiscal year 1962. This increase will provide funds for increases in annual operation and maintenance costs resulting from increases in the cost of material, supplies and labor and increases in annual assessment rates by public and private irrigation and water users associations embracing Indian-owned lands; payment of operation and maintenance assessments formerly paid in full or in part from tribal funds which are no longer available; major repairs beyond the financial ability of the Indians to pay; increases in the number of individual Indians who are financially unable to pay the charges assessed against their lands; and for more adequate and proper maintenance.

The total request is to cover annual operation and maintenance charges assessed against Indian-owned lands included within various private and public irrigation districts and water user associations; annual contract payments authorized by the Congress; and annual operation and maintenance costs for those projects not included within private or public irrigation districts and water user associations.

There are approximately 300 irrigation systems on various Indian reservations west of the Mississippi River, ranging in size from tracts of a few acres such as subsistence garden tracts to major projects of over 100,000 acres.

All collections are deposited in the operation and maintenance receipt account and are available for operating and maintaining the respective projects pursuant to the provisions of the act of August 7, 1946 (60 Stat. 895). These collections include payments by water users not only for current annual assessments for operation and maintenance costs, but also amounts collected on prior year assessments. Where non-Indians receive water services from Indian irrigation systems they are required to pay the full per acre cost. The above referred to irrigation systems and projects fall in the following categories:

1. Projects which are economically feasible on the basis that there is a sufficient quantity of water to supply the assessable area. The lands have characteristics which will produce crops under sustained irrigation and have repayment capabilities which will permit landowners and water users as a whole to pay the full annual cost of operating and maintaining the system. The assessment rates on these projects are fixed to return the full operation and maintenance cost. Any unpaid assessment becomes a lien against the land for which the assessment is not paid.

Funds requested for payment of assessments under this category will be used when necessary to pay into the collection account that part of the uncollectible current annual per acre assessment against Indian-owned lands. Funds so paid into the collection account to cover such unpaid assessments become reimbursable debts due the United States.

2. Projects where the repayment capabilities of the land will not permit payment of the full annual operation and maintenance costs. Assessment rates for Indian water users on these projects are based on the ability of the Indian to pay and therefore do not cover the full cost of operation and maintenance. All or any portion of any unpaid assessment becomes a lien against the land for which such assessment is not paid.

Funds requested for payment of costs under this category will be used when necessary to pay into the collection account that part of the annual operation and maintenance cost on Indian-owned lands in excess of the annual assessment and any part of the uncollectible annual per acre assessment against Indian-owned lands. Funds so paid into the collection account to cover these costs become reimbursable debts due the United States when used to pay all or any part of the annual costs included in the assessment rate. Costs in excess of the assessment rate are nonreimbursable.

3. Irrigated areas, such as subsistence garden tracts and tracts of a few acres which do not represent economical units but do provide Indian landowners with a means of supplementing their livelihood. Because of the low income of the Indian landowners and water users on these irrigated areas and tracts, it is not

feasible from an economic standpoint to assess these lands. Accordingly the operation and maintenance costs are nonreimbursable and do not become a lien against the lands benefited.

Funds requested for payment of costs under this category will be used when necessary to pay into the collection account the total cost for operation and maintenance of these subsistence garden tracts and irrigated areas, or if no collection account has been established and it is not desirable or proper to establish such an account, the funds will be expended when necessary directly from the appropriation account.

4. Irrigation systems and reservoirs serving Indian-owned lands located within and operated by various private and public irrigation districts and water users associations. Assessments for operation and maintenance of the irrigation systems and reservoirs serving these Indian-owned lands are made by the irrigation district or water users association embracing and serving such Indian-owned lands.

Funds requested for payment of assessments under this category will be used when necessary to pay into the collection account for payment to private and public irrigation districts and water users associations for operation and maintenance costs assessed for Indian-owned lands included within such irrigation districts and water users associations. Funds used for payment of assessments covering these costs are reimbursable and become debts due the United States except for those payments that are nonreimbursable by legislation.

5. Projects that are operated by this Bureau at no cost to the Indian landowners and water users as provided for under legislation.

Funds requested for payment of assessments under this category will be used when necessary to pay into the collection account appropriated funds for irrigation projects operated by this Bureau at no cost to the Indian water users as required by legislation.

TIMBER SALES

Chairman HAYDEN. I note that the request for timber sales funds is $260,900 greater than the amount made available last year. Are there any particular reservations on which this increase will be placed?

Mr. NASH. Senator, are you referring now to the Branch of Forestry?

Chairman HAYDEN. Yes, timber sales.

Mr. NASH. Yes, sir. We can give you a list of the projects which are underway and which will be undertaken by our Forestry Branch. The purpose of this appropriation is to improve our timber sales and increase the speed at which this resource is realized in terms of income to the Indians so that the stands will not just be getting old without being cut up at the proper time and we could supply you with a list of the reservations and the locations.

Chairman HAYDEN. I would like to have the receipts from timber sales by reservation. Place it, reservation by reservation, in the record.

Mr. NASH. Reservation by reservation; yes, sir.

[1] Federal trust terminated Apr. 30, 1961.

[2] P. 40 of budget as presented to Congress shows estimate for fiscal year 1962 as 630,750,000 board feet, and cash receipts of $10,631,700. Data in this tabulation is from revised estimates subsequently obtained from the field. Falloff is primarily a reflection of depressed market conditions in the forest products industries.

80391—62——9

DISPOSITION OF RECEIPTS

Chairman HAYDEN. Are these receipts returned to the Treasury to reimburse the United States for provisions made for forest activities on Indian reservations? If not, what disposition is made of them?

Mr. NASH. You are correct. They are placed in the Treasury.

RELATION OF PRODUCTION TO COST

Chairman HAYDEN. Does whatever payment is made to the United States cover the total cost of administering timber sales and furnishing forest protection, including firefighting and fire-suppression activities?

Mr. NASH. Mr. Kephart, the Chief of the Forestry Branch, is here. I would ask him to answer that question.

Mr. KEPHART. The production, Senator, does not cover the entire cost.

FORT APACHE RESERVATION

Chairman HAYDEN. What about Fort Apache?

Mr. KEPHART. It does not cover the Fort Apache Reservation. The Fort Apache Reservation, for fiscal year 1961, spent $163,000. That was broken down to $65,000 for timber sales, $82,000 for fire control, not including the direct administration expense, and $16,000 for forest management activities. This is a total of $163,000 in fiscal year 1961, with deduction of $40,000; 1961 is not a very good year for comparative purposes because, as you realize, the lumber industry and the forest products industry are in a severe slump. Our volume of sales would parallel the national experience.

Chairman HAYDEN. I realize they receive a very substantial revenue every year from the timber sales, but there is a like situation in the national forests. They just have not received enough for the lumber available. Substituting of plastics and aluminum and other things makes a difference.

Mr. KEPHART. The total number of housing starts is a very important thing. For Fort Apache, the cumulative records for 1917 to 1961 as we have it showed the expenditure of funds of a little over $2 million. The deductions were $811,000, so we spend $1¼ million more than deductions. For the period 1931 to 1961, the tribe spent $308,000 and there were no reduction returns. The tribe is helping to pay the cost of the Federal funds. The present policy is that 10 percent is as much as should be charged.

RANGE MANAGEMENT PLANS

Chairman HAYDEN. You request $1,570,800 for development and implementation of range management plans, an increase of $251,353 over the amount available during the current fiscal year. What is your estimate of grazing receipts during the coming fiscal year?

Mr. FRYER. May I supply that for the record?

Senator MUNDT. Also supply a State-by-State breakdown of where this money has been spent and where you expect to spend it next year; the committee grants your request.

Mr. FRYER. We shall.

Chairman HAYDEN. Will these receipts be used to reimburse the United States to the extent of the funds appropriated for rangelands?

Mr. FRYER. No; they are not.

(The information referred to follows:)

The estimated grazing receipts for the fiscal year 1963 is $3,527,000.

The actual expenditures for fiscal year 1961 and estimated expenditures for fiscal years 1962 and 1963 for range-land funds are as follows:

State	Actual expenditure fiscal year 1961	Estimated expenditure fiscal year 1962	Estimated expenditure fiscal year 1963
Alaska	$16,994	$17,000	$20,000
Arizona	401,010	408,463	443,496
Colorado	9,142	9,849	10,150
Idaho	12,785	11,297	29,556
Montana	160,024	165,864	190,288
Nevada	24,011	25,157	32,000
New Mexico	307,766	305,576	400,354
North Dakota	52,160	53,264	63,661
Oregon	39,659	38,910	39,558
South Dakota	134,773	136,136	175,739
Utah	21,603	22,755	25,800
Washington	32,288	35,793	46,886
Wyoming	44,589	40,783	42,712
District of Columbia	43,930	48,600	50,600
Total	1,300,734	1,319,447	1,570,800

FIRE SUPPRESSION

Chairman HAYDEN. Now, with regard to fire suppression for which you ask $140,000 in fiscal 1963, the same amount as was provided for fiscal 1962, but which is now subject to an increase through a supplemental appropriation bill. What has been your average fire suppression cost over the past 10 years?

Mr. NASH. Mr. Kephart?

Mr. KEPHART. I am not sure whether we have it.

Chairman. HAYDEN. You may place in the record the answer to my question.

Mr. KEPHART. Yes, sir.

(The information referred to follows:)

Fire suppression costs for the fiscal years 1952–61

Fiscal year	Appropriated Federal funds		Tribal funds	Total costs
	Fire suppression	Forest and range lands		
1952	$241,791	$35,106	$30,128	$307,025
1953	112,028	34,457	16,900	163,385
1954	150,722	27,311	27,660	205,693
1955	115,208	18,726	21,501	155,435
1956	225,408	19,735	59,191	304,334
1957	281,644	30,631	57,869	370,144
1958	209,888	25,600	37,171	272,659
1959	521,734	59,367	35,133	616,234
1960	439,886	29,057	29,020	497,963
1961	1,206,249	65,770	42,120	1,314,139
Total	3,504,558	345,760	356,693	4,207,011
10-year average	350,456	34,576	35,669	420,701

EFFORT TO AVOID SUPPLEMENTAL REQUESTS

Chairman HAYDEN. Have you considered increasing the amount of your budget estimate with a view to avoiding a supplemental request each year?

Mr. MASSEY. We have considered that, Mr. Chairman. The difficulty is determining what amount we will need.

Chairman HAYDEN. That same question arises with respect to the Forest Service. You never know whether you are going to have a very dry year and a lot of fires or not.

Senator MUNDT. You cannot change the weather you get, can you?

Mr. MASSEY. No.

PUMPING ON SAN CARLOS IRRIGATION DISTRICT

Chairman HAYDEN. Last fall, pumping on the San Carlos Indian irrigation project had to be stopped for the reason that the San Carlos Irrigatlon & Drainage District, comprising the non-Indian lands, was unable to supply funds to meet its share of the cost of pumping. I understand that all available water from whatever source is owned jointly by the Indians and non-Indians, and any which would have been pumped with Indian funds would also have been available to the non-Indian landowners. What solution, if any, was finally reached with regard to this problem?

Mr. NASH. We had some negotiations and discussions on that. Most of those projects down there would be solved by getting into a wetter cycle. We had very good news from the acreage behind Coolidge Dam earlier in the winter. I do not have it in the last couple of weeks.

Chairman HAYDEN. I realize it has been a very dry year and there has been more colder weather than for many years past.

Mr. NASH. At the time we cut off the pumping, Mr. Chairman, Coolidge reservoir was down to about 16,000 or 17,000 acre-feet. About a month ago, which is the last figure I happen to have in my recollection, it was up to 120,000 acre-feet, which is very encouraging to us. There are some negotiations going on now.

Chairman HAYDEN. Unfortunately, a great engineering mistake was made by the Army Engineers a long time ago, who estimated that there was more water in the river than there turned out to be. Therefore more land was included for both Indians and whites for the purpose of irrigation than was justified. We have tried to remedy it in various ways and the storage of these river floods will help some. Further than that, if Arizona gets a suitable settlement in the Supreme Court we can get some Colorado River water which will help those areas quite a bit.

PINE RIDGE IRRIGATION PROJECT

Senator MUNDT. I notice your budget includes several items on construction and rehabilitation of various irrigation projects. What is the present status of the Pine Ridge irrigation system?

Mr. NASH. I am not familiar with any irrigation system on Pine Ridge. Mr. Cornelius?

Mr. CORNELIUS. I do not know the status of that project.

Senator MUNDT. Can you pick it up and put it in the record at this point? And if there are any recommendations you have about moving ahead on it, also supply that.

Mr. CORNELIUS. Yes.

(The information referred to follows:)

During fiscal year 1961, land designation and soil studies were made on this unit and a part of a completion study to determine the feasibility of reconstruction. An economic study is also in process. The engineering studies will be started as soon as conditions permit.

Until the overall study is completed we cannot make any recommendations as to this unit.

CONSTRUCTION

Chairman HAYDEN. The fiscal year 1963 budget estimate for construction is $54,765,000, an increase of $14,172,689 over the amount of funds available during fiscal year 1962. The justifications for this request will be included in the record.

(The justification follows:)

BUREAU OF INDIAN AFFAIRS—CONSTRUCTION

Appropriation, 1962		$39, 561, 000
Transferred to General Services Administration (75 Stat. 353)		1, 011

1. Buildings and utilities, $50,483,000

Construction of education facilities to reduce out-of-school backlog.—The 1962 budget estimate projected a backlog of 4,339 children on the Navajo Reservation in Arizona and New Mexico, in Alaska and in Mississippi who would be without school facilities at the start of the school term September 1962, plus the normal increase in the school population. Actual experience requires this projection to be adjusted to account for 278 less seats than were estimated and 348 more pupils than were projected, adjusting the projected backlog to 4,965. The projected increase in school population for 1963 is 2,226, making a total of 7,191 requiring seats by September 1963. The 1963 budget includes funds to provide for 3,690 additional seats, leaving a projected out-of-school backlog of 3,501 to be provided for in subsequent years, plus the normal annual increase of children becoming of school age.

This estimate also provides for the construction of 330 additional seats in school facilities in locations other than Navajo, Alaska, and Mississippi to relieve overcrowding, and provide space for normal increase in school-age population. The estimate also provides for the replacement of 3,630 seats in some of the most hazardous, unsafe, and substandard buildings in the existing Bureau school plants.

Advance planning.—To permit construction of the needed educational facilities in a timely manner, the Bureau proposes to continue its advance planning program. This program will allow the Bureau to keep pace with the number of children who annually become of school age and to overcome the backlog of out-of-school children in a most expeditious manner. Under this program, drawings and specifications can be prepared in advance and construction can proceed immediately upon availability of funds.

Other needed facilities.—This estimate includes programs for improvements of water, sewer, and other utilities at locations where there is an urgent need of improvement. Also programs for much needed jails as well as housing for employees, which are urgently needed in order to recruit and retain staff personnel to carry out the Bureau programs. An estimate for the major alterations and improvements to some of the existing buildings and utilities systems is also included.

The problems confronting the Bureau.—While excellent progress has been made toward providing educational facilities for children who have not previously had classroom space, the need is still great to overcome three serious problems that continue to confront the Bureau. The three problems are (1) constructing adequate educational facilities for children still out of school, those who will become of school age in subsequent years, and those children now being housed in seriously overcrowded existing buildings; (2) constructing adequate housing for Bureau employees in isolated areas; and (3) replacement of ancient, obsolete, and substandard buildings and equipment which are unsafe for occupancy and require excessive expenditures to maintain.

Buildings and utilities construction program, fiscal year 1963

2. Irrigation systems, $4,282,000

This activity provides funds for the continuation of irrigation development work on existing and approved irrigation projects on Indian reservations located in the arid and semiarid West where the conservation and development of lands and water for agricultural irrigation are of fundamental importance to enable

the Indian to become self-supporting and to make proper use of his land and water resources. The development and extension of irrigation projects on Indian reservations are primarily for the benefit of resident reservation Indian families. The facilities, however, also directly benefit the surrounding community, as well as non-Indian-owned lands included within the projects. Most Indian-owned land is devoted to stock raising. The success of stock raising is largely dependent on an adequate supply of winter feed which can be produced on irrigated land. The early completion of these existing and continuing projects will make possible the determination of final per acre construction costs for reimbursement purposes and will greatly facilitate the program and policy of the Bureau in transferring the responsibility for operation and maintenance of the systems to the water users.

The type of work proposed is the construction, extension, rehabilitation, and betterment of irrigation systems; land clearing and leveling; and surveys and investigations.

The major structures and canal systems are completed, or nearing completion, on many of the projects. The work now proposed will consist primarily of extending canals and laterals, land clearing and leveling, extension of drainage systems and the rehabilitation and betterment of existing irrigation projects.

There was initiated during the fiscal year 1961 a program for the preparation of rehabilitation and completion reports for all existing and authorized projects and feasibility reports for new and unauthorized projects. When completed these reports will provide a complete and up-to-date inventory of project acreages, irrigation facilities, and needs and requirements for long-range planning.

Irrigation Construction

Summary of projects

(a) Annual contract payments	$16,000
Fort Belknap	6,250
Tongue River	9,750
(b) Construction	2,641,872

Geological Survey	4,958	6,186		−6,186

OBLIGATION OF FUNDS FOR SCHOOL CONSTRUCTION

Senator HAYDEN. How much of the appropriation for construction of school facilities provided in fiscal year 1962 has been obligated to date; and how much will be obligated prior to the end of June?

Mr. NASH. Sir, we have that information.

This is the status report. On December 31, 1961, there was $39½ million available. The total adjusted appropriation for 1962, in round numbers was the same amount. With carryover balance, there was available $40½ million. In the ensuing 6 months up to the 31st of December 1961, about $18½ million had been obligated, leaving $21.9 million still to be obligated. Thus, in 6 months of the calendar year, approximately one-half the total obligational authority had been contracted for, so that we are about up to where we would expect to be and have every expectation of using all the money during the current year.

PRIORITY OF PROJECTS

Chairman HAYDEN. In the material which I have placed in the record are summaries of the projects which you have proposed, arranged by States. Are these projects in order of desired priority within the State listings?

Mr. NASH. You are asking, sir, whether the material we submitted for fiscal 1963 are in the order of desirability as determined by our engineers and program people?

Senator MUNDT. Within each State.

Mr. NASH. Within each State.

Senator MUNDT. That was the chairman's request.

Mr. MASSEY. The budget list is not listed in order of priority. We have a listing of the total project by priorities and then we have broken down the priorities by the various areas. We can supply that for the record.

Chairman HAYDEN. Will you also furnish for the record a listing prepared on a priority basis?

Mr. MASSEY. We have a list prepared on a priority basis.

Mr. NASH. My answer is "Yes" on both counts. That is, we have two lists here, one listing all building by priority and then a state list by priority.

(The information referred to follows:)

Priorities have been assigned projects included in the 1963 budget based upon the need for the project considering individually or a combination of the following criteria:

School seats for out-of-school children.

Rehabilitating those school facilities that would otherwise (if not rehabilitated in immediate future) result in adding to out-of-school backlog.

Health and safety of school children and Bureau employees.

The orderly continuation and progress of the Bureau's construction program.

PROJECTS LISTED BY PRIORITY

Keams Canyon sewage lagoon (Arizona)
Lukachukai School (Arizona)
Lake Valley School (New Mexico)
Major alterations and improvements (various)
Tuba City School (Arizona)
Crownpoint School (New Mexico)
Greasewood School (Arizona)
White Cone School (Arizona)
Aneth School (Utah)
Rock Point School (Arizona)
Barrow utilities (Alaska)
Hooper Bay School (Alaska)
Fairbanks School—Advance planning (Alaska)
Kiana School (Alaska)
Kwethluk School (Alaska)
Newktok School (Alaska)
Noatak School (Alaska)
Klagetoh School (Arizona)
Low Mountain School (Arizona)
Red Rock School (Arizona)
Rough Rock School (Arizona)
Kayenta School (Arizona)
Tohatchi School (New Mexico)
Oscarville School (Alaska)
Scammon Bay School (Alaska)
Tatitlek School (Alaska)
Crystal School (New Mexico)
White Horse School (New Mexico)
Fort Yates School (North Dakota)
Mandaree School (North Dakota)
Quarters (various)
Cheyenne-Arapaho storm shelters (Oklahoma)
Flandreau School (South Dakota)
Blackfeet dormitory (Montana)
Phoenix girls' dormitory (Arizona)
Belcourt additional facilities (North Dakota)
Tanunak School (Alaska)
Stebbins School (Alaska)
Nondalton School (Alaska)
Old Harbor School (Alaska)
Alitak School (Alaska)
Eagle School (Alaska)
Tetlin School (Alaska)
Seneca School (Oklahoma)
Advance Planning (various)
Water exploration and development (various)
Sherman boys' dormitory (California)
Stewart School dormitory rehabilitation (Nevada)
Fort Sill kitchen and dining hall (Oklahoma)
Riverside School and dining hall (Oklahoma)
Chilocco shop building (Oklahoma)
Wahpeton dormitories (North Dakota)
Phoenix classroom building (Arizona)
Mescalero water and sewer (New Mexico)
Colville Agency sewage lagoons (Washington)
Uintah and Ouray water storage (Utah)
Salt River water and sewer (Arizona)
Cove School water (Arizona)
Borrego Pass water improvement (New Mexico)
Wingate water improvement (New Mexico)
Busby fire station (Montana)
Northern Cheyenne jail (Montana)
Owyhee jail (Nevada)
Oraibi School multipurpose room (Arizona)

PROJECTS LISTED BY STATES BY PRIORITY

Alaska:
- Barrow Utilities
- Hooper Bay School
- Fairbanks School—Advance planning
- Kiana School
- Kwethluk School
- Newktok School
- Noatak School
- Oscarville School
- Scammon Bay School
- Tatitlek School
- Tanunak School
- Stebbins School
- Nondalton School
- Old Harbor School
- Alitak School
- Eagle School
- Tetlin School

Arizona:
- Keams Canyon Sewage Lagoon
- Lukachukai School
- Tuba City School
- Greasewood School
- White Cone School
- Rock Point School
- Klagetoh School
- Low Mountain School
- Red Rock School
- Rough Rock School
- Kayenta School
- Phoenix girls dormitory
- Phoenix classroom building
- Salt River water and sewer
- Cove School water
- Oraibi School multipurpose room

California: Sherman boys dormitory

Montana:
- Blackfeet dormitory
- Busby fire station
- Northern Cheyenne jail

Nevada:
- Stewart School dormitory rehabilitation
- Owyhee jail

New Mexico:
- Lake Valley School
- Crownpoint School
- Tohatchi School
- Crystal School
- White Horse School
- Mescalero water and sewer
- Borrego Pass water improvement
- Wingate water improvement

North Dakota:
- Fort Yates Elementary School
- Mandaree School
- Belcourt additional facilities
- Wahpeton dormitories

Oklahoma:
- Cheyenne-Arapaho storm shelters
- Seneca School
- Fort Sill kitchen and dining hall
- Riverside School and dining hall
- Chilocco shop building

South Dakota: Flandreau

Utah:
- Aneth School
- Uintah and Ouray water storage

Washington: Colville Agency sewage lagoons

Various:
- Major alterations and improvements
- Quarters
- Advance planning
- Water exploration and development

METHOD OF DETERMINING PRIORITY

Chairman HAYDEN. Indicate briefly in the means by which the priority is determined.

Mr. NASH. You are asking the question, sir, how is the priority determined?

Chairman HAYDEN. Yes. I want to know how you do it.

Mr. MASSEY. Senator Hayden, let me clear it up. The budget justifications which you have before you are not in priority order. The Commissioner is talking about a special listing which is in priority order and this is what we will submit for the record.

Chairman HAYDEN. Well, you will place those lists in the record.

Mr. MASSEY. Yes. We will place this in the record and this list does tell you on what basis we have made the priority listings.

JAIL AT HUALAPAI

Chairman HAYDEN. Last year the Congress appropriated $82,000 for jail facilities in the Hualapai Indian Reservation, stipulating that the tribe should contribute not less than $15,000 for this facility. What is the status of the work on the jail?

Mr. ALLEN. The contract has been awarded. The tribe has put up their $15,000 for their portion.

Chairman HAYDEN. They are just contributing their share?

Mr. ALLEN. Yes; $15,000.

Senator MUNDT. While we are on the subject of jails, there is a question as to new jail facilities for Montana and Nevada and several years ago we constructed new facilities for the jails in South Dakota but we changed the name and concept so as to be sort of a community center and had reading rooms and other facilities and it worked out nicely in that area. I am wondering whether you have in mind making sort of a multiple structure in these new so-called jails so you can do something for the fellow obeying the law as well as the fellow who is violating it.

Mr. NASH. Mr. Benge, do you care to comment?

Mr. BENGE. I believe the new planned facilities in Montana and Nevada are on the same plans as the ones in South Dakota.

Mr. MUNDT. Each will have community rooms and reading rooms. This is very fine. They even put out a little paper from the Indian reservation and it has a pleasing result and with a little extra cost you could make that standard operating procedure.

Chairman HAYDEN. Is that standing operating procedure now in all jails?

Mr. MASSEY. We have not changed our plans on this.

Senator MUNDT. What does that mean, that you have not changed them preceding the experiment in South Dakota?

Mr. MASSEY. They are on the same basis as they were in South Dakota.

REHABILITATION OF "EMORY VICTORY"

Chairman HAYDEN. With regard to the replacement of the *North Star*, have contracts for rehabilitation of the *Emory Victory* been let?

Mr. MASSEY. Yes, sir.

Mr. NASH. That ship will be in service on its regular run when the appropriate time comes.

Chairman HAYDEN. Did this price fall within the estimate of the Bureau of Indian Affairs?

Mr. NASH. No; the costs, when we got into the contract exceeded the amount of our estimates by the difference between $375,000 and $384,044. The difference would not make it necessary to seek additional moneys because that difference can be met out of the reserve fund built into the rate structure.

Chairman HAYDEN. It is contemplated the *North Star* will carry passengers as well as cargo, and commercial as well as Government shipping?

Mr. MASSEY. It will only carry passengers to the extent that our employees move from one location to the other. We do not carry passengers as a service to the public.

COST OF SHIP OPERATION

Chairman HAYDEN. What do you estimate the annual cost for operating the *North Star* to be?

Mr. MASSEY. I believe that the estimate is around a half a million dollars and this is taken care of by the rate structure that we charge for hauling the freight. Of course, as you know, we haul the freight for the natives, for the employees in the isolated places as well as our own operation.

Senator MUNDT. Are you saying there will be no charge against the Government for operation, that it will be self-supporting, the rate structure will be kept high enough to cover the costs of operation?

(The following information was submitted:)

It is estimated that it will cost approximately $714,000 for fiscal year 1964 to operate the new ship *North Star*. The capacity of the new *North Star* is approximately 11,500 tons as compared to approximately 5,300 tons capacity of the old *North Star*.

CHARGE TO GOVERNMENT

Mr. MASSEY. It will be a charge to the Government. For instance, this is the way we operate. When we haul supplies for schools, the education program will pay the rate for the education supplies.

These construction estimates include funds for transportation in Alaska. That is the reason why they are so high. So each activity that is serviced by the vessel pays the rate and this rate structure is fixed to where it will pay the operation plus a reserve for their annual overhaul plus emergencies. When it is built up to an adequate level, then the rate structure is adjusted only to meet the cost of operating the vessel.

Senator MUNDT. Let me rephrase the question, then. Are you establishing a rate structure and operating the ship on the basis so that there is no extra charge on the Government as against your having to pay the shipping costs as by a private shipping company?

Mr. MASSEY. If we had to pay commercial shipping rates for these places it would increase the cost to the Government. The operation of this vessel is a substantial saving to the Government.

Chairman HAYDEN. The reason why, as I understand it, that they have a vessel, is because it goes into holes and around corners that are off the route of the mainline shipping between the United States and Alaska?

Mr. MASSEY. Yes, sir; that is correct.

LIQUIDATION OF CONTRACT AUTHORIZATION

Chairman HAYDEN. There is a request for $17 million during fiscal year 1963 to liquidate contract authorizations in connection with Federal-aid highway contracts, and for completion of Routes 1 and 3 on the Navajo-Hopi Reservations. The justifications will be included in the record.

(The justification follows:)

Road construction contract authorization and liquidation program

FISCAL YEAR 1961

	Contract authority available	Obligations	Unliquidated obligations prior year	Obligations	Expenditures	Unliquidated obligations carried forward
Federal-aid highway roads	$14, 863, 155	$14, 394, 134	$5, 600, 715	$19, 994, 849	$9, 706, 660	$10, 288, 189
Navajo-Hopi, Routes 1 and 3	4, 206, 436	4, 157, 326	2, 645, 821	6, 803, 147	3, 774, 819	3, 028, 328
Total	19, 069, 591	18, 551, 460	8, 246, 536	26, 797, 996	13, 481, 479	[1] 13, 316, 517

FISCAL YEAR 1962

Federal-aid highway roads	$12, 469, 021	$12, 469, 021	$10, 288, 189	$22, 757, 210	$13, 503, 376	$9, 253, 834
Navajo-Hopi, Routes 1 and 3	5, 049, 110	5, 049, 110	3, 028, 328	8, 077, 438	5, 746, 201	2, 331, 237
Total	17, 518, 131	17, 518, 131	13, 316, 517	30, 834, 648	19, 249, 577	[2] 11, 585, 071

FISCAL YEAR 1963

Federal-aid highway roads	$12, 000, 000	$12, 000, 000	$9, 253, 834	$21, 253, 834	$12, 668, 763	$8, 585, 071
Navajo-Hopi, Routes 1 and 3	4, 000, 000	4, 000, 000	2, 331, 237	6, 331, 237	6, 331, 237	----------
Total	16, 000, 000	16, 000, 000	11, 585, 071	27, 585, 071	19, 000, 000	8, 585, 071

[1] Available cash for liquidation is $5,249,577; balance of $8,066,940 is unfunded.
[2] Available cash for liquidation is $2,000,000; balance of $9,585,071 is unfunded.

Status of cash appropriation for liquidation of contract authorization

	1961	1962	1963
Appropriation	$14, 500, 000	$16, 000, 000	$17, 000, 000
Unexpended balance brought forward	4, 231, 056	5, 249, 577	2, 000, 000
Total available	18, 731, 056	21, 249, 577	19, 000, 000
Less expenditures	13, 481, 479	19, 249, 577	19, 000, 000
Unexpended balance	5, 249, 577	2, 000, 000	----------

JUSTIFICATION

Road construction, $16 million

1. *Federal-aid highway roads.—1961, $14,394,134; 1962, $12 million; 1963, $12 million.*—Federal-Aid Highway Act of 1960 (Public Law 86–657) authorized in section 2, for the purpose of carrying out the provisions of title 23 of the United States Code, the appropriation for Indian reservation roads and bridges, $12 million for the fiscal year ending June 30, 1962, and $12 million for the fiscal year ending June 30, 1963.

Title 23 of the United States Code provides, in section 101, the definition of Indian reservations roads; and in section 203, that funds authorized for Indian reservation roads shall be available for contract on a date not earlier than 1 year preceding the beginning of the fiscal year for which authorized; and that the Secretary of the Department charged with the administration of such funds is granted authority to incur obligations, approve projects, and enter into contracts under such authorizations, and his action in doing so shall be deemed a contractural obligation of the United States for the payment of costs thereof.

The objective of the road construction program is to improve roads on the Indian Bureau road system to standards of adequacy that are commensurate with the road transportation needs. The Indian Bureau road system is comprised of those roads which are required to serve Indian lands, and which are not furnished by the counties because of the tax-free status of Indian lands.

It is the practice of the Bureau to enter into agreements whereby the Bureau improves a reservation road and the county takes over the improved road and maintains it henceforth at county expense. The Bureau system has been reduced more than 3,000 miles during the past 10 years due to the transfer of improved roads to local governments. The Bureau road system totals 16,446 miles including 13,649 miles of substandard roads that require improvements to serve the reservations adequately.

The annual program consists of the most critical of these needs, and the projects selected are those which have been judged by Bureau highway engineers, tribal councils, and cooperating counties as those which should be given highest priority. Long-range planning is revised each year in form of control schedules in which projects are scheduled in accordance with anticipated funds and priority. Current control schedules list projects proposed for each year 1963 through 1967 at a total estimated cost of $60 million. Projects are identified by reservation, route numbers, name of road, class of work, length, and estimated cost. Programing of individual projects is subject to the coordination with programs of local governments, available funds, local and engineering conditions.

It is estimated that the following program will result in the transfer of 365 miles of Bureau roads to counties. An itemized breakdown of the 1963 estimate follows:

(*a*) Grading and draining ..... miles	393.0	$5,672,000
(*b*) Surfacing ..... do	429.7	4,838,000
(*c*) Bridge construction ..... feet	1,638.0	589,000
(*d*) Future surveys and plans ..... miles	484.0	901,000
Total		12,000,000

(*a*) Grading and draining, $5,672,000. This feature covers clearing rights of way, installing drainage structures, and constructing a roadbed by excavating high ground and filling low ground. This results in a well-drained earth embankment with easy grades and flat curves, built so that roadbed will provide a firm foundation for the surface course. The estimate covers 393 miles of grading and draining.

(*b*) Surfacing, $4,838,000. This estimate covers the surfacing of 429.7 miles of roads; 290.1 miles will have a base course and surface course of local materials such as gravel. The remaining 139.6 miles are on the heavier traffic roads and will have the gravel surface mixed with bituminous material.

(*c*) Bridge construction, $589,000. This covers the construction of 1,638 running feet bridges. Most of this will replace wornout spans now in a dangerous condition.

(*d*) Future surveys and plans, $901,000. This covers preliminary engineering, surveys, and preparation of plans and specifications for the construction of roads and bridges. The estimate covers surveys and plans for 484 miles of roads.

The average estimated cost for grading and draining is $14,432 per mile; for gravel surfacing, $6,542; for bituminous surfacing, including base course, $21,060 per mile; for bridge construction, $360 per running foot; and for future surveys and plans, $1,861 per mile.

The total 1963 program has been allocated to area offices with jurisdictions covering reservations in 21 States, and to agencies covering one to several reservations. Tentative allocations have been made to individual projects. The final projects built will vary slightly, due to such factors as the amount of the low bid on contracts. Other factors, such as the obtaining of county takeover agreements, and unexpected development in other programs, such as education or irrigation, can affect the final program. The 1963 road construction program is distributed as follows:

(1) *Aberdeen area, $1,710,000.*—This area program totals 65 miles of grading and draining; 78 miles of surfacing of which 7 miles is bituminous surfacing and 300 feet of bridge construction. The program includes the following: Nebraska—Four Corners loop on the Winnebago Reservation; North Dakota—East-West Road and Mission Road on the Fort Totten Reservation; North Reservation Line Road on the Turtle Mountain Reservation; South Dakota—Ridgeview Road on the Cheyenne River Reservation; Grace Mission-Shelby Road on the Crow Creek Reservation; U.S. 18-Slim Buttes Road on the Pine Ridge Reservation; Greenwood-Choteau Road on the Yankton Reservation; He Dog Road on the Rosebud Reservation; Little Eagle Road on the Standing Rock Reservation, and the Little Minnesota Bridge on the Sisseton Reservation.

(2) *Anadarko area, $390,000.*—This area program totals 7.5 miles of grading and draining; 20.5 miles of bituminous surfacing. The program includes the following: Oklahoma—Eagle City Road on the Cheyenne and Arapaho Reservation; Murrow Road and the Fort Sill Road on the Kiowa Reservation; Big Jim Road on the Shawnee Reservation; Kansas—the Haskell Institute streets will be paved.

(3) *Billings area, $800,000.*—This area program totals 37.2 miles of grading and draining; 44.2 miles of surfacing of which 15.5 miles are bituminous surfaced; and 120 feet of bridge construction. The program includes the following: Montana—Birch Creek Road and Cut Bank Creek Bridge on the Blackfeet Reservation; Little Horn-Windy Point Road and the Big Horn feeder roads on the Crow Reservation; South Fork Jocko Trail on the Flathead Reservation; Brookside-Zortman Road on the Fort Belknap Reservation; Box Elder Upper Road on the Rocky Boy Reservation; Poplar West Road on the Fort Peck Reservation; Lame Deer-Birney Road on the Northern Cheyenne Reservation; and Wyoming—Arapahoe-Left Hand Ditch Road on the Wind River Reservation.

(4) *Gallup area, $3,900,000.*—This area program totals 72.8 miles of grading and draining; 72.8 miles of surfacing of which 52.8 miles are bituminous surfaced and 148 feet of bridge construction. The program includes the following: Arizona—Lukachukai Bridge to Rock Point; Rock Point to Route 1 and Route 8 toward Kayenta on the Navajo Reservation; New Mexico—Tapacitos to Route 4 on the Jicarilla Reservation; U.S. 66 to Encinal on the Laguna Pueblo; San Ildefonso road on the San Ildefonso Pueblo; the Jemez Bridge on the Jemez Pueblo; and Colorado—the Moab Road on the Consolidated Ute Reservation.

(5) *Minneapolis area, $490,000.*—This area program totals 43 miles of grading and draining and 43 miles of gravel surfacing. The program includes the following: Minnesota—Ponsford-White Earth Road, White Earth-Kays Corner Road and the Pine Bend Road on the White Earth Reservation; Nebish Road on the Red Lake Reservation; and Wisconsin—Birch Lake Falls Road on the Bad River Reservation and Bear River Road on the Lac du Flambeau Reservation.

(6) *Muskogee area, $410,000.*—This area program totals 26.5 miles of grading and draining, 31.2 miles of surfacing of which 4.7 miles are bituminous surfaced and 130 feet of bridge construction. The program includes the following: Mississippi—School service roads and Manik Waiya Mound Road on the Choctaw Reservation and; Oklahoma—Salina Creek Road, Echota West Road, Stilly School Road, Kemp Road, and Stomp Ground Road for the Five Civilized Tribes.

(7) *Phoenix area, $2,210,000.*—This area program totals 64.3 miles of grading and draining, 63.3 miles of surfacing of which 21.3 miles are bituminous surfaced and 707 feet of bridge construction. The program includes the following: Arizona—Parker-Ehrenberg Road and on the Colorado River Reservation; Highway 60-Cibecue Road on the Fort Apache Reservation; Sells-San Miguel Bridge and Covered Well Bridge on the Papago Reservation; Lehi Road, east boundary to Route 21 and south boundary to FAS 338 on the Salt River Reservation; Antelope Flats-Bronco Road and Hackberry Trail on the San Carlos Reservation; Painted Desert section of Route 4, Painted Desert to Indian Wells and Oraibi Streets on the Hopi Reservation; Nevada—Consolidated roads on the Walker River Reservation and Owyhee Island roads on the Duck Valley Reservation; Utah—Green River Bridge and the Neola-Uintah Canyon Road on the Uintah and Ouray Reservation.

(8) *Portland area, $1,400,000.*—This area program totals 58.5 miles of grading and draining, 58.5 miles of surfacing of which 11 miles are bituminous surfaced and 128 feet of bridge construction. The program includes the following: Idaho—Michaud roads on the Fort Hall Reservation; Oregon—St. Andrews Mission Road and Cayuse Road on the Umatilla Reservation and Lower Warm Springs River Road on the Warm Springs Reservation; Washington—Bridge Creek Road on the Colville Reservation; Moclips-Olympic Road on the Quinault Reservation, and Potatoe Hill Road on the Yakima Reservation.

(9) *Sacramento area, $490,000.*—This area program totals 6.8 miles of grading and draining, 6.8 miles of bituminous surfacing and 65 feet of bridge construction. The program includes the following: California—Agency Creek Road, Willow Lane Road, and Zenia Road on the Round Valley Reservation; Matilton Cutoff Road, Agency streets, Marshall Lane Road, and Hostler Creek Bridge on the Hoopa Valley Reservation.

(10) *Washington area $200,000.*—This area program totals 11.4 miles of grading and draining, 11.4 miles of gravel surfacing, 40 feet of bridge construction and central office supervision of the road construction program. The program includes the following: Florida—State Reservation Road and bridge on the Big Cypress Reservation; North Carolina—Goose Creek Road and Adams Creek Road on the Cherokee Reservation.

FEDERAL-AID HIGHWAY ROADS

Area budget classification—breakdown 1963

Area	Total	Grade and draining		Surfacing		Bridges		Surveys and plans	
		Miles	Amount	Miles	Amount	Feet	Amount	Miles	Amount
Aberdeen	$1,710,000	65.0	$1,055,000	78.0	$385,000	300	$105,000	85	$165,000
Anadarko	390,000	7.5	85,000	20.5	290,000			15	15,000
Billings	800,000	37.2	432,000	44.2	278,000	120	40,000	40	50,000
Gallup	3,900,000	72.8	1,539,000	72.8	2,111,000	148	50,000	120	200,000
Minneapolis	490,000	43.0	282,000	43.0	191,000			15	17,000
Muskogee	410,000	27.5	241,000	31.2	121,000	130	32,000	25	16,000
Phoenix	2,210,000	64.3	1,125,000	63.3	655,000	707	245,000	95	185,000
Portland	1,400,000	58.5	598,000	58.5	603,000	128	38,000	67	161,000
Sacramento	490,000	6.8	188,000	6.8	157,000	65	69,000	12	76,000
Washington	200,000	11.4	127,000	11.4	47,000	40	10,000	10	16,000
Total	12,000,000	393.0	5,672,000	429.7	4,838,000	1,638	589,000	484	901,000

2. *Navajo-Hopi Roads, Routes 1 and 3—1961, $4 million; 1962, $5 million; 1963, $4 million.*—Section 1 of Public Law 474, 81st Congress (64 Stat. 44) approved April 19, 1950, and entitled "An Act to promote the rehabilitation of the Navajo and Hopi Tribes of Indians and a better utilization of the resources of the Navajo and Hopi Indian Reservations and for other purposes" authorizes an item (7) "Roads and trails," $20 million. This was for the purpose of making available the resources of these reservations for use in promoting a self-supporting economy and self-reliant communities, and to lay a stable foundation on which these Indians can engage in diversified economic activities and ultimately attain standards of living comparable with those enjoyed by other citizens. This section further states, "Funds appropriated under these authorizations shall be in addition to funds made available for use on the Navajo and Hopi Reservations, or with respect to Indians of the Navajo Tribes, out of appropriations heretofore or hereafter granted for the benefit, care, or assistance of Indians in general or made pursuant to other authorizations now in effect."

Section 2 of the act states that so far as practicable the programs shall be presented in a manner which will provide for the completion of the program within 10 years of the date of enactment (April 19, 1950.)

Public Law 85-740, enacted August 23, 1958, provides for the improvement of certain roads on the Navajo and Hopi Indian Reservations. This act amends Public Law 474 approved April 19, 1950 (64 Stat 44) (1) by striking out "88,570,000" and inserting in lieu thereof "108,570,000"; (2) by amending clause (7) of such section to read as follows: "(7) Roads and trails, $40,000,000; of which not less than $20,000,000 shall be (A) available for contract authority for such construction and improvement of the roads designated as route 1 and route 3 on the Navajo and Hopi Indian Reservations as may be necessary to bring the portion of such roads located in any State up to at least the secondary road standard in effect in such State, and (B) in addition to any amounts expended on such roads under the $20,000,000 authorization provided under this clause prior to amendment; *Provided*, That such contract authority and such appropriation authorized by this amendment shall be in addition to sums apportioned to Indian reservations or to the State of Arizona under the Federal-Highway Act as amended and supplemented (70 Stat 374)."

ROUTE 1

Navajo Route 1 extends 183.4 miles from Arizona State highway U.S. 89 near Cameron, Ariz., northeasterly via Tuba City, Ariz., Kayenta, Ariz., the four corners of Colorado, Utah, New Mexico, and Arizona to New Mexico State highway U.S. 666 near Shiprock, N. Mex.

Prior to start of this program, 11.5 miles of Route 1 from U.S. 89 to Tuba City were improved with a bituminous surface. This section will require shoulder construction and a high-type bituminous surface. The eastern part of the route, 21.84 miles from the Arizona-New Mexico State line to U.S. 666 near Shiprock, had also been improved to near State highway standards. This section was constructed to a high-type bituminous surface but requires shoulder construction and the replacement of two timber bridges.

The remaining 150.1 miles were of low standard or unimproved road and trail. This unimproved section required complete reconstruction to secondary State highway standards. State secondary highway standards are required to serve the character and volume of traffic which engineering studies have established that this road must carry. All of this 150.1 miles was programed during the 1959 through 1962 fiscal years.

The total estimated cost of the improvements required to improve Route 1 to Arizona State secondary standards is $13,976,000. The 1959, 1960, 1961, and 1962 programs provided for $12,451,000 for Route 1. This 1963 estimate will provide $1,525,000 to complete all work on Route 1.

ROUTE 3

Route 3 extends easterly 163.5 miles from Tuba City, Ariz., via Keams Canyon, Ariz.; Ganado, Ariz.; and Window Rock, Ariz., to New Mexico State highway U.S. 666 north of Gallup, N. Mex.

The 15.9 miles of this route between the Arizona-New Mexico line and U.S. 666 north of Gallup had previously been improved to State highway standards for the grading and base course; only a high type bituminous pavement is required to complete this section. Prior to this program the remaining 147.6 miles had been surfaced with low-type bituminous surface except a 19.5 mile section east of Ganado which was surfaced with a plant mix bituminous mat.

The work required on Route 3 is widening the roadbed and base course and constructing a 26-foot high-type bituminous pavement. Four old wooden bridges must be replaced with steel and concrete structures, and some grading for alinement and grade changes in bad spots is required.

The total estimated cost of Route 3 is $6,024,000. The 1959 through 1962 fiscal year programs have provided $3,549,000 for this route, and this estimate will provide $2,475,000 to complete Route 3.

Summary of 1959, 1960, 1961, and 1962 programs

	Total amount	Grade and draining, miles	Surfacing, miles	Bridges, feet	Surveys, miles
Route 1	$12,451,000	149.8	149.8	967	183.4
Route 3	3,549,000	96.7	96.7	685	163.5
Total, programs through 1962	16,000,000	246.5	246.5	1,652	346.9

1963 estimate

The work covered by this estimate of $4 million obligation program for the 1963 fiscal year falls into the standard budget classifications as follows:

(*a*) Grading and draining, 84.5 miles	$1,088,000
(*b*) Bituminous surfacing, 100.4 miles	2,812,000
(*c*) Bridge construction, 204 feet	100,000
Total	4,000,000

(*a*) *Grading and draining, $1,088,000.*—This feature covers extending culvert pipe, widening the road bed and placing select material thereon: 33.6 miles of Route 1 will be widened, 5 feet on each side at an estimated cost of $27,023 per mile; 50.9 miles of Route 3 will be widened, 1 foot on each side at an estimated cost of $3,536 per mile.

(*b*) *Bituminous surfacing, $2,812,000.*—This feature covers the construction of base course on the widened portion and a bituminous mat over the entire surface to meet requirements of State secondary standards: 33.6 miles on Route 1 will be surfaced at an estimated cost of $18,363 per mile; 66.8 miles on Route 3 will be surfaced at an estimated cost of $32,859 per mile.

(*c*) *Bridge construction, $100,000.*—This estimate covers the cost of bridge construction on Route 3.

The program for 1963 will complete all work as provided in Public Law 85-740.

In accordance with an agreement between the Bureau of Indian Affairs and the States of New Mexico and Arizona, the projects on Routes 1 and 3 are constructed by the Bureau to accepted State highway secondary standards and when completed the States will accept full responsibility and designate each route as a State highway.

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$18,551,460	$17,518,131	$16,000,000	−$1,518,131
Unobligated balances brought forward	−28,069,591	−21,518,131	−16,000,000	+5,518,131
Unobligated balance carried forward	21,518,131	16,000,000		−16,000,000
Contract authorization (new) (permanent)	12,000,000	12,000,000		−12,000,000
Obligations by objects:				
11 Personnel compensation	2,653,815	3,115,908	3,245,908	+130,000
12 Personnel benefits	169,902	193,000	193,000

Total, Bureau of Public Roads	293,238	223,000	100,000	−123,000
Total obligations	18,551,460	17,518,131	16,000,000	−1,518,131

FORCE ACCOUNT WORK

Chairman HAYDEN. At my request you prepared a statement on acquisition of road equipment which will be needed in shifting the Bureau's road construction program from contract to force account. I will include this statement in the record.

(The information referred to follows:)

STATEMENT ON ROADS EQUIPMENT ACQUISITION

During the spring of 1961, the Secretary of the Interior instructed the Acting Commissioner of Indian Affairs to take steps to implement the recommendation of the Task Force on Indian Affairs, that the Bureau return to the force account method of construction wherever it appears practical to do so.

The Bureau implemented this recommendation for road construction in fiscal year 1961 with instructions to field offices as follows:

"The force account method shall be used when justified by the employment and training of Indian workers, and where the acquisition of equipment can be justified. The contract method shall be used on projects where Indian workers are not available, or where the acquisition of specialized equipment cannot be justified.

"Consideration shall be given to performing those parts of a project that lend themselves to Indian employment by the force account method, and those parts requiring specialized equipment by contract. In these cases both methods should be indicated on Form 5–1127, with a supporting explanation.

"The method of construction shall not be changed without the approval of the Commissioner."

When the emphasis on the method of accomplishing the Bureau's road construction program shifted from force account to contract in 1952, the Bureau proceeded to dispose of its road construction equipment. The return to force account came at a time when there was hardly any such equipment on hand.

It is a policy of the Bureau to obtain all equipment possible through surplus channels, and this is being done to the fullest extent. However, it has been found that some of the key pieces of equipment are not available from surplus, and these must be purchased.

These purchases are running somewhat higher than was anticipated because it was planned to obtain the equipment from surplus. It now appears that approximately $1 million of 1962 road construction funds will be applied to equipment purchase; also, that it may be necessary to program about that amount to equipment purchase in 1963.

The purpose of the return to force account as stated in the task force report is to furnish employment to Indians and thus reduce Federal expense. Equally important is the opportunity to provide training for Indians so that they can become skilled workers. It is the training phase which requires some of the modern equipment which is being purchased because it cannot be found as surplus.

FORCE ACCOUNT POLICY

Chairman HAYDEN. Is this change to be applicable throughout the United States? If not, in which areas?

Mr. NASH. Mr. Chairman, this is a policy of general applicability throughout the United States. It is not restricted to any location, not restricted to the Southwest and not restricted to the Navajo-Hopi program. In years past, all this construction was done by the force account. It was a means of employment of Indian labor and a means of introducing a wage income, cash income, to places that did not have it.

Chairman HAYDEN. Let me say this. I understand there was in the past a practice of contracting for road construction?

Mr. NASH. No, sir. Until 1952 the policy was that all road construction, maintenance and construction both, was by force account. Maintenance is still by force account. The policy was changed in 1952, and by about 1954 road construction was nearly all done by contract. Now the task force, of which I was a member last year, found there had been a very substantial decline of Indian employment under the contract system and we felt that the reservations where the force account method was still in use were more stable in their standard of living than the reservation which did not have it. Accordingly, we recommended a modification, not a complete abandonment of contracts, but a shift in the direction of force account to the fullest extent practicable for two reasons: Because of the work provided Indians by that means and because of the value of on-the-job training where Indians are learning how to operate heavy equipment and which has been helpful to them in the past in seeking gainful employment both on and off the reservation.

Now, in the Navajo-Hopi roadbuilding program, for example, you have a very substantial proportion of contract work still. In fact, $2 million worth of contract work was let just the other day. We are, however, moving toward the use of more force account work in that area, not to the exclusion of contracts by any means. It is about approximately 60–40 across the country at the present time.

Senator MUNDT. Sixty-forty what?

Mr. NASH. Sixty contract, 40 force account. In order to make this program possible we are acquiring some surplus equipment and

have made some purchases where no surplus equipment was available. The high grade surplus equipment is about running out. There is not as much around as there used to be.

REASONS FOR PREFERENCE FOR FORCE ACCOUNT

The statement which we gave you, Mr. Chairman, and which was just placed in the record, indicates our reason for having this feeling about the force account—that it is one of the major sources of Indian income. For example, during June and July 1961, on the Navajo Reservation, 84 percent of all the payrolls under the road construction contracts was for skilled workers but only 9 percent of the skilled workers were Indians and only 7 percent of the skilled payroll money was paid to Indians. The average amount paid to Indians was $475 but the average amount paid to non-Indians was $596. So our experience is that in our effort both to provide training for Indians and to raise the Indian standard of living, that the force account method is the best method for reaching that goal. We recognize, of course, that there are many places and many types of work where it is simply not economical for the Government to go the force account route. There we are by no means trying to exclude contractors but we are trying to strike a balance between what is practical and what will do the most for the Indian.

Senator MUNDT. Will you achieve the same result of utilizing the maximum of Indian labor by placing stipulations in the provisions of your contract?

NEED FOR SKILLED LABOR

Mr. NASH. Contract stipulations just do not work out as well as where we are operating programs ourselves. In addition to that, we cannot very well blame a contractor who brings in hundreds of thousands of dollars worth of equipment and then says, "Well, the Indians are not skilled enough to operate this costly equipment. This may be very expensive to me."

The fact that we are using the force account on maintenance and are buying some of this heavy equipment, means that when a contractor comes in, to a greater extent in the future than in the past, he will find operators trained on heavy road equipment ready, willing, and able to go to work.

UNSKILLED LABOR UNDER CONTRACTS

Senator MUNDT. Your figures dealt only with skilled labor. How about the unskilled labor under the contracts?

Mr. NASH. It is considerably better. During this same time, 16 percent of the work was done by unskilled labor, 45 percent non-Indian, and 55 percent Indian. It was a much more even balance even though there was a large percentage of non-Indian workers being employed by the contractor.

STIPULATION FOR INDIAN LABOR

Senator MUNDT. In that area, if you use the contractor's facilities, you could by contract stipulation increase the percentage of nonskilled Indian labor?

Mr. NASH. Yes, sir. Some contracts already contain the nondiscrimination clause in all Government contracts.

Mr. OFFICER. Might I address myself to that statement? My comment relates to my own State and also I served on the task force. For some years there had been a reluctance on the part of the Bureau of Indian Affairs to put a clause in the contracts asking for preferential employment for Indians because of the nondiscriminatory policy of the Government. However, the task force recommended that we include a preference clause for local residents which would take care of both the Indians and non-Indians living in the area and this is something we are considering doing now in the Bureau. I had a meeting the week before last in Tucson with Mr. Gray, of the Operating Engineers, and Mr. McDonald, of the Associated General Contractors of Arizona, and, as I am sure Senator Hayden knows, we discussed the possibility of the unions being able to work with us and the Independent Contractors both in certifying the Indians as skilled in certain areas, and in introducing certain kinds of apprenticeship training. I think we are going to find there will be cases where we will have to use force account on a continuing basis or perhaps increase it somewhat, but also we are going to be able to get more Indian employment out of using this preference clause for local residents, and also out of getting Indians certified as skilled by the unions so that they will in turn be employed by the contractor. We are not suggesting that we abandon the contract program altogether. This was not the task force intention either. We want to try to create as much Indian employment as we possibly can, but we would also like to get the training for Indians that we do know was available under force account.

Chairman HAYDEN. I am glad to hear about that because I was concerned that the Indians were not getting training which would allow them to go out and get jobs off the reservation. Now, if you work together with the contractors, you can get that done.

QUESTION OF UNION AFFILIATION

Mr. OFFICER. I think this: Under the on-the-job program we have that Senator Mundt has spoken so well of, I know the Indians might be provided opportunity where we can get together with the contractors and the unions in some sort of apprenticeship training. However, we have the problem that the amount of work available on an Indian reservation tends to be an unsteady sort of thing. It may be great at one time and little at another and often Indians are somewhat reluctant to pay union dues for a job that may only last 5 months and then leave them unemployed unless they leave the reservation. There may be a reluctance, as we know, on the part of some to leave. The operating contractors, as they come into the reservation, have often, rather than trying to scour around and find Indians who are employable, brought their own force in with them. If we can do a survey of employable skills on the reservation and have the unions certify these employment skills, we will be able to pick up some jobs in this fashion; but I still think, and it is important for us to remember—and I mentioned it to the union people, and to the contractors also down in Tucson when I talked to them—that there are some

areas where we have to have force account to have Indian employment and we may have to increase or accentuate it in these areas to provide both employment and training.

Senator MUNDT. Do I gather from what you say that the Bureau in its force account program, refuses to employ nonunion Indians?

Mr. OFFICER. No; not at all.

UNION CERTIFICATION OF INDIANS EMPLOYED

Senator MUNDT. I thought you said you relied upon the union to certify the Indians employed.

Mr. OFFICER. Here is the point. We might, for example, insert a clause in a contract that would give preferential employment to qualified local people and the contractor then—would come in and refuse to employ Indians. We could then say, "Wait a minute. You haven't employed Indians." And he would say, in turn "There weren't any Indians qualified."

If the union has certified Indians as qualified it would take away his argument against employing any Indians and we are interested in getting Indian employment.

I was speaking only of the case where we worked with unions and contractors and the unions certify these people as qualified.

Chairman HAYDEN. Is not there any way of estimating what would be required for an Indian worker to reach the skill necessary to go off the reservation on a non-Federal job?

TENDENCY OF SKILLED WORKERS TO LEAVE RESERVATIONS

Mr. OFFICER. Well, there are present programs that the unions themselves have. They put stipulations on the amount of training time and very frequently Indians who are trained either under force account or by the unions, when they do achieve a certain level of skill, tend to leave the reservation and to where the work is.

We found that was true with our own force account. Very often we trained Indians and they achieved enough skill to go away from the reservation and qualify with the unions for employment away from the reservation.

Chairman HAYDEN. Do they have to be employed to join a union?

Mr. OFFICER. In some places, yes; and in some places, no. I think that is dependent on circumstances.

UNION INITIATION FEE

Senator MUNDT. How about the poor Indian that gets just one request to work on a job in an area, does he have to pay the regular union initiation fee for a part-time job that is going to last 6 months?

Mr. OFFICER. We are trying to work with the union to see if we cannot get some changes in the initiation fee and also to see if we cannot make some of our own on-the-job training funds available to assist them in getting started in training with the union.

Senator MUNDT. It does not seem fair to the Indian. First, he must start in a union, pay the initiation fee, but in this instance he is not going to have a steady chance to work.

Chairman HAYDEN. On the other hand, if he does pay the fee and he turns out to be a good worker, he can go anywhere and work. It works both ways.

Mr. OFFICER. To answer Senator Hayden's earlier question, in force account, it is not required that the Indian be a union member. However, in some cases, if working on a private contracting job, then union affiliation may be necessary.

TOTAL INDIANS UNDER FORCE ACCOUNT

Mr. FRYER. May I say this: Under force account, about 98 percent of the skilled workers were Indians, tractor and crane operators, and so on. One of the reasons we believe they are not available presently immediately, and the contractors do not find them, when they come on the reservation is the fact so many of them found jobs off the reservation. These men, through the years, have become highly skilled equipment operators and are much in demand.

WINSLOW-TOREVA ROAD

Chairman HAYDEN. With regard to the Winslow-Toreva road, if you had the funds could you complete the grading and base course for the whole 46 miles during fiscal year 1963? I understand that $310,000 is included in the 1963 budget and that $230,000 is the estimated cost of the remaining 17 miles. Could you do the 17 miles by reprograming available funds?

Mr. NASH. It is far along. I will ask Mr. Trier to report in detail on the status of it but while he is getting ready, let me say the first contract was awarded on January 27, 1961. That contract is 90 percent complete but it was closed down for the winter. The second contract was awarded in September for a bridge. That bridge is 40 percent completed.

Chairman HAYDEN. As I understand it, the remaining 17 miles have to be built.

Mr. TRIER. Yes; except that the first 22 miles is practically completed except that the final surface course has not yet been applied. They are putting on a temporary asphalt course and will have the final top course later. In the 1965 estimate we have of $450,000, it is for the purpose of going back over the whole project and applying the final asphalt course.

Chairman HAYDEN. Could you do this 17 miles by reprograming of available funds?

WORK ON REMAINING PORTION

Mr. TRIER. We have examined our program and have concluded that in the order of priority, this work would not be done in 1964 and 1965. However, the work which we have done takes this road up to a place where the soil and existing roads are in good shape so they will be able to travel into Winslow on a direct route as soon as the present contract is completed. The existing road on the remaining 17-mile portion is much better than the existing road was on the 22-mile portion which we have built. The cars can travel there. With the present schedule it would not be possible for us to change this program by taking out other projects which have already been programed, and which are considered to be even more necessary.

COST TO COMPLETE PROJECT

Chairman HAYDEN. What is the estimated cost of the remaining 17 miles?

Mr. TRIER. We have estimated that we will need $530,000 to complete the grading and then $450,000 to go back over the entire road and complete the surfacing.

WIND RIVER PROJECT

Senator MCGEE. Mr. Chairman, I wonder if this is an appropriate place to raise a question. I think it bears on the same general area. I am sorry I was late getting here this morning but again it is the same old story, we are in six different places throughout the morning.

I address this to whomever is equipped to answer our problem on the construction charge controversy that we have been having out on the Wind River project. You know last fall my colleague, Senator Hickey, and I, met with the people out there and had an extended exchange on the question, on the Wind River irrigation project. A misunderstanding arose as to whether the construction charges were to be added to the cost of the land as some of them felt it should be straight O. & M. charges. They received repayment notice in September or October and some of them were, to put it mildly, not only shocked, but at the point of revolution upon receipt of those notices.

I would like to ask what the status right now is of this program in the department to approach this question of the construction charges.

MORATORIUM ON CHARGES

Mr. NASH. Senator McGee, I would like to respond generally and then ask Deputy Commissioner Crow to reply in detail. He handled various parts of the negotiations, along with others. The general status is that there is now a moratorium on those charges and the situation is in a frozen condition at the present time while it is being looked into very thoroughly.

Senator MCGEE. It is being explored carefully now?

Mr. NASH. There is a moratorium and it is being explored carefully.

Senator MCGEE. Is there a terminal point for that moratorium?

Mr. CROW. No, there is no terminal point, Senator. We are going to have to study, I think, each individual case to see what effect the contract, if one exists, has in each individual case. As you know, there is a proposal for cancellation now before the Congress. There very likely will have to be some additional cancellation as we get these additional cases squared away. In the meantime there will be letters furnished to you and Senator Hickey saying that we will not refuse to deliver water during the 1963 irrigation season for lack of payment of these construction charges.

Senator MCGEE. For a point of information, can we assume that we may also receive this notice if or when any new repayment notice will be sent out? As I say, this was a rugged blow at the time.

Mr. CROW. Yes, sir; Senator. I am still sorry about that. We will avoid it happening again.

Senator MCGEE. Fine. Does that finish your comment on it? That gives me the information I need right now on the status of it.

Mr. CROW. Yes.

ROAD ON WIND RIVER RESERVATION

Senator McGEE. I do have one other question involving the Wind River Reservation on the road question there on the reservation. How much is in this year's budget for roads in the Wind River Reservation?

Mr. NASH. Mr. Trier, will you respond to that, please?

Mr. TRIER. Yes, sir.

AMOUNT IN PROGRAM

Senator McGEE. The reason I raised the point, because I will have to double check with you the validity of it, is the Joint Tribal Council of the Shoshones and Arapahoes have advised me that that figure, as they interpret it, is about $75,000.

Mr. TRIER. We have them programed for $95,000 for road construction.

Senator McGEE. $95,000. In their petition to me, they made a rather impressive and detailed breakdown of this, that their road needs could, without any padding at all, absorb another $50,000 and I wanted to get from the Bureau an estimate of the validity of such a judgment as there is in terms of making it meaningful in road construction.

Mr. TRIER. It is valid and applicable to many other places and as in other road programs we are obliged to cut our patterns to fit our cloth.

Senator McGEE. All right. With reference to this $95,000 figure that you refer to or that you think may be the figure, is this $20,000 more than they were getting?

Mr. TRIER. Possibly it is more than they got last year. It has been adjusted to a particular project the Arapahoe road. It is not our practice to allot the same dollar amount to each reservation each year but rather we program to entire projects so that one year they may get a little more and another year less.

Senator McGEE. As far as the $50,000 figure they refer to it as the sum added to the $75,000, which they think would come closer to the mark of their immediate need on this road development. That also makes sense, with the exception that, as you view it, the cloth does not quite stretch so far around the carcass.

Mr. TRIER. That is right. It simply means it will be programed in another year.

Senator McGEE. And the position of the Bureau would be that whatever they fall short of the additional $50,000 they would seek to make up by Bureau request next year?

Mr. TRIER. That is correct.

Senator McGEE. If we could doublecheck those figures and what it represents in this proposed budget in relation to the budget last year and what the step would be to meet this additional $50,000, let us say, in the next budget, if that might be broken down for us, I would appreciate it very much.

Mr. TRIER. Yes, sir. It is possible that the Senator may be talking about our road maintenance program, as well as our construction program. The figures, I believe, are only for the road construction program. We are going to have another item for road maintenance so we may have the figures which you quote in the maintenance item.

Senator McGee. Yes; I think that is one of the points they made with us. While they were impressed it would spread far enough to cover them, there was not much covered and it has been cold out there this winter.

Thank you very much.

(The following information was submitted:)

Funds programed for the Wind River Reservation for fiscal years 1962 and 1963 are as follows:

Fiscal year	Road construction	Road maintenance
1962	$165,000	$35,000
1963	92,000	35,000
Total	257,000	70,000

The cost per mile for road maintenance on the Wind River Reservation is equivalent to the national average for all Indian reservations.

Chairman Hayden. I have two more insertions.

General Administrative Expenses

For general administrative expenses, $4,372,000 is requested for fiscal year 1963, an increase of $450,172 over the funds available during fiscal year 1962. The justifications for this request will be printed in the record.

(The justification follows:)

General Administrative Expenses

Appropriation 1961	$3,967,000
Appropriation 1962	3,967,000
Transferred to "Operating expenses, Public Buildings Service," General Services Administration (75 Stat. 353)	−45,172
Total amount available 1962	3,921,828

SUMMARY OF INCREASES 1963

Employee training program	100,000
Operating expenses	160,172
Boards of U.S. Civil Service examiners	25,000
Agency operations	165,000
Total	450,172
Budget estimate, 1963	4,372,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Departmental office	$1,078,962	$1,082,000	$1,202,000	+$120,000
2. Field offices	2,866,892	2,839,828	3,170,000	+330,172
Unobligated balance	21,146			
Total	3,967,000	3,921,828	4,372,000	+450,172

General administrative expenses

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Departmental office	$1,078,962	$1,082,000	$1,202,000	+$120,000
2. Field offices	2,866,892	2,839,828	3,170,000	+330,172
Total	3,945,854	3,921,828	4,372,000	+450,172

The estimate of $4,372,000 is an increase of $450,172 which will provide $100,000 to develop and train outstanding Bureau employees for top-level assignments; $160,172 for operating expenses, including increased travel costs authorized by Public Law 87–139; $25,000 for boards of U.S. civil service examiners; and $165,000 for increased operation costs at the agency level.

Need for increase

(*a*) *Training program, $100,000.*—Under this program the Bureau would undertake studies to forecast anticipated vacancies in the ranks of top-level personnel. A carefully devised human resource evaluation plan would then be applied to identify outstanding employees with potential for further development as Bureau administrators and managers. A number of these individuals would be given training to prepare them to fill vacancies in the executive ranks as they develop. Each trainee in this program would receive training in accordance with a training plan designed to meet individual needs. Training plans would be approved on the bureau and departmental level before training would be implemented. Selection of individuals for training would be in compliance with the Bureau's merit promotion program and subsequent personnel actions would be made under the Department of Interior-Civil Service Commission executive development training agreement.

(*b*) *Operating expenses, $160,172.*—The additional funds requested for operating expenses include $48,000 to cover increased cost for per diem authorized by Public Law 87–139 (75 Stat. 339) and $112,172 for other operating expenses.

Travel, $48,000: To cover increased cost of per diem authorized by Public Law 87–139. We have 10 area offices and 71 agencies or major installations located in 22 States administered by area directors and superintendents. Area directors and superintendents must travel wide areas to deal with Indians and State, county, and school district officials in the administration of Indian affairs. Currently, travel funds are inadequate.

Other expenses, $112,172: Departmental office, $12,000 for increased cost of supplies, telephone, postage, printing, utilities, etc., involved in servicing expanded Bureau programs.

Field offices, $100, 172 for increased cost of recurring expenses of operating agency and area offices. No additional funds have been provided to meet these increased costs over the past 10 years. Costs of utilities, communication services, supplies, and equipment have increased proportionately to the changes in the economy. The main factor contributing to increased cost of utilities, supplies, and other services is increased labor costs. Costs of fuel and labor have consistently increased over the past 10 years resulting in increased cost of utilities, supplies, and other services.

(*c*) *Boards of U.S. civil service examiners, $25,000.*—An additional $25,000 will provide essential expansion of our present limited examining program and greater job opportunities for our Indians. It will enable the Bureau to employ higher caliber individuals with better qualifications for the specific positions peculiar to our organization.

Over a period of years it became evident that a more effective examining program could be carried out by the establishment of boards of U.S. civil service examiners at agency and bureau level. Such boards are responsible for examining for positions peculiar to organizations and frequently assume full examining jurisdiction for all of their positions and similar ones in other Federal installations. Placing the examining responsibility with an agency or bureau permits Board members (who are bureau personnel) to assist in the development of qualification standards as well as rating schedules for positions peculiar to their organization, thereby establishing registers of qualified individuals. The Civil Service Com-

mission has pointed out our need to assume additional examining jurisdiction and in their regular inspection audits of the personnel management program they have continually pointed out the deficiencies in our current examining program.

The proposed board of U.S. civil service examiners will provide greater opportunities to the Indians for gainful employment in all segments of our Federal Government rather than confining them to an excepted appointment for one segment. Unless and until we are able to provide full examining coverage for positions not only peculiar to this Bureau but also positions for which the Civil Service Commission does not provide examination coverage, Indians with excepted appointments will not be eligible for conversion to career status or transfer to other Federal installations.

(*d*) *Agency operations, $165,000.*—The agency staffing pattern at the present time for most agencies is superintendent, administrative officer, secretary, general clerk, and clerk-typist. With only one clerk to handle the receiving, distributing, inventorying, and accounting for materials, supplies, and equipment at the agency, it is impossible to keep current in this work. The success of the Bureau's programs is directly dependent upon the success of the agency operation. The agency staff is dealing directly with the Indians in execution of programs. Adequate administrative staff must be provided to relieve program managers of details of supply.

In addition, increased activity in such items as realty transactions, timber sales, mineral development, expanded maintenance program, decidedly affects the workload of the Bureau in the billing, collection, distribution, disbursement, and accounting for revenues accruing from these sources. Most of these revenues are collected at the agencies. Additional clerical assistance is necessary to bill, receipt, and account for these increased collections of Government and trust moneys.

The requested increase will enable the Bureau to employ additional clerical assistance at agency offices to assist with the clerical duties required in the receipt distribution, utilization, and accounting for materials, supplies, and property.

Plan of work

The programs of the Bureau of Indian Affairs are administered from three primary organizational levels—the agency or reservation; the area, encompassing several agencies and reservations; and the central office. In the central office basic policy determinations are made, programs are evaluated, and operating procedures are developed, with the area and agency offices carrying out the various programs and functions. In many areas suboffices are also utilized to administer the various programs of the Bureau because of great distances, scattered Indian reservations and communities, and transportation and communication problems. The administration and financing of these programs are complicated by the diffusion of certain program segments to organizational units below the agency level such as schools and irrigation projects; isolation; the operation and maintenance of facilitating services common to all activities of the Bureau such as central heating plants; common facilities such as office, quarters, storage and supply facilities; and the interdependent nature of most of the programs serving the Indian people.

The Bureau's proposed 1963 administration program totals $7,372,000, of which $4,372,000 is requested under the "General administrative expense" appropriation and $3,000,000 allocable to program activities. A comparison of the program follows:

	1961	1962	1963
Administration program	$6,525,827	$6,550,328	$7,372,000
Share of participating program activities	2,579,973	2,628,500	3,000,000
General administrative expense appropriation	3,945,854	3,921,828	4,372,000

The total amount requested for administration, including the increase of $450,172, is $7,372,000 or 3.7 percent of the budget estimate.

Itemization of estimate

REVOLVING FUND FOR LOANS

Chairman HAYDEN. It is requested that $4 million be appropriated for the revolving fund for loans. The statement in support of this request will be printed in the record, as will the statement with regard to activities carried out with tribal funds.

(The information referred to follows:)

BUREAU OF INDIAN AFFAIRS

Revolving fund for loans

Appropriation, 1961		
Receipts and revenues	$2,979,660	
Unexpended balance June 30, 1960	4,462,458	
Total amount available, 1961		$7,442,118
Decreases:		
Acquisition of loans	$2,559,355	
Administrative expenses	686,566	
		3,245,921
Unexpended balance June 30, 1961		4,196,197
Increases:		
Appropriation, 1962	$4,000,000	
Receipts and revenues	1,755,000	
		5,755,000
Total amount available, 1962		9,951,197
Decreases: Acquisition of loans		9,000,000
Unexpended balance June 30, 1962		951,197
Increases:		
Loan program	$4,000,000	
Receipts and revenues	765,000	
		4,765,000
Total amount available, 1963		5,716,197
Less:		
Receipts and revenues	$765,000	
Unexpended balance June 30, 1962	951,197	
		1,716,197
Budget estimate, 1963		4,000,000

Revolving fund for loans

Activity	Appropriated, 1961	Appropriated, 1962	Estimate, 1963	Increase (+) or decrease (−)
Loan program		$4,000,000	$4,000,000	

Revolving fund for loans.—The estimate for this appropriation item is $4 million. This amount is the same as the appropriation for fiscal year 1962. A total of $27 million has been authorized for the fund, of which $10 million was authorized by Public Law 87–250 approved September 15, 1961. The purpose of the fund is to make loans to Indians and Indian organizations to promote their economic development. A total of $17,799,600 of the amount authorized has been appropriated.

The demand and need for loans far exceed the amount of funds available. Although all of the appropriation acts appropriated money to a single revolving loan fund, separate memorandum accounts have been maintained because of the form of the authorization language reserving funds for Oklahoma (49 Stat. 1968, 25 U.S.C. 506) and Navajo-Hopi (64 Stat. 44, 25 U.S.C. 631) Indians. The available cash balance consequently is not available for loans to all Indians and Indian organizations.

Plan of work.—The objective of loans from the revolving fund is to help improve economic and social conditions among Indians through the proper development and utilization of their resources. The work is planned with this object in view. Indians need capital to utilize and develop their resources, both physical and human. Many are without the necessary capital. It has to be borrowed. Primary emphasis is placed upon helping Indians borrow money from the same sources that furnish capital to other citizens. Where, because of the trust status of their property, lack of security, low economic status, or for other reasons, Indians are unable to obtain capital from customary sources, and where tribal funds are not available for financing, loans from the revolving fund are made.

		General fund	Navajo-Hopi	Oklahoma	Total
Unallotted commitments Dec. 31, 1961		$7,973,953	$125,000	$445,000	$8,543,953
Additional applications authorized		5,251,082	50,000	349,000	5,650,082
Applications being held or submittal delayed pending availability of funds		7,110,000	250,000	50,000	7,410,000
Additional applications for tribal land purchases to be held pending availability of funds		19,525,000			19,525,000
Requirements Dec. 31, 1961		39,860,035	425,000	844,000	41,129,035
Less cash balance Dec. 31, 1961	$5,339,009				
Alaska reserve	740,888				
		4,598,121	552,270	1,169,742	6,320,133
Balance			127,270	325,742	
Shortage		35,261,914			34,808,902

The additional appropriation requested will complete the amount authorized for the general fund with the exception of $2,000,400.

	General fund	Navajo-Hopi	Oklahoma	Total
Appropriated	$13,999,600	$1,800,000	$2,000,000	$17,799,600
Appropriation requested	4,000,000			4,000,000
Authorized but not appropriated	2,000,400	3,200,000		5,200,400
Total authorized	20,000,000	5,000,000	2,000,000	27,000,000

The cash balances available for loans to Navajo-Hopi and Oklahoma Indians are adequate to take care for foreseeable needs.

Tribal Funds

HIGHLIGHT STATEMENT

Approximately 300 Indian tribes, bands, or identifiable groups have approximately 600 accounts in the U.S. Treasury which are used for the conduct o tribal financial programs, enterprises, businesses, and other tribal affairs. These funds are available for various purposes under various acts of Congress and are also subject to the provisions of tribal constitutions, bylaws, charters, and resolutions of the various tribes, bands, and groups.

Tribes who need their own funds which are on deposit in the U.S. Treasury are required to prepare budgets for approval. Tribal funds are programed under three categories, namely, "Permanent authorization," "Annual authorization," and "Indefinite authorization."

Funds programed under the "Permanent authorization" are made available under various acts of Congress and can be disbursed either through the Treasury disbursing offices or advanced to a tribe for disbursement through the Indian Service disbursing agent's accounts or advanced to a tribe for the disbursement by a bonded tribal treasurer under an approved plan of operation. These funds do not require annual approval by Congress but are reported annually in the budget schedules. Funds programed under the "Annual authorization" are disbursed through the Treasury disbursing offices, subject to the same procedures and limitations as appropriated gratuity funds and require annual approval by Congress. Funds programed under the "Indefinite authorization" are made available under the annual Interior Department Appropriation Act under the heading "Tribal funds." These funds are advanced to tribes for disbursement by Indian Service disbursing agents or by bonded tribal treasurers under a plan of operation. The following proviso makes these funds available "* * * *Provided*, That in addition to the amount appropriated herein, tribal funds may be advanced to Indian tribes during the current fiscal year for such purposes as may be designated by the governing body of the particular tribe involved and approved by the Secretary: * * *." Some Indian tribes employ more than one of the above methods in conducting their affairs.

In the last 10 to 15 years many tribes have progressed to the point that they have taken over the management of their affairs and the disbursement of their funds under a plan of operation previously approved by the Secretary and it is the policy of the Bureau to encourage tribes in this respect. Annual audits made of tribal funds by certified accountants of commercial auditing firms are submitted to the Bureau for review and information.

Total	2,180,640	3,000,000	3,000,000

Plan of work.—No part of the funds contained in this estimate represents a charge upon the Federal Treasury. This item reflects the disbursement of funds to the credit of Indian tribes or bands under numerous special acts of Congress in compliance with the terms of the various trusts and for carrying out tribal programs recommended by the tribal governing bodies with the approval of the Commissioner of Indian Affairs.

The budget schedule reflects under the permanent authorization disbursements from the tribal trust funds authorized by permanent legislation, and under the annual and indefinite authorizations amounts requested annually by the various tribes for carrying out various tribal activities.

The estimate, therefore, is restricted to the funds requested annually as required by section 27 of the act of May 18, 1916 (39 Stat. 158).

Comparative statement of annual authorization by subactivity

	1961	1962	1963

STATUS OF LAW-AND-ORDER PROGRAM

Chairman HAYDEN. Any more questions?

Senator MUNDT. Yes, sir. Mr. Nash, last year during the hearings I had a colloquy with your associate here, Mr. Massey, concerning the status of law-and-order programs on the reservation and it is my recollection that the record will show that Mr. Massey and I reached a conclusion that there is plenty of room for improvement in this program. I see now you have requested $2,295,000 for fiscal 1963, an increase of $646,000 over 1962, and an increase of $119,656 over 1961. These are rather significant increases. Do you feel that this increased money will effect any real improvement in the law-and-order program and if so, how?

Mr. NASH. Yes, sir. We feel it will effect some improvement. We would not, by any means, assert that this will go all the way or effect all the improvements that are necessary. What we will be able to do with this additional money is to take back from tribal governments some of the expenses of law-and-order activities they have been carrying on with their own tribal funds. In cases where we have reason to feel that the law-and-order program, the protection of life and property is inadequate, or we feel they are really not capable of carrying on a long-range program we propose to absorb part of the cost. For example, these 95 positions, which is the reason for the $646,000 increase, will provide some law-and-order specialists, provide criminal investigators, additional police officers, clerks, cooks, and some additional Indian judges.

QUALIFICATIONS OF JUDGES

Senator MUNDT. On judges, that seems to be the weakness. Can we expect any upgrading in the qualifications of the tribal judges? Last year the record showed that about the only uniform qualifica-

tions for these posts was that the individual was not a convicted felon. That does not inspire much confidence in the anticipated quality of justice. Are you giving any thought to some overall changes and improvements in this program and in setting up some criteria which would be a little bit more constructive than simply that they have not been involved in a felonious crime?

Mr. NASH. Yes, sir. We are very much concerned with the quality of the judges and the need for better background and training.

Senator MUNDT. Will you supply a list of these new criteria as to what the qualifications are for a justice? Put that in the record or give it to us now, if you have it.

Mr. NASH. Yes, sir. It is in the record.

(The information referred to follows:)

Under excepted qualification standards approved by the Department in 1950, positions of Indian judge are restricted to persons of at least one-fourth degree of Indian blood who are enrolled members of the tribe to be served by the position. Candidates are required to be well versed in tribal customs. They must be of high moral character and must have the respect of the tribe. They must be honest, trustworthy, and of good integrity, sound judgment, and temperate habits. They must never have been convicted of a felony nor of a misdemeanor within the year immediately preceding appointment. The positions of Indian judge are ungraded. The rate of pay is $20 per day for chief judges and $15 per day for associate judges while actually employed on the basis of an undetermined tour of duty but not to exceed 120 days per year.

In 1950, the Civil Service Commission approved the classification of positions of Indian judge in grade GS-986-9. However, classification applies only to full-time positions and to part-time positions when the incumbents work a predetermined regularly scheduled tour of duty. Since the incumbents of Indian judge positions spend only 1 or 2 days a week performing duties on an irregular, undetermined basis which depends on the need for holding court, it was determined, pursuant to title II, section 202, paragraph (30) of the Classification Act of 1949, as amended, that Indian judges would be exempt from classification requirements, and the pay rates indicated above were administrativley fixed.

It is planned to raise the qualification standards for judges to require experience or education or a combination of both. It is also planned to establish standards so as to permit the employment of non-Indians who possess qualifications as attorneys or judges of courts of record.

There are no existing civil service standards of which we are aware for positions of this nature. It will be necessary, therefore, to develop such standards in cooperation with the Department and the Civil Service Commission. In general, it is proposed that the standards will require the education, or experience, or a combination, to administer, supervise, or perform quasi-legal work involving the knowledge and application of laws, regulations, precedents, and practices pertaining thereto but not requiring legal training equivalent to that represented by graduation from a recognized law school. The qualifications for non-Indians may be more extensive and may require legal training, education, or experience as a judge, or a combination.

LEGISLATION AUTHORIZING STATE JURISDICTION

Senator MUNDT. Have you given any further consideration to endorsing legislation which would authorize the Secretary to enter into a contractual agreement to reimburse the States for actual costs involved when the State assumes law-and-order jurisdiction as provided for under the provisions of Public Law 280 of the 83d Congress?

Mr. NASH. We have given a good deal of thought to it, Senator, pursuant to your request to Mr. Massey last year. He called my attention to it when I first became Commissioner. In fact, I was a member of the task force when we had the whole matter under study.

Now, the departmental position is, of course, still that contained in Assistant Secretary Carver's letter of last spring and we are in all

respects bound by that. In our discussions, however, let me say that we share your concern about all aspects of the law-and-order problem throughout the Indian country with respect to jurisdiction, with respect to effective protection of life and property, and with respect to the need for improvement in tribal programs where those must still remain.

FINDINGS OF CONSTITUTIONAL RIGHTS COMMITTEE

The other representatives of the Congress, Senator Ervin's Subcommittee on Constitutional Rights, we think have been very helpful. That subcommittee very properly called attention not only to inadequate protection of life and property, but to the possibility of denial of civil rights by tribal courts.

Senator MUNDT. Is it not true that the person before one of these courts lacks the appellate procedures which an outside citizen would get if he were not on a reservation?

Mr. NASH. That is partly true and partly not true. The Secretary's code of regulations provides for appellate procedure. The task force found in many cases the tribal government had not appointed or employed the requisite number of judges and therefore in fact there was no appellate procedure.

APPELLATE PROCEDURE

Senator MUNDT. When you are talking about the appellate procedure, are you talking about a purely tribal appellate procedure or are you talking about giving the Indian or, for that matter, the non-Indian involved in litigation before one of these courts, the full rights that any other citizen has to utilize the appellate procedure established in our concept of jurisprudence, including the Supreme Court?

PROCEDURES IN TRIBAL COURTS

Mr. NASH. At this point, sir, I am talking only about procedure within the tribal courts and by appeals therefrom to other tribal courts and eventually to the Secretary of the Interior.

Naturally, where the 11 major crimes are concerned, there is, of course, all the appeal procedure that is open to anybody in the Federal court system. It seems to us that the problem is basically one of not quite enough to go around in the way of support for the law-and-order programs wherever they are. In addition to that, there are, of course, deficiencies in some of the tribal constitutions. We are working with them and propose to do more during this coming year to encourage them to bring their own tribal ordinances closer in harmony with the State law-and-order codes in cases they decide. For example, in your own State of South Dakota, the Rosebud Sioux Tribe has recently adopted the State traffic code as its own tribal ordinance. There are many other places where similar improvement could be effected with more people to work with the tribes and counsel them and help them.

IMPROVEMENT OF TRIBAL COURTS

In other words, we regard this as a problem which has to be attacked on a broad front and which involves the improving of tribal courts and improving the enforcement of law under existing systems what-

ever they may be. The question of going the route that you discussed with Mr. Massey last year and which was the subject of proposed legislation I must, in all frankness, say presents certain problems. One is that this was discussed last year in the atmosphere of State legislative enactments which proposed 100 percent of the costs to be paid by Johnson-O'Malley-type contracts, although the other Johnson-O'Malley-type contracts would not go a hundred percent of the way. In addition to that the task force was making its study at just about the time this proposal was making its rounds. It led to serious apprehension among the Indians and a serious problem of Indian cooperation and willingness to go along with their own improvement. They felt that rights that are very meaningful to them, which may have a great deal of economic value or may have sentimental value, but nevertheless are very real to them—hunting and fishing, for example, water rights—they feel that protection under State law would be inadequate.

One of the things we have to do, I think, is to satisfy them that in the long run these rights, whatever they are, will be fully protected and therefore we propose to take forward steps in improved law and order, but to take it step by step.

Senator MUNDT. I was not thinking that the time was here or that the action would be wise to compel all of these transfers to be made to the State, but it seems to me we should encourage enlightened leadership of progressive tribes to move in the direction of making these contractual arrangements and having the Government reimburse the State then for its actual cost, because I am sure you are going to have a happier situation all around if you have one code of laws, one system of jurisprudence for everybody living in the State.

Mr. NASH. I fully agree.

Senator MUNDT. And the same caliber of judges, the same rights of appeal, and the dual concept of Government standard and morality. We are outgrowing that in the country. There was a time maybe when it was unjustified. You are a new man on the job. You were not here last year. I hope you do not close up your mind to the possibility of Public Law 280 and of this concept and you move in that direction. In the meantime, so long as we have these courts, it is certainly imperative we upgrade very substantially the quality of the justices and to establish pretty constructive and useful criteria which they have to pass, because if a man's future is to be determined by a judge, you want to get a pretty good judge.

Mr. NASH. Yes, I agree with you fully and I think that you have put your finger on a very serious and very difficult problem. We would want for them the same thing we would want for ourselves.

Senator MUNDT. That is right.

That is all, Mr. Chairman.

Chairman HAYDEN. If there are no further questions, the committee will stand adjourned until 10 o'clock tomorrow morning.

(Whereupon, at 12:15 p.m., Tuesday, February 27, 1962, the committee recessed to reconvenue at 10 a.m., Wednesday, February 28, 1962.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS, 1963

WEDNESDAY, FEBRUARY 28, 1962

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met, pursuant to recess, at 10 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Byrd, McGee, Young, and Dworshak.

DEPARTMENT OF THE INTERIOR

OFFICE OF COAL RESEARCH

STATEMENTS OF GEORGE A. LAMB, DIRECTOR; BERNARD S. BECKLER, CHIEF, DIVISION OF ECONOMICS AND MARKETING; NEAL P. COCHRAN, CHIEF, DIVISION OF UTILIZATION; G. EDWARD LARSON, CHIEF, CONTRACTS AND ADMINISTRATION; AND WAYNE A. McCURDY, CHIEF, DIVISION OF MINING AND PREPARATION

BUDGET ESTIMATE

Chairman HAYDEN. The Office of Coal Research requests an appropriation of $2 million during fiscal year 1963, as compared with an appropriation of $1 million in 1962.

The justification for this request will be placed in the record.

(The justification follows:)

The Office of Coal Research is charged with responsibility, under Public Law 86–599, to contract for research undertakings designed to encourage and stimulate the production and conservation of coal in the United States through research and development by authorizing the Secretary of the Interior to contract for coal research, and for other purposes.

With carryover funds from fiscal year 1961 and a new appropriation for fiscal year 1962, the Office of Coal Research has been staffed within the availability of these funds, and is functioning within the framework of the law and the intent of Congress and this administration to carry forward an effective program of contract research aimed to develop new and more efficient methods of mining, preparing and utilizing coal.

A continuing review and evaluation of scientific, technical, and economic research proposals is going forward on proposals as received and stimulated by the Office of Coal Research. Such proposals are coming from industry, from profit and nonprofit research organizations, from trade groups, from educational institutions and private individuals.

Meetings of the General Technical Advisory Committee of the Office of Coal Research have been held in order to apprise the Committee of OCR activity, both current and pending, and also to obtain the guidance and judgment of the Committee, from an individual as well as collective standpoint, for OCR contract activity as planned for the future.

Each proposal for coal research is considered by the OCR staff as a possible component part of an integrated contract research program, or complex, and some proposals thus must precede others in the priority or scheduling for contract under the integrated program. Some proposals which may be passed over at the present time may later be reevaluated and reconsidered for possible contracts in the light of progress made in the overall complex.

Under the request for fiscal year 1963 a program only slightly larger than the one which was possible this year would be carried out.

It is proposed to increase the limitation on administration and supervision expenses.

Salaries and expenses

Appropriation, 1961	$1,000,000
Appropriation, 1962	1,000,000
Unobligated balance from prior year	939,980
Total available, 1962	1,939,980

SUMMARY OF INCREASES, 1963

Acceleration of program	60,020
Budget estimate, 1963	2,000,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Administration and contract supervision	$60,020	$225,000	$310,000	+$85,000
2. Contract research		1,714,980	1,690,000	−24,980
Unobligated balance	939,980			
Total	1,000,000	1,939,980	2,000,000	+60,020

JUSTIFICATION

The fiscal year 1963 estimate of $2 million represents an increase of $60,000 over the appropriated amount available for fiscal year 1962, plus the carryover balance from fiscal year 1961.

To encourage and stimulate the production, utilization, and conservation of coal through research and development, a sum of $2 million is requested.

This money will be expended for administration of the Office of Coal Research for the compensation and expenses of advisory committee members, for the compensation of consultants, and for a contract program of coal research and development with Government and non-Government organizations.

Fiscal year 1961 was the first year of operation of the Office of Coal Research. A substantial portion of the year was underway before the Office of Coal Research was staffed and operating. No contracts for research were let with fiscal year 1961 funds. Only a small portion of the funds available to the Office of Coal Research were expended for staffing and equipment needs and there was a carryover balance of $939,980. During fiscal year 1962, however, the Office will be more fully staffed and the research and development program in full operation.

A considerably expanded research and development program during fiscal year 1963 will require availability of funds at a level designed to carry forward going research projects, as well as new projects in the offing.

Research and development underway and contemplated for the future within the limits of the Coal Research Act and including scientific, technical, and economic research and the practical application of that research, covers such fields as mining, preparation, utilization, transportation, and marketing of coal.

Specific projects may supplement research previously conducted or currently-underway, but the bulk of the research and development effort will extend primari-

ly into entirely new areas of research and development. A specific program of contract research is selected only after very careful evaluation and an assessment of the impact which that program, if successful, will have on improving the position of the coal industry in the Nation's total economy. The correlation of a specific research and development proposal to other Office of Coal Research projects underway or planned, is considered, as well as the time required to obtain results and enable us to check the practical applications of those results. Those contract proposals which are evaluated as likely to produce the earliest practical results will continue to receive priority attention. However, there is a clear recognition that a specific piece of research or development which may not appear promising today, may nevertheless be the key to a future project which will contribute to a substantial increase in coal tonnage at a future date as a result of intervening coal research efforts.

Coal research activities, from all sources, continue to lag behind the level of the research effort of other fuels and commodities. Coal production, nationwide, continues at a level just able to sustain the industry on a continuing basis with no room for real progress either in technology or the industry's position vis-a-vis competitive fuels. It is, therefore, important that an expanded level of Federal funds and effort be made available for this purpose.

It is apparent that, given a sufficient period of time, funds, and effort, the Office of Coal Research, acting on the basis of promising proposals currently in hand, and others still likely to come forward in the months and years ahead, as well as research ideas generated internally within the OCR technical staff, will be able to make substantial progress toward alleviation of the distress conditions that prevail in the industry, and actually move in such a manner as to strengthen the competitive position of coal as an important and basic natural resource. The Office of Coal Research will continue to make every effort to contract for research projects which show promise of the earliest possible major accomplishment toward betterment of the industry's position. However, it is recognized that there may be many instances where a specific piece of research, basic to the overall solution of the problems confronting the industry, will have to be supported and solved before the practical step designed to result in substantial new tonnage is accomplished.

The future growth of the Nation and the consequent increased demands for bulk energy at low cost will require that coal be prepared to bear its full share of the requirements for low-cost fuel.

In order to properly carry on the expanded program of the Office of Coal Research, it will be necessary to increase the limitation on funds available for administration and supervision from $225,000 to $310,000 for fiscal year 1963, and to increase the number of employees from 18 to 27. As a minimum, in order to properly accomplish the task before us, it is essential that these increases be made.

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$60,020	$1,939,980	$2,000,000	+$60,020
Unobligated balance carried forward	939,980	−939,980		+939,980
Appropriation	1,000,000	1,000,000	2,000,000	+1,000,000
Obligations by objects:				
11 Personnel compensation	35,851	174,000	250,000	+76,000
12 Personnel benefits	2,529	11,000	18,000	+7,000
21 Travel and transportation of persons	2,551	17,000	18,000	+1,000
22 Transportation of things		1,000	1,500	+500
23 Rent, communications, and utilities	660	4,000	5,000	+1,000
24 Printing and reproduction	627	4,000	5,000	+1,000
25 Other services	3,573	1,717,980	1,690,000	−27,980
Service of other agencies		2,000	1,900	−100
26 Supplies and materials	1,463	4,000	5,000	+1,000
31 Equipment	12,766	5,000	5,000	
Total obligations	60,020	1,939,980	2,000,000	+60,020

PREPARED STATEMENT

Chairman HAYDEN. We will be glad to have you discuss this estimate.

Mr. LAMB. Mr. Chairman, I have a statement. Would you like me to read it or summarize it?

Chairman HAYDEN. If it is long, you may summarize it.

(The statement referred to follows:)

STATEMENT OF GEORGE A. LAMB, DIRECTOR OF COAL RESEARCH

I find it a special pleasure, on this occasion, to present the program developed in our Office under Public Law 86-599. The budget estimate for new funds for the Office of Coal Research during fiscal year 1963 is $2 million.

Operations of the Office of Coal Research have begun to move forward through an effective program of contract research designed to bring assistance to the coal industry. Coal is an abundant resource and its greater utilization as a source of energy will be of national benefit.

In recent years bituminous production has stayed around 410 million tons. This figure is considerably below the 500 million tons which the industry has stated it must produce in order to maintain its plant and equipment and to meet the needs of an emergency demand. The need to raise anthracite output is clear. To assist in the development of a stronger coal market in the more immediate years, the Congress created the Office of Coal Research. Although this tremendous assignment is shared with the industry itself and with other agencies of Government and private business, the eventual success or failure of the Office of Coal Research will be measured by its contribution to the development of expanded coal markets.

A vital function of the Office of Coal Research is to aid in finding better and cheaper ways of mining and preparing coal, delivering it to the consumer at lower cost, and improving the efficiency and convenience of its utilization.

Staffing of the new organization was essentially completed shortly after mid-year. In addition to the Director and Assistant Director, the Office of Coal Research consists of four operation divisions—contracts and administration, utilization, economics and marketing, mining and preparation—each headed by a division chief.

The purpose of the Office of Coal Research is to contract for, sponsor, cosponsor, and coordinate research to develop new and more effective uses for coal, to expand present coal uses, and to reduce the cost of coal production and distribution.

As contrasted with the longer term and more basic research program of the Bureau of Mines, the new Office of Coal Research is concentrating its efforts on short-range projects aimed at providing the most immediate assistance to the coal industry. There is no conflict between the two agencies.

Up to the present time, nearly 200 contract proposals have been received and reviewed by the staff of the Office of Coal Research. These proposals came from colleges and universities, coal industry research groups, corporate research organizations, mining and industrial companies, and in some cases from private individuals. It is expected that within a matter of a couple of months, all of the available funds will be committed to contracts.

What are the objectives of the Office of Coal Research and how do we propose to achieve them? Broadly stated, our prime objective is to maximize the value of the coal industry to the national economy. These impressive words can be clarified by saying that we want to see new uses of coal developed and present uses expanded. Our success will be measured largely by the volume of tonnage expansion, and our efforts will be shaped accordingly. But if commercial markets for other products associated with coal can be developed, this is another measure of success.

While increased coal volume is a major consideration in our program, this does not mean that we are not interested in projects that offer little or no tonnage potential. Some projects may correlate with or be vital to other projects that do offer such potential. As an example, a proposal concerning coal chemicals might offer prospects of only limited tonnage increase—but it might result in a profitable undertaking that could help support a proposal of appreciable tonnage impact—or it might develop a new product of special importance to the Nation.

The Office of Coal Research will conduct no projects with its own staff. Instead, it will provide funds for research and development projects through con-

tractual arrangements with universities and colleges, research organizations, mining and manufacturing firms, qualified and equipped individuals, and with other Government agencies. When appropriate, OCR may also cosponsor projects with other agencies or organizations. Work is to be done under contractual arrangements covering particular activity as differentiated from grants sometimes made to nonprofit institutions.

Although all information, uses, products, processes, patents, and other developments resulting from research under Public Law 86–599 must be held available to the public, the spirit of the legislation dictates a considerate treatment of patent policy. Therefore, the decision on patent title will be determined with reference to the equities of the situation. Title to all patents developed as a result of contractual research will be decided on an individual basis. Where justified by unique experience, qualifications, or background knowledge, the contractor may be allowed to obtain title to the resulting patents and royalty rights thereto subject to issuance of royalty-free licenses to the U.S. Government and issuance of licenses to domestic users for reasonable royalties.

All proposals received will be given a careful evaluation by the technical staff of OCR, utilizing in many cases the technical competence and knowledge of our general advisory committee and the professional consultants appointed for this purpose. Evaluation of some projects may require a considerable degree of study.

A prime factor in the evaluation of any proposal will be its impact, if successful, on improving the position of the coal industry in the national economy. As previously mentioned, the correlation of the proposal with other OCR projects will also be considered, as will the time required to obtain results. Those evaluated as likely to produce the earliest practical results will receive primary attention. At the same time, a proposal that fails to appear promising today might be the key to a sure tonnage project next year because of certain developments in the meantime. Other factors given consideration include, but are not limited to, the competence of the contract proposer and members of his staff, the availability and completeness of the required facilities, compatibility with other research, work now going on or conducted in the past and cost of the work to be performed.

We want to do a painstaking job in contract evaluation. The need for coal research is great, and we want to buy the greatest possible benefit to the national economy, to the coal industry, and to the American taxpayer with every dollar spent.

There may be additional points or areas of activity that members of the committee will wish to know about. I and my staff will do our best to answer any questions.

General Statement

Mr. Lamb. Yes. I find it a special pleasure, on this occasion, to present the program developed in our Office under Public Law 86–599. The budget estimate for new funds for the Office of Coal Research during fiscal year 1963 is $2 million.

Operations of the Office of Coal Research have begun to move forward through an effective program of contract research designed to bring assistance to the coal industry. Coal is an abundant resource and its greater utilization as a source of energy as well as other new uses will be of national benefit.

BITUMINOUS COAL PRODUCTION

In recent years bituminous production has stayed around 410 million tons. This figure is considerably below the 500 million tons which the industry has stated it must produce in order to maintain its plant and equipment and to meet the needs of an emergency demand. The need to raise anthracite output is clear. To assist in the development of a stronger coal market in the more immediate years, the Congress created the Office of Coal Research. Although this tremendous assignment is shared with the industry itself and with other agencies of Government and private business, the eventual

success or failure of the Office of Coal Research will be measured by its contribution to the development of new and expanded coal markets.

FUNCTIONS OF OFFICE

A vital function of the Office of Coal Research is to aid in finding better and cheaper ways of mining and preparing coal, delivering it to the consumer at lower cost, improving the efficiency and convenience of its utilization, and developing through our contract research program entirely new uses, products, and processes.

Staffing of the new organization was essentially completed shortly after midyear. In addition to the Director and Assistant Director, the Office of Coal Research consists of four operating divisions—contracts and administration, utilization, economics and marketing, mining and preparation—each headed by a division chief.

The purpose of the Office of Coal Research is to contract for, sponsor, cosponsor, and coordinate research to develop new and more effective uses for coal, to expand present coal uses, and to reduce the cost of coal production and distribution.

As contrasted with the longer term and more basic research program of the Bureau of Mines, the new Office of Coal Research is concentrating its efforts on short-range contract projects aimed at providing the most immediate assistance to the coal industry. There is no conflict between the two agencies.

PROPOSALS AND CONTRACTS AWARDED

Up to the present time, nearly 200 contract proposals have been received and reviewed by the staff of the Office of Coal Research. These proposals came from colleges and universities, coal industry research groups, corporate research organizations, mining and industrial companies, and in some cases from private individuals. It is expected that within a matter of a couple of months, all of the available funds will be committed to contracts.

Total funds available in fiscal 1962 amounted to $1,940,000, of which $225,000 was earmarked for administrative activity, leaving $1,715,000 for research.

Three contracts have been awarded, representing an outlay of $412,000. There are nine additional projects upon which contract negotiations have been virtually completed that will represent a fiscal 1962 outlay of approximately $1 million, of which $600,000 is already encumbered.

STATUS OF PROJECTS

As to five of these nine projects, we will be able to fund only the initial or preliminary phases. On this basis, slightly over $300,000 would remain. However, there are still other projects upon which considerable negotiation has been done. These would take the remaining funds. We are confident that all of our currently available funds, as I mentioned earlier, will be obligated before the end of the fiscal year.

Among these projects there is one I felt sure would be under contract by today. However, certain legal language has to be modified, which may take several days. It is a project that shows great promise for developing the coal market. It involves a new process whereby

coal is treated by high voltage electrical discharges to produce chemicals and synthetic fuels. A total of $200,000 from this year's funds is encumbered for this project, enough to start preliminary work when the contract is signed.

Mr. Chairman, I also have the annual report of the Office which was signed by Secretary Udall and perhaps I might submit a copy, because it contains some of the details on projects.

Chairman HAYDEN. I think it would be well to have it for the record.

(The information referred to follows:)

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D.C., February 15, 1962.

THE PRESIDENT,
The White House, Washington, D.C.

DEAR MR. PRESIDENT: Section 7 of Public Law 86-599 (74 Stat. 336), approved July 7, 1960, provides that the Secretary of the Interior shall submit to the President and the Congress, on or before February 15 of each year, a comprehensive report concerning activities under the authority of this act during the preceding year. This act is administered in the Office of Coal Research of the Department of the Interior.

Organization of the Office of Coal Research, upon an operational basis, began immediately after the appointment of its Director on April 8, 1961. By midsummer, selection of the key professional personnel had been completed. The organizational structure of this Office is shown on attachment A.

The act provides that the Office of Coal Research is "to encourage and stimulate the production and conservation of coal in the United States through research and development by authorizing the Secretary of the Interior to contract for coal research, and for other purposes." Additionally, the act specifies that OCR is to:

"(1) Develop through research new and more efficient methods of mining, preparing, and utilizing coal;

"(2) Contract for, sponsor, cosponsor, and promote the coordination of, research with recognized interested groups, including, but not limited to, coal trade associations, coal research associations, educational institutions, and agencies, of States and political subdivisions of States;

"(3) Establish technical advisory committees composed of recognized experts in various aspects of coal research to assist in the examination and evaluation of research progress and of all research proposals and contracts and to insure the avoidance of duplication of research; and

"(4) Cooperate to the fullest extent possible with other departments, agencies, and independent establishments of the Federal Government and with State governments, and with all other interested agencies, governmental and nongovernmental."

Emphasis is on shorter range research that has prospects for expanding the coal market. As expressed in Congress, the prime objective of the Office of Coal Research is to maximize the value of the coal industry to the national economy. This will require a dynamic coal research and development program conducted with vision, enthusiasm, a positive approach to the problems at hand, and a singleness of purpose. This is essential if the research potentials which exist for expanding the use of coal, reducing costs, and materially improving the economic position of the coal-mining industry at large are to be converted into reality in the near future.

Research activity is initiated through proposals submitted—OCR does not conduct research on its own. Approximately 200 proposals for contract research have been received from educational institutions, coal trade and research associations, and from Government and private organizations. Sponsors of the proposals represent the finest of research talent and facilities. A small percentage of this total has been sent in preliminary form and is to be submitted formally at a later date, perhaps with certain modifications.

Proposals are evaluated with regard to various considerations, including the promise of early practical results, the cost and time involved, and the availability of suitable personnel and facilities. The correlation between a particular proposal and other proposals, as well as with contract research underway, likewise is taken into account.

Two OCR contracts have been awarded. The first, executed on August 4, 1961, is with Booz-Allen & Hamilton in the amount of $139,600 and is scheduled to expire not later than May 1, 1962. The second contract is with Bituminous Coal Research, Inc., and was executed on October 6, 1961, and is scheduled to run for 2 years. It is in the amount of $142,900.

Besides the 2 contract awards, there are 10 research proposals upon which contract negotiations are virtually completed. Also, there are 10 other proposals upon which considerable negotiation has been done, any one of which may reach the final contract stage within a month or two. These 20 proposals give bright promise of developing new and more efficient methods of mining, preparing, and utilizing coal. A number of additional proposals, some requiring a certain amount of modification, appear to have potentials for successful research, and their value in this respect can be more accurately measured when early results from contract research now contemplated are known.

Details covering the scope of work encompassed in the 2 contracts awarded, as well as the 20 proposals, are shown in attachment B.

One hundred and twenty proposals have been rejected, because they failed to present an adequate research program or else represented duplication. Some of these are to be resubmitted with certain changes and will be given full consideration as potential contract projects.

OCR has received substantial assistance from its General Technical Advisory Committee, the membership of which is listed in attachment C. This Committee, represented by leaders from the coal industry, mine labor, education, chemicals, railroads, electric utilities, engineering and mining equipment companies, has met twice within the last 8 months. OCR advises with and will continue to seek the assistance of the Committee on matters dealing with research programing and operations.

Additionally, a number of scientists and technicians, the majority of whom have been recommended by the National Academy of Sciences-National Research Council, in response to OCR requests, have been appointed. These specialists may serve individually or on committees in an advisory capacity with respect to particular research proposals. Their fields of knowledge encompass the several scientific disciplines inherent in the coal research program, and they are proving to be a valuable adjunct to the OCR permament staff.

Congress appropriated $1 million for OCR operations during fiscal year 1962. An additional $940,000 was available, a carryover from the previous year when OCR had but limited activity. A total not to exceed $225,000 was authorized for administrative and supervisory expenses, leaving $1,715,000 for contract research funds. Obligations for the two awarded contracts amount to $282,500. An additional amount of $398,000 has been encumbered on three contracts that are near execution.

It is expected that the funds available for contract research will be entirely obligated before the end of the current fiscal year. In particular cases, available money will cover only the funding of preliminary phases of research projects. When the preliminary research is completed and results give promise of success, considerably more money will be required to carry projects to completion over a period of 3 to 5 years. Plans will call for the construction of pilot and demonstration plants, any one of which may take funds several times larger than the total available this year.

We believe that the Office of Coal Research has made a good start toward activating research that will improve the health of the coal industry and enhance the value of the coal resources to the Nation.

Respectfully yours,

STEWART L. UDALL,
Secretary of the Interior.

Identical letters sent to the President of the Senate and the Speaker of the House of Representatives.

ORGANIZATION -- OFFICE OF COAL RESEARCH

ATTACHMENT "B"

FEBRUARY 1, 1962.

PROJECT LIST

I. Projects under contract:
   1. Booz-Allen & Hamilton.
   2. Bituminous Coal Research, Inc.

II. Projects upon which contract negotiations are largely completed:
   1. Project COED (Char-oil-energy development).
   2. Project Bootstrap.
   3. Project Gasoline.
   *4. Project Package Boiler (intermediate industrial steam market).
   5. Project Gas.
   6. Project High-Temperature Reactions.
   7. Optimization of underground mining.
   8. Western coal study.
   9. Export market study.
   10. Development of industrial complexes based on availability of valuable minerals in or adjacent to coal seams.

III. Projects upon which considerable negotiation has been done—any one of which may be under contract within a few months:
   1. Project Jet Fuel.
   2. Project Fuel Cell.
   3. Project Pipeline Reactor.
   4. Project Western Coal.
   5. Project Low-Temperature Carbonization.
   6. Development of prefailure testing methods for mining equipment.
   7. Coal area power.
   8. Project Rocket.
   9. Project Pipe.
   10. Project Low-Ash Coal.

PROJECTS UNDER CONTRACT

1. The Booz-Allen & Hamilton contract (No. 14-01-0001-223) for an amount not to exceed $139,600 was executed on August 4, 1961. It was the first contract awarded. Completion date is scheduled for not later than May 1, 1962. The contract provides for a comprehensive study of the market potential for coal. As such it represents an overall appraisal by an independent research organization of the opportunities for coal as well as an intensive analysis of several new promising uses of coal. It will provide guidelines to future projects, and it will examine the properties of coal and relate them to specific services which coal can perform, some of which are being satisfied by products other than coal.

2. The second contract which the Office of Coal Research awarded is with Bituminous Coal Research, Inc. Subject contract No. 14-01-0001-226, is in the amount of $142,900 and was executed on October 4, 1961. It is a 2-year contract.

This contract has as its objective the development of processes and methods to prepare, transport, and use pulverized ultrafine coal. Ultrafine sizes have been defined for this contract as falling in the range of 5 to 74 microns. A 74-micron particle is equivalent to 200 mesh; 200 mesh is a screen with 200 openings per inch in each direction so that a particle passing through such an opening would be slightly smaller in size than very fine beach sand. The diameter of human hair will normally fall in the range of 12 to 120 microns. If successful, this development will create an entirely new commodity since finely ground solids exhibit many properties normally associated with fluids. Such materials can be pumped and handled like fluids in simple items of equipment.

The Office of Coal Research is interested in ultrafine coal because of its potential application to a wide range of coal problems. The ease and convenience of handling, which are mentioned above, can introduce coal in many markets which are currently not available to it. Likewise, finely ground coal can be used in many processes and areas of interest such as gasification, liquefaction, and chemical manufacturing in their various forms. An additional potential exists in removal of undesirable impurities from coal such as ash and sulfur. Successful development of this potential may well have a significant effect on coal preparation plant practice and air pollution control by coal users.

*3. The third Office of Coal Research contract (No. 14-01-0001-242) was signed by Secretary Udall on February 26, 1962. This 2-year contract with Pope, Evans & Robbins, consulting engineers, is for $129,185.

Work on this project contemplates the development of a new coal-fired, package boiler and tests of its various components based on simplified coal and ash handling and reduced investment and operating costs. It will probably make available to the intermediate-size-range user many of the advantages presently found only in the large steam generating stations in the electric utility market. As an ancillary contract, one potential user has agreed to install such a unit for demonstration purposes in his steamplant. Successful conclusion of this research and development contract may result in a new market for coal having a potential for new coal use of approximately 3,000 tons per boiler, and an ultimate potential of several million tons annually.

PROJECTS UPON WHICH CONTRACT NEGOTIATIONS ARE LARGELY COMPLETED

1. Project COED (char-oil-energy development)

This project is designed to conduct both bench and pilot plant scale experiments to determine the technical feasibility of extracting from coal the equivalent of a crude oil suitable as a diluent for a refinery feed stock. It is proposed that the contractor conduct experimental work on a multiple fluid bed and a high temperature pyrolysis process or a combination to produce a pumpable synthetic crude oil which can be used to transport the remaining fuel constituents (char) of the coal to a market located some distance away. The contractor's effort will utilize processes which have not been previously investigated, and, if successful, an initial commercial plant could provide an additional market for approximately 1,500,000 to 2 million tons of coal annually. The ultimate maximum potential from numerous plants would be much larger.

2. Project Bootstrap

This project will include bench scale experimentation and process development work to determine the feasibility of upgrading coal by reacting it with hydrogen. The hydrogen will be subjected to electrical discharge to increase its reactivity and simplify the process of introducing additional hydrogen into the chemical compounds which constitute coal. This work will study a new and unique process which appears to have great economic and technical promise for the production of chemicals and synthetic fuels. The potential new coal tonnage which can be realized is, of course, dependent to some degree on success, but an initial commercial-sized plant may provide an additional market for coal of up to 2 million tons annually, with an ultimate potential much greater.

3. Project Gasoline

This project is concerned with an accelerated pilot plant development program for a process utilizing new process methods and a new catalyst for manufacturing gasoline and related chemicals and char from high-volatile bituminous coal. The work will include a detailed feasibility study followed by a pilot plant design, construction, and operation program to determine overall process, technology, and economics. It should be emphasized that this process is not a duplication or a repeat of work previously performed by any organization. This work is along a process line that is somewhat different than past approaches and with success will improve annual coal tonnage markets, with a first commercial-scale plant providing a market for up to 3 million tons annually. Subsequent development could expand this market, and the consequent requirement for coal on a very large scale.

4. Project Package Boiler (intermediate industrial steam market)

Work on this project contemplates the development of a radically new packaged boiler and tests of its various components based on simplified coal and ash handling and reduced costs. It will probably make available to the small user the many advantages of pulverized coal firing currently available to only the large steam raising stations in the electric utility market. As an ancillary contract, one potential user has agreed to install such a boiler for demonstration purposes in his steamplant. A successful conclusion on this research and development contract may result in a new market for coal which carries with it a potential for new coal use approximating (as a minimum) a market for 3,000 tons of coal per unit annually, and an ultimate potential of several million tons annually.

5. Project Gas

Work on this project will include experimental operation of a multiple staged bed gasification process for coal directed to development of a high-quality synthesis gas and/or high British thermal unit pipeline gas. Work will include a detailed

evaluation of various coal materilas including preparation plant wastes as a basic raw material for the process and novel equipment arrangements will be considered and evaluated. Considerable gasification work has been done in the past using various techniques, and this new process is in fact a combination of existing knowledge and technology to reduce capital and operating costs. If a small percentage of the total natural gas requirements in the appropriate geographical areas of the country were to be derived from coal, a tonnage of about 3 million tons annually in an initial plant can be foreseen.

6. Project High-Temperature Reactions

This project is of an exploratory nature and is concerned with a determination of the compounds which may result by reactions of coal or coal compounds with various other materials in a plasma jet. Plasmas of various gases will be considered and reactance, such as hydrogen, ammonia, halogens, etc., will be introduced and the resulting products will be analyzed. The basic information which will be obtained can be related to other projects and the work will be undertaken because of this relationship.

7. Optimization of underground mining

This proposal envisions the development and evaluation of all of the parameters of coal mining, especially those which can be controlled or affected by the coal operator. The study will be made in a depth impossible to any single producer. The results will be developed into computer programs which will make available optimization data that could only be accomplished by many years of actual underground experimentation.

Certain mining simulations have been made on computers, but no individual operator has the staff, knowledge, or facilities to develop a major program of this nature. This proposal has been highly endorsed by leading coal operators throughout the country as being extremely valuable as a means of cost reduction.

8. Western coal study (economic and marketing research)

The objective of this research contract is to examine the potential market for coal produced in the western part of the United States. This study will be based on a locational analysis of the demand-supply energy balance for this regional area both in terms of energy types and consumption purposes. The study will be particularly addressed toward reversing the downward trend in the utilization of western coals and toward revitalizing this important sector of the industry. Potential tonnage may involve several million tons annually.

9. Export market study

The purpose of this research study is to appraise the foreign market potential of U.S. metallurgical and steam coals and the obstacles to the achievement of this potential. In addition the study will attempt to develop new techniques aimed at increasing the shipments of U.S. coal throughout the free world. In terms of additional volume, the implementation of this study may achieve significant tonnage, perhaps upward of several million tons annually.

10. Development of industrial complexes based on availability of valuable minerals in or adjacent to coal seams

Many valuable minerals, such as alumina, are known to be available in shales and clays associated with coal. These could be mined along with the coal at extremely low cost if they were in demand. Changing economics in alumina ores, location of aluminum plants in coal areas, plentiful labor, and low-cost electricity are making this concept increasingly favorable.

This research will determine the quality and quantity of such ores associated with coal in areas where the economics are favorable. Impact on these mining areas could be great, both in the long and short range.

A limited amount of similar work was done in central Pennsylvania some years ago, and some is being done on a purely local basis. But no industrywide evaluation of quality, quantity, and economics has been made.

PROJECTS UPON WHICH CONSIDERABLE NEGOTIATION HAS BEEN DONE—ANY ONE OF WHICH MAY BE UNDER CONTRACT WITHIN A FEW MONTHS

1. Project Jet Fuel

Work on this project will include a brief feasibility study followed by process development and pilot plant tests to develop a jet fuel meeting Air Force and Navy specifications from coal. The contractor will employ conventional hydrogenation techniques in a new process scheme to produce the cyclic type compounds

of the appropriate energy and stability to meet specifications. Somewhat similar work has been performed abroad but OCR effort will utilize a revised and improved process to achieve an economically successful result The total tonnage which can be forecast in this area is not large but such a plant could well act as a complementary unit to other plants which may result from other OCR projects such as those involving gasification and liquefaction.

2. Project Fuel Cell

Work in this area contemplates the development of a coal-based fuel cell for generation of central station power Preliminary work which has been completed by the anticipated contractor indicates that a successful cell will require only engineering development to make it economic Work on the cell will be phased to test prototype units, followed by construction of a large pilot unit to resolve the many engineering problems associated with a development program of this sort. This entire concept is, of course, new and its result on coal tonnage is difficult to estimate. It will act, however, as a defense for coal against further inroads of natural gas and oil

3. Project Pipeline Reactor

This project will involve investigation of the use of transportation pipeline to provide chemical reaction time so that materials placed in one end of the pipeline will interact and produce at the outlet end an upgraded product. Negotiations in this area are in a preliminary state and details of the project as it will develop are not available at this time.

4. Project Western Coal

Work on this project embraces a five-prong approach to improved utilization of western coals to be conducted by a western university with a portion of the funds supplied by the State. It includes evaluation of alternate methods for upgrading specific coals which are available in the Rocky Mountain and Great Plains area of the country. The work will be funded approximately 60 percent by OCR and 40 percent by the State. Work which will be done includes process development studies which can be related to not only the western coals involved but to other major projects which OCR proposes to undertake. As such, it is anticipated it will supply a wealth of scientific data and information which can be applied to the OCR program.

5. Project Low-Temperature Carbonization

A western college has available an experimental coal carbonization plant which OCR would propose to use in a test to determine the potential for producing high British-thermal-unit gas, coke briquets, and liquid products from a variety of typical coals. The contract is a minor one in terms of money but will be related to work performed on major projects of a similar nature.

6. Development of prefailure testing methods for mining equipment

Certain nondestructive testing techniques have been developed for surface industry applications, but not for the coal industry. Because of the strenuous operating conditions, mining equipment has unusually high downtime and maintenance problems. And because of the rugged construction, poor visibility, and limited clearances related to use of mining equipment, problems of examining and inspecting such equipment are unusually difficult and expensive. This research will determine the applicability of prefailure testing techniques to application in a mine, the economics of use of such equipment, and the problems of development of actual equipment.

To our knowledge, no such work has been undertaken. AEC has suggested that certain radioisotopic applications seem favorable for this duty, but no one is presently active in the field.

7. Coal area power

In these studies it is our intention to analyze the increase in coal consumption which would arise from substantial reductions in electricity costs and rates that result from more efficient coal area power. The latter refers to superscale mine-mouth generation of electricity and long-distance extra-high-voltage transmission. Although much research in generation and transmission is being carried on elsewhere (and wherever possible such efforts will be used rather than duplicated) they are not focused on increased coal use which is the primary objective of the OCR studies. Since these studies involve specialized analyses in economics as well as in engineering, two separate and coordinated contracts are planned for this work. Assuming positive results in these contracts, sizable tonnage is envisaged as the potential additional market.

8. Project Rocket

This work proposes to evaluate various fuels which can be derived from coal for military rocket applications. It will include a consideration of energy levels required, cost of production, and effect on the cost of military hardware. If preliminary examination proves successful, fuel grains will be developed at a later stage and actual rocket tests undertaken. The impact of successful production of a rocket fuel from coal on the coal industry is small but the Nation's military posture may well be improved and coal may be made to provide another valuable service to the Nation.

9. Project pipe

It is proposed in this contract to develop a method for continuous field extrusion of a plastic pipe which can be utilized to transport coal suspensions both within plant and transcontinentally. Such a pipeline may very well be adapted to coal suspensions in gases or liquids but would probably not be adaptable to high-pressure natural gas or oil service. This work is associated with OCR interest in gasification and liquefaction processes as it might be applied to delivering a lower cost coal energy to the customer. The contractor will include construction of approximately a 1-mile loop and will pump various coal suspensions through the loop to determine economics for a larger scale operation.

10. Project low-ash coal

This project is directed toward development of a coal fractionation system to produce a high-quality, ash and sulphur-free, coal for use in a broad spectrum of markets which require such a fuel. The method to be employed will generate a variety of useful byproducts which can be marketed to pay for the cost of processing, thereby holding the coal energy price constant even though the fuel is of higher quality. The work which will be done includes preliminary bench scale effort followed by pilot plant development and an actual semiworks scale plant test. The impact of successful research in this area is extremely difficult to assess but substantial tonnages will be retained for coal which might otherwise be lost and the new markets which it will make available are quite substantial.

OFFICE OF COAL RESEARCH

GENERAL TECHNICAL ADVISORY COMITTEE

Chairman: George A. Lamb, Director of Coal Research

Mr. William A. Bear,[1] president, Bear Coal Co., Somerset, Colo.

Dr. Maurice H. Bigelow, technical director, Plastics and Coal Chemicals Division, Allied Chemical Corp., 40 Rector Street, New York, N.Y.

Mr. Jack J. Boyle,[1] president, Mountain States Mining Co., 2420 4th Avenue North, Billings, Mont.

Dr. H. B. Charmbury, head, Department of Mineral Preparation, Pennsylvania State University, University Park, Pa.

Mr. F. S. Elfred, chairman of the board, Peabody Coal Co., 301 Olive Street, St. Louis, Mo.

Mr. Gilbert R. Griswold,[1] Chapman, Wood & Griswold, 530 Jefferson Street NE., Albuquerque, N. Mex.

Mr. Robert H. Hughes,[1] chairman of the board, Clinchfield Coal Co., Division of Pittston Co., 17 Battery Place, New York, N.Y.

Mr. J. D. Jillson, president, Anthracite Institute, Wilkes-Barre, Pa.

Mr. Harry LaViers, president, South-East Coal Co., Paintsville, Ky.

Mr. Samuel Lenher, vice president, research and development, E. I. duPont de Nemours & Co., 1007 Market Street, Wilmington, Del.

Dr. C. J. Potter,[1] president, Rochester & Pittsburgh Coal Co., Indiana, Pa.

Mr. R. E. Salvati, chairman of the board of directors, Island Creek Coal Co., 700 Chafin Building, Huntington, W. Va.

Mr. S. T. Saunders, president, The Norfolk & Western Railway, Roanoke, Va.

Mr. Walter K. Scherer, president, Fred Scherer, Inc., 424 West Madison Street, Ottawa, Ill.

[1] Appointed since Feb. 15, 1961.

Mr. G. A. Shoemaker, president, Consolidation Coal Co., Koppers Building, Pittsburgh, Pa.

Mr. Philip Sporn, American Electric Power Co., Inc., 2 Broadway, New York, N.Y.

Mr. W. L. Wearly, president, Joy Manufacturing Co., Pittsburgh, Pa.

Mr. Michael F. Widman, Jr., director, Research and Marketing Department, United Mine Workers of America, 900 15th Street NW., Washington, D.C.

Dr. E. J. Workman, president, New Mexico Institute of Mining and Technology, Socorro, N. Mex.

DIFFERENTIATION OF WORK OF OFFICE AND BUREAU

Mr. LAMB. Yes. That completes my summary, sir.

Chairman HAYDEN. I wish you would please differentiate for the committee the work which you perform under legislation establishing the Office of Coal Research and the research done by the Bureau of Mines on bituminous coal.

Mr. LAMB. Our research, sir, is done entirely by contract. We do no research on our own in our office or Government facilities. The Bureau, however, does do research on its own and it also has research not only for some of the short-range but a lot of it is of a long-range nature.

Our emphasis is on short-range contracts offering the most immediate promise of benefits for the industry and coal as an important but underused natural resource. We contract for the research with outside organizations.

CONTRACTS AWARDED AND IN PROCESS

Chairman HAYDEN. Would you indicate to the committee the contracts which you have entered into during the past year and the ones which you expect to make during the fiscal year 1963 and for each of them show with whom you contract, the purpose of the contract and amount of the contract. Do you have that here for the record?

Mr. LAMB. Yes, sir; I do. That is covered in the annual report and would you like me to summarize it now, sir?

Chairman HAYDEN. Well, brief it, that is all, and you can put it in the record.

Mr. LAMB. We have three contracts awarded. One is to Booz, Allen & Hamilton, Inc. It is in the amount of $139,600. The second is with Bituminous Coal Research, Inc., in the amount of $142,900 and the third is with Pope, Evans & Robbins in the amount of $129,185, a total of $411,685.

Now, these are the three contracts that have been awarded.

We have a number of other proposed contracts, upon which negotiations have been largely completed and which may be signed in a matter of days or within a month or something like that. There is just a need for some final details to be straightened out.

Chairman HAYDEN. I assume when these three contracts were let you sought a little bit different line of approach in one than the other?

Mr. LAMB. That is right, sir. They each seek an entirely different approach and these are summarized in the annual report, showing the details behind each contract.

Chairman HAYDEN. I see.

Mr. LAMB. If I might add, there was one contract that was awarded since the report came out, but the basis for it is also in the annual report (where it is shown as Project Package Boiler).

INCREASE IN FUNDS FOR ADMINISTRATION AND SUPERVISION

Chairman HAYDEN. Your justification asks that the limitation on funds available to be expended for administration and supervision be increased from $225,000 to $310,000. This is an $85,000 increase. An explanation should be made to the committee why an increase of this size is needed, when you expect to have $25,000 less in contract research than you had in fiscal year 1962.

Mr. LAMB. Mr. Chairman, as these contracts are awarded and the contractors begin their operations, the contracts will have to be monitored and they have to be supervised completely. It is going to take additional personnel to do this. This is the main reason for it. However, I feel that I should point out to the committee that the fiscal year 1963 request for personnel is the same as we requested last year, 27. Our request for administrative funds last year was $297,000 and we are now asking for $310,000. I will assure the committee that we will continue to exercise careful scrutiny over this, and all other areas of our program, in order that any dollar savings in the administrative funds will be available for use in the contract research program.

Chairman HAYDEN. Do you keep constantly in contact with the contractors?

Mr. LAMB. Yes, we have to do that to see that the work is followed through in a proper manner.

Chairman HAYDEN. Senator Byrd, any questions?

RELATIONSHIP WITH BUREAU OF MINES

Senator BYRD. Yes, Mr. Chairman, I have some questions. Thank you.

Mr. Lamb, in your statement you say there is no conflict between the two agencies, the Office of Coal Research and the Bureau of Mines. I am glad to see that in your statement. Would you like to elaborate a little further?

Mr. LAMB. Yes, Senator. In fact we have a cooperative agreement the main purpose of which is to avoid duplication of effort. And this was executed last summer, shortly after I was appointed Director of the Office of Coal Research. What we strive to do is to keep each other informed generally as to the type of our work so that we can avoid any duplication. Not only that, but we find we can learn a lot from the Bureau of Mines. It has had a long experience in the research field and it can be very helpful on many of our projects.

Senator BYRD. It was the intent of the Congress there be no duplication of effort and overlapping, is that true?

Mr. LAMB. That is correct, sir.

Senator BYRD. And in your opinion there is no duplication of effort?

Mr. LAMB. Insofar as I know there is not.

Senator BYRD. And you so coordinate your effort with the Bureau?

Mr. LAMB. That is correct.

Senator BYRD. That is so as to obviate any possible overlapping or duplication of effort. Is that correct?

Mr. LAMB. That is correct.

OBLIGATION OF FUNDS

Senator BYRD. I note that you say in your prepared statement that it is expected that within a couple of months all of the available funds will be committed to contract. Is that correct?

Mr. LAMB. That is correct.

Senator BYRD. How much money was provided for the Office of Coal Research by the Congress in the present fiscal year?

Mr. LAMB. $1 million.

Senator BYRD. The Bureau of the Budget recommended $2 million for the Office of Coal Research during fiscal year 1963?

Mr. LAMB. That is correct. I might add we had a carryover of $940,000 from the year before due to the fact the Office was not organized until last year, starting last spring.

Senator BYRD. But within a few weeks all available funds will be committed to contract?

Mr. LAMB. That might be a few months, but certainly before the end of the fiscal year.

Chairman HAYDEN. How much was the carryover?

Mr. LAMB. About $940,000. We have a total of $1,940,000 available for expenditure during this fiscal year.

Senator BYRD. And the Bureau of the Budget is recommending $2 million for the coming fiscal year?

Mr. LAMB. Yes.

REQUEST TO BUREAU OF THE BUDGET

Senator BYRD. Now what was the amount of the request that you submitted to the Bureau of the Budget?

Mr. LAMB. It was $5,880,000.

Senator BYRD. In other words, you requested nearly three times as much as the Bureau of the Budget is recommending?

Mr. LAMB. That is right.

Senator BYRD. Now if you get $2 million instead of $5,880,000, the plan of operations which you had when you submitted the request to the Bureau of the Budget is going to have to be changed; is it not?

Mr. LAMB. That is correct.

ADJUSTED OPERATIONS UNDER FUNDS ALLOWED

Senator BYRD. How have you adjusted your planned operations with reference to the $2 million recommendation made by the Bureau of the Budget?

Mr. LAMB. Well, we will try to stretch the $2 million as far as we can, but what it means is that it is going to retard our operations and in many cases we will only be able to begin the preliminary phases of projects and as a result it will slow up the entire operation to that extent.

Senator BYRD. Do you think that it would be detrimental to your operations in the long run?

EFFECT OF REDUCTION

Mr. LAMB. Well, certainly the objective of the Office of Coal Research is to do short-range research, and try to expand the coal market within the immediate years ahead. Now the longer that is delayed, the less effective our operation is going to be.

Senator BYRD. How do you view this from the standpoint of the desire and intent of the Congress that the Office of Coal Research will deal rapidly with its work? How do you view this reduction in the budget that has been brought about by the Bureau of the Budget?

Mr. LAMB. Well, as I mentioned earlier, what we have been trying to do is to keep as many contractors activated as we can, but we can only do it on the first phase, which means putting off the second or third, or later phases. Now, as a result of this, it just prolongs the work of the project. I would say that as a result the idea that Congress had that we get the results in the immediate years will not come about.

Senator BYRD. Well, Mr. Lamb, I view it with considerable concern and I assume that you view it similarly. Having lived in the bituminous coalfields of West Virginia during most of my life, I am cognizant of the fact that the economy of the southern part of my State has largely been founded upon the coal industry and over the past 25 years the coal industry has suffered greatly.

We have lost markets to residual oils, we have lost markets as a result of the dieselization of the railroads, we have lost markets for other reasons, but we think there is a great future for the coal industry if steps can be taken to develop new uses for coal, new methods of mining coal, and possibly new methods of transporting coal. As a Member of the House of Representatives I actively sought the creation of an Office of Coal Research and then later when I came to the Senate I continued my efforts because I saw, in such an office, a possibility that we might be able to develop new uses for coal and develop them at a more rapid and more accelerated pace. I saw in this a relief not only for the coal industry but for my State and the people. So I view this reduction with concern. It seems to me that the Congress intended that the Office of Coal Research have more than $2 million in its third year of operation. Those of us who supported this legislation, I think, had a view that by the time the Office was in its third, fourth, or fifth year, you would be ready to expend, economically, $10 million a year or more; and I think that this kind of a reduction impedes the progress of your work. I think that it fails to effectuate the intent of the Congress and certainly the intent of the sponsors of this legislation.

FUNDS REQUIRED TO COMPLETE PROJECTS

Now how much money would be required to complete projects that are near the contract stage?

Mr. LAMB. Well, under our original estimate, Senator, we believe that $5,880,000 would be needed in the next fiscal year. Now in the present situation, with a request for only $2 million—about $1,700,000 for research purposes—in most cases we would be able to do only the preliminary phase work. That, of course, delays everything. It would take considerably more money to speed it up then in the next fiscal year.

I might add that when you think toward a period 5 years ahead and the full execution of final contracts on these projects in order to bring them up to the completion phase, then you are thinking in terms of a much larger amount than is contemplated here.

Senator BYRD. Well, if you were to have provided $5,880,000 you don't think there would be any conflict in the work carried on by your Office and the work that is carried on by the Bureau of Mines?

Mr. LAMB. I am sure there wouldn't be.

Senator BYRD. Now you have five projects near the contract stage? Is that not correct?

Mr. LAMB. Well, actually we have nine, but five are sizable contracts.

Senator BYRD. Well, how much more money would be required to complete the five sizable projects during the next 3 to 5 years?

Mr. LAMB. Well, I think it will take at least something over $18 million to complete those projects.

Senator BYRD. So if you were only to get the $2 million this year, the coming fiscal year, you would only have $100,000 more than you had in the present fiscal year, considering the fact you had a $900,000 carryover from the previous year, is that correct?

Mr. LAMB. That is right.

Senator BYRD. So it does not indicate that you are going to move forward toward the completion of the five sizable projects during the next 3 to 5 years for which you would need a considerable amount of money, $15 million to $18 million, perhaps. We have not only gotten off to a slow start but we are continuing at a slow pace.

Mr. LAMB. Yes, sir.

HOUSE SUBCOMMITTEE ON COAL RESEARCH

Senator BYRD. Now, in the report of the Special Subcommittee on Coal Research of the House Committee on Interior and Insular Affairs, based upon exhaustive hearings, recommendations were made regarding the amount of money necessary for the total research related to your Office. I was a Member of the House at the time this report was printed and I have already made references as to what our goals were. Do you remember what the recommendations were?

Mr. LAMB. Well, the recommendations were prepared for this committee, subcommittee, rather, by the National Coal Association, which recommended that $10 million be provided during the first fiscal year, that the amount be increased to $20 million the second fiscal year, $30 million the third, $40 million the fourth, and $50 million the fifth, and, after the fifth year, that the level remain at $50 million unless Congress decided that additional money might be needed.

PENDING CONTRACT

Senator BYRD. You spoke of a contract you had hoped to have signed by today, is that right?

Mr. LAMB. Yes; that is right, sir. We had hoped to have another one when we appeared before this committee today.

Senator BYRD. Are you prepared to testify on the work to be done on this contract?

Mr. LAMB. Yes. This contract is highly promising, from the standpoint of increasing the proposed market, and this is a project which I

discussed with you, Senator, on several occasions since I had the pleasure of going with you and Secretary Udall and others to the mines last year on a mining trip.

It deals with the high voltage application in the sense as applied to coal, and resulting in chemicals and synthetic fuels. I think perhaps it is one of the best projects we have and we have been very hopeful that we would have it under contract. As I say, there are a few legal matters that have to be cleared up before it will be under contract. Of course, we are only going to start on the preliminary phase. We won't have sufficient money in one fiscal year to carry it through, but carrying this project through 4 or 5 years or to the completion stage might run into the neighborhood of $6 million.

PURPOSE OF PROJECT

Senator BYRD. Just what would you hope to achieve? What does this project do?

Mr. LAMB. Well, what this project will seek to do is give a new process to the coal industry which will produce chemicals and synthetic fuels at competitive levels and will greatly enlarge, as far as we can see, the production of the coal industry. Further details are in the OCR annual report under Project Bootstrap.

Senator BYRD. Now you say you have to use, I believe, $200,000?

Mr. LAMB. Yes.

Senator BYRD. That is for the initiation of this project?

Mr. LAMB. That is right.

Senator BYRD. Now if you only get $2 million, as is recommended by the Bureau of the Budget, what is that going to do to this particular project?

Mr. LAMB. The $200,000, you understand Senator, will come from funds of this year. It would mean that we would have to squeeze pretty tightly the next fiscal year to even give any money to this project. We should give anywhere from maybe $700,000 to a million dollars to this project in the next fiscal year, to carry it on and to push it ahead, you see, so it would be ready to go into commercial operation within 4 or 5 years.

STEPS IN CARRYING OUT PROJECT

Senator BYRD. Will this necessitate the construction of some type of pilot plant?

Mr. LAMB. Yes; it will. The first phase, of course, is the preliminary research. The second one would be the design of the equipment and the processing method. The third would be the pilot plant.

Senator BYRD. How far away would the third stage be?

Mr. LAMB. Well, it is proposed that the construction of the pilot plant will start within 3 years. The planning and so on might start in maybe 2 or 3 years.

Senator BYRD. Do you consider this to be a vital project to the coal industry?

Mr. LAMB. I think, it is one of the better projects we have before us; that is right.

Senator BYRD. Do you think it would enhance the mining of coal or enhance the marketing of coal?

Mr. LAMB. Well, I think it would do both. It would, of course, increase the production of coal substantially and would open up new uses and new markets for the coal industry.

LOCATION OF PROPOSED PILOT PLANT

Senator BYRD. Would this proposed pilot plant be located in low volatile or high volatile coal regions?

Mr. LAMB. Well, it should be located at a point central to the mining fields and near a principal place of coal mining. Now, you mentioned the low volatile coal and that appears centrally in the eastern Appalachian areas. That would be one of the central regions; that is correct.

Senator BYRD. By way of my own information, how does the area from which I come, my hometown being Beckley, located in Raleigh County, which is the heart of the "black diamond" area—how would that area fit into this proposed pilot plant that you envision?

Mr. LAMB. That is an area that is right in, you might say, the central part of the Appalachian field, eastern Appalachian field. It should be ideal for the location.

PROSPECTS UNDER ADDITIONAL FUNDS

Senator BYRD. Do you feel, Mr. Lamb, that if we cannot get the full $5,880,000, if we could get an additional million dollars it would enhance the prospects of your moving forward more rapidly and more surely with the contract that you are just speaking of and with certain other projects you have underway?

Mr. LAMB. There is no question about it. It would help a great deal.

Senator BYRD. Do you consider it is very important?

Mr. LAMB. It is very important if we are going to move ahead.

Senator BYRD. I feel that you have to present the budget requests when you come here; but I do not have to defend them. I will increase them if I possibly can, because people whom I serve are suffering—they have been suffering quite awhile and they are going to suffer quite a while longer. I would like to see coal research move ahead because that is bread and butter for a lot of our miners and children in West Virginia and a lot of our coal operators, too.

So, do you think it is imperative in your honest opinion that the Office of Coal Research have more than $2 million?

Mr. LAMB. Well, I feel certain that that is the case. I think it is necessary, Senator. That is why we asked for considerably more originally.

Senator BYRD. And I ask you once again, there would be no overlapping or duplication of effort between the two agencies, the Office of Coal Research and the Bureau of Mines?

Mr. LAMB. That is correct.

Senator BYRD. Specifically with regard to the contract that you think is about to be completed, is that true of that also?

Mr. LAMB. That is true. It is an entirely new process.

WORK OF OFFICE

Senator BYRD. Mr. Chairman, I think that Mr. Lamb has done a good job with insufficient funds. He has accompanied me to West Virginia and he has been in the coal mines in McDowell County with

me, he and Secretary Udall, and his interests are, I am sure, in doing a good job. He has an important position and is a very capable man and well prepared for the position in which he serves. I think he has made a good statement, a good presentation, in our subcommittee this morning. I am very grateful to him for the explicit, frank, cogent, lucid answers to my questions, and I thank you, Mr. Chairman, for permitting me to ask the questions.

DEPARTMENTAL REQUEST

Chairman HAYDEN. I would like to inquire how much did the Department of the Interior ask the Bureau of the Budget to allow?

Mr. LAMB. $5,880,000.

Chairman HAYDEN. The entire cut was in the Bureau of the Budget?

Mr. LAMB. Yes.

Senator BYRD. Mr. Chairman, I am convinced that the Office of Coal Research should have the full amount of its initial request; and at the proper time I intend to propose that the full $5,880,000 be appropriated.

(The information referred to was received and placed in the committee files.)

Chairman HAYDEN. Very well. Next we will hear from the Bureau of Mines.

BUREAU OF MINES

CONSERVATION AND DEVELOPMENT OF MINERAL RESOURCES

STATEMENT OF MARLING J. ANKENY, DIRECTOR; PAUL ZINNER, ASSISTANT DIRECTOR, PROGRAMS; HENRY P. WHEELER, ASSISTANT DIRECTOR, HELIUM; AND ELWOOD THOMSON, BUDGET OFFICER

BUDGET REQUEST AND JUSTIFICATION

Chairman HAYDEN. The Bureau of Mines budget estimate for "Conservation and development of mineral resources" for fiscal year 1963 is $27,000,000, $2,200,000 more than was appropriated in fiscal year 1962.

The justification for this request will be included in the record.

(The justification follows:)

HIGHLIGHT STATEMENT

Long-range objectives and budget year program

Prudent utilization of our natural resources to meet the economic and industrial needs of the United States and assure its security is the prime consideration motivating the programs proposed under the "Conservation and development of mineral resources" appropriation.

The broad purposes and long-range objectives of the programs conducted under this title are (1) to promote through technologic research the conservation and development of domestic mineral resources to insure the optimum production of materials needed for national defense and an expanding domestic economy, and (2) to provide essential economic and statistical data to insure a sound factual base for establishing and implementing domestic and foreign mineral policies and programs in industry and Government.

The bituminous coal program is directed toward research in the conservation, development, and conversion of bituminous coal and lignite, the safe and efficient production, handling and utilization of explosives, and the collection, interpretation and dissemination of fundamental statistical and economic data pertaining to coal and related products. The realization of the research objectives will permit efficient extraction, preparation, processing, and utilization of bituminous coal. Development of more efficient methods of recovery will conserve the Nation's coal, reduce the cost of mining, and improve coal's competitive position in the energy market. Advancements in preparation will provide better quality products, wider selection of coals with particular properties and increased flexibility in overall operation. Improved combustion techniques and application will lead to new and more efficient methods of producing power. Conversion of coal to other useful forms of energy, carbon, and chemicals will promote industry's ability to meet growing energy requirements and develop new and diverse markets for coal. Research in explosives and explosions will reduce hazards from blasting and industrial gas and vapor explosions throughout the minerals industry. Continued economic and statistical studies will provide defense and other governmental agencies, industry and the general public with basic facts to effectively administer and guide the Nation's total fuel economy.

The anthracite program is designed to develop new uses and expand present uses for this commodity, to develop new or improved mining and preparation equipment and methods, to establish basic economic and statistical data on a national and international basis, and to carry out the Federal Government's responsibilities under the joint Federal-State minewater control program. The Bureau's research on the mining, preparation and utilization of anthracite, complemented by the minewater control program, should increase the national wealth by improving the economy of the anthracite-producing region, promoting mine safety, and assisting in the national defense.

Programs pertaining to petroleum, natural gas, and oil shale are directed toward finding ways to obtain a larger ultimate recovery from the Nation's oil and gas fields and greater benefit to the public from the oil and gas produced. Demands for liquid and gaseous fuels continue to rise rapidly, and new reserves of oil and gas continue to become more difficult and costly to find. Technologic research

designed to obtain higher recovery from underground deposits, to solve problems in transportation and storage, to improve processing, and to increase efficiency in use is essential. This program is aimed, also, at establishing scientific bases for a future oil-shale industry and to supply economic and technical facts needed by the Government, industry, and the public. Bureau research will be supplemented and guided by economic and technologic studies and mineral resource and industry surveys.

In the field of minerals, the program is aimed at maintaining a strong national supply position despite the ever-increasing demands of an expanding industrial economy and rising international tensions. Latent resources are examined to delineate new domestic sources of supply. Mining and metallurgical research is conducted to make submarginal deposits commercially useful. Higher recoveries are sought through perfection of mining methods with higher extractions and lower dilutions, and through new and improved metallurgical techniques. The properties of mineral substances are being studied to discover special characteristics and combinations of characteristics and to intensify known attributes through the techniques of chemistry, physical metallurgy, and other advanced scientific methods. Such information is proving invaluable to designers who must find new materials to meet the exacting requirements for the more advanced vehicles, structures, and weapons.

The Bureau's foreign mineral activities are designed to provide industry and Government with current technical and economic information on mineral developments in foreign lands that affect the mineral economy of the United States. The program includes compilation and interpretation of data on resources, production, consumption, international trade, technology, and the actions of foreign governments that affect production and marketing of foreign minerals and restrict foreign markets for mineral products and mining supplies and equipment manufactured in the United States.

In addition, investigations of mineral resources are designed for the purpose of determining their location, size, and quality. The shape, depth, altitude, and geologic environment of ore-bodies and deposits of nonmetallic minerals; the gross and recoverable content of valuable minerals; the extent, thickness, and depth of coal seams, their geologic structure and the physical character of under- and over-laying formations, the rank and other properties of the coal and the recoverable reserves; the size, structure, and geologic environment of oil pools and reservoirs of natural gas, and the quality and quantity of oil and gas contained in and recoverable from them; and the thickness, depth, geologic structure, and oil content of oil-shale formations are among the data sought for under resources investigations.

Accomplishments During the Past Year

In the bituminous coal program, hydraulic mining tests using a modified conventional loading machine in conjunction with the hydraulic monitor have demonstrated the technical feasibility of extracting coal hydraulically without any preshooting. Water infusion tests demonstrated that methane can be moved to subsequent advantage in the mining operation through a coalbed for reasonably long distances with nominal water pressure and without damaging to roof or floor strata. The blades of the coal-fired gas turbine were redesigned and a contract was awarded for their manufacture. A revised schedule of permissible explosives has been adopted which increases the rigor of certain performance standards for underground coal mine explosives.

A prototype hydraulic mining system, installed in a cooperating anthracite mine, underwent shakedown testing. During preliminary tests, this system broke through coal and rock with relative ease. A self-contained irradiator, containing 23,200 curies of cobalt 60, was installed. This will be used to determine the effects of gamma radiation on anthracite and on the reactions of anthracite with other materials.

Bureau research in secondary recovery of oil has resulted in widespread application of sodium tripolyphosphate to injected water that has greatly improved waterflooding operations. A foam injection method has been developed for displacement of residual oil from sands previously depleted by conventional gas or water drive whereby as much as 70 percent of the remaining oil was recovered. A novel and extremely useful analytical procedure involving microhydrogenation, originally developed for analysis of minute quantities of organic sulfur compounds, was successfully modified for application to organics containing oxygen, nitrogen, and the halogens. In air-pollution research, uranium-bearing catalysts were tested for effectiveness in eliminating smog formers from automotive exhaust gases. Oil-shale research resulted in promising developments in conversion of oil-shale kerogen to oil by bacterial action and in concentration of the organic portion of shales through application of ultrasonic energy.

Outstanding successes in the minerals program included the development of: Fundamental data on dynamic rock mechanics for development of techniques for seismic detection of underground nuclear explosions; means for blast improvements for iron blast furnaces which substantially increase furnace capacity and fuel efficiency; basic data on rock behavior permitting safer, more economic design of underground openings; tungsten coated orifices for rocket engines with greatly improved heat and corrosion resistance and attendant longer service life; new knowledge of the basic mechanisms by which rock is broken with explosives that will permit important increases in blasting efficiency; a new, novel anchor for mine rock bolts to extend the use of this efficient economical roof support to mines in soft rock; a beneficiation process that promises to make commercial the large currently submarginal deposits of nonmagnetic iron bearing rock of the Lake Superior area; new and improved extraction and refining methods to yield high-purity beryllium, molybdenum, lanthanum, cerium, boron, uranium, and yttrium; and new analytical techniques for the detection and quantitive determination for the host of microimpurities in some of the high-purity metals resulting from Bureau research.

Foreign commodity production and trade statistics comprised over 10 percent of volumes I and II of the Minerals Yearbook 1960. An annual analytical summary of world mineral production in 1960 covering 65 mineral items was prepared. In addition to many other special technical services performed, 12 reports on foreign minerals were published in Bureau and trade publications. The latter included evaluations of the status of mineral industries in the Communist countries and a summary of the mining and petroleum laws of the world.

Program changes

Although progress was made on the various investigations during the year, in some cases further research will be required before definite conclusions can be drawn as to the economic feasibility of the projects. In the main, there will be no substantial changes in the overall programs of the Bureau. However, within the stated objectives research will be redirected, as segments are completed, to meet needs and changing conditions in the minerals industry and where developments indicate a need for greater emphasis.

Conservation and Development of Mineral Resources

Appropriation 1961	$23, 019, 000
Comparative transfer to health and safety	−266, 000
Total amount available 1961	22, 753, 000
Appropriation 1962	24, 800, 000
Comparative transfer to health and safety	−267, 000
Total amount available 1962	24, 533, 000

SUMMARY OF INCREASES 1963

Bituminous coal: To provide for initiation of research on use of bituminous coal as a supplemental fuel for blast furnaces	+350, 000
Anthracite coal:	
To provide for microfilming and storing mine maps and other documents relating to abandoned anthracite mines	+20, 000
To provide for testing lower bulk density anthracite metallurgical briquets in a pilot furnace	+30, 000
Total	+50, 000
Petroleum, natural gas, and oil shale: To provide for research needed to establish an oil shale industry	+187, 000
Minerals and Metals:	
To provide for research necessary for a continuously advancing mining technology	+776, 000
To provide for replacement of equipment	+786, 000
To provide for accelerated process research	+182, 000
To provide for employee compensation payments	+2, 000
Total	+1, 746, 000
Foreign mineral activities: To provide for needed expansion of the foreign minerals factfinding program	+134, 000
Net change, 1963	+2, 467, 000
Budget estimat, 1963	27, 000, 000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Bituminous coal	$6,487,015	$6,864,000	$7,214,000	+$350,000
2. Anthracite coal	935,852	992,000	1,042,000	+50,000
3. Petroleum, natural gas, and oil shale	2,974,985	3,271,000	3,458,000	+187,000
4. Minerals and metals	11,902,034	13,040,000	14,786,000	+1,746,000
5. Foreign mineral activities	361,020	366,000	500,000	+134,000
Unobligated balance	92,094			
Total	22,753,000	24,533,000	27,000,000	+2,467,000

Analysis by activities under present and previous activity structure

Activity	Amount available, 1961	Appropriation, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Bituminous coal	$6,487,015	$6,864,000	$7,214,000	+$350,000

[2] Excludes $267,000 transferred to health and safety.

1. Bituminous coal

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Extraction research	$871,206	$922,000	$922,000	
(*b*) Processing and utilization research	4,617,457	4,836,000	5,236,000	+$350,000
(*c*) Resources investigations	543,612	575,000	575,000	
(*d*) Explosives research	454,740	481,000	481,000	
Total	6,487,015	6,864,000	7,214,000	+350,000

(a) Extractive research

The estimate for fiscal year 1963 is $922,000, the same amount as appropriated for 1962.

Plan of work.—The funds requested under this program will be used at Bureau research centers and laboratories for research to be conducted by Bureau personnel. The work will be coordinated with the work of other Government agencies and private industry concerned with such research. The principal program elements under this subactivity are as follows:

Principal program elements	Estimate, 1962	Estimate, 1963
1. Coal preparation	$100,000	$100,000
2. Storage and pulverization of lignite	27,000	27,000
3. Coal sampling, analysis and inspection, hydraulic transport	273,000	273,000
4. Coal mining research; degasification of coalbeds; acid mine water studies	522,000	522,000
Total	922,000	922,000

1. *Coal preparation.*—Research on the preparation properties of various coals from the western part of the United States will be performed as a part of the continuing effort to develop new markets for the relatively high-ash coals found in some of the Western States. Tests on the performance characteristics of conventional coal preparation equipment on western coals will be started and a new project initiated on improved instrumentation in coal preparation plants designed to further reduce the cost of coal cleaning. Research on developing or accepting new coal preparation equipment to U.S. conditions will be continued.

2. *Storage and pulverization of lignite.*—The naturally occurring high moisture content of lignite results in its freezing in railroad cars during transportation in the winter. Several methods of preventing this freezing are being developed; one involves the use of oil sprays and the other the drying of part of the lignite to be transported. The dried portion of the lignite, when properly loaded into the railroad cars, appears to offer a means of eliminating the freezing problem.

To pulverize lignite for combustion in powdered coal furnaces requires specially designed equipment and an investigation is being made of the optimum design of such equipment for minimum power requirements. Other studies on the effect of moisture content and degree of particle size reduction on power requirements are being made.

3. *Coal sampling, analysis, and inspection; hydraulic transport.*—The Bureau-developed system for insuring that all agencies of the Federal Government procure coal at minimum cost and of adequate quality requires sampling of coal at the mine, inspection of mining facilities to determine if bidders can produce the coal they propose to supply, and analysis of all delivered coal. In connection with this work, research is underway to develop improved sampling and analytical methods.

The hydraulic transportation of coal will be investigated further to determine the optimum operating pressures, pressure drops in relationship to size of coal, and velocity of mixture, size degradation, and other problems related to pumping solids through a solids handling pump. A study will also be made to determine the design features of high-pressure feeders and evaluate the economics of this transportation method.

Investigations in coal inspection, sampling, and analysis will continue to provide Federal purchasing agents with complete information on availability and quality of coals.

4. *Coal mining research; degasification of coalbeds; acid mine water studies.*—In a study to evaluate the mining of coal by hydraulic means, determinations will be made of (*a*) the optimum types, shapes, and sizes of water nozzles necessary to effect maximum impact of energy, (*b*) the hydraulic force required to fracture coal and its associated impurities, (*c*) the most efficient methods of applying hydraulic forces necessary to fracture the coalbed, (*d*) the increase in impact energy of the jet stream by interjecting solids into the stream, (*e*) the required natural conditions for extracting coal from pitching beds, and (*f*) the minimum slope angle and water requirements to move coal underground in open flumes and troughs.

The feasibility of extracting methane from coalbeds prior to and during mining operations will be studied thereby reducing dangers of gas explosions, thus reducing work stoppages caused by excessive methane emissions and increasing productivity. This study will include determining methane emission rates from working areas using continuous methane recorders, and determining methane migration rates along and across coal bedding planes, and the effect of water infusion on displacement of methane.

The acid-mine drainage investigation will be continued to (*a*) determine the minerals that react with mine water to form acid-mine drainage, (*b*) develop economic methods for removing mine water before chemical reactions occur, (*c*) develop methods for sealing mine refuse from air and water, (*d*) determine differences between pyritic materials collected in both acid and nonacid producing coal mines.

Evaluation will be made of coal preparation cleaning equipment to establish standards of performance that will enable the coal operator to select the proper equipment based upon the washing characteristics of the coal to be cleaned.

(*b*) *Processing and utilization research*

The estimate for fiscal year 1963 is $5,236,000, an increase of $350,000 over the amount appropriated for 1962. This increase will be used to initiate a new program which will determine the production rate and savings resulting from the injection of bituminous coal as a supplemental fuel in the air blast to a blast furnace.

Need for increase.—The increase is needed to conduct experiments to demonstrate the possibility that the displacement of coke in a blast furnace by injecting powdered coal as a supplemental fuel is more economical than injecting either gas or oil. Currently conversion to either of the latter two fuels is taking place commercially at a rapid rate. Successful experiments with coal injection will answer the competitive threat and stem further decreases in the coal market.

Plan of work.—The funds requested for this program will be used at Bureau research centers and laboratories for research to be conducted by Bureau personnel. The work will be coordinated with the work of other Bureau divisions, governmental agencies, and private industries concerned with such research. The principal program elements under this subactivity are as follows.

Principal program elements	Estimate, 1962	Estimate, 1963
1. Carbonization, utilization, and drying low-rank coals	$122,000	$122,000
2. Fundamental research on lignite; pressure gasification and slag characteristics; production of chemicals	353,000	353,000
3. Carbonization, combustion; boiler water research; coal constitution; organic chemistry; catalysis; coal conversion to gaseous fuels	2,520,000	2,870,000
4. Coal-fired gas turbine; low-temperature tar research; coal gasification; process evaluation	1,891,000	1,891,000
Total	4,886,000	5,236,000

1. *Carbonization, utilization, and drying low rank coals.*—The technology of utilizing western coals for metallurgical carbons and chemicals production will be advanced through studies which will tailor those coals to new processes springing up in the area. The coals will be treated under new methods of drying, carbonizing, and briquetting. The behavior during processing of these coals and their blends will be studied as well as the kinetics and mechanism of their carbonization.

2. *Fundamental research on lignite; pressure gasification and slag characteristics; production of chemicals.*—The slagging fixed-bed pressure gasifier has been modified to operate at a higher pressure of 450° p.s.i.g. to take advantage of increased throughput. Maximum throughputs and minimum coal and oxygen requirements will be determined using lignite and bituminous coal char.

Other research is directed toward developing improved methods of indentifying and characterizing the various components in low-temperature tars, particularly from low rank coals. Such improved techniques will permit better comparing of the effect or tar quality of such variables as coal rank, processing conditions and processing methods.

Research will be continued on developing a fertilizer using lignite as basic raw material and a testing method to make larger quantities of nitrogen in the lignite available to plant life. Other new uses for lignite such as production of carbon disulfide will be investigated.

3. *Carbonization, combustion; boiler water research; coal constitution; organic chemistry; catalysis; coal conversion to gaseous fuels.*—In an effort to seek a more economical supplemental fuel for blast furnaces than either gas or oil, an expanded systematic and critical examination will be conducted in the Bureau's experimental blast furnace of the partial replacement of coke by the addition of powdered bituminous coal in the blast air. The increased production rate of the furnace and the operational savings will be determined.

Low-temperature oxidation-carbonization and a thermosetting heat treatment and other methods will be investigated to make eastern bituminous coals amenable to gasification in fixed-bed tube type, and fluidized reactors. Studies will continue on the effect of coke oven design and other operating variables on coal expansion and coke quality.

Studies will be continued in the use of model furnaces to simulate the distribution of heat in boiler furnaces. Instruments will be developed to measure radiation flux. Processes and conditions which resist heat transfer and gas flow through furnaces by the formation of tightly bonded deposits on external surfaces of boiler tubes will be investigated. Combustion research will be continued with tests to determine conditions required to maintain stable flames of pulverized coal in suspension.

Guidance will be given other Federal agencies in the writing of specifications, the evaluation of bids, proper selection of equipment, awarding of contracts, and testing of equipment for determining whether the manufacturers' guaranteed

results are obtained. Advice on boiler water treatment and related problems will be given those Government agencies requesting the service to improve the fuel economy in Federal heating and power plants.

Combustion of coal at temperatures to approximately 5,000° F. will be studied to determine the problems and effects of ash in the generation of electric power using the principles of magnetohydrodynamics.

To aid in understanding the nature of coal for its improved processing, studies of coal structure will continue with electron, neutron, and X-ray diffraction spectroscopy, and other modern physical and chemical techniques. Also work will be conducted in a continuing effort to develop more rapid and accurate means of analyzing coal and coal ash, including nuclear and spectrochemical means.

4. *Coal-fired gas turbine; low-temperature tar research; coal gasification; process evaluation.*—Work will continue also on the development of a helium-heated coal gasifier using a simulated model of a nuclear process heat reactor. The efficiency of micronized graphite suspended in helium as a heat transfer medium will be determined and compared to that of helium alone. The effects of particle size, rank of coal, temperature, and steam concentration on the gasification of coal will be established using the falling particle technique with radioactive labeled particles. Improved methods of feeding coal to pressurized equipment will be investigated. The conversion of coal to high-British thermal unit gas and means of purifying related gas streams will be studied. Experiments involving the reaction of coals at ultrahigh temperatures will be initiated.

Means will be explored for upgrading low-temperature tar to products of increased value. Emphasis will continue on the utilization of pitch, the largest constituent of low-temperature tar.

Upon completion of the reblading of the stationary coal-fired gas turbine, operating tests will be conducted to establish blade life and increase the efficiency of converting coal to electric power. Electrostatic precipitators, necessary to remove the dust from the combustion gases fed to the turbine, will be developed to operate in a new range of temperature and pressure. Investigations will be conducted into new processing techniques and requirements leading to the potential development of new markets for coal. These involve the use of coal and coal products in new applications which include nonfuel uses. Cost and technical evaluations of processes will continue and act as a guide in directing the coal work.

(*c*) *Resources investigations*

The estimate for fiscal year 1963 is $575,000, the same as appropriated for 1962.

Plan of work.—The funds requested for this program will be used to collect statistical data and make resources investigations. The work will be coordinated with the work of other Bureau divisions, governmental agencies, and private industries concerned with such work. The following activities will be included in the program:

An investigation of the Nation's coking coal reserves will be made to determine: (1) Known minable reserves of coal that are, or can be made, suitable for the production of metallurgical coke, (2) coal deposits that, at present, are not suitable for coke production because of excessive ash and sulfur content, but possibly could be upgraded by technologic techniques, if warranted by economic conditions.

A reconnaissance type investigation will be made of coal deposits occurring in the northern part of Alaska, north of the Artic Circle, to determine if any of the reported thick coalbeds have coking characteristics. If any of these vast coal deposits exhibit characteristics for making satisfactory coke for export either separately or in blends, a preliminary coal exploration study will be conducted to delineate the extent of the reserves.

Surveys of the carbonizing properties of American coals will be extended to areas where coals have not been examined previously.

Evaluate the rapidly changing pattern of energy requirements, both at home and abroad, through technical-economic studies and investigate the complex operations of the bituminous coal, coke, and related industries.

(*d*) *Explosives research*

The estimate for this subactivity for fiscal year 1963 is $481,000, the same amount as appropriated for 1962.

Plan of work.—The funds requested for this subactivity will be used at Bureau laboratories and offices for a continuing program of fundamental and applied research and testing on: the safety and performance characteristics of commercial explosives, especially those for use in underground coal mines and the fire and

explosion hazards involved in the production, handling and use of the mineral fuels and the products derived therefrom. This work will be coordinated with work supported by other Government agencies and industry.

The objectives of this work will be accomplished through a series of long-range research programs which include laboratory and field investigations which are designed to provide qualitative and quantitative data applicable to the solution of problems encountered in the mining and mineral fuels industries.

Research investigations will be continued looking toward a better understanding of the relationship between the chemical and physical characteristics of an explosive and its incendivity toward a firedamp-air atmosphere.

Basic studies on the initiation and propagation of flames and the combustion characteristics of flammable gas-air mixtures will be continued.

Studies of the sensitivity and detonation properties of explosives and potentially explosive materials will be continued.

Close cooperation will be maintained with other Government agencies and industries having problems involving explosion hazards. This will include the investigation of explosions and potential explosion hazards.

2. Anthracite coal

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Extraction research	$323,337	$399,000	$419,000	+$20,000
(b) Processing and utilization	414,676	494,000	524,000	+30,000
(c) Drainage control	197,839	99,000	99,000	
Total	935,852	992,000	1,042,000	+50,000

(a) *Extraction*

The estimate for fiscal year 1963 is $419,000, an increase in the program of $20,000 over fiscal year 1962.

Need for increase.—The increase will be used to purchase equipment and provide personnel for microfilming and storing mine maps and other documents relating to abandoned anthracite mines.

Plan of work.—The funds for this subactivity will be used at Bureau laboratories, principally the Anthracite Research Center, and mines of cooperating companies for research to be conducted independently by Bureau personnel, and in collaboration with personnel of the cooperator. The program will be coordinated with those of other Government agencies, educational institutions, and private industries engaged in similar research. The following research activities are planned under the program:

The hydraulic mining system will be thoroughly tested. Data will be collected and evaluated on the performance of the various system components to determine fully the efficiency and economics of mining anthracite by this method.

The Bureau recently entered into a cooperative agreement with an anthracite mining company to establish a plan for highly productive continuous mining of anthracite on a longwall caving system employing a mechanized roof-support method.

After the experimental hydraulic hoisting system has been thoroughly tested in the laboratory, it is planned to install the unit in an underground mine.

Owing to the shrinking market for Pennsylvania anthracite and the resulting keen competition among producers with large production potential, several of the larger anthracite companies have either abandoned their mines or terminated their corporate existence. In either case, mine maps and other documents relating to vast anthracite reserves that have been inundated, abandoned, or are otherwise inaccessible, are being stored improperly or neglected to the extent that they may be lost forever. It is planned to assemble, microfilm, and store the films in an archive. The microfilms will be indexed systematically and made available for future reference to any parties interested in reactivating these mines. Maps of mines that are still active, or that are being kept open on a standby basis, will be microfilmed only after such mines cease to operate.

Work will be continued on developing a process for producing ultrafine anthracite. Included in this project will be studies on determining the size of minus 1-micron particles.

Procedures for recovering and cleaning minus 100-mesh fines will be investigated further. Flotation procedures will be evaluated fully on this project.

Washability characteristics of northern field anthracite seams will be determined.

A pilot plant will be established to produce minus 1-percent-ash anthracite.

The Bureau will continue sampling coal at breakers to provide Government agencies and prospective buyers of anthracite with analyses and data on the quality of anthracite produced at preparation plants throughout the anthracite-producing region.

Assuming fundamental research now in progress indicates the feasibility of the procedure, an attempt will be made to devise a cleaning process based on the electrical properties of anthracite.

(*b*) *Processing and utilization*

The estimate for this subactivity for fiscal year 1963 is $524,000, an increase of $30,000 over fiscal year 1962.

Need for increases.—The increase will provide funds necessary for testing lower bulk density anthracite metallurgical briquets in a pilot furnace.

Plan of work.—Funds requested for processing and utilization research will be used at Bureau laboratories, principally the Anthracite Research Center, for independent and cooperative research conducted by Bureau personnel. The work will be coordinated with that of other Government agencies, educational institutions, and industry. The following investigations are planned under this program:

Assuming briquetting studies are successful in producing a formed fuel with decreased bulk density and increased surface areas, sufficient quantities will be produced to conduct pilot blast-furnace and foundry tests.

Survey studies will be continued on miscellaneous uses of calcined anthracite and calcined briquets. These will include furnishing samples and making required recommendations.

Also to be investigated is the application of supersonic sound and spark discharges in water to the processing and utilization of anthracite.

The pressure-drop studies will be continued in cooperation with a steel company. They will consist of studies of the velocities at the transition point between static and moving beds with burdens of various sizes, shapes, and degrees of uniformity.

Continued emphasis will be placed on the development of qualitative and quantitative information on oxidation products. The laboratory work will include the use of specialized chromatographic and spectrometric techniques and equipment.

Experimental and theoretical work on the electrical properties of anthracite will be accelerated with the equipment now available.

Plans provide for simultaneously conducting two phases of research on the irradiation of anthracite. Bench-scale tests will be continued in which the gamma cell will be used to explore the effects of radiation on the reactions between anthracite and other materials. If these tests demonstrate that a specific reaction warrants development work on a pilot scale, arrangements will be made to conduct such work.

Research on the hydrogasification of anthracite will be directed at determining the reaction conditions necessary to obtain maximum yields of methane, an evaluation and interpretation of experimental data, and possible modifications of the equipment to improve operations.

Economic and statistical surveys will be made on the marketing, distribution, and utilization of anthracite. Additional studies will include special investigations of world production, export trade possibilities, and other aspects of the world trade in coal which might affect the domestic industry.

(*c*) *Drainage control*

The estimate for fiscal year 1963 is $99,000, the same as for fiscal year 1962.

Plan of work.—This subactivity continues to comprise the evaluation, engineering, and inspection work necessary in carrying out the Federal Government's obligations under the congressional act of July 15, 1955 (69 Stat. 352, 30 U.S.C. ch. 14). This act authorizes the Secretary of the Interior to contribute not more than $8,500,000 to the Commonwealth of Pennsylvania in establishing a joint program (to which the Commonwealth contributes an equal amount) for the control and drainage of water, which, if not controlled or drained, would cause the flooding of anthracite coal formations.

Projects are designed to prevent inundation of active mineworkings and include vertical, turbine-type pump installations to control the level of water pools in

abandoned mines and surface drainage works to prevent seepage into underlying mineworkings. Approved projects are located in all parts of the anthracite region.

The Bureau will continue to examine, appraise, and evaluate projects proposed under the joint Federal-State mine water control program, thus providing the Director and Secretary with the information needed when the projects are considered for approval.

3. Petroleum, natural gas and oil shale

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase
(*a*) Extraction research	$1,367,006	$1,509,000	$1,509,000	
(*b*) Processing and utilization research	616,714	672,000	672,000	
(*c*) Resources investigations	324,571	357,000	357,000	
(*d*) Oil shale research	666,694	733,000	920,000	$187,000
Total	2,974,985	3,271,000	3,458,000	187,000

(*a*) *Extraction research*

The estimate for this subactivity for fiscal year 1963 is $1,509,000, the same amount as appropriated for 1962.

Plan of work.—The funds requested under this program will be used for basic and applied research by Bureau personnel at research centers and other establishments and in the field. Industry organizations, such as the American Gas Association, the Pennsylvania Grade Crude Oil Association, the Independent Petroleum Association of America, the North Texas Oil & Gas Association, the Kansas Independent Oil & Gas Association, various States where oil and gas are produced, and the Atomic Energy Commission all are supporting the Bureau research either technically or financially, or both. The principal program elements under this subactivity are as follows:

Principal program elements	Estimate, 1962	Estimate, 1963
1. Petroleum and natural gas reservoir performance and related production problems in California	$135,000	$135,000
2. Properties and performance of petroleum, natural gas, and reservoir rock in Rocky Mountain oil and gasfields	144,000	144,000
3. Basic and applied research in the production and storage of petroleum and natural gas in the midcontinent area	662,000	662,000
4. Field studies of engineering and related problems in the production of petroleum in Texas, Arkansas, and Louisiana	140,000	140,000
5. Susceptibility of eastern oilfields to newer oil-production techniques	428,000	428,000
Total	1,509,000	1,509,000

1. *Petroleum and natural gas reservoir performance and related production problems in California.*—Oil production research planned, concerned especially with California oilfields, includes the appraisal of oil recovery mechanisms through the use of computers, field evaluation of the efficiency of gas displacement by water drive, the effect of foam injection on oil recovery, relationship between well productive capacity and recovery of oil, well completion practices, and conditioning of sea water for waterflooding.

2. *Properties and performance of petroleum, natural gas and reservoir rock in Rocky Mountain oil and gas fields.*—Physical properties and composition of petroleum reservoir fluids in the Paradox Basin of the Rocky Mountain region are to be determined. Also, studies will be continued on the physical properties, capillary behavior and clay-mineral content of petroleum reservoir rocks, and on engineering problems in the production of oil in the Williston Basin in the Dakotas and Montana.

3. *Basic and applied research in the production and storage of petroleum and natural gas in the midcontinent area.*—The program of research on basic and applied production problems includes field and laboratory experimentation on the underground storage of natural gas and on gas-well stimulation, current and potential methods of stimulating oil production, the application of nuclear techniques to oil-production problems, and properties and flow of reservoir fluids of the gas-condensate (highly volatile) type.

4. *Field studies of engineering and related problems in the production of petroleum in Texas, Arkansas, and Louisiana.*—Typical of the field studies of engineering and related problems is the evaluation of secondary recovery of petroleum by water injection and by miscible-phase displacement (involving use of solvents such as liquefied petroleum gas).

5. *Susceptability of eastern oilfields to newer production techniques.*—The newer oil-production techniques to be explored further include the use of sonic, electric, and magnetic energy for increasing oil recovery and underground combustion of oil to furnish heat for improving oil recovery. Laboratory work will be continued on the determination of the efficiency in vertical flow of gas and liquids through oil-well tubing. Also, eastern oilfields are being individually evaluated to newer oil-production procedures.

(*b*) *Processing and utilization research*

The estimate for this subactivity for fiscal year 1963 is $672,000, the same amount as appropriated for 1962.

Plan of work.—The funds requested will be used for research to be conducted by Bureau personnel at research centers and other establishments. The research will be coordinated with the work of other Government agencies and private industries concerned with processing and use of petroleum and natural gas. Projects will be conducted in cooperation with Government and State agencies, trade associations, and technical societies such as the American Petroleum Institute, the Atomic Energy Commission, the National Petroleum Refiners Association, the Public Health Service, Navy Bureau of Ships, and other defense-connected agencies. The principal program elements under this subactivity are as follows:

Principal program elements	Estimate, 1962	Estimate, 1963
1. Sulfur and nitrogen compounds in petroleum and characteristics of crude oils	$132,000	$132,000
2. Fuel stability in storage, phenomena of combustion of petroleum fuels, thermodynamic properties of hydrocarbons, and chemical-physical research on oilfield fluids	540,000	540,000
Total	672,000	672,000

1. *Sulfur and nitrogen compounds in petroleum and characteristics of crude oils.*—This research is concerned in part with determining the types and extent of occurrence of nitrogen compounds in petroleum. As a part of the overall program of basic research on sulfur and nitrogen compounds in petroleum, extremely pure standard samples of various sulfur and nitrogen compounds will be prepared for measurement of thermodynamic and other properties. New crude oil samples from the Rocky Mountain region will continue to be analyzed.

2. *Fuel stability in storage, phenomena of combustion of petroleum fuels, thermodynamic properties of hydrocarbons, and chemical-physical research on oilfield fluids.*—In fuel stability research, increased use will be made of radioactive tracer techniques to trace deterioration reactions in gasolines and jet fuels under simulated storage conditions. Basic research will be continued in the determination of types and extent of occurrence of sulfur compounds in petroleum. Correlations will be developed relating composition of fuel and conditions of ignition and combustion with composition of products. The basic research in thermodynamics includes accurate measurements of basic thermodynamic properties of petroleum constituents and related substances such as organic sulfur and nitrogen compounds. The basic experimental data will then be used in calculating useful thermodynamic properties of the compounds studied.

(*c*) *Resource investigations*

The estimate for this subactivity for fiscal year 1963 is $357,000, the same amount as available for 1962.

Plan of work.—The funds requested will be used to collect statistical data and make resource investigations of the petroleum and natural gas industries, and oil shale. This work will be coordinated with that of other Government agencies and certain investigations will be conducted in cooperation with State agencies. The general plan of work for 1963 includes the following activities:

Collection and publication of monthly statistics and analysis of the U.S. petroleum producing and refining industry.

Collection and publication of annual statistics and analysis of the U.S. natural gas producing and distribution industry.

Collection and publication of quarterly statistics and analysis of the free world petroleum production, refining, and trade.

Preparation of forecasts of petroleum supply and demand for use of the State regulatory agencies, the Oil Import Administration, and the industry.

Preparation of annual marketing studies of various petroleum products.

Investigation in the field of special facets of the industry of particular regional importance such as the raw material requirements of the petrochemical industry in the South Central States, and the status of existing oil and gas wells in a State or area.

The program of work in resources investigations in fiscal year 1963 will remain essentially the same as in fiscal year 1962. Continuity of work procedures are essential in such activities. Otherwise much of the usefulness of the data for making comparisons and for determining trends will be lost.

(d) Oil shale research

The estimate for this subactivity for fiscal year 1963 is $920,000, an increase of $187,000 over the amount available for 1962. The increase is to provide for accelerated and new research designed to provide information that will be needed in establishing and efficiently conducting an eventual oil-shale industry in the United States.

Need for increase.—Additional research effort is needed to define kerogen chemically and physically. Kerogen is oil shale's organic component that is converted to oil upon heating; knowledge of the material's makeup is basic to any scientific approach to conversion of oil shale and undoubtedly can provide answers to many practical operating problems. New aspects of the kerogen characterization work will include use of selective extraction procedures to isolate particular fractions. Instrumental analytical techniques will be developed and applied as needed to define these extracts and other kerogen materials.

A study will be initiated to provide greatly needed guidance to any future oil-shale industry in regard to the mechanisms of oil mist formation in the retorting process. Efficient and economic recovery of the oil product from the Bureau's gas combustion retorting system, and undoubtedly from any other similar retort, depends upon formation of a fine, stable, oil mist that can be swept rapidly out of the retort without the oil being condensed on shale particles with subsequent degradation and loss. Little is known however, about how such mists can be formed most effectively or about the effects of operating conditions upon maintaining and handling the mist once they are formed. The study that is planned is designed to yield such basic information.

Increased emphasis is needed to characterize the larger oil-shale deposits of Colorado, Utah, and Wyoming. Many potentially important deposits, such as the rather recently located Piceance Creek basin beds have not been examined in enough detail to provide more than cursory information about such important factors as their overall richness, and pattern of oil yield with depth and geographical location. Part of the increased funds will be used for pertinent characterization studies to fill such gaps in the existing knowledge of our oil-shale resources.

The economics of an oil-shale industry will depend, perhaps to an important degree, upon the byproducts that may be manufactured along with conventional fuel products. Of particular importance, oil shale may prove to be an important source of chemicals. At present, little is known about the chemical potential of such an industry. A part of the increase for fiscal year 1963 is intended for a pertinent study, first to show the overall possibilities, and also to serve as a guide in future processing studies.

Plan of work.—The funds requested for this subactivity will be used for work, largely of a laboratory nature, to be done by Bureau personnel at the Laramie Petroleum Research Center, Laramie, Wyo., and to some extent other establishments. Also, funds for the care and protection of the experimental oil-shale facilities near Rifle, Colo., now in standby condition, are included under this subactivity. Information will be developed on the characteristics of the Nation's oil-shale resources, with particular emphasis on the vast deposits of Colorado, Wyoming, and Utah. In addition, research will be directed toward providing the knowledge needed to develop effective means of mining and retorting oil shale and to convert the resulting shale into usable products. The following activities are included in the program:

Evaluation of shale deposits involving the determination of the composition and structure of oil shales from different sources that can be converted to oil by

application of heat and other methods. Studies are made of the organic material (kerogen) of the shale and the inorganic matter (shale ash) which involve prior separation of the two components of the original oil shale.

Studies of the changes in chemical and physical properties of the oil shale that result when kerogen is converted to shale oil by retorting. Related research is planned to determine the optimum temperature and other operating conditions needed for maximum recovery of crude shale oil, particularly in regard to formation and maintenance of stable shale-oil mists in the oil recovery steps.

To develop various individual techniques and methods of refining the crude shale oil, as well as combinations of them, in order to learn which are the most favorable for producing various raw and finished shale-oil products, including chemicals as well as more conventional fuel-type products.

To study refined shale-oil products and determine their suitability for use as supplements to similar petroleum products.

4. Minerals and metals

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Extraction research	$1,161,639	$1,273,000	$2,049,000	+$776,000
(*b*) Processing research	6,031,951	6,609,000	7,329,000	+720,000
(*c*) Utilization research	2,087,616	2,287,000	2,537,000	+250,000
(*d*) Resources investigations	2,620,828	2,871,000	2,871,000	
Total	11,902,034	13,040,000	14,786,000	+1,746,000

(*a*) *Extraction research*

The estimate for this subactivity for fiscal year 1963 is $2,049,000, an increase of $776,000 over the amount appropriated for 1962.

Need for increase.—Research to develop improved methods for extracting minerals from the earth is essential for conservation of domestic resources, increased safety for American miners, improvement in the economic position of the domestic industry, and maintenance of an adequate mineral supply. So long as it was possible to find easily new deposits amenable to extraction at a profit using the mining art as developed through the centuries, there was little need for scientific research. The end of this comfortable situation is at hand; however, the mineral resources necessary for the defense and a continuously expanding economy are limitless if the technology to extract them economically can be developed.

During the last 2 years the Bureau, recognizing the need, has reorganized and revitalized its minerals and metals mining research program. Plans for orderly growth of a balanced research effort to meet both the short- and long-term requirements have been made. The increase requested will permit a step toward the balanced program envisioned by increased emphasis in certain areas of short-range research on problems of vital concern to industry today and initiation of long-range fundamental investigations to develop the knowledge of the material, the environment, and the natural forces involved in the act of mining that will be necessary for a continuously advancing mining technology.

(1) The short-range, processes-based investigations which will be increased include research to develop applications of mathematical statistics, used with striking success in other industries, to the problems of ore search, exploration, development, and extraction; research in types of support and methods of emplacement in deep geologically complex mines; research in the rock mechanics of ground control in certain elements of longwall, room and pillar, block caving, and open-pit mining methods; research in ground water control in mining; and research in the physical processes of drilling and blasting aimed toward increasing efficiency of explosives employed in breaking rock, controlling the vibrations from quarry blasting in suburban areas, and developing new and better methods of rock penetration and fragmentation.

(2) The long-range investigations which will be started or increased involve basic research in the broad complex fields of the physics of rocks and rock structures. An aggressive, imaginative program in this area offers the best possibilities for real advancement in mining technology. A better understanding of the physical, chemical, electrical, magnetic, and other properties of minerals and combinations of minerals and the earth structures in which they occur

can lead to better utilization of the potential energies in the earth or near ore bodies by reason of their structures, locations, positions, chemical compositions, temperature gradients, and other features, thus reducing the expenditure of energy required to extract them and thereby making available mineral materials economically beyond reach today.

Plan of work.—The funds requested under this program will be used for research to be conducted by Bureau personnel at research centers, offices, and laboratories and at mine sites. The work will be coordinated with industry research and some projects will be cooperative with such industry, Federal Government and State organizations as the International Minerals & Chemical Corp., Bear Creek Mining Co., Kennecott Copper Corp., Atomic Energy Commission, Department of Defense (Defense Atomic Support Agency), and California State Division of Mines. The activities included in the mining research program involve research on artificial support, engineering principles, rock disintegration concerned with physical processes of drilling and blasting, water control, rock mechanics, and physics of rocks and rock structures. The principal program elements for this subactivity are as follows:

Principal program elements	Estimate, 1962	Estimate, 1963
1. Research on artificial support for underground openings	$131,000	$212,000
2. Physics of rock structure studies	50,000	160,000
3. Engineering research on the planning and operation of mines	524,000	927,000
4. Rock disintegration and mine water control research	568,000	750,000
Total	1,273,000	2,049,000

1. *Research on artificial support for underground openings.*—In the artificial support program it is planned to continue and expand research to develop improved methods of stope support for thick tabular deposits to enable the mining and recovery of furnace-grade phosphate as a coproduct of high-grade rock in the southern Idaho phosphate rock deposits; conduct laboratory and field studies on the effectiveness and methods of emplacement of hydraulic stope fill, rock stress redistribution with preloaded concrete mine supports, and the optimum design of concrete members for supports in deep geologically complex lead, zinc, copper, and silver mines. Also included in this work are studies to develop rapid and effective means of obtaining rock bolt anchorage by impulsive forming in soft rock to eliminate danger of rock falls and facilitate the mining of deposits in soft rock environments, such as mines in the Ambrosia Lake, N. Mex., uranium and Coeur d'Alene, Idaho, lead-zinc-silver mining districts.

2. *Physics of rock structure studies.*—The physics of rock structure investigations will involve fundamental studies to develop methods for determining the structural properties of rock in place. The ultimate objective of this program element is to develop basic data and establish physical laws predicting the behavior of rock masses during the act of extracting a mineral from its natural environment in the crust of the earth, thus permitting precise, efficient, dynamic design of an entire mining operation. The studies will involve devising measuring devices and techniques for determining and analyzing the inplace properties of mineral deposit environments including the detection, location, and precise measurement of such geologic features as fractures, bedding planes, rock alteration, etc., and other factors that affect rock structural strength and mechanical behavior. The study is long term and will require the development of new research techniques and instrumentation for a field that is virtually unexplored.

3. *Engineering research on the planning and operation of mines.*—Engineering research studies are planned to adapt, utilize, and develop methods of mathematical model construction and analysis, using modern high-speed computing techniques, for application to problems of ore search and exploration, sampling effectiveness and efficiency, and development and production planning operations. The research includes the following: Methods to increase the efficiency of sampling and estimating grade and tonnage of phosphate, potash, uranium, and similar stratified deposits; studies to devise mathematical techniques for the design of sampling programs including the determination of the interrelationship between various sampling factors and methods of establishing reliability limits on grade and tonnage estimate on large disseminated deposits such as the porphyry coppers; investigations of mathematical methods of analysis that will convert location, production, geologic, and engineering data to effective quantita-

tive measures for increasing the probability of selecting the location of hidden mineral deposits; and systems analysis and industrial engineering studies for development of methods for measurement of mining performance and application of these measurements to the analysis of operational systems to produce the most economic and efficient combination of equipment and labor.

Rock mechanics research to develop the theory of mine structure and better methods of ground stabilization and control will be continued and expanded. The studies, with the exception of research on instrumentation, are conducted primarily in the field of using operating underground and open-pit mines as laboratories with the consent and often active participation by mining companies in Idaho, Montana, California, Nevada, Utah, New Mexico, Arizona, Colorado, Wyoming, Michigan, and Pennsylvania. In open-pit mines the studies are to be directed toward determination of the mechanical-structural properties of rock that affect pit wall rock strength; related laboratory studies to determine stress patterns in models of open-pit slopes are important in this study. The research also will include studies on better methods of ground control through determination of the stress distributions around underground openings serving as entries and haulageways in underground mines where the mining methods are room-and-pillar, block caving, and longwall mining. Analysis of the stress patterns developed by these mining methods can lead to a higher percentage of mineral recovery and safer working conditions.

4. *Rock disintegration and mine water control research.*—Fundamental studies of the physics of the minerals and mineral assemblages with which the mining process is concerned and the mechanisms, both natural and artificial, to which they are or may be subjected during extraction will be conducted to provide a basis for improved methods of rock disintegration and mine water control.

Rock disintegration research will include basic and applied studies in the related physical processes of drilling and blasting. Emphasis in the research will be on materials where fragmentation problems are acute such as the taconites of the Lake Superior iron district and the quarrying of hard rock for industrial use.

Blasting research is divided into two phases: (1) seismic phenomena close to blast; and (2) seismic phenomena distant from the blast. The first will include laboratory studies to determine the fundamental physical processes of disintegrating rock with explosives and field studies primarily concerned with determining how the generation and propagation of strain pulses in rock produced by explosives are affected by the properties of the rock and explosive and method of loading the explosive charge. Research on seismic phenomena distant from the blast is concerned with determining propagation laws for the air and ground vibrations resulting from quarry blasting. The studies are most important especially where quarry blasting occurs in suburban areas, because with the development of propagation laws, design criteria for minimizing damage to aboveground structures can be accurately established. In addition to continuing research on the development of propagation laws, research will start on a method of controlling ground vibrations or reducing their intensity at predetermined distances from the source of the blast. Scale model blasting research will continue with emphasis on the scaling of the laboratory results to full-scale application. In addition, research on the effect of underground millisecond delay blasting on a mine roof will continue.

The objective of the drilling studies is to develop theory and principles of rock failure for different existing drilling methods. Photoelastic techniques will be employed to study stress distribution, under static and dynamic loading during energy transfer from the cutting tool to the rock and to determine the significance of rock physical properties with respect to penetrability. Fundamental studies of abraison and the effect of surface-active fluid reagents on the surface of a rock with particular emphasis on its application to rock penetration will be made. Studies leading to possible new processes of rock penetration will be conducted, including experimental application of such mechanisms as thermal shock and cavitation to achieve rock disintegration. A basic study of the nature of the intercrystalline bond that binds together the various minerals that constitute a rock will complement these process-based investigations.

The study of water control problems will be expanded to develop methods, techniques, instruments, and engineering principles for defining mine drainage and control problems prior to mine development. Rock permeability and fluid flow through rock formations will be studied. Electrical analog techniques to stimulate fluid flow through rock formations will be used in this research

to supply visual and statistical aids in solving water control problems. The studies, when completed, will aid in anticipating drainage problems and assist in the engineering design and initial layout of entries and development workings.

(*b*) *Processing research*

The estimate for fiscal year 1963 is $7,329,000, an increase of $720,000 over 1962. The increase includes $718,000 for accelerated process research and $2,000 for employee compensation payments.

Need for increase.—The increased funds are needed for accelerating processing research on domestic mineral resources. As rapid obsolescence of scientific equipment is an unavoidable characteristic of research, the increased funds will be used principally for the replacement of obsolete and the acquisition of new scientific research equipment needed in the improvement of mineral extraction research. In order to develop new avenues of approach for such applied research, substantially expanded efforts must be directed toward developing new scientific concepts and using them in recovering, extracting, and refining minerals and metal compounds by more efficient processing. Mineral resources are assuming an ever-increasing importance in the national economy and security in view of the continued and growing demands for minerals and products therefrom. However, the continued decrease in the grade of domestic ore, the abundance of marginal and submarginal resources, the growing dependence on foreign sources for some significantly important minerals, and the emphasized requirements for superior materials in space age structures, vehicles, and other fabrications all add urgency to the situation. Alleviation of this situation requires enhancement of the domestic mineral deposits through research to develop technically and economically feasible processes for effectively treating the marginal and submarginal domestic resources, particularly those in great abundance.

The increase will provide for expanding and initiating research in mineral beneficiation and extractive metallurgy, including the ascertainment of pertinent and requisite new scientific principles and the establishment of new fundamental data. Of particular significance is the need to bring the immense marginal and submarginal domestic iron ore deposits into greater use as a replacement for the severely depleted reserves of domestic high-grade ores. To make these plentiful low-grade ores economic, research must be conducted to improve efficiency of beneficiation methods and the production of high iron concentrate, preparation of optimum blast furnace feed, and the kinetics of reduction of the iron burden to pig iron. Collectively, the research efforts will be directed toward the development of more efficient methods for processing low-grade ores of various types, and minerals and metals products, thereby enhancing their use possibilities, and to prepare and refine the products suitable for use in new materials. In attacking these complex problems special attention must be given both to basic and applied research, as each is significantly related to the other for achieving fruitful objectives in scientific and engineering applications. An understanding of current and future mineral commodity needs is essential in selecting the most urgent problems in applied research to which available technologies will be applied.

More specifically processing research should include accelerating beneficiation studies, including flotation of phosphate, lithium, and mica-bearing materials to make the commercially attractive processes more widely applicable. The development of improved hydrometallurgical techniques to extract rare and precious metals, base metals, aluminum, and phosphate must be expanded. Extractive research employing high temperature techniques must be enlarged. This research includes blast furnace and direct reduction of iron ores, and reduction of metal oxides, including beryllium oxide, to their respective metals. Research on volatilization techniques must be directed to extracting metals or metallic compounds of manganese and recovery of fluorine from ores or plant products. Processing research must be continued both by laboratory and evaluation studies, on methods for extracting magnesium and manganese from their raw materials, and on the recovery of other metals.

As basic research provides essential data for applying and developing new metallurgical extractive and processing techniques, this activity must be accelerated. Thermodynamics and thermochemical studies, including vapor pressure and activity determinations, need to be intensified on ferrous, base, and rare metals and their compounds. Because of the great potential of fused salt technology in the extraction and refining of metals, studies of physical and chemical properties of electrolytic fused salt systems must be accelerated. Re-

search must be expanded on developing instrumental, chemical, and radiological analytical techniques for determining microimpurities in high purity metals, such as those in the ferroalloy and rare and precious metal group, and for speeding the analyses of ores. Studies of the thermochemical properties of manganiferous slag systems must be made to obtain a better understanding of the characteristics of these slags pertinent to extractive processing.

Plan of work.—The funds requested will be used for research conducted by Bureau personnel at Bureau research centers and laboratories. The work will be coordinated with research of other Government agencies and private industry and some projects will be conducted in cooperation with and partly financed by States or private companies. The principal program elements for this subactivity are as follows:

Program element	Estimate, 1962	Estimate, 1963
1. Mineral beneficiation	$773,000	$871,000
2. Hydrometallurgy	698,000	796,000
3. Pyrometallurgy	1,695,000	1,933,000
4. Electrometallurgy	1,108,000	1,135,000
5. Process metallurgy	851,000	862,000
6. Physical chemistry and basic research	982,000	1,112,000
7. Analytical research	502,000	620,000
Total	6,609,000	7,329,000

1. *Mineral beneficiation.*—Research in beneficiation of iron ore by the employment of flotation and other means will have as its objective the converting of domestic low-grade ore to a product that is competitive with foreign high-grade ore, both in quality and price. Other research involving the development of methods for retrieving iron from iron-ore slimes and otherwise improving the handling of this material, and research on preparing raw agglomerate of iron-mineral concentrate, preparatory to heat hardening for smelting will be continued.

The beneficiation of manganiferous materials to recover concentrated manganese products and the treatment of copper concentrates to improve the separation of molybdenite from copper sulfides by the application of various ore-dressing methods will be studied. Investigations will be continued to develop new and improved flotation and other mineral dressing techniques for recovering beryllium-, copper-, and tellurium-bearing minerals from their ores or other materials. Flotation of uranium minerals, and recovery of lithium, aluminum, and other light-metal minerals from ores and other products will be studied.

Research will be conducted to develop beneficiation processes to improve quality and utility of clays from selected deposits in the Middle West and Southeast, and research on methods of beneficiating mica ores will be started. Ore concentration methods to improve and increase efficiency of phosphate mineral recovery will be sought, and study of the effect of contaminants in water on flotation processes will be continued.

2. *Hydrometallurgy.*—Chemical studies will be continued on the recovery of metal values from high-temperature alloy scrap and on the study of cementation and hydrogen reduction of copper. Research will be undertaken on the recovery of aluminum and alumina from noncommercial domestic bauxites and a Bureau-developed fusion-acid leaching method for recovering alumina from aluminum silicates will be studied intensively as a new approach to the use of these large domestic resources. Solvent extraction studies will be made on the effective reuse of waste solutions from uranium and thorium mills and thus reduce radioactive pollution of ground and surface waters.

The feasibility of modifying standard leaching and digestion methods to the extraction of rare-earth minerals will be investigated and the separation and purification of the various compounds will be made. Research on chemical procedures will be continued on the recovery and separation of base, and rare and precious metals such as selenium, tellurium, beryllium, columbium, tantalum, and yttrium. The study of bacteria as these affect the dissolution of mineral and metal compounds will be accelerated.

3. *Pyrometallurgy.*—Research involving the reduction of iron ores and of specially prepared burdens in the Bureau of Mines experimental blast furnace will be expanded. This work, devoted to increased blast furnace productivity

and lowered cost, will involve evaluation and comparison of raw materials and also will serve to test and develop new operating procedures. Continuous campaigns will be carried out to develop further the Bureau's new fuel injection technique utilizing natural gas, fuel oil, powdered coal, and other additions. The studies will include the determination of optimum conditions for injection of solid fuels, and of the effect of higher blast temperature and close sizing of burden, including narrow limits of size. This program will be expedited and important phases investigated in greater detail if funds from other sources become available. Particularly the principles and problems of fuel utilization will be investigated in coordination with research capabilities of other Bureau divisions. Research on heat-treating raw agglomerate and direct reduction of this product to prepare a superior blast furnace feed, and on the removal of contaminants from iron and steel scrap will be continued.

Electrothermic methods will be investigated to prepare low carbon ferrochromium from subgrade domestic chromites, and studies will be initiated in adapting electric furnace techniques to the smelting of zinc.

Investigation will continue on the segregation process for treating oxide or mixed oxide-sulfide copper ore. Studies will be made on smelting of copper slag to recover copper, iron, and other valuable constituents. Smelting studies applicable to the utilization of argillaceous copper deposits in northern Michigan will be continued. Methods to separate and refine the component elements of alloys, secondary materials, and intermediate plant products will be studied more intensively. Research will be continued on the development of chemical techniques for halogenation of light, rare, and ferroalloy metals both in recovering them from domestic sources, and in purifying the metal halide compounds, and research will be initiated on thermic methods for producing magnesium. Work will be undertaken to recover fluorine or hydrofluoric acid from materials now being wasted. Study of high temperature vacuum reduction techniques for preparing high-purity beryllium from its oxides will be initiated. Extraction of manganese by vaporization of this element from its ores, concentrates, or alloys will be initiated.

4. *Electrometallurgy.*—Electrolyses in fused salt and other media to extract and prepare high-purity chromium, molybdenum, cobalt, nickel, tungsten, vanadium, and rare metals from their ores, concentrates, alloys, and compounds will be conducted. Study of the application of ultrasonics to electrodeposition of base metals will be continued. Research will be continued on the development of electrolytic methods for producing titanium and aluminum. Investigation of electrochemical techniques for the reduction and purification of high purity metals such as beryllium, uranium, zirconium, thorium, columbium, and the rare-earth metals will be continued. Included in the investigation of reduction techniques will be therommetallic, chemical, and electrochemical methods. Metals purification techniques will include electrochemical studies of molten salts and slag systems. Fused salt electrolyses research in preparing high purity boron will be expanded. Study will be continued on fused salt electrolytic extraction techniques utilizing aluminum chloride as the source of aluminum.

5. *Process metallurgy.*—A study of the theoretical and mathematical model of the iron blast furnace will be expanded and research will be accelerated in an investigation of phosphate slimes to include various treatment methods in seeking means to utilize large phosphate resources now wasted. Other work will include process development to extract separately nickel and cobalt, hafnium and zirconium, tellurium, manganese, and iron from their host materials.

Evaluations, based on accumulated data, of various extractive processes for extracting manganese from domestic low-grade resources will be continued to determine which methods and which deposits offer the greatest promise for commercial utilization. Evaluations will also be made of processes for recovering alumina from nonbauxitic ores and magnesium from domestic raw materials.

6. *Physical chemistry and basic research.*—Research will be expanded on the derivation of physical and chemical constants of steel constituents, including impurities, needed for permitting a better understanding of high-temperature steelmaking reactions, and studies will be continued to determine the causes and methods for controlling the dense red fumes at steel plants which employ oxygen in open hearths and oxygen converters in refining hot metal to steel. Vapor pressure measurements of liquid titanium metal and alloys and of metal halides will be continued and similar work started on ferroalloy and rare-earth metals.

Thermodynamic and reaction rate measurements will be expanded on metallic and nonmetallic compounds and measurement of heat contents of metals and slags

will be accelerated to develop data useful in the development of new processes. The use of the Co^{60} facility in permitting studies of the effect of gamma-radiation exposure on metallurgical reactions will be expanded and the use of radioisotopes as tracers in metallurgical operations will be continued.

Studies will be made of the mechanism of reactions in various fused salt electrolytic systems and research will be conducted in the study of thermochemical properties of manganese. A study of the effect of catalysts on extractive chemical reactions will be initiated.

7. *Analytical research.*—As success of the Bureau's research in preparing high purity metals depends upon the exceptional purity of the host compounds, research will be intensified to develop methods and instruments for making precise analytical determinations of trace impurities in these products. Analytical methods involving radiological, chemical, and instrumental procedures, including mass spectrography, will be developed and applied to determining the trace contaminants in these hyperpurity compounds resulting from the Bureau's research. The procedures will include virtually all types of techniques. In radiological research radioactive isotopes will be used in the analyses of elements present in trace quantities in various products resulting from metallurigcal extractions. Chemical analytical methodologies will include colorimetric, volumetric, gravimetric, and electrolytic techniques. In the application of instrumental analytical methods such equipment as X-ray diffraction and X-ray fluorescent, electron probe X-ray spectrograph, optical spectrograph, spectrophotometer, polargraph, and mass spectograph will be used. In the use of all procedures research will be conducted to solve the many analytical problems arising from various element interferences and matrix differences.

In addition studies will be continued to develop and improve methods of analysis and identification of minerals and compounds, and to develop techniques that can be used in the field for detection of selected metals or of their minerals.

(*c*) *Utilization research*

The estimate for this subactivity for fiscal year 1963 is $2,537,000, an increase of $250,000 over the amount appropriated for fiscal year 1962.

Need for increase.—The increased funds are needed for expanding utilization research on metals and alloys and nonmetallic materials to assure that the fullest possible advantage will be taken of these materials including their potential for new and unusual applications. As rapid obsolescence of scientific equipment is an unavoidable characteristic of research, the increased funds will be used principally for the replacement of obsolete and the acquisition of new scientific research equipment needed in an accelerated research program on properties of metals, alloys, and materials.

There is an urgent need for an expanded program to develop the basic scientific data essential to the preparation and evaluation of engineering materials that will withstand new environments. Such research encompasses the development of better methods for determining the mechanical properties of superior structural materials over a wide temperature range and studies on determining and evaluating the chemical, physical, and other properties related to the preparation and application of those materials. As an example of this problem, steel, although the strongest of all materials available to man, must be made still stronger to meet the much higher strength and temperature requirements now envisaged. Physical and chemical aspects of steelmaking should be studied to determine the basic factors controlling impurities and the effects of unusual alloying additives on the structure and uniformity of cast, and hot- and cold-worked steel. Physical metallurgy investigations, including preparation and testing alloys of tungsten and other ferroalloy metals, and alloys of the common base metals, including those of newly available rare metals, will aid in determining and developing new applications. Refractory metals such as titanium, columbium, tantalum, zirconium, and hafnium, need additional research directed toward increasing their usefulness at high temperatures by physical metallurgy investigations of the metals and their alloys. Additional research on controlled crystallization, heat treatment, intermetallic-compound formation, or fiber metallurgy methods may accentuate desirable properties and yield materials with improved structural characteristics.

In space and defense programs the need for lightweight, strong, oxidation- and corrosion-resistant materials calls for intensified research on using protective films of metals or compounds on metals, ceramics, or other materials. In a similar manner, methods of preventing the oxidation of high-melting-point

metals such as tungsten and molybdenum when used in a high-temperature atmosphere environment need to be found if the full potential of these materials is to be utilized.

Serious problems of fabricating simple and complex shapes of refractory metals and alloys must be overcome through utilization of new techniques such as vacuum casting, high-energy forming, coating, and powder metallurgy.

Theoretical concepts must be developed and phase equilibrium, reaction rate kinetics, and process applications must be studied in design and conducting experiments to produce crystals of synthetic mica, synthetic asbestiform fibers, and superrefractories for high-temperature and electronic uses. Most of the Nation's strategic mica is imported and the development of synthetic mica has been an important materials problem. The Bureau's synthetic mica research should be expanded to accommodate the prompt completion of a General Services Administration financed research program formerly assigned to a private contractor to extend into high-temperature applications and to encourage new uses by virtue of the superior electrical, thermal, and optical properties of synthetic mica. Determination of properties of synthetic asbestos and other fibers, such as silicon nitride and zirconium compounds, are needed to open new fields of research in high-temperature materials.

An important part of the current superrefractories program is basic research to accumulate fundamental data on the properties of ceramic raw materials and on the principles and relationships involved in ceramic technology. These data will enable faster, more orderly research for development of new ceramic raw materials for the production of the superrefractories and cermets required to withstand increasingly higher temperatures and other adverse environmental factors encountered in missile, jet-engine, nuclear-energy, and space applications and in metallurgical, chemical, and electronic industries. Studies of unconventional forming methods may show the way to more rapid production of ceramic products and to materials with improved and unusual properties. Research on the possibilities of producing ductile ceramic materials should be undertaken and should be expanded to include carbon and graphite, as graphite, particularly, has many of the properties exhibited by high-temperature ceramic materials.

Properties of materials are frequently influenced by small or trace quantities of additive or contaminating elements of their compounds. For example, the desired electronic properties of transistors and thermoelectric materials are greatly affected by minute variations of the dopant constituent and by the presence of trace contaminants, and the presence of dopants and contaminants must be accurately determined in parts per billion. Properties of alloys, including strength and ductility, are also markedly affected by trace elements and compounds. Hence, in these areas and also in that of extractive metallurgy special analytical techniques are urgently needed to meet the requirements of modern metallurgy.

Plan of work.—The funds requested will be used for research conducted by Bureau personnel at Bureau research centers and laboratories. The work will be coordinated with research of other Federal and State Government agencies and private industry and some projects will be conducted in cooperation with and partly financed by other Federal Government agencies, States, or private companies. The principal program elements for this subactivity are as follows:

Program elements	Estimate, 1962	Estimate, 1963
1. Physical metallurgy	$1,478,000	$1,583,000
2. Synthesizing micaceous and asbestiform materials	147,000	214,000
3. Developing hard and refractory materials	488,000	509,000
4. Basic research	174,000	231,000
Total	2,287,000	2,537,000

1. *Physical metallurgy.*—Studies will be continued on the casting of titanium, beryllium, and ferroalloy and alloys, on vacuum melting of carbon and alloy steels, and will be accepted on the preparation and evaluation of heterogeneous powder compacts.

Research will be continued on developing electrolytic or other coating procedures for depositing films of high-temperature ferroalloy metals and compounds on metals, ceramics, graphite, or similar materials, and on the coating of refrac-

tory structurally desirable but reactive materials with corrosion-resisting platinum group metals. Research on fiber metallurgy techniques will be expanded for the development of materials having improved physical properties and will be initiated on high-intensity forming of metals and alloys. Efforts will be continued to form high purity copper and tungsten in fine powder form and to prepare alloys by coreduction methods.

Accelerated physical metallurgical research will include studies on methods for making and testing high-strength steels, the use of depleted uranium in steel and antifriction alloys, development and evaluation of alloys of columbium, aluminum, titanium, magnesium, zinc, and various rare-earth elements, preparation of high-strength steels, development of phase diagrams and pertinent data of rare-earth metal alloys.

2. *Synthesizing micaceous and asbestiform materials.*—Research will be expanded in the preparation of synthetic micaceous and asbestiform products for high-temperature structural materials needed in space vehicles and in the chemical and electronic industries. The expanded program on synthetic mica will seek new methods of preparing large usable mica crystals or sheets as well as modified mica composition which may have improved useful properties. The program on synthetic asbestos will be expanded to include preparation of fibrous materials and scientific examination of natural and synthetic fibers to obtain a better understanding of preparation methods.

3. *Developing hard and refractory materials.*—Research on the preparation and evaluation of hard materials will be continued and work on high-temperature ceramics and refractories will be expanded to include preparation and study of ductile ceramics and investigation of carbon and graphite as refractory materials. The research on hard materials will include oxide, boride, nitride, and silicide compounds. High-temperature strength and thermal shock resistance will be measured and, in addition, crystal properties as they affect refractory properties will be investigated. Also, research will be continued on the development of continuous, rapid forming and firing methods of high-temperature ceramic structural materials.

4. *Basic research.*—Research pertaining to hard and refractory materials will be continued as studies of phase equilibria, reaction rate kinetics, thermochemistry, and kinetics of sintering. Studies of crystals including the correlation of structure and elastic properties at various temperatures will be made and possibililties examined for predicting from derived relationships the ductility of ceramic materials.

Research involving physics of metals and alloys will be conducted as a means to derive structural metals with unique, important properties. Damping alloys of varied compositions will be studied to determine the relationship of damping effect to alloy composition and to their magnetic and other properties. Basic studies will be initiated on the electron emission of liquid metal surfaces and continued on thermoelectric and related properties of specially prepared materials. Investigations will be continued on developing improved or new instrumental and other analytical techniques for the identification of constituents and compositions of alloys and detection of minute quantities of impurities in high purity metals and alloys. Research on instrumental techniques employing a mass spectrography for accurately determining infinitesimal quantities of elements in high purity products will be initiated.

(*d*) *Resources investigations*

The estimate of $2,871,000 is the same as for 1962.

Plan of work.—This program aims to provide the information and gain the understanding required to strengthen and develop the Nation's mineral raw material base. It comprises the investigation of resources, the collection of current data on production, consumption, and related statistical factors, and surveys and analytical studies of selected segments of the mineral economy. Through reports and publications it assists in policy formation, research guidance, and industrial enterprises. The work is coordinated with that of Federal and State Government agencies and private concerns engaged in the supply and utilization of minerals and metals. The plan of work for 1963 contains many projects from the previous year and undertakes a number of urgent new investigations utilizing personnel freed by the termination of projects in 1962, and includes the following:

Of primary importance in the field of mineral resources surveys are the investigations of domestic iron-ore resources. Appraisal of the vast low-grade deposits of the Lake Superior district and evaluation of deposits in the Appalachian Range will be expanded.

The Bureau, cooperating with other Government agencies, universities, and research institutions engaged in oceanographic investigations, will study the mineral aspects of these investigations.

Ferroalloy mineral resources in several Western States will be investigated.

A continuing investigation of base metal deposits and reserves will emphasize examination of copper, mercury, and tin deposits in Alaska. Special attention also will be given to appraising the magnitude and types of base metal ore reserves and potential reserves of the Western States, and the study will be extended to other areas including a new copper district in Missouri. Increased attention also will be given to byproduct and coproduct constituents of base metal ores, and a special study will be undertaken on the relationship of silver production to coproduct base metals.

Resource studies will be continued on uranium, beryllium, tellurium, germanium, and other metals. These studies are to develop the basic information on potential sources of uncommon metals in mineral deposits or as mineral processing plant byproducts. These investigations have a high priority on the Bureau's research capabilities because of the growing requirements for special property materials in nuclear energy applications, space exploration, and electronics. A national study on the nature and extent of mercury reserves will be continued. As part of the studies it is planned to develop techniques for appraising mineral production potentials of individual mines, or mining districts.

Research will be continued on the water requirements of the mineral industry with respect to both quality and quantity. Engineers will be available for the evaluation of mineral resources affected by proposed damsites and reservoirs, especially in frontier areas such as Alaska.

The search for and appraisal of deposits of ceramic materials, including kyanite and related minerals, refractory clays, and clays and shales for expanded lightweight aggregate in areas where a potential need is known or has been shown by special economic investigations will be carried forward. Studies in the Western United States will be conducted in cooperation with State agencies.

Resource studies of phosphate rock in the Southeast United States will be initiated, and sampling studies in both phosphate rock and potash mines will be accelerated, in the interests of conservation.

Studies including mineral production methods surveys are planned of mining and processing operations having special significance in relation to other aspects of the Bureau's program. A continuing investigation of gypsum and other construction and chemical materials resources will be complemented by studies of mining and processing practices and problems of mineral aggregate producers. Methods of producing fluorspar and asbestos from domestic deposits will be examined for means of increasing the recovery and grade of the product.

An industry survey of the Pacific Northwest zirconium-hafnium mineral occurrences and markets will continue. Another study will review the development, growth, and outlook for the aluminum mill products industry in the Pactific Northwest. The economic potential of the iron and steel scrap industry of the Rocky Mountain States will be assessed.

Collection, compilation, and interpretation of technologic, economic, and statistical information on all minerals and metals (other than fuels) will be obtained and analyzed to aid in the formulation and direction of minerals and metals research in extraction, processing, and utilization. Distribution of these data in the form of mineral industry surveys and minerals yearbooks to other Government agencies, industry, and the public will be an important part of the program.

5. Foreign mineral activities

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Foreign mineral activities	$361,020	$366,000	$500,000	+$134,000

Foreign mineral activities.—The estimate for this activity for fiscal year 1963 is $500,000, an increase of $134,000 over the amount for 1962. The increase will provide for needed expansion in services performed under this appropriation.

Need for increase: International mineral developments are affecting adversely the mineral economics of the United States and the free world. Consideration of the problems arising from this situation necessarily emphasizes the need for expanding the Bureau's factfinding services on foreign minerals. Among the more significant world developments in recent years has been overproduction which contributed to depressed conditions in some domestic mineral-producing districts. As a consequence the U.S. Government has participated in international discussions seeking cooperative measures that might reestablish stability and bring relief to depressed areas. U.S. emphasis on exchange of surplus agricultural products for foreign minerals recently has been increased. Communist aggression in Cuba and the Congo and threats of similar intervention in other parts of the world have focused attention on the minerals produced in these areas and their basic importance to the free world economy. Current efforts to promote export trade have stimulated interest in foreign mineral operations as expanding markets for U.S. mining supplies and equipment. The recent crisis in gold has revealed the need for more reliable information and judgment on the gold-producing potential of the world. Formulation of U.S. mineral policy and programs to cope with domestic problems arising from increased foreign competition commands the attention of many legislators and executives in Government. The Government's program of economic aid to underdeveloped countries likewise requires evaluation of the opportunities for effective technological assistance in the mineral field.

The Bureau of Mines is called upon frequently by private and Government agencies for information and opinions on the basic factors involved in the situations noted above. Because there are many gaps in available data it is necessary at times to resort to estimation. In many instances estimation is essentially guesswork as a consequence of which Government and business programs and policies sometimes involve uncertainties. The purpose of the Bureau's proposal to enlarge its foreign mineral factfinding program is to reduce these uncertainties to a practical minimum.

Plan of work: The funds requested will be used to support the continuous factfinding program conducted by the Bureau in Washington, D.C. This includes maintenance of statistical and technical staffs specializing in foreign mineral data. The statistical unit compiles mineral statistics from all parts of the world for use in Bureau publications and by agencies engaged in current Government operations in the mineral field. The technical staff advises on statistical problems and evaluates mineral developments abroad for the benefit of Government and industry groups concerned with foreign minerals. The activity covers both free and Communist worlds. The program is closely coordinated with other units of Government, particularly the information collecting activities of the Foreign Service. This assures efficiency in the use of funds appropriated for this purpose.

Increased funds requested for fiscal 1963 will be expended for the following purposes:

1. Provision of more complete statistics on world mineral production, consumption, and trade. Deficiencies in existing data on these vital factors are illustrated by the fact that only 52 of the 65 world production tables in Minerals Yearbook 1960 were reasonably complete. Reliable estimates of the output of many minerals in the Communist countries cannot be made with present staff. The yearbook is notably deficient in data showing geographic distribution of world consumption and international movement of mineral commodities.

2. Provision of more analytical appraisals of mineral developments in foreign countries that have an impact on the mineral economy and programs of the United States. A small increase in technical staff is required for this purpose in order to fulfill the numerous requests being received for specialized information which cannot be supplied at present.

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$22,660,906	$24,533,000	$27,000,000	+$2,467,000
Comparative transfer to health and safety	266,000	267,000		−267,000
Unobligated balance	92,094			
Appropriation	23,019,000	24,800,000	27,000,000	+2,200,000
Obligations by objects:				
11 Personnel compensation	16,620,232	17,865,000	18,812,000	+947,000
12 Personnel benefits	1,251,418	1,342,000	1,413,000	+71,000
21 Travel and transportation of persons	490,967	567,000	646,000	+79,000
22 Transportation of things	129,445	137,000	143,000	+6,000
23 Rent, communications, and utilities	638,427	680,000	695,000	+15,000
24 Printing and reproduction	277,165	289,000	320,000	+31,000
25 Other services	499,266	514,000	548,000	+34,000
26 Supplies and materials	1,397,689	1,576,000	1,691,000	+115,000
31 Equipment	1,258,062	1,435,000	2,672,000	+1,237,000
32 Lands and structures	98,902	129,000	61,000	−68,000
42 Insurance claims and indemnities	513			
Subtotal	22,662,086	24,534,000	27,001,000	+2,467,000
Deduct quarters and subsistence charges	1,180	1,000	1,000	
Total obligations	22,660,906	24,533,000	27,000,000	+2,467,000

PREPARED STATEMENT

Chairman HAYDEN. Now, Mr. Ankeny, if you have a prepared statement, we will be glad to hear it.

Mr. ANKENY. Mr. Chairman, I have a rather lengthy statement which I, in the interest of saving time, would like to insert in the record and then would like to make a few comments.

Chairman HAYDEN. You may highlight it.

(The statement referred to follows:)

STATEMENT OF MARLING J. ANKENY, DIRECTOR, BUREAU OF MINES

Mr. Chairman and gentlemen of the committee, I welcome the opportunity to appear before you once again to present the budget estimate for the Bureau of Mines to carry forward programs for the conservation and development of mineral resources and for the promotion of safe and healthful working conditions in the mineral industries.

It would be a pleasure to be able to present a less complicated explanation of our programs, but I do not find it a simple matter to describe to you the complex interrelationships of minerals and fuels in modern society and the role that the Bureau of Mines plays in developing the full potential of these resources.

One of the main attributes of the industrial development of the United States has been our rich supplies of coal, oil, and other minerals. Not surprisingly, but nevertheless not generally foreseen by the layman, this supply situation does not hold true today. Not only has American industry caused serious depletion of many of our domestic raw materials, but dependence on foreign sources has been greatly increased. Logically, we must now turn our efforts to finding, converting, and utilizing other abundant resources as substitutes.

Today, the United States—indeed, the entire Western bloc of nations—is faced with a tremendous scientific and technologic challenge. In this race, we are off to a good start, but we cannot hold our preeminent position without exerting every effort to move ahead at an even faster pace.

Progress in this scientific contest—new and better missiles, nuclear energy, industrial advancement, development of the newer nations—all depend upon materials. We must have the materials we need in kind, quality, and quantity when we need them.

At no time in our history has the work of the Bureau of Mines been more essential than it is today. In this period of accelerating technologic advance and dynamic international competition, national survival is largely dependent

upon speed of acquisition and application of new knowledge to meet the heavy drain placed upon our mineral resources.

The Bureau's programs are dynamic, changing with the problems and demands created by war or economic environments. In keeping with this philosophy, the estimates before you set forth programs which are designed to fulfill the demands of current circumstances and projected to meet the challenge of the future.

Before discussing the Bureau's programs, I would like to point out that our 1963 estimates are being presented under a revised activity-subactivity basis. The previous format had become somewhat obsolete because of gradual redirection of emphasis in both the research and resources field of activity. In this connection, research programs are continuously adjusted to recognize the impact of international affairs, domestic needs, and scientific changes and challenges.

A resources investigations subactivity has been established under the bituminous coal, petroleum, and minerals and metals activities. Resources investigations account for a substantial fraction of the total funds expended under the "Conservation and development of mineral resources" appropriation and therefore merit separate consideration.

This subactivity is designed to do two things to improve our standing in this scientific race: (1) It brings together in usable form the information that can give the country the leadtime needed to assure adequate supplies of minerals and fuels, and (2) it integrates the whole spectrum of complex factors—power, labor, water supply, transportation, markets, resources, etc.—that make for orderly and efficient development of these essential supplies.

Our previous budget structure did not include a comprehensive metals activity even though work related to metals now occupies a major share of the Bureau's concern. Accordingly, the former ferrous metals, nonferrous metals, and nonmetallic minerals activities have been consolidated into the new activity entitled "Minerals and Metals." Since much of the Bureau's research deals with single problems or processes applicable to more than one commodity area, an overall description and presentation of the minerals and metals work under one grouping should prove more meaningful. Previously, major functional changes were difficult to describe and we hope the new structure will permit a clearer understanding of our plans and purposes. We know that the revised format will permit better fiscal control.

Finally, under the "Health and safety" appropriation, a new activity, health and safety research, was added. This activity will include the work of the Health and Safety Research Center and all other research functions presently funded under the inspections and investigations activity. Part of the explosives and explosions subactivity previously funded under bituminous coal is administered by the Health and Safety Research Center and this amount has been moved by comparative transfer to this new activity line.

No changes have been made in the other appropriation items.

The budget estimate for the Bureau of Mines for fiscal year 1963 is $37,491,000, a net increase of $3,366,000 over the amount appropriated for 1962. After deducting the nonrecurring construction items, the estimate provides for an actual increase of $4,156,000 for regular mineral conservation and safety activities. In addition, we are requesting borrowing authority in the amount of $20 million to supplement the $10 million borrowing authority previously provided by the Congress for the helium conservation program.

BITUMINOUS COAL

Our research and technologic work conducted under the bituminous coal program is aimed at developing maximum efficiency in the mining, preparation, and use of coal by industry and Government. We are determined, also, to develop new and improved methods for the conversion of coal to more useful forms and more marketable products. During the past 2 years we have increased our emphasis on problems such as hydraulic mining and the development of the coal-burning gas turbine. Now we propose to attack another problem of immediate nature.

We are requesting an increase of $350,000 to conduct experiments on the possibility of injecting solid fuel into a blast furnace as a supplemental fuel. It has already been demonstrated that it is feasible to inject liquid fuels into the tuyeres of a blast furnace for this purpose. We now propose research to determine if it is technically feasible and economically attractive to inject solid fuel as well. Our purpose calls for trials of injecting this in dried form, powdered

form, and also as a slurry. If successful, this would result in a lower cost in producing steel and it would enable coal to compete with liquid fuels and assume a better competitive position in the metallurgical fuel market.

ANTHRACITE COAL

The anthracite program stresses ways to develop markets for anthracite, better preparation practices, and improved methods and uses. Bureau research on mining, preparation, and utilization of anthracite implements a continuous policy of conserving a great natural resource by promoting wider and more efficient use techniques. The steady decline in the use of coal in the energy market is essentially caused by its replacement by liquid and gaseous fuels. If anthracite is to recover a substantial part of the predicted energy requirements of the future, it is imperative that new technologic processes be developed. Under an agreement with the Commonwealth of Pennsylvania, the Bureau will continue to evaluate, recommend, and supervise jointly financied projects designed to prevent flooding of mines in the anthracite region. Without such projects, vast tonnages of minable hard-coal reserves would be flooded and lost forever. Under this program, a nominal increase is requested to permit the microfilming and storage of maps and other documents relating to abandoned mines and also provide for testing of lower bulk-density metallurgical briquets.

PETROLEUM, NATURAL GAS, AND OIL SHALE

The objective of the petroleum, natural gas, and oil shale program is to assure adequate supplies of liquid and gaseous fuels for national defense and public welfare at reasonable cost. Increased total recovery of petroleum is of utmost importance as evidenced by the continued increase of domestic demand despite the increased difficulty involved in finding new reserves. Encouraging operators to adopt practices that conserve the energies in underground reservoirs and showing how air, gas, and water injection can serve as effective substitutes once the original energies are depleted, are means of increasing total recovery of oil and gas. We are requesting an increase of $187,000 for oil shale research in anticipation of the technologic needs for a potential oil shale industry. The economics of such an industry will depend to some degree upon the byproducts that may be manufactured, together with the conventional fuel products. In view of this, the chemical potential of such an oil shale industry will be probed.

MINERALS AND METALS

This program is aimed at maintaining a strong national supply position despite the ever-increasing demands of an expanding industrial economy and rising international tensions. One of the most obvious ways to expand our supply base is to develop better extractive methods. Minerals left behind in worked deposits in many instances never can be recovered. Hand in hand with this requirement is the need to introduce every possible economy into the process of extraction—in other words, increased recovery at lower costs, and with the maximum in human safety.

Scientific research in mining has a comparatively short history. So long as it was possible to maintain adequate mineral supplies by long-established methods, there was little need for the scientific approach. That the end of this comfortable situation is at hand is evidenced by the variety and rapidly growing amount of mining research in progress all over the world.

To assist the industry in reducing mining costs and recovering a larger percentage of ores from the ground, the Bureau makes numerous important mining studies. These range from investigations of techniques and equipment that have proved workable in operating mines and quarries to fundamental research on drilling, breaking of rock by explosives, and the nature of stresses in underground mine structures.

In metallurgical research the scope of our program is broad, and the purpose is to swell our mineral wealth by learning how to recover, separate, and utilize the mineral values in ores efficiently and economically. The present-day aim has been broadened to include the discovery of ways of replacing scarce commodities with plentiful ones, and to assist the mineral industries to continue the trend of turning out better and better products from raw materials of lower and lower grades.

As the demand for metals and minerals rises and material requirements for jet-powered aircraft, missiles, nuclear powerplants, and other modern uses

become more exacting, we find that the need for metallurgical research is becoming continually more urgent.

The Bureau is constantly carrying on research and experiments in the three main divisions of metallurgy. These are mineral dressing, which means concentrating metallic or nonmetallic minerals from the rocky matrix; extractive metallurgy, which means extracting pure metals, converting pure ores or concentrates; and physical metallurgy, or the converting of pure metals, often alloys of two or more metals, into useful shapes.

Both industry and Government require up-to-date information—facts upon which to formulate policies and make decisions. One of the Bureau's most vital tasks has been to supply a steady flow of data on the production, distribution, and consumption of minerals and metals. Resources investigations are made of mineral deposits to gain a better knowledge of the location, quantity, quality, and recoverability of specific mineral resources.

An increase of $1,746,000 is requested under the minerals and metals activity. Of this amount $776,000 will be used to intensify its mining research program and $970,000 to accelerate its metallurgical research program.

The increase in funds for mining research will permit increased emphasis on such problems as the development of improved means for supporting underground openings, including precast concrete, rock-bolt anchors, and hydraulic backfill and more efficient machines and techniques for drilling and breaking rock. Typical of the fundamental studies to be initiated or increased are investigations designed to make engineering use of such geologic features as faults, fractures, alterations, rock type, rock properties, etc., so that they may be reduced to factors in formulas for predicting rock behavior during the act of mining.

The major portion of the increased funds requested for metallurgical research will be used to accelerate processing research on domestic mineral resources. Mineral resources are assuming an ever-increasing importance in the national economy and security in view of the continued and growing demands for minerals and products therefrom. However, the continued decrease in the grade of domestic ore, the abundance of marginal and submarginal resources, the growing dependence on foreign sources for some significantly important minerals, and the emphasized requirements for superior materials in space age structures, vehicles, and other applications all add urgency to the situation. Alleviation of this situation requires enhancement of the domestic mineral deposits through research to develop technically and economically feasible processes for effectively treating the marginal and submarginal domestic resources, particularly those in great abundance.

Also, the increase will provide for an expanded program to develop the basic scientific data essential to the preparation and evaluation of engineering materials that will withstand new environments. Such research encompasses the development of better methods for determining the mechanical properties of superior structural materials over a wide temperature range and studies on determining and evaluating the chemical, physical, and other properties related to the preparation and application of those materials.

FOREIGN MINERAL ACTIVITIES

Government and industry are provided with current information on mineral developments in foreign lands through our foreign activities program. The Bureau assembles, analyzes, and interprets statistical, economic, and technical data required in the evaluation of international trade in minerals and the mineral economies of foreign countries. The resulting data is disseminated through Bureau publications and special reports for internal Government use. Because there are numerous gaps in available data, it is sometimes necessary to depend on guesswork. This, in turn, is responsible for the uncertainties sometimes involved in Government and industrial programs and policies. An increase of $134,000 is requested to enable the Bureau to enlarge its factfinding program so as to obtain more complete international data on minerals and reduce these uncertainties to a practical minimum.

INSPECTIONS, INVESTIGATIONS, AND RESCUE WORK

Bureau activities under this heading are designed primarily to prevent accidents and injuries in the mineral industries and to preserve the lives and health of those employed in such industries. The prevention of accidents and injuries

enhances the economic well-being of the mineral industries because all accidents and injuries are costly and wasteful. Our activities, therefore, are essentially of a continuing nature such as mine inspections, safety investigations, instruction in accident-prevention and first-aid and mine-rescue and recovery practices. Continual study and appraisal of all hazards in the mineral industries require development of new techniques or revision of old ones to meet changing conditions. In essence, therefore, the commodity dealt with is the mineral industry worker and his well-being. We are requesting an increase of 200,000 to initiate a study of the causes and prevention of injuries and health hazards in metal and nonmetallic mines in accordance with the mandate of Public Law 87-300, 87th Congress. This study is prescribed to determine whether or not there is a need for a Federal inspection program in metal and nonmetallic mines similar to the program now applicable to coal mines.

CONTROL OF FIRES IN COAL DEPOSITS

The purpose of the work under this heading is to stop the destructive action of uncontrolled fires in inactive coalbeds that have caused the loss of valuable coal reserves, damaged or destroyed surface property, and endangered the lives and health of persons living nearby. The estimate holds this program to the 1962 level.

HEALTH AND SAFETY RESEARCH

Activities under this heading are conducted in the Bureau's Health and Safety Research and Testing Center and its two experimental mines. Research is directed toward improving equipment in underground mines; methods and equipment to counteract health hazards of the mineral industries; establishing more scientific bases for roof control; improving ventilation problems; and preventing dust explosions.

An increase of $169,000 is requested to permit expansion of research on and testing of respiratory-protective equipment. The Bureau for many years has been testing and granting approval for equipment meeting our specifications for use in the mineral industries. There has now developed a need for protective equipment for other activities not involved with the mineral industries. Industry and some Government agencies have felt that rather than have various agencies involved in this matter, it should be done centrally and logically in the Bureau of Mines. It is our plan that this would be a national testing center for protective equipment for all industries.

We have another requested increase of $175,000 to expand our diesel research and testing facilities to keep abreast of modern mining and tunneling requirements. The use of diesel-powered equipment in mining is growing steadily and there are a great many new designs of equipment that are reaching the market. Both manufacturers and users are urging the Bureau to provide prompt service for testing leading to approval for underground use. Our facilities are not adequate to keep pace with these increasing demands and in order for the Bureau to fulfill its obligations in this area expansion of this program is mandatory.

CONSTRUCTION

Funds requested under the "Construction" appropriation for 1963 total $1 million. This amount will be used for the design and preparation of detailed engineering plans and specifications in connection with the relocation of fuels and health and safety research functions from Pittsburgh, Pa., to Bruceton, Pa., and the proposed construction of a new analytical methods research center on a Government-owned site at Frederick, Md.

The present facilities at Pittsburgh are no longer satisfactory for the conduct of modern research investigations. These buildings are now considered to be obsolete and inadequate for the needs of our present research activities. The Bureau of Mines feels that relocation in a new, functionally designed building would be advantageous to carry out the major important programs on coal and health and safety research.

The proposed research center at Frederick, Md., is needed to conduct analytical methods and equipment research. Although methods have been developed to allow routine analyses of impurities in quantities of only parts per million, the requirements of new electronic and metallurgical applications demanding ultra-high purity materials have multiplied sensitivity requirements to mere parts per billion.

GENERAL ADMINISTRATIVE EXPENSES

This activity finances certain administrative services in the Washington office and five regional offices incident to the prosecution of the Bureau's responsibilities and also provides for the overall executive direction and coordination of our various programs. The nominal increase of $43,000 requested will provide for procurement of accounting equipment, expansion of the Bureau internal audit program, and within-grade salary increases.

HELIUM CONSERVATION

The Bureau of Mines is requesting borrowing authority in the amount of $20 million to supplement the $10 million borrowing authority previously provided by the Congress to carry out the provisions of the Helium Act.

The Bureau continues to supply all of the ever-increasing demands for helium and concurrently has made excellent progress on a long-range conservation program as authorized by Congress. Every reasonable effort has been made to proceed rapidly with the conservation program in order to save helium that would otherwise be wasted. Utilizing the full $47.5 million contracting authority provided, contracts for periods of 22 years have been negotiated with four private companies under which the companies will finance, build, and operate extraction plants and sell the helium to the Government for conservation. Preliminary negotiations have continued with other potential suppliers in order that contracts may be consummated rapidly should additional contracting authorization be made available. The first plant is scheduled to begin production in July 1962.

A helium research center has been established to strengthen and expand the program of basic and applied research on helium. The research center conducts research and experimentation on the occurrence, properties, production, and utilization of helium, and provides a focal point from which both industry and Government can secure results of helium research.

With the planned installation of additional purification capacity at the Amarillo and Otis helium plants and the purchase of needed additional shipping containers to supplement existing production facilities, we will be able to supply demands for helium in 1963. Construction of a crude helium pipeline, approximately 400 miles long, to transport helium from industry's plants to underground storage near Amarillo, Tex., is scheduled for completion in time to accept delivery of helium when the first conservation plant is ready to begin operations.

GENERAL STATEMENT

Mr. ANKENY. The budget estimate for the Bureau of Mines for 1963 calls for a net increase of $3,156,000 for the regular programs of the Bureau, a request for $1 million for construction purposes, and a request of $20 million borrowing authority for the helium purchase program. In this age of exploration of outer space, there are still many frontiers to be explored here on this earth. To keep pace with the material demands of the space age, not only for the exploration of space and for missile technology, but also for the continued growth and prosperity of our Nation as a place to live, we must have the materials we need in kind, quality, and quantity when we need them.

We are therefore faced with a tremendous challenge to maintain our technical supremacy in the fields of minerals and fuels. We must continue to explore and make scientific discoveries in the fields of minerals and fuels that will yield benefits to mankind.

In the field of energy, we must explore economical ways of producing, transporting, and consuming fuels.

We have a number of projects that are in being and some that are proposed to meet this requirement. I only want to mention a few of the important ones at this time. We have been making substantial progress in our hydraulic mining programs, in which we are conducting an experiment in the State of Washington in the hope that we may increase the productive capabilities of the coal industry in that

area so that coal will have a chance to compete in the energy markets in the Northwest part of our country. We are also doing some hydraulic mining work in the anthracite fields of Pennsylvania.

NORTHWEST WATERPOWER

Chairman HAYDEN. You have a job in the Northwest in competing with that northwestern waterpower?

Mr. ANKENY. It is not a matter of competing, but it is a question of supplementing the waterpower. The situation is that waterpower can only guarantee a certain amount of firm power and they have an overage amount that they can't sell at a very good price because they can't guarantee it. If this can be supplemented with steampower, either from coal or petroleum, then they put on the market a greater quantity of firm power, and it is in this area we hope to go ahead.

Chairman HAYDEN. In other words, it is supplementing their efforts and not competing with them?

Mr. ANKENY. That is correct.

Chairman HAYDEN. Proceed with your statement.

HYDRAULIC MINING

Mr. ANKENY. Recently we have been able to demonstrate hydraulic mining in the anthracite field, where progress had not been as good as in the bituminous field due to the fact that anthracite is very hard material and it is filled with sulfur rocks of various kinds that make it virtually impossible to operate continuous mining operations. We have demonstrated that with hydraulic mining the hydraulic water jets simply disregarded the obstructions and cut right through them. The question, however, of economics of hydraulic mining versus the conventional mining in anthracite fields still remains to be demonstrated.

Chairman HAYDEN. By "hydraulic mining," you mean the application of water by force against the coal face?

Mr. ANKENY. That is correct.

Chairman HAYDEN. How do you get rid of the waste water?

Mr. ANKENY. It runs away and collects into a sump where any impurities would settle out and it would be used over and over again in a cycle. But we hope to carry this hydraulic program one step further. We are now engaged in experimental work for the hydraulic transportation of coarse coal and we conceive that under certain mining conditions you will mine the coal hydraulically, you will pick it up in a hydraulic system and transport it to the cleaning plants or to the powerplants directly from the mine faces. This is for some time in the future, but it will give coal a tremendous advantage in competing with other fuels in electric power generation.

Chairman HAYDEN. That is a system that will operate in the Northwest where there is an abundance or superabundance of water. It wouldn't work down in my country.

COAL-FIRED GAS TURBINE

Mr. ANKENY. We have a project that will work in your country if we ever make a breakthrough on this, and there is considerable interest from people in Arizona right now on our coal-fired gas turbine. This is a project that has been going on for some 2½ years,

and the objective of this is to be able to consume the coal directly in the turbine itself and thus eliminate the steam cycle. If we ever are able to do this economically, it will mean that in dry areas where there is a shortage of water, we needn't worry about the water problem. It will also mean that present-day steamplants, as now constituted, will be supplanted because the turbine will do a more efficient job on the conversion of the energy of coal into electrical energy. Our problem in connection with this is to find a design which will permit the burning of these impurity-laden gases that come from coal to go through the turbine without destructive effect on the turbine blades.

This is the direction in which we are working in our coal-fired gas turbine project at Morgantown, W. Va.

BLAST FURNACE EXPERIMENTS

Another new project in which we hope to engage and in which we are asking for a $350,000 appropriation this year, is to conduct experiments in our blast furnace at Pittsburgh of using coal directly in the blast furnace to supplement some of the coke that is now used in producing steel. If we can do this, it will not only mean a cheaper method of producing steel but it will mean conservation of our relatively scarce reserves of high-grade coking coals.

This is a new project, and as I say, it is in our estimates for this year.

In the field of energy from oil shale, we are also asking for an increase of $187,000 to step up to some degree our research work on the conversion of oil shale to energy.

BETTER RECOVERY METHODS

In the field of metals and nonmetallic minerals, we must explore and find more economical methods of extracting minerals from the earth. We must find out how to obtain more complete recovery of our very limited high-grade reserves. We must find improved methods of supporting underground openings and we must develop better techniques for drilling and breaking ore.

In our estimates for 1963 we are asking for an increase of $776,000 to step up our mineral mining program I have just mentioned. In the metallurgical field we must find more economical means of recovering minerals from our abundance of marginal and submarginal ores. We must find ways of producing superior materials for use in space age structures and superior materials for use in the production of atomic energy.

EVALUATION OF ENGINEERING MATERIALS

We must find and develop basic scientific data essential to the preparation and evaluation of engineering materials that will withstand new environments in the space age and in the atomic age and we want to find and expect to find the effect of nuclear radiation on metallic elements and on metallurgical processes. That is a new field of research and we are getting established to do this work.

In our station at Albany, Oreg., we need an expanded program to develop the basic scientific data essential to the preparation and evaluation of engineering materials that withstand the new environments in the space and atomic age.

FUNDS FOR METALLURGICAL WORK

For our total metallurgical effort we are asking for an increase of $970,000 for fiscal 1963.

In the foreign minerals field we need to do a better job of reporting on the mineral economics and potential of foreign countries. We are asking for an increase of $134,000 to step up our foreign mineral fact-finding activities.

Chairman HAYDEN. In that regard there are still some people who would have you do nothing abroad because it is liable to increase imports?

WORK IN FOREIGN COUNTRIES

Mr. ANKENY. Well, our program is certainly not pointed in that direction and while there may be some people who would object to this, this is a tremendously important activity for the Government. We have to serve many Government agencies with information that is obtained as a result of this activity; moreover, industry itself depends on the Bureau of Mines to be knowledgeable of what is going on in other mineral-producing countries.

Chairman HAYDEN. Now, do you have to keep a number of men abroad to check on this or how do you get your information?

Mr. ANKENY. The information is generally relayed to the Bureau of Mines by mineral attachés and others that are in the employ of the State Department. None of this money goes to support any Bureau of Mines personnel abroad.

SAFETY STUDY

We are also asking for $200,000 to conduct a study of the safety conditions in the metal and nonmetallic mines of the United States. This study was made mandatory by an act of Congress in the 1st session of the 87th Congress and known as Public Law 87–300. They have given us a 2-year time limit in which we must come back to the Congress with the results of this study and with recommendations as to what the Congress should do with respect to proposal for the establishment of a regular system of safety inspection and safety education in those industries.

Chairman HAYDEN. Well, the disasters in mines have caused Congress to institute that action.

Mr. ANKENY. You understand, sir, that this request only has to do with metallic and nonmetallic mines.

Chairman HAYDEN. I understand.

Mr. ANKENY. And in these mines there is not a great disaster history. But there is a substantial history of individual fatalities and injuries.

DUST AND RADIATION HAZARDS

Chairman HAYDEN. I remember now, it is the dust in the lungs that leads to consumption or tuberculosis.

Mr. ANKENY. Part of the study is on the effects of breathing dust and part on the effects of radiation in mines in which uranium is being mined and part of it is on the general run of mine accidents that come as a result of roof falls. But Congress was unwilling to move ahead on legislation at this time without a thoroughgoing study.

HEALTH AND SAFETY RESEARCH

In health and safety research, we are asking for $169,000 to increase our respiratory protective research and testing activities.

Up to the present time the Bureau of Mines has tested respirators and gas masks at various times and granted approval for equipment designed for use in the mining industry but in other industries, in agriculture, in food processing, and in some of the chemical industries also there is a need for this kind of equipment and we have been requested by other Government agencies and by some of the industries to assume the responsibility of testing equipment for industries outside of the mineral industry, on the grounds that we are equipped and ready to do this. It would mean an increase in personnel, but this would be, instead of a laboratory devoted solely to the mineral industry, a national laboratory for the testing and approval of respiratory equipment.

DIESEL RESEARCH AND TESTING

We are also requesting $175,000 to increase our diesel research and testing activities.

We have been testing diesels for nongassy metal mines. The use of diesels is increasing tremendously in metal and in nonmetallic mining operations and our laboratory is so burdened now that we can't keep up with the testing of new equipment of this type. We are therefore asking for this increase to step up the activities of that laboratory.

CONSTRUCTION PLANNING FUNDS

On the construction request of $1 million, this is a request for money to engage an architect to develop plans to replace our Pittsburgh research facility. This facility is now 50 years old. It is rather obsolete. It is expensive to maintain and operate. Inasmuch as there is going to be under construction very soon a new Federal building in Pittsburgh, we contemplate moving all of the office work that is being done at our 4800 Forbes Street facility into this new Federal building. We want to provide facilities at Bruceton to move the coal research work we are now doing at Pittsburgh and also the health and safety research work and the coal mine inspection headquarters now located at 4800 Forbes Street, to the proposed new facility at Bruceton.

We also want to develop plans to establish an analytical methods research laboratory at Frederick, Md.

This is a new field for the Bureau. It is not altogether new because we have been developing to a limited extent analytical methods in our research centers in the field but we want to centralize this work at Frederick, Md., so that all analytical methods work will be done there. The requirement for this has been brought about by the demand these days for pure metals. The researcher, who is seeking to develop high purity metals has progressed so much faster than the development of analytical methods to determine the very small amount of impurities in these metals that we must ask for authority to develop plans for this laboratory.

Mr. Chairman, this completes my statement and I would be happy to answer any questions you may wish to ask.

PITTSBURGH RESEARCH STATION

Chairman HAYDEN. What is to be done with the research station in Pittsburgh after the move to Bruceton is completed?

Mr. ANKENY. This station would be turned over to GSA for disposal. This station is located practically on the campus at Carnegie Tech and I know they are interested in purchasing the station but the disposal would be out of our hands.

BITUMINOUS COAL PROGRAM

Chairman HAYDEN. The estimate for the bituminous coal program is $7,214,000 and is defined as being directed toward research in the conservation, development, and conversion of bituminous coal. The Office of Coal Research, which is requesting $2 million for fiscal year 1963, is charged with the responsibility of encouraging and stimulating the production and conservation of coal through research and development. Would you please differentiate between the two programs?

Mr. ANKENY. Sir, if you are speaking of programs in the broad sense, there is no difference really, except that some of our work is of a longer range nature than that intended for the Office of Coal Research, but the difference will be in the specific projects that the two agencies are engaged in. For example, since the Bureau of Mines is engaged in the development of the coal-fired gas turbine, I am sure that the Office of Coal Research wouldn't enter into a project of that kind.

Chairman HAYDEN. Do you think the work can be properly separated so there will be no duplication?

Mr. ANKENY. There is no reason why it can't be properly separated.

AIR POLLUTION RESEARCH

Chairman HAYDEN. I note in your justifications the statement that during the past year in your air pollution research you have tested certain catalysts for effectiveness in eliminating smog formers from automotive exhaust gases. What success have you had with this experiment? What success have you had, say, in Los Angeles, Calif.?

Mr. ANKENY. I would like Mr. Zinner to respond.

Mr. ZINNER. Senator, air pollution is a matter of continuous concern to us. The research work that we are doing on catalysts is partly funded by the Bureau of Mines and partly by transferred funds from other agencies, particularly the Atomic Energy Commission. In the latter case we are investigating the potential use of depleted uranium as a catalyst.

HYDRAULIC TRANSPORTATION OF COAL

Chairman HAYDEN. In connection with the hydraulic transportation of coal work which you have done, I have noticed in the paper a pipeline for transportation of coal slurry. Is this one of your projects?

Mr. ANKENY. No, sir. This is not one of our projects. We are very much interested in it and we feel that the demonstration of the ability to transport coal in the form of a slurry through pipelines and feed it directly into boilers has been a real breakthrough for coal. We

are concerned, in the work that we are immediately engaged in, in the transportation of coarse coal from the production end to a place where it would be processed or burned in the boiler.

MINERALS AND METALS ACTIVITY

Chairman HAYDEN. You have requested an increase of $1,750,000 in your 1963 requirements for minerals and metals activity, for a total of $14,786,000. Would you inform the committee of the need for this increase, touching on the various subactivities where the increases will apply?

Mr. ANKENY. Mr. Chairman, I have responded in part to that question in my introductory talk. I think that Mr. Zinner, who is assistant director for programs, can more adequately discuss this.

Mr. ZINNER. There are, as you recognize, three broad subactivities in this particular area. In the research on utilization for fiscal 1963, we propose that physical metallurgy research will be intensified to prepare extra high-strength steels; devise methods of forming ferroalloy materials that are difficult to shape by conventional practices; and to speed up studies on zinc, magnesium, columbium, tantalum, tungsten, and other alloys to evaluate their potential value in stringent applications.

EXTRACTION AND UTILIZATION RESEARCH

On the part of the programs which has to do with extraction research, in our terminology this is mining research, the fund increase requested will be used mostly to procure equipment, and increase the effort applied to develop improved artificial supports for underground openings, more efficient methods of rock disintegration, better methods of ground control, and work of that type.

Now, under the part of the program that is concerned with utilization research, one project that I consider to be outstanding was the development of a method for successfully coating rocket-nozzle inserts with tungsten.

TUNGSTEN REDUCTION

Tungsten, because of its extremely high melting point, was selected as a coating material that would withstand the extraordinarily high temperature of the nozzle gases. However, because of the difficulty in forming tungsten into the desired shapes by conventional means, Bureau scientists were forced to devise other methods.

Their efforts, employing carefully controlled gaesous reduction of tungsten hexafluoride by hydrogen, were successful in developing a method whereby high-purity tungsten could be deposited in the desired complex shape and wall thickness. Rocket nozzles coated by this Bureau method were determined by testing to be far superior to those coated by other means.

As a result of the Bureau development a commercial plant for tungsten-coating nozzles was constructed and produced the first satisfactory, full-scale rocket nozzle.

Chairman HAYDEN. This is very interesting information. Thank you for it.

HEALTH AND SAFETY PROGRAMS

For health and safety programs which you have already discussed the 1963 estimate is $8,158,000, an increase of $958,000 over the appropriation for 1962.

The justification will be placed in the record.

(The justification follows:)

BUREAU OF MINES

HEALTH AND SAFETY

Purpose and long-range objective

The programs of the health and safety activity of the Bureau of Mines are designed to (1) prevent accidents and injuries primarily in the extractive mineral industries of the United States, embracing coal, metal, and nonmetallic mining, quarrying, metallurgical, petroleum, and natural gas; (2) safeguard the lives and health of persons employed in those industries; and (3) extinguish or otherwise control fires in inactive coal deposits. By so doing, the economy of the mineral industries is improved by avoiding human suffering and waste of resources and facilities that are coincident with occupational accidents, injuries, and diseases; and preventing destruction of valuable natural resources and loss of facilities to produce them.

The ultimate long-range objective is to eliminate all accidents and injuries in the mineral industries, but this is a target that is virtually unattainable. Occupations connected with underground mining—coal and noncoal—are among the most hazardous of all industrial occupations in the United States; and if a steadily declining frequency rate—lost-time injuries per million man-hours of exposure—can be attained in all underground mines and also in the other mineral industries, this should be considered as satisfactory progress toward the ultimate objective.

Accomplishments during past year

For 1960 the record of Federal coal-mine inspections shows that the average number of inspections per active mine employing regularly more that 14 men underground (designated "Title II" in the Federal Coal Mine Safety Act) was 2.4 times, whereas for mines employing regularly less than 15 men underground (designated "Title I" in the Federal Coal Mine Safety Act) the average was 1.1 inspections. Strip mines were inspected 0.7 time, and auger mines 0.9 time. Because of seasonal or otherwise intermittent operation and abandonment of facilities, some mines were not inspected during the year.

Notwithstanding that numerous inspections and investigations were made of facilities other than coal mines, optimum results in preventing accidents and injuries were obtained largely through safety educational activities. Over 6,200 persons completed various Bureau accident-prevention training courses and over 28,700 completed the first-aid and mine-rescue courses during the fiscal year 1961. Contributory to the overall effort was the attendance of approximately 100,000 persons at the Bureau's demonstrated lectures on safety and 134,000 persons at Bureau screenings of safety films. Also, aproximately 128,000 persons attended Bureau-sponsored safety meetings, including those of the Holmes Safety Association.

Testing equipment and devices for permissibility under specific prescribed regulations, coupled with research and development of new devices to cope with changing or newly encountered conditions, contributed substantially to the overall safety performance of the mineral industries.

Research and investigations in roof and rock bolting to prevent falls of roof, face, and back, coupled with new techniques of bonding poorly consolidated roof strata with resinous substances, and the scientific study of "bumps" or rock bursts, provided the leadership needed by the mining industry to combat the most difficult hazard—falls of roof or ground—that is responsible for most of the deaths and serious injuries in underground mining operations.

An important study carried on vigorously is to determine effective face ventilation and dust-control methods where continuous miners are operated in coal

mines. Ventilation and dust surveys conducted in coal and noncoal mines and the use of the electric analog to solve complicated mine-ventilation problems, periodic public demonstrations at the experimental coal mine of gas and dust explosions and methods of preventing them and also demonstrations of mine firefighting methods aided the mining industry in preventing ignitions of gas or dust and in evaluating and combating the hazards of gas and airborne dusts in the working environment.

For many years the Bureau of Mines has believed that one of the most effective means of preventing accidents, injuries, and impairment of health in the mineral industries is through accident-prevention educational training. Although the Bureau has conducted such training for many years, its instructors are now presenting the course in fundamentals of accident prevention for coal-mine supervisors to serve as a basis for establishing a sound, far-reaching, mine-accident-prevention program, and is designed to create a favorable psychological attitude toward accident prevention. Upon completing this course the supervisors are equipped to train their own workmen in the fundamentals of accident prevention.

New specifications for protective devices will be developed and tried in the field to cope with new operating problems as may arise from mining radioactive ores; gassy coal mines which liberate methane in large volume; and mines that operate under heavy cover, increasing the liability of bumps and rock bursts. These as well as the older hazards of roof support, dust, explosive and noxious gases, and testing for permissibility of underground electric- and- diesel-powered equipment will be given the attention that is necessary to eliminate or minimize the attendant hazards. Broadening the base of respirator approval to cover wider industrial applications is contemplated. A study leading to appraisal of health and safety conditions and practices in noncoal mines, State laws pertaining to such mines, and effectiveness of enforcement thereof is contemplated as a prelude to whether Federal inspection of such mines is desirable or necessary. Such a study is authorized by the enactment of Public Law 87–300.

Dissemination of information through inspection reports, classroom instruction, formal publications, and Bureau participation in safety-promoting agencies will be carried on to the end of achieving a steady reduction in the accident and injury rates of the mineral industries.

The control of fires in inactive coal deposits will be a continuing activity in fiscal year 1963. Projects will be initiated in the order of urgency and the availability of funds. The Bureau has records of 310 fires in inactive coal deposits; of these 110 have been investigated, and 93 have been controlled or extinguished. The objectives are to prevent losses of valuable natural resources, and to prevent loss of life or impairment of health of those living or working near such fires.

The control of fires in inactive coal deposits is a continuing activity in which 13 fires were extinguished or controlled during the year 1961. Some maintenance work was necessary to prevent previously controlled projects from rekindling.

Program changes

Although primary objectives continue unchanged, the programs in health and safety are subjected to continual scrutiny because working and economic conditions in the mineral industries change or new ones arise, requiring flexibility to shift emphasis or to add other programs as conditions warrant. The mining of radioactive ores has emphasized the need for greater protection against radioactive ducts and gases incident to uranium-ore mining. Consequently more rigid specifications for protection of workmen against exposure to radioactive decay products must be developed. The widening application of continuous-mining systems in ultragassy mines has caused revision of precautions that are necessary to safeguard against gas and dust ignitions. This has led directly to the Bureau's investigations to develop a practicable methane-monitoring system, to develop more effective dust-control measures, and to improve face and general mine ventilation.

Roof-control procedures are modified from time to time as more knowledge is gained through studies and investigations. Adaptation of sonic techniques to predict impending bumps or rock bursts, the use of plastic resins injected into rock strata to consolidate the elements, and improvement of self-propelled, protective roof shields for workmen in face areas illustrate the necessity of avoiding rigidity in programs.

80391—62——15

Objectives and program for fiscal year 1963

The Federal Coal Mine Safety Act requires that each title II mine be inspected at least once annually, and that the Bureau of Mines is authorized to make annual or necessary inspections of title I mines.

The Bureau, however, recognizes that its obligations under the act cannot be met by adhering to minimum requirements. The present objective is to inspect each title II mine at least three times annually, each title I underground mine twice a year, and each strip and auger mine at least once annually.

Health and safety

Appropriation, 1961	$7,107,000
Unobligated balance from prior years	250,000
Comparative transfer from "Conservation and Development of Mineral Resources"	266,000
Total amount available, 1961	7,623,000
Appropriation, 1962	7,200,000
Unobligated balance from prior years	47,000
Comparative transfer from "Conservation and Development of Mineral Resources"	267,000
Transferred to "Operating Expenses, Public Building Service," General Services Administration (75 Stat. 353)	−2,000
Total amount available, 1962	7,512,000

SUMMARY OF INCREASES AND DECREASES, 1963

Inspections, investigations, and rescue work:		
Appraisal of health and safety conditions in non-coal mines	+$200,000	
To cover cost of within-grade salary advances for classified personnel	+82,000	
		+282,000
Health and safety research:		
For research on and testing of respiratory equipment	+169,000	
To provide for diesel research and testing	+175,000	
To cover cost of within-grade salary advances for classified personnel	+20,000	
		+364,000
Net change, 1963		+646,000
Budget estimate, 1963		8,158,000

Analysis by activities

1. Inspections, investigations, and rescue work

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Inspections, investigations, and rescue work	$5,871,763	$5,971,000	$6,253,000	+$282,000

Inspections, investigations, and rescue work

The estimate for this activity for fiscal year 1963 is $6,253,000, an increase of $282,000 over fiscal year 1962. The increase includes $200,000 to initiate a new program involving an appraisal of health and safety conditions in noncoal mines in accordance with the recently enacted Public Law 87–300; and $82,000 for within-grade salary advances.

Need for increases

1. *Study of causes and prevention of injuries and health hazards in metal and nonmetallic mines; and investigations of State laws, including enforcement, and inspection of such mines, new program, $200,000.*—This is a new program the need for which is indicated by enactment of Public Law 87–300, authorizing the Secretary of the Interior to conduct the study. Numerous bills had been introduced in the 87th and previous Congresses relating to health and safety conditions in metal and nonmetal mines (excluding coal and lignite mines), some of which proposed mandatory Federal inspection of such mines. The modest request for $200,000 is to enable the Bureau to carry out the mandate of Public Law 87–300.

Studies are needed to evaluate all the factors pertinent or related to existing health and safety conditions in metal and nonmetal mines, so that if future legislation pertaining to inspection of such mines is contemplated, it may be founded on a sound and practicable basis capable of producing an effective program for health and safety in this segment of the mining industry.

The studies would be directed to obtaining information on the scope of coverage necessary; hazards to health and safety that are of prime importance for consideration; tangible benefits derived from health and safety education and training; most effective means of collecting injury statistics; most effective means for attaining the ultimate objective of promoting safe and healthful working conditions in metal and nonmetal mines; analysis and evaluation of health and safety conditions now existing in such mines through the efforts of industry and through the provisions of State or other laws or regulations; and a realistic appraisal of staff required and cost of establishing an effective health and safety program for metal and nonmetal mines.

This program will be carried out under the immediate supervision of the health and safety activity of the Bureau of Mines, and will extend to all parts of the country to provide broad, representative, industry coverage to obtain the necessary information upon which to base valid appraisal.

Additions to the present staff will be needed to conduct field investigations of pertinent conditions in mines; analyze statistical data and study means for collecting such data; determine the need for extending health and safety education and training programs; and review and analyze State or other laws and regulations to determine the scope of coverage and results obtained under such regulatory authorities.

2. *Within-grade salary advances—increase, $82,000.*—This increase is needed to cover costs of within-grade salary advances for classified personnel.

Plan of work

Appropriated funds will be expended mainly in the field coincident with inspections, field investigations, and educational aspects of the Bureau's health and safety activities. The primary objectives of these activities are to prevent industrial accidents, injuries, and occupational diseases of mineral-industry workmen and by so doing protect the lives and health of workmen in the mineral (coal and noncoal), metallurgical, petroleum, natural gas, and allied industries. This is accomplished through mine inspections; safety investigations; accident-prevention education; roof-control, ventilation, and working environment investigations in mines.

Coal-mine inspections and investigations are carried on in compliance with the requirements of the Federal Coal Mine Safety Act (Public Law 552, 82d Cong.). The administration and enforcement of this law was delegated by the Congress to the Bureau of Mines.

Established methods for disseminating accident-prevention education in the mineral industries (coal and noncoal) for workmen and supervisors will be continued by classroom and on-the-job instruction, demonstrations, films and other visual aids, and instruction in first-aid and mine-rescue procedures. New techniques in teaching accident-prevention to stimulate "company-sponsored" training have been instituted to broaden the base of accident-prevention educational training.

Service to the mining industry through improved ventilation, dust-control, and roof-control techniques is a continuing activity germane to the general overall objective of preventing loss of life and impairment of health of workmen, particularly those engaged in underground mining operations.

2. Control of fires in coal deposits

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Control of fires in coal deposits	$514,463	$377,000	$377,000	

Control of fires in coal deposit

The estimate of $377,000 is the same as for 1962.

Plan of work.—Funds for this activity will be spent almost entirely in the field to control or extinguish fires in inactive coal beds on private property and on the public domain. The purpose is twofold: (1) To prevent destruction by fire of valuable resources, and (2) to protect the lives and health of persons living or working in proximity to such fires. Three fires are scheduled for control during the fiscal year 1962, together with six uncompleted projects carried over from fiscal year 1961. The Bureau has records of 217 other fires in inactive coal deposits on private property and the public domain. These will be attacked in order of urgency and availability of funds.

3. Health and safety research

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Health and safety research	$1,143,514	$1,164,000	$1,528,000	+$364,000

Health and safety research

The estimate for the fiscal year 1963 is $1,528,000 and is an increase of $364,000 over funds available during the fiscal year 1962. This increase includes $169,000 to expand research on the testing of respiratory-protective equipment, extending coverage to hazardous industrial areas not presently covered; $175,000 to expand diesel research and testing facilities to keep abreast of modern mining and tunneling requirements; and $20,000 for within-grade salary advances.

Need for increases

1. *Research on and testing of respiratory-protective equipment; increase, $169,000.*—The Bureau of Mines has been concerned with the design, use, and performance of respiratory-protective equipment since before World War I. The Bureau has developed performance standards by which commercially produced respiratory-protective equipment may be considered for approval. These standards (schedules) were developed to comply with requests of industrial users of such equipment and of manufacturers of safety equipment who desire to supply industry with efficient respiratory-protective devices. Under appropriate schedules the Bureau of Mines now approves self-contained breathing apparatus for mine rescue work; industrial gas masks; supplied-air respirators; dust, fume, and mist respirators; and chemical-cartridge respirators. Although respiratory-protective equipment is submitted voluntarily to the Bureau for testing and approval by manufacturers, many industries, insurance companies, and Federal and State agencies require that only Bureau of Mines-approved equipment be used in work with which they are concerned. The Bureau's approval system has done much to stimulate the development of safe, efficient, respiratory-protective equipment.

Although the Bureau's present approval coverage is adequate for respirators suitable in most industrial situations, certain developments in present-day technology have brought forth new and highly toxic materials that greatly complicate the problems of respiratory protection. Use of such materials has created a demand for respirators with performance characteristics not presently covered by Bureau approval requirements. Examples of these are radioactive materials, beryllium, organic phosphates and other agricultural chemicals, and some of the exotic fuels used in missile propulsion.

Research is necessary to develop performance criteria for respirators that will provide adequate protection against such substances. To do so requires expansion of the Bureau's approval program for respiratory-protective equipment through research to provide the broader coverage necessary to meet new technologic problems. The Bureau presently is being urged to extend its coverage by several agencies, including the Atomic Energy Commission, contractors on various projects of the AEC, the American Industrial Hygiene Association, the American Conference of Governmental Industrial Hygienists, and respirator manufacturers represented through the Industrial Safety Equipment Association.

Over the years the Bureau of Mines has been sought for guidance and leadership when new problems arise in the field of respiratory protection, but if restricted to its present limitations other agencies—Federal and State—may be forced to evaluate respirators not now covered by the Bureau's approval system. Such a multiplicity of approval agencies creates a highly undesirable situation, especially among manufacturers and users of respiratory-protective equipment and regulatory agencies. Inevitably such a situation will develop if the Bureau of Mines fails to expand its research and testing facilities to meet the requirements of present-day technology.

Separate staffs are required—one for research and the other for approval testing—and the Bureau's facilities extended to enable proper evaluation of performance of any type, design, or style of respiratory-protective equipment that is developed by manufacturers for industrial use.

2. *Diesel research and testing; increase, $175,000.*—A recent survey of diesel-powered equipment operated in underground mines and tunnels disclosed a total of approximately 2,500 units. Virtually all of this equipment is powered by diesel engines which have not been tested or approved as safe equipment for use in confined underground areas. The use of diesel-powered equipment underground has increased marketedly in recent years, yet much of it is potentially hazardous to the health of workmen who operate it or work in proximity to it, especially where the exhaust gases are carried to the breathing zones of the workmen. If in high enough concentration, such gases are dangerous to inhale. The most dangerous are carbon monoxide and oxides of nitrogen.

On January 24, 1961, regulations, covering the testing and approval of diesel-powered transportation equipment for gassy noncoal mines and tunnels, were published in the Federal Register and became effective on that day. Submission of such equipment for testing and approval by manufacturers is voluntary. The Bureau of Mines would be hard pressed to test diesel-powered equipment if it should be submitted in any large volume.

The Bureau's diesel research and testing facilities were established several years ago, mainly as a pilot-scale laboratory. Recent efforts have been made to enlarge the scope of work, but it has been handicapped by lack of personnel, adequate space, and necessary equipment for the Bureau to fulfill its obligations in this important area.

Both manufacturers and users of disel-powered equipment are urging the Bureau to extend its facilities for testing and engage in diesel reseach to provide needed information on the toxicity of diesel-exhaust gases, establish safe working tolerances, develop procedures for field-testing equipment, and provide prompt service for testing leading to approval for underground use.

A diesel engine used underground not only may be a health hazard to workmen, but also can be a fire hazard by developing excessive heated parts, especially dangerous in atmospheres that contain flammable gas. Therefore, safeguards against the fire hazard must be developed.

3. *Within-grade salary advances; increase, $20,000.*—The increase is needed to cover costs of within-grade salary advances for classified personnel.

Plan of work

Appropriated funds will be expended mainly in Bureau laboratories and its two experimental mines. Research will be directed toward improving electrical and diesel equipment for underground work; methods and equipment to counteract health hazards of the mineral industries; establishing more scientific bases for roof control, including prevention of "bumps" or rock bursts; improving mine ventilation generally, and aiding the mining industry in solving difficult ventilation problems; and preventing dust explosions and mine fires by applying new concepts on dust binding, rock dusting, and controlling float-dust transport.

Test work will be countinued, involving both improvements in equipment that previously had been approved by the Bureau as well as new equipment. Increasing demand for the testing and approval of underground electric- and diesel-powered equipment, lighting and shot-firing devices, gas detectors, drill-dust collectors, respirators, and self-contained breathing devices, calls for greater productive effort of Bureau personnel so engaged to provide this important service that the mineral industries depend upon for unbiased evaluation of the safety of such equipment.

Itemization of estimate

Other laboratory facilities	24,142
Subtotal	1,538,120
Increase: Research facility planning	1,000,000
Budget estimate 1963	1,000,000

Analysis by activities

Activity	Amount available, 1962	Fiscal year 1963			Total available 1963, compared to total available 1962
		Unobligated balance from prior years	Budget estimate	Estimated total available	
1. Laboratory facilities	$1,161,995		$1,000,000	$1,000,000	−$161,995
2. Helium facilities	376,125				−376,125
Total	1,538,120		1,000,000	1,000,000	−538,120

1. Laboratory facilities, $1 million

The construction program for 1963 under this heading totals $1 million. This amount will provide for the design and preparation of detailed engineering plans and specifications in connection with the relocation of fuels and health and safety research functions from Pittsburgh, Pa., to Bruceton, Pa., and the proposed construction of a new materials research center on a Government-owned site at Frederick, Md. Funds appropriated in 1962 enabled the Bureau to contract with the General Services Administration for cost estimate studies at both sites. These studies have been completed and the Bureau proposes to enter into the final planning stages prior to submitting the actual construction estimates to the Congress. The funds appropriated in 1962 also have enabled the Bureau to enter into a contract with the National Academy of Sciences for the development of a conceptual plan that will best accommodate the Bureau's future metallurgical research functions.

Bruceton, Pa.—The first station established by the Bureau of Mines after enactment of the organic act was at Pittsburgh. In 1911 a new building was constructed at Forbes Avenue to house the programs of the Bureau being conducted at that time. In 1917 an experimental coal mine and explosives testing station were established 13 miles from Pittsburgh in order to conduct this work in a neighborhood with conditions suitable for this kind of research. Since that time, many additions and modifications have been made to these buildings as major changes have occurred in the Bureau's program. The present facilities at Forbes Avenue are no longer satisfactory for the conduct of modern research investigations. These buildings are now considered to be obsolete and inadequate

for the needs of our present research activities. The Bureau of Mines feels that relocation in a new, functionally designed building would be advantageous to carry out the major important programs on coal and health and safety research.

A new series of buildings located at Bruceton where the Bureau already owns considerable acreage would consolidate the activities now conducted in several locations and would substantially improve operational efficiency. Moreover, appreciable savings could be anticipated in overhead maintenance costs because of the age of the presently used buildings and the need for continuous remodeling and remodifications to make them partially suitable for present day research equipment and operations.

The new buildings would serve to house the important coal research programs now being carried out by the Bureau and for which Congress and the President have indicated a need for expansion and intensification of effort. The present depressed conditions in the coal mining areas cannot be expected to improve until, through modern research and development and related actions, new and larger tonnage uses for coal can be developed. Research aimed at this objective must be conducted vigorously and with equipment and facilities especially designed for these important programs. Large and expanded programs on all phases of coal research will be undertaken with emphasis on improved and more economic preparation and on the development of new uses for coal. Methods of improving safety in the manufacture, handling, and use of explosives and fire prevention for all nonmilitary activities will also be studied.

The Bureau's health and safety activities cover a broad spectrum of technical endeavor, including such diverse functions as inspections of coal, metal, and other types of mines; development and dissemination of safety educational programs; control of fires in inactive coal deposits; approval testing of many types of equipment; and research in a variety of technical fields to support and augment these functions. At present these operations, or significant portions of them, are situated in different parts of the Bureau of Mines buildings at Pittsburgh, and Bruceton, Pa.

The Bureau of Mines, since its establishment in 1910, has been recognized as the leader in technical endeavors directed toward the promotion of health and safety in the mining and allied industries. To maintain this position, the Bureau's activities and facilities must keep pace with the rapid advance of modern technology. The scattered, and in some instances outmoded, facilities of the health and safety activity at Pittsburgh and Bruceton mitigate strongly against the maintenance of the Bureau's stature which has been achieved by past performance. The proposed buildings to be constructed on Government-owned land at Bruceton will accommodate the present-day needs of this activity for efficient and coordinated operation, and will provide for some future expansion.

Frederick, Md.—In the whole materials area the single most inhibiting factor in the development and use of metals and alloys is the inadequacy of known analytical methods and analytical devices.

Trace analysis: The measurement of a few unwanted atoms in an otherwise pure solid—is the most critical area in the entire spectrum of materials research. Although methods have been developed to allow routine analyses of impurities in quantities of only parts per million, the requirements of new electronic and metallurgical applications demanding ultrahigh purity materials have multiplied sensitivity requirements to mere parts per billion. Products now can be obtained in such pure form that they often surpass the limits of current analytical techniques.

Without constant honing of the sensitivity and accuracy of established analytical techniques and continued development of new methods we cannot keep pace with the demands imposed by the Nation's scientific and defense materials program. The Bureau of Mines proposes to accent its endeavors in this vital area. An integrated five-point program will be initiated, including improvement of preconcentration methods, utilization of radioactive tracer and activation analysis techniques, application of new scientific analytical instruments such as the recently developed atomic absorption spectrometer and solid-analysis mass spectrometer, development of improved measurement instruments, and fundamental investigation of new concepts of impurity detection.

The Bureau of Mines proposes the establishment of a new center where talents and efforts can be concentrated upon this critical problem and to which research scientists in the Government, private research institutions, and industry can look for solution of analytical problems.

Total obligations	1,538,120	1,000,000	−538,120

GENERAL ADMINISTRATIVE EXPENSES

Chairman HAYDEN. There will be included in the record your 1963 estimate of $1,333,000 for "General administrative expenses." This is $43,000 more than was appropriated in 1962. Also there will be placed in the record the narrative explanation of administrative provisions requested in connection with the Bureau of Mines budget for the coming fiscal year.

(The information referred to follows:)

General administrative expenses

Appropriation, 1961	$1,290,000
Appropriation, 1962	1,290,000

SUMMARY OF INCREASES, 1963

To expand internal auditing program	+13,000
To provide for within-grade salary increases	+15,000
For purchase and rental of accounting equipment	+15,000
Net change, 1963	+43,000
Budget estimate, 1963	1,333,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
General administrative expenses	$1,286,636	$1,290,000	$1,333,000	+$43,000
Unobligated balance	3,364			
Total	1,290,000	1,290,000	1,333,000	+43,000

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
General administrative expenses	$1,286,636	$1,290,000	$1,333,000	+$43,000

General administrative expenses

The estimate for this activity for fiscal year 1963 is $1,333,000, an increase of $43,000 over the amount appropriated for 1962. The increase includes $13,000 to cover costs of an increase in audit staff, $15,000 to cover costs of within-grade salary advances, and $15,000 for automatic data processing equipment.

Need for increase.—The increase of $13,000 requested is to cover the salary and expenses of one auditor and one clerk-typist. The Bureau's internal auditing program is a statutory requirement (64 Stat. 836; 31 U.S.C. 66a). Since fiscal year 1954, the Bureau's audit staff has been composed of one auditor only. During this period the Bureau's functions have increased substantially; in fact, the helium activity alone has increased more than fourfold, exclusive of the huge construction and conservation program. Also, the requisite standards of the internal auditing program cannot be adequately met unless the auditing staff is increased.

The increase of $15,000 is requested to cover within-grade salary advancements. Most employees receive a within-grade salary advancement each year. The higher grade positions are spaced every 18 months. With a very low position turnover, the constantly increasing costs due to this one factor, alone, cannot be met without additional appropriations.

The sum of $15,000 is requested for the purchase and rental of new accounting equipment with which to do the accounting work of the Washington office. It is proposed to use equipment of the Accident Analysis Branch for report preparation. The amount recommended would permit the purchase of two bookkeeping card punching machines and rental of card sorters with which to sort and arrange the cards preparatory to printing reports.

Plan of work.—This appropriation provides for the expenses of the immediate Office of the Director, Deputy Director, and the Division of Administration in the Washington office, except for certain services performed for field activities of the Health and Safety and Anthracite Coal Divisions. The five regional offices of the Bureau also are financed from this fund to the extent necessary to cover the salaries and expenses of the regional director and his key administrative staff. All other expenses generally classified as administrative, required to carry on the activities of the technical research staffs, will be charged to program funds. For this purpose, the services involved in the work of the Bureau in the fields of finance, personnel, procurement, and property management will be considered administrative.

The Office of the Director provides executive direction in conducting programs designed to promote the conservation and development of mineral resources, to promote safety and healthful working conditions in the mineral industries, and to disseminate information concerning these subjects in such a manner as will best carry out the purposes of the Bureau's organic law.

Regional directors in five decentralized offices are direct representatives of the Director in their respective regions and are responsible to him for mineral resources programs, personnel, property, and control of funds allotted to the regions.

The Division of Administration provides advisory staff assistance to the Director and is responsible for administrative management within the Bureau. Services are provided in finance, personnel, property management and control, records management, distribution of publications, and employee health and safety programs.

The Bureau's proposed 1963 admiistrative program totals $2,948,000 of which $1,333,000 is requested under the general administrative expenses appropriation. Following is a comparison of the program (obligations):

	1961	1962	1963
General administrative program	$2,837,302	$2,890,000	$2,948,000
Share of participating program activities	1,550,666	1,600,000	1,615,000
General administrative expenses appropriation	1,286,636	1,290,000	1,333,000

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$1,286,636	$1,290,000	$1,333,000	+$43,000
Unobligated balance	3,364			
Appropriation	1,290,000	1,290,000	1,333,000	+43,000
Obligations by objects:				
11 Personnel compensation	1,072,537	1,081,000	1,104,000	+23,000
12 Personnel benefits	80,912	80,000	82,000	+2,000
21 Travel and transportation of persons	45,878	46,000	47,000	+1,000
22 Transportation of things	2,194	2,000	2,000	
23 Rent, communications, and utilities	20,832	20,000	19,000	−1,000
24 Printing and reproduction	19,464	19,000	20,000	+1,000
25 Other services	14,753	16,000	16,000	
26 Supplies and materials	14,309	13,000	15,000	+2,000
31 Equipment	15,757	13,000	28,000	+15,000
Total obligations	1,286,636	1,290,000	1,333,000	+43,000

EXPLANATION OF ADMINISTRATIVE PROVISIONS

Purchase of passenger motor vehicles.—The Bureau of Mines requests authority to replace 67 passenger motor vehicles. The vehicles requested for replacement represent about 16 percent of the Bureau's fleet of passenger motor vehicles and all meet the Bureau of the Budget standards for replacement on the basis of age or mileage. The replacement of these vehicles is necessary in the interest of economy and efficiency since most of the Bureau's vehicles are subject to use under adverse conditions due to poor roads in mountainous areas and under all types of weather conditions in the various field areas.

Transportation of students.—Due to the remoteness of the Bureau's helium plants and some of the synthetic liquid fuels installations, it is necessary to furnish the children of employees with transportation to areas where adequate school facilities are available.

Contributions.—Various industrial organizations have expressed interest in many phases of the Bureau's activities and are at times willing to contribute funds, experienced personnel, special equipment, etc., toward accomplishing certain objectives useful to industrial purposes. The Bureau endeavors to cooperate with industry wherever possible and authorization to accept such contributions is a distinct aid in furthering such cooperation.

Deletion of proviso.—It is proposed to delete the proviso relating to the transfer to the Bureau of funds available to the Army, Navy, and Air Force for the acquisition of helium, and the deposit of such funds and other funds from helium sales to the helium production fund, since it is no longer necessary in view of the provisions of the Helium Act Amendments of 1960.

Section 6(a) of that act reads: "The Department of Defense, the Atomic Energy Commission, and other agencies of the Federal Government, to the extent that supplies are readily available, shall purchase all major requirements of helium from the Secretary."

Section 6(f) of that act reads: "All moneys received under this Act, including moneys from sale of helium or other products resulting from helium operations and from the sale of excess property shall be credited to the helium production fund * * * for carrying out the provisions of this Act * * *."

Sale of metals and mineral products.—In some of the metallurgical pilot plants of the Bureau quantities of special metals may be manufactured which might be of value to industrial concerns. Funds received from the sale of such products would be covered into miscellaneous receipts.

DEVELOPMENT AND OPERATION OF HELIUM PROPERTIES

Chairman HAYDEN. Have you any comment on that?

Mr. ZINNER. No comment on that.

Chairman HAYDEN. The statement submitted in connection with the "Development and operation of helium properties" will be placed in the record. A $20 million borrowing authority is requested for fiscal year 1963; and a supplemental appropriation request for fiscal year 1962 is being submitted, asking that the limitation on payments required under contracts for acquisiton of helium be increased from $47,500,000 to $65 million.

(The information referred to follows:)

This fund is used for production, conservation, purchase, and sale of helium; experimentation and research to discover helium supplies and to improve processes and methods of helium production, purification, transportation, liquefaction, storage, and utilization; and development of helium properties and reserves. Production is primarily for the Department of Defense, Atomic Energy Commission, and National Aeronautics and Space Administration, which reimburse the fund for products received. Other Federal agencies and non-Federal consumers also buy helium for medical, scientific, and commercial uses.

The Helium Act amendments, Public Law 86-777, provide for the conservation of helium now going to fuel markets as a noncombustible component of some natural gases from the southwestern part of the United States. To accomplish the conservation program; up to 12 new helium plants will be needed. Private industry has indicated a willingness to finance, construct, and operate these plants, and to sell helium to the Government under long-term contracts. Contracts have been negotiated with four private companies, and negotiation of contracts with other companies will follow. The first plants will be in operation in fiscal year 1963.

Payments required under contracts for acquisition of helium presently are limited to $47.5 million in any one fiscal year. A supplemental appropriation request for fiscal year 1962 will be submitted asking that this limitation be raised to $65 million. A $20 million borrowing authority is requested for fiscal year 1963.

The helium activity will continue to operate and maintain Government-owned helium production plants at Amarillo, Tex.; Exell, Tex.; Keyes, Okla.; Otis, Kans.; and Shiprock, N. Mex. The Amarillo and Otis plants will be modified to increase purification capacity to enable purification of helium purchased from private industry.

A Government-owned and operated pipeline system will be constructed to transport helium from industry's plants to underground storage near Amarillo, Tex. Storage rights and additional surface, oil, and mineral rights pertaining to the underground storage reservoir will be acquired as needed to protect the Government's interest.

The Bureau plans to construct a new administration building at Amarillo, Tex., to provide consolidated office space for the operational headquarters now housed in dispersed and inadequate rented space.

Additional containers will be provided to meet helium shipping requirements. The helium tank-car fleet will be increased from 188 to 246, and an initial purchase of five helium semitrailers will be made.

A helium research center has been established to enlarge the scope of research into the fundamental properties of helium and helium-bearing gas mixtures to supplement the common store of technical literature and knowledge.

Current research concepts and developments will be applied to improvement of helium production, purification, transportation, liquefaction, storage, and utilization. New instrumentation and methods of analysis will be developed for adoption to helium extraction and purification processes.

The search for new sources of helium will continue so that the helium resources of the United States will be known. The policy of meeting current helium demands insofar as possible by processing privately owned fuel gas and saving Government-controlled reserves will be continued.

The program will be financed principally by income received from sales of helium and by borrowings from the Treasury in accordance with section 12(a) of the Helium Act Amendments of 1960. Other fund sources include sale of byproducts of helium operations not needed for Government use, grazing leases, tank-car and cylinder rentals, and balance in the helium production fund.

The total Government investment at the end of fiscal year 1963 is estimated at $81,986,000, an increase of $40,675,000 over fiscal year 1961. The increase mainly is due to an initial borrowing from the Treasury in fiscal year 1963, estimated at $20 million, and an increase in retained earnings, estimated at $24,350,000 which will accrue during fiscal years 1962 and 1963 primarily as a result of the establishment of a new sales price structure.

Development and operation of helium properties

Estimated income, 1962	$19, 806, 000
Estimated income, 1963	26, 797, 000

The following table indicates the results of operations for 1961 and the estimates for 1962 and 1963:

Operating income and expenses

	Actual, 1961	Estimate, 1962	Estimate, 1963
Income:			
Sale of helium to Government agencies	$6, 141, 778	$13, 255, 000	$17, 770 000
Sale of helium to non-Federal consumers	2, 399, 852	4, 452, 000	6, 240, 000
Other income	1, 127, 356	2, 099, 000	2, 787, 000
Total income	9, 668, 986	19, 806, 000	26, 797, 000
Expenses:			
Manufacturing costs	6, 237, 572	7, 004, 000	8, 534, 000
Interest on Government investment	526, 649	1, 600, 000	2, 228, 000
Other expenses	1, 132, 228	1, 326, 000	1, 561, 000
Total expenses	7, 896, 449	9, 930, 000	12, 323, 000
Net operating income	1, 772, 537	9, 876, 000	14, 474, 000

NOTE.—Revenue for 1962 and 1963 is based on a sale price sufficient to cover costs of production and to provide for future repayment of Government investment, including accrued interest.

HELIUM PROGRAM

Chairman HAYDEN. Any comment on that?

Mr. ANKENY. Mr. Chairman, I have with me Henry Wheeler, who is Assistant Director for the helium program. If you wish he may make a statement or answer any questions.

Mr. WHEELER. We are pleased to be here today to advise the committee on the implementing of an effective program.

We negotiated contracts to fully utilize the funds that were made available by the Congress, within 3 months after the appropriation bill became law. We think we obtained very favorable prices in these contracts and over the life of the contracts we will acquire about 62 billion cubic feet of helium that will be extracted from natural gas going to markets and the helium would be lost if it were not so extracted.

With regard to the $65 million, an increase of $17,500,000, that is in the supplemental appropriation, I would like to say only that this is an increase over the figure that we advised you previously we would need of $60 million. We would not expect to expend any more money

under the $65 million program than we would under the program we described to you previously. The reason for this is the matter of contract authority. We have used some of that authority to provide flexibility in the contracts to accommodate future increases in price that would come about because of inflation and the contracting authority would not be used unless these inflationary costs do occur.

We would expect to buy more helium than we thought we could buy under the program that we described to you previously but it would not cost us any more money.

OPERATION OF HELIUM PLANT

Chairman HAYDEN. The first helium plant will go into production this year. Who operates it?

Mr. WHEELER. The first of these private plants will go into operation about the 1st of July of this year. It will be constructed and operated by the Helex Co., which is an affiliate of the Northern Natural Gas Co. It will be located at Bushton, Kans.

Chairman HAYDEN. Will you supply for the record the names of the companies with which you have contracts now and with which you expect to contract during the coming year, the volume of helium to be produced by each and the amount of each contract?

Mr. WHEELER. Senator, we can give you a list of the ones we have made contracts with and a list of the companies we are considering in connection with the future, but I cannot tell you which, of these companies we are considering, we will actually do business with.

(The information referred to follows:)

List of contracts for purchase of helium for conservation

Company (parent companies in parentheses)	Plant location	Date of contract	Initial unit price (for 1,000 cubic feet)	Maximum annual obligation	Estimated helium volume (million cubic feet)	
					Annual average	Life of contract
				Million		
Helex Co. (Northern Natural Gas Co.).	Bushton, Kans.	Aug. 15, 1961	$11.24	$9.5	675	13,500
Cities Service Helex, Inc. (Cities Service Co.).	Ulysses, Kans.	Aug. 22, 1961	11.78	9.1	610	12,200
National Helium Corp. (Panhandle Eastern Pipe Line Co. and National Distillers & Chemical Corp.).	Liberal, Kans.	Oct. 13, 1961	11.78	15.2	1,053	21,060
Phillips Petroleum Co.	Dumas, Tex., and Sherman County, Tex.[1]	Nov. 13, 1961	10.30	13.7	788	15,766
Weighted average			11.29			
Total				47.5	3,126	62,526

[1] 2 plants.

Proposals to participate in the helium conservation program have been received from the following additional companies:

Amarillo Oil Co., Post Office Box 151, Amarillo, Tex.

Brack Oil Co. of Colorado, Inc., Post Office Box 575, Fort Collins, Colo.

Consolidated Gas & Equipment Co. of America, 612 Vaughn Building, Amarillo, Tex.

Hamilton Bros., Inc., 1517 Denver Club Building, Denver, Colo.

Helco, 1002 Midland National Bank Building, Midland, Tex.

Heli-Chem Products, Inc., 10 Forrestal Road, Franklin Park, N.J.
Helium, Inc., 270 Park Avenue, New York, N.Y.
The Helium Corp., Post Office Box 1087, Colorado Springs, Colo.
San Jacinto Petroleum Corp., 630 Fifth Avenue, New York, N.Y.
The Shamrock Oil & Gas Corp., Post Office Box 631, Amarillo, Tex.
Sinclair Oil & Gas Co., Post Office Box 521, Tulsa, Okla.

HELIUM RESEARCH CENTER

Chairman HAYDEN. Well, I want it as far as you can go. That is all the information I would like to have. I note that a helium research center has been established. Where is it and what is the function and what is the cost of operating it?

Mr. WHEELER. We established a helium research center at Amarillo, Tex., which is an expansion of a relatively small research operation we have carried on there for some time. This is a part of our overall program. The purpose of this center is to learn more about the helium that we are conserving. We think the research program is part of the conservation program and if we spend all of this money to save it, we ought to know more about the properties of the material we are saving so it can be used more wisely and more effectively.

HELIUM RESEARCH EXPENDITURES

In 1963 the estimate of the expenditures for helium research amounts to $437,000. This includes depreciation and amortization of the facilities we have for research and interest on that investment that we are required to calculate under the account.

Chairman HAYDEN. In an audit report the Comptroller General has indicated that you do not have sufficient legal right in the Cliffside gasfield to store helium. He also quotes the departmental solicitor to the effect that the Government has no title at all to these lands. In a previous appearance before this committee you stated that the helium was to be stored in your own property. What is this situation? How did it come about? And what do you propose to do about it?

STORAGE RIGHTS

Mr. WHEELER. Well, we own all of the gas rights in the Cliffside gasfield. We have owned these rights for a long time. This is the right to produce gas from this structure. Normally, this is all of the right you would need to operate a gasfield for the production of a gas. Now we recognized that we might not own the right to store it when it is brought in from some external source, and we finally came to the conclusion we do not have the right to store helium in the Cliffside field.

This has not been a matter of concern to us, however, because we are confident we can acquire those rights by negotiation, which would be our first effort and failing that we have the right of eminent domain in the Act, which would assure us we can acquire the rights for the Cliffside field. We are right now in the process of engaging the services of a qualified consultant to appraise the value of these rights and we will, this year, approach the owners of the rights in an effort to negotiate with them to acquire the rights by negotiation and failing this, we will use our appraisal report as a basis for acquiring the

rights through eminent domain. We know we can acquire the rights to Cliffside field.

Chairman HAYDEN. Well, how did this mistake occur? That is, what was the reason?

Mr. WHEELER. I don't think it was a mistake.

Chairman HAYDEN. Well, a misunderstanding.

CAUSES OF CONTROVERSY

Mr. WHEELER. Well, it was never contemplated when we acquired the rights in Cliffside field, that we would ever store helium in the field, but to produce from the field and take the helium out of the gas that was in that field. Those were the rights we obtained.

Now we want to do something more. We not only want to produce the gas from the field but bring helium from some other source and store it in the reservoir. This is the situation that is encountered every day in the natural-gas industry where natural gas is stored underground to level off consumption and demand from summer to winter. It is similar to what the Washington Gas Light people are trying to do over on the Eastern Shore of Maryland. They would like to develop an area in which they could store gas during the summertime which would be available to them to meet peakloads for gas in the wintertime. Where this has occurred in the natural-gas fields, and most of them are depleted gasfields, they generally also have to go back, even though they own the gas rights initially, and pay the landowner something for the use of his hole in the ground as a safe deposit box.

We recognized this possibility, but, as I say, we did not hesitate because we know that we can acquire these rights.

Chairman HAYDEN. Well, they are not necessarily going to be at a tremendous cost?

Mr. WHEELER. Just as an order of magnitude, I would not want to prejudge the appraisal, but in the order of magnitude there would be maybe $1 million involved.

Chairman HAYDEN. Any further questions?

ASSURANCE AGAINST OVERLAPPING FUNCTIONS

Senator BYRD. I would like to ask a question, if I may. I will be very brief.

Mr. Ankeny, I remember with pleasure your trip to West Virginia last year. You and I accompanied the Secretary of the Department of Interior to one or two of the coal mines here and I want to compliment you on a good statement this morning.

I would like to ask one or two questions. Do the Bureau of Mines and the Office of Coal Research coordinate their work so as to insure against duplication and overlapping?

Mr. ANKENY. Senator, as was said this morning, we do have a cooperative agreement with the Office of Coal Research in which it is provided that the Bureau will review budget proposals to make sure there is no duplication. I have to confess that up to this moment we have not reviewed any projects, save one. There was a proposal on an economic study which was submitted to our Office of Economics and was reviewed.

Senator BYRD. I am sure the taxpayers do not want any duplication of effort between the two Offices. Now what is wrong when you say there has been only one instance of a review?

Mr. ANKENY. All I can say in response to that is that the Bureau stands ready to review any proposals that are submitted to it by the Office of Coal Research.

COAL RESEARCH PROJECTS

Senator BYRD. Are you familiar with the projects that were referred to by Mr. Lamb a little earlier?

Mr. ANKENY. Only by name. We have not reviewed the projects.

Senator BYRD. In your opinion, as far as you know, on the basis of information you have concerning those projects, do you think there will be duplication of effort between the two agencies?

Mr. ANKENY. From what I know I don't think there will be, although it can't be a definitive statement because I don't know enough about the details of the projects they were discussing this morning.

Senator BYRD. Do you know of any duplication of effort between the two agencies thus far?

Mr. ANKENY. No, sir. I feel that I could assure you that up to now, there have been no projects that would constitute a duplication of effort.

Senator BYRD. Thank you, Mr. Chairman.

STATUS OF OIL SHALE RESEARCH IN LARAMIE

Senator MCGEE. Mr. Chairman, I have a couple of small questions to raise and it is only for information. I am sorry to be so late getting in but it is the old story of being six other places. We had some land grant colleges testifying on the agriculture bill and I had a constituent that went there and you know what that means.

Going back to the earlier stages of the hearing on the appropriations available for oil shale research which I note on page 29, what was the status of oil shale activity in Laramie last year?

Mr. ANKENY. The oil shale work at Laramie was rated at between $500,000 and $600,000 a year. It has been continuing. I must say that the work being done at Laramie is all small bench scale type of work. There is no real process work going on. It is possible that with this increase of $187,000 that we may have to do a small amount of work at our facility at Rifle on the smaller retort up there. This hasn't been fully decided yet.

Senator MCGEE. Is any of the $187,000 increase going to research efforts in Laramie?

Mr. ANKENY. It will all go to Laramie and they will make the determination as to whether it is necessary to transfer some people down there temporarily.

Senator MCGEE. Yes. As you know, they felt for a long time that the restrictions on the scope of the work were cramping their style and I am sure you share that view. That is why we are always interested and eager if we can, to broaden the assault on the question.

Mr. ANKENY. Yes, this money will all go to Laramie.

Senator MCGEE. That answers my questions.

80391—62——16

STIMULATING FOREIGN MINERALS PRODUCTION

Senator DWORSHAK. Mr. Ankeny, as you know, our domestic minerals industry is greatly distressed. I know that the Bureau of Mines is not directly charged with the responsibility of rectifying that situation but I also know that you and your staff do have a profound interest in stabilizing our domestic mineral industry. Now we also know that for several years under one plan or another, in some cases using local currencies, there has been a program of stimulating the production of minerals abroad. I know that that started way back during the latter part of the Truman administration. I have opposed it all through the years because I could foresee the time when expanded production of minerals abroad would inevitably create more competition for our mineral industry at home.

Now what I would like to ask you is whether, during this current fiscal year or in the next year's budget you are asking for any funds with which to stimulate and accelerate the production of any minerals abroad?

Mr. ANKENY. No, sir. I can answer that categorically that we are not.

Senator DWORSHAK. Even in this fiscal year?

Mr. ANKENY. Yes, in this fiscal year.

ATTITUDE OF BUREAU

Senator DWORSHAK. I recall about 2 years ago, and possibly a year ago that you did make a request to use $4 million or $5 million of local currencies to encourage expansion of mineral production abroad, is that true?

Mr. ANKENY. Yes, sir. I want to say I feel we were euchred into that position. I don't think it represented the feeling in the Bureau of Mines itself.

Senator DWORSHAK. I see. Well, I will not embarrass you by asking by whom you were coerced, but I do recall that this subcommittee, not the full committee, did reject the request and included no funds for that specific program.

Mr. ANKENY. That is correct.

Senator DWORSHAK. And, of course, then based on what you have just said you are not very much disappointed by that action?

Mr. ANKENY. We were not, sir.

DEPENDENCE ON FOREIGN SOURCES OF RAW MATERIALS

Senator DWORSHAK. You do say in your statement:

> Not only has American industry caused serious depletion of many of our domestic raw materials but dependence on foreign sources has been greatly increased.

Can you amplify that briefly? To what extent, or in regard to which specific minerals are we becoming to a greater extent dependent upon foreign sources?

Mr. ANKENY. Well, one specific mineral is iron ore, of course. This doesn't mean that our resources of iron ore have been depleted, but the industry has taken the position that economical operation of blast furnaces makes it almost imperative that a certain amount of lower

cost foreign iron ore be imported. As a result, imports in 1960 were equal to 35 percent of domestic consumption. Fifteen years ago we obtained virtually all of our iron ore requirements from domestic sources.

Senator DWORSHAK. From what countries is that work being done?

Mr. ANKENY. I can only say that iron ore is being imported from Venezuela, from Canada, and some from Africa.

Senator DWORSHAK. Is not the primary responsibility resting upon private industry to pursue these policies rather than upon the Bureau of Mines for any particular assistance?

Mr. ANKENY. That is correct. And this is all being done on the initiative and resources of private industry.

Senator DWORSHAK. The Bureau is not doing any particular work on it?

Mr. ANKENY. Not to encourage the production of the iron ore abroad. We are doing a great deal of work to try to find ways of making our domestic ores competitive with imported ores. This not only applies to iron ore, but to other mineral commodities as well.

EXPANSION OF IRON AND STEEL INDUSTRIES

Senator DWORSHAK. I understand in some areas like Missouri, that private industry is interested in the iron ore industry, steel industry, and are doing a great deal to expand production of iron ore. Do you know whether that is true?

Mr. ANKENY. Yes, that is correct, sir.

Senator DWORSHAK. Now I have just one more question, I think. Do you have figures indicating any increase in the importation of raw materials for the United States of the domestic minerals industry? You just mentioned iron ore. Are we importing currently any other raw commodities for subsequent use by our domestic industry?

Mr. ANKENY. Senator Dworshak, I would like to have the privilege of submitting a more detailed statement on that. I am sure we can answer the question satisfactorily with a little preparation.

(The information referred to follows:)

The United States imports varying proportions of its mineral needs. Of 52 major mineral products the country is self-sufficient in 17. It imports from only a few percent up to 100 percent of its requirements of the remaining 35. Tin is a classic example of a mineral which the United States obtains from almost completely from foreign sources because exploration to date has not revealed important domestic deposits of this metal. Before the war the United States was a new exporter of copper. During and after the war domestic production was unequal to domestic demand and at times we depended on foreign sources for about a third of our requirements. Recently, however, the situation has improved and the Bureau is pleased to report that in recent months domestic production is equal to consumption and once again the Nation is self-sufficient in this strategic raw material.

POSSIBLE CONFLICT IN STOCKPILING

Senator DWORSHAK. One reason I asked that, Mr. Chairman, is that we are currently hearing a lot about stockpiling of mineral commodities and I am just wondering whether there is any conflict in any possible program as sponsored by the Bureau of Mines, and I am glad to have your assurance that you think you are not doing that to any great extent, that is, to encourage the imports of these raw com-

modities to compete with our own minerals industry when we have a stockpile of supposedly $7 to $10 billion which will be investigated soon by a subcommittee under the chairmanship of Senator Symington. You are all aware of that.

Mr. ANKENY. Yes.

Senator DWORSHAK. And in your Bureau activities, if you have not known this in the past, and I hope you have been cognizant of this phrase, that with proper stimulus as indicated by our tungsten promotion—our tungsten programs—that it is not entirely true that, as the Paley report pointed out in 1952 that we have actually become a "have not" nation insofar as raw commodities are concerned for mineral use.

Mr. ANKENY. I would not agree that we have become a "have not" nation.

RESPONSIBILITY FOR DOMESTIC MINERAL INDUSTRY

Senator DWORSHAK. You do recognize if the mineral industry is in desperate circumstances in our country with widespread unemployment in States like Arizona and Idaho and other Western States, that it behooves us, through the agencies of the executive departments and the Congress, to do everything possible to safeguard the interests of our domestic industry, not only because it provides employment but because it will relieve to some extent this dependence on foreign sources which you referred to in your statement. That is very vital from the standpoint of national preparedness and economic preparedness. You agree with me on that?

Mr. ANKENY. I agree with you.

Senator DWORSHAK. Thank you.

ROCKY MOUNTAIN AREA PROJECTS

Senator MCGEE. Mr. Ankeny, last year, at my request, the Bureau of Mines inserted on pages 24, 25, and 26 of the hearings a list of additional projects which would be provided in the Rocky Mountain area, but which were not budgeted for fiscal 1962.

Will you please give me a status report of these projects and advise whether or not there are any funds in the new budget for any of these programs. You may submit this information for the record.

Mr. ANKENY. I will do that, Senator.

(The information referred to follows:)

In the course of our 1962 hearings, the Bureau submitted a list of programs that could be effectively carried out in the Rocky Mountain area if sufficient funds were made available. While we were doing some work along those lines, it was only on a minor basis due to the funding situation. This committee recommended an additional $150,000 in the 1962 bill to be used in the Rocky Mountain area for development of methods of mining thick beds of coal with high percentage recovery, development of supplies of coking coal, and a survey of coking-coal resources. Unfortunately, the House did not concur in this recommendation and these funds were eliminated in conference.

While our 1963 estimate does not provide any additional funds for Rocky Mountain area activities with the exception of $187,000 for oil-shale research, it does provide for some activity in this area but not on the scale envisioned in the statement we submitted last year.

BITUMINOUS COAL

While the following indicates how our current research efforts may have indirect application to the three Rocky Mountain coal projects under discussion, the broad investigations into these specific problems that were contemplated by the Bureau cannot be conducted under the Bureau's appropriation estimate proposed for fiscal year 1963, other than by the related activities described below.

1. Development of methods of mining thick beds of coal with high percentage recovery

Recently the Bureau of Mines initiated a hydraulic mining system in an operating mine in the State of Washington. Pillars left by conventional mining in a steeply dipping bed are being extracted by high pressure water jets at a productivity rate considerably greater than was achieved using other mining methods. Soon it is expected that mining from the solid will take place using high pressure water jets to win the coal. Since many of the thick beds of coal in the Rocky Mountain areas are deposited under geological conditions that appear conducive to high productivity with hydraulic mining, our experiments in the Pacific Northwest may have application to thick pitching beds elsewhere.

2. Development of supplies of coking coal

The Bureau has a continuing program of studies designed to improve the quality of coke made from Western high-volatile bituminous coals. Assay studies of the various coalbeds are made and oven tests are conducted to assess the value of blends, changes in bulk density and other operational procedures to prepare a better coke using Rocky Mountain coals. Other procedures involving drying and carbonizing are employed to produce a satisfactory fuel material that lends itself well to the formation of a briquet having the desired strength and quality characteristics demanded by the metallurgical market.

3. Survey of coking coal resources of the Rocky Mountain area

The mineral resources investigations of the Bureau, including coal, are continuing. We are examining closely the studies being made by private coal companies and State organizations to delineate more adequately the reserves of coal readily available for mining. Available information on the coal resources of the Rocky Mountain area is being compiled for use as reference material and as a possible aid in the effective direction of our research efforts in this geographical area.

PETROLEUM, NATURAL GAS, AND OIL SHALE

1. Relationship of reservoir fluids and rock characteristics to the occurrence, extraction, and utilization of petroleum

The 1963 estimate does not include funds for this work.

2. Petroleum resources and factfinding surveys

The investigation of future reserves and capacity to produce Rocky Mountain petroleum, natural gas and oil shale will not be conducted at an adequate level. A limited amount of data will be assembled from specific productive areas as permitted by the available funds for this project.

3. Studies of petroleum asphalts and related substances

The 1963 estimate does not include funds for this work.

4. Relationships of chemical compositions of fuels to their stability characteristics and engine performance

The 1963 estimate does not include funds for this work. However, research on relationships of chemical compositions of fuels to their stability characteristics and engine performance is in progress on fuels manufactured from mid-continent crude oils. Expansion of this work to include Rocky Mountain crude oil will be made when funds become available.

5. Laboratory-scale research on oil shale and shale oil

Research under this program is in progress, but not at the level shown in the statement submitted for the 1962 hearings. It includes determination of the composition and properties of shale oil and kerogen, and studies of the pore and crystal structure of oil shale.

Unfortunately, similar progress cannot be reported for lead, zinc, bauxite, and certain other commodities. Prior to World War II, over 90 percent of the Na-

tion's needs for lead and zinc were met from domestic sources. In recent years domestic mines have supplied only about half of the consuming demand for new metal. Our siutation in petroleum also has shifted from a position of net exports before World War II to one of substantial net imports in 1961.

The 1963 estimate includes an increase of $187,000 for new projects on the reactions and physical phenomena involved in the conversion of kerogen to oil, and the petrochemical potential of an oil-shale industry.

MINERALS AND METALS

Activity in the Bureau's minerals and metals program designed to increase the known mineral reserves of the Nation and of potential benefit in strengthening the economic base of the Rocky Mountain area include basic and applied research on benefication, concentration, and reduction of ores; development of technical processes of metallurgy; chemical and physical metallurgy research; and mineral synthesis. Research on the technology of mining, with emphasis on sampling theory and techniques, the prediction of rock conditions or quantities and ore qualities in place, and rock mechanics is also of benefit to the Rocky Mountain area. Mineral resource studies have been directed toward gaining a comprehensive understanding of the area's minerals in relation to the Nation's mineral requirements. The program is kept under constant review to assure prompt reorientation as national mineral needs change, new technologies invite development of latent resources, and local conditions provide the basis for redirection of productive effort. While no funds are included in the 1963 estimate to carry on this work at the level proposed in the 1962 hearings, the Bureau will conduct work on a modest scale as follows:

Ferrous metals

The substantial resources of chromite in Montana will be examined to provide engineering and economic data for their efficient utilization. Studies will be continued on the grinding, classification, tabling, and electrostatic separation of the low-grade chromite ores of the Stillwater complex in Montana. Laboratory research will be continued to develop data for determining the metallurgical process best suited economically and technically for recovering manganese from the Artillery Mountains in Arizona. Research on the theory and application of sampling techniques will be conducted and statistical methods applied to determine the tonnage and average grade of a deposit of titaniferous magnetite in Colorado.

Nonferrous metals

Basic research in the physics of rocks and rock structure and studies in systems analysis methods will be conducted to develop data of potential use in copper, lead, and zinc mines encountering ground control and operational problems arising from mining at increasing depths. Application of statistical mathematics to problems of ore search, exploration, development, and extraction will be continued with the objective of lowering mining costs.

Nonmetallic minerals

Deposits of nonmetallic minerals in the Rocky Mountain area will be examined to determine their extent and grade as potential sources of raw material for the growing industrialization of the West. Included are investigations of refractory clays and related minerals in Arizona, New Mexico, Utah, Colorado, and North and South Dakota.

Mining research in ground stabilization and control, and drilling and breaking of the rock to yield unproved methods of extracting minerals, will be an important part of the nonmetallic minerals research program.

Ground stabilization research will be directed toward the determination and control of stress concentrations around room and pillar openings, the predominant underground mining method of the nonmetallic minerals.

COMMITTEE RECESS

Chairman HAYDEN. We will adjourn until tomorrow morning at 10:30.

(Whereupon, at 11:30 a.m., Wednesday, February 28, 1962, the hearing was adjourned to reconvene at 10:30 a.m. Thursday, March 1, 1962.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS, 1963

THURSDAY, MARCH 1, 1962

U.S. SENATE,
SUBCOMMITTEE OF THE
COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met, pursuant to recess, at 10·30 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden, chairman, presiding.

Present: Chairman Hayden and Senators McGee and Mundt.

DEPARTMENT OF THE INTERIOR

OFFICE OF TERRITORIES

STATEMENT OF JOHN A. CARVER, Jr., ASSISTANT SECRETARY, PUBLIC LAND MANAGEMENT

GENERAL STATEMENT

Chairman HAYDEN. Secretary Carver, we will be pleased to hear from you.

Mr. CARVER. Thank you very much, Mr. Chairman. Let me first assure you that I genuinely welcome this opportunity to appear this morning to present the fiscal needs of our territorial activities for fiscal year 1963. Among the several activities which I supervise, I can honestly say that none is more rewarding than this one.

I suppose that this reaction stems from two things: first, the several territories, each with its own personality, are of such a size that the results of our efforts can be readily identified in measurable progress; second, there is a refreshing challenge in assisting any people who want to help themselves toward a higher standard of living and self-government. I can say with some enthusiasm that in each of our territories the desire for economic and political progress burns brightly. The funds contained in this budget request are intended to foster, encourage, and advance that spirit.

ACTIVITIES UNDER ESTIMATED FUND

These estimates cover the governmental expenses of Guam, American Samoa, the Virgin Islands, and the Trust Territory of the Pacific Islands. In addition, funds for power additions and a grant to cover a deficit in the operations of the Virgin Islands Corporation are included, happily on a much reduced scale from that which faced us last year.

Funds are also provided for overall administration through the Office of Territories. Although the fiscal impact is relatively minor,

I would also like to note the absence of one item carried in this portion of the Department's program for many years: The Alaska Public Works was officially liquidated at the end of calendar 1961.

The activities which I have enumerated will, if these estimates are accepted, be supported by a total funding program of $28,963,000. This, of course, does not include the substantive financial programs of Guam and the Virgin Islands which are financed in part from Internal Revenue collections retained in the territories.

Pacific Areas

Of the direct appropriations requested here, however, 83.4 percent would be allocated to American Samoa and the Trust Territory. If we exclude the VICORP power grant which is in the nature of a loan, 96 percent of the total goes to these neglected areas of our responsibility in the Pacific. This puts the matter in sharp focus. It is our judgment that the deficits in education, health services and economic tools are critical in both of these areas—so much so that progress toward decent standards of human dignity and self-sufficiency must be an illusion until corrective measures are taken. Unfortunately, solution to these problems requires long-range attack. We must, therefore ,lose no more time in taking the essential first steps.

American Somoa

The situation in Samoa was vividly protrayed last year by its energetic Governor Rex Lee. The Congress responded promptly and generously by appropriating a total of $9.6 million, most of it in supplemental grants. As a result, we are well on the way toward eliminating the deficiencies of a decade in certain areas. It will be possible for every prepared Samoan child to attend high school this coming fall, although the need for upgrading the standards of secondary education remains as a continuing challenge. We have been able to proceed with replacement of the antiquated, wornout powerplant and with rehabilitation of the road between Tafuna Airport (soon to have capacity for jet traffic) and the capital, Pago Pago. Governor Lee is pushing vigorously on many other basic facilities made possible by currently available funds.

Increase for Fiscal Year 1963

Regrettably, I cannot inform you that this burden may be cast off. The estimates before you propose a further increase over last year's program in the amount of $5,148,600. This will permit continuance of the road improvement program and initial steps toward the second increment of the power system. But the major change in spending emphasis next year will be focused on the elementary school system. Its physical plant must be completely replaced if instruction is to be effective; its quality must be upgraded if it is to produce graduates competent to deal with the modern world. In this connection, the Governor has received the advice of experts to the effect that an educational television system would be an effective, efficient, and economical means of raising educational standards in the shortest period of time.

Trust Territory

Turning now to the Trust Territory, I must confess that the program contemplated by this budget does not accurately reflect the urgency of the task which confronts us, even though it proposes an increase of 50 percent in the funds justified for this year. The program outlined by High Commissioner Goding very properly emphasizes health, education, economic and political development. Some definite advances are contemplated, such as the institution of a post-high-school-teacher training institute in conjunction with the Pacific Islands Central School and provision for more secondary classrooms.

For the most part, however, the increased estimates result from higher prices, population increases, continuance of a modest hospital and school construction effort begun in 1955, needed airport and harbor improvements, and rehabilitation or replacement of overage plant facilities. We must, of course, maintain these minimal programs and support their increased cost. I would emphasize that up to now it has been the policy to place responsibility for elementary education on the local Micronesian community. The current budget request contemplates no major program change in this critical area, although the shortcomings of this arrangement are quite evident and demand reconsideration. The medical programs will maintain and perhaps improve the general health level; they do not permit aggressive measures to eradicate those diseases which we know how to control and which impede progress in the islands.

Guam and Virgin Islands

As to the other oversea activities, the governments of Guam and the Virgin Islands are supported primarily by other fund sources. One further item requires comment here: the Virgin Islands Corporation requests appropriation of $3.2 million as a Treasury loan to finance expanded power facilities critically needed to sustain the expanding economy of that territory. This represents a revised program for plant augmentation; a 5,000-kilowatt steam turbine to be in use by December 1963 on St. Thomas and two 3,000-kilowatt diesel generators (one for each island) for operation at the earliest possible date. This schedule requires immediate funding of all three units if serious power shortages are to be avoided during the next two peakload seasons.

Mr. Chairman and members of the committee, I have here Mr. Richard F. Taitano, Director of the Office of Territories; Dr. Kenneth A. Bartlett, President of the Virgin Islands Corporation; and certain members of the office staff, and administrative assistant secretaries thereof, who will answer any questions you may have.

Alaska Public Works Program

Chairman Hayden. Even though no funds are being requested for the Alaska public works program for fiscal year 1963, inasmuch as the program is now complete, I will place in the record the departmental statement relative to this activity.

(The statement referred to follows:)

Alaska Public Works

The Alaska public works program was authorized by the Alaska Public Works Act enacted by the Congress in 1949.

Of the 172 projects financed under this program since its authorization, 165 have been completed and transferred to the applicant public bodies.

These transferred projects have been sold to the applicants, in accordance with the act, at a percentage of their total costs. This is usually 50 percent, but on occasion there has been a slight variation up or down, each variation being compensated by another so as to permit, as required by the act, payment into the miscellaneous receipts of the Treasury of approximately one-half of the total costs of the entire program.

The total cost of the transferred projects is $63,120,224. Of this amount, applicants have turned over to the Government in cash and securities issued by the public bodies, a total of $31,182,149. These securities are payable in annual installments over a period of years. The authorized rate of interest on these deferred payments is 2 percent per annum. Of the total amount received from the public bodies in payment of the purchase price of projects, $9,690,537 has been paid in cash, which has been deposited in miscellaneous receipts of the Treasury as required by the act. Securities accepted in the amount of $21,491,612 have, by administrative arrangement with the Department of the Treasury, been turned over to that Department for collection of principal and interest as they became due. In addition to the cash payments against purchase price amounting to $9,690,537, there has been collected, as installment principal payments have become due under accepted securities, the amount of $4,218,523 making a total collection against principal of $13,909,060. Interest on deferred payments in the amount of $1,612,984 has been collected. Total cash deposited into miscellaneous receipts of the Treasury is, therefore, $15,522,044.

Most of these securities mature annually over a 20-year period but in one or two instances, a longer period has been allowed while in a number of instances the maturity period is much shorter.

All of the work is being pressed forward as rapidly as good construction and other practices will permit on the remaining projects. Some small construction items remain to be completed on six of them. In addition, while the projects have been transferred to applicants and are in use, various small items remain to be completed on another 10 projects, such as surveys of and transfer of Federal land upon which 6 of them have been constructed and financial arrangements to be worked out on the others. It is now expected that all projects will have been completed and transferred and that all property and records of the Alaska public works offices will have been disposed of by December 31, 1961.

Itemization of estimate

	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing: Total obligations (reappropriation)	$108,000		−$108,000
Obligations by objects:			
11 Personnel compensation	78,500		−78,500
12 Personnel benefits	4,600		−4,600
21 Travel and transportation of persons	8,500		−8,500
22 Transportation of things	9,900		−9,900
23 Rent, communications, and utilities	5,500		−5,500
24 Printing and reproduction	200		−200

Total obligations	108,000		−108,000

THE ALASKA RAILROAD

STATEMENT OF JOHN E. MANLEY, ACTING MANAGER

GENERAL STATEMENT

Chairman HAYDEN. We will now take up the Alaska Railroad.

Mr. MANLEY. Mr. Chairman, I have a prepared statement.

Chairman HAYDEN. All right, if it is not too long you can read it, but otherwise, just highlight it.

Mr. MANLEY. It is not a long one.

Mr. Chairman and members of the committee, my name is John E. Manley, and I am Acting General Manager of the Alaska Railroad. I appreciate the opportunity to present to your committee a brief summary of our budget situation for fiscal year 1963.

As has been true for several years we are not requesting any appropriations from the Congress. We are, however, requesting your approval for a program of additions and betterments which will be financed from operating revenues. This program for the fiscal year ending June 30, 1963, will amount to an estimated $1,869,000, of which $1,769,800 represents capital items and the balance of $99,200 will be charged to expense accounts.

FISCAL SITUATION

The Alaska Railroad ended fiscal 1961 with a net deficit of $201,-524.67. This net figure is after depreciation charges of $2,071,000. The net deficit was occasioned by work stoppages last spring among the construction employees of Alaskan contractors and some utility crafts, and by passenger train costs which exceeded passenger train revenues by approximately $300,000.

The outlook for fiscal 1962 looks somewhat better, and we hope to present a somewhat improved financial picture next year. The capital expenditure authorities granted by this committee for the purchase of unit rail boxes and more efficient handling equipment, have enabled us to halt, at least for the present, the increasing handling costs on interline freight. We have been able to increase our "piggyback" activities. We are hopeful that, before the end of the fiscal year, we will have provided a way to make carload shipments from the Middle West and points east to the Alaska Railroad railbelt without losing the advantages of sealed shipments.

RAILROAD SCHEDULE

Our wintertime passenger train schedule is reduced to two trains per week. We feel that our obligation to areas and homesteaders, entirely dependent upon the Alaska Railroad for transportation, precludes a reduction in service beyond this point. At the same time we have converted one of these two trains to a mixed train in an effort to attract highly perishable and rush freight and thus increase our revenues. This new service has been well received by shippers.

ACTIVITIES AFFECTING RAILROAD

Remaining problems result from the completion and placing into operation of the new municipal dock at Anchorage and the potential

conversion of Elmendorf Air Force Base and Fort Richardson from coal to gas through the newly completed Anchorage Natural Gas Corp. pipeline into the Anchorage area. Also, on January 8, 1962, Assistant Postmaster General William J. Hartgian announced at Anchorage that the Post Office would commence trucking mail into Anchorage from the lower 48 States. This practice has already been inaugurated insofar as Fairbanks mail is concerned. Since the interline mail revenues of the Alaska Railroad for fiscal year 1961 amounted to $246,261.64, it can be seen that this proposed action of the Post Office Department will have an adverse effect on the revenues of the Alaska Railroad.

DAMAGE FROM SNOWSLIDE

On November 21, 1961, a snowslide on the Alaska Railroad resulted in the derailment of five diesel units, causing substantial damage. Preliminary estimates indicate that his damage will exceed $200,000. One unit, No. 1501, is so badly damaged that it will have to be rebuilt at the factory and, if rebuilt in kind, will cost about $125,000. We are presently determining whether it is to the best interest of the Government to rebuild in kind or to retire and reinvest this equipment and bring the locomotive up to new status, with 50 percent increased power.

I would be pleased to attempt to answer the questions of this committee with regard to details of the proposed program and the operation of the Alaska Railroad. I have with me Mr. Leland P. Draney, Comptroller of the Alaska Railroad, together with Dr. E. M. Fitch, our Washington representative, who will assist in answering detailed questions. If we are unable to provide immediate answers to your questions, we would greatly appreciate the opportunity to obtain such answers from our records and furnish them to the committee so that the record may be complete.

This concludes my general statement, and thank you again.

Chairman HAYDEN. First, I will place in the record the narrative justification of the estimated 1963 programs and the financing for the Alaska Railroad.

(The material referred to follows:)

ALASKA RAILROAD REVOLVING FUND

NARRATIVE JUSTIFICATION OF PROGRAMS AND FINANCING

The objective of providing continued transportation within the State of Alaska is proposed for the budget year through rail-line and miscellaneous operations programs. In connection with these programs, capital outlay is proposed to bring roadbed and track to standard and to acquire equipment principally for the handling of containerized cargo.

By the terms of the Alaska Railroad Act and the annual appropriation acts, revenues and other receipts are available for ordinary operating and maintenance expenses. Exhibit A, attached, reflects estimated operating revenues and expenses complementing the revenue, expense, and retained earnings statement. Expenses are brought to funded costs by elimination of nonfunded costs to harmonize with totals on the program and financing schedule.

Exhibit B reflects actual costs for 1961 capital program, estimates for 1962, including carryover authorizations, and estimates for new authorizations planned for 1963. This is in keeping with Senate Report 1761 (Interior Department and related agencies appropriations bill, 1957) which contained the following comments, in part:

"The committee feels, however, that in order to appropriately review the program of the Alaska Railroad it is essential that the annual budget submission

reflect a schedule of amounts proposed for capital improvements. Accordingly, the Secretary of the Interior is requested to have appropriate schedules included in the budget annually which will disclose, by major items, the amounts proposed for capital improvements. The committee wishes to make it clear that no major capital improvement or rehabilitation is to be financed from revenues until it has been presented to and approved by the Appropriations Committees of the Congress."

Expenditures estimated for operations and maintenance have been developed from trends of prior years tempered by planned economies; expenditures for improvements expense included initially in capital outlay are also on this basis. Equipment acquisition expenditures are predicated on most recent manufacturers list price.

REQUEST FOR RAIL BOXES

Chairman HAYDEN. During the past fiscal year you requested authority to purchase 100 unit rail boxes and later amended this request to 50 such rail boxes, with the additional request that you be permitted to construct a "roll on-roll off slip" at Whittier. Have you acquired the boxes that you wanted and is the slip under construction at this time?

Mr. MANLEY. We acquired the first 50 boxes as per the authority of this committee. When we obtained the approval of this committee to defer the purchase of the second 50 boxes, we proceeded with the construction of this slip and it is under construction at the present time.

EFFECTS ON ROAD OF CONVERTING POWERPLANTS

Chairman HAYDEN. Last year Mr. Fitch indicated to the committee that the Railroad could experience problems as a result of the military's possibly increasing the capacity of a petroleum pipeline and converting powerplants at military installations from coal to use of gas. Have there been any developments along these lines?

Mr. MANLEY. Yes, sir. The pipeline has been newly completed. That belongs to the Anchorage Natural Gas Corp. and is in the Anchorage area now. There is presently a survey in progress relative to the conversion of Elmendorf Air Force Base and Fort Richardson from coal to gas.

Chairman HAYDEN. That means a large loss of revenue to your lines?

Mr. MANLEY. Yes, sir; that would mean a substantial loss of revenue to the lines. Insofar as Elmendorf and Fort Richardson are concerned, it would mean a loss of approximately $600,000.

Chairman HAYDEN. Progress does cost money sometimes. Have they done the converting?

Mr. MANLEY. No, sir; they have not converted as yet and I do not believe they have the money funded to make the conversion at the present time of either base.

Chairman HAYDEN. It may be a year or more before this action takes place?

Mr. MANLEY. That is correct.

Chairman HAYDEN. I have nothing further. Thank you for your appearance.

Mr. MANLEY. Thank you very much, Mr. Chairman.

VIRGIN ISLANDS CORPORATION

STATEMENT OF DR. KENNETH A. BARTLETT, PRESIDENT

PREPARED STATEMENT

Chairman HAYDEN. Our next witness is Dr. Bartlett, President of the Virgin Islands Corporation.

Dr. BARTLETT. Mr. Chairman, I appreciate this opportunity to discuss the operations of the Virgin Islands Corporation. I have a prepared statement which I would like to submit for the record with your approval.

Chairman HAYDEN. That may be done.

(The statement referred to follows:)

Mr. Chairman and members of the committee, I appreciate this opportunity to appear before you to discuss the operations of the Virgin Islands Corporation and to present our request for funds for the fiscal year 1963.

At its last meeting on December 9, 1961, the Board of Directors of VICORP directed the Secretary of the Interior to recommend to the Congress legislation transferring the assets of the Corporation to the Virgin Islands Government. We have no way of knowing what action the Congress will take upon such a proposal, or when, or what the terms of such a transfer might be. Meanwhile, we must have funds to provide for capital improvements needed during the coming fiscal year. The request for funds for the expansion of the power facilities is of particular concern. There is a dire need for generating equipment to meet the explosive power growth which the Virgin Islands is experiencing until such time as someone else has this responsibility. It is fully expected that any funds invested in the power facilities at this time will be fully recovered on the sale of such assets.

Our request for grant funds has been reduced by $90,000 inasmuch as the Virgin Islands Government has agreed to accept financial responsibility for the dam construction program, which has been so successful over the years. It is my recommendation that the forestry program and the livestock program be continued by the Federal Government, and VICORP is the logical agency to maintain these activities until other arrangements for their continuance are worked out.

Your favorable consideration of our request for funds for the next fiscal year is vital, pending a final decision on the future role of the Corporation as a Federal entity in the Virgin Islands.

SUGAR PROBLEM

The production of sugarcane in 1961 was the highest in the history of the Corporation, and amounted to 96,179 tons, an average of 44.4 tons per acre. The net income per tone of cane harvested was $1.73, resulting in a profit of $166,433 in our field operations. The factory operation showed a loss of $213,020, which was due in part to the late sale of our sugar and low sugar recovery. The lack of docking facilities prevented the shipping of sugar until November and December 1961. The impossibility of marketing our sugar during the period of favorable prices reduced sugar income by more than $50,000. In spite of heavy yields of sugarcane, it was impossible to keep the factory properly supplied with cane. Mill lost time amounted to 39.75 percent, of which 19.79 percent was due to lack of cane for grinding. This problem was accentuated as a result of the field operations being placed on a 40-hour workweek. Deliveries of cane on Saturdays were substantially reduced due to the requirement of paying overtime for such work. The lack of sufficient cane for sustained grinding is a factor which contributes substantially to increased factory costs.

A total of 828,486 gallons of molasses were produced and sold to the local rum distillers and livestock producers at a price of 10.39 cents per gallon for 52 percent sugars, based on a contractural agreement.

The appropriation of $100,000 requested for our sugar operations is to replace fully depreciated equipment. The major equipment items to be replaced are mechanical sugarcane loaders, now over 10 years of age, and miscellaneous equipment items for the sugar factory, including retubing a boiler, the replacement of pumps and other accessories.

POWER PROGRAM

The increase in power usage in the Virgin Islands continued to tax all available generation facilities. The continued high demand prevented the carrying out of normal maintenance and the routine overhaul of equipment which are absolutely necessary for efficient operation. A fire and a piston failure in the St. Croix plant were responsible for extraordinary expenses for repairs and necessitated the purchase of emergency equipment to replace the generating capacity temporarily lost.

The Board of Directors approved an increase in power rates for both St. Thomas and St. Croix, effective September 1, 1961. The new rates were established on a basis which should provide sufficient revenue to insure a fair return on the Government's investment.

The St. Thomas Power Division showed an increase in growth of 24 percent based on peakload. A new high peak of 6,150 kilowatts on December 30, 1961, was some 200 kilowatts above our most optimistic projections. With the number of building permits being issued, and the continual higher consumption of electricity by all users, installation of a 5,000-kilowatt steam turbine at the earliest possible date is a must. The St. Thomas Power Division had a profit for the year of $29,484.

The new salt water distillation plant-steam power turbine installed in St. Thomas was placed in operation during early January 1962, and preliminary results have been satisfactory. The new installation will provide firm power until late 1962 when additional capacity will be needed. The Corporation has requested approval for reprograming approximately $400,000 of unobligated funds not needed in the construction of the salt water distillation steam turbine plant on St. Thomas, in order to proceed immediately with the purchase of an additional 3,000-kilowatt diesel unit to meet the December 1962 needs. We are requesting $200,000 in this budget to install and house this new unit. The request also includes funds in the amount of $2,150,000 to finance the purchase and installation of a 5,000-kilowatt steam turbine on St. Thomas. A generator of this size must be available to meet the anticipated needs of December 1963.

The St. Croix Power Division showed an increase of 17 percent based on peakload. A high peak of 3,800 kilowatts on December 29, 1961, was some 200 kilowatts in excess of our projections. The steady growth in power consumption on St. Croix also dictates the installation of additional generating capacity at the earliest possible date. Funds in the amount of $600,000 are requested for a new 3,000-kilowatt diesel generator. The St. Croix Power Division sustained a loss

of $120,780 for the year, occasioned largely by exceptionally high maintenance costs and a problem with power billings resulting from the installation of new IBM billing procedures.

WATER AND SOIL CONSERVATION PROGRAM

The Corporation continued to carry out various agricultural programs under a grant of $130,000 from the Congress. A total of 12 earth dams were constructed on the islands of St. Thomas and St. Croix, with an estimated holding capacity of over 7 million gallons of water. A total of 129 dams with a capacity of over 700 million gallons have been constructed under this program to date. The construction of these dams has had a most favorable effect on the water table of the islands, particularly St. Croix. This program will be taken over by the Virgin Islands government as of June 30, 1962.

The forestry program, in cooperation with the U.S. Forest Service, continued to make substantial plantings of mahogany on Government and private lands, improve natural forest areas, and provide local forest products.

The livestock and pasture management projects were continued in cooperation with the Virgin Islands agricultural program of the U.S. Department of Agriculture. The construction of an abattoir on St. Croix by the Virgin Islands government was started during the year and this should result in an increase in cattle production in St. Croix.

Funds in the amount of $40,000 are requested for the support of the forestry and livestock programs. This is a reduction of $90,000 over the previous year due to the transfer of the dam program to the Virgin Islands government.

A summary of the loan program with respect to grants and collections as of June 30, 1961, follows:

Loans	Outstanding June 30, 1960	Outstanding June 30, 1961
Agricultural	$2,183.47	$1,526.80
Commercial and industrial	141,587.92	118,253.74

The Corporation continued to manage for the Secretary of the Interior properties owned by the Department of the Navy in St. Thomas. The income derived from these properties continued to rise and amounted to $322,482 for the year. The income received from the properties was utilized for their rehabilitation and maintenance. There has been continued improvement in the general condition of the properties, and all available industrial space is presently occupied by small businesses which have contributed to employment and the general economic development of St. Thomas.

GENERAL STATEMENT

Dr. BARTLETT. As Secretary Carver has pointed out, the operations of the Corporation proved substantial during the past fiscal year. We had one of our best sugar crops in the history of the Corporation.

Our primary concern with respect to funds is the need for capital investment in our powerplant. The power needs of the Virgin Islands continues to expand at a rate greater than 20 percent per year. We have had peaks during the past month which are beginning to exceed our firm power facilities available to us and we must have additional funds by December of 1962 and additional facilities installed at that time in order to have some leadtime on installation. The installation of these steam turbines which we propose will take about 18 months and by December of 1963 there will be a critical need for this equipment. We have requested the committee to reprogram $400,000 of funds which remain surplus from our sea water distillation unit, in order to provide immediately a 3,000-kilowatt unit for St. Thomas to

take care of the December 1962 needs. This is a most critical area and one to which I hope the committee will give favorable consideration.

TRANSFER OF CORPORATION'S ASSETS

As you perhaps know, there is legislation to be recommended to the Congress with respect to transferring the assets of the Corporation to the Virgin Islands government. However, we have no way of knowing what action the Congress will take and we feel that the investment of any funds at this time which are invested in the power facilities will be fully recovered on the sale of the assets to the Virgin Islands government, or to private industry, whichever the case may be. We strongly recommend the program.

PROGRESS OF NEGOTIATIONS FOR TRANSFER

Chairman HAYDEN. Has not the Virgin Islands Corporation adopted a resolution asking that it be dissolved and that all of its functions and assets be transferred to the Virgin Islands government?

Dr. BARTLETT. That is correct.

Chairman HAYDEN. What, if anything, more has been done along this line?

Dr. BARTLETT. It is now in the Bureau of the Budget and will be before the Congress shortly.

QUESTION OF NEED FOR GENERATING FACILITIES

Chairman HAYDEN. If the Virgin Islands Corporation is dissolved, would there then be need for construction of the electric-generating facilities being requested?

Dr. BARTLETT. No. This would be true if we were certain this action would take place within a very short period of time. As I pointed out, we have a leadtime in construction of these facilities of approximately 18 months. We will definitely be out of firm power if the action of the Congress should be delayed until another year and if we did not have the funds requested for the investment.

REQUEST FOR STEAM TURBINE

Chairman HAYDEN. Included within the request is $2,150,000 for a 5,000-kilowatt steam turbine to be installed on St. Thomas and you are also proposing diesel generators for St. Thomas and St. Croix; is that right?

Dr. BARTLETT. That is right. The diesel generator for St. Thomas would be purchased with the $400,000 savings which we have requested be reprogramed, and an additional $200,000 in this year's budget for installation.

Chairman HAYDEN. You have not considered that in the program as yet?

Dr. BARTLETT. No. You have the request before you.

Chairman HAYDEN. You made a change in the request sent to the Congress on September 20 of last year wherein $4,500,000 was asked for two steam turbines, one to be placed on St. Thomas and one to be placed on St. Croix. You have switched that?

Dr. BARTLETT. Yes. In view of the dire need of getting something in by December 1962, we changed our planning, or the Engineers said it was desirable to change the planning so we would have the additional 3,000 kilowatts by December of 1962 and on St. Croix it was determined it would be more economical at that time to add another 3,000 watts of diesel than to proceed with the steam installation. We reduced our request.

INSTALLATION AT ST. CROIX

Chairman HAYDEN. When are you going to make this installation for St. Croix?

Dr. BARTLETT. Not at the present time. It would be another 2 or 3 years away, probably about 1964 or 1965.

Chairman HAYDEN. That will be when there will be an increase in the demand?

Dr. BARTLETT. That is right. It has been pointed out the growth has been explosive. It is growing better than 20 percent a year, which is higher than the normal growth here in the United States which runs about 7 or 8 percent.

CONTRIBUTIONS, VIRGIN ISLANDS CORPORATION

Chairman HAYDEN. The budget estimate for "Contributions, Virgin Islands Corporation," for fiscal year 1963 is $185,000, a decrease in funds available during fiscal year 1962 of $484,000. However, the funds available in fiscal year 1962 were derived by transfer from internal revenue collections for the Virgin Islands.

The justifications for this request will be placed in the record.

(The justifications referred to follow.)

The principal purpose of the Virgin Islands Corporation is to improve agriculture and develop the economy of the Virgin Islands, consisting of St. Croix, St. Thomas, and St. John.

All agricultural programs are carried out on the island of St. Croix which is the only area suitable for large-scale farming operations. The major activities are the growing of sugarcane, the processing and sale of raw sugar, and a forestry and livestock improvement program. In addition loans are made available to farmers for growing sugarcane or other agricultural products.

The Corporation is solely responsible for the generation and distribution of electric power. This affects the economy of all three islands. Included in this program is a salt water distillation plant for St. Thomas.

During the past year a 3,125-kilowatt steam turbine generator was installed in conjunction with the salt water distillation plant at St. Thomas. A 2,216-kilowatt diesel generator was also installed at St. Croix. These equipments are essential for the increasing economic growth of the islands, particularly the expansion of tourism.

The principal goal for 1963 fiscal year is the installation of one 5-megawatt steam turbine and two 3-megawatt diesel generators to meet the increasing power demand which continues at a rate of over 20 percent per year. The probable appropriations and expenditures for the 3 succeeding years after the budget year are as follows:

[In thousands of dollars]

	1964	1965	1966
Sugar program	100	100	100
Power program	5,000		7,000
Total appropriations	5,100	100	7,100

The only language change in 1963 is a request to increase the limitation on administrative expenses from $180,000 to $200,000. This increase is required for the salary of an administrative assistant to the President.

Contributions, Virgin Islands Corporation

Appropriation, 1961	$691,000
Available, 1962 [1]	669,000

SUMMARY OF DECREASES, 1963

Funds requested represent a decrease of $484,000 as compared with the amount available in the current year, $394,000 of which is applied to operating losses, and the balance of $90,000 to the water and soil conservation and forestry programs	−484,000
Net change, 1963	−484,000
Budget estimate, 1963	185,000

[1] Derived by transfer from "Internal Revenue Collections for Virgin Islands" (75 Stat. 263).

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Operating losses	$561,000	$539,000	$145,000	−$394,000
2. Programs not predominantly of a revenue-producing character	130,000	130,000	40,000	−90,000
Total	691,000	669,000	185,000	−484,000

1. Operating losses

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Operating losses	$561,000	$539,000	$145,000	−$394,000

The estimate of $145,000 is a decrease of $394,000 as compared to the amount available in the current year. During fiscal 1961 the Corporation sustained losses of $46,000 in its sugar operations due to sale of sugar produced at lower prices than which it was purchased; $91,000 in power operations due to delayed maintenance, a fire, and an explosion in the St. Croix powerplant; and $33,000 in other activities. These losses were partially offset by a profit of $25,000 in land sales. The funds requested to cover these losses are essential to replenish operating capital and thereby maintain a sound cash position.

2. Programs not predominantly of a revenue-producing character

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Water and soil conservation	$100,000	$100,000	$10,000	−$90,000
(b) Forestry program	30,000	30,000	30,000	
Total	130,000	130,000	40,000	−90,000

The estimate of $40,000 represents a reduction of $90,000 as compared to the amount available for these programs in the current year. These funds will be used principally for the forestry program. This includes the establishment of permanent forest cover on suitable land without encroaching upon the demands of other aspects of proper land use. The program covers planting of desirable forest species such as mahogany and teak, the management of established timber areas, and the utilization of forest products. The balance of the funds requested will be used for experimental plantings of fruit and nut trees to determine their commercial value, and for pasture management and livestock improvement.

BREAKDOWN OF ESTIMATE

Chairman HAYDEN. What are you going to do with the $185,000?

Dr. BARTLETT. This is an appropriation for the losses incurred during the year. The amount of $145,000 is for losses and $30,000 is for the continuation of the forestry program and $10,000 is for the livestock program.

Chairman HAYDEN. There will be placed in the record the justification for $3,300,000 for the revolving fund, Virgin Islands Corporation.

(The justifications referred to follow:)

Revolving fund, Virgin Islands Corporation

Appropriation, 1961	$2,538,000
Appropriation, 1962	881,000

SUMMARY OF INCREASES AND DECREASES, 1963

Operating capital: No funds requested in budget year	−611,000
Minor capital improvements: To provide funds to replace old equipment used in sugar operations	+30,000
Power program: To provide funds for the expansion of power distribution facilities on all islands, including the purchase and installation of one 5,000-kilowatt steam turbine and two diesel generators	+3,000,000
Net change, 1963	+2,419,000
Budget estimate, 1963	3,300,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Operating capital	$198,000	$611,000		−$611,000
2. Minor capital improvements	100,000	70,000	$100,000	+30,000
3. Power program	2,240,000	200,000	3,200,000	+3,000,000
Total	2,538,000	881,000	3,300,000	+2,419,000

Minor capital improvements.—An appropriation of $100,000 is requested for the replacement of equipment needed in connection with sugar operations. The major equipment items to be replaced in the field operations are cane loaders which are now over 8 years of age. Capital improvements in the sugar factory will be confined to replacements of miscellaneous equipment.

Power program.—An appropriation of $3,200,000 is requested for this program which will provide for the following:

Power distribution facilities, $250,000; Electric power consumption continues to grow at an extraordinary rate. The expansion of power distribution facilities on all islands is necessary to keep pace with the substantial amount of new construction which is in progress throughout the islands. Continual expansion and rehabilitation of the distribution systems is required.

Steam turbine, $2,150,000: This request is submitted to finance the purchase and installation of a 5,000 kilowatt steam turbine, including electrical switchgear and engineering services, on the island of St. Thomas. Because of the substantial increase in electrical power usage in the Virgin Islands, this new steam generator should be available to meet the anticipated power needs as of December 1963.

The power growth in St. Thomas reached 5,140 kilowatts in January 1961, an increase of more than 20 percent over the previous year. This trend has been steady for a number of years which means that by the end of 1963 St. Thomas will require in excess of 8,000 kilowatts.

The power growth on St. Croix has begun to reach the growth experienced in St. Thomas over the past few years. In 1959 the growth was slightly more than 22 percent, and, on the basis of new hotels, industrial facilities, and a general increase in usage, the generating capacity needed to meet such growth will probably double in the next 4 years. The Corporation, as the only producer and supplier of electric power in the Virgin Islands, has a responsibility to satisfy the power needs of a growing community and a rapidly expanding economy. Peak power loads exceeded 5,370 kilowatts in St. Thomas and 3,100 kilowatts in St. Croix in 1961.

Diesel generators, $800,000: There is expected to be not less than $400,000 of unexpended funds from the steam turbine salt water distillation plant, St. Thomas. The anticipated savings from this project will be used to purchase a 3-megawatt new diesel unit for St. Thomas which does not include installation and housing. The $800,000 additional requested in the budget year will provide for the following:

Construction of a building to house the new unit for St. Thomas and install it	$200,000
One 3-megawatt diesel unit for St. Croix (including installation)	600,000

LANGUAGE CHANGE

It is requested that the limitation on administrative expenses be increased to $200,000. This is an increase of $20,000 over the current authorization, and is required because of the expanding power program and the operation of a new salt water distillation plant. The authorized increase in travel expenses will also have to be absorbed in this limitation as well as general increases in our salary levels.

The President of the Corporation requires assistance with the many administrative duties he has to perform. The next officer in line is the Comptroller, who is responsible for all fiscal matters.

The Corporation has extensive programs in two islands and the workload, public relations and liaison with the Virgin Islands Government requires that the President have a representative on the island other than that on which he resides.

VICORP manages property in St. Thomas known as the Marine Air Corps Facility covering about 300 acres, with several buildings of all types, including hotels. The property belongs to the Navy but is held by the Interior Department under an interim or use permit. Interior, in turn, has turned its management over to VICORP.

ADMINISTRATIVE EXPENSES

Authority is requested to expend $200,000 in fiscal year 1963 incident to the operation of the Virgin Islands Corporation, broken down as follows:

Administrative expenses by objects

[In thousands]

	1961 actual	1962 estimate	1963 estimate
Total number of permanent positions	640	594	662
Full-time equivalent of other positions	187	147	165
Average number of all employees	827	741	827

Chairman HAYDEN. All right, Dr. Bartlett, we thank you.

Dr. BARTLETT. Thank you, Mr. Chairman, for this opportunity.

OFFICE OF TERRITORIES

STATEMENT OF RICHARD F. TAITANO, DIRECTOR; ACCOMPANIED BY VINCENT A. GIRARDI, BUDGET AND FINANCE OFFICER

ADMINISTRATION OF TERRITORIES

Chairman HAYDEN. Our next witness is Richard F. Taitano, Director, Office of Territories.

The fiscal year 1963 budget estimate for administration of territories is $15,478,000, an increase of $5,144,000 over the amount available in fiscal year 1962. Of this increase, $2,579,000 was sent to Congress on February 7, after submission of the regular 1963 budget. This is the portion of the estimate requested for establishing a program of educational television in American Samoa. The justifications for the entire budget request will be printed in the record.

(The justifications referred to follow:)

HIGHLIGHT STATEMENT

The major purpose of the Office is to carry out its responsibility to assist in guiding the growth of the non-self-governing areas toward full economic and political maturity. Included in this program are the Virgin Islands, Guam, and American Samoa. The activity of the Trust Territory of the Pacific Islands which is also under the supervision of the Office of Territories is reported separately in this presentation. In addition, the Office of Territories has administrative jurisdiction over Canton and the neighboring islands. All of these areas are in different stages of political and economic development. They are encouraged to and are constantly moving toward a greater degree of home rule and economic development.

The economy of American Samoa should improve due to the development of tourism in the South Pacific because of increased international air service activity; continuing heavy production at the tuna cannery, and the jet runway construction which is now nearing completion. The scheduled meeting of the Fifth South Pacific Commission Conference in American Samoa in July 1962, which will be attended by delegates from 17 Pacific territories, also will focus attention on and interest in this area, as it will be the first time that an American territory has been the site of this Conference.

In the budget year, it is contemplated that the programs for American Samoa will be greatly accelerated to continue the trend begun in the current year. The primary objectives of this speedup is to (1) give the youth of American Samoa the best educational opportunities by providing adequate school and equipment facilities; (2) promote economic development by greatly accelerated road improvements and increased electric power capacity.

Tourism in the Virgin Islands has continued to increase, resulting in a marked rise in governmental revenues which has led to expanded governmental services and public works construction. The government of Guam continued to improve the facilities and services which are provided to the residents of the island.

Administration of territories

Appropriation, 1961	$3, 321, 000
Appropriation, 1962	10, 334, 000
Summary of increases and decreases, 1963:	
Virgin Islands: To provide for operating expenses of the Governor's office, the legislature, and the Comptroller's office	−1, 015
Guam: To provide funds for operating costs of the Governor's office and the legislature	−23, 550
American Samoa: Net increase is $2,569,600, the greater portion, or $2,508,450, is for grants due to an accelerated program involving considerable expansion of educational and medical facilities, including construction of schools, hospitals, employee housing, and purchase of equipment	+2, 569, 600
Canton Island administration: To provide for costs, mainly salaries, of operating the school for employees' children	+315
General administration: Additional funds required for increased travel to field areas, and other related operating costs of the Washington office	+19, 650
Net change, 1963	+2, 565, 000
Budget estimate, 1963	12, 899, 000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Virgin Islands:				
(a) Governor's office	$80, 856	$84, 915	$86, 000	+$1, 085
(b) Legislative expense	11, 027	12, 600	13, 000	+400
(c) Comptroller's office	161, 996	227, 500	225, 000	−2, 500
2. Guam:				
(a) Governor's office	115, 318	104, 250	80, 000	−24, 250
(b) Legislative expense	24, 435	23, 300	24, 000	+700
3. American Samoa:				
(a) Governor's office	78, 742	99, 300	139, 600	+40, 300
(b) Legislative expense	31, 204	30, 800	30, 000	−800
(c) Chief justice and high court	39, 003	45, 350	67, 000	+21, 650
(d) Grants	2, 486, 800	9, 429, 950	11, 938, 400	+2, 508, 450
4. Canton Island administration	12, 024	20, 685	21, 000	+315
5. General administration	260, 623	255, 350	275, 000	+19, 650
Unobligated balance	18, 972			
Total	3, 321, 000	10, 334, 000	12, 899, 000	+2, 565, 000

1. VIRGIN ISLANDS

(*a*) *Governor's office, $86,000.*—The estimate represents an increase of only $1,085 over the amount available in the current year, $935 for personnel compensation and benefits and $150 for travel. The expenses of this office are distributed as follows:

Personnel compensation and benefits	$82, 262
Travel and transportation of persons	3, 738

(*b*) *Legislative expense, $13,000.*—This activity will continue at approximately the same level as for the current year. The funds requested are required to pay the salaries of 11 legislators at $600 per annum, in addition to their per diem and travel expenses, as authorized in the Revised Organic Act of the Virgin Islands.

(*c*) *Comptroller's office, $225,000.*—The estimate is $2,500 less than funds available in 1962, as this activity will continue at approximately the current year level. Expenditures of the office are distributed as follows:

Personnel compensation and benefits	$197, 120
Travel and transportation of persons	11, 000
Transportation of things	2, 380
Rent, communications, and utilities	5, 000
Printing and reproduction	500
Other services	3, 000
Supplies and materials	3, 000
Equipment	3, 000
Total estimate	225, 000

2. GUAM

(*a*) *Governor's office, $80,000.*—The estimate is $24,250 less than the amount available for this activity in the current fiscal year. There is a decrease of $27,639 for personal services and benefits due to the fact that three positions heretofore financed with Federal funds are to be paid out of local funds in fiscal 1963, this is offset by a net increase of $3,389 in other objects.

(*b*) *Legislative expense, $24,000.*—This activity will continue at approximately the same level as for the current year. The legislature meets annually in regular sessions for 60 days and in special sessions not to exceed 14 days, as authorized under section 18 of the organic act. The estimate covers the expense of 21 members at the rate of $15 per day for each member.

3. AMERICAN SAMOA

(*a*) Governor's office	$139, 600
(*b*) Legislative expenses	30, 000
(*c*) Chief justice and high court	67, 000
(*d*) Grants	11, 938, 400
Total estimate	12, 175, 000

The estimate of $12,175,000 for the fiscal year 1963 represents a net increase of $2,569,600 over the amount allotted during the current fiscal year. The increase in the office of the Governor is due primarily to the proposed hiring of four additional stateside personnel and one local employee to adequately handle the workload in the executive office. Legislative expenses are about the same and additional costs in the chief justice and high court division are in connection with the addition of an associate judge, his travel, and lawbooks for the new incumbent's office. The portion for grants has more than doubled due to an accelerated program planned for this territory, involving large increases in school buildings and equipment to give the youth of Samoa the best educational opportunities, salary adjustments in the education and medical departments to retain local employees and attract the best grade of contract employees for the more skilled positions.

Anticipated revenue of $1,100,000 will help defray a small portion of the above expense.

The territory of American Samoa is comprised of seven islands which are divided into the eastern and western districts on Tutuila and the Manu'a district which covers the outlying islands. The well-protected harbor of Pago Pago is situated on the south side of Tutuila, the largest of the islands, which has the small island of Aunu'u located at its southeastern tip. To the east of Tutuila, a

distance of 60 miles, are the three islands of the Manu'a group, consisting of Ofu, Olosega, and Ta'u. The seat of government is located in the Pago Pago Bay area. This area contains one-fifth of the island group's 20,000 population. Swains Island, with a population of 106, is located due north at a distance of 240 miles and small, uninhabited Rose Island is 60 miles eastward of the Manu'a group. American Samoa comprises 76.1 square miles of land, the larger portion of which is mountainous.

The population of American Samoa was listed at 5,679 in 1900 when the United States assumed its administration. The population, according to the 1960 census, is now 20,045. Farming methods at the beginning of the century were adequate enough for the population at that time, using local primitive methods. Samoa today is clearing land clear to the tops of the hills in order to find soil suitable for raising bananas and taro, which in addition to breadfruit is the staple diet of the Samoans.

The government of American Samoa is divided into three branches—the executive, legislative, and judicial. Salaries and expenses of these branches are considered to be a Federal responsibility. Funds for other expenses that are involved in the administration of the government are derived from a grant, appropriated by the Congress of the United States, and funds from local revenues. Funds requested for each branch of the government are justified as follows:

Summary, fiscal year 1963

Object class	Direct appropriation			Grants		
	Governor's office	Legislature	Chief justice, high court	Administration and operation	Construction	Total estimate
11 Personnel compensation:						
Stateside	$87,220		$44,849	$809,463		$941,532
Samoan	10,780	$16,550	6,673	1,985,006		2,019,009

12 Personnel benefits	5,000	500	2,930	78,595		87,025
Total	103,000	17,050	54,452	2,889,855		3,064,357
21 Travel and transportation of persons	20,800	8,150	6,200	121,060		156,210
22 Transportation of things	4,300	50	2,100	78,175		84,625
23 Rent, communications, and utilities	500	100	180	17,980		18,760
24 Printing and reproduction	2,000	1,000	150	7,255		10,405
25 Other services	2,500	900	200	111,970		115,570
26 Supplies and materials	2,500	1,750	218	837,505		841,973
31 Equipment	4,000	1,000	3,500	690,050		698,550
41 Grants, subsidies, and contributions				126,100		126,100
32 Lands and structures					$8,158,450	8,158,450
Total	139,600	30,000	67,000	4,879,950	8,158,450	13,275,000
Estimated income				1,100,000		1,100,000
Total estimate	139,600	30,000	67,000	3,779,950	8,158,450	12,175,000

(*a*) *Governor's Office.*—It is estimated that $139,600 will be needed for the operating expenses of the Governor's office. This is $40,300 higher than the amount available in fiscal year 1962. The increase is due to activation of four additional Federal positions and three local positions; namely: a special assistant confidential assistant to the secretary, a legislative counsel, and clerk-typist, plus a local senior account clerk and administrative clerk as well as reclassification of present confidential secretary to the Governor from grade 9 to 11 and present clerk-typist from grade 4 to 5, also travel of four new stateside employees involved.

The Governor of American Samoa, as chief executive of the territory has duties involving the supervision and general direction of administrative agencies and instrumentalities of the local government. The Governor has the authority, with the approval of the Secretary of the Interior, to formulate and execute territorial policies. All bills and resolutions of the legislature of American Samoa are presented to the Governor for his approval or veto. In addition, the Governor acts on behalf of U.S. Federal agencies, such as the Passport and Visa Division of the Department of State. He also maintains contact with other Federal agencies through the Department of the Interior. The chief executive of this territory is assisted by the Secretary of American Samoa in handling the various

executive duties, the latter serving thus as Lieutenant Governor. The secretary acts as Governor during the absence of the chief executive or when the latter position becomes vacant.

The expenses of this office are distributed as follows:

	1962 estimate	1963 estimate	Difference
Personnel compensation	$61,372	$98,000	+$36,628
Personnel benefits	3,103	5,000	+1,897
Travel and transportation of persons	19,800	20,800	+1,000
Transportation of things	4,025	4,300	+275
Rent, communications and utility services	500	500	
Printing and reproduction	2,000	2,000	
Other services	2,500	2,500	
Supplies and materials	2,500	2,500	
Equipment	3,500	4,000	+500
Total estimate	99,300	139,600	+40,300

(*b*) *Legislative expense.*—The estimate of $30,000 is $800 less than the current fiscal year due to procurement of essential equipment during the previous year.

The Legislature of American Samoa consists of two groups, the senate and the house of representatives. The former has 15 members and the latter consists of 18 officials. Members of the senate are elected to office through the vote of Samoan village councils, which is done along traditional lines. As the eastern and Manu'a districts have five counties each and the western only four, the latter is permitted to choose one extra senator. This plan is rotated by the counties in the western district. Members qualifying for the house of representatives are elected by the people by secret ballot. The majority of the counties are represented by one representative with the exception of one county in the bay area of the eastern district and one in the western district which are more heavily populated, thus permitting the bay area county to have three representatives and the western county is granted two. The legislature meets annually in a major session plus special sessions that are ordered convened by the Governor, after due consultation with the senate president and speaker of the house. Swains Island has a delegate in the House.

Both the senate president and speaker of the house are elected by their associates. In accordance with terms of the new constitution, all members receive a maximum of $300 each yearly.

The expenses of this office are distributed as follows:

	1962 estimate	1963 estimate	Difference
Personnel compensation	$17,050	$17,050	
Travel and transportation of persons	8,150	8,150	
Transportation of things	200	50	−$150
Rent, communications, and utilities	100	100	
Printing and reproduction	1,000	1,000	
Other services	900	900	
Supplies and materials	1,900	1,750	−150
Equipment	1,500	1,000	−500
Total estimate	30,800	30,000	−800

The amount requested for personal services is distributed as follows:

Senate, 15 members, $5 a day for a maximum of 60 days	$4,500
House of representatives, 17 members and 1 delegate from Swains Island, $5 a day for a maximum of 60 days	5,400
Employees engaged on a per diem basis during sessions	7,150
Total personnel compensation	17,050

(*c*) *Chief justice and high court.*—The estimate of $67,000 for this activity in 1963 is $21,650 higher than fiscal year 1962. Most of the increase involved is in obtaining an associate justice for American Samoa, transportation and travel of this official and his family, and procurement of office equipment and lawbooks for same.

The judicial system of American Samoa comprises a high court and five district courts. The high court, with jurisdiction throughout the islands, has an appellate,

a trial, and a probate division. Appeals may be taken from the district courts and the trial and probate divisions of the high court to the appellate division of the high court.

The judicial branch of the government is under the general supervision of the chief justice of American Samoa. It is independent of the executive and legislative powers by express constitutional provision.

Samoan judges sit on all courts with the exception of the probate division of the high court in the first instance. Presently the judiciary is composed of the chief justice and four Samoan judges.

The high court and each of the district courts has a clerk and a marshal. The clerk of the high court serves as court reporter. He is also the clerk of the court for the first district, registrar of titles, registrar of vital statistics, secretary of the land commission, and the archivist for the government. He issues marriage licenses. In addition he performs the functions usually performed by a county recorder in the United States.

The deputy clerk of the high court is the interpreter for the high court and the district court for the first district. The marshal of the high court serves as the marshal of the district court for the first district. Presently, with the exception of the chief justice and the clerk of the high court, both of whom are from the United States, all court personnel in American Samoa are Samoans.

The Samoan judges and also the clerks and marshals of the various district courts, except the district court for the first district, are paid from local funds.

During the fiscal year ending June 30, 1961, 357 persons were tried on criminal charges in the various courts and 209 civil cases were disposed of by them.

The expenses of this office are distributed as follows:

	1962 estimate	1963 estimate	Difference
Personnel compensation	$35,698	$51,522	+$15,824
Personnel benefits	1,902	2,930	+1,028
Travel and transportation of persons	4,800	6,200	+1,400
Transportation of things	1,450	2,100	+650
Rent, communications, and utilities	150	180	+30
Printing and reproduction	150	150	
Other services	200	200	
Supplies and materials	200	218	+18
Equipment	800	3,500	+2,700
Total estimate	45,350	67,000	+21,650

(*d*) *Grants.*—The estimate for this activity for the fiscal year 1963 is $11,938,400, an increase of $2,508,450 over the current fiscal year.

Operating costs of the government of American Samoa are met by grants appropriated by the Congress of the United States which is partially supplemented by local revenue. Operating costs of the government for fiscal year 1963, excluding direct Federal obligations for the Office of the Governor, the legislature, and the judiciary is estimated to be $13,038,400. This amount includes $4,879,950 for general administration and maintenance of facilities, and $8,158,450 for construction of schools, quarters for new employees, road paving and construction, and major utilities improvements. Revenues for fiscal year 1963 are estimated to be $1,100,000. This amount would have to be supplemented by a Federal grant of $11,938,400 to meet the above costs.

The following statements outline the costs of governmental functions for fiscal year 1961, the current year and budget years.

	Actual, 1961	Estimate, 1962	Estimate, 1963	Difference + or −
Health, education, and welfare:				
(a) Public information	$10,033	$22,469	$14,550	−$7,919
(b) Department of education	404,612	928,359	1,581,700	+653,341
(c) Medical services department	504,685	796,507	909,200	+112,693
(d) Public defender	4,863	6,689	6,850	+161
(e) Public safety and legal affairs	79,305	113,809	137,450	+23,641
(f) Local judicial	5,731	7,600	8,400	800
Total, health, education, and welfare	1,008,869	1,875,433	2,658,150	+782,717
Economic and industrial development:				
(a) Department of agriculture	47,477	92,414	211,500	+119,086

Health, education, and welfare, $2,658,150

Public information	$14,550
Department of education	1,581,700
Department of medical services	909,200
Public defender	6,850
Public safety and legal affairs	137,450
Local judicial	8,400
Total	2,658,150

Public information, $14,550.—The sum of $14,550 is required for fiscal year 1963. This represents a net decrease of $7,919. This decrease is due to a reduction in equipment needs, a new broadcasting transmitter having been purchased during the current fiscal year.

Public information publishes a daily mimeographed press news during working days of each week, consisting of press news received over teletype for which it pays UPI press rates of $1,500 annually. A mimeographed summary of general news in the Samoan language is printed weekly for distribution in Samoan villages. There is also a government news journal which is printed quarterly. News, as well as general government information is broadcast during week days over the local radio station. Coverage also includes speeches at ceremonies, official functions, and musical programs.

Department of education, $1,581,700.—The amount needed for fiscal year 1963 totals $1,581,700, or an increase of $653,341 over the present fiscal year. Qualification for school entrance by age has been lowered to 6 years and the increasing number of students in school has now reached the junior high school level. This will result in over 7,000 students, or one-third of the island's population attending school. In addition, an increased enrollment in the local Dependents School due to FAA facilities in connection with the new jet airfield and plans to upgrade school standards at all levels by providing full-time principals in large elementary and junior high schools is scheduled. Supervision in these schools will be done by stateside personnel. With these plans and a determined effort to improve the English language instruction program in order to provide a high school education for all ninth grade graduates instead of the present 25 percent, it is necessary to increase the teaching staff. This will involve 44 more U.S. employees at a cost of $285,000, plus an increase in travel and transportation of things, totaling $62,000. The increase in employees will include 10 junior high school supervising teachers, 6 village school supervisors, 1 English language specialist, 1 textbook specialist, 2 more teachers in Dependents School, 1 business manager, 1 teacher training college instructor, 13 more high school teachers, 7 more vocational school teachers, a library supervisor, and an adult education supervisor. Needs for more local positions include: 40 Samoan schoolteachers, 4 library assistants, and 7 clerks, as well as a typist. An additional 30 positions for Samoan schoolteachers are also requested on a temporary basis so that present teachers without a high school education or teacher-training college education may be returned to the high school and/or teacher-training college to complete their education and improve their teaching abilities.

Personal service costs in this budget for education have been more than doubled over the current year. Costs for hiring 44 stateside and 82 local employees amounts to $408,000. An amount of $251,000, which includes $15,000 per diem for outer island teachers and $236,000 to reclassify all contract and local teachers, plus increments for the educational staff, is listed. The supply costs have increased by $103,000 to procure school supplies for the three new high schools, five junior high and consolidated village schools. It includes new books for grades 1, 2, and 3 which should be serviceable for 5 years; replacement of other books and a book stock for the school library; technical magazines; cooking supplies for the over 50 elementary and junior high schools lunch program; paper to be used for preparation and publication of 2 local cultural textbooks used in classwork. Equipment costs are $39,200 this year. It is also requested that the scholarship program be increased $35,200, which will cover costs of the 5 fourth-year college students, 11 third-year, 16 second-year, and 20 first-year, at $800 per person plus travel of the last 10 and 2 returning graduates, as well as travel for 2 Samoan degree teachers or administrative personnel for further study in Hawaii.

Pupil enrollment for 1963 is expected to approximate 7,000 in the public schools at a cost of $220 for each student. There is an additional 1,644 in the private schools over which the department of education has jurisdiction for maintaining standards, but not for providing financial support. Pupil cost is quite reasonable compared to the $230 pupil cost in Hawaii and the $340 pupil cost based on the U.S. average expenditure. If the construction program for secondary education is approved, all students of the ninth grade level will be provided with an opportunity to attend high school.

Medical services department, $909,200.—The sum of $909,200 required this fiscal year is an increase of $112,693 over the present fiscal year 1962. The sum of $10,020 is reflected in FICA costs. About 30 percent of the increase is in personal services. This includes hiring an additional stateside dentist, a registered nurse, and a medical statistician. It also includes hiring 85 additional Samoan personnel required to efficiently staff the hospital, as well as 30 more positions in the student nurse training group. The latter increase will provide an adequate future source of supply of Samoan nurses. Other personal services costs include reclassification of all doctors and the hospital administrator's position, as well as a number of local personnel, regular increments, terminal leave for outgoing personnel, and

overtime. It will be necessary to hire a repairman from Hawaii on a temporary basis to repair the X-ray equipment this year. With over a 100-percent increase contemplated for contract personnel and families as well as incoming FAA personnel and the increasing number of tourists, it is necessary to likewise increase medicinal supplies by 33½ percent, an increase in supplies for the dental program, supplies and materials for nurse training classes, publishing of nurse training manuals, more X-ray film, food supplies, and medical supplies for the continuance of planned health programs. The latter include: (1) Immunizations, (2) TB program, (3) iron program-oral prophylactic, (4) public health work in villages, and (5) polio program, as well as extensive spraying and village cleanup. A new garbage disposal program is also underway. Equipment needs reflect a $110,000 increase. Because of a change in planning it is contemplated to activate a landfill system of garbage disposal. The $65,000 appropriated for an incinerator in fiscal year 1962's deficiency appropriation will be applied to this cost. Also involved are an insecticide mixing tank, spray tanks, insecticide fogging machine, high-pressure sprayers, two generators, three sterilizers, beds, mattresses, assorted furniture, stoves and refrigerators for dispensaries, two mechanical chlorinators, water transfer pump, chlorine test kits, cyclone fence, portable X-ray machine, film-processing tank, film drier, replacement old laboratory equipment, technical books for nurse training, steam pressure ovens for kitchens, three typewriters, two office desks, mimeograph, and two dictaphones. A scholarship program costing $17,100 this year is proposed for the purpose of sending two students to the United States to become doctors of medicine, one for doctor of dental surgery, one sanitary engineer or sanitarian, and a laboratory technician. It is also planned to send three nurses to the United States for a year's training in either obstetrics, pediatrics, nursery, TB, or OR and also to send three medical practitioners or other hospital personnel to seminars in other islands or territories, or to medical instruction meetings in various points of the South Pacific for which this government had no funds budgeted in previous years.

Public defender, $6,850.—The estimate for fiscal year 1963 is $6,850, an increase of $171 over the current year. The increase consists of FICA costs and salary increments. This activity employs a lawyer from Western Samoa on a part-time basis to represent defendants in all criminal cases. This official likewise acts as counsel for the people of American Samoa. It is less expensive to obtain the services of a qualified lawyer from neighboring Western Samoa for such purposes. The local staff includes a specially trained Samoan, also a typist.

Public safety and legal affairs, $137,450.—The estimate for fiscal year 1963 is $137,450, an increase of $23,641 over the current fiscal year. The increase is largely connected with payment of overtime for police and firemen, salary increments, and hiring of a statesider to fill the new position of public safety officer. The latter position involves supervision and training of personnel in the police and fire department and administration of the prison, thus relieving the attorney general for more important legal work. Funds are also included to employ a stateside lawyer for a period of 6 months to codify the law of American Samoa, plus costs of having same reprinted. It has been found necessary to establish a police mess to provide one hot meal per shift for policemen who travel some distance to stand duty at the police station and remain there for periods up to 24 hours. Other additional costs include procurement of four typewriters, an adding machine, new police uniforms, a hydraulic expander, hose storage, and other firefighting tools.

The attorney general heads this department and is chief legal officer of the government. His duties also include immigration matters, plus incorporating all amendments into the Code of American Samoa, and their dissemination. During fiscal year 1961 a total of 293 complaints were handled and 210 cases prosecuted. A total of 264 persons were convicted, 15 acquitted, and 20 nolle prosequis were entered. A total of 36 complaints were annulled and 12 yet remain open—either under investigation or unsolved. There are 51 policemen in the police division and 8 firemen in the firefighting division. The latter unit is equipped with three fire engines and a single two-man pump. The local prison had an average of 15 confined prisoners during the past fiscal year. Of this group, several prisoners are assigned to the prison farm where taro, breadfruit, and bananas are grown to supplement the prison fare.

Local judicial, $8,400.—The estimate for fiscal year 1963 is $8,400, which represents an increase of $800 over the current fiscal year. The increase is mainly for FICA costs and a small increase for travel costs to hear court cases in the outlying islands.

There are five district courts: One for Ituau and Mauputasi Counties and Swains Island; one for Ofu and Olosega Counties in Manu'a; and one for Faleasao,

Fitiuta, and Ta'u Counties, also in Manu'a; one for Lealataua, Leasina, Tualatai, and Tualauta Counties; and one for Sua, Vailfanua, and Sa'ole Counties. There is also the high court which has territorial jurisdiction throughout the islands. The high court has an appellate division, a trial division, and a probate division. Each court has a clerk and a marshal. Presently, with the exception of the chief justice and the clerk of the high court, both of whom are from the United States, all court personnel are Samoan. During the fiscal year ending June 30, 1961, a total of 357 persons were tried on criminal charges in the various courts and 209 civil cases were disposed of by them.

The following is a distribution of the expenses of the Office of Health, Education, and Welfare:

Personnel compensation	$1, 829, 130
Personnel benefits	47, 845
Travel and transportation of persons	76, 450
Transportation of things	57, 375
Rent, communications, and utilities	1, 695
Printing and reproduction	5, 805
Other services	13, 330
Supplies and materials	439, 240
Equipment	119, 680
Grants, subsidies, and contributions	67, 600
Total	2, 658, 150

Economic and industrial development, $290,150

Department of agriculture	$211, 500
Local government	78, 650
Total	$290, 150

Department of agriculture, $211,500.—The estimate for fiscal year 1963 represents an increase of $119,086 over the current fiscal year. Efforts are being made to comply with the recommendations in the Senators Long-Gruening Report to Congress, which states that agriculture is basic to the economy of this territory and improvement to increase output is vital to Somoa's future development. Accordingly, five stateside employees abe being hired; a plant pathologist, veterinarian, two agronomists and an agriculture extension agent, plus a college trained local agriculturist and six extension agents. This will increase personal services costs by $40,000 and FICA costs will be $3,635. Other services will be increased $31,000 for (1) rental or lease of land for agriculture development in order to conduct demonstrations for Samoan farmers on improved methods, and (2) to procure an additional foreman and labor force for each 200-acre leased development and for continued field work on plant disease and pest control. Additional equipment costs of $26,650 will permit purchase of good grades of poultry, hogs, two portable brush saws, two motorized sprayers, four haversack sprayers, one chain saw, one tractor mounted milling unit for utilization of local lumber; cottage industry machine for coir rope and mat production which consists of one husk crusher, one comber, one rope maker, one mat maker; also two oil expellers and two macerators. The sum of $21,000 is needed of which $3,000 will be awarded in the form of incentive prizes to private individuals for outstanding achievement in agriculture development, and $18,000 for six outstanding agricultural trainees to take a year's intensive extension course in Hawaii at the East-West Center School. At present there are three experimental farms having a total of 248 acres. The Mapusaga farm is used for a new experimental nursery project. The cattle are now located on the Taputimu farm which also operates a plant nursery and disseminates seeds and plants to local growers for planting. The farm at Tafuna has the poultry farm and also developes pasture and new local crops used to feed the livestock in part as well as poultry.

Department of local government, $78,650.—The sum of $78,650 is required for fiscal year 1963. This is $8,577 above the current fiscal year. Under personal services, the cost is $3,500 and includes one additional typist, some reclassifications and salary increments of local island officials. The FICA costs are $2,240 and a $1,200 increase in travel includes trips to Honolulu and western Samoa of district governors and the Samoan secretary. Under other services, an additional $1,700 is needed to pay for election expenses during the year and repair to the western district Governor's office. One additional typewriter must be purchased for use in the director's office.

The American Samoan territory is comprised of three districts which are subdivided into 14 counties, containing 52 villages. A close liaison is maintained with the chiefs and village officials to whom are transmitted instructions and information of general interest to the various counties, villages and districts. Operation is along traditional lines. County chiefs elect mayors (Pulenu'us) of each village and each mayor is aided by a policeman (lelleo). The head of each family in the villages is called a "matai." He participates in the councils and village meetings.

The county council nominates the county chief who leads them and this appointment is approved by the district governor and ultimately a formal appointment is issued by the Governor of American Samoa. District governors are appointees of the Governor and selections are invariably made from the islands highest ranking chiefs, following a recommendation from the district councils.

Expenses of the Office of Economic and Industrial Development are distributed as follows:

Personnel compensation	$153, 605
Personnel benefits	5, 870
Travel and transportation of persons	10, 200
Transportation of things	7, 100
Rent, communications, and utilities	3, 650
Printing and reproduction	100
Other services	40, 350
Supplies and materials	16, 200
Equipment	32, 075
Grants, subsidies and contributions	21, 000
Total estimate	290, 150

Operations and maintenance $1,125,450

Communications	$94, 500
Public works	1, 030, 950
Total	1, 125, 450

Communications, $94,500.—This estimate represents an increase of $14,801 over the current fiscal year. Nearly $6,000 in personal services is reflected in the terminal leave for the communication and assistant radio engineer officers, overtime of operators, per diem of the operator on Swains Island and salary increments of the general staff. The FICA costs are $1,660. Travel and costs incidental to the repatriation of the above two employees requires an additional $2,000. The increase of over $5,000 in equipment is for the purchase of four teletype machines and associated equipment for use between the new jet airport and the main communication office; also purchase of a sideband radio telephone for communications between Pago Pago and Apia, western Samoa.

Communication is maintained with Hawaii, Fiji, and western Samoa. The facilities in American Samoa operate on a 24-hour basis, and include a receiving station and central office, a radio material office and transmitter building, all in the Pago Pago bay area. The air-ground facilities, beacon transmitters and meteorological office are located at the Tafuna Airport. Government and commercial radio service, ship-to-shore service, air ground enroute and control service are thus provided, as well as meteorological observations for local and international dissemination and beacon facilities for radio navigation. During fiscal year 1961, a total of 26,670 messages containing 1,162,558 words were sent and received, an increase of 305,793 words over the last fiscal year. Revenue also increased to $35,960 or a 4.8 percent increase over the previous fiscal year.

Department of Public Works, $1,030,950.—The estimate for fiscal year 1963 is $1,030,950, which is an increase of $163,114 over the current fiscal year. One-fifth of this increase is in personal services where additional personnel are required to handle the greatly expanded building and repair program in American Samoa. This includes procuring five more stateside employees consisting of a planning officer, refrigeration mechanic and three supervisors. In addition, 38 local employees will be required, consisting of a local surveyor, 12 additional carpenters, 4 telephone repairmen, 3 refrigeration mechanics, 6 plumbers, 6 linemen and 6 electricians, plus overtime and regular salary increments. The FICA costs are $14,500. Supply costs are $38,000 less due to a deficiency budget this fiscal year to help with a heavy painting and repair program. To meet the power requirements for industrial development along with providing power for educational and general consumption, a new power plant is being constructed to house six 1,000-kilowatt generators. When this plant is in full operation, the present power

generation plant can be cannibalized because of age, condition, and cost of operation. Equipment needs call for a sum of $230,300 for replacement of essential items and procurement of needed new items.

The public works department handles public utilities, including electric power, water supply, and telephone service. It also provides the maintenance of the local government physical plant. The area covered has 341,852 lineal feet of primary and distribution power lines, transformers, poles, and hardware; 60,000 lineal feet of overhead and underground telephone cable, 752,000 lineal feet of outside twist wire and 45,540 feet of cast iron, steel, and galvanized piping in the water systems of the territory. The antiquated local powerplant has an installed capacity of 2,518 kilowatts but due to its age and costly operation, only 1,680 kilowatts can be utilized. Electrical energy for fiscal year 1961 was 7,220,400 kilowatts indicating an increase of 369,000 over the previous fiscal year. Estimated needs for 1963 will be 10,200,000 kilowatts. The public works department also maintains approximately 70 miles of roads.

The following is a distribution of the expenses of the office of operations and maintenance:

Personnel compensation	$535, 375
Personnel benefits	16, 150
Travel and transportation of persons	17, 500
Transportation of things	9, 000
Rent, communications, and utilities	10, 025
Printing and reproduction	2, 900
Other services	294, 200
Equipment	240, 300
Total	1, 125, 450

General administration, $806,200

Audit office	$22, 350
Budget and finance department	579, 650
Executive office operations	16, 700
Personnel office	74, 000
Department of port administration	88, 500
Interisland water transportation	25, 000
Total estimate	806, 200

Audit office, $22,350.—The estimate for fiscal year 1963 is $22,350, which is an increase of $4,449 over the current fiscal year. Of this $3,400 is involved in the terminal leave, transportation and travel costs of the outgoing auditor and procurement of his relief. A new local position is required to handle the increased workload and FICA costs are $400.

The mission of this office is to conduct audits of all phases of government financial management, as well as review and appraisal of policies, plans and procedures through the local government and regulated activities. The staff receives directions from the Governor and secretary of American Samoa and is an advisory, rather than a line or operating function.

Budget and finance department, $579,650.—The estimate for fiscal year 1963 shows an increase of $284,416 over the current fiscal year. This increase is almost entirely reflected in three items: (1) essential replacement of several government vehicles that are overage; (2) the sum of $20,000 will be needed to pay for a government audit by an outside commercial firm; and (3) increase in personnel through establishment of a stateside position of business machine repairman which is greatly needed to keep the numerous government machines in operating condition, plus activation of 15 local positions, including a senior typist in the treasurer's office, a clerk in revenue, an assistant supply officer, 1 senior clerk, 1 account clerk, 1 packing helper for general supply, a mechanic and 2 bus drivers due to increased activity in land transportation as well as 5 drivers and a mechanic's helper to maintain a 24-hour service in the motor pool.

This department handles all financial matters of the government, including funds received and disbursed, all payrolls, reports, financial statements, as well as the procurement, storage, and issuance of general and medical cupplies. This department also maintains property inventory and control. All departmental budgets are coordinated and written up for approval of the Governor and then submitted to the Office of Territories for review and eventual presentation to Congress. Some direction of commercial activities of the government is included in this department such as land transportation and motor pool, as well as the print shop. The hotel activity will be discontinued immediately on the activa-

tion of a commercial establishment which is now in the planning stage. Analytical services are supplied to the Governor's Office in connection with the compilation of annual fiscal and numerous special reports, as well as the preparation of periodic and special publications in collaboration with other departments.

Executive office operations, $16,700.—The estimate for fiscal year 1963 is $16,700 which represents a decrease of $8,100 over the current fiscal year. The decrease is reflected in the furniture and equipment replacement that took place at Government House in fiscal year 1962.

Personnel office, $74,000.—The estimate for fiscal year 1963 is $74,000, which is a decrease of $35,275 compared to the current fiscal year. This is due to a decrease in travel costs due to nonrecurrence of travel for the personnel director, a reduction in student costs being borne by medical services and a sharp reduction of $29,000 in costs for workmen's compensation, group health insurance and retirement fund due to activation of social security.

The mission of this office is in the handling of all matters concerning recruitment, employment, reclassification, promotion or demotion of government personnel. Assistance is also rendered to department heads or staff members on personnel problems, procedure or programs connected with same, acting under the authority of the Governor's office. This office has been handling the medical training program which involves sending trainees to the Suva Medical School or other suitable areas for training; also candidates from other government departments or activities. Personnel also handles both travel and transportation of household effects for all government personnel.

Department of port administration, $88,500.—The estimate for fiscal year 1963 is $88,500. This represents a net decrease of $1,055 compared to the current year's appropriation.

The mission of the port administration department is to act as a coordinating activity on all matters pertaining to the arrival and departure from American Samoa of all ships and aircraft; airport management, berth assignments of vessels, harbor inspections, furnishing pilots for ships needing same; maintenance of a port patrol force for security measures, checking tide gages and providing tidal records for the U.S. Coast and Geodetic Survey; inspect and service aids to navigation locally for the U.S. Coast Guard. The department enforces customs regulations and procedures as set forth in the Code of American Samoa; it studies and recommends methods and procedures that will give maximum protection locally against contraband, submitting such to the Governor's office. It supervises clearance of passengers on all shipping and planes entering or clearing American Samoa; maintains and operates all government-owned harbor craft; enforces harbor regulations and recommends to the Governor any changes or improvements in same. The harbor craft are used for berthing and unberthing ships, transporting students to bay area schools and providing water transportation to coastal villages as needed by the government or the public on a charter basis. The department is also responsible for the assessment and collection of import and export duties, port and harbor charges, cargo storage and wharfage charges provided by law for such services. This activity takes custody of all imports into the territory for local consumption or for transshipment to other areas, releasing same upon payment of duties and/or other charges.

Interisland water transportation, $25,000.—It is essential that adequate water transportation be maintained between Tutuila and the Manu'a Islands group. The people of Manu'a operate their privately owned vessel, the *Manu'a Tele*, which is now old and in a bad state of repair. They find the ship very costly to maintain. It is found more feasible to use the *Isabel Rose* for island operations at a more reasonable cost. This plan was recommended in the Long-Gruening report after their study of American Samoa. The sum of $25,000 has been estimated as the deficit this government will be required to pay in operating this vessel.

The expenses of the general administration office are distributed as follows:

Personnel compensation	$293, 150
Personnel benefits	8, 730
Travel and transportation of persons	16, 910
Transportation of things	4, 700
Rent, communications, and utilities	2, 610
Printing and reproduction	1, 300
Other services	55, 440
Supplies and materials	87, 865
Equipment	297, 995
Grants, subsidies, and contributions	37, 500
Total estimate	806, 200

Construction and nonrecurring cost, fiscal year 1963

	Total	Labor and overhead	Supplies, materials, and transportation	Furnishings and standard equipment	Other

4. *Canton Island administration, $21,000.*—The estimate for this activity represents an increase of only $315 over current year funds as the program will continue at about the same level. Estimated expenditures are distributed as follows:

Personal services and benefits	$19, 000
Travel and transportation of persons	1, 000
Supplies and materials	1, 000
Total	21, 000

5. *General administration, $275,000.*—The estimate represents an increase of $19,650 over the amount available for this activity in the current fiscal year. Part of the small increase is necessary for increased travel to field areas which are at a considerable distance from Washington, and the balance for other related operating costs of the office. This increase is directly related to the greatly accelerated and expanded programs in our territories; there has been a two-fold increase in the budget appropriations in the trust territory and a five-fold increase in the budget appropriations for American Samoa. These greatly expanded programs place a burden on this office to assist the territorial governments to tie in long-range program planning with their budgeting resources, to insure balanced development in our territories.

Estimated expenditures for the Washington office are distributed as follows:

Personnel compensation and benefits	$235, 600
Contractual services and supplies	38, 700
Equipment	700
Total	275, 000

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$3, 302, 028	$10, 334, 000	$12, 899, 000	+$2, 565, 000
Unobligated balance lapsing	18, 972			
Appropriation	3, 321, 000	10, 334, 000	12, 899, 000	+2, 565, 000
Obligations by objects:

Budget Amendment, 1963

Appropriation: Administration of territories: Request, $2,579,000, for 12 months from July 1, 1962.

PURPOSE AND NEED FOR ADDITIONAL FUNDS

The $2,579,000 requested in this amendment is required to cover obligations not anticipated when the 1963 budget estimates were submitted. This amount will provide funds for the installation of television and related facilities in American Samoa to be used in furthering the educational program in that territory.

JUSTIFICATION

American Samoa does not now have anything approaching an adequate public school system. Its buildings and facilities are almost nonexistent by the lowest American standards. The Samoan teachers have an approximate sixth grade education and are almost illiterate in English. Yet the children exposed to this condition are American, and their needs must be of vital concern to the United

States. This condition is exposed to the view of the world by every ship and every plane that comes to Tutuila. Uncomfortable comparisons have been made and will continue to be made until the situation is corrected. In spite of all of the deficiencies under which the Samoan schools have suffered, there is a reservoir of talent, a high rate of intelligence, an eagerness to learn, and a potential motivation for self-advancement, that makes a crash rehabilitation of the educational system, not only possible and desirable, but entirely feasible.

A new educational structure and outlook must be established that will provide the Samoan children with the skills, knowledge, and insight into modern concepts that will enable them to participate with other Americans, without scarificing the essential and desirable values of their Samoan culture. The whole Samoan population must be included in the process. The most feasible, the quickest, and in the long run, the most economical way to do this is through the use of educational television. The home is still the most powerful single force in the education and development of the Samoan children, and only educational television can reach both the home and the school with equal force. The adults in the villages must understand and participate in the new educational structure if it is to be built rapidly, and is to be effective. This can be done through television at a feasible cost, and with the least strain on the social structure of the islands. All the teachers can be upgraded through continuing inservice teacher education that would not be possible without the use of television. Through instructional television English equivalents to Samoan understandings can be graphically demonstrated, and English comprehension and practical use can be advanced several years. This is an economic as well as an educational advantage.

Experience and research in the United States have shown that the use of television can improve the quality of instruction tremendously, and make quality instruction available to more children at less cost. In a society such as Samoa, where it is difficult to communicate abstracts, and thinking is basically concrete, the ability to produce graphic demonstrations by expert teachers through television will improve teaching and learning to an even greater degree. It will:

1. Hasten the development of a truly dual-language education that will advance understanding in both languages.
2. Allow start of formal instruction at an earlier age and at no additional cost.
3. Provide a continuing opportunity for adult education in the villages.
4. Provide a continuing program of in-service teacher education.
5. Provide opportunities for gifted children to move ahead.
6. Develop a sympathetic community and family climate that will facilitate the rebuilding of the school program.

In the long run the installation and effective use of educational television will save money while building a first-class system of education. Such an installation as proposed for American Samoa will be unique in the world. It will take advantage of all that has been learned about educational communications in the United States and, starting from scratch, create a system that will attract attention all over the world. There is no doubt of the effect it will have on American influence in the South Pacific.

If the present 267 inadequate Samoan teachers were to be replaced with American stateside teachers and supervisors at the nationally accepted ratio at the present time of 229 instructional staff members for the 5,500 children, this would mean a minimum expenditure of $2,300,000 including administration cost and amortization of housing over a 20-year period. Against this cost it is estimated that the yearly operating cost of instruction on a television basis, which would include 35 technicians and engineers, 12 TV teachers, 28 TV supervisors in schools, 260 Samoan teachers, 50 additional classroom teachers primarily on the secondary level and other operating cost, would amount to $1,400,000. By the inclusion of TV in the educational system of American Samoa, the net saving in operating cost would approximate $900,000.

It must be remembered that should the alternative of TV instruction be applied, that the greater number of imported personnel would not necessarily be of acceptable quality, nor would there be any guarantee that they would be satisfied enough to stay in Samoa long enough to become adjusted to the problems existing in the Samoan educational system.

The proposed television installation will require 6 channels in order to provide effective instruction throughout the 12 grades. In view of the fact that there is a job recruitment to be done in order to organize a staff for this operation, it is requested that a special item of $40,000 be approved for recruitment consulation and travel.

The introduction of this system will require the following capital expenditure:

Television studio and production center	$225,000
Studio equipment	405,500
Microwave equipment	100,000
Transmitter building	50,000
3 transmitter towers	150,000
6 VHF antenna	200,000
6 high-power transmitters	710,000
Transmission lines, filters, and transmitter monitoring equipment	50,000
Tower lighting equipment	1,000
Repeater equipment from islands of Manua	60,000
Receiving antenna and cable for local distribution system	7,500
300 tropicalized receivers for the schools	90,000
Access road to Mount Alava	100,000
30 housing units for television technicians and instructors (including furnishings)	390,000
Recruitment, consulation, and travel cost	40,000
	$2,579,000

It is estimated that the installation and construction program for the television station will take approximately 1 year. The general specifications are as follows:

1. Six, 100-kilowatt, VHF transmitters with two or three (whichever can be engineered) 500-foot towers located on or near Mount Alava, the approximate usable elevation of which is 1,400 feet above mean sea level.
2. A one-stage microwave system to relay picture and sound over six channels from the studios in Utulei to the transmitter site.
3. Use of strategically located and oriented receiving antenna feeding into coaxial cable of adequate length to reach receivers at schools and villages located in the television shadow regions.
4. The use of low-power, automatic relay stations located on the island of Ta'u to provide a local signal strength sufficient to cover the islands of Ta'u, Olosega, and Ofu.
5. The primary VHF channel assignments for Tutuila which are tentatively recommended as the even-numbered channels 2, 4, 6, 8, 10, and 12.
6. The low-power VHF repeater station channel assignments tentatively recommended for the island of Manua are the odd-numbered channels of 3, 5, 7, 9, 11, and 13.
7. Studios and production center to be located at Utulei as previously noted. This building would contain three live studios approximately 25 feet each, and three rehearsal studios, together with a projection room fitted for the operation of six vidicon film-chains, six video-tape recorders and, complementary motion picture and slide projectors—a master control room to house all the necessary power and control equipment, together with three local control rooms, with each having control over two of the transmitting channels.

AIRFIELD, AMERICAN SAMOA

Chairman HAYDEN. I note in the material which has been prepared for the committee a request for $600,000 to complete the jet airfield on American Samoa. As I recall, the 1962 budget carried funds in excess of $2 million, which was supposed to complete this airfield. Please explain to the committee what has happened and indicate whether the amount requested now will be all that is necessary to complete the construction.

Now, Mr. Taitano, do you have a statement you want to put in the record?

JUSTIFICATION FOR AIRSTRIP

Mr. TAITANO. No, sir; I do not have a statement. The Assistant Secretary has gone through it in general. I have this statement to say with respect to the jet airstrip. As you know, the previous justification is for the strip itself. That is the runway. Now, the $600,000 that we are asking for is to set up the seawall. This is the protective part along the shoreline and is to set up a seawall along there. The $600,000, of course, originally was estimated only for the seawall, but recent studies indicate that we may be able to save from the $600,000 about $100,000 for the terminal.

REPLACEMENT OF TERMINAL

As you perhaps remember, Mr. Chairman, in the past we did not justify anything for the terminal. Incidentally, Mr. Chairman, we have reorganized the construction organization of American Samoa. The U.S. Navy has been very cooperative and have loaned us their their engineers. Their engineers have recommended that we set up the seawall so that it will protect the runway. The $600,000 is primarily for that and for the replacing of the existing terminal, which is just a frame building.

NEED FOR SEAWALL

Chairman HAYDEN. Well, what is the purpose of the seawall? What is the menace? Would it be a storm?

Mr. TAITANO. From the lapping of the water from the storms it will gradually eat away the runway. That is correct, sir.

Chairman HAYDEN. Sometimes it deposits sand and sometimes it eats away the shoreline and in this case it has been eating it away in the past, is that right?

Mr. TAITANO. It has, sir. As you see, the runway is right along deep water. It is not on shallow water. We have covered the shallow water with fill. That is where the strip lies now, so that actually the water washing in won't be able to bring in sand because it is deep right by the runway.

Chairman HAYDEN. A seawall can be constructed in order to resist that?

Mr. TAITANO. That is correct.

Chairman HAYDEN. Do you believe that?

Mr. TAITANO. That is what the engineers say, sir.

Chairman HAYDEN. Very well.

TOURISTS TO AMERICAN SAMOA

A part of your construction funds are to be used for park and exhibition purposes to meet the demands of tourists. How many tourists are there a year coming to American Samoa and from where do most of them come?

Mr. TAITANO. A large number of the tourists presently are from the area itself, that is, from the South Pacific, mostly from Australia and the Fijis. They are not the type of tourists that stay too long in American Samoa, as it is now, because we do not have any hotel facilities for them. They are the tourists who will just come and spend a few hours in American Samoa and then leave.

Our program, of course, with the jet airstrip, is to gradually provide for facilities so we can have these tourists stay in Samoa for a longer period than they are staying now. I understand that about two boats a year will come in, that is, passenger boats, bringing tourists from Australia, the Fijis, and New Zealand, but of course these are the nonspending tourists.

Now, tourists from the United States and from Hawaii are very inconsequential and this is probably because of a lack of hotel facilities.

NEGOTIATIONS WITH HOTEL FIRM

Chairman HAYDEN. Is there any possibility of someone risking his own money to build facilities there?

Mr. TAITANO. Yes, sir. In fact, the Governor of American Samoa has been negotiating with a firm to construct a $1 million hotel. Now, the setback on that up to this time relates to the land problem, because under the laws of Samoa, long-term leases may not be made until the legislature under their own constitution, has approved the lease, and this takes or requires action of two legislatures. The legislature at the last special session approved the lease. Now, I think it takes another action, possibly this year.

Chairman HAYDEN. If this legislation is enacted by the legislature, then you believe that a private company would come in and make the investment?

Mr. TAITANO. It is quite probable, sir. You understand, the company is also having difficulty with its financing, that is, the finance company which is going to finance the project is not quite satisfied with the arrangements.

Chairman HAYDEN. They will not put money into it unless they think they can make money, is that right?

Mr. TAITANO. Yes.

PURPOSE OF GOVERNMENT INVESTMENT

Chairman HAYDEN. And also the government is not interested in putting money into this unless they can make money. In other words, the government of that area is not doing this for the purpose of taking in tourists, is that right?

Mr. TAITANO. That is correct.

Chairman HAYDEN. And it should not cost us anything. If they want to come and spend money there, that is fine, but I cannot see us putting up American taxpayers' money to entertain them.

Mr. TAITANO. Well, the project in the request here really involves the improvement of the market area. This does not only involve making the place attractive, but also some governmental facility would be provided. We have a public market in American Samoa that is really dilapidated. We want to replace that and make it more attractive. We also would like to set up facilities for a taxi and bus station right in this same area. They could improve the seaside portion of it by a little fill.

Now, as far as the hotel, the Governor realizes the problem and he has been trying to get private capital to invest in Samoa. For this reason, as you perhaps remember last year, Congress appropriated $180,000. We have not used that money. We are not going to improve the Rainmaker Hotel. We do not think it will be economical. So we are just holding on to that money, not spending it, and we are keeping, so to speak, our fingers crossed that the private capital will come in and invest in it.

FACTS ABOUT "TOURISM"

Chairman HAYDEN. There isn't any question at all that tourism, unless it exists to an extensive degree, is not profitable. I can say that for my own State. I have been an advocate of a Federal-aid highway system for a long, long time. As I explained to President Roosevelt once, when he wanted to know why Arizona needed roads more than any other State, it does not need them but there is in northern Arizona the Grand Canyon and other great scenic attractions and the best climate in America and I am interested in the National System of Highways to bring people into the State.

Now, the same problem exists in the islands. If a sufficient number of tourists come in they will buy the products of the islands, buy the curios and things like that, and in that way it would be profitable to the people of the islands. We have not spent any money in Arizona in building hotels, any money furnished by the Federal Government.

Mr. TAITANO. That is correct. We have not so far.

TV EDUCATIONAL PROGRAM

Chairman HAYDEN. In your justification material you have described the establishment of a television educational program in American Samoa as a crash rehabilitation of the educational system. Would you describe for the committee just what you have in mind?

Mr. TAITANO. Early this year, the government of Samoa entered a contract with the National Association of Educational Broadcasters and perhaps, Mr. Chairman, for the record, if I may I would like to include the biographical program data of the people that were sent out there and the firm we engaged.

Chairman HAYDEN. It will be included in the record.

(The information referred to follows:)

THE NATIONAL ASSOCIATION OF EDUCATIONAL BROADCASTERS

The National Association of Educational Broadcasters, the only professional organization of noncommercial radio and television broadcasters, is now in its 37th year of building, supporting, and upgrading educational broadcasting.

It is a nonprofit trade and professional association of educational institutions operating educational, noncommercial television and radio stations, or closed circuit and production centers. NAEB membership comprises educational institutions and organizations which own and operate radio and TV stations; educational institutions which act as production centers, regularly producing educational programs independently or over commercial outlets, or operate closed circuit TV installations; educational institutions or public service organizations interested in promoting educational broadcasting; and individuals whose careers are in educational broadcasting.

The association serves educational broadcasting through workshops, seminars, regional and national conferences, legal and management consultant services, and the publication of numerous publications in radio and TV, including a monthly Newsletter and Washington Report and a bimonthly Journal (including research fact sheets). NAEB has an exchange advisory membership relationship with most national educational organizations and exchanges programs and publications with the radio systems of more than 23 foreign countries.

The NAEB operates the Nation's only educational radio network, which distributes 10 hours of programs per week to some 107 member stations. In addition, the association conducts research in educational broadcasting, maintains a placement service for educational radio and television personnel, and contracts with Government agencies to carry out projects in the United States and abroad.

Since the NAEB membership includes the principal educational institutions of the United States in its constituency, the NAEB is in a position to provide the best qualified personnel from the national pool of talent in research, engineering, programing, management, inschool instructional program development, special studies, and other areas. Many of the consultants available have already had successful experience in foreign assignments.

From this unique reservoir of expertise, the NAEB has made its services available to professional and regional groups, and U.S. agencies for projects ranging from the conduct of studies of engineering, financing, programing, and utilization of radio and TV systems for schools and colleges in the United States, to the sending of consultation teams abroad to conduct feasibility studies, prepare plans, and assist in development of radio and television systems in underdeveloped countries.

WILLIAM G. HARLEY

President of National Association of Educational Broadcasters. Currently on leave as professor of radio-television education, University of Wisconsin, where he has been for 25 years successively chief announcer, program director of station WHA, program supervisor of Wisconsin State Broadcasting Service (10 radio stations owned and operated by the State of Wisconsin); manager of WHA-TV.

In 1952-54, executive producer, NAEB adult education project, financed by Ford Foundation.

National offices held include: chairman of board, NAEB, 1959-60; chairman, affiliates committee of the National Educational Television and Radio Center.

Currently, member of board of directors of: Joint Council on Educational Broadcasting, Educational Media Council, FM Broadcasters Association, Learning Resources Institute.

At invitation of U.S. Department of State, represented American educational broadcasters at First International Festival of Television Arts and Sciences, Montreux, Switzerland, 1961; delegate, International Conference on School Broadcasting, Rome, 1961.

Traveled extensively re international exchange of educational program materials and consultation for newly emerging countries establishing radio and TV systems: England, Italy, Switzerland, France, Turkey, Iran, Sudan, Netherlands, and Denmark.

VERNON BRONSON

Recently retired from the Dade County (Miami) Fla., public school system, has been actively engaged in educational administration and supervision for the last 30 years. He has worked on all levels of education from school through college, and for a number of years was intensely involved in teacher education. He has supervised both State and local programs, and for many years has been a nationally recognized consultant in education and in educational communications. He has been the author of several workbooks, pamphlets, monographs, articles, and teachers' manuals in this area, and has written local, State, and National reports of educational surveys. He planned and built the educational radio, and, later, the educational television system in Miami, one of the outstanding in the country.

He was adviser to Governor Collins of Florida, and wrote the plan for statewide educational television that was enacted into law under Governor Collins' sponsorship.

He has planned and built two television stations and two radio stations, and has participated in the planning of several others. He has been consultant on educational television and the use of television in the schools for the States of Kansas, Florida, Tennessee, West Virginia, Virginia, and Alabama, and for the Southern Regional Education Board, the National Education Association, the North-Central Association of Colleges & Secondary Schools, and the National Association of Educational Broadcasters, as well as numerous schools, colleges, and school districts. He has conducted teacher training for television teachers at the University of Virginia, Auburn University, University of Miami, and at Barry College. He was the director of the National Survey on the Needs of Education for Television Spectrum Space, and several State and local surveys. He is presently engaged in directing a survey for the U.S. Office of Education on the use of satellites in educational communications.

DR. LAWRENCE H. SHEPOISER

Has been superintendent of the Wichita, Kans., public schools for a number of years and has developed this system into one of the outstanding school systems in the United States. He has been recognized nationally as a school administrator and was superintendent of schools in Mason City, Iowa, for 10 years prior to coming to Wichita. Dr. Shepoiser has been an experimenter in the use of television in classroom instruction for the past 8 years.

DR. WILLIAM T. KESSLER

Professor of electroengineering at the University of Florida for the past 20 years, and is consulting and design engineer for the Florida Educational TV Commission and is consultant to the Florida Central East Coast Television Association.

ELEMENTARY SCHOOL SYSTEM

Mr. TAITANO. What we have in mind here, we realize we do have a problem with our elementary school system. As you perhaps might recall in the past we have left this responsibility for the local Samoan people, the problem of the elementary school system. Now, this is a part of our secondary system. The Samoans, neither having the money nor the know-how, cannot come out with a reasonable school system. So what has happened is that when they finish the sixth grade, really they are only comparable to the second or third grade student here by stateside standards.

Now, this survey group that we sent down comprising four people, three educators, most of them in the past dealt with education through radio broadcasts and through television, and the educators themselves have pointed out that the elementary school system has not been working well. In fact, the report pointed out that perhaps only one or two of the instructors in the educational system are qualified personally to teach.

SHORTAGE OF QUALIFIED TEACHERS

Realizing this, this comes now as a matter for improving the quality. What will be the best way to improve the quality in the shortest time possible? Now, certainly, there is no substitute for qualified teachers, but this would mean to us to perhaps replace about 270 Samoan teachers, 269 of whom are not qualified.

Now, to bring in qualified teachers will mean we either have to recruit them from Hawaii or from the mainland. This will entail housing facilities and the usual costs that we find when setting up an acceptable system.

Now, the firm itself, through their team which they sent down, came back and recommended that in order to solve the elementary school deficiency, the quickest way would be to install a television system.

TELEVISION TO SUPPLEMENT TEACHING

Now, we realize, Mr. Chairman, that this is perhaps a novel approach. In the United States I understand that the television system is used only as a supplement to the existing system. Now here, however, we are proposing that we use the educational television to upgrade and at the same time train the teachers to upgrade the quality of education and to also train the Samoan teachers.

COST OF INSTALLATION

The report came back and it estimated that to do this it will cost, in the first year, approximately $2,579,000. This will entail, I understand, six channels, the setting up of studies, towers, television equipment, I mean receivers, and personnel later; but this will take approximately 1 year of further study to recruit people and to go into more specific engineering studies so that actually the money requested now will not mean that we will have an educational program going in 1963, but rather it will be in the following year.

Chairman HAYDEN. I am a little bit curious as to how you are going to go about assembling those who will listen to the television program?

PUPIL RECRUITMENT

Mr. TAITANO. Well, sir, this is what we are doing. There will be a double approach to it and it will be not only for the elementary school education but also for adult education. What we are proposing to do is to also replace the elementary buildings. Presently they have about 54 school buildings. The Senate Committee that was down there thought that the schools were so scattered out that we cannot teach effectively. Also, this team that went down there came back and recommended a consolidating of the school system into 20 schools rather than the 54 schools we now have.

Now, we will have then 20 schools where we will have television receivers. Of course, from the broadcasting station then or from the studio you will have live teaching supplemented by tape recordings and slides and the like, the usual things.

Chairman HAYDEN. Will there be then certain hours in the day when the young people or anyone else who is interested in education will go to this place?

Mr. TAITANO. No, sir. They will go to school at their normal times. They will go to school during the normal school hours. They will have a Samoan teacher there and of course in each school they plan to put in a stateside supervisor, one qualified in teaching through television.

TEACHERS IN TELEVISION SERVICE

Now, from the studio the lessons would be brought to the teacher in each classroom who will be with the children following the lessons as broadcast from the central studio.

Chairman HAYDEN. How many of those would there be?

Mr. TAITANO. You mean how many school buildings?

Chairman HAYDEN. No, how many teachers will perform this service?

Mr. TAITANO. There will be 12 teachers. They are what we call television teachers. There will be 12 of them scattered out in the schools

SUPERVISORY PERSONNEL

Now, in addition to this, we will have the Samoan teachers in the classrooms. The supervisors will be out there helping the Samoan teachers.

Chairman HAYDEN. Would those supervisors be from the mainland?

Mr. TAITANO. That is correct, sir. We have to recruit only those who are qualified and experienced in that field.

Chairman HAYDEN. Now, how many of those will there be?

Mr. TAITANO. Twelve. I believe, sir, it is 12.

Chairman HAYDEN. What I am trying to get out is, how are those 12 being spread? Is it over a larger number of places?

Mr. TAITANO. Twelve teachers and twenty television supervisors.

Chairman HAYDEN. They will be from the United States?

Mr. TAITANO. That is correct, sir.

Chairman HAYDEN. I see. There will be one person, then, wherever there is a television for somebody to view.

Mr. TAITANO. Yes, sir.

Chairman HAYDEN. And he will explain the television program as it goes along?

Mr. TAITANO. That is correct, sir. Otherwise, if we want to improve the quality, we have to replace every Samoan teacher that we have now, and perhaps even send the Samoan teachers to school.

HOME TELEVISION FACILITIES

Chairman HAYDEN. Also, in your justifications, you include the statement:

The home is still the most powerful single force in the education and development of the Samoan children and only educational television can reach both the home and the school with equal force.

If there are no television facilities in Samoa now, there must be no television receiving sets in the homes. What is proposed by way of providing home television receivers?

Mr. TAITANO. The television sets that we are asking for will be used primarily for the school. The homes the individual ones, we will buy, or the ones who can afford them will buy their own.

Now, we might have, say in a community building, like in a village where we have a community building, the government might furnish the set so that people, at certain stated hours, may come in in the evening. But those who want to have sets in their own homes will pay for those.

ANNUAL COST OF PROGRAM

Chairman HAYDEN. Now, when it is all completed and installed, what is the estimate of the annual operating cost of those programs?

Mr. TAITANO. I thought I had the figure here, sir, but I do not have it. I will have to get the breakdown. In any event, the report pointed out that, compared to the alternative, we will be saving about $900,000. Now, the entire school system, after the setting up of the televisions, will annually cost us approximately $1,400,000. This is the television after it is installed.

Chairman HAYDEN. The alternative would be to bring teachers in from the United States?

Mr. TAITANO. That is correct, sir.

Chairman HAYDEN. And compared to that, this would be cheaper?

Mr. TAITANO. That is correct, sir.

NUMBER OF CHANNELS NEEDED

Chairman HAYDEN. Now, you propose six television channels. Could your program operate efficiently, at least at first, with any lesser number of channels? If so, how many less and at how much less cost?

Mr. TAITANO. You would have to ask me that. I am not prepared to answer that, but I am willing to get the figure. I know the Governor is trying to get the figures.

Chairman HAYDEN. You may insert that in the record.

Mr. TAITANO. Yes.

(The information referred to appears on p. 742.)

NUMBER OF TELEVISION SETS NEEDED

Chairman HAYDEN. You have proposed purchase of 300 tropicalized receivers for schools. Does this mean that there are 300 schoolrooms in which these television sets will be placed?

Mr. TAITANO. Approximately, sir. This is not only the schoolrooms but also what I mentioned before, in certain community buildings.

Chairman HAYDEN. Do you think altogether there are more than 300 places you could put them? I am trying to find out how you arrived at this figure of 300.

Mr. TAITANO. This is our best estimate. This includes the combinations of schools where we want to place them and the community buildings where we will need to place them and, of course, perhaps in the studio there will be some sets.

COMMUNITY BUILDINGS

Chairman HAYDEN. How many community buildings are there?

Mr. TAITANO. Right now, sir, we have several villages, or we have in the main island over a dozen villages. Now, of course, we may not necessarily follow the pattern of just putting one in each village. For instance, under our present plan we are not going to extend the television to two of the villages. These are two on the other side of the island where actually there is quite a bit of difficulty. Now, the community villages I am talking about, for instance, in the Pago-Pago area, in the bay area, as it is now, they divide themselves, right there alone, into several districts, maybe a dozen. Of course, we are not going to follow that pattern, but are rather going to set it up where you will have a maximum number with the optimum use.

COST OF MODIFIED SETS

Chairman HAYDEN. These are estimated at a cost of $300 each. Who made these estimates? Is there one company proposing to supply all the sets, and does this cost include such modifications as are necessary to tropicalize the sets?

Mr. TAITANO. It certainly includes modifications to tropicalize the sets, sir. You are correct. It will include that. This is giving it the extra protection it needs because of the type of climate we have in American Samoa. Now, the estimate, I understand, was made by a certain firm which has been in this type or line of product. I don't know, sir, the name of the firm.

Chairman HAYDEN. Would you give us that for the record?

Mr. TAITANO. I will do that, sir.

(The information referred to appears on p. 742.)

Chairman HAYDEN. That is all on that subject. Next will be the Trust Territory of the Pacific Islands.

Mr. Taitano, are you speaking to this, also?

TRUST TERRITORY OF THE PACIFIC ISLANDS

Mr. TAITANO. I am sorry, the High Commissioner is not able to be here. He is right now very much engaged in, and I might mention this for the record, making preparation for the transfer of the headquarters of the trust territory government from Guam to Saipan. We have received notice from the U.S. Navy that by July 1 they would leave Saipan. They will no longer need Saipan as a military base. They will be leaving some facilities, plant facilities there.

Now, as you perhaps might recall, there has been a movement to move the trust territory headquarters from American soil to trust territory soil. Originally, it was at Hawaii, then it was transferred to Guam and now we are proposing to transfer it to Saipan, one of the Marianas Islands. On July 1 the trust territory headquarters will be moving to Saipan and that is why the High Commissioner is not able to be here.

Chairman HAYDEN. I see.

AMOUNT REQUESTED

Ten million dollars are requested for fiscal year 1963 for the Trust Territory of the Pacific Islands. This is $3,696,000 more than was made available in fiscal year 1962. The justification for this estimate will be included in the record.

(The justification referred to follows:)

TRUST TERRITORY OF THE PACIFIC ISLANDS

The purposes and objectives of the administration of the Trust Territory of the Pacific Islands continue in accordance with the aims of the trusteeship agreement under which the United States of America administers the trust territory. The basic objectives are to promote political, economic, educational, and social development of the inhabitants, and to improve the health and well being of the people through the introduction and use of modern and improved public health measures.

All programs made significant progress during the past year. There has been continued participation and leadership by Micronesians. The Interdistrict Advisory Committee meeting for 1961 was the first to have delegates from Saipan, who were previously observers only, and the movement toward popular election of delegates is nearing reality.

Micronesians continue to replace U.S. employees in higher level positions, with over 60 positions in 19 categories, formerly encumbered by Americans, now held by Micronesians. A new and higher pay scale, to more adequately compensate Micronesians in positions of leadership, has been established, and in January 1961, an across-the-board pay raise was granted the Micronesian employees of the trust territory. In-service training and scholarships continue as an important program, including medical and dental training at the U.S. Navy hospital in Guam.

Copra production and exports reached a record level. The cacao and fisheries programs made good progress. A Trust Territory Farm Institute was started at Ponape to offer training in agriculture to Micronesian farmers, as well as research and development. District economic development boards, staffed by Micronesians, continued to play an increasingly active role in local economic affairs, with credit unions, producing and marketing cooperatives, handicraft development, and small scale industries such as charcoal, small boat building, coir fiber, etc., being developed throughout the territory. Banking facilities in the trust territory were increased by the opening of a commercial bank at Palau, in September 1961. A new field trip vessel will be put into service shortly. Typhoon rehabilitation is progressing ahead of schedule, including rehabilitation at Yap from the 1960 typhoon at Ulithi.

Specialized public health training in sanitation and laboratory work was accelerated during the year, and tuberculosis treatment and control teams have been set up in all districts. Hospital construction was continued at Palau and in the Marshalls.

Teacher requirements and salaries were standardized during the year. Scholarships to schools of higher learning continued, with over 50 students on Government scholarships during fiscal year 1961. Intermediate schools were constructed wholly with trust territory government funds, and financial assistance, in the form of grants-in-aid was given to municipalities for the construction of elementary schools. Better school facilities and programs for dependent U.S. children have been provided.

No major program changes are contemplated for the current year. However, additional emphasis is being given to the economic development program and assistance to the elementary schools, which are the foundation for continued progress in the educational system of Micronesia.

The objectives and programs for the budget year are designed to carry forward the aims of the trusteeship agreement. To achieve these aims an expanded program is contemplated with particular emphasis being placed on health, education, economic, and political development, transportation, communications, and other support activities, and continuation of the permanent-type construction program begun in 1955 which includes, in 1963, projects for hospitals, schools, utilities, airfields, roads, and docks and harbor facilities.

It is desired that the revolving fund for loans to locally owned private trading enterprises continue to be available during the 1963 fiscal year in order to encourage and strengthen their participation in the economic development within the area.

Trust Territory of the Pacific Islands

Appropriation, 1961	$5, 925, 000
Appropriation, 1962	6, 304, 000

SUMMARY OF INCREASES 1963

High Commissioner's Office: To provide for an executive officer and increased operating costs	+20, 600
Judiciary: To provide for a small increase in operating costs as this activity will continue at approximately the current year level	+900
Grants: To provide for expansion of programs relating to public health, education, political and economic development, and construction	+3, 674, 500
Net change, 1963	3, 696, 000
Budget estimate, 1963	10, 000, 000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. High Commissioner's Office	$78, 844	$71, 400	$92, 000	+$20, 600
2. Judiciary	62, 545	86, 100	87, 000	+900
3. Grants	5, 783, 500	6, 146, 500	9, 821, 000	+3, 674, 500
Unobligated balance	111			
Total	5, 925, 000	6, 304, 000	10, 000, 000	+3, 696, 000

The Trust Territory of the Pacific Islands is administered by the Secretary of the Interior under Executive Order 10265, as amended, in accordance with a trusteeship agreement between the United States and the Security Council of the United Nations approved by the President under authority granted by the Congress (61 Stat. 397). Under the terms of the agreement, the United States exercises full administrative, judicial, and legislative authority over the territory and has undertaken obligations to promote the political, economic, social, and educational advancement of the inhabitants.

The entire trust territory which consists of the Marshall, Caroline, and northern Marianas Islands, comprises 96 islands and island groups with a total land area of 687 square miles. Pursuant to Executive Orders 10408 and 10470 of November 10, 1952, and July 17, 1953, respectively, the northern Marianas excluding Rota, were transferred to the Navy. That portion of the territory under the jurisdiction of the Department of the Interior extends over 3 million square miles of ocean, consists of 83 islands and island groups with a land area of 564 square miles, and has a population of about 75,000.

The Interior Department's administration of the territory is conducted by the government of the Trust Territory of the Pacific Islands under the High Commissioner to whom has been delegated executive, and to a large extent legislative, powers under the direction of the Secretary. The judicial system has been established independent of the executive and legislative functions within the territory. The High Commissioner administers the territory through a headquarters staff at Guam, and staff headed by a district administrator at Yap, Koror, Truk, Ponape, Majuro, and Rota.

Grant funds are being requested to supplement local revenues for health, education, and other essential services, as well as for establishing and maintaining the necessary facilities for the government of the territory. Funds are also being requested for the continuation of the permanent construction program. The 1963 request includes funds for the construction of hospitals, schools, warehouses, family quarters, and various facilities and purchase of fixed equipment. The costs of government are distributed as follows:

Summary by activity

Activity and subactivity	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
High Commissioner's Office	$78,844	$71,400	$92,000	$20,600
Judiciary	62,545	86,100	87,000	900
Health, education, economic and political development:				
(a) Public health	583,901	575,000	700,000	125,000
(b) Education	506,406	575,000	975,000	400,000
(c) Economic and political development	452,613	497,000	836,000	339,000
(d) Legal and public safety	203,708	184,000	210,000	26,000
Operation and maintenance:				
(a) Operation and maintenance of physical plant	1,301,259	1,000,000	1,450,000	450,000
(b) Radio communications	171,693	175,000	300,000	125,000
Transportation Service:				
(a) Sea transportation	1,207,766	1,100,000	1,610,000	510,000
(b) Air transportation	384,118	600,000	421,000	−179,000
General Administration	1,394,631	1,490,500	1,320,000	−170,500
Construction	982,387	1,350,000	3,499,000	2,149,000
Subtotal	7,329,871	7,704,000	11,500,000	3,796,000
Less: Estimated local revenues and reimbursements	1,404,871	1,400,000	1,500,000	100,000
Total	5,925,000	6,304,000	10,000,000	3,696,000

Statement of estimated revenue by source

Source of revenue	Actual, 1961	Estimate, 1962	Estimate, 1963
Public Health Department: Medical and dental fees	$42,507	$48,000	$43,000
Public Works Department operation and maintenance:			
Building, land and dwelling rental	93,096	83,000	93,000
Equipment rental	3,940	15,000	4,000
Garage and other service charges	12,547	10,000	13,000
Utility charges	38,785	30,000	40,000
Cargo handling	64,195	60,000	64,000
Total operation and maintenance revenue	212,563	198,000	214,000
Communications: Radio dispatch revenue	30,095	40,000	38,000
Agriculture Department: Sales of agriculture products	6,839	10,000	9,000
Transportation services:			
Freight and passenger revenues:			
Sea transportation	417,621	528,000	520,000
Air transportation	72,694	80,000	80,000
Total transportation revenue	490,315	608,000	600,000
General revenues:			
Stevedoring	92,580	95,000	92,000
Internal revenue [1]	4,423	5,000	5,000
Copra processing tax	266,740	247,000	250,000
Cigarette tax	40,542	55,000	55,000
Licenses, fines, and forefeitures	6,081	5,000	5,000
Trochus royalties	1,280	5,000	5,000
Interest earned	42,098	25,000	25,000
Miscellaneous, not classified [2]	20,634	14,000	14,000
Scrap sales, miscellaneous	15,396	15,000	15,000
Sales of trust territory property	20,931	25,000	25,000
Petroleum products sales [3]			400,000
Discount earned	3,932	5,000	5,000
Total general revenue	514,637	496,000	896,000
Subtotal	1,296,956	1,400,000	1,800,000
Less: Allocation of local revenues to establish a "Supply Revolving Fund"			300,000
Total revenue applied to operating expense	1,296,956	1,400,000	1,500,000

[1] Consists of excise tax on imports.
[2] Miscellaneous revenues are composed of items not generated in all districts, such as laundry charges.
[3] These sales were not shown as revenues during 1960 and 1961 fiscal years, but were credited to expense. The petroleum sales are made to local trading enterprises, and to the scattersite projects at Palau and Ponape. During 1961 fiscal year the amounts were $290,000 and $130,000 respectively.

Petroleum products are essential to the general welfare, but no means is available to finance and distribute these products except through the facilities of the Trust Territory Government. Rather than finance the purchase of petroleum products through use of operating funds, it is requested that $300,000 of the estimated collections from sale of petroleum products be used to establish a "Supply revolving fund" for purchase of petroleum products and other common use items.

Property and supply stock fund, $300,000

	Actual, 1961 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
Property and supply stock fund			$300,000	$300,000

The purpose of this fund is to provide a better method of financing the procurement and distribution of petroleum products and other common use items in trust territory. At present the only available petroleum products storage and distribution system belongs to the trust territory government, and this is an integrated system that cannot be broken down for rental or use by outside interests. During 1961 fiscal year the use of petroleum products in trust territory was as follows:

(*a*) Trust territory operations	$345,000
(*b*) Sales to local trading companies and U.S. Government agencies	290,000
(*c*) Sales to scatter-site projects at Palau and Ponape	130,000
Total	765,000

Heretofore the purchase of petroleum products has been financed through use of grants and local revenues that were appropriated for operating expenses. The above statements also hold true where other common use items are purchased for inventory. Due to the distance from stateside sources of supply, it is imperative that certain goods be on hand for use when required. Prior to 1957 fiscal year most purchases were made for account of the programs with no accountability for the asset represented by the cupboard stocks of goods.

As of June 30, 1961, the value of inventories on hand (exclusive of cupboard stocks charged to expense) was: Cement, $17,000; medicines and medical supplies, $70,000; spare parts for equipment, $240,000; general stores, $290,000; aviation gas and oil, $19,000; other petroleum products, $220,000. It is expected that June 30, 1962, levels would be approximately the same. The statement of assets and liabilities as of July 1, 1962, would as presently contemplated be composed of cash and/or receivables in the amount of $300,000 and the above inventories.

1. HIGH COMMISSIONER'S OFFICE

The estimate of $92,000 for the budget year is $20,600 greater than the amount available in the current year. This increase is to provide for an executive officer GS–15, and the additional necessary funds for travel, office supplies, personnel benefits, and equipment.

The High Commissioner is responsible to the Department of the Interior for administration of the Trust Territory of the Pacific Islands.

The expenses of this office are distributed as follows:

U.S. personal services and benefits	$80,000
Travel and transportation	10,000
Supplies and materials	1,500
Equipment	500

2. JUDICIARY

The estimate of $87,000 is $900 greater than the amount available in the current fiscal year. This activity is headed by the chief justice, with a staff composed of an associate justice, a court reporter, a secretary, 17 full-time Micronesian judges and clerks of court, and 94 part-time judges and clerks who serve on a per diem basis. The part-time staff are on duty and paid only for the days when court is in session. The high court of the trust territory consists of appellate and trial divisions. In each district there is a court having original jurisdic-

tion concurrently with the high court in all civil cases where the amount or value of property does not exceed $1,000, except admiralty and maritime matters, and the adjudication of title to land or any interest therein; also in all criminal cases where the maximum punishment may not exceed a fine of $2,000 or imprisonment for 5 years, or both.

The expenses of the judiciary are distributed as follows:

U.S. personal service and benefits	$47,000
Micronesian judges and clerks of court	34,000
Travel	5,000
Materials, supplies, and equipment	1,000

3. GRANTS

Administration and operation	$6,322,000
Construction	3,499,000
Total grants	9,821,000

A Federal appropriation of $9,821,000 is estimated to be required for the trust territory in the fiscal year 1963 to supplement local revenues. These funds will permit an expansion of the programs affecting public health, education, political and economic development, public works, and construction.

(a) Health, education, economic, and general welfare services

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Public health department	$583,901	$575,000	$700,000	$125,000
Education department	506,406	575,000	975,000	400,000
Economic and political development	452,613	497,000	836,000	339,000
Legal and public safety	203,708	184,000	210,000	26,000
Total	1,746,628	1,831,000	2,721,000	890,000

Public health department, $700,000

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Hospitals	$368,901	$300,000	$361,200	$61,200
Field medical services	70,000	75,000	78,000	3,000
Sanitation	35,000	32,000	34,200	2,200
Medical education and training	40,000	40,000	33,000	−7,000
Administration	70,000	63,000	109,900	46,900
Nursing school		15,000	25,600	10,600
Dental services		50,000	58,100	8,100
Total	583,901	575,000	700,000	125,000

Hospitals, $361,200.—This estimate represents an increase of $61,200 over 1962 fiscal year. The increase is required to meet the operating costs of eight hospitals, six at the district centers and two enlarged subhospitals at outisland locations ($26,200). All medicines and medical supplies are purchased from the funds allotted to the hospitals. The program for the care and protection of infectious diseases is increased, particularly in the fields of tuberculosis and leprosy as well as preventive inoculations ($10,000). Replacement of equipment is a necessity and an estimated $25,000 will be needed to meet the increased cost of new equipment for the hospitals. The enlarged subhospitals are located at Kusaie, 300 miles from Ponape; and Ebeye, 240 miles from Majuro. Both have increased inpatient facilities and larger staffs. The population served is 3,000 at Kusaie and 1,500 at Ebeye. A leprosarium has been activated at Pingelap, 150 miles from Ponape, to increase direct attack on this disease.

In the past year 49.4 percent of the total births were in the hospitals, about 3,100 women were seen in prenatal and postnatal clinics, about 1,400 children were seen in well-baby clinics, there were 8,038 discharges from the hospitals, there were 66,419 cases seen in the outpatient clinics at the hospitals. This work was done

by a Micronesian staff which included 32 medical officers, 18 dental officers, 61 nurses, 13 dental assistants, 105 nursing trainees, and 123 other helpers in laboratories and offices.

Field medical services, $78,000.—This is an increase of $3,000 over the current year. This amount is only for salaries of Micronesian personnel who work at 103 dispensaries and health centers. This group served 102,700 visits in the past year and drew their supplies from the hospitals at the district centers. There will be an increase in the amount of preventive work done at these outisland dispensaries in the coming year and some increase in personnel is expected. Normal step increases in salary account for $1,000 of the increase. Fifty percent of the population of the territory depend on field dispensaries for their day-to-day health services.

Sanitation, $34,200.—The estimate is an increase of $2,200 over fiscal 1962. Special work in health education has been assigned to the department of sanitation and extra teaching materials and added personnel are necessary as the program expands. There is a definite program to increase the contact with the schoolchildren and village people to provide more on-the-spot health education. Much of this will pertain to sanitation. There is also an incease in the epidemiological search for locations of infectious diseases and a greater effort to improve actual field conditions. This means more personnel and more supplies to combat pests. A team of 22 sanitation trained men performs this work both in teaching and pest eradication; these men also make regular inspections for cleanliness as related to food processing and the preparation of same at dining establishments, and assist in quarantine work.

Medical education and training, $33,000.—This is a reduction of $7,000 as compared to the current year. There will not be any reduction in the amount or quality of the training during the year, but rather full use of the funds so designated. There are 10 students at Fiji Medical School, and it is planned to send 4 more this year. There are two students at the University of the Philippines, and two more have qualified for entrance and will be sent. Six medical interns are at the Navy hospital on Guam, and four are expected to replace them on completion of their postgraduate training. Dental officers are getting an intensive course in the Navy dental clinic at Guam; and two men at a time attend for a period of 6 weeks until all have had this special training. The same type of course is in progress at the Guam Memorial Hospital in the sanitation department for the trust territory sanitation men. Special short courses of 4 to 6 weeks are offered to medical officers and nurses who express a desire for some special subject. One dental officer will go to the University of Michigan for an intensive postgraduate course.

Administration, $109,900.—This is an increase of $46,900 over the current year. There is an increase in the headquarters staff in the Micronesian group of two special assignment medical officers, one in sanitation, one American typist and two Micronesian clerks in the statistics division; $31,900 is allocated for the replacement of capital equipment to be assigned by the director of public health, costs for hospital care outside of the trust territory will be absorbed by this headquarters fund. Travel by the new special medical and sanitation officers will be an increase over the past years. Special reference books are purchased from this fund for use in special teaching. Travel costs for students going away to school are borne by headquarters moneys (Fiji, Manila, Honolulu, United States). There will also be supplied from headquarters funds vaccines for public health protection and immunization of the people. This vaccination program will be put into effect during the budget year, and will be a continuing effort to create general biological protection.

Nursing school, $25,600.—The estimate is an increase of $10,600 over 1962. This school is the professional training source for all nurses serving in the trust territory hospitals. This year there is an increase in the student group to include a student from the Bonin Islands. All are scholarship students and fully supported by school funds. An increase in the curriculum in the fields of public health and administration is planned; an up-to-date library of reference books is in the process of being acquired. In the past all clinical training has been at the Koror hospital; it is now planned that students will get clinical training in other district hospitals to enlarge their field of experience. This added cost must be borne by the nursing school budget. Graduate work in nursing is planned for special students; and the five members of the regular teaching staff will be sent to the College of Guam for a summer course in new teaching techniques. New teaching equipment in visual aids is needed. The additional funds will be used to improve the quality of the nursing staff at the undergraduate and graduate levels.

Dental services, $58,100.—This is an increase of $8,100 over 1962. The dental services have increased the schoolchild program of preventive care and health education in mouth hygiene. There is more service and greater travel by the staff to accomplish this work. There is a school for dental nurses and one class has been graduated and absorbed into the district dental services. This is a part of the preventive program. A new class of nine students has been started and a larger class program is underway. The extra equipment necessary to support these added nurses includes dental units for the cleaning of teeth as well as hand instruments. The new group will be trained in simple dental repair work to improve the future volume of repair and reconstruction available. The dental force handled 18,176 cases in the past year and will be prepared to care for more with the enlarged trained group. Service is offered in the district centers, at the hospital clinics, and portable units go into the field to carry on the work there (5,601 cases done in the field last year). The new plan is to add education in schools and villages to the field groups.

Education department, $975,000

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
Pacific Islands Central School	$90,850	$90,000	$170,000	$80,000
Secondary schools			50,000	50,000
Intermediate school	214,150	184,500	275,438	90,938
Elementary school	103,406	114,000	256,937	142,937
Special training	65,000	35,000	62,625	27,625
Administration	33,000	116,500	125,000	8,500
English-speaking schools		35,000	35,000	
Total	506,406	575,000	975,000	400,000

Pacific Islands Central School, $170,000.—The estimate for 1963 represents an increase of $80,000 over the current fiscal year. This additional sum provides $30,000 to cover costs of approximately 30 more enrollments in the high school, and $50,000 to start postgraduate teacher education courses. Present attendance is 150 students.

The teacher education courses are needed to provide better training for Micronesian elementary school teachers. An enrollment of about 25 teacher-trainees is expected for the 1963–64 school year. The increase for fiscal year 1963 will be needed to take care of the first teacher education class, but the continued growth of PICS and a second year of teacher education will require additional capital improvements in 1964–65.

The $50,000 for teacher education covers the recruitment of two U.S. teachers, two Micronesian employees, housing and feeding costs, and purchase of supplies and equipment.

Pacific Islands Central School is now a 3-year high school consisting of eight major structures; a three-classroom building; a science and laboratory classroom; a cafeteria-auditorium; an industrial arts shop; and three dormitories. Eight homes for faculty members are on a campus of 100 acres.

Seven U.S. and three Micronesian teachers are presently employed. With the addition of one post graduate class, the staff for 1963 will be nine U.S. teachers and five Micronesian teachers. In addition to the teaching personnel there are 10 more Micronesian positions, including kitchen, maintenance and clerical help.

In 1963 the major curriculum will continue to be in general education, although there will be electives in agriculture, commercial subjects and industrial arts, with teacher education as the postgraduate offering.

District school systems.—Each of the six districts of the trust territory runs a school system which includes village elementary schools extending through the 6th grade, and an intermediate school extending through the 9th grade (Ponape has 2 intermediate schools). At the present time there are 7 intermediate schools and 164 elementary schools. Beginning with fiscal year 1963, two districts will start 10th grades, and by 1966 all districts should have complete junior-senior high schools through the 12th grade. Adult education, community development programs, and long-wave broadcast stations will be accelerated in fiscal year 1963 as important adjuncts to the regular curriculum.

Secondary schools, $50,000.—These funds will be used for teachers' salaries, equipment and supplies to start 10th grades in Palau and Truk because in 1963 PICS will be able to absorb only about 15 percent of all the intermediate school graduates who will seek high school education.

Intermediate school, $275,438.—An increase of $90,938 will be needed at this level in order to provide additional U.S. staffing, increased food costs, equipment and supplies. The present intermediate enrollment of 886 will increase approximately 20 percent in fiscal year 1963; some will be absorbed in 2 new intermediate schools at other population centers in 1964.

Although the intermediate curriculum is designed as terminal education for some, there are more students each year seeking a broad general curriculum in English, science, mathematics, social studies, industrial arts, agriculture and homemaking. This necessitates better qualified teachers, a larger library, more supplies and teaching aids. The increasing population, the great distances which students have to travel in order to attend intermediate schools, the establishment of more dormitories, and feeding programs add to the higher costs in fiscal year 1963.

Elementary school, $2 6,937.—The increase of $142,937 for elementary education in fiscal year 1963 represents the first stage of an accelerated program aiming at universal primary education by 1966. These funds are to provide better supervision, transportation costs, more teaching materials, supplies and equipment, and increases in teachers' salaries; $75,000 is provided as a contribution to municipalities for use in raising salaries of qualified teachers; elementary school teachers' salaries now average $27.50 per month.

The elementary schools have been financed primarily by the Micronesians with funds derived from local taxes, fees, and assessments. The trust territory has provided supervisory personnel and most of the supplies. Schoolhouse construction is a local responsibility which has received some assistance from a trust territory grant-in-aid program that has contributed over $40,000 to date. Improvement of the elementary schools is dependent on substantially more financial support by the trust territory in order to supplement the budgets derived from local taxes.

Official statistics show that there are 164 elementary public schools, 10,580 pupils and 358 teachers in the trust territory. In the outer islands many of these schools consist of little more than a thatched roof with sand floor and little or no furniture. About half of the teachers have only an intermediate school education; in many cases, attendance is intermittent and spasmodic. Six years of primary education is provided with the emphasis on the basic subjects of reading (in vernacular and English), arithmetic, science, social studies, arts, and crafts.

Special training, $62,625.—The increase of $27,625 is needed to meet rising costs in college tuition, books, subsistence, and travel. Qualified Micronesians are carefully selected for this special training and represent an investment in leaders who are gradually assuming positions formerly held by Americans. Most of the scholarship students attend the local College of Guam, although many continue for degrees in the Philippines, Hawaii, and the United States.

Administration, $125,000.—The acceleration of education at all levels has necessitated the addition of a staff librarian and supervisor of languages who will function on the headquarters staff. These new positions have been created primarily to improve the teaching of English throughout the territory and to help in the production of teaching materials.

The director of education, his assistant, a secretary, a housemaster for the scholarship students, and the six district educational administrators comprise the other administrative positions of the department of education. Funds requested are to be used for salaries, travel, printing and publication, equipment, supplies and materials.

English-speaking schools (dependent schools), $35,000.—These funds are needed to pay the salaries of five U.S. teachers and to provide materials and supplies for the English-speaking schools that serve dependent American children. Formalized schools for dependent American children did not exist until 1962. At the present time, there are 84 dependent American children and 11 Micronesians who attend these schools. Qualified Micronesian pupils who can speak English pay a nominal tuition to attend these schools.

Economic and political development, $836,000

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program staff			$100,000	$100,000
Anthropology	$33, 00	$34,000		−34,000
Land and claims	100,000	110,000	146,000	36,000
Agriculture and fisheries	266,613	300,000	330, 00	30,000
Economic development	53,000	53,000	260,000	207,000
Total	452,613	497,000	836,000	339,000

Program staff, $100,000.—This is a reorganized staff headed by the programs officer, and the funds requested are for salaries only. Its function is to assist the people of Micronesia in further advancing their political and economic aims. In addition to the programs officer, the U.S. staff will include a political affairs officer, economist, a business analyst, two economic development officers for districts, a claims assistant, a special assistant to the High Commissioner (economics), a secretary, and a housekeeper. Micronesian employees will serve this activity in all districts, and be provided for in district budgets. The economist will work closely with the programs officer and the agriculturist in fully developing the economic potential of Trust Territory. Further, in the political affairs field, assistance will be available to the Council of Micronesia, the district congresses, and municipal governments on chartering, budgeting, training, and management problems. Additionally, this department will survey the economic potential of Trust Territory and develop plans for the greatest possible realization of this potential. The estimate for this department is to cover salaries, travel, and miscellaneous office expenses. Necessary funds for travel, supplies, and miscellaneous expenses are provided for under the plans and programs activity section of general administration.

Land and claims, $146,000.—The increase of $36,000 over 1962 fiscal year results from the increased emphasis on the activities of this department, the planned addition of two new positions and increases for supplies, materials, and equipment, in addition to substantial increases in the Micronesian surveying and land office staffs in the major districts. The two new positions are a land and claims administrator and an assistant, both to be located at Headquarters, with the assistant qualified and expected to perform extensive field duties. This will bring the total strength of the U.S. personnel to eight, with two land title officers and three survey and cartographic engineers at the district level and one chief surveyor and cartographic engineer on headquarters field staff.

This department, officially entitled the "Office of Land Management," is responsible for the surveying, leasing, settlement, homesteading, or other use of the public lands of the Trust Territory. It also has direct responsibility for the administrative settlement of all claims arising out of or pertaining to the use or occupation of private lands by the U.S. Government or any of its agencies, or by the Government of the Trust Territory.

There continues to be a large backlog of surveying to be performed in most districts, particularly in connection with the establishment of boundary lines in claims for use or occupation of private land, and the returning of public land to Micronesian ownership through homesteading.

Agriculture and fisheries, $330,000.—This estimate is an increase of $30,000 over 1962 fiscal year. The sum of $8,000 is for the salary of the superintendent of the farm institute at Ponape, and the balance of $22,000 covers the cost of additional agricultural extension work and special training.

The Farm Institute is an agricultural extension training school located at the former Madolenim demonstration center site in the Ponape district. This area was formerly a large coconut plantation, the greater portion of which has been homesteaded and a portion kept for a farm demonstration center with field demonstration and trial plantings of coconut, cacao, pepper, coffee, potential commercial spice, fruit and nut trees, timber, and livestock. The greater part of training will be of a practical nature with students from all trust territory districts.

The agriculture and fisheries program is based on a policy directed toward maximum self-sufficiency for Micronesia, including food and cash crop production, local and export fisheries production, and development of related agricultural industries. The program is generally divided objectively into development of:

(*a*) *Subsistence crop development.*—Food and utility crops, poultry, livestock, conservation, forestry.

(*b*) *Cash crop development.*—Coconut, cacao, black pepper, rice, ramie, coffee, and other suitable crops.

(*c*) *Fisheries resource development.*—Production of fisheries products for local consumption; production of fisheries products for export.

(*d*) *Entomology program.*—This includes biological and chemical control of insect and plant pests, quarantine service, research on insect pest control participation in exchange of information, research and insect predators with the SPC entomology and quarantine programs and other technical governmental agencies.

(*e*) *Agricultural extension training.*—(1) Basic practical agricultural training for extension agents at the Farm Institute at Ponape; (2) fisheries and boat handling training at the School of Fisheries at Palau; (3) boatbuilding training at Palau; (4) special training at foreign agencies in field of agriculture and fisheries; degree agriculture and fisheries training at Hawaii and the Philippines.

Program direction is administered by a director of agriculture and fisheries; additional staff includes a clerk typist at the Guam office, a staff entomologist at Palau, a fisheries specialist at Palau, a horticulturist specialist at Ponape, and a Farm Institute superintendent at Ponape. Fifteen extension agriculturists and fisheries specialists plus 160 Micronesians are employed in the districts.

The estimated cost of this program by type of expenditure is: U.S. salaries, $160,000; Micronesian salaries, $130,000; agriculture and fisheries extension work and training program, $40,000.

Economic development, $260,000.—The $207,000 increase in this program over 1962 fiscal year is for use as follows: (*a*) new programs: (1) to establish an economic development fund for lease and loan guarantees to promote establishment of small industrial enterprises, $100,000; (2) coir fiber, Truk, $10,000; (3) fisheries development at Truk, $28,000; (4) rice development at Ponape, $10,000; (5) rice development at Palau, $4,000; (6) sugar development at Palau, $5,000; (7) boatbuilding at Palau, $15,000; (8) fisheries school at Palau, $5,000. (*b*) expanded programs: (1) increase of $15,000 for cacao development; and (2) increase of $15,000 for fisheries development at Palau.

The principal resources of the trust territory are its agriculture and fish products.

Leadership will be given to this program by the staff economist working with the programs officer and director of agriculture and fisheries and his staff. In addition to fisheries research and development of new cash crops, small local industries fall under this title, such as slaughterhouses, poultry businesses, fish byproducts, and utilization of coconut fiber. Development will also be conducted along such lines as subsistence fishing, handicraft programs, homestead programs, construction of local buildings, contract construction, repair and maintenance of fishing and other type vessels, canning, and other methods of fish preservation.

Legal and public safety, $210,000

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
Legal and public safety	203,708	$184,000	$210,000	$26,000
Total	203,708	184,000	210,000	26,000

The increase of $26,000 for 1963 fiscal year over the current year is to provide for the pay increase granted in January 1961, to purchase new equipment and supplies, and bring the estimate in line with actual costs.

This department is responsible for drafting all laws and amendments thereto, executive orders and other regulations and directives having the force of law, in addition to providing general legal services for the High Commissioner and his staff. It is also charged with the responsibility for certain phases of industrial safety, and supervises the trust territory insular constabulary which, in turn, carries out police and fire protection functions in all districts.

The funds requested for operation of this department include the salaries and expenses of an attorney general, 5 other Federal employees, consising of an assistant attorney general, district attorney, public defender, director of public safety, and legal secretary, in addition to 126 Micronesian employees, consisting of 9 assistant public prosecutors and 117 constabularymen.

(b) *Operation and maintenance*

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
Operation and maintenance of physical plant	$1,301,259	$1,000,000	$1,450,000	$450,000
Radio communications	171,693	175,000	300,000	125,000
Total	1,472,952	1,175,000	1,750,000	575,000

Operation and maintenance of physical plant, $1,450,000

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
Administration	$25,940	$24,545	$30,400	$5,855
Headquarters operation and maintenance	106,000	101,671	106,681	5,010
Central repair shop	60,000	50,000	88,750	38,750
District operation and maintenance	1,109,319	832,784	1,224,169	400,385
Total	1,301,259	1,000,000	1,450,000	450,000

Administration, $30,400.—This estimate for administration of public works and construction represents an increase of $5,855 over the 1962 estimates.

The increase will provide sufficient funds to cover salaries and expense of the headquarters administration staff which is composed of a director, assistant director and a secretary. The director of public works has technical direction over the operation and maintenance and permanent construction programs for the trust territory, and serves as staff advisor to the High Commissioner. The assistant director supervises and inspects the district public works and constructiontion programs to determine if such programs are in conformity with approved plans and programs.

The operation and maintenance of physical plant involves operation and maintenance of transportation, support and service facilities such as docks, airfields, powerplants, buildings, motorized equipment, and boats. A permanent construction program was started in 1955, with funds provided by the U.S. Congress, and is still in progress. This program includes the replacement of overaged buildings, powerplant, schools, hospitals, and other facilities with new construction and equipment.

Headquarters operation and maintenance, $106,681.—The estimate is an increase of $5,010 over fiscal 1962. This increase covers the maintenance and repair cost of additional office and housing space as these requirements will expand as a result of reorganization and acceleration of the education and economic development programs.

The headquarters operation and maintenance staff is composed of a foreman and 12 crew members. Five widely separated housing and office areas are maintained: (1) the Piti warehouse area consisting of an office building, a warehouse and storage yard, and the central repair shop; (2) the cliffline housing area where 7 temporary housing units are maintained; (3) the Maiti housing and office area, composed of a hotel, 33 housing units and the headquarters administrative offices; (4) the High Commissioner's residence and (5) the Deputy High Commissioner's residence.

Repair and maintenance consist of plumbing, carpentry, and electrical servicing. The cost of materials and supplies used in repair work is included in this estimate.

Central repair shop, $88,750.—The estimate is an increase of $38,750 over the current fiscal year. Some $30,000 will cover the cost of new equipment and tools, and $8,750 is provided for an increase of two in the repair shop staff which presently consists of nine employees.

As the construction program is accelerated, and the repair of automotive and other equipment increases, the present equipment, tooling, and staffing will not meet requirements.

The central repair shop, headed by a quarterman transportation, serves as a clearing house for all equipment shipped to or transshipped within the trust territory. Any newly acquired equipment is inspected at this shop before shipment to a district, and necessary repairs or rehabilitation work performed. Equipment repair too difficult for repair in the districts is shipped to this central repair shop.

In addition to supervising the central repair shop operations, the foreman (quarterman transportation) conducts regular surveys of district equipment and equipment purchasing plans, and sets up repair, acquisition, and disposal programs for them.

District operation and maintenance of physical plant, $1,224,169.—This estimate reflects an increase of $400,385 over 1962 fiscal year. About $350,000 of this increase covers the cost of petroleum products used by district activities. Most of the petroleum products are used in the public works and construction programs. This cost was financed at headquarters in 1962 fiscal year, and distributed to the district activities. Some $25,000 of the increase will be used to replace public works equipment and tooling, and the remainder of $25,385 for partial payment of salaries of additional U.S. and Micronesian personnel.

Each district has its own public works department which handles maintenance, operation, and construction. A district public works department is responsible for transportation, maintenance of plant facilities such as powerplants, reefer plants, waterplants, powerlines, telephone systems, maintenance of buildings, operation of dock facilities and assigned construction, water and land transportation facilities, road maintenance and equipment support to all construction and maintenance projects. The replacement value of capital improvements and equipment is estimated at $25 million. Operation of transportation in the districts is unique as a wider scope of work is performed than is usual for public works. Transportation includes harbor traffic, stevedoring, POL fueling from ships, and field ship operation at main islands, using small craft up to 50 feet in length.

The permanent construction program, although separately funded, is to a great extent supported by the operation and maintenance program, since the labor pool, both skilled and unskilled, are interchangeably used in each program as are the heavy equipment, rolling stock, and small watercraft. This means that to properly carry out the construction program and the mission of the trust territory, public works must be able to properly supply the necessary facilities, structures, and service to the construction program.

The distribution of this estimate by object of expenditure follows: (1) U.S. salaries, $380,000; (2) Micronesian salaries, $380,000; (3) petroleum products, $350,000; (4) materials and supplies, $64,169; (5) equipment, $50,000.

Radio communications, $300,000

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
Radio communication system	$171,693	$175,000	$300,000	$125,000
Total	171,693	175,000	300,000	125,000

This estimate is an increase of $125,000 over 1962 fiscal year; $100,000 of this increase is for new equipment that will be used to standardize and modernize the communications system, reduce the inventory of parts and supplies, simplify training of personnel, and create faster and more accurate means of communications. The equipment includes a transmitter, receivers, power supply and antenna multicouplers. The remaining $25,000 will be used to pay the salaries of 15 additional Micronesian employees and purchase parts and supplies.

This department maintains a communications system that extends throughout trust territory. A transmitting and receiving station is located at Guam; the central electronics maintenance and supply headquarters is at Truk. The staff is composed of 9 U.S. employees, and the present staff of 48 Micronesians is being increased to 63.

(c) *Transportation services*

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
Sea transportation	$1,207,766	$1,100,000	$1,520,000	$420,000
Air transportation	384,118	600,000	421,000	−179,000
Acquisition of vessel			90,000	90,000
Total	1,591,884	1,700,000	2,031,000	331,000

Sea transportation, $1,520,000.—The increase of $420,000 over 1962 fiscal year is not entirely an increase in operating costs. Of this amount, $257,000 covers commercial freight and handling costs on supplies and equipment shipped to Guam, previously budgeted for under general administration. The actual increase of $163,000 includes $100,000 required to bring the estimate into line with previous actual expenditures ($1,229,061 in 1960 and $1,207,766 in 1961), and $63,000 for increased overall cost of operation under the contract accounted for by wage and price increases and the addition of one new vessel (M/V *Militobi*) placed in service in October 1961.

There are seven vessels in the fleet, which consists of one 3,825-ton cargo vessel that operates out of Guam to all districts, a small tanker, and five smaller vessels that serve the outer islands within a district. These ships are operated by the Pacific Micronesian Line on a cost-plus-fixed-fee contract basis. An additional vessel, owned and operated by the Marshall Islands Import-Export Co., is used to supplement the service of the trust territory-owned station vessel in that 678,000 square mile area, and is partially subsidized by the Government.

Air transportation, $421,000.—Air transportation is furnished under a contract with Pan American World Airways on a per mile basis, the estimate represents an increase of $21,000 over the amount available in the current year for the same purpose due to revised rates. Two SA–16 planes are used in a weekly service to five of the districts, and twice monthly to Rota. A third amphibious aircraft previously used in this service was lost in a water landing in July 1961. A study and reevaluation of the air service operation conducted shortly thereafter indicated that replacement should be made with a DC–4 type aircraft and that the operation should be phased into a land plane service as rapidly as feasible. Air traffic had increased in recent years to an extent beyond what can be handled efficiently with the amphibious aircraft available. A supplement appropriation of $200,000 in the current year made possible the purchase of a DC–4 to replace the lost SA–16. Effective payload will be increased approximately sixfold. As this is a nonrecurring item, funds are not being requested in the budget year. Aviation gas and oil are purchased by trust territory for use of the contractor and stored at district centers where refueling is necessary, and sold to the contractor as needed.

Acquisition of vessel, $90,000.—In order to render a service to the out-islands which will aid in their development economically and socially, it is necessary to institute a field service fitted to such needs. This is best accomplished by equipping a small ship with facilities which will carry political and economic advisers, agriculture specialists, education personnel, and medical services to all islands and be in contact a sufficient time to provide effective service. Present field trip service to outlying atolls is inadequate because of limitation of time that can be spent at each point of call. A small ship will carry at all times the personnel and equipment to assist with local problems and to further the educational, health, and economic development needs of the island people. The objective is to assist the people of the out-islands to attain self-advancement through self-help and intelligent guidance.

The field medical service is the only practical means of bringing medical care to the population of outlying atolls—inoculation programs, infectious disease finding, emergency surgical treatment, supervision of the local medical dispensaries, and effective public health programs in environmental sanitation and health education.

Economic development officers and extension agriculturists will conduct training in better methods of planting crops, introduce new subsistence and cash crops, set up more efficient copra producing methods, develop standards for handicraft production, aid in the development cottage industries, aid in establishing cooperative producing and marketing units and credit unions. In short, a complete aided self-help program to raise local standards of living will be possible under this special field trip vessel project.

One of the most difficult problems in improving elementary education throughout the dispersed islands of Micronesia is providing periodic supervision. In the past, the field trip ships served the outer islands primarily for the purpose of inspections, to pick up copra, and to trade. There was not enough time for the elementary supervisor to conduct demonstration classes or to observe classes in session. With the acquisition of a field trip ship which will serve only for island development, it will be possible to bring the elementary schools of the outer islands up to minimum standards.

(d) General administration

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase or decrease (−)
Reports	$14,770	$18,000	$18,000	
Plans and programs	20,435	42,000	53,000	$11,000
Personnel	42,315	56,000	56,000	
Property and supply	156,852	166,000	180,000	14,000
Budget and fiscal	109,866	125,000	125,000	
Administrative services	78,828	75,000	80,000	5,000
District administration	593,017	529,000	578,000	49,000
Freight and handling	241,097	250,000		−250,000
Personnel benefits	137,451	229,500	230,000	500
Total	1,394,631	1,490,500	1,320,000	−170,500

Reports office, $18,000.—There is no change in the estimate for this office as compared to fiscal year 1962. Staffing for this office includes a reports officer, clerk-typist, and a Micronesian editorial assistant. The editorial assistant was added to the staff in fiscal year 1962 as part of a program of increasing Micronesian participation in headquarters work. It is felt that this added cost can be absorbed within the framework of the reports office funds without an increase. This office provides information service for the trust territory, issuing news articles and pictures to newspapers and radio-TV and to the districts, and also provides photographic coverage of the trust territory.

The Micronesian Reporter, the official news publication of the trust territory government, is prepared and published by this office. Also, monthly and annual reports to the Secretary of the Interior, as well as other special reports as required, are prepared by the reports officer.

Plans and programs, $53,000.—The increase of $11,000 in this activity is required to provide funds for increased staffing. A 1962 fiscal year reorganization of the economic and political development programs resulted in the transfer and consolidation of certain functions of this and other related activities. The plans and programs and staff anthropologist positions were eliminated, and administration of the copra and surface transportation contracts was transferred to the executive officer. A program staff has been developed to coordinate the work of the activities participating in the economic and political development of trust territory. The estimate for this activity provides for travel, supplies, and administrative expense of the program staff and the economic and political affairs activities.

Personnel, $56,000.—There is no change in the estimate for this office as compared to fiscal year 1962. This department administers a comprehensive agency personnel program for 260 civil service employees as prescribed by the "Federal Personnel Manual" and pertinent directives, and a uniform personnel program for approximately 1,900 Micronesian employees of the trust territory government, plus the related programs of training, safety, housing, and travel.

The policies and procedures of the Micronesian program are developed by the personnel department and promulgated in the Micronesian title and pay plan and the "Trust Territory Personnel Manual." During the fiscal year 1962, the program for Micronesian employees has been studied in considerable depth in light of increased responsibilities being assigned to Micronesian positions. Pay schedules, classification and qualification standards, and related fringe benefits will be reevaluated. Planned personnel management assistance to district administrators in the field will be expanded, involving considerable travel by the personnel department staff. Employee training and utilization will receive extra emphasis to facilitate replacement of civil service employees with Micronesians, and for more effective use of the civil service work force.

Property and supply, $180,000.—This estimate provides for an increase of $14,000 over the current year for additional staffing to help meet the increased requirements resulting from accelerated economic, political, public health, education, and construction programs.

These expanding programs will considerably increase the need for equipment and supplies, and increase the workload of the property and supply department to maintain the long supply line serviced by this department.

The property and supply department is responsible for the overall management of the trust territory property and supply program, including procurement of all supplies and equipment by direct purchases and acquisition from Federal

excess sources. Purchases average $1.6 million per year of which 50 percent is accomplished through the General Services Administration, with the balance through naval supply depot, Guam local merchants, and others. A central supply depot is maintained at Guam, administering stock fund inventory programs valued at over $1 million, including medical stocks, spare parts and general stores, as well as replenishment of packaged and bulk petroleum products stocked at the district level. This department administers the U.S. Department of Agriculture surplus commodity program for the trust territory and a property accountability program with over $25 million in capital assets.

Budget and fiscal, $125,000.—No change has been made in the estimate for this department. This office provides financial accounting and budgetary services for the trust territory. Each district maintains a finance office, performing cash collection, disbursing, accounting, and reporting duties, which receive technical and staff supervision from the Comptroller. In all except one district, the chief finance officer is a Micronesian, and staffing is entirely Micronesian. The annual district and departmental budgets are coordinated and assembled in this office for approval of the High Commissioner and transmittal to the Office of Territories. This office also disburses Federal funds for the High Commissioner's office, judiciary, the Governor's office and selective service headquarters at Guam.

Included in this estimate is $15,000 for the internal audit office for the auditor's salary, office supplies, and travel. The internal auditor is on the High Commissioner's staff. Audits are conducted of commercial business enterprises in trust territory as well as Government operations.

Headquarters administrative services, $80,000.—The estimate represents an increase of $5,000 over 1962 fiscal year. The increase will bring the 1963 estimate in line with actual costs for 1961 fiscal year, and provide funds to service an expected increase in air transportation services. A DC–4 land-based aircraft is being acquired to supplement the present service. This office handles the paperwork in connection with scheduling flights and booking passengers. In addition to air operations, the office performs liaison immigration service, administers a centralized communications facility linking headquarters with all district centers by radiotelephone and teletype, and operates a mail and files section, through which all incoming and outgoing correspondence and mail are routed.

District administration, $578,000.—This estimate is an increase of $49,000 over 1962 and will be used to defray costs resulting from the 1961 Micronesian pay raise, and to hire 11 additional Micronesian employees. No increase in U.S. staffing and other administrative costs are anticipated except as may occur from price rises and ingrade raises.

There are six districts or administrative areas in addition to headquarters at Guam; each is administered by a district administrator who is directly responsible to the High Commissioner. Each district has the same line and staff organization as headquarters—public health, education, economic and political development, agriculture, and administration. Each district administration staff includes an assistant district administrator, an administrative assistant (personnel officer), and finance and supply employees. This estimate covers the wages of 34 U.S. and 154 Micronesian employees. The distribution of costs is as follows: salaries and expenses, $525,000; supplies and materials, $43,000; equipment, $10,000.

Freight and handling.—This service has been budgeted for under transportation services in 1963.

Personnel benefits, $230,000.—The estimate reflects an increase of only $500 over fiscal year 1962. It provides for such employee benefit programs as recruitment, incentive awards, hotel operations, and a safety program. Experience has shown that the funds provided for recruitment were inadequate in past years; additional funds have been included in the budget year to meet this need. Provision has been made also for the group life insurance contribution which had not been estimated in previous years. The trust territory has found it necessary to operate hotels in the districts and at Guam due to the isolated nature of these posts and the nonavailability of local facilities. The Overseas Differential Act (Public Law 86–707) made payment of quarters living allowances, transfer allowances, and education allowances a factor, and charges are to be made to this account.

A breakdown of the estimate follows: employee recruitment, $120,000; employee compensation insurance, $12,000; incentive awards, $1,000; retirement contributions, $42,520; health benefits contributions, $13,330; FICA contributions, $5,700; commissary and hotel operations, $25,000; safety program, $5,000; group life insurance contributions, $5,450.

(e) Construction

Type of construction	Actual, 1961	Estimate, 1962	Estimate, 1963
Hospitals	$180,137	$200,000	$460,000
Schools	225,815	375,000	536,500
Administration buildings	52,262	50,000	170,000
Warehouses	8,309		
Quarters	76,326	550,000	636,000
Shops and garages	6,519		
Facilities and equipment	136,123	100,000	1,496,500
Docks, harbors, and dredging	296,896	75,000	200,000
Total	982,387	1,350,000	3,499,000

The 1963 fiscal year construction program represents an increase of $2,149,000 over 1962 fiscal year. The largest increases are for hospitals and utilities. New projects being financed for the first time on a large scale are airfields, $400,000; economic development projects, $174,000; and grants-in-aid to local communities for construction of roads and schools, $183,000. Acceleration of the long-range construction program is urgently needed in order to keep pace with program goals. The buildings being replaced are mostly of frame construction with corrugated sheet metal roofs. New replacement structures are more permanent being of concrete, hollow tile, and steel.

A detailed description of the 1963 construction projects by districts follows:

Hospital construction, $460,000

District	Description	Estimate, 1963
Palau	Nurses' dormitory (training school)	$40,000
Truk	Hospital	170,000
Ponape	Hospital wards	100,000
	Hospital kitchen	15,000
Marshalls	Hospital	135,000
Total		460,000

The increase of $260,000 for 1963 provides funds to start work on new hospital facilities at Truk and Ponape, and to complete work in the Palau and the Marshalls districts. Palau hospital facilities will be completed in 1963 at an estimated total cost of $475,000. Some $40,000 is programed for a dormitory for male student nurses as quarters are not presently available for students from other districts attending the central nurses training school. This program also provides for initial construction of new hospital facilities at Truk and Ponape to replace the present temporary wood frame and quonset type buildings. New facilities will be of permanent-type concrete, hollow tile, and steel frame construction at an approximate cost of $500,000 for each facility. The Marshalls hospital will be completed in 1963 at an estimated total cost of $400,000, including the cost of medical equipment and furnishings.

Present hospital facilities in trust territory consist of six hospitals; one at each district center, and two subhospitals at Ebeye and Kusaie. There are 354 bed spaces in the hospitals. Future population growth and increased medical service to outer islands may require additional hospital improvements, but the facilities now being constructed will provide 190 additional bed spaces in modern, permanent surroundings.

School construction, $536,500

District	Description	Estimate, 1963
Rota	Intermediate school	$30,000
Palau	do	30,000
Yap	do	100,000
Truk	Dormitories and library	95,000
	Secondary school classrooms	30,000
Ponape	Intermediate school	100,000
Marshalls	Secondary school classrooms	30,000
	Intermediate school classrooms at Ebeye	30,000
Territorywide projects	Local grants-in-aid for construction of elementary schools.	91,500
Total		536,500

The 1963 estimate for school construction represents an increase of $161,500 over the current fiscal year. Some $385,000 is for the continuation of projects started in 1962 and prior years. Work on the Rota intermediate school will begin in 1962 and will be completed in 1963 with this additional $30,000. The Palau intermediate school was started in 1961 and will be completed to incorporate classrooms and facilities for a senior high school. There are 155 pupils in attendance at this school, with anticipated growth to 800 by 1966. Construction of the Yap intermediate school began in 1962 fiscal year and will be continued in 1963 and 1964 fiscal years. There will be sufficient classroom space for 200 pupils in this school. The Truk intermediate school will be completed in 1963 except for dormitories and a library. Seventy-five percent of the students attending this school are from outer islands and must be housed and fed at the school. At Ponape, the intermediate school plant will be consolidated with PICS in order to provide a consolidated junior-senior high school. A total of $30,000 is provided for increasing intermediate school classroom space at Ebeye where attendance is expected to increase from 30 to 100 by 1966.

New projects are slated to start in 1963 in all districts. Secondary or high school classes will be started at Palau, Truk, and in the Marshalls; an additional classroom and equipment will be necessary at Truk and the Marshalls, requiring $30,000 at each district.

The grants-in-aid are projects jointly financed by the trust territory government and the local municipalities. Usually this financing is on a 50–50 basis with the government paying for materials and supplies, and the municipality furnishing labor. Technical assistance is also provided by the trust territory government, with complete plans and estimates being drawn in advance before an agreement is concluded and work started.

Administration buildings, $170,000

District	Description	Estimate, 1963
Palau	Constabulary building	$25,000
Truk	Courthouse	60,000
Marshalls	Administration building	85,000
Total		170,000

The estimate for administration buildings is an increase of $120,000 over 1962.

At Palau, the constabulary building will be enlarged and modernized. This structure is a prewar concrete building with a quonset on top for a constabulary quarters. It will be enlarged and a permanent constabulary quarters built as a second floor at an estimated cost of $25,000.

Sixty thousand dollars are provided for a permanent new courthouse at Truk to replace a frame and corrugated sheet-metal building constructed during the immediate postwar period. The new structure will be 3,600 square feet in floor area and contain space for the chief justice chambers, court clerk offices, and public hearing area.

An administration building for the Marshall Islands district is planned at an estimated cost of $85,000. The present building consists of several frame and sheet-metal quonsets joined together to form one large building. Floor space of

2,000 square feet will remain the same in the new building. New construction will be of concrete, hollow tile and steel. Office space will be provided for the district administrator and a staff of 20 other employees.

Quarters, $636,000

District	Description	Estimate, 1963
Palau	Employee housing (4 units)	$80,000
Yap	Employee housing (3 units)	60,000
Do	Hotel	81,000
Truk	Employee housing (4 units)	80,000
Ponape	Employee housing (3 units)	60,000
Marshalls	Employee housing (3 units)	75,000
Guam headquarters	Cliffline housing	200,000
Total		636,000

The estimate of $636,000 for quarters is $86,000 greater than the adjusted figure for 1962. The original estimate of $650,000 for 1962 was revised by transferring $100,000 of Cliffline funds to Palau district for hospital construction, and $100,000 originally budgeted for quarters at Ponape was transferred to the Marshalls because the immediate need for housing was more urgent in that district. There will be no other new quarters construction starts in the districts during 1962 fiscal year.

For 1963 fiscal year, the program calls for construction of 17 new units in the districts at a cost of $436,000. Most of these units will replace present old quarters, which are excessively expensive to maintain. In all cases, the quarters being replaced are of frame and corrugated sheet metal or quonsets that date from the immediate postwar period. The plans call for three-bedroom houses having reinforced concrete floors, concrete block walls, and frame or concrete roofs.

Facilities and equipment, $1,496,500

District	Description	Estimate, 1963
Rota	Water system	$30,000
Do	Piggery	5,000
Do	Demonstration farm improvements	20,000
Palau	Airfield	100,000
Do	Water reservoir	100,000
Do	Powerlines installation	100,000
Yap	Airfield	100,000
Do	Powerplant reroofing	15,000
Do	Gaanalay agriculture station development	30,000
Do	POL storage tank	25,000
Truk	Powerlines	50,000
Do	Water system	100,000
Ponape	Powerlines	100,000
Do	Cold storage plant	100,000
Do	Rehabilitation of agriculture station	16,000
Do	Airfield construction	200,000
Marshalls	Fishery freezer conversion and ice machine	40,000
Do	Water storage	75,000
Do	Ejit Islands agriculture facilities	25,000
Territorywide projects	Economic and agriculture station development	100,000
	Intradistrict vessel	74,000
	Local grants-in-aid for roads and other public facilities	91,500
Total		1,496,500

The 1963 estimate for the construction projects in this category is $1,396,500 greater than for 1962. A large part of this increase results from the need to expand air transportation and public utility systems.

Airfields, $400,000.—The present air service consists of two amphibious planes (SA–16's) which are certificated to fly at gross weight of 29,000 pounds each. This allows a gross payload of approximately 2,500 pounds. During the last 2 years, mail cargo alone has grown to the extent that it sometimes takes up to 1,500 pounds of this space. This causes large backlogs of passengers and essential trust territory cargo to accumulate at Guam, and extra flights very often must be

flown to move this backlog. To improve this situation, a larger plane has been purchased; it is a land-based plane that will require construction of airfields at Palau, Yap, and Ponape. Preliminary surveys and work have been started with 1962 fiscal year funds. The estimated total cost of constructing the airfield at Palau will be $100,000; for Yap, $100,000; and Ponape, $1 million.

Water systems, $305,000.—The principal source of water in each district is by means of dammed streams and water catchments. Almost every year there is a period of water rationing in at least one of the districts. In Palau, most of the fresh water is obtained from a river on Babelthuap by means of a dam and an underwater pipeline to Palau. This is a Japanese dam which was bombed during World War II. By reconstructing the damaged section, the elevation of the dam can be raised to provide additional storage amounting to over 10 million gallons. The $100,000 estimate is the first increment of an estimated $300,000 necessary to accomplish this job.

The $30,000 for Rota is needed to replace water mains in Rota Village. The present water mains were put in prior to 1950 using pipes available from surplus. Repair of these lines is not feasible due to deterioration of the black iron and invasion-type pipe.

The water system at Truk is to be renovated and expanded so that storage capacity will be increased from 500,000 to 1 million gallons.

A concrete water reservoir of 21,000-gallon capacity will be built at Marshalls district for use of the intermediate school. Marshalls district as a whole consumes 200,000 gallons of water daily from the trust territory water system. Daily consumption at Palau is 220,000 gallons; Yap, 28,000 gallons; Ponape, 248,000 gallons; Truk, 110,000 gallons.

Power facilities, $265,000.—Powerlines are inadequate to meet present requirements in many areas without any increase in demand. Original powerplants were constructed during the 1946–51 period, using material and design from World War II. Generator units were 75 kilowatts. Banks of these units were installed to meet power requirements in each district. These units have been replaced by larger diesel units. Expanded programs have extended and increased the load on these lines leaving them underdesigned for the present load. Transformers, hardware, and poles have deteriorated beyond economical repair and wire sizes are too small. The amounts budgeted for powerlines at Palau ($100,000); Truk ($50,000), and Ponape ($100,000) are to modernize and bring the lines up to date. Also included in this estimate is $15,000 to reroof the powerplant at Yap.

Economic and agricultural development projects, $236,000.—This estimate includes $116,000 for replacement of agricultural facilities and $40,000 for a fishery in the Marshalls. At Rota, a piggery is needed to expand and improve the breeding stock. During a storm in 1961, a toolshed at the demonstration farm was blown down. The estimate of $25,000 will replace this shed and provide for a piggery, chicken hatchery, and purchase of tools.

Gaanalay agriculture station at Yap is an agricultural demonstration and farm improvement center where a piggery, hatchery, additional farm buildings, and tools are required at an estimated cost of $30,000. The $16,000 for Ponape is for use in replacing and rehabilitating the agriculture station at the district center as it is the territorywide headquarters for cacao development.

A $40,000 estimate for a fishery at Marshalls is for use in converting a part of the present reefer so that it may be used to freeze fish for storage, and to provide a necessary icemaking machine.

Alsi in the Marshalls, $25,000 is estimated for use in improving the Ejit Islands agriculture facilities. The requirements are the same as for the demonstration centers at Yap, Rota, and Ponape; and a piggery, hatchery, additional buildings, and tools are needed.

In addition to the $96,000 described above to improve and expand the central agriculture demonstration centers at Rota, Yap, Ponape, and the Marshalls, an estimated $100,000 is necessary to provide the same type of facilities at the smaller agricultural centers, remote villages, and outlying islands. These facilities include hatcheries, piggeries, purchase of farm equipment and tools, and construction of sheds for agricultural and livestock purposes.

Bulk petroleum storage plant, $25,000.—A petroleum bulk storage tank estimated to cost $25,000 is to be constructed at Yap. This tank will permit wholesale purchase and storage of diesel without the more costly use of drums; it will provide for storage of 80,000 gallons of diesel and 42,000 gallons of MoGas.

Cold storage plant, $100,000.—The $100,000 for a new cold storage plant at Ponape replaces a present inadequate and wornout plant. Increased requirements have resulted from addition of PICS school facilities, increased local demand, the scatter-site projects, and cooperative fisheries program.

Intradistrict vessel, $74,000.—This estimate is for a small steel vessel with single screw which will be able to operate within the shallow waters around islands within the lagoon of islands within the Truk district. These islands are not visited by regular field trip vessels and depend on the irregular service of native-owned boats. This vessel will also be available to service islands within a short distance from Truk Atoll which will result in better field trip service for the entire district.

Grants-in-aid for road construction, bridges, and municipal buildings, $91,500.—The grant-in-aid program is a joint program whereby the government contributes to communities' requirements and desire to construct municipal roads, bridges, and buildings where local resources are inadequate to carry the program without help. This cooperation is on a 50–50 basis, with the trust territory government supplying equipment and technical assistance, and the local municipalities providing labor and local material.

In prior years, grants-in-aid were budgeted for under administrative funds, but the nature of the fund is construction; therefore, the estimate is included under construction for 1963. Approximately $80,000 of grants-in-aid construction has been completed during prior years, one-half of which was financed by the trust territory government. Most of this work was to build elementary school buildings. Very little has been done on road construction with grants-in-aid funds, except for one bridge construction project.

Most of the roads in all districts are in bad shape, with many being impassable by motor vehicle. At Babelthaup in Palau district, and at Ponape, it is necessary to use a boat to reach villages and government facilities in remote areas because of the poor condition of roads. Adequate low-standard roads are essential for the development of the economic potential of the larger island areas in the trust territory.

Development and improvement of port facilities, $200,000

This estimate is an increase of $125,000 over 1962 fiscal year. Additional dock and harbor improvements are required at all districts except Truk. Emphasis will be placed on improving existing facilities at Yap, Ponape, and Rota. The harbors at Yap and Rota must be dredged to permit larger vessels entry to the dock. At present, much of the cargo destined for Yap must be transshipped from Palau to Yap after delivery at Palau by the *Gunners Knot*, a vessel of 3,865 gross tonnage which cannot use the Yap dock.

Camels and fenders are required at all existing docks to protect the vessels from damage.

The dock facilities at Ponape are inadequate as the dock is located over a mile from the district center and is not connected by roads. Freight must be lightered through a shallow lagoon that is rapidly silting.

TYPHOON DAMAGE AND RELIEF FUND

In November of 1957 and in January of 1958, typhoons Lola and Ophelia struck trust territory, causing widespread damage in the Marshalls, Ponape, and Truk districts. Lesser damage was inflicted at Guam.

The amount provided to repair this damage and rehabilitate the areas was $1,350,000.

A summary of expenditures through June 30, 1961, follows:

Funds available	$1, 350, 000. 00
Funds applied:	
Direct relief aid	599, 650. 69
Replacement and repair	724, 081. 06
	1, 323, 731. 75
Funds available for expenditure in fiscal year 1962	26, 268. 25

Additional damage was caused by other typhoons in 1958 at Yap and Rota, and funds were used for damage and relief purposes in these districts as well as in the Marshalls, Ponape, Truk, and Guam. It is expected that the program will be completed during 1962 fiscal year.

Below is a statement showing expenditures from this fund by district.

Typhoon damage funds, expenditures as of June 30, 1961

District	Direct aid	Replacement and repair	Total
Rota		$23,822.71	$23,822.71
Yap	$34,429.43	31,761.97	66,191.40
Truk	154,896.73	524,549.35	679,446.08
Ponape	71,987.09	111,574.74	183,561.83
Marshalls	338,337.44	24,549.49	362,886.93
Headquarters		7,822.80	7,822.80
Total	599,650.69	724,081.06	1,323,731.75

TRUST FUNDS

The following trust funds are administered by the trust territory government for the benefit of the Micronesians:

1. Copra stabilization fund
2. Angaur mining trust fund
3. Angaur scholarship fund
4. Kili trust fund
5. Ujelang trust fund

There is no management charge by trust territory, and the funds are self-supporting as to capital and income. Therefore, no appropriation is required or requested.

A description of the purpose and use of each fund follows. Financial statements are also presented.

COPRA STABILIZATION FUND

The price of copra in world markets fluctuates frequently and over a wide range. Most of the costs of collecting the copra in the islands and delivering it to market do not fluctuate with changes in the market price.

Copra affords the main source of dollar income for the people of the trust territory. The next most valuable crop provides less than 10 percent as much income as copra. This situation means that the income of the people is subject to violent fluctuations if payments to copra producers are tied to the ups and downs of the world market. The copra stabilization fund is used to mitigate the drastic change in the world's price of copra and to provide greater stability of income in order that undesirable effects can be avoided.

The copra stabilization program operates through the maintenance of an official buying price for copra at the various collection points. When world prices are high and the copra is sold for more money than is necessary to pay the official price plus marketing costs, the excess money is put into the copra stabilization fund. When world prices are less and insufficient revenue is derived to cover the official price plus marketing costs, the deficit is made up by payments out of the copra stabilization fund. No attempt is made to hold the official price absolutely constant. During the major upswings of the market, part of the higher prices is passed along to the producer. Similarly, during major downswings, the official price is lowered so that the producer bears part of the decline. However, changes are infrequent and are held within reasonable bounds which do not disrupt the island economy. Since the stabilization program has been in operation, there has been a difference of $210 per short ton between the highest price received in the world market for trust territory copra and the lowest price received. The official buying price in the islands has varied only over an $80 range in this time, which indicates the degree of stabilization accomplished.

This is not a price support program. It does not use funds from U.S. Government sources. It is self-financed through withholding proceeds of copra sales in good times for distribution in bad times.

On the following page is a financial statement which shows the status of this fund as of June 30, 1961.

Balance sheet, June 30, 1961

ASSETS

Cash on deposit	$19, 432. 09
Time deposit with bank	680, 000. 00

ANGAUR MINING TRUST FUND

The Angaur Mining Trust Fund was established pursuant to an agreement of December 1949, between the people of Angaur Island, representatives of SCAP, and representatives of the High Commissioner of the Trust Territory for the purpose of mining phosphate rock on Angaur. Upon termination of SCAP, a new agreement was concluded in 1951 by the High Commissioner and the people of Angaur for continuation of the mining.

The trust fund capital was derived from income received in the form of severance fees paid for each ton of phosphate ore removed from Angaur.

The agreement provided that the High Commissioner would be trustee, whose duties were to collect principal and income to build up capital, safely invest same, and distribute annually to the permanent residents of Angaur at the time of the agreement.

Mining ceased during 1955 fiscal year, and by June 30 of that year all moneys due and bills payable have been accounted for. Since then, the principal duty of the trustee has been to invest the capital, collect the income, and distribute to beneficiaries. All investments are in U.S. Government securities. As of June 30, 1961, the cost value of these securities was $1,164,000.

On the following page is a financial statement which shows the status of the fund as of June 30, 1961.

Balance sheet, June 30, 1961

ANGAUR SCHOLARSHIP FUND

The Angaur Scholarship Fund was established during fiscal year 1957 at the request of the Angaur Trust Fund beneficiaries.

Original capital of $23,462.50 was obtained by transfer from the Angaur Trust Fund, with the added proviso that 3 percent of the "Business Account" or approximately $450 per year, be transferred annually from income of the trust fund before distribution to beneficiaries.

The purpose of the fund is to provide a means of financing the cost of higher education for those persons who might have the desire, and otherwise qualify, but lack the funds to pay for such schooling. In September 1959, the Scholarship Fund, by request of the Anguar people, was changed from outright scholarship grants to a revolving loan fund. The use of these funds is limited to members of the clans participating in the income from the Angaur Mining Trust Fund.

On the following page is a statement showing the financial condition of this fund as of June 30, 1961.

Balance sheet, period ending June 30, 1961

PROPOSAL TO REMOVE CEILING ON APPROPRIATION

Chairman HAYDEN. This amount exceeds the authorized limit on your appropriation, does it not? Do you expect that the limitation will be relaxed prior to July 1?

Mr. TAITANO. We hope so, sir. A recent report, for instance, which I received is that the Senate Committee on Interior and Insular Affairs last Monday reported out favorably bill No. S. 2775 to provide another ceiling. Our proposal is to just remove the ceiling. I understand that the committee is not disposed to just removing it but to provide another ceiling. It has recommended a $15 million ceiling. The approach, I understand, for the $15 million is not for this year but for submission, rather in 1964.

Chairman HAYDEN. Well, if that is reported we will obtain it for this record.

(The bill and report follow:)

[S. 2775, 87th Cong., 2d sess.]

A BILL To remove the ceiling on the authorization for appropriation for the government of the Trust Territory of the Pacific Islands

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the appropriation authorization in section 2 of the Act of June 30, 1954 (68 Stat. 330), is hereby amended by increasing it from $7,500,000 to $15,000,000.

Amend the title so as to read: "A bill to amend the Act of June 30, 1954, providing for a continuance of civil government for the Trust Territory of the Pacific Islands."

[S. Rept. 1223, 87th Cong., 2d sess.]

The Committee on Interior and Insular Affairs, to whom was referred the bill (S. 2775) to remove the ceiling on the authorization for appropriation for the government of the Trust Territory of the Pacific Islands, having considered the same, report favorably thereon with amendments and recommend that the bill, as amended, do pass.

The amendments are as follows:

On page 1, strike all after the enacting clause and insert the following:

"That the appropriation authorization in section 2 of the Act of June 30, 1954 (68 Stat. 330), is hereby amended by increasing it from $7,500,000 to $15,000,000."

Amend the title so as to read:

"A bill to amend the Act of June 30, 1954, providing for a continuance of civil government for the Trust Territory of the Pacific Islands."

PURPOSE OF THE BILL

The purpose of S. 2775, as amended, is to provide for an increase in the present authorized appropriation for the Trust Territory of the Pacific Islands from $7,500,000 to $15,000,000.

BACKGROUND

The Trust Territory of the Pacific Islands is administered by the Secretary of the Interior under Executive Order 10265, as amended, in accordance with a trusteeship agreement between the United States and the Security Council of the United Nations approved by the President under authority granted by the Congress (61 Stat. 397). Under the terms of the agreement, the United States exercises full administrative, judicial, and legislative authority over the former Japanese-administered territory and has undertaken obligations to promote the political, economic, social, and educational advancement of the inhabitants.

The entire trust territory which consists of the Marshall, Caroline, and northern Marianas Islands, comprises 96 islands and island groups with a total land area of 687 square miles. Pursuant to Executive Orders 10408 and 10470 of November 10, 1952, and July 17, 1953, respectively, the northern Marianas excluding Rota, were transferred to the Navy. That portion of the territory under the jurisdiction of the Department of the Interior extends over 3 million square miles of ocean, consists of 83 islands and island groups with a land area of 564 square miles, and has a population of about 75,000.

NEED

The Department of the Interior, by executive communication of January 19, 1962, requested the introduction of legislation to remove the $7,500,000 ceiling now applicable to appropriations for the administration of the trust territory. In recent years, according to testimony from representatives of the Office of Territories, appropriations for programs in the trust territory have averaged about $5 million annually. This amount, in the face of steadily rising administrative costs, has permitted little more than a holding operation in the islands for which the United States has responsibility. The Department of the Interior believes that programs and facilities of the trust territory should be improved and accelerated beyond the level maintained in the past. It is felt that special emphasis should be placed on the construction of needed hospitals, utility systems, and school buildings, as well as the political and economic development of the area. A further justification for lifting the present ceiling stems from the fact that, beginning July 1, 1962, the Saipan district, which has heretofore been the responsibility of the Navy Department, will be administered by the trust territory.

COST

In its proposed budget for fiscal year 1963, the Department is requesting approximately $10 million—an increase of about $2.5 million over the present limitation—to carry out its plans and programs in the territory. There is set forth below a breakdown of amounts, by activity, being sought for fiscal 1963, together with a projection of amounts to be requested for fiscal year 1964:

Projected maximum grant authorizations, trust territory, fiscal year 1964

	1963 budget	Projected 1964
Direct appropriations	$179,000	$200,000
Education	975,000	2,500,000
Public health	700,000	1,500,000
Economic and political development	836,000	1,200,000
Legal and public safety	210,000	210,000
Operation and maintennce	1,750,000	1,850,000
Transportation services	2,031,000	2,250,000
General administration	1,320,000	1,500,000
Construction	3,499,000	3,700,000
Saipan (district administration)	1,500,000	1,500,000
Total	13,000,000	16,410,000
Less local revenues and reimbursements	1,500,000	1,500,000
Total	11,500,000	14,910,000

COMMITTEE AMENDMENT

As introduced, at the request of the Department of the Interior, S. 2775 would have provided for the complete removal of a ceiling on authorization for appropriations for the trust territory. However, it is the committee's recommendation that the ceiling not be raised to a level beyond that which will meet the anticipated needs of the Department in the foreseeable future. Further, it is intended that the $15 million limitation shall not be considered by the Department of the Interior as applicable to its requirements for the trust territory in fiscal year 1963.

REPORT

The executive communication, dated January 19, 1962, requesting the introduction of this legislation follows:

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D.C., January 19, 1962.

Hon. LYNDON B. JOHNSON,
President of the Senate, Washington, D.C.

DEAR MR. PRESIDENT: Enclosed is a draft of a proposed bill to remove the ceiling on the authorization for appropriations for the government of the Trust Territory of the Pacific Islands.

We suggest that this bill be referred to the appropriate committee for consideration, and we recommend that it be enacted.

Section 2 of the act of June 30, 1954 (68 Stat. 330; 48 U.S.C. 1681 note), provides that appropriations for the Trust Territory of the Pacific Islands shall not exceed $7,500,000 per year. This figure includes the appropriation for the Saipan district, which is administered by the Navy. For the fiscal years 1953 through 1960, exclusive of the Saipan district and special typhoon funds, the annual appropriations for the trust territory have averaged about $4,750,000 per year.

Included in each annual appropriation, beginning with fiscal year 1954, has been some $900,000 for construction purposes. An additional appropriation of $400,000 was provided in fiscal year 1960 for continuance of work on a dock project on Truk. We believe that the programs and facilities of the trust territory should be improved and accelerated beyond the level maintained in the past few years. Our aim is not only to accelerate construction, but to develop programs in the public health, education, and economic fields.

Therefore, we plan to request appropriations in excess of $7,500,000 for the Trust Territory of the Pacific Islands for the fiscal year ending June 30, 1963.

In light of these circumstances, we respectfully request the enactment of the enclosed bill. Our appropriations request for the trust territory will include, of course, details of the programs we hope to initiate.

The Bureau of the Budget has advised that there is no objection to the presentation of this draft bill from the standpoint of the administration's program.

Sincerely yours,

D. OTIS BEASLEY,
Assistant Secretary of the Interior.

A BILL To remove the ceiling on the authorization for appropriations for the government of the Trust Territory of the Pacific Islands

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section 2 of the Act of June 30, 1954 (68 Stat. 330) is hereby amended by deleting therefrom the words ", not in excess of $7,500,000 per year,".

CHANGES IN EXISTING LAW

In compliance with subsection (4) of rule XXIX of the Standing Rules of the Senate, changes in existing law made by the bill (S. 2775), as reported, are shown as follows (existing law proposed to be omitted is enclosed in black brackets; new matter is printed in italic; existing law in which no change is proposed is shown in roman).

ACT OF JUNE 30, 1954

(68 Stat. 330; 48 U.S.C. 681)

Whereas, pursuant to the authority of Public Law 204, Eightieth Congress, approved July 18, 1947, the President approved a trusteeship agreement for the Trust Territory of the Pacific Islands between the United States Government and the Security Council of the United Nations; and

Whereas responsibility for civil administration of the Trust Territory was vested in the Secretary of the Navy by Executive Order Numbered 9875 of July 18, 1947; and

Whereas responsibility for such administration was transferred to the Secretary of the Interior, effective July 1, 1951, by Executive Order Numbered 10265 of June 29, 1951, as amended by Executive Order Numbered 10408 of November 10, 1952, and Executive Order Numbered 10470 of July 17, 1953: Therefore

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That until Congress shall further provide for the government of the Trust Territory of the Pacific Islands, all executive, legislative, and judicial authority necessary for the civil administration of the Trust Territory shall continue to be vested in such person or persons and shall be exercised in such manner and through such agency or agencies as the President of the United States may direct or authorize.

SEC. 2. There are hereby authorized to be appropriated such sums, not in excess of [$7,500,000] *$15,000,000* per year, as may be necessary to carry out the provisions of this Act.

PROPOSED USE OF INCREASE IN GRANTS FUNDS

Chairman HAYDEN. $3,674,500 of the increase is for grants. Would you please outline to the committee the uses proposed for these funds?

Mr. TAITANO. Yes, sir. The major increases are in our proposed capital improvements program. Now, the proposed capital improvements programs are primarily for secondary schools, for hospitals, and for upgrading of certain facilities that we now have.

In the schools, we are going to add additional facilities in our present Pacific Island Central High School. We are going to add an additional building there and, of course, additional teachers.

In addition, we are going to provide a post high school teacher-training facility. This will require not only the building, but also teachers.

Then, in addition, we are going to provide a 10th grade over in Palau and Truk, and, of course, in the intermediate schools we are going to have them on the other islands.

In the hospitals, we are going to set up dispensaries in some of the outer islands and we are going to replace some of the hospitals that we do have now, on which there were buildings built right after the war.

Now, this is a continuation of our program to replace these hospital buildings as needed. As you know, in 1950 the buildings were largely frame or quonset huts and they are now overage and need replacement. This is a continuation of that replacement program.

MATERIAL USED FOR BUILDING

Chairman HAYDEN. What kind of material do you use for the buildings?

Mr. TAITANO. Concrete block, with reinforcement, hollow concrete block. This will be a permanent type structure now that we want to build.

Now, on the operational side, the same thing is true. Our main emphasis will be in the teaching in the schools and hospitals and health. Now, what we have here reflects primarily increased costs from the increased load that we have.

PURCHASE OF DC-4 AIRCRAFT

Chairman HAYDEN. $200,000 was appropriated for the Trust Territory of the Pacific Islands in the supplemental appropriation bill enacted late during the last session of Congress for purchase of a DC-4 aircraft. This was to be the beginning of a land-based air service for the trust territories. Has this aircraft been acquired?

Mr. TAITANO. Yes, sir. It is supposed to be delivered today, March 1. We bought the airplane from Pan American for $167,000. Now, it is certificated as modified for delivery out to Guam. Subsequently, however, we found that we have to install radar for navigation purposes.

Chairman HAYDEN. Did they not have radar on it when they operated it themselves?

Mr. TAITANO. No, sir. It is either they did not have it or the type that they used is not operating; but, I believe when we bought it, it did not have the radar in it.

So it is going to cost us about $193,000. In a few days I hope it will be over in Guam, ready.

LAND CLAIMS PROBLEM

Chairman HAYDEN. Has any progress been made with regard to settlement of the land claims problem?

Mr. TAITANO. Since last April, sir, we have had several meetings with the representatives of the Marshalleses, the people involved in the claims. In about July, finally, their lawyer proposed to us certain terms and conditions whereby we will settle the claims. The following October we wrote a letter containing a counterproposal. Now, in just this month of February, we received another counterproposal from the lawyer saying, "No; I do not like your proposal." So that is where it is now.

Now, we are trying to get with the lawyer to find out our differences. Of course, initially, they claim that there is a matter of 1,180 acres that they need payment for. Our records show that approximately 670 is involved.

Another proposal they have is for indefinite use. That is, we will pay for the use of the land for this past 17 years and then rent the land from here on. Now, our plan, as it is now, is that we are trying to get together with them and if we cannot see eye to eye, we may have to start our condemnation proceedings.

Chairman HAYDEN. Where is the attorney located?

Mr. TAITANO. The attorney has an office here. It is a firm that has an office here in Washington and they also have an office in Hawaii.

Chairman HAYDEN. Hawaii?

Mr. TAITANO. Yes, sir.

Chairman HAYDEN. And the land involved here is further out—beyond Hawaii?

Mr. TAITANO. It is beyond Hawaii. The land itself is over in the Marshall Islands, Kwajalein.

Chairman HAYDEN. All of it in the Marshall Islands?

Mr. TAITANO. Yes; all of it in the Marshall Islands.

Chairman HAYDEN. I think that is all. Thank you very much.

Mr. TAITANO. Thank you, Mr. Chairman.

GEOLOGICAL SURVEY

STATEMENT OF THOMAS B. NOLAN, DIRECTOR, ACCOMPANIED BY ARTHUR A. BAKER, ASSOCIATE DIRECTOR; ROBERT M. LYDDAN, ASSISTANT DIRECTOR; GEORGE D. WHITMORE, CHIEF TOPOGRAPHIC ENGINEER; CHARLES A. ANDERSON, CHIEF GEOLOGIST; LUNA B. LEOPOLD, CHIEF HYDRAULIC ENGINEER; HAROLD J. DUNCAN, CHIEF, CONSERVATION DIVISION; ROBERT L. MORAVETZ, CHIEF, PUBLICATIONS DIVISION; PERRY B. SIMMS, ASSISTANT EXECUTIVE OFFICER; AND FRED E. STEARNS, BUDGET OFFICER

JUSTIFICATIONS

Chairman HAYDEN. Our next witness is Dr. Nolan, Director of Geological Survey.

The justifications for the fiscal year 1963 budget estimate for the Geological Survey will be placed in the record.

(The justifications referred to follow:)

GEOLOGICAL SURVEY

Surveys, Investigations, and Research

The life of nations, as well as civilizations, depends upon the utilization of natural resources. Optimum utilization, in turn, depends upon the adequacy of the information on which development, use, and conservation of the resources is based.

The President, in his special message to the Congress on natural resources, emphasized the importance of the Nation's natural resources to our wealth and progress, and of understanding our resource problems, in view of the increasing demands of a U.S. population predicted at 300 million by the year 2000. He stated that "Wise investment in a resource program today will return vast dividends tomorrow, and failure to act now may be opportunities lost forever."

The Congress, in 1879, established the Geological Survey to provide this Nation with its required basic resources information. Long-range objectives which evolved from the Geological Survey's original charter are directed both at acquiring the knowledge and data that permit optimum development of our resources, and also at providing a complete understanding of our resource problems. These objectives are to determine and evaluate the quantity, quality, and distribution of the mineral and water resources of the United States, its territories and possessions; to provide topographic map coverage of these areas at scales adequate for modern needs; to classify the public lands as to their mineral character and waterpower potential; and to supervise oil, gas, and mining leases on public lands.

In keeping with the expanding population and industrial development, this budget provides for the extension of the Survey's research and data collection facilities into marine geology and hydrology to provide information necessary to effectively utilize the vast resources of the oceans and to permit optimum exploitation of the deposits on and beneath the ocean floor.

This 1963 budget represents a continuing effort to collect the information required for understanding and evaluating resource problems. It also provides for the basic research that can, literally, create new resources through a better knowledge of the distribution, nature, and relationships of the materials—of which water is one—that make up the earth's crust.

Financing of Geological Survey programs

An appropriation of $59,900,000 is requested for fiscal year 1963, an increase of $10,080,000 over the current year as summarized on pages GS–8 through GS–10. The total program of the Geological Survey, estimated at $87,214,000 in 1963, is financed approximately 69 percent by direct appropriation, 14 percent by contributions from State and municipal agencies, and 17 percent by reimbursement from Federal agencies and sundry non-Federal entities. The sources of funds for each activity for 1961, 1962, and 1963 are shown below:

80391—62——21

	Actual, 1961	Estimate, 1962	Estimate, 1963
Topographic surveys and mapping:			
Direct appropriation	$15,533,552	$16,910,000	$19,500,000
States, counties, and municipalities	3,169,360	2,530,000	2,530,000

Explanation of appropriation language changes

Marine geology and hydrology

Included in the Geological Survey's 1963 budget request is an increase to provide for a program of research on marine geology and hydrology. The natural processes which govern the formation of sedimentary rocks and related mineral deposits, and the behavior and nature of water, are constantly at work in the oceans. Knowledge of these processes that is obtained from the study of marine geology and hydrology will contribute much to the understanding of geologic and hydrologic principles that are of vital importance on the land. In order to pursue a systematic and fruitful program of study in this broad field it is important for the Geological Survey to operate outside of the United States, its territories and possessions. The Geological Survey needs to pursue a program designed to provide a better understanding of the geologic resources and phenomena along the continental shelves and seaward.

U.S. National Committee on Geology

The Secretary of the Interior, acting jointly with the president of the National Academy of Sciences, appointed a U.S. national committee consisting of geologists, geochemists, and geophysicists, to support and participate in the activities of the newly formed International Union covering the geological sciences. The Union was formed to promote the exchange of information more freely and promptly among nations active in the field of geology. Knowledge of new techniques and concepts developed in other countries will materially benefit the work being done by the Geological Survey and others in this country. The committee will establish continuing liaison with counterpart organizations in other countries in order to better develop information as to new geologic techniques and concepts in those countries. The committee has been designated the "U.S. National Committee on Geology" to reflect its broad concern and that its membership is drawn from the principal national scientific organizations dealing with the geological sciences. Expenses necessary to enable the U.S. National Committee to function as a member of the International Union, are to be paid by the Geological Survey. The cost incurred in travel and other expenses of the committee members is estimated to be about $2,500, and the U.S. share of the cost of operating the Union is estimated to be about $2,500.

Purchase of replacement aircraft

The purchase of one replacement aircraft is essential for the safe and efficient performance of airborne geophysical studies and exploration in fiscal year 1963. The present inadequate and obsolete aircraft (a DC–3) was acquired in used condition in 1948 and it is being kept operational in part by cannibalizing a second aircraft (recently obtained without exchange of funds from the Department of Defense) considered uneconomical to repair. It has been determined that a suitable replacement aircraft is not available from the Department of Defense.

Funds for the purchase of the replacement aircraft are budgeted in the subactivity "Regional geology, geologic and mineral resource surveys, and mapping activity." The estimated gross cost is $200,000, less an exchange value of about $50,000 from the two present aircraft to be applied as trade-in.

Authorization for the purchase of 49 passenger motor vehicles for replacement only

The vehicles requested are used to transport men and equipment over all kinds of roads and terrain and in all kinds of weather, in the conduct of the fieldwork of the Geological Survey. These cars must give dependable service at all times, since a great deal of the transportation required is in areas where repair services are not available. Field use tends to shorten the efficient life of a vehicle.

The 49 vehicles to be replaced meet or exceed the age or mileage replacement standards prescribed by General Services Administration, and can no longer give dependable and economical service. The vehicles will be used in areas not serviced by vehicle pools maintained by the General Services Administration.

Gross cost of vehicles to be purchased	$82, 500
Allowance on old vehicles to be exchanged	14, 500
Net cost	68, 000
Number of old passenger vehicles still to be used	213

Appropriation, 1961 (total amount available)		$45, 956, 000
Appropriation, 1962	$49, 720, 000	
Supplemental appropriation, 1962	100, 000	
Total amount available, 1962		49, 820, 000

SUMMARY OF INCREASES AND DECREASES, 1963

Topographic surveys and mapping:		
Accelerated program of topographic mapping and map revision, to meet an immediate need engendered by problems of population growth urbanization, greater complexity of industrial technology, national defense, and resultant increasing demands upon natural resources	+$2, 090, 000	
Maintenance and revision of standard quadrangle maps	+450, 000	
To meet increasing demands for current, accurate maps of national parks, urban areas, and States	+50, 000	
		+$2, 590, 000
Geologic and mineral resource surveys and mapping:		
To accelerate basic investigations of rare elements and mineral resources, and urban and construction geology, to meet a growing need for many minerals and fuels and for data essential to urban and engineering development	+450, 000	
To match increased State funds for cooperative geologic mapping of Kentucky	+100, 000	
Purchase of an aircraft for airborne geophysical surveys, to replace the present inadequate and obsolescent plane	+150, 000	
To expand the geochemical census program in the interest of acquiring increased knowledge of the distribution and geochemical behavior of the chemical elements	+450, 000	
Study of the earth's crust to aid in solving the problem of determining accurately the epicenters of man-made explosions and earthquakes and distinguishing between them, as well as to provide a better understanding of the origin of metallic ore deposits, and of other earth processes	+450, 000	
		+1, 600, 000
Marine geology and hydrology: Research to provide information on geologic and hydrologic processes in oceanic areas		+1, 000, 000
Water resources investigations:		
Transfer of basic research projects to the new activity, Institute of Water Research	−900, 000	
Increase in the Federal program to provide for an expanded network of streamflow stations and ground water observation wells, accelerated reconnaissance of ground water supplies, training of professional employees in the science of hydrology, and emergency flood studies	+1, 305, 000	
		+405, 000

SUMMARY OF INCREASES AND DECREASES, 1963—continued

Institute of Water Research:		
To establish and support an Institute of Water Research, for the purpose of conducting an accelerated program of basic research in the field of water	+$1,900,000	
Transfer of basic research projects from the water resources investigations activity	+900,000	
		+$2,800,000
Conservation of lands and minerals:		
To provide more effective supervision of an ever-increasing workload of oil and gas and mining leases, including provision of essential over-water transport to Outer Continental Shelf leases and wells, and to improve the accounting for royalties	+270,000	
To extend the enforcement activities of the Federal Petroleum Board beyond the present designated areas	+71,000	
		+341,000
General administration: To provide executive direction and administrative support for the enlarged substantive programs of the Survey, provide staff research and facilities in the field of information storage and retrieval, and strengthen the personnel management program by establishing additional examining facilities		+244,000
Special purpose buildings: To construct a laboratory building at Denver for research in isotope geology and hydrology involving unusual levels of nuclear radiation		+1,100,000
Net change, 1963		+10,080,000
Budget estimate, 1963		59,900,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Topographic surveys and mapping	$15,533,552	$16,910,000	$19,500,000	+$2,590,000
2. Geologic and mineral resource surveys and mapping	12,349,968	13,420,000	15,020,000	+1,600,000
3. Marine geology and hydrology			1,000,000	+1,000,000
4. Water resources investigations	12,847,516	14,125,000	14,530,000	+405,000
5. Institute of Water Research			2,800,000	+2,800,000
6. Soil and moisture conservation	184,312	185,000	185,000	
7. Conservation of lands and minerals	3,550,285	3,724,000	4,065,000	+341,000
8. General administration	1,434,920	1,456,000	1,700,000	+244,000
9. Special purpose buildings			1,100,000	+1,100,000
Unobligated balance lapsing	55,447			
Total	45,956,000	49,820,000	59,900,000	+10,080,000

1. Topographic surveys and mapping

The estimate of $19,500,000 is an increase of $2,590,000 over 1962.

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Standard quadrangle mapping	$12,965,329	$14,560,000	$16,650,000	+$2,090,000
(b) Small scale and special mapping	608,764	600,000	650,000	+50,000
(c) Map maintenance and revision	1,959,459	1,750,000	2,200,000	+450,000
Total	15,533,552	16,910,000	19,500,000	+2,590,000

(a) *Standard quadrangle mapping*

The estimate of $16,650,000 is an increase of $2,090,000 over 1962. This subactivity covers the field and photogrammetric surveys, cartographic processing, printing and distribution required for publication of 7½- or 15-minute quadrangles of the national topographic map series. All topographic surveys, except in Alaska, are now being made with accuracy and content suitable for publication at 1:24,000 scale. Immediate publication may be either 7½-minute quadrangles (scale 1:24,000) or 15-minute quadrangles (scale 1:62,500), depending upon the need. If 15-minute maps are published initially, the 1:24,000 scale materials remain available on open file, and for future publication as 7½-minute maps.

The field and photogrammetric surveys and cartographic operations necessary to prepare and publish 7½- and 15-minute quadrangle maps are illustrated in plate T–3. The field surveys are carried out from temporary duty stations within the areas to be mapped. The photogrammetric surveys and cartographic processing are done at four installations located at Arlington, Va.; Rolla, Mo.; Denver, Colo.; Menlo Park, Calif.; and at a Branch of Special Maps in Washington, D.C. Overall direction of the program is exercised from headquarters offices in Washington, D.C.

Plate T–4 shows the present status of published 7½- and 15-minute topographic mapping.

Need for increase.—Problems of population growth, of demands upon natural resources, of greater complexity in technology, and of national defense are increasing tremendously. Economists, scientists, engineers, political leaders, and others in responsible places are urging that means be found to understand these problems better and to step up programs aimed at their solution and control. The solutions to many of these problems involve a study of the basic data contained in topographic quadrangle maps. Because of the extensive areas involved, it is important to obtain comprehensive quadrangle coverage as expeditiously as the efficient expansion of force will permit.

The Senate Select Committee on National Water Resources reported on January 30, 1961, that, "The Federal Government can make one of its greatest contributions to water resource development through stimulation of necessary research to guide future progress." The committee pointed out that more complete coverage of topographic maps is essential to water development.

The unprecedented expansion of many urban and metropolitan areas has created greatly increased demands for up-to-date topographic map coverage to aid in the solution of such highly complex and interrelated problems as land and water management, utilities and transportation facilities, pollution control, and zoning.

The stepped-up military program indicates increased requirements for topographic maps. A mapping project including approximately 19,000 square miles is being undertaken currently in southern Arizona in response to a high priority military request for maps of that area. Funds for this program are included in the increase that is being requested.

The space age is creating needs for modern topographic maps at a rate that surpasses past production. Requirements are increasing for more accurate location data for the space surveillance program. Not only must suitable sites be found for tracking telescopes, cameras, and electronic equipment, but these locations must be carefully studied with respect to possible interference factors from local sources. Extensive topographic survey coverage is necessary to evaluate the adequacy of a site from all aspects. Topographic maps are also necessary for selecting launching sites, laying out trajectories of missiles, and for determining magnitude and direction of mass-density corrections for gravimetric measurements.

The increase requested is a practical effort to expand the topographic mapping program so as to meet the obligations foreseen in the national situation. There is a need that this be done immediately, as the total requests for topographic mapping for 1963 from Federal agencies alone amounts to more than 1,200,000 square miles. Current annual production is less than a tenth of this figure.

Plan of work.—New starts for the federally financed part of the program are determined each year on the basis of priority statements received from Federal map-using agencies under procedures outlined by the Bureau of the Budget, and from requests received from State and local sources. In many instances the State requests come from officially established State mapping advisory committees. An evaluation is made of all these requests to select those areas for which topographic surveys will best serve the national interest.

In accordance with the long-range plan, sufficient new starts will be made in fiscal year 1963 to build up to a production rate by 1967 of about 122,000 square miles per year for the conterminous States. The 1:24,000-scale mapping of Hawaii will have been completed by that date as will the 1:63,360-scale mapping of about three-fourths of Alaska.

The increases in personnel and equipment contemplated under the long-range plan will be acquired through gradual expansion during the period 1962 to 1967.

Funds to finance the total program for the subactivity, standard quadrangle mapping, come from several sources as listed below:

	Amount available, 1961	Estimate, 1962	Estimate, 1963
Direct appropriation	$12,965,329	$14,560,000	$16,650,000
States and municipalities	2,863,376	2,230,000	2,230,000
Bureau of Reclamation	1,001,765	1,008,000	1,044,000
Other Federal agencies	118,929	85,000	
Total	16,949,399	17,883,000	19,924,000

(*b*) *Small-scale and special mapping*

The estimate of $650,000 is an increase of $50,000 over 1962. This subactivity includes the cartographic and printing operations necessary to compile special maps from previous field and photogrammetric surveys, or from maps previously prepared. Also, it may include original surveys for maps to be published at scales smaller than 1 mile per inch. The principal elements of this program are:

(1) The National Atlas of the United States: In March 1961 the Secretary of the Interior approved a recommendation of the National Academy of Sciences that the Geological Survey undertake production of a national atlas. Most other nations have a national atlas, and the need for one of the United States has long been recognized by scientists, economists, and planners. During fiscal year 1963, it is expected that detailed planning and negotiating for getting the program into operation will be continued and, to the degree feasible, actual production operations will be undertaken. Close coordination has been maintained and will be continued with appropriate officials of the National Academy of Sciences as well as with authorities in the field of atlases.

(2) 1:250,000-scale maps: Although originally prepared as military editions by the Army Map Service (AMS), maps at this scale for the conterminous United States and Hawaii are now, through mutual agreement, revised and maintained by the Survey for both civil and military use. The 1:250,000-scale mapping in Alaska is prepared and published by the Survey.

This series of maps is being widely used by both civil and military map users. The maps provide an intermediate-scale base for general geologic and hydrologic studies, and for reconnaissance and preliminary planning of major engineering projects.

(3) International map of the world—scale, 1:1,000,000: This worldwide, million-scale series of topographic quadrangle maps was originally sponsored by the International Geographic Union. Geological Survey representatives attended the nine-nation conference at London in 1909, at which time international agreement was reached on the international map of the world (IMW) series, and the Central Bureau of the Maps of the World on the Millionth Scale was formed. Following the conference, the Survey began preparing the IMW maps of the United States areas, and 14 (of a total of 44 within the conterminous United States) were produced prior to 1955. At that time, the Army Map Service began work on a military series at 1:1,000,000 scale, to somewhat different specifications. The basic maps were prepared for AMS by the Survey from 1:250,000-scale maps, on a reimbursable basis. The Survey has since been distributing a slightly modified version of the AMS maps for civil use, in lieu of continuing with the regular IMW series. In 1954, the responsibilities of the IMW Central Bureau at London were transferred to the Cartographic Office of the United Nations at New York. A U.N. conference is planned for Bonn, Germany, in the latter part of 1962, to consider adoption of more flexible specifications for the IMW series. Assuming that such new specifications would make the AMS-type of million-scale maps eligible, with only slight changes for the IMW series, the Survey plans to resume work in fiscal year 1963 toward production of the complete set of IMW's for all areas of the United States.

(4) State maps: State maps are prepared at 1:500,000 scale for use as base maps and for general administrative planning. Twenty-five of these have been recently published as a new series to modern standards. Three editions are usually published for each State. These editions are: (1) Base map, (2) base map with highways and contours, and (3) base map with shaded relief. The 1:250,000-

scale series is being used as source material for the State maps. As up-to-date material for the 1:250,000 series is now available for virtually all of the States, it is feasible to expedite the preparation of new State maps for the remaining States.

(5) Urban area maps: These maps are prepared by combining on one or more sheets the 7½-minute quadrangles that cover an urban area. Sixty-five maps of this series have been published to date, all of which have been extremely useful to local governments, private industry, and metropolitan area development interests. There is a continuing need for urban area maps to meet certain Federal military and civil requirements, aside from local and other needs. These maps are prepared as the 7½-minute quadrangle maps become available.

A recent publication in this series is a set covering New York City, consisting of eight sheets, each being 39 by 54 inches in size. When joined together the set measures approximately 12 by 12 feet and includes an area of about 1,600 square miles.

(6) National park maps: Maps of 42 of the 184 national parks, monuments, and other areas administered by the National Park Service have been prepared so far. These are made by combining into one map sheet all existing quadrangle maps, or occasionally by use of surveys covering only the park area. These maps are used by the National Park Service for administrative and planning purposes, and by the public for general sightseeing and recreational purposes. There is currently a need to expand this program in response to high priority requests by the National Park Service.

(7) Topographic surveys of Antarctica: Field and photogrammetric surveys of Antarctica are being carried out by the Survey with funds supplied by the National Science Foundation. The field surveys include geodetic control obtained by astronomic fixes, triangulation, and/or electronically measured traverses, with elevations based on aneroid barometric readings. The photogrammetric operations utilize the geodetic data and aerial photography which is obtained by the Navy. The objectives are: (1) to prepare a series of topographic maps at 1:250,000 scale of selected mountain areas (mainly in western Antarctica) considered worthy of geologic or other scientific study; and (2) the preparation of some of the sheets of the 1:1,000,000-scale map (equivalent to IMW) of the entire continent, as recommended by the Operations Coordination Board and in accordance with specifications sponsored by the Special Committee on Antarctic Research of the International Council of Scientific Unions.

(8) Civil editions: In order that topographic maps prepared by the military can be made available to the general public, they are modified to exclude certain military data, with change of symbolization, and are printed for civilian use with standard quadrangle scale and format.

(9) Series conversion: Where there are obvious needs for additional coverage in the 15-minute series, four existing 7½-minute quadrangles are reduced in scale from 1:24,000 to 1:62,500 and published as a single 15-minute series quadrangle. These demands most frequently occur in zones between blocks of 7½- and 15-minute quadrangles, where the area of a map user's project might extend from one zone of scale pattern into another. Dual coverage in these areas satisfy the requirements for consistency of scale.

Need for increase.—This increase is required to meet the constantly increasing demands for up-to-date accurate State maps, national park maps, urban area maps, and others.

There is critical need for constant revision of the 1:250,000-scale maps to keep abreast of major changes. In many of these maps there is also a need for a rather complete overhaul, as 7½- and 15-minute quadrangle coverage becomes available. This program needs expansion to meet the growing demands for this map series

Plan of work.—The program for this subactivity is developed from requests received from time to time from Federal and State agencies and other interested groups throughout the country which are concerned with matters affecting the national interest.

The funds available for this subactivity are as follows:

	Amount available, 1961	Estimate, 1962	Estimate, 1963
Direct appropriation	$608,764	$600,000	$650,000
States and municipalities	17,123	15,000	15,000
National Science Foundation	379,590	385,000	385,000
Total	1,005,477	1,000,000	1,050,000

Production in small scale and special mapping is expected to result in the publication of the following maps in fiscal year 1963:

State maps	3
1:250,000 scale	23
Other (includes series conversion, shaded relief, etc.)	250

(c) *Map maintenance and revision*

The estimate of $2,200,000 is an increase of $450,000 over 1962. This subactivity includes all field and photogrammetric surveys and cartographic operations necessary to revise or to effect other improvements in existing 7½-minute or 15-minute quadrangle maps, the reprinting of maps as required to maintain stocks and the map distribution services.

Need for increase.—There are now nearly 300,000 square miles of 7½-minute mapping in need of revision, a backlog which is expected to increase by an additional 35,000 square miles by the end of fiscal year 1963. Some of the needed revision is already in progress. Although the planned increase in funds will not completely offset the increase in revision backlog at this time, it is considered to be the maximum that can be used to staff up for efficient operation in 1 year's time. The requested increase would implement the long-range plan, slow down the increase in the backlog, and help resolve the revision problem in future years. Further, the requested increase will provide the capacity needed to revise certain of the older quadrangle maps in the Tennessee Valley. For a period of over 20 years, the Tennessee Valley Authority and the Geological Survey have cooperated in the preparation of 7½-minute maps of the valley. The last of these maps are scheduled for completion in 1962, but provision must be made for the sizable job of maintaining them through revision and reprinting. It is estimated that about $200,000 of this requested increase should be used on maps in the valley, in keeping with the Survey's national responsibilities.

Plan of work: The major problem in this subactivity is to keep up with the revision of the 7½-minute maps, and to eliminate the revision backlog. The areas now covered by 7½-minute maps are generally those which have undergone, or are subject to, extensive economic development. When economic development occurs in areas covered by 15-minute maps the resultant need is usually for new surveys and maps of the 7½-minute series, rather than revision of the 15-minute maps. This replacement mapping is then provided for in the subactivity, standard quadrangle mapping.

A considerable amount of revision is being accomplished through cooperative agreements with States, and the outlook for fiscal year 1963 includes programs with Kentucky, Indiana, Massachusetts, Puerto Rico, and Connecticut. These programs are designed to provide continuous revision to keep the 1:24,000-scale maps of the State up to date.

The length of time between revision surveys depends on the changes within the area covered by each quadrangle. In most metropolitan areas extensive changes, especially in suburban areas, occur in a very few years; while in some rural areas 15 or more years may pass before sufficient changes occur to affect the utility of the maps. The current practice is to make periodic reviews of the changes in each area, and to revise and publish new editions when the changes are deemed numerous enough to warrant such action, to the extent that available funds will permit.

Funds available for map maintenance and revision are as follows:

	Amount available, 1961	Estimate, 1962	Estimate, 1963
Direct appropriation	$1,959,459	$1,750,000	$2,200,000
State and municipalities	288,861	285,000	285,000
Total	2,248,320	2,035,000	2,485,000

Production achieved in this program includes the publication of 150 revised maps and the reprinting of 760 maps without revision in 1961. It is expected that the number of revised maps published will increase to about 350 in 1962.

STATUS OF PROGRAM

As of June 1961, 20 percent of the country had been surveyed for topographic maps of the 7½-minute series and an additional 34 percent for maps of the 15-minute series; 1:24,000-scale maps of another 7 percent of the country had been completed through the compilation stage, and photo copies of the unedited advance manuscripts are available on request (plate T–8).

The Survey now has in stock about 23,000 different topographic maps, and adds to this approximately 1,250 maps per year. Of the approximately 4 million copies of topographic quadrangle maps now being distributed annually, about 3 million copies are sold, and about 1 million copies are distributed free to government agencies, public libraries, university collections, and foreign exchange.

Other operations.—In addition to the work carried out under the regular subactivity schedules outlined above, from time to time the Topographic Division also performs work within its field of competence for other agencies on a reimbursable basis. This work is related to, but does not directly benefit, the national mapping program.

2. Geologic and mineral resource surveys and mapping

The estimate of $15,020,000 is an increase of $1,600,000 over 1962.

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Field and laboratory research in economic geology	$3,360,823	$3,387,000	$3,837,000	+$450,000
(b) Field and laboratory research in regional geology	6,164,045	6,673,000	6,923,000	+250,000
(c) Field and laboratory research in experimental geology [1]	2,825,100	3,360,000	4,260,000	+900,000
Total	12,349,968	13,420,000	15,020,000	+1,600,000

[1] Subactivity previously called field and laboratory research in geologic processes.

(a) *Field and laboratory research in economic geology*

The estimate of $3,837,000 is an increase of $450,000 over 1962.

Need for increase.—The increase in 1963 is needed to expand and accelerate: (1) basic investigations of rare elements and mineral resources; and (2) urban and construction geology.

(1) Rare elements and mineral resources: The pressing need for materials with special properties for space vehicles, rockets and propellants, nuclear reactors, jets, and electronics has created sudden demand for many rare or uncommon substances, such as beryllium, germanium, selenium, tellurium, rhenium, cesium, lithium, boron, tantalum, niobium, scandium, and rare earths. Many of these substances had no substantial previous use; others were in use only on a small scale and generally in precarious supply. Knowledge of all these substances is poor and much more must be learned of their geologic and geochemical habits as a basis for both appraising and developing usable sources. Part of the attack on this problem will be made by studies of the distribution of these elements in the rocks of the earth's crust and in geologic processes. The attack described here, however, is aimed at studies of known high-grade concentrations and favorable terranes in an effort to develop principles that will aid in the search for new deposits.

Continued acceleration of our economic growth requires, as discussed earlier, that we develop new sources of supplies of many minerals and fuels. Although domestic or foreign surpluses of some mineral commodities exist and are temporarily depressing a few domestic mineral industries, reserves of many other minerals are in short supply, and a 10-year or longer view of mineral needs across the board stresses the necessity of accelerating the research required to develop new supplies. Particularly important is research on the extent and habits of low-grade sources of many ferrous and nonferrous minerals; little is known of these now, but it is plain that they will be the mainstays of many parts of our mineral industry in the not too distant future.

An increase of $250,000 is requested for 1963 for needed expansion of rare-element and mineral resource studies of the nature outlined above. An appreciable part of this increase would be used to provide essential laboratory facilities and equipment, and laboratory analytical support.

(2) Urban and construction geology: The balance, $200,000, of the increase requested in 1963 is needed to accelerate and intensify geologic studies that are vital to sound urban development and engineering construction.

Billions of dollars are spent annually in urban development, for highways, and for other forms of engineering construction. All building and engineering structures stand on earth materials and in some part are built of them. Geologic studies provide fundamental knowledge of these materials—knowledge that results in substantial savings to Government at all levels by distinguishing stable from unstable ground, measuring the diverse properties of earth materials, and locating sources for construction materials. Thus urban construction, city planning, water supply and pollution, utility, street and bridge construction, highway building, and a host of other engineering activities require detailed geologic data for maximum efficiency. As each of these development activities continues to increase annually at an alarming rate, the demand for additional fundamental geologic information becomes more and more pressing.

Landslides, subsidence, and soil creep cause great damage each year, yet they are amenable to geologic analysis and hence to corrective measures. Similarly, rock-bursts and coal mine "bumps," which take an additional toll in human lives, may be reduced through geologic study.

The Survey has had a relatively small program in all of these fields for several years, but there is a great and immediate need for expanding this work, particularly on urban and highway geology, landslides, and other rock failures, and the engineering properties of earth materials.

Importance of work.—The wealth of a nation is directly proportional to its consumption of minerals and fuels. Economic geology investigations relate directly to specific mineral and mineral fuels resources, and to the application of geology to land development and engineering use. Each of these studies yields results that can be applied readily to problems of economic significance. For example, geologic research in known mineralized areas provides basic knowledge of geochemical environments, natural associations, ore controls, and regional geologic setting of the deposits—knowledge that plays an important part in the search for new ore bodies and new mineral districts.

Plan of work.—Underway in this subactivity are detailed geologic mapping and related field and supporting laboratory research studies that have immediate application to the search for and appraisal of specific deposits of the following: (1) base and ferrous metals, such as copper in the Western States; lead, zinc, iron in Wisconsin and the Southeastern States; and many other less common mineral commodities; (2) light metals and industrial minerals, such as beryllium in Nevada, Colorado, and Utah; bauxite and clays in Hawaii; phosphates in southwestern Montana; borates in California; and titanium, graphite and asbestos; (3) rare but strategic metals, such as selenium, germanium, rhenium, niobium, cesium, and scandium; (4) organic fuels, including oil and gas in California, Kansas, and other States; oil shale in Colorado; and coal in eastern Kentucky and selsewhere; and (5) radioactive materials, including uranium and thorium in several Western States. Also included in the economic geology program are research on geochemical and other methods of modern field prospecting for specific mineral commodities; geologic mapping and specialized geologic studies in areas of intense urbanization, of industrial growth, and of highway and other construction development, such as Denver, Los Angeles, San Francisco, and Seattle; and research on specific geologic-engineering problems. In addition, special studies and advisery services required by the Office of Mineral Mobilization are also included in this subactivity.

(b) Field and laboratory research in regional geology

The estimate of $6,923,000 is an increase of $250,000 over 1962.

Need for increase.—The increase requested in 1963 is needed: (1) to expand the cooperative geologic mapping program in Kentucky; and (2) to acquire a replacement aircraft for airborne geophysical surveys.

(1) Cooperative geologic mapping program in Kentucky: A large-scale, statewide geologic mapping program in Kentucky, begun in cooperation with the State in 1961, is designed to yield complete geologic map coverage of the State at a scale of 1:24,000 by 1970. This program not only represents an important step in one of the Survey's major responsibilities to achieve essential and adequate geologic map coverage of the Nation, but also is providing fundamental geologic data being sought by those working to stimulate industrial and economic growth in all sections of the State.

The State and Federal Governments share the cost of this program equally and appropriated $300,000 each to begin the geologic mapping in 1961; this amount

was doubled ($600,000 by each) in 1962. It is planned to level off support of this program at $700,000 by each party, for a total of $1,400,000 annually for the years 1963 through 1968. The program would then taper off to totals of $1,200,000 and $600,000 in 1969 and 1970, respectively, to complete the work. In order to carry out this program on the agreed upon schedule, the Survey must increase its support by $100,000 in 1963, which will match the $100,000 increase to be provided by Kentucky.

(2) Replacement aircraft for airborne geophysical surveys: An increase of $150,000 is requested to provide the net cost of the purchase of a suitable plane to replace the present inadequate and obsolescent aircraft used for airborne geophysical surveys. The cost of maintaining the present plane in a safe operating condition is becoming prohibitive, and this plane cannot be economically modified to accommodate newer equipment required to modernize geophysical surveying techniques. New and improved methods and equipment for magnetic and electromagnetic surveys are now available, and airborne gravity surveys may be possible in the near future. Radio location equipment and data processing systems now in existence make it desirable to point toward fully automating the preparation of airborne geophysical maps of all types. The aircraft requested will provide the range, altitude, and lift capabilities necessary to safely utilize these new methods and equipment.

Airborne geophysical surveys provide essential support to geologic investigations. Not only do such surveys expedite geologic studies of broad or relatively inaccessible regions, but also they provide data essential to sound appraisal of potential mineral and mineral fuel resources by helping to define favorable rock strata, and the extent and depth of basins and other important geologic structures.

Importance of work.—Regional geology investigations are designed to provide geologic maps and fundamental multipurpose data on the geology of the United States, its territories, and possessions. Individuals and groups, public and private, use these data as basic tools in the search for and development of mineral and mineral fuel deposits, in water resource studies, and in solving land development and use problems. In addition, these investigations provide the foundation for broad resource appraisals and furnish basic data applicable to many other phases of national development and welfare. The basic data acquired have a useful life of many years, inasmuch as they concern, for the most part, elements of nature that are relatively unchanging. The giant strides being made in sciences closely allied to geology, and in engineering methods and technology, however, impose enormously increased demands for more detailed geologic data. The geologic detail required to resolve scientific and technologic problems increases in marked degree as new concepts are developed and new demands are made in the raw-materials field. This in turn means that geologic maps themselves become obsolescent in 30 to 40 years.

Even though a large part of the Survey's current geologic effort is expended in this subactivity, the amount of work done is meager in terms of the accelerating national need for geologic maps and other essential geologic data. At the present time only about 16 percent of the United States, including Alaska and Hawaii, is covered by geologic maps on a scale of 1 inch to a mile or greater (the minimum scale considered satisfactory to meet the needs of intensive modern use). Plate G–2 shows the areas in the conterminous United States covered by published geologic maps on a scale of 1 inch to a mile or greater.

Plan of work.—The investigations are directed primarily toward the general study of the composition, structure, history, and distribution of geologic materials that compose the earth's accessible crust in selected regions throughout the Nation. Geologic mapping, mostly on scale of 1:24,000, 1:62,500, and 1:250,000, is the principal element in these investigations, but to make the results useful, this mapping must be supplemented and supported by regional geochemical, geophysical, stratigraphic, and paleontologic studies. Although most of the work is aimed at factfinding and acquiring new and better data, considerable effort is devoted to the collating, synthesizing, and interpreting such geologic knowledge for the public use. Paleotectonic maps (maps that depict the rock structures, mountains, and basins of sediment accumulation at specific periods during the geologic past), individual State geologic maps, and the geologic map of the United States as a whole are examples of such syntheses of regional geologic data.

(c) *Field and laboratory research in experimental geology*

The estimate of $4,260,000 is an increase of $900,000 over 1962.

Need for increase.—The increase in 1963 is needed to expand and intensify research investigations in two very timely programs in experimental geology: (1) geochemical census, and (2) study of the earth's crust.

(1) Geochemical census: An increase of $450,000 is requested to provide for needed expansion of the geochemical census program begun on a relatively small scale in 1962.

The entire substance of the known earth is made up of about 90 chemical elements. Some of the elements constitute many percent of the earth as a whole; others only a few one-hundred-thousandths of 1 percent. Whatever its total fraction, each element is distributed in a multitude of different materials and, among these, exhibits a wide range in concentration.

This Nation is now seeking concentrations of many of the elements. In addition, we have interest in all of them for their effects on foods, waters, and soils; on human, animal, and plant physiology and health; on the usability of other materials; and on the geologic and geochemical processes that help dictate the uses to which the land is put.

Pyramiding demands for geochemical data make urgent an accelerated program to collect and organize available geochemical data; to appraise these data, and catalogue and classify by priority those areas of little or no geochemical knowledge; and to conduct special investigations to fill the gaps in existing knowledge of the distribution and geochemical behavior of the elements.

The increase proposed in 1963 would be distributed to (*a*) studies on the abundance and distribution of the elements including the development of guidelines for sampling procedures and computer programs for analyzing data; (*b*) studies of fundamental geochemical processes such as studies of migration of elements, equilibrium processes, and thermodynamic properties of minerals and complexes; (*c*) applied studies, as in the field of health, such as compilation and analysis of data on areal distribution of radioactivity; (*d*) acquisition of necessary facilities; and (*e*) essential laboratory support and development of new techniques of study.

(2) Study of the earth's crust: Many basic scientific problems require for their solution more reliable and detailed knowledge of crustal and upper mantle structures. Of immediate and paramount importance, for example, is the problem of determining accurately the epicenters of manmade explosions and earthquakes and distinguishing between them. Detailed knowledge of the earth's crust is needed also (*a*) to provide a better understanding of the dynamics of faulting in order to interpret the growth and distribution of mountains; (*b*) to determine how large masses of granite, called batholiths, are formed; (*c*) to help explain why volcanoes erupt; and (*d*) to provide a better understanding of the origin of the many metallic ore deposits that are related to mountains, batholiths, and volcanoes.

The composition and structure of the crust and its common boundary with the upper mantle (the Mohorovicic discontinuity) can be studied by seismic, gravity, and other geophysical measurements. The Geological Survey has long been conducting a modest program in this field, but these studies need to be expanded appreciably. An increase of $450,000 in 1963 is requested for this purpose.

Recent interest in improving this Nation's ability to detect underground nuclear explosions and to distinguish them from natural seismic disturbances has provided the Geological Survey with short-term support for studies of some aspects of the crust under the Vela uniform program of the Department of Defense.

Importance of the work.—Research in experimental geology is essential to advances in all fields of applied geology. Only through a better understanding of fundamental geologic processes and principles can we hope to keep pace with unprecedented demands not only for mineral raw materials, but also for basic geologic data that have a wide variety of important applications.

Experimental geologic studies are designed to develop the new concepts and new and improved techniques and methods that are needed to keep pace with modern requirements, and to make full use of the remarkable advances being made in other sciences and technologies. Most of these research studies are basic, long-range investigations that work indirectly, though none the less potently, to the benefit of discovery and economic development of the Nation's resources. In many instances they have produced data that have found early application and had profound bearing on the resolution of problems not only in the field of resource development, but also upon many other aspects of scientific endeavor.

Plan of work.—Underway in this subactivity is a wide variety of fundamental research investigations in several different fields, such as (1) in experimental geochemistry and mineralogy, studies of chemical weathering, crystal chemistry, geologic thermometry, and the environments of ore deposition; (2) in field geochemistry and petrology, studies of the geochemistry of minor elements, origin and composition of thermal waters, volcanic phenomena such as displayed at the

Hawaiian Volcano Observatory, and of igneous, sedimentary, and metamorphic processes; (3) in theoretical geophysics, studies of the diverse physical properties of rocks, and development of geophysical exploration methods utilizing electrical, infrared, electromagnetic, and other physical properties; (4) in isotope geology, studies in geochronology, nuclear geology, and of the isotope geology of lead and other elements; and (5) in crustal research, study of the earth's crust.

3. Marine geology and hydrology

The estimate of $1 million is for new funds to support a new activity.

Need for increase.—The increase will enable the Geological Survey to expand appreciably its marine geologic and hydrologic activities and initiate development of a formal, integrated, and balanced program of research in order to meet the increasing need of other Federal agencies and overall national need for geologic and hydrologic information on oceanic areas.

The Interagency Committee on Oceanography has developed a unified national program for all oceanographic activities of the Federal Government in fiscal year 1963, and that program has been fully endorsed by the Federal Council for Science and Technology. The Geological Survey's proposal of timely research in marine geology and hydrology thus is a considered and integrated part of this national program and of the Nation's overall long-range effort in oceanography.

Oceanic areas have a common interest to many sciences, industries, and Government agencies. Study of these areas has lagged because of their large size and the cost and difficulty of work. Now, however, accelerating demands on natural resources require long-range development plans, and these will require better knowledge of the resources of the entire earth, not just the one-fourth of it that is dry land.

To understand and exploit the emerged lands in all coastal regions, it is essential that surface and subcrustal geological surveys be carried beneath the seas. To understand the nature, history, and probable future of our continent itself, we must know its geologic boundary relations with the contiguous ocean basins. To extend our comprehension of the sedimentary record, rocks, ores, minerals, and mineral fuels of the continent, we must study rock-forming materials and sedimentary and diagenetic processes wherever they can be reached. In short, to safeguard the economy and future of the Nation, we must discover and evaluate those geologic resources that exist on or beneath our continental shelves or the deeper sea floor.

Opening vast new areas to exploitation for mineral resources will be made possible by extending study to the oceans and the ocean floors. For many years oil, gas, and sulfur have been mined from offshore areas of the United States, and coal is mined from beneath the sea in some other parts of the world; beach sands are important sources of titanium, thorium, and rare earths, and have been worked also for chromium, tin, platinum, and gold; sea water is already an "ore" of bromine, iodine, magnesium, and common salt; and will sooner or later become a source for many other substances. In addition, metal-rich deposits and fertilizer materials are known to lie on the sea floor in places.

The ocean areas, which contain 97 percent of all the earth's water, have a dominant role in manufacturing gross weather patterns of the world and hence have much to do with precipitation on the land areas. The world ocean is the largest single element in the hydrologic cycle, which is one of the Survey's primary concerns. The oceans are the principal source of evaporated moisture, which, as it turns to precipitation, replenishes the fresh-water supply of the continents.

There are many real and important water problems in the marine areas, especially estuarine, tidal, and shelf areas. For example, contamination by industrial, radioactive, and sewage wastes has become a significant and rapidly growing problem. Some of this contamination is contributed by streams flowing off the land, but other contamination originates with coastal shipping and shoreline developments. Other examples are the landward incursion of salt water, which is degrading the quality of water supplies in coastal ground water aquifers; upstream invasion of salt water in fresh-water channels, including channels which have been dredged; and residual brine in coastal aquifers which were submerged and charged with salt water during the recent geologic past.

Plan of work.—1. Research in marine geology:

(*a*) Regional research in marine geology: geologic history, structure, evolution, sedimentation, and mineral deposits of specific geographic areas, such as along the Atlantic Continental Shelf, the Pacific continental margin and basin, the Aleutian borderland and trench.

(*b*) General synthesis of available data pertinent to marine geology, particularly data on the continental shelves of the world.

(*c*) Research in general marine geologic processes, instrumentation, and methods, including such studies as the formation of marine ore deposits, organic materials, and minor elements in marine and lake sediments, continuous gamma radiation profiles of bottom sediments, mineralogy of marine sediments, and other high priority experimental and theoretical studies.

2. Water and sediment investigations: These would be chiefly but not exclusively, in estuarine, near-shore and shelf areas.

(*a*) Continuation of studies of chemical and physical erosion of continents and contributions of dissolved and suspended matter to the seas; behavior of waste contaminants in the sea; paths of fresh-water plumes discharged by rivers in shelf and delta areas and associated patterns of sediment deposition; geochemical and physical processes that determine the fate of pollutants and other materials.

(*b*) Hydrology of shelf and shore areas; extension of current salt-water encroachment studies into shelf areas in order to decipher the hydrodynamics of coastal aquifers and their extensions offshore; seaward discharge of fresh water in aquifers that extend into the continental shelves.

(*c*) Studies of marine hydrologic processes, especially those that are keys to processes and conditions under which were formed water-bearing materials that now occupy the land areas, would provide information that would have a bearing, for example, on the origin and history of brine waters which now occur in aquifers which lie inland throughout the Nation.

(*d*) Sedimentation and diagenetic processes, especially in delta and estuary areas; their relation to inland erosion and production of sediment; their role in the decontamination of water by adsorption and entrainment of contaminants.

Necessary laboratory facilities would be required to carry out the program planned in 1963 and succeeding years.

STATUS OF PROGRAM

The Geological Survey has no formal program in marine geology and hydrology at present, and only a few current investigations are directly oriented in this field.

4. Water resources investigations

The estimate of $14,530,000 is an increase of $405,000 over 1962. Basic research projects in the estimated amount of $900,000, heretofore financed within this activity, are proposed for transfer to the new activity, Insitute of Water Research. Thus, the increase over the adjusted base (after the transfer) is $1,305,000.

Importance of water resources investigations and research.—"The task confronting the Nation in the water field is one of meeting the growing demands on water resources in the most efficient manner consistent with accepted public aims. * * * Water shortages can be alleviated. The lack of water need not limit our economic destiny. But positive action must be substituted for complacency. There is work to be done, work to develop and use the abundant resources placed in our custody."

In these words the Senate Select Committee on National Water Resources defined the Nation's goal in water use, placed it in perspective in relation to the country's economy, and urged action. The President has called for comprehensive long-range planning for better management of the country's water. The Geological Survey has a 10-year plan for water investigations of which the present budget is a part. This long-range plan is based on the recognition that decisions in water development and management are based on water facts and observations. To obtain these facts takes time. Water studies to acquire knowledge must move forward at an increasing rate to provide the facts and understanding before the decisions are made. The Geological Survey, which is the principal Federal agency engaged in hydrologic research, proposes an expanded program that will provide this information.

Water is a dynamic resource. It is always in motion. As it moves, men interrupt its motion, divert it from its natural path, and send it on toward a new destination, often seriously changed in quality by the addition of waste products. The understanding of the consequences of man's use of water depends on detailed knowledge of how water behaves in various environments. To use water resources intelligently, the following kinds of questions must be answered: (1) What, when, and where is water available? (2) where is it going? (3) by what

routes will it travel? (4) how long will it take to get there? (5) what changes—physical, chemical, and biological—will take place? (6) how do these changes take place? and (7) how can they be controlled?

Studies of the physical environment in which water occurs requires the skills of many disciplines: hydraulics, hydrology, geology, geophysics, geochemistry, and others. Some of the scientific principles applicable are known; many remain to be established by research.

The water investigations proposed by the Geological Survey are designed to increase the fund of knowledge about the occurrence of water, its movement, and its interaction with the environment.

To pursue these goals vigorously will require: (1) an increased technical staff including additional research scientists; (2) a fully equipped central research facility; (3) field research stations, including instrumentation; and (4) field demonstration projects including instrumentation.

To conduct an expanded program of basic research designed to improve capabilities for analyzing and solving water problems, it is proposed to establish an Institute of Water Research, a new activity. Further, it is proposed that the Federal program of the water resources investigations activity be strengthened in the direction of greater capability for appraising the Nation's water resources and conducting applied research to improve the scope and methods of investigations. Basic research presently supported by the Federal program would be transferred to the Institute of Water Research.

Program elements	Amount available, 1961	Amount available, 1962	Fiscal year 1963			
			Transfer to institute (−)	Adjusted base	Estimate	Increase (+) or decrease (−)
(1) Federal program	$5,270,085	$5,695,000	−$900,000	$4,795,000	$6,100,000	+$1,305,000
(2) Federal-State program	7,577,431	8,430,000	----------	8,430,000	8,430,000	----------
Total	12,847,516	14,125,000	−900,000	13,225,000	14,530,000	+1,305,000

(1) *Federal program.*—The estimate of $6,100,000 is an increase of $1,305,000 over the adjusted base. The Federal program consists of investigations in which national interest is dominant. Studies of hydraulic and hydrologic methods and techniques and other applied research receive special attention. This work complements the cooperative programs, which are financed in part by State and local governments.

Need for increase.—An increase of $1,305,000 is requested for the following purposes:

1. Expansion of hydrologic network: Expansion of the primary network of streamflow stations, both quantity and quality, and ground water observation wells is planned. The designed network is planned for completion in 10 years. Also included will be the establishment of several hydrologic benchmark areas in which the quantity and quality of surface and ground water will be observed continuously. The areas will be selected so as to minimize the effects of manmade changes. Records so collected will provide a basis for the study of long-term hydrologic trends. An ultimate goal of 100 benchmark areas is contemplated. A substantial number is planned for activation during fiscal year 1963.

2. Reconnaissance of ground water supplies: In order to achieve the goal of nationwide coverage by 1973, this program will be accelerated during fiscal year 1963.

3. Hydrologic education: Because of the inadequate number of men sufficiently trained in hydrology and the water science, the Geological Survey is working with universities toward improvement of college curricula, and is engaged in advanced training activities. The types of education and training being emphasized in fiscal year 1963 include the following:

(*a*) Selected employees are being supported in additional graduate studies under Public Law 85–507, the Government Employees' Training Act.

(*b*) Research by selected graduate students is supported by offering summer employment.

(*c*) In-service training seminars for professional employees are being conducted by the Geological Survey in collaboration with university staffs.

4. Emergency flood studies: Disastrous floods may be expected to occur somewhere in the United States on the average of about once every 2 or 3 years. From three to eight major floods may be expected to occur in the United States every year.

The Geological Survey has, for many years, made limited investigations during and immediately following floods to document vital hydraulic and hydrologic information related to such events. The data obtained are made available to the general public as well as to Federal, State, and local agencies that are concerned with planning remedial action or control works to prevent or alleviate a recurrence of the disastrous flood effects of similar future storms.

In the past, the budget has not been sufficient to provide for adequate investigations of extraordinary floods including immediate field surveys and rehabilitation of damaged record-collection facilities. Much valuable information has been lost, such as flood profiles throughout the flood reaches of the principal rivers, and flood discharges at critical locations between gaging stations or on ungaged streams. The availability of funds for immediate use in extraordinary floods would permit necessary documentation of flood facts and more efficient utilization of manpower.

5. Equipment: Equipment needs include chemical laboratory equipment for applied research, digital recorders for data collection, and well augers for ground water exploration.

Subactivity	Amount available, 1961	Amount available, 1962	Fiscal year 1963			
			Transfer to Institute (−)	Adjusted base	Estimate	Increase (+) or decrease (−)
(a) Surface water investigations	$2,249,651	$2,470,000	−$270,000	$2,200,000	$2,770,000	+$570,000
(b) Ground water investigations	1,739,395	1,870,000	−345,000	1,525,000	1,850,000	+325,000
(c) Quality-of-water investigations	1,281,039	1,355,000	−285,000	1,070,000	1,480,000	+410,000
Total	5,270,085	5,695,000	−900,000	4,795,000	6,100,000	+1,305,000

(a) *Surface water investigations*

The estimate of $2,770,000 is an increase of $570,000 over the adjusted base. The estimate includes $2,592 for the Geological Survey payment to the Bureau of Employees' Compensation as required by section 209 of Public Law 86-767. This subactivity includes collection and compilation of basic streamflow data, analysis and interpretation of these data for specific purposes, and supporting research in hydrology and open-channel hydraulics.

(b) *Ground water investigations*

The estimate of $1,850,000 is an increase of $325,000 over the adjusted base. This subactivity includes systematic collection, analysis, and interpretation of hydrologic and geologic data; and applied research to improve the scope and methods of investigations.

(c) *Quality-of-water investigations*

The estimate of $1,480,000 is an increase of $410,000 over the adjusted base. This subactivity includes collection and interpretation of data on the sources, chemical and physical characteristics, quantity movement, and distribution of suspended and dissolved substances in water. Supporting research dealing with sediment movement in streams, distribution of radioelements in water, and organic substances in water are a continuing part of this subactivity.

Investigations common to two or more subactivities.—Some studies now in progress or planned for 1963 relate to more than one subactivity. These studies include water resources of areas, relation between water and land use, and water use.

(2) *Federal-State program.*—The estimate of $8,430,000 is the same as for 1962. Water resources investigations in cooperation with State and local agencies provide an appropriate and equitable arrangement for financing work in which there is substantial joint interest and responsibility. State and local agencies began in 1895 to contribute to the Survey's water resources investigations through financial cooperation. Since then, Federal funds have been appropriated each year for such Federal-State investigations. Since 1929, the appropriation

language has required that the Survey's share not exceed one-half the total cost of investigations.

With few exceptions, the objective of work done in the Federal-State program is to inventory and describe the water resources of specific areas. Emphasis is placed on obtaining facts needed to help solve local and regional water problems and guide in the sound development and management of water supplies. The work includes the systematic collection of water records and studies of the quantity and quality of surface water and ground water supplies.

Plan of work.—Cooperative programs planned for 1963 will be a continuation of existing work to determine and appraise the water resources of the Nation. Increased emphasis will be given to analytical and interpretive studies of the occurrence and availability of water, to definition of the area and frequency of flooding in urban areas, and to water quality studies.

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Surface water investigations	$4,214,811	$4,600,000	$4,600,000	
(b) Ground water investigations	2,678,224	3,000,000	3,000,000	
(c) Quality-of-water investigations	684,396	830,000	830,000	
Total	7,577,431	8,430,000	8,430,000	

5. Institute of Water Research

The estimate of $2,800,000 is to establish and support the Institute of Water Research, a new activity. It includes $900,000 for the support of basic research to be transferred from the Federal program of the "water resources investigations" activity to the Institute of Water Research.

Need for increase.—The recommendations of the Senate Select Committee on National Water Resources stress the urgent need for an accelerated program of basic research in the field of water.

Management of water requires a foundation of scientific knowledge and facts about its relationship to the environment in which it occurs. Despite the tremendous growth in water requirements, water use, and water problems, there is nowhere in the world today an institution devoted solely to research in the water science. All existing organizational units, laboratories, and centers that concern themselves with water either divide attention among several resources, or among research, operations, and construction. The proposed Institute of Water Research would be devoted solely to the water science and only to research.

The Institute is envisioned as being staffed with scientists and engineers, representing a variety of disciplines, whose job it will be to discover and codify the natural physical laws to which water is subject. As the need for expanded research focusing on water becomes more widely recognized, similar institutions will probably spring up in other levels of government, in universities, and in other nations of the world.

Plan of work.—The program proposed for the Institute is threefold:

(1) Research in fundamental hydrology, with particular emphasis on its environmental relations on, in, and over the earth.

(2) Research of a clinical nature addressed to the understanding of the scientific aspects of particular water problems or particular types of environments. This research would use specific areas for study but would be concerned with gaining knowledge that would have applicability to similar areas elsewhere.

(3) Research aimed at translating scientific information into management terms. This would include the joint consideration of economic, biologic, and physical factors. The aim of such research would be to provide a scientific basis for judging the economic and physical results of various alternative actions or decisions. Research results would not prescribe what decisions should be made in water development or management, but would provide a basis for estimating the effect of different decisions.

Institute research will include studies of the hydrologic varieties of water forms and the effects of water action including studies of glaciers, lakes, rivers, rills, and ground water systems. It will be concerned with time sequences in hydrologic phenomena or geochronology which involves the study of time series and time changes in storage, in rates of various processes, and methods of dating hydrologic events of the past. And it will be concerned with the chemistry of organic and inorganic substances in water, seeking the basic laws governing the chemical solution and settling out of substances with which water comes in contact. Research will be conducted both in the laboratory and in the field.

The Institute will require equipment and facilities for carrying on such research, including hydraulic flumes, geomorphic models, electronic analogs, and laboratories for studies in spectroscopy, X-ray diffraction, flame photometry, inorganic, organic, and physical chemistry.

The Institute will encourage research in universities and collaborative efforts with other Government agencies. Scientists in the employ of other agencies will be encouraged to utilize the facilities and specialized skills found in the Institute in the conduct of research for their respective agencies. The Institute will be concerned with stimulating education in the water science at universities, and with international cooperation in scientific hydrology.

In the first year, the effort will include organizing and equipping scientists already on the staff of the Geological Survey and those university personnel and students already collaborating with the Survey in hydrologic research. Simultaneously new skills from disciplines now poorly represented in hydrologic research will be recruited, particularly in the fields of economics, limnology, physical chemistry, hydrodynamics, mathematics, and biology. Research effort of the kind described in the foregoing paragraphs that was formerly included in the water resources investigations activity of the Geological Survey will be transferred to the Institute of Water Research.

6. Soil and moisture conservation

The estimate of $185,000 is the same as for 1962.

This program provides basic hydrologic and geologic data needed for improving and maintaining the productive value of public lands. The basic data and the investigational and advisory services provided by the Survey are utilized by land-management agencies of the Department in planning land-treatment measures and in locating and designing successful wells and reservoirs. The Survey's program includes water-supply exploration; studies of erosion and sedimentation, degradation and aggradation in stream channels, runoff and sediment yield, and effects of land-treatment measures; and the collection of hydrologic data for planning conservation structures.

Plan of work.—During 1963, the kinds of work now in progress will be continued. Activities in well-site locations will be stepped up to keep pace with increasing demands, especially from the Bureau of Land Management and Bureau of Indian Affairs. Some projects now in progress will be completed. One or two projects will be expanded to cover a greater number of areas yielding information on a larger number of climatic and physiographic environments.

7. Conservation of lands and minerals

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Supervising oil and gas leases	$1,922,584	$1,937,000	$2,154,000	+$217,000
(*b*) Supervising mining leases	456,901	457,000	510 000	+53,000
(*c*) Mineral classification	698,849	843,000	843,000	
(*d*) Waterpower classification	250,000	258,000	258,000	
(*e*) Federal Petroleum Board	221,951	229,000	300,000	+71,000
Total	3,550,285	3,724,000	4,065,000	+341,000

(*a*) *Supervising oil and gas leases*

The estimate of $2,154,000 is an increase of $217,000 over 1962.

Need for increase.—To provide for: (1) essential overwater transport to Outer Continental Shelf leases and wells; (2) increased utilization of the Electronic Data Processing equipment to bring royalty accounting to a current status; and (3) additional petroleum engineers and supporting services to keep pace with the ever-increasing workload.

Plan of work

	Actual, 1961	Estimate, 1962	Estimate, 1963
Number of oil and gas properties and wells supervised	180,000	205,000	228,000
Value of oil and gas produced	$935,000,000	$1,025,000,000	$1,134,000,000
Royalty accruals	$127,000,000	$142,000,000	$156,000,000
Available funds for supervision	$1,922,584	$1,937,000	$2,154,000
Number of employees	235	231	255

KANSAS MAY 16 1962 MANHATTAN KANSAS

Administering the operating regulations under the various mineral leasing acts is a continuing subactivity. This work involves onsite supervision of exploration, development, and production of oil and gas on Federal, Indian, and certain naval petroleum reserve lands in the United States. The objective is to so perform the work that the interests of conservation may be assured with due regard to the reduction of waste. The responsibilities include the determination and maintenance of an accurate account of production and of the royalties due, and, when appropriate, taking such royalties in kind and disposing of them pursuant to applicable laws and regulations.

Current developments in connection with the oil and gas potentials of the Outer Continental Shelf areas of the United States continue to have a significant bearing on the actual and anticipated future workloads of this subactivity. There is considerable new interest in the offshore areas off both the Atlantic and Pacific coasts.

(*b*) *Supervising mining leases*

The estimate of $510,000 is an increase of $53,000 over 1962.

Need for increase.—To provide funds for: (1) increased responsibilities in enforcement of health and safety measures in uranium mines on Indian and acquired land leases; (2) staffing and opening a new supervisory office at a centrally located site in New Mexico or Arizona; and (3) personnel to handle normal workload increases.

Plan of work

	Actual, 1961	Estimate, 1962	Estimate, 1963
Value of minerals produced	$165,276,448	$182,000,000	$201,000,000
Royalty accruals	$8,000,000	$8,500,000	$9,000,000
Available funds for supervision	$456,901	$457,000	$510,000
Number of employees	39	39	45

This is a continuing subactivity, enforcing the operating regulations under the various mineral leasing acts governing the exploration, development, and production of mineral deposits from leases on Federal and Indian lands in the United States. This function is conducted in such manner as may best serve the interests of conservation of the resources. The responsibilities include the maintenance of an accounting record of the minerals produced, the determination of the royalty liabilities, and the collection of lease rentals and royalties. The work includes: (1) the assembly of data from Federal and Indian lands under lease or permit being prospected for coal, potassium, phosphate, radium, uranium, manganese, fluorspar, mica, lead, zinc, etc.; (2) the assembly of data on known and possible ore reserves in areas being mined; (3) the assembly of basic data on ore reserves of quality too low to merit beneficiation by present techniques, but which probably could meet purchase requirements with improved beneficiation methods; (4) onsite supervision and regulation of development and production operations; and (5) attention to protective methods for workmen exposed to radiation or other hazards.

The normal workload of this subactivity is expected to increase during the budget year. In addition, the newer responsibility in regard to the health and safety of workmen in uranium mines, stemming from an interagency meeting called by the Public Health Service in 1959, adds an additional workload of considerable magnitude. It is held by the Public Health Service that the air in most uranium mines contains radon daughter products in concentrations many times the recommended working level; that mine air in many mines carries excessive amounts of free silica; and that exposure of workmen to excessive concentrations of radon daughter products in mine air and adhering to silica dust could lead to lung cancer. Our findings corroborate the statements of the Public Health Service as they pertain to silica dust and radon daughter products.

The Survey is responsible for the enforcement of health and safety measures in uranium mines on Indian and acquired land leases. Although substantial improvement has been made in the ventilation of uranium mines, continued vigilance and more frequent examinations of such mines is essential to assure a safe working level of mine atmosphere. During the budget year the Survey proposes to intensify the examination program by making more frequent inspections of all mining operations to effectively minimize mine hazards. To accomplish this objective, two additional engineers will be employed, one at Carlsbad, N. Mex., and one at Salt Lake City, Utah. Also, with the increased interest in coal for

thermal power and petrochemicals in Arizona and New Mexico, it is proposed to open a new supervisory office at some centrally located site for better service to the public, perhaps in western New Mexico or in Arizona.

(c) *Mineral classification*

The estimate of $843,000 is the same as for 1962.

Plan of work.—This is a continuing subactivity responsible for classifying the Federal land area as to mineral character, for determining what Federal land areas are to be withdrawn for the purposes of investigation for leasable minerals, and for recommending the restoration of such lands from withdrawal after adequate geologic mapping and classification. The primary objectives are: (1) the determination, from geological data and other evidence, of the actual or probable presence of mineral deposits of value in specific tracts or parcels of public land anywhere in the United States; (2) the protection of such mineral estates (by timely notice, withdrawal or classification) from inadvertent disposal under nonmineral land laws; (3) the promotion of the exploration and development of such estates under applicable provisions of the Federal mining or mineral leasing laws; and (4) the prompt referral, to the administrative and supervising agencies involved of the geologic determinations and counsel requisite to the effective discharge of their responsibilities.

Under the mineral leasing laws, determination and definition of the "known geologic structures" of producing oil and gas field are the basis for discrimination between lands subject to lease by application or by competitive bidding. For each such lease application the Survey determines whether the land sought is within the known geologic structure of a producing field. The Survey is also responsible for reporting to the Bureau of Land Management all first discoveries of oil and gas under application-type leases and discoveries of new oil and gas fields, or deposits, pursuant to applicable laws for their effect on rental and royalty liabilities. Reports to the Bureau of Land Management are also made on the occurrence of the leasable minerals: coal, oil shale, phosphate, potash, sodium, sulfur, and asphaltic minerals. These reports involve State selections, forest exchanges, mineral permits and leases, nonmineral entries, and lands, under the jurisdiction of other Government bureaus and agencies.

Expansion of industrialization in the United States, particularly in many of the Western States, is resulting in an increasing demand for land and mineral resources. This demand has stimulated the search for and development of leasable minerals on Federal and Indian lands, particularly in the public land States west of the Mississippi River. A similar interest exists in acquired and public lands east of the Mississippi River. Mineral land classification is an essential function in the administration of the mineral leasing laws applicable to Federal lands. The timely performance of this function is of particular importance if this Nation is to derive optimum benefits from the conservation, development, and production of its mineral resources.

(d) *Waterpower classification*

The estimate of $258,000 is the same as for 1962.

The recent comprehensive report by the Senate Select Committee (Kerr committee), Water Resources Activities in the United States, emphasizes the need for the investigation, evaluation, and inventorying of all possible water development sites in order that the most effective plans can be made for the fullest possible utilization of the Nation's water resources. President Kennedy, in his special message to the Congress on natural resources on February 23, 1961, urged the enactment of legislation permitting the reservation of known future reservoir sites wherever such protection is necessary. In regard to public lands, the Geological Survey has had a continuing program, with these exact objectives, in progress since 1909 in connection with its authority to classify the public lands for waterpower and water storage values.

Plan of work.—This is a continuing subactivity, the objectives of which are the discovery, investigation, and the valuation of potential waterpower and storage sites on public lands and the protection of such land value through the segregation in waterpower or reservoir site reserves of the public lands affected. Waterpower classification by the Survey is achieved by field investigations to obtain basic data and related information needed for the location and evaluation of sites on the public lands, and through subsequent office studies in which the basic data are analyzed and final reports are prepared. These reports provide the basis for scientific classification of lands with regard to their power and storage values. Maps and reports prepared during these investigations bring potential water-

power and storage sites to the attention of the public, and are extensively used by States, industry, and Federal agencies in the preliminary planning of proposed developments. They are of particular value to the Bureau of Land Management and the Federal Power Commission in fulfilling their responsibilities relating to the administration of the public lands.

An updated report on developed and potential waterpower of the world is planned. The first compilation of potential and developed waterpower for the world was made in 1918 when engineers of the U.S. Geological Survey prepared estimates by countries, for use at the Versailles Peace Conference. These estimates were published in 1921 by the Geological Survey in the World Atlas of Commercial Geology, part II, Water Power of the World. Since that time the estimates have been prepared and released at irregular intervals. Geological Survey Circular 329 with data as of 1952 was the first formal publication of the estimates after 1921. The estimates were revised at the end of 1954 and published as Geological Survey Circular 367. Requests for an up-to-date report on this subject have been received from many sources in the United States and also from many countries throughout the world. The preparation of a new report is important. The availability of many new sources of information and the essential need for the most accurate estimates possible make this a very large and significant undertaking.

(e) *Federal Petroleum Board*

The estimate of $300,000 is an increase of $71,000 over 1962.

Need for increase.—To provide: (1) for eight additional investigators; and (2) the establishment of one additional field office in order to extend the enforcement beyond the present designated areas.

Plan of work.—The Federal Petroleum Board, under supervision and direction of the Geological Survey, administers the Connally Act of February 22, 1935. The act supports conservation activities of certain oil-producing States by prohibiting the interstate shipment of oil produced in violation of State oil and gas proration laws.

Examiners of the Board, by gaging lease production, by inspection of leasehold operations, by lease visits, by checking pipelines, feeder lines, or tank batteries, by interviewing lease employees, lessees, operators, or well service company employees, and by checking all records of production and oil shipments, detect violations of the State proration laws. Following such preliminary investigation and formal docketing of the cases, the Board of Examiners makes a full-scale investigation, takes depositions, and prepares the case against the violator for submission through departmental channels to the Attorney General for prosecution.

One of the principal duties of the Board is to see that the oil producers maintain proper records of oil production and disposal, and that prescribed reports are filed with the Board. By means of these required records and reports the Board maintains an accurate knowledge of the production of oil, the products derived therefrom, and its transportation in interstate commerce.

The Connally Act is applicable wherever State laws limit the rate of production and prescribe conditions for producing and handling the oil. However, due to the small size of the Board, its primary activity is in 106 counties of Texas, Lea and Eddy Counties in New Mexico, and all of Louisiana. Unless exempted by the Board in writing, or by constructive notice, producers within the above designated area are required to maintain daily production records and file monthly production reports of operations for each lease. Transporters and refiners are also required to file monthly reports. The processing of such reports accounts for a considerable portion of the workload of the Board.

The investigative authority of the Board is not limited to the required reports nor to the designated areas described above, except for the limitation put upon its activities by the availability of funds and personnel, to determine that contraband oil has been produced and shipped in interstate commerce.

The Board also strives, within the limit of its funds, to enforce provisions of the act in other States nearby its offices, such as Mississippi, Oklahoma, Arkansas, and Kansas. This regulatory activity should be extended to other oil-producing States as well.

In the absence of additional funds for this activity, efforts to extend the enforcement beyond the present designated areas will remain futile. The increase requested for 1963 will permit the employment of about eight additional investigators, the establishment of one or two additional field offices, and will, perhaps, offer some rebuttal to the often repeated criticism that Louisiana, Texas, and New Mexico have been unfairly singled out for discriminatory and unnecessarily harsh Connally Act enforcement.

Program objectives

(1) The enforcement of conservation laws and regulations applicable to oil, gas, and mineral leases on Federal and Indian lands, and the accounting for and collection of royalties due from production therefrom.

(2) Classification of public lands as to their mineral and waterpower potential, and the restoration to entry of hitherto withdrawn lands classified as nonmineral or nonwaterpower, to assure optimum use of such lands.

(3) Enforcement of the Connally "Hot Oil" Act prohibiting interstate or international shipment of petroleum produced in violation of State proration laws.

8. General administration

The estimate of $1,700,000 is an increase of $244,000 over 1962.

Need for increase.—An increase of $244,000 is requested to provide for executive direction and administrative support for the Bureau's $86 million program ($59 million in the direct appropriation). This increase will provide for normal operating increases necessitated by enlarged substantive programs of the Survey, and also for strengthening of the personnel management program by establishing local examining facilities at the four field personnel offices.

Expansion of the systems development program is planned primarily for staff research in the field of information storage and retrieval. The initial investment in equipment facilities required to carry out this program is estimated at $140,000 in fiscal year 1963.

Plan of work.—This activity provides for the executive direction and overall management of the Geological Survey, as well as such essential services as organization and procedures, systems development, budgeting, accounting, voucher examination, internal audit, payroll, personnel, purchasing, property control, mail, and messenger.

This activity is financed from funds appropriated directly and by an assessment against reimbursements from other Federal agencies and certain nongovernmental sources. No assessment is made against funds for the State cooperative program. A comparison of funds for executive direction and administration, relative to the entire program of the Geological Survey follows:

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Direct appropriation	$1,434,920	$1,456,000	$1,700,000	+$244,000
Assessment against anticipated reimbursements	499,926	559,000	550,000	−9,000
Total general administration	1,934,846	2,015,000	2,250,000	+235,000
Total Survey program (excluding construction of special-purpose buildings)	71,349,150	77,457,000	86,114,000	+8,657,000
Ratio of general administration to total (percent)	2.71	2.60	2.61	+0.01

9. Special-purpose buildings

Funds in the amount of $1,100,000 are requested for a special-purpose laboratory building at the Denver Federal Center for research in isotope geology and hydrology involving unusual levels of nuclear radiation. This amount includes about $110,000 for engineering and supervision of construction. The separate facilities are urgently needed for two different but very cogent reasons: safety and efficiency. Presently the research involving nuclear radiation is performed in locations where facilities are woefully inadequate because safety precautions cannot be fully provided, or because the accuracy of research results may be seriously impaired, or the scope of research programs severely restricted.

New applications of radiation to research problems in geology and hydrology include the newly developed technique of activation analysis. This requires a high-energy neutron generator to excite the samples being studied, and this in turn required adequate protection of personnel and highly sensitive instruments. The use of radioactive tracers in hydrologic research is another facet of the Survey's programs which promises great advances in the knowledge of water circulation. Further development of instruments and techniques is clearly anticipated.

Because the magnitude and complexity of radioisotope research programs are growing rapidly, the new facilities are most pressingly needed. The very stringent requirements for use and storage of moderately and highly radioactive isotopes clearly indicates the need for a separate facility. Yet, because it is intimately related to other work being conducted at the Federal center, it should be located there. In collaboration with the U.S. Public Health Service, Atomic Energy Commission, and the General Services Administration, a location and layout of the proposed laboratory has been developed. There are no available facilities in the Denver area now existing that would serve this need.

The General Services Administration has prepared preliminary estimates of cost and identified a suitable site at the center. It is anticipated that a design contract will be let early in fiscal year 1963 with a contract for construction later in the year. The General Services Administration would supervise the project.

It is understood that specific authorization by the congressional Committees on Public Works will not be needed, because of the highly specialized purposes of the building.

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$71,349,150	$77,457,000	$87,214,000	+$9,757,000
Unobligated balance brought forward	−400,000	−400,000	−400,000	
Advances and reimbursements from:				
Other accounts	−13,196,255	−14,819,000	−14,435,000	+384,000
Non-Federal sources	−12,252,342	−12,818,000	−12,879,000	−61,000
Unobligated balance carried forward	400,000	400,000	400,000	
Unobligated balance lapsing	55,447			
Appropriation	45,956,000	49,820,000	59,900,000	+10,080,000
Direct obligations:

Total obligations	71,349,150	77,457,000	87,214,000	+9,757,000

Consolidated accounts and central services financed by benefiting activities

Services, supplies, or equipment which are in common need by two or more divisions are, for efficiency and economy, reported in consolidated accounts. Charges are initially made to these accounts, are ultimately charged to the activity benefited, and are justified in the budget document for those activities. The actual costs of these accounts for 1961 and the estimates for 1962 and 1963 are summarized below:

	Actual, 1961	Estimate, 1962	Estimate, 1963
Consolidated accounts:			
Motor vehicle fleet operation	$1,408,876	$1,413,000	$1,500,000
Rental and maintenance of certain facilities at headquarters and field centers	330,074	350,000	368,000
Warehouse stock of common-use supplies and materials	518,790	522,000	569,000
Survey's proportionate share of departmental charges, safety committee, and contingencies arising from operation of field centers	71,383	74,000	75,000
Total consolidated accounts	2,329,123	2,359,000	2,512,000
Central services:			
Map reproduction	1,524,975	1,813,000	1,750,000
Editing and illustration of publications	1,202,109	1,542,000	1,832,000
Distribution of maps and reports, response to public inquiries and related functions	830,384	917,000	1,075,000
Property maintenance and instrument development	464,457	490,000	515,000
Computing and tabulating services	625,026	575,000	580,000
Total central services	4,646,951	5,337,000	5,752,000
Grand total	6,976,074	7,696,000	8,264,000
Less interoffice billings	227,111	295,000	298,000
Net cost	6,748,963	7,401,000	7,966,000

Financial support for these accounts and services is summarized as follows:

Activities	Actual, 1961	Estimate, 1962	Estimate, 1963
Topographic surveys and mapping	$2,675,664	$2,960,000	$2,975,000
Geologic and mineral resource surveys and mapping	2,045,129	2,448,000	2,620,000
Marine geology and hydrology			64,000

Net cost	6,748,963	7,401,000	7,966,000

General Statement

Chairman Hayden. The estimate for this year is $59,900,000, an increase of $10,080,000 over the amount provided in fiscal year 1962. Included in your estimate is a new program of marine geology and hydrology, which you estimate will cost about $1 million in the coming fiscal year, the establishment of an Institute of Water Research, for which you ask $2,800,000, and a special-purpose building at Denver at a cost of $1,100,000.

Now we will be glad to receive your explanation of the budget request.

Mr. Nolan. Thank you, sir.

It is my pleasure to again appear before this committee to discuss the programs of the Geological Survey and their relationship to our resource problems.

The budget estimates for 1963 propose increases largely for the purpose of expanding our capabilities in mapping and resources investigations. This expansion is necessary to keep pace with the increasing requirements that our expanding population imposes upon us and with the demand for scientific knowledge that is required to effectively develop and manage the country's natural resources.

Institute of Water Research

To provide the necessary knowledge for water resource development, the Geological Survey plans to establish an Institute of Water Research whose activities will be devoted entirely to research in water science.

The functions of the Institute will be concentrated on investigations of hydrologic principles, which have been severely limited in the past by other demands on our funds. Its establishment follows much careful review in the Department, the Budget Bureau, and Committees of the Federal Council for Science and Technology. I want to emphasize that the research activities of the Institute will relate to fundamental principles of water sciences with which the Geological Survey has long had primary concern and that these programs will not supplant work by other Federal agencies.

Raw Materials Research

Raw materials requirements will increase with our expanding population, and maintenance of our industrial economy requires intensified research activity in resource occurrence and discovery. Because of the long time required to develop mineral deposits and bring them into production and because discovery of new deposits is becoming progressively more difficulty, research in the factors that control the formation of workable deposits and in new techniques of discovery is urgently needed. We propose to undertake some of this urgently needed research with the increased funds requested in this budget.

Topographic Maps

Fundamental to innumerable present-day activities, including national defense, the search for and development of natural resources, urban development, and highway construction is the availability, accurate topographic maps. A sizable part of the increased funds we request for next fiscal year will go to increase our topographic map coverage and to update some of the older maps.

Oceanographic Research

Increased awareness of our ultimate resource requirements has focused the attention of the scientific community—in particular, the Interagency Committee on Oceanography—on oceanographic research, which has lagged far behind other research activities. As a result of this attention, the Geological Survey this year proposes a new program of research in marine geology and hydrology which will be an integrated part of the oceanographic research program of the Federal Government. Knowledge of geologic and hydrologic processes and of the resources of the oceanic areas will be acquired through

this program. We will commence this work largely through an extension of our onshore activities to estuarine, nearshore, and Continental Shelf areas, and will also cooperate with other agencies in some deep-sea studies, particularly, in the Aleutian Trench.

Oil and Gas Production on Continental Shelf

Oil and gas production and prospecting activities on the outer Continental Shelf have developed to the point where a considerable expansion of our supervisory staff is required. Much of the increase in our "conservation of lands and minerals" activity will be used for this staff and supporting services. We are also faced with the need for more personnel to handle the expanding responsibilities in mining lease supervision, in health and safety enforcement in uranium mines on Indian and acquired lands, and for investigations by the Federal Petroleum Board.

Replacement of Aircraft

Obsolescence of our present DC–3 aircraft and the need for greater load-carrying capacity have forced us to request funds for a replacement. The airplane is a necessary tool in our continuing research to develop and apply new airborne methods to search for ore deposits and to solve numerous geologic problems. Much success in these activities has been achieved by airborne geophysical surveys that are closely coordinated with field and laboratory geologic and geophysical studies. Our pioneering work beginning in 1943 in redesigning the Navy airborne submarine detector to make magnetic surveys led to the establishment of a commercial activity that is now of considerable importance. Our design and use of airborne radioactivity equipment undertaken in 1949 in cooperation with the Atomic Energy Commission similarly led to the development of another aspect of the airborne geophysics industry which was largely responsible for the discovery of adequate resources of much needed uranium. We have used the same equipment and techniques to map areas of radioactive fallout and lately to measure the background radiation that may be an important factor in the geographic distribution of certain diseases. Our continuing research in applying new methods such as infrared sensing and airborne gravity, which cannot be accomplished with the same facility by any other means, has been seriously hampered by the load restrictions of our present plane.

Office and Laboratory Facility in Washington Area

We are hopeful that this fiscal year will see the beginning of a solution to the major, long-standing problem of the Geological Survey: The lack of a suitable office and laboratory facility in the Washington area. We now carry on our activities in more than 20 separate buildings in the Washington area, in quarters largely designed for quite different uses than ours. We are convinced that greater efficiency and faster attainment of our goals would result from consolidation of our activities into a single facility, designed to fit our special needs.

Chairman HAYDEN. What is the prospect of obtaining that facility at the moment?

Mr. NOLAN. I hope it is looking up, sir. We had hoped in this year's budget to have an item that would provide for the procurement of a site and the preparation of plans for such a building. It is my understanding that when this reached the final budget stage, the Bureau of the Budget felt that since there had not been specific approval by the two committees on public buildings of the House and the Senate, the item should not be included. I believe there was some uncertainty as to whether this approval was specifically needed, since the facility could be considered a "special-purpose" building.

Chairman HAYDEN. This was to be within the District?

Mr. NOLAN. Yes; that was true of the authorization we had at one time under the lease-purchase system. Our hope is that it would not be in downtown Washington where we would have crowding; the environs of Washington would be better. At any rate the Bureau of the Budget, I believe, informed Secretary Udall that on approval of the proposal by the two congressional committees the Budget Bureau would submit, as an addition to the present bill or as a supplemental, the estimates for the preparation of plans and for the site. I am rather hopeful that this approval will be obtained.

Several years ago, you may remember, the House Public Works Committee approved this same building plan and the restriction as to location was imposed by the Senate committee. I am hoping that this year the committees will again give the item active consideration. We badly need the building.

GEOPHYSICAL PROSPECTING

Chairman HAYDEN. Your statement made reference to geophysical prospecting. I would like to know how long ago that became practical.

Mr. NOLAN. Geophysical prospecting in the broadest sense, that is, ground methods, began to be rather generally used about 1920. It was chiefly applied in the field of petroleum prospecting and initially largely used gravity methods.

Chairman HAYDEN. How about in metal mining?

Mr. NOLAN. In metal mining it was not very successful until after the last war. My opinion is that much of the present use of geophysical methods in metal mining was the result very largely of the pioneer work of the Geological Survey in applying some of the devices that were developed during the war to the problems of mineral prospecting.

Initially, through the airborne magnetometer, in particular, we were able to devise techniques for exploration for iron ores, which of course are magnetic. Application of this equipment was later broadened by research and experimentation to the search for nonmagnetic ores in certain structural conditions. The need to speed the search for uranium led us, working with the Atomic Energy Commission, to adapt Geiger counters and later, scintillation counters, to airborne methods. This, I think, is probably one of the major factors that led to the country's very successful search for uranium resources.

Just after the war we learned that the Norwegians had developed still another geophysical technique—electromagnetic prospecting—and we did some work with them. This was taken up and expanded

by some of the mining companies in cooperation with the geophysical companies, and led to a series of successful discoveries, particularly in Canada.

My own belief is that much more experimentation and the development of techniques is going to be required if we are to be able to discover new deposits that are not easily discovered by present methods. This is one of the reasons we have been anxious to acquire a plane that will permit us to do some experimental work with infrared sensing. This has been a development largely in the military area which now, I think, is applicable to some of our mineral problems.

Chairman HAYDEN. I asked that question because I recently visited some copper sites down near Tucson and evidently something had been done because apparently there was just desert soil.

GEOCHEMICAL WORK

Mr. NOLAN. A second development which has gone hand in hand with the geophysical prospecting is geochemical work. Beginning immediately after the war, the Geological Survey pioneered in the development of both methods and instrumentation for geochemical prospecting. Our own group developed most of the field tests, and methods of testing. The combination of geochemical prospecting and geophysical prospecting is now very widely used both in this country and abroad by most of the major mining companies. Some of the developments that are going on in the Department of Defense for military purposes are the subject of continuous review by the Survey and these methods may make our prospecting much more successful.

As a result of the VELA project, which was designed, as you know, for the detection of nuclear underground shots, our geophysical group by ground methods is working very closely with the ARPA people in the Department of Defense. As a result, we designed a mobile seismograph which can be truck installed and moved around the country. These are probably almost a whole order of magnitude more sensitive than any previous equipment.

It is my expectation that this, too, may be applied to the mining industry's search for new deposits.

Chairman HAYDEN. Thank you.

NATIONAL ATLAS

I note in the justifications that the Secretary of the Interior has approved the production of a national atlas, on which detailed planning to place the program into operation will take place during fiscal year 1963. Would you please describe the national atlas, and if possible, indicate what you expect it will cost?

Mr. NOLAN. I do have, sir, a statement for the record that I could put in about the national atlas. I would like to summarize it first.

Chairman HAYDEN. That will be placed in the record.

(The statement referred to follows:)

STATEMENT RE U.S. NATIONAL ATLAS

We have recently completed arrangements with the Library of Congress for the loan of Dr. Arch C. Gerlach, a well-known geographer in charge of the Map Division of the Library of Congress, to serve for at least 2 years as Director of

the Atlas project. We feel fortunate in having been able to obtain the services of such an unusually well-qualified person for this important post.

Within a short time, with the help of advisers from all sections of the country in each major field of atlas information, studies will be made to determine appropriate content, optimum sources of information, and most effective methods of presenting the data. At the same time, our staff will be intensively analyzing and comparing several recently completed national atlases, notably by Canada, U.S.S.R., Austria, Switzerland, and certain other countries.

Within a few months, we hope to embark on actual production operations. These will include research for source data; compilation of plates (maps, charts, statistics); drafting, engraving, typesetting; and publication (lithographic printing, binding, etc.). Tentative plans indicate that the first edition of the atlas will contain about 150 plates, which will show graphic and/or statistical data for about 30 general subjects, under the three broad divisions of physical, economic, and sociological information.

Based on the meager information available on costs of similar atlases produced by other countries, and assuming a first printing of 10,000 copies, the cost is being tentatively estimated at about $200,000 per year, for a few years, with perhaps 50 percent of this being recovered through sales to the public. However, if public response is as favorable as it has been in several other countries, as many as 100,000 or 200,000 copies may ultimately be published, with some increase in total funds required. In that case, because unit costs would be less, a larger share may be recoverable, depending on pricing and public sales.

RESPONSIBILITY FOR PLANNING ATLAS PROJECT

Mr. NOLAN. The United States is one of the very few of the major countries that does not have a national atlas. These present, in graphic form, the geographic, the historical, the economic patterns that can be shown by maps and accompanying data. Some work was begun in the National Academy of Sciences several years ago through a committee that was set up for the purpose of devising plans for such an atlas. About a year ago, through an exchange of correspondence between the Secretary of the Interior and the President of the Academy, the Geological Survey was asked to take over the responsibility for continuing the planning, and the bringing to completion, of such an atlas. Within the last month we have been fortunate enough to secure an unusually well qualified leader for the project, Dr. Arch C. Gerlach, who is in charge of the Map Division, Library of Congress. With the approval of the Librarian of Congress, he is being detailed to the Survey for 2 years, and is now actively engaged in completing the plans and getting organized for production operations.

ESTIMATED TOTAL COST

The very tentative estimates of costs that have been developed so far indicate that the total cost may be somewhere in the order of half a million dollars, to be distributed over a few years, with expenditures initially at about $200,000 a year. We expect that it will have a first printing of 10,000 copies, and anticipate that about half of the initial cost may be regained to the Treasury through sales to the public and other levels of government.

Chairman HAYDEN. There should be a good market for it.

Mr. NOLAN. From the experience of other countries, Dr. Gerlach is inclined to think we may ultimately have a distribution closer to 100,000 copies than 10,000 copies, in which case a larger part of the total cost might be recovered.

TOPOGRAPHIC COVERAGE OF UNITED STATES

Chairman HAYDEN. How much of the United States is now covered by adequate topographic maps and how much additional time do you estimate will be required in order to complete topographic mapping of the whole country?

Mr. NOLAN. Our current estimate of topographic coverage is approximately 61 percent of the area of the United States. About 20 percent is covered by the 7½-minute series at 1:24,000 scale, and about 34 percent by the 15-minute series at the mile-to-the-inch scale. About 7 percent of this coverage is not yet published in final form, but photo copies of the completed map drawings are available to those who have urgent need for the information. We have developed a plan which we have presented to the Budget Bureau to complete the initial complete countrywide coverage by 1976; and the request that we have before you this year is the first step in this plan. The plan also provides for considerably more effort to be devoted to the parallel need of map revision and maintenance, to bring up to date the most urgently needed of the maps that have become obsolete through the rapid economic development of so many parts of the country.

PHREATOPHYTE INVESTIGATION PROGRAM

Chairman HAYDEN. With regard to water resources investigations, in the supplemental appropriation bill for 1962 enacted just as Congress adjourned last September the Geological Survey was provided with $100,000 to study water savings through eradication of phreatophytes.

Please furnish for the committee a statement as to the progress which has been made to date with this appropriation and indicate whether the present budget presentation includes $200,000 which was estimated as the need for the second year.

Mr. NOLAN. It is my understanding that the present estimate does provide for a continuation of that work. I have a very brief statement with me as to the work which has been accomplished thus far which I will be glad to put in the record.

Chairman HAYDEN. You may insert that in the record at this point.

(The statement referred to follows:)

STATEMENT ON PHREATOPHYTE INVESTIGATION PROGRAM

Work is proceeding in accordance with the program outlined in the Survey's statement to the Appropriations subcommittee on August 24, 1961. There are no scientific findings to report at this time because the phase of the work now in progress consists largely of preparations for study, including selection of areas and procurement and installation of instruments. The San Carlos Irrigation District and the Bureau of Indian Affairs are assisting the Survey to obtain easements to lands that will be included in this study. The areas tentatively selected are in the vicinity of Calva and between Winkleman and Kelvin.

The Arizona Fish and Game Commission has requested that in water salvage operations a strip of land 200 feet wide on each side of any river be left in phreatophytes. To do this will complicate our study procedures. It seems imperative that the effects of the fish and game commission's demands be evaluated. This will require that clearing be done in two steps: First, removal of vegetation beyond the 200-foot strip on each side of the river. Second, after an observation period, removal from the 200-foot strip. This complication is important because, along many reaches of the river, the width of the phreatophyte growth averages less than 200 feet on each side.

Operations for this year will include selection of areas, obtaining easements, procurement of specialized equipment for measurement of soil moisture and of incoming and outgoing radiation, wind movement, ground water levels, and stream-gaging stations. The areas will be mapped by photographic methods and the density of vegetation will be determined in the same way.

The budget request for 1963 includes adequate funds for an expansion of the work scheduled for 1962. A precise estimate of what funds will actually be spent in fiscal year 1963 has not yet been made, but the program calls for an expenditure of about $200,000.

GROUND WATER STUDIES

Chairman HAYDEN. You also indicate in your presentation that the program of ground-water supply reconnaissance is to be accelerated during the coming fiscal year. Would you care to comment upon the extent of the planned acceleration?

Mr. NOLAN. The increase that is proposed for our work on ground water provides for an increase of $325,000 under the Federal appropriation and contemplates investigations of ground-water supplies combining studies of ground-water availability area by area, ground-water contamination, relations to surface streamflow, and collaterally a continuation and expansion of the network of observation wells. The proposal for the Institute of Water Research also contemplates additional study of ground-water problems. In this field there will be a very considerable increase, partly as a result of the transfer from current water resources investigation, plus the work to be done with the additional funds that will be provided for the institute. In connection with the institute we plan a considerably enlarged program of research on the principles that control the movement and behavior of ground water in the natural environment.

Chairman HAYDEN. I asked this question because it is of vital importance in Arizona where they take more water out of the ground than is being returned. We hope from a decision to be rendered by the Supreme Court of the United States to have access to the Colorado River which will help mitigate the situation, but whatever information you can develop with respect to underground water will be of tremendous importance to my area of the United States.

Mr. NOLAN. Actually, in some ways it is related to the management of the Colorado water. Because of their interrelationship, surface water and ground water should be managed together. For several years we have been trying to understand, better than we do now, the physical problems that arise when an effort is made to recharge ground water reservoirs through the use of surface water. Initially, I suspect many of us felt that this was simply a matter of getting enough intake wells and letting some of the excess surface water seep down into the underground reservoir.

The work we have been doing in a number of areas, initially in New York State, more recently rather extensively in the lower Mississippi River area and in California, indicates this is not by any means as simple a solution as it might be thought. There are a number of factors to be considered. In some instances, water will require treatment and preparation if this kind of a recharge is to be successful. Extension of this kind of research on artificial recharge is contemplated under the estimates that we are providing.

FUNDS FOR INSTITUTE OF WATER RESEARCH

Chairman HAYDEN. With regard to the Institute of Water Research you decided to establish this year with an initial appropriation of $2,800,000, will you indicate what you expect the future year costs to be?

Mr. NOLAN. We have some estimates which have not yet been finalized and I would be glad to put these tentative estimates into the record, if I might.

Chairman HAYDEN. That may be done.

(The estimates referred to follow:)

As was indicated in a statement submitted to the Federal Council for Science and Technology, dated November 28, 1961, the starting budget of $2,800,000 for fiscal year 1963 would include about $900,000, which would be transferred to the institute from the present program. The tentative estimate for the second year of operation would be $4,200,000. The budget would be increased in successive following years, perhaps reaching about $16,800,000 in the 10th year. (Note: These estimates do not include costs for special-purpose laboratories and equipment.)

ACTIVITIES TO BE TRANSFERRED TO INSTITUTE

Chairman HAYDEN. Identify by specific projects the regular activities proposed to be transferred in the amount of $900,000 to the Institute of Water Research. Show for each project the number and classification of the professional grade personnel and the funds required for each project.

Mr. NOLAN. I have that list here and will be glad to submit it.

Chairman HAYDEN. That may be inserted in the record.

(The list referred to follows:)

INSTITUTE OF WATER RESEARCH

Projects to be transferred from Federal program

Project	Geographic location	Professional personnel	Gross funds (thousands)
A. FUNDAMENTAL HYDROLOGIC PROCESSES AND PRINCIPLES			
1. Mechanics and physical laws which govern the infiltration and percolation of soil water and ground-water recharge; ground-water flow, dispersion and diffusion; fluid mechanics and physical responses of aquifers.	Laboratories in District of Columbia, Phoenix, Ariz., Denver, Colo., Arlington, Va.; research groups at University of Arizona in Tucson, Honolulu, Hawaii, Tallahassee, Fla., and Long Island, N.Y.	GS-14, 2; GS-13, 5; GS-12, 4; GS-11, 2; GA-9, 1.	$275.5
2. Hydromechanics of flow, dispersion, erosion, and sediment transport in surface streams. Special attention to the base flow of streams, interrelations between ground water and surface water, and the effects of dams and stream-channel modifications.	Laboratories and research groups at Phoenix, Ariz., Minneapolis, Minn., and Arlington, Va.	GS-13, 1; GS-11, 1; GS-7, 1.	46.7
3. Evaporation and transpiration processes and results. Special emphasis is on phreatophytes and phreatophyte problems in the Southwest, their use of water, the effectiveness of control and eradication measures, and water salvage possibilities.	Laboratories and field research units in Arizona, California, New Mexico, and Colorado.	GS-14, 2; GS-12, 4; GS-11, 3.	151.5
4. Chemical and geochemical phenomena in hydrologic environments. Emphasis is on fundamental processes, involving dissolved solids which are present in waters only in trace amounts; ion-exchange and its role in water quality; behavior of natural radio-nuclides, fission products, and chemical pollutants; isotopic composition of certain dissolved solids; and chemical weathering of rocks and soils.	Laboratories and research groups in California, Maryland, Massachusetts, Pennsylvania, Colorado, and Virginia.	GS-14, 1; GS-13, 5; GS-12, 5; GS-11, 4.	246.0
Subtotal, category A			719.7
B. WATER MANAGEMENT SUPPORT			
1. Clinical studies of specific water situations and water-management problems. Includes special aspects of operational projects, and analysis and interpretation by advanced methods of basic data for management purposes.	Arizona, California, Colorado, Utah, and Wyoming.	GS-15, 1; GS-12, 3; GS-7, 1.	85.0
2. Interplay effects of land use and cultural changes with ground-water recharge, surface runoff, erosion, and sediment transport and deposition.	Potomac River Basin	GS-12, 1	17.0
3. Chronology and mechanics of accumulation, growth, movement, and decay of glacier ice and snow in high-altitude watersheds.	Cascade Range, Wash	GS-12, 1; GS-11, 1.	37.4
Subtotal, category B			139.4
C. EDUCATION AND TRAINING			
1. Training at universities	Columbia University and New York University, N.Y.; University of Arizona; University of Florida; Harvard College; Stanford University; University of New Mexico; Penn State; Johns Hopkins University; California Institute of Technology; University of Michigan; University of Pittsburgh.		46.0
Total, all activities			905.1

PROPOSED NEW PROJECTS

Chairman HAYDEN. Please list the specific water research projects proposed for fiscal year 1963 that are not being accomplished in fiscal year 1962 showing the purpose of each investigation, the amount of money proposed for each investigation, the number and classification of the professional grade personnel to be assigned to each investigation.

Mr. NOLAN. I will be glad to put this into the record.

(The information referred to follows:)

Proposed new projects, fiscal year 1963

Project	Geographic location	Professional personnel	Gross funds (thousands)
A. SCIENTIFIC SUPPORT FOR WATER MANAGEMENT			
1. Studies of entire hydrologic basins, including urban-industrial complexes and their effects on erosion, sedimentation, streamflow, ground-water recharge, and water quality. Will use pilot areas in contrasting humid and arid regimes; possibilities for integrated management of surface water and ground water will be studied; electronic model and computer techniques will be applied to make systems analyses, making full use of basic data.	District of Columbia, Arizona, Colorado, and New Mexico.	GS-15, 3; GS-14, 6; GS-13, 4; GS-12, 2; GS-11, 3; GS-9, 5.	$365
2. Hydrologic aspects of ecological systems in prairie pothole environments and other aspects of wetlands problems.	Minnesota, North Dakota, and South Dakota.	GS-15, 1; GS-11, 1; GS-9, 2.	60
3. Develop basis and means for nationwide appraisal of ground water resources to put quantitative knowledge about ground water on a basis comparable to that for surface water.	Nationwide; headquartered in District of Columbia.	GS-14, 1; GS-13, 1; GS-11, 1.	50
4. Studies of problems of the arid zone, to develop broader and more incisive understanding of hydrology in arid climates in relation to agriculture, urban-industrial development, water conservation and use, recreation, and other purposes.	Southwestern States; Idaho	GS-13, 3; GS-9, 1.	65
Subtotal, category A			540
B. CLINICAL CASE STUDIES OF WATER SITUATIONS			
1. Analysis of history, current situation, trends, and probable future of water supplies, conservation and use. Will include areas where ground water is being depleted, as well as special situations, such as those in the Atlantic and Gulf Coastal Plains, where lithologic, stratigraphic, and geological structural controls of water are prominent.	Texas, New Mexico, Southeastern States.	GS-15, 1; GS-14, 2; GS-13, 2; GS-11, 2; GS-9, 3.	150
2. Hydrology of fractured, fissured, and cavernous rock aquifers with special attention to the peculiarities of hydraulic and hydrologic phenomena, especially as related to behavior of water contaminates by dispersion, natural purification, and other processes.	Idaho, Ohio	GS-15, 1; GS-14, 1; GS-13, 2; GS-11, 1; GS-9, 2.	100
3. Thermal degradation of water by industrial and cooling use; diffusion and dissipation of heat; thermal gradients in streams, lakes, and reservoirs; effect of heat on aquatic organisms and on recreational use of water.	Kentucky, Ohio, and West Virginia.	GS-13, 1; GS-12, 2.	60
Subtotal, category B			310

Proposed new projects, fiscal year 1963—Continued

Project	Geographic location	Professional personnel	Gross funds (thousands)
C. CHEMICAL PROPERTIES OF WATER AND GEOCHEMICAL PROCESSES			
1. Determinations of the nature, causes, and effects of the chemical evolution of water in its passage through the hydrologic cycle and use cycles. Special attention to areas where there are unusual concentrations of undesirable dissolved materials such as salt and compounds of sulfur, nitrogen, phosphorus, and others.	District of Columbia, Texas, and Oklahoma.	GS-14, 1; GS-13, 2; GS-11, 1; GS-9, 1.	$75
2. Stratigraphic, structural, and mineralogic controls of ground water in specific environments; chemical processes and causes of chemical alteration and degradation of quality; use of mathematical models for difficult concepts and complex situations.	Colorado, Utah, and Wyoming.	GS-14, 2; GS-13, 1; GS-11, 2; GS-9, 1.	105
Subtotal, category C			180
D. GEOMORPHIC AND HYDRAULIC PROCESSES			
1. Physical and dynamic processes whereby landscapes are formed and altered and whereby stream channels and river systems evolve. Special attention to stream discharge (including storm runoff, channel shapes, channel slopes, and sediment load).	Colorado, New Mexico	GS-14, 1; GS-11, 3.	60
2. Study of large rivers to determine relations between turbulence and sediment transport and between flow characteristics and dispersion of sediment and dissolved solids. Will include laboratory-model studies.	Various States where suitable reaches of river.	GS-15, 1; GS-14, 3; GS-11, 6.	145
Subtotal, category D			205
E. LAKE HYDROLOGY			
1. Analysis of roles of lakes and reservoirs in stream and ground-water regimens; significance of lakes in the national hydrologic budget; function of lakes in relation to absorption and dilution of contaminants.	Nationwide	GS-13, 1; GS-11, 1.	30
2. Analysis of distinctive characteristics of lakes in various environments and processes and stages in their evolution.	Oregon	GS-15, 1; GS-14, 1.	60
Subtotal, category E			90
F. RESEARCH SUPPORT			
(Expenditures which support all activities but are not specifically chargeable to each separately)			
Specialized in-house recruiting, training, and education of Institute personnel; research by employees assigned to work at universities.	Nationwide	GS-15, 2; GS-13, 2; GS-11, 14.	200
2. Specialized equipment, purchase of computer time, and related activities.	District of Columbia	GS-15, 2; GS-14, 1; GS-11, 5.	100
3. Printing and binding, dissemination of information.	do	GS-15, 1; GS-14, 1; GS-11, 7.	145
4. Additional support to projects transferred from Federal program which currently are underfinanced and underequipped.	Nationwide	GS-15, 3; GS-14, 1; GS-11, 6.	130
Subtotal, category F			575
Total, all activities			1,900

AVOIDANCE OF DUPLICATION OF ACTIVITIES

Chairman HAYDEN. Will you describe the measures taken to assure that projects proposed to be done in the Institute of Water Research do not duplicate or conflict with the water research programs of other Federal departments such as the Department of Agriculture and the Department of Health, Education, and Welfare.

Mr. NOLAN. We not only plan to avoid duplication insofar s we can in that respect ourselves but a mechanism has been established under the Federal Council of Science and Technology which will help to assure that undesirable duplication does not occur. This is a panel, or a subcommittee, of the Federal Council composed of representatives of each of the agencies engaged in water research. They are charged with the responsibility of reviewing each year, prior to the budget consideration of the estimate for water research, the programs of each of the agencies and to report to the Budget Bureau on duplications, inadequacies and the like. I believe this will be an effective mechanism.

COLLABORATION WITH COLLEGES AND INSTITUTIONS

Chairman HAYDEN. Yes. You contemplate collaboration during fiscal year 1963 with universities, colleges, and other non-Federal research institutions concerned with water resources research?

Mr. NOLAN. Yes, sir; as well as with other Federal agencies.

Chairman HAYDEN. Include in the record what you plan to do there.

Mr. NOLAN. Yes, sir; I shall.

Chairman HAYDEN. List for the committee the locations at which each of the proposed investigations will be taken and include for each of them the number and grade of professional personnel to be utilized, if you can. Can you do that?

Mr. NOLAN. I believe that information is included in the two tables that I have already given to you.

WATER UTILIZATION AND CONSERVATION

Chairman HAYDEN. Very well. Now for each of the principal research investigations contemplated, will you explain its relation to water utilization and conservation purposes?

Mr. NOLAN. I have a statement for that which I will be glad to put in and I also have a short statement in answer to your two previous questions which I would like to put into the record, too.

Chairman HAYDEN. That may be done.

(The material referred to follows:)

STATEMENT ON POTENTIAL DUPLICATION OR CONFLICT

Research by the Water Resources Division is aimed to enable the Nation to achieve more complete use and benefit from its water resources. All present and proposed research is germane to traditional responsibilities of the Geological Survey, supports activities of other agencies in the Department of the Interior, and supports work of other Federal agencies at their request.

The Geological Survey is represented on the Subcommittee on Hydrology and Sedimentation of the Federal Inter-Agency River Basin Committee, and on other interagency committees whose members exchange information about their agency programs.

The Subcommittee on Water Research of the Federal Council for Science and Technology reviews the water-research programs of all Federal agencies on behalf of the Bureau of the Budget. Proposed activities of the Water Resources Division in fiscal year 1963 have been reviewed by the subcommittee and by it in turn with the Bureau of the Budget. In addition, the Federal Council has reviewed proposals for the Institute for Water Research.

The Survey publishes reports on its research projects and makes frequent public announcements about its activities. Government circles and the scientific community are adequately informed about our activities. We try to keep informed about the activities of others and to avoid duplication. Actually, there is little potential duplication because Survey scientists concern themselves with basic data and with fundamental principles and processes, not with action programs or development projects.

Collaboration with Universities and Colleges

The collaboration between universities, colleges, and non-Federal research institutions expected in fiscal year 1963 will take three forms. The first is to assign a limited number of experienced, well-qualified employees to graduate study at universities in accordance with provisions of the training act. The second will be to utilize faculty members of universities and colleges on a when actually employed basis, to do research on projects of interest to the Survey. The third will be to provide part-time employment for graduate students having research capabilities, to screen them for subsequent full-time employment and simultaneously increase their potential value to the Geological Survey. These students also will be employed on a WAE basis. They will be paid, at rates established under civil-service regulations, for work actually done in the collection and analysis of data and the writing of research reports that are of interest to the Survey.

Part-time employment will be offered to faculty members whose special interests and competence are along lines which are of interest and importance to the Survey. This WAE employment of faculty members not only permits the Survey to utilize the special skills and experience of such individuals but also frequently leads to the recruitment of promising students as assistants to the faculty member.

Relation of Research Projects to Water Utilization and Conservation

FUNDAMENTAL HYDROLOGIC PROCESSES AND PRINCIPLES

This project includes activities which are related to principal aspects of the behavior of water in the physical environment. In order for water to be used and conserved to optimum advantage, it is necessary to do something about it (exercise some management) in each of its physical states: solid (ice), liquid, and gaseous (vapor); in each of its environments: in the air, on the land surface (lakes, rivers, swamps, the sea), and in the ground (underground water); in each of its modes of action: evapotranspiration, precipitation, streamflow, infiltration and percolation, ground-water underflow, and ground-water discharge; and in terms of its principal effects: erosion, sediment transportation, sediment deposition, and chemical solution, dispersion, and precipitation.

Water in all its forms has the same properties when it is managed and used as it does when it is free to behave in a natural manner. Understanding of principles and processes therefore is essential to management for conservation and use.

SCIENTIFIC SUPPORT OF WATER MANAGEMENT

Work to support water management consists, in a general sense, of studies that will lead to continual improvement in understanding of the interplay of water, the physical environment, and the activities of man. This understanding should, in turn, lead to development of plans that will achieve maximum con servation and use of available surface-water and ground-water supplies. For example, studies of whole basins in the field and by means of analog models would assist determination of the optimum distribution and rate of withdrawals from ground-water and surface-water sources and of the desirable extent of ground-water recharge, surface storage, and reuse which are required for each kind of environment. The research also will help the matching of available water qualities with use requirements throughout large geologic areas.

Water management should be based on consideration of all the implications of various management alternatives, including beneficial and nonbeneficial side effects. Recognition and consideration of total environments and total effects is the only means for assuring full use and conservation of water resources with minimal damage to their quality.

CLINICAL CASE STUDIES

Case studies of existing situations would include descriptive analysis of the preexistent natural situations, the developments that have been imposed on them, and the effects of these developments as expressed in current situations. The information would be used to elucidate principles of hydrology and their significance in water management.

For example, study of the heat balance in the vicinity of industrial plants would aid the development of means for predicting thermal die-away patterns in surface streams and ground water which have received single or multiple injections of warm waste water. Chemical and radiometric studies would aid prediction of dispersion, diffusion, and other phenomena in the vicinity of waste-discharge points.

Prediction of consequences is a principal requisite to full use and conservation of water under various management alternatives.

CHEMICAL PROPERTIES OF WATER AND GEOCHEMICAL PROCESSES

It is necessary to determine the effects of various kinds of soils and rocks on the chemical quality of water during the processes of infiltration, percolation, and capillary movement. One kind of study, for example, would include the quality changes from the locus of precipitation to the ground-water zone and back to the soil zone. Other studies would concern interactions between artificially recharged water (including industrial wastes) and natural rocks and water in the recharge zone. Emphasis would be on quality effects of natural biological, physical, and chemical processes such as adsorption, ion exchange, chemical precipitation, and bacterial conversions of organic and mineral components. The findings would have important bearings on the use and conservation of water supplies. For example, they would aid prediction of iron-complexing reactions and consequent iron contamination of ground-water aquifers during recharge operations. They would show the ability or lack of ability of soils and rocks to neutralize acid wastes and to filter, exchange, or adsorb dissolved solids from waste water.

Geochemical research in the behavior of elements which are dissolved in water in only minor amounts would aid study of the travel of solutes from ground water to soils, to streamside vegetation, to aquatic organisms, to bottom sediments, and so on through the hydrologic cycle. Information about mineralogic changes in clays and other minerals during weathering and stream transportation would lead to better understanding of the sources and behavior of minerals that affect the quality of water.

LAKE HYDROLOGY

Large lakes on the North American continent contain nearly a fourth of all the fresh water in the world. Lakes thus have a prominent role in the water cycle, but knowledge of this role is very deficient. Knowledge about reservoirs (artificial lakes) is almost equally poor. Better understanding of lakes and lake hydrology is potentially a very large contribution to enhanced use and conservation of water.

An example is the so-called aging of lakes. "Aging" is the physical, chemical, and biological processes which occur during the history of a lake. Knowledge of these processes will permit determination of the history and present stage of development of individual lakes and prediction of their future development. Understanding of these processes should ease the task of controlling them so as to minimize undesirable effects and to enhance desirable ones. An example is the study of interrelations between the dissolved mineral content of lake waters, their sediment load, biological responses to and effects on these factors, and the chemical evolution of their waters.

GEOMORPHIC AND HYDRAULIC PROCESSES

Work in this project would be aimed initially to classify stream channels on the basis of geologic and environmental factors in relation to physical characteristics of streams. Influence of streamflow, nature of bank material, width and depth

of stream, and direction of flow are factors to be considered. The study is closely related to conservation and use of water. For example, construction of reservoirs invariably changes the characteristics of downstream flow, including channel erosion, sediment movement, and other characteristics which affect the use and conservation of water.

Purpose of the work is to explain principles and processes of channel erosion and of sediment transportation, dispersion, and deposition. The explanations, which are expressed as natural laws and mathematical concepts, can be used to predict changes in the water courses and watersheds which may be induced by river developments and by agricultural, industrial, urban, and other activities. Knowledge of this sort will aid improvement in methods of development and of controls to minimize undesirable effects, thus contributing to conservation and more effective use of land and water resources, to protection of water quality from degradation, and to control of watershed and channel erosion.

LEGAL AUTHORITY FOR ESTABLISHING THE INSTITUTE OF WATER RESEARCH

(Except from letter of Feb. 15, 1962, from Secretary Udall to Mr. Aspinall, chairman of the House Committee on Interior and Insular Affairs)

"Regarding your question as to the authority for establishing the Institute, I am advised by the Solicitor that inasmuch as the functions and programs planned for the proposed Institute of Water Research would merely emphasize and expand basic research activities presently carried on within the Department of the Interior under existing authority, in his opinion special legislative authority would not be required for its establishment. Further, the authority of the Secretary to create and assign a name to a specific organizational unit within the Geological Survey to carry out these functions and programs is based upon the broad powers of the Secretary of the Interior under Reorganization Plan No. 3 of 1950, and the authority of the Secretary as head of the Department charged with the performance of various functions. The Secretary's general authority in this regard is discussed in Solicitors Opinion M-35024 of January 23, 1948 (Decisions of the Department of the Interior, 60 I.D. 111)."

LOCATION OF ACTIVITIES

Chairman HAYDEN. Any questions, Senator McGee?

Senator McGEE. Yes, Mr. Chairman.

Now, I am getting in on the tail end of this thing and perhaps you have already said where this is going to be located?

Mr. NOLAN. Do you mean the activities of the Institute of Water Research?

Senator McGEE. Yes.

Mr. NOLAN. That will be carried on through our field offices over most of the country. There will be a headquarters or administrative center for the work in Washington initially. Before you came in we were talking about our plans or hopes for a new building which would provide laboratory facilities here in Washington for many of the activities to be carried out, in addition to the laboratory facilities which we now have, particularly at Denver and at Menlo Park in California. There are smaller laboratories and offices in other parts of the country where work of this sort would be carried on, among others Worland. I think Worland has been identified as one of the areas in which we would be doing some of the work.

Senator McGEE. How much would be there?

Mr. NOLAN. I would have to look into this tabular material, but I think it is in there.

Senator McGEE. I would like to have that, if I might, when it is convenient.

That is all, Mr. Chairman.

AIRCRAFT FOR AERIAL SURVEYS

Chairman HAYDEN. Objection has been registered with the committee to your purchase of an aircraft to perform aerial surveys, for which you have budgeted $150,000. In addition, it will be necessary to place required technical equipment in the aircraft. Are private companies equipped to do the needed work?

Mr. NOLAN. As I mentioned in my initial statement and also in our discussion about our work in the field of geophysics, the primary interest of the Survey is not in carrying out routine aerial surveys, or in specific searches such as the kind that mining companies themselves make. Our interest is in the development of new methods, the application of new techniques; and, in order to achieve this, I personally feel that it is essential that the equipment be part of the everyday working machinery of the Geological Survey. We regard the plane not as a device to carry out the routine surveys or the exploration searches that are of interest to the mining companies and that are normally and extensively carried out by private groups, but as essentially a laboratory in which we can experiment with the new equipment that is being devised and that is thus made available, through publication, to private industry.

Chairman HAYDEN. Well, could private enterprise supply that? Is it available to you at the times you would require it?

Mr. NOLAN. In our experience I don't think there are any that could carry out the close correlation of airborne surveys and field and laboratory research that is necessary to design and test the new equipment and methods which would be applicable in a variety of geologic environments.

Chairman HAYDEN. Can they perform the work at a lesser cost than you can?

Mr. NOLAN. Again, in our experience, they cannot; no, sir.

Chairman HAYDEN. In this connection I will place in the record a letter from Mr. George Strawbridge, president of the Aero Service Corp. of Philadelphia.

(The letter referred to follows:)

AERO SERVICE CORP.,
Philadelphia, Pa., February 27, 1962.

Re: Senate Interior Appropriations Committee, objection to U.S. Geological Survey budget item "Purchase of replacement aircraft."

Hon. CARL HAYDEN,
U.S. Senator, Chairman, Senate Appropriations Committee, Chairman, Subcommittee for Interior Appropriations, Senate Office Building, Washington, D.C.

DEAR SENATOR HAYDEN: Aero Service Corp., of Philadelphia, Pa., a wholly owned subsidiary of Litton Industries of Beverly Hills, Calif., wishes to register objection to the U.S. Geological Survey budget item "Purchase of a replacement aircraft." Under this item the U.S. Geological Survey requests an estimated gross cost of $200,000 for purchase of one aircraft less an exchange value of about $50,000 for the present two aircraft now retained by the U.S. Geological Survey to be applied as trade-ins. This will result in a net budget increase of $150,000 for this item in the U.S. Geological Survey fiscal year 1963 budget.

Aero Service Corp. objects to this appropriation on the following grounds:

1. This budget request should not be granted because private aerial survey companies maintain a complete capability for airborne geophysical surveys and feel that the U.S. Geological Survey airborne geophysical capability represents Federal Government competition in this field.

2. We further maintain that private aerial survey companies like ourselves have up-dated and modernized the techniques of airborne geophysical surveys to maintain a sophisticated capability. The profit margin, so vitally required to conduct

private enterprise research in airborne geophysics, cannot continue if the U.S. Geological Survey or other Federal Government agencies are permitted to conduct their own geophysical surveys.

3. The U.S. Geological Survey has a very proper and constructive role in research for airborne geophysical techniques. However, aerial survey flight testing in connection with these research programs should and can be carried out by the private consulting aerial survey firms of the United States.

4. Initially, the U.S. Geological Survey had a mandate to conduct research airborne geophysical surveys, and instead this has largely been replaced by routine production airborne geophysical surveys which is the proper area of the private aerial survey company. The most recent example of this is the State of Iowa, whereby Aero Service Corp. and another aerial survey contractor went to the trouble of making specific proposals to the Geological Survey of Iowa at their own expense to conduct airborne geophysical surveys. However, the program is now being performed by the U.S. Geological Survey airborne geophysical group in direct competition with our services.

For several years there has been a Federal match-money arrangement with various States to perform airborne geophysical services. We are definitely in agreement with this program but feel that these surveys, since they are routine production airborne geophysical programs, should definitely be conducted by a private aerial survey consultant rather than the U.S. Geological Survey.

5. Acquiring additional capacity to perform airborne geophysical surveys is not warranted by the U.S. Geological Survey since there is more than enough unused commercial capacity available in the United States. The airborne geophysical contractors in the United States must depend on foreign sources for at least 80 percent of their annual volume. This condition has arisen out of the twofold situation whereby (*a*) there is a depression in the mining industry which cuts down on the amount of airborne exploration carried out by private companies, and (*b*) the fact that most domestic airborne geophysical surveys are now carried out by the U.S. Geological Survey in competition with the private aerial survey industry.

6. Assuming that maintaining the existence of a private industry capability for export is of interest to the United States, it would follow, then, that it is in the interest of the Government to have these American companies perform whatever domestic surveys are anticipated by the Federal Government.

7. In addition to the moneys requested for acquisition of a new aircraft, additional expenditures will ultimately be required to equip this aircraft with newer geophysical survey equipment and ancillary electronic gear for navigation. All or most of these items already exist within the commercial capacity of private aerial survey companies in the United States and would be duplicated by providing this equipment to the U.S. Geological Survey.

8. A further objection to U.S. Geological Survey participation in the field of airborne geophysical surveys is that completion and publication of geophysical maps for the public good is severely delayed. Backlogs exist where aerial surveys were performed by the U.S. Geological Survey over 1 year ago and the maps have not yet been provided to the public for prospecting purposes. This would not be possible by private aerial survey consultants since their contracts would limit them usually to a 2- to no more than 5-month lag between flying time and publication of final maps.

9. Finally, parallel cases can be drawn with Great Britain and Canada. Both of these countries have embarked upon large-scale inventory of their natural resources through airborne geophysical services. In both countries they have abandoned the use of a Federal-controlled airborne geophysical capability in favor of performing these programs by private aerial survey contractors, not only because the cost was lower but because of the moral issue involved of Federal intervention in an existing private aerial survey capacity.

We would appreciate it if these remarks would be entered in the record of testimony and we respectfully request the opportunity to testify in further detail.

Sincerely,

AERO SERVICE CORPORATION,
GEORGE STRAWBRIDGE, *President.*

ROUTINE SURVEYS BY PRIVATE INDUSTRY

Mr. NOLAN. Mr. Chairman, I would like, if I might, to make one additional comment on that. As an example of the policies which I feel we have followed and will continue to follow, several years

ago the Atomic Energy Commission asked us to use one of our planes to carry out some airborne surveys of air radioactivity over some of their facilities; in fact they assisted us in getting the plane which is now being cannibalized. We devised the methods and techniques by which this could be done and carried to completion surveys over some of their plants. We proposed that the rest of the work be done by private industry. To the best of my knowledge this is now being continued on a routine basis by industry itself. This is a policy that I expect we will continue to follow.

(The following additional statement was submitted:)

The various points raised by the Aero Service letter are discussed in order in the following paragraphs, keyed by numbers to the numbered paragraphs of the Aero Service letter:

1 and 2. The private companies referred to are engaged in the production of geophysical maps that are then turned over to users. These maps are produced to certain contract specifications as to area, height, and spacing of flights, tolerance, etc. These surveys can be executed without regard to most conditions other than those which affect the actual flying.

In contrast to this, the Geological Survey is engaged primarily in integrated geological-geophysical surveys, mostly of relatively small areas. Spacing of flight lines, heights, etc., are tailored to the needs of the geological problem being studied and considerable flexibility in flight schedules is required. Test lines may need to be flown to determine the best way to get the desired information. The geologist working on the ground may be consulted at all stages of the operation, and often fly aboard the plane. They help to interpret the geophysical data as it is obtained, and participate in decisions that may alter preliminary flight plans. It is difficult to write this kind of minute-by-minute control and flexibility into contracts for routine surveys, except at considerable extra cost. Once a contract is let, its execution is in the hands of the contractor, and it is difficult to seriously change or cut off a survey.

3. In research for airborne geophysical techniques, minute-by-minute control by the users of the test results is even more important than in investigations in support of ground geological surveys. More flexibility and room for experimentation is required than can be obtained on a contract basis. If the geophysicists engaged in the development of the techniques do not participate actively in the data gathering process, their interpretations are always subject to question.

4. The Geological Survey is in full agreement with the principle that routine production airborne geophysical surveys is the proper area of the private aerial survey company, and has no desire to compete in this field. Numerous opportunities to undertake surveys of this nature in cooperation with States have been refused. The Geological Survey has also followed a consistent hands-off policy with respect to the large petroleum basins, since these can be profitably surveyed geophysically on a more or less routine basis. The survey being conducted in cooperation with the State of Iowa is exceptional, and was undertaken for the following special reason: The area of the survey covers part of the most prominent gravity high in the United States, extending southwest from the Lake Superior region. Integration of magnetic and gravity data were needed for an interpretation of the basement rocks in this area, both to support studies of the rocks in the Lake Superior region and to provide material for a basement rock map of the United States, to which the Geological Survey is contributing.

5. The aircraft requested does not represent appreciable additional capacity in terms of flight-miles per year, but is simply a replacement of existing capacity. It would not, therefore, represent an inroad into work that might be undertaken by unused commercial capacity. The added lift capacity that would be provided by the plane requested would merely increase safety and permit the use of more sophisticated geophysical equipment than that which the present plane carries.

The Geological Survey does not have accurate figures for the actual amount of surveys conducted by private companies in the United States, because the results of private surveys are seldom made public, but the statement that "most domestic airborne geophysical surveys are now carried out by the Geological Survey," does not appear reasonable.

6. A complete aeromagnetic and aeroradiological survey of the United States, or large segments thereof, would be more useful to the Geological Survey than to any other single organization, since it is charged with the responsibility for

preparing geologic maps of the United States. Only private companies have the capacity to execute such a survey, and the U.S. Geological Survey would be happy to see it executed. It would not take the place of many of the special-purpose geophysical studies now executed by the Geological Survey, but would unquestionably make them more effective.

7. The assertion that equipment installed in a Geological Survey aircraft would duplicate items existing within the commercial capacity of private companies is not a valid argument against Survey use of such equipment. Most Government laboratories and agencies have equipment that is also found in private companies. The study of geology has made enormous strides in the last few decades, very largely because new devices have become available that increase the Survey's ability to measure and interpret earth materials. The proposal of the Aero Service Corp. would seem to deny the principal geologic agency of the United States the use of the most modern tools available, simply because private companies use them also.

8. The statement that completion and publication of geophysical maps by the U.S. Geological Survey is severely delayed is not really valid. The products of many Survey investigations are integrated geological-geophysical reports, which naturally take longer to publish than an almost mechanically produced geophysical map. Where maps have been required in advance of publication for use in prospecting, they have been furnished promptly through open file. Great strides have likewise been made in speeding preparation of more formal reports.

9. The Canadian Geological Survey has not abandoned the use of a Federal-controlled airborne geophysical capability in favor of performing these programs by private aerial-survey contractors. They have, it is true, contracted for routine production surveys on a very large scale, but they have also maintained their own capability. Capacity, not cost or the moral issue of Federal intervention, was the reason for this choice. The experience of the Canadian survey proved to their own satisfaction that they could operate more cheaply than the companies. They have maintained their own capacity primarily to remain active in the field so that they could properly supervise the execution of the contracts.

LABORATORY AT DENVER, COLO.

Chairman HAYDEN. With regard to the special-purpose laboratory building at Denver, is $1,100,000 to be the full cost?

Mr. NOLAN. It represents the full cost of construction of the building.

Chairman HAYDEN. That might answer what I was going to ask next. How about the equipment?

Mr. NOLAN. I have here, incidentally, the breakdown of that $1,100,000, which provides for the mechanical and electrical work and it includes the basic laboratory equipment such as hoods, chemical sinks, tables, et cetera, and if I may, I will put that in the record.

Chairman HAYDEN. That may be inserted in the record at this point.

(The material referred to follows:)

Nuclear research building, Federal Center, Denver

Preliminary estimates:	
General contractor (structural and architectural)	$356,000
Mechanical (heating, air conditioning, plumbing)	300,000
Electrical work	154,000
Basic laboratory equipment: Hoods, chemical sinks, tables, etc	120,000
Pneumatic tube system	8,000
Contingent	47,000
Administrative and engineering	108,000
Total	1,093,000

These estimates were worked out with GSA in Denver in May 1961.

COST OF ACTIVATOR

Mr. NOLAN. Mr. Chairman, that breakdown does not include the cost of some of the specialized equipment. The estimates that we have received so far on the cost of the activator, which is the most elaborate single piece of equipment, indicate that it will cost somewhere in the neighborhood of $50,000 which it is our intention to meet out of regularly appropriated funds.

Chairman HAYDEN. Do you have any further questions, Senator McGee?

Senator MCGEE. Yes, I have one or two other questions.

Chairman HAYDEN. You may proceed.

PROGRAMS IN ROCKY MOUNTAIN AREA

Senator MCGEE. A year ago, when you were here, you may recall the conversation we had on getting some additional programs going in the Rocky Mountain area.

Mr. NOLAN. That is right.

Senator MCGEE. That was in geological work and minerals and at the time you submitted a statement for the record that suggested that if you had the money or had the budget included the money a total of $835,000 could have been usefully put to work in the nature of ore exploration, new mineral exploration techniques and geological and topographic maps, which are desperately needed and still lacking, properties of rocks and temperature measurements and implementations to deal with prospecting studies. My question to you is whether there has been an attempt, in your new budget requests, to point toward these programs that you spelled out for me.

Mr. NOLAN. Yes, sir. We have specifically identified the same kinds of activities in the requests for increases for this coming year in the geological program proposal. We have asked for a total increase of $1.6 million for the work on geological and mineral resources. That has been broken down into three items: $450,000 which is proposed for field and laboratory research in economic geology. This work would, to a considerable extent, be carried out in the mining regions of the West and in the laboratories that we have at Denver; $250,000 is proposed for field and laboratory research in regional geology, but this includes the $150,000 for the plane and for some increase in geological mapping in Kentucky. The major element of the increase, $900,000, for field and laboratory research in experimental geology, is almost wholly of the type of fundamental research in problems of ore formation and ore deposition that we discussed in the hearings last year. It is designed to give us a better understanding of the conditions under which ore deposits are formed and of the methods by which they may be searched for.

Senator MCGEE. As to the $900,000 you referred to for experimental geology research, its principal focus would be in the Rocky Mountain area or would this be nationwide?

Mr. NOLAN. It is designed primarily for a nationwide research in experimental geology rather than to be applied in a particular area. The work, however, would to a large extent be carried out in our major facility in Denver. Menlo Park has fewer laboratory facilities but may be used. The proposal for a special purpose building at

Denver will be for a building specifically designed to carry out research using some of the new nuclear methods. This building is essential, because of the need to provide adequate safety in the utilization of nuclear materials.

Senator McGee. What about the mapping operation? You mentioned a moment ago that some of the money would go into a plane and that some of this program is to be concentrated in Kentucky.

GEOLOGIC MAPPING IN WESTERN STATES

Mr. Nolan. Of the increase of $250,000, $100,000 was for straight geological mapping in Kentucky. That is a relatively small part of the total estimate for regional geology, which is the item under which we do most of our geologic mapping. The estimate for fiscal year 1963 for field and laboratory research in regional geology for the whole country is $6,923,000. As you know, a very large part of the geologic mapping is carried out in the Western States.

Senator McGee. That is why I wanted to ask, in pinpointed fashion in view of the background that was submitted for this last year, if you could tell me how much of that was going into this rather substantial area in the Rocky Mountains where the need for this seemed to be particular acute. Your specification there a year ago was, to quote your language, "for the Rocky Mountain area alone, an additional increase of $400,000 would make possible the acceleration of geological mapping."

Mr. Nolan. As I mentioned earlier, the increase of $450,000 is for field and laboratory research in economic geology, item (a) on our justifications. It also will provide for an increase in the rate of geologic mapping in the Rocky Mountain region. I would like, if I may, since I do not have a breakdown of where these two sums, $3,837,000 for field and laboratory research in economic geology and $6,923,000 for similar work in regional geology with me, I would like to provide for the record how much of that would be in the Rocky Mountains.

Senator McGee. I would appreciate that if that would be put in the record and the reason I press it at all is to have it take on some meaning for me. The vernacular of the professional geologist sometimes escapes my comprehension, but I do think I understand the terms in which we talked about this last year and if I could get the breakdown on the relationship of the proportion that is going to be devoted to obtain these goals we have been talking about, I will have a better chance to evaluate the assault you are making on this.

Mr. Nolan. I am reminded I neglected to mention another item under which geologic mapping will be done and which is also largely concentrated in the Rocky Mountain region. It is under the item of "Conservation of lands and minerals," and is shown on page GS-56 of the justifications. It will provide, to a considerable degree, for geological mapping in the Rocky Mountain States, and other public land, to improve our knowledge of the distribution of leasable substances such as coal, phosphate, and oil and gas for purposes of the mineral classification of the public lands.

Senator McGee. Might I have that breakdown, and please have those breakdowns grouped to indicate any overlapping programs which may be separate in the budget request but still apply in the same general area, so that we can get the total picture. I would be very appreciative of that.

Mr. NOLAN. We will be glad to do that.

Senator MCGEE. That is all I have, Mr. Chairman.

(The information referred to follows:)

The three subactivities carried on under "Geological and mineral resources surveys and mapping," with corresponding estimates for 1963 are: (a) Field and laboratory research in economic geology, $3,837,000; (b) field and laboratory research in regional geology, $6,923,000; (c) field and laboratory research in experimental geology, $4,260,000. Of these amounts, the approximate amounts for the Rocky Mountain region are: (*a*) $1,200,000, (*b*) $1,600,000, and (*c*) $500,000.

The subactivity ($843,000) for mineral classification, under the activity "Conservation of lands and minerals," provides for approximately $500,000 for geologic mapping, including standard classification for leasable minerals in the Rocky Mountain region. In regard to topographic mapping, approximately $4,230,000 are to be available for this work in the Rocky Mountain region, out of a total of $19,500,000 for this activity.

PROGRAMS IN UTAH

STATEMENT OF HON. FRANK E. MOSS, A UNITED STATES SENATOR FROM THE STATE OF UTAH

GENERAL STATEMENT

Chairman HAYDEN. Senator Moss, we will be glad to hear any statement you wish to make.

Senator MOSS. Thank you, Mr. Chairman.

It is always a pleasure to appear before this committee because I know that in its distinguished chairman and its members we have some of the most dedicated and knowledgeable conservationists of the country. I am confident that I am speaking to colleagues who are as interested as I in realistic appropriations for the preservation and development of our resource heritage. I will, therefore, be as brief as possible.

First, may I say that I was gratified, as I know you were, to note that the fiscal 1963 appropriations requested for the Interior Department activities to be considered by this committee, total $600,004,000, an increase of $110,503,000 over the amounts appropriated for the fiscal year 1962. Similarly, the budget request for the Forest Service is up $24,136,000 over last year's request, for a total of $222,900,000.

This indicates to me that the Kennedy administration, despite the terrible pressures of national security and the space race, realizes that proper resource management is a sound investment, and continues to support and advance it. This is most satisfying to those of us from the West, where proper resource management and conservation are absolutely essential to our economic well-being.

Because I am requesting three amendments, I will discuss them first:

1. I ask that $20,000 be written into the Forest Service appropriations for the purchase of surface rights on patented mining claims interspersed with Uinta National Forest Service lands in the upper American Fork watershed in Utah County, Utah.

2. I ask that $900,000 be added to the Forest Service research budget for the construction of a forest watershed research laboratory at the Utah State University in Logan, Utah.

3. I ask that $105,000 be made available to the Fish and Wildlife Service to repair the 14-mile highway that extends west from Brigham City, Utah, to the Bear River Migratory Bird Refuge.

Now, may I discuss each of these requests in a little more detail.

AMERICAN FORK WATERSHED

The watershed plan for American Fork Canyon has been worked out by the North Utah Water Conservancy District, in cooperation with the U.S. Forest Service under the authority of the Watershed Protection and Flood Prevention Act (Public Law 566).

For many years damaging floods have been originating in the headwaters of this canyon, menacing the cities of Pleasant Grove, American Fork, Lehi, and Alpine. There has been an average of one flood every 5 years since 1870. In 1951 and 1953 floods caused direct damage in excess of $123,000.

Under the watershed plan completed in 1958, all depleted national forest lands in the upper watershed have been contour-trenched and seeded except 4,000 acres of scattered and seriously depleted land upon which there are patented mining claims. These claims are many years old, and are owned by over 25 groups and individuals, most of whom live in distant cities. Because of the steep topography and the kind of measures required, treatment of the entire area must be carried out in one operation. The private lands are, therefore, the key to the success of the whole watershed plan. Surface rights to these lands are needed if the project is to be thoroughly effective.

I have consulted with the Forest Service, and am advised the Service could use $20,000 in the fiscal year 1963 to begin purchase of these surface rights. Similar amounts will be needed in the next 2 or 3 fiscal years. The funds would be repaid under the authority of the act of August 26, 1935 (49 Stat. 866) as amended by the act of May 26, 1944 (59 Stat. 277) which allows the Secretary of Agriculture, with the approval of the National Forest Reservation Commission, to acquire by purchase lands within the boundaries of the Uinta and Wasatch National Forests, and to pay for such lands from receipts obtained from the sale of natural resources of occupancy of public land within these national forests when appropriated. The Unita National Forest had total receipts in the fiscal year 1961 of $92,002.41.

I ask unanimous consent to have included in the record of the hearings sections from a February 16 letter from Edward P. Cliff, Assistant Chief of the National Forest Service Management Divisions, which gives more detail on the American Fork watershed problem. I will also leave with the chairman some questions which I would appreciate having asked of Forest Service representatives when they appear before the committee in order to more fully develop the case.

Chairman HAYDEN. Very well.

(The information referred to follows:)

EXCERPTS FROM LETTER FROM EDWARD P. CLIFF, ASSISTANT CHIEF OF THE NATIONAL FOREST SERVICE MANAGEMENT DIVISIONS, FOREST SERVICE

As you know the American Fork drainage has a long flood history. Available records show that floods which caused serious damages have occurred in the major tributaries of the watershed area on the average of one every 5 years since 1870. For example, the floods of 1951 to 1953 caused direct damage in excess of $123,000.

Following the flood of 1953, a survey was made of watershed conditions in the American Fork canyon. This investigation and later studies have established the fact that these damaging floods originate in headwater areas where conditions of soil and vegetative cover are seriously deteriorated because of past grazing use. Historically, the floods have increased since early settlement with respect to both frequency and magnitude. These studies concluded that there is a definite probability of the occurrence of rainstorm floods of increasing magnitude and damage potential unless flood prevention measures are taken.

In 1958, a watershed work plan was completed for the American Fork dry creek watershed pursuant to the Watershed Protection and Flood Protection Act approved August 4, 1954, (68 Stat. 666) as amended. This plan was prepared by the cities of Pleasant Grove, American Fork, Alpine and Lehi; the Pleasant Grove, American Fork, Alpine, and Lehi Irrigation Cos.; Utah County; and the Alpine Soil Conservation District; with assistance from concerned Federal and State agencies.

The watershed plan proposed treatment of all of the flood source areas in the upper watershed which it is physically possible to treat in order to restore vegetative cover and check advanced gully and channel erosion. This upper watershed consists mainly of national forest lands, but includes 4,000 acres of patented mining claims. Treatment was planned for both private and Federal lands. Actual watershed protection and flood prevention work in the upper watershed under authority of Public Law 566 was initiated in 1959 and has continued according to schedule through 1961. To this time, all of the work on flood source areas in the upper watershed has been done on these national forest lands not intermixed with mining claims. The remaining work required under the watershed plan will be on areas of intermingled private and national forest ownership. Because of the steep topography and kind of measures required, treatment of the flood source areas must be carried out as one operation. Therefore, the 4,000 acres owned by about 25 private owners becomes the key to completion of this project.

The act of August 26, 1935 (49 Stat. 866), as amended by the act of May 26, 1944 (58 Stat. 227), among other things, authorizes the Secretary of Agriculture with the approval of the National Forest Reservation Commission "to acquire by purchase any lands within the boundaries of the Uinta and Wasatch National Forests, in the State of Utah, which, in his judgment, should become the property of the United States in order that they may be so managed with other lands of the United States as to minimize soil erosion and flood damage." This legislation authorizes the appropriation of the receipts from these two forests for this purpose. Under this authority the Secretary may acquire the surface of land and permit the owner to reserve his mineral interest.

The watershed plan contemplates that the local sponsors will obtain easements from the private landowners to permit performance of the needed work. It was considered that easements would provide an adequate means of accomplishing the measures included in the watershed project work plan. However, from the standpoint of the national forest program, approximately 4,000 of these acres are inholdings to which the United States should acquire title in order that they, and the adjoining national forest lands, can be rehabilitated, managed, and protected for multiple-resource purposes. Such acquisition is consistent with a development program for the national forests which the President submitted to the Congress on September 21, 1961.

Forest Service Watershed Laboratory

Senator Moss. On February 15, I endorsed the proposal made on the floor of the Senate by that great friend of forestry research, Senator Stennis, to provide more adequately in the fiscal year 1963 for research programs and the construction of research facilities. One of the facilities recommended was the Forest Watershed Research Laboratory which, if constructed at the Utah State University at Logan, would greatly facilitate studies aimed at the solution of problems of vital importance not only to Utah, but also to Idaho, Nevada, western Wyoming, and Montana.

The Forest Service's Intermountain Forest and Range Experiment Station which is headquartered at Ogden, Utah, now has a project located at Logan to determine how watershed management may be

improved under the conditions of climate, vegetation, and soils occurring in the Great Basin and Missouri River headquarters. While this project should be appreciably strengthened through increased appropriations to provide for additional scientists, we should also get a laboratory established since it would speed up the entire program. Emphasis would be placed on research to improve water yields, reduce floods and erosion, and to rehabilitate mountain watersheds.

I will not take the time of the committee to detail the studies which would be undertaken, but will offer as an attachment a more complete statement. I have also prepared some questions which I hope can be asked of Forest Service representatives to clarify some of the aspects of the work of the laboratory which I cannot cover in this short period.

The Great Basin and the headwaters of important tributaries to the Missouri River are plagued with periods of inadequate water supply. Maintenance of stable flows of good quality water is imperative to the continued existence and further development of industries, or irrigated agriculture and of the many communities in the region.

(The statement referred to follows:)

STUDIES TO BE UNDERTAKEN BY FOREST SERVICE WATERSHED LABORATORY, LOGAN, UTAH

Certain techniques of watershed management offer promise of increasing water yields or improving the timing of such yields. Studies by the Forest Service in California, Arizona, and Colorado have shown that manipulation of vegetation may result in significant increases in streamflow. These studies have also shown that the effects of such vegetative changes will vary depending upon climate, type of vegetation, and soils. Therefore, the results of studies in other parts of the West cannot be applied directly to the Intermountain region.

Another pressing Intermountain problem is how to reduce flood runoff, erosion, and sedimentation from deteriorated rangeland watersheds through restoration of plant cover and supplementary structures. Past research has developed some structural and vegetation control methods that are being applied successfully on thousands of acres of cover-depleted flood-source rangeland with a high recovery potential. Yet, many harsh depleted sites defy rehabilitation by current practices. Land managers lack adequate information on which to base management practices to halt further deterioration, restore range and watershed values to their potential, and simultaneously utilize efficiently the forage resources to an extent compatible with other resource values.

The laboratory proposed at Logan would provide facilities that would speed up the work on this problem. Under controlled environment various plant species and methods of planting or seeding could be more rapidly evaluated in terms of establishment on severe sites and effectiveness in stabilizing soil. Provision would also be made for mechanical and chemical studies of soils to determine those characteristics of soils that influence their relative stability.

Closely associated, but requiring quite different research methods and facilities, would be studies aimed at stabilizing steep eroding mountain stream channels. These unstable channels constitute the sources of much sediment. For example, the sedimentation rate for Upper Kanab Creek in southern Utah is estimated to be two-thirds from gullies and channels and only one-third from sheet erosion of slopes; 90 percent of the sediment contributed by Five Mile Creek to the Boysen Reservoir in Wyoming comes from erosion of the main channel.

Fundamental to the control of eroding channels is a sound knowledge of stream hydraulics. Although much has been done in the field of hydraulics of irrigation canals and flatland streams, I am informed that practically nothing has been done of a basic nature to determine the hydraulic relationships under the extreme conditions of steep headwater mountain streams. The proposed laboratory would provide for model studies that would determine the basic hydraulics of such streams followed by studies to determine how structures and vegetation might be used to alter hydraulic characteristics and thereby reduce bank and channel cutting.

KEYSTONE FACILITY

Senator Moss. I want only to say again that the Laboratory proposed for Logan is a keystone facility needed to support the type of studies required to answer the pressing problems in the area, and I urge that this committee give favorable consideration to providing $900,000 in the appropriation of the Forest Service for construction of a Forest Watershed Management Laboratory in Utah.

My request for funds to repair the 14-mile highway that extends west from Brigham City to the Bear River Migratory Bird Refuge is based on the fact that Box Elder County officials tell me they cannot foresee when the county will be able to finance this much-needed road improvement by itself.

The road is the only method of access to the refuge. It is used principally by visitors to and employees of the Government wildlife installation. Some 22,000 persons visit the refuge each year, and 16,000 ducks are taken there annually.

Box Elder realized only $100 per year in taxes from an area of 64,000 acres, which, if it were taxable, would return some $3,000. The county has offered to furnish the labor and equipment to repair the road if the Federal Government will furnish materials.

The Federal Government's cost has been estimated by the Fish and Wildlife Service as $105,000, which would include the cost of one bridge.

I am hopeful that the committee will feel this is a valid expenditure, and will recommend it.

In conclusion, may I say that in general I support the items and programs in the budget requests of the bureaus and agencies represented in these hearings—all of them are important to the building of the West. I wish to reserve my comments on the Institute of Water Research which is proposed for establishment under the Geological Survey to collect and correlate scientific knowledge of the occurrence, use and development of our water supplies. Some questions have arisen in Utah about this institute, and I may wish to make some observations later, which I will do by letter to the chairman.

I want to particularly stress my support for the requests for two programs. First, I am glad that the budget for the Bureau of Mines provides for additional research for improved recovery and utilization of coal and other minerals, and for further development of scientific data to form a basis for an oil shale industry. Discovery of expanded uses for coal would give a real lift to Utah's depressed coal industry, and since we have considerable undeveloped oil shale lands, basic knowledge upon which an oil shale industry could be developed would also be most welcome.

And second, I am glad that the fiscal year 1963 budget for the National Park Service provides for an increase of $15,380,000 available to the Service over the fiscal year 1962.

We are not at the present time fulfilling our obligations for outdoor recreation opportunities for our people. We are not building adequate facilities in the national parks and monuments we now have, and we are not developing enough new areas. I am working with

Secretary Udall in an effort to establish a vast and spectacular new national park in Utah—the Canyonlands National Park—and hearings on my bill will be held shortly in both Washington and Utah. But meanwhile, I am hopeful that increased funds will be made available to continue the development and improvement of the 12 national parks, monuments, historical sites and recreation areas already located in full or in part in the State. I ask that a statement of the amounts requested for these parks be included in the record of the hearings.

(The information referred to follows:)

Funds requested in the 1963 fiscal year estimates for national parks in the State of Utah

	Management and protection	Maintenance and rehabilitation of physical facilities			Acquisition of—		Construction and development	Grand total
		Roads and trails	Buildings and utilities	Total	Lands	Water rights		
Arches National Monument	$48,981	$18,473	$13,547	$32,020			$237,600	$318,601
Bryce Canyon National Park	124,094	54,968	54,478	109,446		$600		234,140
Capitol Reef National Monument	30,664	18,577	15,407	33,984	$40,000		262,700	367,848
Cedar Breaks National Monument	15,698	10,248	9,047	19,295			8,000	42,993
Dinosaur National Monument (Utah portion)	42,753	14,211	10,881	25,092			45,000	112,845
Flaming Gorge Recreation Area (Utah portion)	19,865	4,481	6,833	11,314		26,800	[1] 500,000	557,979
Glen Canyon Recreation Area (Utah portion)	143,218	62,199	103,719	165,918			[1] 247,000	556,136
Hovenweep National Monument (Utah portion)	3,385	586	1,228	1,814			12,550	17,749
Natural Bridges National Monument	10,544	2,894	1,787	4,681			418,000	433,325
Rainbow Bridge National Monument		322		322				322
Timpanogos Cave National Monument	46,955	8,044	12,942	20,986				67,941
Zion National Park	195,861	78,655	81,675	160,330	162,000		559,900	1,078,091
Total	682,018	273,658	311,544	585,202	202,600	27,400	[2] 2,290,850	[3] 3,787,470

[1] These development funds ($747,000) contained in Bureau of Reclamation budget estimates.
[2] Total for development in National Park Service estimates, $1,543,850.
[3] Grand total of estimates for State of Utah in National Park Service budget, $3,040,470.

Committee Recess

Senator Moss. Thank you, Mr. Chairman, and the members of the committee for your courtesy in hearing me.

Chairman Hayden. Are there any further questions?

If not, then the committee will stand in recess until Friday, March 2, 10 a.m., when we will take up the Fish and Wildlife Service.

(Whereupon, at 12:20 p.m. Thursday, March 1, 1962, the hearing was adjourned to reconvene at 10 a.m., Friday, March 2, 1962.)

DEPARTMENT OF INTERIOR AND RELATED AGENCIES APPROPRIATIONS, 1963

FRIDAY, MARCH 2, 1962

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met, pursuant to recess, at 10 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Kefauver, Byrd, Mundt, Young, and Dworshak.

DEPARTMENT OF THE INTERIOR

ARKANSAS PROJECTS

STATEMENT OF HON. J. W. FULBRIGHT, A U.S. SENATOR FROM THE STATE OF ARKANSAS

GENERAL STATEMENT

Chairman HAYDEN. The committee will be in order.

Senator Fulbright, we will be glad to hear from you.

Senator FULBRIGHT. Thank you, Mr. Chairman. I appreciate your patience in letting me come here to testify every year.

I have always considered the Interior appropriation bill to be one of the most important appropriation bills which we act on each year. What the Congress does or does not do about the programs financed through this bill has a far-reaching effect and will, to a great extent, determine the shape the Nation's natural resources will be in when they are handed over to future generations. This committee has consistently shown a keen awareness of the importance of developing and conserving the Nation's natural resources. You have always been generous in approving funds for Arkansas projects. I am grateful for the committee's support of our projects, and I know that the requests which I will make today will receive your usual sympathetic consideration.

There are several projects in Arkansas under the jurisdiction of the Fish and Wildlife Service which should receive additional funds above the amounts included in the budget. The project for research on large reservoirs in north Arkansas is one in which I am particularly interested.

I want to emphasize this research is applicable not only to lakes in northern Arkansas. The knowledge gained there will be available,

of course, and will be useful in all reservoirs created by the various agencies of the Government.

As the chairman will recall, I testified before this committee last year about the need for initiating research to determine why fishing declines after reservoirs are a few years old. This I believe is the uniform experience throughout the country.

APPROPRIATION FOR RESEARCH

The committee recognized the need for this research and recommended an appropriation of $170,00. Unfortunately, this was cut back to $85,000 in the conference committee. The budget for the coming fiscal year contains only $85,000 to continue this work, and, in my opinion, this is unrealistic in view of the magnitude of the problem. I have been advised that $170,000 could be used effectively next year on this project.

New Federal reservoirs are being constructed throughout the Nation, and the knowledge which will be gained through reservoir research can decide whether these lakes will have a permanent good fishing potential, or whether they will follow the same boom and bust cycle we experience today. Money spent on this research will be a good investment when you consider the increased taxes resulting from stimulation of economic activity in areas around reservoirs where there is good fishing.

In my State it has been estimated that sports fishing generates some $50 million in business each year, much of it in the communities near these big Federal reservoirs in the northern and central part of the State.

Chairman HAYDEN. I have had that experience in my own State.

Senator FULBRIGHT. I am told that this problem is universal, that this happens in all of them.

I urge the committee to provide the full $170,000, which the Department can use for research on the lakes in north Arkansas.

FISH HATCHERIES IN ARKANSAS

We are fortunate to have several Federal fish hatcheries located in my State. These have been of great help in establishing Arkansas' reputation for good fishing. Two existing hatcheries and one under construction need additional funds in the next fiscal year. One hundred and fifty thousand dollars was appropriated last year to initiate expansion of the Norfork trout hatchery. The famed trout fishing in the White and North Fork Rivers in north Arkansas is supported by stocking from this hatchery. Since it was established the requirements for trout have increased 100 percent. There are no funds in the budget this year to continue the expansion program initiated with last year's appropriation. An additional $190,000 could be used effectively in the next fiscal year to continue the expansion program and bring the project to the point where it could produce fish. It seems quite unreasonable to stop this project just as it is getting underway. Unless the work is carried out as originally scheduled, it will undoubtedly cost a great deal more to complete the project in the future; which I am sure they are likely to do, and it will only add to the cost to delay it.

GREERS FERRY HATCHERY

A similar financing problem is involved in connection with the Greers Ferry hatchery, for which an initial appropriation of $170,000 was made last year. This hatchery will supply trout for stocking the waters below the Greers Ferry Dam which is now nearing completion. The reservoir is already being filled. The budget contains an item of $95,000 for work on the hatchery, but this is not sufficient to construct a unit that will produce fish. A total of $265,000 is needed for the next fiscal year to build a producing unit, although additional work will be required later on.

There is a pressing need for improvements at one of Arkansas' older Federal hatcheries—Mammoth Spring. Congress appropriated some funds in the 1960 and 1961 fiscal years to update the facilities at this hatchery. The bids for the construction work were considerably above the estimates, and the improvement program has not been completed. There are no funds in the budget to complete the project. I have been advised that it will take an estimated $122,000 to complete the improvement program, and I hope that the committee will allow this amount.

FEDERAL FISH FARM EXPERIMENT STATION

As the members of this committee know, I have been keenly interested in the Federal Fish Farm Experiment Station which was authorized by a bill I introduced. The committee is aware of the importance of this project and has taken action to insure that it proceeded at a reasonable rate. There are two units in this project—the headquarters area at Stuttgart and an operating area with considerably more acreage a Kelso. The buildings at Stuttgart have been completed, and the pond system will be finished early this spring. Research is already underway in privately owned reservoirs and ponds at the State fish hatchery in Lonoke pending completion of the pond system at the experiment station. The property at Kelso has not been developed for experimental purposes, and I hope that the committee will recommend an item of $225,000 for development of this property during the next fiscal year. The budget does not contain any funds for the Kelso unit, but it does request funds for construction and operation at the Stuttgart unit. This new fish farming industry has great potential, and the work that will be carried out at the experiment station will be invaluable in solving some of the problems encountered by fish farmers.

I may add again that this is not significant only for fish farmers, but this is an integral part of the development of the rice industry. Really, I think probably the most important part, financially, economically, and for the future, is the effect that it has upon the rice industry. It is a part of that very important and very large industry in this part of the State.

WETLANDS PURCHASE PROGRAM

I would now like to discuss briefly a project which is definitely of national significance—the wetlands purchase program. I was pleased that the Congress last year passed the bill authorizing a loan program to expedite purchase of good waterfowl breeding and resting lands.

The decrease in waterfowl population in recent years has been alarming, and drastic action is necessary to halt the decline. I am disappointed that the President's budget did not contain the maximum amount that could be used in the wetlands acquisition program. The recently released waterfowl survey of the Mississippi Flyway showed a 14-percent decrease in waterfowl numbers compared to a year ago. The mallard population was 38 percent below the previous year, and 43 percent below the 12-year average. It is my understanding that the staff of the Department of the Interior is geared to expedite the acquisition program if additional funds were made available.

Approximately $8 million above the budget estimate could be used effectively in the next fiscal year to buy the good wetlands while they are still available. If we continue to delay on this program, much of the good land will be lost forever for waterfowl conservation.

Bird Control Program

Arkansas farmers, particularly those in eastern Arkansas, suffer millions of dollars in crop losses each year from depredations by blackbirds and starlings. It has been estimated that these birds cause $5 million a year in damages to the rice crop alone. The Fish and Wildlife Service is trying to find an answer to this problem, but additional funds are needed to step up this control program. This is a serious situation, and I hope that the committee will give sympathetic consideration to providing additional funds for this work.

Another predator problem exists in southweast Arkansas, where wolves and coyotes are giving cattlemen considerable trouble.

I do not know whether these came in after being driven out of Arizona or New Mexico or not, but they sure are causing us a lot of trouble down there.

The Arkansas Game and Fish Commission has been cooperating with the Fish and Wildlife Service on a control program, but both State and Federal funds for this program are quite limited. I urge the committee to take a good look at the cooperative predator control program with a view to stepping up this activity.

National Park Service Funds

The budget for the National Park Service contains funds for four units in Arkansas—Hot Springs National Park, Pea Ridge National Military Park, Arkansas Post National Memorial, and the Fort Smith National Historic Site. I support the budget request for these units.

Forest Service Activities

In closing, I wish to discuss briefly the importance of Forest Service activities in my State. Forestry is Arkansas' major industry, and over 60 percent of the State is covered by timber. Two Forest Service research centers, located at Crossett and Harrison, are conducting important research which has been, and will continue to be, of much significance to this industry; and here, again, not just locally, but of interest to the entire South, because we are a typical forest area in the South.

Approximately $110,000 is allocated for the Crossett Center and $126,000 for the Harrison Center under the budget request. These

amounts will be sufficient to continue work at about the same level as last year. Although I am not asking for additional funds for these centers, I hope the committee will provide additional funds for the Stoneville, Miss., Research Station. I have been advised that $50,000 above the budgeted amount is needed to carry out important work on southern hardwoods at this station, particularly hardwood seeding and planting.

These research programs all work together, and this station, although it is not located in my State, is very important in the overall research program, especially in the field of production and utilization of hardwoods.

In general, I urge the committee to give its usual sympathetic treatment to the forestry research program. I know of no other Government program which has demonstrated its value and effectiveness as much as this one has in my State.

Mr. Chairman, I again wish to thank you and the members of this subcommittee for your past help on Arkansas projects. I know that the items I have mentioned today will receive careful attention.

I appreciate very much your giving me this opportunity to testify before the subcommittee.

That completes my statement, Mr. Chairman.

Chairman HAYDEN. Senator Bennett?

ACCESS ROAD TO BEAR RIVER NATIONAL WILDLIFE REFUGE

STATEMENT OF HON. WALLACE F. BENNETT, A U.S. SENATOR FROM THE STATE OF UTAH

GENERAL STATEMENT

Senator BENNETT. Mr. Chairman, I greatly appreciate the opportunity of appearing before the committee this morning in support of an appropriation to rebuild the road which gives the only means of access to the Bear River National Wildlife Refuge west of Brigham City, Utah.

The road is about 14 miles in length, extending from just west of Brigham City to the refuge headquarters. Both the Bureau of Sport Fisheries and Wildlife and the Box Elder County Commission have surveyed the road and report that 11½ miles is in poor condition and in need of repairs. Some sections are in extremely bad condition, and in some places are hardly passable.

The Director of the Bureau of Sport Fisheries and Wildlife, D. H. Janzen, indicated to me in a letter of February 20 that the Bureau feels a "moral responsibility" to cooperate with county officials "to whatever extent possible." However, there are no funds included in the current budget, and none are presently included in the fiscal year 1963 budget requests which is now being considered by this committee.

No doubt, Director Janzen's statement that the Bureau has a moral responsibility to assist in building the road is based upon the fact that the road is the sole access to the refuge, and the great bulk of its use comes from Government employees and others using the refuge. Approximately 22,000 people visited the refuge last year. This high degree of use has resulted in the present serious condition of the road.

At the present time, Box Elder County realizes only about $100 in

taxes from this vast 64,000-acre area which has almost totally been removed from the county property tax rolls.

PRECEDENTS FOR FEDERAL AID TO ROAD

Federal participation in this kind of a road program for national refuges has recent precedents. The Okefenokee refuge in Georgia presents an almost direct parallel to the Bear River refuge road situation. There, Congress appropriated funds to rebuild the road in fiscal years 1957 and 1958. The work was placed up for bid by the Bureau of Sport Fisheries and Wildlife according to specifications prescribed by local county officials. Shortly thereafter, Congress approved a similar cooperative road program at the White River, Ark., refuge. In this case a fire protection road was built around the refuge, using existing roads as much as possible.

TYPE OF WORK NEEDED ON ROAD

The Box Elder County officials have estimated that the road could be placed in good condition by adding a new gravel base along with a 3-inch bituminous surface. They also believe the road should be widened to 24 feet, and that the bridge across Reeder's Canal should be replaced and relocated to remove a hairpin curve in the road at that point. The total cost of the road improvement is estimated at $105,000 to $115,000.

The county is not in a position to build a road because its funds are already committed elsewhere to roads which serve residents of the county, and which have a higher priority than the Bear River refuge access road, which is essentially a service road for the refuge. The available Federal aid secondary funds have been budgeted by the county over the next 3 years for a road north of Great Salt Lake leading to Nevada. The county's problem has been made even worse by the recent floods throughout the county, with consequent need to repair county roads and bridges.

Although the county does not have funds to rebuild the road, it is willing to cooperate fully, and will furnish county labor and equipment to assist in rebuilding the road. It is also willing to maintain the road in the future, just as it has in the past.

AMOUNT REQUESTED

This is a most worthwhile cooperative project, and I urge the committee to appropriate $115,000 for this purpose.

I would be grateful if the committee would include at the end of my remarks the letter which I received from Director Janzen, together with a wire and letter which I have received from Clyde B. Stratford, chairman of the Box Elder Chamber of Commerce Highway Committee.

Chairman HAYDEN. That will be done.

(The communications referred to follow:)

FEBRUARY 28, 1962.

Senator WALLACE F. BENNETT,
Senate Office Building,
Washington, D.C.:

Regards Bear River bird refuge road material costs to reconstruct road and bridge $115,000. If this amount available through Interior Department,

county will furnish labor for construction and maintenance repairs to county roads and bridges caused by floods will deplete funds for 2 years secondary road money budgeted next 3 years for north of lake road.

Regards,

CLYDE B. STRATFORD,
Chairman of Road Committee,
Box Elder Chamber of Commerce.

DEPARTMENT OF THE INTERIOR,
FISH AND WILDLIFE SERVICE,
BUREAU OF SPORT FISHERIES AND WILDLIFE,
Washington, D.C., February 20, 1962.

Hon. WALLACE F. BENNETT,
U.S. Senate,
Washington, D.C.

DEAR SENATOR BENNETT: In response to a telephone request of February 15 by Mr. Mecham of your office for details on the road from Brigham City, Utah, to the Bear River Migratory Bird Refuge, the following information is furnished:

The road referred to above is located almost entirely outside the boundary of the refuge and is about 14 miles in length from the refuge headquarters to Brigham City. An estimated 11½ miles of the road is in poor condition and in need of repairs. The Box Elder County officials believe that the road could be placed in good condition by adding a new gravel base along with a 3-inch bituminous surface. They believe the road should be widened to 24 feet. It is also the opinion of the county that the bridge across Reeder's Canal be replaced and relocated to remove a hairpin curve in the road. The total cost of the road improvement is estimated at $105,000.

We recognize the difficulties experienced by the county in maintaining the road and bridge. Although we have no legal responsibility for using Bureau funds for improvement of this road, we do feel a moral responsibility for cooperating with county officials to whatever extent possible. We have no funds in our current budget and none are presently listed in our fiscal year 1963 budget which would permit us to assist the county in the road and bridge repairs.

A map of the Bear River Migratory Bird Refuge is enclosed as requested. We have marked in red the route of the subject road from within 2 miles of Brigham City to the refuge headquarters.

Sincerely yours,

D. H. JANZEN, *Director.*

BOX ELDER CHAMBER OF COMMERCE,
Brigham City, Utah, February 9, 1962.

Hon. WALLACE F. BENNETT,
U.S. Senate, Washington, D.C.

DEAR SENATOR BENNETT: The Box Elder Chamber of Commerce would appreciate your support in assisting us in prevailing upon the Department of Interior, Bureau of Fish and Wildlife, to appropriate the necessary funds to rebuild the 14 miles of highway from west of Brigham City to the Bear River bird refuge. We wish to draw your attention to the following facts:

1. This road with very few exceptions serves the Government employees and tourists visiting this Government installation.
2. Statistics show that about 22,000 persons visit this refuge each year.
3. Hunters take 16,000 ducks from this refuge which is quite an economic factor in our area.
4. This tourist attraction in Box Elder County is served only by this vital road.
5. Box Elder County realizes around $100 from this vast area of 64,000 acres which has been gleaned from tax roles. If this were taxable property, the county would collect some $3,000 annually in taxes.

In view of the above facts, we feel that it is the responsibility of the Government to see that this road is adequately maintained. Upon inspection, we have found that these 14 miles of road are in an extremely bad condition, in fact, in some places hardly passable.

It has come to our attention that Box Elder County does not have funds available now or in the foreseeable future for the rebuilding of this road. In meeting

with the Box Elder County commissioners, we were assured of their assistance and cooperation in rebuilding this road, to the extent that they would furnish county labor and equipment if the Government would purchase the materials.

Thanking you for your cooperation.

Best wishes,

CLYDE B. STRATFORD, *Chairman.*

TOTAL CARS USING ROAD

Senator BENNETT. Thank you, Mr. Chairman.

Senator YOUNG. How many cars use this road a year, did you say?

Senator BENNETT. 22,000 people; assuming maybe 2 people to the car, 10,000.

Senator YOUNG. Would this be stepped up if this is improved?

Senator BENNETT. The road goes nowhere else except to the refuge. There are no people who use the road to bypass or pass the refuge on the way to another destination, so this would depend entirely on the use of the refuge. But I think the condition of the road is making it difficult, certainly not yet dangerous, but difficult, for the Government employees and others who go out there on official business to the refuge.

Thank you very much, Mr. Chairman.

Chairman HAYDEN. You are very welcome.

Mr. Rice?

FISH AND WILDLIFE SERVICE

OFFICE OF THE COMMISSIONER

STATEMENTS OF THOMAS D. RICE, SPECIAL ASSISTANT TO THE COMMISSIONER; ROBERT A. WELLS, DIRECTOR, OFFICE OF INFORMATION; WILLIAM M. TERRY, DIRECTOR, OFFICE OF INTERNATIONAL RELATIONS; AND O. LLOYD MEEHAN, DIRECTOR, OFFICE OF PROGRAM REVIEW

BUDGET ESTIMATE

Chairman HAYDEN. The budget estimate for fiscal year 1963 for the Office of the Commissioner of Fish and Wildlife is $364,000. This is the same amount as has been appropriated for the past 2 fiscal years.

Mr. Rice, you may make such statements as you care to with regard to the Fish and Wildlife Service, or you may place your written statement in the record and highlight it if you care to do so.

(The statement and justification follows:)

Mr. Chairman and members of the committee, the estimate for salaries and expenses, Office of the Commissioner, for the fiscal year 1963 is $364,000, the same as the appropriation for 1962.

The Office of the Commissioner continues to provide general supervision of the Bureau of Sport Fisheries and Wildlife and the Bureau of Commercial Fisheries to insure the carrying out of the objectives of the Fish and Wildlife Act of 1956. Organizationally, in addition to the Commissoner's immediate office, there is an Office of International Relations, an Office of Information, and an Office of Program Review.

The Office of the Commissioner continues to be involved actively in the formulation and implementation of policy with regard to international fishery and wildlife relations. International cooperation in the conservation of marine fishery resources, competition for these resources, the rights of American fishermen on the high seas, and the competition in domestic and foreign markets offered by foreign fishery products are matters which affect virtually all of our important

fisheries. In addition a growing need for a continentwide approach to the conservation of migratory waterfowl raises problems of bringing about more effective cooperation between the United States, Mexico, and Canada.

The growth of foreign fisheries and their expansion into waters traditionally fished by American fishermen raise new conservation problems as well as pose difficult economic problems for American fishermen. Expanding Soviet fisheries in the Northwest Atlantic, and expanding Soviet and Japanese fisheries in the North Pacific are causes for concern on both counts. The Commissioner is a member of the International North Pacific Fisheries Commission, the tripartite (United States-Canada-Japan) organization responsible for the conservation of fishery resources in this area, and is intimately involved in the activities of this Government related to problems in the area. The Commissioner's Office also advises the Assistant Secretary for Fish and Wildlife, who is a member of the International Commission for the Northwest Atlantic Fisheries, on resource problems in the northwest Atlantic. The Commissioner is also a member of the International Pacific Salmon Fisheries Commission, the United States-Canadian organization responsible for the management of the sockeye and pink salmon of the Fraser River system.

During the past year, the need for regulation of the tuna fisheries of the eastern tropical Pacific Ocean has presented new management problems, and the Commissioner has continued to be concerned with threats to American fisheries posed by claims by a number of foreign governments to exclusive jurisdiction over waters off their coast long fished by American fishermen.

In connection with migratory waterfowl conservation, the Commissioner's Office has provided advice to the Assistant Secretary for Fish and Wildlife on the conduct of informal discussions with representatives of Mexico and Canada aimed at exploring the possibilities of closer coordination of the activities of the three governments in this field.

Public support and action are requisites to the success of the basic Fish and Wildlife Service program for conservation of important food and recreational resources. Public support and action are available only to the degree that the public understands the program and what each individual must do to make it succeed. Within the lifetime of persons now being born, the population of this country will pass the 300 million mark, offering a constantly growing challenge to our basic resources. Thus, information and education are vital to our basic task of assuring adequate resources for the future.

Our present activities in this area are limited, but this does not diminish the importance of what is being done. With a small staff, we are making every possible effort to bring information on Federal fish and wildlife programs to as many persons as possible. We are also striving to contribute to the education of our young people in conservation, working in cooperation with personnel of other Federal departments and of State and private agencies and through the various youth groups.

Fish and Wildlife Service, Office of the Commissioner

SALARIES AND EXPENSES

Highlight statement

The Commissioner provided supervision of the activities of the two bureaus of the U.S. Fish and Wildlife Service, and liaison of the Service with the Assistant Secretary for Fish and Wildlife. The Commissioner also served as U.S. Government representative and participated in meetings of the International North Pacific Fisheries Commission, the International Commission for the Northwest Atlantic Fisheries, and the International Pacific Salmon Fisheries Commission, as well as a number of national and local conferences of fishery and wildlife interests and activity.

Office of Information.—The purpose of the program of this Office is to expedite for the fish and wildlife profession the publication of information on the research findings and management techniques produced by the Service's two bureaus and to achieve public understanding and use of these advances through a broad conservation education effort, using all media of communication.

Activities include editing various Service technical publications; preparing popular pamphlets, special magazine articles, and current news items; producing photographs and art to illustrate publications and articles; preparing special program posters; writing reports and speeches; developing exhibits; pro-

ducing motion pictures and TV shorts on Service conservation programs; developing slide presentations on Service programs; producing talk outlines on Federal conservation activities for use by Service personnel in appearances before schoolchildren, clubs, meetings and on radio and TV; supplying extension services for youth and adult membership groups on national conservation programs and consulting services on curricular planning and teaching aids on conservation; furnishing information and source material on Federal conservation programs for magazines and radio-TV programs.

Office of International Relations.—This Office is concerned with international interests, activities, and policies of the Fish and Wildlife Service. In both the commercial fisheries and wildlife fields, there are major international problems.

The coming year will witness critical periods for the International North Pacific Fisheries Commission and the commercial fisheries of Alaska and the Pacific Northwest; for the North Pacific Fur Seal Commission and the resource with which it is concerned, as both conventions become renegotiable. The unsettled state of international law regarding the extent of national jurisdiction over fisheries continues to pose threats to the U.S. fishing industry. The growth of foreign fishing industries, particularly that of the U.S.S.R., makes increasingly severe the competition for resources in the high seas.

Conservation of the migratory waterfowl resources of the North American Continent requires closer and closer cooperation with Mexico and Canada and in turn the solution of complicated international problems in this field.

Office of Program Review.—This Office is responsible for coordination and review of Service programs, legislation, and safety.

Several bills concerning functions of the Fish and Wildlife Service were enacted during the 1st session of the 87th Congress and a legislative program has been prepared for the 2d session. In the past, considerable time has been spent in the development of material for use at hearings and in providing assistance to committees of Congress on pending legislation. It is anticipated that this practice will continue.

This Office is responsible for conducting and coordinating a Service-wide safety, health, and fire prevention program directed at the reduction of personnel injuries, property damage loss through accidents, tort claims, and inefficiencies arising from unsafe conditions and unsafe acts.

Future plans call for a continuation of the program with increasing emphasis on the preparation of accident prevention guidelines, safety training, and more frequent field inspections to reduce accident frequencies, lower costs, and improve operating efficiencies. The program is designed to protect the employee and also the public who may have occasion to use the facilities of the U.S. Fish and Wildlife Service, Government equipment and property.

Salaries and expenses

	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Departmental expenses	$364,000	$364,000	$364,000	
Unobligated balance lapsing				
Total appropriation	364,000	364,000	364,000	

Salaries and expenses.—The estimate of $364,000 is the same as for 1962.

Plan of work.—The Office of the Commissioner will continue to provide general supervision of the programs of the Bureau of Sport Fisheries and Wildlife and the Bureau of Commercial Fisheries to insure the carrying out of the objectives of the Fish and Wildlife Act of 1956. The estimate will provide funds for the following organization units, and to cover cost of general administrative services rendered by the Bureau of Commercial Fisheries on a reimbursable basis.

	Number of positions	Estimate, 1963
Commissioner's Office	3	55,600
Program review	7	79,300
International relations	4	46,600
Information services	19	182,500
Total	33	364,000

Itemization of estimate

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$363,850	$364,000	$364,000

GENERAL STATEMENT

Mr. RICE. For the purpose of the record, I am Thomas D. Rice, special assistant to the Commissioner, Fish and Wildlife Service.

Mr. Chairman, the estimate for salaries and expenses, Office of the Commissioner, for the fiscal year 1963, is $364,000, which is the same as the appropriation for 1962.

The Office of the Commissioner continues to provide general supervision of the Bureau of Sport Fisheries and Wildlife and the Bureau of Commercial Fisheries, to insure the carrying out of the objectives of the Fish and Wildlife Act of 1956.

Organizationally, in addition to the Commissioner's immediate office, there is an Office of International Relations, an Office of Information, and an Office of Program Review.

The Office of the Commissioner continues to be involved actively in the formulation and implementation of policy with regard to international fishery and wildlife relations. International cooperation in the conservation of marine fishery resources, competition for those resources, the rights of American fishermen on the high seas, and the competition in domestic and foreign markets, offered by foreign

fishery products, are matters which affect virtually all of our important fisheries.

CONSERVATION OF MIGRATORY WATERFOWL

In addition, a growing need for a continentwide approach to the conservation of migratory waterfowl raises problems of bringing about more effective cooperation between the United States, Mexico, and Canada.

GROWTH OF FOREIGN FISHERIES

The growth of foreign fisheries and their expansion into waters traditionally fished by American fishermen raise new conservation problems, as well as posing difficult economic problems for American fishermen.

Expanding Soviet fisheries in the Northwest Atlantic, and expanding Soviet and Japanese fisheries in the North Pacific are causes for concern on both counts.

INTERNATIONAL NORTH PACIFIC FISHERIES COMMISSION

The Commissioner is a member of the International North Pacific Fisheries Commission, the tripartite (United States-Canada-Japan) organization responsible for the conservation of fishery resources in this area, and is intimately involved in the activities of this Government related to problems in the area. The Commissioner's Office also advises the Assistant Secretary for Fish and Wildlife, who is a member of the International Commission for the Northwest Atlantic Fisheries, on resource problems in the Northwest Atlantic. The Commissioner is also a member of the International Pacific Salmon Fisheries Commission, the United States-Canadian organization responsible for the management of the sockeye and pink salmon of the Fraser River system.

REGULATION OF TUNA FISHERIES

During the past year, the need for regulation of the tuna fisheries of the eastern tropical Pacific Ocean has presented new management problems, and the Commissioner has continued to be concerned with threats to American fisheries posed by claims by a number of foreign governments to exclusive jurisdiction over waters off their coasts long fished by American fishermen.

SOVIET FISHING ACTIVITIES

Chairman HAYDEN. I would like to ask in this connection: Is there any cooperation with the Soviet Union in this North Pacific Fisheries Commission, in which the United States, Canada, and Japan participate?

Mr. RICE. There has been little evidence of cooperation yet.

Chairman HAYDEN. There have been extensions of Soviet fisheries in that area?

Mr. RICE. Yes; there have been, and they have plans for continuing expansion.

In connection with migratory waterfowl conservation, the Commissioner's office has provided advice to the Assistant Secretary for Fish and Wildlife on the conduct of informal discussions with representa-

tives of Mexico and Canada aimed at exploring the possibilities of closer coordination of the activities of the three governments in this field.

NEED FOR PUBLIC SUPPORT

Public support and action are requisites to the success of the basic Fish and Wildlife Service program for conservation of important food and recreational resources. Public support and action are available only to the degree that the public understands the program and what each individual must do to make it succeed.

Within the lifetime of persons now being born, the population of this country will pass the 300 million mark, offering a constantly growing challenge to our basic resources. Thus, information and education are vital to our basic task of assuring adequate resources for the future.

Our present activities in this field are limited, but this does not diminish the importance of what is being done. With a small staff, we are making every possible effort to bring information on Federal fish and wildlife programs to as many persons as possible. We are also striving to contribute to the education of our young people in conservation, working in cooperation with personnel of other Federal departments and of State and private agencies and through the various youth groups.

That concludes my statement, Mr. Chairman.

RELATIONS WITH JAPAN AND RUSSIA ON OFFSHORE FISHING

Chairman HAYDEN. Senator Young, any questions?

Senator YOUNG. Yes.

How are our relations with Japan and Russia now with respect to the fishing off the shores of the United States?

Mr. RICE. Our relations with Japan are very good, but there is some evidence of a more aggressive fishery policy on the part of Japan now.

As far as Russia is concerned, it is about the same as our relationship in any other field. However, they do periodically concede to us in some form or other, as evidence of cooperation, but, as I said to the chairman, not to the extent we would like to have them cooperate.

Senator YOUNG. Are they increasing the tonnage of the fish taken in areas adjacent to our shores?

Mr. RICE. Yes; they are. They made the boast about 3 years ago that by 1965 they would be the leading fish producing nation in the world, and they are rapidly reaching that point.

Senator YOUNG. This is one of our major problems, too?

Mr. RICE. It is, Senator.

Senator YOUNG. That is all; thank you.

Chairman HAYDEN. Thank you for your statement.

80391—62——25

BUREAU OF COMMERCIAL FISHERIES

STATEMENTS OF DONALD L. McKERNAN, DIRECTOR; HAROLD E. CROWTHER, ASSISTANT DIRECTOR; CLEO F. LAYTON, CHIEF, DIVISION OF ADMINISTRATION; J. LAURENCE McHUGH, CHIEF, DIVISION OF BIOLOGICAL RESEARCH; CHARLES BUTLER, CHIEF, DIVISION OF INDUSTRIAL RESEARCH; AND C. E. PETERSON, ACTING CHIEF, DIVISION OF RESOURCE DEVELOPMENT

OCEANOGRAPHY PROGRAM

Chairman HAYDEN. The budget justification for the Bureau of Commercial Fisheries includes an opening statement on the contribution of the Bureau to the national oceanographic program. It is proposed that the Bureau participate to the extent of over $14 million in this program during fiscal year 1963. There will be printed in the hearing record the statement and a table comparing the 1962 appropriation and the 1963 budget estimates.

(The statement and table referred to follow:)

BUREAU OF COMMERCIAL FISHERIES CONTRIBUTION TO THE NATIONAL OCEANOGRAPHIC PROGRAM

During the past 3 years the Bureau of Commercial Fisheries has been working closely with other Government agencies, with the National Academy of Sciences-National Research Council, and with university and private research institutions to plan and carry out a coordinated national program in oceanography. This program was endorsed by President Kennedy in his message to Congress in March 1961: "The seas around us represent one of our most important resources. If vigorously developed, this resource can be of great benefit to the Nation and all mankind." A primary objective of the national oceanographic program is to increase knowledge of the ocean in all its aspects, including physical, chemical, and biological properties. Secondly, the program is to apply the accumulated knowledge to enhance our economy, security, and general well-being.

The principal objective of the Bureau of Commercial Fisheries in the oceanographic program is maximum development and utilization of the living resources of the sea. This requires a full understanding of the kinds and quantities of plants and animals in the sea and their interrelations with the environment. Need for research to meet this objective has been clearly expressed in reports from the National Academy of Sciences Committee on Oceanography and in reports from the Interagency Committee on Oceanography of the Federal Council for Science and Technology.

Each Government agency with responsibility for research in the oceans is attempting to carry out a program in oceanography to meet its original mission, and in addition to undertake new studies which will improve our Nation's total benefit from the sea. This is being coordinated through the Interagency Committee on Oceanography. The basic content of the new program was recommended by the National Academy of Sciences Committee on Oceanography (NASCO).

Concerning living resource developments, especially fisheries, the National Academy Committee pointed out fundamental gaps in our knowledge of marine organisms which may be impeding their full utilization. The Bureau plans to develop and support programs in biological oceanography to meet the need for increased knowledge. At the same time we find it important to continue and in some cases expand programs which support particular fisheries. Such work, underway in the Bureau for many years, falls within the broad definition of oceanography which has been adopted for the national program.

It has been considered important that a clear distinction be made between new programs developed in accordance with NASCO recommendations and those which began years ago. For this reason the Bureau's oceanographic program may be classified into two categories:

(1) Marine research directed mainly toward support of a particular fishery.

(2) New research and surveys to obtain basic information which will lead to understanding biological processes in the oceans. The second category describes the broad objectives of the national oceanographic program.

This research should in time lead to development of better methods for predicting places and times of fish concentrations, discovery of unexploited stocks, development of new and more efficient means to capture marine organisms, control of environment to increase natural production, and use of new sources of protein not previously taken from the sea.

The total effort in oceanography represents funds from several sources which reach across appropriation, activity, and subactivity classifications. The Bureau budget accrues from annual and permanent appropriations, and minor amounts of contributed funds. Construction funds for ships and facilities used for marine research are also included in our total oceanographic effort.

The Bureau's new oceanographic program starts logically in fiscal year 1962. Budget increases for oceanography are being used to support new programs for training grants and fellowships, increased efforts to identify and classify marine animals, support of the National Oceanographic Data Center, basic studies of estuaries and inshore waters, and biological oceanography of the tropical Atlantic off Africa. The 1963 program proposes several additional new basic research programs.

There follows a tabulation and brief description of the Bureau's present and proposed activities in oceanography. This is a summation of the program which has been underway during fiscal year 1962 and that which is proposed for fiscal year 1963.

National oceanography program

[In thousands of dollars]

Appropriation, activity, and subactivity	Marine research supporting particular fishery			New research—Obtain basic information			Total oceanography		
	1962	1963	Increase	1962	1963	Increase	1962	1963	Increase
Management and investigations of resources	4,302.8	4,709.8	407.0	1,000.0	1,809.0	809.0	5,302.8	6,518.8	1,216.0
Marketing and technology	591.8	685.8	94.0				591.8	685.8	94.0
Exploratory fishing and gear research	591.8	685.8	94.0				591.8	685.8	94.0
Faunal surveys and fishery explorations to locate new fish stocks of commercial importance. New ways of fishing are sought. This work is centered primarily in the Pacific Northwest, in the Gulf of Mexico and off the South Atlantic coasts of the United States. Explorations are for high seas pelagic fish, bottom species, and shellfish. New explorations in the oceanography program will be for shrimp and fish stocks in the Caribbean and western tropical Atlantic.									
Research	3,711.0	4,024.0	313.0	1,000.0	1,809.0	809.0	4,711.0	5,833.0	1,122.0
Coastal and offshore	3,382.3	3,620.3	238.0	1,000.0	1,750.0	750.0	4,382.3	5,370.3	988.0
Shellfish	328.7	403.7	75.0		59.0	59.0	328.7	462.7	134.0
Biological research and physical oceanographic studies on coastal and high seas fisheries. Principal investigations are on ocean phases of salmon life cycle, on groundfish, pelagic species such as shrimp, sea scallops, clams, and oysters. This represents part of the oceanographic program which meets the needs of specific U.S. fisheries. New programs in 1962 and 1963 are on basic research on marine resources, on tropical Atlantic investigations and on increased training of scientists through graduate fellowships. The total program is being effected in cooperation with other Government agencies which have responsibilities for oceanography. New programs are in response to recommendations of the National Academy of Science.									
Promote and develop fishery products and research pertaining to American fisheries (S-K funds)	2,186.2	2,186.2					2,186.2	2,186.2	
Marketing and technology	364.5	364.5					364.5	364.5	
Exploratory fishing and gear research	364.5	364.5					364.5	364.5	
New trawl and pelagic fisheries are sought off New England and the central Atlantic coast. Extensive gear research is conducted, particularly to seek new advances in the efficient capture of trawl fish species. Special explorations to meet the more immediate needs of industry are conducted.									
Research	1,821.7	1,821.7					1,821.7	1,821.7	

Coastal and offshore	1,545.3	1,545.3					1,545.3	1,545.3	
Shellfish	276.4	276.4					276.4	276.4	
Biological and oceanographic research to meet the needs of specific fisheries. Programs are closely related to those carried out with annual appropriations but in general include objectives of more immediate importance to industry. Major programs are on tuna, shrimp, sardines, menhaden, and trawl fish species.									
Construction				6,130.0	5,301.0	−829.0	6,130.0	5,301.0	−829.0
Fishery facilities				6,130.0	5,301.0	−829.0	6,130.0	5,301.0	−829.0
Provides research and exploratory ships, construction of new laboratories and improvements to existing laboratories with which to carry out the Bureau's total program in oceanography. Continues a program of upgrading of fishery research facilities as recommended by the National Academy of Sciences, Committee on Oceanography.									
Total	6,489.0	6,896.0	407.0	7,130.0	7,110.0	−20.0	13,619.0	14,006.0	387.0

PREPARED STATEMENT

Mr. McKERNAN. My name is Donald L. McKernan, Mr. Chairman. I am the Director of the Bureau of Commercial Fisheries.

I would like to put a statement in the record and simply highlight it for you.

Chairman HAYDEN. Very well.

(The statement referred to follows:)

GENERAL STATEMENT BY DONALD L. MCKERNAN, DIRECTOR, BUREAU OF COMMERCIAL FISHERIES

Mr. Chairman and members of the committee, it is a pleasure to appear again before this committee to discuss the operations of the Bureau of Commercial Fisheries and to present for consideration the estimates of the financial needs of the Bureau for fiscal year 1963.

Our estimates for fiscal year 1963 total $25,293,000. Of this total, $15,213,000 is for management and investigations of resources; $300,000 is requested under the special foreign currency program; $8,414,000 is for construction; $616,000 is for general administrative expenses; and $750,000 is for assistance in construction of fishing vessels. An additional $1,998,000, to be derived from the Pribilof Islands fund, is requested for administration of the Pribilof Islands.

Increases totaling $2,637,318 are included in the estimate for management and investigations to provide $1,075,000 for program expansion in research on fish migration over dams; $1,216,000 for Bureau participation in the national oceanographic program; $68,000 for expansion of exploratory fishing programs in the Gulf of Alaska; $120,000 for research on fish flesh protein; and $158,318 for operation and maintenance of other programs at current or slightly expanded levels.

Funds requested under the special foreign currency program are to finance technological and biological studies by scientists in foreign countries, to complement work being done in these fields in the United States under the "Management and investigations of resources" appropriation.

The $8,414,000 "Construction" estimate includes $5,301,000 for facilities required for our oceanographic programs, $1,478,000 for facilities urgently needed for our regular research and exploratory fishing and gear programs, and $1,635,000 for construction and related purposes necessary to carry out the objectives of the Columbia River fisheries program.

I shall be pleased to discuss the estimates for specific items in the budget in greater detail as they come up for discussion in the course of the hearing.

There have been significant developments affecting the fisheries since our appearance at the hearings last year. Perhaps a review of these happenings may be helpful in providing a backdrop for the Bureau's projected programs for fiscal year 1963.

During 1961, there was tremendously increased activity in the fisheries throughout the world. The major gains, however, were not made by the United States, but by Russia, Red China, Peru, and other nations. The Russian fleet has increased enormously during the past few years and all indications are that this growth will continue. The United States dropped to fifth place in 1961—behind Japan, Red China, Russia, and Peru—in total catch of fish. Our country for decades had been in the "top three" among fish-catching nations of the world.

During this last year we saw foreign vessels moving closer and closer to the shores of the United States. In the North Pacific both the Japanese and the Russians moved in force into fisheries traditionally fished only by the U.S. fishermen. Although these foreign fleets are fishing in international waters, our industry is understandably concerned about their presence. Both the Japanese and Russians have been fishing in the Bering Sea and have now moved into the Gulf of Alaska. The trend, especially by the Japanese, obviously is to move southward.

It is possible, too, that in the very near future we may see Russian vessels fishing off the coasts of Washington and Oregon. The Japanese expansion of their area of fishing is clear, for they have always been a major fishing power. The pattern of the Russian operation in the North Pacific is well established—their first move being to probe with an exploratory vessel, then to move in fishing

vessels in force. The stocks of halibut now fished jointly by Canada and the United States may be their next target.

This year in the North Atlantic, Russian vessels appeared on Georges Bank for the first time and are now fishing what we once considered our own private fishing grounds. Georges Bank, as you may know, lies just off the coast of Massachusetts. The Russians in 1961 moved to Georges Bank en masse. It is not possible to determine yet what effect this will have on the resources they are fishing, or on our industry, but results could be disastrous to a domestic industry already in economic difficulties. The fishing industry during 1961 operated in a climate of severe competition from foreign products. Imports of fishery products into the United States during the calendar year 1961 jumped about 35 percent. Not all of this increase is in food fish, which increased about 7.4 percent. A tremendous surge of 65 percent in imports of fishmeal accounted for most of the 1961 increase. Many of these foreign products were produced with lower labor costs and various forms of Government assistance.

Advances in the establishment of the Common Market in Europe were another development last year. The formation of the Common Market was stimulated, and rightly so, by the United States. However, it is moving ahead at an unexpected pace. It now appears likely that England will join the Common Market, which event would increase the possibility of problems for our domestic fishing industry. The tariff patterns being established by the Common Market will undoubtedly make it more difficult for some of our domestic fishery products to be exported to foreign countries. But even more serious, this tariff structure will cause nations such as Japan, Iceland, and Norway, who may be forced out of the European market, to divert their products to the United States. This in turn means more competition for our own people. Should across-the-board cut in tariffs by the United States become a reality we will find many segments of our fishing industry in difficulty.

Tremendous advances have been made recently in the Columbia River in the face of increased dam building and other developments. These are some of the things we have accomplished. Scientists have made solid progress in the fields of electrical guiding and the development of more efficient and economical fishways. An improved fishway, incorporated in the new Ice Harbor Dam on the lower Snake River, represented a saving of $500,000 in construction costs compared with previous designs.

Studies also have shown that a reduction is possible in the flow of "transport" water, a flow released to attract fish into a fishway. The 2-feet-per-second velocity, formerly regarded as minimal, has successfully been reduced to 0.7 feet per second, without loss in attraction efficiency, permitting a substantial saving in water released for this purpose.

Damage has also been mitigated through construction of hatcheries, fish screens, fish ladders, and stream clearance. Supplementing research on facilities are studies of the salmon themselves, their basic behavior patterns, and their capabilities at various stages of maturity. Endless fishways, designed to test endurance, have demonstrated that salmon may climb to heights of at least 1 mile under certain experimental conditions. Such information is essential for planning methods of passage that will avoid catastrophic delays in reaching the spawning grounds. Without these programs the salmon runs would undoubtedly be at a much lower level. But there is one problem we have not solved—how to pass fish over high dams. We need a tremendous surge of effort to find ways of getting large populations of fish over these high structures. As you know, we have launched a vigorous program in this area aimed at finding significant answers by the end of 1964.

Atomic energy, both for defense and peaceful purposes, required more of our attention last year. The possible concentration of radioactive material in fishery products from fallout, or from nuclear reactors for power production or other purposes, is a growing problem. The operation of nuclear reactors which are being set up throughout the country may radically change the local aquatic environment or, through accident or normal operation, may discharge radioactive materials into waters from which commercial fish are harvested. To protect the public and the commercial fishing industry, we must thoroughly understand the potential hazards and be prepared to take appropriate action.

It is evident that the Bureau has an important part to play in what many consider to be the world's No. 1 problem—population increase. It has been said that the present population equals four-fifths of all the people who have lived on the face of the earth since time began. Despite the progressive increase in

population this same statement will be true in years to come. It is estimated that at present one-half of the world's population is undernourished, most of them suffering from a deficiency of protein of the type found in fish. It is obvious that as this population explosion occurs we will need every ounce of food that can be harvested from the seas. In many countries, especially those which are heavily populated, fishing plays an important role in the diet. In future years this same situation may exist in the United States. To meet this need we must have sufficient knowledge of the oceans and their resources to properly manage not only the well-known species such as salmon and halibut, but also the presently underutilized species such as thread herring, hake, and others.

Serious declines occurred in two fisheries during the last year. The catches of shrimp and Maine sardines dropped to such an extent that both these segments of our fishing industry found themselves in trouble. At the same time there was recovery in one of our fisheries. The menhaden industry which appeared to be in a steep decline last year recovered rapidly and had a successful year with a near-record catch. Some credit for the reversal in the trend of the menhaden industry is credited to an FAO meeting in Rome last March which the Bureau stimulated and helped to organize. This conference dealt with the worldwide problems in fish meal.

Finally, the national oceanographic program, in which the Bureau plays a major part, moved into high gear in 1961. Much has been learned about the oceans in the past, but not until recent assessments of the Nation's research requirements did oceanography emerge in its present form as a program of systematic scientific studies.

The urgent need for an expanded national research program in this scientific frontier was expressed by the House Committee on Science and Astronautics of the 86th Congress when it listed these four reasons for the urgency:

(1) The undersea threat to our national security;

(2) The emerging significance of science and technology as an instrument of world affairs;

(3) The potential of the sea for greater international understanding and cooperation; and

(4) The eventual worldwide exploitation of ocean resources.

The President, in a special message to Congress last year, called for concerted attention to the whole national effort in the basic and applied research of oceanography.

The Bureau of Commercial Fisheries responsibility in this program is significant. We are charged with the development and conservation of the living aquatic resources, particularly those important as human food or to satisfy needs for oils of marine origin, animal feed supplements, and other uses. Some of these resources occur in fresh waters, but those of the oceans are by far the most important.

It is obvious that if our industry is to compete successfully for the harvest of these resources we must have the basic knowledge that will put our fishermen on an equal footing with those of expanding fishing nations such as Japan and Russia. We believe we can do this through oceanography.

MANAGEMENT AND INVESTIGATIONS OF RESOURCES

Chairman HAYDEN. There will be placed in the record justifications for the fiscal year 1963 budget estimate for management and investigations of resources. This amount is $15,213,000, an increase of $2,637,318 over the amount available in fiscal year 1962.

(The justification follows:)

BUREAU OF COMMERCIAL FISHERIES, MANAGEMENT AND INVESTIGATIONS OF RESOURCES

During the past year, in the "Management" activity, the Bureau has intensified its program of enforcement, particularly in Alaska where large fleets of Japanese and Russian vessels have engaged in fishing operations in international waters adjacent to the shores of Alaska. On the east coast, the appearance of Russian vessels on Georges Bank during the summer of 1961 resulted in additional

surveys of foreign fishing activity in this area. The Bureau will be obliged to continue surveillance of foreign fishing activities in both the Atlantic and Pacific fisheries during fiscal year 1963.

In the "Marketing and technology" activity, Bureau scientists contributed many significant discoveries in fisheries-related scientific disciplines. These discoveries, all involved in the manifold missions of the Bureau, ranged from prevention of blue discoloration of canned crabmeats through the addition of ascorbic acid (vitamin C) and the clarification of the process factors affecting the nutritional value of fish protein to the development of a new fundamental technique for separating the components of complex fish oils and the determination of differences in food utilization by warmblooded animals and coldblooded fishes. The research findings of the Bureau on the therapeutic effects of fish oils on elevated blood-cholesterol levels are being increasingly accepted by authoritative medical researchers and being put to practical use in the formulation of corrective diets. Other researchers were successful in the location of hitherto unknown concentrations of edible and industrial fishes off the coasts of South Carolina, Florida, Oregon, and Alaska, which are now being commercially exploited. Our economists published a detailed clarification of the economic interrelationships between price and demand for blue crabs and oysters. In the first of quality improvement, developmental work was completed on 2 new U.S. standards—those of flounder and scallops, making a total of 12 voluntary standards in effect or in the final stages of promulgation and use. Similarly, three purchase specifications, designed to insure receipt of high-quality fishery products by State institutions—for ocean perch fillets, haddock fillets, and scallops—were developed and made available to the purchasing agents of each of the 50 States.

In the field of industrial services, the Bureau contributed many accomplishments designed to foster the growth of the U.S. fishing industry. Statistical data have been collected and published on the employment of fishermen, fishing craft, and gear employed in the fisheries, the volume and value of the catch, and the production of manufactured fishery commodities. Bureau marketing services during the past year rendered great assistance to the domestic fishing industry—as exemplified by the establishment of an integrated marketing service for new Arkansas ricefield fisheries and the completion of three industry-financed motion pictures designed to acquaint the consumer public with the operations and products of the domestic fisheries.

Import problems are affecting virtually every segment of the U.S. fishing industry. The industry is not only facing overwhelming competition in domestic and world markets for fishery products, but its fishing fleets are competing with ever-enlarging fleet of other nations in waters traditionally fished by U.S. fishermen. The acquisition, on a current basis, of information of use to the domestic industry on developments in foreign fisheries and fishing effort was accelerated by the establishment of a fishery attaché post in Western Europe, in cooperation with the Department of State.

In the "Research" activity, one of the Bureau's principal highlights is in the accelerated participation in the vital national oceanography programs with a major responsibility for biological studies. Under this program, a longer range and more fundamental attack on the biological basis of marine resources has been initiated. Without this program, the United States cannot effectively carry out its national and international responsibilities for marine resources development. In cooperation with other governmental and international agencies, an oceanographic survey of the tropical Atlantic is being organized. This program is designed to make U.S. participation possible in the exploitation of one of the most fertile marine regions on earth, the waters off central Africa. A program of educational grants in the fields of science related to the study of our waters and their living resources was begun to create a larger group of scientists of the highest caliber from which the Bureau and other agencies concerned with fishery problems can recruit research staffs.

An emergency salmon research program, now underway, will provide information essential for favorable renegotiation of the International Convention for the High Seas Fisheries of the North Pacific Ocean. This emergency program will terminate at the end of the current fiscal year. Increases for the fiscal year 1963 are being requested for continuing biological research on salmon and related species in Alaska and the Pacific Northwest and on the high seas of the North Pacific Ocean and Bering Sea, and for biological investigations in areas of Alaska fished by foreign trawl fleets.

In the "Research on fish migration over dams" activity, a vigorous, short-range research plan is in process to protect the Columbia River salmon runs against the effects of construction of additional high dams, now imminent.

The cooperative Columbia River fishery development program is of utmost importance to the highly valuable Pacific coast salmon fishery with its protection and enhancement of salmon populations. Initiated in 1949 with the States of Oregon, Washington, and Idaho, to offset the losses of salmon and steelhead runs resulting from Federal water-use developments, this program has mitigated some damages through the construction and operation of hatcheries, fish screens, fish ladders, and stream clearance. Without the fishery development program, the runs, although they have at present declined, would undoubtedly be at a much lower level.

Management and investigations of resources

Appropriation, 1961		$7,926,000
Comparative transfer from "Operation and maintenance, general," Corps of Engineers, Civil, Department of the Army		2,004,331
Total amount available, 1961		9,930,331
Appropriation, 1962	$12,150,000	
Supplemental appropriation, 1962	400,000	
Total appropriation, 1962		12,550,000
Transferred from "Operation and maintenance, general," Corps of Engineers, Civil, Department of the Army (unobligated balance)		+30,146
Transferred to "Operating expenses, Public Building Service," General Services Administration		−4,464
Total amount available, 1962		12,575,682

SUMMARY OF INCREASES AND DECREASES, 1963

Management: To provide for increased vessel charter costs for enforcement program		+7,000
Marketing and technology:		
To provide for initiation of larger scale commodity studies		+75,000
To provide for additional days at sea in connection with exploratory fishing programs in the North Atlantic and the Gulf of Alaska		+162,000
For increased costs of conducting the market news programs and the purchase of more efficient processing equipment	+$50,000	
For modernization of the automatic data processing unit and to provide for collection of statistical data in the lower Mississippi River States	+36,464	
To initiate a program of fundamental and applied research on fish flesh protein	+120,000	
To provide for the uncontrollable increased workload in Bureau's Foreign Fisheries and Trade Unit	+20,000	
		+463,464
Research:		
Decrease due to completion of emergency salmon research program	−1,500,000	
For biological research on salmon and related species in Alaska and the Pacific Northwest	+510,000	
For biological investigations of the effect of fishing by foreign trawl fleets in the Alaska and Pacific Northwest areas	+197,000	
For research on salmon and related species in the high seas of the North Pacific Ocean and Bering Sea	+450,000	

Management and investigations of resources—Continued

SUMMARY OF INCREASES AND DECREASES, 1963—continued

Research—Continued		
For the tropical Atlantic oceanography programs	+275,000	
To provide for the more productive utilization of the research vessel *Black Douglas* in studies in eastern Pacific fishes	+68,000	
For basic research in biological oceanography and ocean surveys	+405,000	
To provide for operation of the research vessel being constructed to replace the *Albatross III*	+140,000	
To determine effects of Russian fishing on the fish stocks on the New England fishing banks	+158,000	
To bring to a more productive level the operations of the Brunswick, Ga., biological laboratory	+30,000	
To provide for participation in the International Indian Ocean Expedition	+70,000	
For operation and maintenance of the new salt water system and for research programs utilizing the new system, at the Oxford, Md., shellfish laboratory	+75,000	
To provide for research on shellfish genetics	+29,000	
To provide for field experiments on the effect of radioactivity on marine organisms	+30,000	
		+937,000
Research on fish migration over dams: To provide for expansion of effort with regard to emergency programs involving fish passage at high dams		+1,075,000
Columbia River fishery facilities:		
To provide for operation of new facilities and for increased costs of operating existing facilities	+$185,000	
Decrease in availability of unobligated balances of prior year funds	−30,146	
		+154,854
Net change, 1963		+2,637,318
Budget estimate, 1963		15,213,000

1. Management

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Administration of Sockeye Salmon, Northern Pacific Halibut, North Pacific Fisheries, Northwest Atlantic Fisheries and Whaling Acts	$367,295	$369,000	$376,000	+$7,000

Administration of Sockeye Salmon, Northern Pacific Halibut, North Pacific Fisheries, Northwest Atlantic Fisheries, and Whaling Convention Acts.—The estimate of $376,000 represents an increase of $7,000 needed for increased patrol vessel charter costs.

Enforcement of Sockeye Salmon Fishing, North Pacific, Northern Pacific Halibut, Whaling Convention, and Fur Seal Acts

Need for increase.—The $7,000 is required for increased vessel charter costs for enforcement of the Sockeye Salmon Fishing and Northern Pacific Halibut Acts and regulations issued under the authority thereof. This will provide for an additional 1½ months of charter time as well as a more appropriate vessel for patrol of the fog-shrouded "Bonilla-Tatoosh" line at the entrance to the Straits of Juan de Fuca in Washington.

Plan of work.—This program involves the enforcement of restrictions on fishing, whaling, and sealing as provided by law and/or regulation, which for the most part implement the treaty obligations of the United States. Eight full-time agents and four to six seasonal employees are actively engaged in the program in Alaska, Washington, Oregon, and California. Patrol by vessel and aircraft is carried out under cooperative arrangements with the Coast Guard for offshore waters and the State of Washington for enforcement of the Sockeye Salmon Act in Puget Sound waters. In addition, the Bureau operates one seagoing vessel in Alaska, the *John R. Manning*, and charters a patrol vessel in the State of Washington. Continuing expansion of the Bering Sea and Gulf of Alaska trawling operations by the Japanese and Russian fleets has required greater emphasis on offshore patrol, including the boarding of many Japanese vessels to determine whether Japan is abstaining from salmon and halibut fishing. Russian vessels in the North Pacific Ocean and Bering Sea are kept under constant surveillance; however, in lieu of boardings, sample trawling is carried out in the vicinity of the fleet to determine catch composition. Dockside inspection of catches is conducted at major ports from nothern California to Alaska.

Administration of Northwest Atlantic Fisheries Convention Act

Plan to work.—To continue collection of and analysis of statistical information relating to current conditions and trends of the fishery resources of the Northwest Atlantic Ocean and to conduct studies concerned with the maintenance of the Northwest Atlantic fisheries as required under provisions of the International Convention for the Northwest Atlantic Fisheries (art. VI, par. 3).

Enforcement of Northwest Atlantic Fisheries Convention Act

Plan to work.—To implement the provisions of the International Convention for the Northwest Atlantic Fisheries and the departmental regulations promulgated pursuant theretof. Haddock and cod are subject to regulatory control in the high seas area extending roughly from Cape Cod eastward to include the Grand Banks off Newfoundland. It has been found that the maximum sustained production of these stocks can be realized by restricting the size of meshes of trawls used in the fisheries. Four field enforcement agents and one supervisor are stationed in Maine and Massachusetts. Continuous dockside inspections of fishing vessels at all major New England fishing ports are maintained as well as high seas patrol in which assistance is rendered by the U.S. Coast Guard.

Administration of Whaling Convention Act

Plan to work.—Under the 1946 International Convention for the Regulation of Whaling, the Bureau issues licenses to U.S. citizens or firms engaged in commercial whaling, inspects plants and operations for compliance with regulations, and carries on a limited amount of whaling biological research. Bureau employees conduct inspections in the course of other enforcement work and two biologists, one of whom is permanent, are engaged in work essential to the management of whalestocks utilized by the United States. Biological sampling of whale catches will be conducted at each of the whaling stations. The gray whale census will be continued.

2. Marketing and technology

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Economics	$88,000	$88,000	$163,000	+$75,000
(b) Exploratory fishing and gear development	636,000	661,000	823,000	+162,000
(c) Market news	516,223	519,000	569,000	+50,000
(d) Statistics	307,877	303,536	340,000	+36,464
(e) Technology	784,315	980,000	1,100,000	+120,000
(f) Foreign fisheries and trade	71,855	79,000	99,000	+20,000
(g) Education and market development		38,000	38,000	
Total	2,404,870	2,668,536	3,132,000	+463,464

(*a*) *Economics*

The estimate of $163,000 represents an increase of $75,000 to initiate larger scale commodity studies aimed at helping the fishing industry eliminate or reduce financial losses due to lack of adequate information as to potential economic difficulties in time to avert the difficulties.

Need for increase.—In recent years many segments of our fishing industry, such as the tuna, groundfish, sea scallop, and shrimp industries have suffered severe economic losses. The menhaden industry is a recent addition to the list. Since the start of its economic difficulties in 1959, it is estimated that the gross income of the industry, because of maladjustment of supply to demand has dropped over $5 million annually.

Adequate knowledge obtained beforehand could have avoided some of these losses. Predictions as to future production and marketing conditions are needed to aid in better industry planning. This is done for agriculture by the U.S. Department of Agriculture through its crop and livestock estimates service and situation reports. Farmers can adequately plan the marketing of their crops and livestock because they are forewarned as to the kind of marketing conditions to expect in the next marketing period.

Because no attention has been given to economic forecasting for commercial fishermen and because of their economic difficulties, there exists a great need for this service. For example, if a dearth of fish appears imminent during the up-coming fishing season, the industry can husband its storage stocks to provide a flow of products during the period of shortage. Conversely, if excessive supplies appear imminent, storage stocks can be reduced in time to avoid market gluts.

These funds are requested to provide the industry and the public with fishery economic situation reports. These reports would combine economic, biological, and other available kinds of information to form the basis of an early warning system of imminent economic difficulties in a particular segment of the fishing industry.

Plan of work.—Work will be accelerated in the collection and analysis of economic data on production, distribution, and consumption of fishery products as an aid to the U.S. fishing industry in economic production and marketing and to the Government in efficient administration of the domestic fisheries. Studies to be conducted with the increased funds involve assembling economic data and information on production, imports and exports, storage stocks, consumption, etc.; analyses of such information; collation with biological information on the condition of particular fishery stocks; and preparation of briefs projecting future trends and conditions for each of the several segments of the industry. These briefs would be similar to the situation reports for agricultural commodities issued by the U.S. Department of Agriculture. After a developmental period responsive to the urgent needs of the tuna, groundfish, shrimp, scallop, and menhaden industries, the program will be expanded to include such other important industry segments as the salmon, halibut, sardine, crab, oyster, clam, and lobster industries.

(*b*) *Exploratory fishing*

The estimate of $823,000 represents an increase of $162,000. The increase will provide $94,000 for North Atlantic explorations, and $68,000 to finance an exploratory fishing program in the Gulf of Alaska.

Need for increase.—(1) North Atlantic fisheries exploration: The $94,000 requested for this program is needed for the operation of the exploratory fishing

vessel *Delaware*, or operation of its replacement, to foster increased emphasis on the offshore and pelagic aspects of the fisheries exploration studies in the western North Atlantic, a part of the general objectives of the national oceanography program. The *Delaware* is being operated at an annual rate of 110 days at sea on exploratory fishing programs and 110 days on biological research programs. Funds for constructing a vessel to replace the *Delaware* were appropriated for the fiscal year 1962. The additional operating funds requested will provide for utilization of the new vessel designed especially for exploratory fishing, at an increased number of sea-days for exploratory fishing programs from the present 110 to approximately 210. This additional sea time will increase the efficiency of area exploratory fishing activities, and provide the sea time necessary to carry out the phase of the oceanography program planned for 1963.

(2) Alaska fisheries exploration: The $68,000 requested for this program is needed to provide for a full-time exploratory fishing program in Alaska waters. The recent full-scale commercial fishing activities of the U.S.S.R. and of the Japanese in the Bering Sea and the Gulf of Alaska, make adequate knowledge by the U.S. agencies of the ground fish stocks imperative. The proposed program will provide information essential to decision on extending the fishing year for vessels of the U.S. halibut fleet, restricted to a very short season as a conservation measure, through alternative fishing on other species during closed seasons for halibut. Present level of funding provides for 10 weeks of exploratory fishing work per year, utilizing a chartered vessel. The increase requested will provide for work during the entire fishing season of 6 months. This increase in time at sea is important for adequate work because the 10 weeks time possible with present funding does not present an adequate picture of the fishing potentials of a variety of species over the entire fishing season.

Plan of work.—To continue to plan and conduct exploratory fishing programs to locate and determine the extent of new fishing grounds and the size and character of the resource using specially equipped vessels; design, test, and develop new types of fishing gear and equipment; determine the effectiveness of new and conventional types of fishing gear and fishing craft and demonstrate the most efficient and safe means and methods of operations; and to conduct a consulting service on fishing methods and operations.

The plan of work for programs to be conducted with the increased funds is outlined below:

(1) North Atlantic fisheries exploration: With the requested increase effective and full-year operational schedules in exploratory fishing essential to continuance of our New England-Middle Atlantic industry in competition with other fishing powers currently supplying U.S. markets with fish and fishery products will be conducted. Additions to present operations will include pelagic exploration, particularly in midwater and deepwater bottom trawling for such species as ocean perch and whiting to locate new stocks available to the domestic fishing fleets. The work will be coordinated with other phases of the national oceanographic program.

(2) Alaska fisheries exploration: Planned exploration will involve making trawling stations arranged as a grid to cover geographical areas but with the exact location of stations adjusted to avoid patches of extremely rough bottom or other conditions making trawling impossible. Although the initial program will be primarily concerned with ground fish trawling other gear will be used where trace catches of such species as crabs, clams, scallops, and shrimp are made in order to fully ascertain the commercial potential of all bottom-dwelling fishery resources. Fishing for alternative species may form the basis for a commercial fishery for halibut vessels now operating during a very short season. The area of operations during fiscal year 1963 will extend from Cape Spencer to Kodiak Island, Alaska, and will be concentrated primarily inside the 100-fathom curve.

(c) *Market news*

The estimate of $569,000 represents an increase of $50,000 to provide for increased costs of supplies, communications, and the procurement of replacement and additional timesaving equipment.

Need for increase.—Of the $50,000 increase, $35,000 is for built-in increased costs for communication services, postage, mimeograph paper, and other supplies, and for replacement of old processing equipment. A steady increase in mailing lists and more complete coverage to keep abreast of the changes in the marketing of fishery products as requested by industry on an increasing scale entail

increased costs. The sum of $7,000 is for the purchase of collating machines for field offices, to eliminate the time-consuming task of manually assembling daily reports of more than one sheet. Time saved by mechanical collating is necessary on other phases of the program. The amount of $8,000 is for increased costs in the publication of "Commercial Fisheries Review." A steady increase in the mailing list and increases in the amount of material to be published results in higher reproduction costs over which there is no control. These increases in costs and number of copies reproduced for distribution will not exceed the limitations approved by the Bureau of the Budget.

Plan of work.—To continue at the present level to collect, compile, publish, and disseminate data on fishery landings, receipts, prices, stocks, packs, market conditions, trends, imports, rail and truck movements, and information on developments in this country and foreign countries affecting our fishery industries.

Information is distributed by daily, monthly, annual, and other periodic reports; through newspapers, periodicals, and radio; and by telephone, wire, and personal contacts. Work is performed by Bureau employees. This information is used primarily by the fishery and allied industries and is not available from any other source.

(*d*) *Statistics*

The estimate of $340,000 represents an increase of $36,464 of which $27,464 is for improvement of the branch's automatic data processing unit and $9,000 to reactivate the program covering the collection of catch, and manufactured products data in the lower Mississippi River States.

Need for increases.—The increase of $27,464 is needed for the modernization of the branch's automatic data processing unit in order to expand the volume of statistical data processed by automatic equipment and to expedite the preparation and release of statistical reports. The increase of $9,000 is needed to provide for the salary and expenses of an employee to resume conducting an annual survey of the fisheries of the lower Mississippi River States. Modernization of the branch's automatic data processing unit will permit preparation of additional biological and economic tabulations relating to the yield of the fisheries, will aid in programs to conserve our fishery resources, and will assist in more orderly marketing of fishery products. More rapid tabulation and release of data will make the information of more value to conservation agencies and members of the industry in determining the condition of the stock of fish and in making marketing decisions. Resumption of the annual statistical survey of the fisheries of the lower Mississippi River will reinstate complete annual surveys of the fisheries of the United States; and will provide needed information on changes in the production and stock of fish and shellfish in an area which is undergoing rapid ecological changes as the result of dredging of river channels, flood control, and stream projects.

Plan of work.—To conduct statistical surveys of the fisheries of the United States. These include the collection, tabulation, analyzing, and dissemination of information on the volume and value of the catch of each species by types of gear and geographical areas; the number of operating units employed in the fisheries; the volume and value of processed fishery products; monthly freezings and stocks of frozen fish; monthly production of fish meal and oil; the publication of monthly State landing bulletins; release of monthly foreign trade statistics; and the conduct of staff activities relating to statistical matters. The increases will permit tabulation of needed data not possible with present equipment, and the more rapid preparation and dissemination of the Bureau's statistical reports, and resumption of the collection of data on the fisheries of the lower Mississippi River States.

(*e*) *Technology*

The estimate of $1,100,000 represents an increase of $120,000 to finance research programs designed to improve the quality and marketability of fishery products. The increase is needed to initiate a program of fundamental and applied research on fish flesh protein. In fish, the most important single constituent is its nutritious protein. It is also a constituent for which our store of scientific knowledge is fragmentary or nonexistent and the quality of which is most adversely affected by mishaps in handling, processing, and distribution.

Need for increase.—Consumer acceptability of any product is affected to the greatest degree by quality. The fishing industry continues to market a product with great quality variation from one boatload to the next. This quality variation has been included among the factors inhibiting an increase in domestic per

capita consumption of fishery products from the longstanding figure of 10 to 11 pounds per person per year. Loss of quality in distribution channels also has a very serious adverse effect on our USDI product inspection and certification program. The USDI grade A shield is applied to packages of high-quality fishery products as they are inspected at the plant. When these products reach the consumer, however, they often no longer qualify for the grade A shield which they bear because of quality losses during distribution. Deterioration of fish protein, for which no effective preventive measures are available, is a major factor in quality variation.

Improving the quality and marketability of fish is a much more complex problem than one requiring simple improvements in handling practices. Although fish is used in preparation of a multitude of food products by all the established processing techniques, practically nothing is known about the fundamental changes in fish protein during processing and storage. For example, additional knowledge is needed as to why shrimp, lobster, or fish develop a tough, chewy, flavorless character in frozen storage; why flavor is lost in storage of iced fish; why some fish, e.g. hake, become so soft within days after death as to be unmarketable; why there is damage to the protein in some processing operations; how the fluctuations in temperature of frozen fish products adversely affect the protein. These are protein changes that could be avoided if we had the basic knowledge of the chemical and physical reactivities and properties of fish protein. The products could then be processed, stored, and consumed in a manner calculated to provide man with all of the nutritionally complete, balanced, and easily digestible protein inherent in fish as it comes from the sea. Until this level of use is possible we are wasting an essential food item chronically in short supply around the world.

The domestic fisherman faces many special problems in handling his unique and highly perishable product. These problems include the need for the most fundamental research on protein quality which, because of its cost, he cannot undertake on his own. He must, nevertheless, maintain the highest quality in his products to meet strong competition from the growing flood of high quality fisheries products from abroad and at the same time meet competition from other domestic food products. Often the production of each of these food products is being supported directly or indirectly by Government subsidies or research.

Plan of work.—Research to develop new, improved, or more economical methods of handling and procesing fish and shellfish and of utilizing fishery byproducts and seaweed products will be continued and an additional program added. This program will encompass fundamental research on the biochemical and nutritional changes which occur in fish protein during holding on ice, cooking, canning, freezing, and storage. The texture, flavor, color, and odor of fish protein will be investigated with a view to reducing undesirable changes and enhancing those which add to the quality of the final product. Methods will be sought to maintain the uniformly high biological value of fish protein during capture, processing, and distribution.

Protein systems will be studied both in pure form and in association with fats and oils as they are found in nature.

(*f*) *Foreign fisheries and trade*

The estimate of $99,000 represents an increase of $20,000 to provide the salary and expenses of additional personnel needed because of the uncontrollable increased workload under this subactivity.

Need for increase.—The increase is needed to provide salaries and expenses for two professional personnel so that Bureau participation in international organization affairs can be discharged effectively in accord with increased governmental and industry demands for such services.

The continuing rapid development of the world's fisheries has generated numerous problems for U.S. fishery interests. The United States is also directly or indirectly involved in many of the fishery development programs being conducted throughout the world. Moreover, worldwide fishery developments have politico-economic ramifications, especially with regard to the developing countries of Africa, Latin America, and Asia. To protect the interests of the U.S. Government and the fishing industry, the Bureau has been obligated to participate in international affairs on an ever-increasing scale. The Bureau represents the U.S. Government in the fishery activities of international organizations such as the Food and Agriculture Organization of the United Nations (FAO) and the Organization for Economic Cooperation and Development (OECD); the United States is a member country of both organizations. In addition, the Bureau par-

ticipates in numerous intergovernmental and Government-industry meetings dealing with foreign fishery problems or international developments that vitally affect the U.S. fishing industry. During the past year, the Bureau prepared for, and participated in, over 20 such international conferences, Government-industry meetings, and Government actions concerned with problems created by oversea developments. Preparation for participation in international organization affairs requires the collection of technical materials on domestic and foreign fishery developments and the preparation of comprehensive and authoritative situation reports. Also position papers, together with substantiating background information, need to be developed in conformity with U.S. policy. The current workload stemming from international fishery developments is beyond the capability of the present staff.

Plan of work.—To continue to—

(1) Conduct studies and prepare and coordinate reports as requested on—

(*a*) foreign fishery developments and their effect on the U.S. fishing industry

(*b*) production and flow to market of fishery products of foreign producers which affect domestic fisheries; and

(*c*) competitive position of domestic and foreign produced fishery products.

(2) Conduct studies and provide services on foreign trade and tariff problems, prepare materials for trade agreement negotiations, and prepare analyses of import and export trends in relation to problem areas.

(3) Conduct and service the foreign reporting program for fisheries, coordinate and prepare requests for information from foreign posts, appraise and evaluate foreign reporting, service the fishery attaché program.

The increase requested will enable the Bureau to more effectively—

(1) Coordinate participation in international organization affairs and to provide expert advice to Bureau participants on conference procedure for international conferences and Government-industry meetings.

(2) Take appropriate actions regarding fishery programs conducted by intergovernmental and other international organizations, such as FAO and OECD, and to participate in international meetings.

(3) Take appropriate actions in the work of international bodies concerned with problems in international trade, and to participate in international meetings.

(4) Coordinate and/or prepare position papers, background papers, contingency papers, briefing books, and other supporting materials for international meetings and conferences dealing with fishery matters.

(*g*) *Fishery education and market development*

The estimate of $38,000 is the same as for 1962.

Plan of work.—The following marketing activities, as part of a coordinated research and development program developed jointly by the Bureau of Sport Fisheries and Wildlife and the Bureau of Commercial Fisheries to meet the intent of Public Law 85-342 (72 Stat. 35), will be conducted at the same level as in 1962:

(1) Development of new products, recipes, and markets for buffalofish and other ricefield species.

(2) Market research studies, in cooperation with the University of Arkansas and other Arkansas State agencies, to determine consumer acceptance and preference for buffalofish and other ricefield species.

(3) Conduct of a vigorous consumer education program featuring ricefield fishery products and byproducts.

In addition to funds shown under this activity, additional funds are available under the Saltonstall-Kennedy program as shown in the following table:

Subactivities	Annual definite appropriation		Saltonstall-Kennedy funds		Total program	
	1962	1963	1962	1963	1962	1963
(a) Economics	$88,000	$163,000	$132,000	$132,000	$220,000	$295,000
(b) Exploratory fishing and gear development	661,000	823,000	353,500	394,000	1,014,500	1,217,000
(c) Market news	519,000	569,000	37,000	37,000	556,000	606,000
(d) Statistics	303,536	340,000	300,700	321,000	604,236	661,000
(e) Technology	980,000	1,100,000	391,000	410,000	1,371,000	1,510,000
(f) Fishery education and market development	38,000	38,000	564,500	569,000	602,500	607,000
(g) Foreign fisheries and trade	79,000	99,000	20,000	20,000	99,000	119,000
Total	2,668,536	3,132,000	1,798,700	1,883,000	4,467,236	5,015,000

3. Research

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Coastal and offshore research	$4,205,021	$5,976,000	$6,779,000	+$803,000
(b) Inland fisheries	214,393	215,000	215,000	
(c) Shellfish	335,974	391,000	525,000	+134,000
(d) Designing fish protective devices	34,663	36,000	36,000	
Total	4,790,051	6,618,000	7,555,000	+937,000

(a) Coastal and offshore research

The estimate of $6,779,000 represents an increase of $803,000 over the amount available for 1962. The 1963 estimate represents an increase of $2,303,000 over the base, considering a nonrecurring item of $1,500,000 in 1962. Of the $2,303,000, $988,000 is the amount required for the Bureau's participation in the expansion of the biological research aspect of the Nation's oceanographic effort. The remaining $1,315,000 is needed for research not included in the national oceanography program but essential within the Bureau's responsibility to meet new situations which have developed in the fisheries. These have not been placed in the oceanographic program because:

(1) The need for the work has arisen recently and the results are required to solve immediate problems.

(2) These subjects were not recommended by the National Academy of Sciences Committee on Oceanography and have not received review by the Interagency Committee on Oceanography.

(3) The work is mainly on fresh water aspects of the salmon life cycle, which have been excluded from the oceanographic program.

Coastal and offshore fisheries receive a major part of the Bureau's research efforts. They furnish an important protein food supply and support a large fishing industry which contributes substantially to the national income. Competition for high-seas stocks of fish is growing rapidly. To meet this competition there is need to continue programs which the Bureau is now conducting. Expansion into new areas and into new kinds of research is also required. It is important that we commence accumulation of basic knowledge about the oceans and the fish which inhabit them. Such information will in time allow maximum development and wise use of the ocean's living resources. This is one of the principal objectives of the national oceanographic program.

Descriptions of proposed research and the reasons why it should be carried out are presented under broad geographical categories.

Need for increase.—1. North Pacific high seas and inshore research (non-oceanography): An increase of $1,157,000 is needed for programs in this area as follows:

(a) $510,000 for biological research on salmon and related species in Alaska and the Pacific Northwest, as a basis for improved management of the resources.

Recent emergency programs have provided additional funds for salmon research. These studies have concentrated on very narrow aspects of salmon biology, needed for favorable renegotiation of the International North Pacific Fisheries Convention in 1963. The new agreement is certain to have much broader conservation objectives than the present treaty, and research must therefore take broader pathways. Investigations of salmon, herring, king crab, and bottom fish resources on the high seas must be concerned with growth and mortality rates, movements, and effects of fishing. In the inshore environment, and in the fresh-water phases of salmon life history, it will be necessary to understand much better the patterns of growth, mortality, and movements, and the reasons for their variation.

(*b*) $197,000 for biological investigations in areas off Alaska and the Pacific Northwest that are or may be fished by foreign trawl fleets. In 1960 it is estimated that the combined trawl fleets of Japan and Russia took more than a billion pounds of bottom fish from waters of the Bering Sea and North Pacific Ocean. It is estimated that they will take a billion and a half pounds in 1961. Operation of these foreign fleets already is being expanded south of the Aleutian Chain and Alaska Peninsula into the waters of the Gulf of Alaska.

Although the take so far has been confined mainly to groundfish (other than halibut) and king crabs, equipment now in operation can be used at any time to catch salmon, halibut, and other valuable food fishes. Obviously it is only a matter of time until foreign fishing effort expands operations south along the coasts of Canada and the U.S. Pacific Northwest. It is essential that we have adequate biological information about the stocks of fish in these coastal areas. Only with an adequate basis of scientific facts can the United States successfully negotiate with other nations regarding the protection of stocks vital to the American fishing industry.

(*c*) $450,000 for research on salmon and related species on the high seas of the North Pacific Ocean and Bering Sea, to strengthen the United States in negotiation with Japan and the U.S.S.R.

The International (Japan, Canada, United States) Convention for the High Seas Fisheries of the North Pacific Ocean now provides good protection for Alaskan salmon. Almost all pink and chum salmon and most red salmon are protected from capture on the high seas by the abstention line (175° W.), east of which Japan cannot, under the Convention, fish for salmon. In 1963 it will become possible for Japan to terminate the Convention, or to use the threat of termination to force renegotiation. The U.S.S.R., not a signatory to the Convention, is also interested, since most Asian salmon stocks, from streams in Kamchatka and Siberia, also are subject to fishing by Japan. Investigations since 1955 under the International North Pacific Fisheries Commission (created by the Convention) have created a substantial fund of information on our high seas salmon stocks. This was gathered, however, to meet the very restricted requirements of the protocol to the present Convention. Hence, it deals only with the question of distribution of salmon of Asian and North American origin upon the high seas. The renegotiated Convention, which is certain to have broader objectives and to raise even greater problems for the U.S. fishing industry, will require reorientation of the entire research program, delving into questions that have been of secondary importance up to now.

Plan of work.—(*a*) Research will be intensified to secure basic knowledge on such important subjects as the numbers of spawning fish needed to produce the maximum harvest. The influence of chemical and other environmental factors on survival of salmon will be investigated. Studies will be extended to populations of salmon, king crabs, clams, and groundfish important to the fisheries but not heretofore covered. Particular emphasis will be placed on salmon biology during the transition from fresh to salt water, a life history phase about which almost nothing is known. Resources not now heavily exploited but which may be important to the economies of the States include Alaska groundfish and shrimp, resources now threatened by growing fishing fleets of other nations. Studies will be commenced to obtain information under near-virgin conditions for comparison with the condition of these resources under exploitation.

(*b*) Surveys will be made in waters off the coasts of Alaska and the Pacific Northwest to determine the abundance, distribution, and life histories of the stocks of fish and shellfish that are of present or potential commercial importance. These include several species of sole, Pacific Ocean perch, king crab, schrimp, herring, and halibut. Particular emphasis will be placed on an understanding of the effects of fishing upon these resources, and their capacity to withstand heavy fishing. Activities will include vessel observations at sea,

laboratory examination of scientific samples, and biometric analysis of the resulting data.

(*c*) Larger vessels will be placed in service, permitting work in winter and at other times and places not coverable by the small wooden fishing vessels now chartered. Techniques of differentiating North American and Asian fish, such as serological analysis, will be strengthened. Special emphasis will be placed on the effects of such characteristics of the marine environment as temperature, salinity, and chemical composition. Marked changes in these characteristics probably exert a strong influence on salmon survival and migrations. The estuarine phases of salmon life history, until now largely neglected, will also be studied. King crab investigations will be extended to areas threatened by expanding Japanese fishing activities, and not now covered adequately. These investigations will have the practical objective of managing these fishery resources for maximum sustained yields.

Need for increase.—2. Tropical Atlantic oceanography and fisheries (oceanography): The increase of $275,000 is needed to conduct a program of oceanographic and fishery research in the eastern tropical Atlantic. This is a region of rapidly growing interest by the major fishing nations and the developing nations of Africa and South America. Our interest in this region will benefit the U.S. fishing industry and provide knowledge in an area now largely unknown but of primary importace to the national security.

The fishery resources off west Africa appear to be rich and capable of sustaining greatly increased yields, yet the humid rain forest belt in the Gulf of Guinea region of west Africa has a serious protein shortage, with a population among the coastal states of about 80 million people. Expansion of animal husbandry is not likely to provide the necessary increase in protein supply, at least within the present economic reach of the people, but the fisheries appear to be capable of sufficient expansion to provide such protein requirements at reasonable cost.

Recent expansion of the tuna fishery in the eastern Pacific has pushed the yield of that fishery to the limit of what it can sustain, yet world demand for tuna is growing rapidly. Some oceanographic features of the eastern tropical Atlantic resemble those of the eastern tropical Pacific, suggesting that the ocean off Africa may prove to be a major source of tuna. Indeed, there are expanding tuna fisheries in this area now. However, for efficient exploration of this resource, especially by U.S. fishermen, investigations of tuna distribution and abundance in relation to oceanographic features of the eastern tropical Atlantic are essential.

Plan of work.—The funds requested will provide for conversion and operation of two surplus vessels of a type most suited to this purpose as well as for the analysis of the data thus obtained. The vessels will be converted to meet the requirements for oceanographic and fishery research on the high seas. Conversions of existing vessels, rather than new construction, are planned in order to meet program deadlines. This program is part of a larger cooperative plan that will include vessels of other Federal agencies and possibly private oceanographic institutions. In addition, it is planned that fishery research vessels of three African nations bordering the Gulf of Guinea will participate in some portions of the program without cost to the United States. There is also a proposal by CCTA/CSA, a regional technical and scientific agency of the African nations south of the Sahara, for a coordinated program of research on the ground fisheries of west Africa. Financing of this program is being sought through the Agency for International Development, and there is every indication that such support will be forthcoming.

Need for increase.—3. Eastern Pacific oceanography: An increase of $68,000 is needed to provide for operational costs and maintenance of the research vessel *Black Douglas.* This will improve our knowledge of the population dynamics of marine animals, and expand life history studies on eastern Pacific fishes. A substantial contribution to the oceanography of eastern Pacific waters will be made. This effort will improve the overall understanding of eastern Pacific fishery resources and should lead to their full development and utilization.

Plan of work.—The scientific staff and research vessel time will be employed to obtain an understanding of variations in the abundance and distribution of Pacific fishes in relation to the environment, to help explain, for example, the causes of the drastic decline in abundance of Pacific sardines, and to predict the likelihood of their return. Other species of fish, such as anchovies, hake, and jack mackerel are also included in these studies, since they are ecologically associated with the sardine. These will be broad investigations, to examine the interactions of marine animals with each other and with the environment.

Research will be directed from the Bureau's Biological Laboratory at La Jolla, Calif.

Need for increase.—4. Basic research in biological oceanography, and ocean surveys (oceanography): An increase of $405,000 is needed for new research to satisfy a fundamental need for information on marine organisms, information not now being obtained by present, applied research programs.

For example, diseases cause high mortalities among some species but the extent that disease limits fish abundance is not known. Population size may be limited in some periods because the young fail to survive beyond certain critical stages. Fishery scientists need to know more about the critical stages and what causes them.

Instrumentation for fishery research and marine biological studies should be improved. It is completely incongrous that, in this age of electronic miracles, most instrumentation for research on living marine resources is still essentially that of the "horse and buggy" days.

Fishery research programs now being carried out by the Bureau are overtaxed to meet everyday problems. It has not been possible to conduct basic studies to provide the fundamental store of information needed to understand, conserve, and improve our yields of marine resources.

The Bureau has a unique opportunity to cooperate on ocean survey programs with the U.S. Navy and the Coast and Geodetic Survey to produce maps of the sea bottom and an atlas of biological and oceanographic conditions for large areas of the oceans. This is a necessary prerequisite to maximum utilization of ocean resources. International cooperation on ocean surveys is being planned through UNESCO. The Bureau plans to join this effort which will enhance high-seas fishery exploration and development.

Plan of work.—Several Bureau laboratories have recently completed new sea water systems and have space for experimental research on behavior and survival of marine organisms under various conditions. In addition, the Bureau has scientists highly qualified as physiologists, geneticists, behaviorists, and pathologists. These men can undertake some of the new research recommended if staff assistants are recruited to help them. Under present plans, basic, experimental research will be undertaken at Boothbay Harbor, Maine, Woods Hole, Mass., La Jolla, Calif., and Honolulu, Hawaii.

We plan also a program of grants or contracts in universities and private research institutions which have capable biologists on their staffs. This will add the efforts of non-Government scientists on these research tasks.

Grants are to be given to universities which specialize in the training of fishery biologists and oceanographers, to enhance the training of scientists.

Bureau scientists and technicians will be placed on the cooperative ocean survey program. Present plans of the Interagency Committee on Oceanography call for surveys to begin in 1963, with two or possibly three ships working in offshore waters of the North Atlantic and Pacific.

The research and surveys mentioned here are part of the national oceanographic program, which is to be carried out over the next 10 years.

Need for increase.—5. North and South Atlantic regions ($170,000 oceanography and $158,000 nonoceanography): An increase of $328,000 is needed for programs to be conducted in this area as follows:

(*a*) $140,000 to operate a new research vessel, the replacement for the *Albatross III*, that will be commissioned early in fiscal year 1963 (oceanography).

(*b*) $158,000 to gather information on the effects of Russian fishing activities on the fish stocks of Georges Bank and adjacent waters (nonoceanography).

(*c*) $30,000 to bring to a more productive level the operations of the Biological Laboratory at Brunswick, Ga. (oceanography).

Plan of work.—(*a*) The new vessel will make regular surveys of fish populations to determine the seasonal distribution and abundance of important commercial species. Spawning concentrations will be delimited and the survival of eggs and larvae determined. Changing oceanographic conditions will be related to changes in fish populations. The program includes a study of bottom fauna and its importance as food for haddock and other valuable species. The full-time operation of this new vessel is essential to our Bureau's fishery-oceanographic research program in the northwestern Atlantic and our commitments and obligations under the International Commission for the Northwest Atlantic Fisheries.

(*b*) To determine the effects of trawling by Russian vessels upon the immediate and long-term supply of groundfish, particularly haddock, on the New

England banks, detailed surveys will be made to investigate changes in size, age composition, and species composition of the groundfish catches, and possible changes in success of U.S. fishing vessels. Results of this work will place the United States in a much stronger position to make such representation as may be necessary through the International Commission for the Northwest Atlantic Fisheries to conserve groundfish stocks and to protect American historical fishing rights.

(*c*) Much data still remain to be analyzed from the nine cruises of the *Theodore N. Gill* made in the South Atlantic in 1953–54. The increase in funds will be used for a small increase in staff so that this work related to past operations can be completed and the information on South Atlantic fishery resources and oceanography made generally available.

Need for increase.—6. Oceanography in the International Indian Ocean Expedition: An increase of $70,000 is required for Bureau participation in the International Indian Ocean Expedition which is being sponsored by the Special Committee on Ocean Research of the International Council of Scientific Unions. This is a cooperative international effort by about 30 nations to improve knowledge of physical oceanographic and biological features of a productive but poorly known part of the world oceans. One of the principal aims is to develop fisheries for use by protein deficient peoples of countries which border the Indian Ocean.

Plan of work.—The Bureau plans to participate in the Indian Ocean Expedition by taking responsibility for fishery aspects of the U.S. biological program. Bureau scientists are to carry out fishery explorations and related biological studies aboard a ship being furnished by the National Science Foundation and operated by the Woods Hole Oceanographic Institution. Research will consist of fishing explorations on the high seas and in little explored coastal areas to make inventories of species present. The information gained will be used for an evaluation of fish production potentials. According to the present international plan, the United States will concentrate its fishery and biological studies in the western Indian Ocean and Japan and Australia will conduct fishery studies in the eastern part.

(*b*) *Inland fisheries*

The estimate of $215,000 is the same as for 1962.

Plan of work.—The inland fisheries research programs for the Great Lakes will be performed by Bureau personnel in cooperation with State fishery agencies, the Province of Ontario, and the Fisheries Research Board of Canada, using one Bureau vessel and two chartered vessels. Frequent measurements will be made of the chemical characteristics of the water to keep check on presence and concentration of man-induced substances, such as pesticides, detergents, and organic pollution. The effects of such substances on the abundance and composition of fish stocks will be determined to see if they may have been factors in the marked decline of the resource. The importance of plankton as fishfood and its susceptibility to a changing environment will be studied. It is known that major changes have occurred in the bottom-living animals (benthos) of the lakes. Criteria will be established that will serve as indices to such changes and their significance.

(*c*) *Shellfish*

The estimate of $525,000 represents an increase of $134,000, all of which is for programs recommended in the national oceanographic program.

Need for increase.—1. Oceanographic programs to meet needs of specific fisheries: An increase of $75,000 is needed for expanded research to determine the cause of oyster mortalities, and for operation and utilization of a new sea water pond system at Oxford, Md.

Mass oyster mortalities which began in Delaware Bay have now spread through Chesapeake Bay. Additional fieldwork and expanded laboratory research will be required to find the causative agent and to develop control measures.

The new sea water system at the Oxford, Md., laboratory will be ready for use in fiscal year 1963. Funds are needed for operation and maintenance of this system and for a new research program utilizing these facilities.

2. New programs in oceanography: An increase of $59,000 is needed to begin laboratory and field research on shellfish genetics and radiobiology. Almost no knowledge exists concerning the methods by which inherited characteristics are passed from one shellfish generation to the next. Such knowledge of genetics

is necessary to develop desirable characteristics such as fast growth and disease resistance. This program is comparable to genetics research in agriculture on which our present high crop yield is based.

In radiobiology, controlled field experiments in confined bodies of water are needed to verify previous laboratory studies of the accumulation of radioactivity and its effect on marine organisms. These studies will later be expanded to natural estuaries. This research, a part of the Bureau's cooperative program with the Atomic Energy Commission, was recommended by the National Academy of Sciences' Committee on Oceanography.

Plan of work.—To continue programs relating to investigations of mollusks of inshore waters, including oysters, clams, and their predators, such as green crabs, sea stars, and drilling snails. The additional funds requested will provide for the following:

1. Oyster mortality studies based at the Oxford, Md., laboratory will include field studies, using the Bureau research vessel in Chesapeake Bay, to determine factors involved in the spread of the disease. In the laboratory, experiments will be conducted to determine methods of transmission of the disease from one oyster to another.

Also, at the Oxford laboratory oysters from various sources will be held in the new sea water ponds to determine their resistance to the oyster disease in an attempt to develop disease-resistant strains of oysters.

2. Genetics research will include controlled breeding of oysters and clams at the Milford, Conn., laboratory to determine principles governing transmission of inherited characteristics. An expert geneticist and supporting personnel will be employed for this work.

Radiobiological experiments will be conducted in outdoor tanks at Beaufort, N.C., to determine accumulation and effect of radioactive substances on marine organisms. Specialized scientific and supporting personnel to carry out this work will be employed.

(*d*) *Designing fish protective devices*

The estimate of $36,000 is the same as for 1962.

Plan of work.—The tremendous water resource development throughout the Nation has resulted in an increasing demand for biological and engineering planning and development of fish protective facilities, including such devices as screens, louvers, ladders, and elevators. Plans must also be developed to assure proper hydraulic conditions compatible with maintenance of the fisheries. The development of mesasures for protecting fish at dams and other barriers is one of the most serious problems facing the fisheries agencies. This work is carried on by a small group of biologists and engineers. Although the activity is headquartered in the Pacific Northwest, assistance is provided in connection with problems resulting from water developments throughout the country.

In addition to funds shown under this activity, additional funds are available under the Saltonstall-Kennedy program, as shown in the following table:

Subactivities	Annual definite appropriation		Saltonstall-Kennedy funds		Total program	
	1962	1963	1962	1963	1962	1963
(*a*) Coastal and offshore research	5,976,000	6,779,000	2,191,700	2,311,000	8,167,700	9,090,000
(*b*) Inland fisheries	215,000	215,000	99,000	99,000	314,000	314,000
(*c*) Shellfish	391,000	525,000	288,200	309,000	679,200	834,000
(*d*) Designing fish protective devices	36,000	36,000			36,000	36,000
Total	6,618,000	7,555,000	2,578,900	2,719,000	9,196,900	10,274,000

4. Research on fish migration over dams

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Research on fish migration over dams	$299,967	$924,000	$1,999,000	+$1,075,000

Research on fish migration over dams

The estimate of $1,999,000 represents an increase of $1,075,000 needed for expansion of effort with regard to programs conducted under this activity.

Need for increase.—Unsolved problems of passing anadromous fish at high dams are delaying the licensing by the Federal Power Commission as well as authorization and construction by Federal agencies of high dams in the Columbia Basin. Serious losses are presently occuring to the fishery resources at recently constructed high dams. Obviously, the licensing of new dams cannot be held in abeyance indefinitely. In view of this, the Secretary of the Interior, in a letter to the Federal Power Commission dated March 15, 1961, requested that no licenses be issued for high dams in the middle Snake River area (Oregon and Idaho) at the present time and indicated his intention, with the concurrence of the President, to initiate immediately a crash research program on the problem of passing migrant salmon and steelhead over dams. The Secretary described the most critical phase of the problem as that of providing safe passage for downstream migrants at high dams. He further stated that the aim of the crash program was to provide at least some significant findings by the end of 1964.

The $524,000 in the regular budget for 1962 carried the emergency studies into the first months of the fiscal year. The $400,000 added in the supplemental appropriation extended the studies to one-half the necessary level of effort. The scientists of the Bureau in collaboration with those of the State fish and game agencies of Washington, Oregon, and Idaho have developed an essential research program which will cost approximately $2 million. This level of expenditure is required if significant findings are to be provided by the end of 1964—a period of only 2½ years. Columbia River salmon and steel head stock which provided an average commercial catch of about 20 million pounds during the period of 1941 to 1949 provided a catch of only 5 million pounds in 1960. Although the sport fishery effort is rapidly expanding, the catches have been seriously affected by the declines in abundance. The primary cause of this decline has been the rapid industrial development of the river. If the serious downward trend of these valuable runs is to be halted, and the runs preserved, the knowledge to be gained from this expanded research effort is essential.

Plan of work.—Fish passage research will be accelerated to the extent of available funds to obtain factual information on the requirements of migrating fish. This will be needed to determine the direction toward which a sound water development program should proceed in the middle Snake River Basin. In fiscal year 1963, it is intended to examine behavior of adult salmon subjected to changes in pressure, or as they approach dams and leave fishway exits at dams; to extend fish-tracking experiments to the Columbia and Snake Rivers; to undertake a large-scale effort in evaluating fingerling passage problems at dams and to develop techniques to reduce losses; to undertake large-scale field tests of fish behavior in the vicinity of dams; and to conduct field experiments to determine the guiding efficiency of an electrical array in a wide range of water velocities. This research work will require the purchase or fabrication and installation of louvers, floating traps, collectors, sorters, and other experimental facilities, and the construction of two experimental flumes—one flume of 100-foot length with necessary circulating pumps and tanks, estimated at $35,000; the other, a 600-foot flume and related equipment, estimated at $420,000. The latter flume will be constructed of concrete, as an open canal, and equipped with intake and outlet water control structures. Since this flume may be located in an isolated area, the construction of access roads, utility lines, and a few small temporary buildings for protection of personnel and equipment used to attend the experiments may be necessary.

5. Fishing vessel mortgage insurance

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Fishing vessel mortgage insurance	$44,180	$51,000	$51,000	

Fishing vessel mortgage insurance

The estimate of $51,000 is the same as for 1962.

Plan of work.—This program provides for the insurance of mortgages given to aid in the construction, reconstruction, or reconditioning of fishing vessels. The funds loaned are provided by banks or other private lending institutions and their loans on mortgages are insured by the Bureau. An insurance premium is paid by the borrower which goes into a revolving fund along with investigation and commitment fees paid by the borrower. This fund will be used to pay any claim which may occur provided the mortgage or loan goes into default. In this circumstance the collateral will be taken over by the Bureau and can be liquidated with the funds obtained being returned to the revolving fund. Work necessary to the administration of this program is performed by the Bureau with legal assistance furnished by the Office of the Solicitor, a unit of the Office of the Secretary.

6. Columbia River fishery facilities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase + or decrease (−)
Columbia River fishery facilities	$1,974,185	[1] $1,945,146	$2,100,000	+$154,854

[1] Includes $30,146 unobligated balance from prior years.

Columbia River fishery facilities

The estimate of $2,100,000 represents a net increase of $154,854 for the program. There is in 1962, in addition to the $1,915,000 available from the 1962 appropriation for the Columbia River fisheries program, an unobligated carryover of $30,146 from prior years. An increase of $185,000 over the 1962 base of $1,915,000 is needed to finance the 1963 program.

Need for increase.—The increase will provide for greater costs of fish foods and other goods and services, as well as for added operation and maintenance of newly constructed fish facilities. Included in the new construction are the following: Dagger Falls ladder (Middle Salmon River), Castille Falls (Klickitat River), Lookinglass Falls (Grande Ronde River), fish screens, and other smaller projects, including stream clearance. Experiments conducted at the hatcheries have demonstrated that greater survival and return of fish can be expected by rearing silver salmon for 13 months and steelhead trout to the size of 10 to the pound before releasing them to make their downstream migrations to the ocean. This additional period of rearing, plus increased costs for commercially prepared fish foods, will result in an increase in operational hatchery costs. A vastly accelerated hatchery evaluation program, including the marking of 10 percent of all fall Chinook to be released from program hatcheries, will be in full operation in fiscal year 1963 and will require additional seasonal help.

Plan of work.—The operation and maintenance of facilities constructed under the Columbia River fishery development program will be continued as in the current year in cooperation with the State fish and game agencies of Washington, Oregon, and Idaho. More than 60 percent of the funds available under this activity is utilized by the cooperating fish and game agencies under contract with the Bureau. Another 25 percent is utilized by the Bureau of Sport Fisheries and Wildlife in operating the six Federal hatcheries. The principal items of work are the following: (1) Operation and maintenance of hatcheries, (2) operation and maintenance of screens, (3) maintenance of stream clearance projects, (4) appraisal of project results, and (5) administration and inspection. Longer hatchery rearing periods than in the current year for silver salmon and steelhead trout will require the employment of additional seasonal help to carry out the fiscal year 1963 hatchery operation programs.

Itemization of estimate—Management and investigations of resources

	Actual 1961	Estimate 1962	Estimate 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$9,880,548	$12,575,682	$15,213,000	+$2,637,318
Comparative transfer from "Operation and maintenance, general," Corps of Engineers, civil, Department of the Army	1,974,185			
Unobligated balance transferred from "Operation and maintenance, general," Corps of Engineers, civil, Department of the Army (Public Law 87-122)		−30,146		+30,146
Transferred to "Operating expenses, Public Buildings Service," General Services Administration (Public Law 87-141)		+4,464		−4,464
Unobligated balance lapsing	19,637			
Appropriation	7,926,000	12,550,000	15,213,000	+2,663,000
Obligations by objects:				
11 Personnel compensation	$4,407,069	$5,401,000	$6,412,000	+$1,011,000

Total obligations	9,880,548	12,575,682	15,213,000	2,637,318

General Statement

Chairman Hayden. I will be glad to hear from you, sir.

Mr. McKernan. Just very briefly highlighting the situation with respect to the commercial fisheries of the United States, Mr. Chairman, there have been some rather significant developments and occurrences this past year. One of the most important has been the expansion in the Nation's oceanographic program to attempt to bring us up somewhere near the level of some of the other great fishing and maritime nations of the world, such as the U.S.S.R. and Japan.

This program was endorsed by President Kennedy in his message to Congress last year, in March of 1961, when he stated that the seas around us represent one of the most important resources. If vigorously developed, this resource can be of great benefit to the Nation and all mankind.

Our Bureau has been participating actively in the formation of the national oceanographic program in order to increase our knowledge of the oceans and all their aspects, especially that applicable to the harvest of the living resources of the seas.

FISHING ENCROACHMENT OF FOREIGN NATIONS

The chairman and Mr. Young both indicated a great interest in the expansion of foreign fishing near our coasts. There is a great expansion by both the Soviet Union and Japan, especially the latter. These great nations are fishing in almost all of the oceans of the world. In the North Pacific Ocean, for example, Japan has increased her

take of fish from nothing in about 1951, or very small amounts, close to her shores, until this year, for example, she took about 1,300 million pounds of fish in the Bering Sea, in fact the eastern Bering Sea.

Chairman HAYDEN. I have heard that fish is the basic food of the Japanese people at this time. Is that correct?

IMPORTANCE OF FISH TO JAPAN

Mr. MCKERNAN. Fish is a very important source of meat protein to the Japanese, and they are expanding their fisheries both in the Pacific as well as the Atlantic. The Soviet Union is doing the same, and is fishing very actively in the eastern Bering Sea at the present time, and has had research ships south of the Bering Sea along the coast of Alaska exploring in the areas where we do extensive fishing.

We have always considered these grounds to be more or less our own fishing grounds. The Soviet Union has indicated an interest in these areas, and we expect to be in direct competition with both Japan and the Soviet Union in the eastern North Pacific Ocean off the shores of the United States, including Alaska.

These problems are bearing heavily on us at this time. We are working through the International North Pacific Fisheries Commission in attempting to get maximum cooperation from Japan. Up until the present time, we do not have any active cooperation with Russia on this front, although we do participate with her in the conservation of the fur seal stocks of the North Pacific Ocean.

TUNA

Just very briefly capsulating some of the other happenings in our own fisheries industries during the past year, the tuna fishermen in southern California have been expanding the size of their boats, and they are now competing with Japan and other nations in the Atlantic Ocean, off the shores of Africa, for new tuna resources which have been found in this location.

They have expanded their distant water fishing fleets and are fishing deep into the South Atlantic off the shores of Central and South America, and have learned, through research carried on by the Federal Government and other research agencies, of tuna stocks elsewhere, particularly in the Central Pacific.

IMPORT OF FISHERY PRODUCTS

Of course, the importation of foreign fishery products still remains a rather serious problem in the American fishing industry, and a good deal of the effort of the Bureau is involved in getting information and attempting to help the industry find ways to mitigate the problems involved with increased importation of rather inexpensively produced foreign fisheries products.

SHRIMP

The great shrimp resources of the Gulf of Mexico support the most valuable fishery in the United States, in dollar value of the catch. This particular fishery has had a very serious problem this past year. The resource itself was not available to the fishermen. That is, there was a dearth, a very great shortage, of shrimp, in the Gulf of Mexico,

throughout the whole South Atlantic and Gulf of Mexico area, and the catch was down almost by one-half during 1961. This has caused tremendous economic hardship to the fishermen from Texas clear over to Florida and on up through the Carolinas.

We are altering our own research and survey programs to attempt to learn more about new shrimp beds in deeper waters, and are doing our very best to help the industry in its problems in finding new resources.

Chairman HAYDEN. Is there any logical explanation for this drop?

Mr. MCKERNAN. Yes, Mr. Chairman. Undoubtedly this is, at least to a considerable degree, due to some changes in the environment in the Gulf of Mexico.

Now, our research has not proceeded far enough to explain the precise causes of this dearth of shrimp in the gulf, but we are quite certain that it has been caused by changes in the ocean environment; that is, changes in temperature, changes in amount of fresh water, or changes in the current systems. We are attempting to learn right now the migrations and habits of the shrimp in greater detail, so that we can explain and perhaps predict in advance when we are going to have these fluctuations in the natural abundance of shrimp.

MENHADEN FISHERIES

The great menhaden fisheries, which in fact produce about 40 percent of the total U.S. catch of over 5 billion pounds, had a good season insofar as their catch was concerned this year. They are, however, struggling with increased competition on the marketplace with their fishmeal, which is a product of the menhaden fishery, with such nations as Peru, where in recent years the increase of the capture of anchovies has flooded the world markets with fish meal.

Even so, through the aggressive actions of this industry, through tremendous amounts of economies placed upon themselves, they have been competing in this market quite well. However, the fish oil market throughout the world is in rather bad shape at the present time; and so the menhaden industry is attempting to modify its own research and has been working with our Bureau in attempting to find other uses for the fish oil, such uses perhaps as those for medical purposes as well as other industrial uses.

NEW ENGLAND GROUND FISH

In the case of the New England ground fish fisheries, Mr. Chairman, you will remember we have had some problems with this industry. It is the oldest fishery in the United States. These problems have not been resolved yet, but there is, in my opinion, some sign of life in the New England ground fish industry.

The fishing vessel differential construction subsidy program, authorized by Public Law 86–516, approved June 12, 1960, is being used in New England to construct some newer, larger, and more efficient ground fish vessels, which we hope will compete successfully with the vessels of foreign nations fishing the Grand Banks.

You will remember there are 13 or 14 nations fishing the Grand Banks at the present time. In fact, during this past year the U.S.S.R. has moved down onto George's Bank, right off our own shores of New England, and has been heavily fishing the herring stocks there, and some of the ground fish stocks as well. It simply means that they have their research vessels and their fishing vessels there, and it means more difficult and tough competition for our New England fishermen.

MAINE SARDINES

The Maine sardine industry is in grave economic condition because of serious problems resulting from a recent sharp drop in supply of raw material, apparent changes in the migratory pattern or environment of the fish, and a lack of knowledge of how to efficiently catch and preserve fish taken in open waters. For the past 20 years the supply has undergone but minor fluctuations. In 1961, however, the schools of fish failed to appear on the normal fishing grounds, and consequently the catch dropped to approximately one-fifth of its normal size. Most of these fish were taken from the normal fishing area. Because of the lack of technological information, it has not been possible to harvest or utilize fish available in the open waters.

OYSTERS

One other great fishery has had enormous difficulties in the past few years, and that is the oyster fisheries of the Atlantic coast.

You may remember, Mr. Chairman, that I reported to this committee that a new scourge had hit the oyster industry, a thus far unidentifiable organism called MSX. It is apparently a small funguslike organism, absolutely harmless to man, and yet it has killed oysters in tremendous quantities in both Delaware Bay and the lower Chesapeake.

Our research laboratories, along with the State agencies and with cooperation and encouragement from the industry, have been intensively studying this particular problem, attempting to find disease-resistant strains of oysters. There is some glimmering of hope on the horizon at the present time in Delaware Bay that we may be developing such disease-resistant strains.

Mr. Chairman, I have just briefly highlighted some of the important occurrences this past year, and I will be pleased to answer any further questions.

INCREASES REQUESTED

Chairman HAYDEN. There are three sizable increases included in this estimate. Over $463,000 for marketing and technology, $937,000 for research, and $1,075,000 for research on fish migration over dams.

Will you brief the committee on each of these items, indicating the major requirements for increases?

Mr. McKERNAN. The increase in the management activity, Mr. Chairman, a small increase of $7,000, is for increased charter time of vessels for enforcing our international fisheries obligations. The increase is for enforcement during the heavy summer fishing season in the Pacific Northwest of the United States, where there is intensive fishing by both United States and Canadian fishermen, and the U.S. Government is responsible for this particular enforcement.

TREATIES COVERING FOREIGN FISHING

Senator MUNDT. On the subject of enforcement, you spoke in your statement about the increased encroachment of Russian and Japanese fishing vessels into international waters in our area. Do we have any treaty arrangements with them spelling out how far we can go in their direction and they can come in our direction in fishing?

Mr. McKERNAN. With some countries we do, Senator Mundt.

Senator MUNDT. I am talking about Japan and Russia.

Mr. McKERNAN. In the case of Japan we have an International North Pacific Fisheries Commission. This is an international convention, which does spell out where the Japanese will fish with respect to both salmon and halibut, the two major species that are fished by our fishermen in the eastern North Pacific Ocean.

With respect to Russia, we do not have such a convention at the present time.

We have been studying these problems, the problem of how we would come out in such a convention if Russia were added to this particular convention or a similar one in the North Pacific Ocean.

Senator MUNDT. In the absence of any such convention, how close can Russia come to our shore? Three miles?

TERRITORIAL FISHING LIMITS

Mr. McKERNAN. Three miles. A number of nations, of course, have called for an expansion of the territorial limits, or an expansion of their authority over fishing. Some nations, for example, have even claimed out to 200 miles. Our own interests, by the way, even in fisheries, vary.

For example, in New England, it is, in some instances, with the smaller fleets an advantage to us to have an expanded territorial sea, or at least jurisdiction over fisheries, but on the other hand, some of our distant water vessels in New England do go up off Nova Scotia and off the Grand Banks, and to that extent we might be damaged.

Our shrimp fleets in the Gulf of Mexico, for example, fish fairly close to shore. In fact, they developed the fishery off Tampico and Campeche down off the gulf coast of Mexico, and an expansion of the territorial seas in this area would be very damaging to our great shrimp fisheries. The same is true with respect to our tuna fisheries.

Senator MUNDT. As far as Russia is concerned, if she wanted to, she could come legitimately within 3 miles of our border and fish, in salt water or any other place in the world, and we have the same right vis-a-vis her?

Mr. McKERNAN. Russia can legitimately fish in waters 3 miles or more off our shores. She however, claims a 12 mile limit. Were our vessels to fish off the coast of Russia, she probably would attempt to limit our participation to 12 miles. We do not recognize such limitations since international law now recognizes only a 3-mile jurisdiction.

EFFECTS OF 12-MILE LIMIT

Senator MUNDT. Would it be good or bad if we claimed 12 on our side?

Mr. McKERNAN. From the standpoint of the North Pacific fisheries, it would be of some advantage. From the standpoint of the shrimp fishermen and, to a lesser extent, the tuna fishermen and New England groundfish fishermen, and Pacific Northwest trawl fishermen, who fish off the coast of Canada, it would be bad.

Senator MUNDT. In what way?

Mr. McKERNAN. Because they fish inside of 12 miles of Canadian waters, for example, at the present time. That is, our trawl fisheries, fishing bottom fish in the Pacific Northwest, fish in Hecate Strait. This is the strait between some of the British Columbian islands and the mainland.

We have fished for, perhaps, 50 years, in these areas, for bottom fish. The 12-mile limit would exclude us from these particular fishing grounds that U.S. fishermen have developed.

The same is true with the shrimp fishermen in the gulf. A 12-mile territorial limit would hurt us, because many of our fishermen fish closer to shore than 12 miles.

Senator MUNDT. To Mexico?

Mr. McKERNAN. To Mexico, yes, and the same is true with tuna.

Senator MUNDT. Then this extra vessel you are asking for—is this a kind of patrol vessel or police vessel to see whether everybody is fishing in the right place?

Mr. McKERNAN. In this instance it is an increase in the charter costs. At the present time we are only chartering these vessels for about 2½ months during the summer, and there are still very active fisheries beyond this time.

Our enforcement people inform me that these vessels ought to be patrolling for about 4 months, instead of 2½ months. This is about what the requested funds will provide.

MARKETING AND TECHNOLOGY

In the marketing and technology activity, the increase of $463,464 consists of several important items.

ECONOMICS

There is an increase of $75,000 for economic studies. In this instance, we are aware that the problems in some of the American fisheries are economic, rather than biological. That is, they do not involve the resources as much as they do the marketplace. We think these problems are going to increase, because of the Common Market

situation in Europe and the increased activity in these fishing nations of the world who are bringing in tremendous quantities of their products into the U.S. market.

We are attempting to develop indexes and predictions as to what these are, in order to predict, both for the National Government as well as for the industry, what the status of these fisheries might be in the future.

EXPLORATORY FISHING AND GEAR RESEARCH

There is $162,000 for an increase in exploratory fishing and gear research, in order to make our fishermen more competitive with those who are now fishing even on what we have considered our own fishing grounds and, yet, are capturing the U.S. markets.

Part of this increase is for explorations in New England waters, where, of course, if we can learn more about the resources than the Russians or others, right off our coast, perhaps we can provide an economical environment for our New England fishermen.

We are doing such things as attempting to extend the fisheries beyond the traditional fishing grounds, take them out into deeper waters. This requires, of course, different kinds of fishing gear and different kinds of power on the boats themselves. In our opinion, however, these are the only ways to compete successfully with these foreign fishing nations; that is, to keep ahead of them technologically and researchwise.

EFFORTS OF INDIVIDUAL FISHERMEN

Senator MUNDT. Do fishermen do anything at all to find better fishing grounds and better ways to fish, or does the Government have to point out to them how to fish, how to bait the hook, how to catch the fish?

Mr. MCKERNAN. No; the fishermen do a great deal of this themselves, Senator. Of course, many of these programs are tremendously costly, and fishermen, or even a group of fishermen, can hardly stop their fishing, stop making their livelihood, in order to go out into unknown areas.

It is true that, in areas where it appears that the fishermen themselves cannot support these researches and explorations, then the Government has attempted to help them. We do use good judgment as to how far Government should go, in such explorations. When we find the resources we publish information and bring it to the fishermen's attention. From there on it is up to them.

Now this has worked in two or three places. Right now, for example, an enormous scallop fishery is developing off the Florida coast. Our research boats found there what we think may be among the largest scallop beds in the world. Now an industry has started, and they have apparently invested well over a million dollars already in developing ways of harvesting these and ways of handling them. This is an investment by industry itself.

MARKET NEWS

We have asked for an increase of $50,000 for increased operational costs and mechanization of our market news activities. In market news, we attempt to provide information to the industry about the

resources being caught. In other words, we attempt to try to bring buyer and seller together.

This is a daily activity, and we have offices in major fishery centers of the country, such as New York, Seattle, San Pedro, and Chicago to do that.

SHARING OF COSTS

Senator MUNDT. On the question of providing marketing services for livestock, the chairman of the companion committee to this, Senator Russell, of Georgia, of our Agricultural Subcommittee, pretty much insists that the stock industry, or State involved, share in this marketing cost on a 50–50 basis. What is the attitude of the Department of the Interior?

Mr. MCKERNAN. Well, to a considerable degree, the kind of marketing services we are providing for the industry approximate quite closely those of the Agriculture Department at the present time. We have not gone beyond what are being provided in the Department of Agriculture now to a considerable degree.

This market news service is quite old. I think it has been carried on for about 25 years or so, and it in a sense was an attempt to see that the fisherman himself obtained the maximum price for the product when he brought in large quantities of fish. People in such buying places, marketplaces, as Chicago, learned of this and learned of it rapidly, so that they could bid and take advantage of this.

Senator MUNDT. Do the fishermen or the States involved contribute anything to this?

Mr. MCKERNAN. The States involved do contribute statistics very rapidly.

Senator MUNDT. No; I am talking about the cost of publishing and projecting the service.

Mr. MCKERNAN. Well, in a sense what they do is aid in the participation, by participating in the program. But they do not provide direct costs which come to us for expenditures. In other words, they do work with us, the fishing States throughout the United States, in both statistics as well as in market news.

Senator MUNDT. How much does the whole reporting and marketing service cost us annually?

Mr. MCKERNAN. It cost us $519,000 out of this appropriation during 1962.

Senator MUNDT. It would total $569,000 if you get your extra $50,000?

Mr. MCKERNAN. Correct, Senator.

STATISTICS

A small increase for our statistics: We are the depository. We compile the fishery statistics of the United States, much like other Government departments do for other areas of our economy, and in this regard, for example, this year, we are budgeted for $303,536 out of this appropriation. We are asking for a $36,464 increase principally for some automatic data processing equipment to attempt to put these statistics out on a more current basis for use by other Government departments and for other uses generally throughout the United States.

TECHNOLOGICAL RESEARCH

We have asked for a $120,000 increase for research for protein research, for our technological research program. These are more fundamental studies of the makeup of fish proteins, attempting to understand the chemical composition and the features of storage and the problems of denaturation of the proteins themselves.

FOREIGN FISHERIES AND TRADE

We have a Branch of Foreign Fisheries and Trade, where we attempt to keep up on international trade and markets. We have asked for a $20,000 increase in this.

BIOLOGICAL RESEARCH

In the "Research" activity, there is an increase of $937,000 over the amount available in 1962 which includes the nonrecurring item of $1,500,000 in 1962 which was for the emergency salmon research program scheduled to terminate in that year. The 1963 estimate represents an increase of $2,437,000 over the base.

Of the $2,437,000, $1,122,000 is the amount required for the Bureau's participation in the necessary expansion of the biological aspect of the Nation's oceanographic effort.

The remaining $1,315,000 is needed for research not included in the oceanography program but essential within the Bureau's responsibility to meet new situations which have developed in the fisheries. These important items include:

$510,000 for biological research on salmon and related species in Alaska and the Pacific Northwest, as a basis for improved management;

$197,000 for biological investigations in areas off Alaska and the Pacific Northwest that are or may be fished by foreign trawl fleets;

$450,000 for research on salmon and related species on the high seas of the North Pacific Ocean and Bering Sea, to strengthen the United States in negotiation with Japan and the Soviet Union;

$158,000 to gather information on the effects of Russian fishing activities on the fish stocks of Georgia Bank and adjacent waters.

Did the chairman ask for all of our increases, or just those in marketing and technology and research?

Chairman HAYDEN. $1,075,000 in research. This is over dams?

RESEARCH ON FISH MIGRATION OVER DAMS

Mr. MCKERNAN. Over dams. Yes. We have asked for a $1,075,000 increase for research on fish migration over dams. There is a large program of river development in the Columbia River, as this committee well knows.

There is one remaining problem that remains with respect to maintaining fishery runs in view of these dams, and that is the problem at high dams.

Now, we have been successful in the last 15 or 20 years in our research in finding means of successfully passing adult salmon up over relatively low dams, up to about a hundred feet in height, and bringing the young fish back down.

These are salmon, migratory fish, which migrate upstream to spawn and die.

Chairman HAYDEN. I thought you said in your statement—I must have read it inaccurately; I read it rather fast—that you had caught salmon or had tested salmon that could climb a mile high straight up.

Mr. MCKERNAN. That is right. We have them in the laboratory.

Chairman HAYDEN. If they can do it in the laboratory, can't they do it in the stream?

Mr. MCKERNAN. Yes, we think probably they can.

COST OF FISH DAMS

The trouble with high dams: If you go to build a fish ladder to take these fish up 700 feet high, then you run into tremendous cost problems. So what we are trying to do is to find ways to do this in the most economical fashion.

Now, we have not known exactly how much, in the case of stresses and strains, the salmon would take at one time. After all, under natural conditions they pass this height over many, many miles. Now they are being required to do this in the matter of a mile or two.

We have found that the salmon can in fact climb great distances. We are quite certain of this from our laboratory studies. And now we are trying to find the most efficient way, the most economical way, to put them over these high dams.

SNAKE RIVER DAM

There remains a very major problem in the middle Snake River; in Senator Dworshak's area, in fact. And there is quite a controversy as to whether a very high dam on the Snake River system below the mouth of the Salmon should be constructed in that area, or whether it should be constructed above the mouth of the Salmon River. The Salmon River is a tributary of the Snake River, which is a tributary of the Columbia River. And it has the major salmon run in the Columbia River at the present time, in the neighborhood of 240,000 salmon, if my memory serves me correctly.

Some engineers say it would be much more efficient to construct this dam down below the mouth of the Salmon, and flood control and power would be much better developed if this dam were constructed. On the other hand, conservationists and fisheries people feel that it could wipe out this last large tremendously valuable salmon run.

The Secretary of Interior has indicated that he would like to carry on a full program in this area, to see whether or not the salmon can be successfully passed over a 600- or 700-foot dam. And for this reason, we have asked for a rather sizable amount of money in order to carry out this objective.

If it could be done, it might mean the construction of perhaps a more efficient dam; although I am not an expert in these matters. If it is not successful, then it would be perhaps in the public interest to put this dam further upstream, where perhaps some loss in power might occur, and yet you would save these tremendous runs of fish.

In a sense, this is the last difficult problem remaining in fish passage.

PROGRESS ON CRASH PROGRAM

Senator DWORSHAK. Mr. Chairman, could I ask Mr. McKernan at that point: What progress has been made during the past year on that crash program which was started about a year ago? You had over a million dollars, did you not, for this year, on that program?

Mr. MCKERNAN. It was $1,176,732, including $252,732 of SK funds. But we have made some rather substantial progress. We started last spring a little later than this. We have gotten together a staff. We have set up a program and are working actively with State participation in this program at the present time. We have put some sizable test installations in the stream, where we are trying, on a pilot plant basis, some of the research results that have been found in the laboratory, such things as electrical fish guiding, such things as attempting to use the louvers, Senator, that you will remember were successful in certain parts of the Sacramento River. In a sense, we have tooled up during this past year for studies of the large downstream migration this coming spring. This is our major accomplishment during the past year. But I am very much encouraged, very enthusiastic over our progress so far.

Senator DWORSHAK. In your statement you say: "This is one problem we have not"—and the "not" is underlined—"solved, how to pass fish over high dams."

Isn't the real problem getting the small fish back downstream over the dams? Is that not more difficult than going up?

Mr. MCKERNAN. Yes; and I meant to imply both of these problems in my statement, Senator.

COOPERATION WITH IDAHO POWER CO.

Senator DWORSHAK. Can you tell us very briefly what has been accomplished through the cooperative program between three or four Federal agencies, Idaho Fish and Game Department, and Idaho Power Co. in handling salmon through that extensive program of the private power company, for which it is paying at Brownlee and Oxbow Dams?

That is very vital to your overall program is it not?

Mr. MCKERNAN. Yes; it is, Senator. There has been active cooperation, better cooperation in the last year or two, since the Idaho Power Co. hired a scientist to work with the Federal Government and the State governments involved.

We have been trying to find out why the fish which were passed above this Brownlee Dam, the Idaho Power Co. dam, did not successfully spawn and send the young back down the stream.

PROBLEM ATTENDING MIGRATION

We found, for example, in years when we should have had 22 or 23 million downstream migrants coming back down to be collected in the big collection systems that were in effect at that time, we got more like 100,000 or 200,000 young. We have been studying this very actively. There are some very serious complications.

In the first place, the facility that was put in to collect the young fish in the forebay has not collected them. Holes have developed, and they have gone through to be chewed up in the turbines going down through this high dam and are picked up in great quantities by sea gulls down at the base of the dam.

The water temperatures in the forebay of the dam itself have not been conducive to the growth and health of the young fish moving down, and apparently the adults have been damaged in the rather crude methods that are being used to put them above the dam, and many of them have not spawned successfully.

For this reason, we have lost major portions of that run, which formerly was so very valuable to the State of Idaho, to your State, that went up and spawned above there. We believe these can be overcome, but it certainly will take major efforts in this regard. This is what we are doing at the present time.

LOSS IN MIGRATION

Senator DWORSHAK. What percentage of the downstream migration do you think is lost now? That is, what percentage will finally reach the ocean?

Mr. MCKERNAN. Of those just going into this area above Brownlee?

Senator DWORSHAK. Coming down through Brownlee and Oxbow.

Mr. MCKERNAN. Well, at the present time, of the potential egg deposition, from the females that are put up above, we think a way upward of 90 percent are lost before they hit the sea. Above 90 percent.

Senator MUNDT. What would you consider normal?

Mr. MCKERNAN. We would think about 50 percent or something like this would be normal. In fact, the present losses are so exorbitant that if we do not find an answer, we are going to lose this segment of the Columbia River run. Most of us believe that.

Senator DWORSHAK. That is up above the mouth of the Salmon?

Mr. MCKERNAN. Yes, this is at Brownlee about the mouth of the Salmon. This is a relatively small segment of the Columbia River run, and yet a very important one.

The numbers, by the way, are in the general magnitude of 20,000 salmon, whereas the numbers into the Salmon River, which enters the Snake River below this area, are in the neighborhood of 200,000 to 300,000 salmon.

EXPENDITURES OF IDAHO POWER CO.

Senator DWORSHAK. Do you know how much Idaho Power has spent in these various experimental programs so far?

Mr. MCKERNAN. They have spent great sums of money. If my memory serves me correctly, in the general magnitude of $5 million or so.

Senator DWORSHAK. I think it is between $7 and $8 million right now.

Mr. MCKERNAN. Yes. It certainly may well be.

COOPERATION BY THE COMPANY

Senator DWORSHAK. In other words, there is no lack of cooperation on the part of the private power company in cooperating fully with all of the Federal and State agencies in trying to reach some solution. You have had complete cooperation, have you not?

Mr. MCKERNAN. We are having good cooperation now. I would be less than honest if I did not say that we have had some difficulty with this particular company in the past. They have a very excellent scientist working with them now, and it seems to me that they are trying their very best to correct these various problems. I do not think they felt the problems were as serious, during the first stage of this.

Senator DWORSHAK. You think, then, there was not the proper cooperation a year or 2 or 3 ago?

Mr. MCKERNAN. Yes, that is correct. I do not think there was proper cooperation.

Senator DWORSHAK. Do you not think that much of the misunderstanding and the lack of progress stemmed from the fact that the various Federal agencies charged with responsibility had not worked out successful programs, and that everybody faced a serious challenge, and there seemed to be confusion, and not a real lack of cooperation, or an unwillingness to expend money? If they have spent $7 or $8 million, certainly they have had no hesitancy to provide necessary money for the program.

Mr. MCKERNAN. Well, I certainly do not mean any implication, nor do I mean to put special onus on this company. But in answering your previous statement, I attempted to take into account the state of our knowledge at that time, and the problems, and some confusion that did exist. I certainly recognize that. But I believe that I took that into account in my previous statement, Senator.

MIGRATION OVER BROWNLEE DAM

Senator DWORSHAK. How high is Brownlee Dam?

Mr. MCKERNAN. It is about 300 feet.

Senator DWORSHAK. Which is materially higher than the lower Snake River dams?

Mr. MCKERNAN. A much more difficult problem, yes.

Senator DWORSHAK. And without any desire on my part to criticize any of the Federal agencies which have this program under their supervision, is it not a fact that up until the last 2 or 3 years after the construction of Brownlee Dam, there was virtually no information available which would facilitate migration of salmon upstream and the migration downstream of the small fish?

Mr. MCKERNAN. It is certainly true that the knowledge that we had was insufficient to solve this problem at that time.

Senator DWORSHAK. I am glad to have you say that, because I have been up during the congressional recess to visit that area, and while I am not an expert, I am interested, like everybody, in conserving the salmon run, and I have been impressed by the fact that there seems to be a groping around to work out a program.

For instance, your people are supervising this new spawning pond, are they not?

SPAWNING CHANNELS

Mr. McKERNAN. Yes, spawning channels. And there are ponds connected with it, yes.

Senator DWORSHAK. Have those been successful?

Mr. McKERNAN. The experimental results are very promising. Here, again, the quality of the water must be followed very carefully. If you can get proper water quality and temperatures, then it appears to me that these show great promise, Senator.

Senator MUNDT. What is going to happen to those adult salmon? I thought salmon always returned to the place of their birth.

Mr. McKERNAN. They do.

Senator MUNDT. To spawn. How are they going to get back to that spawning point?

Mr. McKERNAN. These ponds are running water, and we would surmise they would come back to the place from whence they were hatched and reared.

Senator MUNDT. Are you going to tag them, or something, so that you can tell?

Mr. McKERNAN. Yes, we do this regularly. In fact, we have developed an electronic tag, and we have been able to follow these fish in our studies at the base of these dams by this electronic tag and watching their progress across the face of dams, trying to see what sort of flow conditions and attraction conditions will more efficiently bring them to the place. It saves water and actually saves money by attempting to know exactly what their habits are, and what does attract them.

PURPOSE OF SPAWNING CHANNELS

Senator DWORSHAK. Do you not think you ought to explain to the subcommittee that in the spawning development you divert the salmon going upstream, so that it is not necessary to raise them over the high Brownlee Dam, and you try to get them to spawn in this spawning pond or these ponds below the dam?

Mr. McKERNAN. Yes, we have carried on some experiments this past year below Brownlee. And here we have been trying to see whether or not we could successfully bring the salmon up and hold them and mature them below and then have them spawn in this artificial spawning area, and then have the young go down. We have not been particularly successful in this experiment.

Senator MUNDT. Maybe you ought to wire it to play "Home Sweet Home," so that the salmon will think he is where he is supposed to be.

Mr. McKERNAN. We do anything to find a solution, Senator.

Senator DWORSHAK. I am surprised Senator Mundt does not inquire why the salmon are not as self-reliant as the catfish in my State.

Mr. McKERNAN. On the evolutionary scale, a catfish is a very special and highly developed kind of fish.

Senator MUNDT. A friend of the common people.

Senator DWORSHAK. The Idaho Fish and Game Department also are cooperating in these special programs?

Mr. McKERNAN. Very special cooperation exists at the present time, sir.

COLUMBIA RIVER CONSTRUCTION

Senator DWORSHAK. And does this $1,635,000 which you are asking for construction and related purposes to carry out the objectives of the Columbia River fisheries program relate in any way to this crash program, or is that a continuation of the original fish sanctuary program which started in 1949?

Mr. MCKERNAN. That is a continuation of the Columbia River fishery development program, where we do have cooperation with the States of Idaho, Washington, and Oregon.

Senator DWORSHAK. I will not take the committee's time, but at this point, will you give us a breakdown on how that money would be spent, with allocations to the various States in the basin and the kind of work, whether fish hatcheries are being built, or channelization, or whatever it is?

Mr. MCKERNAN. To the best of my ability, Senator, yes.

Senator DWORSHAK. Thank you, Mr. Chairman.

(The information referred to follows:)

Columbia River Fishery Development Program

Summary of construction—All agencies

	Total estimated cost	Funds available and required				Expenditures to June 30, 1961	Completion program		
		Available to June 30, 1961	Appropriated, fiscal year 1962	Budget, fiscal year 1963	Additional to complete		Fiscal year 1964	Fiscal year 1965	Fiscal year 1966

RESEARCH ON FISH FLOUR

Chairman HAYDEN. If there are no further questions, I will ask this: Last year, in addition to the requests contained in your budget, Congress provided funds for research on the manufacture and use of fish flour and on the fishery programs for the rice areas. Will you tell the committee what has been done with these funds and how much is needed to continue the program during the coming fiscal year?

Mr. MCKERNAN. In the case of the fish flour or fish protein concentrate studies, we have been evaluating these programs throughout the world. The committee may be aware of the fact that there is a feeling among nutritionists throughout the world that perhaps supplementation of protein from cereals with a very small percent of animal protein concentrate from fish would help alleviate malnutrition in many parts of the world, and in fact in some parts of the United States, if it were possible to use this fish protein concentrate here.

By the way, the proportions or the concentrations that they are thinking about are in the neighborhood of 5 to 10 percent of required total protein intake.

There has been research carried on in various parts of the world in this regard. We have been contributing through the Food and Agricultural Organization of the United Nations to a study of these various manufacturing techniques.

We have obtained the services of a very highly skilled man from the Masachusetts Institute of Technology, who is examining these processes to find out which one would produce the most nutrition material in the very cheapest and most efficient manner.

Right at the present time, of course, there is some question as to what the Food and Drug Administration will allow to go into the processing of fish flour or fish protein concentrate, but we are hopeful that during the next year we can resolve these problems. Perhaps the development of a fish protein concentrate might be a very major factor in providing adequate diet to people of developing countries, and also a very cheap supplement to the diet in some areas of the United States where at least protein malnutrition does occur.

AREAS OF PROTEIN DEFICIENCY

Senator YOUNG. Which areas are these?

Mr. MCKERNAN. Some areas in the Southeastern United States, I am told have problems with animal protein deficiency in the diet.

Senator YOUNG. I did not know we were short of food any place.

Mr. MCKERNAN. In fact, I am told, Senator, that among some transient workers here on the shores of Chesapeake Bay, the children of these particular people are suffering from protein deficiencies.

Senator YOUNG. Could we not get them to eat more high protein North Dakota wheat?

Mr. MCKERNAN. With that North Dakota wheat, if they would put in just a little of this fish concentrate, they would have a completely balanced diet. The sulfur containing amino acids are not present in great quantities in the wheat, even from North Dakota.

Senator MUNDT. They could use South Dakota wheat and no fish; it has everything.

Mr. MCKERNAN. Maybe you could get away with a little less, but you would have to have some fish protein.

RICE FARM FISH

Chairman HAYDEN. How about the rice areas?

Mr. MCKERNAN. In the rice areas, we have been contributing to the development of products as well as markets in this particular area.

Now, as was said earlier, in this particular hearing, by Senator Fulbright, the development of rice culture itself is aided by the use of these rice areas for fish farming, and the common species that are produced on these areas, sometimes catfish, sometimes buffalo fish—appear to have a good potential sale value in the Midwest. There are problems, though, with getting the right size. In other words, apparently a buffalo fish of 3 or 4 pounds sells very well in the market, whereas there is not much of a market for smaller ones.

This is really a cooperative project between our Bureau and the Bureau of Sport Fisheries and Wildlife. They are carrying out a good deal of the culture work. We are carrying out work with respect to the products and attempting to work with the industry in developing markets for this products.

We have been working with some of the cooperatives in the Mississippi River Basin, and working on products, trying to find ways of handling the bone problem in these particular fish. We think we have made good progress in this. We have also been working with some of the major food chains in this area of the country in developing attractive products and products which will help these farmers with their marketing problems.

FUNDS FOR SHRIMP AND CRAB RESEARCH

Chairman HAYDEN. On behalf of Senator Ellender, I want to make this inquiry. Last year Congress approved an item of $175,000 for shrimp research. In addition, a total of $100,000 for research into the development of a mechanical crab picker was approved. As you will recall the original requests were $500,000 for shrimp research and $180,000 for crab-picking research. Are there any items this year which will continue this very important research? If not, would you set forth for the committee the amount of money that could be used for the two programs?

Mr. MCKERNAN. In the case of the blue crab programs, first, you may remember that due to the large amount of hand labor in picking blue crabs from the shells, the industry was in bad shape with the passage of increases in the minimum wage laws. We have been carrying on research, in fact, we have contracted out a part of this research problem. This research is being carried out and is about to be extended, to help the industry modify its practices so that it can continue to exist and provide this very high quality food with a minimum of labor. And I think our program in blue crab is coming along very well in this regard.

SHRIMP SUPPLY

In the case of shrimp, however, because of the increasing problems brought about by the fluctuations, all of the States, the scientists of the gulf, and the industry believe, and our scientists believe, also, that perhaps a program eventually at a higher level than we are now carrying out, is necessary, before we can understand and predict the causes

of these violent fluctuations, and also expand our knowledge of the deeper water species of shrimp.

We know, for example, that at the present time the fishery operates at depths of around 30 or 40 fathoms in the Gulf of Mexico. Yet from our very brief exploration into deeper waters, we know there are some very large quantities of these large shrimp found in deeper waters. But we do not know much about this. We believe that we might be able to help the industry, so that they could expand, if we did. If we could locate these resources, they could actually expand their fishing into deeper waters.

This would require considerable evolution in their gear and boats, but it might mean that this industry would have a much more stable existence than is now possible fishing in the shallow waters on the edge of the shelf.

Chairman HAYDEN. You would need additional funds?

Mr. MCKERNAN. Yes.

Chairman HAYDEN. How much?

AMOUNT NEEDED FOR RESEARCH

Mr. MCKERNAN. About $350,000 for additional biological research, and in the neighborhood of $250,000 for exploratory fishing and gear research has been indicated by my staff.

Chairman HAYDEN. Senator Ellender and Senator Sparkman have also suggested an increase of $350,000 in the budget for increasing gear research and exploration activities in connection with the shrimp industry. What is provided in your budget now, and can you profitably use such a sum in the coming year?

Mr. MCKERNAN. This is the $250,000 I just mentioned, Mr. Chairman. We could explore deeper water areas for other species of shrimp and provide during the present off-season work for the shrimp fisheries, we believe.

RESEARCH PROGRAM IN FOREIGN COUNTRIES

Chairman HAYDEN. Last year $300,000 was appropriated for the research program in foreign countries, where you used foreign currencies derived from the sale of surplus agricultural commodities. This year you are requesting $300,000 again, which is the same amount appropriated last year. The justification will be placed in the record.

Will you need any more than that?

Mr. MCKERNAN. No, Mr. Chairman. We are getting along very well with that.

(The justification follows:)

MANAGEMENT AND INVESTIGATIONS OF RESOURCES (SPECIAL FOREIGN CURRENCY PROGRAM)

The purpose of this program is to complement Bureau research programs for the benefit of the American fishing industry through work performed in foreign countries with surplus foreign currencies. The Agriculture Trade Development and Assistance Act of 1954, as amended, authorizes the use of such foreign currency derived from the sale of surplus agricultural commodities for the conduct and support of scientific research activities and programs between the United States and other countries. The Bureau was not participating in this

program during fiscal year 1961, as enabling legislation was not passed until August 3, 1961. The current year's appropriation of $300,000 was provided for research in Egypt, India, Israel, and Pakistan. Of this sum $125,000 was for technological research and $175,000 for biological research. Preliminary steps have been taken to initiate research grants in these countries through the preparation of letters to each of the embassies describing the proposed Public Law 480 projects. Methods of approach and broad program objectives have been developed for each area of research. Contract and progress reporting forms have been prepared. A delay of several months will be encountered before the grants can actually be made since the approval of each country in which the work is to be conducted must be obtained.

Management and investigations of resources (special foreign currency program)

Appropriation 1961	----------
Appropriation (total amount available) 1962	$300,000
Budget estimate 1963	300,000

Management and investigations of resources (special foreign currency program)

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Marketing and technology	----------	$125,000	$125,000	----------
2. Research	----------	175,000	175,000	----------
Total	----------	300,000	300,000	----------

A tabulation of the programs to be conducted with the foreign currencies, by country, follows. Amounts are shown in their U.S. dollar equivalents.

Country	Marketing and technology	Research	Total
Egypt	----------	$40,000	$40,000
India	$50,000	55,000	105,000
Israel	75,000	40,000	115,000
Pakistan	----------	40,000	40,000
Total	125,000	175,000	300,000

1. Marketing and technology

Technology.—The estimate of $125,000 is the same as for 1962.

Plan of work: This program will be continued at the same level as in fiscal year 1962. Research grants let during that year will be revaluated and renewed as is deemed appropriate during fiscal year 1963. Research will be conducted in India and Israel. The studies in India will deal with the nutritional contributions of fishery products to the well-being of humans and animals. Studies in Israel will deal with the causes and nature of the denaturation of protein in frozen fish during storage.

2. Research

Coastal and offshore research.—The estimate of $175,000 is the same as for 1962.

Plan of work: Biological research studies will be conducted in India, Israel, Pakistan, and Egypt. Two basic research grants will be let in India, one in radiobiology and one in biometrics. Research in Israel will concern behavior and physiology of sardines. Studies in shrimp physiology and culture methods will be conducted in Pakistan. The food chain in fresh water lakes will be studied in Egypt. These projects, which include basic research in difficult or little known fields, will require several years for completion.

Itemization of estimate—Management and investigations of resources (special foreign currency program)

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing: Total obligations		$300,000	$300,000	
Appropriation		300,000	300,000	
Obligations by objects:				
21 Travel and transportation of persons		22,000	22,000	
25 Other services		278,000	278,000	
Total obligations		300,000	300,000	

CONSTRUCTION OF FISHING VESSELS

Chairman HAYDEN. Also there will be included in the record your request for $750,000 for construction of fishing vessels, the same as was provided last fiscal year.

(The justification follows:)

The purpose of this activity is to assist those segments of the fishing industry which have been injured by imports to construct new, modern fishing vessels to assit them in meeting foreign competition. This program began in fiscal year 1961. During that year three applications from eligible fisheries were received. One more was received in the first 5 months of fiscal year 1962. Four additional are in the process of development prior to formal submission. No major deviation from the curent year's program is planned. This is the last year in which applications can be filed as the final date for this action is June 12, 1963, although payments on applications filed prior to that date may be required in the following fiscal year.

Construction of fishing vessels

Appropriation, 1961	
Supplemental appropriation (total amount available), 1961	$750,000
Appropriation (total amount available), 1962	750,000
Budget estimate, 1963	750,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Subsidy payments		$670,000	$670,000	
2. Administrative expenses	$26,218	80,000	80,000	
Unobligated balance lapsing	723,782			
Total	750,000	750,000	750,000	

1. Subsidy payments—The estimate of $670,000 is the same as for 1962

Plan of work.—The fishing vessel construction differential subsidy program provides for the payment of a subsidy by the Department under certain very restrictive conditions to encourage construction of fishing vessels. This payment may be equal to the difference in construction costs of a fishing vessel built in domestic shipyards and one built in a foreign shipyard but with a ceiling of 33⅓ percent of the domestic cost. Among the restrictive conditions is the requirement that the vessel operate in a fishery which is being injured or threatened with injury by reason of increased imports. The act provides that plans must be approved by the Maritime Administrator and the Secretary of Defense

and the construction of the vessel must be under the supervision of the Maritime Administrator. The difference between the domestic and foreign costs must also be determined by the Maritime Administrator.

Itemization of estimate—Construction of fishing vessels

	Actual, 1961	Estimate 1962	Estimate 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$26,218	$750,000	$750,000	
Unobligated balance lapsing	723,782			
Appropriation	750,000	750,000	750,000	
Obligations by objects:				
11 Personnel compensation	2,758	20,000	20,000	
12 Personnel benefits	144	1,000	1,000	
21 Travel and transportation of persons	308	4,000	4,000	
23 Rent, communications, and utilities	387	2,000	2,000	
24 Printing and reproduction	212			
25 Other services		1,000	1,000	
Services of other agencies	22,388	50,000	50,000	
26 Supplies and materials	21	2,000	2,000	
41 Grants, subsidies, and contributions		670,000	670,000	
Total obligations	26,218	750,000	750,000	

CONSTRUCTION FUNDS

Chairman HAYDEN. Your budget estimate for construction is $8,414,000, and I will place the justifications for this request in the record.

(The justification follows:)

Construction

Appropriation 1962	$7,561,000
Unobligated balance from prior years	353,562
Transfer from "Construction general, Corps of Engineers, civil" (unobligated balance)	685,335
Total available for obligation	8,599,897
Decreases:	
Fishery facilities	6,483,562
Columbia River fishery facilities	2,116,335
Subtotal	8,599,897
Increases:	
Fishery facilities	6,779,000
Columbia River fishery facilities	1,635,000
Total available for obligation	8,414,000
Less unobligated balance from prior years	
Budget estimate 1963	8,414,000

Analysis by activities

	Amount available 1962	Fiscal year 1963			Total available 1963 compared with total available 1962
		Unobligated balance from prior year	Budget estimate	Estimated total available	
1. Fishery facilities	[1] $6,483,562		$6,779,000	$6,779,000	+$295,438
2. Columbia River fishery facilities	[2] 2,116,335		1,635,000	1,635,000	−481,335
Total obligations	8,599,897		8,414,000	8,414,000	−185,897

[1] Includes $353,562 unobligated balance from prior years.
[2] Includes $685,335 unobligated balance transferred from Corps of Engineers.

CONSTRUCTION

The $8,414,000 requested for 1963 is to provide $5,301,000 for facilities required for our oceanographic programs, $1,478,000 for facilities urgently needed for our regular research and exploratory fishing and gear programs, and $1,635,000 for construction and related purposes necessary to carry out the objectives of the Columbia River fisheries program.

1. Fishery facilities, $6,779,000

The $6,779,000 is needed for the following:

(*a*) Construction of a research laboratory at Seattle, Wash	$2,257,000
(*b*) Construction of a biological laboratory at Ann Arbor, Mich	1,448,000
(*c*) Construction of a radiobiological laboratory at Beaufort, N.C	394,000
(*d*) Construction of a fishery research vessel as a replacement for the *Black Douglas*	2,500,000
(*e*) Design of a fishery research vessel for use in the North Pacific and Bering Sea	150,000
(*f*) Rehabilitation of the warehouse and dock facilities at the St. Simons Island Lighthouse Station, St. Simons Island, Ga., to serve as a base for the 96-foot MV *Silver Bay*	30,000
Total	6,779,000

(*a*) *Construction of a research laboratory at Seattle, Wash., $2,257,000*

The present Bureau of Commercial Fisheries research laboratory in Seattle was completed and occupied in 1931. It was designed for 30 fishery research biologists and necessary complementing personnel and facilities, required to meet the Government's fishery research obligations at that time. Over the last 30 years, however, problems and research activity have materially increased and the Bureau is faced with a critical need for additional laboratory space and facilities. At the present time there are over 100 people working in this seriously overcrowded building to the point where the efficiency of the work is seriously affected. Valuable data and personnel are subject to serious hazards from such overcrowding including fire and safety.

In fiscal year 1961, $45,000 was received for the design of the laboratory based upon an estimated construction cost of $900,000, excluding shelter facilities, for approximately 25,000 square feet of space. The increase in space requirements and consequent increase in the estimated construction cost of the laboratory represent a proposed structure of masonry construction designed for present research needs, and those of the immediate future.

The laboratory will be the headquarters for oceanographic and biological research on the high seas of the North Pacific Ocean and for the national program for research on fish passage problems and behavior of anadromous species. The tremendous potential of the North Pacific fishery resource only recently has become evident. Japanese and Soviet fleets are tapping this resource now. The Bureau has the responsibility to monitor the status of fish stocks on the high seas contiguous to our shores to provide a basis for possible international negotiation for their conservation. Concerning fish passage and behavior of fish at dams and in reservoirs, the Government has a national responsibility to maintain runs at Federal installations.

The new building will house the Bureau's Seattle Biological Laboratory Marine Mammal Biological Laboratory, Technological Laboratory, and Exploratory Fishing and Gear Research Base. Some of these are now occupying rented space in various parts of Seattle. Including laboratories, offices, conference rooms, library, halls, stairways, storage, etc., approximately 60,000 square feet of floor space would be distributed over three floors and a basement area. Fallout shelter facilities are also included. The present building would continue to house other Bureau programs in the Seattle area such as the regional office, marketing, administration of Pribilof Islands and supporting services.

The site for the proposed laboratory is presently owned by the Fish and Wildlife Service.

(*b*) *Construction of a biological laboratory at Ann Arbor, Mich., $1,448,000*

The present laboratory at Ann Arbor is the headquarters for the entire lamprey control and lake trout rehabilitation program of the Bureau. This is being conducted through an international commitment between the United States and Canada, under the Great Lakes Fishery Commission. The U.S. research program represents an annual expenditure of over $1 million and a staff of 149, of whom 26 are stationed permanently at Ann Arbor.

The present building is an ancient frame residence furnished through the courtesy of the University of Michigan. It does not fulfill the functions of a properly designed and constructed laboratory and office building; overcrowding interferes with work efficiency, valuable data and personnel are subject to serious hazards from fire and other disasters. Lack of suitable laboratory space for biologists and technologists also limits the scope of research. The university has condemned the building and has requested the Bureau to vacate the premises so that it may be torn down. Commercial space is not available in Ann Arbor that would be suitable for biological and chemical laboratories.

The proposed 2-story building of masonry construction would provide office and laboratory space for 65 employees engaged in the following activities: biological research, technology, market development, and exploratory fishing and gear research. Also it will contain suitable space for offices of the Great Lakes Fishery Commission. Space requirements amount to 30,000 square feet of laboratory and office space and 3,000 feet of storage and garage space. Fallout shelter facilities are also included. An estimated $250,000 of the amount requested will be used for office and laboratory equipment. The funds requested will cover costs of design, landscaping, roads, and a parking area. The university has agreed to deed to the Government a suitable site for the new laboratory.

(*c*) *Construction of a radiobiological laboratory, Beaufort, N.C., $394,000*

This laboratory will replace the present overcrowded wooden building which was converted from a terrapin hatchery to a temporary laboratory over 10 years ago. The present structure is located at a lower elevation than the main Beaufort laboratory, and has been flooded many times by hurricanes and coastal storms. Much equipment has been damaged by flooding and fires have been caused by salt left in electrical outlets.

Furthermore, the Bureau's radiobiological program in cooperation with Atomic Energy Commission is expanding as additional fisheries problems are caused by increased peaceful use of nuclear energy. Additional laboratory space as well as outdoor tanks and an adequate sea water system are needed for this program.

The proposed laboratory will be of fireproof masonry construction and will provide approximately 10,000 square feet of floor space. These funds will also provide laboratory and office equipment, sea water system with temperature, salinity and turbidity control, outdoor tanks and pools, fallout shelter facilities, and special provisions required for safe use of radioactive materials. This building will be used by approxmately 25 scientists and supporting personnel.

(*d*) *Construction of a fishery research vessel as a replacement for the "Black Douglas," $2,500,000*

The Bureau is carrying out an intensive program of biological oceanography in the eastern Pacific. This is done in cooperation with several California agencies for the purpose of explaining causes of a drastic decline in Pacific sardine abundance and to estimate the productive potential of other Pacific coast species associated with the sardine. The research vessel *Black Douglas*, a 133-foot converted schooner, is operated by the Bureau in this program. Cooperative cruises are run monthly.

The *Black Douglas* is an old vessel as the original hull was placed in service in 1928. She was converted to a motor vessel by the Navy during World War II. Since then the Bureau has used the vessel in Alaskan and Pacific coast waters.

The *Black Douglas* is now beyond the point of efficient operation, requiring constant repair and overhaul. The vessel has a limited range and because of the design can't be used for many operations necessary in modern oceanography.

It is proposed to construct a new biological and physical oceanographic research vessel which will be fully adequate for use in the present sardine program and for use in any future cooperative work in the national oceanographic program. The vessel will be about 160 to 170 feet in length of approximately 800 tons. It will have a range of 9,000 to 10,000 miles which is necessary for high seas cruises. It will be equipped for fish sampling and fish detection and for fishing on a limited scale. Plankton research, shipboard experimentations, midwater trawling and physical oceanographic research will also be carried out with this vessel. Provision will be made for addition of new instrumentation as it is developed. Space will be available for at least 12 scientists. The crew would vary from 15 to 20 depending upon the type of cruise and work being done.

(*e*) *Design of a fishery research vessel for use in the North Pacific and Bering Sea, $150,000*

The amount requested is to provide for design of a $3 million vessel, projected for construction in the fiscal year 1964.

A modern, all-season, high seas research vessel is essential to the development of programs now in existence and others proposed for the future. Japan and Russia have several vessels of this type, 200 tons or larger, engaged in fishery and oceanographic research in hte North Pacific and Bering Sea. Canada will have one in the near future. We are undertaking experiments on travels and electronic equipment relative to the design of a vessel of this type.

Preliminary experience with chartered vessels has shown that efficiency increases rapidly with vessel size. Not only can the projected vessel work in rough weather when small chartered vessels cannot operate, but work not possible on smaller vessels can be done aboard. Furthermore, the new vessel would be designed specifically for the job it has to do, whereas chartered vessels, designed primarily for fishing, are quite inefficient as floating research laboratories.

Other nations are aggressively expanding their fishing operations in the North Pacific Ocean. A sound background of such facts from research is absolutely necessary in international negotiations.

(*f*) *Rehabilitation of warehouse and dock facilities at the St. Simons Island Lighthouse Station, St. Simons Island, Ga., $30,000*

The sum of $30,000 is required for the rehabilitation of the warehouse and dock facilities at the above-mentioned station in order to provide a suitable base for berthing and servicing the 96-foot exploratory fishing vessel *Silver Bay*. This vessel is utilized in fishery exploration and gear research in the South Atlantic area. The vessel berth and the headquarters of the South Atlantic fishery exploration program are now located in Brunswick, Ga., at an unsatisfactory docking facility where the controlling depth of 15 feet at dead low water, scheduled to be maintained through dredging, has not been accomplished. At present, the controlling depth is only 7½ feet at low tide. The vessel draws 12 feet. The new docking location, consisting of the warehouse buildings and property at the St. Simons Island Lighthouse Station, St. Simons Island, Ga., recently transferred to the Bureau of Commercial Fisheries, is a more adequate facility and should be occupied as soon as possible. Effective operating and program time of the vessel would be increased.

The following tabulation shows the amount appropriated for 1962, the estimate for 1963, and the increase requested for Columbia River fishery facilities and related activities financed from construction funds.

2. Columbia River fishery facilities, $1,635,000

	Appropriation, 1962	Estimate, 1963	Increase (+) or decrease (−)
Hatchery facilities		$82,000	+$82,000
Operational studies	$500,000	510,000	+10,000
Project appraisal	10,000		−10,000
Screening diversions	370,000	210,000	−160,000
Stream improvement	460,000	729,000	+269,000
Program supervision and inspection	91,000	104,000	+13,000
Total	1,431,000	1,635,000	+204,000

It will be noted from the foregoing tabulation that the estimate contemplates a shift in emphasis and that the increases amounting to $374,000 for hatchery facilities, operational studies, stream improvement, and supervision and inspection are partially offset by decreases in other items totaling $170,000. The net increase requested is therefore $204,000.

Need for increase.—The net increase of $204,000 is needed to continue the construction necessary to carry out the objectives of the Columbia River fisheries program and to provide continuation of the construction program in Oregon, Washington, and Idaho of fish ladders at natural barriers to migration of salmon and steelhead; the clearance of obstructions from streams; the provision of a supplemental water supply system at Big Creek Hatchery in Oregon and a permanent rack for trapping salmon at Cascade Hatchery, Oregon; and the continuation of operational studies with increased emphasis on studies relating to improvement of natural habitat for production. Unless funds are provided as requested, the result can only be a further delay in construction of these facilities for which there is urgent need. Development of the tremendous power potential of the Columbia River, as well as the control of floods and the needs for irrigation and navigation, has resulted in a program of construction of major dams. The Columbia River fishery development program must be prosecuted as rapidly as possible to counteract, insofar as possible, the expected damage to the salmon and steelhead resource.

Plan of work.—Under a cooperative arrangement with the five fish and game agencies of the States of Washington, Oregon, and Idaho, the basis of which is the act approved May 11, 1938 (52 Stat. 345) as amended by the act of August 8, 1946 (60 Stat. 932), the Bureau is responsible for the coordination and administration of this program designed to offset the losses to salmon and steelhead resulting from Federal water-use developments in the Columbia Basin. The operational studies are designed to develop improved techniques for both artificial and natural production of anadromous fish. Examination and analysis of ways to alter the environment utilized by salmon and steelhead will be the key to improving the natural habitat for better use by salmonids. Predator control studies will be directed toward a thorough understanding of the predator-prey relationship in order to develop effective methods for the control of predators. The determination of supplemental methods for rearing salmon and steelhead is directed toward more efficient production for less cost. The numerous aspects of these projects will be undertaken on a detailed and specific contract basis with the Bureau by various State agencies of Idaho, Oregon, and Washington. Certain phases will be carried on by personnel of the Bureau.

Surveys of the upper Columbia Basin have been conducted to determine unscreened diversions existing within the watershed as well as needs for fish ladders at barriers to migration. Evaluation of each proposed project is made and a priority for the construction is scheduled. As funds are made available, projects will be constructed according to priority. If barriers are of human origin, legal responsibility under State law must be established before Federal participation is authorized.

Generally, all construction to be accomplished will be under contract to the States of Idaho, Oregon, and Washington.

Itemization of estimate—Construction

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) decrease (−)
Program and financing:				
Total obligations	$3,604,000	$8,599,897	$8,414,000	−$185,897
Comparative transfer from "Construction, general," Corps of Engineers, civil, Department of the Army	−1,312,207			
Unobligated balance brought forward	−245,355	−353,562		+353,562
Unobligated balance carried forward	353,562			
Unobligated balance transferred from "Construction, general," Corps of Engineers, civil, Department of the Army (Public Law 87-122)		−685,335		+685,335
Appropriation	2,400,000	7,561,000	8,414,000	+853,000
Obligations by objects:

32 Lands and structures	115,142	2,594,000	3,689,000	+1,095,000
Total obligations	3,604,000	8,599,897	8,414,000	−185,897

RESEARCH LABORATORY, SEATTLE, WASH.

Chairman HAYDEN. I note that several laboratories and ships are planned. Would you please discuss briefly each of those proposals for the committee?

Mr. MCKERNAN. Yes, Mr. Chairman. We have a research laboratory in Seattle, Wash., where we are planning to carry out and house our staff in connection with the increase in the national oceanographic program, the program that I mentioned previously. At the present time our research facilities in Seattle are terribly crowded, inefficiently so, with people even working in the hallways. This laboratory was constructed in the 1930's, and is in very, very serious need of expansion of facilities.

REPLACEMENT OF "BLACK DOUGLAS"

We have a research vessel to replace an obsolete oceanographic vessel in the southern part of the Pacific coast of the United States. We are now using a converted pleasure boat, and it is entirely inadequate for the purpose for which we are using it. In fact, our entire oceanographic fleet of this country is completely obsolete and needs replacing very rapidly.

We do not have a single fishery oceanographic vessel that is anywhere near as new or efficient as those of any other major nation, including Canada, for example, and we are attempting to replace this fleet in some reasonable fashion, and these vessels that I am talking about in this particular program would tend to improve and bring up to date, modernize, our oceanographic fleet.

Chairman HAYDEN. That would be new construction? Or the modification of existing vessels?

Mr. MCKERNAN. This is new construction for the new research vessel.

RADIOBIOLOGY LABORATORY, BEAUFORT, N.C.

We are doing a great deal of work on radiobiology, Mr. Chairman, in cooperation with the Atomic Energy Commission. We are requesting roughly a $400,000 item for construction of this laboratory in Beaufort, N.C. This, of course, is to study the accumulation and effects of radioactive waste materials in the estuarine waters, how fast they accumulate in fish and shellfish, and whether they possibly might do some damage to people or to the fish themselves.

BIOLOGICAL LABORATORY, ANN ARBOR, MICH.

We have a biological laboratory at Ann Arbor, Mich., requested in this budget, Mr. Chairman, for approximately a million and a half dollars. At the present time our research people who are doing this very wonderful work, this excellent work on the lamprey in the Great Lakes, are working in a condemned house in the University of Michigan campus. This house has been condemned by the university and is going to be torn down, and we simply have no good facilities. We have laboratories in the basement of this old house.

LAMPREY RESEARCH

Chairman HAYDEN. Are you ever going to get rid of that accursed lamprey?

Mr. MCKERNAN. Yes, Mr. Chairman; I am glad to say we are making good progress in that, and we are looking for a major increase in lake trout this year. The sampling of the trout in Lake Superior itself indicates there are fewer lamprey scars and much less evidence of lampreys this winter than there ever has been in recent years.

Senator MUNDT. You might slow down that condemnation at Ann Arbor by suggesting you are going to move the laboratory to East Lansing.

Mr. MCKERNAN. I am sympathetic to the university, Senator, but they have torn down all the other surrounding buildings.

Senator MUNDT. I think if you indicated a desire as to some other campus, their enthusiasm for condemnation would sort of wane.

Mr. MCKERNAN. However, I am extremely enthusiastic to get a good, modern research laboratory and good facilities.

Senator MUNDT. That might be. I am just not impressed by the condemnation threat.

Mr. MCKERNAN. But the facilities are completely inadequate——

Senator MUNDT. Could be.

Mr. MCKERNAN (continuing). And are terribly old and in fact very dangerous. It is a firetrap for very valuable scientific data and a new laboratory there is one of our greatest needs.

Did you want me to talk further on the Columbia River construction, on Columbia River facilities, Mr. Chairman?

Chairman HAYDEN. I think you have fairly well covered that.

GENERAL ADMINISTRATIVE EXPENSES

The justification for the request of $616,000 for "General administrative expenses" will be placed in the record.

(The justification follows:)

BUREAU OF COMMERIAL FISHERIES—GENERAL ADMINISTRATIVE EXPENSES

The purpose of the general administration program financed by this appropriation is to provide the executive direction and the general administrative services required by the operating programs of the Bureau which are financed by annual definite appropriations.

Since the Bureau assumed complete responsibility on July 1, 1959, for its administrative management activities, a vigorous program of financial, personnel, management, and contract improvement has been in effect. In addition to efforts directed toward improving these functions, the expanded biological research, oceanography, technological, and resource development programs have generated a constantly increasing administrative workload.

A new accounting system was installed on July 1, 1960. The system was designed to conform to the standards prescribed by the Comptroller General of the United States and be in accord with the requirements of the Budget and Accounting Procedures Act of 1960, as amended, and Public Law 84-863, while at the same time meet the financial needs of the Bureau. In October 1960, a program planning and control system was placed in effect to provide greater control over the planning and review of operations on Bureau programs, including research programs and projects. The system includes, as integral parts, the formulation and execution of the budget and the new accounting system. Initial benefits from these improved systems are being realized for they have enabled management to beter control and evaluate progress and performance on approved work programs and projects.

In the field of personnel management some progress has been made in analyzing program needs and in the establishment of a system for meeting those needs by the issuance of new personnel procedures, development of active training programs, and the issuance of new classification and qualification standards.

Special attention has been given to the development of management improvement projects by staff and line offices of the Bureau. Title 50, Code of Federal Regulations, has been republished and brought up to date. There has been established a system for the issuance and control of directives and procedures.

The program objectives for the budget year specify greater attention to the management of manpower, financial, and physical resources. Included are the establishment of an internal audit staff to provide a needed independent and objective review of Bureau operations in accounting and financial matters; the acceleration of the financial management improvement program including the preparation for conversion to cost-based budgeting; the emphasis on the long-delayed inspection of field offices; and facilitation of the Bureau's program expansion.

General administrative expenses

Appropriation 1961	$385,000
Comparative transfer from "Operation and maintenance, general," Corps of Engineers, civil	31,900
Comparative transfer from "Construction, general," Corps of Engineers, civil	65,100
Total amount available, 1962	482,000

SUMMARY OF INCREASES, 1963

Departmental expenses:	
To provide for an internal audit unit as required by law and good management practices	+50,000
To provide for more adequate financing in the Office of the Director	+10,000
To provide for more adequate and effective administrative staff work	+10,000
Subtotal	+70,000
Regional office expenses:	
To provide for a more adequate staff for executive direction at the Ann Arbor, Mich. regional office	+25,000
To provide for the purchase of five bookkeeping machines	+39,000
Subtotal	+64,000
Net change, 1963	+134,000
Budget estimate, 1963	616,000

Analysis by activities (total funds)

Activity	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Departmental expenses:				
Direct appropriation	$207,800	$202,000	$272,000	+$70,000
Saltonstall-Kennedy funds	124,200	124,000	124,000	
Great Lakes Fishery Commission (contributed funds)	375			
Reimbursement from the Office of the Commissioner of Fish and Wildlife	8,200	8,200	8,200	
Subtotal	340,575	334,200	404,200	+70,000
2. Regional office expenses:				
Direct appropriation	176,583	280,000	344,000	+64,000
Saltonstall-Kennedy funds	203,655	243,000	243,000	
Great Lakes Fishery Commission (contributed funds)	31,592	35,000	35,000	
Comparative transfer from "Operation and maintenance, general," Corps of Engineers, civil—Army	65,200			
Comparative transfer from "Construction, general," Corps of Engineers, civil—Army	31,900			
Subtotal	508,930	558,000	622,000	+64,000
Total	849,505	892,200	1,026,200	+134,000
Direct appropriation	384,383	482,000	616,000	+134,000
Saltonstall-Kennedy funds	327,855	367,000	367,000	
Contributed funds	31,967	35,000	35,000	
Reimbursements	8,200	8,200	8,200	
Comparative transfers	97,100			

Analysis by activities (annual definite)

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase
1. Departmental expenses	$207,800	$202,000	$272,000	$70,000
2. Regional office expenses	273,683	280,000	344,000	64,000
Unobligated balance lapsing	617			
Total	482,000	482,000	616,000	134,000

The general administrative expenses appropriation has not been increased, except to provide for pay costs provided by law, since the Bureau assumed complete responsibility for its administrative management activities. During this period, however, there has been a considerable expansion of the Bureau's research and development programs, including active participation in the national oceanography program. This has created additional administrative workload including, in addition to increased day-to-day administrative services, such services as analysis of legislative proposals and legislative provisions as they pertain to management of the Bureau and use of funds; recruitment of scientific and supporting personnel, some of which are in critical shortage categories; procurement of specialized scientific equipment and construction of facilities and vessels; execution of contracts and grants with universities and colleges and contracts with commercial firms for research and development; working out changes in integrated programing, budgeting and accounting systems due to the changes in scope of operations brought about by the expanded programs; and the necessity for providing more staff advice to program officials as preventive maintenance to minimize the Bureau's management operational problems. Such accomplishments as have been made have been at the price of the forfeiture of many days of annual leave and the voluntary contribution of considerable overtime by members of the executive direction and administrative staff, both in the Washington office and the regional offices.

The Department committee, which made a study in 1958 of the administrative functions in the Fish and Wildlife Service, provided a balanced organization with a minimum number of positions on the basis of the 1958 workload analysis. The distribution of general administrative expense funds for executive direction and for administrative services provided $721,400 for the Bureau, of which $571,200, or 79.2 percent, was for personal services and $150,200, or 20.8 percent, for other objects of expenditure. The 1962 fiscal year costs of the same positions provided by the 1958 survey will be $764,300 or 89.3 percent, out of currently available funds of $856,200, with $91,900, or 10.7 percent, remaining for other objects of expenditure. In view of this situation, the amount of travel for the administrative staff has been severely restricted and funds available for supplies and equipment very limited. The increase of $134,000 requested for 1963 will provide $80,000 for salaries, $25,000 for major equipment and $29,000 for general operating expenses. The additional $29,000 for general operating expenses would result in a basic staff salaries cost-general expenses ratio of 86.3 to 13.7 for 1963.

An increase in the general administrative expense appropriation for 1963 fiscal year is essential to meet the following needs:

1. Departmental expenses

The estimate of $272,000 represents an increase of $70,000 to provide for an internal audit unit, and additional funds for more effective and efficient executive direction and general administrative services at Bureau headquarters.

Need for increase.—A. *Internal audit unit:* An increase of $50,000 is needed to establish an internal audit unit in the Bureau as required by law and good management practices. A major gap exists in administrative operations of the Bureau by reason of the fact that it lacks the staff and facilities to conduct reviews and audits to assure that the interest of the Government are being protected. *The Bureau of Commercial Fisheries is the only major bureau in the Department that does not have an audit staff*, yet it has programs that by their nature need an independent review as much or more than most other Government operations. Typical of these operations are:

(1) Research performed under contract: Several million dollars are spent annually by the Bureau under contracts with universities and other institutions and organizations having certain specialized competence in the research field.

Most of these contracts are cost-reimbursement-type contracts which provide that the contractor will be reimbursed for all direct and indirect costs. These contracts provide for audit but the Bureau has not been able to perform this function adequately because of the lack of audit personnel. In a recent report by the General Accounting Office on an audit of region 3, Gloucester, Mass., the following comments appeared:

"Our review disclosed that only 3 of the 55 cost-type research contracts, executed since May 5, 1955, and completed prior to June 30, 1960, have been audited. These unaudited contracts amount to more than $600,000 * * *. Members of your staff agreed that the research contracts should be audited but contended that the regional Division of Administration did not have sufficient personnel to perform such audits. In our opinion, it is essential that the regional office have copies of all open contracts for work being performed for the region. *We also believer that a site audit be made for all contracts where the amount is substantial in order to determine that charges made by the contractors on these cost-type contracts are proper.*" [Italic added.]

(2) Fur seal operations: All costs involved in the fur seal operations from the time the furs are harvested on the Pribilof Islands and processed by the fur seal processor to the time of their sale at auction are paid from receipts from the sale of the sealskins. These costs include care and welfare of natives on the islands; construction, rehabilitation, and maintenance of facilities; operation of a supply vessel; and charges incurred by the fur seal processor involving transportation of employees to and from the Pribilof Islands for certain sealing operations of the contractor. Several millions of dollars are involved annually in this operation, but because of lack of auditors it has not been possible to review these operations adequately.

(3) Internal operations of the Bureau: The Bureau expends about $27 million annually in carrying out all operations, with $31.5 million proposed for fiscal year 1963. The overall operations of the Bureau are audited by the General Accounting Office, but that Office looks to the administrative agency to audit its own contracts and to perform internal reviews. This is stated clearly in the GAO Manual for Guidance of Federal Agencies. The administrative agencies also have the responsibility for insuring that all operations are conducted in accordance with law and administrative regulations, that unnecessary duplication or waste is prevented, that financial reporting is accurate and complete, that assets are properly safeguarded, and that fraud or dishonesty are promptly revealed. While a part of these responsibilities can be accomplished by management review and supervision, it is essential that an independent review be made by persons skilled in the procedures for conducting reviews, audits, and appraisals. Internal auditors are best qualified to perform these functions, and both business and Government have accepted such a program as an essential management tool. Congress itself, recognizing the benefits of internal auditing, provided in section 113(a) of the Budget and Accounting Procedures Act of 1950 (31 U.S.C. 66a) that: "The head of each executive agency shall establish and maintain systems of accounting and internal controls * * * *including appropriate internal audit.*" [Italic added.]

Diligent Bureau management requires a determination that all operations are properly conducted. It needs an independent review to assure that operations are in fact being conducted effectively and efficiently.

A minimum audit program is planned. A minimum of three auditors and a clerk-stenographer are required to initiate an effective program.

Experience in Government and industry proves that the benefits gained from an effective internal audit program outweigh the cost of operating the program.

B. Executive direction: An increase of $10,000 is needed to adequately finance the immediate Office of the Director. The expanded biological research, oceanography, and technological programs carried on by the Bureau have greatly increased the demands on the Director for consultation with State officials and cooperating agencies. In addition, the needs of the vital fishing industry require a great amount of travel by the Director and Assistant Director to keep fully abreast of the many problems. Additional funds to cover the travel required of the Director and the Assistant Director and an additional clerk-stenographer are required.

C. General administrative services: A $10,000 increase is needed to provide for more adequate and effective administrative staff work. Effective administration requires that the Washington office staff familiarize themselves with both program and administrative activities being conducted in the field. Field reviews

provide the best opportunity for an evaluation of how the regional administrative staffs are meeting the needs of the offices they serve and the field requirements for instruction and guidance from the headquarters staff. The Washington office administrative staff must be intimately familiar with field programs to perform effectively their function of providing the Director with the best possible staff assistance with regard to administrative matters. The Department requires field reviews and administrative inspections of field offices. It has not been possible for the Bureau to carry out such reviews because of the lack of funds for such purposes. However, we now intend to establish a system of regular cyclical reviews and inspections to meet these requirements. The increase will provide, in addition to the funds required for travel costs, for the unavoidable increase in other general operating costs resulting from the expansion of Bureau operations.

2. Regional office expense

The estimate of $344,000 represents an increase of $64,000 to provide for more adequate and efficient executive direction and general administrative services at the regional and area offices.

Need for increase.—A. Executive direction: An increase of $25,000 is needed to provide for an Assistant Regional Director position and a secretary in the Ann Arbor, Mich., regional office.

At the time the Ann Arbor regional office was established, the staffing pattern did not provide for an Assistant Regional Director. It has since become extremely difficult to provide adequate executive direction for the Great Lakes and Central States programs. It is now essential that we provide an Assistant Regional Director to assist in the overall direction of the regional programs; work with the Great Lakes Fishery Commission; handle contracts with the States, other Federal agencies, and the public; and generally assist the Regional Director in carrying out all other phases of his work. A secretary for the Assistant Regional Director will also be required. The increase is to provide for the salaries, travel costs, and other expenses incident to the two new positions.

B. General administrative services: An increase of $39,000 is needed to provide for the replacement of five decrepit bookkeeping machines. Bookkeeping machines in use average more than 10 years of age. The equipment must be replaced to avoid breakdowns and costly, uneconomical repairs. Lack of dependable bookkeeping machines would require reversion to manual postings.

Plan of work.—The estimate provides for the executive direction at the Washington headquarters and regional offices and the general administrative services (budget, finance, personnel management, property management, and related functions) at the Washington headquarters and the five regional offices. With the increased staffing in internal audit, comprehensive financial reviews are planned. The additional funds will be used to provide more effective and efficient executive direction and general administrative services for the Bureau in facilitation of its expanding programs. The Washington headquarters staff also provides administrative services for the office of the Commissioner of Fish and Wildlife.

The estimate of $616,000 for this appropriation will provide for general administration of the programs financed by the "Management and investigations of resources and construction" appropriations. General administrative services for programs financed by the permanent appropriation "Promote and develop fishery products and research pertaining to American fisheries" and by contributed funds, advances and reimbursements, and transfer funds are financed by assessment against the program funds on the basis of predetermined costs.

A summary table comparing the total 1963 estimate with 1962 is as follows:

General administrative services program

Appropriation	Program, 1962	Estimate, 1963	Increase or decrease
Annual definite general administrative expenses	$482,000	$616,000	+$134,000
Other funds:			
Great Lakes Fishery Commission (contribution for operation of sea lamprey program)	35,000	35,000	
Promote and develop fishery products, etc. (Saltonstall-Kennedy funds)	367,000	367,000	
Reimbursement from office of the Commissioner of Fish and Wildlife	8,200	8,200	
Total	892,200	1,026,200	+134,000

Itemization of estimate—General administrative expenses

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$481,483	$482,000	$616,000	+$134,000
Comparative transfer from "Operation and maintenance, general," Corps of Engineers-Civil, Department of the Army	−65,200			
Comparative transfer from "Construction, general," Corps of Engineers-civil, Department of the Army	−31,900			
Unobligated balance lapsing	617			
Appropriation	385,000	482,000	616,000	+134,000
Obligations by objects:				
11 Personnel compensation	381,329	409,500	484,000	+74,500
12 Personnel benefits	28,305	31,000	36,000	+5,000
21 Travel and transportation of persons	29,449	19,000	39,000	+20,000
22 Transportation of things	929	3,000	3,000

25 Other services	9,435	7,000	8,000	+1,000
26 Supplies and materials	8,358	5,000	6,000	+1,000
31 Equipment	5,859	1,000	28,000	+27,000
Total obligations	481,483	482,000	616,000	+134,000

Internal Audit Unit

Chairman Hayden. You may comment on it if you so desire.

Mr. McKernan. We have not had an essential internal audit unit in our Bureau since its formation through the Fish and Wildlife Act of 1956. We are attempting to provide such a unit on a minimal basis in these rather modest increases. We have had considerable increases in our program due to the national oceanographic program, due to our trade problems, and yet we have had no increase in general administration at all.

What this amounts to is that many of our scientists, many of our program people, are doing administration. I would like to pull the administration out and have it done by people who are more competent in this field, and who are paid for doing administration, rather than having scientists do it.

ADMINISTRATION OF PRIBILOF ISLANDS

Chairman HAYDEN. For the administration of Pribilof Islands, you are asking $1,998,000. Your justifications for this request will be placed in the record.

(The justification follows:)

The U.S. Government protects and manages the fur seal herd of the Pribilof Islands, maintains the Pribilof Islands, Alaska, as a special reservation for this purpose, and is responsible for the harvest, processing, and sale of the sealskins. As operating agency, the Bureau of Commercial Fisheries manages all fur sealing and maintains 2 permanent communities of 600 resident Aleuts on the islands. During the sealing season, employment on the islands reaches several hundred persons, including almost 200 natives, 50 Aleuts, and Eskimos transported from the Aleutian Islands and the Alaska mainland and staff employees. Physical facilities include some 200 U.S.-owned buildings—warehouses, residences, dormitories, commissary buildings, schools, hospitals, powerhouses, a byproduct plant, etc.

The 148-foot supply vessel, *Penguin II*, is operated the year round and an MSTS vessel, obtained by charter from the Navy, has been used for one voyage a year to supply the islands and convey to Seattle fur seal products valued at $5 million or more a year. Since the Navy has advised that it will be unable to provide the MSTS vessel after 1961, the Bureau is negotiating for a larger vessel or supply support through BIA. An airport capable of handling four-engined aircraft is maintained, and a rolling stock of over 50 trucks, cranes, graders, bulldozers, tractors, etc., utilizes over 60 miles of graveled roads.

The Pribilof fur seal herd spends the greater part of each year on the high seas where the animals in earlier years were taken in large numbers by the nationals of other countries. A treaty with Canada, Japan, and the U.S.S.R. commits the United States to a cooperative approach to fur seal research and management problems and a product-sharing system whereby the United States delivers 15 percent of the fur sealskin production each to Canada and Japan.

The Bureau also is responsible for the disposition of the U.S.-owned products of the fur seal industry. Meal and oil have been disposed of to the highest bidder as landed in Seattle, Wash., but the fur sealskins have been finished and dyed and sold by public auction by a private fur processor under contract with the Government.

During fiscal year 1961, over 40,000 sealskins were taken and cured for processing and marketing at St. Louis, Mo. Twenty-five Aleut residents were relocated elsewhere through a cooperative program with BIA to reduce the resident population to that needed in the sealing industry.

During the current year, over 90,000 sealskins were taken. The training of Aleut residents is being undertaken under auspices of our own Bureau to encourage their relocation and to qualify some participants for assignments to key Bureau positions on the islands. The Alaska State Educational Department is operating the school system at the Pribilof Islands under a contract arrangement effective July 1, 1961. Construction of the powerhouse on St. George and the tank farm on St. Paul is scheduled for completion in the current fiscal year.

Fur seal investigations are conducted to achieve maximum sustainable production. In practice this requires knowledge of almost every main aspect of fur seal biology. The program attempts to furnish concurrently the information for management of seals by the United States and for decisions of the North Pacific Fur Seal Commission.

Large-scale tagging of fur seal pups is continuing. Data collections which are needed for studying the population dynamics of the Pribilof seal herd are made from June to September. These include age classification of the males killed, by means of a 10-percent sample of canine teeth, the recovery of tagged male and female seals, bull counts, relative growth determination by weighing pups and tagged males, counts of dead pups, and checking for errors in estimates caused by overlooked tags and possible mortality caused by tagging. Reports

for the use of the Bureau of Commercial Fisheries and the North Pacific Fur Seal Commission are prepared.

Hookworm investigations show that pups are apparently infected through nursing the females and the infection rate is nearly 100 percent. A pelage study to determine fur growth and loss in all months was continued.

One thousand three hundred and fifty-two seals were collected at sea from November 1960 through April 1961. The area of collection extended from northern British Columbia to south-central California. Age analysis of the kill, stomach examinations, and data tabulations for a report on food, distribution, growth, and reproductive condition for the Bureau and Fur Seal Commission have been completed.

Future plans call for continuation of the fur seal industry, rehabilitation of physical structures, training of Aleut residents for key island management positions, and vocational training of Aleuts associated with the relocation program. A new employment and compensation plan is being formulated for possible adoption sometime in calendar year 1962, which will reduce the total Aleut working force to minimum industrial and incidental needs, and place those Aleuts retained in an employment status into classified and wage board positions for the first time.

Increased effort will be placed on studies of the life of fur seals during their first year. This includes pup behavior studies, tagging of yearlings, and pelegic collections.

Administration of Pribilof Islands

Appropriation (total amount available) 1961	$2,099,000
Appropriation (total amount available) 1962	1,981,000

SUMMARY OF INCREASES, 1962

To provide for additional effort and increased general operating costs in connection with the fur seal research program	17,000
Budget estimate 1962	1,998,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase
Administration of Pribilof Islands	$2,072,614	$1,981,000	$1,998,000	$17,000
Unobligated balance lapsing	26,386			
Total	2,099,000	1,981,000	1,998,000	17,000

Administration of Pribilof Islands

The estimate of $1,998,000 represents an increase of $17,000 required for the fur seal research program.

Need for increase.—The additional $17,000 is necessary to provide for increased vessel charter costs, costs of scientific illustrations required for research reports, and for increases in general operating costs.

Plan of work.—Activities concerning the Pribilof Islands will follow the same general lines as in recent years. These include (*a*) management of the Alaska fur seal herd; (*b*) care of the native population of about 600 Aleuts—civic guidance, employment in the fur sealing industry, community services (medical, dental, and educational, and care of the indigents); (*c*) maintenance of buildings, roads, docks, and other facilities on the islands; (*d*) maintenance and operation of a supply vessel; and (*e*) conduct of research studies so as to control and improve the techniques of management of the fur seal herd and the processing of the skins, and to meet the commitments of the U.S. Government under the terms of the Interim Convention on Conservation of the North Pacific Fur Seals. Emphasis will be placed on training of the Aleuts to assume more responsible positions and for relocation to outside areas. Some changes in the supply operation are contemplated as a result of the discontinuance by the Navy of its supply support. In connection with adoption of a new pay plan, careful consideration will be given to overall staffing to minimize labor and salary costs.

Itemization of estimate—Administration of Pribilof Islands

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
PROGRAM AND FINANCING				
Total obligations	$2,072,614	$1,981,000	$1,998,000	+$17,000
Unobligated balance lapsing	26,386			
Appropriation	2,099,000	1,981,000	1,998,000	+17,000
OBLIGATIONS BY OBJECTS

Total obligations	2,072,614	1,981,000	1,998,000	+17,000

NEED FOR NEW VESSEL

Chairman HAYDEN. I note that the vessel which has been provided by the Navy to supply the Pribilof Islands to take the fur seal products out will not be available after 1961, and that the Bureau of Commercial Fisheries is endeavoring to secure a larger vessel or to secure this service through the Bureau of Indian Affairs.

Will you inform the committee of the present status of these negotiations?

Mr. MCKERNAN. Yes. We are really trying to take over or have the use of a vessel that the Bureau of Indian Affairs is discarding at the present time. We are competing with one of our sister Bureaus in the Department for the use of this vessel, the *North Star II*. The Office of Territories also would like to get hold of it. But it would provide us with adequate space so that we could send our supplies up to the Pribilof Islands.

We have some problems here, because there is no harbor on the Pribilof Islands. And so we have to lighter—in other words, put on barges or landing craft—all of our supplies and equipment. Fuel oil as well as food items and items necessary to harvest the fur sealskins in the summertime must be brought to the islands.

For this year, we have been working with the Bureau of Indian Affairs to see if we can charter their new vessel or use the one she is discarding for the new one. We believe that we can work out of this problem, although it was mighty handy to have the use of the Navy vessel for the past many years for this purpose.

POSSIBLE CHARTER OF "NORTH STAR"

Senator MUNDT. You mean there is a possibility you might charter the new *North Star?*

Mr. MCKERNAN. Yes. She may have some cargo capacity that we can use. There is some question about this. And there is especially a question about the time that she could be available.

She in a sense has obligations in the various Indian villages and islands and so forth of Alaska, and we have been negotiating with the Bureau of Indian Affairs to see if we could do it this way. We are trying to do it in the most economical way that we possibly can.

Senator MUNDT. I am a little curious. The *North Star* was a matter of some controversy in the Congress. It looks as though instead of getting any money back for the Treasury from the old *North Star*, it is going to be shifted around from one bureau to another, without any compensation back to the Government. We will be operating a fleet now of two socialized ships up there, instead of one. Do you think that is going to happen?

Mr. MCKERNAN. In our case, Senator, we have been operating a vessel, also, the *Penguin*, a much smaller vessel and inadequate for the total job. And by the way, I am reminded by Mr. Larson that the new ship is the *Emory Victory*. It is the new one to replace the one you spoke about. So the issue is just the same.

Senator MUNDT. A rose by any other name would smell as sweet.

NAVY TO REMOVE VESSEL

Mr. MCKERNAN. I agree. In this case, though, I really do not believe there are going to be additional vessels doing this kind of thing in Alaska. For example, there may be a replacement of one for another, but there will not be an increase in these, because the Navy has been doing this for us, and the Navy is pulling her vessel out.

Senator MUNDT. Why?

Mr. MCKERNAN. Could I supply that for the record, Senator? I should know this, but I do not.

Senator MUNDT. There must be a reason for it.

Mr. MCKERNAN. Yes, there is a reason for it, and we have been negotiating with them for several months, and have not been able to change their mind.

(The information referred to follows:)

STATEMENT ON DISCONTINUANCE OF PRIBILOF ISLANDS SUPPLY SUPPORT BY DEPARTMENT OF NAVY

The termination of supply support by the Navy of the Pribilof Islands is best related in the exchange of letters between the Department of the Navy and the Department of the Interior:

DEPARTMENT OF THE NAVY,
OFFICE OF THE SECRETARY,
Washington, D.C. March 21, 1961

Hon. STEWART L. UDALL,
Secretary of the Interior,
Department of the Interior,
Washington, D.C.

MY DEAR MR. SECRETARY: Since 1927 the U.S. Navy has assisted the Department of the Interior in the annual resupply of the Pribilof Islands. This operation takes place during the summer months for a period of 5 to 8 weeks, contingent upon weather conditions prevailing at the time of resupply. No deep-water dock is available in the islands and, therefore, this operation must be handled by amphibious small scraft. For this purpose the Navy has assigned in recent years, either directly or through the Military Sea Transport Service, an amphibious cargo ship which carries landing craft for the ship-to-beach cargo movement.

Due to budgetary considerations, the U.S. Navy has not been able to replace the World War II amphibious ships with new construction in pace with the number of ships which are being retired due to old age and obsolescence. There

now remain only seven amphibious cargo ships in commission in the Pacific with no outlook of any increase. These remaining ships are committed to the limits of their operational capabilities to sustain our national defense posture.

In order to alleviate this untenable situation for the U.S. Navy, I would propose for your consideration that, effective fiscal year 1962, the U.S. Navy withdraw its support from the Pribilof Islands annual resupply operation. The Military Sea Transport Service is capable of undertaking this operation without direct Navy support by means of a ship loan. It also may be possible for the Department of the Interior to arrange for this resupply by means of commercial charter. Should you be amenable to this proposal, U.S. Navy facilities could be made available for the training of amphibious small craft and hatch crews until a degree of proficiency could be attained in the peculiarities of this operation.

I am appreciative of the fact that this proposal would break with some 34 years of precedent. I am also aware that this proposal involves considerable changes in funding. However, basic naval costs in support of this operation have been estimated as high as $273,000 annually for which, heretofore, only minimal charges have been made. The Navy cannot support the project without severe impact on the amphibious and contingency war readiness of the Pacific Fleet.

Sincerely yours,

KENNETH E. BELIEU,
Assistant Secretary of the Navy (Installations and Logistics).

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D.C., April 7, 1961.

Hon. KENNETH E. BELIEU,
Assistant Secretary of the Navy (Installations and Logistics),
Department of the Navy,
Washington, D.C.

DEAR MR. BELIEU: This is in response to your letter of March 21 in which you propose that commencing in fiscal year 1962 the U.S. Navy withdraw its support from the Pribilof Islands annual resupply operation. As you have pointed out, the U.S. Navy has assisted this Department in the resupply operation each summer since 1927. In recent years, the vessels utilized in this operation have been provided through an arrangement with the Military Sea Transport Service. Native communities numbering some 600 individuals as well as the multi-million-dollar fur-seal industry are dependent on this operation.

We can appreciate your proposal to discontinue this service to us. However, our planning for the coming season, which, of course, has been underway for many months, has been predicated on a continuance of our longstanding arrangement with the U.S. Navy for the resupply operation. To make other arrangements at this late date will place us in a most difficult position. Our budget for fiscal year 1962, which is presently before the Congress, is based on the continuance of this assistance from the U.S. Navy. Among other problems, the present construction program on the Pribilof Islands requires that the U.S. Government, under contract, provide for the delivery of certain tonnages of supplies and materials on a scheduled basis. This schedule contemplates a sizable delivery by the U.S. Navy resupply operation in August 1961.

We are presently studying other arrangements for supplying the islands. In this connection, we appreciate your offer to assist us in the training of amphibious small craft and hatch crews, and we very possibly may wish to request such assistance in the future. However, at this advanced date, we would not be able to initiate major changes in the resupply program prior to the 1961 summer season. We, therefore, would be most hopeful that the U.S. Navy could provide this valuable service to us in the forthcoming summer. If, upon further consideration, it is determined that this can be done, loading in Seattle should begin August 8, with departure for the islands scheduled for August 15. As in other recent years, the Bureau of Commercial Fisheries of this Department is prepared to reimburse the U.S. Navy for this resupply operation.

If it would be helpful to you, we would be happy to arrange for a conference to review this matter further. Because of the critical time element, your prompt consideration of the above will be most appreciated.

Sincerely yours,

JAMES K. CARR,
Acting Secretary of the Interior.

DEPARTMENT OF THE NAVY,
OFFICE OF THE SECRETARY,
Washington, D.C., April 19, 1961.

Hon. JAMES K. CARR,
Acting Secretary of the Interior,
Department of the Interior, Washington, D.C.

DEAR MR. CARR: With reference to your letter of April 7, 1961, concerning naval support requirements for the resupply of the Pribilof Islands, I am appreciative of the difficulties which you would encounter in attempting to make other budgetary reservations for fiscal year 1962 in the event U.S. Navy supply vessels were withdrawn.

I therefore am requesting the Chief of Naval Operations to support the resupply program commencing August 8, 1961, in the manner to which it has been attended in the past.

In accordance with your letter, the Navy would expect the Department of the Interior to make other arrangements for the resupply of the Pribilof Islands commencing with the summer of 1962. Any training assistance which may be found desirable in connection with this turnover may be arranged with naval authorities.

I am most gratified by the consideration you have given this matter.

Sincerely yours,

JAMES H. WAKELIN, Jr.,
Assistant Secretary of the Navy (Research and Development).

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D.C., May 5, 1961.

Hon. JAMES H. WAKELIN, Jr.,
Assistant Secretary of the Navy (Research and Development), Department of the Navy, Washington, D.C.

DEAR MR. WAKELIN: Your letter of April 19 concerning resupply of the Pribilof Islands has been received. We very much appreciate your prompt reply to our letter of April 7 concerning this matter and your offer to support the resupply program commencing August 8, 1961.

The regional office, Bureau of Commercial Fisheries, in Seattle has been instructed to contact the Pacific area office of the Military Sea Transportation Service in San Francisco to arrange for the details of the 1961 resupply operation.

We are very appreciative of the long-term assistance which the Navy has given to us in supplying the Pribilof Islands and particularly the arrangements which have been made for the 1961 operation. We are exploring other possible arrangements for the resupply of our isolated Pribilof Islands stations, commencing with the summer of 1962.

Sincerely yours,

FRANK P. BRIGGS,
Assistant Secretary of the Interior.

COMMENT ON DISPOSAL METHODS

Senator MUNDT. The thing that is always difficult for me to understand: I simply cannot understand the governmental way of doing business. We move along with the old *North Star*, and they put up a plea which I thought was unsound, but I was overruled and outvoted in that, and I believe in majority rule, so that is a dead argument. So you get a new *North Star*. In any other business in the world, you would trade in the old vessel and get some money and pay it back to the treasury. The Government never does that. We pile ship upon ship, service upon service, never thinking that there must be some value received.

We even have a surplus disposal program where we dispose of Government property by a long, tortuous route, just to make as sure

as possible it never gets sold to somebody, so that the money comes back to the Treasury.

That is all right, but if we wreck the economy of the country, we are all in trouble. You do not get your salary. We do not get ours. The country goes broke.

Somehow or other, it seems to me we have to develop a little bit of business principle and economic soundness in these concepts. As I say, you are the lucky recipient of public policy. You buy one ship and get two.

I am not criticizing you. Maybe you have a ship now that you are getting rid of and you are going to hand on to some other Government bureau. You said you have a ship you are getting rid of, the *Penguin*.

Mr. McKernan. If we get rid of this ship, I am quite sure we are going to dispose of it through regular surplus property procedures and possibly sell it, Senator, but I am afraid to say I do not think the Government is going to be much richer. That is, they will not get very much for this.

In defense of the Department's position here, I would like to point out, however, that this is a much better way of doing than getting rid of a ship for a fraction of its real value and then coming before Congress and asking for a brandnew one.

I think the Secretary of Interior is very well aware of the economics of this problem, and he has been making sure that the construction of new ships was not requested while we had one that might fill the bill. And he has very carefully canvassed various departments.

ECONOMY OF TRUST TERRITORIES

Let us take the need for the trust territories, and since I have been negotiating with them with respect to this, I am somewhat familiar with that, although on this matter I do not attempt to speak for the Department. But I know the idea here is to try to make it possible to more quickly develop the economy of the trust territories and try and encourage some industry into the trust territories. Apparently the ship they are using at the present time is completely inadequate for this purpose, and the old *North Star* would be much better.

I think the Secretary's intent, whether it is fulfilled or not, is to try and bring about greater economies, and not have one bureau sell a ship that might be worth $40,000 for $20,000 at public auction and at the same time have another bureau that could possibly use this come before Congress and request funds for maybe $1 million or $2 million.

REMODELING SHIPS

Senator Mundt. Can't you ever modify the inside of a ship? Unless they have all been sunk? There must be some in the mothball fleet. I can remember seeing whole rivers full of ships which have been mothballed, that the Navy owner and nobody wanted.

I am a landlubber. I do not have much salt water in my nostrils. But I would think you could remodel the inside of a ship in some way.

Mr. McKernan. That is correct, and we have been doing this whenever it is possible. In fact, our own Bureau, with respect to carrying

out our obligations in research, has searched and surveyed these particular vessels. And what we have done is project these costs to the best of our ability, to see how we can do it more economically, whether it is more economical to build a new oceanographic vessel or perhaps to alter an existing one. And sometimes we find it is best to construct a new one, but on the other hand, many times we have been modifying them, and we are right at the present time.

FISHERY LOAN FUND

Chairman HAYDEN. For Administrative Expenses, Fisheries Loan Fund, you are requesting $250,000 for the coming fiscal year, the same amount as appropriated last year. This is an expense limitation on which you may have some comment.

The narrative accompanying this request will be placed in the record.

(The justification follows:)

FISHERIES LOAN FUND—ADMINISTRATIVE EXPENSES

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Administrative expenses	216,535	250,000	250,000	
Unobligated balance no longer available	33,465			
Total	250,000	250,000	250,000	

Administrative expense limitation

The estimate of $250,000 is the same as for 1962.

Plan of work.—The administrative requirements for this program will be about the same as in 1962. Functions performed in connection with the administration of the program will include investigating the fishery and financial aspects of loan applications, consideration of applications for approval or disapproval, preparation of authorizations for a loan or letters of decline, preparation of the final loan documents, closing of approved loans, collecting payments and keeping the required records. Up until September 1961, the financial investigation of loans over $10,000, and the closing and servicing of loans were handled by the Small Business Administration. Since that time these functions as well as other functions connected with the loan fund have been handled by the Bureau of Commercial Fisheries with legal matters connected with the closing and servicing of loans being supervised by the Office of the Solicitor of the Department.

Itemization of estimate—Fisheries loan fund administrative expense limitation

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:

Total, Bureau of Commercial Fisheries	131,110	250,000	250,000	

PURCHASE OF PASSENGER VEHICLES

Chairman HAYDEN. There will also be included in the record justification for the Bureau of Sports Fisheries and Wildlife to purchase 103 passenger motor vehicles, 76 for replacement, as well as two additional aircraft. The Bureau of Commercial Fisheries is asking authority to purchase 11 additional passenger carrying vehicles. The justifications for these requests will be placed in the record.

(The justifications follow:)

FISH AND WILDLIFE SERVICE—ADMINISTRATIVE PROVISIONS

BUREAU OF SPORT FISHERIES AND WILDLIFE

Passenger motor vehicles

The estimates of the Bureau of Sport Fisheries and Wildlife for the fiscal year 1963 contemplate the purchase of 133 passenger motor vehicles, 76 of which are for replacement. All of the vehicles to be replaced will meet the age and mileage replacement standards. Many will have run over 100,000 miles in hard service.

The principal use for vehicles is by U.S. game management agents. Police-type passenger motor vehicles are necessary to effectively carry out responsibilities for enforcing fish and game laws, including the Black Bass Act (16 U.S.C. 851–856); the Bald Eagle Act (16 U.S.C. 668–668d); the Lacey Act (16 U.S.C. 701–2); the Migratory Bird Treaty Act (16 U.S.C. 703–711) and the Criminal Code (18 U.S.C. 41–44). Enforcing these laws involves police-type work of patrol and pursuit and apprehension of law violators. Vehicles used by the Bureau for law enforcement average 30,000 miles per year. Much of this mileage is on unimproved roads and over rough and hazardous terrain. Power is needed to travel in snow or on ice and pull out of mud, sand, and deep ruts. Power is needed to get in and out of areas where violations are likely to occur and for pursuit of violators with rapid acceleration and sustained high speeds. The work often involves using the vehicles to haul cargo or boat trailers which can be done efficiently only with vehicles equipped for heavy duty. Sixty-one of the new vehicles will be of police-type, for use by game management agents.

Twenty-six station wagons are included in the estimate, 16 new and 10 for replacement. These will be used principally by biologists, wildlife refuge managers, and predator and rodent control operators for extensive driving, the hauling of personnel, scientific instruments, materials, and field equipment.

General Services Administration standards provide for replacement of passenger motor vehicles every 6 years or 60,000 miles. On an age basis this permits an economical replacement of the entire fleet in 6 years. On a mileage

basis economical replacement is every 2 to 4 years. Replacement of vehicles at the rate authorized for 1961 and 1962 and estimated for 1963, will permit maintenance of the fleet on an economical basis in accordance with replacement standards established by General Services Administration.

Aircraft

Aircraft in Alaska are needed for patrol and transportation of Bureau personnel to areas having no other access. These aircraft are piloted by U.S. game management agents, biologists, refuge managers, predator control operators, and in a few instances by pilot-mechanics. Operations are largely in isolated areas where transportation facilities and roads are inadequate, making it necessary to rely on aircraft and boats. The nature of the work is such that good equipment is necessary in the interest of safety. There are 14 planes in Alaska engaged in sport fish and wildlife program activities.

One additional plane is requested for use at the Clarence Rhode National Wildlife Refuge in Alaska. This refuge, encompassing some 1,870,000 acres of tidal marsh and flat tundra bordering on the Bering Sea, is probably the greatest remaining waterfowl breeding ground on the North American Continent. To effectively patrol and manage an area of this nature the only feasible mode of travel is by airplane.

Aircraft in the contiguous 48 States are used for waterfowl surveys; law enforcement; refuge management, including plant control, seeding of waterfowl feeds, and crop depredation control work; and predator control. One additional aircraft is requested for use in enforcement activities.

No aircraft are used to transport personnel as a primary function.

Aircraft to be purchased:	
Number	2
Gross cost	$36,000
Aircraft to be exchanged:	
Number	-------
Allowance	-------
Net cost	$36,000
Old aircraft still to be used	34

BUREAU OF COMMERCIAL FISHERIES

Passenger motor vehicles

The Bureau requests authority to increase by 11 the total number of passenger-carrying vehicles it now operates. It is proposed to purchase three automobiles and eight station wagons.

Two automobiles are requested for the use of statistical field agents operating out of the Bureau's New Orleans office and the remaining automobile for marketing activities conducted by the new field station at Dumas, Ark.

Eight station wagons are needed for the use of fishery biologists in carrying out research investigations in the Great Lakes area. Station wagons are the most suitable vehicles for transporting the personnel and carrying the equipment and supplies required to carry out these programs.

CLEARING OUT ROUGH FISH

Senator MUNDT. I have one further question.

In any of the operations of the Commercial Fisheries Bureau, Doctor, do you do anything in connection with the only type of commercial fishing that we have out in our area? That is rough fish, cleaning our lakes of rough fish, usually carp. I do not know whether you have any problems or whether you can improve the marketability of carp.

I just wondered whether you had anybody that was working in that area.

Mr. MCKERNAN. Yes, Senator, I am pleased to say that we have a very active program going on in this area. We are aware that many times reservoirs and lakes, as well as such large bodies of water as the Great Lakes, have tremendous quantities of these so-called rough fish, and they are a source of very valuable protein.

USE FOR PET FOOD

We have been working with such people as General Foods, and others, to develop the use of these for pet food, for example, and also for mink food.

Now, there are some problems with this. Some of these fish contain a chemical called thiaminase. That is, it is a chemical which destroys thiamin, vitamin B_1, in its raw state. It does not do that after it is cooked. We have been working with them to develop antithiaminases, and also to work out ways to economically process these so that they can be used for fur farming in the Midwest and also for the enormous pet food industry.

They tell me, Senator, that this is the largest canned food industry in the United States. And meat products are getting scarce, and they are turning more and more to fishery products. The rough fish are ideal for this purpose. And we have an active technological and marketing program going on in the Midwest, and we have a regional office there that takes care of your area, as well as the Mississippi River Basin and Great Lakes area, and we are hopeful to find economic ways of harvesting these, working with our sister Bureau, and then to find markets where they can be used. But there is a great deal of activity right now, and thought, on industry's part, on the construction of pet food manufacturing plants in the Midwest for the use of rough fish species.

Senator MUNDT. Thank you.

WORLD FISHERY COMPETITION

Senator DWORSHAK.. Mr. McKernan, I missed the first part of your statement, but I am interested in what you say that notwithstanding the tremendously increased gain in fisheries throughout the world, the major gains were made not by United States but by Russia, Peru, Japan. What is responsible for that? We are dropping to fifth place in 1961, from third position.

What is responsible? Can you tell us, briefly? Or have you already explained that?

Mr. MCKERNAN. Not in any great detail. No, I have not.

The matter is that both Russia and Japan and Red China have taken a national position that the development of the harvest of the seas should be carried out, and Russia, for example, has set goals of doubling their fish catch in a relatively short time.

This year, for example, Russia took in the neighborhood of 7 billion pounds, as compared with our own 5.3 billion pounds of fish, and she claims by about 1970 she is going to double this again.

That is national policy. She is sending research boats to all oceans of the world, including the South Atlantic and South Pacific. She has research vessels and production vessels in the tropical Atlantic Ocean as well as the tropical Pacific. She is on both our coasts, and she is deliberately going out with the idea of competing actively for the living resources of the sea.

INCREASED OCEAN STUDIES

I think that some of the activities of our Government are very healthy in this regard. Just in the past couple of years, we have launched on a program to increase our studies of the oceans, from the standpoint of defense, but also from the standpoint of competing more successfully in the harvest of these living resources.

I am of the opinion that we must do much more, Senator, in learning about the ocean as an environment for these living resources, and that while we may not wish to subsidize tremendous fleets to go to all oceans of the world, by learning more through research, we can compete successfully in technology and also in research for these resources.

Senator DWORSHAK. Is it possible that the American private fishing industry is handicapped because the expenses are higher than those of other countries with which we compete?

Mr. MCKERNAN. Most certainly.

Senator DWORSHAK. And in your statement you also point out the possibilities that with the development of the Common Market and possible trade development patterns, you say definitely—

> Should across-the-board cut in tariffs become a reality, we will find many sections of our fishing industry in difficulty.

You are forecasting the real problems that will face the industry, and we are already dropping far behind. You really feel that the economic factors are very vital in this competition?

Mr. MCKERNAN. Yes, I do, Senator.

Senator DWORSHAK. Thank you.

Chairman HAYDEN. If there are no further questions, we thank you for your appearance, sir.

BUREAU OF SPORT FISHERIES AND WILDLIFE

STATEMENTS OF DANIEL H. JANZEN, DIRECTOR; ABRAM V. TUNISON, ASSISTANT DIRECTOR; LANSING A. PARKER, ASSISTANT DIRECTOR; RAYMOND E. JOHNSON, CHIEF, DIVISION OF SPORT FISHERIES; NOBLE E. BUELL, CHIEF, DIVISION OF WILDLIFE; JAMES T. McBROOM, CHIEF, DIVISION OF TECHNICAL SERVICES; W. E. CORBIN, CHIEF, DIVISION OF ADMINISTRATION; AND R. E. PODOLAK, CHIEF, BRANCH OF BUDGET AND FINANCE

ESTIMATE AND JUSTIFICATION

Chairman HAYDEN. We will now hear from the Bureau of Sport Fisheries.

There will be placed in the record the justifications for the budget estimate for the year 1963 for "Management and investigations of resources," amounting to $26,572,000, an increase of $3,231,693 over the amount available in fiscal year 1962.

(The justification follows:)

BUREAU OF SPORT FISHERIES AND WILDLIFE—MANAGEMENT AND INVESTIGATIONS OF RESOURCES

The purpose and long-range objectives of the program for management and investigations of resources are the perpetuation, use, and enjoyment by the people of the sport fish and wildlife resources of the Nation. These objectives are attained through production and distribution of hatchery fish; the maintenance of a nationwide system of wildlife refuges; the regulation of migratory bird hunting; and the management of fish and wildlife populations by scientific research and methods, all conducted in cooperation with the States and private organizations.

For 1962, appropriation increases provided for uncontrollable items and expansion in some activities to better meet Bureau responsibilities. The uncontrollable items include shifts in financing to replace supplementary funds no longer available; replacement of over-age and unservicable equipment; a start in eliminating deferred maintenance work on refuges; and increases to cover rising costs of labor, supplies, equipment, and services. Program expansion includes operation and maintenance of new hatcheries, refuge areas, and facilities; increased research effort in most study fields with the addition of new projects for reservoir research and the elimination of undesirable fish in the Southeastern States; establishment of the first cooperative fishing unit at Utah State University under the act of September 2, 1960 (16 U.S.C. 753a–b); and a more adequate Federal contribution to the cooperative predator and rodent control program.

The program for 1963 provides increases for operation of new hatcheries and refuges; improved maintenance of all hatcheries and refuges; strengthening of the migratory bird management and enforcement program by additional staffing; a more adequate program of soil and moisture conservation work in the refuge system; review of applications for drainage assistance which affect waterfowl habitat; and expansion in the research fields of trout liver cancer, Pacific marine sport fisheries, waterfowl data analysis, fish and wildlife pesticide relationships, and studies of bird hazards to aircraft.

There is no substantive language change.

Management and investigations of resources

Appropriation, 1961	$19,308,000
Appropriation, 1962, total	23,315,650
Comparative transfer from: Grain for migratory waterfowl	+35,000
Transfer to: Operating expenses, Public Building Service, General Services Administration	−10,343
Total amount available, 1962	23,340,307

SUMMARY OF INCREASES, 1963

Management of fishery resources:	
To operate new facilities at existing hatcheries and to place new hatcheries into production	+398,500
To provide a more adequate level for the maintenance of physical facilities	+75,000
Fishery research:	
To replace Federal aid reverted funds no longer available	+50,000
To expand research on trout liver cancer	+75,000
To initiate the Pacific marine game fish program	+75,000
To staff and equip new laboratory space for fish-pesticide relationship studies	+55,000
Administration of wildlife resources:	
Wildlife refuges:	
To maintain existing refuges at an adequate level	+600,892
To provide for operation and maintenance of new refuge areas	+250,000
To provide a more adequate base for equipment replacement	+55,000
To provide for costs of employees compensation payments	+10,108
Enforcement and surveys:	
To provide for additional undercover agents and enforcement personnel	+368,000
To provide premium pay for extra duty of enforcement personnel	+150,000
To provide for increased operating costs	+49,000
To provide for costs of surplus grain for starving waterfowl	+5,000
Control of predatory animals and injurious rodents: Adjustment for office space rental costs assumed by General Services Administration	+3,000
Wildlife research:	
To provide for expansion of the waterfowl data analysis program	+85,000
To meet increased costs and expansion of the pesticide-wildlife relationship program	+115,000
To provide for studies of bird hazards to aircraft	+190,000
Soil and moisture conservation: To provide for program expansion	+497,000
River basin studies: To better meet responsibilities for review of applications for drainage assistance affecting waterfowl	+125,193
Net change, 1963	+3,231,693
Budget estimate, 1963	26,572,000

1. Management of fishery resources

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Fish hatcheries	$5,112,634	$5,691,500	$6,165,000	$473,500
(*b*) Enforcement of black-bass law	16,065	16,000	16,000	
Total	5,128,699	5,707,500	6,181,000	473,500

(a) Fish hatcheries

The estimate for this subactivity is $6,165,000 an increase of $473,500 of which $398,500 is needed to operate new facilities at existing hatcheries and to place new hatcheries into partial production; and $75,000 is needed for maintenance of physical facilities.

Need for increase.—(*a*) Operation of new hatcheries and new facilities being constructed at existing hatcheries, $398,500: A construction program is currently authorized which will provide additional facilities in areas where the need for additional fish propagation and stocking of waters is most critical. The $398,500 increase for new hatcheries and new facilities at existing hatcheries is needed for salaries, fish food, and other operational expenses and costs of distributing the increased production of fish. These funds are for use at 19 hatcheries, as shown in the following table:

Operation of new hatcheries and new facilities being constructed at existing hatcheries

Fish hatchery	1962 construction appropriation	1962		1963 increase				When operating at 100 percent capacity	
		Operating costs	Estimated production	Operating costs	Estimated production	Total operating costs	Estimated total production	Operating costs	Estimated production
			Pounds		*Pounds*		*Pounds*		*Pounds*

[1] Construction with funds appropriated prior to 1962.

NOTE.—All cost figures are exclusive of major repairs and equipment.

(*b*) Maintenance of physical facilities, $75,000: A serious backlog of maintenance work accumulated at national fish hatcheries during World War II and the postwar years. Facilities at hatcheries constructed at or before the turn of the century deteriorated extensively and even those hatcheries established in the years immediately prior to 1940 were affected adversely. In 1950, the Congress recognized the need for the establishment of a maintenance program and appropriated $150,000 to initiate it. $135,000 was allowed for this program in each of the following 2 years. There were increases in more recent years until in 1959, $697,350 was appropriated for the maintenance program.

The total cost of annual maintenance necessary for the protection of the Government's investment in fish hatcheries has been determined by an evaluation of physical improvements and the application of percentages obtained from data secured from such agencies as the Housing and Home Finance Agency and the Public Roads Administration. Physical improvements at national fish hatcheries were valued at approximately $45,964,200 in June 1961. By using application percentages for each of the 11 categories listed, a total of $1,511,400 is found to be the annual requirement for a proper maintenance program.

Physical improvement	Value	Maintenance required (percent)	Cost of annual maintenance
Buildings	$19,090,100	2	$381,802
Earthen ponds	7,237,000	5	361,850
Concrete structures	8,809,200	3	264,276
Water supply and drainage lines	6,433,800	3	193,014
Roads and driveways	1,545,400	4	61,816
Bridges	151,500	3	4,545
Fences	149,360	10	14,936
Ditches and canals	1,498,300	10	149,830
Wells	435,050	5	21,753
Traps and racks	486,800	10	48,680
Power and telephone lines	127,700	7	8,939
Total	45,964,210		1,511,441

The increase of $75,000 when added to the $697,350 presently available will provide $772,350 for maintenance and permit a program that more closely approaches the tabulated requirements.

Plan of work.—The $6,165,000 estimate is for salaries and other costs of operation and maintenance of hatcheries and distribution of fish. The Bureau works in cooperation with all States in the distribution of hatchery-reared fish to insure that stocking will conform with State management plans and to avoid duplication of effort.

(*b*) *Enforcement of black bass law*

The estimate of $16,000 is the same as for 1962.

Plan of work.—The estimate of $16,000 will be used for expenses of enforcement of the Black Bass Act of 1926, as amended (16 U.S.C. 851–856) which prohibits interstate traffic in black bass and all other fishes taken contrary to the laws of the State in which taken.

2. Extension and training

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Extension and training	$206,657	$237,000	$237,000	

(*a*) *Extension and training*

The estimate for this activity is $237,000, the same as 1962.

Plan of work.—The $237,000 estimate will be used for salaries and expenses of personnel engaged in providing assistance to cooperating Federal and State agencies in the management of sport fishery resources; in seeking the maximum contribution to sport fishing from the fish produced at the national fish hatcheries; in providing information on sport fishery management in response to

requests from the public; and in the training of fishery biologists for employment in the profession. The estimate is broken down by functions, as follows:

Function:	*Estimate, 1963*
(*a*) Technical assistance in sport fishery management	$187,000
(*b*) Better fishing from hatchery fish	20,000
(*c*) Cooperative fishery units	30,000
Total	237,000

3. Fishery research

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Fishery research	$893,943	$1,449,000	$1,704,000	+$255,000

Fishery research.—The estimate for this activity is $1,704,000 an increase of $255,000 of which $50,000 is needed to replace Federal aid in fish restoration and management reverted funds that will no longer be available due to decreased reversions by the States and $205,000 is for expansion of programs and full-year financing of new studies.

Need for increase.—(1) $50,000 is needed to replace reverted funds under the Federal Aid in Fish Restoration Act which will no longer be available and must be replaced to maintain existing levels of programs.

(2) The items making up the $205,000 increase for expansion and full-year financing of programs are as follows: $75,000 is needed to expand research on cancer in hatchery-reared trout to determine its origin, influence on hatchery production, and prevention or control. $75,000 is needed for Pacific marine game fish research. $55,000 is needed to staff and equip a fish-pecticide research laboratory in new quarters at the Patuxent Wildlife Research Center.

These latter items are explained in greater detail below:

Pathology, $75,000: When trout liver cancer was found to be widely distributed in Federal and other hatcheries throughout the United States, about a year ago, the Bureau diverted its resources, with partial support from the National Cancer Institute, to studies of the disease from several standpoints of cause, effect transmissibility, cell changes, and regression. An increase of $75,000 is needed to explore further possible causes of trout liver cancer. Attempts at isolating the particular agent causing the condition will be expanded to include diet ingredients because research appears to implicate fats. Dietary fats will be broken down into types and fed to trout. As liver cancer develops, hormone and special diet treatments will be used to halt or reverse the condition. Causative agents will be cataloged and eliminated from hatchery diets to prevent the occurrence of this malignant disease.

Public water areas, $75,000: An increase of $75,000 is needed for marine game fish research to commence a program on the Pacific Coast at the recently acquired site in Tiburon, Calif. Activities planned include recruitment of a staff of biologists; partial rehabilitation of buildings for laboratory, office, and library; procurement of instruments and equipment; planning for future research and initiation of research on marine sport fishes.

Environmental influences, $55,000: The new laboratory building at the Patuxent Wildlife Research Center, near Laurel, Md., provides space for both fish and wildlife research on the effects of pesticides on animals. An increase of $55,000 is needed for staff, equipment, and some contract specimen examination to expedite final reports.

4. Administration of wildlife resources

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase
(a) Wildlife refuges	$5,764,675	$7,482,000	$8,398,000	$916,000
(b) Enforcement of Migratory Bird and Lacey Acts	1,919,657	2,400,000	2,972,000	572,000
Total	7,684,332	9,882,000	11,370,000	1,488,000

(a) Wildlife refuges

The estimate of $8,398,000 is an increase of $916,000 consisting of:

(1) $600,892 to maintain existing refuges at a more adequate level.
(2) $250,000 for operation and maintenance of new refuge areas.
(3) $55,000 for equipment replacement.
(4) $10,108 for employees' compensation payments.

Need for increase.—(1) Existing refuges: An increase of $600,892 is needed for additional staff and other costs to permit operation and maintenance of existing refuges at a more adequate level to realize their potential as feeding, resting, and breeding areas for dangerously low populations of migratory waterfowl. The National Wildlife Refuge System consists of 284 areas, totaling approximately 28½ million acres, with a physical plant valued at over $90 million. The increase includes the following:

Forty thousand dollars for increased pumping and water transportation costs at the Sacramento, Colusa, Sutter, Bowdoin, Nine Pipe, Pablo, Kern, Pixley, and Tule Lake Refuges. These refuges alone winter over 4½ million waterfowl and produce tens of thousands of birds. Surface water, and to an increasing degree underground water, in the Western States is generally in very short supply, is under appropriation law, and is mostly controlled by irrigation districts. Successful refuge operations require the development and operation of underground water sources.

One hundred and ninety-five thousand dollars for needed staffing, including 12 maintenancemen, with 1 each at Camas, Minodoka, Ouray, Tewaukon, Gulf Islands, Pea Island, St. Marks, Savannah, Bombay Hook, Killcohook, and 2 at Crab Orchard; 4 clerks with 1 each at Slade, Minneapolis, Big Lake, and Santee; 1 wildlife aid at Holla Hend; 7 assistant refuge managers with 1 each at Crab Orchard, Agassiz, Horicon, DeSoto, Quivira, Buffalo Lakes, and Modoc; 1 administrative assistant at Albuquerque; 2 wildlife management biologists, with 1 each at Boston and South Florida, refuges; and 5 program planners with one each at Portland, Albuquerque, Minneapolis, Atlanta, and Washington, D.C. The full potential and wildlife use of these refuges can better be realized with an expanded staff. The program planners are urgently needed to provide technical assistance in working up master development and management plans required for the major refuges in addition to new refuges being added to the system each year. Of the present 130 major wildlife refuges, master plans have been scheduled for only 23 refuges. Plans are to step up this program to provide for the master planning of at least 12 to 15 refuges each year.

One hundred twenty-five thousand dollars for increases in wages for unclassified personnel. These wages are set by wage board surveys, and have been increasing each year in varying amounts. For example, the hourly rate of a laborer at the Savannah refuge in Georgia which was $1 in 1960 increased to $1.66 in 1961; the hourly rate for maintenancemen at the Blackwater refuge in Maryland this past year increased from $1.96 to $2.32 and at Malheur refuge in Oregon, the rate has increased from $2.13 to $2.37. Increases of this type must be provided for in operation and maintenance funds. With approximately 275 permanent wage rate personnel plus temporary and seasonal employees and an estimated average increase of 7 percent, wage increases in 1963 will amount to a minimum of $125,000.

One hundred forty thousand dollars for fire protection on national wildlife refuges. The refuge system encompasses 13 million acres of grassland, brushland, and timberland in need of continuing protection to prevent or control the spread of wildfires. The Bureau currently has an incidence of 100 wildfires annually which damage an estimated 17,000 acres. This increase will make available $100,000 for fire presuppression work consisting of maintenance of firebreaks,

trails, and planned controlled burning of high hazard areas; and $40,000 for hire of emergency fire labor and supplies.

One hundred thousand eight hundred ninety-two dollars for increased costs of basic materials, supplies, and utilities, resulting from higher price levels and additional quantities needed, and for expanded management work on primary lands and waters within the refuge system, which exceed 6 million acres of cropland, timber, and wetlands. Croplands must be managed to produce in excess of 2 million bushels of grain each year to provide food for migratory waterfowl. The cost of seed, fertilizer, land preparation, and water for irrigation purposes has increased in the last year. Cropland food production is vital to the sustenance of wintering waterfowl during the critical wintering period and necessary to prevent depredations to neighboring private farmland crops. The management of over 1 million acres of woodlands within the refuge system is essential for improved wildlife habitat, watershed protection, and proper utilization of the resource which returns money to the Government and to local communities. An additional 230,000 acres of marsh and water area, so important in the production of aquatic foods for migratory birds, must be placed under improved management in 1963. Management measures must be primarily designed to provide optimum wildlife habitat through water level control, the distribution of water, and the control of pest plants.

(2) New refuges: An increase of $250,000 is needed for operation and maintenance of the following new refuges:

Clarence Rhode, Alaska, $103,000: The Clarence Rhode National Wildlife Range will be staffed and activated this year. Located on the vast delta area of the Kuskokwim-Yukon complex, this area is the most important waterfowl producing area of the National Wildlife Refuge System. Management of the area is complicated by problems of isolation, communication, transportation, and especially relations with the natives. The Alaskan natives in this area represent some of the most primitive people in North America. Dealing with this ethnic group and securing their cooperation in the conservation of waterfowl, is a great challenge. To accomplish this, a staff of three permanent positions, and $77,100 for equipment and operating expenses are needed.

Waterfowl production areas, North and South Dakota and Minnesota, $70,000: Management of additional Dakota waterfowl production areas is a 1963 objective. In order to carry out basic land-use planning, management, and other work to achieve conditions most productive to waterfowl and best economic uses of the areas, a staff of four permanent positions, $46,000 for posting the areas and funds for equipment and operating expenses are needed. This estimate is broken down by State as follows: North Dakota, $17,000; South Dakota, $33,000; and Minnesota, $20,000.

Ottawa, Ohio, $77,000: This new area is the only national wildlife refuge in Ohio. It is a strategically situated waterfowl area, on Lake Erie, of importance to migratory bird movements both in the Atlantic and Mississippi flyways. Management of this area in 1963 will consist of production of agricultural crops and the impounding and regulation of waters. The estimate covers a staff of five permanent positions, pumping costs, and $48,000 for equipment and operating expenses.

(3) Equipment replacement: An increase of $55,000 is needed for equipment replacements. This increase will provide a total of $305,000 for this purpose and prevent a further buildup in the backlog of overage equipment. Items to be replaced have been kept in service considerably beyond recommended useful life periods and this has resulted in excessive maintenance costs and safety hazards.

(4) Employees' compensation payments, $10,108: Section 209 of the act of September 13, 1960 (5 U.S.C. 785) requires annual reimbursement to the employees' compensation fund for payments on account of the injury or death of employees occurring after December 1, 1960. The act provides that such costs be included in budget estimates for the next year after being reported by the Secretary of Labor. The costs chargeable to the Bureau for employees' compensation payments during December 1, 1960, to June 30, 1961, amount to $10,108.

Field reports of work injuries for the calendar year 1960 indicate a disabling injury frequency rate for the Bureau of 11.2. This is 3.2 disabling injuries per million man-hours of work lower than the 5-year average of 13.4. Of the total work injuries reported for this period, 40 percent involve wildlife refuges, 22 percent fish hatcheries, 17 percent predator and rodent control operations, and 21 percent all other operations. Principal causes were handling materials and objects—23 percent and falls—18 percent. There were three job-incurred fatali-

ties—two drownings, and one incident to aircraft operations. Three heart fatalities were referred to the Bureau of Employees' Compensation for adjudication.

The Bureau is vigorously conducting a safety program with a disabling work injury frequency goal of 5.0 or less per million man-hours of work.

Plan of work.—The $8,398,000 estimate is for salaries and other refuge operating and maintenance costs in carrying out the wildlife and resource management program of the national wildlife refuge system. Significant to this year's plan of work are the following factors:

1. Management of wildlife refuges will stress timber, grassland, cropland, and water management. Funds will be earmarked for the prevention, presuppression, and suppression of fires on lands of the refuge system.
2. Existing facilities will be maintained at a more adequate level.
3. Emphasis will be placed on long-range master planning for refuge areas to increase their wildlife capacities.

(*b*) *Enforcement of Migratory Bird and Lacey Acts.*—The estimate of $2,972,000 is an increase of $572,000 for the following:

	Enforcement	Surveys	Total
Additional staffing	$328,000	$40,000	$368,000
Premium pay	150,000		150,000
Operating costs	49,000		49,000
Surplus grain	5,000		5,000
Total	532,000	40,000	572,000

Need for increase.—The increase of $572,000 is needed for the following purposes:

(*a*) *Enforcement—Additional staffing, $328,000*

This increase is needed for salaries, equipment, and other costs of additional enforcement personnel. The staff will be increased by 17 game management agents and 3 undercover investigators who will be assigned to locations throughout the United States that are now seriously in need of greater protection for migratory game birds. The illegal activities of an increasing number of hunters throughout the United States have overtaxed the ability of the State game departments to provide equal and adequate protection to resident game species and migratory birds alike. The Federal Government must therefore assume a greater share of the burden of protecting migratory species than ever before. The present staff of U.S. game management agents is insufficient to fill the gap or meet the Government's treaty commitments and must be expanded. In addition to an increase in the number of agents for conventional enforcement activities, additional staff will be needed for a stepped-up undercover program which will be strengthened by three more investigators. The need for undercover investigations has become more and more evident as this program has progressed. Substantative evidence gleaned by the present staff of investigators, game management agents, and other reliable sources indicates that illegal practices such as sale of birds, night hunting, baiting, and commercialization in game and fish are being carried on in many areas of the United States. Additional undercover investigators are required to stamp out these unlawful activities. The undercover staff functions as an adjunct to the regular enforcement body. The present staff of five investigators will serve as a nucleus for an expanded program which will permit broader distribution of the undercover effort.

Clerical assistance will be provided to some of the game management agents whose offices are located in the more heavily populated areas where proper office facilities are essential to the program. Nine clerks are included in the increase for this purpose.

One technical assistant and one clerk are needed to handle the workload resulting from the September 2, 1960, amendment of the Lacey Act which clarifies and broadens certain provisions of the Criminal Code relating to importation or shipment of injurious mammals, birds, amphibians, fish, and reptiles (18 U.S.C. 42(a), 42(b)) and the transportation or receipt of wild mammals or birds taken in violation of State, National, or foreign laws (18 U.S.C. 43).

Premium pay, $150,000: Premium pay for employees engaged in certain types of work is recognized by the act of September 1, 1954 (5 U.S.C. 926) which

specifically provides that any officer or employee in a position in which the hours of duty cannot be controlled administratively, and in which substantial amounts of irregular, unscheduled, overtime duty including duty at night and on holidays are required, may receive premium compensation for such duty on an annual basis. The estimate includes funds to pay 156 game management agents not to exceed 15 percent of the minimum of grade GS-9 salary, or $965 each as compensation for overtime in accordance with this act and regulations issued thereunder. All legal and regulatory criteria necessary to qualify for premium pay under the act are met in the case of these agents and equity, good personnel management, and high morale require such compensation.

Operating costs, $49,000: This increase is needed to provide for increased costs resulting from higher price levels of basic operating essentials, such as, travel, supplies, materials, and equipment. While the primary function of game management agents is enforcement of the Migratory Bird Treaty Act and other Federal statutes concerned with wildlife conservation, they also engage in such closely associated management activities as the conduct of population surveys in the winter, breeding pair and production surveys in the spring and summer, kill surveys during the hunting season, banding projects during the summer, early fall, and winter, waterfowl depredations control work, and dissemination of information about hunting regulations and other phases of wildlife conservation. Ability of the enforcement staff to give full attention to all of these important responsibilities is vital to the effectiveness of the entire program of game management. An expansion of these activities results in a corresponding increase in travel costs. The expanded undercover program will require additional funds for payments for information or evidence concerning law violations. The success of the undercover program depends entirely on the approach to the market hunter and the transactions involved in obtaining evidence are costly.

Surplus grain, $5,000: An increase of $5,000 is needed for surplus grain for distribution to starving migratory water fowl during adverse weather conditions, under the provisions of section 2 of the act of August 17, 1961, Public Law 87-152. This amount is in addition to $35,000 presently available for surplus grain that is used in controlling migratory waterfowl depredations under the act of July 3, 1956 (7 U.S.C. 442-446). The grain is obtained from the Commodity Credit Corporation which is reimbursed by the Bureau for such grain. The increase will make a total of $40,000 available for these purposes.

(b) Migratory game bird surveys, $40,000

An increase of $40,000 is needed for costs, including part-time clerical assistance, of two additional pilot-biologists who will serve as permanent observers and relief pilots for survey crews operating within and outside the United States. They will assist in the breeding ground surveys, migration (periodic) surveys, wintering ground surveys, and special surveys. They also will conduct special banding operations and habitat utilization surveys and hunter bag checks. The gathering, evaluation, and application of data acquired under the surveys program are basic to establishment of the annual migratory bird hunting regulations. A variety of extensive and intensive aerial and ground surveys are conducted throughout the United States, Canada, Mexico, and the West Indies for the purpose of obtaining statistical information about migratory waterfowl. This is a cooperative program engaged in by the Federal, State, and foreign governments, Ducks Unlimited, and the Wildlife Management Institute. It is no longer possible to rely on outside assistance for dependable observers on the aerial surveys. Continuity of personnel is an absolute necessity to obtaining useful data from the survey operations.

Plan of work.—This activity covers (1) the administration and enforcement of the Migratory Bird Treaty Act, as amended (16 U.S.C. 703–711) and regulations promulgated thereunder to give effect to the treaties with Great Britain and Mexico for the protection of migratory birds; the Lacey Act (16 U.S.C. 701–702) regulating interstate and foreign commerce in birds and furs; and other Federal statutes enacted for the protection, conservation, and management of certain wildlife resources in the United States, the Virgin Islands, and Puerto Rico; (2) the gathering, evaluation, and application of data affecting the preservation and utilization of migratory game birds; and (3) providing farmers with assistance in curbing and reducing damages caused by migratory waterfowl. The estimate is broken down by functions as follows:

Function	Estimate, 1962	Estimate, 1963	Increase
Enforcement and depredations control	$1,971,000	$2,503,000	$532,000
Surveys	429,000	469,000	40,000
Total	2,400,000	2,972,000	572,000

5. Control of predatory animals and injurious rodents

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase
Control of predatory animals and injurious rodents	$2,131,298	$2,503,000	$2,506,000	$3,000

The estimate for this activity is $2,506,000, an increase of $3,000, resulting from assumption by General Services Administration of certain rental costs.

The increase of $3,000 results from a reduction in the 1962 estimate by an appropriation transfer to General Services Administration for office space rentals, which were assumed by General Services Administration and will not be paid by the Bureau in 1963.

Plan of work.—The $2,506,000 estimate will be used to meet the Bureau's share of costs of its partnership with 129 individual farmers and foresters, 117 associations of farmers and foresters, 33 towns and cities, 421 counties, and 79 State agencis in 37 States in the program. All Federal land-management agencies are likewise included in this nationwide teamwork to decrease damage caused by wildlife. Non-Federal contributions are estimated at $3,700,000 in 1963.

In this united effort the Bureau provides professional supervision which assures coordination of projects, conformance to technical standards, demonstration of tested methods, and distribution of technical information. Research to assure efficacy, suitability, and safety of techniques is also provided by the Bureau under the wildlife research activities. Included in the control program is alleviation of economic damage by wildlife, as well as reduction of wildlife transmission of disease, such as rabies.

The distribution of the estimate, by predator and rodent control districts, is as follows:

State	Estimate, 1962	Increase	Estimate, 1963	State, private and other cooperative funds	Total program, 1963
Pacific region (1):					
California	$204,000	$1,000	$205,000	$585,000	$790,000
Idaho	144,000		144,000	160,000	304,000
Montana	122,000	1,000	123,000	218,000	341,000
Nevada	153,000		153,000	225,000	378,000
Oregon	126,000		126,000	250,000	376,000
Washington	77,000		77,000	48,000	125,000
Pocatello supply depot				40,000	40,000
Regional office (Portland)	41,000		41,000		41,000
Southwest region (2):					
Arizona	104,000		104,000	160,000	264,000
Colorado	144,000		144,000	265,000	409,000
New Mexico	153,000		153,000	145,000	298,000
Oklahoma-Kansas	99,000		99,000	73,000	172,000
Texas	192,000	1,000	193,000	710,000	903,000
Utah	130,000		130,000	160,000	290,000

Northeast region (5): Connecticut-Delaware-Maine-Massachusetts-New Hampshire, New Jersey-New York-Pennsylvania-Rhode Island-Vermont	84,000		84,000	60,000	144,000
Alaska region (6): Alaska	49,000		49,000	10,000	59,000
Central office: Washington, D.C.	118,000		118,000		118,000
Total	2,503,000	3,000	2,506,000	3,700,000	6,206,000

It is nearly half a century since the cooperative predator and rodent control program began in 1915. Today, many of the types of damage caused by wildlife have been reduced to a level tolerable to the affected people and industries. Principal exceptions are rodent and rabbit damage to reforestation projects and growing trees (foresters estimate wildlife damage now exceeds fire losses); damage by rodents, chiefly pocket gophers, to western rangelands; miscellaneous damage by nonnative animals (nutria) and birds (starlings); and the hazards from rabies transmitted by wildlife. Reduction of these four types of damage is underway and is expected to reach the level of tolerability attained in other phases of the work as rapidly as new techniques are developed.

6. Wildlife research

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Waterfowl management	$322,726	$439,000	$524,000	$85,000
(b) Other migratory bird research	258,953	314,000	314,000	
(c) Upland wildlife	155,104	199,000	199,000	
(d) Pesticide-wildlife relationships	365,620	423,000	538,000	115,000
(e) Diseases, parasites	145,762	167,000	167,000	
(f) Control methods	356,355	393,000	583,000	190,000
(g) Classification, distribution, and life history	144,554	144,000	144,000	
(h) Cooperative wildlife research units	182,978	221,000	221,000	
Total	1,932,052	2,300,000	2,690,000	390,000

(a) Waterfowl management

The estimate for this subactivity is $524,000, an increase of $85,000 which is needed for waterfowl data analysis work.

Need for increase.—The increase of $85,000 is needed for waterfowl data analysis projects. Following the fire which occurred in the birdbanding center on June 13, 1959, it was impossible to analyze waterfowl band recovery data which had been accumulated under the cooperative waterfowl banding programs sponsored jointly by the Bureau, the four flyway councils, the individual State and Provincial game departments, and the Canadian Wildlife Service. Detailed reports on 11 species of waterfowl important in the hunting kill are urgently needed. The fire-damaged records have been restored to usable condition and the work should be undertaken without delay.

Plan of work.—The estimate of $524,000 will be used for waterfowl research work and the annual production and hunter success surveys. Research will be continued on means of creating waterfowl habitat in idle or waste areas and reclaiming low-quality habitat through noxious weed control, water level manipulations, and related practices. Habitat requirements, ecological relationships, migratory habits, and annual productivity of species important in the hunting kill will be studied. Data analysis based on banding records and studies of the effects of hunting regulations on kill levels will be vigorously pursued Information resulting from these projects has immediate applicability in the Bureau's waterfowl management program.

(b) Other migratory bird research

The estimate of $314,000 for this subactivity is the same as 1962.

Plan of work.—The estimate of $314,000 will be used for research work on cranes, pigeons, doves, woodcock, jacksnipes, rails, and nongame migratory species, and for continued operation of the Records Center. Mourning dove research will be carried out in accordance with the comprehensive plan developed cooperatively with participating States and the International Association of Game, Fish, and Conservation Commissioners, but at a level less than recommended in the plan. Attention, will be devoted to the development of population. production, and harvest measurement techniques, and the analysis of banding records. Woodcock and snipe inventories will be performed and summarized for application in hunting season determinations. Studies of whooping cranes and sandhill cranes will be continued as scheduled. The status and seasonal movements of nongame migratory birds will be analyzed through the cooperative census and banding programs.

(c) Upland wildlife

The estimate of $199,000 for this subactivity is the same as 1962.

Plan of work.—The estimate of $199,000 will be used fof research work and for preparation and publication of Wildlife Review, a literature reference and abstracting publication for wildlife biologists. Studies of the response of farm game populations to soil conservation practices will be continued. Research on biological characteristics, inventory techniques, habitat requirements, ecological relationships and the influence of forest and range management practices on wildlife will be pursued in accordance with established plans.

(d) Pesticide-wildlife relationships

The estimate for this subactivity is $538,000, an increase of $115,000 which is needed for increased costs and expansion of research work.

Need for increase.—Of the $115,000 increase $100,000 is needed for minimum staffing, specialized equipment, and operating costs of the biochemical section of the new laboratory at Patuxent Wildlife Research Center which will be ready for occupancy in 1963. Three chemists and one biological aid will be added to carry out residue analyses and perform basic toxicological tests in connection with the pesticide-wildlife research program. Up to now, neither the laboratory facilities nor the technical staff have been adequate to service the research studies at a level needed to insure prompt completion of projects and reporting of results. The increased funds will enable elimination of this bottleneck. The $15,000 is needed for additional costs of service, materials and supplies, equipment, and within-grade increases in maintaining current field and pen experiments at an efficient operating level.

Plan of work.—The estimate of $538,000 will be used for research work and for related laboratory services. Acute and chronic toxicity determinations will be made of 20 to 30 commercial pesticidal chemicals by means of feeding tests and controlled plot studies employing pheasants, quail, mallards, Canada geese, mule deer, and other species. Areas treated operationally or experimentally in pest control programs will be studied for effects of chemical pesticides on wildlife populations and their food organisms. Methods, materials, timing, and dosage rates will be correlated with wildlife responses to assist in the development of pest control techniques which will provide maximum possible safety for the wildlife resource.

(e) Diseases and parasites

The estimate of $167,000 for this subactivity is the same as 1962.

Plan of work.—The estimate of $167,000 will be used for research work and for associated laboratory services. The purpose of this program is to determine the nature and significance of disease factors in wildlife and to evolve feasible control methods. Work in progress in botulism, aspergillosis, trichomoniasis, fowl pox, and multiple infections resulting in food impactions will be continued in accordance with established plans. Studies of the role of birds in the transmission of equine encephalitis will be expanded as will studies relative to the actual or potential role of disease in controlling nuisance species of birds such as starlings and blackbirds. The new laboratory facilities will make possible the furtherance of research on diseases and parasites of migratory birds and enable the Bureau to provide some diagnostic services to cooperating agencies.

(f) Control methods

The estimate for this subactivity is $583,000, an increase of $190,000 which is needed for research on bird hazards to aircraft.

Need for increase.—The $190,000 increase is needed to continue, at above the current level, studies of bird hazards to aircraft which were initiated in 1961 on an emergency basis and financed by the Federal Aviation Agency in 1961 and 1962.

Plan of work.—The estimate of $583,000 will be used for research work and laboratory services for the control of nuisance and destructive birds and mammals. Studies will be continued on the biological peculiarities and behavior patterns of blackbirds, grackles, gulls, and starlings as a basis for selective control procedures; on the origination, testing, and refinement of mechanical, electronic, and chemical bird repellants; and on direct and indirect population reduction techniques. In the birdwork, stress will be placed on the solution of agricultural damage problems and on the elimination of bird hazards to aircraft. Mammal control methods research will include studies of methods of forecasting changes in rodent and carnivore populations, the effects of predator control on the distribution and numbers of rodents, the development of new coyote control techniques, and the screening and field testing of chemicals for toxic and repellent properties. In chemical development work, stress will continue to be placed on materials useful in the reduction of damage on forested lands.

(g) Classification, distribution, and life history

The estimate of $144,000 for this subactivity is the same as 1962.

Plan of work.—The estimate of $144,000 will be used for research work, identification services involving birds and mammals, maintenance of scientific specimen collections at the U.S. National Museum, and coordination of nationwide bat-banding activities of interest to public health and other agencies. Taxo-

nomic and distribution studies of birds and mammals of importance to Bureau operations will be carried out in accordance with scheduled plans. Preparation of the manuscript on the avifauna on the northern Rocky Mountains will be initiated. Marine mammal research will continue to place emphasis on the walrus and sea otter populations.

(h) Cooperative wildlife research units

The estimate of $221,000 for this subactivity is the same as 1962.

Plan of work.—The cooperative wildlife research units are sponsored jointly by the Bureau of Sport Fisheries and Wildlife, the Wildlife Management Institute, and the land-grant colleges and conservation departments of 17 States. They are maintained for the purpose of providing research findings and trained personnel which are essential to the wise use and efficient management of the Nation's fish and wildlife resources. The units also serve as conservation education and liaison centers which bring closer cooperation and mutual benefits to the Federal, State, and private conservation agencies.

The estimate of $221,000 will be used for salaries and expenses of unit leaders and vehicle replacements. The following shows the distribution of the estimate by units:

Field station:	*Estimate, 1963*	Field station—Continued	*Estimate, 1963*
Auburn, Ala	$11,100	Missoula, Mont	$11,500
College, Alaska	18,900	Ithaca, N.Y	12,200
Tuscon, Ariz	11,600	Columbus, Ohio	11,100
Fort Collins, Colo	12,200	Stillwater, Okla	11,300
Moscow, Idaho	12,000	University Park, Pa	11,600
Ames, Iowa	11,800	Logan, Utah	11,600
Lafayette, La	11,200	Blacksburg, Va	11,100
Orono, Maine	11,600	Central office headquarters	17,000
Amherst, Mass	11,600		
Columbia, Mo	11,600	Total	221,000

7. Soil and moisture conservation

Activity	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase
Soil and moisture conservation	$205,233	$208,000	$705,000	$497,000

The estimate for this activity is $705,000, an increase of $497,000 which is needed for the following:

Land use planning	$29,000
Soil stabilization and improvement	261,000
Water management	157,000
Project operations and maintenance	50,000
Total	497,000

Need for increase.—This increase will permit the following soil and moisture conservation work on lands of the national wildlife refuge system.

1. Land use planning, consisting of soil capability studies and conservation planning in cooperation with the Soil Conservation Service of the Department of Agriculture, local soil conservation districts and other agencies will be increased from an annual accomplishment rate of 0.5 to 2.6 percent of the total work to be done.

2. The execution of soil stabilizing and improvement practices will be increased from a current annual rate of 0.5 to 1.5 percent of the total work to be done.

3. The carrying out of water conserving and management measures will be increased from a current annual rate of 0.4 to 1.5 percent of the total work to be done.

4. The development of the total soil and moisture conservation program on wildlife refuge areas will be increased from an annual rate of accomplishment of 0.4 to 1.4 percent of the total work to be done which will be a step closer to a goal of 3 percent during the period 1964–69.

Plan of work.—The estimate of $705,000 will be used for priority soil and moisture conservation work on 89 refuges of the national wildlife refuge system in 41 States, an increase of 42 areas and 10 States over the 1962 level. Basic soil and water conservation on these areas is necessary for the protection and rehabilitation of the land and water resources. Conservation measures are needed to provide improved soil stabilization, soil fertility, and water control for increased productivity and better utilization of the areas by waterfowl, other wildlife, and man.

The estimate is distributed as follows:

Land use planning	$35,000
Soil stabilization and improvement	388,000
Water management	211,000
Project operations and maintenance	71,000
Total	705,000

The 1963 program will be carried out without any increase in permanent personnel and will utilize existing equipment and temporary local labor. The following tabulation shows the distribution of the estimate by States and refuge:

State	Refuge	Estimate, 1963	State	Refuge	Estimate, 1963
Alabama	Wheeler	$13,000	North Dakota	Long Lake	$8,000
Alaska	Kenai	10,000		Lostwood	5,000
Arizona	Cabeza Prieta	3,000		Lower Souris	6,000
	Kofa	8,000		Tewaukon	20,000
Arkansas	Holla Bend	9,000		Upper Souris	5,000
California	Merced	6,000		Waterfowl production areas.	5,000
	Modoc	5,000	Oklahoma	Salt Plains	3,000
	Sacramento	12,000		Tishomingo	5,000
California-Oregon	Klamath Basin	14,000		Wichita Mountains	3,000
Colorado	Monte Vista	8,000	Oregon	Cold Springs-McKay	4,000
Delaware	Bombay Hook	6,000		Malheur	10,000
Georgia	Savannah	5,000	Pennsylvania	Erie	4,000
Idaho	Camas	3,000	South Carolina	Carolina Sandhills	8,000
	Deer Flat	3,000		Santee	9,000
Illinois	Crab Orchard	20,000	South Dakota	Lacreek	9,000
	Mark Twain	4,000		Sand Lake	10,000
Iowa	Union Slough	5,000		Waubay	2,000
Kansas	Kirwin	5,000		Waterfowl production areas.	5,000
	Quivira	5,000	Tennessee	Tennessee	13,000
Kentucky	Kentucky Woodlands	12,000	Texas	Aransas	6,000
Louisiana	Lacassine	2,000		Buffalo Lakes	2,000
Maine	Moosehorn	7,500		Hagerman	6,000
Maryland	Blackwater	5,000		Laguna Atascosa	9,000
Michigan	Seney	12,000		Muleshoe	2,000
	Shiawassee	12,000	Utah	Bear River	2,000
Minnesota	Agassiz	20,000		Fish Springs	5,000
	Rice Lake	10,000	Vermont	Missisquoi	5,000
	Tamarac	13,000	Virginia	Presquile	2,000
	Upper Mississippi	4,000	Washington	Columbia	4,000
Mississippi	Noxubee	9,000		McNary	14,000
	Yazoo	9,000		Turnbull	8,000
Missouri	Mingo	10,000		Willapa	4,000
	Squaw Creek	4,000	Wisconsin	Horicon	10,000
	Swan Lake	8,000		Necedah	8,000
Montana	Benton Lake	5,000	Wyoming	Hutton Lake and Pathfinder.	10,000
	Bowdoin	2,000		National Elk	12,000
	Fort Peck	8,000	Regional offices:		
	Medicine Lake	4,000	Region 1, Portland, Oreg.		3,000
	National Bison Range	4,000	Region 2, Albuquerque, N. Mex.		3,000
	Red Rock Lakes	11,000	Region 3, Minneapolis, Minn.		3,000
Nebraska	Crescent Lake	14,000	Region 4, Atlanta, Ga.		10,000
	Fort Niobrara	20,000			
Nevada	Desert Game Range	4,000			
	Ruby Lake	12,000			
	Stillwater	16,000			
Nevada-Oregon	Sheldon-Hart Mountain.	21,000			
New Jersey	Brigantine	4,000			
New Mexico	Bitter Lake	6,000			
	Bosque del Apache	8,000			
New York	Montezuma	6,000			
	Oak Orchard	7,500			
North Carolina	Mattamuskeet	2,000			
North Dakota	Arrowwood	4,000			
	Des Lacs	3,000	Total		705,000

8. River basin studies

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
River basin studies	$1,049,525	$1,053,807	$1,179,000	+$125,193

River basin studies: The estimate of $1,179,000 is an increase of $125,193 which is needed for an expansion of the wetlands preservation program to permit investigation of a greater number of applications for agricultural drainage in the waterfowl-producing States of North Dakota, South Dakota, and Minnesota.

Need for increase.—The increase of $125,193 is needed to carry out more effectively Bureau responsibilities under an agreement of May 2, 1960, with the Agricultural Conservation Program Service and the Soil Conservation Service of the Department of Agriculture. For many years, this Bureau has advocated a reduction in agricultural drainage which has been eliminating valuable waterfowl production habitat in the waterfowl-producing States of North Dakota, South Dakota, and Minnesota, which provide about 42 percent of the total waterfowl production in the contiguous United States. After studying the conflict between the agricultural drainage program and the waterfowl conservation program, the Bureau of the Budget recommended in 1957 that this Bureau and interested agencies of the Department of Agriculture solve this problem through their joint administrative efforts. In 1959 the House Committee on Appropriations expressed its desire that waterfowl values be given full consideration under agricultural programs. The agreement of May 2, 1960, resulted from these events and its full implementation during 1963 is expected to result in the saving of a substantial amount of valuable waterfowl habitat.

Plan of work.—Under authority of the Fish and Wildlife Coordination Act (16 U.S.C. 661 et seq.), the Bureau studies water-use projects of Federal agencies and other agencies under Federal license or permit throughout the United States to determine their effects on sport fish, commercial fish, and wildlife resources, and recommends measures needed for the protection and improvement of these resources. Investigations by this Bureau are conducted in close cooperation with the Bureau of Commercial Fisheries and with the State fish and game agencies concerned. The magnitude of the river basin studies program is not controlled by this Bureau but depends entirely upon the size of the water-use programs of other Federal and private agencies which have been increasing substantially each year. It can be expected that more and larger Federal projects will be included in these programs in 1963 than in 1962. This will have an ever-increasing impact on fish and wildlife resources. In 1963 the various phases of the river basin studies activity will be continued as follows:

Wetlands preservation program: The increase in this program for 1963 will permit the Bureau in cooperation with the Agricultural Stabilization and Conservation Service of the Department of Agriculture to investigate all agricultural drainage applications requesting Federal financial assistance in 89 critical, waterfowl-producing counties in North Dakota, South Dakota, and Minnesota. The ASC county committees will be advised as to the effect each drainage proposal will have on wildlife resources so that this may be considered in deciding whether to approve the applications. Funds available to date have permitted annual screening of about 500 applications in 11 of the 89 critical counties. The increase of $125,193 will provide a total of $180,500 for this work in 1963 and will permit the screening of the entire 2,000 applications anticipated from all 89 counties. The successful accomplishment of this work is essential to provide protection for waterfowl in the three-State area until such time as adequate wetland areas can be acquired through lease or purchase. The wetlands preservation program in other parts of the Nation will be conducted at the same level as 1962. Vigorous and appropriate steps will continue to be taken to maintain privately owned wetlands as continued habitat for future wildlife populations. Proposals affecting wetlands will be studied, and, when considered harmful, appropriate corrective action will be recommended to Federal, State, and other conservation organizations. Liaison is carried out with appropriate agencies and organizations to keep them advised as to wetlands threatened with destruction and wetlands offering opportunities for preservation and development as wildlife habitat.

80391—62——31

Surveys of water-use projects: This phase of the program will be continued at the same level as 1962. Investigations will be conducted of Bureau of Reclamation projects, Corps of Engineers projects, hydroelectric project subject to Federal Power Commission license or permit; small reclamation projects; private dredging, filling, and other projects subject to Corps of Engineers navigation permits; and projects subject to Forest Service and Bureau of Land Management permits. Inventory type, basinwide surveys will also be conducted in several river basins being considered for early development. Studies of Corps of Engineers and Bureau of Reclamation projects under this activity are of a reconnaissance nature and will be used in determining the extent to which further detailed studies will be required.

Small watershed program: Work under this program will be conducted at the same level as 1962. Detailed studies will be conducted on projects proposed under the Watershed Protection and Flood Prevention Act (16 U.S.C. 1008) administered by the Department of Agriculture. Section 12 of that act specifically assigns to the Secretary of the Interior responsibility for investigation of the fish and wildlife aspects of these projects and for assistance in planning federally cost-shared fish and wildlife developments. This program provides an excellent opportunity for State fish and game departments to obtain needed fish and wildlife developments at a reasonable cost. Interest among State fish and game departments and among local projects sponsor groups in this program is increasing rapidly.

Urban planning assistance program: This program will be continued at the same level as 1962. Close cooperation will be maintained with State and municipal governments in planning fish and wildlife areas for urban and rural development programs. Such cooperation by this Bureau has been urged by the Federal Housing and Home Finance Agencies at both the Washington and regional levels. Section 701 of the Housing Act of 1954 (40 U.S.C. 461) authorized the urban renewal program of the Housing and Home Finance Agencies to administer Federal grants to State planning agencies for use in planning for development of urban and rural areas. This act was amended September 23, 1959, to provide broader authority for participation in the program by State planning agencies and increase the Federal grants and aid available to such agencies. Through close coordination with State and private planners, local residents, and governments, fish and wildlife planning is effectively introduced into county zoning plans, and areas are thereby set aside for future fish and wildlife benefits. Similar areas are set aside by municipal governments in the development of plans for expanded urban areas.

Followup program: This phase of the activity will be conducted at the same level as 1962. Information will continue to be obtained on completed projects for use in analyzing more effectively future water resource projects. Projects previously studied by the Bureau will be examined to determine whether or not recommendations were adopted and to evaluate the biological soundness and results of the conservation measures incorporated in these projects.

The 1963 estimate is broken down by areas as follows:

Region 1 (Pacific)	$177,000
Region 2 (Southwest)	209,000
Region 3 (North Central)	261,000
Region 4 (Southeast)	155,000
Region 5 (Northeast)	129,000
Region 6 (Alaska)	76,000
Washington office	172,000
Total	1,179,000

Detailed studies of projects being planned and constructed by Corps of Engineers and Bureau of Reclamation and also reconnaissance surveys in the Missouri River Basin will be financed by funds included in the public works appropriation estimates.

Itemization of estimate—Management and investigations of resources

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$19,231,739	$23,340,307	$26,572,000	+$3,231,693
Unobligated balance lapsing	76,261			
Comparative transfer from other accounts		−35,000		+35,000
Transfer to "Operating Expenses, Public Building Service," General Services Administration (75 Stat. 353)		+10,343		−10,343
Appropriation	19,308,000	23,315,650	26,572,000	+3,256,350
Obligations by objects:				
11 Personnel compensation	$12,757,838	$14,579,000	$16,000,000	+$1,421,000
12 Personnel benefits	1,015,817	1,136,000	1,210,000	+74,000
21 Travel and transportation of persons	913,461	1,163,000	1,340,000	+177,000

Deduct quarters and subsistence charges	211,150	197,000	208,000	+11,000
Total obligations	19,231,739	23,340,307	26,572,000	+3,231,693

PREPARED STATEMENT

Chairman HAYDEN. We will be pleased to hear from you.

Mr. JANZEN. Mr. Chairman, I have a statement. I believe in the interest of saving time I will place it in the record and very briefly summarize it.

Chairman HAYDEN. A very good idea.

(The statement referred to follows:)

STATEMENT OF DANIEL H. JANZEN, DIRECTOR, BUREAU OF SPORT FISHERIES AND WILDLIFE

Mr. Chairman and members of the committee, I welcome this opportunity to discuss some of the more important accomplishments of the Bureau of Sport Fisheries and Wildlife during the past year and tell you some of the problems which confront us.

We cannot overlook the fact brought out by the 1960 National Survey of Fishing and Hunting that 50 million of the 130 million people in this Nation over 12 years old went fishing, hunting, or both in 1960. This is nearly two out of every five persons in this group. These fishermen and hunters spent $3.9 billions for the sport of fishing and hunting. This in itself contributed much to the national economy. Because of the continued and rising demand for more recreation, a well organized effort must be made now to preserve and furnish additional recreational opportunities and facilities. One incongruous feature of this modern world is that many of the factors which strengthen our economy threaten our natural resources. For example, urbanization, industrialization, and agriculture expansion through drainage of wetlands is threatening the continued existence of the waterfowl resource as we know it. Copies of the 1960 Fishing and Hunting Survey have been furnished all Members of Congress.

A big step forward in the preservation of migratory waterfowl was achieved with the enactment in the 1st session of the 87th Congress of Public Law 87–383 which authorizes the appropriation within the next 7 years of $105 million for wetlands which will be repaid in subsequent years from revenues from the sale of migratory bird hunting stamps. As you know receipts from the sale of migratory bird hunting stamps in excess of Post Office Department expenses are earmarked for costs of location and acquisition of migratory bird refuges and waterfowl production areas. With the rapid economic growth of the country and the expanding human population, wetlands have been converted to other uses faster than duck stamp revenues could save them as needed to preserve waterfowl. This situation has become more acute by reductions in duck stamp revenues over the past several years. Severe drought conditions in the duck breeding areas have necessitated more restrictive regulations for protection of the remaining waterfowl. This in turn has had an adverse effect on the number of hunters purchasing duck stamps. Recent reports from the Post Office Department covering receipts through January 6, 1962, indicate a 22-percent decrease over the same period in fiscal year 1961 or an estimated reduction of over a million dollars in fiscal year 1962. With the enactment of Public Law 87–383 it is hoped that this trend can be arrested. To this end $7 million is being requested under the "Migratory bird conservation account" in fiscal year 1963.

An additional $1,389,500 is being requested in the "Management and investigations of resources" appropriation for initiation of operations at new refuges and hatcheries and operation and maintenance at more adequate levels at existing facilities. Of this total, $473,500 is for hatcheries and $916,000 is for refuges.

A $645,000 increase is for expansion of research in the fields of pesticide-wildlife relationships, trout cancer, marine sport fisheries, waterfowl data analysis and bird hazards to aircraft. Studies of bird hazards to aircraft were initiated in 1961 on an emergency basis and continued in 1962 with funds provided by the Federal Aviation Agency. The Federal Aviation Agency cannot provide this support in 1963 and $190,000 is included in the above-mentioned increase to carry on this important work.

For the third consecutive year, drought conditions have caused an overall reduction in the waterfowl population in the Mississippi flyway. Certain steps must be taken to offset this situation. The accelerated wetlands acquisition program will provide more adequate nesting areas. The program of reviewing applications for assistance in drainage in the critical waterfowl producing areas will be made more effective by the requested increase of $125,193.

Moreover, with a reduced waterfowl population the illegal take of waterfowl poses an ever-increasing problem The enforcement of Federal game laws is being strengthened by an increase of $572,000 for expansion of the game agent force and additional operating expenses.

The habitat on a number of our wildlife refuges has been greatly improved through the use of good soil and moisture practices. In order to extend this needed work to other refuges, we are requesting an increase of $497,000 for the soil and moisture conservation program.

The overall increase for "Management and investigations of resources" is $3,231,693 for a total of $26,572,000. Intensive research, planning, and management are the keynotes to preservation of our remaining fish and wildlife resources. I feel this year's request is a good effort in this direction.

The "Construction" estimate is a decrease of $1,171,500 from the previous year for a total of $4,086,000. It provides $654,000 for continued construction of 5 new hatcheries and improvement of another; $325,000 for continuation of construction of 2 fishery research laboratories and planning for a new fish-pesticide relationships laboratory; $2,928,000 for development of 18 refuges; and $179,000 for wildlife research facilities including a start on the Northern Great Plains Wildlife Research Station.

With the demands on the Bureau of Sport Fisheries and Wildlife for a more effective program, the efficiency of internal operations will to a material extent aid in accomplishing these goals. The estimate for the "General administrative expenses" appropriation is $1,331,000 or an increase of $260,000 for executive direction and administrative services needed for taking on the additional workload and better servicing the expanding operating program. This increase includes $42,000 for the establishment of civil service examining boards which is essential to recruit positions unique to the Bureau and provide a source of fully qualified candidates to carry on the expanded program.

This concludes my statement. My staff and I are ready to answer any questions you may have concerning the estimates.

GENERAL STATEMENT

Mr. JANZEN. I have with me Mr. Parker, Assistant Director, on this side, and Mr. Tunison, the second one down, and any other witnesses we will call by name so that the recorder can get their names.

I would like to call to the attention of this committee that since our last meeting a year ago there has been completed a national recreation survey for the year 1960, in which it was found that 30 million people in the United States over 12 years of age went fishing, hunting, or both. This is about two out of every five persons.

INCREASED HUNTING AND FISHING DEMAND

This greatly increased demand for hunting and fishing, contrasting with the greater pressures on fish and wildlife habitat because of urbanization, industrialization, and agricultural expansion, is probably the reason for our problems and why we are here asking for some increased appropriations to carry out some of our programs.

Copies of this report have gone to every Member of Congress.

WETLANDS RESERVATION PROGRAM

Congress last year recognized one of these serious problems in authorizing $105 million for a 7-year wetlands preservation program. This program is designed to purchase and preserve wetlands in the waterfowl production areas of the North, the migration areas through the central part of the country, and the wintering areas in the South.

The problem has become very acute. Wetlands are being lost at a so much faster rate than we are able to purchase with the duck stamp funds now available to us that we feel that except for this loan program we probably would have gotten so far behind that we would not be able to assure the preservation of this resource.

DROUGHT CONDITIONS

The severe drought conditions have complicated the problem—fewer ducks, tighter regulations, less duck stamp receipts—so that, for example, this year even at the present time our funds are at a level where we will have to stop taking any further options except those that can be accepted after July 1.

I will run over these other items very hurriedly.

OPERATION OF NEW HATCHERIES AND REFUGES

We are requesting $473,500 for operating new hatcheries and $916,000 for new refuges and for maintaining some of our present areas at more adequate levels.

We feel that an increased research program is our only answer to solving some of our problems. We are asking for a $645,000 increase for research in the fields of pesticide-wildlife relationships, a very important problem, trout cancer, marine sport fisheries, better ways of

managing our waterfowl, and trying to minimize the hazards to aircraft from birds.

The $190,000 item for this last-mentioned program is not an increase in program. Two years ago when the Federal Aviation Agency made available to us $200,000, for carrying on this work, it was agreed that in this year we would place this in our own budget.

FEDERAL DRAINAGE PROJECT INSPECTION

We are asking for $125,000 to employ a few more men so that we can do a better job of inspecting federally assisted drainage projects in the various sections of the waterfowl production areas of our country. We are able to cover only a part of this area, and believe that more complete coverage should be done.

EXPANSION OF ENFORCEMENT

We are asking for a little additional money in the expansion of our enforcement organization. We are very much concerned about the commercialization of waterfowl, about which we have learned a great deal more through our undercover operations.

Senator MUNDT. In what areas of the country does that take place?

Mr. JANZEN. Unfortunately, as a result of our studies it appears it is going on pretty well from coast to coast and through the Middle West.

I might say that I was regional director for 10 years in the Middle West, and I did not appreciate what was going on until we put on our undercover operators. Even some of our agents did not appreciate what was going on. We think we are having a very heavy loss to commercialization.

IMPROVED SOIL AND MOISTURE PROGRAM

We are asking for an increase of $497,000 in improved soil and moisture program. We feel that certainly on our federally owned lands we should do a fair job of soil conservation and water conservation.

TOTAL MANAGEMENT AND INVESTIGATIONS REQUESTS

The total increase for management and investigations is $3,231,693, for a total of $26,572,000.

CONSTRUCTION PROGRAM

We are asking for $4,086,000 for construction work this year, which is a decrease of a little over a million from the previous year. It provides for continued construction of 5 hatcheries, $654,000; $325,000 for continuation of construction of 2 fishery research laboratories and planning for a new fish-pesticide relationship laboratory; $2,928,000 for development of 18 refuges, and $179,000 for wildlife research facilities, including a start on the Northern Great Plains Wildlife Research Station.

FUNDS FOR RESEARCH LABORATORY

Senator YOUNG. Could I ask a question at this point?

With respect to that laboratory, how much money do you have in the budget?

Mr. PARKER. This year we have $50,000 for a planning item. In 1963 there is $139,000 for the substation that would be located at Woodworth, N. Dak.

Senator YOUNG. There is a great amount of interest in this research laboratory. I think it would go a long way toward resolving some of these difficult problems we have regarding the destruction of crops by ducks.

Do you need more money than you have requested to get this project going?

Mr. PARKER. It will cost more money than that, Senator. With the $50,000, we made a study of the three-State area, North and South Dakota and Minnesota, attempting to locate a site that would adequately do the job.

We were not able to find a site near any town of any size to make a combination laboratory and field study location; so that we have selected one of the areas that we already own near Woodworth for the field station. And we have now narrowed down the possibilities for the central laboratory to two sites near Jamestown, N. Dak. We are currently investigating the water supply to determine if it will be adequate.

We will need additional funds for the central laboratory. The $139,000 just covers the portion that would be located at Woodworth.

Senator YOUNG. You really should have more money than this to get this project going?

Mr. PARKER. Very definitely.

Senator YOUNG. How much more?

Mr. PARKER. To complete the job, we estimate it would cost $505,000 for the central laboratory. The buildings and the ponds and the fencing, plus the lands.

Senator YOUNG. Mr. Chairman, could I ask one more question while I am at it?

Is this a total cost, or an additional amount?

Mr. PARKER. This is the additional amount that would be needed for the central laboratory. The funds that are in the 1963 budget are $139,000 for the substation, and we would need $505,000 additional for the central station.

Senator YOUNG. What are those sums, again?

Mr. PARKER. $139,000 plus $505,000, or a total of $644,000.

Senator YOUNG. This is pretty close to the original estimate?

Mr. PARKER. Yes.

GARRISON RESERVOIR HATCHERY

Senator YOUNG. How much money do you have in the budget for the fish hatchery at Garrison Reservoir, near Garrison Dam?

Mr. TUNISON. We have $124,000 in our budget. At our hearing last year I mentioned to you that we thought that amount of money would complete the hatchery. We have run into some difficulty, and unfortunately we will not be able to complete the hatchery with the $124,000.

Senator YOUNG. How much would you need to complete it?

Mr. TUNISON. $90,000. Actually it came from an overrun in the pond contract because of peat in the area.

Senator YOUNG. If you got the additional $90,000, you could complete the project a year earlier?

Mr. TUNISON. A year earlier, yes.

Senator YOUNG. With respect to the Great Plains Waterfowl Research Laboratory—did you say you were investigating two sites near Jamestown?

Mr. PARKER. Two potential sites near Jamestown.

Senator YOUNG. And what would you have near Woodworth?

Mr. PARKER. The substation would involve the manipulation of the ponds in conjunction with studies on the effects of drawdown on waterfowl, farming practices as they influence the life of a pothole, and farming practices as related to grazing or not grazing the edge of the marsh and its effects on waterfowl production, attempting to tie in farming practices with the management for waterfowl production.

Senator YOUNG. I have never known a project this size that has attracted so much interest as this one has. The sportsmen all over are greatly interested, as well as farmers.

Mr. PARKER. There is no question that we will have to eventually find the answers of increasing duck production, because the duck production of the United States will have to come out of the prairie States.

Mr. JANZEN. I will conclude my remarks, Mr. Chairman, with one more point I would like to make.

GENERAL ADMINISTRATIVE EXPENSES

We have an increase of $260,000 for general administrative expenses. For the past several years our program has been increased. Our field program and operational program, has been increasing steadily, but with very little increase for administrative expenses, and we have reached the stage where we have to have some relief if we are just going to take care of our general housekeeping functions.

That concludes my statement.

RESEARCH ON RESERVOIR FISH

Chairman HAYDEN. Last year, funds were provided to you for research on reservoir fish productivity in the White and Missouri Rivers, and for research on eliminating undesirable fish in the southeastern portion of the United States. Will you inform the committee of the progress being made in this research, and also indicate whether and how much more money you require during the coming fiscal year?

Mr. JANZEN. Yes, sir.

I am going to have Mr. Tunison answer that.

Mr. TUNISON. We have located that work at Fayetteville, Ark., Yankton, S.Dak., and Warm Springs, Ga. Warm Springs is also a fish hatchery, but the facilities were such that we could expand them somewhat in order to accommodate this work. During the past year we have been primarily concerned with getting our facilities ready. This actually is a part of a research project on the same type of problem located at La Crosse, Wis.

In reply to your other question, last year we estimated that it would require $210,000 annually to properly pursue the fish control work.

Congress appropriated one-half of that amount, and we would need the other $105,000 to get it in full operation. Congress also appropriated one-half of the amount required for the reservoir research work; namely, $85,000 for the White River work and $110,000 for the Missouri River studies. The additional funds would be required to place the work in full operation.

Chairman HAYDEN. Is that in the budget?

Mr. TUNISON. No, sir.

FIRE PROTECTION

Chairman HAYDEN. Included in your request for funds for administration of wildlife resources is $140,000 for fire protection on national wildlife refuges. To what extend do you cooperate with the Forest Service and with the Bureau of Land Management in firefighting?

Mr. PARKER. The firefighting that we do is in conjunction with the refuge areas that we have under our jurisdiction.

The Forest Service is the agency that does the research and develops the methods of control, and we have a cooperative agreement with the Forest Service in that respect.

Our operations on fire suppression and control relate only to our own areas.

RESEARCH UNIT, UNIVERSITY OF GEORGIA

Chairman HAYDEN. Senator Russell has expressed an interest in the establishment of a cooperative sport fisheries research unit at the University of Georgia. Are you aware of this suggestion?

Mr. JANZEN. Yes, sir; I believe that Mr. Tunison has the latest on that.

Mr. TUNISON. Yes, Mr. Chairman, we have had considerable correspondence with the State of Georgia and Senator Russell's office on this.

As you may know, this program was authorized several years ago and is somewhat similar, in fact very similar, to our wildlife cooperative units. At the present time, we have one fisheries cooperative unit located in Utah. It would be appropriate to have a fisheries cooperative unit in the Southeast.

Chairman HAYDEN. How much do you need to set up this unit, and what personnel would you place there?

Mr. TUNISON. It would require $30,000 to establish the unit, and that would cover the salaries of two people, plus their equipment, operating expenses, and there would be some for helping out graduate students.

RESEARCH UNIT AT LOUISIANA STATE UNIVERSITY

Chairman HAYDEN. Senator Ellender has asked me to inquire about a cooperative sport fisheries research unit at the Louisiana State University.

I will place in the record a statement concerning this which was given to me by the Senator.

(The statement referred to follows:)

The following summary has been compiled so that the facilities and favorable aspects for the location of a cooperative fisheries unit at Louisiana State University will be readily apparent. Louisiana State University during

its past 100 years has developed an excellent teaching, research, and extension program. Its teaching and research facilities rank among the finest in the Nation. These include a new $3 million library in which the science division alone receives approximately 4,000 different journals annually. The library is an official depository for U.S. Government and United Nations publications. Complete series of most fisheries publications are available. A new $750,000 nuclear science center and a computer center are available as well as the assistance of strong supporting departments such as zoology, botany, agronomy, chemistry, bacteriology, veterinary science, animal industry, medical college, and others.

Research facilities of other agencies located on the Louisiana State University campus include the Louisiana Water Pollution Control Division Laboratory and the U.S. Geological Survey, Ground Water Branch. Branch offices of the Louisiana Wild Life and Fisheries Commission located in Baton Rouge include those concerned with aquatic weed control research, lake and reservoir research, and education and information.

FISHERIES COURSES AND STUDY AT LOUISIANA STATE UNIVERSITY

The importance of subjects on equatic sciences is recognied by the university in that graduate courses are offered in three departments on the campus, which include ichthylogy, limnology, fisheries management, marine biology, algae, and bacteriology of water and sewage. In addition, Louisiana State University collaborates with the Gulf Coast Marine Laboratory, Ocean Springs, Miss., at which six marine courses are offered. A master of science degree for students majoring in fisheries is offered by the school of forestry and wildlife management.

RESEARCH FACILITIES

Opportunities and facilities for field research in fisheries are unlimited at Louisiana State University. The university campus is adjacent to the Mississippi River as well as to five ponds or lakes of 1 to 150 acres. Three university-owned ponds ranging from 1 to 16 acres are located within 5 miles of the main campus. Numerous ponds are located on the 13 agriculture experiment stations, including a rice experiment station. The Louisiana State University campus is within 30 miles of the most extensive overflow area in the United States—the Atchafalaya Floodway (15 by 160 miles). These overflow areas have had the least amount of research conducted on them of any type of fresh water habitat. Louisiana State University campus is centrally located to the watershed systems flowing into the north-central portion of the Gulf of Mexico, as well as the 4 million acres of Louisiana coastal marshes. As such, it is favorably located for the study of estuarine problems. Laboratory facilities including circulating salt water systems have been available through the Louisiana Wild Life and Fisheries Commission at Grand Isle, La. Field laboratory space and quarters has been available by cooperative agreements at the Gulf Coast Research Laboratory, Ocean Springs, Miss., and Rockefeller Wildlife Refuge, Grand Cheniere, La. These facilities would also make offshore marine fisheries research possible.

LOUISIANA FISHERIES VALUE

The commercial fisheries industry of Louisiana ranked first in volume of catch in the United States in 1959 and had the greatest increase (78 percent) over 1958 of any State (Powers, 1961, p. 202, U.S.F. and W.S. Stat. Digest 51). As such, it employed 8,784 fishermen and had a value of $7,475,000. As manufactured fisheries products, Louisiana's 1959 commercial catch had a value of $39,338,391. Of the total U.S. near-record 1961 commercial fishery landings of 5.1 billion pounds, 21 percent (1.1 billion pounds) was taken from the coastal waters between Pascagoula, Miss., and Port Arthur, Tex. The value of sport fisheries to the tourist trade and economy of Louisiana is difficult to determine but it has been estimated to exceed the commercial value and is increasing in value. Considering only new fishing areas in Louisiana, the Soil Conservation Service as of July 1960, has assisted in the construction of 19,317 farm ponds totaling about 40,000 acres.

FISHERIES PROBLEMS IN LOUISIANA

The extent of the problems related to the fisheries resources are noted when the 1961 reports show that Louisiana reported the greatest number of fish-kills

related to insecticide use for 1960. Very little data is available on the long-term effects of these chemicals on the fisheries resources in Louisiana. Louisiana has the majority of the estuarine habitat of the Gulf of Mexico and these areas serve as the major spawning and nursery areas for crabs, shrimp, and fishes. Additional research needs in these areas was demonstrated by the poor 1962 shrimping season in Louisiana. The conflicts that have developed as related to the fisheries resources on various water control and navigation projects in Louisiana are increasing yearly. Request for information on the possibilities of pond culture of shrimp and crayfish as well as the commercial farming of fish and crayfish with the rice-rotation are increasing rapidly. Research is being conducted on these problems; however, the establishment of the cooperative fishery research unit would allow rapid expansion in studies into these areas.

The basic fisheries resources in Louisiana is enormous and the need for trained fisheries personnel and research is urgent. Louisiana State University is aware of these opportunities and possibilities and feels that with a cooperative fisheries research unit it can better help solve these problems. We feel there are many favorable advantages for a cooperative unit at the School of Forestry and Wildlife Management, Louisiana State University.

FEASIBILITY OF PROJECT

Chairman HAYDEN. Would such a fisheries unit be feasible?

Mr. TUNISON. Yes, it would, Mr. Chairman.

Chairman HAYDEN. How much would you need to establish such a unit, and what personnel would you station there?

Mr. TUNISON. It would require $30,000, and similar to the State of Georgia, it would cover the cost of two personnel and their expenses.

Senator MUNDT. What do you do at cooperative fisheries units like that?

Mr. TUNISON. It is mainly a training program, Senator Mundt. We like to locate them at good schools, where there is need for additional students of fisheries. It is slanted at the graduate level.

The purpose would be to train them primarily in research work, fundamental research work. And in so doing, during the training period, they are assigned projects, and invariably those will be in conjunction with State and Federal programs.

We like very much to have the State people as cooperators on this program, on at least a three-way agreement, wherever it is possible.

Mr. JANZEN. I would like to add that we have 17 wildlife cooperative units started about 25 years ago, and this is the reason we have many trained wildlife technicians. There has not been a similar program in the fisheries field, and there is a shortage of fisheries workers.

CONTROLLED ERADICATION OF NUTRIA

Chairman HAYDEN. Senator Ellender asked me to ask this question: Last year, in accordance with contacts between Senator Ellender's office and that of Assistant Secretary of the Interior Briggs, a recommendation was made on a basis of need for increased research on the controlled eradication of nutria. At that time, Senator Ellender was informed that a biologist would be assigned in the field to study this program and that, this year, the Department of the Interior would attempt to have it included in the budget. Can you tell me if such a program is planned for this year, and, if not, how much money could the Department of the Interior adequately use to continue this study?

Mr. PARKER. The nutria as you may know, has increased through the years in the gulf coast. It is an animal that was imported into the

United States from South America. It feeds entirely on vegetation. It causes considerable damage in the sugarcane fields, the ricefields, and in the duck marshes.

In January of 1961, there was enough interest developed in the problem in Louisiana and Texas so that a planning committee was organized. They developed a program that called for cooperative research and control between the two State fish and game departments, the two universities, Texas A. & M. and Louisiana State, and the Bureau.

AMOUNT REQUESTED

The program called for $50,000 for the Bureau in research and $50,000 to start the control. We were not able to include it in the budget this fiscal year. On the control aspect we were able to add one man, who is down there now doing a combination of control with the methods that we currently have available, which are either trapping or shooting, and attempting to test out other methods. The big problem is one of trying to develop some kind of a bait which would attract the animals and then use a poison on the bait to get rid of them.

Senator MUNDT. Why were they imported in the first place?

REASON FOR IMPORTING ANIMALS

Mr. PARKER. They were brought in for fur purposes. They are halfway between a beaver and a muskrat in size. The guard hair is rather coarse. I am sure they anticipated that it might be a valuable fur animal in this country.

Actually, as it has turned out, the fur has very little value; generally $1 or $2 apiece. It takes almost as much time to skin one as it does a beaver, so that there is no one interested in harvesting them at the present time.

Senator MUNDT. Is the attempt now to exterminate them?

Mr. PARKER. Right. We have no methods yet that are workable, other than trapping or shooting.

FUNDS TO COPE WITH STARLING PROBLEM

Chairman HAYDEN. There will be included in the record a letter from Mr. Charles Paul, director of the California Department of Agriculture, urging that an additional $400,000 be provided to the Fish and Wildlife Service to assist Western States in coping with the starling problem.

(The letter referred to follows:)

STATE OF CALIFORNIA,
DEPARTMENT OF AGRICULTURE,
Sacramento, February 13, 1962.

Hon. CARL HAYDEN,
U.S. Senator,
Washington, D.C.

DEAR SENATOR HAYDEN: Starlings are becoming an increasing threat to American agriculture. In recent years, these serious pests have been moving from the east coast across the country to the Pacific coast. Crops have suffered considerable losses and livestock feeders are now finding starling depredations troublesome and costly.

Attempts at control have not been satisfactory and it is imperative that expanded intensive investigation and research be undertaken immediately in an effort to stem the tide and avert what will come to be a real disaster.

Losses to date are but the beginning of what can turn out to be serious and widespread economic distress among our ranchers.

After studying the situation, our people are firmly of the opinion that there are inadequate Federal funds available to assist the States in coping with the starling problem. Accordingly, it is hoped that the budget of Sport Fisheries and Wildlife, U.S. Department of the Interior, now pending before the Congress, will be augmented to include an additional $400,000 as the Federal Government's share of costs to assist the Western States in developing ways and means to reduce the starling menace. We sincerely believe that, unless such funds are made available now, the cost will eventually become many multiples of this amount.

Your assistance and support in obtaining these much needed funds will be greatly appreciated.

Sincerely yours,

CHAS. PAUL, *Director.*

DAMAGE BY STARLINGS ON WEST COAST

Chairman HAYDEN. Senator Kuchel has requested me to ask these questions in that regard.

The California Department of Agriculture advises that a substantial increase in the starling population is resulting in widespread and costly depredations against various crops, particularly grapes. Has any investigation or experimentation been carried out into the extent of damage done by these birds?

Mr. PARKER. Our work to date has been largely in attempting to develop methods of controlling the starlings. It is another foreign bird introduced in this country originally in New York City. It has spread out across the country until now it has put in an appearance on the west coast.

The work to date has been in attempting to figure out reductional methods of control. So far we do not have anything that looks real good. We have reported to the committee in the past the use of the light trap.

I have with me, if you care to look at them, some photographs of what starlings look like around feedlots. Those pictures happened to be taken near Caldwell, Idaho, but you would encounter the same thing in Arizona and New Mexico or any place where they have cattle feedlots. It is not only the amount of feed that the bird consumes, but also it defiles that much more.

STARLING CONTROL PROGRAM IN WASHINGTON

Senator MUNDT. Are you also in charge of the starling program in Washington?

Mr. PARKER. In the District, here?

Senator MUNDT. Right.

Mr. PARKER. No. We have counseled with the District Commissioners on what little we may have to offer in the way of control methods, but frankly, we have not begun to scratch the surface on figuring out ways of eliminating the starlings.

Chairman HAYDEN. Is it the starlings that make it dangerous for airplanes?

Mr. PARKER. Yes; those are some of the birds. I think it is common knowledge now that the airplane crash at Logan Airport was the result of ingesting starlings in the motors. There are other birds that do cause troubles there, too. Gulls, for example, have caused some difficulties, on the airports where they occur.

CONTROL OF STARLINGS NEAR VINEYARDS

Chairman HAYDEN. Senator Kuchel also wants to know whether the Service contemplates undertaking any program looking toward the control of starlings or providing means of repelling them from vineyards and fruit or berry producing areas?

Mr. PARKER. We do not yet contemplate any operational method of control, because we do not have a satisfactory method. We have some tools by which we could kill birds, but we feel it is essential, when we undertake an operational program, that we do it with complete safety. For example, using poisons, there is always danger unless you can develop one that is rather specific—the danger of killing other birds, domestic animals, and even humans. So we have not resolved the problem of research on control methods yet.

BOUNTIES FOR STARLINGS

Senator MUNDT. Has the State of California ever undertaken a program of bounties for starlings, like our State back home did on crows, for example?

Chairman HAYDEN. That was Senator Kuchel's next question. He says, Has such a problem been discussed with the agricultural authorities in California, the growers' organizations, and others, to determine its scope and seriousness?

Mr. PARKER. Yes; there was a pest control meeting held quite recently in California, and as a result of that meeting—and this, incidentally was a meeting attended by people from all over the United States as well as some of the foreign countries—it was very apparent that the problem was very severe in California, particularly in the vineyards.

WIDESPREAD STARLING DEPREDATION

Also along the west coast it is a serious problem among the holly growers, the people that are growing holly for Christmas decorations. The birds roost in the trees in the evenings.

But the problem is not confined to the west coast alone. We have all kinds of difficulties through the Midwest with the starlings, and also here in the East.

We have one very sore spot up at Hanover, Pa., in the watershed that furnishes water for the municipality. There are sufficient starlings that roost in the trees that have been planted in the watershed, so that they have seriously damaged a good share of the trees.

We have been using a light trap, which is a series of nets strung up on poles about 40 feet high with a funnel leading into a catch area, and we use strong electric lights behind the net. The employees go through the trees stirring up the birds, and they are attracted to the light and fly into the trap.

If you are interested in seeing the results of some of the trapping, here is a picture of 1 night's catch at the Hanover watershed. And this is just a small part of the total birds present.

FEASIBILITY OF BOUNTY SYSTEM

Senator MUNDT. Back to my question: Has the State of California ever set up a program of bounties for people to shoot starlings?

Mr. PARKER. Not to my knowledge. They do have an active control program carried on by the Department of Agriculture with their own employees. In all of the appraisals of the effects of bounties, it is pretty well proven that they do not really work. If we are going to control an animal, it had much better be done by people qualified to do it and who can carry it out more economically that way. Generally, with a bounty you develop an interest to start with, and then when the number of animals get reduced to the point where it is no longer profitable, interest wanes and the bird populations go right back up; or any animal, for that matter.

Senator MUNDT. We have killed a lot of crows back home with crow shoots. Do they ever have any starling shoots?

Mr. PARKER. I imagine there are places in the country where they carry on some starling shoots. It is generally not an efficient method of starling eradication.

Senator MUNDT. A lot of people would as soon shoot at a starling as a clay pigeon.

Mr. PARKER. The unfortunate thing now is that the price of ammunition is such that many folks are inclined to pass over that opportunity.

USE OF BOMBS AND NETS

Senator MUNDT. Have they ever tried bombs? I understand they put these bombs up in the places where they nest at night and kill them by the tens of thousands.

Mr. BUELL. I am not sure whether they have ever tried the bombs on that. Not to my knowledge have they been tried on starlings.

Senator MUNDT. The nets will work, but you will have to have an awful big army to go around and net them all.

Mr. PARKER. This light trap is used in concentration areas, where they are in compact areas. The nets are set up, and it takes a crew of 10 or 15 men a matter of an hour to drive into a trap all you can handle in a single night. We have taken as many as 100,000 in a single drive in 1 night.

Mr. JANZEN. I would say from what experience we have had with crow bombing in the Midwest, that the light trap, even though not yet developed as far as we would like, is more efficient than the bombing would be, and safer.

ESTIMATE OF FUNDS FOR STARLING CONTROL PROGRAM

Chairman HAYDEN. I will ask Senator Kuchel's final question.

Could the Service offer an estimate of how much might be expended in the next fiscal year to survey the starling problem and formulate and initiate an experimental control program? Would $400,000, as suggested by the California authorities, be adequate, and how might it be utilized?

Mr. PARKER. Currently our total bird program is $360,000, and of this there is about $200,000 that replaces FAA money that was transferred to us.

To specifically answer your question, it would take in the neighborhood of $400,000 to give us what we should have on bird control.

Chairman HAYDEN. We will recess until 3 o'clock.

(Whereupon, at 12:15 p.m., the subcommittee was recessed, to reconvene at 3 p.m. the same day.)

(AFTERNOON SESSION—FRIDAY, MARCH 2, 1962)

BUREAU OF SPORT FISHERIES AND WILDLIFE

STATEMENTS OF DANIEL H. JANZEN, DIRECTOR; ABRAM V. TUNISON, ASSISTANT DIRECTOR; AND LANSING A. PARKER, ASSISTANT DIRECTOR—Resumed

CONSTRUCTION OF FACILITIES

Senator BYRD of West Virginia (presiding). The hour of 3 o'clock having arrived, the hearing will be resumed.

Good afternoon, gentlemen.

We will place in the record the budget justification for fiscal year 1963 for construction of facilities required by the Bureau of Sport Fisheries and Wildlife. This amounts to $4,086,000, which is $3,340,936 less than was available in 1962. This sum will provide for continued construction at five new hatcheries and improvement at one existing hatchery.

(The justifications referred to follow:)

The purpose and long-range objectives of the program for construction are to provide land, buildings and other facilities for the conservation, management, and investigations of the Nation's sport fish and wildlife resources.

Accomplishments planned for 1962 include construction of new hatcheries and expansion of existing hatchery facilities, construction of refuge facilities to further develop waterfowl habitat, engineering planning for future refuge development, and expansion of laboratory facilities for studies of chemical agents for nuisance bird control.

For 1963, the program provides for continued construction and improvement of existing hatcheries; continuation of construction of fishery research laboratories and planning for a new fish-pesticide relationship laboratory; further development of refuge facilities, including engineering planning to meet future needs; and a start on construction of the Northern Great Plains Research Station.

Construction

Appropriation, 1962	$5, 257, 500
Unobligated balance from prior years	+2, 661, 436
Total available for obligation, 1962	7, 918, 936
Decreases:	
Fish hatchery facilities	4, 403, 026
Fishery research facilities	52, 228
Wildlife refuge facilities	2, 999, 855
Wildlife research facilities	217, 827
Subtotal	7, 672, 936
Subtotal	246, 000
Increases:	
Fish hatchery facilities	654, 000
Fishery research facilities	325, 000
Wildlife refuge facilities	2, 928, 000
Wildlife research facilities	179, 000
Subtotal	4, 086, 000
Total available for obligation, 1963	4, 332, 000
Unobligated balance from prior years	−246, 000
Budget estimate, 1963	4, 086, 000

Analysis by activities (total funds)

Activity and appropriation	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Sportfish facilities:				
Construction	$2, 225, 754	$4, 455, 254	$1, 114, 000	−$3, 341, 254
Construction of recreational and fish and wildlife facilities, Bureau of Reclamation		245, 000	471, 000	+226, 000

1. SPORTFISH FACILITIES, $979,000

(a) *Fish hatchery facilities*

The estimate of $654,000 is for continued construction at five new hatcheries, and improvement of one existing hatchery as follows:

Fish hatcheries:	
Arizona: Alchesay	$100,000
Arkansas: Greers Ferry Dam	95,000
California: Coleman	134,000
Michigan: Jordan River	101,000
Nevada: Lahontan (Minden)	100,000
North Dakota: Garrison Dam	124,000
Total	654,000

Alchesay, Ariz., $100,000.—Construction of this station was authorized by the act of June 23, 1959 (73 Stat. 92). It is located on the Fort Apache Indian Reservation on land that was made available by the tribe. When fully developed it will be capable of producing 150,000 pounds of trout annually. The Williams Creek National Fish Hatchery is also located on the reservation.

Present stocking requirements for waters of the Fort Apache Reservation alone are approximately 110,000 pounds of trout annually. The Williams Creek Hatchery can supply less than half of this amount. In addition, 90,000 pounds of trout are needed for the Navajo, Zuni, Jicarilla and San Carlos Reservations, military installations and other Federal areas. At a later date trout will be required for the Navajo Dam and the Stream below the dam, and for the Hopi and Laguna Reservations.

It will be necessary to provide housing for all permanent employees at the Alchesay National Fish Hatchery. The nearest town is White River (less than 250 population), 8.5 miles from the hatchery site with no rental houses available. Globe is the nearest town in the 5,000 to 8,000 population class, and is 90 miles from the hatchery.

Funds were appropriated during 1960 to 1962 for construction of facilities at the Alchesay Hatchery. In view of the increasing demands for trout in this section of the United States, funds are now needed for the full development of the site.

The 1963 estimate is for the following:

Four residences with carports	$80,000
Equipment (fish-cultural and maintenance)	20,000
Total	100,000

Greers Ferry Dam, Ark., $95,000.—Corps of Engineers construction activities in the Little Red River and Red River drainage areas of southwestern Arkansas and eastern Oklahoma will result in a need for trout for stocking reservoirs and cold tailwater streams. Greers Ferry Dam and Reservoir project, on the Little Red River, is now under construction. Additional dam and reservoir projects now authorized will follow in the near future.

Recent studies indicate that 60,000 pounds of trout will be required annually for stocking cold waters created by the construction of Greers Ferry Dam. An additional 90,000 pounds will be required annually to stock other existing and future cold-water habitants in southwestern Arkansas and eastern Oklahoma.

In 1962, $170,000 was appropriated for initiation of construction of a hatchery below the Greers Ferry Dam. The estimate for 1963 is for the following:

Concrete raceways, with water supply and drainage features	$82,000
Water supply line, intake and control structure	13,000
Total	95,000

Coleman, Calif., $134,000.—The Coleman National Fish Hatchery was established in 1941 to maintain the run of Chinook salmon of the Sacramento River that was cut off by the construction of Shasta Dam. The success of this station is shown in a high return of marked fish to the salmon fishery of the Sacramento. The annual egg takes of this station have exceeded 40 million.

The operation involves the trapping and hauling of adult fish as well as the trapping, rearing, and distribution of up to 32 million other fish, weighing approximately 200,000 pounds. In addition to the production of salmon a very

important run of steelhead has been built up in the Sacramento River system through releases of this species from the Coleman Hatchery. Kamloops and other species of trout are produced at Coleman incidental to salmon and steelhead.

In 1962, $160,000 was appropriated for needed improvements at this station. The $134,000 estimate for 1963, is for the next phase of this improvement program as follows:

Water supply line, 5,000 feet 36 inches	$116,000
One residence	18,000
Total	134,000

Jordan River, Mich., $101,000.—The Great Lakes lake trout population has been decimated by the ravages of the sea lamprey, and has practically disappeared from the waters of Lakes Huron and Michigan. It is making a last stand in Lake Superior. A lamprey control research program was initiated on the Great Lakes several years ago, administered by the Great Lakes Fishery Commission consisting of the Lake States and the Governments of the United States and Canada.

Recovery of the lake trout population through natural reproduction would take many years, and would probably never be completely successful. Hatchery reared young lake trout must be released in the Great Lakes to effect a reasonable recovery. Present rearing facilities operated by the Lake States, Canada, and the United States do not have the capacity to produce lake trout in the numbers required. It is urgent that stocking be accelerated to meet annual requirements to fill the void left by the disappearance of the lake trout from their former habitat.

The 1962 appropriation included $425,000 for initiation of construction of a hatchery at Jordan River, Mich. The $101,000 estimate for 1963 is for the following:

Concrete raceways (8 ft. by 100 ft.) with individual supply and drainage features	$101,000

Lahontan (Minden), Nev., $100,000.—There is a large demand for trout for distribution to waters in the western part of Nevada. The Bureau does not operate a hatchery in Nevada and applications for planting in this State are filled from the trout production at the Hagerman National Fish Hatchery in Idaho. This has resulted in excessive costs for fish distribution and has limited the distribution of fish to waters of western Nevada. Existing requirements now total 80,000 pounds of trout annually, most of which are for Lahontan cutthroat trout for Pyramid and Walker Lakes. As the Washoe reclamation project is developed an additional 43,000 pounds will be required. The two interstate lakes, Topaz and Tahoe, also will require trout from this hatchery. None of these requirements takes into consideration any increase of fishing pressure that may occur in the area in years to come. A hatchery, including facilities to produce a minimum of 125,000 pounds annually, is needed in western Nevada to eliminate the long distribution trips and to meet the Federal responsibility in this area.

The 1962 appropriation contained $150,000 for initiation of construction of a hatchery near Minden, Nev. The estimate of $100,000 for 1963 is for continuation of the construction, as follows:

Pipelines from wells to hatchery site	$66,000
River intake, including 2 pumps and standby unit	34,000
Total	100,000

Garrison Dam, N. Dak., $124,000.—Construction of a hatchery at Garrison Dam was authorized by the act of July 1, 1957 (71 Stat. 264). The construction of Garrison Dam and other large dams on the Missouri River, and the program of increased water storage at every possible location has increased the need for both trout and warm water fish for stocking purposes in North Dakota and adjoining States. The hatchery site is immediately below the dam. The new hatchery will have facilities for the rearing of trout for stocking waters below large reservoirs, pike and walleyes to be used as predatory species in reservoirs, and other warm water species for farm ponds.

Funds for the construction of the Garrison Dam hatchery were appropriated from 1958 through 1962. The estimate for 1963 is for the following:

Trout raceways (twelve 4 by 100 by 3 feet)	$45,000
Trout raceways (nine 8 by 100 by 3 feet)	70,000
Equipment (fish cultural and maintenance)	9,000
Total	124,000

The following is a summary of the construction program at the six hatcheries included in the 1963 estimate.

Hatchery	Total estimated cost	Appropriated 1958 to 1961 inclusive	Appropriated 1962	Estimated, 1963	Estimated appropriation required to complete construction
Alchesay, Ariz.	$913,000	$390,000	$330,000	$100,000	$93,000
Greers Ferry Dam, Ark.	800,000		170,000	95,000	535,000
Coleman, Calif.	444,000		160,000	134,000	150,000
Jordan River, Mich.	892,000		425,000	101,000	366,000
Lahontan, Nev.	996,000		150,000	100,000	746,000
Garrison Dam, N. Dak.	1,051,000	530,000	307,000	124,000	90,000
Totals	5,096,000	920,000	1,542,000	654,000	1,980,000

(*b*) *Fishery research facilities, $325,000*

The estimate of $325,000 will provide for laboratory construction as follows:

Arkansas: Stuttgart	$195,000
California: Convict Creek	80,000
(Site not selected): Fish-pesticide lab	50,000
Total	325,000

Stuttgart, Ark., $195,000.—The headquarters laboratory of the fish-farming experimental station at Stuttgart, Ark., for which construction funds were appropriated in 1960, is now complete except for necessary ponds, holding tanks, and related facilities for fish farming research. The estimate will permit completion of the construction of the laboratory.

Convict Creek, Calif., $80,000.—This estimate will complete redevelopment of the station which was commenced in 1959 by doubling the fish-holding and experimental facilities and providing yearlong residence for all permanent staff members. This will permit closing the Reno office and saving of rent. The estimate is for the following:

Experimental fish-holding laboratory	$30,000
2 prefabricated residences	30,000
4 water control structures	12,000
4 controllable ¼-acre ponds	8,000
Total	80,000

Fish-pesticide laboratory (site not selected), $50,000.—Space and water at the Denver Federal Center are inadequate for a full program of research on fish-pesticide relationships. Construction of a $900,000 structure to house chemistry and biology laboratories, fish-holding and experimental facilities, office and storage space is anticipated to meet this need. The 1963 estimate is for site surveys, land acquisition, and architectural and engineering planning. Proposed sites in Colorado, Utah, and Wisconsin are under consideration.

Site surveys, land acquisition, engineering, and architectural planning.. $50,000

2. WILDLIFE FACILITIES, $3,107,000

(a) Wildlife refuges, $2,928,000

The estimate for this subactivity is $2,928,000 for construction, development, and improvement of refuges, and engineering planning, as follows:

Refuges:	
Aleutian Islands, Alaska	$206,000
Havasu Lake, Ariz	35,000
Imperial, Ariz	25,000
Holla Bend, Ark	163,000
Kern-Pixley, Calif	283,000
Modoc, Calif	85,000
Lower Klamath and Tule Lake, Calif. and Oreg	84,000
Monte Vista, Colo	200,000
Bombay Hook, Del	80,000
Crab Orchard, Ill	410,000
De Soto, Iowa and Nebr	185,000
Quivira, Kans	146,000
Noxubee, Miss	110,000
Benton Lake, Mont	80,000
Crescent Lake, Nebr	45,000
Montezuma, N.Y	127,000
Malheur, Oreg	48,000
Fish Springs, Utah	366,000
Engineering planning	250,000
Total	2,928,000

Aleutian Islands, Alaska, $206,000.—At present the Bureau must rent substandard facilities for the operation of the Aleutian Islands National Wildlife Refuge. Three residences, an office-laboratory, and a service building-warehouse are needed. This refuge, comprising 2,720,000 acres, is the second largest unit of the national wildlife refuge system. It extends 1,000 miles westward from the Alaska Peninsula and includes 200 islands. The Alaskan brown bear, sea otter, caribou, migratory waterfowl, and numerous colonies of seabirds are benefited by this important area. Portions of the refuge are open to the hunting of migratory birds, upland game, and big game, and all waters are open to sport and commercial fishing. Increasing public use of this vast area and the frequently severe weather make adequate management and enforcement a serious problem under the best of conditions.

Havasu Lake, Ariz., $35,000.—This estimate is needed to continue a program of land clearing and development. At present this refuge is unable to provide adequate habitat to compensate for that which has been lost and is being destroyed in the southern portion of the Pacific flyway. Additional habitat is also needed to insure the preservation of an important wintering population segment of the Great Basin goose and to prevent duck depredations in southern California. The area in which this land clearing and development is scheduled is covered by silt deposits and useless weed plants. It must be cleared, leveled, and otherwise prepared for the planting of waterfowl foods.

Imperial, Ariz., $25,000.—Of this estimate, $6,000 is needed for the construction of dikes and ponds. This work is needed because food and resting habitat is now inadequate. It will improve wintering conditions for Pacific flyway waterfowl, including the Great Basin goose. At present there are numerous sloughs and ponds with no river connection. Since there is no control over water levels and no means to prevent the runoff of water which could serve as a reserve during dry periods, these potentially productive water areas provide little waterfowl habitat. The sum of $15,000 is needed for land clearing which will provide cereal grains and browse needed to supplement the wild foods and cultivated crops. Browse production is especially needed for geese, since this is an important item in their diet. It can be expected that any increase in waterfowl use will improve hunting conditions in the refuge vicinity; $4,000 is needed for fencing to protect cultivated crops from trespass cattle. Unless this is done, funds expended for crop production will be largely wasted, and there will be an even greater shortage of waterfowl food than now exists on this important area.

Holla Bend, Ark., $163,000.—Of this estimate, $82,000 is needed for the completion of water impoundment facilities which will complete the water development project at this refuge. The improved habitat thus provided will increase

the wintering potential of the refuge to an estimated 80,000 ducks and 20,000 geese in addition to the thousands of migrating waterfowl which temporarily seek food and shelter. It will be possible to regulate the water levels of the new pools, creating optimum conditions for the production of wild foods. About $81,000 is needed for the construction of headquarters facilities. These will include a service-office building, storage building, residences, seed and grain building, oil and paint storage building, fuel storage and pump house, and pumps and shelter. It will be impossible to either manage or protect this important refuge unless a headquarters is provided. Personnel must be on hand at all times for emergencies and public contacts as well as to supervise and carry out the daily work program. Storage facilities must be provided for the equipment needed for construction, farming operations, and maintenance, and suitable buildings for the repair of this equipment are also essential. The seed and grain building will store grain for emergency feeding programs at this or other refuges, and also seed needed for habitat improvement.

Kern-Pixley, Calif., $283,000.—This estimate includes $176,000 for impoundments, $55,000 for wells and pumps, $27,000 for roads and bridges, and $25,000 for headquarters development of an equipment-service building and oil house. If an orderly development program is not vigorously pursued, there will be no return on the great investment already made here. Furthermore, the Bureau is risking the loss of vital water rights if there is no adequate water development. The development of headquarters, which will be at Kern, is of prime importance to the proper administration of these refuges. Since the nearest town is 20 miles away, facilities for proper storage, maintenance, and office work must be on the area. Suitable living quarters will be needed so that personnel will be on hand for emergencies and have ready access to their work.

Modoc, Calif., $85,000.—The estimate will complete step 1 of the development plan. The Parker Creek Dam, necessary to preserve the present water system, is in danger of failing and must be replaced. Low dikes will be constructed to spread out the available water to create habitat for the production of both ducks and geese as well as provide suitable sanctuary for migrants. When development is completed, Modoc will be ideally located to serve the vast number of Pacific flyway waterfowl which annually migrate through this part of California. Wetlands which have been lost to waterfowl through agricultural development will be restored for waterfowl use.

Lower Klamuth and Tule Lake, Calif. and Oreg., $84,000.—Of this estimate, $24,000 is needed to complete the east-west dike and related control structures for unit 12 on lower Klamath. There is need to divide this large and difficult-to-manage emergency flood sump into four smaller units that can be utilized for farming during nonflood periods. Only by doing this can full advantage be taken of the production and feeding potential of this large unit. In the event of a water shortage, available water can be stored safely in one or several of the smaller units whereas the same amount of water, dispersed over a large area, could be entirely lost. Construction of this dike has been started with funds previously appropriated. About $60,000 is needed for the Tule Lake refuge to continue work on soil drainage to improve agricultural production of lands which have been damaged through an accumulation of salts. This is a normal consequence of irrigation in northern California. Tule Lake is one of the refuges in the Klamath Basin refuge complex through which migrates a major part of the waterfowl of the Pacific flyway. Tule Lake itself is famous as the location of the largest annual concentration of waterfowl on the continent. Failure of this refuge to adequately provide for migrants would adversely affect the entire Pacific flyway waterfowl population as well as cause depredation problems in California and Oregon.

Monte Vista, Colo., $200,000.—This estimate is needed to construct impoundment facilities and to renovate unproductive land. Additional acreage will thus be provided on which waterfowl can feed and rest. Adequate impoundment facilities in which water levels can be controlled are the lifeblood of this refuge, since annual precipitation in the vicinity averages only 8 inches. While the production of adequate food for migrating waterfowl is important here, the improvement of nesting habitat is an even greater justification for the proposed development. The present annual production of over 8,000 ducks will be raised to 25,000 or better with the new habitat. The additional crop-producing area is needed to supplement wild food production to prevent serious crop depredations in the refuge vicinity. As a normal result of the increased waterfowl capacity of the refuge, hunting on the area and in the vicinity will improve.

Bombay Hook, Del., $80,000.—This estimate is needed to construct a dike which will subdivide Shearness Pool, one of several fresh water impoundments which previously was unproductive salt marsh. The cross-dike is one of the steps in an orderly program of development having the primary objective of improving the refuge's capacity to provide sufficient food for the increasing number of migrating waterfowl which depend upon the area for sanctuary. The improvement of this refuge is made more urgent by the rapid encroachment of industry and resort areas in this portion of the Atlantic flyway. One of the important management features envisioned is the control of water levels in the refuge pools to reduce or remove the existing carp population. These fish not only lack economic or recreational value in the area, but almost completely destroy the ability of the refuge pools to provide needed waterfowl food. An orderly system of draining and flooding is therefore essential.

Crab Orchard, Ill., $410,000.—This estimate is needed for work at Devils Kitchen Dam. The grading and base course have been completed on approximately 23 miles of road around Devils Kitchen Lake. Construction of spillway and bridges, and appurtment facilities has been completed by the Corps of Engineers with funds appropriated in prior years. The 1963 estimate covers the following:

Riprap of stream banks below dam at Big Grassy Bridge	$40,000
23 miles of bituminous road surface	370,000
Total	410,000

Prompt completion of this work is necessary (1) to prevent water and weather damage to the roadwork in places which would make ultimate completion more costly if delayed and (2) to make this project usable to the public.

De Soto, Iowa and Nebr., $185,000.—This estimate is needed to construct a headquarters for this comparatively new refuge which has already received a great amount of attention and publicity in the Midwest. Due to its location in a densely populated area, this refuge focuses public attention on the Bureau's national wildlife refuge program. An essential development phase is the construction of adequate administrative headquarters facilities, including three residences, a service-office building, two equipment buildings, and oilhouse, and three grain bins. In addition to providing adequate supervision of the one-half million people expected to visit the refuge annually, suitable buildings are needed to properly store and repair the equipment which will be used in the farming and maintenance program. Up to this time the public-use problems of the area have received the most publicity. However, waterfowl will gain their proper status in the overall picture as more and more people observe the vast flocks of snow and blue geese, sometimes totaling 400,000 birds, which will stop at the refuge each spring. In addition, improved birdwatching and waterfowl hunting opportunities will be provided in the vicinity. DeSoto refuge will serve an important function in improving the distribution of the eastern prairie flock of Canada geese. As a side benefit, public hunting for this species will once again be possible in this vicinity.

Quivira, Kans., $146,000.—This estimate is needed to construct an impoundment facility which will provide badly needed food and shelter in normal seasons and store a reserve supply of water during dry years, which periodically occur here. By providing suitable nesting and feeding conditions for waterfowl in this portion of the central flyway, Quivira will improve the general distribution of ducks and geese. Hunting opportunities, especially for Canada geese, will increase through a management program geared, in part, to better conditions for this species. The diversions, channels, and impoundment constructed will take full advantage of existing water supplies and pools. A series of small potholes will provide nesting habitat in order that this refuge will in the future provide sanctuary for a large number of migrating waterfowl and also be able to produce birds to help sustain the duck population of the central flyway.

Noxubee, Miss., $110,000.—This estimate is needed for the construction of four additional green-tree reservoirs to supplement those already built, which are inadequate for a suitable waterfowl food production and timber management program. This type of management consists primarily of flooding bottomland hardwood species with 6 to 8 inches of water during the winter season. Not only is a great amount of mast made available to waterfowl, but timber volume is increased and quality is improved. Green-tree reservoirs create excellent waterfowl habitat out of land which otherwise has little available food for ducks

of geese. Without this type of development, this refuge is neither providing sufficient waterfowl food nor is it being managed in the best interests of both the land and wildlife.

Benton Lake, Mont., $80,000.—This estimate includes $20,000 for nesting islands; $25,000 for a drain; $6,000 for interior roads; $9,000 for fencing; and $20,000 for one dwelling. These items will complete the development of this refuge and are essential if the benefits of the great investment already made here are to be fully realized. With proper attention to the nesting potential of this area, waterfowl production per acre can be expected to equal that on the best breeding grounds in the country. Roads must be surfaced to allow adequate public enjoyment of the refuge and to require a minimum investment in future maintenance. They are also essential if the refuge staff is to properly carry out its patrol and management duties, as well as maintain the important pumps and other facilities now installed. The fencing is needed to protect refuge croplands from grazing by trespass cattle, which would result in the destruction of food needed for waterfowl. The manager assigned to this area will have headquarters in Great Falls, 12 miles away. It is essential that the maintenance staff live on the area to be on hand for emergencies.

Crescent Lake, Nebr., $45,000.—This estimate is needed to construct two residences which will replace the quarters occupied by the clerk and maintenance-man. The quarters occupied by these employees and their families were improvised by grouping several old homestead cabins together into some semblance of houses. None of the floors are level, sills and studs are rotting, and their general condition is far below ordinary standards for health, comfort, and safety.

Montezuma, N.Y., $127,000.—This estimate is needed for water control structures. The south unit of this refuge is undeveloped land of no benefit to waterfowl. Being too low to be farmed, it contains either weeds, brush, or undesirable trees. The levees and structures included in this estimate will allow the flooding of this unit, converting it into productive use both for wild food production and waterfowl nesting. The control structures will allow proper manipulation of water levels to provide optimum waterfowl habitat, and will also allow periodic drainage for carp control. This new pool will provide a sufficient reserve water area so that other refuge pools can be drained as needed for the control of carp. Without such a program, carp will increase to the point where wild food production is prevented.

Malheur, Oreg., $48,000.—This estimate is needed to complete construction of the Diamond drain unit. This must be done before any benefits can be realized from the work already accomplished. Rainfall is normally quite scarce in this region. As a result, water levels of impoundments are often too low to permit proper management. Completion of this drain system will permit regulation and distribution of available water.

Fish Springs, Utah, $366,000.—This estimate is needed for construction of impoundment facilities which will complete the most important phase of water development on this refuge. Unless this work is done, there will be little benefit from the investment already made on this project. In addition to creating an ideal nesting area for ducks in this arid section of the Pacific flyway, this refuge will provide important nesting habitat for the Great Basin goose. Some population segments of this large bird are now endangered. From a legal standpoint, it is essential that we create these impoundments in order to place in good standing the vital water rights that were obtained in the acquisition of this project.

Engineering planning, $250,000.—Under this program, 6 master plans were completed in 1960, 7 in 1961, and 10 are planned in 1962. The orderly management and development of the refuge system can best be accomplished by completion of master planning on all major refuges at the earliest possible date. At the present rate of completing 23 master plans in 3 years, it will take 13 years to complete planning on all of the present 130 major wildlife refuges. New refuges being added to the system each year will result in a further backlog of refuges requiring master planning. The program must, therefore, be stepped up to provide for the master planning of at least 12–15 refuges in 1963, at a cost of $200,000 for general engineering planning.

There is an urgent need to determine the availability and distribution of ground water. This involves studies of rainfall, runoff, stream gaging and stream flow and forecasts of flood and river stages. Reservoirs, dams, penstocks, spillways, and other hydraulic features so vital to the management and development of our national wildlife refuges must be planned and maintained to obtain beneficial usage and establish clear legal rights to water. It also is

essential to prove up and file on water rights in conformance with State laws. In 1962, $35,000 was provided for water rights surveys; $50,000 is needed in 1963 to continue these surveys and to reduce the backlog which is estimated at $320,000.

(*b*) *Wildlife research, $179,000*

Patuxent Wildlife Research Center, $40,000.—The estimate of $40,000 will provide $30,000 for the construction of a 1,600-square-foot isolation building for the confinement and care of experimental animals in studies of contagious wildlife diseases and $10,000 for a waste disposal system for the pesticide-wildlife study pens to prevent contamination of the center's water supply and the Patuxent River.

Northern Great Plains Wildlife Research Station, $139,000.—In 1962, $50,000 was appropriated for site investigations and preliminary planning preparatory to establishment of a Northern Great Plains Research Station. The principal purpose of this station will be to find ways and means of maintaining optimum populations of waterfowl through the better utilization of available water supplies and wetland acreages in the face of increasing agricultural expansion. Planning the location of the station and developing plans and specifications are being accomplished with the $50,000 appropriation.

The 1963 estimate of $139,000 is for the construction of a field laboratory that will operate as a substation of the main research laboratory once it is constructed and placed in operation. Constructing this field laboratory will enable an immediate start on the work of determining the most effective ways of maintaining optimum populations of waterfowl. The field laboratory will be constructed on a site near Woodworth, N.Dak., that has already been acquired under the wetlands acquisition program.

The estimate includes $55,000 for the construction of a field laboratory; $20,000 for a residence; $15,000 for a garage equipment shed; $20,000 for water supply and impoundment structures; and $29,000 for roads, fences, gates, vehicles and other equipment needed to carry out seasonal studies and experiments on habitat requirements, ecological relationships and management of waterfowl in pothole habitat.

Itemization of estimate—Construction

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$4,430,295	$7,672,936	$4,332,000	−$3,340,936
Unobligated balance brought forward	−1,956,731	−2,661,436	−246,000	+2,415,436
Unobligated balance carried forward	2,661,436	246,000		−246,000
Appropriation	5,135,000	5,257,500	4,086,000	−1,171,500
Obligations by objects:				
11 Personnel compensation	585,812	706,000	377,000	−329,000
12 Personnel benefits	26,052	30,000	23,000	−7,000
21 Travel and transportation of persons	75,823	90,000	75,000	−15,000
22 Transportation of things	10,752	14,000	10,000	−4,000
23 Rent, communications, and utilities	33,219	10,000	10,000	
24 Printing and reproduction	46,816	9,000	10,000	+1,000
25 Other services	76,703	148,000	45,000	−103,000
Services of other agencies	103,618	30,000	95,000	+65,000
26 Supplies and materials	199,662	209,936	100,000	−109,936
31 Equipment	401,385	141,000	85,000	−56,000
32 Lands and structures	2,870,453	6,285,000	3,502,000	−2,783,000
Total obligations	4,430,295	7,672,936	4,332,000	−3,340,936

STATUS OF CONSTRUCTION PROGRAM

Senator BYRD. Mr. Janzen, will any of the five new hatcheries for which funds are requested in this bill be completed during fiscal year 1963?

And if so, which ones?

Mr. TUNISON. Mr. Chairman, none of the hatcheries for which we are asking funds will be completed with these funds this year. They all contain funds for continuing construction.

CHATTAHOOCHEE FOREST, GEORGIA, NATIONAL FISH HATCHERY

Senator BYRD. Does this budget contain funds for the second phase of expansion work initiated last year at the Chattahoochee Forest Fish Hatchery?

Mr. TUNISON. No, sir, it does not, Mr. Chairman.

Senator BYRD. If not, and as you have said it does not, please furnish for the record a statement of the work to be done and its cost.

Mr. TUNISON. We will be glad to do that.

(The information referred to follows:)

This hatchery produces trout for stocking waters within and adjacent to the Chattahoochee National Forest. Fishing pressure on these waters has increased rapidly in the past few years; on several selected management area streams the number of fishermen increased 385 percent in 7 years. To meet the increased fishing pressure it has been agreed to open additional management areas in the forest, and to develop and manage streams on privately owned lands under suitable lease agreements. In addition, the State has scheduled the construction of access roads to streams now lightly fished because of inaccessability, and started removal of rough fish to increase trout-carrying capacity in some streams.

A survey by fishery biologists shows that there are about 690 streams in the nothern part of the State which are suitable for trout. About 175 of these are being stocked. Present requirements are estimated to total 400,000 catchable-size trout weighing 133,000 pounds. On completion of various programs to increase the recreational use on the waters of the Chattahoochee National Forest and other suitable waters, annual trout stocking requirements in the State will amount to 600,000 fish weighing 200,000 pounds. It is anticipated that with completion of the development program for the Chattahoochee Forest National Fish Hatchery, the annual production will be about 100,000 pounds of trout.

In fiscal year 1962, Congress appropriated $150,000 for an expansion program at this station. These funds will be used to (*a*) replace the Mill Creek water supply dam intake structure and pipeline, (*b*) construct trout-rearing facilities with water supply features, (*c*) provide a supplemental water supply to each building for fire protection and miscellaneous uses, (*d*) construct a concrete bridge, and (*e*) purchase various items of fish-cultural and maintenance equipment.

Funds are now required to complete the development program for the Chattahoochee Forest Hatchery.

Additional funds needed for the program

Air, powerlines and floodlights to raceways	$12,000
Equipment storage building	15,000
2 residences with carports (nearest available housing 31 miles from station)	40,000
Water supply and sewage disposal	4,000
Complete grading, filling, and surfacing roads	39,000
Fencing and landscaping	19,000
Equipment	5,000
Total funds needed	134,000

RANCH A IN WYOMING

Senator MUNDT. Mr. Chairman, while we are on trout hatcheries, I would like to ask a question.

Senator McGee of Wyoming has been in contact with you in connection with what is known as Ranch A out in Wyoming.

Mr. TUNISON. That is right, Senator Mundt.

Senator MUNDT. Will you tell us what your plans are or what studies you have given to the program that he envisions?

Mr. TUNISON. If I might back up just a bit on that: At the time we finally made the selection of McNenny in your State of South Dakota, we had, along with McNenny, considered the site at Ranch A, Sand Creek, and for various reasons we finally selected McNenny at that particular time.

It is a very exceptional site. The water supply is good. And the facility, or the land there, would lend itself to development for either a production hatchery or a research station.

Senator MUNDT. I believe he has in mind something in the nature of a research station, because the bulk of the trout population in Wyoming is rather far removed from Ranch A.

Mr. TUNISON. That is right, Senator. Throughout the years we have spent considerable sums of money, and effort, in research on other phases of trout propagation. We have worked on diseases and nutrition, but I must admit that we have neglected the field of genetics. For this reason, we have considered this now for at least 5 years as a program. We do have a program, and it is a matter of finding a site which Ranch A would lend itself to, and at such time as we have the necessary funds, we would embark upon such a program.

Senator MUNDT. I have been out to Ranch A. It is a place which is pretty hard to duplicate at many other places in the world, both from the standpoint of the water and the fact that somebody has a substantial number of buildings and ponds already constructed in that area. What would you envision in terms of dollars would be required to get underway with the kind of research station that you have described?

COST OF RANCH A

Mr. TUNISON. It is my understanding that the owner is willing to sell for a little over $300,000. We would estimate around $340,000, including our appraisal costs and necessary realty work.

You have been there, and I am sure you agree with me that that lodge is beautiful. It is something that no doubt raises the price of that piece of property. But it is our understanding recently that the owner would be willing to sell for a little over $300,000. In the overall, through years of continuing construction, it will cost better than a million dollars before we are through. A statement concerning studies of qualities and selective breeding of sport fishes and estimated costs is inserted for the record:

(The statement referred to follows:)

STUDIES OF GENETICS AND SELECTIVE BREEDING OF SPORT FISHES

The development of genetic facts and principles and their continuing application to the selective breeding of domestic animals and cultivated plants is recognized as a successful and profitable program. Similarly, the scientific selection and breeding of propagated fishes will produce strains of uniformly high quality and with desired characteristics highly advantageous in the more intensive fishery management required to meet growing recreational demands.

Cultivated sport fishes are inherently variable in physical and physiological characteristics. This strongly suggests, and limited short-term trials with a few aquarium and hatchery stocks confirm, that genetic stabilization and upgrading of sport fishes is feasible. However, substantial benefits will accrue only through major and sustained effort. The Bureau's research planning envisages such studies, a proposed Federal research function of such merit and propriety as to have elicited strong support from professional fishery conservationists.

As planned, the rainbow trout is the choice for first research effort. This fish is widely distributed, has high recreational popularity, is important in the production of Federal, State, and private hatcheries, and is adaptable to closely controlled propagation. The scientific knowledge and technical developments resulting from this initial study will be applicable to studies of other fishes.

A good site for this trout study, known to the Bureau for some years, has recently become available for purchase—Ranch A and the adjacent Babcock tract located on Sand Creek near Beulah, Wyo. This property includes approximately a square mile of land, an excellent spring-water supply, and major improvements having an estimated replacement value approaching $1 million. Ranch A is now operated as a private trout hatchery and resort. The major improvements are well constructed and in good condition; they can be easily remodeled to provide, in large part, facilities needed for the proposed research. A most important consideration is the spring-water supply of at least 12 cubic feet per second arising on the property and entirely suitable in temperature and quality for trout propagation. Such water supplies are rare.

At this site, a four-stage development of facilities and research program could be undertaken:

PHASE 1		
Construction:		
Purchase Ranch A and Babcock tract, including surveys, appraisals and related costs of acquisition		$340,000
Develop detailed engineering plans		60,000
Remodel existing structures to provide office, laboratory, library, garage, shop, and storage space		60,000
Subtotal, phase 1 construction		460,000
Operation and maintenance: Employ nucleus research staff to develop detailed biological program	$35,000	
PHASE 2		
Construction:		
Experimental hatchery and laboratory facilities with equipment		350,000
Three residences with garages		60,000
Subtotal, phase 2 construction		410,000
Operation and maintenance: Salaries and expenses of research staff (increase of $55,000)	$90,000	
PHASE 3		
Construction:		
Trout rearing facilities		290,000
Special research equipment		40,000
Subtotal, phase 3 construction		330,000
Operation and maintenance: Salaries and expenses of research staff (increase of $80,000)	$170,000	
Total constructions funds needed for the program		1,200,000

PHASE 4

Operation and maintenance: Salaries and expenses of research staff (increase of $80,000) ---------- $250,000

NEED FOR LABORATORY BUILDING

Mr. TUNISON. There will be need for a laboratory building, and then a number of very small ponds to hold fish from one year to the next, with selected breeding and work on genetics, which as I think you appreciate, it is necessary to continue these generations over a period of time.

CONVERSION OF LODGE

Senator MUNDT. Would your plan be to try to convert that lodge into a laboratory, or into an administrative building, or quarters for personnel, or what would you do?

Mr. TUNISON. Probably a combination of both. It is a shame to do that, but in this particular case we are more concerned with the water supply than we are with the beautiful lodge. We would not leave it as a lodge, as such, I can assure you.

Senator MUNDT. But I mean it would not be torn down.

Mr. TUNISON. No, definitely not.

Senator MUNDT. You would convert it?

Mr. TUNISON. That is right.

Senator MUNDT. As I recall there are some other buildings there too that are to be converted into quarters for personnel, cabins.

Mr. TUNISON. Yes, in the back of that lodge there is a small private hatchery that would not serve its purpose for us. We would have to replace that.

Senator MUNDT. But there are some ponds there.

Mr. TUNISON. That is right.

Senator MUNDT. Thank you, Mr. Chairman.

NEW HATCHERY IN TENNESSEE

Senator BYRD. Mr. Tunison, Senator Kefauver is here now and may wish to ask some questions about the matter which we were just discussing a few minutes ago.

Senator Kefauver?

Senator KEFAUVER. Thank you, Senator Byrd.

About a little more than a year ago, the Interior Department felt, as we all feel in Tennessee, with the increasing number of lakes and tourists and vacationers, that another fish hatchery was imperative and necessary to take care of the demand in Tennessee and to some extent in western North Carolina.

We have one hatchery at Erwin, Tenn., where the capacity is limited, and it is not sufficient at all to take care of the need. So the State game and fish people and the good people at the Interior Department have, since that time, been looking around for the best possible site to locate a hatchery. The need for it has been recognized by the Fisheries and Wildlife section of the Interior Department and by the Secretary of the Interior and by others there, and Mr. Tunison has been closely associated with the need and with the search for a location for a hatchery.

It is my understanding, and, Mr. Tunison, if you will speak on this subject and enlarge on my remarks, I would appreciate it, that they have found an ideal location at Dale Hollow Reservoir for the construction of a new hatchery but they did not make the decision in time to get it formally submitted to the Bureau of the Budget, or anyway the decision was just recently made, and it is not in the budget request as it came up.

The first phase would be $195,000. And then I also understand that an appropriation of $59,000 for the establishment of a fish management team to work in connection with the hatchery is necessary.

We are very anxious that this be included in the appropriation, and I have a brief statement in more detail which I would like to make a part of the record at this point, if I may.

Senator BYRD. It may be placed in the record.

(The statement referred to follows:)

DALE HOLLOW DAM, TENN., NATIONAL FISH HATCHERY

Within the Appalachian Range a preponderance of the acreage is in Federal ownership. The northern terminus is comprised of the Unaka, Nolichucky, and Wautauga districts of the Cherokee National Forest and in the southern portion are the Tellico, Ocoee and Hiwassee districts. Midway along the boundary, and straddling the North Carolina-Tennessee line, the Great Smoky Mountains National Park divides the holdings of the Forest Service. For all practical purposes the entire eastern area of Tennessee is now owned and administered by the Federal Government, and the total acreage in such ownership is well over a million acres. Add to this the network of 12 tributary storage reservoirs owned or operated by the Tennessee Valley Authority in the eastern area and it becomes obvious that any consideration of fisheries management problems be viewed from the standpoint of all the governmental agencies involved. Also, in north central Tennessee some dams have been constructed by the Corps of Engineers. The waters below Dale Hollow and Center Hill Dams are suitable for trout. It appears that the reservoirs created by these dams provide suitable habitat for cold-water fishes.

The cold water discharged from the deep, stratified, tributary stream reservoirs in the TVA system has provided high-quality trout fishing for several years. Presently, the rivers below Norris, Wilbur, South Holston, Chilhowee, and Appalachia Dams contain good fishable trout populations from fingerling stocking. However, new research findings just completed on the Clinch River strongly indicate that the stocking of larger trout at more frequent intervals will more than triple the catch by providing a more stable year-round fishery.

According to present management studies, by 1965 there will be a requirement for approximately 1 million more trout for the stocking of waters in the State of Tennessee than present facilities, both State and Federal, will be capable of producing. Since additional trout are needed for the stocking of waters on land under Federal control, the Tennessee Game and Fish Commission feels that a new national fish hatchery should be constructed in Tennessee.

During the calendar year of 1961, the Bureau of Sport Fisheries and Wildlife working with the Tennessee Game and Fish Commission, the TVA and the Corps of Engineers, looked at 77 potential hatchery sites. The most suitable site is below Dale Hollow Dam, a Corps of Engineers project. There are pipelines through this dam which would permit a gravity water supply of approximately 5,000 gallons per minute of a temperature range from about 48° to a maximum of 61°, with the general maximum being about 57°. About a half mile below the dam there are 65 acres of land upon which a large trout hatchery could be constructed. This land is owned by the Corps of Engineers. The Corps is willing to make the land available to this Bureau for the construction of a trout hatchery.

With the 5,000 gallons of gravity water and the funds enumerated below, a trout hatchery could be constructed that would produce 100,000 pounds or more of trout annually, at an operating cost of $125,000 per year. Should it be determined at some subsequent date that there was need to enlarge this

hatchery, there is space in the dam whereby a booster pump could be installed that would double the hatchery water supply (10,000 g.p.m.).

Funds needed for the program

First phase:	
Acquire water and land rights, use agreements, preliminary engineering	$20,000
Water supply and drainage lines including intake and control structures	160,000
Entrance road	15,000
Total	195,000
Second phase:	
Concrete raceways with individual water supply and drainage features	117,000
Combination hatchery building, including hatching room, fish food cold-storage and preparation rooms, laboratory, display facilities, storage, shop, and office	155,000
One residence with garage	20,000
Domestic water supply and sewage facilities	18,000
Equipment (fish-cultural and maintenance)	15,000
Total	325,000
Third phase:	
Concrete raceways with individual water supply and drainage features	187,000
Garage and storage buildings (2)	35,000
Residence with garage	20,000
Rehabilitate present buildings	12,500
Driveways, fencing, landscaping, floodlights, air and electric outlets at raceways, and utilities	50,500
Equipment (fish-cultural and maintenance)	25,000
Total	280,000
Total estimated cost of the program	800,000

DEPARTMENT SEARCH FOR HATCHERY SITES

Senator KEFAUVER. I would appreciate it, Mr. Tunison, if you would have something to say about that.

Mr. TUNISON. I would be glad to, Senator Kefauver.

Following our meeting last April in the Interior Department, we spent months looking at sites in eastern Tennessee. We have tried to keep your office informed on the status of those inspections.

Last spring you and Senator Gore and Congressman Baker met with Secretary Udall and Assistant Secretary Briggs and brought up this matter. From that time on, we spent months in looking at sites in eastern Tennessee.

FAVORABLE ASPECTS OF DALE HOLLOW

It was not until January, after looking at some 77 sites, that we finally decided on Dale Hollow. We feel that this is the best site in the eastern part of Tennessee, and I might say that I had the pleasure of looking at that on the ground in the middle of January while I was down that way.

I think it will serve the purpose well. It happens to be a Corps of Engineers project and not only the local manager but other corps people are heartily in favor of having a hatchery below the dam.

There is a pipe through the dam to which we can attach and get our water supply. There is land available. I think that it will be a very good hatchery site. There is no money in the budget as you mentioned, Senator.

In the case of the management project, we too would favor that. This subject, gentleman, has been discussed in this committee before. We now put out right close to 3 million pounds of fish annually; and as you also know, it costs money to raise those fish. We do not like to see those fish stocked and wasted. It would be our purpose, wherever it is possible to have management people check the waters to determine if the fish are needed, and if needed that the waters will be stocked properly, so that we will get the greatest returns possible. For that reason we would favor a management project in connection with this hatchery.

Senator KEFAUVER. Do I have the amount right? One hundred ninety-five thousand dollars would be what would be needed in the next fiscal year?

Mr. TUNISON. That would be required to initiate the construction of that hatchery, yes, sir.

Senator KEFAUVER. And the Erwin Hatchery capacity is at a peak now, and there is a great need for another hatchery in that area?

Mr. TUNISON. That is correct, Senator. I think that we have developed Erwin to the maximum. It is a matter of the water supply. I think that when it is completed, with the money we have this year, we will have reached that peak.

Senator KEFAUVER. And there is a need for that whole area?

Mr. TUNISON. Very definitely, Senator. There is no question. Forrest Durand, the Tennessee director of fish and game, has written to us many times on the additional need.

Senator KEFAUVER. Thank you very much.

Would you, Mr. Tunison, place in the record a concise statement with reference to the Dale Hollow Hatchery and the fish management team, including the funds that would be required in this next fiscal year?

Mr. TUNISON. We will be glad to, Senator.

(The material referred to follows:)

FISHERY MANAGEMENT PROJECT IN EASTERN TENNESSEE

A project to cost $59,000, is needed to provide a fishery management team in eastern Tennessee. The project would:

(*a*) Provide technical guidance in the stocking of fish produced at the Erwin and Dale Hollow National Fish Hatcheries.

The Bureau of Sport Fisheries and Wildlife produces trout at its hatchery at Erwin, Tenn., for stocking in the public waters of that State. A second large trout hatchery has been authorized for Tennessee and will be constructed at Dale Hollow Dam. This will serve the tailwaters below dams created by the Tennessee Valley Authority and the Corps of Engineers. Efficient operation of these hatcheries requires attention to fish stocking requirements including the kind of trout, the number and size of fish required, and the season when they can contribute the most to sport fishing. Distribution of trout in this area presents special problems because of the distances involved and the location of the waters.

Interest in trout fishing in eastern Tennessee is growing rapidly. Tennessee ranks fifth in number of nonresident fishing licenses sold, and wishes to maintain this position.

(*b*) Provide a means of cooperation with the Tennessee Game and Fish Commission in sport fishery programs.

The director of the Tennessee Game and Fish Commission has strongly endorsed the proposed management project. Biologists of the State and Federal agencies will work closely in examining waters below the large Government dams and in certain of the reservoirs to determine suitability for trout, to formulate realistic trout stocking schedules, and to learn the contribution the fish hatchery fish make to public fishing and fish restoration programs. Joint surveys of waters in Cherokee National Forest are needed to meet the greatly expanded requirements for recreational fishing in those waters.

(c) Conduct fishery surveys and provide technical assistance to the Superintendent, Great Smoky Mountains National Park: The Bureau has a responsibility to provide technical assistance to the National Park Service in the management of the important trout fishery at Great Smoky Mountains National Park. Conditions in the park streams, the fish populations they contain, and the extent of public use change from year to year. Valuable information gathered by an earlier fishery research project must be kept up to date. The new project will determine the annual requirements for hatchery fish, conduct creel and angler censuses on important streams, and provide current information on the status of fish populations in park streams. The restoration of native fish species is indicated in several watersheds by the National Park Service.

The funds indicated, $59,000, would provide the salaries of three fishery biologists on a permanent basis, temporary fishery aids to assist in the program during the summer season, the necessary clerical assistance, costs of travel, transportation, and equipment. Principal headquarters would be at Knoxville.

BOWDEN AND LEETOWN, W. VA., HATCHERIES

Senator KEFAUVER. Thank you, Mr. Chairman.

Chairman HAYDEN. Questions have been raised regarding needs at the Bowden and Leetown, W. Va., Fish Hatcheries. Can you tell the committee what facilities are desirable at these places and the estimated costs of them?

Mr. TUNISON. May I take the Bowden Hatchery first? That is a relatively new hatchery. We thought, actually, that we had it completed and, I believe, 2 years ago we had a rather serious flood there, and it was necessary to construct a dike to prevent that flooding. Congress provided $70,000 last year for that.

There is yet need for some $62,000 to complete a dirt pond, in conjunction with this flood dike. That would complete that.

Chairman HAYDEN. Senator Byrd, would you want to ask some questions about this?

Senator BYRD. I would just like for Mr. Tunison to continue to elaborate on the requirements for the Bowden Hatchery and the Leetown Hatchery, and I would also like to insert in the record a letter which I have written to the distinguished chairman with reference to these two items.

Chairman HAYDEN. That may be done.

(The letter referred to follows:)

U.S. SENATE,
COMMITTEE ON ARMED SERVICES,
February 28, 1962.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
U.S. Senate, Washington, D.C.

DEAR SENATOR HAYDEN: Inasmuch as I am having some floods in southern West Virginia, I anticipate leaving by automobile, since flying weather is bad, and hope to visit the flooded area. I hope to be back in time to attend the hearings on Friday morning. However, should it be impossible for me to get back to Washington for the Friday morning hearings, I would like very much to make the following observations for your consideration and that of the committee.

I am informed that $62,000 is needed for the new national fish hatchery at Bowden, W. Va., and that $148,000 is needed for expansion of the national fish hatchery at Leetown, W. Va. Neither of these is budgeted in fiscal year 1963.

With reference to the Bowden hatchery, $47,000 is needed to complete the earthen ponds, service roads, and landscaping, and for fencing and drainage ditches. The sum of $15,000 is needed for equipment (fish-cultural and maintenance).

In regard to the Leetown hatchery, $30,000 is needed for the channel (flood bypass). The sum of $70,000 is needed to construct three earthen raceways and to provide a pipeline bypass for water used for experimental work in the hatchery, to be returned to the drainage channel below earthen raceways. The sum of $6,000 would be needed for equipment, $30,000 would be needed for screen trout raceways, and $12,000 would be needed for a storage building.

I shall attempt to include these items in the appropriation bill for the Department of Interior and related agencies, so I wanted you to know of my interest in the foregoing matters.

With highest personal esteem,

Sincerely yours,

ROBERT C. BYRD, *U.S. Senator.*

BOWDEN HATCHERY

Mr. TUNISON. Yes, Senator Byrd.

Again, it was my pleasure to be at Bowden last October, and I am convinced in my own mind of the wisdom, when funds are available, of making that additional dirt pond there at Bowden.

In addition to that, there certainly is need for landscaping. If you have been in there recently, I think you will agree with me. It does need to be improved in that respect as far as the public is concerned.

Senator BYRD. Is it not true also that about $15,000 is needed for equipment and maintenance?

Mr. TUNISON. That is right.

Senator BYRD. And that there is some need for service roads and for fencing and drainage ditches at Bowden.

Mr. TUNISON. That would be included in the $62,000, Senator. Does that answer your question?

Senator BYRD. Yes, indeed. Thank you.

LEETOWN HATCHERY

Mr. TUNISON. In the case of Leetown, that is one of our more important fish hatcheries and laboratories here in the eastern part of the the country. It is a combination station. Fish are produced there in the normal manner of fish production and are distributed throughout parts of Virginia, West Virginia, and the Maryland area.

In addition, we have centered at Leetown our eastern fish disease laboratory. We have one on the east coast and one on the west coast.

This laboratory has been in operation now since the thirties and we rely very heavily upon it for research in order to control diseases of fish in hatcheries and actually things that they learn can be applied at times to wild fish. In addition to that, they also carry on a training school for fish culturists in training men to detect diseases and apply control measures. These trainees after they are there for a year are transferred to various hatcheries throughout the country. It is not local. It is a national program. They go from one coast to the other.

In the case of the needs of Leetown we have made some recent improvements. There yet remains to be done some work on the flood channel involved, some additional raceways, and, particularly because

it is a research station, we are desirous of screening certain of those raceways. You may think it is odd. Here in our own Bureau we have parts of our activities greatly concerned with the preservation of birds. Well, we like the birds, too, but we don't want them eating up our fish; so we feel it advisable to screen raceways. There is need for some equipment and a storage building.

TOTAL COST OF WEST VIRGINIA WORK

The total of those items, in response to your question, would be $148,000.

Senator BYRD. And neither of the two items is budgeted in fiscal year 1963?

Mr. TUNISON. No, Senator.

Senator BYRD. Do you think it imperative that adequate moneys for both items be appropriated in this fiscal year?

Mr. TUNISON. Those items are well justified, and certainly the expenditure of those funds would greatly help those projects.

Senator BYRD. Were the requests for the two items included in your agency's request to the Bureau of the Budget? Were these items included?

Mr. TUNISON. Frankly, Senator, I can't remember. I should think so in the case of Bowden, because it would be a continuation from what we received in 1962. I can't honestly say in the case of Leetown. We can supply that for the record, if you wish.

Senator BYRD. Thank you very much, Mr. Tunison.

Thank you, Mr. Chairman.

(The information referred to follows:)

Budget estimate sent to the Bureau of the Budget for fiscal year 1963 did not include funds under the construction appropriation for the Bowden or Leetown, W. Va., national fish hatcheries.

QUILCENE NATIONAL FISH HATCHERY

Chairman HAYDEN. I have a letter from Senators Magnuson and Jackson in regard to the Quilcene National Fish Hatchery and their contributions to the trout and salmon situation.

Funds needed for the program include, in the first phase, a hatchery building, $73,000; two residences with single garages, replacements, $40,000; domestic water supply and sewage facilities, $14,000; and equipment, $5,000, for a total of $132,000. Then they go on in the second phase to include rearing ponds, oil and paint building, landscaping grounds, road surfacing and equipment, totaling $115,000, or a total of project funds needed of $247,000. What do you know about that project?

Mr. TUNISON. Quilcene is one of our older stations, dating back, I am sure, into the "teens" sometime—I don't quite recall the date. It has undergone rehabilitation at several different times. The last time, I believe, it was somewhere along in the middle forties, or something like that.

There is heavy demand for trout for stocking the national forest and park areas there. In the case of salmon, I think that we have made a great record at that station. I believe it can be accepted that that hatchery is responsible for establishing the run of chum salmon

in the Hood Canal. We also propagate silver salmon and steelhead.

So as far as the needs are concerned, they are justified, Mr. Chairman.

Chairman HAYDEN. I will place the letter in the record, and if there are any further justification needs, you can place them in.

Mr. TUNISON. We will be glad to.

(The letter referred to follows:)

U.S. SENATE,
Washington, D.C., March 2, 1962.

Senator CARL HAYDEN,
Chairman, Senate Appropriations Committee,
Washington, D.C.

DEAR CARL: We would like to bring to your attention the need for additional facilities for expanding and modernizing fish-cultural operations at the Quilcene, Wash., national fish hatchery.

The Quilcene national fish hatchery is a combination trout and salmon station. Fish produced contribute to the sport fishery in the State and also to the perpetuation of salmon runs in streams of the area. Trout are stocked in waters on lands under Federal jurisdiction, principally to the Olympic and Mount Rainier National Parks, while the salmon provide both commercial and sport fishing.

Average annual production of the Quilcene hatchery is about 56,000 pounds, salmon and trout. Present facilities do not permit either adequate handling of the salmon run or propagation of sufficient trout to meet stocking requirements.

A development program is outlined below which will provide optimum facilities for operations at this station. Modern rearing ponds are needed. An additional hatchery building is required for production and to conduct studies of both trout and salmon in cooperation with the Bureau of Sport Fisheries and Wildlife's research laboratory in Seattle.

Funds needed for the program

1st phase:	
Hatchery building, additional	$73,000
2 residences with single garages (replacements)	40,000
Domestic water supply and sewage facilities	14,000
Equipment	5,000
Total	132,000
2d phase:	
Rearing ponds	85,000
Oil and paint building	4,000
Landscaping grounds	10,000
Road surfacing	11,000
Equipment	5,000
Total	115,000
Total funds needed	247,000

With these additional facilities and adequate operating funds, annual production will be approximately 100,000 pounds of salmon and trout.

Approval of the Appropriations Committee on this project would provide Quilcene with the tools to improve its important role of helping to maintain the sports fishery and salmon runs so essential to the recreation and economy of the Northwest.

Sincerely yours,

WARREN G. MAGNUSON.
HENRY M. JACKSON.

MARION, ALA., NATIONAL FISH HATCHERY

Chairman HAYDEN. Senator Hill has written me a letter with regard to modernization of the Marion national fish hatchery in Alabama. I will insert his letter and the enclosure thereto in the record.

This correspondence indicates that the improvements will require a total of $895,000 and that the first year need is $280,000.

(The letter referred to follows:)

U.S. SENATE,
COMMITTEE ON LABOR AND PUBLIC WELFARE,
Washington, D.C., February 21, 1962.

Re need for funds for modernization of the Marion, Ala., national fish hatchery, Department of Interior appropriation bill.

Hon. CARL HAYDEN,
Chairman, Senate Appropriations Committee,
U.S. Senate, Washington, D.C.

MY DEAR SENATOR HAYDEN: The Marion, Ala., national fish hatchery was constructed more than 25 years ago, and the facilities are badly in need of improvement and modernization to meet the increased demand for warm-water fish and because of new developments in fish culture methods, as well as the deterioration of subsubstandard installations, such as water supply and drain lines, pond embankments, and other essential facilities.

I was very disappointed to learn that the administration's budget for the fiscal year 1963 contains no request for funds for needed improvement of the Marion fish hatchery.

Last fall I requested and obtained from the Director of the Bureau of Sport Fisheries and Wildlife the enclosed report regarding a consolidated program for improvement and modernization of the Marion fish hatchery. The report includes needed items for research, as well as fish production, and I shall appreciate your including it in the record of the hearings on the Interior appropriation bill, together with my letter in support of funds to accomplish the work.

Let me strongly urge approval of the funds needed to carry out the Marion Fish Hatchery modernization program. This would enable the hatchery to meet its responsibilities of furnishing fish to its distribution territory in Alabama, Georgia, and Florida (it also serves as an emergency supply for hatcheries in Mississippi and other Southeastern States); to more effectively fulfill its functions as an inservice training school for warm water fish culturists; and in the field of warm water fish culture research under the direction of the Southeastern Fish Cultural Research Laboratory, which was established at the Marion Hatchery in 1959. This research facility is the only Federal research station of its kind in the United States and its work is of benefit not only to State and Federal hatcheries, but also to commercial and private fish culturists.

I shall be grateful to you and the members of the subcommittee for your earnest consideration in the above.

With kindest regards, I am,

Very sincerely,

LISTER HILL.

MARION, ALABAMA NATIONAL FISH HATCHERY AND SOUTHEASTERN FISH-CULTURAL RESEARCH LABORATORY

Program for the improvement and modernization of the station.

Funds needed for the program

1st phase:	
Laboratory and office building, including wet lab and constant temperature room	$165,000
Construct 30 1/10-acre earthen production ponds by dividing ponds Nos. 22–26, install water supply and drainage facilities	85,000
Road, grading, installing culverts, and resurfacing	30,000
Total	280,000
2d phase:	
Construct experimental earthen ponds (50 1/10-acre, 20 1/4-acre, and 10 1/2-acre ponds) install water supply and drainage facilities	200,000
Divide and rebuild ponds Nos. 27, 30–34, with a surface area of 11 acres and install water supply and drainage facilities	55,000
Water supply for research laboratory and research ponds (well and pump)	24,000
Total	279,000
3d Phase:	
Divide and rebuild ponds Nos. 28, 29, F, L, M, N, O, and P with a surface area of 35 acres and install water supply and drainage facilities	165,000
Garage, shop, storage building for laboratory	20,000
Water supply for rebuilt production ponds and domestic use	34,000
Fertilizer, dry feed, and chemical storage building	12,000
2 duplex apartments for trainees	60,000
Raceways, 400 linear feet of double raceways, 8 feet wide and 3 feet deep	25,000
Laboratory and fish cultural equipment	20,000
Total	336,000
Total estimated cost of the program	895,000

JUSTIFICATION

Construction of the Marion Station was accomplished more than 25 years ago. While adequate at the start, facilities have become badly outmoded because of the increased need for specific species, sizes, and numbers of warm-water fishes, changes in the program of the station, new developments in fish cultural methods, and deterioration of substandard pond installations such as water supply and drain lines, embankments, and other essential facilities.

Since the Marion Hatchery was built, the needs for fingerling fish to stock both existing and newly created waters have increased manyfold. Not only does the station furnish the necessary fish for an assigned distribution territory in Alabama, Georgia, and Florida, but it also serves as an emergency supply for hatcheries in Mississippi and other Southeastern States. Three species of fish in addition to largemouth bass and bluegills are being supplied to applicants at the present time. Since the pond system was built, extensive cultural methods in large ponds have been replaced by intensive methods in smaller, more manageable units.

In addition to the production program for which the hatchery was originally designed, two more functions have been located at Marion during recent years. In 1951, an inservice training school for warm-water fish-culturists was established at the station. This is the only school of its type in the United States. The obsolete, substandard production facilities greatly hamper efforts to demonstrate modern fish cultural practices and techniques which is a major objective of the training center.

A third activity, warm-water fish cultural research, was initiated at Marion in 1959. In cooperation with the Branch of Fishery Research, the Southeastern Fish Cultural Research Laboratory has been established at the Marion Hatchery to conduct needed research on problems related to warm-water fish culture. While the results of this work will primarily benefit hatcheries, both commercial and private fish culturists will obtain information that should enable them to conduct a more profitable enterprise.

The renovation of the remaining obsolete ponds of the Marion Hatchery, along with the addition of 80 small earthen ponds, should satisfy the present needs for fish production units, training uses and pond space for essential warm-water fish cultural research. The multiple program being carried on at Marion makes the hatchery the center of interest for warm-water fish culture in the United States. Until the station is completely modernized, this major phase of our fish conservation effort will not be able to make the contribution it should to the important warm-water sport fishery it services.

MARION, ALA., FISH HATCHERY

Chairman HAYDEN. Do you have any information you can give the committee about this?

Mr. TUNISON. This, Mr. Chairman, is something like the Leetown station. It is actually the major station in the Southeast. It is a combination production hatchery and research station and training station, very similar to Leetown; only in this case the work is done on warm water fish. And in the area of research and training, I have to confess that we have not given the attention to warm water species of fish as compared to trout and salmon, over, say, the last 30 or 40 years. The research work was only recently initiated at Marion. And as Senator Hill has written to you, we do feel that there is work which will justify expansion of the Marion station.

ERWIN FISHERY

Senator KEFAUVER. Mr. Chairman, since you have finished that, Mr. Tunison, you said you were doing some more work, finishing-up work, at the Erwin Fishery. Did I understand that?

Mr. TUNISON. Money was appropriated in 1962, the contract will be let this spring, and when that is completed I am reasonably sure we will have reached maximum production.

Senator KEFAUVER. Are there any additional funds required to carry out that contract?

Mr. TUNISON. No, Senator, not as far as we now know.

Senator KEFAUVER. And how about the maintenance? Is that out of general funds?

Mr. TUNISON. That is out of our regular budget, and at the present time we feel those are adequate.

Senator KEFAUVER. Very well.

FISH HATCHERIES IN MISSISSIPPI

Chairman HAYDEN. I have a letter from Senator Stennis. He asks that I ask you the following questions:

How many national fish hatcheries do you have in Mississippi?

Mr. TUNISON. There are three, Mr. Chairman.

Chairman HAYDEN. Where are they located?

Mr. TUNISON. Tupelo, Meridian, and Lyman.

Chairman HAYDEN. Is the Lyman Hatchery fully developed?

Mr. TUNISON. No, sir, Mr. Chairman. It isn't. It is near Gulfport, and we have suffered the effects of several hurricanes there, and unfortunately we have not had the funds to put the station where it does belong. We have not completed it.

Chairman HAYDEN. How much money will be needed to take care of this program?

Mr. TUNISON. $192,000 will be required to complete that.

Chairman HAYDEN. Are there any State fish hatcheries in Mississippi?

Mr. TUNISON. No, sir, Mr. Chairman, there are no State hatcheries in Mississippi.

Chairman HAYDEN. Are there State fishery authorities that you work with?

Mr. TUNISON. Yes, there are, and we have fine cooperation with the State people there. Actually, they cooperate with us at all three of these hatcheries in distributing these fish. We carry on some distribution, but we rely in large part on the help from the State people.

FISH MANAGEMENT FOR MISSISSIPPI

Chairman HAYDEN. The Senator has some suggested questions on fishery management for Mississippi.

Would this project be carried out in cooperation with the Mississippi Game and Fish Commission?

Mr. TUNISON. If such a project were established, very definitely it would, yes.

Chairman HAYDEN. Would the project result in savings in fish produced at the national fish hatcheries?

Mr. TUNISON. We feel it would. Unquestionably, and I hate to admit it, we feel at times we do waste fish. If the waters could be examined before the fish are stocked, then I am sure that the salary of a biologist would more than be offset by the savings.

Chairman HAYDEN. How will it contribute to better fishing?

Mr. TUNISON. By stocking the proper species and amount of fish in the various waters.

NEEDS OF OTHER STATES

Chairman HAYDEN. In what other States are similar projects needed?

Mr. TUNISON. Projects of the nature to which you refer are needed in Montana, Ohio, West Virginia, either Texas or Oklahoma, and in Mississippi.

Senator MUNDT. Will you explain what there is about those States that make them different from other States.

Mr. TUNISON. I choose those because they are hot spots in our regions.

Senator MUNDT. Meaning what?

Mr. TUNISON. In the Montana area, because of the Ennis Hatchery there, with the Madison River, we feel that we should have closer biological attention to the stocking of those fish in that general area.

In the case of Ohio, we of course have the farm pond program throughout that whole general area.

In West Virginia, as Senator Byrd I am sure would agree, at Bowden, in the national forest area there, we feel if we had a biologist

to check first and then followup on these stockings, we would have better return from the hatchery fish.

Senator MUNDT. In a State like Ohio, do you have a Federal hatchery that provides pan fish for stock ponds on farms?

Mr. TUNISON. Yes, indeed.

Senator MUNDT. With bass?

Mr. TUNISON. Bass, bluegills, and walleyes at Hebron, Ohio, and Senecaville. We have two hatcheries in Ohio. In the case of South Dakota, you may be wondering. We do have a project, as you know, in South Dakota, McNenny. We work very closely with the State people in the stocking out of McNenny.

RESTRICTIONS ON STOCKING FARM PONDS

Senator MUNDT. What restrictions or requirements do you place on stocking a farm pond with Federal fish?

Mr. TUNISON. Normally we would hesitate to stock anything less than one-half acre. There are exceptions, but normally they must be at least one-half acre in size. Depending on the latitude of the country, they have to have certain depths. They must be deeper in the northern part of the country so that they don't freeze out. In other words, they must go down to 8 feet in certain areas. They must have continuous water. In other words, if they habitually go dry year after year, there is no point in stocking fish.

Senator MUNDT. They have to be made available for public fishing?

Mr. TUNISON. Yes, they do, sir.

SOURCE OF FISH FOR SOUTH DAKOTA LAKES

Senator MUNDT. Where do you get the fish, if you stock any, in the lake region of South Dakota, which roughly dips in 100 miles from the Minnesota line and 100 miles down from the North Dakota line, but is 400 miles away from McNenny.

Mr. TUNISON. For that type of stocking, they would come from Yankton and before we had Yankton they were transported from New London, Minn.

Senator MUNDT. Right. What types of fish are you producing at Yankton?

Mr. TUNISON. They are the warm-water species, bass and bluegills and walleye pike. The walleyes we wouldn't use in farm ponds, of course, and catfish.

Senator MUNDT. How about perch?

Mr. TUNISON. No.

KANSAS STATE UNIVERSITY LIBRARY
MAY 16 1962
MANHATTAN, KANSAS

PERCH MANAGEMENT

Senator MUNDT. Do you raise any perch any place?

Mr. TUNISON. No, only by mistake.

Senator MUNDT. What have you got against perch. I used to make a living catching perch.

Mr. TUNISON. Certainly in farm ponds, they would very quickly overpopulate the pond, and you would have a stunted population. In the Adirondacks we don't want to see perch. They cause us trouble in the lakes up there.

Now, I will go along with you that there are wonderful places for perch fishing. They will grow to wonderful size, and they make good

ice fishing. Under those conditions, yes, I am for perch in the right places. But we don't rear them.

Senator MUNDT. No place in the Federal Government?

Mr. TUNISON. No, sir. Only by mistake.

Senator MUNDT. How about sauger?

Mr. TUNISON. I don't think we do. Normally we have difficulty in obtaining those eggs. The States are very jealous with some of their species and it is only in cooperation with the local State that we are able to participate in, say, walleyes. We do have that cooperation in South Dakota.

ROAD FROM BRIGHAM CITY TO BEAR RIVER BIRD REFUGE

Chairman HAYDEN. Will you please tell the committee about the road from Brigham City, Utah, to the Bear River Bird Refuge, about which Senator Bennett testified this morning? How much of the road is within the refuge? And how much will it cost to improve the road as proposed by the county commissioners? I understand that the county is willing to supply labor and equipment if the United States will provide the necessary materials; am I correct?

Mr. PARKER. The Bear River refuge is located on the edge of Great Salt Lake, 14 miles from the town of Brigham City. The county road is the only access that we have to the refuge. There is about a half a mile of it that is within the refuge itself, and there are around 11½ miles of it outside that are in poor shape, as was testified to this morning.

Chairman HAYDEN. Do you have authority to spend funds to improve a road outside the boundaries of the Bear River Migratory Bird Refuge?

FUNDS FOR BEAR RIVER REFUGE

Mr. PARKER. We don't have any specific authority currently to build or improve the roads outside the refuge.

Chairman HAYDEN. If we included that authority in this bill, it would be all right?

Mr. PARKER. As far as I understand that would adequately take care of it, if the committee recognized that.

Chairman HAYDEN. Now what is the estimated cost that you have on this?

Mr. PARKER. The figures that have been developed with the county would run to $105,000. This would include widening the road to 24 feet, graveling it, putting a 3-inch black-top surface on it, and straightening a very sharp curve in the road where it crosses one of the drains.

Chairman HAYDEN. Does this include the bridge?

Mr. PARKER. It includes the bridge; $105,000 would include all of it.

MIGRATORY FISH

Chairman HAYDEN. Would you please inform the committee of the status of your activities under Public Law 86–359 with regard to research in migratory marine species of game fish? What do you plan under this authority for the coming fiscal year?

Mr. TUNISON. Mr. Chairman, that program was initiated 2 years ago with funds appropriated by Congress, and we established our

main laboratory at Sandy Hook, N.J. With those funds and from that laboratory, we established a field station at Tiburon Naval Base in California. The Navy was glad to provide us quarters there.

We are asking for an increase of $75,000 this year to increase the work on the west coast.

Chairman HAYDEN. What fish are migratory?

Mr. TUNISON. These are all salt water fish, and I would guess that when that language was developed in the bill the word "migratory" was put in to recognize that fish would migrate past the coastlines of various States.

ALCHESAY FISH HATCHERY

Chairman HAYDEN. In this budget there is $100,000 for continuation of work on the Alchesay fish hatchery. Will this amount complete the hatchery?

Mr. TUNISON. No, Mr. Chairman, it will not.

Chairman HAYDEN. If not, how much more will be required and could you economically use that amount in fiscal year 1963?

Mr. TUNISON. It will require $93,000 to complete that hatchery, Mr. Chairman, and we could utilize it in 1963. That will complete the hatchery.

Chairman HAYDEN. Is there a demand for the product of the hatchery that will justify it?

Mr. TUNISON. There is no question on that, Mr. Chairman.

MOURNING DOVE PROGRAM

Chairman HAYDEN. I have received communications regarding a national mourning dove program. Are you familiar with this? If so, do you agree with the need for $256,000 for research and management under the program?

Mr. PARKER. Some year and a half ago, the International Association of Game, Fish, and Conservation Commissioners set up a committee to develop a continuation of a program that had been underway for dove research. There has been, in 1962, some $30,000 that was already appropriated.

I am sorry; in 1962 we received a $26,000 increase to implement this expanded program, and the total, as developed, was $225,000 for the total program.

Chairman HAYDEN. And what is left to be done now?

Mr. PARKER. Well, it would be a continuing research program in cooperation with the State fish and game departments, wherein we are trying to develop methods of better managing doves. This would embrace inventories to determine the current status of the birds.

It would embrace research on methods of improving habitat to increase dove production, and any other aspects of dove management.

Chairman HAYDEN. Do you have funds enough to do that now?

Mr. PARKER. We have a total of $56,000 currently. The program as developed envisioned a yearly budget of $225,000. So we are still quite a way off from what we ultimately would need to carry the program on.

Chairman HAYDEN. How much is the program in this year's budget?

Mr. PARKER. There is a total of $56,000 this year, and, as I say, this is a part of the ultimate program that should be developed.

WHITE WING DOVE

Chairman HAYDEN. There is a dove that comes up from Mexico.

Mr. PARKER. The white wing?

Chairman HAYDEN. The white wing. It arrives about the time the cactus fruit gets ripe. It remains in the Arizona area for a time and then goes back.

Now, where do they go to?

Mr. PARKER. They go into Mexico. They breed in Arizona on up into the southern part of Nevada. We have a separate population in Texas that breeds along the lower Rio Grande Valley. They summer there and winter in old Mexico.

Chairman HAYDEN. How far down?

Mr. PARKER. We have not done enough research on the white wing to know how far down it does go. That would be some of the work that would be contemplated under this type of program.

Chairman HAYDEN. They are a little bit larger than the ordinary dove?

Mr. PARKER. Yes.

Senator MUNDT. Have you any treaty arrangements with Mexico that protect them?

Mr. PARKER. Yes; they are included in the migratory bird treaty with Mexico.

ENNIS NATIONAL FISH HATCHERY

Chairman HAYDEN. I have a letter from Senators Mansfield and Metcalf which I shall insert in the record with regard to modernization of the Ennis National Fish Hatchery, Montana.

Last year Congress appropriated $151,000 for this purpose.

This was only the amount necessary for the first phase of the work. How much is required to complete the improvements?

Mr. TUNISON. Mr. Chairman, it is true there was $151,000 appropriated last year for expansion. The next phase in the construction program would amount to $89,000 and the third phase, the third and final phase, would be $113,000.

ALEUTIAN ISLANDS NATIONAL WILDLIFE REFUGE

Chairman HAYDEN. In connection with your request for funds for the development and improvement of wildlife refuges, you have indicated that $206,000 is needed at the Aleutian Islands National Wildlife Refuge. Does this particular refuge have any connection with the Arctic and Izembek ranges for which funds were refused last year?

Mr. PARKER. No. This relates only to the Aleutian refuge, which is far to the west.

HAGERMAN STATION, IDAHO

Senator DWORSHAK. I have just two or three questions. I would like to get some information concerning the budget funds requested for Hagerman station. This is the only Federal hatchery in Idaho, serving not only our State but northern Nevada also.

I understand the demand is very great, and there is a possibility of installing more rearing ponds. Will someone tell us about that?

Mr. TUNISON. In our budget for 1963, there is only a minor increase shown for operations. It is a part of the $75,000 we are asking for maintenance. There are no construction funds in 1963 for Hagerman.

Senator DWORSHAK. Does the Agency know of any real demand for additional rearing ponds there?

Mr. TUNISON. We have heard of that; yes, sir.

Additional trout could be used in that area. It is a wide distribution area, as you know.

Senator DWORSHAK. It has been operating at full capacity; has it not?

Mr. TUNISON. It has. And we have not been able to satisfy the requirements for that area.

Senator DWORSHAK. How much money would be required in the next year to take care of this extension?

Mr. TUNISON. A project of that nature could start with $160,000 for raceways.

Senator DWORSHAK. And how much of an increase would that mean in the current output?

Mr. TUNISON. That would be the first phase. The second phase would require $147,000 and that would complete it, and with that we should have an increase of about 100,000 pounds of fish.

Senator DWORSHAK. What is the output now?

Mr. TUNISON. Currently it is about 170,000 pounds.

Senator DWORSHAK. Would not this first installment of $160,000 accomplish part of the program? Or do you have to have both segments?

Mr. TUNISON. We would almost have to have both.

Senator DWORSHAK. That would increase the capacity from about 170,000 to 270,000?

Mr. TUNISON. Yes.

Senator DWORSHAK. You have not requested funds for that?

Mr. TUNISON. No, sir, we have not, Senator.

RESEARCH ON TROUT LIVER CANCER

Senator DWORSHAK. Another question. I recall a year ago that, in some of the Western States, trout liver cancer developed in both Federal and private hatcheries, and some money was provided, quite a limited amount, as I recall, for pathology research.

What has been accomplished? You are asking for what, $75,000?

Mr. TUNISON. $75,000 increase for 1963. We are asking for that, Senator.

Senator DWORSHAK. Have you accomplished anything so far or found out the cause of that disease?

Mr. TUNISON. Unfortunately, we have not found out the cause. Let me assure you that we have found out a number of things about the disease. Actually, we have found some elements, chemicals, that will actually cause it. But in trying to pin down our present problem, unfortunately, we have not solved that yet.

Senator DWORSHAK. Is the trouble as prevalent now as it was a year ago?

Mr. TUNISON. I do not believe so. We have not had the reports that we did a year ago.

Senator DWORSHAK. It caused a lot of disruption, particularly in private hatcheries, as I recall.

Mr. TUNISON. That is correct.

Senator DWORSHAK. Some of them were completely put out of business, at least temporarily.

Mr. TUNISON. That is right, Senator.

Senator DWORSHAK. So you think with this money you can really do a job in the next fiscal year.

Mr. TUNISON. We think so; yes, sir.

BETTER FISHING RESEARCH

Senator DWORSHAK. I noticed another item that you had on better fishing. You had an item for $20,000 as I recall. What does that encompass?

Mr. TUNISON. That is a part of the item on extension and training. It appears on page 18, Senator.

Senator DWORSHAK. In these justifications, it is on page 20. "Better Fishing From Hatchery Fish."

Mr. TUNISON. That is right.

Senator DWORSHAK. Is that a practical program?

Mr. TUNISON. Yes, indeed, it is, Senator. And it is to that program that I referred in talking to the chairman on various parts of the country, including Mississippi. It is indeed a very practical program.

Senator DWORSHAK. Can you accomplish what is necessary with $20,000?

Mr. TUNISON. Unfortunately; no. A minimum of $75,000 additional could be used in 1963. A statement detailing this amount is provided for the record.

(The statement referred to follows:)

STATEMENT CONCERNING AN INCREASE OF $75,000 FOR THE ITEM "BETTER FISHING FROM HATCHERY FISH"

Fishery management projects in the States of Arkansas, Montana, Ohio, Texas, and West Virginia are needed to give effective guidance in the stocking of fish produced at the 17 national fish hatcheries located in those States. No fishery management biologists are stationed at locations where they can assist the national fish hatcheries in developing realistic fish production schedules and fish stocking plans or to work with the State fish and game departments in cooperative sport fishery projects. These activities would include the evaluation of the results of stocking hatchery fish in terms of the public fishing afforded. Attention would be given the extensive public trout streams, tailwaters below Government dams, farm ponds built under the agricultural conservation programs and stocked by the Bureau to assure their maximum contribution to sport fishing. Public fishing programs on the national wildlife refuges, Department of Defense areas, and other Federal areas, require technical assistance to achieve their objectives.

The additional sum of $75,000 would permit the assignment of five additional fishery management biologists in the States indicated where the needs are greatest and where particular problems exist. Purchase of necessary equipment, payment of travel costs, provision of temporary and seasonal assistance, and other related costs are included in the estimate. Substantial savings in hatchery fish and increased opportunities for recreational fishing would result from the expanded effort.

MARCH 5, 1962.

PART-TIME BIOLOGISTS

Senator DWORSHAK. Where would that money be spent?

Mr. TUNISON. The $20,000 that is indicated in our budget actually is made up of a number of people. It is only part time of 17 biologists throughout the country.

Senator DWORSHAK. Where was this research done on the trout liver cancer?

Mr. TUNISON. Actually it is spread into several laboratories. We have considerable work going on at the Willard Laboratory, Cook, Wash. There is also work being carried on out of Cook at Hagerman. The disease laboratory at Seattle is very definitely concerned and working on this program. We also have work at our Leetown station here in the East.

I would think that the Cortland, N.Y., nutrition lab would contribute something on this.

PRESIDENT'S CONSERVATION AND RECREATION PROGRAM

Senator DWORSHAK. One more brief one. Do you have any idea as to the extent to which your Bureau will be involved in the President's conservation and recreation program which was submitted to Congress yesterday?

Mr. TUNISON. I think, Senator, it may be too soon, but very definitely we will be involved.

To what extent—perhaps the Director can answer.

Mr. JANZEN. You have answered the question. I think it is a little too soon to comment on that, Senator.

LIST OF PROJECTS UNDER EXPANSION PROGRAM

Senator MUNDT. On page 1 of your highlight statement you described a program of expansion in connection with new hatcheries, refuge areas, facilities, research stations, and projects.

Would you supply a list of what you have in mind, for the record?

Mr. TUNISON. We can do that, Senator; yes. I think actually, Senator, that paragraph more or less summarizes what is in here. But we will be glad to provide that.

(The information referred to follows:)

BUREAU OF SPORT FISHERIES AND WILDLIFE

Statement concerning program of expansion under the construction appropriation

[In thousands of dollars]

Facility or project		Status of program

PLANS FOR OTHER REFUGES

Senator MUNDT. Do you have plans for other refuges not now pinpointed by location?

Mr. JANZEN. Yes, sir; we do. We are working out our plans with the various States in the Union through the Flyway Councils, and actively at the present time setting up priority lists where we feel that these projects should be located, so that there will be many refuges that are not yet pinpointed.

GAVIN'S POINT HATCHERY

Senator MUNDT. I think I should ask you this question: Have you finished all your construction at Gavin's Point down at Yankton?

Mr. TUNISON. Yes, sir.

Senator MUNDT. Do you have any further plans in the future for expansion of that hatchery? Or is this the unit as you envision it now?

Mr. TUNISON. Very likely the hatchery will be expanded sometime in the future. At the present time we would like very much to see what we can get out of that in the way of full production with the facilities we have and whether or not that production will meet the needs of the area. There is area there for expansion.

Senator MUNDT. That is a tremendous large area to serve, and it seems to me this is one hatchery where you are not going to be limited by water or by space. I would think they would have trouble meeting the demand.

Mr. TUNISON. That is correct, sir.

RESERVOIR RESEARCH PROGRAM ON MISSOURI RIVER

Senator MUNDT. Can you give us a brief résumé of your negotiations to date in connection with the cooperative program which has been set up in the Missouri River? You discussed it on page 33, very briefly. You say negotiations are in progress with the States and the construction agencies looking to the development of a cooperative program for the location of buildings and headquarters. This is at the bottom of page 33 in the statement that you submitted.

Mr. TUNISON. You are speaking now of reservoir research?

Senator MUNDT. That is right.

Mr. TUNISON. The Corps of Engineers have very kindly offered us space at their headquarters at Yankton. In the case of the State, yes; we have worked with them, and we are now in the process of developing a program. We have recruited the staff with the funds that we had available, and I am sure that something very definite will be worked out so that we will be in business this coming spring.

Senator MUNDT. Is there anything that needs to be done to expedite the program? Or was it going along at an optimum rate?

Mr. TUNISON. I think you realize, Senator, last year, when we gave you the statement on the needs for this project, it amounted to $220,000 and $110,000 was appropriated.

Senator MUNDT. Have you asked for the other half at this time?

Mr. TUNISON. No; we haven't, Senator.

Senator MUNDT. I mean in your request to the Budget?

Mr. TUNISON. In normal budget channels, I am sure that was included; yes, sir.

ACQUISITION OF LANDS IN SOUTH DAKOTA AND MINNESOTA

Senator MUNDT. With regard to the water production areas, you have $70,000 earmarked for North and South Dakota and Minnesota. Is that what you were talking about this morning in connection with Jamestown? Will you give a few more details on this?

Mr. JANZEN. These are the areas being acquired under the Migratory Bird Conservation Act, the Duck Stamp Act, and the loan fund. Funds are being requested for this in 1963.

80391—62——34

These are the small pothole areas located in the two Dakotas and Minnesota, wherein we are acquiring fee title to some and securing easements on others. In regard to those that we are acquiring in fee, the funds that are requested in here will be used to build the fences around the outside and post them to identify them and do what other things are essential to increase waterfowl on these small potholes.

MIGRATORY FOWL FEEDING

Senator MUNDT. As you know, South Dakota this year has had an unusually heavy blanket of snow. I wonder if that has given rise to any requests from your Department for the feeding of migratory fowl, or whether the migratory fowl are pretty well driven out of the State this year by the inclement weather.

Mr. JANZEN. We have not received any requests for feeding this winter, but there have been a few places in the United States but not in South Dakota, as I recall.

Senator MUNDT. I haven't either. I did not know whether that was because the birds were all driven out.

Mr. JANZEN. I think there was not much water there and they went on without spending too much time in the State.

Senator MUNDT. The ducks were there pretty late in the season.

Mr. JANZEN. Our heaviest counts were to the south.

PROTECTION AGAINST BLACKBIRDS

Senator MUNDT. Not in connection with migratory waterfowl, but in connection with blackbird devastation, I have had considerable correspondence with your Bureau and I am wondering what can be done to give the farmer some protection against these great flocks of blackbirds, that really move into a cornfield and do a pretty good job of shucking it.

Mr. PARKER. As you know, we are carrying out some research currently. As a matter of fact, some of it is being done in South Dakota around Sand Lake.

Senator MUNDT. Yes.

Mr. PARKER. It is a problem that I must confess we do not have any very good answers for yet. It is a problem that requires considerable research. We are approaching it from the standpoint of repellants and we have developed such things as the shell crackers and intermittent firing of fire crackers and other frightening devices, although that does not alleviate the problem by any means.

We are also doing some research on lethal methods, using chemicals to actually kill the birds. But we don't have any chemical yet that looks too good. There are some that will kill birds, all right, but most of them have too great a spectrum of effect. In other words, they will kill other birds and kill livestock and people.

So we have not dared try them out on any large scale. But we are continuing research on all phases.

Some of the new aspects that we are working on include using some of the chemicals to sterilize the birds, to cut down on production that way. And we also have the problem that the birds, for example, that are living in South Dakota during the summertime may be roosting down in Arkansas in the wintertime. We are doing some population studies to get an idea of where the birds are raised and where they

winter, so that when we have methods that will be satisfactory, we will know which part of the flock we should be working on. We cannot visualize killing all of the blackbirds in the country.

We are going to have to center on those parts of the flocks that are actually causing the damage. This embraces studies and inventories.

Senator MUNDT. Our farmers out there in the Sand Lake Refuge Area claim that these birds nest and hatch right there on the refuge. Have you had people in the field determine whether that is correct?

Mr. PARKER. It is correct.

Senator MUNDT. You should be able to do something out there on that piece of property, because that is yours. If they are nesting in there——

PROBLEMS OF CONTROL OF BLACKBIRDS

Mr. PARKER. One difficulty in the summertime is to find some method that will draw enough birds together. They have plenty of opportunity to feed. In the wintertime, when they concentrate in small roosts, is when it looks like the better opportunity of reducing birds. And that is what I was envisioning when I was discussing the study of population and migrations, so that we can know and identify each segment of the blackbird population and be able to apply the control to that.

Senator MUNDT. In that connection, I was going to ask you a question. I notice that the cooperative wildlife research units, jointly operated by the Bureau of Sports Fisheries and Wildlife and the Wildlife Management Institute and the land-grant colleges are operating in 17 States. You are pretty well spattered all around South Dakota, but you do not have any of them there. I am wondering if this would be one of the types of things such a research center would study and why no such cooperative unit was established in South Dakota?

Mr. PARKER. Well, it would very definitely be a type of research that a unit like that could undertake. The basic purpose of units is to develop students and trained technicians. These units involve advanced study in masters' and doctors' degree work so this very definitely would be a type of problem that could easily be carried out by unit.

COOPERATORS IN UNITS

As far as South Dakota is concerned—if I might back up one moment, there are four cooperators in each of the units, the State college, the State fish and game department, the Wildlife Management Institute, and the Bureau. We must have the interest of all four before we can establish a unit. As I understand it, in the last year or so there has been growing interest in South Dakota to undertake a unit. As yet we have not been in a position to budget for such a unit.

Senator MUNDT. With whom have you negotiated? The State college?

Mr. PARKER. That is right.

Senator MUNDT. Are they willing, from their standpoint?

Mr. PARKER. There is growing interest out there, very definitely

FISH PESTICIDE LABORATORY

Senator MUNDT. Let us see. I had another question over here. In talking now about this fish pesticide laboratory, what are the requirements, the site requirements to develop an optimum location for that?

Mr. TUNISON. Senator, this particular laboratory, the one we would like to start, would be concerned with work on cold water species. In other words, trout. For that reason, we need, say, something like another McNenny. We are looking for spring water, preferably. In fact, we will do our best to find suitable spring water or perhaps well water. But at this time it does not have the priority in the case of warm water as it does in the case of trout.

Senator MUNDT. In other words, this is going to be primarily stream. The Ranch A qualification would seem to fit into that?

Mr. TUNISON. That is a possibility, but whether or not we could have a combination of selective breeding and genetics work with pesticides is something we would need to give a little study to.

Senator MUNDT. Will you give it what study you need and then in the record, if you can do it that fast, provide it; or else, if you cannot, provide a personal letter to me? If you could do them together, it would seem to me there would be economy involved.

Mr. TUNISON. I would hesitate to give you a yes or no answer today, but we will let you know.

Senator MUNDT. Before the record closes?

Mr. TUNISON. Yes.

(The information referred to follows:)

PROPOSED NEW FISH-PESTICIDE RESEARCH LABORATORY

In 1959, specifically authorized studies of the effects of pesticides on sport fishes were initiated with the establishment of the Fish-Pesticide Research Laboratory at the Denver Federal Center, Colo. There, space and facilities of the previously established wildlife-pesticide research activity are shared in a mutually advantageous cooperative program, concentrating on chemical analytical techniques for measurement of residual pesticides and metabolites.

A lack of water at the Denver Federal Center severely restricts the scope of the fishery research program. In borrowed facilities at four scattered installations, limited experimental fish populations are being maintained. A major new laboratory is needed to accommodate the growing fish-pesticide studies. The new facility will provide for planned studies of physiology, toxicology, and radiobiology and supplement established research in biochemistry, analytical chemistry, and histopathology. The fiscal year 1963 budget includes $50,000 for planning construction of the needed laboratory, office, storage, and experimental fish-holding facilities.

A site for this installation has not been selected, but several possible sites are being considered. Among these is the Ranch A site near Beulah, Wyo. This, however, is the site of choice for proposed studies of genetics and selective breeding of trout; adequate space for both investigations is available but to superimpose the fish-pesticide installation would tax the flow volume of the fine Sand Creek headwater. Other considerations of particular importance in the selection of the fish-pesticide site include proximity to: State or Federal hatcheries which could supply large numbers of uniform-size test fish, warm-water species as well as the trouts; research installations working in cooperative and related fields; and the libraries, staff, facilities, and students that would be available, for example, at a large university with strong chemistry, biochemistry, and fishery departments. We recognize, of course, that it may not be possible to find a site offering the ideal combination of attributes, but search is underway.

AVAILABILITY AND DISTRIBUTION OF GROUND WATER

Senator MUNDT. On page 112, you say there is an urgent need to determine the availability and distribution of ground water. This involves the study of rainfall, runoff, stream flow, and forecasts of floods, and many other things in connection with your engineering and planning.

Do you ever work in conjunction with the Department of Agriculture in some of their stations in that connection? That pops into my mind. We were discussing that same kind of study at a station located out in Newell, S. Dak., at the foot of the Black Hills, where they do a lot of that same type of work.

I wonder if you ever had cooperative arrangements with the Department of Agriculture, where you could achieve these results at the same location?

COOPERATION WITH OTHER AGENCIES

Mr. PARKER. Senator, they are working now on an agreement with all agencies concerned with water, in the Department of Interior. The Geological Survey has some projects in the two Dakotas currently studying water levels, and we are underwriting part of the cost of those studies but the funds that are set up here are for the purpose of developing and proving up our water rights on the refuge areas.

They are not basic water studies, but rather to establish the water rights that we have on the property that we have acquired.

HELBING'S SLOUGH, S. DAK.

Senator MUNDT. In conjunction with this expansion of refuge, have any of you ever heard of a place called Helbing's Slough, south of Watertown, S. Dak., a rather large slough which some of the sportsmen around there claim would be an ideal place for a refuge or a public shooting ground?

I don't know whether you go into the business of providing public facilities of that kind or not. Do you?

Mr. JANZEN. We are not familiar with that, but if it had any prospects for purchase the State of South Dakota would provide this as one of their candidates for this list that I mentioned a few minutes ago.

Senator MUNDT. In other words, what I had better do with that correspondence is refer them to the game and fish departments. You get all your recommendations from the State departments?

Mr. JANZEN. No, sir. If it is submitted to us, we will see to it that it gets the proper consideration.

Senator MUNDT. I think you probably have a bigger staff and would be a little better able to advise whether it fits the needs of a refuge or a public shooting ground, and we do acquire public hunting grounds through our departments back home. The sportsmen want a little guidance. It seems that being owned privately, it is not serving the sportsmen or the propagation aspects of migratory waterfowl. Either you could use it as a refuge, and it would be a good breeding ground, or in lieu of that, if you say this is not for that, they might go to the fish and game department and say, "Let's make it a public shooting place?"

SEARCH FOR AVAILABLE SITES

Mr. JANZEN. We are looking for every potential site. Our regional office in Minneapolis serves South Dakota. We have a staff that is specifically supposed to look at every potential area. Now, if it is a small production area, it could be opened entirely to hunting. If it is established as a national wildlife refuge under the law, up to 40 percent could be open for hunting.

Senator MUNDT. Will you have your Minneapolis region take a look at that and send me a report to at least guide my correspondence?

Mr. JANZEN. We will be glad to do that.

NO STOCKING OF PONDS WITH CHARGE FOR FISHING

Senator MUNDT. Just one other thing, Mr. Chairman. That grows out of this question I asked earlier about whether or not we ever stocked private ponds, where the owner can charge people to fish. You said "No," I believe.

Mr. TUNISON. No, we do not.

Senator MUNDT. Somebody had reported before another committee that some farmer up around Philadelphia has made about $6,000 a year charging people to fish. Of course, that does not necessarily mean he got his fish from you.

Mr. TUNISON. That is right.

Senator MUNDT. But the letter I got assumed it. So I can tell him categorically we do not stock ponds and lakes where they make a charge for fishing. They can charge for boats, probably, but none of this Colorado business where you get so much a pound for fish, and so forth.

Mr. TUNISON. We do not stock any waters on which there are commercial charges for fishing.

Senator MUNDT. How about where there are exclusive fishing rights?

Mr. TUNISON. No.

There is a great increase in fee fishing lakes that are sponsored in large part by commercial trout hatcheries, and no doubt you have seen these, and perhaps you have been there. And I think we will see more of them. We leave that type of project to the commercial hatcheries.

Senator MUNDT. If some rancher out west of the river who is building himself a good stock pond—and may I say we have some of the best bass fishing I have ever seen, in some of those—is perfectly within his right to write in and request fish. He should do that through the game and fish department of the State, I presume?

Mr. TUNISON. He can do it that way, or to our regional office, or to the local Soil Conservation Service office. We work very closely with the Soil Conservation Service.

Senator MUNDT. Thank you.

TRANSFER OF FACILITIES TO FISH AND WILDLIFE SERVICE

Chairman HAYDEN. Last year in the public works appropriation bill, money was made available for the Bureau of Reclamation for the transfer to the Fish and Wildlife Service to construct fish and

wildlife facilities in the Upper Colorado River Basin. Will you outline briefly for the committee the work accomplished with that money?

NAVAJO UNIT

Mr. McBROOM. Mr. Chairman, total funds made available by the Congress for the current year were $663,000. Of that, $167,000 was for the Navajo unit, a reservoir on the San Juan River in New Mexico, and extending into Colorado. For the Navajo unit, $72,000 was for rough fish eradication, prior to impoundment. This was carried out last September, I believe, successfully by the fish and game departments of the State of New Mexico and the State of Colorado and by our people.

Chairman HAYDEN. Did you get them all?

Mr. McBROOM. As far as we know, it worked out well. The remainder of the funds were for the establishment of a big game range around the Navajo unit, and we are attempting to work that out with the Bureau of Land Management and the New Mexico game and fish department.

FLAMING GORGE UNIT

We had an additional $473,000 for the Flaming Gorge unit, which is a large reservoir on the Green River in northeastern Utah and extending into Wyoming. For Flaming Gorge, $300,000 was for a big game range acquisition purpose, which is in the same status as I reported for Navajo.

One hundred and seventy-three thousand dollars was for rough fish eradication at Flaming Gorge, and that will be undertaken in cooperation with the Utah and Wyoming Game and Fish Departments this summer. We have had plenty of time, thanks to this committee, to make preparations for this, and we are looking forward to a successful operation.

Chairman HAYDEN. There was some question, I know, about whether it could be done in time.

VERNAL, UTAH, UNIT

Mr. McBROOM. Yes, sir. But now we have the time, and I think we are in good shape on that. The remainder of the funds for 1962 was for the Vernal unit of the central Utah participating project, which is a fairly small project in Utah along the Green River.

The major part of the funds there were for the continuation of a pump to supply water to a State waterfowl refuge whose existing supply was being diverted by the program of the Bureau of Reclamation.

GLEN CANYON AREA

Chairman HAYDEN. Now the Glen Canyon Dam has not filled yet, but when it does, what are you going to do for fish and wildlife in that area? There is Lake Powell above the dam.

Mr. McBROOM. As to the fisheries, I believe we have in our program the idea of studying the Flaming Gorge area to determine what can be done to take care of the fish.

Now there has been suggested by the Utah Game and Fish Department, that there be substantial stocking of trout in Flaming Gorge

and part of our proposal for 1963 would lead to the establishment of a sizable hatchery for this purpose and others.

Chairman HAYDEN. That is in Flaming Gorge, but I am talking about the water backed up from the dam at Glen Canyon into the Colorado River.

Mr. MCBROOM. Yes, sir. I am talking about that, too. The hatchery that would be developed in the area would serve several units, including Glen Canyon.

Chairman HAYDEN. I see.

PREPARED STATEMENT

I will include in the record a statement which was presented by Mr. Thomas L. Kimball, executive director of the National Wildlife Federation, but who will not be able to appear this year.

(The statement referred to follows:)

STATEMENT BY THOMAS L. KIMBALL, EXECUTIVE DIRECTOR, NATIONAL WILDLIFE FEDERATION

APPROPRIATIONS FOR THE BUREAU OF SPORT FISHERIES AND WILDLIFE

Mr. Chairman, the National Wildlife Federation is a private organization dedicated to the attainment of conservation goals through educational means. It is composed of 51 independent affiliates in all States and the District of Columbia. These affiliates are constituted of local groups and individuals who, together with other supporters of the National Wildlife Federation, number an estimated 2 million persons.

We should like to limit our comments to appropriations for the Bureau of Sport Fisheries and Wildlife and particularly those providing for an emergency waterfowl wetlands acquisition program under jurisdiction of this agency.

One of the two major conservation accomplishments of the first session of this Congress was the enactment of Public Law 87-383. This new law authorized an emergency loan of $105 million over the next 7 years for a "crash" wetlands acquisition program designed to save continental flights of migratory waterfowl. It must be noted that this advance would be repaid from future sales of migratory bird hunting stamps, or "duck stamps." In other words, waterfowl hunters have asked for this loan to finance acquisition on behalf of the Federal Government. Land purchased with duck stamp funds remains in Federal ownership.

Without going into detail, Mr. Chairman, we might say that the preservation of wet lands is viewed as critical. In fact, this has been made the subject of the 1962 observance of National Wildlife Week, sponsored March 18 to 24 by our organization. Wetlands preservation has been termed the single most important problem facing wildlife today.

Now, unless implemented by this committee, the new law is meaningless. The Bureau of Sport Fisheries and Wildlife has been permitted to ask for only $7 million of the $105 million advance loan. Simple arithmetic shows that $105 million over a 7-year period averages $15 million per year, or more than double the figure requested. Mr. Chairman, an absolute minimum of $11 million is necessary for this program and up to $15 million could be utilized. Even more will be necessary in future years once the wetlands acquisition program is established and functioning smoothly.

Virtually all conservation groups are in accord on a need for a national mourning dove program. As much as $400,000 is needed for mourning dove research in fiscal 1963 and only $56,000 is proposed. Doves are migratory species truly within jurisdiction of the Federal Government and much more needs to be learned about their management.

The Branch of Fishery Management Services, never adequately funded to carry out its program on Federal properties, needs additional money to derive better returns from fish hatcheries. The $20,000 allocated to this activity needs to be increased to $200,000. Worthy research programs also are necessary in salt water sport fishing and in managing large reservoirs for sport fishing.

We are encouraged that the Branch of Management and Enforcement would be strengthened and we hope the committee may see fit to hold the proposed budget for these activities.

Thank you, Mr. Chairman, for the opportunity of making these remarks.

LETTER FROM CHARLES H. CALLISON

Chairman HAYDEN. I also include a letter addressed to me by Mr. Charles H. Callison, assistant to the president of the National Audubon Society, with regard to the plans for a national mourning dove program.

(The letter referred to follows:)

NATIONAL AUDUBON SOCIETY,
New York, N.Y., February 23, 1962.

Hon. CARL HAYDEN,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HAYDEN: The National Audubon Society has participated in the formation of plans for a national mourning dove program, that has the endorsement of the International Association of Game, Fish, and Conservation Commissioners as well as the Bureau of Sport Fisheries and Wildlife of the Department of the Interior. The research parts of this program are quite important and sufficient funds should be made available to the Bureau of Sport Fisheries and Wildlife to provide an adequate beginning in the fiscal year 1963.

We urgently recommend that not less than $256,000 be provided for this purpose in the appropriation bill for the Department of the Interior and related agencies for fiscal 1963.

We would appreciate it if this letter were made a part of the record of your current hearings in order that our recommendation may be known to other members of your committee. Thank you for your consideration of this request.

Sincerely yours,

CHARLES H. CALLISON,
Assistant to the President.

GENERAL ADMINISTRATIVE EXPENSES

Chairman HAYDEN. The justifications for the estimate of $1,331,000 required during fiscal year 1963 for general administrative expenses will be placed in the record. This is $260,000 more than was provided in fiscal year 1962.

(The justifications referred to follow:)

BUREAU OF SPORT FISHERIES AND WILDLIFE

GENERAL ADMINISTRATIVE EXPENSES

Highlight statement

The purpose and long-range objectives of this program are to provide executive direction and general administrative services for the Bureau. Executive direction consists of the services of the Director, two Assistant Directors, and secretaries at Washington, D.C., headquarters and a regional director and secretary at each regional office. General administrative services include personnel, budget and finance, property management, and related business management activities.

The 1962 program contains an increase for modernization of the Bureau's accounting system. For 1963, the program provides increases for taking on the additional workload and better servicing of expanded operating programs.

There is no substantive language change.

General administrative expenses

Appropriation 1961	$1,016,000
Appropriation 1962 (total available)	1,071,000

SUMMARY OF INCREASES, 1963

Departmental expense: To provide for additional workload and better servicing of operating programs	+88,000
Regional office expense: To provide for additional workload and better servicing of operating programs	+172,000
Net change, 1963	260,000
Budget estimate, 1963	1,331,000

Analysis by activities (total funds)

Appropriation	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
General administrative expenses	$1,015,151	$1,071,000	$1,331,000	+$260,000
Federal aid in fish restoration and management	47,889	44,000	35,000	−9,000
Federal aid in wildlife restoration	123,931	121,800	85,400	−36,400
Management of national wildlife refuges	91,508	89,450	57,700	−31,750
Migratory bird conservation account	55,372	105,500	67,300	−38,200
Construction, general, Corps of Engineers, Civil		15,200	24,000	+8,800
General investigations, Corps of Engineers, Civil			4,000	+4,000
Construction and rehabilitation, Bureau of Reclamation	14,948		11,200	+11,200
General investigations, Bureau of Reclamation			11,600	+11,600
Construction of recreational and fish and wildlife facilities, Bureau of Reclamation			9,000	+9,000
Advances and reimbursements			89,800	+89,800
Total, direct appropriation	1,015,151	1,071,000	1,331,000	+260,000
Other funds	333,648	375,950	395,000	+19,050
Grand total	1,348,799	1,446,950	1,726,000	+279,050

Analysis by activities (direct appropriation)

Activity	Amount available, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Departmental expenses	$239,693	$264,000	$352,000	+$88,000
2. Regional office expenses	775,458	807,000	979,000	+172,000
Total appropriation	1,015,151	1,071,000	1,331,000	+260,000

The estimate of $1,331,000 is an increase of $260,000 of which $163,000 is needed for an increase in workload and costs and $97,000 is needed for essential expansion of administrative services.

Need for increase.—The increase of $260,000 is needed as follows:

(1) Increased workload and costs, $163,000: This consists of—

(*a*) $54,000 for serving an expanded program: Increases in estimates of Bureau programs which are supported by the "General administrative services" appropriation amount to $9,319,000, or a 30-percent increase over 1962 estimates. An increase in the "General administrative expenses" appropriation is needed to recruit and appoint the additional operating staff, procure supplies, services, and equipment for the expanded programs; payroll an increased number of employees; and process and account for a larger volume of financial transactions as well as provide more administrative and management services of other types. The estimate for this purpose is $54,000. The estimate covers salaries and expenses of five GS–6 Government accountants and four GS–5 personnel clerks, a total of nine permanent positions.

(*b*) $109,000 for increased costs: This includes $39,000 for an increase in salaries due to schedule step increases; sufficient travel funds to maintain a

program of field management inspections; increased costs of supplies and services; essential equipment replacement; and $70,000 for replacement of one bookkeeping machine at $10,000 in each of the central and six regional offices. Bookkeeping machines now in use average more than 10 years of age. The equipment must be replaced to avoid paralyzing breakdowns and costly, uneconomical repairs and to provide greater versatility and additional automatic features for use in the new accounting system which is being modernized with the specific appropriation increase allowed for this purpose in 1962.

(2) Expansion of administrative service, $97,000: This increase is needed to raise the level of administrative work to a point where operating programs are being adequately served and the requirements of law and regulatory agencies are being met. The increase consists of—

(*a*) Budgetary management, $17,000: Budgetary management should be strengthened by improving procedures for the development, execution, and control of the budget. This will result in more cohesive, uniform, and acceptable presentation of budgetary data. Expenditures will be more closely reviewed by the budget staff to assure the proper execution of the budget and guard against the incurring of deficiencies. Additional budget staff is required not only for these purposes but also to modernize budgetary management to provide for cost-based budgets that will be fully integrated with the cost accounting and program planning and scheduling system. The Bureau's financial management improvement program calls for effort and changes in all administrative areas and the budget staff has an important part in attaining overall objectives. The estimate is for a budget analyst, GS–12; clerk-typist, GS–5; and related costs in the central office, a total of two permanent positions.

(*b*) Management analysis, $17,000: The management analysis staff should be strengthened so it can effectively handle the workload and all the administrative responsibilities assigned to it. The present staff of two analysts and a secretary is sufficient barely to handle the continuing, routine functions of forms control, the incentive awards program, the management improvement program, and developing and maintaining current the administrative and technical manuals. An additional GS–13 management analyst and a GS–5 clerk-typist will augment the staff sufficiently so it will be able to undertake organization, management, and procedural studies and the development of standardized Bureau-wide policies and procedures. The estimate covers two permanent positions and related costs.

(*c*) Civil service examining boards, $42,000: Civil Service Commission principles for establishing boards of examiners provide that agency boards will be established when positions are unique to the agency; when the speciality is one in which prestige of the agency in the occupational field calls for full utilization of agency personnel in the recruiting and examining process; when the agency is the primary user in the recruiting area appropriate to the examination or when the usual hiring method in the occupation is on a local basis. All of these conditions apply specifically to the Bureau. Positions of fish and wildlife biologists and technicians of various types, wildlife refuge managers, fish hatchery managers, game management agents, and local wage board personnel such as fish hatcherymen and wildlife refuge maintenancemen are distinctive to the Bureau. It is essential that examining boards be established and maintained to provide a continuing source of fully qualified candidates to stabilize the work force by eliminating limited tenure appointments; to improve the quality of recruits; and to provide for normal turnover and program expansion needs. It is anticipated that response of applicants to future examination announcements will be high because of intense interest in fish and wildlife conservation employment as evidenced by 6,986 formal employment inquiries in 1961. During the period February 1, 1960, to January 31, 1961, there were 806 applications for a nationwide fishery and wildlife research biologist examination and 884 for a fishery and wildlife management biologist examination. A recent regional examination announcement for game management agent resulted in 130 applications being filed in the first 20 days the announcement was open. The estimate is for five GS–5 personnel assistants at the Washington and regional offices and a GS–4 clerk-stenographer at the Washington office and related costs, or a total of six permanent positions.

(*d*) Property management, $21,000: The property management function has not been staffed at the Washington office at a level in keeping with its importance to the successful and efficient accomplishment of the Bureau's programs. A property management specialist is required to guide the program in such important fields as construction contracting, material and service procurement,

research and development contracting, equipment management, surplus and excess personal property disposal and acquisition, space control, and records management. This additional position will augment the property management staff sufficiently to enable it to give the operating programs guidance and staff support in the form of current manualized policies and procedures, field inspections, counseling, and evaluation of effectiveness on a Bureau-wide basis. The estimate includes a GS–13 property management officer and a GS–6 secretary and related costs, a total of two permanent positions.

Plan of work.—The estimate is for executive direction and general administrative services at the Washington headquarters and regional offices. Executive direction is provided by the Director and two Assistant Directors at Washington and a regional director at each regional office. Executive direction consists of overall management control, program coordination, and decisionmaking for all organizational units and functions of the Bureau. General administrative services are provided by the Division of Administration consisting of an office of the Chief of the Division and four service branches in Washington and an administrative officer and staff at each regional office. Administrative services consist of inspection of field offices; development, presentation, and execution of budgets; making all payments and collecting all amounts due; maintaining payroll, retirement, and leave records; maintaining accounts for control of funds and recording assets, liabilities, and income and expenses; preparing financial reports; recruiting, training, placing, classifying, and servicing employees; maintaining administrative and other manuals for Bureau guidance; forms and reports control; organization and staffing studies; centralized mail, filing, and communication services; procurement of supplies, equipment, and services; contracting for construction; and control of utilization and disposition of property.

The 1963 estimate of $1,331,000 will provide executive direction and general administrative services to the programs financed by the "Management and investigations of resources," "Construction," and "Migratory bird conservation fund" (annual definite) appropriations. Executive direction and general administrative services for programs financed by permanent indefinite appropriations, appropriation transfers, and advances and reimbursements are provided for by these funds on the basis of predetermined cost or assessment ratios. These ratios are 4 percent in the case of funds that are available primarily for salaries and expenses and 0.3 percent of funds that are available for other purposes such as land acquisition and payments to States. The total estimate for executive direction and administrative services from these sources in 1963 is $394,700, which, added to the $1,331,000 estimate for the "General administrative expenses" appropriation, makes a total estimate of $1,726,000. A summary table comparing the total 1963 estimate with 1962 follows:

General administrative services program

[In thousands]

Source	Estimate, 1962	Estimate, 1963	Increase
1. "General administrative expenses" appropriation	$1,071	$1,331	+$260
2. Financing from permanent indefinite funds, transfer appropriations and advances and reimbursements	376	395	+19
Total, general administrative services program	1,447	1,726	+279

The total estimate for executive direction and general administrative services is broken down by organizational units, as follows:

	Total positions	Estimate
Departmental:		
Office of the Director	6	$87,000
Division of Administration	2	25,000
Branch of Budget and Finance	17	147,000
Branch of Management Analysis	5	51,000
Branch of Personnel Management	12	95,000
Branch of Property Management	14	95,000
Subtotal, departmental	56	500,000
Regional offices:		
Region 1, Portland, Oreg	17	237,000
Region 2, Albuquerque, N. Mex	32	239,000
Region 3, Minneapolis, Minn	32	235,000
Region 4, Atlanta, Ga	32	245,000
Region 5, Boston, Mass	23	182,000
Region 6, Juneau, Alaska	8	88,000
Subtotal, regional offices	144	1,226,000
Total	200	1,726,000

Itemization of estimate, general administration expenses

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:

PREPARED STATEMENT

Chairman HAYDEN. Is there any comment on that?

Mr. TUNISON. Mr. Chairman, if we might, in the interest of saving time, we have a little supplementary statement. Could we file that?

Chairman HAYDEN. Do that.

(The statement referred to follows:)

The fiscal year 1963 estimate for the general administrative expenses appropriation is $1,331,000, an increase of $260,000.

Before briefly detailing the need for this increase, I would like to cite a few comparative figures. In fiscal year 1959, the first year the Bureau of Sport Fisheries and Wildlife submitted a completely separate budget, the ratio of administrative expenses to the Bureau's total program was 2.41 percent. In fiscal year 1963, including the increase requested, it is 2.36 percent or slightly less. In 1959 the ratio of administrative employees to total employees of the Bureau was 6.25 percent. In 1963, including the increase requested, the ratio is 5.44 percent or about 1 administrative position less for each 200 employees of the Bureau. These figures are cited to show that the administrative staff has

increased its efficiency while giving improved service to a larger and broader program.

An amount of $39,000 is requested to cover expenses of the existing administrative staff. Most of this is needed to pay periodic salary increases for a relatively stable staff where the turnover is not sufficient to permit these costs to be absorbed. Small amounts are also included for more adequate travel allowances and increased cost of services and supplies.

Included is $70,000 for replacement of bookkeeping machines that are over 10 years old and no longer dependable or economical to operate. This item would also enable us to procure more modern equipment with automatic features need to improve our accounting system.

The sum of $54,000 is requested for personnel to service the additional work that will be involved in a program that is expected to be approximately 13 percent larger in fiscal year 1963.

An increase of $97,000 is requested to expand the administrative staff in areas where program operations are not now being adequately served. The principal amount is for full-time personnel to handle the work of our civil service examining boards. These boards are established to handle positions unique to the Bureau and where the number of recruitments is small. These examining procedures enable us to identify the better qualified persons and to offer them career appointments in the Government service. It is work that is essential to the successful and efficient staffing of our operating units. Smaller amounts are requested to strengthn our budget, property management, and management study staffs.

In conclusion, Mr. Chairman, the increase requested of $260,000 represents approximately 2.6 percent of the Bureau's request for increases in annual definite appropriations for fiscal year 1963.

Expanded Wetlands Acquisition Program

Chairman Hayden. There will also be included in the record your request for $7 million during fiscal year 1963 to initiate an expanded program for acquisition of wet lands for the preservation of waterfowl. I will put that in the record.

(The material referred to follows:)

Migratory Bird Conservation Account

The purpose and long-range objectives of this program are to provide for an expanded program of acquisition of wet lands for the preservation of waterfowl over a 7-year period under the provisions of Public Law 87-383 (75 Stat. 813). Funds provided under this appropriation supplement amounts available from the sale of migratory bird hunting stamps (16 U.S.C. 718).

The appropriation for 1963 will initiate the program and accelerate the acquisition of wet lands.

Analysis by activities (total funds)

Activity and appropriation	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Acquisition of refuges and other areas:				
Current definite			$7,000,000	+$7,000,000
Permanent indefinite	$4,326,527	$5,498,904	4,782,700	−716,204
Total	4,326,527	5,498,904	11,782,700	+6,283,796

Analysis by activities (direct appropriation)

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Acquisition of refuges and other areas			$7,000,000	+$7,000,000

The estimate of $7 million is for acceleration of the wetlands acquisition program. This is in addition to the estimate of $5 million in permanent indefinite funds under this account derived from the sale of migratory bird hunting stamps.

Need for estimate.—The estimate of $7 million is needed to initiate the expanded wetlands acquisition program authorized by the act of October 4, 1961 (Public Law 87-383), which provides for the appropriation of not to exceed $105 million for a 7-year period for the acquisition of wetlands and other essential waterfowl habitat.

The estimate consists of the following items:

(*a*) *Realty costs, $265,000.*—For location, ascertainment, and appraisal of areas and presentation of proposals to the Migratory Bird Conservation Commission; and following approval of the Commission, negotiation, title verification, title clearance, and other expenses incident to vesting title to areas in the United States. This includes the salaries and expenses of 1 realty officer, GS-12; 6 realty officers, GS-11; 16 appraisers, GS-9; 8 appraisers, GS-7; 3 foresters, GS-5; 5 clerk-stenographers, GS-4; and 3 clerk-typists, GS-3.

(*b*) *Engineering costs, $343,000.*—For the location and ascertainment of areas, drafting services, and other costs incident to preparation of preliminary development plans, outline specifications and estimates and topographic maps, engineering studies and water rights investigations and filings, and other costs incident to preparing cases for presentation to the Migratory Bird Conservation Commission; and following approval by the Commission, cadastral surveys incident to vesting title in the United States. This includes the salary and expenses of 4 civil engineers, GS-11; 2 hydraulic engineers, GS-11; 4 civil engineers, GS-9; 1 cartographic technician, GS-9; 3 civil engineers, GS-7; 5 cartographic draftsmen, GS-6; 4 cartographic draftsmen, GS-5; 16 engineering aids, GS-5; 15 engineering aids, GS-4; and 3 clerk-typists, GS-3.

(*c*) *Biological investigations, $92,000.*—Costs of biological work in the location and ascertainment of refuge areas and waterfowl production areas in the prairie pothole region of the Midwest, and the preparation of preliminary management plans and estimates. This includes the salary and expenses of seven wildlife biologists (management), GS-11.

(*d*) *Acquisition and rental of areas, $6,300,000.*—Costs of acquisition or rental of areas including water rights, rights-of-way, easements, removal expenses of occupants, and other direct costs of acquiring the areas or rights therein.

Plan of work.—As of June 30, 1961, approximately 3,500,000 acres of land and water have been acquired or reserved in Federal ownership for this purpose, and approximately 2 million acres have been acquired by the States for waterfowl needs. The Bureau has been working closely with the four flyway councils in determining what area shall be given priority attention and which projects shall be acquired with State or Federal funds. Agreement subject to annual revision has been reached and it is now estimated that of the 7 million acres left to be acquired 4,500,000 will be by the Federal Government and 2,500,000 by the States. Included in the total to be acquired by the Federal Government are 1,750,000 acres of wet lands in the Prairie States of Minnesota and the Dakotas of which 600,000 acres are proposed for purchase and 1,150,000 are to be controlled through easements.

The cost of lands being acquired in fee has steadily increased, partly because wet lands once considered wastelands have in recent years become valuable for conversion to uses other than wildlife. The remaining waterfowl habitat is being rapidly reduced through drainage for agricultural and industrial purposes so that it is essential that the needed 4,500,000 acres be acquired to preserve the migratory waterfowl resource while the wet lands are still available. An accelerated wet lands acquisition program is in accord with the President's statement in his special message on natural resources to the Congress that "Wise investment in a resource program today will return vast dividends tomorrow, and failures to act now may be opportunities lost forever."

Receipts from the sale of Federal migratory bird hunting stamps under the Hunting Stamp Tax Act of March 16, 1934 (16 U.S.C. 718), are available exclusively for payment of Post Office Department expenses of printing and selling migratory bird hunting stamps and for the location, ascertainment, and acquisition of suitable areas for migratory bird refuges under the provisions of the Migratory Bird Conservation Act. Estimated receipts of the Migratory Bird Conservation Account in 1963 are $5 million to be derived from sales of 1,666,666 stamps at $3. When added to the $7 million in annual definite funds requested herein a total of $12 million will be available in 1963. This sum will provide for the acquisition of 258,850 acres of land, of which 115,850 acres will be for migratory waterfowl refuges. The remainder will be for the waterfowl production area program with 60,000 acres acquired in fee and 83,000 acres controlled by easement.

It is estimated that the $105 million fund will be expended during a 7-year period as follows:

1963	$7,000,000	1967	$20,000,000
1964	20,000,000	1968	18,000,000
1965	20,000,000		
1966	20,000,000	Total	105,000,000

Total obligations	4,495,264	5,754,404	12,000,000	+6,245,596

PROGRAM OBJECTIVES

Chairman HAYDEN. This is a new appropriation under Public Law 383, approved last October. I think they call that the wetlands bill. It is estimated that $105 million will be required for this program, and I believe that you should advise the committee of your plans for it.

Mr. JANZEN. Yes, sir. We are asking for $7 million, which, together with the duck stamp receipts, will make a total program of between $11 and $12 million for the next fiscal year. We have been developing a staff for this program and working out the areas, the location of the areas, and the general criteria that will be used with the national flyway councils. There are four of them across the country. In fact, I am meeting with them week after next in Denver, just preceding the North American Wildlife Conference, to discuss our wetlands acquisition program.

So we are working on that very closely with State fish and game departments.

As you know, the bill provides that we must have the Governor's assent for each area to be purchased, which assures very close cooperation in working out this program.

PAYMENTS IN LIEU OF TAXES

Senator MUNDT. I noticed in the paper the other day that our Governor in South Dakota had raised some question, I believe, at one of your meetings or maybe someplace else about some kind of payments in lieu of taxes for the local governing bodies where these wetland acquisitions take place. Have you any comments to make about your policy in that regard.

Mr. JANZEN. Yes; under our present authorization, 25 percent of refuge receipts go back to the county for schools and roads, which are presumably to cover such services as the county might furnish to those lands, since the Federal Government cannot pay taxes on these lands.

This has created a special problem in the Dakotas on our waterfowl production areas, because we anticipate a light return on many of these areas, and it has been of some concern to the local county as to how important this might be to their tax base.

Senator MUNDT. As I remember his request, it was that it be upped to 50 percent, or else some other means for determining a more satisfactory quid pro quo would be developed.

Mr. JANZEN. Yes. There have been a number of bills introduced already in Congress relating to the subject, with different formulas and we are at the present time studying this problem to see if we could come up with some sort of equitable solution.

Senator MUNDT. You do recognize that the present system in that area—and that happens to be an area where I presume they are going to have to intensify the wetlands acquisition program because it is a pretty good breeding area—presents a problem concerning these local governments that lose part of their tax base, and they have no place else to go to get their money.

Mr. JANZEN. Yes, sir; we recognize we have a problem here.

Senator MUNDT. The Federal Government cannot pay taxes, but if something could be developed that would enable you to turn back an equivalent of what you take away, it would eliminate a lot of resistance to the program in that way.

Mr. JANZEN. Most assuredly and that is our objective. We are hopeful we can come up with something that we could justify. It would, of course, require legislation.

PROVISIONS OF PENDING WETLANDS BILL

Senator MUNDT. There are two wetlands bills. You have one in the process of passage and one that has passed. And if this other wetlands bill is passed, would that tend to intensify the problem, or would you be able to incorporate your recommendation into it?

Mr. JANZEN. I feel you are referring to the bill that was passed, I believe, by the House, that would call for our insepcting federally assisted drainage projects in the Dakotas.

Senator MUNDT. It involves just three States, I believe.

80391—62——35

Mr. JANZEN. Yes; but it has a proviso that if we turn down a project, we must offer the farmer a lease or some sort of an acquisition proposition within 1 year, in order that this turn down would remain effective.

Now, we feel that in most cases the type of areas that would qualify under, let us say, the Department of Agriculture regulations, would be the type that we would lease, and where we lease, there is no tax problem, because it still remains in the ownership of the farmer. So we see no tax complications resulting from the acquisition feature of this bill.

Chairman HAYDEN. Are there any other questions?

If not, this committee will stand in recess until 10 o'clock Monday morning, when we will hear departmental officers.

(Whereupon, at 4:20 p.m., Friday, March 2, 1962, the committee recessed to reconvene on Monday, March 5, 1962, at 10 a.m.)

DEPARTMENT OF INTERIOR AND RELATED AGENCIES APPROPRIATIONS, 1963

MONDAY, MARCH 5, 1962

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met, pursuant to recess, at 10 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Bible and Dworshak.

DEPARTMENT OF THE INTERIOR

OFFICE OF THE SECRETARY

STATEMENTS OF D. OTIS BEASLEY, ADMINISTRATIVE ASSISTANT SECRETARY; JAMES N. FABER, DIRECTOR OF INFORMATION; SIDNEY D. LARSON, DIRECTOR OF BUDGET AND FINANCE; AND DALE L. ROTHROCK, FINANCE OFFICER

BUDGET ESTIMATE

Chairman HAYDEN. The committee will be in order.

We will be pleased to hear from you, Mr. Beasley.

The budget estimate for fiscal year 1963 for the Office of the Secretary, Department of the Interior, is $3,568,000, which is $132,500 more than the amount available during the past fiscal year. The justification will be placed in the record.

(The justification follows:)

SALARIES AND EXPENSES

The appropriation for the Office of the Secretary finances the salaries and expenses of the Secretary, the Under Secretary, the Assistant Secretaries, resources program staff, and the Administrative Assistant Secretary with their supporting staffs. The Secretary and the supporting staffs listed provide direction, guidance, coordination, and service to all the bureaus and offices of the Department. The programs carried on by the Department are extremely diversified and far reaching, extending throughout the United States and the territories. They have also grown a great deal during the past several years.

With the exception of increases to cover pay increases and two specific items in 1962, the appropriation for the Office of the Secretary has remained substantially the same for a number of years. With the increase in activity and responsibilities, and also a gradual increase in costs, it is essential that some increase in several areas and for some items of expense be provided. Specific increases requested for staff are justified under the activity to which they pertain. One item of

general application, however, is that of travel. During the past year, during and immediately following the change in administration, travel was restricted until the Secretariat and their immediate staff could become organized. It is necessary, however, that the staff acquire firsthand knowledge of the programs and the problems by inspecting them in the field and meeting with local officials, and increased funds for travel are requested in certain areas so that this may be done to a greater extent.

In addition, a general increase of $12,000 is included to cover the cost occasioned by Public Law 87-139 approved August 14, 1961 amending the Travel Expense Act of 1949. There has been a gradual increase in travel costs over the past several years as the result of increased per diem rates and also transportation costs. Additional appropriations have not been obtained in the Office of the Secretary as a result of these increases. To continue to absorb them, even though the individual items may be small, will seriously hamper the work and effectiveness of the staff. It is considered essential that an increase to cover this cost be provided and it is distributed throughout the various activities.

This budget also provides $106,500 for several specific defense items, which were formerly carried in the delegate agency appropriation made to OCDM, now Office of Emergency Planning. The items are justified in detail under the subactivities for the immediate Office of the Secretary and the Assistant Secretary for Water and Power.

Language changes

Authorization is requested in the appropriation language for the purchase of a passenger motor vehicle which would be a medium sedan at not to exceed $3,000, and which would replace a 1946 sedan. This automobile is for use of the Secretary and the Under Secretary. The automobile being replaced has been driven over 60,000 miles, is approximately 15 years old, and the excessive repairs required make it quite uneconomical and unsatisfactory for continued use.

The appropriation language proposed for the fiscal year 1963 includes the following new phrase: "not to exceed $2,000 for official reception and representation expenses." The purpose of this language is to provide authority to use appropriated funds to cover the expenses incurred by the Secretary in fulfilling the courtesy and social responsibilities directly associated with his official duties. Approval of the language would result in relieving the Secretary of the financial burden of paying from personal funds the costs of these responsibilities which are of direct benefit to the Government.

The Secretary, by reason of the office held, is obligated to meet with State and local officials, and with foreign dignitaries. Many of these officials have important responsibilities in their localities for conservation and utilization of natural resources and are interested in the policies of the administration as they relate to natural resources programs. It is essential that the Secretary meet with these people to explain departmental policies and to exchange ideas. Common courtesy demands that luncheon invitations or other forms of hospitality be extended to these officials. On many occasions representatives of the Congress, civic associations, foreign exchange students, scouting groups, etc., call on the Secretary and luncheons or refreshments are provided. These expenses rightly should be borne by the Government rather than be financed from personal funds.

Many other Government agencies have been faced with this problem and have received authority to use appropriated funds to finance such costs.

No increase in funds is requested to cover these additional authorizations.

Salaries and expenses

Appropriation, 1961	$2, 898, 000
Transfer from Office of Emergency Planning for financing defense functions	44, 052

1. Departmental direction

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Office of the Secretary	$337,534	$382,700	$416,400	+$33,700
(*b*) Office of the Under Secretary	84,729	72,100	82,000	+9,900
(*c*) Division of Information	72,971	78,400	199,900	+121,500
Total	495,234	533,200	698,300	165,100

(*a*) *Office of the Secretary, $416,400*

This estimate for the Office of the Secretary includes increases of $33,700. The first part of the estimate totaling $362,900 provides for the immediate Office of the Secretary and a staff of 28 employees. Included is the Assistant to the Secretary for Research who is responsible for policy—direction, administration, and development of complex research programs throughout the Department. Other assistants to the Secretary serve as personal aides and confidential advisers to the Secretary, and may act on behalf of the Secretary on specific matters referred to them for disposition, or represent the Secretary in various Executive Office and interagency groups.

No increase in personnel is requested but $6,700 is included for increased travel costs. Of this, $1,700 is the result of the increased per diem cost and the remainder is to provide for other increased travel costs. The need for the Secretary and his staff to travel throughout the United States and the territories for the purpose of meeting with various groups or to obtain firsthand knowledge of the many and varied problems of the Department continually increases and additional funds are urgently needed for this purpose.

The second part of the estimate for $53,500 covers several miscellaneous defense activities which were formerly carried in the appropriation for delegate agencies made to the Office of Civil and Defense Mobilization but which are being included in the Department of the Interior budget for 1963.

These defense activities are as follows:

(1) *National Resource Evaluation Center, $19,000.*—The amount of $19,000 is requested to continue Interior's representation at the National Resource Evaluation Center. The Department has had one professional employee, with part-time secretarial assistance, located at the Center, and these employees are responsible for processing data in the fields of electric power, metals and minerals, petroleum and gas, and fisheries for insertion into the computer. While much of this data is already in the machine, it is necessary continually to up-date this data and to gather additional data in order to obtain complete coverage in all essential areas.

(2) *Radiological defense training, $17,500.*—The Department of the Interior has been requested by the Office of Civil and Defense Mobilization to man 325 stations of the Federal fixed station monitoring network designed to map promptly the national fallout situation resulting from a nuclear attack. This responsibility is being continued under the direction of the Department of Defense. The sum requested is mainly to pay the traveling expenses of employees to locations where they can receive training, and it also includes $7,500 for radiological equipment. It is estimated that the amount requested will cover the training of about 80 employees. This is a continuous activity within the Department due to the number of personnel requiring training, refresher courses, and the necessity of training new personnel to replace those who leave Government employment or who are transferred to other locations. No personnel will be employed and no salaries will be paid from this fund.

(3) *Expenses of interior-paid mobilization personnel, $17,000.*—The regions and areas of the Department's bureaus, and for the most part, those of Interior's mobilization agencies, cannot, because of their particular function, correspond to the regions of the Office of Civil and Defense Mobilization, now Office of Emergency Planning. Since there may be from 3 to 11 different Interior regions, or parts of regions, within or as a part of one OEP region, it has been necessary for the Department to establish one single contact point for coordination and the flow of information from the Department to OEP and now Department of Defense also, and from these agencies to the Department.

No new positions are set up for this activity but the Department draws on the bureaus operating in the field for personnel who can devote part of their time to this activity. Their salaries continue to be paid by the individual bureau or office furnishing the employees. However, it is not possible for the bureau to absorb the extra expenses (over and above the salaries) necessary for these employees to satisfactorily carry on these defense functions. The same situation exists with respect to part-time mobilization personnel in the Washington office. The funds are requested, therefore, to cover travel expenses primarily of these Interior employees when conducting defense business, and also for communications and printing or reproduction work.

The total requested for the above three defense activities for the fiscal year 1963 is $53,500, and this compares with $26,500 which is being allocated to the Department in 1962.

(*b*) *Office of the Under Secretary, $82,000*

An increase of $9,900 is requested to provide for a GS–9 secretarial assistant, personnel benefits, and additional funds for travel and other expenses. The Under Secretary assists the Secretary in the discharge of his duties and in the absence of the latter performs his functions. Current funds available are sufficient only for the salary and expenses of the Under Secretary, an assistant, and three other employees. The workload and responsibilities of the Under Secretary are of a very high level and extremely heavy and additional assistance is required. It is necessary that the Under Secretary and his assistant perform considerable travel throughout the United States and the territories in order to carry out their responsibilities, and $2,000 is included to cover the per diem increase and other increased travel needs.

(*c*) *Division of Information, $199,900*

The estimate includes an increase of $121,500. The Division of Information is responsible for technical and general functional supervision over all information activities of the Department. This includes providing public relations and infor-

mation services for the Secretary and other officers; directing the coordination, review, and distribution of information developed for all types of media; initiating information programs of a departmentwide nature; and guiding and assisting the the bureaus and offices of the Department in their informational activities.

In order to assure more effective coordination and direction of the Department's services in providing information about its activities to the public, an increase in the staff of the Division of Information is essential.

The lack of effective central direction of such informational media as publications, films, and reports has resulted in a costly overlapping of informational activities with various bureaus and offices producing material of a duplicating nature. By providing for a central coordination of information production facilities, similar to the system employed by other Federal agencies such as the Department of Agriculture and the Department of Health, Education, and Welfare, overall costs can be reduced with significant resulting savings. The budget of the Division of Information has remained virtually constant for at least 10 years while the workload has increased greatly.

Request is being made, therefore, for an increase of 13 positions and $121,500 in funds for salaries, personnel benefits, and other expenses. This increase in staff will pay major dividends in assuring that the overall Department information effort is carefully geared to the needs of the public, the Congress, and those groups which are especially interested in its activities. By providing for effective review and direction of the work of the various bureaus in areas such as publications, visual media, and reports, the usefulness of the informational output of the Department can be greatly increased. In making possible projects such as the preparation of publications and films on the natural resources of each of the States, for instance, informational material which is in wide public demand can be supplied.

The increase in public interest in such activities of the Department as its Office of Saline Water, Office of Coal Research, and the Oil Imports Administration has placed added and important responsibilities on the Division of Information to meet public requests for information about these activities. The energetic conservation programs which have been developed by the Secretary and approved by the Congress, in such areas as improvement and expansion of the national park system and of other recreational opportunities, has also heightened public interest and led to a greatly augmented demand for informational material and services.

The specific increases requested are as follows:

Personal services:	
2 GS–15 information officers	$27, 498
2 GS–14 information officers	24, 460
1 GS–13 information specialist	10, 650
1 GS–12 information specialist	8, 965
1 GS–11 writing and editing specialist	7, 571
2 GS–9 writing and editing specialist	12, 896
1 GS–7 secretary	5, 366
2 GS–5 clerk-typists	8, 694
1 GS–3 clerk	3, 765
Total	109, 865
Less lapse	65
Total personal services	109, 800
Personnel benefits	7, 900
Other expenses	3, 800
Total	121, 500

2. Program direction and coordination

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Assistant Secretary for Water and Power	$215,905	$229,200	$261,500	+$32,300
(*b*) Assistant Secretary for Mineral Resources	156,765	165,200	189,700	+24,500
(*c*) Assistant Secretary for Public Land Management	201,187	202,500	216,700	+14,200
(*d*) Assistant Secretary for Fish and Wildlife	85,301	96,000	96,800	+800
(*e*) Resources program staff	221,733	448,500	450,000	+1,500
Total	880,891	1,141,400	1,214,700	+73,300

(*a*) *Assistant Secretary for Water and Power, $261,500*

The estimate covers the salaries and expenses of the Assistant Secretary for Water and Power and a staff of 19 employees in his office and provides for increases of $32,300. The Assistant Secretary discharges the duties of the Secretary with respect to the development of water and power. He exercises secretarial direction and supervision over the Bureau of Reclamation, Bonneville Power Administration, Southeastern Power Administration, Southwestern Power Administration, and the Office of Saline Water. He is also responsible for carrying out the defense functions of the Secretary with respect to electric power. In the past several years a small amount has been received from the appropriation made to the Office of Civil and Defense Moblization to assist in carrying out specific defense functions. For the fiscal year 1963 the portion relating to defense power activities is carried in this item in the amount of $53,000. This is an increase of $29,000 over the amount available for 1963 from the OCDM appropriation.

The Department has been delegated responsibility for preparedness measures in the field of electric power. Plans must be developed and actions which can be carried on now must be taken for prompt restoration of electric power service as soon as possible after an attack. To effect policy coordination for preparedness planning and control for restoration of power service after an attack, Interior has established a Defense Electric Power Administration, on a standby basis, which will be activated as conditions warrant during a national emergency. The main operating part of this standby Administration is the field organization consisting of 16 power areas throughout the United States. Area power directors and alternates are employed by the Department of the Interior on a without-compensation basis. These w.o.c.'s are employees of utilities devoting part of their time to moblization planning and action without cost to the Federal Government, either for salaries and other expenses, except for security clearances which are secured by Interior. In all, approximately 50 w.o.c. appointments are necessary and to complete this number and provide for replacements, it is estimated that approximately 10 security clearances will be required during the year.

Much of the mobilization planning is carried on at the State and local level and meetings and conferences with Federal and State officials are necessary to develop plans and the organizations for defense mobilization and to keep these current. It is necessary also to bring a radiological monitoring capability to electric power industry personnel. Interior personnel train instructors in the industry who in turn instruct monitors within their utility. Another area of responsibility is that of special power studies in relation to national defense in various parts of the Nation where the electric power supply is or may become critical. These studies are performed under the direction of the Technical Interagency Power Group which is composed of technical representatives from five Federal agencies, with Interior supplying the Chairman and the bulk of the staff work.

At present, defense electric power functions in the Washington office are carried on by employees on the regular departmental roll who spend part of their time in mobilization activities. One additional employee is stationed in OCDM region 5 where he is engaged in full-time mobilization work in that area. His salary and expenses have been covered by the allocation from OCDM, now OEP. For the fiscal year 1963 funds are requested to employ one additional professional engineer and a clerk-stenographer in the Washington office. Due to the shortage of personnel in the Washington office, it is not possible to keep up with actions on the regional level nor to provide fully information and help to the area power directors who are spread throughout the United States. Additional help is due these WOC employees who expect their guidance and assistance to come from Interior, and unless this help is provided, the organization and planning soon lapses and be-

comes ineffective. Considerable travel is required and the funds provide for this together with that required for communications, printing, security clearances and the necessary supplies, and other services.

A small increase, or $3,300, is requested also to cover communications, increased per diem cost, and some increased travel of the Assistant Secretary and his staff. This is urgently needed to provide on-the-ground information and guidance for the many problems which arise in the water and power operations of the Department.

(*b*) *Assistant Secretary for Mineral Resources, $189,700*

The estimate for the Assistant Secretary for Mineral Resources, which includes an increase of $24,500, provides for the salary and expenses of the Assistant Secretary and a staff of 16 employees. The Assistant Secretary discharges the duties of the Secretary with respect to the development and utilization of minerals and fuels, including defense minerals activities. The Assistant Secretary exercises secretarial direction and supervision over the Bureau of Mines, Geological Survey, Office of Geography, Office of Minerals Mobilization, Office of Oil and Gas, Office of Minerals Exploration, and Office of Coal Research.

The estimate includes the addition of a GS–15 position which is needed to provide supervision and support to activities relating to mining conducted by the Bureaus and Offices in the Mineral Resources area. The incumbent would review the mining-related programs of the area; participate in preparation of staff studies relating to the mineral industries; assist in the development of the Department's policies respecting minerals. He would have supervision over the participation of the mineral resources area in programs affecting depressed mining communities undertaken in cooperation with the Area Redevelopment Administration and would serve as Staff Adviser to the Assistant Secretary in matters relating to mining and mineral commodities. Establishment of this position will also entail addition of a secretary GS–5 to the staff of the office. Additional funds totaling $6,500 are required also for accompanying personnel benefits, increased per diem cost and travel needs, and other expenses.

(*c*) *Assistant Secretary for Public Land Management, $216,700*

The estimate, which is an increase of $14,200 over that available for 1962, provides for the salary and expenses of the Assistant Secretary for Public Land Management and a staff of 17 employees assigned to his office. The Assistant Secretary discharges the duties of the Secretary with respect to land utilization and management, territorial affairs, and Indian Affairs. The Assistant Secretary exercises secretarial direction and supervision over the Bureau of Land Management, National Park Service, Bureau of Indian Affairs, Office of Territories, and the Alaska Railroad. Matters requiring the attention of the Assistant Secretary and his staff are continually increasing and many of these require detailed and time-consuming study, visits to the field locations, and meetings with Indian or public groups, and State or local officials. Additional staff to meet this workload is needed and the estimate includes funds for one additional GS–13 staff assistant. Travel costs are increasing also and an addition of $2,800 is included for this.

(*d*) *Assistant Secretary for Fish and Wildlife, $96,800*

The estimate provides for the salary and expenses of the Assistant Secretary for Fish and Wildlife and seven employees of his office. An increase of $800 is included to cover increased per diem cost. The Assistant Secretary for Fish and Wildlife discharges the duties of the Secretary with respect to the development, conservation, and utilization of the fish and wildlife resources of the Nation. The Assistant Secretary exercises secretarial direction and supervision over the Fish and Wildlife Service.

(*e*) *Resources Program Staff, $450,000*

The estimate for the fiscal year 1963 is an increase of $1,500 over the total available for 1962. The Resources Program Staff consists of highly qualified professional employees with varied backgrounds of training and experience in economics, engineering, political science, international affairs, forestry, soil conservation, fish and wildlife, water, power, and public lands who have a broad familiarity with all programs, policies, and procedures of the Department in addition to specialized knowledge of one or more particular fields. The Staff provides advisory services to the secretariat and Bureau chiefs upon request and provides central staff service to the Secretary and Under Secretary in program planning. Also, the participa-

tion of the Secretary and Under Secretary in meetings of high level policymaking groups requires staff services which the Resources Program Staff provides, involving assembly of data, preparation of necessary reports, and briefing.

The Staff provides, in addition, departmental liaison with the field committees of the Department, with the Bureau of the Budget on coordination of statistical standards, and with other Federal agencies on program matters of mutual concern which are regional, national, or international in character. It reviews planning reports initiated within Interior or submitted to Interior by other agencies. It coordinates the participation of Department representatives on interagency committees dealing with program and policy matters. And it includes staff members who provide central staff services in connection with the coordination and direction of the Department's participation in international activities (concerned with foreign trade and technical assistance in the natural resources field).

The objectives of the Resources Program Staff are: (1) To provide competent advisory staff service available for consultation, assistance, and advice to the secretariat and Bureau chiefs; (2) to provide central staff service to the Secretary and Under Secretary in program planning; and (3) to provide a means of coordinating the activities of the various Department bureaus in the field and in Washington and to activities of the Department with those of other Departments and agencies.

The only increase is $1,500 to cover increased per diem cost.

3. Administrative management services

Subactivity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(*a*) Administrative Assistant Secretary	$60,019	$63,600	$64,100	+$500
(*b*) Division of Budget and Finance	157,229	183,200	185,200	+2,000
(*c*) Division of Management Research	124,626	126,400	163,500	+37,100
(*d*) Division of Property Management	71,277	71,800	83,600	+11,800
(*e*) Division of Personnel Management	316,635	318,300	318,700	+400
(*f*) Division of Administrative Services	485,064	484,900	485,000	+100
(*g*) Division of Security	34,848	41,500	41,600	+100
(*h*) Division of Inspections	112,341	102,700	143,800	+41,100
(*i*) Correspondence Management Control	55,053	44,300	44,300	----------
Total	1,417,092	1,436,700	1,529,800	+93,100

(*a*) *Administrative Assistant Secretary, $64,000*

Provision is made for the salary and expenses of the Administrative Assistant Secretary and a small staff of four employees in his office in this estimate. The Administrative Assistant Secretary discharges the duties of the Secretary with respect to administrative management functions in the Department, and directs and supervises the divisions listed above. An increase of $500 is provided to cover increased per diem cost.

(*b*) *Division of Budget and Finance, $185,200*

The estimate for the Division of Budget and Finance will provide for the salaries and expenses of 15 employees and includes an increase of $2,000. The Division has primary staff responsibility for the budget and finance activities of the Department including internal audits. It performs a liaison function with the Bureau of the Budget and the Appropriation Committees of the Congress on all appropriation matters for the Department. It also has general direction of the development, preparation, and execution of the Department's budget and participates in determinations relating to Department programs and evaluations of the programs in terms of budget requirements. The Division has the responsibility for improving and developing accounting systems and establishing and effectuating internal audit programs in the various bureaus and offices of the Department. The organization of the Division consists of the Office of the Director and two branches covering budget and finance.

An increase of $2,000 in travel funds is needed in order that staff of this Division be able to make scheduled trips to field installations of the bureaus, and also to cover the increase in per diem costs. The operations of the Department are decentralized. It is important that staff examiners in both budget and finance make periodic and continuing examinations in the field to insure that financial programs are being carried out in accordance with established procedures and on the basis approved by the Congress in annual appropriation acts. Such

examinations would also allow for improvement in the formulation and execution of accounting and budgeting programs through closer liaison between staff and operating officials.

(c) *Division of Management Research, $163,500*

The increase over 1962 in this estimate is $37,100. The Division of Management Research is responsible for the improvement of management and organization throughout the Department including the management improvement, incentive awards, and departmental committee management programs, conduct of management surveys, and the management of a system of secretarial directives including orders, manuals, handbooks, Federal Register documents, and other written instructions. Advice is provided through a consultative service to the bureaus and offices on these matters as well as those relating to organization, electronic data processing, and general management operations.

The activities of the Department are continually expanding and becoming more complex. This raises many problems requiring management research assistance, and the emerging workload is such that additional staff is required if an adequate level of assigned responsibilities is to be performed. The use and application of data processing, operations research, and other management science techniques to the operations of the Interior Department also require careful analysis and study. In order to meet these needs, an increase of $37,100 is requested to provide for three additional positions, related personnel benefits, and other expenses. The positions would be a GS–14 management analyst to supervise the expanding directives and paperwork management program, a GS–14 management analyst who could devote full time to leadership in the application of data processing and other new techniques, and a GS–7 management analyst who would serve as junior staff assistant on rotating assignment throughout the Division.

(d) *Division of Property Management, $83,600*

An increase of $11,800 is provided for in this estimate. The Division has primary staff responsibility for all property management activities of the Department. These include development of policy standards and objectives, providing staff guidance and direction, review and appraisal of the procedures and activities of the Department relating to procurement, utilization, and disposition of real and personal property, construction contracting, quarters and subsistence, records and forms management, and radio frequency use and assignment. The staff of the Division represents the Secretary in interdepartmental property management activities and performs periodic field examinations of bureau activities relating to property management.

During the fiscal year 1963, it is proposed to add one supply management analyst (GS–9) and one clerk-stenographer (GS–5) to handle new inventory controls and to assist in the development of improved and expanded reporting procedures in other phases of property and records management. On the basis of tests which have already been completed, it is planned to develop and install more precise cost controls over warehousing and supply storage operations, including stock purchasing standards, throughout the Department. It is believed that this effort will produce significant savings and better control over inventory assets. Additional emphasis will be applied to establishment of more accurate inventories of real property under the jurisdiction of the Department, including a realistic appraisal program in each bureau having real property management responsibility. The additional staff requested will make it possible to accomplish these and other objectives and to realize such savings as may result from additional improvements in all phases of property and records management. The total increase for the salaries, personnel benefits, and per diem cost is $11,800.

(e) *Division of Personnel Management, $318,700*

An increase of $400 is included to cover the increase in per diem cost. The Division of Personnel Management is made up of a staff of 32 employees. The Division provides departmental leadership and staff guidance in the development and maintenance of a comprehensive personnel management program throughout the Department; develops policies, standards, objectives, and programs designed to establish and maintain an adequate, qualified, and efficient working force; provides general direction of a comprehensive program of personnel administration including position classification, labor relations, wage administration, employment, training, employee relations, inspection, personnel standards, procedures and records and safety and health; coordinates bureau personnel programs; and plans and stimulates studies of personnel management improvement including executive development and training.

(f) Division of Administrative Services, $485,000

The estimate provides for the salaries and expenses of 73 employees. The only increase is $100 for increased per diem cost. The Division of Administrative Services under the direction of the Chief Clerk of the Department, formulates and develops policies and procedures and provides coordination for a program of administrative services for the Department, and administers centralized services for the Department on such matters as space, printing, duplicating, library, health, communications, and storage and shipping of office supplies and forms. The Division also provides administrative services such as fiscal, personnel, mail, file, messenger and procurement, for the Office of the Secretary, Office of the Solicitor, Office of Oil and Gas, Office of Minerals Mobilization, Office of Saline Water, Office of Geography, Office of Minerals Exploration, and Office of Coal Research.

(g) Division of Security, $41,600

A staff of four employees is provided for in this estimate, which is $100 more than provided for 1962. The Division of Security has primary staff responsibility for the establishment and maintenance of security throughout the Department. This includes development of policies, procedures, and regulations for the administration of the Department's personnel security program, the security of classified documents and materials, and the physical security of all types of facilities and equipment for which the Department has responsibility. It is responsible for the coordination and development of policies and procedures for natural disaster planning and for the establishment and maintenance of a radiological monitory program designed to protect the personnel and facilities within the Department. It represents the Department before other agencies of the Government with respect to security, disaster, relief, and radiological monitoring matters.

(h) Division of Inspection, $143,800

The estimate for 1963 includes increases of $41,100. The Division of Inspection, with two Branches, Investigations and Inspections, has primary staff responsibility for all inspection and investigation functions of the Department. Included are development of the policy, reporting, and procedural requirements of the Department's inspection program; preparation of instructional material; enforcement of inspection policies and procedures; liaison with external agencies on inspection matters; coordination of bureau inspection activities; conduct of special inspections, investigations and reporting on alleged irregularities; and handling of cases arising in connection with the nondiscriminatory employment policy.

The Division of Inspection, Branch of Investigations, emphasizes positive management as a deterrent for wrongdoing. The Division, as such, furnishes staff services to the Administrative Assistant Secretary in preserving the highest ethical standards in the management of the Department's programs and in the deportment of its employees. Executive Order 10939 has placed increased emphasis on ethical conduct and, therefore, the investigation-decision time lag must be shortened. To furnish timely, positive, and objective findings, it is necessary that the present staff be strengthened. Funds are requested, therefore, for four additional employees, a GS–14, a GS–12, a GS–7 and a GS–5, and related personnel benefits, travel, and other expenses; in all an increase of $41,100.

(i) Correspondence Management, $44,300

The estimate provides for six employees and some expenses. This unit was established for the purpose of improving the handling of important correspondence in the Department and to avoid delays in replying. It provides centralized responsibility for the determination of disposition of correspondence directed to the secretariat and to the Department of the Interior and all congressional mail directed to the secretariat or the bureaus and offices in Washington. Prompt referral of incoming correspondence is made directly to the bureau or office responsible for initiating the reply, and the departmental correspondence control officer has authority to enforce compliance with deadlines on controlled correspondence at all levels.

4. General services

Subactivity	Available, 1961	Available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) General services	$109,712	$124,200	$125,000	+$1,000

This activity covers general expenses of the Office of the Secretary which it is not practicable to distribute to the various activities under this appropriation. Included are printing and binding, telephone, health and library services, postage, and travel of Members of Congress in connection with examination of field activities of the Department. An increase of $1,000 is requested to cover increased travel costs.

5. Natural resources studies

Subactivity	Available, 1961	Available, 1962	Estimate, 1963	Increase (+) or decrease (−)
(a) Natural resources studies		$200,000		−$200,000

This was a special item provided in the Supplemental Appropriation Act, 1962, to provide funds for transfer to the National Academy of Science which is undertaking and directing a comprehensive study of research relating to the conservation and development of the natural resources of the United States. No funds are requested for this in the fiscal year 1963.

PREPARED STATEMENT

Chairman HAYDEN. You may proceed.

Mr. BEASLEY. Mr. Chairman, I have a prepared statement I will insert in the record, and I will give the highlights of the estimate.

Chairman HAYDEN. That may be done.

(The statement referred to follows:)

STATEMENT BY D. OTIS BEASLEY, ADMINISTRATIVE ASSISTANT SECRETARY, DEPARTMENT OF THE INTERIOR

Mr. Chairman and members of the committee, the budget estimate for the Office of the Secretary for the fiscal year 1963 is in the total amount of $3,568,000 which is a net increase of $132,500 over the funds available for the current fiscal year. This net increase consists of several items of increase totaling $332,500 less a deduction of $200,000 for the nonrecurring item of the special study of the natural resources research program provided for in the 1962 appropriation.

As you are aware, this appropriation finances at the Secretarial level the general administration of the Department. Expansion of the Department's water, mineral, land, and Indian and territorial programs has resulted in increasing the Secretary's responsibility not only with respect to the development of long-range plans but after their development to see that they are carried out wisely and in the most economical and efficient manner. It is essential, therefore, that the Secretary have an able staff to provide him with an informed and effective leadership and responsible supervision of the various bureaus with their diversified activities.

Throughout the country there is increasing recognition that conservation of our natural resources extends directly or indirectly into every household, school, and industry. As a result, public requests for information about the whole range of the Department's conservation activities has grown tremendously. In order to meet effectively this need for a wide variety of informational material—information releases, publications, films, educational pamphlets—we are asking for an increase of $121,500 for the Division of Information. By assuring the preparation in a form to meet the public requirements of the material needed, the Department will be better able to perform the information function that is an essential part of its overall mission. Through closer coordination of bureau activities in such areas as publications and visual media, wasteful duplication of effort will be eliminated.

The other major item of increase is that for the defense activities of the Department which are provided for in this budget rather than in the estimate for the Office of Emergency Planning (formerly OCDM) as was done in prior years. The amount of $106,500 requested for this purpose represents an increase of $56,000 over the $50,500 available for the current year and is primarily for two additional positions for directing the electric power activities and for travel of Interior personnel to provide direction, coordination, and training for industry and Interior personnel.

The balance of the increase is for additions to staff and related expenses to give adequate staff assistance to the Under Secretary, the Assistant Secretary for Mineral Resources, the Assistant Secretary for Public Land Management, and the Administrative Assistant Secretary.

This committee is aware of the complex and varied matters which reach the Secretary for decision. In many—if not most—occasions these matters cross responsibilities of more than one bureau within the Department. The Secretary must have facts upon which he must act in making his decisions. Competent staff assistance at the secretarial level is necessary to bring important and essential information to the Secretary's attention.

I want to assure this committee that adequate staff facility does not, and will not, act as a bar to the close relationship of the secretariat with bureau head's. On the contrary, the single purpose of staff assistance is to supply the secretariat with the means whereby coordination of the farflung activities of the Department may be assured.

Two additions in the appropriation language are requested; one is for authorization to replace a passenger motor vehice at a cost of not to exceed $3,000. This automobile is for the use of the Secretary and the Under Secreatry and would replace one that is approximately 15 years old. The other would permit the use

of not to exceed $2,000 for official reception and representation expenses. The Secretary, by reason of his office, is continually meeting with State and local officials, foreign dignitaries, or other groups. Common courtesy demands that luncheon invitations or other forms of hospitality be extended to these officials. Approval of the language requested would relieve the Secretary of the financial burden of paying from personal funds the costs of these responsibilities which are of direct benefit to the Government. Other Government agencies have been faced with this problem and have received authority to use appropriated funds for this purpose. No increase in funds is requested for this or the automobile.

General Statement

Mr. Beasley. This is the appropriation item that finances the general executive direction of the Department, and includes the funds for salaries and expenses of the Secretary and other members of the secretariat and the staff with responsibilities performed at the departmental level.

INCREASE REQUESTED

Over the years there have been no increases in this appropriation item except for two units in the 1962 appropriation, and with the exception of increases to cover pay raises.

We are asking for certain increases this year to meet the demands upon the staffs in some of the offices. Our total increase is as you have indicated, and is broken down into certain broad categories, such as additional personnel, per diem, increases in travel expense, other expense, and defense activities.

PERSONNEL

The increases in personnel are requested for the Office of the Under Secretary, the Division of Information, the Assistant Secretary for Mineral Resources, the Assistant Secretary for Public Land Management, and under the Office of Administrative Assistant Secretary, for the Division of Management Research, Division of Property Management, and the Division of Inspection.

PER DIEM ALLOWANCE

I will be glad to go into such details as you wish.

The increase requested for per diem is based on the additional per diem allowance authorized in the last session of Congress; and while in general the Department is absorbing these costs, this is an item which it is difficult or impractical to absorb, because of the small appropriation involved, and to absorb it would be at the expense of positions which we feel are very important to the Secretary and the management of the Department.

TRAVEL

We are also asking for some increase in general travel, which results from our experience that there are increasing demands on the part of the public for the Secretary and other members of the secretariat to appear in various parts of the United States to discuss matters of importance or to attend meetings or conventions.

LANGUAGE CHANGES

The only other item which I will make specific reference to is the defense activities. This is an item that in the last several years has been financed by transfer of funds from what was OCDM, now the OEP.

Chairman HAYDEN. You have been obtaining funds for transfer?

Mr. BEASLEY. We have been obtaining funds by transfer in the past, but this year the Budget is proposing that the funds be appropriated directly to the Department.

We are asking for two language changes, one which would permit us to exchange an automobile that has been in use for 15 years. We think the time has come to replace it. It is one that is used for the Secretary and Under Secretary.

REPRESENTATION ALLOWANCES

A second language change is one that would permit the Secretary to use up to $2,000 for reception and representation expenses. This is an expense that he has had to bear personally in the past, and we have included this provision this year, which would enable the Secretary of the Interior to use up to $2,000 for this type of expense.

Many other Government agencies already have this type of authority, and those that do not—it is my understanding that provision is being made in their appropriation language for 1963.

Chairman HAYDEN. We thank you for your statement, sir.

Mr. BEASLEY. Thank you, Mr. Chairman.

OFFICE OF THE SOLICITOR

STATEMENTS OF FRANK J. BARRY, SOLICITOR; EDWARD W. FISHER, DEPUTY SOLICITOR; AND EDITH A. MAHON, ADMINISTRATIVE OFFICER

BUDGET ESTIMATE

Chairman HAYDEN. The budget estimate for 1963 for the Office of Solicitor is $3,747,000. This is an increase of $255,000 over the appropriation for fiscal year 1962. The justification for this estimate will be included in the record.

(The justification follows:)

SALARIES AND EXPENSES

All legal services required by the bureaus and offices of the Department are furnished by the Office of the Solicitor. With the steady increase of business, the demands upon the Solicitor's Office have long since exceeded its capacity to perform with efficiency and dispatch at its present strength. The result is lengthening delays in attention to all matters except those having the highest priority. There is a direct correlation between the activity of the agencies and bureaus and the demands on the Solicitor's services. Whatever the cause may be, there is much activity in the agencies presenting an ever-increasing volume of legal problems. As examples, land appeals have increased from 156 in 1956 to an estimated 650 in 1962; the saline water and coal research activities have been greatly increased, with important legal implications. Delaware Basin and petroleum defense programs are examples of new activities requiring continuous legal

attention. Preparations are being made for expected litigation in matters involving oil-shale contests, excess lands problems, and fraudulent oil and gas leasing.

The size of the budget estimate for the Office of the Solicitor for the 1963 fiscal year, therefore, is designed to increase the ability of the law office to supply the needs of the agencies. The estimate provides for an increase of $255,000 to be used where the need is greatest.

Salaries and expenses

Appropriation, 1961	$3, 475, 000

Legal services	$3, 412, 648	$3, 492, 000	$3, 747, 000	+$255, 000
Unobligated balance lapsing	62, 352			
Total	3, 475. 000	3, 492, 000	3, 747, 000	+255, 000

JUSTIFICATION

The budget estimate for legal services in the 1963 fiscal year provides for an increase in funds of $255,000, for the following purposes:

(1) $41,721 to increase the man-year services in authorized positions.

(2) $145,579 to add 10 professional and 16 clerical positions to the existing number of authorized positions.

(3) $13,200 to cover personnel benefits costs.

(4) $54,500 to cover additional office maintenance costs.

As it is the function of the Office of the Solicitor to furnish the legal services associated with the administration of the programs and activities of the Department, the budget requirements of the Office necessarily are directly influenced by the operations of the bureaus and offices. In the current fiscal year, the agencies have moved and are continuing to move into new and expanded activities, with emphasis on their acceleration in many instances. In the 1963 fiscal year, substantially greater dimensions are in contemplation according to the forecasts of the agencies.

If timely and competent legal assistance is to be rendered proportionate to demands, the staff of lawyers and auxiliary personnel cannot remain static. The legal business stemming from the stepped-up programs of the Department in the last fiscal year showed a notable increase, there having been an incoming volume of over 150,000 matters as against some 139,000 in the previous year. Unrevealed in the statistical comparison is the important fact that the character of the workload, in preponderant part, was marked by the highly complicated type of legal problem accompanied by the urgency of prompt solution. Demands of this sort, in their variety and scope, are arising in virtually all areas of departmental activity and they are settling into a pattern of work pressures for which the staff capacities of the office are not equal.

This estimate accordingly is designed to overcome the present shortages in manpower resources and to raise the general level of legal services to a point more reasonably related to the requirements of the bureaus and offices. In part, the funds requested will enable the office to maintain a higher-year employment in authorized positions than can be financed within the limits of the current year appropriation. Among the benefits will be the discontinuance of prolonged delays in hiring replacements of departing employees in instances of substantial terminal leave costs and the alleviation of the resulting loss in the continuity of services.

In the departmental service, additional positions are provided for the Branch of Land Appeals and the Branch of Patents. In the category of land appeals, the caseload has been increasing at a rapid rate and the backlog of cases has grown from 211 at the beginning of the last fiscal year to 474 to date. This alarming backlog and its continued growth in the months ahead will remain to be disposed of irrespective of any changes in appellate procedures that may result from current studies. In fact, revising the appellate process is not seen as likely to influence in any marked degree the number of attorneys that are essential to the workload requirements at the departmental level. What is proposed in this estimate, therefore, is the addition of two attorneys and two clerks to the work force of the Branch as a basic need of a continuing nature in any future determinations respecting the decision-making processes.

The proposal to strengthen the small staff of the Branch of Patents derives its justification from the advancements that are being made by the Department in scientific, technologic, engineering, and other fields involving experiments and research. In both volume and complex technical matter, the patent work has been increasing with the passage of time. To avoid costly delays, which could run into the seriousness of abandonment of patent applications, it is clear that a patent attorney, with a specialization in one or more of the technical fields in which he would be engaged, must be hired along with a clerk-stenographer to aid the work of the Branch.

In the field, most of the offices are understaffed in either professional or clerical services, or both. Generally, the impact of acceleration in departmental programing is causing difficulty in meeting service demands. In some of the offices—the Portland regional office in particular—priority scheduling of the bureaus' legal business has become necessary with the result that attention to many matters important to the progress of the Department's programs is having to be deferred.

The list below identifies the positions and their locations included in this estimate for the relief of the situation in the field. Among the positions are three probate clerk, GS–5, positions to be respectively stationed in Aberdeen, Billings, and Portland. Services in these positions will help to offset the burdens that are falling upon the hearing examiners in the issuance of formal orders to correct errors in inventories of trust property in prior probate decisions. These errors are being discovered in substantial number through the operation of the new land records improvement program of the Bureau of Indian Affairs. Since the major portion of the Bureau's program will be completed in the fiscal year 1964, the need for the services of these clerks should be concluded by the end of that year.

In summary, the cost of the new positions in the Washington headquarters office is estimated at $39,645 and those in the field, $105,934. The total personnel benefits costs incident to these positions will require an additional $13,200.

To support the office on the scale of operations that must be reached to discharge the obligation to furnish adequate legal services to the bureaus and offices, an increase in other expenses to the extent of $54,500 is estimated. In the travel item, approximately $10,000 is attributable to the rise in per diem allowances.

Itemization of estimate—Office of the Solicitor, salaries and expenses

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$3,548,639	$3,622,000	$3,877,000	+$255,000
Advances and reimbursements from other accounts	−135,991	−130,000	−130,000	
Unobligated balance lapsing	63,352			
Total (appropriation)	3,475,000	3,492,000	3,747,000	+255,000
Obligations by objects:				
11 Personnel compensation	2,992,708	3,115,350	3,302,650	+187,300
12 Personnel benefits	222,190	229,550	242,750	+13,200
21 Travel and transportation of persons	84,830	88,500	110,000	+21,500
22 Transportation of things	8,725	4,000	5,000	+1,000

PREPARED STATEMENT

Chairman HAYDEN. You may proceed with your statement, Mr. Citizen of Arizona.

Mr. BARRY. Mr. Chairman, I have submitted a prepared statement, which I have placed in the record, and I would like to expand on it.

Chairman HAYDEN. That may be done.

(The statement referred to follows:)

STATEMENT OF FRANK J. BARRY, SOLICITOR, DEPARTMENT OF THE INTERIOR

Mr. Chairman and gentlemen of the committee, I appreciate the opportunity to present the appropriation request of the Office of the Solicitor.

The request includes $255,000 in excess of the amount appropriated for the present year. I believe that the request is conservative, and that a larger request could well have been justified. I believe that I can demonstrate this to you today.

As our society is developing over the years, two forces seem to require a continuing increase in the number of people involved in doing the work of the Government. The first is the increase in the bulk of the work done by the Government; the second is the increase in the need for specialists to do the work. Of course, as the business of the Department of the Interior has increased in bulk and in intensity, the work of the lawyers for the Department of the Interior has also increased. In years past the lawyer who advised you in your business affairs, helped prepare your income tax returns, represented you in court, and finally probated your estate was one and the same person. Now that is all changed for specialization has reached the field of law.

Having come from private practice, I had heard, and perhaps echoed the familiar complaint, that the business of Government is conducted too slowly. When I entered upon my duties as Solicitor for the Department of the Interior, I found what I considered to be one of the main causes of delay; the volume of work is simply too great for the number of people provided to do it. I have been in the Solicitor's Office for a little more than a year. I think I have been sincerely concerned with the problem of cost of Government. I think I can say honestly that no change of policy in employment and no change of method in management could increase the output of my office without the addition of more people to do the work.

A number of important and time-consuming activities have been carried on in my office during the last year which were not anticipated, and could not have been

anticipated, when the 1961 and 1962 budget requests were made. Some of these are enumerated in the justification you have before you. The details of one such activity are illustrative of many of the others. Early in the session last year, bills were introduced in the House and the Senate for the approval of the Delaware River Basin compact. In many respects this was a unique compact between States. It had been negotiated by the States of New York, Pennsylvania, New Jersey, and Delaware without consultation with many of the interested agencies in the Federal Government. Yet the Federal Government was proposed to become a member of the Delaware River Basin Commission with one vote in five on matters coming before the commission. Furthermore, the compact authorized the Commission to construct and operate water resources projects and facilities within the basin. This, too, was a radical departure from the past where commission activity had been limited to advisory planning. No precedent existed for such a compact. Significantly, the bill was accompanied by an elaborate treatise on its constitutionality prepared by distinguished law professors.

The reaction in the executive departments approximated mild panic. However, the administration, recognizing the need for, and the many fruitless efforts in the past to coordinate, the water resources of the Delaware Basin, was sympathetic. The executive departments, including the Department of the Interior, were instructed to find means whereby the compact legislation might be supported by reserving areas of essential Federal interest. President Kennedy designated Secretary Udall as the person through whom negotiations with the basin States should be conducted.

The greater burden of this responsibility fell on personnel in my office. Four members of my staff spent extreme time and energy in study and negotiation, not only with representatives of the basin States but in numerous large meetings of representatives of the various Federal agencies in Washington. In due course, reservations satisfactory to the United States and acceptable to the particular States involved were hammered out and incorporated in the Act which was finally approved last September. A short time later the President designated Secretary Udall as the Federal representative on the Delaware River Basin Commission. The immediate pressure of our Delaware River Basin work has somewhat abated since the adoption of the bill. However, the Commission is now getting organized and I could easily assign one man full time to the legal matters arising out of Secretary Udall's new responsibility as Federal representative.

In addition to the extraordinary and unanticipated duties which have fallen upon the Office of the Solicitor in the last year, and which I must prudently expect to be joined by others in the 1963 fiscal year, there has been an increased activity in the various bureaus and agencies within the Department. My office provides all of the legal services to the various agencies and bureaus in the Department of the Interior. The more business the agencies have the more legal assistance they call for and our budget must keep pace with their activities.

There are some areas in the Solicitor's Office where increases of grade and pay have been neglected so that the occupants of various positions are now earning less and have less future prospects than are available to them in other departments of Government. No doubt you are aware that the Department of Health, Education, and Welfare is now employing hearing examiners in connection with the social security program. We have long considered it necessary for us to apply to the Civil Service Commission to increase the grade of our Indian hearing examiners. They are now in grade 12. The Department of Health, Education, and Welfare is offering hearing examiners a grade of GS–14. Many of our hearing examiners, men who are experienced and not readily replaceable have applied for the jobs now available in Health, Education, and Welfare. We can no longer delay in raising their pay to induce them to stay with us.

Prior to 1954, most of the lawyers in the Department of the Interior were employed by the various bureaus and agencies of the Department. In that year the Office of the Solicitor was expanded and all lawyers were brought within a single organization, the present Solicitor's Office. In terms of efficiency, economy, and superior service to the Department, I think the integration of the Solicitor's Office was a good thing. Not only is there a better communication between the Secretary and the lower echelons of the Department through the Solicitor's Office, but there is better coordination and better supervision of the legal activities of the Department.

However, until the integration of the Office the lawyers have never had serious budgetary problems. For example, in the years after World War II the Bureau of Reclamation had a budget in the neighborhood of $250 million per year. From this sum lawyers were employed, together with all the other personnel.

In 1952, there were 13 lawyers in the Office of the Chief Counsel of the Bureau of Reclamation in Washington. Today there are seven lawyers doing the same work in my Division of Water and Power under the Associate Solicitor for Water and Power. In January 1952, there were 90 lawyers employed in Washington in the Department of the Interior and 135 lawyers employed in the field. This is a total of 225 lawyers in the Department. In the next year the total rose to 227. Now in Januray 1962, we have 75 lawyers in Washington and 117 lawyers in the field working for the Department of the Interior, a total of 192. This is a reduction of 35 lawyers since January of 1953.

I think that this reduction has been due in part to the increased efficiency of an integrated office. On the other hand, I assure you that while diligence and efficiency and devotion may be expected from the Solicitor's Office, that alone cannot do the job. I am compelled to ask that our budget request be granted.

General Statement

Mr. Barry. I believe, in the justification we indicate in what offices we are requesting personnel increases, that is, which will require this additional appropriation.

Rather than deal with them individually in this statement, I would just like to give the committee an idea of what our problem is as lawyers in the Department.

It is awfully difficult to justify a budget in advance of knowing what is going to come up that is going to require additional services, and that depends on what appropriations are made or what happens in the next fiscal year.

DELAWARE RIVER BASIN COMPACT

To give some examples, I touched on one in the prepared statement, that is, the Delaware River Basin compact, which was entirely unexpected, unbudgeted for, and required the almost continuous services of four people in my office at the time it was pending in Congress.

There are several others that have come up in the last year that I have been in the Office that were not anticipated. At least, they were not covered by any previous budget request, but they required so much time that the impairment of the efficiency of the Office is such that it is seriously affected unless we have additional personnel to handle these matters.

Where the difficulties have become most critical as a result of the emergencies that have developed, we have gotten into a situation where there are serious backlogs that impair the efficiency of the Government. I believe that we have to keep pace with the other departments of Government.

LEGAL STAFF FOR BUREAU OF RECLAMATION

The Bureau of Reclamation, for example, in 1952, with a budget of around $250 million, had an office of Chief Counsel with 13 lawyers working for the Bureau of Reclamation. Now, since the integration of the Office of the Solicitor, we have a Division of Water and Power with an Associate Solicitor who handles all of the work that was previously done by the Chief Counsel's office and, in addition, has further responsibility for legal matters at the departmental level relating to Bonneville Power Administration, Southwestern Power Administration, and Southeastern Power Administration. This office now has seven lawyers, just a little bit more than half as many as there were in 1952. And yet, the budget for the Bureau of Reclamation

has increased from $250 million to a little more than $340 million. At least, this is the request for fiscal 1963.

Now, we have in the field of saline water and coal research a new and pressing problem which has come up, which has required a great deal of time and which is still in process, having to do with the patent policy to be applied to these very important public programs.

There is considerable confusion in the Departments of Government concerning the patent policy, and they are not at all consistent. There are bills pending in Congress to establish a uniform patent policy, and we have had to sort of hammer one out there, in our Department, which would be consistent with the responsibilities of the Secretary of the Interior and at the same time encourage the activities that Congress is so interested in furthering.

BUREAU OF LAND MANAGEMENT PROBLEMS

In the Bureau of Land Management, we have tremendous assets, of course, which we have to manage. The revenue is in the order of 3 to 1 over the cost of management in the Bureau of Land Management; and largely this work is the work which has to be cleared through the Office of the Solicitor.

Certain problems have come up with that—oil shale in northwestern Colorado and in Utah and Wyoming; the *Davis-Featherstone* cases, which involve problems of fraudulent leasing in years past. The court has recently held that we could not cancel leases for fraud; that we would have to go to court and have them canceled if based on that ground.

The Supreme Court denied certiorari in a 10th circuit court decision to that effect; so we now have an elaborate program in the Bureau of Land Management, which is largely handled by the lawyers, getting the cases ready to submit to the Justice Department.

ADMINISTRATIVE CANCELLATION OF LEASES FOR FRAUD

Chairman HAYDEN. It is strange to me that where there is clearly fraud you cannot cancel without going to court.

Mr. BARRY. Apparently this is it. We canceled some leases which were being held by Pan American Oil Corp. about 2 years ago. The Secretary canceled them for fraud. A dummy had located, and they were in violation of the excess land laws as applicable to oil leasing. The leases were canceled, and suit was filed, and the cancellation was enjoined before it became effective. The case was tried, and the 10th circuit held, the Supreme Court denying certiorari, that we could not cancel for fraud. That is to say, we cannot administratively cancel for fraud. We can do so if we can establish a proper case in court.

This is the effect of the *Davis-Featherstone*, so-called, cases, although actually in court they were the *Pan American* case. Davis and Featherstone were individuals who were active in securing leases in this area. And there are a large number of such leases and a great deal of work involved.

OFFICE OF MINERALS EXPLORATION

I heard at the House Appropriations Committee, the office that was just before us, and it sort of points up the problem that we have

in the Solicitor's Office; it was the Office of Minerals Exploration, and they were discussing the lead and zinc program which has been authorized and asking for money in connection with that program, which is supposed to provide money for small mine operators. And in the course of the discussion, the representative of the Office stated that every one of the contracts is going to require legal review.

Well, so far we do not have anyone in our office doing that work; and from the magnitude of the program as he indicated, it would certainly require practically the full-time services of someone else, whom we cannot even anticipate, because Congress may not appropriate the money, and so forth, that may be required.

I am only indicating that I think we have to keep pace. We have 35 fewer lawyers in the Department of the Interior doing the legal work of the Department than we had in 1952; and that notwithstanding great increases in budget, great increases in activities. I think we have to keep pace, or the entire Department will reduce in efficiency.

I would be happy to answer any questions you have with reference to any statements.

Chairman HAYDEN. I think you have made your case.

Mr. BARRY. Thank you.

OFFICE OF SALINE WATER

STATEMENTS OF CHARLES F. MacGOWAN, DIRECTOR; DR. W. S. GILLAM, CHIEF, DIVISION OF RESEARCH; JOSEPH J. STROBEL, CHIEF, DIVISION OF PROCESSES DEVELOPMENT; ALLEN CYWIN, CHIEF, DIVISION OF DEMONSTRATION PLANTS; AND J. W. O'MEARA, STAFF ASSISTANT TO THE DIRECTOR

BUDGET ESTIMATE

Chairman HAYDEN. The Office of Saline Water.

Mr. MacGowan?

The budget estimate for 1963 for the Office of Saline Water for salaries and expenses is $7,700,000, an increase of $2,445,000. The budget justification will be placed in the record.

(The justification follows:)

OFFICE OF SALINE WATER—SALARIES AND EXPENSES

The Saline Water Act of 1952, as amended (42 U.S.C., 1951–58) and as further amended by Public Law 87–295, approved by President Kennedy on September 22, 1961, provides for a research program for the development of low-cost saline water conversion processes. Public Law 85–883 provides for the construction of at least five saline water conversion plants to demonstrate the reliability, engineering, operating, and economic potentials of the most promising of the presently known processes. The Secretary of the Interior is authorized to carry out the purposes of those acts through such agencies of the Department as he deems appropriate. The Office of Saline Water was established to carry out the research and development program and was assigned the further responsibility of carrying out the construction and operation of demonstration plants. Public Law 87–295 has increased the authorization for appropriations from $10 million over an 11-year period to $75 million for a 6-year period, fiscal years 1962 to 1967, inclusive. To initiate this expanded program, the Congress approved a supplemental appropriation of $3,500,000 on September 30, 1961 (Public Law 87–332). The estimate

of $7,700,000 represents an increase of $2,445,000 over the appropriation for fiscal year 1962. This increase will permit the Office of Saline Water to expand and accelerate its research and development program and undertake new activities authorized by Public Law 87-295.

The general activities to be pursued include exploratory research, extraction and use of byproducts, use of atomic energy in conversion, small conversion units, pilot construction, special equipment components, and the physical chemistry of absorption, etc.

During the past year the basic and exploratory research effort has been increased. Fundamental information and data necessary for the development of new or improved conversion processes has been obtained in a number of areas. This research progress included additional information on corrosion and scale prevention. New research is underway on improvement of membranes for electrodialysis and reverse osmosis processes, supersaturation studies on electrodialysis equipment, and economic feasibility studies using radioactive isotopes as a source of energy. Advances through applied research included expansion of the program on the conversion of saline water through the use of gas hydrates, operation of a wiped-film evaporator unit, additional results on liquid-liquid heat exchange in connection with the vapor-reheat flash processes, and improvement of materials for distillation applications.

Pilot plant advances include successful operation of a direct freezing process pilot plant, initiation of a larger freezing pilot plant using a secondary refrigerant, and obtaining laboratory and small pilot plant data on other freezing processes. A freezing process will be utilized in the fifth demonstration plant which will be erected at Wrightsville Beach, N.C. Scale-control techniques have been improved through continued operation of the long-tube vertical pilot plant at Harbor Island. Electrodialysis development has continued at the Bureau of Reclamation laboratories on brackish water.

The research and development operations have shown progress toward reduction of saline water conversion costs. They also have indicated that the best and most economical answers have not yet been reached and that further research and development activity is needed both in the improvement of processes which are now reaching commercial application and in the exploratory and research effort to bring into feasibility the newer conversion ideas which hold promise of lower cost than can now be attained.

The major expenditures planned for the funds are discussed below:

A. Basic research, $3,275,000

During the coming year basic research will be accelerated. That work will include investigations on basic properties of solutions, transport phenomena, crystallization, membranes, including biological membranes, corrosion, ion exchange, extraction, use of byproducts, and others.

B. Applied research, $3,800,000

During the past year progress has included advances in distillation processes, scale control, and development of methods now suitable for pilot plant operations such as the thin-film evaporator and the vapor-reheat flash process. Two pilot plants (35,000 and 15,000 gallons per day) have been in operation evaluating the direct freezing process. Additional data will be obtained. A third freezing process which makes larger ice crystals will be going into pilot plant evaluation. Several applied research laboratory investigations on washing methods and problems will be carried out. New electrodialysis commercial prototype equipment has been evaluated. Further work including field testing is planned. Investigation of some aspects of ion-exchange processes also is planned. In other applied research the gas hydrate process has advanced to the pilot plant level and it is expected that a pilot plant (10,000 gallons per day) will be built and placed in operation. Other applied research includes further work on the solvent extraction process, byproduct studies, materials investigations, process data compilations, and heat-transfer and scale developments.

An important accomplishment in fiscal year 1962 was the initiation of a project for a pilot plants test facility. Experience in research on saline water conversion has shown that it is necessary to test and evaluate pilot plants on actual sea water at a seacoast site where a constant supply of clean sea water is available. The State of North Carolina made land available to the Department of the Interior for the facility at an excellent location at Wrightsville Beach. The fiscal year 1963 funds requested will provide for operation and expenses at the test site and facilities for the various pilot plants being installed.

The increased program authorized for basic and applied research should result in the improvement of processes now commercially feasible, further development of processes now approaching commercial use, and expanded basic research efforts which may lead to new means yet to be discovered which could make conversion costs lower than can now be reasonably predicted.

Salaries and expenses

Appropriation, 1961	$1,355,000
Supplemental appropriation, 1961	400,000
Total appropriation, 1961	1,755,000
Appropriation, 1962	1,755,000
Supplemental appropriation, 1962	3,500,000
Total appropriation, 1962	5,255,000

SUMMARY OF INCREASES, 1963

Acceleration of the research and development program in accordance with the expanded authorization as provided by the act of Sept. 22 (Public Law 87-295)	+2,170,000
Commensurate increase in administration and coordination	+275,000
Budget estimate	7,700,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Administration and coordination	$214,084	$350,000	$625,000	+$275,000
2. (a) Contracts and grants (non-Federal)	1,390,500	4,105,000	5,775,000	+1,670,000
(b) Federal laboratories	144,500	800,000	1,300,000	+500,000
Unobligated balance lapsing	5,916			
Total	1,755,000	5,255,000	7,700,000	+2,445,000

JUSTIFICATION, RESEARCH AND DEVELOPMENT PROGRAM

The Saline Water Act of 1952, as amended (42 U.S.C., 1951-58), and as further amended by Public Law 87-295, approved by President Kennedy on September 22, 1961, provides for a research program for the development of low-cost saline water conversion processes. Public Law 85-883 provides for the construction of at least five saline water conversion plants to demonstrate the reliability, engineering, operating, and economic potentials of the most promising of the presently known processes. The Secretary of the Interior is authorized to carry out the purposes of those acts through such agencies of the Department as he deems appropriate. The Office of Saline Water was established to carry out the research and development program and was assigned the further responsibility of carrying out the construction and operation of demonstration plants.

Public Law 87-295 has increased the authorization for appropriations from $10 million over an 11-year period to $75 million for a 6-year period, fiscal years 1962-67, inclusive. To initiate this expanded program, the Congress approved a supplemental appropriation of $3,500,000 on September 30, 1961 (Public Law 87-332).

The estimate of $7,700,000 represents an increase of $2,445,000 over the appropriation for fiscal year 1962. This increase will permit the Office of Saline Water to expand and accelerate its research and development program and undertake new activities authorized by Public Law 87-295.

Most scientists and engineers agree that the most effective and economical means of saline water conversion may yet remain to be discovered and that the foundation of an effective program is a continuous program of basic and applied research.

This budget request reflects the increased emphasis being placed on the research and development program. The general activities to be pursued include exploratory research, extraction and use of byproducts, use of atomic energy in conver-

sion, corrosion, improved membranes, scale prevention and control, thermodynamics of solutions, small conversion units, pilot plant construction and operation, mobile conversion units, economic studies and surveys, polarization, transport depletion, dropwise promoters, plastic evaluations, heat transfer, special equipment components, and the physical chemistry of adsorption.

The major expenditures planned for the funds are discussed below:

A. Administration and coordination, $625,000

The amount requested provides for planning, supervision, and administration of research and development and contract funds. It also provides for related activities which are expanded under the new law in areas such as operation of test site, economic surveys, greater participation in national and international conferences, inspections of conversion projects, and coordination, correlation, and publishing information. The additional staffing is needed to carry out the expanded program.

B. Basic research, $3,275,000

1. Current contracts and proposals	$1, 075, 000
2. Exploratory research, new proposals, and surveys	1, 200, 000
3. Federal laboratories	1, 000, 000
Total	3, 275, 000

1. *Current contracts and proposals.*—Attainment of ultimate objectives of the saline water conversion program is dependent on adequate fundamental research. Potential processes currently under study, such as reverse osmosis, gas hydrate formation, etc., and the development of essential basic data and study of various phenomena will be continued. A tremendous amount of basic data must be obtained and analyzed before any new processes can be fully developed. Investigation of mechanisms of scale formation, radioisotopes as energy sources, corrosion mechanisms and means of prevention, byproducts, and other studies will also be continued.

2. *Exploratory research, new proposals, and surveys.*—One of the most urgent needs for a well-balanced program is a strong basic and exploratory research effort. In fact, the Desalination Research Conference at Woods Hole, Mass., last summer, which involved a critical review of the entire water problem and the saline water conversion program, recommended that the basic research effort be drastically increased, concentrating on certain fields or disciplines such as mechanism of transport across membranes, thermodynamic and phase equilibrium properties of solutions, transport properties in solutions and at interfaces, structure (microscopic) of water, hydrates, etc., and nucleation and crystal growth.

3. *Federal laboratories.*—Certain specific Federal laboratories have an abundance of well-trained personnel, excellent research facilities, and an interest in saline water conversion. Since such laboratories have demonstrated capability in specific disciplines and have expressed an interest in saline water conversion, additional research on properties of solutions, separation processes, ion exchange, and other phenomena will be undertaken. For example, it has been determined that the Oak Ridge National Laboratory is uniquely suited because of its long experience in separation processes to undertake a broad range of fundamental and applied research in the field of desalination. Cooperative research efforts with Federal laboratories will be mutually beneficial.

C. Applied research, $3,800,000

1. Distillation processes	$1, 100, 000
2. Freezing processes	725, 000
3. Membrane and related processes	600, 000
4. Other applied research, including hydrate, solvent extraction, and humidification processes	1, 075, 000
5. Pilot plants test site	300, 000
Total	3, 800, 000

1. *Distillation processes.*—Operations of experimental equipment have led to promising approaches in scale control and in bringing several new or improved distillation methods to a degree of development where pilot plant operations are in order. A proposed new concept which could offer reduction in plant cost is being considered. The funds will provide for the investigation of several processes at the pilot plant level. Complete pilot plant units are scheduled for the thin-film

evaporator and liquid-liquid heat transfer, combined with vapor reheat cycles. Included also are a continuation of pilot plant studies in LTV pilot equipment to obtain data relating to demonstration plant problems, and also pilot plant developments in the flash evaporation process. Applied research on a laboratory level is planned on dropwise promoters, humidification phenomena, special studies on energy transfer, and new concepts for use of solar energy. The estimates also provide for development of a trailer-mounted, self-contained mobile conversion equipment for many uses, including operation under emergency conditions and in connection with civil defense applications.

2. *Freezing processes.*—Four freezing processes are being investigated. Two pilot plants are in operation evaluating the direct freezing process—one a 15,000-gallons-per-day unit based on flash evaporation and the other a 35,000-gallon-per-day plant which utilizes direct contact freezing with a secondary refrigerant. The operation of both plants will be continued to obtain additional data. The third freezing process, developed in the laboratory and which makes use of larger ice crystals to facilitate washing operations, is being scaled up for pilot plant evaluation at a 10,000-gallon-per-day capacity. The fourth process being considered for development is one which is based upon the formation of ice crystals through the use of propane hydrate. It is planned to study this process at the bench-scale level. Laboratory studies on the various aspects of the direct freezing process, such as liquid-liquid heat exchange, washing by means of hydraulic piston-bed displacement, and the recovery of hydrocarbons from product water and reject brine, will be continued.

3. *Membrane and related processes.*—Continuation of the electrodialysis program is planned to evaluate new prototype cell designs and membranes being further developed by commercial firms and research organizations. The current test program in electrodialysis conducted at the Bureau of Reclamation Laboratory in Denver indicates the need for investigating hydraulic features, polarization characteristics, temperature effects, cost reductions in membranes, scale prevention, etc., which will be undertaken as part of the process improvement program. The estimates include additional development of ion-exchange processes for pretreatment of saline water to prevent scale formation, the investigation of ion-exchange processes based on the recycling of regenerants, and the development of small pilot units in reverse osmosis.

4. *Other applied research.*—The development of the gas hydrate process is planned at the pilot level. The results of laboratory investigations indicate a promising economic potential for this process. The solvent extraction process, specifically applicable to the desalination of certain brackish waters, has been under development at the laboratory level for several years. It is anticipated that this process will be evaluated further in a small pilot plant operation to determine its technical feasibility. A continuation of research on humidification cycles is planned. It is anticipated that several developments will be undertaken relating to small conversion units on the order of several hundred to several thousand gallons per day capacity. Also included in this category are evaluations by consultants, special investigations and reports, byproduct studies, materials investigations, process data compilations, and heat transfer and scale developments.

5. *Pilot plants test site.*—Under the fiscal year 1962 supplemental appropriation, which was obtained under the new Saline Water Act, a pilot plants test site is to be constructed at the site made available by the State of North Carolina at Wrightsville Beach. The funds requested would provide for the operational expenses of the test site and facilities provided for the various pilot plants being installed.

PREPARED STATEMENT

Chairman HAYDEN. We will be glad to hear from you, sir.

Mr. MACGOWAN. Thank you, Mr. Chairman.

I have a brief statement which we have submitted for the record. I would be happy to highlight this, if it would suit your convenience.

Chairman HAYDEN. Please do that.

(The statement referred to follows:)

STATEMENT OF C. F. MACGOWAN, DIRECTOR, OFFICE OF SALINE WATER

Mr. Chairman and gentlemen of the committee, it is my privilege to again appear before this committee to report on the operations of the Office of Saline Water. In accordance with the authorization enacted by the 1st session of the 87th Congress (Public Law 87-295), we have developed a plan of work which will effectively enable us to carry out the explicit directive of the Congress to accelerate the pace of research and development.

The estimate of $7,700,000 represents an increase of $2,445,000 over the "Research and development" appropriation for fiscal year 1962. This increase will permit the Office of Saline Water to continue to expand and accelerate its research and development program and undertake new activities as contemplated and authorized by Public Law 87-295.

Most scientists and engineers agree that the most effective and economical means of saline water conversion may yet remain to be discovered and that the foundation of an effective program is a continuous program of basic and applied research.

This budget request reflects the increased emphasis being placed on the research and development program as directed by the Congress. The general activities to be pursued include exploratory research, extraction, and use of byproducts, use of atomic energy in conversion, corrosion, improved membranes, scale prevention and control, thermodynamics of solutions, small conversion units, pilot plant construction and operation, mobile conversion units, economic studies and surveys, polarization, transport depletion, dropwise promoters, plastic evaluations, heat transfer, special equipment components, and the physical chemistry of adsorption.

The major expenditures planned for the funds are as follows:

Administration and coordination, $625,000

The amount requested provides for planning, supervison, and administration of research and development and contract funds. It also provides for related activities which are expanded under the new law in areas such as operation of the pilot plant test site, economic surveys, inspections of conversion projects, and coordination, correlation, and publishing information, and greater participation in national and international conferences.

With respect to international activities, I am pleased to advise the members of this committee that the parliamentarians of the North Atlantic Treaty Organization at their seventh annual conference in Paris last November, recommended that the Office of Saline Water be designated as the clearinghouse for coordinating all saline water conversion research work sponsored by NATO nations. I should like to insert in the record at this point a Department of the Interior news release dated January 4, which gives additional information on this development which will immeasurably assist us in avoiding any duplication of research effort and help us to obtain useful data from other interested nations.

Basic research, $3,275,000

Attainment of ultimate objectives of the saline water conversion program is dependent on adequate fundamental research. Potential processes currently under study, such as reverse osmosis, gas hydrate formation, and the development of essential basic data and study of various phenomena will be continued. A tremendous amount of basic data must be obtained and analyzed before any new processes can be fully developed. Investigation of mechanisms and means of prevention, byproducts, and other studies will also be continued.

One of the most urgent needs for a well-balanced program is a strong basic and exploratory research effort. Last summer, the Office of Saline Water and the National Academy of Science-National Research Council jointly sponsored a monthlong symposium on research needs for saline water conversion. Participating in this meeting were some of this Nation's outstanding scientists. They made a comprehensive and critical review of the entire water problem and the saline water conversion program and recommended that the basic research effort must be drastically increased, concentrating on certain fields or disciplines such as mechanism of transport across membranes, thermodynamic and phase equilibrium properties of solutions, transport properties in solutions and at interfaces, microscopic structure of water, hydrates, nucleation, and crystal growth.

Certain specific Federal laboratories have an abundance of well-trained personnel, excellent research facilities, and an interest in saline water conversion. Since such laboratories have demonstrated capability in specific disciplines and have expressed an interest in saline water conversion, additional research on properties of solutions, separation processes, ion exchange, and other phenomena will be undertaken.

Applied research, $3,800,000

Operations of experimental equipment have lead to promising approaches in scale control and in bringing several new or improved distillation methods to a degree of development where pilot plant operations are in order. A proposed new concept which could offer reduction in plant cost is being considered. The funds will provide for the investigation of several processes at the pilot plant level. Complete pilot plant units are scheduled for the thin-film evaporator and liquid-liquid heat transfer, combined with vapor reheat cycles. Included also are a continuation of pilot plant studies in LTV pilot equipment to obtain data relating to demonstration plant problems, and also pilot plant developments in the flash evaporation process. Applied research on a laboratory level is planned on dropwise promoters, humidification phenomena, special studies on energy transfer, and new concepts for use of solar energy. The estimates also provide for development of a trailer-mounted, self-contained mobile conversion equipment for many uses, including operation under emergency conditions and in connection with civil defense applications.

Four freezing processes are being investigated. Two pilot plants are in operation evaluating the direct freezing process—one a 15,000-gpd unit based on flash evaporation and the other a 35,000-gpd plant which utilizes direct contact freezing with a secondary refrigerant. The operation of both plants will be continued to obtain additional data. The third freezing process, developed in the laboratory and which makes use of larger ice crystals to facilitate washing operations, is being scaled up for pilot plant evaluation at a 10,000-gpd capacity. The fourth process being considered for development is one which is based upon the formation of ice crystals through the use of propane hydrate. It is planned to study this process at the bench-scale level. Laboratory studies on the various aspects of the direct freezing process, such as liquid-liquid heat exchange, washing by means of hydraulic piston-bed displacement, and the recovery of hydrocarbons from product water and reject brine, will be continued.

Continuation of the electrodialysis program is planned to evaluate new prototype cell designs and membranes being further developed by commercial firms

and research organizations. The current test program in electrodialysis conducted at the Bureau of Reclamation Laboratory in Denver indicates the need for investigating hydraulic features, polarization characteristics, temperature effects, cost reductions in membranes, scale prevention, etc., which will be undertaken as part of the process improvement program. The estimates include additional development of ion-exchange processes for pretreatment of saline water to prevent scale formation, the investigation of ion-exchange processes based on the recycling of regenerants, and the development of small pilot plant units in reverse osmosis.

The development of the gas hydrate process is planned at the pilot plant level. The results of laboratory investigations indicate a promising economic potential for this process. The solvent extraction process, specifically applicable to the desalination of certain brackish waters, has been under development at the laboratory level for several years. It is anticipated that this process will be evaluated further in a small pilot plant operation to determine its technical feasibility. A continuation of research on humidification cycles is planned. It is anticipated that several developments will be undertaken relating to small conversion units on the order of several hundred to several thousand gallons per day capacity. Also included in this category are evaluations by consultants, special investigations and reports, byproduct studies, materials investigations, process data compilations, and heat transfer and scale developments.

Under the fiscal year 1962 supplemental apporpriation, which was obtained under the new Saline Water Act, a pilot plants testsite is to be constructed at the site made available by the State of North Carolina at Wrightsville Beach. The funds requested would provide for the operational expenses of the testsite and facilities provided for the various pilot plants being installed.

DEMONSTRATION PLANTS

Public Law 85-883 authorized $10 million for the construction of at least five plants to demonstrate the reliability, engineering, and economic potentials of the most promising of the presently known processes, together with such additional funds as may be necessary for their maintenance and operation.

The status of the demonstration plant program is given in the following chart:

Status of saline water conversion demonstration plant program

Location	Process	Capacity (gallons per day)	Architect and engineer	Construction contractor	Management and operation contractor
Freeport, Tex.	Long tube vertical multiple effect distillation.	1,000,000	W. L. Badger & Associates, Ann Arbor, Mich.	June 8, 1960, Chicago Bridge & Iron Co., $1,255,000.	Stearns-Rogers Manufacturing Co., Denver, Colo.
Point Loma, San Diego, Calif.	Multistage flash distillation.	1,000,000	Fluor Corp., Whittier, Calif.	Nov. 5, 1960, Westinghouse Electric Corp., $1,640,000.	Burns and Roe, Inc., New York, N.Y.
Webster, S. Dak.	Electrodialysis	250,000	Bureau of Reclamation, Denver, Colo.	Nov. 16, 1960, Asahi Chemical Industry, $486,000.	Mason-Rust Co., Lexington, Ky.
Roswell, N. Mex.	Forced circulation	1,000,000	Catalytic Construction Co., Philadelphia, Pa.	Bids opened Dec. 12, 1961.	
Wrightsville Beach, N.C.	Freezing	250,000	The Lummus Co., New York, N.Y.	Construction funds appropriated.	

Fiscal request, $2,085,000

The request for fiscal year 1963 compared to the appropriation for fiscal year 1962 of $4,550,000, represents a decrease of $2,465,000. The funds request for fiscal year 1963 will provide for the full year maintenance and operation of the demonstration plants at Freeport, Tex.; San Diego, Calif.; and Webster, S. Dak., and for operation of the plants at Roswell, N. Mex., and Wrightsville Beach, N.C., during part of the year.

In conclusion, I should like to point out that although our request for research and development activities represents an increase of $2,445,000, this increase is more than offset by our reduced request for the demonstration plant program. Our total budget request for fiscal year 1963 is $20,000 less than for fiscal year 1962.

This committee has nurtured and fostered the saline water conversion program. We hope we will continue to have your cooperation and support.

GENERAL STATEMENT

Mr. MACGOWAN. Thank you sir.

It is my privilege to again appear on behalf of the Office of Saline Water; and I would like to state that we have developed a plan which will effectively enable us to carry out the explicit directive of Congress to accelerate the pace of exploration and development.

The estimate represents an increase of $2,445,000 over the research and development appropriation for the fiscal year 1962. This budget request reflects the increased emphasis being placed on the research and development program as directed by Congress.

The general activities to be pursued include such things as exploratory research, use of byproducts, scale prevention and control, and thermodynamics.

ADMINISTRATION AND COORDINATION

The major expenditures planned for the funds are as follows: Administration and coordination, $625,000.

The amount requested provides for planning, supervision, and administration of research and development contract funds. It also provides for related activities which are expanded under the new law in areas such as the administration of the pilot plant test site, economic surveys, inspections, and so forth, as well as greater participation in national and international conferences.

With respect to international activities, I am pleased to advise the members of this committee that the Parliamentarians of the North Atlantic Treaty Organization at their seventh conference in Paris last November recommended that the Office of Saline Water be designated as the clearinghouse for coordination of all saline water conversion research work sponsored by the NATO nations.

As to basic research, the attainment of ultimate objectives of the saline water conversion program is largely dependent upon adequate fundamental research. This would include studies of such things as reverse osmosis, gas hydrate formation, and so forth. A tremendous amount of basic data must be obtained and analyzed before any new processes can be fully developed, if indeed a process ensues.

One of the most urgent needs for a well-balanced program is a strong basic and exploratory research effort. Last summer, the Office of Saline Water and the National Academy of Sciences National-Research Council, jointly sponsored a monthlong symposium of research needs for saline water conversion.

Participating in this meeting were some of the Nation's outstanding scientists. They made a comprehensive and critical review of the entire water problem and the saline water conversion program and recommended that the basic research effort must be drastically increased, concentrating on certain fields or disciplines such as: mechanism of transport across membranes, thermodynamic and phase equilibrium properties of solutions, transport properties in solutions and at interfaces, microscopic structure of water, hydrates, nucleation, and crystal growth.

Certain specific Federal laboratories have an abundance of well-trained personnel, excellent research facilities, and an interest in saline water conversion. Since such laboratories have demonstrated capability, we feel that much research should be undertaken at these places.

APPLIED RESEARCH

Applied research, $3,800,000: Operations of experimental equipment have led to promising approaches in scale control and in bringing several new or improved distillation methods to a degree of development where pilot plant operations are in order.

Also, applied research on a laboratory level is planned on dropwise promoters, humidification phenomena, special studies on energy transfer, and new concepts for the use of solar energy.

INVESTIGATION OF NEW PROCESSES

In addition, four freezing processes are being investigated. Continuation of the electrodialysis program is planned at this time to evaluate new prototype cell designs and membranes being further developed by commercial firms and research organizations.

The development of the gas hydrate process is planned at the pilot plant level. The results of laboratory investigations indicate a promising economic potential for this process. The solvent extraction process, specifically applicable to the desalination of certain brackish waters, has been under development at the laboratory level for several years. It is anticipated that this process will be evaluated further in a small pilot plant operation to determine its technical feasibility. A continuation of research on humidification cycles is planned. It is anticipated that several developments will be undertaken relating to small conversion units on the order of several hundred to several thousand gallons per day capacity. Also included in this category are evaluations by consultants, special investigations and reports, byproduct studies, materials investigations, process data compilations, and heat transfer and scale developments.

Under the fiscal year 1962 supplemental appropriation, which was obtained under the new Saline Water Act, a pilot plants tests site is to be constructed at the site made available by the State of North Carolina at Wrightsville Beach. The funds requested would provide for the operational expenses of the test site and facilities provided for the various pilot plants being installed.

DEMONSTRATION PLANT PROGRAMS

Public Law 85–883 authorized $10 million for the construction of at least five plants. These plants are to demonstrate the reliability, engineering, and economic potentials of the most promising of the presently known processes.

The status of the demonstration plant program is given in the following chart, which I should like to include, if acceptable.

Chairman HAYDEN. These five plants are pursuing five different methods?

Mr. MACGOWAN. Yes, sir.

Chairman HAYDEN. And up to date, which ones have had the best luck?

Mr. MacGowan. We have three plants currently being built, and I would like to supply for your information, Mr. Chairman, these pamphlets which contain data on each of the three plants which are currently in operation.

The first plant was Freeport, Tex. The second plant is Webster, S. Dak. And the third plant will be dedicated this coming Saturday.

The Webster plant is not yet fully accepted. There was a 6-month operating test period made a part of the contract. I understand the 6-month operating period is just concluded, and we are preparing to formally accept the plant from the manufacturer.

Chairman Hayden. Where is that plant located?

Mr. MacGowan. This is the plant in Webster, S. Dak.

The Freeport plant is the one which has been operating since June.

Virgin Islands Plant

Chairman Hayden. They have a water shortage problem in the Virgin Islands, and I understand that some kind of a plant has been erected there, not by the Federal Government but perhaps by the island government, to improve the water supply. Do you know anything about that?

Mr. MacGowan. Yes, sir. That plant was built by the Virgin Islands Corporation. The Office of Saline Water provided some advice in a consultant capacity to the Office of Territories in connection with the plans, specifications, and bid evaluations. The architect and engineering services for the Office of Territories were performed by a private firm.

The Virgin Islands plant was not authorized as a part of the Office of Saline Water program.

Chairman Hayden. Is it working well?

Mr. MacGowan. Yes, sir; it is working quite well. It has a production capacity of 275,000 gallons a day.

Chairman Hayden. It is absolutely essential that they have more water there on the islands. I know that.

Mr. MacGowan. The design of this plant resembles our San Diego plant. It is that type of plant. And our chart here shows Freeport, Tex., which has been on the line since June 21 of last year. We had an unfortunate shutdown because of a corrosion problem. but since then, except for the hurricane, it has operated steadily until this time. As a matter of fact, immediately following the hurricane, at which time it sustained major damage to the building, not to the plant, but to the office and instruments, the plant was back on the line in 4 days, which was before the facilities of the city were back in order. We are very proud of that record.

It has operated steadily since then. We are now planning an orderly shutdown for some revisions that we have discovered need for.

FUNDS FOR DEMONSTRATION PLANTS

For the demonstration plants, our fiscal request is for $2,085,000. This request, as compared with the appropriation for fiscal year 1962, of $4,550,000, represents an actual decrease of $2,465,000. The funds requested for fiscal year 1963 will provide for the full year maintenance and operation of the demonstration plants at Freeport, Tex., San

Diego, Claif., and Webster, S. Dak., and for operation of the plants at Roswell, N. Mex., and Wirghtsville Beach, N.C., during that part of the year in which they are in operation.

REDUCED COST OF DEMONSTRATION PLANT PROGRAM

In conclusion, I should like to point out that although our request for research and development activities represents an increase of $2,445,000, this increase is more than offset by our reduced request for the demonstration plant program. Thus our total budget request for the fiscal year 1963 is actually $20,000 less than for fiscal year 1962.

This committee has nurtured and fostered the saline water conversion program. We hope we will continue to have your cooperation and support.

ADMINISTRATION AND COORDINATION

Chairman HAYDEN. In 1963 you are requesting $625,000 for administration and coordination. How does this compare percentagewise with the amount approved for this purpose in prior years?

Mr. MACGOWAN. The regular 1962 salaries and expenses appropriation of $1,755,000 included $220,000 or about 12.5 percent for administration and coordination. The 1962 supplemental of $3,500,000 included $130,000 for this purpose. Our 1963 estimated requirement is $625,000 to administer and coordinate the expanded program, about 8.1 percent of the total appropriation of $7,700,000.

OPERATION AND MAINTENANCE

Chairman HAYDEN. Your budget estimate for operation and maintenance for fiscal 1963 is $2,085,000. The justification will be included in the record.

(The justification follows:)

Program objective

Public Law 85-883 provides for the construction, operation, and maintenance of five saline water conversion plants. By law, three of these plants are to be located, respectively, on the west coast, gulf coast, and east coast for sea water conversion. Two other plants are for brackish water conversion and are to be demonstrated in the northern Great Plains and arid Southwest. Each plant is to demonstrate a different process. Construction and operation are to proceed as rapidly as possible after processes are selected, as provided in the act.

Program status

The five processes and plants have been selected and are located as follows:

1. Freeport, Tex.: Multiple-effect long tube vertical distillation.
2. San Diego, Calif.: Multistage flash distillation.
3. Webster, S. Dak.: Electrodialysis.
4. Roswell, N. Mex.: Forced-circulation vapor-compression distillation.
5. Wrightsville Beach, N.C.: Freeze demineralization.

The first three plants have been completed and the specifications for the fourth plant are issued. Architect-engineering of the fifth plant is in progress.

Fiscal requests

Requests are made for fiscal year 1963 to provide for the full-year maintenance and operation of the first three demonstration plants at Freeport, Tex., San Diego, Calif., and Webster, S. Dak., and for the part-year operation of the plants in New Mexico and North Carolina.

Administrative funds requested will enable a continuation of the present level of staffing plus two additional engineers.

Operation and maintenance

Appropriation, 1961	$0.00
Appropriation, 1962	0.00
Comparative transfer from "Construction operation and maintenance" and total available 1962	1,254,688

SUMMARY OF INCREASES, 1963

The increase will provide for the operation of 2 additional plants on a partial year basis and currently operating plants on a full-year basis	830,312
Budget estimate, 1963	2,085,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
Demonstration plants	$224,477	$1,254,688	$2,085,000	+$830,312

JUSTIFICATION, DEMONSTRATION PLANT PROGRAM

Public Law 85–883 provides for the construction, operation and maintenance of five saline water conversion demonstration plants. Three of these plants are for sea water conversion and two for brackish water conversion. Each plant is to demonstrate a different process. Construction is to proceed as rapidly as possible, after processes are selected, as provided in the law.

Three of the demonstration plants have been constructed and funds for the remaining two, mentioned above, have been appropriated in fiscal year 1962. Both the San Diego and Webster plants are undergoing their final startup tests. The estimate of $2,085,000 therefore reflects a decrease of $2,465,000 for the current fiscal year appropriations due to the fact that no construction funds are being requested for fiscal year 1963.

Operation and maintenance

The first demonstration plant was completed in fiscal year 1961 and is in operation at Freeport, Tex. It is demonstrating the long tube vertical multiple effect process and produces fresh water at the rate of 1 million gallons per day. Funds are being requested for a full year of operation for this plant which includes provisions for experimental changes to improve the potentials of this process.

The second plant is at Point Loma in San Diego, Calif., and will demonstrate the multistage flash distillation process. This 1 million gallon distillation plant was completed in November 1961, and is currently undergoing startup tests before final acceptance by the Government. Funds are being requested for a full year of operation for this plant which includes provisions for changes that may develop from operating this plant for the first time and for process improvements.

The electrodialysis process is being demonstrated at Webster, S. Dak. It was completed in September 1961 and is also undergoing startup performance tests. It is capable of producing 250,000 gallons per day of fresh water from a low salinity brackish water of 1,800 parts per million. Funds are being requested for a full operating year with minor process improvements.

The fourth demonstration plant is located at Roswell, N. Mex. The forced circulation vapor compression process will be used to convert a particularly difficult brackish water at an output of 1 million gallons per day. The specifications for that plant have been issued. Construction should start early in 1962. Funds are requested for operating this plant for half a year.

An architect-engineering contract is in progress for the design of the Wrightsville Beach, N.C., sea water conversion plant. It will demonstrate a freeze demineralization process at an output of up to 250,000 gallons per day. Construction is scheduled to begin in the spring of 1962. Funds are requested for operating the plant one-fourth of the fiscal year.

Administration

The full-time engineering staff needed to administer the demonstration plant program presently consists of the Chief of the Division, assisted by two office engineers and five field engineers. With a multitude of engineering problems from foundations through electrical, mechanical, chemical, and sanitary engineering, etc., plus the number of actions and travel requirements necessary for this nationwide program, it is necessary to augment the office staff by two additional engineers.

Itemization of estimate—Operation and maintenance

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$224,477	$1,254,688	$2,085,000	+$830,312
Comparative transfer from other accounts	224,477	−1,254,688		+1,254,688
Appropriation			2,085,000	+2,085,000
Obligations by objects:				
11 Personnel compensation	123,388	159,000	180,000	+21,000
12 Personnel benefits	8,464	12,000	13,000	+1,000

31 Equipment	6,536	3,000	3,000	
Total obligations	224,477	1,254,688	2,085,000	+830,312

Construction Program

Chairman Hayden. I note that there are no construction funds needed at all during this year.

Mr. MacGowan. The construction funds for the five plants were allocated and appropriated during the previous year, sir.

Private Industry Plant At Buckeye, Ariz.

Chairman Hayden. Ionics, Inc., announced recently that it is constructing a 650,000-gallons-per-day saline water conversion plant in Buckeye, Ariz. It is estimated that fresh water will be produced at 50 cents per thousand gallons, not including water supply, distribution, or general water system costs. This is an electrodialysis plant, such as your demonstration plant at Webster, S. Dak.

Are you familiar with the Buckeye plans? How does the water cost at the two plants compare?

Mr. MacGowan. That is an interesting question, Mr. Chairman. The plant at Buckeye, Ariz., was only recently announced. We have no details on it. We do note, however, that the water at Buckeye is not going to be brought down to as pure a state as is the water at Webster. This implies less staging, less processing, for the water.

At the same time, the plant is considerably larger than our Webster plant, and the two should not really be compared for this reason. However, if they are producing water at 50 cents on our schedule of rates, it would be about 30 percent less than our costs. But of course, this is the advantage of the second generation plant, also.

Chairman HAYDEN. They have been experimenting for a considerable time?

Mr. MACGOWAN. Yes, sir; much of the experimentation on electrodialysis was sponsored by this Office.

Chairman HAYDEN. We thank you for appearing.

OFFICE OF MINERALS EXPLORATION

STATEMENTS OF GEORGE FUMICH, Jr., DIRECTOR; FRANK E. JOHNSON, DEPUTY DIRECTOR; GEORGE C. SELFRIDGE, CHIEF, DIVISION OF FIELD OPERATIONS; AND ALLEN S. DAKAN, CHIEF, DIVISION OF ADMINISTRATIVE MANAGEMENT

BUDGET ESTIMATES

Chairman HAYDEN. The Office of Minerals Exploration.

The Office of Minerals Exploration budget estimate for fiscal year 1963 is $1 million, $250,000 more than was appropriated in fiscal year 1962. The justification for this estimate will be included in the record.

(The justification follows:)

OFFICE OF MINERALS EXPLORATION

Under Public Law 85-701, the Office of Minerals Exploration stimulates exploration by private industry for domestic sources of minerals by contracting to pay a specified part of the cost of authorized exploration work. Federal funds provided under a contract are repaid with interest by a royalty on production from the property. The program is designed to encourage exploration for long-range mineral reserves rather than to bring new properties into immediate production. The OME also administers the projects certified under the program of the former Defense Minerals Exploration Administration.

Interest in exploration assistance received a great boost at the beginning of the current year when six mineral commodities were added to the list of those eligible for exploration assistance. The number of applications received during the first half of the current year indicates that the total for this year may exceed the total received during the first 3 years of the program. Contract obligations are increasing accordingly with every indication that the entire amount available for the current year will be obligated. This level of interest is expected to continue in fiscal year 1963 assuring the obligation of the entire amount requested for financial assistance.

A slight increase in the fiscal year 1963 allowance for administrative and technical services is essential to cover the substantial increase in workload occasioned by the greater number of applications and the greater number of active contracts to be administered.

Office of Minerals Exploration

Appropriation, 1961	$550,000
Unobligated balance brought forward	183,726
Total amount available, 1961	733,726
Appropriation, 1962	750,000
Unobligated balance brought forward	304,253
Total available, 1962	1,054,253

SUMMARY OF INCREASES AND DECREASES, 1963

Financial assistance to participants in exploration projects	−70,653
Administrative and technical services	+16,400
Net change	−54,253
Budget estimate, 1963	1,000,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Financial assistance to participants in exploration projects	$220,178	$840,653	$770,000	−70,653
2. Administrative and technical services	209,295	213,600	230,000	+16,400
Unobligated balance	304,253			
Total	733,726	1,054,253	1,000,000	−54,253

JUSTIFICATION

The estimate of $1 million is $250,000 more than the appropriation for the current year. Except for $16,400, all of this increase will be applied to the financial assistance program providing $770,000 for that purpose. The $16,500 will raise to $230,000 the authorization for administrative and technical services.

There are four substantial reasons for the increased program expected in fiscal year 1963. First, the regulations were changed early in fiscal year 1962 by adding six mineral commodities to the list of those eligible and by simplifying the application procedure. The changes produced an immediate increase in public interest in the program. More applications were filed during the first half of the current year than were filed in the entire past year and this increased interest is expected to continue in the fiscal year 1963. Second, improvements in the metal market will revive interest in exploration. The change in the silver market is an example. Third, there is an increasing need for Government assistance in exploration because new domestic deposits of minerals are becoming more difficult and more expensive to locate. The OME provides both the financial assistance and the technical assistance which is not otherwise available to most small operators. And fourth, the Government funds provided for exploration assistance go directly to the mining communities where the work is done. This increases the effectiveness and the scope of the contractors' exploration and doubles their capacities to pay for wages, services, and supplies in the mining communities, many of which are suffering severe economic depression.

The trend of the program in number and value of applications and contracts is shown in the following table:

Number and value of OME applications and contracts

Fiscal year	Applications received		Contracts executed		
	Number	Amount requested	Number	Government participation	Total value
1959 actual	[1] 57	$3,572,305	8	$90,295	$180,590
1960 actual	38	3,929,913	11	308,000	616,000
1961 actual	44	2,219,631	12	276,923	553,846
1962 first half, actual	68	7,002,778	5	[2] 191,760	383,520
1962 second half, estimate	62	5,108,000	30	648,240	1,296,480
1963 estimate	120	12,240,000	35	770,000	1,540,000

[1] Includes 15 DMEA applications refiled under the OME program.
[2] Does not include 7 approved contracts for $137,460 awaiting acceptance by applicants.

The projection for fiscal year 1963 is a modest one. Present activity indicates that the entire $840,000 available for financial assistance will be obligated during fiscal year 1962 and assures obligation of the $770,000 requested for fiscal year 1963.

The additional $16,400 requested for administrative and technical services for fiscal year 1963 will be used for additional field details from Bureau of Mines and Geological Survey and for the additional travel necessitated by the greatly increased workload. This trend in workload is clearly indicated by the following table of major actions:

Actions	1961	1962	1963
Field examinations for new applications	44	130	120
New contracts negotiated	12	35	35
Inspections of contract work	120	210	210
Inspections of certified projects	375	367	300
Total actions	551	742	665

Because the peak load of inspections of contracts and certified projects is expected during the current year, it may be necessary to defer some of them until fiscal year 1963 when the additional staff will be available.

The requests for information and advice which were averaging 20 to 30 per month during fiscal year 1961 have jumped to an average of more than 400 per month and are expected to continue at that rate during fiscal year 1963.

In the 3 years covered by the data in this request the funds obligated for financial assistance are expected to increase 400 percent, from $192,000 to $770,000, while the obligations for administrative and technical services have risen only 11 percent, from $209,000 to $230,000.

The OME program

The Office of Minerals Exploration offers financial assistance to firms and individuals who desire to explore their properties or claims for 1 or more of the 38 mineral commodities listed in the OME regulations. This help is offered to applicants who ordinarily would not undertake the exploration under present conditions or circumstances at their sole expense and who are unable to obtain funds from commercial sources on reasonable terms.

The Government will contract with an eligible applicant to pay up to one-half of the cost of approved exploration work as it progresses. Each contract specifies the work to be performed in a described area at costs estimated on an actual or fixed unit-cost basis but limited in total amount. The work, based upon sound engineering and geological principles, is approved by the Government only after careful investigation. Ordinarily, contracts will not be approved for work which will require more than 2 years to complete; however, the time limit for most projects is fixed for a much shorter period.

Funds contributed by the Government are repaid with interest by a royalty on production from the property. If nothing is produced, there is no obligation to repay. A 5-percent royalty is paid on any production during the period the

contract is in effect, and if the Government certifies that production may be possible from the property, the royalty obligation continues until the Government's contribution is repaid with interest, or for the 10-year period usually specified in the contract.

Simple interest is calculated at a rate not less than the rate which the Department would be required to pay if it borrowed from the Treasury, plus a 2-percent interest charge in lieu of the actual cost to the Government of administering the contract.

Accomplishments

Under the DMEA program, predecessor to the OME, 396 projects were certified as discoveries on which the net recoverable value of potential ore reserves exceeds $1 billion estimated at current market prices. Royalties paid on production from DMEA projects exceed $4 million, and royalty payments from DMEA and OME projects are expected to continue at about $400,000 per year. Thus, it has cost the Government approximately 3½ cents for each dollar of recoverable value. This figure lessens as royalty payments increase. Also, as the deposits are mined, they will result in more industrial production, more employment, and more taxable income.

OME organization

The Office of Minerals Exploration is a separate agency of the Department of the Interior, functioning under the supervision of the Assistant Secretary for Mineral Resources.

All OME employees are headquartered in Washington. The organization consists of the Director's Office, Division of Field Operations, Division of Minerals, Division of Contract Administration and Audit, Division of Administrative Management, and a Review Committee. All contract actions are reviewed by this Committee composed of the Chiefs of Field Operations, Division of Minerals, and Division of Contract Administration and Audit for conformance with OME standards and policy. Legal services are performed by the Solicitor's Office of the Department.

OME field officers detailed from the field staffs of the Bureau of Mines and the Geological Survey are utilized for all onsite field examinations, work inspections, interim reports, checking monthly vouchers for the amounts of the Government's share of the costs, field administration of exploration contracts, final reports, inspecting and reporting on certified projects, and representing the OME in all other activities within their respective regions.

Itemization of estimate—Office of Minerals Exploration

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$429,473	$1,054,253	$1,000,000	−$54,253

PREPARED STATEMENT

Chairman HAYDEN. We will be happy to hear from you.

Mr. FUMICH. Mr. Chairman, rather than read the prepared statement, do we have permission to maybe make just a few off-the-cuff remarks?

Chairman HAYDEN. Certainly. We will place your statement in the record, and you may proceed.

Mr. FUMICH. Thank you, sir.

(The statement referred to follows:)

STATEMENT OF GEORGE FUMICH, JR., DIRECTOR, OFFICE OF MINERALS EXPLORATION

Mr. Chairman and members of the committee, thank you for this opportunity to appear before the committee to discuss the appropriation needed by the Office of Minerals Exploration to encourage exploration for domestic mineral reserves as authorized by Public Law 85-701.

Need of $1 million for fiscal year 1963

We estimate that a minimum of at least $1 million will be required for the fiscal year 1963. Of this amount, we expect to obligate $770,000 for financial assistance for new exploration projects. The remaining $230,000 will be needed for technical appraisals and administrative expenses including the cost of administering projects certified under the program of the former Defense Minerals Exploration Administration. This is a 400-percent increase for exploration assistance from the amount obligated in 1961, while the cost of administrative and technical services is expected to increase only 11 percent. The increase is based upon the large number of inquiries about the program, and the size of our present and projected workloads.

Status of workload

Midway in this fiscal year we had received 68 applications, 24 more than received during the entire past year. Five contracts for $192,000 had been executed, and seven more contracts for $137,000 were awaiting execution by applicants. Thirty-nine applications had been denied or withdrawn in the first half, and 42 applications requesting $4,636,000 were still in process. Requests for information were pouring in at the rate of 400 per month. Last year they averaged only 30 per month.

Our big job is to complete action on the 42 applications now in process and to step up processing to handle 60 more applications we expect to receive before the end of this fiscal year. If we can do this, we will execute about 30 more contracts and obligate the entire $840,000 available for this fiscal year. Our present workload includes, in addition to this new OME business, the inspection of work in progress on 16 or more active OME contracts and approval of the operators' reports and vouchers so that they may be paid for work done. It includes also the checking of more than 360 DMEA certified projects for production and royalties. However, it may become necessary to defer some of this checking until next fiscal year when we hope to have a slightly larger field staff.

The workload in fiscal year 1963 is expected to continue at about the same level as in fiscal year 1962 for OME applications and contracts, but the number of DMEA certified projects requiring production and royalty checks will drop because of the expiration of the 10-year certification periods on some 70 projects. This reduction is likely to be offset, however, by the work deferred from fiscal year 1962. Most of the $16,400 increase requested for administrative and technical services will go for additional field staff and its expenses. The fiscal year 1963 program will require nearly 700 visits to projects in 30 or more States. This will mean an average of four inspections per week for each of the three fieldmen with all attendant travel and reports and a commensurate load on the Washington office staff. Although we would rather have our own field personnel, we must continue to rely on the Bureau of Mines and Geological Survey employees for part-time field work in our three western regions. We plan to cover the eastern region from the Washington office. The entire OME staff will not exceed 18 and will average only 16.

A very great deal of our so-called administrative expense is used for professional assistance and technical guidance for applicants under the program. Obviously we do not want to fritter away Government funds on "blue-sky" projects. Neither do we want to see exploration projects of merit spoiled by ill-advised methods. We are not doing business with the great mining corporations with their large and capable professional staffs; generally speaking, we are doing business with people who must depend upon us to tell them:

Whether to explore or not, what to do, and how to do it

Service of this sort costs money, yet the cost is insignificant compared to what it would be if we went along and dumped money into every wild goose chase.

Many persons are blissfully unaware of the administrative burden of the former DMEA program for which we are also responsible. There is a lot of work involved in this program alone. For instance, we have been collecting royalties that in recent months have approximated $40,000 monthly. We are in critical need of an accountant to assist in this and many other phases of the former DMEA and present OME programs.

The $230,000 requested for administrative and technical services should alleviate some of these needs.

We are convinced that the volume of work in fiscal year 1963 will equal the already heavy present workload, and that the funds requested will help to make our program more effective.

Program

Briefly stated, the OME offers financial assistance to firms and individuals who wish to explore their properties for one or more of 38 mineral commodities. This help is offered to applicants who ordinarily would not undertake the exploration under present conditions or circumstances at their sole expense and who are unable to obtain funds from commercial sources on reasonable terms.

We contract with an eligible applicant to pay up to one-half of the cost of approved exploration work. The applicant pays the rest. The Government participation in a single contract cannot exceed $250,000. Interest, at rates which have ranged from 5¾ to 6½ percent, is charged from the time funds are made available.

Funds contributed by the Government are repaid by a 5-percent royalty on production from the property. If nothing is produced, there is no obligation to repay. A royalty is paid on any production during the period in which the work is done under the contract; and if the Government certifies that production may be possible from the property, the royalty obligation continues until the Government's contribution is repaid with interest, or for the 10-year period usually specified in the contract.

Need for long-range exploration

Adequate supplies of new materials are of vital importance to our nationa economy. We all know that the United States must have an adequate, dependable, and continuing supply of raw minerals. This is indispensable to meet the needs of an expanding population, a rising standard of living, and our national security.

The amazing growth of the Nation since the turn of the century has not taken place without a tremendous increase in the consumption of minerals. The amounts of minerals used today are huge in comparison with those of 20 or 30 years ago, and those of today undoubtedly will seem small when viewed 30 years hence. All future projections point in that direction. For instance, the population of the United States is expected to reach 235 million by 1975, an increase of approximately 45 percent. And both industrial production and construction are expected to almost double today's figures by the same year. Our energy requirements, another good indicator, are expected to reach 67,000 trillion British thermal units in 1975, an increase of approximately 50 percent. The Bureau of Mines economists believe that the per capita consumption of minerals during this period will increase by 50 percent. Putting this projection together with the expected increase in population you get an increase of 75 percent in total consumption of minerals by 1975. Shifting technology, the use of new materials, advances in the recovery of scrap, and other factors will mean that the increase in the consumption of minerals will probably be somewhat less than the 75 percent figure, but nevertheless it will be a staggering increase. Yet it is common knowledge that practically all of the low cost, surface mineral exposures have long since been found. The great majority of the future ore discoveries of significant size will be deep below the surface. These, of course, will require expensive,

high-cost exploration projects. If this country is to produce substantial portions of its own requirements and have reserves available for emergencies, more encouragement must be given for domestic mineral exploration. The OME program is one way in which the Government's responsibilities in this area are being carried out.

Short-term aspects

Although the OME program is designed for and focused primarily on the long-range needs of our Nation, many ramifications of the program have beneficial economic manifestations today.

Every exploration project, whether large or small, successful or unsuccessful, means more men at work, more supplies purchased, and more taxes paid in mining areas where most needed. And although we do not create "economic cripples" or encourage the development of submarginal, uneconomic deposits that would actually be a burden to the minerals industry, there are and will be more discoveries of higher grade ore deposits resulting in the development of economic mines that can compete against the influx of imported ores, meaning even more employment, tax money, et cetera for hard hit mining communities.

If you have any questions, I shall try to answer them.

General Statement

Mr. Fumich. As you know, we are operating on a $750,000 budget this current fiscal year, and we are, of course, asking for $1 million. On the face of it, it would seem that we were asking for a $250,000 increase. But the facts are a little different.

CARRYOVER FUNDS

The reason is that although we are operating on a $750,000 budget this year, we had a carryover of $340,000 last year, approximately, which gives an operating actual budget of $1,054,000, in round figures.

So actually, if this budget that we are asking for now is approved, it will mean that we will be operating on $54,000 less than we are operating on now.

DIVISION OF FUNDS

The way we propose to divide up the million dollars that we are asking for is this: We are asking for $770,000 for contract obligation money, and we are also asking for $230,000 for administration costs. This is the heart of our real problem. What we are doing, in effect, is asking $16,400 increase in our administration costs, in the $250,000 increase.

The reason for that is this: When the OME program was originally set up, it was inaugurated with over a million dollars for administration costs. Actually, the amount set up alone for administration was more than our entire budget that we are asking for right now.

And although we had high hopes at that time for the original program, for several years the program did not meet expectations, and so the crew was skeletonized. We actually, for a nationwide program, right now have a total of 14 men.

And although the DMEA program was theoretically and legally supposed to terminate in 1958, we, the OME group, still have to administer the dying out phases of the DMEA program.

ACTIVITY IN PROGRAM

That program is still far from dead. Let me give you an illustration. This year, the program—and I am talking about DMEA, right now—is still in force. We have around 390 contract projects that we still have to administer this particular program. The total money value of those contracts is about $33 million. The amount of money that the Government has invested in that particular program is $15 million. This year we have received $400,000 in royalty payments from that particular group.

And actually, as far as our current picture is concerned, we have been averaging around $40,000 a month in royalty from that particular group.

Now that program is still far from dead. We expect it is going to take several more years before it is phased out enough so that it will not hurt our administration for the current OME program. Sir, the DMEA——

DISTINCTION BETWEEN PROGRAMS

Chairman HAYDEN. What does DMEA mean?

Mr. FUMICH. Defense Minerals Exploration Administration.

The OME, of course, is a successor group, and it is called the Office of Minerals Exploration. I am sorry I did not explain the DMEA to you when I first started.

But, of course, while we were administering the DMEA program with only 14 men, we could do it, because, like I said at the start of my presentation, the OME program was very much on the anemic side. That was the reason they cut the force down. And we could do it, because, although we did not have much of an OME program, we still had quite a large load as far as the DMEA program was concerned. But that situation has come to an end this year, because frankly, we are finally coming of age.

This is what I mean: Last year, for instance, we had a total of 44 applications for the entire year. Out of that particular group of 44 applications, we ended up with 12 signed contracts amounting to $277,000 in Government obligation money.

GROWTH IN PROGRAM

We were averaging about 30 inquiries and requests per month last year compared to 350 per month this year.

This year, up to this current month, we have received a total of 87 applications, almost double what we received in all of last year. Out of the 87 applications, we already have 10 signed contracts. We have six contracts that I have signed that are out in the field for signature by the operators, and we also have two amendments obligating and reserving a grand total of $584,020.

Now that is our program for this year. In other words, we have already obligated approximately 70 percent of our money. We have already gone over our regular formal budget, and as you can see, this big workload has taken up practically all of our time, and we just do not have enough of a staff right now to administer both programs properly.

NATURE OF NEW WORK

Chairman HAYDEN. What is the nature of some of this new work?

Mr. FUMICH. Sir, we increased our program by six minerals this year, including gold, silver, iron, and three of the minor minerals; and because of the inclusion of those particular minerals, we have received a great influx of applications, based mainly on gold and silver. Out of the 50 applications that we are processing right now, we have about 24 applications for gold alone.

Chairman HAYDEN. What will you do with one of those gold applications?

Mr. FUMICH. You mean in processing, sir?

Chairman HAYDEN. Yes.

PROCESSING APPLICATIONS

Mr. FUMICH. Well, in processing an application, whether it is gold or one of the other 37 minerals that we have included in our program, we do this: For instance, say that you have a piece of property, or you have a claim, and you want to explore for one of the minerals that we have included in our program. You make an application to our Washington office or one of our regional offices, stating that you have a claim, that you think there is a good possibility of finding gold there, but you do not have enough money for the program. You tell us what the program will cost, in your estimation.

First, you go to two banks to try to borrow the money. Of course, they have to turn you down before we can try to help you. Then when you send that application in with the two refusals from the banks, we either send a geologist or a mining engineer out to that particular project, and he has to determine this: First, the geological feasibility of that particular mineral being there; second, the grade and the amount of that particular mineral, and whether it would justify the expenditure that both the Government and the applicant——

Chairman HAYDEN. A sampling service?

Mr. FUMICH. That is right, sir.

Third, he would check the costs, and so forth, and he would go into the applicant's personal background to see whether he was the type of person that would have the knowledge, or whether he had the type of program that would give a pretty good chance of a favorable result.

After that, we would go over the contract to make sure that he was charging the right amount for the proper items and for labor and the other expenses involved, and then sign that particular contract, and the man would go in and start working.

We would not advance any money. He would have to work for approximately 2 months, and he would send us a signed voucher for his expenses, and we would pay 50 percent of the expenses of the project.

After the project was completed, we would again send a geologist out to see if he discovered enough of a mineral deposit that we could certify and require him to pay us a 5-percent royalty on any production from that particular area. If he did not find any mineral, he would not owe us any money. The project would be wiped out.

TIME NECESSARY FOR PROCESSING

Chairman HAYDEN. How long would it ordinarily take to work out one of these projects?

Mr. FUMICH. Well, sir, I will just give you an example. Just recently, our man up in Spokane, Wash., checked four projects. It took him 8½ days. He traveled 2,100 miles just checking, making a routine inspection of each of the projects. But if he actually wanted to go in right at the start, it might take him 2 or 3 days to really go into it and make a good inspection of the whole project.

Chairman HAYDEN. How long does that contract operate?

Mr. FUMICH. Six months to a year. Let us say we sign a contract with you and you start working on your project. Then we send that man back two or three times in succession to make sure that when you are sending your labor in there, you are actually charging for the right expenses.

If we did not send anyone in, of course, you could say you had so many men, and your expenses were so-and-so, and of course there would be no way of checking your figures. But by sending a man in once or twice at different periods, you would be on notice that we were going to send someone, and you would come up with the correct figures for your expenses.

When you finished your project, he would come back again to see what type of results you got from that particular project. That is the man in the field.

Now let us come into the main office, here. When that contract is signed, it comes here, and we, of course, check all the vouchers coming in. On that particular project, if there is any delinquency, or if there is commingling of ores—he might have ore from this particular project, and he might have another mine some place, and there might be commingling. We go into all of those details. And that is a special type of problem that we have been having with our DMEA projects. That has been taking quite a bit of work, just on the administering phase alone.

Chairman HAYDEN. Now you run along a while and then decide that the project looks feasible. Then what happens?

TIME LAPSE BEFORE PRODUCTION

Mr. FUMICH. Sir, let us say the project looks feasible. After we send our geologist out, he inspects the project and says, "This project looks pretty good." Maybe there will not be any production from this project for several years. But it does look favorable enough so that at some time in the future there should be some production from this particular project, and we will certify it. We will send the man a letter saying that we have certified that project.

TEN-YEAR ROYALTY LIEN

And for 10 years thereafter, we will have a lien on that particular project.

In case there is any production from that particular project in the next 10 years, it will be subject to our royalty lien. And, of course, if there is no production from that particular project during that 10-year period, then, at the end of the 10 years, we send the man a release, saying that the certification is terminated.

Chairman HAYDEN. How much royalty do you collect?

Mr. FUMICH. This last year we collected around $400,000 in royalties.

Chairman HAYDEN. But I mean percentagewise.

Mr. FUMICH. Well, we have collected approximately 18 percent, percentagewise, on royalty payments.

Chairman HAYDEN. Is there no rule about it?

Mr. FUMICH. Well, we have had approximately 63 contracts from which we got all our money paid back. Let us say we loaned you $30,000 on a project. Then you would be charged 5 percent royalty until that $30,000 was repaid, if you had that much production.

Of course, if you did not have that much production, you would pay us a 5-percent royalty until such time as you ceased production.

ADMINISTRATIVE AND TECHNICAL SERVICES

Chairman HAYDEN. This budget estimate includes $16,400 additional, for administrative and technical services, in fiscal year 1963, bringing this total to $230,000. You have indicated that this increase is necessary because of the increased workload. However, the informantion you supplied shows that you expect 10 less field examinations for new applications, 67 less insepctions of certified projects, or a total of 77 less actions during the coming year.

Would you comment on that?

SOURCE OF FIGURES

Mr. FUMICH. Sir, those are merely formal figures. Actually we expect a lot more than that, but we had to put in a figure to justify the costs that were approved to us.

We are basing that on 120 applications. As you can see, this year alone we already have 87. And let us say we get an average of 10 each month, for the rest of the year. That will give us 40 more. Next year, say we get our 120 applications.

We would have 120 trips initially for the total applications that we received. Then we would have approximately 30-some contracts that we would award out of the 120 applications, and we would go back to the explanation that I gave you before. Each contract would have several inspection trips, and at the end of the contract we would again have to inspect that, which would mean another trip; plus the fact that out of the 390 DMEA contracts we have to make a check to see whether the man is again in production, whether the ownership has changed, if there has been a commingling of ore. It is just the consolidated figure of all these estimates.

SUCCESS OF PROJECTS

Chairman HAYDEN. What do you consider the most outstanding success that has come from a project into which you have put money?

Mr. FUMICH. I would answer that in this way. I think a few years ago we thought we were at the bottom of the basket, mineralwise. But there were several programs inaugurated at that time, and we now find that those programs did do the job.

The DMEA program was inaugurated in about 1951. For 7 years the DMEA was in effect. The minerals discovered based on dollar

value we figure amounted to about a billion dollars. You could figure that for each dollar value of minerals discovered, it cost the Government about 3 cents.

Or you could say that for each dollar the Government put into this program, you got back about $33 in minerals; plus the fact we got back again about 18 percent just in money alone from these particular projects; plus the fact, again, that this money is going out into depressed areas.

And here is what you find on each project that you get.

Say we go in and have a project, and it is successful. He pays all the money back. That is not too often. But of course that is the best.

OK, let us get the next best thing. Say the man goes in and he discovers some mineral, and it might be a certain grade, but it is not good enough to go into production. But we do know 30 or 40 years from now that particular area has been examined by a geologist, a mining engineer. We know what is in that particular area. We do know we have a certain grade mineral in there that we can always get in the future if we want to.

On the other hand, let us go to an even lesser possibility. Here we have a project, and we do not discover anything. We have spent our money, and the man has spent his money. But we do end up with this. Again, that particular area has been checked by a geologist. We know no one is going to fool around with that particular place again. We know nothing is there. That is an advantage in itself. I mean, it is knowledge.

We also know that most of the places these people are trying to explore for minerals are in depressed areas. What that means is that the man hired some men and bought some supplies. It has meant in each of these projects we have sent money out into a community, so that even though nothing was discovered, there was still a positive result for that particular program.

St. Joseph Lead Deposit

Chairman Hayden. But I was just trying to think: What one of these particular mining enterprises that you sponsored is the best one in the United States? That is what I am trying to get at. Which one of them?

Mr. Fumich. We have one particular contract that we are proud of, but the office had been criticized for it in the past. That is the St. Joseph lead deposit, that has turned out to be a wonderful success.

Chairman Hayden. Where is this project located?

Mr. Fumich. It is in Missouri. And there you have complete communities set up, built, with a thriving industry that can compete against lead prices anywhere in the world. That is the project that we like to bring out.

Senator Dworshak. Is that in operation already?

Mr. Fumich. Oh, yes, sir.

Senator Dworshak. How many men do they employ there?

Mr. Fumich. It is a major project. It is in the hundreds.

MAJOR CONTRIBUTION OF PROGRAM

We think that one of the main contributions is not any of these specific things that I have been telling you about. We think it is this: We know that all the projections for the country are on the increase. In other words, our gross national product is supposed to be around $728 billion by 1975. Our construction and our production is supposed to double by that time. Our population is supposed to be around 235 million by 1975. And we know in the past 50 years that our per capita usage of minerals has increased 150 percent.

So putting all those things together, we know that we are going to need a lot more minerals, not for defense purposes, but just for our thriving economy in the future, the next 30 or 40 or 50 or maybe 100 years.

We also know that we have certain minerals that are in short supply in reserve. We do know that these minerals are going to be critical in later years.

And this program has been one of the programs that has pushed that reserve supply into the years ahead. So I think it is very vital.

Chairman HAYDEN. I am convinced of the merits of the program, but I thought it would be well to make a record of some of these things for the benefit of people who have not paid attention to it.

MINERALS AVAILABLE FOR ASSISTANCE

Senator DWORSHAK. Which minerals are available now for assistance, under this program?

Mr. FUMICH. We have antimony, asbestos, bauxite, beryllium, bismuth, cadmium, chromite, cobalt, columbium, copper, corundum, diamond, fluorspar, gold, graphite, iron ore, Kyanite, lead, manganese, mercury, mica, molbydenum, monazite, nickel, platinum group metals, quartz crystal, rare earths, rutile, selenium, silver, sulfur, talc, tantalum, tellurium, thorium, tin, uranium, and zinc.

Senator DWORSHAK. Lead?

Mr. FUMICH. Yes; lead and zinc.

Senator DWORSHAK. Have you added any minerals during the past year?

Mr. FUMICH. Sir, we added six minerals at the start of the year. We added iron ore, gold, silver, bismuth, sulfur, and tellurium.

Senator DWORSHAK. I noticed you included in the list cobalt. Of course, a few years ago we closed down the only cobalt mine in the United States, in Idaho, because they could not produce cobalt in competition with low cost African cobalt.

LOW WORLD PRICES

I agree with you, Mr. Chairman, that there is a lot of merit in this program insofar as making efforts to discover deposits which may be essential at some future time; but our great difficulty is that with lead and zinc and cobalt—and I might mention several others—it is almost impossible for domestic producers to operate at a profit because of the low world prices.

Do you take that into consideration when you act on any of these applications?

Mr. FUMICH. Oh, yes, sir. Just, for instance, lead and zinc. Now, there is a lot of talk about lead and zinc. A lot of people, frankly, are inquiring why lead and zinc are included in our program. But again, the main mission of this program—we are thinking about the next 25 or 50 or 75 or a hundred years.

Lead, for instance. According to most recent projection, you are supposed to have 2.9 million tons of lead indicated or found in reserve. You also have 2.7 million tons of lead in inferred reserve, giving you a total of 5.6 million tons. Our consumption has been a little over a million tons. So just basing it on consumption, we would have a little over 5 or 6 years of lead reserves for the future. That is one of our major metals.

Now, basing it on production of around 300,000 tons a year, we would only have 16 or 17 years, which is merely tomorrow, as far as time is concerned.

Senator DWORSHAK. If you do not get a higher price than 9½ cents for lead, where it is now, you will not have any lead mines functioning. That is not your responsibllity. I am not blaming you.

IRON DEPOSITS

Have you discovered any iron ore deposits recently in this country?

Mr. FUMICH. We have had a few applications for iron ore deposits, and we have one application pending, but as far as the last year or so is concerned, I would have to say no.

Senator DWORSHAK. Has there not been an iron ore deposit discovered in Missouri in the last few years?

Mr. FUMICH. Yes, sir.

Senator DWORSHAK. Who has that? What company? Do you know?

Mr. FUMICH. It is a combination, I understand.

Senator DWORSHAK. Did you help on that project?

Mr. FUMICH. No, sir.

Senator DWORSHAK. Are they producing at that mine now?

Mr. FUMICH. That is my understanding.

MINERALS MOBILIZATION AGENCY

Senator DWORSHAK. Do you work in cooperation with this minerals mobilization agency that was established a few years ago? I do not know whether it is now in the Interior Department or has been moved over.

Mr. FUMICH. Yes, sir; it is still in the Interior Department.

Senator DWORSHAK. Minerals mobilization? Is there an appropriation in this budget, Mr. Larson?

Mr. LARSON. The estimate is to be considered by another committee in the Senate as well as the House. It is not in our estimate before you.

Senator DWORSHAK. Which committee has that?

Mr. FUMICH. I think it is included in something else.

Senator DWORSHAK. I thought it was no longer under the jurisdiction of Interior. But it is still located down there in its old quarters?

Mr. FUMICH. Yes, sir.

Senator DWORSHAK. They compile statistics that are vital to national defense?

Mr. FUMICH. Yes, we coordinate with that particular group, AEC, and other Government agencies.

Senator DWORSHAK. You have not covered this other statement on lead and zinc, have you?

Mr. FUMICH. Not yet, sir. That is next.

OFFICE OF MINERALS EXPLORATION—LEAD AND ZINC STABILIZATION PROGRAM

Chairman HAYDEN. We will next take up the lead and zinc stabilization program.

A budget estimate of $4,900,000 is submitted to provide for stabilization payments to small domestic producers of lead and zinc ores and concentrates. Four million five hundred thousand dollars of the estimate will be used for stabilization payments and $400,000 is required for expenses of administering the program. The justifications will be placed in the record.

(The justifications follow:)

The Secretary of the Interior is authorized by the act of October 3, 1961, (Public Law 87-347) to establish and maintain a program of stabilization payments to small domestic producers of lead and zinc ores and concentrates produced during the calendar years 1962 through 1965. To achieve the maximum benefits of the program, appropriations for the stabilization payments must be made well in advance of the calendar year. Consequently, the funds requested are for use during the calendar year 1963.

The funds requested for the fiscal year 1963 appropriation total $4,900,000. One-half of this amount, $2,450,000, is expected to be carried forward for obligation during the first half of fiscal year 1964. Similarly one-half of the funds proposed for the fiscal year 1962 supplemental appropriation are expected to be carried over for obligation in fiscal year 1963.

The act (Public Law 87-347) authorizes a maximum of $4,500,000 in stabilization payments during calendar year 1963. That amount is requested for use as explained above.

The remaining amount of $400,000 is needed for administration of the program. Approximately 500 producers are expected to apply for eligibility to receive stabilization payments. As many as 6,000 applications for payment may be received during 1963. The staff required to administer this program is expected to reach a peak of 34 persons during fiscal year 1963 when most of the applications for eligibility are being processed and the maximum amounts are being paid.

Lead and zinc stabilization program

Appropriation, 1961	----------
Appropriation, 1962	----------
Total available, 1962	----------

Summary of increases and decreases, 1963

Stabilization payments	+$4,500,000
Administration	+400,000
Net change	+4,900,000
Budget estimate, 1963	4,900,000

Analysis by activities

Activity	Amount available, 1961	Amount available, 1962	Estimate, 1963	Increase (+) or decrease (−)
1. Stabilization payments			$2,250,000	+$2,250,000
2. Administration			200,000	+200,000
Unobligated balance carried forward			2,450,000	+2,450,000
Total			4,900,000	+4,900,000

JUSTIFICATION

This estimate of $4,900,000 is to provide for payments in pursuance of the act of October 3, 1961 (75 Stat. 766), which authorizes the Secretary of the Interior to establish and maintain "a program of stabilization payments to small domestic producers of lead and zinc ores and concentrates in order to stabilize the mining of lead and zinc by small domestic producers on public, Indian, and other lands as provided in this act."

To achieve stabilization in the annual rate of production and to assure equitable distribution of the benefits of the program as intended by the act, it is essential that the appropriations for stabilization payments be made well in advance of each calendar year.

Since the act establishes the maximum payments that may be made on a calendar year basis, the funds requested herein are for the calendar year 1963. Of the amount requested, $4,500,000 is for stabilization payments and $400,000 is for expenses of administering the program.

Funds for carrying on the program in the calendar year 1962, the first year specified by the act, will be requested in the next supplemental appropriation bill.

The act provides that the stabilization payments to small producers of lead and zinc are to be based on actual sales to smelters or other processors, and will be determined by the metal content of ore or concentrate sold and the relationship between the average market price of the commodity during the month in which sale is made, and the stabilization price fixed in the act. The act sets out elaborate criteria as to eligibility for participation based primarily on historical production by the producers involved. It also provides for "equitable distribution of the benefits of the program," which will necessitate the allocation of individual quotas and continuous review and revision of allocations so that the total amount appropriated for stabilization payments will provide the greatest benefit.

Historical U.S. Bureau of Mines data indicates that over 600 lead and zinc mining operations may be eligible under the program. For this estimate it is assumed that about 500 participants will eventually be certified for eligibility.

The administrative workload may be divided into three primary phases: (1) the analysis, processing, and certification of applications for participation under the program; (2) establishment of quotas and allocations for each producer, and continuous review and revision where necessary; and (3) processing of applications for stabilization payments.

1. *Processing and certification of applications.*—The 500 applications expected will be received from lead and zinc producers in 20 States. The analysis, processing, and certification of these applications will include initial receipt, recording, and control of all applications; review of applications for basic papers required, and necessary correspondence for missing items; analysis of basic data submitted covering the base years 1950 to the present; verification of data submitted with information in the U.S. Bureau of Mines, State bureau of mines, other Government agencies, or in private hands; review of data to determine history of ownership and operations during the base period and to determine whether the producer is eligible for participation; and review of organizational history of the producing unit including changes of ownership, operations through permit or lease arrangement, splitup or merger of properties, etc.

2. *Establishment of quotas and allocations.*—This phase of administration will require continuous review and revision when necessary of quotas and allocations based on a number of interrelated factors, including such items as the approximate level of participation based on applications received to date; total maximum tonnage allowable, computed on base period production; total tonnage estimated to be certified within the current and ensuing quarters, and for the balance of the

calendar year; the present market price for each commodity; the predicted market price; and data based on actual sales to processors and applications for payment.

3. *Application for payment.*—Each applicant or producer is expected to submit one bill each month, a maximum potential of 6,000 applications per year. All applications must be processed to determine that applicant is entitled to payment, that amounts submitted are within the established quotas, and the amount of payment. This will include, as a minimum, the following determinations:

(*a*) That application is from an eligible producer;
(*b*) That production is from an eligible unit;
(*c*) That ores or concentrates are "newly mined" as defined by the statute;
(*d*) That bona fide sale has been made or that producer will further process in lieu of sale;
(*e*) Of metal content according to assay report;
(*f*) Of validity of assay report;
(*g*) That quantity is within allowable maximum for individual producers;
(*h*) That maximum computed stabilization payment is within quota allocation for each producer.

The overall workload includes also the development and amendment of regulations, extensive legal services, factfinding audits or compliance checks at mining properties or offices where records are maintained, printing, public information activities, budget and fiscal operations, and other staff services.

Itemization of estimate—Lead and Zinc Stabilization Program

	Actual, 1961	Estimate, 1962	Estimate, 1963	Increase (+) or decrease (−)
Program and financing:				
Total obligations			$2,450,000	+$2,450,000
Unobligated balance carried forward			2,450,000	+2,450,000
New obligational authority			4,900,000	+4,900,000
New obligational authority: Appropriation			4,900,000	+4,900,000
Obligations by objects:				
11 Personnel compensation			126,000	+126,000
12 Personnel benefits			9,000	+9,000
21 Travel and transportation of persons			15,000	+15,000
22 Transportation of things			3,000	+3,000
23 Rents, communications, and utilities			3,000	+3,000
24 Printing and reproduction			3,000	+3,000
25 Other services			2,000	+2,000
Services of other agencies			28,000	+28,000
26 Supplies and materials			3,000	+3,000
31 Equipment			8,000	+8,000
41 Grants, subsidies, and contributions			2,250,000	+2,250,000
Total			2,450,000	+2,450,000

PREPARED STATEMENT
