A breakdown of personnel requirements for each of the above separate functions is shown here. You call some ancillary duties, accident and safety inquiries, training, program direction. You have 48. These are more or less just what you call them here; are they not? You call them ancillary duties and then you have accident and safety inquiries, training, but these are the duties incident to the investigators.

How many investigators do you have actually out of your 201? You have about 50 here doing ancillary work. Is that about right? How many people do you have doing your analytical work? That is not some more statistical work; is it?

Mr. BOYD. No, sir; this is such things as metallurgical tests and wind tunnel tests.

Mr. THOMAS. In this presentation this heading pertains to studies and general research undertaken by Bureau headquarters specialists subsequent to completion of the on-scene investigation. It covers laboratory tests, flight and wind tunnel tests, metallurgical tests, and others. Are these technical people?

Mr. BOYD. Yes, absolutely.

Mr. THOMAS. Let us see the green sheets on these 200. These are some of your best trained engineers. Turn to your big table and maybe I can get what I want.

Mr. BOYD. Page 20

Mr. THOMAS. You have one 18; two 17's; three 16's; eleven 15's; sixteen 15's; twenty-three 13's. How many is that 13 and above? Fifty-six 13's and above; is that correct?

Mr. BOYD. Yes. sir.

Mr. THOMAS. In the field column you have about 80 people, 13's and above.

Mr. BOYD. Yes. sir.

LOCATION OF FIELD OFFICES

Mr. THOMAS. Where are the people located, in the field?

Mr. BOYD. Anchorage, Alaska; Seattle, Wash.; Oakland and Los Angeles, Calif.; Denver, Colo.; Kansas City; Fort Worth; Miami; Oak Park, Ill.; and New York.

Mr. THOMAS. I asked the clerks to give me a list of your field offices. We could not find it in here. My memory is that you had 8 or 10 little offices.

Mr. BOYD. Yes, sir.

Mr. THOMAS. They are not in your justifications. Where are they and how may people do you have in them?

Mr. BOYD. We will provide them.

(The information supplied follows:)

Civil Aeronautics Board: Field offices, Bureau of Safety

Location:	Number positions
Oak Park, Ill.	10
Anchorage, Alaska	4
Oakland, Calif.	5
Los Angeles, Calif.	11
Denver, Colo.	5
Kansas City, Mo.	5
New York, N.Y.	12
Fort Worth, Tex.	8
Seattle, Wash.	5
Miami, Fla.	11
Total, 10 field offices	76

Mr. THOMAS. Repeat those you just gave.

Mr. BOYD. Anchorage, Seattle, Oakland, Los Angeles, Denver, Kansas City, Fort Worth, New York, Miami, and Oak Park, a total of 10.

Mr. THOMAS. How many people; three, or four, or a half dozen?

Mr. BOYD. Two or three.

Mr. THOMAS. What do they do?

Mr. BOYD. New York is a bigger office. We have 12 people in New York.

Mr. THOMAS. What division do they belong to? Are they all in the Bureau of Safety?

Mr. BOYD. All in the Bureau of Safety, all field investigators, with a stenographer.

Mr. THOMAS. These 9 or 10 offices are nothing but your safety offices?

Mr. BOYD. Absolutely.

Mr. THOMAS. What do these people do besides investigate accidents?

Mr. BOYD. That is all they do, and they are occupied on that at all times.

Mr. THOMAS. Where is your limitation? Under how many pounds is it you do not look at?

Mr. BOYD. Under 12,500 pounds.

Mr. THOMAS. Where no deaths occur?

Mr. BOYD. Where no deaths occur.

ACCIDENT INVESTIGATIONS

Mr. THOMAS. How many investigations did you have in fiscal 1963 with these 200 people?

Mr. BOYD. In 1963 there were 960.

Mr. THOMAS. What is your work units on page 90, investigations? You have 960 accidents where people were killed?

Mr. BOYD. We not only investigate accidents where people are killed. Those are the only ones we investigate in light planes. We investigate all accidents involving air carriers, whether there are any fatalities, injuries, or not. We investigate all incidents occurring to air carriers. For example, a nosewheel comes off of a jet, nobody is hurt, but we investigate it because we want to know what caused that.

Mr. THOMAS. Does FAA do the same thing? Are you not doing too much? Why do you not save your good staff, your 15's and 16's, these highly skilled engineers? Why do you get mixed up in that small stuff? Where is your probable cause? Is that not an operating problem in the final analysis?

Mr. BOYD. Not necessarily.

Mr. THOMAS. They should have caught that in the Inspection Service before the plane left the factory when they certified it.

Mr. BOYD. That is right.

Mr. THOMAS. Why should you come in? Yours is probable cause on serious accidents where death occurs and big planes. Why get into chasing rabbits?

Mr. BOYD. It is not chasing rabbits, if I may say so. It is the hope that by finding out what happens in these occasions we can prevent——

Mr. THOMAS. Is not that the job of the operating people?

Mr. GURNEY. They have already looked at it in the manufacturer's plant. We want to see if they have missed anything. We have to.

AUTHORITY FOR ACCIDENT PREVENTION

Mr. THOMAS. Does not the statute say your jurisdiction is to determine probable cause in case of serious accident or death?

Mr. BOYD. No, it does not say that.

Mr. THOMAS. Read what your authority is.

Mr. WANNER. Section 701(a), subsection 5. Includes the duty of the Board of—

ascertain what will best tend to reduce or eliminate the possibility of, or recurrence of, accidents by conducting special studies and investigations on matters pertaining to safety and air navigation and the prevention of accidents.

EXECUTIVE STAFF ACTIVITIES

Mr. SHIPLEY. We will go ahead into executive staff. We will put in the record page 94, which covers the purpose and objectives and the financial requirements. Also 95, which covers part of the justification of the staff requirements.

(The pages follow:)

EXECUTIVE STAFF ACTIVITIES

The offices of members and office of secretary perform the functions of this activity.

I. PURPOSE AND OBJECTIVES

This activity embraces the functions of the members of the Board in fulfilling the general responsibilities assigned to the Board in the Federal Aviation Act of 1958, including the adjudication of cases and the formulation of policies and plans to carry out the provisions of law; and supporting work concerned with

the processing of all documents for Board action; recording, filing, and authentication of Board actions; maintaining custody of all public records, preparation of Board decisions for publication in bound volumes, and distributing information concerning Board actions.

Financial requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Permanent positions	82.0	82.0	77.0	−5.0
Average number of all employees	78.2	77.9	75.1	−2.8
Obligations:				
Personnel compensation and benefits	$784,754	$819,000	$821,200	$2,200
Other objects	79,398	87,000	87,100	100
Total	864,152	906,000	908,300	2,300

The increase of $2,200 for personnel compensation and benefits is the net result of eliminating five positions offset by the cost of within-grade salary advancements, and increased pay costs pursuant to Public Law 87–793.

III. JUSTIFICATION OF STAFF REQUIREMENTS [1]

The breakdown of staff by organization is shown in the following table:

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Immediate offices of members	29	29	29	
Office of Information	5	5	4	−1
Office of Community and Congressional Relations	4	4	4	
Planning Office	4	4	4	
Office of Secretary	40	40	36	−4
Total	82	82	77	−5

1. *Immediate offices of members.*—The responsibilities of the members of the Board are established by statute and the members are charged with carrying out the duties and functions devolving upon the Civil Aeronautics Board under the Federal Aviation Act of 1958. The Chairman is also the executive head of the Board. Also included is the Executive Director, who is the chief operating and executive staff official of the Board and assists the Chairman in the performance of major administrative and executive functions, and the Board through the coordination of quasi-judicial matters.

2. *Office of Information.*—This Office serves as the primary channel for general inquiries from the public and the press, and prepares or reviews and coordinated proposed press releases and other information materials with Board officials. Three positions formerly reported in the "Safety" activity and two positions formerly reported under the Office of Secretary are included here as a result of the consolidation of the information function in the Office of Information.

3. *Office of Community and Congressional Relations.*—During the fiscal year 1963, the Office of Community and Congressional Relations continued its informal work with the communities in attempting to solve air service problems before they reached the stage of formal proceedings before the Board. In this it has been successful in that no new adequacy of service complaints have been filed with the Board by any city.

The Office was successful in resolving the very knotty Oakland, Calif., air service problem. With the cooperation of civic officials, and the air carriers serving Oakland, jet service was instituted there in June 1963 by several of the carriers. The carriers and Oakland are making all-out efforts to promote this service and it appears to be developing worthwhile traffic.

[1] The data for fiscal years 1963, 1964, and 1965 reflect, on a comparable basis, the transfer of positions during 1964 between this activity and other activities of the Board as explained under the appropriate headings on the following pages.

Liaison has been maintained by the Office with the National Association of State Aviation Officials, the Airport Operators Council, the American Association of Airport Executives, and civic bodies in all parts of the country. Meetings in many communities between the air carriers and civic officials have resulted in a better understanding of the mutual problems of each group and also in improved air service.

The Office will continue these endeavors during fiscal 1964 and 1965 to improve the relations between the air carriers and the communities that they serve. It is difficult to predict what trouble spots may arise, but where they do occur, through personal contact with the air carriers and civic officals, we will attempt to exercise fire-prevention methods rather than firefighting after the fires have started.

Continuing close liaison with the national associations and other Government agencies interested in air transportation will be maintained.

EXECUTIVE STAFF FUNCTIONS

Mr. SHIPLEY. This activity embraces the responsibility of the members of the Board in fulfiling the general responsibilities assigned to the Board in the Federal Aviation Act of 1958, including the adjudication of cases and the formulation of policies and plans to carry out the provisions of law, and the supporting work concerned with the processing of all documents for Board action, recording, filing, and authentication of Board actions, maintaining custody of all public records, preparing of Board decisions for publication in bound volumes, and distributing information concerning Board actions.

For 1965 a total of $908,300, which is an increase of $2,300 over 1964.

Permanent positions for 1964 were 82; you have a reduction shown to 77, a reduction of 5 in 1965. Is the majority of this for personnel compensation?

Mr. BOYD. Yes, sir.

Mr. SHIPLEY. The increase of $2,200 is for personnel compensation benefits and is the net result of eliminating five positions offset by the cost of within-grade salary advancements and increased pay cost.

Justification of staff requirements is shown on page 94. There were 29 in 1964, 29 in 1965 for the immediate office of the members. The Office of Information has a reduction of one from five to four. The Office of Community and Congressional Relations stays the same as the previous years, four in 1965. The Planning Office stays the same at four. The Office of the Secretary shows a reduction from 40 in 1964 to 36 in 1965, a total reduction of four in the Office of the Secretary. For the entire executive staff activities it makes a total reduction of five; is that right?

Mr. BOYD. Yes, sir.

Mr. SHIPLEY. I think everyone is acquainted with the duties and obligations and responsibilities of the members.

CONGRESSIONAL RELATIONS FUNCTION

How many cases has the congressional relations unit handled in 1964 or for a given year?

Mr. BOYD. We do not carry that work by cases, Mr. Shipley. We have more a continuing activity. The complaints about service to communities go immediately to this office. As far as I know, we do not set it up on a case basis. It is just a matter of a continuing function on the part of that office.

Mr. SHIPLEY. Where does their workload originate?

Mr. BOYD. The workload originates through complaints from communities primarily about the quality of service they are receiving. One of the best examples is set forth in the second paragraph under item No. 3. Oakland, Calif., had a brandnew airport and no air service. It filed inadequacy of service complaint with the Board. In an effort to eliminate all of the expense and time involved in a formal hearing, Colonel Dregge, head of this office, made any number of trips to Oakland, meeting with the Oakland officials, San Francisco Airport officials, a competitor, and airlines certificated to serve Oakland.

One of the things that evolved was an agreement to conduct a survey of where people came from to the San Francisco Airport to see how many Oakland passengers were involved in flying out of San Francisco.

As a result of that suvey and of his work, the airlines agreed to provide very considerably expanded services at Oakland. It has wound up now that the service is being provided at Oakland; Oakland is happy; San Francisco does not feel that it has been treated unfairly because this was all done with the knowledge of the San Francisco people, even though they lost frequencies; and the airlines are making a success out of it. This is one of our shining examples, I might say, but on a smaller scale this is what is done to a considerable extent.

OFFICE OF INFORMATION

Mr. SHIPLEY. How about your Office of Information? This Office serves as the primary channel for general inquiries from the public and the press prepares or reviews and coordinates proposed press releases and other information materials with Board officials. Tell us about this. Are you making a transfer there?

Mr. BOYD. Yes, sir. The three positions which are in the Bureau of Safety, dealing altogether with safety information, have been transferred into the Office of Information, so we have one Information Office now instead of two as we had in the past.

One of the primary functions of this Office, in addition to handling safety matters, is that unfortunately many of our orders are extremely complicated and technical orders. So what we try to do is prepare a press release saying, this is what we mean.

Mr. SHIPLEY. That is probably needed.

Mr. BOYD. It seems to be quite helpful.

PLANNING OFFICE—SUBSIDY REDUCTION

Mr. SHIPLEY. The Planning Office. The purpose of the Planning Office is to help the Board in strategic planning of major substantive policies and action programs. What was you major activity in the Planning Office?

Mr. BOYD. I guess the major program of last year was the airlines subsidy reduction program. Another major program has been the compact air transport. We have had the supersonic transport evaluation program now in which we are participating from the economic point of view.

We made a stab at drafting long-range goals. We had a very successful effort, which was handled under the Planning Office in cargo

cost finding so we could get some sort of a feel for what it cost to provide cargo services.

The carriers have worked with us, we have worked with the carriers, so that now we expect a revised formula to be used where everybody means the same thing when they say the same thing about their costs in providing cargo service.

AIR TRANSPORT PROMOTIONAL AND DISCOUNT PRICING

Mr. SHIPLEY. I see where there was a study begun in August 1962 to measure the traffic and revenue results of air transport promotional and discount pricing. How has that worked out?

Mr. BOYD. We had great hopes on that study. We were disappointed.

Mr. SHIPLEY. Are they not participating?

Mr. BOYD. The form that we have suggested to the carriers will be utilized, but the study itself did not give us the information we wanted. The only thing we really found for sure was the carriers did not have any substantial information themselves on whether their promotional fares were good or bad. There was a lot of hip-pocket operation.

That is why we devised this form in the hope that in the future when they put in a promotional fare, they will know and we will know whether it is a success or a failure.

OFFICE OF THE SECRETARY

Mr. SHIPLEY. The Office of the Secretary was reconstituted during the second quarter of fiscal 1964 by the transfer of the Public Information Section, with a staff of two persons, to the Office of the Executive Director and by the transfer of the Office of Secretary of the following components:

From the Office of Carrier Accounts and Statistics, the Reference and Control Unit, three positions——it tells us that you have transferred how many in total?

Mr. BOYD. That would be 26 in and 2 out, a net change of 24,

Mr. SHIPLEY. What were the grades of the 26 you transferred in and the 2 you transferred out?

Mr. BOYD. We can put that in the record.

(The information supplied follows:)

Office of the Secretary

Positions transferred to Office of the Secretary:	
GS–12	1
GS–11	1
GS–10	1
GS–9	3
GS–8	2
GS–7	5
GS–6	1
GS–5	7
GS–4	4
GS–3	1
Total	26

Positions transferred from Office of the Secretary:	
GS–15	1
GS–7	1
Total	2
Net increase	24

Mr. BOYD. These were primarily clerical personnel except the two we transferred out. I believe one is a grade 15 and one is a clerical position, I believe a GS–7. The bulk of the 26 transferred in are clerical.

Mr. THOMAS. May I inquire if you will be good enough to combine these 2 tabs here, executive staff with 77 people, which was a reduction of 5, with your other housekeeping activities known as administrative services, where you have 100. Out of 850 people, in round figures, you have 177 from that doing administrative duties. We will except the Board and its 30 employees. There are still 140 people taking care of 850. That is considerably out of line, gentlemen.

ADMINISTRATIVE SERVICES ACTIVITIES

Look at "Administrative services activities." We will put pages 110 and 111 in the record.

(The pages follow:)

ADMINISTRATIVE SERVICES ACTIVITIES

The Office of Administration performs the functions of this activity.

I. PURPOSE AND OBJECTIVES

To provide for the entire Board: (1) Overall general administration within the Board, including financial management, personnel, organization and procedures, internal administrative policies and regulations and other administrative activities; and (2) supplies and services, including procurement, mail and messenger, reproduction, central files, library and other general office services. In addition, to determine amounts due carriers on monthly billings for subsidy in accordance with applicable rate orders of the Board and at the close of each calendar year under the provisions of the local service class rate, and process carriers' capital gains reports.

Financial requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Permanent positions	107	106	100	−6
Average number of all employees	99.9	101.7	97.5	−4.2
Obligations:				
Personnel compensation and benefits	$707,724	$760,100	$760,400	$300
Other objects	93,066	113,200	114,700	1,500
Total	800,790	873,300	875,100	1,800

The increase of $300 for personnel compensation and benefits is the result of a decrease of six positions offset by the cost of within-grade salary advancements, and increased pay costs pursuant to Public Law 87–793.

Of the $1,500 increase in other objects, $1,300 is for duplicating supplies related to the increased workload projected for the Board, and $200 is for small increases in cost such as the increase in GSA telephone switchboard rates.

III. JUSTIFICATION OF STAFF REQUIREMENTS

As shown in the above table, a total of 107 positions were utilized during the fiscal year 1963 to perform the various functions comprising administrative services activities; 106 are estimated for 1964 and 100, a decrease of 6 compared with 1964, are requested for the fiscal year 1965. The level of work and distribution of staff (positions) are summarized by function in the

following tables and are explained in subsequent paragraphs covering each such functional area:

	1963		1964		1965		Position increase
	Number of work units	Positions	Number of work units	Positions	Number of work units	Positions	
Personnel	2,520	9	3,140	8.6	3,200	8.6	.....
Management analysis	224	8	248	9.4	241	8.4	−1
Budget and fiscal	21,326	15.7	21,489	15.7	21,483	15.7	.....
Carrier (subsidy) payments	334	7.3	358	7.3	361	6.3	−1
Publications and reproductions	16,273	22.0	18,212	21.0	19,215	21.0	.....
Administrative services	23,429	23.0	26,540	22.0	26,628	21.0	−1
Library services	58,503	4.0	56,552	4.0	59,494	4.0	.....
Central files	.....	14.0	.....	14.0	.....	11.0	−3
Other matters and overall direction	.....	4.0	.....	4.0	.....	4.0	.....
Total	.....	107.0	.....	106.0	.....	100.0	−6

ADMINISTRATIVE OVERHEAD

Mr. THOMAS. You have this for everything but Legal. You have a separate 40 or 50 for that. We have too many chiefs and not enough Indians here. Look at these people doing this housekeeping work. It is more than housekeeping, but it has to be a lot more. Excluding the 30 here doing the work in the Office of the Commissioners themselves, in round figures you have about 145 or 150 people taking care of how many, 850? In the field in your 9 or 10 offices you have another 40 or 50. You have located here in the District of Columbia 140 people taking care of 800. That is considerably high any way you look at it. Of course, we understand you are doing accounting service, bookkeeping.

Mr. BOYD. That is not involved in this.

Mr. THOMAS. That is what your justifications say on page 110. There is nothing new about it. We see it in every agency.

Mr. BOYD. If I may say so, if you will permit me, I will disagree wholeheartedly with you about what is set forth——

Mr. THOMAS. We respect you. You may say anything, although we may not agree.

Mr. BOYD. On page 94, the people involved here, 77 people are not involved in housekeeping in any sense at all.

Mr. THOMAS. Let us look at this. We will exclude the 30 in the Board. Here is the Planning Office with 4, the Office of the Secretary with 36. That is nothing but administrative work, getting out notices, what your hearing examiners did, what the Board did. We exclude your 30.

Mr. BOYD. Mr. Chairman, in the Office of the Secretary we have all of the docket section and indices section.

Mr. THOMAS. We understand that.

Mr. BOYD. We do not consider that housekeeping at all. We could set the examiners off in Los Angeles, and they would still have to have this for their business and for the lawyers and the Board and lawyers on the outside. The Planning Office is composed of four people who are completely involved in substantive work of the Civil Aeronautics Board.

Mr. THOMAS. What is the grade of those people? That is the brain trust section.

Mr. BOYD. One 17, two 16's, and a secretary.

Mr. THOMAS. We cannot complain about that.

Mr. BOYD. The Office of Information, you might consider that as a housekeeping function, I do not know.

Mr. THOMAS. You could not run your shop without the Secretary's Office notifying your customers of what has been done, what you expect to do, when you are going to do it.

Mr. BOYD. The Office of Community and Congressional Relations is to take care of requests by Members of Congress and to deal with——

Mr. THOMAS. We are not going to argue with you. We know what the activities are. We see it every day. You think it is all right. We think it is a little high. Gentlemen, are there any questions?

Mr. BOYD. Please do not leave out our Legal Section.

Mr. THOMAS. We were just combining. Mr. Shipley, will you please proceed with the Legal Section.

LEGAL STAFF ACTIVITIES

Mr. SHIPLEY. We will put in page 103, which describes the legal staff and their activities and the purposes and objectives, which are (reading):

To advise and assist the Board and members of the Board's staff in connection with all legal phases of economic and safety activities and perform specific functions in connection therewith, including responsibility for providing technical assistance in the preparation of Board opinions and orders in formal proceedings, the preparation of all Board regulations, the provision of necessary legal services in connection with accident investigations and Board participation in safety rulemaking proceedings and the handling of litigation matters. This work is essential in order that the Board and its staff will perform their responsibilities in conformity with the requirements of law, and, in the case of litigation, in order that Board actions will be defended and its interests represented in judicial proceedings.

The financial requirements for 1965 are $681,000, which is an increase of $15,400 over 1964. The increase of $14,200 is for personnel compensation. A $1,200 increase is for other objects, a thousand dollars of this is for travel expenses. For the most part, this is in connection with the projected increase in accident investigation hearings and deposition proceedings, and the remainder is for the small increases in costs such as the increase in GSA telephone switchboard rates.

(The page follows:)

LEGAL STAFF ACTIVITIES

The Office of General Counsel performs the function of this activity.

I. PURPOSE AND OBJECTIVES

To advise and assist the Board and members of the Board's staff in connection with all legal phases of economic and safety activities and perform specific functions in connection therewith, including responsibility for providing technical assistance in the preparation of Board opinions and orders in formal

proceedings, the preparation of all Board regulations, the provision of necessary legal services in connection with accident investigations and Board participation in safety rulemaking proceedings, and the handling of litigation matters. This work is essential in order that the Board and its staff will perform their responsibilities in conformity with the requirements of law, and, in the case of litigation, in order that Board actions will be defended and its interests represented in judicial proceedings.

The Office of General Counsel made substantial progress in 1963 toward meeting its two stated objectives of bringing its reports on legislative items up to a current basis and in significantly enlarging its output of procedural and other rules. During the fiscal years 1964 and 1965 the efforts of the Office are to be directed toward the elimination of backlogs in all areas of its work so that all items may thereafter be handled on a current basis. An increase in accident investigation counseling workload is programed in 1965 in accordance with the planned increase in accident investigation hearings and deposition proceedings.

Financial requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Permanent positions	60	60	58	−2
Average number of all employees	55.2	57.7	56.6	−1.1
Obligations:				
Personnel compensation and benefits	$585,677	$647,000	$661,200	$14,200
Other objects	$21,199	$18,600	$19,800	$1,200
Total	$606,876	$665,600	$681,000	$15,400

The increase of $14,200 for personnel compensation and benefits is the net result of eliminating two positions offset by the cost of within-grade salary advancements and increased pay costs pursuant to Public Law 87–793.

Of the $1,200 increase for other objects, $1,000 is for travel expenses, for the most part in connection with the projected increase in accident investigation hearings and deposition proceedings, and the remainder is for the small increases in costs such as the increase in GSA telephone switchboard rates.

LITIGATION ACTIVITIES

Mr. EVINS. What is the nature of your litigation? We know about opinion-writing and rulemaking. What is the nature of your litigation?

Mr. BOYD. Northeast Airlines case is one. The matter I alluded to this morning of the third carrier attempting to establish service in Hawaii. We are being sued by Pan American for disapproving an application that Pan American and Japan Airlines filed jointly with the Board, which we turned down. We just recently finished another suit that Pan American had filed against us.

Mr. EVINS. Do your lawyers have a good batting average? Do they win these cases for you?

Mr. BOYD. Yes, sir; we have a pretty high-class bunch of lawyers.

Mr. THOMAS. You do not have but seven people involved in litigation. Where is your litigation, in which courts?

Mr. BOYD. Either in the district court or the court of appeals.

Mr. THOMAS. Federal or State?

Mr. BOYD. All Federal.

Mr. THOMAS. What is the nature of the litigation you have in the Federal courts, in the district courts?

Mr. BOYD. I would like to ask Mr. Wanner. I am not sure of the different jurisdictions.

Mr. WANNER. Any final action of the Board is appealable to the circuit court of appeals.

NUMBER OF CASES IN CIRCUIT COURT

Mr. THOMAS. How many cases do you have in the circuit court or did you have in 1963?

Mr. WANNER. Roughly three-quarters of our cases are appeals.

Mr. THOMAS. How many cases in 1963?

Mr. WANNER. Around 35 cases per year.

Mr. THOMAS. How many appellate lawyers do you have?

Mr. WANNER. We have seven in that work which would be roughly four lawyers and three secretaries.

Mr. THOMAS. What is the nature of your suits in the district courts?

Mr. WANNER. Those would be either actions brought by the Board to attempt to bring an injunction proceeding or action——

NUMBER OF LAWYERS AND WORKLOAD

Mr. THOMAS. Where are your green sheets on your legal staff? How many lawyers do you have?

Mr. BOYD. Page 20.

Mr. THOMAS. Judge, your worksheet over on page 104 might be inserted in the record.

(The page follows:)

JUSTIFICATION OF STAFF REQUIREMENTS—LEGAL STAFF

A total of 60 positions were utilized during the fiscal year 1963 to perform the various functions comprising the work of the legal staff activities; 60 are estimated for 1964 and 58, a reduction of 2, for 1965. The functions performed include (1) opinion writing; (2) legal research and assistance; (3) rules, regulations, and policy; (4) litigation; (5) legislation; and (6) special projects and overall direction. The situation with respect to each of these functions is set forth in paragraphs which follow:

	1963		1964		1965		Position increase
	Number of work units	Positions	Number of work units	Positions	Number of work units	Positions	
Opinion writing	148	20	153	20	155	19	−1
Legal research and assistance	323	16	325	16	328	15	−1
Rules, regulations, and policy	123	8	115	8	122	8	
Litigation	26	7	40	7	35	7	
Legislation	104	4	101	4	111	4

LEGAL RESEARCH

Mr. THOMAS. Here is your breakdown. Opinion writing, legal research. What are you researching and when do you get through with the research?

Mr. BOYD. I do not think we ever get through with that. The justification for that is set forth on 105.

Mr. THOMAS. I am looking at it. It seems we are a little topheavy here.

Mr. BOYD. No, sir.

Mr. THOMAS. Legal research involves performance of legal research and the rendering of opinions thereon in relation to legal problems of unusual difficulty or importance. You are making a distinction from your day-to-day inquiries involving points of law from Members of Congress and from the general public from research? We always get supsicious of all these fancy words. What does it all mean? How many lawyers out of the 60 people do you have and how many stenographers, and so forth?

Mr. WANNER. About 40 lawyers and 20 secretaries, about 2 to 1.

LAWYERS APPEARING BEFORE TRIAL EXAMINERS

Mr. THOMAS. In an agency your size, what do you do with 40 lawyers? How many of them appear before your trial examiners, how many trial lawyers that go before the trial examiners?

Mr. WANNER. None of the lawyers in this unit would appear before the trial examiners.

Mr. THOMAS. Where are the lawyers that appear before your trial examiners?

Mr. WANNER. They are in the Bureau of Economic Regulations.

Mr. THOMAS. How many do we have there?

Mr. WANNER. And in the Enforcement office?

Mr. BOYD. There are 30 trial lawyers in the Bureau of Economic Regulation.

Mr. THOMAS. Any in rates and fares?

Mr. BOYD. That covers the entire economic area except for enforcement. That is rates, routes, and fares.

Mr. THOMAS. How many do you have in Enforcement?

Mr. BOYD. We have 10 lawyers in Enforcement.

Mr. THOMAS. Thirty, forty, and forty. How many is that?

Mr. BOYD. Eighty lawyers.

Mr. THOMAS. Eighty lawyers? That is about 50 too many. Mr. Shipley, you go ahead.

Mr. SHIPLEY. We covered "Rules and regulations and policies." You covered "Litigation," Mr. Chairman. How about "Legislation" on page 107?

Mr. THOMAS. We know what that is.

Mr. SHIPLEY. We shall put pages 105, 106, and 107 in the record.

(The pages follow:)

LEGAL RESEARCH AND ASSISTANCE

Involves performance of legal research and the rendering of opinions thereon in relation to legal problems of unusual difficulty or importance; providing legal and related policy advice to the Board, its staff, and the public, including specialized expertise in legal problems related to route, rate, intercarrier and intercorporate relationships, labor, international, accident investigation, and Federal-State relations matters. The workload and staff requirements for this function are summarized below:

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Workload:				
Research projects completed	230	220	220	----------
Accident investigation counseling	93	105	108	3
Special legal counseling activities (the nature of this work is such that no feasible means has been found to measure it in terms of work units).				
Position requirements:				
Attorneys	11	11	10	−1
Secretarial and clerical	5	5	5	----------
Total	16	16	15	−1

The volume of research projects and special legal counseling activities is expected to remain fairly stable. However, an increase is anticipated in accident investigation counseling, particularly in view of the large number of recent tort actions filed against the United States, with increasing demands upon the time of the staff in dealing with requests for testimony and the planned increase in the number of accident investigation hearings and deposition proceedings. It is anticipated that the work can be kept current in these overall fields through the more efficient use of manpower and allow a reduction of one position in 1965.

RULES, REGULATIONS, AND POLICY

Involves the preparation, review, and coordination of Board regulations and policy statements and participation in safety rulemaking proceedings. The workload and staff requirements for this function are summarized below:

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Workload:				
Completed during year: Economic, procedural, and special regulations and policy statements:				
Amendments and additions	95	82	90	+8
Notices of rulemaking	25	30	29	−1
FAA safety rulemaking proceedings	3	3	3	----------
Total completed	123	115	122	+7
Received during year	115	109	117	+8
Uncompleted work on hand at end of year	38	32	27	−5
Position requirements:				
Attorneys	5	5	5	----------
Secretarial, typing, and clerical	3	3	3	----------
Total	8	8	8	----------

The Board's program of procedural reform, the increased statutory responsibility with respect to supplemental air carriers and civil penalties, and a program for reduction of rulemaking backlog resulted in a substantial increase in rulemaking projects in 1963. Some reduction in the workload is expected for 1964 but thereafter the continuing growth of the air transportation system is expected to increase the volume of work of this function.

LITIGATION

Involves defense of Board orders and actions in the courts, including the drafting of all necessary documents and arguing of cases. The workload and staff requirements for this function are summarized below:

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Appeals from Board orders and related litigation:				
Number of cases received	33	36	36	
Carryover from preceding year	14	21	17	−4
Total worked on	47	57	53	−4
Cases concluded	26	40	35	−5
Uncompleted work on hand at end of year	21	17	18	
Position requirements:				
Attorneys	5	5	5	
Secretarial, typing, and clerical	2	2	2	
Total	7	7	7	

The number of litigation cases received is expected to increase slightly in 1964 and continue at that level in 1965. No increase in staff is requested.

LEGISLATION

Involves preparation of the Board's legislative program and comments and testimony on legislation. The workload and staff requirements for this function are summarized below:

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Workload:				
Reports completed on pending legislation	87	80	90	+10
Legislative drafting	12	10	10	
Preparation of testimony	5	11	11	
Total completed	104	101	111	+10
Uncompleted work on hand at end of year	36	44	35	−9
Position requirements:				
Attorneys	2	2	2	
Secretarial, typing, and clerical	2	2	2	
Total	4	4	4	

In addition to the workload shown above, staff assigned to this function provide a substantial amount of assistance in appearances before congressional committees and committee staffs. It is anticipated that the workload will remain fairly stable, and no changes in staff for this function are anticipated.

OVERALL DIRECTION

The provision of guidance and direction for the operating divisions of the Office; the rendition of legal and related policy advice to the Board, its staff and the pub-

lic; and the exercise of control over the operating divisions from the standpoint of all necessary coordination, supervision, review, and administration; the rendition of staff decision on legal problems that involve the most complex, novel, and significant matters, are accomplished by the immediate Office of the General Counsel. The staff requirements for this function follow:

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Position requirements:				
Attorneys (General Counsel and Deputy General Counsel)	2	2	2	
Secretarial, typing and clerical	3	3	3	
Total	5	5	5	

OTHER OBJECTS OF EXPENSES

Mr. EVINS. Other objects, transportation of persons, is up $31,000 from $673,000 to $705,000. Transportation of things is up $20,000, $22,000. Two items stay the same but you have no decreases. Communications are up $28,000. Mr. Chairman, why the $28,000 increase for rents?

Mr. BOYD. That is the memory unit primarily. We rent those, Mr. Evins.

OTHER SERVICES

Mr. EVINS. Other services up $55,000. What are these other services?

This is page 120.

Mr. BOYD. Repair of office machines and other equipment; this appears at the bottom of page 122: Repair and maintenance of office space, rental cars space, cars rented from GSA motor pool, health room services, security investigations for personnel having access to classified material.

Mr. EVINS. It was $189,000 last year. Do you have to have more this year?

Mr. BOYD. Analysis and checking of aircraft parts, including teardown, salvage accident wreckage, reporting, other expenses incurred in relation to aircraft accidents, tuition, related fees—yes, sir; I think we do.

BUDGET FORMULATION

Mr. EVINS. Who makes up this budget for these items, Mr. Chairman?

Mr. BOYD. The budget is made up in the first instance by the Bureau. It then goes to the Office of Administration, Mr. Russell; it then goes to the Executive Director. It then comes to me. It then goes to the Board.

Mr. EVINS. During this process are there any reductions from what the original bureau chief suggested he have for the next year?

Mr. BOYD. Tremendous; yes, sir.

Mr. EVINS. You show no reductions and only two items are the same.

Don't you think you can make a few reductions in other objects?

Mr. BOYD. All I can say, Mr. Evins, we gave this our best effort and this is where we came out.

Mr. EVINS. We will place in the record pages 120 through 122.

(The pages follow:)

OTHER OBJECTS

This statement covers all requirements of the Board for other objects (expenses other than personnel compensation and benefits). The estimates for most object classifications reflect increases over 1964 and are related to the program and staff increases (12 new positions in the "Safety" activity) and decreases (26 positions in other activities of the Board) set forth in the justification statements covering the several budgetary activities.

The following statements show the actual obligations incurred for the fiscal year 1963; estimates for the fiscal years 1964 and 1965; and the increase for 1965 over 1964—by object class and by budgetary activity:

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
BY OBJECT CLASS				
21 Travel and transportation of persons	$554,697	$673,500	$705,200	$31,700
22 Transportation of things	12,752	20,900	22,200	1,300
23 Rents, communications and utilities	271,296	289,900	318,100	28,200
24 Printing and reproduction	89,125	88,600	88,600	----------
25 Other services	148,160	189,400	244,400	55,000
26 Supplies and materials	101,845	102,500	108,800	6,300
31 Equipment	49,426	58,000	63,600	5,600
42 Insurance claims and indemnities	1,315	1,500	1,500	----------
Total	1,228,616	1,424,300	1,552,400	128,100
BY ACTIVITY				
1. Economic regulation:				
(a) Operating authorities and practices	49,258	57,200	62,600	5,400
(b) Rates and fares	33,132	35,800	39,200	3,400
(c) International aviation agreements	14,807	19,100	25,400	6,300
(d) Economic enforcement	47,623	45,300	47,600	2,300
(e) Hearing activities	39,611	37,500	40,000	2,500
(f) Accounting regulations and audits	312,425	333,900	355,000	21,100
(g) Statistical and research	21,029	23,400	24,300	900
Total	517,885	552,200	594,100	41,900
2. Safety activities	517,068	653,300	736,700	83,400
3. Board adjudication, executive and legal staff activities:				
(a) Executive staff activities	79,398	87,000	87,100	100
(b) Legal staff activities	21,199	18,600	19,800	1,200
Total	100,597	105,600	106,900	1,300
4. Administrative services activities	93,066	113,200	114,700	1,500
Total, all activities	1,228,616	1,424,300	1,552,400	128,100

TRAVEL

The $705,200 requested for 1965 is an increase of $31,700 over the $673,500 available in 1964.

These funds requested are for travel expenses incurred in conducting route and rate hearings in the field, class subsidy rate matters, participating in negotiations and consultations as members of U.S. delegations outside of the United States, auditing the carriers records at the site of operations, conducting accident investigations and hearings, investigation and enforcement of the Board's rules and regulations, participating in court cases, attending training courses, necessary transfers of employees and their dependents for the benefit of the Government, and performing emergency preparedness functions.

The increase requested in 1965 is for:

	Increase
1. For participation in route proceedings in the field	$5,000
2. Travel expenses (including rental of aircraft) in connection with 10 new technical positions requested in 1965 for accident investigation activities and increased number of public hearings	11,700
3. Travel expenses in connection with the field audit of air carrier accounts and records	4,000
4. Travel expenses in connection with class subsidy rate matters and conferences on IATA matters	3,000
5. Travel expenses in connection with negotiations and consultations in the International Aviation Agreement activity	6,000
6. For increased investigation workload in the economic enforcement field	2,000
Total increase	31,700

TRANSPORTATION OF THINGS

The $22,200 requested for 1965 is an increase of $1,300 over the $20,900 available in 1964. The increase is for transportation of household effects of employees assigned to field offices.

RENTS, COMMUNICATIONS, AND UTILITIES

The $318,100 requested for 1965 is an increase of $28,200 over the $289,900 programed for 1964. Under this heading is included rent and utility costs incurred for office space and utilities for field offices, the cost of renting office machines, tabulating machines, and electronic computer equipment, rental of warehouses for aircraft wreckage mockups and space for holding hearings in connection with the investigation of aircraft accidents, local telephone service, toll calls, penalty mail, postage, telegraph charges, rental of post office boxes, and teletypewriter charges. The increase requested is for:

	Increase
1. Provision of essential communication facilities and service, including the increase in GSA telephone switchboard rates	$7,400
2. Rental of an additional memory unit for the electronic computer	13,000
3. Increase in rental of warehouses, hearing rooms, and public address systems in connection with investigation of accidents and increase in number of public hearings	7,800
Total increase	28,200

COST OF COMPUTER SYSTEM

Mr. THOMAS. Inquire how much rent they are paying on the computer, what kind of contract they have on it and whether they can buy it.

Mr. EVINS. How many computers do you have, how much is the cost, how much rent do you pay, how much annual repair are you charged?

Are you able to reduce any personnel by reason of the purchase of the computers?

Mr. BOYD. I think that is where some of the savings are coming from.

Mr. EVINS. Can you show us some for the record?

Mr. BOYD. On the computer, we have got one computer system, which is called a 1401 and the rental on that is $89,020 for 1964 and $102,020 for 1965.

Mr. EVINS. Do these charges progressively go up each year?

Mr. BOYD. No. These charges as I understand it are standard. I do not know the answer to your question as to maintenance.

Mr. THOMAS. That is an additional unit?

Mr. BOYD. Yes, sir.

Mr. THOMAS. How many units do you have?

That is an additional unit?

Mr. BOYD. That is an additional memory unit. This system is made up of a variety of things, Mr. Chairman. I will take just a minute. There is one E–4 processing unit, one card reader punch.

Mr. THOMAS. Are they all separate units or are there different gadgets in one of these things?

Mr. BOYD. They are different components of a system. This is the way they are charged to us.

PURCHASE OF COMPUTER

Mr. THOMAS. Are you planning to buy it? What can you buy it for?

Mr. BOYD. They can be bought.

Mr. THOMAS. If you have the machine that does your work, of course you have to be sure you have the right machine; if not, you will have a white elephant. The minute you are sure you have the machine that serves your purpose you had better buy it. You will save money. What can you pay for the machine?

Mr. BOYD. $250,000.

Mr. THOMAS. You can pay for it in 2½ years, does it do your job?

Mr. BOYD. Mr. Hord is what we have what we want, and if it is, why don't we buy it?

Mr. HORD. It is almost obsolete now, the one we have.

Mr. THOMAS. How long have you had it?

Mr. HORD. A year and a half.

Mr. THOMAS. Obviously that is not the one you want to buy, then.

Mr. BOYD. Of course, the rent——

Mr. THOMAS. When you get back you and your Board ought to take another look at this and familiarize yourself with the details of it and see whether you should get rid of it or buy it.

Obviously you should not buy this one. Our distinguished friend says it is obsolete now. These things can run into money. Some of the agencies have had their unpleasant experiences with them. Like he says, they become obsolete before they know it. Some of them purchased and now they have a white elephant on their hands. Familiarize yourself with the details.

Mr. BOYD. We will do that. Mr. Driscoll tells me we have a study going on now to see what would be the best.

Mr. EVINS. Are there further questions on other objects? If not, there is one other tab, "Payments to carriers."

Mr. THOMAS. I think Mr. Shipley has been familiarizing himself with that. Would you work that out for us, Mr. Shipley? You are quite familiar with the details of it.

Payments to Air Carriers

Program and financing

[In thousands of dollars]

	1963 actual	1964 estimate	1965 estimate
Program by activities:			
1. Domestic operations		2,800	3,700
2. Local service operations	68,975	68,421	67,824
3. Helicopter operations	5,379	4,300	3,000
4. Alaskan operations	8,030	10,792	8,614
5. Hawaiian operations	355	1,343	886
Total program costs funded—obligations (object class 41)	82,740	87,656	84,024
Financing: New obligational authority (contract authorization (72 Stat. 731))	82,740	87,656	84,024

Status of unfunded contract authorization

[In thousands of dollars]

	1963 actual	1964 estimate	1965 estimate
Unfunded balance brought forward	6,287	5,166	8,536

Mr. Shipley. Mr. Reporter, put in the record pages 125 through 133, inclusive.

(The pages follow:)

Payments to Air Carriers, Budget Year 1965

Summary of requirements

[In thousands]

Appropriation, 1964	$79,000
Add:	
Unexpended balance brought forward June prior year (1963)	1,478
Estimated supplemental	5,000
Total requirements, 1964	85,478
Net payments, 1964	85,478
Base for 1965	0

REQUIREMENTS FOR 1965

By activity:	
Domestic trunklines	3,700
Local service operations	68,297
Helicopter operations	3,108
Alaskan operations	8,665
Hawaiian operations	886
International operations	−1,832
Net payments, 1965	82,824
Total estimate of appropriation, 1965	82,824

Summary of estimated obligations and payments

[In thousands]

	Actual, 1963	Estimate, 1964	Estimate, 1965
Estimated subsidy accrual (amount to be due carriers under final mail rates for carrier operations during the year)	$84,179	$85,011	$83,200
Deduct that part of the above subsidy accrual which is not expected to be covered by mail rates until later years	−2,035	0	0
Subtotal, obligations for carrier operations during the year	82,144	85,011	83,200
Obligations for carrier operations in prior years	595	2,645	824
Gross obligations	82,739	87,656	84,024
Reduction of amounts obligated in prior years	−996	−286	−1,832
Total (net) obligations	81,743	87,370	82,192
Unliquidated obligations:			
Brought forward from prior years	6,880	6,845	8,536
Carried forward at end of year	−6,845	−8,536	−7,904
Uncollected refunds:			
Brought forward from prior years	−122	−201	0
Carried forward at end of year	207	0	0
Net payments	81,857	85,478	82,824

JUSTIFICATION

It is estimated that subsidy will be required in fiscal 1965 for the following categories of services: (1) domestic trunkline operations; (2) local service operations; (3) helicopter operations; (4) Alaskan operations; and (5) Hawaiian operations, with approximately 82 percent of the total required to support local service to the relatively smaller communities in the continental United States.

Subsidy payments are estimated to total $85,478,000 during the fiscal year 1964 and $82,824,000 in 1965, a decrease of $2,654,000. However, the $85,478,000 for 1964 is $6,478,000 more than the $79 million appropriated for 1964. Therefore, after reflecting cash brought forward from the prior year in the amount of $1,478,000, a supplemental appropriation for 1964 is projected in these estimates in the amount of $5 million. The supplemental appropriation will be required to pay the carriers' subsidy bills as they become due. This is a no-year appropriation for "liquidation of contract authorization."

The payment estimates are based on estimated subsidy accruals, with the relationship of "Subsidy accrual" to "Payments" for the fiscal years 1963, 1964, and 1965 shown in the following table:

[In thousands]

	1963 actual	1964 estimate	1965 estimate
Subsidy accrual: Estimated amount to be due carriers under final subsidy rates for carrier operations during the year	$84,179	$85,011	$83,200
Add: Unpaid subsidy accrual for prior year (brought forward)	5,673	7,995	7,528
Deduct: Unpaid subsidy accrual at end of year (carried forward)	−7,995	−7,528	−7,904
Subsidy payments: Estimated amount which will require payment during the year	81,857	85,478	82,824

As shown above, the total amount of subsidy payments in any fiscal year is not in direct proportion to the estimated subsidy accruing to the carriers during that fiscal year. This is further illustrated in the following table which shows

the breakdown of total payments during the fiscal years 1963, 1964, and 1965, to the fiscal year of carrier operations:

[In thousands]

	Actual, 1963	Estimate, 1964	Estimate, 1965
Fiscal year of carrier operations:			
1960 and prior years	—$271	—$156	—$1,477
1961	46	407	469
1962	6,898	—243	0
1963	75,184	8,995	0
1964		76,475	7,156
1965			76,676
Total	81,857	85,478	82,824

It is the subsidy accrual figures—relating, as they do, the subsidy to the year in which the service is rendered—which provide the most accurate indicator of the level of subsidy. The following table shows by carrier group the Board's latest estimates of subsidy accruing to the air carriers for operations conducted by the carriers during each of the fiscal years 1954 through 1965.

[Amounts shown in thousands]

Fiscal year	Total	Carrier group					
		Domestic trunk-lines	Local service operations	Helicopter operations	Alaskan operations	Hawaiian operations	International operations
1954	$41,079	$3,316	$18,389	$1,965	$5,454	$497	$11,458
1955	39,790	2,825	22,358	2,656	6,530	293	[1] 5,128
1956	43,217	1,820	24,120	2,735	6,283	291	[1] 7,968
1957	48,626	1,585	28,444	3,771	6,248	216	[1] 8,362
1958	52,539	2,282	32,703	4,419	6,676	45	[1] 6,414
1959	50,016	1,201	36,451	4,866	7,336	168	
1960	65,737		51,808	4,930	8,669	330	
1961	72,735		57,420	5,538	9,272	505	
1962	80,877		65,725	5,780	9,034	338	
1963	84,179		69,192	5,000	9,467	520	
1964	85,011	2,800	67,800	4,300	9,225	886	
1965	83,200	3,700	67,000	3,000	8,614	886	

[1] Includes $1,371, $1,336, $1,459, and $1,503 for fiscal years 1955 through 1958, respectively, for the Alaskan operations of Pan American.

Determination of subsidy

Once a carrier has been certificated for carriage of mail, provision of mail pay, including subsidy in those situations where the carrier demonstrates a statutory need for subsidy, is provided for by the act for the duration of the carrier's operations under its certificate. The policy of the Board has been to establish a subsidy rate, where required, in an amount sufficient to cover the carrier's operating loss incurred under honest, economical, and efficient management and provide it an opportunity to earn a fair return (after taxes) on the investment used and useful in the carrier's air transportation services.

Neither the act nor the Board guarantees that each carrier will earn a profit at the above levels, but the rates are established so as to provide reasonable opportunity to do so under conditions of honest, economical, and efficient management. In other words, the Board has adhered to the public utility rate regulatory pattern, under which losses incurred by carriers in past years while on closed rates cannot be made up with subsidy in fixing future rates; and at the same time, rates, once established, remain final and closed until reopened. The Board has the power under the act to reopen rates prospectively on its own initiative. Pursuant to this power, the Board maintains a continuing review of all established mail rates, and has reopened numerous rates, including those of self-sufficient as well as subsidy carriers. In this manner, the Government ultimately reaps the benefit, through decreased mail pay-

ments, of the economies effected by the carriers—economies which management has maximum incentive to develop because, while operating under a closed rate, the carrier bears the risk of losses but at the same time has the benefit of bettered earnings resulting from improvements in operations.

Th total of the subsidy in any given case depends upon the volume of service and extent to which the revenues of the carrier from all commercial sources (including the service mail payments from the Postmaster General) fail to meet its prudently incurred costs. In establishing rates since 1938, the Board has developed ratemaking principles of general applicability to implement the mandate of section 406(b) of the act that only those losses which are incurred under "honest, economical, and efficient management" shall be underwritten with subsidy. Therefore, the basic determinations in subsidy rate cases involve (1) reasonableness of capacity operated; (2) reasonableness of costs; (3) the proper investment base to be recognized for rate purposes and the related fair return; and (4) the amount of revenue to be recognized for rate purposes.

While the Board has no power to limit the number of schedules operated by a certificated air carrier, it can and does refuse to provide subsidy for schedules instituted by management which, from a business standpoint, do not appear to carry any hope of being profitable or are otherwise not justified. The Board has, in many instances, decreased the subsidy which would otherwise be required by refusing to underwrite nonproductive operations over various segments of a carrier's routes. As indicated previously, the Board has adopted standards in this area, among others, as guidelines to the carriers in planning their volume of service.

One important technique employed in determining the reasonableness of costs is comparison of the expenses of any given carrier with those of like carriers. Where one carrier's costs exceed those of comparable carriers, the excess will not be recognized by the Board unless there may be circumstances which clearly justify doing so. Apart from costs not allowed as the result of application of the comparative technique, various other expenses are not allowed based upon differing considerations. For example, it is the firm rule of the Board that expenses in the nature of charitable contributions, costs of entertainment, or excessive salaries will not be underwritten with subsidy.

In determining the recognizable amount of revenues, all sources thereof are scrutinized. In the case of profits earned by the carriers for services performed in military airlift operations, for example, the amount of such profit has been accounted for in determining the subsidy required by such carriers. Net revenues from other types of transactions, such as charters, are similarly considered in determining a carrier's subsidy requirement.

Consistent with the above policies and principles, as regards the local service carriers, a subsidy class rate is in effect, which by its own terms, automatically adjusts the subsidy payments with changes in the character of a carrier's operations. In addition, the class rate contains a profit-sharing clause whereby the carrier shares with the Government profits earned in excess of a specified rate of return on graduated bases.

The procedures of the Board provide for a continuous review, on as extensive a basis as its resources will permit, of the overall situation with respect to the subsidized carriers. Their operations are reviewed to determine whether particular services have become so costly as to require elimination completely or whether the carrier's route structure should be modified in such manner as to decrease its dependence upon the Government for subsidy.

It is also the Board's policy to maintain a continuing review of the financial results of each carrier operating under a final rate, so as to permit reduction of the rate itself where a decreasing requirement is indicated.

Subsidy by carrier group

A. Domestic trunkline.—Subsidy of $3,700,000 is projected in this area for fiscal 1965. This represents the support required to sustain the New England services of Northeast Airlines, Inc. The $3,700,000 represents the final subsidy rate established by the Board for Northeast on October 4, 1963, in conjunction with its decision not to renew the services of that carrier south of New York. The $3,700,000 is solely for the New England regional services and accordingly all other domestic trunklines are expected to continue to be subsidy free, a status which they have generally occupied since the early 1950's. In this connection, one domestic trunkline (Eastern Airlines) has a formal petition pend-

ing in which it claims substantial subsidy from July 9, 1962, forward. It is considered inappropriate and premature at this time to budget subsidy related to this petition, since the timing of its disposition and the outcome of the matter is conjectural.

B. Local service operations.—Subsidy for the 13 local service carriers is currently estimated at $67 million, or about 1 percent less than the $67,800,000 now estimated for fiscal 1964, subject to the qualifications noted below. For fiscal 1964, the Board originally projected subsidy aggregating $66,192,000 which would have been $3 million less than the $69,192,000 forecast and, in fact, experienced for fiscal 1963. The $66,192,000 figure for 1964 did not include the impact of the routes activated by Trans-Texas in the fall of 1963, pursuant to the Board's decision in the *Southwest Local Service Area* case; and these awards will increase the subsidy in the net amount of $1,121,000 annually, or approximately $800,000 in fiscal 1964. In addition, on the basis of current data, it does not appear that the amount of subsidy previously estimated to be recaptured through the profit-sharing provisions of the local service class subsidy rate formula will eventuate. After reflecting these factors and subject to other considerations adverted to hereinafter, it currently appears that the subsidy accrual for the local service industry for fiscal 1964 should be $67,800,000.

The 1965 estimate of $67 million includes a full year of operation of the routes newly awarded to Trans-Texas. Excluding this factor, the 1965 estimate is some $1 million less than that for fiscal 1964. The 1965 estimate is tentative at this time in that: (1) it is based upon existing policies of the Board and does not reflect any increases or decreases that would stem from the implementation of the programs set forth in the Board's June 1963 report to the President, since the status of such programs has not been determined finally at this time; and (2) while the Board and its staff are currently reappraising and reassessing the economic needs of the 13 local service carriers for the purpose of establishing a new final class subsidy rate during 1964, the outcome of the subsidy proceedings in which the revised rate is to be established will not be known until a subsequent period of time. These two factors render the $67 million estimate a tentative one, subject to revision upward or downward to accord with further developments in these two areas.

C. Helicopter operations.—Consistent with the limitation in the subsidy appropriation language for fiscal 1964, subsidy for the three helicopter operators serving the Chicago, Los Angeles, and New York metropolitan areas is budgeted at $4,300,000 for 1964. A total of $3 million is requested for fiscal 1965. These figures are approximately $1.5 million and $2.8 million less than the $5,775,000 requested by the Board for 1964 for helicopter services.

The Board's request anticipated a bulge in subsidy for fiscal 1964, since that would represent the first full year of experimentation and operation of new turbine-powered equipment by both Los Angeles and New York. It also reflected the expectation that as the turbine aircraft, which hold out the promise of more economical operations due to increased reliability of performance and decreased seat-mile costs, become fully integrated the subsidy need of each of the two carriers would decline substantially in 1965 and subsequent periods.

The three helicopter carriers have been operating under temporary rates since July 1, 1963. The Board's staff is currently exploring with the carriers, on an informal basis, the scope and character of operations which may be possible at a total subsidy cost not in excess of $4,300,000 as specified in the 1964 Appropriation Act.

D. Alaskan carriers.—Seven carriers are currently eligible for subsidy for services provided solely within the State of Alaska, of which six currently require subsidy. Four carriers provide services between the Pacific Northwest and the State of Alaska, of which two currently require subsidy, and these two also provide some amount of intra-Alaska services.

The level of subsidy estimated for all Alaskan services shows a favorable trend from the 1963 level of $9,467,000 to $9,225,000 estimated for 1964 and $8,614,000 for 1965. This decline is anticipated essentially as the result of the significant upward trend in mail volume, based upon Post Office Department estimates, since increased payments for mail services serve to reduce the carriers' subsidy need in substantially the same manner as any other source of commercial revenue. However, the actual subsidy for both 1964 and 1965 may prove to be significantly higher, depending upon current and future developments in requirements of the two subsidized carriers providing service between the Pacific Northwest and the State of Alaska. As regards these services,

the Board has been convinced for a considerable period of time that the particular markets involved cannot economically support four carrier services—the two subsidized and the two nonsubsidized. The Board had, in earlier years, commenced proceedings looking toward an economical amalgamation or combination of the services in this area, which proceedings were terminated as the result of congressional action. Recognizing that, with the advent of the large jet aircraft currently operated by all four carriers in the States-Alaska market, the situation would worsen, the Board met with all four carriers in the hope that it could thereby encourage a consolidation of services with a consequent reduction in subsidy. Its efforts having failed, the Board then instituted a formal investigation for the same basic purposes, which was halted in 1962 by adversary court proceedings. The Board, nevertheless, is pressing forward with its investigation, within legal limits, and formal hearings are currently being held in that proceeding. As indicated in the Board's subsidy appropriation presentation last year, while the Board continues to seek other avenues for tailoring the subsidy in this area, in the absence of successful conclusion of the formal investigation referred to above—or some voluntary consolidation by the carriers—there is no reasonable prospect that the subsidy, from an economic standpoint, can be stabilized or substantially reduced.

E. Hawaiian carriers.—The two carriers serving the State of Hawaii are estimated to require the same amount of subsidy in fiscal 1965 as currently estimated for 1964—$886,000 each year. These estimates assume that third carrier services, authorized by the State public utilities commission in 1963 but enjoined by the Federal District Court of Hawaii in mid-1963, will not be reinstituted, and that the carriers' use of four-engined equipment for expanded traffic needs will have a beneficial effect on their operating requirements.

F. General.—No subsidy is budgeted for any U.S. air carrier providing international services, although Panagra and Braniff have formal subsidy claims pending involving substantial amounts of subsidy for these areas. The status of these cases is such that it is considered premature in terms of cash requirements to budget subsidy for either of these two carriers for fiscal 1964 or 1965.

SUBSIDY PAYMENTS AND AWARDS

Mr. SHIPLEY. It shows on page 125 that the net payment from 1965 is $82,824,000 and on page 126 it has a breakdown or a summary of estimated obligations and payments, which gives the actual and estimate for 1964 and 1965, which shows the net payments will be $82,824,000 in comparison with $85,478,000 in 1964.

Mr. Chairman, would you take one moment on page 127, where it shows the estimate for 1964 and 1965, on the subsidy accrual, where you add an unpaid subsidy accrual for a prior year? Would you go into that for a moment?

Mr. BOYD. Yes, sir. I will try to. I think that the second paragraph on page 127 will cover that fairly well. [Reading:]

Subsidy payments are estimated to total $85,478,000 during the fiscal year 1964 and $82,824,000 in 1965, a decrease of $2,654,000. However, the $85,478,000 for 1964 is $6,478,000 more than the $79 million appropriated for 1964. Therefore, after reflecting cash brought forward from the prior year in the amount of $1,478,000, a supplemental appropriation for 1964 is projected in these estimates in the amount of $5 million. The supplemental appropriation will be required to pay the carriers' subsidy bills as they become due.

That is what you call a no-year appropriation?

Mr. BOYD. Yes, sir.

Mr. THOMAS. In other words, we missed our guess by about how much? What did we miss it by the year preceding?

Mr. BOYD. The year before——

Mr. EVINS. About $4 million.

Mr. BOYD. About 3½.

Mr. THOMAS. But that was in the form of what; plus rather than minus?

Mr. BOYD. I am not sure that I follow you. You mean we were up.

Mr. THOMAS. Yes.

Mr. BOYD. I think we are always up. We seem to be.

Mr. THOMAS. That is what it is, that is correct. We worked it out this morning.

SUBSIDY FOR NORTHEAST AIRLINES

Mr. SHIPLEY. On page 130, subsidy by carrier group, it shows domestic trunk lines subsidy of $3,700,000 is projected in this area for fiscal year 1965. This represents the support required to sustain the New England services of Northeast Airlines, Inc. The $3,700,000 represents the final subsidy rate established by the Board for Northeast Airlines on October 4, 1963, in conjunction with the previous decision.

Are there any questions?

PASSENGER VOLUME REPORTED

Mr. EVINS. Mr. Chairman I think we talked once before about going behind the numbers of passengers as reported to be enplaned at a particular station. Do you just take any figures that the local people certify to you? Do you go behind them? Do you look into these figures and determine who is riding and what groups and classes of people are there, whether they are carrying schoolchildren into the next town, giving them a free ride, with rotary clubs sponsoring the trips so they can build up their percentage of enplanements? Do you have any system or method, or do you have any intention of going behind and checking the types of enplanement?

Mr. BOYD. We have the ticket list available to examine but that does not give us anything as to who the people are and we have, so far as I know, always taken the position that the motive of a traveler was none of our business. There have been criticisms of providing air service to Las Vegas because people go there to gamble.

Mr. THOMAS. He did not ask you that. He asked if you checked to see whether they got a free ride.

Mr. BOYD. Yes, sir. We check to see that the cash represents the ticket sales. It is against the law to give free rides.

Mr. EVINS. I did not ask particularly about motives. I was asking whether or not you checked whether they were free rides or whether they were promotional deals underway.

Mr. BOYD. We know about the promotional deals because those are tariffs filed with the Board, but they apply to everybody.

Mr. EVINS. The rotary club raises $500 and gives the children a free ride to the next town for their first or second airplane ride.

Mr. BOYD. We figure that is none of our business. As long as the airline is being paid the tariff rate for the people who travel in cash that is the extent of our interest.

Mr. EVINS. My question is you just take all figures for granted and do not go behind them?

Mr. BOYD. That is right, sir.

Mr. MURPHY. I would like to have your view. What do you think we should be doing about that situtation?

Mr. EVINS. I am asking the Board what they do; what are their practices?

Mr. BOYD. I think we have operated on the theory that as long as the passenger pays for the ticket, it is really not a great deal of our business who the passenger is or why he is traveling. I can just imagine the trouble we would get ourselves into by alleging that somebody was not a legitimate traveler if that person had paid for the ticket or if the ticket had been paid for.

FORMULA FOR SUBSIDY DETERMINATION

Mr. THOMAS. What Mr. Evins is primarily asking is just how much investigation does the Board give to the economics involved in this subsidy. We are just dealing with the fringes of it. What is the formula you use?

Let's go back to fundamentals for the record. What is the formula you use for arriving at the amount of subsidy you pay x carriers? Then we are going to have our friend, Mr. Hord, tell us how much checking he does, et cetera.

Mr. BOYD. I think I would ask Mr. Roth if he would explain the formula to you and it may take the rest of the afternoon.

Mr. THOMAS. He will try to. I am not sure he will succeed.

Put it in the record right quick.

Mr. ROTH. Do you want to put that two-page statement in the record?

Mr. THOMAS. No, one sentence. You have a few magic words. Let's get them in the record right quick.

Mr. BOYD. Honest, efficient, economical management.

Mr. THOMAS. Did you ever figure out what that meant?

Mr. BOYD. We apply it every day.

Mr. THOMAS. What all does it cover? Here is a man who goes out and borrows some money and goes into operation. How much will you let him make? Go into the details of his operation. Then what does Mr. Hord do to see that it is carried out? We want to know how loose and how tight it is.

Mr. BOYD. Mr. Hord, will you explain the functions of your audit?

Mr. THOMAS. Tell us what is involved first before we get around to Brother Hord to do the auditing.

Mr. BOYD. What is involved is the break-even need of the carrier for the service provided over the route certificated by the Board, plus an element of return and taxes. On the return element there is a differentiated rate of return which does not allow for any profit on money that is borrowed. It is merely to pay—it is supposed to cover the amount of interest that is paid.

There is a profit element on the equity capital put in by the shareholders of the corporation.

Mr. THOMAS. Did you used to let him make 8 or 10 percent on the money he borrowed? If he borrowed at 3 percent, you would let him charge 8 or 9 percent or 10.

Mr. BOYD. Not since I have been on the Board.

Mr. THOMAS. You were up to 10 at one time.

Mr. JONAS. You are up to 10 now.

Mr. BOYD. Not since I have been with the Board. That is not on borrowed money. I guarantee you and assure you that on the borrowed money of these airlines——

Mr. THOMAS. You knocked it down, then. Go ahead. What else?

Mr. BOYD. That is about the size of it.

Mr. THOMAS. What do you let him make, and on how much?

Mr. BOYD. On the differentiated rate of return, depending on the amount of equity involved, the carrier can earn from 9 to 12¾ percent.

Mr. THOMAS. How do you figure out what he is entitled to make? What is your basis or your yardstick?

Mr. BOYD. It depends on the ratio of debt to equity, Mr. Chairman.

Mr. THOMAS. Suppose he takes in through his operations, and he has got one source of income, the cash he collects for hauling his passengers, in round figures, say he takes in a million dollars and in order to take in that million it costs him $1,200,000.

Mr. BOYD. Well, then, we check to see what we are going to disallow first. We have a long list of disallowances. I believe I provided it for the record last year. I can provide another copy this year. It hasn't gotten any shorter.

Mr. THOMAS. Haven't you refreshed your memory on that last year's record? Go ahead.

Mr. BOYD. We make adjustments for the expenses that he had. It may well be that he has spent $1,200,000, but we just won't acknowledge, say, $150,000 of those for subsidy purposes, so he is short $50,000.

Mr. THOMAS. Briefly, what items do you let him put in there for subsidy purposes? He goes out and rents a warehouse, a ticket operation, his salaries and maintenance, gasoline, oil, et cetera. Do you let him put in a couple or three jobs for some of his friends that maybe he doesn't need?

Mr. BOYD. Well, I just don't know. We don't try to tell him how many jobs he can have.

Mr. THOMAS. The number of jobs he has is a big factor in how much you pay him in the way of subsidy, is it not?

Mr. BOYD. No, sir.

Mr. THOMAS. Explain why it isn't.

Mr. BOYD. Because we pay him on his total costs less the total disallowances that we make.

Mr. THOMAS. In making up his total cost, the number of jobs he has in producing that business is a fair factor, is it not? It is a factor that you allow. You have to.

Mr. JONAS. Mr. Chairman, didn't we have a case in here a few years ago where they had more employees in the terminal than they had passengers?

Mr. BOYD. That was a statement that I made, Mr. Jonas, and I was dead wrong. I subsequently corrected the record.

Mr. THOMAS. We looked up one pretty close to it. It was considerably out of line. That was not the example you gave. It was an example developed on examination.

Mr. GURNEY. Williamsport, Pa.

Mr. BOYD. That is the one I gave where I was wrong.

Mr. THOMAS. You owe so much for the airplane. He has a legitimate expense according to your books, and your audits. You approve it. It is costing him $1,200,000 to take in a million dollars. How much subsidy do you pay him?

Mr. BOYD. There is no way I can answer that, sir. It has to be based on an audit and on disallowances that are made, but we do not, and do not understand that we are in a position to say to a carrier, "You may not have a stewardess on an airplane because you don't need a stewardess." We do not think the law permits us to say that "You should have only one ticket man at the counter," when the carrier thinks he needs two.

CAPITAL TO DEBT RATIO

Mr. JONAS. Right there, does the law give you any right to tell him how much capital he should have, his ratio to debt?

Mr. BOYD. No, sir.

Mr. JONAS. I would like to see a list of those ratios with respect to the subsidized carriers, if it is easily available?

Mr. BOYD. We can make that available.

(The information supplied follows:)

Local service carriers: Debt-equity ratio—By carrier, as at Dec. 31, 1960, and Sept. 3 1963

	As at Dec. 31, 1960		As at Sept. 30, 1963	
	Debt	Equity	Debt	Equity
Allegheny	85.44	14.56	69.38	30.62
Bonanza	68.29	31.71	55.04	44.96
Central	17.80	82.20	48.08	51.92
Frontier	58.98	41.02	54.71	45.29
Lake Central	79.84	20.16	44.90	55.10
Mohawk	90.11	9.89	55.10	44.90
North Central	96.13	3.87	67.43	32.57
Ozark	65.88	34.12	75.89	24.11
Pacific	74.90	25.10	60.86	39.14
Piedmont	64.02	35.98	63.80	36.20
Southern	44.46	55.54	62.06	37.94
Trans-Texas	42.13	57.87	48.70	51.30
West Coast	67.44	32.56	56.92	43.08
13 carriers	74.21	25.79	61.20	38.80

Source: Form 41 reports, adjusted in accord with the profit-sharing provisions of the class rate.

Mr. JONAS. I understand some of these carriers are undercapitalized?

Mr. BOYD. I think they are. One of the reasons we have this sliding scale differentiated rate of return was in the hope that this would encourage them to bring more equity into their businesses. At the time we started that differentiated rate of return the ratios were about between 75 and 80 to 20 or 25 and now it is somewhat better.

Mr. BOYD. It is now about 60 to 40. It is improving.

INVESTMENTS BY SUBSIDIZED CARRIERS IN RELATED ACTIVITIES

Mr. JONAS. If the chairman will permit me to follow that one step further, isn't it true that some of the subsidized carriers are making investments in related activities?

Mr. BOYD. Yes, sir.

Mr. JONAS. Do you have any authority to control that?

Mr. BOYD. Yes, sir. I think we do. We have taken the position, however, that we would not accept any losses from any outside activities, but that we would utilize any revenues from outside activities going against, as an offset against the total subsidy requirement.

Mr. JONAS. That is the point I was coming to. Do you do that?

Mr. BOYD. Yes, sir.

Mr. JONAS. Is that definite?

Mr. BOYD. Absolutely. No question.

Mr. JONAS. If X airline invests a half million dollars in an outside activity, unrelated to airline service and makes a profit, you would require that it be considered?

Mr. BOYD. Yes, sir.

Mr. JONAS. What if they do it through a wholly owned subsidiary?

Mr. BOYD. The same thing.

Mr. JONAS. But a separate corporation?

Mr. BOYD. Yes, sir. It is my understanding that we do it exactly the same.

Mr. JONAS. Have you got your statistical people here that can, if you are not sure, can they verify that?

Mr. BOYD. I am sure.

Mr. THOMAS. What would you call an outside activity?

Mr. JONAS. Buying a hotel for example.

Mr. BOYD. Allegheny Airlines, for example, has an interest in a car rental business and any revenues that come to Allegheny from that car rental business are utilized.

Mr. THOMAS. Is it an adjunct to their airplane business?

Mr. BOYD. I think they would claim that it is because they rent cars. I do not know anything, really, about their business, but my understanding is that they have them at terminals which they serve by airplane, on the theory that they have more or less a captive class of customers so they can move them out of the plane into the cars and back from the cars into the plane.

Mr. EVINS. Very handy.

Mr. THOMAS. You mean right there on the ground?

Mr. BOYD. Yes, sir.

PROFITS FROM UNRELATED ACTIVITIES

Mr. JONAS. That would be pretty closely tied into the operation. What if it is an entirely unrelated activity?

Mr. BOYD. My understanding, and I would like to ask, Mr. Hord, any operation performed by a carrier, either directly or through a wholly owned subsidiary would have its revenues thrown into the total requirement. Am I right on that?

Mr. HORD. We would segregate every unrelated activity, whether or not it is a separately incorporated enterprise——

Mr. THOMAS. If you get in a Hertz car and you ride 200 miles and go back to the airport 3 or 4 days later, what does that have to do with the operation of that airline?

Mr. HORD. We would segregate completely the airline operation from other activities and we would assume that any other activities should stand on its own feet. We would also allocate costs to that

other activity in proportion to what seemed to us to be the burden to the carrier.

Mr. THOMAS. Did I understand the chairman to say that you do not look into the necessity of items of expense submitted to you in arriving at subsidy?

Mr. BOYD. The items of expense submitted to us——

Mr. THOMAS. In arriving at the subsidy requested?

Mr. HORD. Mr. Chairman, could I make one little statement?

Mr. BOYD. Yes, sir.

SUBSIDY DETERMINATION

Mr. HORD. The subsidy is paid in part in terms of seat-miles operated, and so far as that unit of it is concerned it is determined by the number of seat-miles operated. Then there is in this class rate setup a profit-sharing provision and the extent to which profits are recouped by the Government depends entirely——

Mr. THOMAS. You are going back to your class rates.

Mr. HORD. That is the subsidy.

Mr. THOMAS. How do you arrive at a total? Here are so many seats. In arriving at your revenue per seat you are going to have to figure gasoline, oil, help, rent, and everything else in it. You haven't answered the question yet.

Mr. BOYD. We do that on the average industry cost for providing the service, which comes from the audits made by Mr. Hord. That is the way we arrive at it.

Mr. THOMAS. How can you come to a fair conclusion or an honest, accurate, and economical formula in arriving at a class rate unless you go into the elements? If he is charged with 99 people and he only needs 90 and it is obvious to you your class rate is out of line.

Mr. BOYD. We get back to the same old thing, sir, that we think you are talking now about management prerogative, and that you are talking about——

Mr. THOMAS. Certainly you have more authority than to just write out a check. After this fellow gets his certificate, your authority does not end with writing out a check by any means, does it?

Mr. BOYD. No, sir.

Mr. THOMAS. It is not mandatory that you write it out until you satisfy your formula on his economy and efficiency. You do not do it until that has been satisfied.

Mr. BOYD. Let's look at it this way: The break-even load factor for the local service carriers is about 61 percent. The carriers are operating an actual load factor of about 43 percent. There is such a spread in there, Mr. Chairman, that even—well, I do not know where I was headed.

Mr. THOMAS. Take your time.

Mr. BOYD. We know what it costs to buy gasoline, we know what it costs them for their equipment, what it costs them for their salaries. This is completely out of our control. From what they say, it seems to be out of their control. But right there with the aircraft, gas, oil, flight crews, you have the vast bulk of the costs of providing airline service.

Mr. THOMAS. I think you are exactly correct. However, suppose he goes to Podunk and pays $10,000 to a friend for a warehouse that

you do not think he needs. This is in his base. You do not have to accept that.

Mr. BOYD. We have a provision in the class rate for disallowances which we worked out on a percentage basis based on past experiences of disallowances. I would be the last one to tell you there is no possibility of an airline operator giving us the business if that is what he sets his mind to do. But the fact remains that, so far as I know, these are all honest and conscientious people. They try to get the best of everything, but I have no reason to think that they have ever been dishonest. They know we have a good audit staff.

Mr. THOMAS. Judge, we are not going to dispute anything you said but you are going to make me cry. I remember several of these big corporations were just as honest and capable and went to church every Sunday, but they all went into a conspiracy and agreed to hold the price up against Uncle Sam. Finally they all pled guilty. They were just fine and not going to take advantage of anybody. You will remember a few of those cases. Your people are just as fine and all of that.

Mr. BOYD. We do audit these people. If anything is out of line, we are advised of it by Mr. Hord.

ITEMS DISALLOWED FOR SUBSIDY PURPOSES

Mr. EVINS. Mr. Hord, what do you find out of line, if anything? What do you find that you have to put a red pencil around?

Mr. HORD. Anything that has been expended that in our judgment is questionable, we put a red pencil around it. We have had cases, for example, where family cars have been used at company expense. We take it out.

Mr. OSTERTAG. What do you do about it?

Mr. HORD. We disallow it. There are hundreds of thousands of dollars disallowed.

Mr. JONAS. Give us some more examples.

Mr. EVINS. Mr. Jonas says uncover some more.

Mr. HORD. We have uncovered items aggregating over $1 million in 1963. One device to reduce profits is to get expenses in one period that belong in the next period. We put the expenses in the period in which they belong, which is one of the common bases of juggling profit as between two periods. Anything that is unrelated, you take expenditures in organizations or clubs, lobbying costs, things of that kind.

Mr. EVINS. That is what the chairman was speaking of, unrelated items.

Mr. HORD. They are disallowed, they are deleted.

REASSESSING ECONOMIC NEEDS OF LOCAL SERVICE CARRIERS

Mr. EVINS. This interests me. You say that the Board is reassessing the economic needs of 13 local service carriers for the purpose of establishing a new class subsidy rate for 1964. Fiscal year 1964 is well underway and about gone. What are you doing in this reappraisal and reassessing of economic needs?

Mr. BOYD. We are trying to tighten up on the formula, Mr. Evins, to boost their load factor requirement and to get the formula in line

with regard to the different types of equipment used so that there is no excessive benefit from utilizing bigger equipment.

Mr. EVINS. Does your experience thus far show there is a need for setting a different subsidy rate?

Mr. BOYD. Yes, sir. As you can imagine, with 13 local service carriers effectively blanketing the United States—North, South, East, and West—they have some extremely different characteristics. Trying to get a single factor formula or a single formula that will cover all of them equally and fairly has proved to be most difficult.

What we found in the first two rates is that some carriers, by just the action of the formula, would fall into the excess profits category and others were living on thin soup and not getting all they should be getting. We keep trying to readjust these things to get an even application of the formula to all carriers.

Mr. EVINS. Very well said.

Mr. JONAS. Will you yield to me?

Mr. EVINS. Surely.

FIVE-YEAR GOAL FOR REDUCTION OF SUBSIDY

Mr. JONAS. You told the President last year you thought you would get these subsidies down by about $55 million in 5 years.

Mr. BOYD. Yes, sir.

Mr. JONAS. Do you think you are on schedule?

Mr. BOYD. No, sir.

Mr. JONAS. That is a good, sharp, clear, quick answer. I was afraid of that.

Mr. OSTERTAG. To follow the question one step further, you believed it then, did you, at the time that this statement was made or the release was made about these reductions?

Mr. BOYD. Sure, that was an absolutely sincere belief, Mr. Ostertag. But there have been several things that have militated against it, one of which is after that study was published, along came Northeast Airlines with a requirement for $3¾ million, which was certainly not contemplated.

As you can also imagine, that study had to be based on a static route system because we could not project what changes would be made in the route alinements in the future. There have been some changes since then of cases that were finished that the study did not take into effect, which have added some money.

We had hoped that we would have this new class rate 3 out and operating by the first of January. It is not. We have not, either we or the carriers have not been able to come to grips with it yet. We have made a proposal, and the carriers have not come back to tells us what it is going to do to them. A good portion of what was involved in that reduction was based on increased productivity and efficiency of the carriers and traffic growth without consequent expense.

Mr. OSTERTAG. Let us take it from the start, which is a reduction over a period of 5 years from $81 million to about $56 million, which is $25 million.

Mr. BOYD. Yes, sir.

Mr. OSTERTAG. Now you have cited one or possibly two circumstances which make that impossible to achieve. What do you antici-

pate you can and will achieve? You said no to Mr. Jonas' inquiry that you are not going to meet this, but what are you going to meet? Is this just a false alarm sort of thing?

Mr. BOYD. I do not think so at all. I think you will see this general type of reduction coming about as time goes on.

Mr. OSTERTAG. This was a 5-year goal, if I understand it correctly.

Mr. BOYD. That is right.

Mr. OSTERTAG. Accepting your premise that you will not achieve your goal, within that period——

Mr. BOYD. I say we are not on schedule.

Mr. OSTERTAG. That is what I say. What will you achieve at the end of 5 years as things stand?

Mr. BOYD. I do not know.

DELAY IN REACHING EXPECTED SUBSIDY LEVEL

Mr. OSTERTAG. Let me ask it in another way. When will you reach this $56 million level of subsidy? If you do not reach it in the fifth year, do you anticipate you will ever reach it?

Mr. BOYD. Certainly we hope so.

Mr. OSTERTAG. What does it look like?

Mr. BOYD. Any figure I give you will be just a guess. I would say that given the conditions that we had in the study, what we talked about in terms of 5 years will more likely be seven and a half years.

Mr. OSTERTAG. This, of course, is based on your own studies and findings?

Mr. BOYD. That is right, sir.

Mr. OSTERTAG. That is why it is difficult to find so many flies in the ointment at this point.

Mr. BOYD. You see, the things that we think we can do we are moving on. We are requiring the two round trips a day in the class rate 3. We are moving on the regional airport front as fast as we can, which is a snail's pace because this is a public notice and hearing procedure.

The bulk of that, however, we based on the traffic growth without consequent expense growth and this is something that the carriers, it is up to the carriers as much as it is up to us.

The traffic growth has surpassed what we projected. So from that point of view, that part is moving along. The reginal airport thing is moving along. The minimum and maximum frequencies, which is intrinsic to this, is moving along. But it is not going to be done within 5 years, in my judgment. It is going to take longer to accomplish it.

Mr. EVINS. If new or additional companies are organized and new territories are to be served, new frontiers are to be covered, you may have to inaugurate new programs.

Mr. BOYD. That is right, sir. That is one thing this study makes clear, and I want to make clear on the record, which is, that that was based on the route system as of the time the study was made.

Mr. EVINS. I was noticing the Frontier carrier. Where is their base?

Mr. BOYD. Denver.

Mr. EVINS. They are the highest paid, highest subsidized carrier of all your 13 carriers, $8,282,000 a year.

Mr. Boyd. They operate across the northern tier of States of the Midwestern States—Montana, North Dakota, Wyoming. They were put in there originally, I think—this is before my time—I believe the military had a great deal to do with their being put in to service the SAC bases up in that area.

SUBSIDY STATISTICS

Mr. Thomas. We would like to have some information on your 13 subsidized carriers and you might include the Hawaiian and Alaskan carriers, too. Your table set out from 1954 through 1965, shows the amount of subsidy paid and accrued. Can you show how much traffic, dollar traffic, originated to earn this subsidy? For instance, take Frontier. For 1965 you estimate $8,261,000. We are using this is an example only. How much was the revenue and the difference between the cash revenues and your allowances of his expense account—that is this subsidy?

Mr. Boyd. Yes, sir.

Mr. Roth. Plus profit and taxes.

Mr. Boyd. I do not have a breakdown on the revenues of the carriers. I can provide that for you.

Mr. Thomas. Will you complete this table on his revenues, his profits, his taxes, and his subsidy? You are going to add two more items, three more items.

Mr. Boyd. Revenues, profits, and taxes. Do you want this back to 1954?

Mr. Thomas. The last 5 years should be satisfactory.

Mr. Boyd. That is for Frontier or all of the 13?

Mr. Thomas. All of the 13.

Mr. Boyd. All right, sir.

EASTERN AIRLINES APPLICATION FOR SUBSIDY

Mr. THOMAS. Eastern has an application pending for subsidy. You have not taken any action on it, have you?

Mr. BOYD. No, sir.

Mr. THOMAS. Are they not beginning to make some money now?

Mr. BOYD. No, sir.

Mr. THOMAS. Are there any further questions by anybody? We thank you gentlemen for being so nice and cooperative. You really do a fine job. We like to do business with you.

WEDNESDAY, FEBRUARY 19, 1964.

Mr. THOMAS. The committee will please come to order. We have with us this morning the distinguished gentlemen from the Federal Power Commission. It is always nice to have these gentlemen. They are certainly specialists and technicians in their own respective fields.

It is nice to have Mr. Swidler, the Chairman; Mr. Woodward, Vice Chairman; Mr. O'Connor, Mr. Ross, and Mr. Black, Commissioners; also Mr. Trainor, the executive director. Here is Mr. Freeman, assistant to the Chairman; Mr. Solomon, General Counsel; Mr. Brown, Chief of the Bureau of Power. He was with us last year. We have Mr. Watters, Chief of the Bureau of Natural Gas; Mr. Wald, Chief Economist. We have Mr. Pilcher, Director of Administration; and Mr. Capar, Chief of the Division of Program, Budget, and Fiscal Services. We are delighted to have you gentlemen.

All of the Commissioners are here this morning, a hundred percent attendance. We are grateful to all of you.

Mr. EVINS. Mr. Chairman, I have a press release from the Federal Power Commission announcing the appointment of Mr. Watters. It seems there have been a lot of new chiefs brought in, a lot of division heads. This is a biography which is very good. It seems Mr. Watters' predecessor was also from California. There might be some press releases on these other gentlemen.

Mr. THOMAS. We are delighted to have them. We might get these gentlemen to tell us something about themselves.

BACKGROUND OF COMMISSIONER BLACK

Commissioner Black, tell us about yourself. Where did you go to school, what have you been doing?

Mr. BLACK. I went to school at the University of Washington for most of my training, then 1 year of law school at Stanford. I graduated from law school in 1954. I practiced law in Seattle for about 3 years in private practice. I became assistant attorney general and counsel for the Washington Public Service Commission for about 4 years. Then I was appointed to be General Counsel of the Bureau of Public Roads and served there for 2½ years.

Mr. THOMAS. How long were you with the Bureau of Public Roads?

Mr. BLACK. Two and a half years.

Mr. THOMAS. When did you start there?

Mr. BLACK. April 6, 1961.

Mr. THOMAS. You were over there at a very interesting time, spending a lot of money.

Mr. BLACK. We spent as much as we could get away with. The Federal-aid highway program accounts for about $4 billion a year. The Federal Power Commission does not spend that much.

Mr. THOMAS. How do you like it at the Federal Power Commission?

Mr. BLACK. Very exciting and fascinating and challenging.

Mr. THOMAS. How old are you now?

Mr. BLACK. I am 35.

Mr. THOMAS. That is remarkable. You have traveled a long way in 35 short years. When did you get out of college?

Mr. BLACK. In 1954.

Mr. THOMAS. Did you have any military service?

Mr. BLACK. I fought the battle of Camp Hanford. I did not get out of the State of Washington. My military career was not very exciting.

Mr. THOMAS. You must have had peacetime duty because of your age.

Mr. BLACK. This was at the time of the Korean war, but I was in an antiaircraft battalion.

Mr. THOMAS. This is a very commendable record. I am sure you will go far. You have many good years ahead of you.

What about Brother Watters, Chief of the Bureau of Gas? Tell us about yourself, Mr. Watters.

Mr. WATTERS. Sir, I came into the Federal Power Commission in October of 1963. I had been with the California Public Utilities Commission for 23 years previous thereto. My prior experience to that was 3 years with a major oil company, 2 years in exploration work in Egypt, and prior to that 2 years with Tennessee Valley Authority. I am a graduate of the University of California, class of 1935, in civil engineering.

Mr. THOMAS. What about our Chief Economist, Mr. Wald?

Mr. WALD. I did my undergraduate work at Clark University, Worcester, Mass., and graduate work at Harvard. I have been with the Federal Government, more or less, since 1938.

Mr. THOMAS. When did you get out of school?

Mr. WALD. In 1938 from undergraduate school. I took time off to go back to graduate school on two occasions. I have been with various Government agencies starting with the Federal Reserve.

Mr. THOMAS. You are a good, outstanding example of a Federal employee, a good career man. We need more like you. What degree did you take in Harvard?

Mr. WALD. A Ph. D. from Harvard.

Mr. THOMAS. In economics?

Mr. WALD. Yes, sir.

Mr. THOMAS. Well, Doctor, welcome aboard. Any group is entitled to at least one doctor. I guess that is the only doctor we have present. Mr. Capar?

Mr. CAPAR. I was born and raised in Jeannette, Pa., and came to work for the Signal Corps back in 1942 in budget work and comptroller-type activities. After I had gone to business school back home, near my home, in Greensburg, Pa., I went into the service in 1944 and spent several years with the infantry. I came back and went to school and got my degree at Georgetown University in 1959. I worked with the military for about 18 years in budget activities and went to the Federal Aviation Agency in 1959.

Mr. THOMAS. How long have you been in Government service?

Mr. CAPAR. Since 1942, sir.

Mr. THOMAS. You have not lived long enough to have had much experience outside of Government.

Mr. CAPAR. No, sir. I worked at night at other places while going to business school.

Mr. THOMAS. That is a fine record.

Mr. CAPAR. I joined the Federal Power Commission in May of 1963 from the Federal Aviation Agency.

Mr. THOMAS. We are delighted and honored to have all of you. Mr. Chairman, do you or any of your brother Commissioners have any statements to make? We will be glad to listen to you talk. Tell us something about your headaches and pleasant activities and unpleasant ones. Talk about anything you want to.

GENERAL STATEMENT

Mr. SWIDLER. Thank you, Mr. Chairman. I have a prepared statement which I should like to offer for the record.

Mr. THOMAS. Very well. Without objection, it will be placed in the record.

(The statement follows:)

Mr. Chairman and members of the committee, I appreciate the opportunity to appear before you today to report on the activities of the Federal Power Commission in the past year and to support our appropriations request for fiscal 1965.

The President in his budget message to the Congress requested a total appropriation of $13,335,000 for the Federal Power Commission during the coming year. The request is an increase of $1,485,000 over the $11,850,000 appropriated for fiscal 1964. It will provide funds for a total of 1,234 positions in fiscal 1965, an increase of 86 over the 1,148 maximum positions in 1964. A summary is attached.

The Commission's appropriation request has met the President's test of thrift and frugality. The Commission scrutinized each activity with emphasis on maximum utilization of existing manpower. The request is limited to essential activities that have a significant beneficial impact on the Nation's economy. It is the Commission's judgment that the request represents only the amount required to carry out our responsibilities for the regulation of the natural gas and electric power industries.

The major portion of the increase is for our electric power work, "to enable the Federal Power Commission to step up its examination of interstate wholesale electric rates" as the President stated in his budget message. The staff requested for natural gas work is only 664 positions, an increase of 26 positions over 1964 but a reduction of 13 from the 677 positions in natural gas which Congress made available to the Commission in 1963.

The Commission's appropriation for 1964 of $11,850,000 which became available in December required us to reduce the level of our staff. As of February 15, 1964, there were only 1,069 permanent FPC employees actually on the payroll. It has also been necessary to defer certain important work such as data processing for area rate proceedings and printing current opinions. We are now operating with far fewer people than we need.

The increase of $1,485,000 requested for 1965 is made up of $219,000 to provide a full year's salary for 48 positions filled in the first half of 1964 but unfilled in the second half due to force reduction; $373,000 to cover the pay raise effective in January 1964 and in-grade promotions for existing staff; $383,000 for increased cost of rent, supplies, etc.; and $510,000 for 86 new positions.

In reviewing our budget request and specifically our need for increased manpower, Mr. Chairman and members of the Appropriations Committee, I hope you will keep in mind that the Federal Power Commission regulates two of the largest and fastest growing industries in the Nation.

The consequences to the Nation's economy from inadequate staff for the Federal Power Commission are indeed grave as recent history amply demonstrates. Construction of natural gas pipelines will be delayed unless we have adequate staff to process certificate applications. Over a billion dollars in proposed natural gas pipeline projects is now pending before the Commission. Some of the applications are for overlapping projects not all of which can be granted, but even so the failure to provide funds for sufficient FPC staff will result in delays in processing projects which when approved will pour hundreds of millions of dollars into our economy. The same can be said about the licensing of hydroelectric power projects and indeed for all of our activities which affect the pace of progress in the Nation's two basic energy industries.

The damage to the natural gas and electric power industries from insufficient FPC staff will be compounded by the loss of protection to the gas and electric consumers, that is to say, practically the whole of our population. I believe the Commission's record in the past 2 years of ordering over a half billion dollars in refunds to the customers of the Nation's natural gas pipelines is in itself ample proof of the large dividends to the economy from small investments in FPC staff. The Commission through its National Power Survey is stimulating the construction of stronger transmission line interconnections and larger and more efficient generating units by the electric power companies to reduce electric power costs. Electric rates reversed their upward trend of a decade in 1962 and rate reductions are now the order of the day. I believe that the Commission as presently constituted has demonstrated that it can make effective use of the funds made available to it.

We have made good progress in increasing the productivity of our staff. We have streamlined our procedures for processing rate cases and certificate applications for both natural gas pipelines and sales by gas producers. As a result, we have made great strides toward clearing up the backlog of natural gas rate and certificates cases which existed 2 years ago and we are now handling new cases in an expeditious manner that will prevent another backlog from accumulating.

The Commission now has an active program for electric rate regulation which needs strengthening. The FPC has a responsibility to the thousands of cooperatives and municipalities as well as to consumers of private companies who purchase power at wholesale in interstate commerce to insure that they can obtain electricity at reasonable rates and on fair terms. The FPC, by the fulfillment of its responsibilities for the assurance of such supply, will make it unnecessary to build uneconomic sources of power and will instead provide consumers with low-cost electric power from economical sources. Effective Commission regulation can be a substitute for large investments in plants of relatively low efficiency which are justified only in the absence of effective wholesale rate regulation.

The Federal Power Commission's actions to speed up the regulatory process have benefited the economy in a number of important respects. In calendar year 1963, for example, the Commission issued certificates for $812 million of

new gas pipeline construction, the second highest total in history. The three largest applications, involving $195, $56, and $49 million, respectively, were each processed and approved in less than 6 months from the dates they were filed. Another example of the results of our accelerated efforts is the clearing up of a billion dollar backlog of natural gas rate increase applications by ordering refunds of some $550 million in the past 2 years, the major portion of which has been passed along to ultimate consumers in all parts of our country.

The Commission has also shown marked improvement in its activities which bring revenues into the Federal Treasury. In 1963 we collected over $2,800,000 from owners of downstream hydroelectric projects for the benefits they received from upstream Federal project, a sum which is five time the aggregate amount collected in the previous history of the Federal Power Act. We are also increasing the fees charged hydroelectric project licensees, other than those exempted by statute, to compensate the Government for all of the costs of administering part I of the act, except for certain old licenses covering less than 10 percent of the fees in which the Commission's authority to require additional fees is uncertain. We estimate total payments to the Treasury of about $5,800,000 in fiscal 1965. Our appropriations request should, therefore, be offset by these increased payments to the Federal Treasury by licensees and for headwater benefits. The net cost of the Commission's work to the U.S. Treasury in fiscal 1965 will be about $7,500,000, which is not much more than in earlier years when the Commission staff and productivity were both far smaller, and when salary scales and other expense levels were much lower.

Let me discuss now in more detail our record and our needs in both our natural gas and electric power work.

The Commission's major success in the past 2 years was to clear up the incredible backlog of pipeline rate cases. In so doing we have reversed the upward trend of natural gas prices which has plagued gas consumers and the industry in recent years. The billion-dollar backlog of pipeline rate increases is now down to a normal working inventory of about $100 million. Over $550 million have been ordered in refunds. The city-gate price of natural gas has been reduced by a net amount of over $95.7 million annually, a reduction which consumers receive every year.

Not only were pipeline rates reduced but the Commission has adhered to its interim price ceilings for new sales by gas producers and there have been downward adjustments in some areas in which the existing ceiling prices were out of line. The stabilizing of prices in the field, coupled with pipeline refunds and rate reductions, has renewed public confidence in natural gas as a low-cost fuel.

The benefits to natural gas consumers from the refunds and rate reductions we have ordered are obvious. The Commission's performance has also been of large benefit to the natural gas industry. For the first time in years most pipeline companies have a financial status that is not clouded by staggering contingent refund obligations. Pipeline securities can now be valued on a firm financial basis in the light of the industry growth as it continues to supply the ever-increasing demand for natural gas by both industrial and domestic consumers. The lower rates and the fact that rate levels have been stabilized are big factors in enabling the industry to meet the stiffening competition from other energy sources.

To my mind, the Commission's pipeline rate settlement program is a demonstration of the administrative process at its best. It is only an administrative agency such as the Federal Power Commission with a staff to participate in the settlements and assure that the consumer interest is protected, that can utilize the settlement procedure with full confidence that the results are in the public interest.

We are not asking for any increase in our staff for pipeline rate work because we believe that with our new procedures and emphasis on increased productivity we can keep current. To do so will require a maximum effort from the full number of positions now available for this activity. The existing moratoriums on rate increases which many pipelines agreed to as part of our settlement program will soon be expiring and manpower must be available to dispose of rate increase filings speedily if huge sums of money subject to refund are not to be again accumulated.

Actually the number of pipeline rate cases estimated for 1965 represents only a small measure of the workload of the staff requested for pipeline rate work. In a practical sense, there is "a rate case" currently pending against all major pipe-

line companies because it is necessary to scrutinize their earnings level each year to insure that their rates remain just and reasonable under changing circumstances. The tax bill which is moving swiftly toward the President's desk will provide reductions in the corporate tax rates of the natural gas pipelines. This reduction in expenses alone will require studies of each pipeline company to insure that any excess earnings are passed along to customers in the form of rate reductions.

Our staff studies of pipeline earnings under existing rates reveal that several companies may be earning in excess of a fair return. The staff is engaged in conferences with these companies, which hopefully will lead to voluntary rate reductions. One company has already filed a voluntary rate reduction of $1.5 million annually, effective January 1, 1964, and other settlement conferences are well along toward agreements. The staff work required in each such investigation is comparable to the effort required to prepare for a rate case .

We believe that settlements rather than formal hearings are the most expeditious and effective means of implementing the results of these investigations. Our estimate of a reduced number of rate cases in 1965 reflects our belief that many of our investigations will result in voluntary settlements rather than formal rate cases.

Let me turn now to a fuller discussion of our pipeline certificate work. The growth of the pipeline industry is entirely dependent upon prompt handling of certificate applications by the Federal Power Commission. I have already stated that in 1963, the Commission issued certificates for $812 million of new construction. These projects made natural gas available to many new communities and provided as well the additional facilities needed for the growing needs of existing pipeline customers.

The normal volume of certificate applications pending before the Commission represents a huge amount of proposed investment. As of January 1, 1964, certificate applications for $1.1 billion of pipeline construction were pending before the Commission. Not all of these projects will be approved—some are in conflict with each other and a few may prove to be lacking in merit—but it is very much in the public interest that all should be decided promptly; that the good be separated from the bad and permitted to go forward; and that the applicants for the projects which do not meet the public interest test be advised of this conclusion as soon as possible so that they and their consumers will no longer be burdened with the heavy standby costs of these projects, the financial commitments, the commitments for gas reserves, the legal, engineering, and witness fees, and so forth.

The Commission has taken several important steps toward insuring more speedy handling of pipeline certificate cases. We have adopted regulations similar to our new regulations in rate cases to require a pipeline, in formal proceedings, to file its full case-in-chief with its application so that the hearing can be set promptly and proceed with expedition.

As I previously mentioned noncontested cases are now handled swiftly and applications whether involving small amounts or hundreds of millions of dollars are scrutinized and, if found satisfactory, approved in a matter of months. Contested cases require a formal hearing, but these hearings are now conducted under procedures that minimize delay and insure a conclusion as soon as is consistent with affording due process to all parties.

One important aspect of the Commission's pipeline certificate work often overlooked, is its importance to gas consumers. Certification of an uneconomic project, or even an economic project which does not afford the cheapest means of bringing gas to market, can cost consumers many millions of dollars each year for the entire life of the project. The Commission in the past 2 years has emphasized economics as the determinative factor in choosing among competing applications by pipelines to serve the same market.

One way in which the Commission expects to speed the processing of pipeline certificate applications is by requiring that pipelines report annually their gas reserves. The Commission's staff will review and record the information reported, and maintain a current picture of each pipeline company's reserves. We thus expect to avoid the protracted trial in each certificate case of the question whether the pipeline's reserves are adequate. We shall also be in better position to insure that no pipeline's reserves will fall below a prudent level. The small increase in staff we are requesting for certificate work is needed primarily for the analysis of pipeline reserve data.

We have made significant progress in our producer certificate work. The backlog has been cut down by over 1,100 cases last year. A year ago 2,814 cases were pending. On January 1, 1964, the backlog was reduced to 1,687 producer certificate cases. In most of the remaining cases the issue is the initial rates at which the proposed sale will be certificated. Hearings are underway in which hundreds of the remaining certificate applications are being tried under new procedures and pursuant to Commission guidelines which eliminate the need for elaborate cost showings.

Noncontested producer certificate applications are now being disposed of in 6 to 7 weeks from the date they are filed. Our new procedures have completely eliminated the hearing before the examiner. The applications, after staff screening and notice to the public, are brought directly to the Commission for prompt approval.

Although on the whole they are the more difficult producer certificate cases which remain to be tried, we believe that we can continue our progress in becoming current in this work without any increase in staff. The number of positions for this activity is therefore projected to remain at the 1964 level.

Producer rate regulation is the activity for which we are requesting 13 additional positions so that we can push forward with our area rate proceedings to fix just and reasonable prices for natural gas in all of the producing areas throughout the country. In the area rate program the Commission has developed an efficient and workable administrative tool by which the rates for all the producers in an entire area are fixed in one hearing. Progress in implementing the area rate program is greatly hampered by the lack of sufficient FPC staff and the modest increase we are requesting is the minimum we need to move ahead with this program which involves rates totaling hundreds of millions of dollars annually.

The Commission's settlement program has enabled us to dispose of many cases while our area rate proceedings are getting underway. Between July 1, 1961, and January 1, 1964, we disposed of 920 producer rate cases and ordered producers to refund over $49.9 million. This is in addition to the $550 million of pipeline refunds. These settlements provide for moratoriums for future rate filings and thus build an additional element of stability into the natural gas pricing structure.

We are greatly encouraged by the opinion of the Supreme Court in the *Phillips* case handed down on May 20, 1963, in which the Court gave judicial approval for proceedings with our area rate program. The Court said:

"We recognize the unusual difficulties inherent in regulating the price of a commodity such as natural gas. We respect the Commission's considered judgment, backed by sound and persuasive reasoning, that the individual company cost-of-service method is not a feasible or suitable one for regulating the rates of independent producers. We share the Commission's hope that the area approach may prove to be the ultimate solution" (p. 16).

The hearing in the lead case involving the Permian Basin area, which lasted 23 months, was concluded in September 1963. The parties all filed their briefs in December, and the examiner is now preparing his initial decision which is expected in late spring. The case should be ripe for decision by the Commission by the end of the year.

The south Louisiana proceeding which has been delayed because of manpower limitations is now moving expeditiously as we perfect our procedures for trying the area rate cases. In south Louisiana, we eliminated the trial by stages which prolonged the Permian hearing. All parties were required to file their entire case in chief simultaneously in December 1963. The remaining steps in the case have also been put on an accelerated schedule. Rebuttal testimony is due on March 24, 1964, and the hearing for complete cross-examination of all testimony is due to commence on April 21, 1964. With the experience gained in Permian, I have every reason to believe that the hearing in the South Louisiana case will be completed within 1964, which would cut in half the hearing time as compared with the Permian Basin proceeding.

South Louisiana and Permian combined account for over 40 percent of the gas moving in interstate commerce, so you can see that we are indeed making progress.

The Commission, by order of November 27, 1963, initiated two additional area proceedings, one in the Hugoton-Anadarko area and the other in the Texas gulf coast area. Completion of these proceedings, coupled with those in the Permian Basin and south Louisiana, will result in the establishment of effective rate regulation for approximately 75 percent of the sales of natural gas made in interstate commerce. We have moved first in the areas of greatest production, and all four

of the key production areas are now covered by an area proceeding in some stage of progress.

The following table gives the basic facts on the four pending area rate proceedings:

Docket No.	Title	Number of rate dockets	Number of respondents	Estimated amounts subject to refund
AR61-1	Permian Basin area	[1] 360	399	[1] $68,700,000
AR61-2	South Louisiana area	392	233	97,000,000
AR64-1	Oklahoma-Kansas-Texas District No. 10 areas	848	719	65,000,000
AR64-2	Texas gulf coast area	615	701	72,400,000
	Total	2,215	2,052	303,100,000

[1] Decision in this proceeding should be a basis for expeditious disposition of 308 additional dockets involving approximately $60,000,000 more of amounts subject to refund. These are cases filed after the area proceeding was started and not consolidated into the proceeding.

Our ability to move forward with these area rate proceedings depends on obtaining the funds we are requesting for this activity in 1965. We must devote more manpower to this program so that several of these huge proceedings, each of which involves the rates of hundreds of producers, can proceed simultaneously. Producers in all areas, and the consumers they serve, are entitled to decisions on the just and reasonable rates for their gas.

The Commission has made progress in its electric power work in the past year. The most important of our activities have been the national power survey and the Commission's program for regulating rates of the sales of electricity at wholesale in interstate commerce.

The Commission's survey report is being prepared for publication in this fiscal year. We have worked with advisory committees from all segments of the industry in the survey and 21 advisory committee reports have already been completed. These reports have been made available to the public.

In the survey report we expect to describe how the new technology in generation and transmission can best meet estimated loads in the 1970's and to suggest paths of further study to insure that the industry makes the fullest use of the advantages of present-day technology as applied to fully coordinated power networks. The Commission's report will not pinpoint generating sites or detail the transmission grids of the future. We expect to suggest region by region the general mix and sizes of nuclear, hydro, and conventional steam capacity, the possibilities for EHV interties between regions, and the potential savings in higher load factory operation, reduced reserves, larger unit sizes, better plant efficiency, and reduced transportation costs; in total, some rough measure of all of the cost savings inherent in a fully integrated power supply system for this country. We hope also to suggest how much these savings could mean in terms of reduced rates to consumers. We hope in this way to stimulate definitive studies along the same lines by the industry itself.

One of the most important benefits which the national power survey has already achieved is that it has focused attention on the need for greater research and development in the electric power industry. The industry will be investing in the neighborhood of $140 billion in the next 20 years, yet it has been spending in recent years only about 1 percent of its revenues on research and development, and most of this research money is spent on nuclear reactor research.

The Commission has taken steps to stimulate a reappraisal by the industry of its research efforts. A select 11-member ad hoc research organizing committee, representing all segments of the electric industry, the manufacturers, and the research community, has been formed to study and make recommedations on the possible formation of a permanent industrywide organization to encourage and coordinate research and development activities. This committee which is headed by Erwin Will, president of Virginia Electric Power Co., is expected to announce its report next month. The Commission has high hopes for permanent research progress as a result of the work of this committee. Its report may well set in motion a greatly expanded research program by all segments of the electric power industry. Both the industry and its consumers stand to benefit.

Our studies in the national power survey to date indicate that if full advantage is taken of the new technology in the coming decades large savings can be

made in the cost of generating and transmitting electricity and that all power systems—both publicly and privately owned—can share in these savings. I believe the electric power industry can meet the challenge of bringing low-cost electricity to all of America and I trust the Commission's national power survey will lead the way.

A staff of 10 positions will be continued in 1965 to work with the industry to follow through on the survey's suggestions in shaping a system of power supply for this country which will minimize power costs. The survey is a major program in promoting closer coordination between power systems throughout the country and a followup program is essential if the potential benefits are to be realized promptly. The technology is changing so rapidly in this dynamic industry that the survey recommendations must be continuously reviewed to keep abreast of changing conditions. The working relations which have been established between the Commission and the industry and between the various segments of the industry should not be allowed to lapse. They are among the most valuable products of the survey. A small staff will pay great dividends by continuing this important job of providing the catalyst that is stimulating all segments of the industry to make the most of their opportunities.

A continuation of the national power survey's close analysis of growing power pools is necessary to support an expanded rate regulation activity. Effective regulation of the wholesale rates of power companies must be built on a thorough working knowledge of how power pools can best be operated in the public interest. Many of the survey benefits will not be realized by the smaller private, municipal, and cooperative systems without such a follow-through effort.

The Commission's program for wholesale electric rate regulation has advanced from its dormant state to an activity which holds promise to wholesale customers throughout the Nation. Additional staff for rate regulation is vital to insure that the cost reductions stimulated by the national power survey will be translated into rate reductions for the power consumers.

Vigorous action by the Commission over the past 2 years to exercise its responsibility for the regulation of wholesale electric rates has resulted in a rapid expansion in rate workload and operations. The Commission received 1,882 wholesale rate filings in the past fiscal year, a record number, and we are continuing our efforts to obtain compliance with the filing requirements of the Federal Power Act by writing the companies and where necessary by the issuance of show-cause orders.

For the first time in history, a list of the major public utilities subject to the Commission's jurisdiction has been published. The list is tentative, and the Commission will give a hearing to any company which thinks that it was listed erroneously. Most of these companies agree that they are subject to FPC jurisdiction. We are proceeding against those that disagree so that jurisdictional questions may be resolved in an orderly way.

A thoroughgoing review of all electric rate schedules presently on file is being made with a view toward eliminating excessive or discriminatory rates and unreasonable provisions in these rate schedules. This work is being delayed because of insufficient manpower but 21 formal rate cases have already been initiated by the Commission dealing with failures to file, restrictive provisions, dual rates, refusals to serve, and unlawful rate levels. These cases are now in various states of completion. Additional staff will help move them along at a faster pace.

We have revised our regulations to insure that staff work is kept to a minimum. The new regulations require electric utilities to support rate filings with cost information that will facilitate meaningful Commission review without the need for a detailed field investigation of the company's books in connection with the rate case.

A failure to provide adequate staff for the Commission could have a serious impact on the efficient operation of the electric power industry and on the consuming public. The United States has entered an era in which the cost of electric power can be substantially reduced through interconnected power pools covering many States. The lower cost power from these pools should be made available at reasonable rates to the many small utilities, public and private, whose operations are not large enough to enable them to generate their own power economically. The present staff for electric power rates must be increased to achieve this goal and to keep pace with the dynamic growth of interstate sales of electric power as the industry moves closer to a completely interstate operation.

We propose an increase of 25 positions for electric power rate regulation which results in a total of 223 in the electric power industry activity.

The Commission is proposing new ways to improve its oldest program—the licensing of hydroelectric projects. The licensing activity, as you know, is self-supporting under the terms of the Federal Power Act and as I have mentioned, the Commission has taken steps to assure that to the extent possible all of the cost of this work is recovered from licensees.

Applications for licenses and preliminary permits for non-Federal hydroelectric projects for new capacity pending before the Commission involve construction costs approximating $3.2 billion. The Commission must develop better tools to move these cases along so that these large projects can provide jobs and electricity, as well as the numerous other benefits of well-planned water resource development projects.

One of the handicaps which has plagued the Commission in its licensing program has been the lack of even skeleton surveys of the river basins concerned. In many river basins, demands for water supply, water quality control, recreation, and wildlife are competing with flood control, navigation, irrigation, and power. The Federal Power Commission needs up-to-date basinwide plans to discharge effectively its statutory responsibilities for insuring that its licensing activities will advance the development of the Nation's river basins on the most efficient and comprehensive basis.

To meet this need, the Commission has undertaken a program of basinwide appraisals of the water resources of river basins with the highest priority for hydroelectric licensing purposes, with due regard for the emerging problems of water supply, water pollution, and the enhancement of recreation. The Commission intends to use the studies made by other Federal agencies in this area to the maximum extent possible, adding whatever additional studies and inspections by the staff may be necessary for its own purposes.

Basinwide resources studies can provide the essential standards for determining the desirability of hydroelectric projects and the features that should be incorporated in their construction and operation for the best use of the water resources. With the benefit of these studies, the Commission can more effectively exercise its authority to condition licenses to further the public interest in optimum overall water resource development. The availablility of such studies will expedite the licensing of projects and encourage applicants to file for the projects set forth in the development plans.

Basinwide studies will also be very valuable to the Commission in considering proposals for recapture of licensed projects, for Federal development of certain projects, for withdrawals of land of the United States for power purposes, and for cooperative studies with other agencies concerning Federal projects.

The 86 license applications for proposed major hydroelectric projects currently pending before the Commission provide evidence of the Commission's immediate and urgent need for such plans. In addition, the owners of 285 existing unlicensed projects have either filed or reported to the Commission that they intend to file applications for license. These 285 projects will reduce by more than half the number of unlicensed projects in operation 2 years ago. The basin studies are also needed to appraise the many projects which will be subject to recapture beginning as early as 1968.

As a first step in the appraisal program, a brief planning status report will be prepared for each major river basin summarizing the past and current planning studies and the schedules of planning by other agencies. Approximately 25 basins with priorities for Commission purposes, on which early investigations are not contemplated by other agencies, will be selected for detailed appraisal studies. An estimated 2 to 3 years will be required to complete these studies. Five initial studies will be completed in 1964, additional appraisal studies will be scheduled for completion in 1965 and in 1966. The results of the appraisal studies will then be published, either as reports for single basins or for groups of related basins.

Another aspect of our licensing program warrants special attention. Licenses for projects of substantial size will expire beginning in 1968 and licenses for projects of major size will expire beginning in 1970. As licenses expire, the Government has the right under section 14 of the Federal Power Act to recapture the projects, upon 2 years' notice to the licensee. Licenses for two projects with total installed capacity of 82,000 kilowatts will expire in 1968 and licenses for 25 projects with total installed capacity totaling 429,520 kilowatts will expire in 1970.

Evaluation studies of the streams on which projects subject to early recapture are located must be initiated as soon as possible. Our basin survey program will fill this need. We will begin immediately evaluation studies of 10 streams with projects on which licenses will expire between 1968 and 1970, and expect to

complete studies of several of these streams in 1965. Studies must be completed well before the expiration of the license periods in order that the Commission may recommend to Congress whether the projects should be recaptured by the United States.

An additional task of large dimensions is the accounting necessary to determine the price at which the projects may be recaptured. Stated in general terms, the price on recapture must take into consideration the net investment less an amortization reserve based on excess earnings of the licensee plus severance damages. These determinations are yet to be made. Our manpower requests should be evaluated in light of this urgent additional workload that is now upon us.

We are requesting 18 additional people to speed action on license applications which, if approved, could pour billions of dollars of new construction into our economy. The additional staff will enable us to do a better as well as a faster job. Existing projects which are unlicensed need to be brought under license so that these projects can make the greatest possible contribution to the most comprehensive use of our water resources. Additional staff is needed to move this activity along. The recapture problem adds a new element to the workload for licensed projects which cannot be delayed. These 18 people will not represent additional cost to the Government because their salaries will be largely reimbursed by fees from the licensees.

We also believe it is essential to increase our efforts in the supervision and inspection of licensed projects and are requesting five additional people for this purpose. The Commission must assure itself that projects are constructed in accordance with approved plans and good engineering practices and that constructed projects are operated safely and efficiently. This is especially important with respect to old projects coming under license under our program for unlicensed projects. These inspections are directed toward assuring that the licensees have adequate operating and inspection procedures so that risk of accidents such as those which have occurred in the past year with great loss of life and property in the United States and foreign countries will be minimized.

We are requesting an increase of 23 positions to a total of 198 in the non-Federal hydroelectric projects activity. The increase is due primarily to our licensing work and the program of water resources appraisals and as I have mentioned it is largely reimbursable from fees by licensees.

The final activity I shall discuss is our work on Federal river development projects.

River basin planning activities of Federal agencies have been increasing since 1961 when the President accepted the planning goal of the Senate Select Committee on Water Resources that comprehensive water development plans be prepared for all major river basins of the United States. The Corps of Engineers has expanded its program of comprehensive river basin surveys and has established basin survey coordinating committees to aid in the conduct of these surveys. The Commission has designated representatives of each committee, 12 of which had been formed by the end of fiscal year 1963, and has major responsibilities for studies of the potential development of hydroelectric power in these basins.

Since additional funds were not available for this work in 1964, six positions were financed by reimbursement from the Corps of Engineers. Funds are requested in 1965 for 12 additional positions including the 6 currently financed by the Corps of Engineers.

Summary of 1965 budget

[Dollars in thousands]

	1964		Increase		1965	
	Positions	Amount	Positions	Amount	Positions	Amount
1. Natural gas industry	638	$6,466	26	$517	664	$6,983
2. Electric power industry	198	2,136	25	384	223	2,520
3. Non-Federal hydroelectric projects	175	1,885	23	372	198	2,257
4. Federal river development projects	45	462	12	155	57	617
5. Administration	92	901		57	92	958
Total	1,148	11,850	86	1,485	1,234	13,335

Summary table of increases (1965 over 1964)

Personnel compensation and benefits (86 new positions)	$510
Personnel compensation and benefits (to restore 48 positions not filled in 2d half of 1964)	219
Increase due to pay raise	273
Cost of within-grade promotions	100
Other cost increases such as travel, ADP rental, equipment, supplies, materials, and printing	383
Total increase 1965	1,485

	Positions		Dollar amount
NATURAL GAS INDUSTRY			
Certificates: Increase in natural gas reserve and deliverability requirements activity.	+13	Increased personnel compensation and benefits costs due to 26 new positions.	$158
Rate cases: Increase for independent producer rate proceedings.	+13	Other personnel service cost increases	265
		Increase in level of other costs	94
Total	+26	Total	517
ELECTRIC POWER INDUSTRY			
Regulation of rates:			
Increase in rate investigation	+14	Increased personnel compensation and benefits costs due to 25 new positions.	143
Increase in rate cases	+11	Other personnel service cost increases	140
Power system analysis:		Increase in level of other costs	101
Completion of national power survey	−14		
Increase in power requirements and supply activity.	+14	Total	384
Total	+25		
NON-FEDERAL HYDROELECTRIC PROJECTS			
Licensing:			
Increase for processing applications	+5	Increased personnel compensation and benefits costs due to 23 new positions.	137
Increase in water resources appraisals for hydroelectric licensing.	+9	Other personnel service cost increases	113

Mr. SWIDLER. I would like to hit the highlights of it. I have no connected statement.

Mr. THOMAS. By the time you get through this crowd will connect it for you.

RECENT INCREASES IN EMPLOYMENT

Mr. SWIDLER. This is the third opportunity for the new Kennedy-Johnson Commissioners to report to this committee and present to you an accounting for the results of our activities and to present you with our program for the ensuing fiscal year.

The fiscal 1965 appropriations request is for $13,335,000. That compares with an appropriation for 1964 of $11,850,000, or an increase of $1,485,000. This request would provide for 1,234 positions in 1965, which would be an increase of 86 over the 1,148 maximum positions of 1964.

Mr. THOMAS. We are sort of puzzled. You referred to the Kennedy-Johnson crowd. We cannot understand what you are doing that your predecessors did not do. You are operating under practically the same act. We remember Nelson Lee Smith. He was one of our favorite administrators, happened to be a Republican professor of economics from Dartmouth. He had around 700 or 725 employees throughout the Commission.

You and your colleagues have come in and the first rattle out of the box it was 968, in 1963 it was 1,178, in 1964 you wanted a lot more but you did not quite get them all. You got around 1,150. This year you want to jump up to 1,234. That is what puzzles us. We cannot see what the advantage to the taxpayers is. We did not think the country was going to ruin under your former colleagues on the Commission. We all thought they did a reasonably good job. The country seemed to get along about as well then as it does now. So how do you justify all this increase? We have seen a lot of empire builders, but we give you about the No. 1 spot.

Mr. SWIDLER. That is not really the kind of award I have been seeking.

Mr. THOMAS. We are sort of obliged to give it to you whether you seek it or not. We are just going by the record.

Mr. SWIDLER. Your question, of course, goes to the heart of our request. The reason for the additional people over earlier years is that we are doing more and doing it better. I think our record demonstrates that.

You said, Mr. Chairman, that the country got along and was not going to ruin before we got there. I am sure that is true. But in our field of activity there was a collapse of regulation. This may not have been the most profoundly significant situation in the whole Federal establishment, but we are not responsible for the whole Federal establishment.

In our area of activity we found little but backlogs.

Mr. THOMAS. You will find enough argument in your field without taking on other fields. In regard to where it fell flat on its nose, we have been here a long time, we are not as smart as you are, but we are not the dumbest folks in the world. Do you mean to tell us we did not know what we were doing here for 10 or 12 years before you came along and that you are the Messiah who is going to save the country and show us where we are all wrong? Your egotism is most astounding. This crowd has been here a pretty long time. You come in here saying it has just collapsed, that we did not know what we were doing. That is what you are saying in sum and substance.

Mr. SWIDLER. Mr. Chairman, when I was asked to take this position, it was in recognition——

Mr. THOMAS. Off the record.

(Discussion off the record.)

Mr. EVINS. Mr. Chairman, the justification points out that the electrical power industry has grown, it is the largest industry in the United States. The gas industry has also grown enormously. It is a tremendously big and important industry.

With the growth of these two industries, the Congress has charged the Commission with regulating the industry. The Commission has a tremendous responsibility, and perhaps some of this growth is due to the fact that the industry has grown also. This is pointed out in the justifications.

REGULATORY FUNCTIONS IN RECENT YEARS

Mr. SWIDLER. I go beyond that. There was a collapse of regulation at the time we took over that was widely recognized throughout the United States. The Federal Power Commission was pointed out by many as the prime example of a breakdown of regulation. We were the objects of a study, a special study, made by the White House. You may remember that the Landis report commented that the Federal Power Commission had completely failed in its statutory missions.

I do not want to claim personal credit, Mr. Chairman. We are here defending an appropriation request; not to recognize the state in which this Commission found its work when we came in does not do justice to our request.

Mr. THOMAS. There was criticism of the Interstate Commerce Commission and most regulatory agencies. I do not know that he set yours out as perhaps the worst.

Mr. SWIDLER. It was called the worst, sir.

Mr. EVINS. The Federal Power Commission at that time was criticized for not doing its job effectively. As I recall, back in those days, they were given hard going. At the present time we commend the former Chairmen and former Commissioners for doing a good job, but as I recall at that time, they were given hard going because it was said they were not doing their job as they should. I recall that they were criticized severely for not doing a job.

Now, after they have gone, we give them accolades. At the time Commissioner Swidler came in as Chairman of this Commission, for the very first time there was introduced a new look and a new, fresh approach. I think he should be given a proper opportunity to carry out his enforcement authorities as he interprets his duties as Chairman of the Commission.

Mr. THOMAS. Off the record.

(Discussion off the record.)

Mr. SWIDLER. I would like to offer for the record an article from the September 21, 1963, issue of Business Week, which is not a journal especially favorable to regulation, and to read the first paragraph into the record for the information of the committee:

> When the Kennedy administration took office, the Federal Power Commission was Peck's bad boy among U.S. regulatory agencies. According to one observer, it was an "outstanding example of breakdown in the administrative process."

Mr. THOMAS. Whose statement is that?

Mr. SWIDLER. That is Business Week's article.

Mr. THOMAS. You are sort of building up a strawman. All the agencies were criticized. I do not remember yours as being any worse than some of the rest. You can get any publication, either side of the fence, and get about what you want if you look far enough. Go ahead and offer it for the record. I do not know the purpose of it.

(The article from Business Week follows:)

[From Business Week, Sept. 21, 1963]

EXTRA-HIGH-VOLTAGE AT THE FPC

Under Chairman Joseph C. Swidler, the agency, once nearly overwhelmed by caseload, has been revitalized, but some of its moves are creating uneasiness among both gas and electric men.

When the Kennedy administration took office, the Federal Power Commission was Peck's bad boy among U.S. regulatory agencies. According to one observer, it was an "outstanding example * * * of breakdown in the administrative process."

Today, all that has changed. The head of the American Gas Association, John E. Heyke, Jr., of Brooklyn Union Gas Co., lauds FPC for an "outstanding job in clearing up a terrific backlog of natural gas rate cases. I feel kindly toward FPC."

The architect of this new look is FPC Chairman Joseph C. Swidler (with fellow Commissioners, picture), 57-year-old former General Counsel for the Tennessee Valley Authority who likes to think of himself as a "Federal buff."

Bypassing formal rate proceedings, Swidler has been responsible for getting the pipelines together with their customers to negotiate one rate settlement after another. Funds collected by gas transmission companies subject to refund, pending FPC review of proposed rate increases, have dwindled from $1.1 billion in 1961 to about $440 million. Most of the present total is accounted for by El Paso Natural Gas Co., and a settlement could come at any moment.

But while the Swidler broom has swept clean, his tough aggressive brand of regulation and his persistent bids to expand FPC's jurisdiction are beginning to make utility men nervous in both the gas and electric industries:

This summer Swidler shook up the gas pipeliners by launching an FPC investigation of their 1962 earnings, with an eye toward cutting their rates. FPC has always had power to initiate such proceedings, but this is the first time that gas transmission companies have been the target. One industry economist calls the investigation a "new kind of McCarthyism. If you haven't come asking for a rate increase lately, this means you must be earning too much." So far, nine companies have been tagged, including Cities Service Gas Co., Colorado Interstate Gas Co., and Panhandle Eastern Pipe Line Co.

Swidler is bidding hard to broaden FPC's role in the electric industry. Traditionally, this role has been limited because less than 10 percent of power generated in the United States moves in interstate commerce. But with the development of extra-high-voltage transmission lines, this percentage is going up. For the first time, too, FPC is taking a close look at the rates charged for power already moving over State lines. Swidler inherited on interstate power rate staff of 4; he's shooting for 70 next year. What's more, Swidler recently issued a list of 189 companies over which he claims rate jurisdiction (some immediately contested this claim), and, with fine impartiality, he also wants to gain jurisdiction over rural electric cooperatives.

The perennial issue of giving FPC power to regulate industrial sales of natural gas is before Congress again, and gas industry men say that chance for passage is the "best ever." They attribute this to Swidler's aggressiveness.

Swidler has asked for control over sale of securities by pipeline companies, and he has indicated that he would use this power to force sale by competitive bidding in favor of negotiated underwritings. This might result in lower costs for some pipeline financings, but it also might interfere with a utility's freedom to finance when and where it sees fit. Swidler also has been vainly pushing a plan to take over administration of the 1935 Public Utility Holding Company Act from the Securities and Exchange Commission. This would give FPC a new tool for overseeing many of the Nation's largest electric utilities.

Through all this, Swidler seems to have one guiding principle: low-cost power for the consumer. Some industry critics, however, argue that his pursuit of this goal has been at the expense of another important task: setting clear guidelines as just what constitutes a fair rate of return for companies he regulates.

There is no well-defined standard of a fair return in American law; rather, as the Supreme Court put it in the precedent-setting *Hope Natural Gas* case in 1944: "The ratemaking process * * * involves a balancing of investor and consumer interests * * *."

Quite obviously, this frees FPC from adherence to narrow formulas in setting rates. By the same token, utility analysts say, this puts the burden on regulatory agencies such as FPC to interpret the Court's broad language in a manner that allows businessmen and investors to make intelligent decisions based on past precedents. This, they say, FPC so far has avoided doing. Actually, no issue divides the five members of the Commission more thoroughly than rate-of-return philosophy; in their last opinion, five members all had somewhat different ideas.

Telegraphing his punch.—From Swidler's point of view, his brand of regulation should not have taken the utility industry by surprise. He pledged a tough line immediately after he was named to the job. But it has taken him 2 years to shake FPC free of its regulatory snarl in the gas industry.

The snafu was partly an inevitable consequence of the expansion of gas in the home heating market in the early 1950's; more importantly, it was due to the outright refusal by former FPC members to accept the 1954 Supreme Court decision, involving Phillips Petroleum Co., that gave the Commission responsibility for regulating natural gas producers (as well as the transmission companies).

The FPC tactic had been to lobby for Congress to reverse the decision, a course of action that one observer tabbed "contemptuous of the Supreme Court." Swidler reversed this line and accepted the *Phillips* decision.

This move, which Swidler considers his most significant, had two important consequences: (1) It cleared the way for rate settlements, and (2) made it possible to start refining FPC's area pricing policy (which sets price ceilings for gas within defined areas) into a workable system of regulation.

Thus, Swidler thinks that FPC's major problems are now in hand, and he feels that he has the time and resources to devote to his main goal: greater efficiency and lower costs in both the gas and electric industries. He expects to become more and more controversial in doing so. "I think the honeymoon may be over," a pipeline official comments.

More than a reviewer.—Even if it is, Swidler plans to continue with the style that marks him as almost the model New Frontier regulator. He insists on efficiency at the Commission. He shies away from the sort of anti-industry attacks that characterized regulators of 30 years ago. He describes himself as "a consumer's man," but he is nearly as solicitous of industry.

In this way, he hopes to be a shaper of important decisions in the making, instead of just a reviewer of business decisions already made.

Swidler likes results more than strife over doctrine. He leans to negotiation and compromise. He loves novel solutions to tough problems—the kind with something for the consumer, and something for the company. An example is his dream of a system of incentives in pipeline ratemaking, to allow more profit to the best-managed companies.

Two-way benefit.—In a kind of "regulation-can-be-fun" campaign, Swidler has asked companies for new ideas. He preaches the notion that intelligent regulation that brings down rates can benefit companies as well as their customers.

In short, Swidler is maneuvering the agency into a position to influence the battle coming to a head between natural gas and electricity.

Swidler will be prodding both sides to become better competitors. Already, he is urging the power companies to take advantage of the efficiency of extra-high-voltage transmission, while seeking to keep gas prices stable from the producing fields to the furnaces of New England and Chicago.

The coming pinch.—While Swidler's objectives are hard to argue with, industry will find his policies pinching more and more. "I expect people to want to buy low and sell high," he says, "but what I do ask is that they take the long view."

But a gas distributing company lawyer, disappointed with FPC's results in bringing down producer prices, says: "We've been getting a lot of regulation by press release. The Commission is in danger of hypocrisy when it trumpets victories for the consumer that aren't there."

II. TEAMWORK—ALMOST

Swidler has had the advantage of heading a major regulatory agency composed entirely of Kennedy appointees, three Democrats and two Republicans. This hasn't made life a breeze, however. Early in his term, he got into a bitter personality conflict with Howard Morgan, a maverick Oregonian named by Kennedy who was slated to be dropped from the Commission if he hadn't beaten the President to the punch by declining reappointment.

With Morgan gone, bitter feuding is at an end. But policy differences remain. The two Republicans, Charles R. Ross, former chairman of the Vermont Public Service Commission, and Harold C. Woodward, former Illinois judge, both have differences with the Chairman. So does Democrat Lawrence J. O'Connor, Jr., a Texas oil executive and former administrator of the Federal oil import program. The third Democrat, who was Morgan's replacement, is 35-year-old David S. Black, former general counsel of the Bureau of Public Roads.

But these differences, though sharp, are not likely to upset the balance of power at FPC. With the powers inherent in the chairmanship and a staff of competent assistants in key spots, Swidler is able to dominate Commission operations fairly well with a handpicked cadre. Chief among his staff appointees is Richard A. Solomon, who Swidler recruited from the Justice Department.

In addition, Swidler set up a separate Office of Economics, now headed by Dr. Haskell P. Wald, former assistant director of the Treasury Department's Office of Financial Analysis. Wald's office may number 22 economists by next year. Swidler also brought in a young lawyer-engineer, S. David Freeman, from TVA to act as his personal advisor, and put a widely respected Army Corps of Engineers official, F. Stewart Brown, in as head of the Bureau of Power.

III. A NEW KIND OF REGULATION

With the backlog under control, Swidler has some new departures in store for the gas pipelines.

He would like to see a kind of continuous regulation. The companies would be looked into regularly, and their rates adjusted up or down. A contested case would become a rare event, necessary only to resolve some new policy question.

That's the thought behind the industrywide rate investigation that has alarmed the pipelines recently. Actually, this procedure is routine with many State utility commissions. No utility contends that it is entitled to earn consistently more than its allowed rate of return.

If this is the sort of thing the FPC has in mind, a number of companies quietly will negotiate cuts. Swidler isn't tipping his hand, but if the Commission plans a general rollback of rates, a fight is brewing.

A nod toward higher earnings.—This does not seem to be in the cards. Indeed, the Commission appears to be looking more favorably on somewhat higher earnings. Swidler would like to abolish the FPC's informal 10 to 10.5 percent limit on common stock earnings of the pipelines. This was imposed shortly before he came to the Commission, and took a lot of zip out of pipeline stocks. The limit has become one of the depressing facts of life, says a pipeliner, because high leverage companies, on account of their higher risk, had previously been allowed considerably more than 10 percent earnings on equity.

Swidler believes that a higher proportion of debt, encouraged by letting equity earnings rise, would benefit gas users. He argues, paradoxically, that companies with a high proportion of debt in their capital structures actually have a lower net level of fixed charges than do companies with low debt, thus permitting the high-debt company to cut its rates. In effect, Swidler is saying that for a utility (which must constantly attract new capital) the payment of common dividends is in fact a fixed charge, even though there is no legal requirement to pay. Interest, of course, is tax deductible, while dividends are not.

Commissioner Ross doesn't see it that way. To him, the fiscal integrity of the pipelines comes first. He sees no merit in encouraging riskier companies, and speculates that the consumer actually might lose in the long run if higher leverage brought lower bond credit ratings, and higher interest costs.

Disapproval.—Ross follows this reasoning to sharp disapproval of the trend among some pipeline companies, such as Tennessee Gas Transmission, toward buying enterprises that are not regulated. Ross is against this, particularly when new subsidiaries have no relationship to the oil and gas business.

IV. PRODUCER PUZZLE

Swidler still is far from finished, too, in setting us a workable system for regulating natural gas producers. True, his endorsement of the *Phillips* decision breathed new life into the faltering concept of area pricing. But the legal bickering goes on.

The test case involves fixing ceiling prices for gas in the Permian Basin of west Texas and New Mexico. The argument boils down to whether producers should get 18 cents per thousand cubic feet, as they contend; 16 cents now allowed by the FPC under a temporary ceiling; or 14 cents as the FPC staff argues. The betting now is that the FPC will finally wind up where it is now, at 16 cents, but the importance of the case lies in how it arrives at that figure.

To make sense out of the 27,000 pages of testimony, the hearing examiner, Seymour P. Wenner, took the unusual step of calling his own witness, Charles H. Frazier, director of development of the Philadelphia Gas Works, and a respected industry spokesman.

Frazier goes along with the 16-cent price level which Permian Basin producers could live with. But they are alarmed by Frazier's method of reaching the figure.

A possible rollback.—Producer economists say that Frazier's methods applied to the rich, newer producing areas of southern Louisiana and the Texas gulf coast would result in a price rollback—probably from 20 to 18 cents in Louisiana. This would please the east coast gas distributors, for it would cut their gas costs significantly. But producers say the price isn't high enough for costly offshore production.

Meanwhile, however, the cost of gas in the field has stabilized—partly because of oversupply, partly because of the FPC's determination to hold to its temporary ceilings, reducing them in some areas.

Happy—and unhappy.—Distributors are pleased by this, but some of them are not so happy with Swidler's attempts to influence their rates. They have received huge refunds from the pipelines in the rate settlements and—despite his lack of authority in the intrastate gas business—Swidler is pressuring them into passing on the refunds to their retail customers. This effort has been widely criticized as a heavy-handed push outside FPC's sphere.

It would be unrealistic to expect Swidler and the present FPC to swing away from this basic orientation toward the consumer. FPC officials look forward with gusto to the sharpening battle between electricity and gas, and they see the future growth of the gas industry depending on its ability to compete with electric power.

Swidler sees the FPC as the logical forum for bringing the conflicting forces together. But despite Swidler's long career with TVA, his arbitration promises to be impartial between power sources, though clearly consumer biased; private power companies, indeed, have been pleasantly surprised to find him more interested in cheap kilowatts than in crusading for more public power. Says one power company executive: "At least this gives us a fighting chance."

Mr. JONAS. Mr. Chairman, may I ask who was the man quoted?

Mr. SWIDLER. This is the Landis report, as I recall.

Mr. JONAS. Dr. Landis?

Mr. SWIDLER. James Landis; yes, sir.

Mr. THOMAS. Go ahead. Is he the one who got his income tax balled up about this time because he was so busy he overlooked it for 5 or 6 years?

Mr. JONAS. I think so.

Mr. THOMAS. Go ahead.

Mr. SWIDLER. That is the man.

Mr. JONAS. He is your chief witness?

Mr. SWIDLER. He made the report for the President, sir. Whether he filed his income taxes or not, he was a man with a great deal of experience in administrative matters.

Mr. JONAS. Would you state for the record some of the other people besides Dr. Landis who said there had been a breakdown in the Federal Power Commission activities. You said it was generally accepted and understood that that was the case.

Mr. SWIDLER. I will be glad to.

Mr. JONAS. Put them right there in the record now.

Mr. SWIDLER. I do not recall their names. I will get them for the record. I have not made a point of memorizing these things. I had thought this was something that everybody knew.

Mr. JONAS. I would say to you there was a considerable dispute about that. There are some people in the country who thought they were overregulated under your predecessors. You will not get a unanimous verdict on that.

(The information requested follows:)

SPECIAL MESSAGE TO CONGRESS ON REGULATORY AGENCIES

(President Kennedy, April 13, 1961)

B. *The Federal Power Commission.* One situation, however, is not amenable to this general treatment [certain general recommendations for administrative reform]. This is the condition that exists in the Federal Power Commission. In that Commission some 4,000 rate increases by independent natural gas producers and pipelines are pending and are still unresolved. Under the existing law, these rate increases are suspended but nevertheless go into effect within 6 months after their filing, subject to the provision that such sums as are collected in excess of the rate ultimately found to be reasonable are to be refunded to the consumer. This incredible backlog of cases, consisting frequently of rate increases piled upon rate increases, involves hundreds of millions of dollars deemed ultimately refundable to the consumer. Indeed the annual amount of rate increases so suspended is over $500 million. The total amount of rates collected pursuant to such increases is well over $1 billion.

This situation is paralleled by another just as serious. Under existing procedures and methods for processing applications for pipeline construction, some 193 applications, proposing construction of 5,761 miles of pipeline at a total estimated cost of some $850 million were pending before the Federal Power Commission as of the end of February 1961. It is not to be assumed that all these applications would be granted; but it can safely be assumed that more prompt handling of these matters would release hundreds of millions of dollars for construction, giving substantial employment throughout the country and making firm commitments out of orders for materials that are now merely contingent—orders that in turn would provide jobs for men and women in mills, factories, and foundries.

EXCERPT FROM REPORT ON REGULATORY AGENCIES TO THE PRESIDENT-ELECT

Submitted by the chairman of the Subcommittee on Administrative Practice and Procedure to the Committee on the Judiciary of the U.S. Senate, December 1960, 86th Congress, 2d session

6. The Federal Power Commission without question represents the outstanding example in the Federal Government of the breakdown of the administrative process. The complexity of its problems is no answer to its more than patent failures. These failures relate primarily to the natural gas field, in the Commission's handling of its responsibilities with respect to the transmission and the production of natural gas. Enough has already been said about the delays in this field, so terribly costly to the public and so productive of unemployment in other basic industries (pp. 54–55).

* * * * * * *

* * * primarily leadership and power must be given to its chairman and qualified and dedicated members with the consumer interest at heart must be called into service to correct what has developed into the most dismal failure in our time of the administrative process (p. 58).

[From Fortune, September 1949]

THE UNNATURAL PROBLEMS OF NATURAL GAS

(By Richard Austin Smith)

* * * * * * *

The unhappy fact, however, is that natural gas today is in a mess. Seldom has any industry been so fouled up by bureaucratic lassitude, so burdened with internal confusions and uncertainties. None of the 1,300 distributors who are dependent on interstate gas can confidently make the business decisions upon which systematic growth depends, so long as the Federal Power Commission shirks its statutory responsibility of regulating the price of gas in the interests of the consumer. None of the 100-odd interstate pipelines can know with reasonable certainty what its past or future earnings may be until the FPC sets up a new yardstick for profits and gets cracking on a backlog of well over 2,000 unsettled pipeline-producer rate cases (the bulk of which have been gathering dust for 2 or 3 years). None of the 150 major producers can be sure how well they will do on their interstate sales, which represent over half of all the gas put on the market; after 5 years the Commission has still to come up with a formula for regulating producer prices. On those few occasions when the usually lethargic FPC has stirred its stumps, nobody has had any assurance that its stirrings were in the right direction. Last year courts of appeal reversed more than half of the Commission's contested orders. And this year the Supreme Court, in a unanimous opinion, upbraided the agency for having approved a new high price for gas producers on "insufficient evidence."

[From the American Bar Association Journal, May 1962, vol. 48]

THE FEDERAL POWER COMMISSION AND "THE FOLKLORE OF CAPITALISM"

(By William A. Brewer, District of Columbia Bar)

* * * * * * *

Since then (the *Phillips* decision in 1954), a battle royal has raged on the fields of the Federal Power Commission, the Congress, and the White House. * * * As one result of the strife, the administration of the Federal Power Commission has almost completely broken down.

[From the T-World, published by Tennessee Gas Transmission Co., winter, 1961]

NEW FPC FACES CHALLENGING OPPORTUNITY

* * * * * * *

To a situation which has been deteriorating for years, Chairman Swidler and his new Commission bring promise of fairness and order. They have stated frankly that they knew very little of the gas business prior to their appointments to the Commission. But in the short period of less than half a year, in public speeches and other discussions, they have set a new tone for an entire industry. By open invitation they have obtained a hopeful measure of cooperation from all segments of the industry and have made it again appear worthwhile to work for improvement in the regulatory processes.

There are many avenues through which improvements can be made. The new Commissioners, unbound by past actions of their own, may well be exploring many of these already.

Faced with its inheritance of cases and a procedural pattern which was set by past Commissions and is inadequate to solve present problems, the Commission is presented with a serious challenge. New ground must be plowed. New regulatory literature must be written. Bold action and much courage will be necessary. But however burdensome, the challenge carries with it the opportunity of performing an outstanding public service.

[From the New York Times, Apr. 8, 1962]

KENNEDY'S FPC PLEASES GASMEN

* * * * * * *

Certain definite facts emerge from the present situation. The new Commission, which now comprises five Kennedy appointees, three Democrats, and two Republicans, inherited a tremendous backlog of rate cases. The bulk of them related to producer rates but there were quite a few related to open-rate cases of pipeline companies.

Most people in the industry will concede that the FPC has set out to do just about everything within its power to clean up this backlog.

[From Gas, September 1962]

FPC ACCELERATES

The momentum achieved by FPC under the strong leadership of Chairman Swidler is remarkable and commendable. Acceleration is important to produce FPC policy statements as well as decisions in pending major rate and certificate cases for the guidance of the gas industry. To repair the breakdown of the administrative machine, and to put FPC in high gear are the aims of Chairman Swidler.

[From Forbes, Jan. 1, 1963]

NATURAL GAS

Natural gas executives in 1962 at last began to settle their important rate cases. Until that happened, pipelines could only guess how much of their revenues might have to be refunded. And distributing companies had trouble setting their own rates with State and local regulatory bodies, because they could only guess what the actual cost of the gas they purchased from the pipelines would turn out to be.

To be sure, rate troubles had not exactly stunted the industry's growth. Measured by capital invested, natural gas had become the sixth largest U.S. industry. It provided over a third of the Nation's energy needs in the form of 13 trillion-plus cubic feet of natural gas that brought in revenues of over $6 billion. But the clouds had begun to gather ever since the *Phillips* decision in 1954, when the Federal Power Commission was adjudged responsible for regulating the price of natural gas sold by independent producers moving in interstate commerce. The FPC tried to handle each of the resulting thousands of producer and pipeline cases individually, and fell hopelessly behind. As the years passed, comanies kept making new rate increases (as many as a dozen) before the FPC had decided on their old ones. As a consequence, by December of 1961 the eight largest pipelines had collected a staggering $800 million that they could be ordered to refund.

* * * * * * *

President Willis A. Strauss, of Northern Natural Gas Co., expressed the intense relief that industry executives felt as the uncertainty was dispelled. "For the first time in 5 years," said Strauss, "we know where we stand earningswise. It's only good business to know where the hell you stand running your business."

[From Forbes, Sept. 1, 1963]

* * * As of mid-1962, U.S. pipelines had collected a staggering $1.1 billion subject to refund.

But that threat has now been largely faced and dealt with. * * * Now, for the first time in years, many a pipeline's earning's statement could be trusted to mean what it said.

For this relatively clean slate, the industry can thank the new Kennedy-appointed Federal Power Commission, which, while seldom dealing gently with the pipelines, has nevertheless acted with decision and dispatch. * * *

STATEMENT BY REPRESENTATIVES OF THE AMERICAN PUBLIC POWER ASSOCIATION AND THE NATIONAL RURAL ELECTRIC COOPERATIVE ASSOCIATION TO THE PRESIDENT AT MEETING WITH HIM ON SEPTEMBER 23, 1963

We commend the FPC for assuming, during this administration, an increased role in wholesale electric rate regulation. The Commission is for the first time, closely scrutinizing the rates and practices under which wholesale power is made available by investor-owned utility systems to municipally owned electric distribution systems. Suspension by the Commission of certain wholesale rate increases in the State of Wisconsin has already resulted in a benefit to these municipal systems of approximately $100,000. The Commission staff has recommended, in a formal proceeding, that wholesale power be made available to the municipal power system in Shrewsbury, Mass., at substantially reduced costs. The Commission is also investigating certain inequitable rate schedules imposed upon municipal electric systems and rural co-ops in several States. For these activities the municipal electric utilities are grateful.

Mr. BOLAND. There was an article in Fortune magazine a few years ago highly critical of Federal Power because of its inability to do the work as it should be done. He does have some occasion to talk about the fact that it was criticized, and highly so, for its failure to regulate properly. This is a very difficult agency to run. It is very highly controversial.

BACKLOG SITUATION ON NATURAL GAS CASES

Mr. SWIDLER. Let me give an example, Mr. Chairman. When the Commission took office, there was a backlog of pipeline rate cases which involved over a billion dollars of rates which had been suspended subject to refund. This meant that there was not a major pipeline in the whole country that had a firm financial report. This hung like a cloud over the ability of these pipelines to finance themselves. It meant that hundreds of millions of dollars of rates paid by consumers were held in suspense by the companies who did not know how much of it belonged to them and how much to the consumers.

I am happy to say that situation has been cured. I think it was a very serious one. We have ordered $550 million of refunds. There is no major pipeline rate case stalled on the tracks.

We have now no more than a normal backlog of pipeline rate litigation. We have in all disposed of cases in which the aggregate amount of rates collected subject to refund approached $2 billion. I consider this quite a break from the past and a real achievement.

What I have to show for my years of work are only some claims such as this for having performed a public service. Clearing up the pipeline rate backlog is something that I feel proud of and I think the Commission feels proud of.

Mr. THOMAS. That has been done, but it was not an impossible job to do. You had a tremendous job over there, a blanket order, they could take it or leave it. That was it. It covered dozens upon dozens. I do not know why it took you so long to do it, even at that.

Mr. SWIDLER. That may be, but it was not done before. There were no programs or plans set up for doing it. It was not done with the staff that was previously available and could not have been done with that staff. It was with the support——

Mr. THOMAS. Why?

Mr. SWIDLER. Because it took more people to do this. Each of these cases involved a great deal of manpower. We needed the staff support

which we received in order to dispose of these cases. I am speaking of the pipeline rate cases.

On the producer side the situation was, if anything, just as bad. The Commission had not developed a method of fixing producer rates. It had abandoned individual pricing of the producers.

Mr. THOMAS. You have been over there 3 years. You certainly made some progress. You have about four pricing areas. How many of them are completed? When you get the four completed, it will cover about 75 or 80 percent of your producers throughout the United States. When will you get it completed? You have had 3 years.

Mr. SWIDLER. This is a slow program.

Mr. THOMAS. Suppose you were to leave the Commission. Somebody else would come on. He would say that this fellow had 3 years, he did not do it, here it is, I have done it in 6 months. He would be about in the same position you are putting yourself in now, would he not?

Mr. SWIDLER. He would be entitled to a great deal of credit if he did it in 6 months. To my mind, the greatest administrative challenge that any regulatory agency has faced is to bring gas producers within the scope of a scheme of regulation. I need not tell the members of this committee that they are not well suited to conventional regulation in the way that most utilities are.

It has been necessary to develop a type of regulation which would take into account the realities of the production of natural gas by the great petroleum industry of this country, with all their problems of joint products, with all their problems of dry holes, with all the problems of joint ownership of the wells and of the fields, with all the relationships of prorations and conservation. This is a real challenge.

PERMIAN BASIN CASE

Where we are now, Mr. Chairman, is that we have one case which is moving rapidly toward completion. All the proof is in.

Mr. SHIPLEY. What case is that?

Mr. SWIDLER. That is the Permian Basin case. All the proof is in. The briefs have been filed. Now the examiner has this case for decision.

Mr. SHIPLEY. You have been working on that case about two and a half years?

Mr. SWIDLER. Yes, sir, this is the lead case where we have been forging new tools, you might say.

Mr. SHIPLEY. With the chairman's permission, what have been some of the obstacles that have taken so long on this case? This is an example case and you have been working on it for two and a half years.

Mr. SWIDLER. This case is a consolidation of some 360 separate dockets. There are in this case scores of producers, each with their separate interests, scores of pipelines, and scores of distributors intervening to protect their interests.

Mr. SHIPLEY. Are these independent producers?

Mr. SWIDLER. The word "independent" is used in a double sense in the industry. The term "independent producer" sometimes distinguishes them from the pipeline segment. In that sense, it includes the large producers. Sometimes it is used to designate the smaller units of the industry.

Mr. SHIPLEY. This is what I am interested in.

Mr. SWIDLER. The parties in the Permian case include both the large integrated producers like Phillips and Humble, as well as the smaller producers and their associations.

Mr. SHIPLEY. How many are independents not associated with Humble or one of the other major producers?

Mr. SWIDLER. How many are in this case?

Mr. SHIPLEY. Yes.

Mr. SWIDLER. I cannot answer that question. Mr. Watters may be able to.

Mr. WATTERS. I would have to supply that.

(The information follows:)

For reporting purposes, the Commission considers any independent producer selling less than 10 billion cubic feet of natural gas is a small producer. Using this as a guideline, there are 306 small producers in Permian Basin case.

Mr. SHIPLEY. What percentage, if you can give me a guess?

Mr. SWIDLER. I would not want to guess except that one of the parties in the proceeding is the Texas Independent Producers & Royalty Owners Association, so that a great many of the small producers are represented through a joint spokesman and each is not under the necessity of putting in its own case.

Mr. SHIPLEY. I did not get the answer I wanted. I realize there are many individual companies involved in this. Is this the only reason it has taken 2½ years?

Mr. SWIDLER. No, sir.

Mr. SHIPLEY. What are some of the other reasons?

Mr. SWIDLER. I think the primary reason is feeling our way on the procedures. It was necessary to hold a number of prehearing conferences to determine the scope of the evidence, the order of presentation, nature of proof.

Mr. SHIPLEY. How many hearing days have you had on this case—200?

Mr. SWIDLER. I would say at least that. (The exact number is 254 days.)

Mr. SHIPLEY. Is that exaggerating?

Mr. SWIDLER. No; it is not exaggerating. Another thing that held it up was these hearings were not held consecutively because, as I say, the parties were feeling their way.

STATUS OF NATURAL GAS REGULATION

In the second case, which is the *Southern Louisiana* case, the hearings will be consecutive. We think the hearing in that case can probably be held in about half the time that it took in *Permian*, but *Permian* was the first case in which such a proceeding had ever been tried.

Mr. THOMAS. You are bragging on yourself a little too much; are you not? You never saw a gas well, did you, before you got this job? Your experience has been in the electric power industry and TVA. What do you know about oil and gas? Are you trying to tell us now all the brains in the gas industry are over in the Federal Power Commission?

Mr. SWIDLER. No, sir.

Mr. THOMAS. You did not say it in so many words, but you have intimated that. You have done this, you have done that, you have done the other. It never had been done before. Who furnished all these brains? What did you know about the gas industry before you got this job? Did you ever see a gas well before?

Mr. SWIDLER. No, sir.

Mr. THOMAS. You learned quickly; did you not?

Mr. SWIDLER. I am just trying to do as good a job as I can, sir. I make no claim to being an expert, and in my confirmation hearings I said very frankly that I knew very little about the oil and gas business.

Mr. THOMAS. You have done the impossible, starting from scratch. So, ipso facto, you are the greatest gasman in the world and know more than all of them put together. This was in 3½ short years.

Mr. SWIDLER. Two and a half, sir, as Chairman.

LETTER FROM INDEPENDENT PETROLEUM ASSOCIATION OF AMERICA

(NOTE.—The following letter from the Independent Petroleum Association of America was subsequently received:)

INDEPENDENT PETROLEUM ASSOCIATION OF AMERICA,
Washington, D.C., March 16, 1964.

Hon. ALBERT THOMAS,
House of Representatives,
Washington, D.C.

DEAR CONGRESSMAN THOMAS: The Federal Power Commission recently has submitted to Congress its 1963 annual report. We believe this report is grossly misleading.

In this report it is stated that "the Commission has put into effect a workable plan" for regulating producers of natural gas. It further states that during the year it has made "considerable progress" and "solid gains" in producer regulation. Thus, the report seeks to create the impression that all is well with respect to producer regulation. The facts show to the contrary.

For 10 years, since the Supreme Court *Phillips* decision in 1954, the FPC has been experimenting with producer regulation. Utility-type regulation was abandoned as unworkable after 6 years. For the past 3 years, the FPC has been experimenting with the "area price" method involving 23 separate areas. The first area proceeding is still underway, being far from final determination and even then subject to question as having no legal basis. The record therein shows that in groping for a solution, the Commission is resorting to absurd schemes and theories of regulation. A reply brief, copy of which is enclosed, which we filed in this case cites some examples of these absurdities.

This 10-year experiment by FPC has involved a tremendous waste of public funds, unnecessary costs to the industry, and higher prices to the consumers of natural gas. We believe this situation warrants investigation by the Congress. Your consideration of this matter would be very much appreciated.

Very truly yours,

L. DAN JONES.

UNITED STATES OF AMERICA BEFORE THE FEDERAL POWER COMMISSION

DOCKET NOS. AR61–1, ET AL.

IN THE MATTER OF AREA RATE PROCEEDING ET AL. (PERMIAN BASIN AREA)

Response to Presiding Examiner's Questions to Parties and Reply Brief of Independent Petroleum Association of America

INTRODUCTION

This is in response to the Examiner's communication issued in this proceeding on December 19 requesting parties to answer the following two questions.

1. What is the significance, if any, upon the determination of the fair rate of return of the difference, if any, between the earnings-price ratios of the integrated and the nonintegrated producers?

2. Assuming directionality of search between gas and oil, what is the impact on exploration for gas of a return for gas less than that received for oil?

This is also being submitted as a reply brief in the nature of a general commentary on the Initial Staff Brief filed in this proceeding.

There two matters are joined herein because both (1) the fact that the Examiner finds it necessarily to propound these two questions and (2) the general nature of the Initial Staff Brief are exemplary and highly significant in our opinion in demonstrating a singular point, namely, that this proceeding is now beyond the rule of reason as to both scope and complexity.

These two matters very persuasively reveal that this proceeding has become a morass of experimentations with theoretical ideas and concepts in the continuation of a 9-year administrative effort to find guidelines for the regulation of producers of natural gas.

COMMENTARY

The answers to the two questions posed by the Examiner are irrelevant to the responsibilities of the Commission. The mathematical earnings-price ratio is remote from the field price of natural gas; it is especially inappropriate when applied to the hundreds of small producers who operate in the Permian Basin; it involves the complexities of the stock market including the human element that injects the uncertainties of the speculators; and it is separated from the supply and demand function which has been the historic determinant of the field price of natural gas. Thus, the earnings-price ratio has no function in the determination of the field price of natural gas of either the integrated or nonintegrated producer and, therefore, there is no ascertainable or meaningful significance in the difference in the ratios of the two groups of producers. Also, if natural gas is underpriced in relation to oil, and all other factors are equal which they are not but which we must assume or we become enmeshed in endless assumptions, obviously the producer is going to direct his efforts in the exploration for oil.

Yet, despite the vague, if any, relationship these two questions have to the field price of natural gas, the status of this proceeding has become so involved with superficial considerations that parties in this proceeding are now engrossed in metaphysical excursions into a myriad of meaningless facets of the (1) earnings-price ratio and (2) the simple economic incentive that makes man explore for oil and gas.

With reference to the Initial Staff Brief, it is pertinent to observe that it is over 500 pages long. Three aspects of the brief will illustrate the purpose here.

First, a basic premise of the Staff case rests on the construction of a composite rate base of a selected group of producers. Despite the fact that in 1960, after 6 years of experimentation, the Commission found that it was improper and impractical to apply the traditional utility rate-base concept to producers, we now find that the Staff has retrogressed to that rejected base and, in fact, through the composite process injected further complexities. Although the area pricing approach was designed as a substitute for utility rate-base cost-of-service regulation, after almost 3 years in this proceeding, it is now apparent that the Staff case and objective is a utility rate-base cost-of-service regulation of producers. At the outset, the Staff rests its case on a selected group of producers thereby subjecting the results of the inherent weakness of the sampling process. Aside from the legal questions posed by this approach, there are also questions as to the adequacy or propriety of the mathematical result of the sample, since the effect of omitting many producers will remain an unknown. This process of grouping pro-

ducers in a composite rate base may offer administrative efficacy but it preserves all the weaknesses which led the Commission 3 years ago to relegate the utility rate-base cost-of-service concept. And the composite rate-base cost-of-service approach is especially onerous on small procedures who do not have the personnel or financial resources to cope with the complexities inherent therein.

Second, and even more revealing of the abstruse complexities with which this proceeding is becoming involved, is the Wein econometric theory which is a keystone to the Staff case. In essence, the Wein theory finds that if prices are decreased sufficiently, it follows that demand increases, production increases, and exploration increases. The traditional supply and demand function, tied inextricably to cost of production, which has been vital in developing the U.S. economy second to none in the world, is discarded. So are other factors such as the all-important one of management judgment that is indispensable in the competitive system in which we live. The Wein theory may be a recondite and eminently expertise analysis of an economic theory but it overshoots the day-to-day facts of business life faced by producers of natural gas. And it leads to false and erroneous conclusions. For example, based upon the Wein theory the Staff in its Brief (Page 300) concludes that there is an oversupply of natural gas which imposes upon the Commission, under the Natural Gas Act, the burden of enabling the states to assure a market for shut-in production. The Commission has no responsibility or authority under the law to concern itself with the stimulation of markets or the problems of the states or the industry regarding shut-in capacity. This illustrates how far afield the area pricing approach may go unless corrective action is taken.

Such undertakings and theories as here expounded by the Staff are incompatible with the natural gas producing industry as it exists today, and if imposed upon it, the very nature of the industry would be basically altered in our opinion, bringing about catastrophic upheaval in the economic framework of the industry with chaotic results, damaging both to the consuming public and the Nation's supremacy in energy availability.

Third, another incomprehensible conclusion contained in the Staff Brief (Page 414) is the statement: "* * * admittedly, a wildcat, viewed singly, has only a one-in-nine chance of being successful. But the very materials referred to by respondents show that this has been regularly true through at least the last 15 years. For the prudent industry, then, this aspect of wildcatting appears fairly certain and accountable."

Through this deceptive and circuitous argument, the Staff reaches the unsound conclusion that an independent producer who individually may drill nine wells, all dry, which often happens, is not dealing in a high-risk industry because the overall industry ratio of one successful well for every nine wildcats drilled has existed for 15 years. In other words, since the risk factor has been consistent then it does not exist.

Thus, Staff is contending that if an industry remains risky long enough the risk factor will disappear. This wholly disregards the experiences of individual producers and the effect of the risk factor upon individuals. It ignores the fact that the industry is made up of thousands of individual producers. Based on this faulty premise, the Staff then concludes "production not shown riskier than other petroleum operations," such as marketing refining, and transportation.

Although in this proceeding the Commission is concerned only with natural gas production, the Staff case and argument encompass all segments of the petroleum industry, including the marketing, refining, and transportation of oil as well as gas. The Staff then argues that its study "indicates petroleum to be less risky than most industries."

Applying these conclusions to this proceeding, the Staff seems to be saying that searching for gas in the Permian Basin involves little risk, no more than most industries, and in establishing rates for the sale of gas in the Permian Basin, there is no need to recognize the risks of the individual producer in that area. If the producer can't live under the Staff's criteria, then apparently the Staff would have him quit the business, as independents would be forced to do.

CONCLUSION

There is an urgent need that the Commission responsibility in this proceeding be brought into proper perspective. It is recognized that the Commission is faced with a practical problem of carrying out the mandate of the Phillips decision of 1954. But surely practical men in the Commission, the Staff, and the industry concerned can find reasonable answers and apply workable concepts to the very practical and ordinary business problems faced in the operations of the natural gas producing industry. The answers do not necessarily have to

be simple but they must be subject to ordinary comprehension and within the bounds of practical and feasible applicability. The Examiner in his tentative conclusions in this proceeding has recognized this need by finding that the complexities involved impose a heavy burden on parties herein, particularly the small producers.

At this juncture in the area pricing approach, we submit that the responsibility rests upon the Examiner to bring this proceeding into focus on the practical job at hand by coming forth with a simplified and practical basic guideline for producer regulation.

To this end, we again urge the Examiner to find that "market value" as determined by currently negotiated arm's-length contract be established as the guideline in producer regulation.

It is further urged that the Examiner recommend that the Commission seek a legislative mandate that would establish this standard *by law* so as to lay to rest the legal uncertainties which now plague the entire area pricing concept.

Respectfully submitted.

INDEPENDENT PETROLEUM ASSOCIATION OF AMERICA,
L. DAN JONES, *General Counsel.*
WILLIAM I. POWELL, *Assistant General Counsel.*
By L. DAN JONES, *General Counsel.*

Dated at Washington, D.C., January 15, 1964.

(NOTE.—The following letter was received subsequently from the Federal Power Commission:)

FEDERAL POWER COMMISSION,
Washington, D.C., April 13, 1964.

HON. LINDLEY BECKWORTH,
House of Representatives,
Washington, D.C.

DEAR MR. BECKWORTH: I greatly appreciate the opportunity you have given me to respond to the March 16, 1964, letter sent to you by Mr. L. Dan Jones, general counsel of the Independent Petroleum Association of America. In his letter Mr. Jones takes issue with statements in this Commission's 1963 annual report to the Congress in which it was indicated that the Commission has "put into effect a workable plan" for regulating natural gas prices charged by producers for sales to interstate pipeline companies, and that "considerable progress" and "solid gains" have already been made in this sphere. Mr. Jones argues that the only result of the Commission's efforts has been "a tremendous waste of public funds, unnecessary costs to the industry, and higher prices to the consumers of natural gas." Further, he suggests that the area pricing techniques now being applied by the Commission in fixing the just and reasonable prices for gas sold by producers of natural gas are doomed to failure. I disagree with Mr. Jones on both counts.

This Commission has never minimized what the Supreme Court has recently characterized as "the unusual difficulties inherent in regulating the price of a commodity such as natural gas" (*Wisconsin* v. *F.P.C.*, 373 U.S. 294, 310). We are proud, however, of the progress which has been made in our program for producer regulation since the present Commissioners took over the task in mid-1961.

As the annual report makes clear, we have taken action toward both a permanent and interim solution to producer rate regulation problems. First we are establishing a practical system for fixing just and reasonable producer rates. In the interim it is essential that the Commission take action to hold the price line and stop the price spiral which had characterized the natural gas industry prior to 1961. We believe that we have achieved considerable success in both areas.

As a permanent solution to the problem of producer rates the Commission is proceeding with the so-called area rate approach, a concept which recognizes that it makes neither economic nor administrative sense to fix producer gas prices by determining the individual cost of service for each of the thousands of producers of natural gas. The new area concept is of course not free from problems and Mr. Jones is correct in saying that none of the area proceedings are as yet completed. However, 4 such proceedings are now underway involving approximately 75 percent of all of the gas flowing in interstate commerce, and 10 of the 23 pricing areas referred to by Mr. Jones. The hearings in the first of these proceedings covering the Permian Basin for Texas and New Mexico has been completed and the examiner is now preparing his initial decision; the second case covering all of southern Louisiana, where the Com-

mission and the parties have been able to take advantage of the experience gained in the pilot proceeding, is moving at about twice as fast a pace and already the direct and rebuttal cases of all parties have been introduced into the record.

It would of course not be appropriate for me to comment on the specific matters raised in Mr. Jones' brief in the *Permian* case which he enclosed in his letter to you since that case will soon be before the Commission for decision. I think it should be noted, however, in view of Mr. Jones' suggestion that the area pricing method may have "no legal basis," that the Supreme Court of the United States recently stated that "we have no indication that the area method will fall short of statutory or constitutional standards" and that it "share[d] the Commission's hopes that the area approach may prove to be the ultimate solution" (*Wisconsin* v. *F.P.C.*, 373 U.S. 294, 308-310, decided May 20, 1963).

As I indicated above, the Commission has taken interim measures to exercise its jurisdiction in the public interest pending completion of the area rate proceedings. Specifically the Commission has—

(1) Prescribed guideline prices which are ceilings above which price increases are suspended and new producer sales applications are rejected;

(2) Taken steps to fix the initial inline rate in all areas where either the producers or the consumers have contended that the guideline ceiling is inappropriate;

(3) Established procedures which have drastically shortened the time required to process both contested and uncontested certificate applications; a routine certificate application is now completed in 6 weeks to 2 months;

(4) Encouraged reasonable settlements of outstanding producer rate and certificate proceedings so that all parties could enjoy firm prices at a reasonable level, subject only to the outcome of the area rate proceedings as applied to prices in effect after the conclusion of those proceedings;

(5) Set for immediate disposition those few rate increase proceedings which, if allowed to go into effect, might trigger many new price increases under outstanding certificates.

The results of these various efforts, are, I believe, quite impressive. As indicated in the chart at page 110 of the 1963 annual report, a copy of which is enclosed, field prices of natural gas have practically leveled off in the past 2 years, after a steady period of rapid climb. In the period between July 1, 1961, and January 31, 1964, Commission orders have resulted in refunds by producers of $55 million and prospective reductions of rates amounting to $33 million annually. Moreover, these figures do not reflect the limits of the savings to consumers resulting from other Commission regulatory efforts. Since the development of the area pricing concept hundreds of permanent and temporary certificates have been granted which authorized producers to initiate service at prices below those provided under contracts and applied for in their applications.

The halt in the upward spiral of producer prices has benefited consumers The purchased gas costs of the pipelines have been stabilized and in the past 2½ years the Commission has ordered the pipelines to refund approximately $550 million in cash and to reduce rates for the future. Recent evidence of the success of the Commission's program was the announcement of the Bureau of Labor Statistics on March 31 that the major factor in the reduction in the cost of living index in February of 1964 was the gas service refunds ordered by the Federal Power Commission.

In my opinion the results described above fully justify the statements relating to producer rate regulation contained in our recent annual report. We do not underestimate the magnitude of the task lying ahead, but we are convinced that with continuation of the cooperation we have thus far received from virtually all segments of the natural gas industry, we shall be able to establish and maintain a system of producer regulation which will insure a healthy industry, an industry which provides adequate supplies of natural gas in a manner consistent with the statutory objective of making natural gas available to consumers at the lowest practicable prices.

I hope this information is helpful. Please let me know if you have a further question.

I am sending copies of my reply to all Members of the Congress in view of my understanding that all Members received Mr. Jones' letter.

Mr. Jones' correspondence is returned herewith.

Sincerely,

JOSEPH C. SWIDLER, *Chairman.*

(NOTE.—The following summary from the industry was also received in answer to the above letter:)

The letter of Chairman Swidler of the Federal Power Commission to Representative Beckworth, a copy of which was sent to every Member of Congress, sets forth a number of details which supposedly support his case for what he regards as the progress his Commission has made repecting independent producer regulation.

The only attempt Chairman Swidler makes in answer to the fundamental question—Why has independent producer regulation failed?—is to set forth platitudinous conclusions and new bureaucratic techniques instituted by his Commission. Self-serving declarations, more Government forms and questionnaires, and monstrous new proceedings requiring years to complete have failed to hide the two most crucial conclusions which have developed respecting attempted independent producer regulation: (1) the backlog of Federal Power Commission producer-rate cases continues to increase year after year, and (2) no method has ever been devised by the Federal Power Commission to ascertain "just and reasonable" rates for producers. No amount of verbiage or studies can conceal these facts.

Although Chairman Swidler in his letter sets forth various new regulatory devices promulgated by the Commission, he has not and cannot refute the fact that the Commission has never established a formula for determining just and reasonable rates for producers, nor have they been able to reduce the backlog of producer rate cases. It was 10 years ago, in 1954, when the Supreme Court forced the Federal Power Commission to determine just and reasonable rates for producers. Never has the Chairman admitted that they have not been able to fulfill this Court-imposed statutory duty. He talks about their progress, he talks about new procedures, he talks about what they hope to do, but he has not arrived at a solution. Nor has this been a problem capable of being solved by prior Commissions. For 10 years the case backlog has continued to increase, and for 10 years there has been no formula devised for ascertaining just and reasonable rates. At this point in the attempted regulation of independent producers one cannot blame the Swidler Commission for failing to find the answer, for it is apparent that there is no answer. Chairman Swidler can be blamed for attempting to delude us into believing there is an answer when 10 frustrating years of bureaucratic turmoil tell us otherwise.

Mr. THOMAS. Get over and tell us about the electrical business. You know all about that, too.

Mr. SHIPLEY. Mr. Chairman, before leaving the subject of natural gas, let me say this, if I may.

The efforts of the Federal Power Commission to regulate production of natural gas on an area pricing basis is becoming so complicated and has forced an undeserved burden upon the independent oil and natural gas operators of America. They simply cannot afford the time, personnel, and cost to participate in the lengthy proceedings as they should.

The natural gas producing industry is one of the most competitive segments of the economy. The competitive effort assures the consumers that the oil and natural gas operators must provide effective insurance for active and widespread exploratory and development activity. Unfortunately, with the Federal Power Commission attempting to regulate production of natural gas on an area pricing basis, they are, in fact, forcing many small producers to sell out or merge, rather than remain active in the business of finding and developing oil and gas, which in my opinion is taking away from the free enterprise system, rather than adding to it.

Doing away with the independent producers will also do away with most of the wildcat drilling, which would mean less new gas reserves and which would only result in a disservice to the consuming public through a shortage in supply and increased prices.

Government policy should encourage the widespread search for new gas reserves for this country, rather than hinder.

ELECTRIC POWER INDUSTRY GROWTH

Mr. SWIDLER. On the electrical side, sir, I am frank to say the situation that we found was no better. The Commission had not carried out programs committed to it by statute. There was hardly a pretense of wholesale electric rate regulation. Four people were assigned to this work and could hardly keep track of the filings, and filings did not come in from the major elements in the industry that were subject to jurisdiction.

So far as wholesale rate regulation is concerned, it is practically a brand new activity. You may say this is boasting, but it is the literal fact. Regulation of the electric power industry had collapsed at the time that this Commission took office.

Mr. THOMAS. During the period of that collapse you are talking about, did not the industry perhaps hold its prices down to a figure that is pointed to as a golden period of the industry? It served the growth of the country admirably. Was anybody complaining?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. Tell us about that. That period you are talking about was perhaps one of the most prominent periods of inflation in this country, a great period of growth as well as a great period of inflation. Perhaps the steadiest commodity of all through that period was electric power, was it not, as a general proposition? In some particular localities it may have been out of line, but was not electric power generally considered to be the least inflated commodity pricewise?

Mr. SWIDLER. I think the electric power industry had a very good record; yes, sir. But the price of electric power had gradually crept up. I think this is a trend that has reversed itself in the last couple of years.

JURISDICTION OVER ELECTRIC INDUSTRY

Mr. THOMAS. I noticed you published a list of 192 companies. Are those all the companies you claim jurisdiction over, or what is the purpose of the list?

Mr. SWIDLER. The purpose of the list is to give notice of the companies that on staff study seem to be within the jurisdiction of the Commission. Houston is on the list but has not filed.

Mr. THOMAS. It is generally pointed out—I never saw it in one of your justifications—what part of the total power produced in the United States annually comes under the jurisdiction of the Federal Power Commission? Is it a very small part?

Mr. SWIDLER. Interstate wholesale transactions are about 10 percent of the total industry transactions.

Mr. THOMAS. Ninety percent of the power produced in the country does not come under the jurisdiction of the Federal Power Commission?

Mr. SWIDLER. I would say 90 percent is sold in retail transactions.

Mr. THOMAS. You have no jurisdiction over purely intrastate transactions, do you?

Mr. SWIDLER. No, sir; but I think we would have jurisdiction over many of these companies because they are heavily interconnected and part of interstate power pools. So that while we only perhaps have jurisdiction over 10 percent of the transactions, I think we would probably have a much wider jurisdiction over the companies.

Mr. THOMAS. Is there any demand or pressure upon the Federal Power Commission for you to gradually take jurisdiction over these 90 percent that you have not had jurisdiction over? Where is the demand? Where is the wrong you are going to right by your activities? What is the wrong and how are you going to right it?

Mr. SWIDLER. In the first place, Mr. Chairman——

Mr. THOMAS. What is sacred about Federal regulation? We have it thrown in our faces every day that the Federal Government is moving into industry, taking over. Washington is taking over. Here you are leading the procession. You are hard to carry come November, you know that.

Mr. SWIDLER. Mr. Chairman, the question whether there should be a Federal Power Act is not my question. That is a congressional question.

Mr. THOMAS. You make it your question when you want to enlarge your jurisdiction. You are saying regulation has just gone to pot. You are the savior riding the great white horse, going to save the country. We are asking you: Where are the wrongs? Who has commissioned you to cure the wrongs and what are those wrongs?

Mr. SWIDLER. I am trying to answer your question, sir. I start by saying we did not write the act. We are only commissioned to administer it. The act provides for wholesale rate regulation. It is not for us to repeal it, sir. It is for Congress to repeal it if it wishes to. It is for us to administer it.

If you think there is no need for Federal regulation of the rates of the interstate electric power industry, which is a perfectly respectable point of view, then the Federal Power Act should be revised accordingly. But we took over an act which provides for such regulation.

I personally, Mr. Chairman, believe in that part of the act. I think that the Congress, in providing for wholesale rate regulation by the FPC, enacted a law that is sound.

Mr. THOMAS. How long has the act been in operation?

Mr. SWIDLER. It was passed in 1935, this part of the Federal Power Act. There has been a very uneven administrative history since that time.

ELECTRIC RATES

Mr. THOMAS. For 30 years the country has not gone to pot. Where is the evil that crept in during the prior years?

Mr. SWIDLER. The evil that has crept in is that as a practical matter, wholesale transactions are unregulated and many purchasers of elec-

tricity in interstate commerce are paying excessive and discriminatory rates.

Mr. THOMAS. If they are being robbed and gouged, that is something else.

Mr. SWIDLER. Yes, sir; this is what we are now in the process of looking into.

Mr. THOMAS. What localities are being robbed or gouged or are paying excessive rates? Who is getting the benefit or the money, the illegal money?

Mr. SWIDLER. The power companies, sir.

Mr. THOMAS. Name one. Who is it?

Mr. SWIDLER. I think many of these cases are now in process. I do not want to discuss particular cases. We have a number of cases in which we are now investigating the rates of individual power companies and the fairness of their rate schedules and the fairness of the terms upon which transactions are entered into in interstate commerce.

Mr. THOMAS. You say you do not want to discuss them now. You have prejudged them. You say they are gouging the public, charging excessive rates.

Mr. SWIDLER. I say this as a matter of generality, but I do not want to commit myself on specific situations which are under litigation.

Mr. EVINS. Will the chairman yield?

Mr. THOMAS. Surely.

Mr. EVINS. The chairman is well familiar with the public utilities investigation by the Federal Trade Commission which disclosed the Samuel Insull interests in Chicago, the fact that they had been pirating the consumers. The Department of Justice prosecuted him. He escaped this country in a yacht and went to Italy and never returned.

Following these disclosures, following these pirating practices, the Congress was exercised and passed the Utility Holding Company Act and the Federal regulatory powers for the Commission and the utility industry.

Mr. JONAS. Mr. Chairman, would you yield to me?

Mr. THOMAS. Yes.

STABILITY OF ELECTRIC RATES

Mr. JONAS. Apropos of the response to your question about the stability of utility rates, I would like to read the following into the record, if I may. I am quoting from the Federal Power Commission report of June 30, 1960:

The following table shows average monthly bills for these services—

that is, electric power, current—

since 1935. Based on data from U.S. communities of 2,500 population and more for residential service and 50,000 population and more for commercial and industrial services.

The table shows that in 1935 the average bill for electric service, based upon 250 kilowatt-hours for residential use, was $8.91. By 1960 it had gone down to $7.44.

The average bill for electric service for commercial use, based on 30 kilowatts, 6,000 kilowatt-hours, was $182.23 in 1935, and by 1960 it had gone down to $165.12.

For industrial use per thousand kilowatts, 200,000 kilowatt-hours, it was $3,081 in 1935 and only $3,281 in 1960.

I wish I had the information available to compare the increases in cost of automobiles, groceries, clothing, and everything else in the United States. The only thing I know that has gone down during that period or remained constant has been the cost of electricity for home and commercial consumption. Somebody was doing a pretty good job of regulation if by regulation you mean that your purpose is to hold down the costs to the ultimate consumer.

Mr. EVINS. Will the gentleman yield?

Mr. JONAS. Yes.

Mr. EVINS. I understand the chairman indicated there are several companies whose rates have gone up. Just because a few have held down their rates there might have been an example of a few public power agencies, citing specifically the Tennessee Valley Authority, which was an example of a yardstick measuring cost of electricity, which has kept the rates down all over the country for the benefit of the consumers.

Mr. JONAS. We will not argue the TVA at this point.

Mr. EVINS. Will the Chairman of the Commission cite some cases for the record of utility rates that have gone up in the last few years? My understanding is that rates have been going up a great deal in New England and in other areas far distant from the publicly owned utilities. All utilities are monopolistic by nature.

(The information supplied follows:)

MAJOR WHOLESALE RATE INCREASES 1960 TO DATE

The following list represents total annual amounts of major wholesale rate increases filed with the Federal Power Commission for companies listed. Each figure represents the amount per year by which the cost of power has been increased to one or more buyers at wholesale for resale. The last two increases listed were suspended by the Commission and the increased rates are being collected subject to possible refund at the conclusion of the proceedings to determine whether the increases are justified. Increases in the cost of electricity at wholesale are usually reflected in higher electric bills at retail.

Companies	*Amount*
Ohio Edison Co	$153,900
New England Power Co	1,545,000
Pacific Gas & Electric Co	216,400
Do	246,600
Do	270,500
Wisconsin-Michigan Power Co	233,000
Utah Power & Light Co	136,000

Examples of retail electric rate increases, calendar year 1963 (compiled from published sources)

Companies	Annual rate increase (revenue)	Remarks
Utah Power & Light Co	$2,466,087	5.96 percent net income increase $1,336,341.
Idaho Power Co	2,500,000	7.5 percent general rate increase. Net income increases $1,100,000 annually.
Sierra Pacific Power Co., Nevada	1,059,100	Systemwide increases averaging 8.7 percent.
Puget Sound Power & Light Co	2,200,000	1.5 percent across-board increase.

Mr. JONAS. That may be so. The cost of telephone service has gone up, the cost of Western Union service has gone up. Everything has gone up, but power has gone up less than anything according to the record. I do not know who is responsible.

Mr. EVINS. I placed in the record recently—I will try to find it and put it in this record if I am given permission to do so—the profits and dividends and stock splits of utilities over the past decade. They have been larger and larger than ever before. Their profits have been greater. Their stock splits have been more numerous, and their dividends have been greater. Even with their low-cost rates, they are still not suffering, but making handsome profits. They are still making a profit—greater than ever before. Perhaps they are following the Ford industry plan of volume sales.

Mr. WYMAN. Mr. Chairman.

Mr. THOMAS. Mr. Wyman.

Mr. WYMAN. May I follow up on one or two of the lines of questioning?

Mr. THOMAS. Surely.

Mr. WYMAN. I would like to say this. I served as attorney general of New Hampshire for a long time and had to participate in proceedings before the Public Utility Commission in New Hampshire. I know a rate base governs the rate of return and that rate of return is usually a percentage. Depending upon what is included in the rate base, it is a pretty steady factor for your utilities. The opportunity to gouge the public is regulated by State utility commissions or in the case of interstate commerce by the Federal Power Commission, as I understand it.

The chairman asked you about companies that have been gouging or companies that you felt had practices that might be illustrative of the sort of thing you conceived it the function of the Power Commission to properly regulate.

I would like to ask you now for the names of companies against which proceedings, either administrative or judicial, are pending by the Federal Power Commission or to which the Federal Power Commission is a party.

ELECTRIC RATE PROCEEDINGS

Mr. SWIDLER. I will insert in the record, Mr. Wyman, a list of all proceedings involving rates of electric power companies which are now underway.

Mr. WYMAN. Unless it would be altogether too onerous, would you also insert in the record with respect to the names of companies involved a brief summary of the gist of the complaint against each company in each instance. I do not mean a five-page thing, but I mean overcharging or including in the rate-base things which are not allowable, or what have you.

Mr. THOMAS. A short description of the nature of the action.

Mr. WYMAN. That is right.

Mr. SWIDLER. We will provide a capsule summary of the case.

(The information supplied follows:)

FORMAL ELECTRIC CASES

Name of utility	*Description of case*
Southern California Edison	Complaint by city of Colton, Calif. that company was not charging FPC filed rate. Oral argument held before U.S. Supreme Court on Jan. 14, 1964.
Nevada Power Co	Suspension of proposed rate increase of $26,000 per year to Colorado River Commission of Nevada and California-Pacific Utilities Co. Expanded to include investigation of sale to Southern California Edison Co. for resale in Death Valley area.
Southern California Edison	Suspension of proposed increase of $131,000 per year to city of Colton, Calif.
New England Power Co	Complaint by Municipal Light Department of town of Shrewsbury, Mass., that New England Power will not serve it directly and that it is, therefore, required to take service from Massachusetts Electric Co. (a corporate affiliate of New England Power) at a higher rate.
Wisconsin-Michigan Power Co	Suspension of proposed rate increase of $233,000 per year to 7 municipalities and 2 private power companies.
Southwestern Public Service Co	Suspension of proposed rate decrease of $79,000 per year to 12 cooperatives and investigation of all of the company's wholesale rates.
Carolina Power & Light Co	Company ordered to show cause why certain wholesale sales are not subject to FPC jurisdiction.
Indiana & Michigan Electric Co	Do.
Arkansas Power & Light Co	Do.
Georgia Power Co	Company ordered to show cause why dual rates and restrictive provisions in its wholesale rate schedules are not unjust and unreasonable.
Potomac Edison Co	Investigation of company's wholesale rates on Commission's own motion.
Mississippi Power Co	Company ordered to show cause why certain provisions of its filed rate schedules are not unjust and unreasonable.
Dairyland Power Cooperative, Minnkota Power Cooperative, South Central Rural Electric Cooperative.	Each cooperative ordered to show cause why it should not be required to comply with the requirements of the Federal Power Act.
Eastern Shore Public Service Co. of Maryland.	Complaint by St. Michaels Utilities Commission that the company is charging discriminating rates.
Do	Complaint by Stockton Light & Power Co. that the company is charging excessive and discriminating rates.
Georgia Power Co	Complaint by Crisp County Power Commission seeking an order requiring the company to interconnect with Crisp County and enter into an agreement for the exchange of power.

FORMAL ELECTRIC CASES

Name of utility	*Description of case*
Duke Power Co	Company ordered to show cause why certain restrictive provisions in its wholesale rate schedules are not unjust and unreasonable.
Cincinnati Gas & Electric Co	Investigation of all of the company's wholesale rates on Commission's own motion. Company also ordered to show cause why certain sales are not subject to FPC jurisdiction.
Utah Power & Light Co	Suspension of proposed rate increase of $136,000 and investigation of all of the company's wholesale rates.
Delaware Power & Light Co., Eastern Shore Public Service Co. of Maryland, Eastern Shore Public Service Co. of Virginia	Investigation of all of these companies' wholesale rate schedules and contracts.
Northern States Power Co. (Minn.)	Investigation of all of the company's wholesale rates on the Commission's own motion.

Mr. WYMAN. As I understand it, they cannot get away with very much in the way of overcharging in this field. It might be a half of 1 percent or it might be the inclusion of a plant as part of the rate base or a claim of a valuation placed on it which is too high, but they cannot get away with the kind of gouging practices that perhaps might be consistent with an unregulated industry. Is that not so?

Mr. SWIDLER. Mr. Wyman, I would like to make clear that when I speak to most audiences, I take occasion to express my pride in the two industries that we regulate. I think that both of them have done a good job. It is not my position that this performance started——

Mr. THOMAS. When they are doing a good job, it is a good thing for the country those regulations broke down which you were decrying a while ago.

Mr. SWIDLER. It does not seem that those two things follow. They can do a good job overall and there can still be need for regulation to help them do better, to eliminate inequities, to eliminate instances of high rates, to spur them to even greater efforts at integration of power systems and increased efficiency.

Mr. THOMAS. You mean papa knows best about the regulations.

Mr. EVINS. The chairman would not propose to do away with the police force.

Mr. BOLAND. I hate to think what would happen if they were not regulated.

Mr. WYMAN. Will the chairman yield?

Mr. THOMAS. Mr. Wyman.

Mr. WYMAN. What percentage of the segment of this industry nationwide that you regulate, that is subject to your jurisdiction, what percentage of it is affected by complaints of the nature that have generally been described here? How much of the industry is engaged, even on the basis of contentions by the FPC, in this kind of practice?

Mr. SWIDLER. I have made clear, Mr. Wyman, that the interstate wholesale transactions only cover about 10 percent of the industry.

I am sure that the cases that I mention are a fairly small part of that 10 percent. So that I am not speaking quantitatively of abuses of large extent.

What has happened, Mr. Chairman and members of the committee, is that in the absence of regulation in the past, there has developed in the industry a sort of law of the jungle in wholesale transactions where the treatment a purchaser receives in these transactions depends upon his ability to protect himself and where regulation has not played the role of assuring equity and fairness in interstate dealings.

Mr. WYMAN. With regard to these companies that are subject to your regulation, is the cost of the power transmitted in interstate commerce included in the rate base in regulation of utilities selling intrastate in some States?

Mr. SWIDLER. Usually the same plant is used for both interstate and intrastate transactions, so far as generation and transmission are concerned. Of course, the distribution plant is localized.

Mr. EVINS. Would the chairman yield?

Mr. THOMAS. Mr. Evins.

ELECTRIC POWER SUPPLIERS SUBJECT TO FPC JURISDICTION

Mr. EVINS. Did I understand Chairman Swidler to testify earlier that you had published a list of utilities that were supposed to file subject to your jurisdiction and that a number of these utilities have not filed information with the Commission as required by law?

Mr. SWIDLER. Yes, sir; that is the fact. We have published a list of, I think, 189 companies. I would be glad to provide it for the record.

Mr. EVINS. Without objection, I would like to have it provided for the record.

(The information supplied follows:)

LIST OF ELECTRIC POWER SUPPLIERS WITH ANNUAL OPERATING REVENUES OF $2,500,000 OR MORE CLASSIFIED AS PUBLIC UTILITIES UNDER THE FEDERAL POWER ACT, AS OF JANUARY 1963

FOREWORD

This pamphlet is being published to give the general public and the industry a list of the electric utility systems that are classified as "public utilities" for purposes of the Federal Power Act, as of January 1, 1963.

The "public utility" classification is assigned herein to electric power suppliers which, on the basis of available information, are the owners or operators of facilities for the transmission of electric energy in interstate commerce or for the sale at wholesale for resale of electric energy in interstate commerce within the meaning of the Federal Power Act. This list includes only those electric power suppliers having annual electric operating revenues of $2,500,000 or more. "Public utilities" having annual electric operating revenues of less than $2,500,000 will be included in subsequent editions of this pamphlet. Omission of any suppliers from the list does not mean that such suppliers are not subject to Commission jurisdiction but only that they have not as yet been classified as "public utilities" for purposes of the Federal Power Act. Conversely, the Commission recognizes the legal right of electric power suppliers classified as public utilities herein to challenge that classification in proceedings before the Commission by or against such suppliers.

It is contemplated that revisions of this pamphlet will be published annually, or at more frequent intervals if the extent of the changed listings should warrant. Facts bearing on the completeness and accuracy of the listings will be considered in connection with each revision.

The Federal Power Act provides that the rates and charges for the sale of electric energy at wholesale of a "public utility" are subject to the jurisdiction of the Federal Power Commission; Commission approval is required for the disposition of any of their facilities subject to the jurisdiction of the Commission having a value in excess of $50,000; they are also required to obtain Commission approval of a merger or consolidation of their facilities with those of any other electric system; and they must maintain their accounts in accordance with the Commission's accounting requirements. For a complete statement of these and other requirements of the Federal Power Act applicable to public utilities, reference must be made to the statute.

The Commission has not decided the question of its jurisdiction over cooperatives and for that reason cooperatives that may be public utilities are not included in the list.

Name of power supplier	*Operating in State(s)*
Alabama Power Co	Alabama.
Appalachian Power Co	Tennessee, Virginia, and West Virginia.

ELECTRIC POWER COMPANIES NOT FILED WITH FPC

Mr. EVINS. Would you point out names of some who have not filed?

Mr. SWIDLER. I hesitate because they may have defenses. I do not wish to put the finger on them.

Mr. EVINS. Let me see the list, then. I will ask you. Alabama Power Co. Have they filed with you?

Mr. SWIDLER. Yes, sir, some filings but not their rates to municipals and cooperatives.

Mr. EVINS. Baltimore Gas & Electric?

Mr. SWIDLER. Yes.

Mr. EVINS. California Pacific Utility?

Mr. SWIDLER. Yes.

Mr. EVINS. Commonwealth Edison of Indiana?

Mr. SWIDLER. Chicago.

Mr. EVINS. Indiana. You have several Commonwealth Edisons.

Mr. SWIDLER. I think the answer is "Yes."

Mr. EVINS. Florida Power Corp.?

Mr. SWIDLER. I think the answer to that is "No."

Mr. EVINS. This is the first one on your list that has not filed. Coming down alphabetically, Missouri Edison Co.?

Mr. SWIDLER. No.

Mr. EVINS. Texas Power & Light?

Mr. SWIDLER. Texas Power & Light has not. I do not think any Texas companies have filed except Southwestern Public Service Co. and Gulf States and a few filings from Southwestern Electric Power and El Paso Electric Co.

Another group of companies that think that they have special defenses are the Michigan companies. Detroit Edison and the Consumers Power Co. of Michigan have not filed.

Mr. EVINS. Houston Lighting & Power Co.?

Mr. SWIDLER. No, sir.

Mr. EVINS. Does the Commission have information as to the rates of this company, how many times they have split stocks, how many times they have declared dividends, what their profit situation is?

Mr. SWIDLER. No, sir; I do not think we have that.

Mr. EVINS. You would not have that information unless they provided you with filings?

Mr. SWIDLER. That is right. We wouldn't have all of it.

STATUTORY FILING REQUIREMENTS

Mr. EVINS. Would the General Counsel of the Commission read into the record at this point the section of the law which requires these filings.

Mr. SOLOMON. Section 205 of the Federal Power Act covers this matter. Section 205 (a) and (b) provides that the rates and charges of all public utilities for or in connection with the transmission or sale of electric energy, subject to the jurisdiction of the Commission, shall be just and reasonable and nondiscriminatory.

Section 205(c) requires that these rates be filed with the Commission.

Section 201 determines what is subject to our jurisdiction. It provides that the Commission—reading from 201(b):

> The Commission shall have jurisdiction over all facilities for such transmission or sale of electric energy but shall not have jurisdiction, except as specifically provided in this Part and the Part next following, over facilities used for the generation of electric energy or over facilities used in local distribution or only for transmission of electric energy in intrastate commerce or over facilities for transmission of electric energy consumed wholly by the transmitter.

In other words, the test of whether a company is a public utility is whether it owns or operates facilities used in connection with interstate sale or transmission of electric energy. If it is a public utility, then it is subject to our accounting regulations and a number of other regulations.

Mr. EVINS. The Commission would be unable to determine whether rates are just and fair unless data was supplied to the Commission through the filing procedure. This is a prerequisite to the first determination; is that not correct?

Mr. SOLOMON. That is right. There is, of course, in all of these cases a preliminary question of jurisdiction over both the utility generally and the specific rate.

Mr. EVINS. If the company did not have anything to hide, they would have no hesitancy in voluntarily giving you the information which the Government requested.

Mr. THOMAS. Are there any further questions?

JURISDICTION OVER ELECTRIC COMPANIES

Mr. WYMAN. I cannot help but just ask Mr. Swidler whether or not it is not perhaps a natural reluctance; is it not understandable that there might be a natural reluctance to disclose the internal financial management and arrangements and stock splits and ownership, et cetera, of a company unless it was properly subject to regulation? There is such a thing as a right of business privacy in the absence of power to regulate which is an understandable and not particularly reprehensible business practice. Would you not agree?

Mr. SWIDLER. I assume that a company that did not think it was subject to regulation would not volunteer for it. I have no criticism for companies which think that their circumstances are such as not to bring them within the act. This is something that will have to be tested in formal proceedings.

Nevertheless, as Mr. Evins said, we cannot know the extent of the problem until we determine the jurisdictional questions and until these companies file. When they file and when we have had an opportunity to survey their transactions at wholesale, their accounts, then we will know the extent to which they raise problems under our statute.

The starting point to know whether these companies are observing the requirements of the act is to determine the question of jurisdiction and to bring them within our statute if they belong there, Mr. Wyman. This has never been done before in a comprehensive manner.

Mr. EVINS. I might ask this. In good faith, many utilities, when called upon for information, supply it, then the Commission may very well determine they do not have jurisdiction and the rates are not unfair or unjust and the case is closed; is that right?

Mr. SWIDLER. Yes, sir.

ELECTRIC COMPANY DIVIDENDS

Mr. EVINS. Mr. Chairman, a while ago Chairman Swidler gave us an overall volume figure. I referred to the profit and dividend structure of the electric power companies. I have now been provided with some additional material from my files on this matter. The material which I have relates to the electric power industry, profits and dividends.

This report here shows that the net profits and dividends of private power companies are soaring to new heights. Some of the advertisements that they have been running would indicate that private power is in great danger, or suffering from competition, but nothing could be further from the truth. A recent story shows the actual profits and dividends over a 25-year period. I want to refer to a few of them on the border of the TVA area and then the national average. Middle South Utilities in 1937 had net profits of $4.3 million; in 1962, 25 years later they had net profits of $28 million or a percentage increase of 551-percent profit increase. The Southern Utilities Co., in 1937, had net profits of $9.6 million; in 1962, their net profits were $52.3 million or a 445-percent profit increase.

Then I can cite another one, Kentucky Utilities, which has a profit increase of 709 percent. These are companies on the perimeter, on the outside of the TVA. Here are the figures for the total private power industry of the Nation: In 1937, their net profits were $500 million; in 1962 their net profits were $2,100 million, or an increase of 320 percent.

Whereas the national private power profits all over the Nation increased 320 percent, those on the perimeter of the TVA increased 494 percent. This shows that they are certainly not suffering. To the contrary, their profits are soaring to new heights.

The next table deals with common dividends. The same companies, Middle South Utilities declared dividends in 1937 of $500,000; 1962, they declared dividends of $18,200,000, or a 3,540 percent increase in dividends alone. The Southern Co. in 1937 declared common dividends of $900,000 and in 1962 declared dividends of $35,-300,000, or a percentage increase of 3,882. The average percentage increase in common dividends was 4,050 percent by these companies on the perimeter of the TVA.

For the private power industry as a whole in 1937 there were $300 million in common dividends declared. In 1962, there were $1,300 million in stock dividends declared, or a percentage increase of 333 percent. This is for the Nation as a whole—a 333 percent stock dividend increase as against 4,050 on the periphery of the TVA territory elsewhere. I would like for all of these tables and this statement to be placed in the record.

(The information referred to follows:)

NET PROFITS AND DIVIDENDS OF PRIVATE POWER COMPANIES SOAR TO NEW HEIGHTS

Extension of Remarks of Hon. Joe L. Evins, of Tennessee, in the House of Representatives, Monday, September 30, 1963

Mr. EVINS. Mr. Speaker, the net profits and dividends of the private power companies are soaring to new heights. The "combined" ads of "unfair competition" by the public power companies, notwithstanding and to the contrary.

In these advertisements, the impression is given that private power is in great danger from public power operations.

Nothing could be further from the truth. A recent story in Power Association News points out the folly in these contentions and shows quite clearly the increased profits and increased dividends the private power companies are making.

The story shows that in the 25-year period from 1937 through 1962 the net profits of the Nation's private power industry increased by 320 percent. However, the net profits of the nine private power companies that border on the TVA service area increased their profits by 494 percent over the 25-year period—this net profit increase is more than 1½ times as much as the national average.

The dividends paid on common stock of the private power companies bordering the TVA area also show a greater increase than for the national private power dividend average. While the dividends paid by the Nation's private power companies rose by 333 percent over the 25-year period, the common stock dividends paid by the nine power companies which are neighbors of TVA went up by the astonishing amount of 4,050 percent.

Mr. Speaker, the power companies in fact are doing better than ever and those companies adjacent to the Tennessee Valley area are doing even better than the other companies. As the story points out perhaps these high price advertisements are really aimed at taking the customers' mind off how much profit the private power companies are really making from rate paying customers.

Mr. Speaker, under unanimous consent, I include this very informative article from the September 1963 issue of the Power Association News in the Appendix of the Record.

(The article follows:)

PROFITABLE POWER COMPANIES

If you believed the national advertising of the private power companies, you would be certain that public and co-op power was about to drive the private companies out of business.

Private power complains that public power is "unfair competition," and suggests that the Nation's private power companies are in great danger. But a recent analysis by the Electric Consumers Information Committee has revealed that private power companies in the Southeast "have not only survived this 'dangerous force within,' as an industry propaganda ad put it recently, but they and their stockholders have fared better financially than the private power industry as a whole."

In the 25-year period from 1937 through 1962, the net profits of the Nation's private power industry increased by 320 percent; but the net profits of nine of TVA's neighbors—Middle South Utilities, Southern Co., and Kentucky Utilities—went up to 494 percent, more than 1½ times as much.

On common stock dividends, the record is much more striking. Common dividends paid by the Nation's private power companies rose by 333 percent in the 25-year period; but the common stock dividends paid by these nine power company neighbors of TVA went up by whopping 4,050 percent, more than 10 times as much.

Earlier this year, Time magazine, commenting on TVA's 30th birthday, said: "Despite TVA's gigantic operations there is no evidence that nearby private utilities have been hurt. * * * Competitively lowering rates, the private companies have kept them low—yet the latest studies show that their common stock earnings are twice as high as the U.S. average."

Basically, the facts are these:

1. Competition by example from TVA and its distributors has helped the private power companies around the TVA area * * * stimulating them to lower rates, and through increased efficiency and higher sales of electricity, to record-breaking profits.

2. The public power systems have led the way for the private companies, instituting the low rate-high use policy which the private companies previously had been fearful of. Once the private companies began to lower their own rates, they found that this was a good way to greater electrical growth. In other words, the greatest period of power company profits came not when the companies followed their long time conservative approach but when they adopted the new concept advanced by public power.

Here are the tables that show the remarkable record of profit progress made by these private power companies in the 1937–62 period:

Net profits

Company	1937	1962	Percent increase
Middle South Utilities	$4,300,000	$28,000,000	551
Southern Co.	9,600,000	52,300,000	445
Kentucky Utilities	1,100,000	8,900,000	709
Total	15,000,000	89,200,000	494
Total, private power industry	500,000,000	2,100,0001000	320

Common dividends

Company	1937	1962	Percent increase
Middle South Utilities	$500,000	$18,200,000	3,540
Southern Co.	900,000	35,300,000	3,882
Kentucky Utilities	None	4,600,000	
Total	1,400,000	58,100,000	4,050
Total, private power industry	300,000,000	1,300,000,000	333

The Southern Co. is a holding company, including the Georgia Power Co., Alabama Power Co., Gulf Power Co., and Mississippi Power Co.; the Middle South Utilities is also a holding company, including Arkansas Power & Light, Louisiana Power & Light, Mississippi Power & Light, and New Orleans Public Service.

Here, in quick summary, is the record of the Nation's private power companies for the 1937–62 period:

Net profits—up from $0.5 billion in 1937 to $2.1 billion in 1962, an increase of 320 percent; common stock dividends—up from $0.3 billion in 1937 to $1.3 billion in 1962, an increase of 333 percent; total assets—up from $15.3 billion in 1937 to $49.6 billion in 1962, an increase of 224 percent; and net utility plant—up from $12.4 billion in 1937 to $44.9 billion in 1962, an increase of 262 percent.

The study by Electric Consumers Information Committee also shows that private power companies have already set new records in the first half of 1963—new highs for profits, dividends, and revenues. Nationally, electric revenues for the first half of 1963 were up 5½ percent; net profits were up nearly 6.5 percent; and common stock dividends declared were up 5.3 percent over the first half of 1962.

To any objective observer, it is obvious that the private power companies are doing better than ever. The year 1962 was a record year; the first half of 1963 saw even higher records set.

Frankly, it's difficult to work up a tear for the "poor" power companies. Maybe they spend so much money on negative propaganda advertising—telling people how much they're threatened by public power—to take their customers' minds off how much money the companies are making. In any case, the facts speak for themselves—the power companies are doing better than ever * * * and those companies adjacent to sizable public power areas are doing better than the rest.

Mr. JONAS. Will you yield?

Mr. EVINS. Yes.

RELATION OF INVESTMENT TO DIVIDENDS

Mr. JONAS. That is meaningless unless you know how much capital investment increased over that period.

Mr. EVINS. It shows a picture that they are not suffering.

Mr. JONAS. Wouldn't you agree that the mere recital of total amounts of dividends over such a period of time, to have any meaning whatsoever, you would have to know how much increase there had been in capital investment?

Mr. EVINS. I think those are facts that certainly should be taken into consideration.

Mr. JONAS. Is it true, since you have all that information, that there has been, over that same period, a tremendous increase in capital investment of these utilities?

Mr. EVINS. I would think so.

Mr. JONAS. For example, I do not think it makes too meaningful a statement to say that American Telephone & Telegraph earned x dollars in 1937 and then paid a billion dollars out in dividends in 1963, because you have to know how much they increased their investment during that period of time. Maybe a billion dollars in dividends in 1963, based on the amount of capital investment, was a smaller return than the lower dividend in 1937.

Mr. EVINS. The net profit increase of 320 percent over this period and the 333 percent for the Nation as a whole is not to be discounted. I think that some of these full page ads that they are running, screaming about their hardships and their difficulties, with a token of competition, is designed to masquerade and to cover up and to take the customer's mind off of the profits and the dividends.

Mr. THOMAS. Any further questions, gentlemen?

VOLUNTARY COMPLIANCE WITH FEDERAL POWER ACT

Mr. BOLAND. Are a number of these cases in the list you were reading from not subject to FPC jurisdiction? Are some willing to file although they are not subject to the act?

Mr. SWIDLER. We would not assert any authority over a company that we did not think was subject to our statute.

Mr. BOLAND. Have there been any voluntary filings?

Mr. SWIDLER. Many, many voluntary filings. We have had filings which in 1 year I think tripled those of the previous year. We are only beginning now to get compliance with the statute. This is the irony of the chairman's question. What are you doing? We are administering our statute that was not administered before, Mr. Chairman.

DEGREE OF REGULATION

Mr. THOMAS. May I interrupt? As to your jurisdiction—I speak for myself and I imagine for most of the members here—we all are for regulation, we know the value of it. I, for one, just do not want you to overregulate anybody.

Mr. SWIDLER. No, sir. I agree.

Mr. THOMAS. We have that thrown at us, we on this side of the table. We have to go to the people every 2 years. You never have to go to them. We have to carry you.

Mr. SWIDLER. Mr. Chairman, you do not have——

Mr. THOMAS. Wait until I get through. It is said one of your sins is that you are overregulating. Whether it is true or not in all instances I do not know. We will have a pretty good idea before we get through today. As far as I am concerned, I believe in a reasonable amount of regulation.

Specifically as far as your jurisdiction is concerned in the Federal Power Commission, a company has to be engaged in interstate commerce.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. If he is not selling to anybody in interstate commerce, and you write and ask him to submit you information, he does not have to do it; does he?

Mr. SWIDLER. If he has no facilities employed in the transmission or sale of electricity in interstate commerce, he is not required to file as a public utility with us.

Mr. THOMAS. You cannot very well criticize him. Half the criticism that the Members of Congress get from industry—big, little, and so forth—is that they are subject to the various controls, the paperwork, we have to fill out these forms.

You cannot blame this fellow who does not think he is subject to your jurisdiction for not filling out your forms because he knows when he once starts filling them out, you are going to come back in the next 30 days, or 10 days, and ask him for three times that much more. I am stating the practical view. I am not telling you anything you do not know. You cannot say that he is a bad operator, a poor operator, an expensive operator if he does not comply with your request if, in his judgment, he should not be under your jurisdiction. If he is under your jurisdiction, that is something else.

Mr. SWIDLER. I have no critical feeling whatever about companies that raise substantial legal questions relating to our jurisdiction. I

am sure if I were counsel for these companies, I would do the same. These are questions that need to be resolved. A number of cases raise very respectable legal questions upon which reasonable people may differ. We need to determine them. I think the Commission must find out who it is regulating. We must know, they must know. Then you can have peace.

Mr. EVINS. Will the chairman yield?

Mr. THOMAS. Surely.

Mr. EVINS. I certainly agree with what the chairman just said about proper regulation. Members on this side of the table feel that there should be regulation but not overregulating. Any criticism that I may have ever expressed concerning Chairman Swidler was directed toward his lack of exercising the authority invested in him by the Congress.

Let me add one thing further. If there is any place in the world where there is opportunity or should be an opportunity for a little test case or a few test cases, as to whether there is going to be underregulating or overregulating, I think it ought to be on the side of overregulating in these industries and particularly the private utilities, all in the public interest.

Mr. SWIDLER. I might say, if you are interested, Mr. Chairman, my own philosophy of regulation is to regulate with as light a hand as possible. I am not an advocate of taking over the responsibilities of management. On the contrary. But we all know that these are basic industries, that in almost all the rest of the world they have been taken over by the Government in order to assure that they function in the public interest.

They are operated here by private enterprise because we have developed a system of regulation which at the same time protects the interests of the private operators of these great systems while insuring that their operations conform with the requirements of our national society.

Mr. BOLAND. I think that is a good statement of your philosophy and is a very fair one.

Mr. SWIDLER. Thank you. While regulation should not be heavy-handed, it should not be a sham, either. Many companies claim quite freely that they are subject to State and Federal regulation. But some have not yet filed with us.

ELECTRIC RATE FILING REQUIREMENTS

Mr. SHIPLEY. May I interrupt? What does filing with you require?

Mr. SWIDLER. It takes filing their rate schedules for interstate transactions, their wholesale transactions in interstate commerce, and to comply with our accounting requirements.

Mr. SHIPLEY. Do you have a questionnaire you send out?

Mr. SWIDLER. No, we require them to file their rate schedules and to file annual reports and original cost material.

Mr. SHIPLEY. Where do you go from there after they file this? What is the next step?

Mr. SWIDLER. When they file these reports and their wholesale rate schedules, they are analyzed to see whether on their face they raise questions of fairness that require immediate investigation. If they do not, they are accepted for filing. There is no burden on the company unless a complaint should be filed, or the Commission later initiates an investigation.

Because of the fact that there has been such haphazard administration of the power provisions of our statute, our experience has been that most of the thousand or so of wholesale purchasers of power in interstate commerce do not know that the Federal Power Commission was created to protect them. I think it will require some years of administration before they realize that they have a forum where they can go when they are aggrieved. But they are beginning to come to us.

Mr. SHIPLEY. I am interested in the paperwork involved in this, how often they have to refile, what they do after you file a complaint, and what they are subject to.

Mr. SWIDLER. When a complaint is filed, the company would, of course, be given an opportunity to answer. Then the case would normally be set for hearing if it could not be worked out by agreement. Frequently these things can be adjusted by conference. It would be set for hearing and heard before an examiner in contested proceedings, which are the exception.

So far as the utilities books are concerned, their accounts, they would become subject to our accounting regulations. To the extent that money was available, we would make studies of their original cost data to be sure their costs were not inflated. We would periodically test check their accounts to be sure they were complying with our system of accounts.

NATURAL GAS QUESTIONNAIRE

Mr. SHIPLEY. To be specific, on the *Permian Basin* case, did you send out a questionnaire to gain information?

Mr. SWIDLER. We did send out a questionnaire in connection with our new proceedings which also cover the Permian area. Maybe you have that questionnaire in mind. We recently sent out a comprehensive questionnaire to all large natural gas producers, those that produced more than 10 million thousand cubic feet per year so that we would have the basic data with which to proceed with gas producer regulation.

Mr. SHIPLEY. How have they been responding to that?

Mr. SWIDLER. The data for filing has not arrived yet. I presume that all will be filed in good order.

You understand that the natural gas producers do not file comprehensive annual reports such as we require from the pipelines or the electric power companies.

Mr. SHIPLEY. I realize that.

Mr. SWIDLER. We therefore do not have in our files the body of information that is required to ground these area rates proceedings in the facts. It has been necessary to acquire this information by sending out these questionnaires.

Mr. SHIPLEY. I would like to have one of those questionnaires, if I may. Would you see that I get one sent to my office?

Mr. SWIDLER. I would be very glad to do so.

Mr. SHIPLEY. Regulation we may need but in my opinion, the way the Commission has gone about this has maybe been a little bit too fast. Maybe it has deteriorated over the years, I do not know. I am not qualified to say. I think, frankly, you are moving too fast in the area and trying to do too much too fast. I think that the case that we discussed where it has taken 2½ years, I cannot see——

Mr. EVINS. It is not very fast.

Mr. SHIPLEY. That is what I mean. There is something wrong, in my opinion, or they could have had this thing settled long ago. I do not understand how the independents involved—I say independents meaning small independent producers—can keep up with the proceedings or functions or anything else that are going on with the Federal Power Commission. I know it is very expensive for them. Most of them I have knowledge of cannot afford this added cost. I just say that I think you are moving a little too fast in this field. That is all, Mr. Chairman.

Mr. THOMAS. Mr. Wyman.

DEFINITION OF INTERSTATE TRANSACTIONS

Mr. WYMAN. Mr. Chairman, what constitutes one of these companies engaging in interstate commerce, from your understanding of the requirements of the law?

Mr. SWIDLER. In general, a company which has facilities which are used for interstate transactions.

Mr. WYMAN. Merely because, for example, the company might use wire in its intrastate transmission lines that it acquired outside of the State would not put it in interstate commerce, would it?

Mr. SWIDLER. This is a significant thing. Becoming a member of an interstate power pool is, I think, a significant factor in determining, perhaps the most significant factor, in determining whether that company is subject to the Federal Power Commission.

Mr. BOLAND. Excuse me. Was that the correct response? Were you talking about the purchase of wire which is used by a company in the intrastate transmission of electric energy but not transmitting the electric energy over a State boundary? Are you just talking about equipment?

Mr. WYMAN. I will clear that up. Do I understand you to say that you have a basis for FPC jurisdiction even though a particular company within a State does not transmit any power across State lines?

Mr. SWIDLER. No, sir, I am not sure I understood your question. It may be that——

Mr. WYMAN. Let me illustrate it and perhaps help. Suppose we have a little company in a small town within a State—there are not too many—that has lines that go out to perhaps five or six other towns, a privately owned company. We will say it buys its wire from some wire company in Ohio, another State. It strings its lines up. It has on its shelves a lot of goods that were purchased in other States. It incorporates in its plant an assembly system of goods purchased in other States. Does this put it in interstate commerce?

Mr. SWIDLER. No, sir. I did misunderstand your question.

Mr. WYMAN. Is there anything in the language of your act which uses the phrase "affecting commerce" as a basis for jurisdiction of the Federal Power Commission?

Mr. SWIDLER. I think it is "in interstate commerce."

Mr. WYMAN. Generally speaking, for there to be a claim of jurisdiction there must be activity of a company that directly carries power as a part of a pool or otherwise across State lines?

Mr. SWIDLER. Were it not interconnected with systems across State lines, I do not see how we would have jurisdiction over the company, under Part II.

Mr. WYMAN. I have reference, of course, to the new approach in the civil rights bill which uses the phase "affecting commerce" for the basis of claiming that activities are in interstate commerce.

Mr. SWIDLER. No, sir. Under Part II of the Federal Power Act, that is not a criterion.

Mr. THOMAS. Are there any further general questions?

MAGNITUDE OF ELECTRIC POWER AND GAS INDUSTRIES

Mr. EVINS. Would it be possible for the chairman to spell out for the record the volume of business of the utilities and the gas companies and give us some round figures of the enormity of the industries you regulate as to size and volume dollarwise?

Mr. SWIDLER. I can give that to you in round figures.

Mr. EVINS. Numbers of industries, amount of investment, amount of profits, size of the industry. Give us a picture of all.

Mr. SWIDLER. The electric power industry in terms of investment is the largest in the country. Its investment is in the order of $70 billion. I think its revenues are running something over a billion dollars a month, on the order of $13 billion or $14 billion a year gross revenue.

The natural gas industry is roughly half the size. It has an investment in the order of about $20 billion. Its revenues are in the order of about $6 billion a year.

About 20 percent of all the energy that is used in the United States is used in the form of electric energy. This is a percentage which is rapidly increasing.

HYDROELECTRIC POWER

Mr. THOMAS. What part of that electrical energy is produced hydroelectrically?

Mr. SWIDLER. About 20 percent.

Mr. THOMAS. Steam is about 80 percent?

Mr. SWIDLER. Steam is about 80 percent.

Mr. THOMAS. That is a big percentage, that 20 percent.

Mr. EVINS. That is all over the United States?

Mr. SWIDLER. Yes.

Mr. BOLAND. I understand that the movement now seems to be toward hydroelectric. Some statements I read a few weeks ago indicated that the production of energy by hydroelectric plants instead of by steam is probably the best area to get into. Is this so?

Mr. SWIDLER. No, sir; but the share of hydro is holding up surprisingly well. Only about a fourth of this Nation's hydroelectric resources have been developed. We have on file 105 applications for

major licenses. This volume of work is very heavy. Of course, inasmuch as——

Mr. THOMAS. At a cost of $4 billion, I believe.

Mr. SWIDLER. Something like $2 billion. It is a very large amount. these require processing. The hydropower is a renewable resource and to the extent that hydropower is economical, we ought to encourage license applications.

Mr. THOMAS. Mr. Boland raises the question of what is the economy involved between hydroelectric and steam? You take the fairest point of advantage for hydroplants and say a steamplant located right over a coal mine where you have a low cost. How would the cost average out between the two?

Mr. SWIDLER. There is a very great variation in hydro cost depending on the site. You could not equal the very best hydro sites with any thermal source, some of the best sites on the Columbia, for example, or on the St. Lawrence system.

On the other hand, poor hydro sites are not competitive with steamplants at all.

PUMPED STORAGE

You may be thinking, Mr. Boland, about the new developments in pumped storage, which is a relative novelty. Pumped storage is a special kind of hydro project now coming into very wide use. In effect, it is a way of storing steampower. It does not require a great deal of water. Any site where you have a modest amount of water and a great deal of head is suitable. Two pools at different elevations are required. You can pump the water at night from a lower pool into the higher pool with off-peak steampower and use that stored water to generate hydropower during the peak hours of the next day. You pump for perhaps 16 hours and you can generate about eight. You obtain something on the order of 2 kilowatt-hours of peak power for every 3 kilowatt-hours of off-peak power. This is the great charm of these pumped storage plants, which are coming into increasing use as manufacturers are learning to make dependable reversible pumped storage units. We have a good many applications for these projects. I think the number of applications will increase.

NUMBER OF POWER CONSUMERS

Mr. EVINS. You have given us a rather good picture of the volume and size of the industries. I do not believe you touched on numbers of consumers in each.

Mr. SWIDLER. The electric power industry has something over 60 million consumers. The natural gas industry has about 34 million customers. Of course, the natural gas lines do not go out into many of the smaller communities, into the country areas, the way electric power lines do. Nowadays there is virtually a hundred percent electrification in the United States.

JURISDICTION OVER COOPERATIVES

Mr. THOMAS. In your justification you mentioned with quite a bit of interest in two or three different spots in your justification about your jurisdiction or your alleged jurisdiction over cooperatives. We

have seen through the years on this side of the table that regardless of what is said to the contrary, perhaps one of the most popular things that the Congress has done in a long time is to make available to rural communities electric power. What jurisdiction are you asserting now over these cooperatives and what are you basing your jurisdiction on?

Mr. SWIDLER. We have now proceedings underway involving three electric power cooperatives to determine whether we have jurisdiction. The question of jurisdiction arises because in the language our General Counsel read to you we have jurisdiction over persons operating facilities in interstate commerce.

Mr. THOMAS. Do you have any demand from individual farm users requesting that you take jurisdiction or do you have any demand from co-ops themselves that you take jurisdiction?

Mr. SWIDLER. No, sir.

Mr. THOMAS. What is the object of your asserting jurisdiction, then?

Mr. SWIDLER. We are talking only about those cooperatives which sell power at wholesale in interstate commerce. We are not talking about the distribution cooperatives. We are not talking about roughly the thousand——

Mr. THOMAS. Farm co-ops?

Mr. SWIDLER. We are not talking about those. We are talking about interstate transmission cooperatives. These are primarily the ones involved. These are increasingly active in interstate pools. We look forward to the day when they will have even heavier responsibilities in combination with the private companies and the public systems.

I think there is a real question whether we should arbitrarily exclude them.

Mr. THOMAS. Does your statement apply to a farm co-op that serves purely a farm communuity if it then goes across the State line and serves purely another farm community?

Mr. SWIDLER. The statute exempts distribution operations. In the case of a purely distribution cooperative, we would have no jurisdiction.

Mr. THOMAS. Is that specifically set out? Will you read into the record at this point that language?

Mr. SWIDLER. This is section 201(b):

> The provisions of this Part shall apply to the transmission of electric energy in interstate commerce and to the sale of electric energy at wholesale in interstate commerce, but shall not apply to any other sale of electric energy or deprive a State or State commission of its lawful authority now exercised over the exportation of hydroelectric energy which is transmitted across a State line. The Commission shall have jurisdiction over all facilities for such transmission or sale of electric energy, but shall not have jurisdiction except as specifically provided in this Part and the Part next following, over facilities used for the generation of electric energy or over facilities used in local distribution or only for the transmission of electric energy in intrastate commerce, or over facilities for the transmission of electric energy consumed wholly by the transmitter.

What this exempts are the industry plants; generation as such is exempted so that if the Ford Motor Co. has a generating plant which is a part of its industry complex, and not interconnected with public systems——

Mr. THOMAS. That language——

Mr. SWIDLER. We would have no jurisdiction.

Mr. THOMAS. That answer does not answer the question.

Mr. SWIDLER. "Or over facilities used in local distribution" was the key language. I was trying to explain some of the other exemptions at the same time. If the facilities are used in local distribution they would not be a basis for the assertion of jurisdiction by this Commission.

Mr. JONAS. Mr. Chairman.

Mr. THOMAS. Yes.

FPC 1961 ACTIVITIES IN NATURAL GAS

Mr. JONAS. I was not expecting the chairman to say that there had been a complete breakdown in the regulatory activities of the Federal Power Commission when he took office and I, therefore, am not prepared to discuss that with him but I have had the clerk hand me a copy of our hearings on January 21, 1960, and with your permission I would like to read several colloquys that occurred here with the then chairman, which may give the committee and the record a little picture—and it is not thorough or complete—of the activities of the Commission in the year preceding the one that Mr. Swidler took over.

Mr. SWIDLER. Mr. Jonas, I did not say that there was a complete breakdown in the regulatory activities of the Commission. At least I did not mean to. I have pointed out some areas in which there was a breakdown; wholesale electric power rate regulation was one such area. In other areas there was a great deal of effective activity.

Mr. JONAS. I thought you referred to the gas problem as one of the areas in which there was a breakdown.

Mr. SWIDLER. Yes, sir. I do think on the natural gas side there was.

Mr. JONAS. Of course, the Commission's jurisdiction was not completely established until the *Phillips* case; is that correct?

Mr. SWIDLER. Until 1954; yes, sir.

Mr. JONAS. Mr. Gatchell, who was with the Commission at that time, at the time I referred to—I forget what his title is.

Mr. THOMAS. He was chief counsel and had been for many years.

Mr. JONAS. He responded to a question asked about activity in the natural gas industry division with this statement:

> I can give you some figures on that period. During the period from June 7, 1954, when the *Phillips* case was decided, up to December 31, 1959, the Commission received 42,462 rate filings by independent producers and it had to act on all of those carrying increases within 30 days of the filing.
>
> During that period we had 12,339 certificate filings. It disposed of 9,700 certificate filings during that period. None of the work on independent producers had come before the Commission prior to June 1954. Within that period that is the number of cases that the Commission had been faced with over and above the certificate and rate work it had on pipeline companies prior thereto.

Then later on my colleague, Mr. Evins, asked this question:

> Before the *Phillips* case you said you had 42,000 rate filings and you had to act on them by statute within 30 days.
>
> Mr. GATCHELL. When they file a change in rates the Commission must act on it within 30 days if they want to suspend them. If they go into effect without suspension the Commission, may, under section 5(a) undertake its own investigation and change those rates from the date of its determination. If they are suspended, they can be placed into effect at the end of the suspension period

without the Commission's consent. Then the Commission continues its investigation and whatever amount it finds is not justified has to be refunded.

Mr. EVINS. You did act on those 43,000 cases within the 30-day period?

Mr. GATCHELL. Yes, sir.

Mr. EVINS. How many of those were because of rate increases?

Mr. GATCHELL. The Commission has suspended as of November 30, 1959, $139 million of independent producer rate increases.

Mr. EVINS.—

and I am skipping a couple of questions—

How many cases is that out of the 42,000 filings?

Mr. GATCHELL. 2,282. Rates have been suspended and still would be pending as of November 30. A great many others had been suspended prior to that. I do not have the figures.

Later on Mr. Evins asked another question:

Of the 42,000 cases you talk about, you take pride in stating you suspended $137 million of rate increases annually but you do not have the figures as to how many of those cases represented actual rate increases to the public.

Skipping a few lines:

Mr. KALLINA. On independent producers during calendar 1939 the Commission allowed 33 tax increases amounting to $132,000 and the Commission allowed 806 other rate increases without suspension, amounting to $5,430,000, so the total allowed by the Commission during calendar year 1959 was 839 increases, aggregating $5,612,000. During that same period the Commission suspended 1,265 increases, aggregating 69½—

and then the reporter did not get what he meant by 69½; I don't know whether he is talking about millions or not.

Mr. EVINS. Of that $5½ million of increase for 1959 that would be about the average? That was calendar year 1959.

Mr. KALLINA. As against the $5.6 million the Commission suspended 1,265 cases, aggregating $69,500,000. In 1958 the Commission suspended 1,064 increases, aggregating $37,612,000.

Mr. EVINS. That is both sides of the coin and it is a good picture. One year you suspended an amount of $69 million and the next year $37 million, as compared to $5 and $7 million of increases.

Mr. KALLINA. That illustrates the point I was trying to make about the difficulty of striking an average. You just cannot control the increases as they come in from the producers. Each one has to be analyzed and the Commission has to act on each one of them as they come in.

So it would appear in that year at least the Commission was quite active. It had a backlog of 43,000 filings dumped in its lap following the *Phillips* decision and the vast majority of them were suspended and the Commission apparently was doing a pretty good job of denying increases because the denials of requested increases far exceeded the increases granted.

Mr. SWIDLER. Yes, sir. I do not want to downrate the work of our predecessors but the significant thing in what you read was the extent of the suspensions without disposing of the suspended cases. That is what created the backlog that confronted us. It is much easier to suspend, which in effect initiates a case, than it is to take that case and run it through a rate proceeding and dispose of it by settlement or decision.

EXTENT OF PROGRESS ON SUSPENSION CASES BY PRIOR COMMISSION

Mr. JONAS. Will you tell us, when you came into office, had any work been done on these suspensions?

Mr. SWIDLER. Yes, sir.

Mr. JONAS. Isn't it true that in many cases you had to have a field investigation, you had to have a hearing examiner's investigation, and then you finally had to have board action? You would not say there had not been anything done on these cases.

Mr. SWIDLER. A great deal of work had been done but not any of them had been disposed of.

Mr. JONAS. You would not say not any of them. That would be an exaggeration, would it not?

Mr. SWIDLER. I will try to find out exactly how many had been disposed of, but not many.

Mr. JONAS. I do not want to hold the hearing up, but there is some information indicating here that a substantial amount of these cases from year to year had been disposed of.

Mr. SWINDLER. My associates tell me that the Commission had not disposed of any major producer cases.

Mr. JONAS. Any major producer cases?

Mr. SWIDLER. Yes, sir.

Mr. JONAS. How many of the 43,000 were major?

Mr. SWIDLER. These are filings, sir. The filings are either accepted or suspended. I do not know how many of them were major, but when——

Mr. JONAS. Ask your associate who volunteered the information that none was completed. Ask him how many were involved. How many were pending when you took over, major cases.

Mr. SWIDLER. May I put that in the record?

Mr. THOMAS. There is more trouble with a little case than in a major one.

Mr. JONAS. I would like to know how far along these major cases were toward disposition. You had led me to believe in your opening statement that there had not been anything done on them. You had to start from scratch. Now if some of these cases were 50-percent completed you would at least have to give somebody else credit for 50 percent of the work. If some were 75-percent completed, the credit would have to be divided also, would it not?

Mr. SWIDLER. I am glad to do that. A good many of these cases had already been in hearing. There had been accumulated a great deal of data that was indispensable to the settlement and a lot of them had gone a substantial way through the process of disposal, but none of them had finally been liquidated.

Mr. JONAS. If you are going to supply the information for the record, give the date when these cases were instituted and the extent to which they had moved toward completion.

Mr. EVINS. Will the gentleman yield?

Mr. THOMAS. Are you through, Mr. Jonas?

Mr. JONAS. Yes, sir.

Mr. SWIDLER. What I said about no major case having been disposed of related to producer cases; on the pipeline side I think there had been some cases disposed of, but there was, nevertheless, this backlog which was almost hopeless.

Mr. THOMAS. Mr. Chairman, you do not want to low-rate anybody?

Mr. SWIDLER. No, sir.

Mr. THOMAS. You are not of that disposition, but your opening statement clearly low-rated everybody. It sort of low-rated the committee in my judgment, as if we had been handing out money, not

knowing what we were doing. Isn't it a fair statement to say that your predecessors were plowing in absolutely virgin soil?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. They had done a lot of work. You have come along and you had the advantage of what they had done already in this virgin soil and you have carried it on and in your opinion you have carried it on expeditiously.

I think we will all agree with you, too. Isn't that a fair statement?

Mr. SWIDLER. I am very pleased to accept that statement.

(The information supplied follows:)

Natural gas industry—Rate activity during period July 1, 1954, through June 30, 1961

Although the figures tabulated above are not entirely comparable, the following paragraphs from the Commission's Opinion No. 338 in the *Phillips Petroleum Co.* case, decided September 28, 1960, indicates the extent of the Commission's backlog at that time.

"An illustration of the administrative impossibility of separate determinations for all producers' rates is found in the fact that there are 3,372 independent producers with rates on file with this Commission.[6] The producers have on file with us 11,091 rate schedules and 33,231 supplements to these schedules. Currently, 570 of these producers are involved in 3,278 producer rate increase filings now under suspension and awaiting hearings and decisions. The number of completions of independent producer rate cases per man-year during the first 6 years following the *Phillips* decision indicate that nearly 13 years would be required for our present staff to dispose of the 2,313 cases pending on July 1, 1960. Within this 13-year period an additional estimated 6,500 cases would have been received.

"Thus, if our present staff were immediately tripled, and if all new employees would be as competent as those we now have, we would not reach a current status in our independent producer rate work until 2043 A.D.—82½ years from now. Of course, we could expect to improve our techniques and thus shorten the time required to process these cases. If we increased our efficiency 1,000 percent, we would achieve current status in 1968—8⅞ years from now. And regardless of how much our staff is increased every case must still be reviewed by us and our own time and capacity is not unlimited.[7]"

[6] To these add 15,435 nonfiling coowners whose rights should also be considered under any rate base theory.

[7] The bills introduced into Congress to eliminate some smaller producers from our jurisdiction would not actually reduce these figures to any substantial extent. Field unitizations, production fluctuations from year to year, fluctuations in the allowables set by the States, processing contracts, and various other factors would prevent such a law from reducing our workload to any great extent beyond that which it has already been reduced by our own regulations in regard to filings.

Mr. THOMAS. Gentlemen, let's get some lunch and come back at 1 o'clock.

AFTERNOON SESSION

Mr. THOMAS. Gentlemen, will the committee please come to order?

SUMMARY HIGHLIGHTS OF BUDGET REQUEST

Mr. Reporter, will you be good enough to put pages 1 and 2 in the record.

(The pages follow:)

INTRODUCTION

The Commission is requesting $13,335,000 for fiscal year 1965. This amount is an increase of $1,485,000 over the 1964 appropriation of $11,850,000. We are requesting 86 additional positions over the maximum 1,148 positions authorized in 1964 for a total of 1,234 in 1965. Of the total increase, $510,000 is needed for personnel compensation and benefits for the 86 new positions, $592,000 is needed for pay increases and for personnel compensation and benefits for the 1,148 maximum positions authorized in 1964, and $383,000 is needed for other costs such as travel, rentals, equipment, and supplies.

While the Federal Power Commission is budgeting for $13,335,000 in 1965, this amount is estimated to be offset by $5,832,000 in payments to the Treasury. This is an increase in receipts of $1,189,121 over 1963. The increase reflects action taken by the Commission to insure that the non-Federal licensing activity under part I of the Federal Power Act is self-supporting and that payments owed the Treasury by licensees for benefits from upstream Federal projects are paid. The net cost to the Government for the Federal Power Commission's work in 1965 would thus be $7,503,000.

The budget submitted provides the resources for regulating the electric power and natural gas industries—two of the largest and fastest growing industries in this Nation. The pace of progress in these two basic energy industries is largely controlled by the Federal Power Commission's ability to discharge its regulatory functions promptly. Adequate staff is the heart of effective regulation and is an absolute necessity for prompt disposition of workload. Construction of hundreds of millions of dollars of natural gas pipelines will be delayed unless we have adequate staff to process certificate applications. The same can be said about our licensing work for non-Federal hydroelectric power projects and indeed for all of our regulatory activities.

The damage to the natural gas and electric power industries from insufficient FPC staff would be compounded by the loss of protection to the gas and electric consumers which include almost everyone in the Nation. The Commission's record in the past 2 years of ordering some $550 million in refunds to the customers of the Nation's natural gas pipelines is in itself ample proof of the large dividends to the economy from small investments in FPC staff. We are also encouraging the construction of stronger transmission line interconnections and larger and more efficient generating units by the electric power companies to reduce electric power costs and thus facilitate rate reductions to consumers. The benefit of FPC activities is thus nothing less than a long-term reduction in two major energy sources of the Nation.

Mr. THOMAS. Pages 4 and 5 are excellent. This is condensed. In truth and in fact it is a summary of the Chairman's statement. They are both excellent.

The first two paragraphs really tell the tale in the condensed form.

[Reading:]

The Commission is requesting $13,335,000 for fiscal year 1965. This amount is an increase of $1,485,000 over the 1964 appropriation of $11,850,000. We are requesting 86 additional positions over the maximum 1,148 positions authorized in 1964 for a total of 1,234 in 1965. Of the total increase, $510,000 is needed for personnel compensation and benefits for the 86 new positions, $592,000 is needed for pay increases and for personnel compensation and benefits for the 1,148

maximum positions authorized in 1964, and $383,000 is needed for other costs such as travel, rentals, equipment, and supplies.

Your increase is broken down; $510,000 is for compensation for the 86 new jobs; $592,000 is for the pay increases, and $383,000 is needed for other costs and travel. He breaks it down.

I want to take special notice of the last paragraph.

(The paragraph follows:)

The Commission in the past 2 years has concentrated on improving its procedures to utilize its manpower more efficiently and in general accelerating the regulatory process. The budget request for 1965 is the minimum amount that will enable us to continue our core programs without reverting to former standards which resulted in endless delay to the industry and rendering illusory the congressional objective of consumer protection.

Mr. THOMAS. I cannot put my finger on where the Corps picked up six of your jobs last year.

Mr. SWIDLER. Yes, sir. We discussed this with them.

Mr. THOMAS. If you were to put them all in uniform you would have a young army.

Mr. SWIDLER. No doubt that is true. This is a very comprehensive program of surveys that the corps is planning to make. Our part of the program will be evaluation of the power aspects.

COMPARATIVE SUMMARY BY ACTIVITIES

Mr. THOMAS. Let's put the cover sheet No. 8 in the record.

You have natural gas, electric power, non-Federal hydroelectric projects, Federal river development projects. This is by activities. You get your other objects later.

Page 9 is also well done. Let's put this in the record.

(The pages follow:)

Mr. THOMAS. This is the meat in the coconut. You can get all the details you want right here.

We like your charts. They are always good.

ORGANIZATION

Gentlemen, take a look at the charts. We want to keep them in mind. Here is a complete organization setup on page 10. The more complete one, the one that gives you a whole lot is your organization breakdown with your personnel and with your grades. Keep these in mind as we go through the justification.

Mr. SWIDLER. May I call attention to one item, Mr. Chairman?

Mr. THOMAS. Go ahead.

COMMISSIONERS' STAFF

Mr. SWIDLER. You will notice that under the Commission there is an increase of six positions, which give——

Mr. THOMAS. I noted that this morning at 6 o'clock, Mr. Chairman.

Mr. SWIDLER. You got up very early this morning, Mr. Chairman. I wanted to call this item to your attention. It includes one additional assistant for each of the Commissioners.

Mr. THOMAS. You will notice the horsepower he has up with the Commissioners. Besides the Commissioners you have an 18, 17, four 15's, and 14.

Off the record.

(Discussion off the record.)

Mr. OSTERTAG. Will the chairman yield?

Mr. THOMAS. Yes.

Mr. OSTERTAG. Mr. Chairman, is that grade 15 technical adviser as assistant to the Commissioners a new position?

Mr. SWIDLER. Yes.

Mr. OSTERTAG. There is an increase of one grade 13 under the Commission, but you have a total increase of about 17 in grade 13 throughout the Commission.

Mr. THOMAS. All your operating bureau chiefs are 18's, except the hearing examiners and certainly the chief examiner——

Mr. JONAS. Mr. Chairman, before you leave the Commissioners——

Mr. THOMAS. Mr. Jonas.

Mr. JONAS. I notice you are asking for an assistant for each of the five Commissioners.

Mr. SWIDLER. An additional assistant.

Mr. THOMAS. They already have one.

Mr. JONAS. That is what I say. How many will that give to the Chairman, three assistants?

Mr. SWIDLER. I would then have three.

Mr. THOMAS. Look at the box. There is an assistant to the Chairman.

Mr. JONAS. He is a 17.

OFFICE OF SPECIAL ASSISTANTS

Mr. SWIDLER. The Office of Special Assistants to the Commission is the opinion-writing group, sir. They analyze the records in these complex cases and prepare summaries that are aids to us for decision and then they prepare the first drafts of most opinions.

OFFICE OF ADMINISTRATION

Mr. THOMAS. Look at the housekeeping activities—Office of Administration, 166 people. You have wage boards, 24, but they are people, too. You have 166 people to take care of less than 1,300. But at that you are better than one of the agencies we took a look at not long ago.

Mr. SWIDLER. I should explain that a great many of these people work in our reproduction plant.

We are a decisional agency. We have 18 hearing examiners. Our normal agenda is in the neighborhood of 60 to 120 items. The opinions, pleadings and briefs run very long. Our reproduction staff does a tremendous volume of work.

OFFICE OF HEARING EXAMINERS

Mr. THOMAS. What is the grade of your hearing examiners? Your chief is 17; assistant, 16. You have 13 at 15. What do you have altogether, 27 or 28 hearing examiners?

Mr. SWIDLER. We have 18 hearing examiners. The others are technical and clerical staff.

Mr. THOMAS. You mean of the majority of them? Fifteen is not too many.

Mr. SWIDLER. As you know, the hearing examiner positions are not rated directly by us but by the Civil Service Commission, which allocated a certain number of grade 16's and 17's; I think one 17 to each agency for the chief hearing examiner position. The 16's have been awarded on the basis of seniority so the number that we have so far as 16's are concerned depends on their seniority in relation to all the hearing examiners in the Federal service of similar grade.

Mr. THOMAS. Mr. Reporter, put page 12 in the record.

Subtotal, other collections	141,860	99,000	99,000
Total collections	5,268,975	5,652,000	6,436,000

Mr. THOMAS. This has to do with the collection of fees. Your collection comes from one source and one source alone. This year you had $5,652,000 and you estimate it will be $6,436,000. Where do the fees come from?

Mr. SWIDLER. There are two major sources of fees which go into the Federal Treasury.

Mr. THOMAS. Is it two or one?

Mr. SWIDLER. There are two, sir.

Mr. THOMAS. What is the other one?

Mr. SWIDLER. One is licenses and the other is headwater benefits.

Mr. THOMAS. Which produces the most?

Mr. SWIDLER. The headwater benefit payments we estimate are now going to produce more than the fees. We estimate for 1965 that we will get $3,500,000 from headwater benefits.

Mr. THOMAS. Where are the fees from non-Federal projects?

Mr. SWIDLER. Non-Federal projects are listed on the top line. Those go into the Federal Treasury.

Mr. THOMAS. All of them go in?

Mr. SWIDLER. Yes, sir.

Mr. OSTERTAG. This whole $6,337,000 goes into the Federal Treasury?

Mr. SWIDLER. Some, as you see, is paid out. Some is paid out to the Indians, some go into other trust funds, but most of it stays in the Treasury.

Mr. THOMAS. Are the fees based on a break-even basis for licenses for non-Federal projects?

Mr. SWIDLER. Yes, sir. We have revised our fee system now so as fully to compensate the United States. There is one little problem that I should mention to you.

Mr. THOMAS. That is both categories?

Mr. SWIDLER. I am talking now about license fees for non-Federal hydro projects.

Mr. THOMAS. That is your big source.

Mr. SWIDLER. That is a big source. The headwater benefits is the larger one.

Mr. THOMAS. That has been your source all along, or the main source, hasn't it?

Mr. SWIDLER. In the past it has been the only one because the other collections did not amount to anything.

Mr. THOMAS. There are two sources. When did you start this one on the fees for non-Federal projects?

Mr. SWIDLER. The fees have been the main source all along and as you see we are projecting a very substantial increase because we have revised our fee basis. So far as headwater benefit payments are concerned, through the whole period of the history of the statute, until 1962, the total collections were about half a million dollars.

Last year alone we collected about, as I recall, $2.8 million.

Mr. THOMAS. What is the yardstick of the fee in both instances, non-Federal and headwater benefits?

Mr. SWIDLER. The yardstick of the license fees is our cost of administration and all of the costs that go into the licensing part of our statute are reimbursable so that so far as the increase in positions are concerned—this is the point that I had in mind——

Mr. THOMAS. Is there any fee on the gas side?

Mr. SWIDLER. No, sir.

So far as licensed project administration is concerned, there is little or no net cost. When these two sources of revenues are taken into consideration, the net amount of the appropriation which we are requesting is $7,500,000, not greatly larger than for the appropriations for a good many years ago.

On license fees there is this one small problem I wanted to mention to you. Recently one of the licensees, in response to our efforts to collect additional fees which would make them pay a pro rata share of the cost of these activities, made the point that their license prescribed a maximum amount. They contend that their license provides that the license fees will not be increased, regardless of our costs. This is in my judgment a respectable legal point. The case has not been decided. I cannot tell you how it will be decided, but we may arrive at the conclusion——

Mr. THOMAS. You estimate you will collect $2,049,000 for fees for non-Federal projects?

Mr. SWIDLER. Yes, sir. This point I just mentioned might cover 10 percent of the fees.

Mr. THOMAS. How many cases are you going to handle this year? I am trying to figure out how much it is per case.

Where is that table on the workload?

Mr. SWIDLER. You are talking about Federal projects.

Mr. THOMAS. Yes.

Mr. SWIDLER. On page 60 there is a summary of workload and positions required, on pages 59 and 60. I think page 59 is probably the one you have in mind, sir.

Mr. THOMAS. You have licenses. How many are there? I am talking about the number of licenses you are going to issue next year. You have it here in the table.

Mr. SWIDLER. We assume we will complete 109.

Mr. THOMAS. And if you are going to say 109 and you are going to collect $2 million how much is that for each one?

Mr. OSTERTAG. That is 1963 you are talking about?

Mr. SWIDLER. I am sorry, 173 in 1964; you are right. We are not really dealing with a fee for the issuance of a license but rather a fee for license administration which licensees pay every year. An important part of our responsibility is the administration of the provisions of the license, including safety, and we, as you know——

Mr. THOMAS. You mean it is an annual fee?

Mr. SWIDLER. Yes, sir; it comes in every year.

Mr. THOMAS. How much is it per year?

Mr. SWIDLER. About $2.5 million now.

Mr. THOMAS. I mean per company.

Mr. SWIDLER. It depends on the capacity of the licensed project. Owners of little projects pay a small amount, the big ones pay a larger amount.

Mr. THOMAS. Would the average fee be 500 or 2,000, 5,000?

Mr. SWIDLER. One way to estimate it is that we have about 300 major projects under license roughly, so that I think that the fee would be about $10,000 a licensee on the average.

Mr. THOMAS. The justification did not give the total number under license. Here is rate filings. Do you have a table showing how many you intend to license this year?

Mr. SWIDLER. This table shows the number; yes, sir. One hundred and seventy-three, if you will look, sir, at the fourth figure on the very last line.

Mr. THOMAS. Do you have a cumulative figure? We used that 2 or 3 years ago. I forget what it is. What is the total under license now?

Mr. SWIDLER. 280 major projects.

Mr. THOMAS. You haven't come up with it yet. Is the figure between 280 and 300 correct under license?

Mr. SWIDLER. Yes, sir.

NATURAL GAS INDUSTRY

Mr. THOMAS. Mr. Reporter, put page 15 in the record.

(The page follows:)

NATURAL GAS INDUSTRY

Comparative summary of activities

	1963 actual		1964 estimate		1965 estimate	
	Positions	Funds	Positions	Funds	Positions	Funds
A. Certificates of convenience and necessity	220	$1,870,297	212	$2,141,400	225	$2,378,000

GROWTH OF COMMISSION STAFF—1956 THROUGH 1965

Mr. THOMAS. Put in the record the number of employees in the Commission starting with 1956. I wish you would check this out, Mr. Budget Officer, when you get back to your office, and see if it is correct. In 1956 you had 713 employees; 1957, you had 750; these are appropriated jobs; 1958, 742; 1959, 844; 1960, 853; 1961, 906; 1962, 963; 1963, 1,178; 1964, 1,148; 1965, you have a budget estimate here of 1,234. That is a pretty steady expansion is it not?

Mr. SWIDLER. Except for last year, sir.

Mr. THOMAS. Beg your pardon?

Mr. SWIDLER. Except for last year. Except for the current year, I should say.

Mr. THOMAS. You did not grow too much last year.

Mr. SWIDLER. No, sir.

Mr. THOMAS. And considering the annualization you did pretty well at that.

STAFFING FOR 1964

How many annualized jobs do you have in here for this year, in violation of the committee's instructions to you?

Mr. SWIDLER. This year as you know, sir, we have less than the number of annualized jobs. We got started on a higher level than we could annualize and when the appropriation finally came out we had to reduce staff by eliminating 48 people.

Mr. THOMAS. How long have those been on the payroll that you eliminated 30 days, 3 weeks, 6 weeks, less than 2 months, weren't they? You put on about 75 or 100 right off the bat. They were on the payroll less than 60 days in the fiscal year, weren't they?

Mr. SWIDLER. They weren't released in quite that way. Most of the people who were released were new employees, yes, sir; but not all.

Mr. THOMAS. They had all been annualized. They were put on the payroll in the last 30 or 60 days of the fiscal year. That was going back to 1962 and 1963. That was the same proposition.

Mr. SWIDLER. Sir, what we had done, and we evidently did not do it right, but what we did is to start recruiting as fast as we could once the previous appropriation bill for the year had been passed.

This did not give us a very long period to recruit because the appropriation bill, as you know, was not passed for several months after the fiscal year had started.

Mr. THOMAS. You are doing the opposite of most agencies. People seeking employment go by and file an application with the agency and the agency will keep it on ice for 4 or 5 months and keep a backlog of people looking for work.

Don't you do the same thing?

Mr. SWIDLER. We try to, yes, sir; but we had carried over from the previous year more people than the money appropriated for this year would enable us to keep on the payroll.

GAS INDUSTRY JUSTIFICATION

Mr. THOMAS. Here is your breakdown on page 15. We have put that in the record. This relates to your natural gas industry, certificates of convenience and necessity. You are going to increase it from

212 to 225 this year. Rate filings remain the same, 56 and 56 jobs; rate cases go from 338 to 351. Your accounting section is 17 and your data gathering and analysis is 15. I notice you wanted 12 to go out and study your backlog of reserves.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. Put pages 16, 17, and 18 in the record.

(The pages follow:)

NATURAL GAS INDUSTRY

In the past 2 years, the Commission has cleared up its huge billion-dollar backlog of pipeline rate cases and we are now reasonably current. We have ordered refunds to $550 million and reduced rates for the future by $95.7 million annually.

Our program for clearing up our pipeline backlog has been coupled with procedural reforms to make sure that another backlog does not accumulate. The Commission's interim price ceilings for producers have stabilized field prices of gas as contrasted with the pattern of increases in the past decade which resulted in doubling the wellhead price. The combination of procedural reform, rate moratoriums, and stabilization of field prices has greatly reduced the number of pipeline rate increase filings.

Elimination of the backlog has placed the Commission in a position to handle its pipeline rate work much more effectively than in the past. The Commission has initiated investigations to determine whether the existing rates should be reduced and pipeline earnings in several instances appear to be excessive. One voluntary rate reduction has already been filed as a result of this program.

The pipeline industry continues to grow and the applications filed for new construction, which are the industry "birth certificates," also continue to grow. These cases are becoming more complicated because (1) in some instances several pipelines have filed competitive applications to serve the same market which are combined in a single hearing, and (2) the particular construction may involve some new type of equipment such as use of jet aircraft engines as prime movers in compressor stations, or "first of its kind" projects such as the cryogenic in-ground liquefied gas storage project certificated during the last fiscal year (this project is now under construction by Transcontinental Gas Pipeline Corp. and represents the first commercial development of a project which will liquefy natural gas). These more complicated cases require more time for analysis and evaluation and require highly trained professional people. Here, too, the Commission has adopted new procedures to increase our productivity and enable us to handle the increased number of more complicated cases.

We are asking for additional staff to make a continuing review of the gas reserves of the pipeline companies, reserves upon which the 34 million gas consumers in the country depend for continuity of service. This work will enable us to speed the processing of new certificate applications because the adequacy of the reserves backing up the application will be fully known, or substantially known, at the time the application is filed. Prompt approval of new pipeline construction is of tremendous importance to the national economy. Pending applications before the Commission amounted to $1.1 billion as of January 1, 1964. Equally important, current reserve information is essential to the protection of consumers' long-term gas supply.

In 1965, the Commission will be moving ahead with its area rate program for fixing just and reasonable field prices in all parts of the country, an activity which the Commission has failed to discharge effectively to the detriment of consumers and the industry alike. A recent Supreme Court decision has given us encouragement to proceed with our area rate program to fix just and reasonable rates for all of the gas flowing in interstate commerce. The hearing before the examiner in the lead case involving the Permian Basin in Texas and New Mexico has now been concluded and the Commission expects to render its decision in this landmark case in the coming fiscal year. The hearing in the second case involving south Louisiana is well underway and we have initiated proceedings in the Hugoton-Anadarko and the Texas gulf coast areas. These four proceedings, when completed, will eliminate the backlog of cases for 75 percent of all the natural gas produced in this country. We estimate that we need 13 additional staff members to go forward with these important proceedings

and to process the other producer rate applications that currently are being filed.

In summary, we shall be able to take on this greatly increased workload in natural gas matters with a comparatively small increase in staff because we are reaping the fruit of an intensive effort in the past 2 years to develop the organizational and procedural devices required to utilize our manpower more effectively.

Mr. THOMAS (reading):

In the past 2 years, the Commission has cleared up its huge billion-dollar backlog of pipeline rate cases and we are now reasonably current.

I understand that is an understatement. You have nothing to do. The staff is running around wringing their hands trying to find something to do. As one fellow put it, he said it is in a devil of a mess, the emphasis on the mess.

We have ordered refunds of $550 million and reduced rates for the future by $95.7 million annually.

RATE CASES—WORKLOAD AND POSITIONS

How many people do you have in this rate section? They tell me they have nothing to do.

Mr. SWIDLER. Under rate cases we have now, or we are projecting, 351 positions.

Mr. THOMAS. That workload——

Mr. SWIDLER. Of course, that includes the producer rate program which is just beginning to gain momentum.

Mr. THOMAS. You have got half a dozen breakdowns under that but in your pipeline rate cases how many people do you have on the job? You used to set it out here in a separate classification.

Mr. BLACK. Twenty-four, for the pipelines themselves.

Mr. THOMAS. Put the pertinent part of this table on page 24 in the record.

(The material referred to follows:)

Rate cases—Summary of workloads and positions required

	On hand 1st of year	Number received	Total workload	Number completed	On hand end of year	Positions required
1963 actual:						
Pipelines	82	13	95	53	42	187
Independent producers	2,939	501	3,440	461	2,979	179
Total	3,021	514	3,535	514	3,021	366
1964 estimate:						
Pipelines	42	22	64	46	18	168
Independent producers	2,979	530	3,509	317	3,192	170
Total	3,021	552	3,573	363	3,210	338
1965 estimate:						
Pipelines	18	27	45	29	16	168
Independent producers	3,192	530	3,722	[1] 845	2,877	183
Total	3,210	557	3,767	874	2,893	351

[1] Includes 528 in Permian Basin area rate proceedings in which a final Commission decision will probably not be forthcoming until after July 1, 1964.

PIPELINE RATE CASES

Mr. THOMAS. This is cases on hand for the pipeline. The number on hand the first of the year for 1963 is 82; number received is 13; total workload, 95; number completed, 53; on hand, 42, and positions required, 187.

Let's see the picture after you skip a year. We are still talking about pipeline. On hand, beginning 1965, you had 18; received, 27; total workload, 45; number completed, 29; on hand end of the year—you are about out of seed corn—you only have 16 and you have 168 people. You certainly can cut that division in half.

Mr. SWIDLER. Well, sir, I think that is an exaggeration. There will be a great deal——

Mr. THOMAS. You mean your budget officer's figures or my statement?

Mr. SWIDLER. Your statement is "a little exaggerated" in stating that we could cut it in two, sir.

Mr. THOMAS. It might be a little high, maybe a 49-percent cost.

Mr. SWIDLER. There is a great deal of work for the pipeline rate staff.

Mr. THOMAS. Generally your big workload is over with.

Mr. JONAS. Mr. Chairman, would you yield?

Mr. THOMAS. Yes, sir.

Mr. JONAS. That is made apparent when you consider only the number of cases completed, 46 in 1964 with 168 people and projected only 29 cases for 1965, but you still want the same number of people.

Mr. SWIDLER. If I can explain that, in the first place——

Mr. THOMAS. In other words, in 1963 you completed 53 cases with 185 people and this year you are going to complete 29 cases with 168 people.

Mr. SWIDLER. The number of cases is not the only or the best index to the work that these people perform. The works involves not merely formal cases but the review of the current status of the pipelines so so that as their circumstances change we can determine whether their rates should be adjusted.

Mr. JONAS. I think you have a better answer than that because you could point out that your completed cases of independent producers will go up substantially.

Mr. SWIDLER. Yes, sir. That is a separate problem. We are now talking only about the staff for the pipeline rate cases. I was pointing out that our staff is engaged in a continuous analysis of the earnings position of the pipelines.

If we just wait until a pipeline files for rate increases I think we could get along with a smaller staff, but that would not be doing the whole job.

REFUNDS

Mr. JONAS. I had a question on 16.

This $550 million in refunds represented how many cases, too many to count?

Is that a large or small number of cases?

Mr. SWIDLER. I didn't hear the question, sir.

Mr. JONAS. Of this half billion in refunds, how many cases did that involve? It is $550 million refund.

Mr. SWIDLER. I think we are talking about perhaps 50 cases.

Mr. JONAS. Isn't a substantial part of that $550 million involved in one case, the *El Paso* case? How much was involved in that?

Mr. SWIDLER. El Paso involved about $150 million and the *Tennessee* case involved about $125 million.

Mr. JONAS. That is over half of it in two cases?

Mr. SWIDLER. $275 million.

Mr. JONAS. How long were those cases pending before the Commission?

Mr. SWIDLER. Each of them for a good many years. I cannot tell you exactly.

Mr. O'CONNOR. El Paso was pending 6 years.

Mr. THOMAS. What was that money drawing, 4 or 6 percent?

Mr. SWIDLER. Six and seven percent; some parts six, some seven. The amounts I have given you include interest.

Mr. JONAS. That is all I have. I thought it was true that the bulk of it was in a few cases.

Mr. SWIDLER. About half of it is in two cases; yes, sir.

PIPELINE RATE CASES

Mr. THOMAS. Insert the bottom of page 24 and page 25 in the record.

(The pages follow:)

PIPELINE RATE CASES

As we have previously mentioned, the Commission has reduced its backlog of pipeline rate cases to a current basis and has developed procedures to avoid the creation of a backlog situation in the future. However, existing moratoriums on rate increases will soon expire and there will be many cases which the Commission will need to initiate on its own motion to insure that rates are kept at the "just and reasonable" level as provided in the Natural Gas Act. There will be a sharp upsurge in section 5(a) cases (initiated by the Commission to reduce rates) as producer rates are stabilized and Commission action is needed to see that lower unit costs are passed on to consumers.

The number of actual pipeline rate cases estimated for 1965 represents only a small measure of the work that will be performed by the staff requested for pipeline rate work. In a practical sense, there is a "rate case" pending currently against all major pipeline companies because it is necessary to scrutinize their earnings level each year to insure that their rates remain just and reasonable under changing circumstances. In past years, we have been unable to make these reviews because our staff has been completely absorbed with the backlog of 4(e) rate cases, the applications by the pipeline companies for rate increases.

Our staff studies reveal that several pipelines may be earning in excess of a fair return and the staff is engaged in conferences with these companies, which hopefully will lead to voluntary rate reductions. One such pipeline company has already filed a voluntary rate reduction of $1.5 million annually, effective January 1, 1964. The staffwork required in each such investigation is comparable to the effort required to prepare for a rate case. Because we believe that many of these investigations will result in voluntary settlements rather than formal rate cases explains why our estimate of the number of cases is reduced from former years.

Mr. THOMAS. Let's put page 19 in the record.

(The page follows:)

CERTIFICATES OF CONVENIENCE AND NECESSITY

Summary of workloads and positions required

	On hand 1st of year	Number received	Total workload	Number completed	On hand end of year	Positions required
1963 actual:						
Pipelines	269	360	629	396	233	143
Independent producers	2,520	1,654	4,174	1,928	2,246	77
Total	2,789	2,014	4,803	2,324	2,479	220
1964 estimate:						
Pipelines	233	360	593	393	200	138
Independent producers	2,246	1,713	3,959	2,025	1,934	74
Total	2,479	2,073	4,552	2,418	2,134	212
1965 estimate:						
Pipelines	200	360	560	400	160	151
Independent producers	1,934	1,720	3,654	2,150	1,504	74
Total	2,134	2,080	4,214	2,550	1,664	225

WORKLOAD

Estimated receipts of certificate applications are based on the trend of growth in the gas industry. As indicated, the total number of applications will continue to increase. On the pipeline side the applications will involve a greater number of vigorously contested proceedings involving conflicting proposals for the same market as the major pipeline companies compete for the growth requirements of the great metropolitan areas. The Commission's responsibility for protecting the public interest will become more and more complex.

Mr. THOMAS. This deals with certificates of convenience and necessity. You have already taken a look at the pipeline. Let's look at independent producers now.

Take a look at 1963: On hand at the beginning of the year, 2,520; number received, 1,654. Total workload is 4,174; number completed, about half of it; 1,928 on hand. At the end of the year it was 2,246. You have 77 jobs. Let's skip and go down to 1965 to see what the estimate is. On hand, 1,934, independent producers; we have already looked at pipeline. Number received is 1,720; total workload, 3,654 against 4,174 a year earlier, completed, 2,150; you completed 1,928 the year before. On hand at the end of the year 1,504 and you have 74 people, a reduction of 3 over the year earlier.

Put page 19 and the reading material on page 20 and 21 in the record.

(The pages follow:)

PIPELINE CERTIFICATES

The important prerequisite in the expansion of the gas industry is the expeditious processing of certificate applications by the Commission. The Commission has speeded up its work in this area. In fiscal 1963, the Commission issued certificates for $686 million of new construction compared with $373 million the year before. These projects represent substantial contributions to the health of our economy. They have made natural gas available to many new communities as well as to meet the growing needs of existing pipeline customers.

The normal volume of certificate applications pending before the Commission represents large capital expansion investments. As of January 1, 1964, certificate applications for $1.1 billion of pipeline construction were pending before the Commission. The need for sufficient staff to facilitate prompt decisions is obvious.

The Commission is instituting new procedures to speed disposition of certificate applications. Pipelines will now be required to file complete information in support of their proposals at the time the certificate applications are filed. This will eliminate much preliminary work by our staff and speed the processing of the applications. Also, as described above, we have developed a procedure for keeping in current touch with the gas reserve situation of the pipelines so that we can be sure reserves are sufficient to support their applications for expansion. Thus, the question of adequate reserves to support pipeline expansion will no longer be an issue in each case and a major cause of delay in certificate cases.

The information submitted by the gas pipeline companies will involve 65 reports on 210 trillion cubic feet of gas which must be summarized and analyzed by the staff each year. The reports are of necessity voluminous, requiring as much as 3,700 pages, inclusive of field maps, for one company.

The development and implementation from the annual reports of information pertaining to 210 trillion cubic feet of natural gas from more than 90,000 producing gas wells and several hundred thousand oil wells that also produce gas is a tremendous workload. In addition, the data must also be updated regularly for about 4,000 new gas wells completed each year.

We are requesting additional staff of 13 positions for this work. The development of reliable data on a continuing basis is a formidable task but one which will pay big dividends in relation to this small staff increase.

It is planned to use electronic data-processing techniques to the fullest extent possible in developing gas supply data quickly and in useful form for proceedings before the Commission. In this way the staff requirements will be held to a minimum.

The new procedures and efficient use of staff should expedite pipeline certificate cases in 1965.

Mr. SWIDLER. I hope I made clear on the pipeline rate cases that the job of continuing supervision of pipeline rates is a different and bigger job than just handling those cases which are imposed on us by rate increase applications.

Mr. THOMAS. Where are your green sheets on your pipeline and independent producers? Where do we get a look at them?

Mr. CAPAR. I am not sure I follow the question. Do you mean the details——

Mr. THOMAS. For grade classification of employees.

Mr. CAPAR. I have a copy here, sir.

Mr. THOMAS. Your big table does not set that out. More than likely it is in here. It is on 11, I think.

Mr. BLACK. The top of page 11.

Mr. THOMAS. Where are the green sheets on these two?

Mr. SWIDLER. I have here a breakdown by subactivities.

Mr. THOMAS. That is exactly what we are looking for. We don't have it.

You don't have it by grades, either.

Mr. SWIDLER. Not by grades; no, sir.

Mr. THOMAS. Can anybody give it to us?

Mr. CAPAR. We can give it to you. We do not have it by grades, by pipelines, and producers. I have the total grades in the entire agency here.

TURNOVER IN THE FPC

Mr. THOMAS. We are dealing with certificates. For pipelines and independent producers, give us a little look at the quality or caliber of your personnel, what is their civil service status, what is the turnover throughout the agency generally? Do you know? Is it 15 or 16 percent?

Mr. CAPAR. I can work that up for the record.

Mr. THOMAS. Do you have it already worked up? Does anybody know?

Mr. SWIDLER. Apparently not, sir.

(The information follows:)

The turnover rate of the Commission is 18 percent annually, largely in the lower salaried positions.

PERSONNEL—BUREAU OF NATURAL GAS

Mr. THOMAS. Here is the bulk, certainly, of your power employment, your biggest Bureau. It is at least 40 percent. Your memory should indicate what grades these people are. Are they 10, 7, 9, and what is the turnover?

Mr. CAPAR. The natural gas section, sir, on page 11 will give you the bulk of people represented in the gas work. It will identify the grades.

Mr. THOMAS. You lump them in here: 315 GS–13 and below; that is wide open as a barn door. It does not give us much help. Are they 8's, 9's, 10's, 11's, or what?

Mr. SWIDLER. It is only broken down from 13 and above. We will break it all down for the record.

(The information follows:)

Personnel compensation data sheet—Bureau of Natural Gas

Operating title	GS-	Pipeline				Producers				Total

TURNOVER OF PERSONNEL

Mr. THOMAS. Do you have any idea what the turnover is in these two divisions of power? What is the breakdown of these two subdivisions in the Bureau of Natural Gas? Do you have any idea? Where is your personnel man?

Mr. SWIDLER. He is not here.

Mr. TRAINOR. We don't have it here by subdivisions. We can work it up and put it in the record.

(The information follows:)

The turnover rate of the Bureau of Natural Gas is 19 percent annually, largely in the lower salaried positions.

Mr. THOMAS. I am asking if anyone here has an idea of what it is.

Mr. TRAINOR. We have the whole range of grades from two up.

Mr. THOMAS. We have all of this high-powered staff here. The Commissioner has one or two special agents. Don't you know what goes on in your agency about your personnel problems?

Mr. SWIDLER. I am under the impression, sir, that our turnover is not out of line, but I could not give you a figure for it.

Mr. THOMAS. Do you know whether it is 18 percent, 15 percent, 10 percent, 9 percent?

Mr. SWIDLER. No, sir.

Mr. THOMAS. We have gone into rate cases pretty well.

ORIGINAL COST STUDIES OF PIPELINES

Let's put in your cost studies, page 26.

(The page follows:)

Original cost studies—Pipelines

Year	On hand 1st of year	Number initiated	Total workload	Number completed	On hand end of year
1963 actual	77	0	77	4	73
1964 estimate	73	4	77	8	69
1965 estimate	69	8	77	10	67

The foundation for any pipeline rate case is the determination of the rate base upon which the utility is permitted to earn a reasonable rate of return. The rate base is the original cost of the company's property devoted to public service less depreciation. Rate regulation cannot be solidly based without an audit of the recorded cost of the property in order to eliminate improper items. Because of the pressure of other work, these original cost studies were suspended from 1950 to 1960, resulting in a large backlog of plant investment which has not been examined. There are $7 billion of jurisdictional pipeline properties which are earning a return but which have not been subjected to Commission scrutiny. The Commission's staff is now engaged in an effort to catch up on its examination of the natural gas pipelines' property costs. When the backlog is eliminated in 1967, it is planned to keep this work up to date as additions and other changes occur in the property accounts of the pipeline companies.

GAS RESERVES

Mr. THOMAS. This is where you want 13 additional jobs to study reserves. How many people do you have studying reserves for your pipeline cases? You allege it will give you ready information when a pipeline comes in and you want to know whether he has a backlog. You are going to check him. The agency has been studying pipelines for a long time. Don't you have any of that information now?

Mr. SWIDLER. We have no comprehensive information on the reserve position of the pipeline. They introduce a case on their reserves whenever they come in with a major certificate application but it is just the reserve showing to support that particular certificate and it is not kept up to date.

In addition to holding up the issuance of certificates, and of course as you know we are trying now to dispose of these cases as quickly as possible and get these pipelines started and construction going as soon as possible, we do not have the data on which to feel assured that the consumer's stake in adequate gas reserves is being protected.

Mr. THOMAS. How much more are you going to get than you have?

Mr. SWIDLER. We will have a continuing inventory of pipeline reserves, something we don't have now.

Mr. THOMAS. You certainly have the information available in your office someplace, don't you?

Mr. SWIDLER. No, sir. We just have the ad hoc case put in on an individual case basis as the pipelines apply for certificates. There is no provision for a continuing master inventory of the pipelines' reserve position.

Mr. THOMAS. Are you saying by that then you want something to controvert the evidence presented to any particular case at hand?

Mr. SWIDLER. No, sir. I am saying we would like to take that issue out of these cases. We would like to know their reserve position before they file and then it won't be necessary, we hope, to hold up the certificate cases.

Mr. THOMAS. You are concerned with X case. If there is 2 billion cubic feet available throughout the United States, you want to know how much X has his hands on and can deliver in the next 25 years to your pipeline?

Mr. SWIDLER. Exactly.

Mr. THOMAS. How will you figure that out in advance until he puts it down in black and white?

Mr. SWIDLER. We will have it down in black and white every year.

Mr. THOMAS. How can you? You don't know what his application is going to state. You don't know where his reserves are. I doubt if he does until he files his application.

Mr. SWIDLER. They do not have a new set of reserves.

Mr. THOMAS. The information you are seeking I don't think is helpful.

Mr. SWIDLER. Pipelines don't abandon existing reserves each year and get a new set. It is a continuing thing. There will be abandonment of some fields, as they become depleted. They will add others to the system.

Mr. THOMAS. This fellow wants to add a new pipeline. Under your rules and regulations, you require him to file in his application, among other things, setting out x million number of cubic feet of gas, where he is getting it, where it is located, et cetera, and what he is paying for it. You require him to have a reserve of some number of cubic feet over a period of what, 20 or 25 years?

Mr. SWIDLER. In the past we have been requiring deliverability of at least 10 or 12 years.

Mr. THOMAS. What do you mean by "deliverability"? He has to have it tied up where he can get his hands on it, doesn't he?

Mr. SWIDLER. Yes, sir; but——

Mr. THOMAS. Or do you require that his pipeline is adjacent to a field where he can go in and perhaps get it?

Mr. SWIDLER. The question is not only how much is the total gas in the ground, but how fast can it be withdrawn in accordance with conservation principles so as to be able to take care of peakloads.

Mr. THOMAS. But as far as X pipeline application is concerned, you don't want to know how much is available in the area and how much is available in the United States. You want to know how much you have your hands on that you can deliver.

Mr. SWIDLER. Yes, sir. I believe you are thinking in terms of an altogether new pipeline.

Mr. THOMAS. Yes.

Mr. SWIDLER. That is not the typical situation. We now deal with expansions of existing pipelines for the most part.

Mr. THOMAS. Expansions and extensions?

Mr. SWIDLER. Extensions of existing pipelines so that all the information we accumulate has pertinence to any new extension or expansion of their systems. All we have to do is bring it up to date.

Mr. THOMAS. That is not tying the Commission up in a knot. It is when they come in with a brand new application wanting a brand new line. That is where your headache really is, isn't it?

Mr. SWIDLER. No, sir. It is on both. Even the major expansions have been major cases.

ENFORCEMENT OF UNIFORM ACCOUNTING

Mr. THOMAS. Let's take a look at the cost accounting. You want 17 positions. That is also what you have had. Who has audits this year?

Mr. SWIDLER. Our chief accountant, Mr. Rainwater, retired as of the first of the year.

Mr. THOMAS. Did Mr. Rainwater retire?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. You have filled the position?

Mr. SWIDLER. We have appointed a man who will be reporting on February 24; Arthur Litke. He is now with the GAO. He is an Associate Director of the Civil Audits Division of the GAO.

Mr. THOMAS. I don't recognize that name. Do you, Mr. Boland?

Mr. BOLAND. I don't believe so.

Mr. THOMAS. Compliance audits: The objective of the activity is to check the accounts of the pipeline companies to insure compliance. What is his staff? He has a staff in all of his activities of around 125 or 150, as well as I remember. Let's turn back to page 11 and see, gentlemen. Office of Accounting and Finance——

Mr. SWIDLER. We go up from 125 to 128.

Mr. THOMAS. It is 125 now?

Mr. SWIDLER. Yes, sir.

UTILIZATION OF ACCOUNTING POSITIONS

Mr. THOMAS. They are broken down. Can you break them down in one spot here for us? Can you read them into the record? How are

they broken down into divisions? Read them for the record at this point.

Enforcement and uniform accounting is set forth, here. You have 17 set out here for pipelines.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. Can you break it down?

Mr. CAPAR. For the accounting office?

Mr. SWIDLER. How did you want that broken down, sir?

Mr. THOMAS. By activities.

How does he use his 125 men? I would like to see it in one spot. Some of them are in gas. Some of them are in pipelines. Some of them are in hydroelectric. Some of it is in gas rate cases. Some of it is in electric power rates. Break it down.

Mr. SWIDLER. We will do that, sir.

(The information supplied follows:)

Office of Accounting and Finance—Utilization of positions

	Actual 1963	Estimate 1964	Estimate 1965

Non-Federal hydroelectric projects: Licensed project accounting	36	33	33
Total, Office of Accounting and Finance	126	125	128

Mr. THOMAS. You have 125 people. You go up every year. Then we look a little further and we find out you are going over here and trying to get a certificate out of some fellow who has been sitting on some little creek in New England for the last 25 years and he wants to get a little money out of it.

ELECTRIC POWER INDUSTRY PUBLICATIONS

Here are publications (reading:)

The collection, analysis, and interpretation of such financial and operating data are necessary functions for the regulation of the natural gas industry; in addition, these data enable the Commission both to keep the public informed—

what part of the cost of your publications do you get back? They are not all throwaways, are they?

Mr. SWIDLER. No, sir. A good many of them are sold by the Government Printing Office, all the large ones.

Mr. O'CONNOR. $36,000 comes from the sale of publications.

Mr. SWIDLER. I do not think that includes the amount received by the Government Printing Office. That is only what we receive and return to the Treasury.

GAS INDUSTRY CENSUS

Mr. THOMAS (reading):

The Commission expects to conduct a gas industry census in 1964, and continue through 1965, in collaboration with the Bureau of the Census. This will be the first such undertaking since natural gas supplanted manufactured gas as a domestic fuel. The census will be conducted by mail and will require a minimum of manpower.

What is the object of it?

Mr. SWIDLER. The same object as in any other business census, to find out the status of the industry.

Mr. THOMAS. The stove manufacturer does not make a stove made out of coal or natural gas. It is still gas. It is still gas. Finally, this is for the use and benefit of, among other people, the manufacturers of a gas stove and I guess a hundred other people. I do not understand the purpose of breaking it down between artificial gas and natural gas. After all, it is gas, isn't it?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. The same stove uses both.

Mr. SWIDLER. There would be very little manufactured gas so far as the public supply is concerned. I think this census is primarily of the natural gas industry. Of course, it would cover not only the wholesale end, but the whole natural gas industry and the form of the questionnaire will be determined largely by the Bureau of the Census in order to fit into its overall census.

ELECTRIC POWER INDUSTRY

Mr. THOMAS. Let's take a look at electric power. Put pages 33 and 34 in the record.

(The pages follow:)

ELECTRIC POWER INTRODUCTION

The Commission's 1965 electric power budget request is required to meet a rapidly growing workload in the important area of wholesale electric rate regulation and to permit a continuation of our program to encourage stronger interconnections and closer coordination between electric power systems to lower costs. The experience our staff has gained in the national power survey will pay dividends in encouraging the Nation's power systems to improve their efficiency and achieve reductions in costs which are the key to lower rates for the benefit of consumers.

The Commission needs additional staff to carry out its full responsibilities with respect to the growing number of electric utilities subject to its jurisdiction. In the last fiscal year we published for the first time a list of 189 companies classified as "public utilities" by the Commission. The Commission has not previously exercised its jurisdiction over many of these companies and several major hearings on the issue of jurisdiction are now underway and more will undoubtedly be

required. The Nation's electric power systems are rapidly becoming a single interconnected network in interstate commerce with the wholesale rates of almost all large power companies in the country subject to our scrutiny. It is obvious that our electric rate workload is one of major proportions and will require additional staff if we are to provide assurance of low-cost power to the thousands of municipal, cooperative, and private power distributors throughout the country.

The Commission is also asking for sufficient staff to be able for the first time in its history effectively to license hydroelectric projects in the public interest. The Commission has learned through painful experience that without adequate and current basinwide plans it cannot properly discharge its responsibility to license projects which are "best adapted to a comprehensive plan" nor give Congress the impartial and expert advice on water resource projects which Part I of the Power Act intended. Some 105 license applications for major projects with a total installed capacity of more than 9 million kilowatts and a total estimated construction cost of about $1.9 billion were pending as of January 1, 1964, many of them for projects on rivers that are not now covered by adequate plans of development. Basinwide plans are also needed in considering recommendations to Congress for recapture of those licensed projects whose licenses soon begin to expire and in considering Commission recommendations for Federal development.

To meet these needs, the Commission proposed to revitalize its licensing work by expanding and reorganizing its River Basin Division for a program of water resources appraisals for hydroelectric licensing. The appraisals would be based to the maximum extent on utilizing the studies of other agencies, supplemented by FPC studies only to the extent necessary to meet the Federal Power Commission's licensing program needs.

Mr. THOMAS. In the last fiscal year we published for the first time a list of 189 companies classified as "public utilities by the Commission." [Reading:]

The Commission is also asking for sufficient staff to be able for the first time in its history effectively to license hydroelectric projects in the public interest.

You are not speaking of non-Federal projects, are you?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. What do you mean effective? You always license non-Federals. These are little bitty Federal projects you are talking about. They have been in existence 25 or 30 years. They are sitting on some creek up in good old New England. That is what you are doing.

Mr. SWIDLER. What we are trying to say, sir——

Mr. THOMAS. There is a good case of featherbedding. It is the antithesis of it, going out making work. I guess it is featherbedding.

Mr. SWIDLER. Let me try to explain that if I may, Mr. Chairman. The Federal Power Act has a standard of comprehensive development set forth in section 10(a).

Mr. THOMAS. I know. This is not the first year you have been doing it. You have been doing it for a couple of years since you have been over there.

Mr. SWIDLER. But as a practical matter we have never had comprehensive plans to which to relate these projects. We have not been able really——

Mr. THOMAS. What good do you accomplish when you do all this?

Mr. SWIDLER. Sir, there is a great difference between an optimum development of our natural resources——

Mr. THOMAS. Some of those fellows get up there and use their own power. Maybe they supply a few neighbors or some little village but as far as interstate commerce is concerned they are not in it, never have been in it, and the only reason you have jurisdiction is because

it is a stream that is not even navigable. They tell me in floodtime if it will float a 2-inch log you have jurisdiction.

Mr. SWIDLER. You are talking about a somewhat different problem. I would like to come to the question you are raising, too, but my basic point is that in order to do the job that the statute contemplates, we must have a conception of the proper way to develop each of the country's rivers so that we do not operate in the dark when we issue these licenses.

So far as the small existing projects are concerned, as you know, we recommended to Congress and fought vigorously to persuade Congress to agree to a virtual exemption of small projects. The exemption at first was in the 100-horsepower range and we asked Congress to increase it to 2,000 horsepower. The amendment which was passed in 1962 enables us to use a simple form of license which requires no expense and no redtape for small projects. We are not trying to do any empire building which does not pay off in the public interest.

Mr. THOMAS. When we get to the big ones, there is no argument with you. [Reading:]

Some 105 license applications for major projects with a total installed capacity of more than 9 million kilowatts and a total estimated construction cost of about $1.9 billion were pending as of January 1, 1964.

These are more or less your big ones.

Mr. SWIDLER. The new applications are for the big ones. That is right.

Mr. THOMAS. You have been studying that. You have eight or nine regional offices. For years and years this is all they did. Your activities under power were here in the District of Columbia. Those basins have not changed one iota today over what they were 30 years ago. They have been studying them every year. You have had 200 or 300 people studying them.

Mr. SWIDLER. I bet the basins in Texas have changed a lot. Has nothing changed in Texas river basins in the last 30 years?

Mr. THOMAS. We don't have enough rain down there to do that.

SUMMARY OF ELECTRIC POWER INDUSTRY

Mr. JONAS (presiding). Let's put page 35 in the record.

(The page follows:)

ELECTRIC POWER INDUSTRY

Comparative summary of activity

	1963 actual		1964 estimate		1965 estimate	
	Positions	Funds	Positions	Funds	Positions	Funds
A. Regulation of rates	32	$322,966	53	$560,000	78	$878,000
B. Regulation of finances and operations	22	222,463	22	241,000	22	251,000
C. Enforcement of uniform accounting	10	100,503	16	175,300	16	182,000
D. Power system analysis	84	848,069	58	624,400	58	650,000
E. Interconnection and coordination	19	191,978	19	208,100	19	217,000
F. Gathering and analysis of data	30	303,768	30	317,600	30	342,000
Total activity	197	1,989,747	198	2,136,000	223	2,520,000

Mr. JONAS. That is a comparative summary of activity of the Commission with respect to the electric power industry; is that correct?

Mr. SWIDLER. Yes, sir.

Mr. JONAS. You have six different activities.

Mr. SWIDLER. Yes, sir.

Mr. JONAS. First, the regulation of rates. You want to go up from 32 people in 1963 to 53 people in 1964 and then to 78 positions in 1965.

Mr. SWIDLER. Yes, sir.

Mr. JONAS. That is an increase from $569,600 in 1964 to $878,000 in 1965.

That is the only activity in which you are asking for increased positions.

Mr. SWIDLER. Yes, sir, for the reasons I mentioned.

Mr. JONAS. For the reasons already stated and are in the record.

The other activities are regulation of finances and operations, enforcement of uniform accounting, power system analysis, interconnection and coordination, and gathering and analysis of data. They remain constant as far as positions are concerned. There is some increase in cost but that is due to the pay act and in-grade promotions?

Mr. SWIDLER. Yes, sir.

Mr. JONAS. The total cost of these activities goes up from $1,989,747 in 1963 to $2,136,000 in 1964 and $2,520,000 in 1965.

Once you install a uniform system of accounting, why do you need that many people to continue working in the field? Is it a question of enforcing?

Once you force an adoption or encourage adoption of a uniform system, it is adopted. Then you do not have any problems of policing, do you?

Mr. SWIDLER. Yes. There are substantial problems of policing because the entries are frequently not made in accordance with the FPC system of accounts. We find that it takes a certain amount of sticking with it to keep the accounts in accordance with the system that we prescribe. By keeping up with it currently, any time we need to rely on the utilities' figures they are available without having to go back many years to check them out.

Mr. THOMAS. Did you point out here your only increase is from 53 to 78 in your rate cases?

Mr. JONAS. Yes, sir.

REGULATION OF RATES

Mr. THOMAS. I have underlined something here at the bottom of page 36, which we will include in the record. Also include 37.

(The pages follow:)

REGULATION OF RATES

Vigorous action by the Commission over the past 2 years to exercise its responsibility for the regulation of wholesale electric rates has resulted in a rapid expansion in rate workload and operations. The Commission received 1,882 wholesale rate filings in fiscal year 1963, and we are continuing our efforts to obtain compliance with the filing requirements of the Federal Power Act.

Revised regulations have been issued requiring electric utilities to support rate filings with cost and other pertinent information that will facilitate meaningful Commission review and eliminate the need for extensive correspondence

and fieldwork by our staff. Recently, for the first time in history, a list of the major public utilities subject to the Commission's jurisdiction was published. A thoroughgoing review of all electric rate schedules presently on file is being made with a view toward eliminating excessive or discriminatory rates and unreasonable provisions in these rate schedules. The Commission has initiated 21 formal rate cases dealing with failures to file, restrictive provisions and dual rates, refusals to serve, and unlawful rate levels and these cases are now in various states of completion and new cases are being initiated almost every week. The completion of these cases will require a great deal of work by our professional staff of lawyers, engineers, and accountants, and most of them will result in formal hearings. These will establish the precedents that will enable the Commission to handle the nationwide job of wholesale rate regulation with a minimum number of people.

The electric power industry is continuing its rapid movement toward interstate power pools. The national power survey has encouraged the industry to accelerate this trend toward interstate operations which permit lower cost operations. The Commission requires an adequate staff to keep pace with the larger number of interstate rates and the increased opportunities of the regulatory process to effect rate reductions. The present staff must be increased to deal with an industry whose interstate operations are showing such dynamic growth. The small staff we are requesting will be required in 1965 to regulate the wholesale rates for the Nation's largest industry, with assets of more than $70 billion and monthly revenues exceeding a billion dollars. The public benefits of effective regulations are truly enormous because an abundant supply of electric power at reasonable rates is an essential ingredient of a dynamic growing economy.

The United States has entered an era in which the cost of electric power can be substantially reduced through interconnected power pools covering many States. The lower cost power from these pools must be made available at reasonable rates to the many small utilities, public and private, whose service areas are not large enough to enable them to generate their own power in large plants which are much more economical than small ones. The assurance of power by the long-term fulfillment of the Commission's responsibilities will provide an alternative for large investments in plants of relatively low efficiency which are justified only when low-cost power on fair terms cannot be guaranteed by effective wholesale rate regulation.

Mr. THOMAS (reading):

The Commission has initiated 21 formal rate cases dealing with failures to file, restrictive provisions and dual rates, refusals to serve, and unlawful rate levels and these cases are now in various states of completion and new cases are being initiated almost every week.

NATIONAL POWER SURVEY

Mr. THOMAS. When were you going to wind up that national power survey you started?

Mr. SWIDLER. This fiscal year, we hope, sir.

Mr. THOMAS. Are you going to reduce the budget next year? How many people are doing this work?

Mr. SWIDLER. We have 24 people on the work now.

Mr. THOMAS. I did not notice any reduction of 24 people.

Mr. SWIDLER. Fourteen of them were borrowed from other work to which they would be returned, from the power requirements and supply, where their studies are now far behind. Ten would be in a continuing effort to encourage interconnections so as not to lose the momentum that has been built up by the survey.

ELECTRIC RATE REGULATION

Mr. THOMAS (reading):

The Commission requires an adequate staff to keep pace with the larger number of interstate rates and the increased opportunities of the regulatory process to effect rate reductions. The present staff must be increased to deal with an industry whose interstate operations are showing such dynamic growth.

It has been testified to this morning that about 10 percent of the power produced in the United States is under the jurisdiction of Federal Power Commission and the other 90 percent, isn't it? [Continues reading:]

The small staff we are requesting will be required in 1965 to regulate the wholesale rates for the Nation's largest industry, with assets of more than $70 billion and monthly revenues exceeding a billion dollars. The public benefits of effective regulation are truly enormous because an abundant supply of electric power at reasonable rates is an essential ingredient of a dynamic growing economy.

We used the figure 50 this morning.

Mr. SWIDLER. That was in error.

Mr. THOMAS (continuing reading):

The United States has entered an era in which the cost of electric power can be substantially reduced through interconnected power pools covering many States—

that is, provided they want to go in interstate commerce.

ELECTRIC RATE CASE WORKLOAD

We will put the top of page 40 in the record, "Summary of workloads and positions required."

(The page follows:)

Rate cases—Summary of workloads and positions required

	On hand 1st of year	Number received	Total workload	Number completed	On hand end of year	Positions required
1963 actual	8	6	14	2	12	16
1964 estimate	12	11	23	16	7	25
1965 estimate	7	16	23	18	5	36

Mr. THOMAS. You speak of your rate cases. You go into fiscal 1963 with eight cases. You initiate six new ones. It gives you a total of 14. You only completed two that year. Somebody was dragging his feet.

Positions required, 16. You go into 1965 with 7 and initiate 16. You get rid of 18. You drop down to five at the end of 1965.

Positions required, 36, a 50-percent increase in 1 year. Your workload is just the same.

Mr. SWIDLER. Our completions are not good. We are seriously understaffed. There is a great deal to be done.

Mr. THOMAS. You have no backlog. You go into the fiscal year with seven cases.

Mr. SWIDLER. We began fiscal 1964 with 12.

Mr. THOMAS. Can you imagine that this Chairman wants to work himself out of business?

Mr. SWIDLER. Twelve cases, sir.

Mr. THOMAS. You will work yourself out of business and have no seed corn here. On hand at the beginning of the year only seven.

Mr. SWIDLER. Twelve, sir. I am sorry; you are talking about 1965; that is seven.

RATE INVESTIGATION WORKLOAD AND COST STUDIES

Mr. THOMAS. Put the table at the top of 41 in the record, and also the table in the middle of page 42.

(The tables follow:)

Rate investigations—Summary of workloads and positions required

	On hand 1st of year	Number initiated	Total workload	Number completed	On hand end of year	Positions required
1963 actual	2	5	7	1	6	2
1964 estimate	6	24	30	20	10	10
1965 estimate	10	30	40	25	15	21

Original cost studies

	Number completed	Positions required
1963 actual	0	0
1964 estimate	1	1
1965 estimate	3	4

REGULATION OF FINANCES AND OPERATIONS

Mr. THOMAS. We will put page 43 in the record beginning with the regulation of finances and operations.

(The page follows:)

Regulation of finances and operations—Summary of workloads and positions required

	On hand 1st of year	Number received	Total workload	Number completed	On hand end of year	Positions required
1963 actual	2	165	167	159	8	22
1964 estimate	8	220	228	220	8	22
1965 estimate	8	238	246	240	6	22

The performance of regulatory duties prescribed by section 201, 202, 203, 204, and 305 of the Federal Power Act, and in Executive Order 10485, includes the following functions: Temporary connections during emergencies; exportation of electric energy; issuance of permits to construct and maintain facilities at international borders; disposition of property, consolidations, or purchase of securities; issuance of securities or assumption of liabilities; interlocking directorates; and jurisdictional determinations.

Mr. THOMAS. Summary of workloads and positions required. You have 22 positions. You show completed cases, 240, about 10 cases per person. This is all your auditing division work, is it not?

Mr. SWIDLER. No, sir.

Mr. THOMAS. Who does this?

Mr. SWIDLER. It is done by the lawyers, accountants, and engineers.

Mr. THOMAS. Where are your green sheets? This is under Mr. Rainwater's division, is it not?

Mr. SWIDLER. No, sir, this is in power.

Mr. THOMAS. Still it is one of his divisions, which is why I called for a breakdown of his 125 people. Where is this?

Mr. CAPAR. This is regulation of finance. Three in the Office of Finance, two in the Office of the General Counsel, four in Administration, seven in Power, two in the Office of Economics.

Mr. THOMAS. That is Brother Rainwater?

Mr. CAPAR. Mr. Rainwater has three; seven in Power. That is the biggest group.

LEGAL STAFF

Mr. THOMAS. How many lawyers are scattered throughout, not in the Office of the General Counsel but the lawyers in all divisions? How many are in the Chief Counsel's office?

Mr. SOLOMON. 120 people in the Office of the Chief Counsel. About 78 lawyers.

Mr. THOMAS. Scattered throughout the agency how many do you have?

Mr. SOLOMON. Excluding the Commissioners' legal assistants——

Mr. THOMAS. We want them, too.

Mr. SOLOMON. Five lawyers for the Commission. Five lawyers doing opinion writing work. My lawyers and the hearing examiners. There are no lawyers in our agency scattered in the Bureau of Power or Natural Gas.

Mr. THOMAS. You do not have them scattered on the payroll throughout the agency?

Mr. SWIDLER. We do not have that system.

Mr. SOLOMON. We followed the Hoover Commission report and all lawyers except those two general categories are in the Office of the General Counsel.

Mr. THOMAS. You have about 85 lawyers?

Mr. SOLOMON. That is right, roughly.

Mr. O'CONNOR. 105.

Mr. SWIDLER. These other categories do not serve as part of the legal staff. They are the opinion writers and assistants to the Commissioners.

Mr. THOMAS. How do you find these people? How do you hire them? Is it under civil service?

Mr. SWIDLER. Are you talking about the lawyers?

Mr. THOMAS. Yes.

Mr. SWIDLER. The lawyers are a special schedule under civil service.

Mr. SOLOMON. Schedule A, subject to the Classification Act, but they are not hired pursuant to civil service. As you may remember, there used to be a Board of Legal Examiners but Congress prohibited that. They are now hired by the agency direct.

Mr. THOMAS. I wondered whether you were living up to that prohibition we carried in the bill. After all, you do your own hiring and firing. You do not have to go through civil service for the lawyers.

Mr. SOLOMON. That is right; they have to be classified by civil service but we do our own hiring and firing.

Mr. SWIDLER. Assistants to the Commissioners are schedule C.

Mr. THOMAS. By that you mean——

Mr. SWIDLER. Not under civil service at all, subject to removal.

Mr. THOMAS. They get the benefits of civil service and have a civil service classification but they are subject to removal at the wish of the Commission, and that is it.

Mr. SWIDLER. That is right, sir.

Mr. O'CONNER. These new additional people in the Commissioners' office will be the same way.

ENFORCEMENT OF UNIFORM ACCOUNTING

Mr. THOMAS. Going to the Enforcement of Uniform Accounting, we will put pages 45 and 46 in the record.

(The pages follow:)

Enforcement of uniform accounting—Summary of workloads and positions required

	Total workload	Number completed	On hand end of year	Positions required
1. Compliance audits:				
1963 actual	167	0	167	1
1964 estimate	202	1	201	4
1965 estimate	201	6	195	4
2. Other (review of annual reports, accounting regulations, and actions):				
1963 actual	200	200	0	9
1964 estimate	200	200	0	12
1965 estimate	200	200	0	12

NOTE.—Workload data on review of annual reports only.

Electric rate regulation demands that data submitted in rate proceedings be reliable for accurate determinations. Annual reports filed by the companies must also be uniform and consistent in nature to insure the validity of the Commission's published statistics on the electric industry.

1. Compliance audits

Compliance audits were initiated in 1964 in connection with the separate program of original cost studies as a prerequisite to effective rate regulation. The backlog of 202 companies awaiting compliance audits requires the Commission to strengthen this function if the backlog is to be reduced and companies are to be audited every 3 years as a minimum. The staff will initiate one audit in 1964 and will participate extensively in the planning, scheduling, training, and orientation required to initiate the program and increase the number of audits to six in 1965.

2. Other

Since the Commission's jurisdiction over interstate electric utilities was established, reviews of the annual financial reports are made as a check on compliance with the Commission's prescribed system of accounts. Where violations are discovered, action is instituted through correspondence or conferences to correct the deficiencies.

Drafting of revisions and interpretations of the Commission's uniform system of accounts, other accounting regulations, and design of financial report forms are also performed under this program. Reviews are made of proposed accounting for acquisitions and sales of utility property, amortization of financing costs, and special accounting proposals. These require approval of the Commission before being placed into effect.

Mr. THOMAS. In 1964 you have a backlog of 202 companies awaiting compliance audits. You say that this requires the Commission to strengthen this function. Who are these 202 companies? Are these

big non-Federal projects or are they little hydroelectric Federal projects sitting up on some little creek? When you get through, you do not have a shirttail full of power wrapped up in it.

There was one case we had in Michigan a few years ago. The company moaned and groaned and wrote two or three letters. You have sent more people out there than they had employees. Is that the nature of these cases?

Mr. SWIDLER. No, sir. We are trying all the time to analyze——

Mr. THOMAS. Give us a list of these 202 companies. Where are they located? Let us see how much power they generate.

Mr. SWIDLER. I have that list here. I will be glad to supply it.

Mr. THOMAS. Read us some from the list. How much power do some of them generate? Do you have any big ones there?

Mr. SWIDLER. Yes, sir, some of the largest. Alabama Power Co.

Mr. THOMAS. Is that one of of the small units? That is not the Alabama Power Co., is it? They have a good many units. Does that include all units?

Mr. SWIDLER. This is the whole of the company.

Mr. THOMAS. Where are they located? Are they Federal hydroelectrics or non-Federals? Are they steam, or what?

Mr. SWIDLER. There are some of each. This includes practically all the large companies of the industry.

Mr. THOMAS. This figure here, a backlog of 202 companies awaiting compliance audits. Do you mean to say that 202 companies deny the jurisdiction of the Federal Power Commission or have they been sending you in reports and you say, "Well here is one we do not like, we want more information." Do you call that a case of noncompliance?

Mr. SWIDLER. First, I do not suggest that this means we are going to audit 200 companies in the year. This does mean that as to practically every company in the whole industry we consider——

NUMBER OF POWER COMPANIES

Mr. THOMAS. You do not have but 280 power companies under your jurisdiction all together, do you? How many are under your jurisdiction?

Mr. SWIDLER. We list 189, but they are all large. There are about 400 or 450 private companies in the industry, I believe.

Mr. THOMAS. How many under your jurisdiction? You gave the figure this morning.

Mr. SWIDLER. One hundred and eighty-nine, sir.

Mr. THOMAS. Is that all the power companies under your jurisdiction, 189?

Mr. SWIDLER. No, sir. Those are with revenues over a certain base amount, the larger companies.

Mr. THOMAS. How many companies do you have in your jurisdiction?

Mr. SWIDLER. I do not know. I do not believe we have analyzed the status of the little ones, just the big ones so far.

Mr. THOMAS. Do you have an idea how many the number is, disputed and otherwise?

Mr. SWIDLER. I would hesitate to guess, but there are a total of about 400 or 450 companies in the industry. I would venture to say that the 189 big ones included most of those that would ultimately be determined as being under our rate jurisdiction.

Mr. THOMAS. If you only had 10 percent of the total output of electric current in the United States under your jurisdiction, how could you have 189 of the big ones out of a total of 450? Those figures do not quite jibe.

Mr. SWIDLER. The 189 companies would account for 90 or 95 percent of the electric power business in the United States. The remaining couple of hundred companies are very small in comparison.

ELECTRIC POWER INDUSTRY PUBLICATIONS

Mr. THOMAS. Where is the list of those publications? It is back under "Other objects." We will put pages 57 and 58 in the record.

(The pages follow:)

PUBLICATIONS

The Commission's regular publications containing information about the electric power industry are listed below. Extensive revisions are planned in these during 1964 and 1965 to improve their usefulness to Government, industry and consumers and as a regulatory aid to the Commission.

RATE STATISTICS

Typical Electric Bills, Annual.
All-Electric Home Survey, Annual.
National Electric Rate Book, Annual.

POWER STATISTICS

Production of Electric Energy and Capacity of Generating Plants, Monthly and Annually.
Electric Utility System Loads, Monthly.
Consumption of Fuel for Production of Electric Energy, Monthly and Annually.
Sales of Electric Energy by Class of Service, Monthly.
Steam-Electric Plant Construction Costs and Annual Production Expense, Annual.
Hydroelectric Plant Construction Costs and Annual Production Expense, Annual.
Electric Facility Maps.
Transmission Lines Placed in Service.
Interstate Flows of Energy, Annual.

FINANCIAL AND CORPORATE STATISTICS

Statistics of Electric Utilities in the United States, Privately Owned, Annual.
Statistics of Electric Utilities in the United States, Publicly Owned, Annual.
Monthly Financial Statistics, Electric.
Electric Utility Depreciation Practices.

Mr. THOMAS. Take your list and put the number of copies you print, the sale price or if they are giveaway, the revenue you get, and what they cost.

(The information supplied follows:)

Electric publications

	Actual, fiscal year 1963						Estimate, fiscal year 1965, cost to produce
	Sales price	Cost to produce	Number of copies for FPC	Revenues collected (by FPC)	Number of copies ordered by Superintendent of Documents	Revenues collected (Superintendent of Documents)	
Contract printing:							
Typical electric bills	$0.60	$826	1,000	$60	3,000	$1,500	$800
All-Electric Homes, Annual Bills	.20	391	1,500	20	3,000	600	1,200

Mr. THOMAS. What does this entire printing bill for power cost you?

Mr. SWIDLER. We will try to provide that for the record.

PRINTING AND REPRODUCTION

Mr. THOMAS. I do not see any way to break it out of your "Other objects." You did it one time. You had a much bigger chart than the one you have on page 11. It is all together. Do you have a horseback opinion? Your entire printing bill for this year is $142,000 against $110,000 last year, an increase of $32,000. Would you hazard a guess what part is for power?

Mr. SWIDLER. No, sir. I will have to try to get the accountants to break that down.

Mr. THOMAS. Take your table on page 58 and make a table out of it.

Mr. CAPAR. I understand.

Mr. O'CONNOR. That figure is printing and reproduction, which I assume is reproduction of our opinions, which are the most numerous of our publications.

Mr. THOMAS. You have an item in there for that.

Mr. O'CONNOR. I would think most of it would be reproduction of our opinions.

Mr. SWIDLER. And opinions of the hearing examiners and the briefs and pleadings of our counsel in all cases. Most of it relates to just the——

Mr. THOMAS. Your figure of $80,000, that covers what part of your publications?

Mr. CAPAR. That covers both power and gas publications.

Mr. THOMAS. Let us see what your opinions cost. Turn to "Other objects." You set it out here.

Mr. SWIDLER. We have an item 24.

Mr. THOMAS. On page 95 you show "Printing and reproduction." You say although an increase of $32,000 over 1964 will be required in 1965, experience has shown that actual cost is invariably higher than the estimates. What do your opinions cost? Does anybody have a figure on that? You got your annual report. What does it cost?

Mr. CAPAR. The annual report cost $2,500.

Mr. THOMAS. Are you figuring on binding any of your opinions this year?

Mr. CAPAR. $51,500 for opinions and decisions.

Mr. THOMAS. This year?

Mr. CAPAR. For 1965.

Mr. THOMAS. How many volumes?

Mr. CAPAR. Volumes 32 and 33, and binding volumes 27 and 28.

Mr. THOMAS. $51,000. How often do you do this, every year?

Mr. CAPAR. No, sir. We did not do the printing this year that we intended to do.

Mr. THOMAS. How many volumes are you behind from being current?

Mr. CAPAR. On binding, in 1965 we will print the 1962 volume. We are behind 1963 and this coming year, sir.

Mr. THOMAS. Is there any pressing need for that right now, gentlemen?

Mr. O'CONNOR. I think one of the resolutions passed by the Federal Power Bar Association urged us to bring the bound volumes up to date.

Mr. SWIDLER. The practitioners before our agency, of whom there are a considerable number, about 600 members of the Federal Power Bar Association, have, of course, a great need for the volumes of our opinions.

Mr. THOMAS. Do you license or certificate the brothers?

Mr. SWIDLER. No, sir. Anyone can practice before us. We have a very able and very active bar.

NON-FEDERAL HYDROELECTRIC PROJECTS

Mr. THOMAS. Let's turn to "Non-Federal hydroelectric projects." Insert page 59 in the record.

(The page follows:)

Non-Federal hydroelectric projects—Comparative summary of activity

	1963 actual		1964 estimate		1965 estimate	
	Positions	Funds	Positions	Funds	Positions	Funds
A. Licensing	88	$933,190	97	$1,047,300	115	$1,313,000
B. Supervision of licensed operations	21	221,340	23	242,500	28	322,000
C. Headwater benefit determination	19	126,797	19	198,400	19	219,000
D. Licensed project accounting	40	468,263	36	396,800	36	403,000
Total	168	1,749,590	175	1,885,000	198	2,257,000

LICENSING OF PROJECTS

Mr. THOMAS. Referring to licensing on page 59, you want to go from 97 to 115 employees. These are small projects, are they not?

Mr. SWIDLER. The unlicensed project activity——

Mr. THOMAS. You got into some big ones here. These are non-Federal. You run into some sizable operations here.

Mr. SWIDLER. These are large operations. These constitute a backlog in dollars of $3 billion of construction, although I must say some overlap.

Mr. THOMAS. We will put pages 60 and 61 in the record.

(The pages follow:)

A. Licensing: Summary of workload and positions required

	On hand 1st of year	Received or initiated	Total workload	Number completed	On hand end of year	Positions required
1963 actual:						
1. Permits and license applications	160	167	327	108	219	86
2. Unlicensed project investigations		1	1		1	2
3. Declarations of intention	2	1	3	1	2	
4. Water resources appraisals		5	5		5	
5. Recapture provisions						
Total	162	174	336	109	227	88
1964 estimate:						
1. Permits and license applications	219	168	387	146	241	76
2. Unlicensed project investigations	1	22	23	10	13	5
3. Declarations of intention	2	1	3	2	1	
4. Water resources appraisals	5	10	15	5	10	15
5. Recapture provisions						1
Total	227	201	428	163	265	97
1965 estimate:						
1. Permits and license applications	241	170	411	151	260	81
2. Unlicensed project investigations	13	15	28	10	18	5
3. Declarations of intention	1	2	3	2	1	
4. Water resources appraisals	10	10	20	10	10	24
5. Recapture provisions						5
Total	265	197	462	173	289	115

We are requesting an increase of 18 positions in 1965 to perform our licensing function for hydroelectric projects. The costs of this work, including the cost of the staff of 115 people, is reimbursable as provided in part I of the Federal Power Act to the Government by the licensees except for public bodies which are specifically exempt by the terms of the act.

1. Processing permit and license applications

During the past 17 years, the operating capacity under license has more than quadrupled from about 4 million to 17,900,000 kilowatts in 280 projects. The ultimate capacity under license has increased almost five times from about 5,500,000 to more than 26,900,000 kilowatts. At present, 29 projects totaling 6 million kilowatts of hydroelectric capacity are under construction. These projects represent a construction program of $1.5 billion.

At the start of 1965, we expect that approximately 241 applications for permits and licenses will be pending. Three of these will be for preliminary permits, 100 for major licenses, 21 for minor licenses, 82 for amendments, and 35 for surrender or transfer.

The Commission attempts to process all license applications as promptly as possible. Formal hearings are held only when required in the public interest or to provide a record to resolve a dispute that cannot be otherwise resolved. Two hearings involving licenses for new capacity were held in 1963 involving the proposed Don Pedro project on the Tuolumne River in California, having an installed capacity of 130,000 kilowatts, and the proposed Little White Salmon project in the State of Washington, having an installed capacity of 30,600 kilowatts. Hearings are planned to start in 1964 on five applications (Belden, Calaveras County Water District, Tuolumne County Water District No. 2, Hawks Nest project, and Richvale Irrigation District). Final Commission action on these cases and other cases to follow will be expedited by the programs and manpower we are requesting.

Mr. THOMAS. You say there are many existing hydroelectric projects that are still operating without an FPC license as required by section 23(b) of the Federal Power Act. These are small ones. How old are they?

Mr. SWIDLER. They are of various ages and sizes.

Mr. THOMAS. These were in operation before the Federal Power Act was passed. When was it passed?

Mr. SWIDLER. The Power Act was first passed in 1920. This is part I of the present act.

Mr. THOMAS. Some were in operation before it was passed.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. Are you not chasing rabbits?

Mr. SWIDLER. No, sir.

Mr. THOMAS. Are there any bears in the crowd?

Mr. SWIDLER. Let me try to explain the problem. There were about 550 existing projects we thought came under our jurisdiction. In the first place, we do not think it is up to us to appraise——

Mr. THOMAS. How many of the 550 have not been licensed? How many are you gunning for here?

Mr. SWIDLER. About half of those are in the process of being licensed. They have either come in and applied for licenses or they have indicated they intend to. The remainder we are gradually working out of our system. The question is whether the laws enacted by Congress are going to be observed. We do not think it is up to us to pick and choose and say, you can be exempt from the requirements Congress imposed, and somebody else is subject to them.

Mr. THOMAS. The only concrete information is this. You say (reading):

On May 4, 1962, the Commission sent letters enclosing its opinion No. 357 to 193 owners or operators of approximately 500 unlicensed hydroelectric projects

asking them whether they proposed to file applications for licenses. The Commission has received responses from all but one of these owners.

As of October 1, 1963, 77 owners have stated their intention to file applications for license for approximately 284 developments having a total installed capacity of about 1,800,000 kilowatts.

Does that mean 77 out of 193?

Mr. SWIDLER. Yes, sir; but it means 284 projects out of 550.

Mr. THOMAS. Having a total installed capacity of about 1,800,000 kilowatts. Is that big, small, meduim, or what?

Mr. SWIDLER. This includes some at 30,000 or 40,000 horsepower and others are quite small.

Mr. THOMAS. Some were in existence long before your act went into effect?

Mr. SWIDLER. Yes, sir; and have been reconstructed since.

Mr. JONAS. You cannot touch them.

Mr. SWIDLER. If they have been reconstructed.

Mr. THOMAS. They are trying to.

Mr. JONAS. The act excludes them. Section 23(b) excludes those in operation prior to 1920, does it not?

Mr. SWIDLER. If they have a valid permit and if it is the same project. Some of these projects have been completely reconstructed. For example, some permits may have been for a project involving no hydropower at all.

Mr. JONAS. It says except in accordance with the terms of a permit or with valid existing rights-of-way granted prior to June 10, 1920.

Mr. SWIDLER. Exactly.

Mr. JONAS. That does not say a Federal permit.

Mr. SWIDLER. In the number that we have given you we have excluded the cases that do not require licenses. When any of these people to whom we write point to the existence of a valid permit, that concludes it as far as we are concerned.

Mr. THOMAS. How many people do you have working on it?

Mr. SWIDLER. Let me say first of all this licensing activity is reimbursable. It will not cost the Federal Government a dollar net. We will get out of it the orderly development of our river systems, which was the purpose of the Federal Power Act.

Mr. THOMAS. These little fellows pay their own costs. This is about the only one where it is self-supporting. How many people do you have engaged in it?

Mr. SWIDLER. We are asking for a total for all non-Federal hydroelectric projects of 198 positions.

Mr. THOMAS. I am talking about going out and getting these fellows to come up and——

Mr. SWIDLER. Five new positions.

Mr. THOMAS. That does not cover it. That is investigation. How many do you have doing the licensing work? How many do you have doing the accounting work?

Mr. SWIDLER. They are covered by a share of the other work.

(The following was subsequently supplied for the record:)

There is a total of 115 positions in the licensing work, of which 5 are allocated to unlicensed projects investigations. In addition, 36 positions are allocated to licensed project accounting, 28 positions to supervision of licensed operations, and 19 positions to headwater benefits determinations, or a total of 198 positions for the non-Federal hydroelectric projects activity.

Mr. THOMAS. What is a horseback opinion? You have 12 or 15 people doing this work, you are bound to have.

Mr. SWIDLER. That may be a good horseback figure, sir. I think it is worth every bit of the cost.

UTILIZATION OF RIVERS

Let me tell you some of the values of licensing old projects. I am sure I would not be much interested in it except as doing a routine job if I did not think it had importance. But it does have importance. A project, even though a small project, may be the key to the effective use of a stream. Some of these streams are coastal rivers that affect the whole question of reviving the fishing industry on the eastern coast. They may have a very important effect on pollution. They may have a very important effect on ———

Mr. THOMAS. How is that going to affect the fishing industry, whether he has a license or does not have a license to produce power?

Mr. SWIDLER. Our license is not like a driver's license. Our license is a comprehensive document which integrates these projects into the pattern for development of our river systems and which provides that they will develop the recreation potential, that they will fit themselves into the naviagation and flood control schemes, that they will cooperate in pollution activities.

Mr. THOMAS. I have just one question. How did this industry get along for the last 25 years without all this regulation?

Mr. SWIDLER. I think we all know that there are serious——

Mr. THOMAS. Did anybody go broke or die from lack of regulation?

Mr. SWIDLER. We know a lot of our streams have been spoiled, that there are serious problems of pollution, and that it is one of the great congressional objectives now to do something to encourage the cleaning up of our rivers.

Mr. JONAS. Do you have responsibility on the question of pollution?

Mr. THOMAS. He said he had an overall jurisdiction, even fishing, a comprehensive plan.

Mr. SWIDLER. Yes, sir; we try to fit these projects into the best overall development of these river systems. All licenses are referred to the Department of Health, Education, and Welfare for their recommendations as well as to the Department of the Interior, so that we coordinate the recreational aspects, pollution aspects, the fish aspects, the navigation and flood control aspects.

Mr. THOMAS. Is there any wonder some of these people do not want to submit to the jurisdiction of the Federal Power Commission? They want to disturb their fishing, they want to disturb everything they have been doing for 40 years. Here comes Mr. Swidler with his overall plan.

Mr. BOLAND. We suffer in New England because of a lack of a comprehensive study on our rivers. The powerplants were developed by private companies and were developed piecemeal, not putting to full utilization the best overall use of the river itself. There is no question about it in our area. I think this is an important program, except it started too late. You cannot touch some of these, as Mr. Jonas points out. These were in being long before the Power Act of 1920,

with the result that you cannot touch them unless they are reconstructed.

Mr. JONAS. Will the gentleman yield?

Mr. BOLAND. Yes.

RECAPTURE PROVISIONS OF THE FEDERAL POWER ACT

Mr. JONAS. This one section of the act gives the Government the power to take it over.

Mr. THOMAS. At the expiration of the license.

Mr. BOLAND. I am kind of in favor of that. You should see some of the development of our river basins.

Mr. THOMAS. I have not seen any of them in a long time. There use to be hundreds of little ones.

Mr. ROSS. Look at Androscoggin River, the Penobscot, St. Croix, for instance. These are all a disgrace.

Mr. THOMAS. One time I was there I saw some little plants, a shoe factory, a paper factory, a plant every 5 or 6 miles. That water was not wasted. Everybody used it.

Mr. BOLAND. It is the worst possible utilization of the river. There is nobody to blame because that is a very old section of the country. This is the way the area was developed. Unfortunately, we at the time did not have a Federal Power Commission in operation. This is a good program.

Mr. THOMAS. These licenses are for 50 years?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. At the end of 50 years the Government has the right to take them over?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. By paying just compensation?

Mr. SWIDLER. Yes, sir.

Mr. JONAS. You do not have to do that.

Mr. THOMAS. What do they pay?

Mr. JONAS. What the Commission says is fair.

Mr. SWIDLER. The amount they pay is original cost adjusted for excess profits.

Mr. THOMAS. Can they not go to court and get just compensation?

Mr. SWIDLER. No, sir; they cannot because they have accepted the license provisions.

Mr. THOMAS. The Government has the right under section 15 of the Federal Power Act to relicense the project. You do not want to go into the electric power business as a matter of practical everyday common horsesense. You will relicense them if they want to and, of course, they will want to. You will relicense projects. You say that under section 14 you have the right to take over, maintain, and operate the projects upon payment to the existing owner. Of what?

Mr. O'CONNOR. The net investment plus severance damage.

Mr. JONAS. As determined by the Federal Power Commission—period.

Mr. SWIDLER. Less excess profits.

Mr. THOMAS. Net investment is arrived at how—including depreciation for the last 50 years?

Mr. SWIDLER. Less depreciation.

Mr. THOMAS. Plus new capital investment. That is the reason you want to audit the books, because you are figuring on taking them over and you do not want them to change too much.

Mr. ROSS. Also the municipal organizations have a preference upon the expiration of the license, too.

Mr. JONAS. It also specifically excludes consideration of goodwill, going value, or prospective profits.

Mr. THOMAS. How many of those licenses have expired? We looked at it close 2 or 3 years. None had expired. You were not figuring on taking them over. Did any expire this year?

Mr. SWIDLER. No, sir. I have here a table showing expiration dates.

Mr. THOMAS. When is the first one?

Mr. SWIDLER. 1968. We feel it is our responsibility to see that the problem of license expiration does not stand in the way of the overall progress of the electric industry in the United States so that when these licenses do expire, that there will be some orderly procedure either for recapturing them or relicensing them.

Mr. THOMAS. We will put pages 68 and 69 in the record, dealing with recapture provisions of the Federal Power Act.

(The pages follow:)

RECAPTURE PROVISIONS OF FEDERAL POWER ACT

Licenses for projects of substantial size will expire beginning with 1968, and license expirations of major size projects will begin in 1970. Many other licenses will expire within the decade to follow. As they expire, the Government has the right under section 15 of the Federal Power Act to relicense the project or under section 14 to take over, maintain and operate the projects upon payment to the existing owner. While the Federal Power Act gives the United States the right to recapture licensed projects, it does not establish the procedures by which the Congress or the Commission is to determine whether the United States should exercise its recapture rights. The Commission, on November 6, 1963, proposed to establish certain procedures to aid Congress in determination of the recapture of major hydroelectric power projects upon expiration of FPC licenses, and to permit relicensing where recapture was not in order. The Commission proposed procedures to (1) provide Congress with information in time for it to exercise its discretion to recapture projects at the expiration of licenses, (2) provide licensees and others with notice and opportunity for timely filing applications for relicensing, (3) expedite the processing of applications for projects which Congress does not elect to recapture, and (4) provide for the transferring to the United States of possession and title to project properties and the fixing of compensation to the licensees of projects which Congress elects to recapture.

Licenses for 2 projects with total installed capacity of 82,000 kilowatts will expire in 1968 and licenses for 25 projects with total installed capacity totaling 429,520 kilowatts will expire in 1970. The Commission plans to evaluate the use of water resources by each of these licensed projects well before the expiration of its license terms in order to recommend to Congress whether in its judgment the projects should be recaptured by the United States. The appraisal studies previously mentioned of the streams on which these projects are located must therefore be initiated as soon as possible. Evaluation studies will commence in 1964 of 10 streams with projects on which licenses will expire between 1968 and 1970.

Mr. SWIDLER. The decision on whether to recapture is fundamentally a congressional decision. If Congress decides to recapture, either directly or by delegating that right to some executive agency, if it wishes to do so, then we ought to be in a position, as the act requires us to be, to determine what the price is.

Mr. THOMAS. How are you going to determine what to pay for it? You say in the last 40 years he did not pay anything for this, he paid

this, you have had inflation, he has been paying taxes. I have a feeling that the Court is going to say that you just cannot take property in this country without due and just compensation regardless of what your statute says. This fellows says I have a market value in this plant of a million dollars, and after you depreciate it, it is $50,000. The court will say "You pay that million dollars or not take it from him."

Mr. SWIDLER. That may be so, but from the time aspect we are almost against the gun when Congress is going to say, what are the circumstances with respect to this project? What function does it serve? How can it be integrated into the power network? What is the recapture price? If we do not put a little thinking and manpower into it, we will not have the answers.

Mr. THOMAS. You have been doing a little auditing for several years.

Mr. SWIDLER. We have no staff for this activity.

Mr. JONAS. Will the chairman yield?

Mr. THOMAS. Mr. Jonas.

Mr. JONAS. I am glad to hear Chairman Swidler say that because, as I read the section, I do not find where it says who will take this over or who will make the decision. It does not say the Federal Power Commission shall have the authority to make this decision. I take it from what you said that the thinking of the Commission is that that should be an act of Congress.

Mr. SWIDLER. We do not claim that authority, sir.

Mr. JONAS. It should be a congressional decision. I do not think such power should be vested in any commission.

Mr. SWIDLER. We are now initiating a rulemaking proceeding, and our intention is to put ourselves in position to make recommendations to Congress which will be informed and factual and not leave ourselves in position where this or some other committee of Congress would come to us and say, what have you done to carry out your responsibilities, and we would have to say, nothing.

Mr. THOMAS. You have been working on this same thing for 20 years. Your justifications look as though they have been copied from one year to the other.

COLLECTIONS FROM LICENSES

We have looked at license fees. We will put page 71 in the record. (The page follows:)

ANNUAL CHARGES COLLECTED FROM LICENSEES

Section 10(e) of the Federal Power Act provides for the collection of annual charges for various purposes from non-Federal hydroelectric projects in operation. Total collections from licensed projects, and the amounts collected to cover the cost of administering part I of the act are as follows:

	Total	Administration of pt. I
1963 actual	$2,287,129	$1,474,566
1964 estimate	2,553,000	1,765,000
1965 estimate	2,837,000	2,049,000

The Commission has acted to increase the assessment of annual charges under licenses (other than State and municipal) for projects of more than 2,000 horsepower installed capacity to make sure that they cover the actual costs of administering part I of the act, including the costs of the water resources appraisals for hydroelectric licensing program. In recent years, charges for this purpose have not been sufficient to recover the full cost of administering the licensing function. The action now being taken will assure that annual charges hereafter fully cover the appropriate administrative costs as intended by the Congress.

Federal River Development Projects

Mr. Thomas. Turn to "Federal river development projects" and insert pages 76 and 77 in the record.

(The pages follows:)

Federal river development projects—comparative summary of activity

	1963 actual		1964 estimate		1965 estimate	
	Positions	Funds	Positions	Funds	Positions	Funds
A. Cooperative investigations and related activities	42	$425,168	38	$388,500	38	$408,000
B. Survey coordinating committees	8	80,826	7	73,500	19	209,000
Total activity	50	505,994	45	462,000	57	617,000

The Commission has a vital role to play in connection with the power aspects of river development projects and programs proposed by the Corps of Engineers and the Bureau of Reclamation.

Under the requirements of the flood control and river and harbor acts, the Commission cooperates with the Corps of Engineers in studies of proposed projects and makes recommendations to the Secretary of the Army for safeguarding the hydroelectric power potential of such projects. Members of the staff participate as representatives on the basin survey coordinating committees established by the Corps of Engineers to conduct comprehensive river basin surveys. The Commission cooperates with the Bureau of Reclamation and makes recommendations, under the provisions of section 4 of the Federal Power Act, with respect to reclamation projects.

The Commission reviews proposals by the Department of the Interior for the sale of hydroelectric power for projects constructed by the Corps of Engineers. This review provides the basis for Commission approval of rates for the sale of this power as required by the Flood Control Act of 1944 and other acts.

Work under the activity also includes cost allocations, interagency committee participation, and action on requests for information and technical assistance from Congress and interested organizations. The cost allocation work provides a basis for the approval of Federal project power rates as well as headwater benefits determinations.

Mr. Thomas. Cooperative studies with the Interior Department and the Corps of Engineers. Who has the final say on the rates for power?

Mr. Swidler. As you know, the Department of the Interior is the marketing agent for the projects built by the Corps of Engineers under the Flood Control Act of 1944. Under that act, the approval of the Federal Power Commission is required for their rate structure. They submit their rates to us for approval.

We do not have the same compliance jurisdiction over the Secretary of the Interior that we do over the Alabama Power Co. or over the Duke Power Co. I think it remains to be determined just who does have the last word because obviously the Secretary is the fellow who sends out the bills.

Mr. THOMAS. I remember quite well—I think I do—when this act was passed. We had quite a heated argument between Secretary Ickes and the Secretary of the Army, Secretary Patterson. Was it not the intention at that time that Ickes would set the power rate? That is my recollection.

Mr. SWIDLER. Subject to approval of the Federal Power Commission.

Mr. THOMAS. He let everybody come in and have a joint say, but the old gent said, I am going to set it. I will let you all have a piece of the pie, but the final word will come from the Secretary of the Interior. Is that not the way it operates today?

Mr. ROSS. Nobody knows.

Mr. SWIDLER. I think you are being realistic in this sense. We do not have any way to police our jurisdiction over the Interior Department. If he does not comply with our requirements, all we can do is report it to the Congress.

Mr. THOMAS. I think he purposely let everybody have a little peace and harmony and come to the party, but when the party was over, he was going to call the shots, and he publicly stated it. I think I remember it quite well. That is the way it is working out.

COOPERATIVE INVESTIGATIONS AND RELATED ACTIVITIES

We will go to "Cooperative investigations and related activities," and put pages 78 and 79 in the record.

(The pages follow:)

Cooperative investigations and related activities—Summary of workload and positions required

	On hand 1st of year	Number received	Total workload	Number completed	On hand end of year	Positions required
1963 actual	58	66	124	31	93	42
1964 estimate	93	36	129	34	95	38
1965 estimate	95	40	135	36	99	38

The Commission's estimated workload on Federal project investigations is based primarily on the activities of the Corps of Engineers and the Bureau of Reclamation. The work includes investigations and studies, undertaken by the Department of the Army or the Interior or by other Federal planning agencies, in which the Commission cooperates either informally or through established Survey Coordinating Committees or comparable organizational arrangements and on which the Commission submits formal comments and recommendations to the reporting departments.

The Commission participates in the formulation of Federal reservoir projects by serving, with respect to the power features, as power consultant and adviser to the construction agencies which have the primary responsibility for the detailed investigations and construction of such projects. Based on these cooperative studies, the Commission formulates its recommendations concerning power facilities to be provided in Federal plans for river basin development.

The cooperative studies include consultations with the Federal construction agencies on the amount of power that could be produced at proposed projects and the economic feasibility. In response to these agency requests, the Commission furnishes advice on the value of and market for power from hydroelectric projects, including estimates as to the time of demand and utilization.

In view of the Commission's special background in the electric power field, the information and data it processes on the industry, and its experience with river basin studies and the licensing of non-Federal projects, there is and will continue to be increasing requests for assistance by other Federal agencies and by

the Bureau of the Budget in planning the power features of proposed projects in the interests of sound and orderly development of the Nation's water and land resources. Such consulting service is not a duplication of work since it does not include the detailed surveys and investigations, the damsite explorations, and the project designs which are all performed by the constructing agencies.

Work of similar character is necessary and is performed at the postconstruction or operating stages in connection with cost allocations, determinations of headwater benefits, approval of rates, and the determination of the need and the economics of adding new units at constructed projects. The Commission's work relating to such Federal hydroelectric projects is of a continuing nature, extending from the early survey stages into the operating phases. Information obtained in the cooperative studies with the other Federal agencies is needed in the Commission's licensing of non-Federal projects.

Mr. THOMAS. In the beginning of 1963 you had on hand 58, number received 66, total workload 124, completed 31, carried over 93.

In 1965 you carry over 99, complete 36. The workload has gone up a little, 135, received 40 new ones. Is there any rush on these projects?

Mr. SWIDLER. They determine the pace of the public works program so far as river basin projects are concerned.

Mr. THOMAS. You say [reading]:

In response to these agency requests, the Commission furnishes advice on the value of and market for power from hydroelectric projects, including estimates as to the time of demand and utilization.

The Corps of Engineers have an army of engineers. If there ever was a duplication, here it is. You come to the party that Mr. Ickes intended. After all, this work is done either by the Corps of Engineers or Interior. You are just present at the party. From a constructive point of view, I am talking about.

Mr. SWIDLER. So far as rates are concerned——

Mr. THOMAS. You could do away with your people here and it would not amount to a hill of beans.

Mr. O'CONNOR. We serve as more or less an auditing function of the Congress in this case because both the Corps of Engineers and Interior are involved in construction. It is my understanding that as to the power values we furnish, we are the one independent auditing agency. We check on power values.

Mr. SWIDLER. The fact of the matter is that Interior must come to us with these rates, and we have to have a staff to analyze them. If Congress thinks this is not worth doing——

Mr. THOMAS. They have a staff twice as big as yours. They claim they are the finest experts in the world on power.

Mr. SWIDLER. They are a program agency and Congress apparently felt someone that did not have a program interest ought to take an objective look.

Mr. THOMAS. You had a three-way fight, and this is a compromise.

REIMBURSEMENT FROM CORPS OF ENGINEERS

I alluded this morning to that last paragraph. It is on page 82 where the Corps of Engineers picked up the bill for six of your employees and you are taking them back. You want 12 for the job. We will insert the last paragraph on page 82.

(The material referred to follows:)

Although the Commission did not request additional funds for this work during 1964, it is essential that funds be included for 12 additional positions to enable the Commission to carry its share of the work of the survey coordinating committees. This includes six positions being financed by reimbursement from the Corps of Engineers in 1964.

REGIONAL OFFICES AND EMPLOYMENT

Mr. THOMAS. Where are your regional offices located?

Mr. SWIDLER. One is in New York, one in Atlanta, one in San Francisco, one in Chicago, and one at Fort Worth.

Mr. THOMAS. Where is that list of regional offices and their employment? You usually set it out, but I do not find it. Is it in these exhibits?

Mr. SWIDLER. Page 10.

Mr. THOMAS. Is that the only place you have it? Atlanta, Chicago, Fort Worth, New York. I wanted the employment by grades. How many people are in your regional offices?

Mr. SWIDLER. I have that right here, sir. Let me give you these sheets.

Mr. THOMAS. How many people do you have in Atlanta? We have been to your Atlanta office.

Mr. SWIDLER. We have now 21 people.

Mr. THOMAS. That is a good one. How many in Chicago?

Mr. SWIDLER. In Chicago we have also 21.

Mr. THOMAS. How many in Fort Worth?

Mr. SWIDLER. Twenty-one.

Mr. THOMAS. New York?

Mr. SWIDLER. Nineteen.

Mr. THOMAS. San Francisco?

Mr. SWIDLER. Thirty-three in the Bureau of Power and 22 in our accounting work.

Mr. THOMAS. I thought you had nine offices and about 80 percent of them were for power and maybe two or three for—do you not have a compiled chart of regional offices?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. Where is it?

Mr. SWIDLER. It is shown on page 10, showing five regional offices of the Bureau of Power. Then we have a Houston field office for the Bureau of Natural Gas.

Mr. THOMAS. Where are the green sheets on these regional offices? How many people do you have in your regional offices, all together, about 200 or 175?

Mr. SWIDLER. These sheets give that information broken down by grade, down to the lowest grade.

Mr. BOLAND. This is just the Bureau of Power.

Mr. SWIDLER. Here is the Houston office.

Mr. THOMAS. What is each office headed by?

Mr. SWIDLER. By a grade 15, sir, in each case.

Mr. THOMAS. Insert these green sheets in the record.

(The pages follow:)

BUREAU OF POWER

The regional offices, within their geographic areas, perform work of the Bureau of Power which can be done most effectively and efficiently in the field, including study of river basins, participation with other agencies in the planning of proposed Federal projects, field supervision of permits and licenses for non-Federal hydroelectric projects, special studies and investigations in connection with the processing of applications, survey of power markets, interconnection and coordination studies of power systems, review of power system statements submitted by the electric power industry, and representation of the Commission on field committees.

Bureau of Natural Gas

FUNCTION

This office performs field audits, engineering, geological, and accounting investigations pertaining to the aspects of rate and certificate filings made pursuant to the Natural Gas Act which involve matters of rate base, cost-of-service determinations, cost classification and allocation, rate design, gas supply, reserves, deliverability, and rate structure; verifies statements made in such filings, participates with the headquarter's office in formal hearings in location where hearings are scheduled, and participates with headquarter's office in programing work.

Office of Accounting and Finance

FUNCTION

This Office performs fieldwork on original cost examinations of plant accounts and on accounting compliance audits of natural gas companies having offices in Houston or other cities in the southwestern part of the United States.

Houston office

OFFICE OF ACCOUNTING AND FINANCE

FUNCTION

This Office performs the accounting work with respect to all major licensed hydroelectric projects located west of the western boundaries of the States of Minnesota, Iowa, Missouri, Arkansas, and Louisiana. Performs field audits of the books of licensee companies as the basis for Commission determination of the plant cost, depreciation reserves, and amortization reserves of excess earnings for the projects in this area.

FIELD OFFICE FUNCTIONS

Mr. THOMAS. What do they do in these regional offices? Are they engaged in river basin survey work? That is 95 percent of their activity. They have been surveying that territory ever since the Power Act was passed some 40 years ago. When are you going to get through surveying?

Mr. SWIDLER. Let me read you the things that they do: They do the work which can be best done in the field, including study of river basins, participation with other——

Mr. THOMAS. That is 95 percent of their work. I have been in the office a good many times.

Mr. SWIDLER (continuing). Participation with other agencies in the planning of proposed Federal projects, field supervision of permits and licenses for non-Federal hydro projects, special studies, and investigations in connection with the processing of applications, surveys of power markets, interconnection and coordination studies of power systems, review of power system statements submitted by the electric power industry, and representation of the Commission on field committees.

Mr. BOLAND. What is the answer to the chairman's assertion that "as long as I have been sitting here we have been studying river basins; the same river basins every year. The river basins don't change." What is the answer to the chairman that we have been doing this over the years? Why do we have to continue to do it? That is a good question, I think.

Mr. SWIDLER. It is a good question. I would like to have Mr. Brown supplement my answer, but let me say in the first place river basins do change; that whenever, for example, a community in a river basin grows, you completely change the economics of navigation projects, of power projects, of everything else that affects the development of that basin. The project which might be feasible if you did not have to flood out a town becomes infeasible when that town grows; a navigation improvement which would not be worthwhile if you had no industrial development along the river becomes very important when industry grows, as the chairman should know from his experience with the Houston Ship Channel. Our Nation is a rapidly growing nation, a rapidly changing nation, and the river basins are the country itself. They reflect the changes that take place in the economy of the country. The hydrology may remain the same but the economy changes.

Mr. THOMAS. You are talking power purposes. You are primarily concerned with rainfall and for your purposes it does not make much difference whether it floods 10 or 15 feet. You have your gates and your sluiceways. You are not going to flood so many highways here. You are not concerned with that. You are not concerned with how many basins you are going to get wet because water cannot go off. Every time you build a house you usually have 50 by 50, it is 1,500 feet of roof space that intensifies your runoff. You have those problems. You are not particularly concerned with that. Not once in a blue moon is a stream going to change its course as did the Rio Grande River, when we gave Mexico 15 or 20 acres. That is not one of your basic problems.

Mr. SWIDLER. The hydrologic problem is only a part of the overall problem to river development and, even as to that, despite all these years our information is by no means complete or accurate. I would like to have Mr. Brown say an additional word on this.

Mr. THOMAS. You say you are concerned in these studies about your power market. As your river basin grows in population you want to know how much power will be consumed within what distance of your source of production. Isn't that some of your problem? That is constantly changing, of course.

Mr. SWIDLER. The alternative cost of power supply changes all the time, with changes in the economics and the technology of the industry and changes in freight rates.

Mr. ROSS. Section 10(a) is the magna carta of the Power Act. It makes us insure that the power development fits into the development of the river basin.

We have to measure each and every licensed river basin to see whether it does fit into the best comprehensive development of the basin.

Mr. THOMAS. You are saying that the study you made last year is going to be different from the one made this year, provided there is some growth in the basin?

Mr. ROSS. Many projects that are coming before us for license today are on small rivers, for example, in New England. There has never been a basin study of the smaller streams in New England—the Kennebec, Penobscot, St. Croix, et cetera. On the Connecticut River there was a joint State group that made a study in the early fifties. It was not a complete basin study. The Engineers are now in the process of making the first thorough study of the Connecticut River Basin which is a multistate study. We are cooperating with them. When we relicense these projects or license existing projects, this would give us the first chance to analyze how to fit those projects into this comprehensive plan that the Corps of Engineers is drawing up.

Mr. SWIDLER. If the committee does not mind, Mr. Brown, I think, could add something here.

Mr. BROWN. I think these statements by Mr. Swidler and Mr. Ross have covered the question fairly well but let me say this: This program is designed to avoid overlapping and duplicating the studies of the Corps of Engineers. We are closely tied in with them on the larger river basin studies.

What we have in mind, as Commissioner Ross stated——

Mr. THOMAS. What we are concerned with and what we are not completely concerned with, is what did you learn in 1963 that you did not learn in 1958 about *x* river.

Mr. BROWN. Many of these river basins have not been studied in years. It isn't a matter of going back to 1958. It is going back further than that. One of our early approaches is to make a quick survey of the reports and available information that can be compiled.

Mr. THOMAS. It looks like a better answer would be when you have a project coming up you just go to study it at that particular time and forget until you have a bird in the hand, because you are going through a lot of lost motion. Studies you made in 1958 are no good to you in 1959. If you do not have a project coming up until 1961 why don't you wait until 1961 and study it then.

Mr. BROWN. The ones we will study I am sure will be well documented for the use of the Commission.

Mr. THOMAS. We hope you are right. We will take your word for it for the time being. Both fingers are crossed.

OTHER OBJECTS OF EXPENSE

Put page 84 in the record. You have personnel compensation, personnel benefits, transportation, et cetera. You list other services, reproduction, total costs. These are in thousands. Let's take a detailed look at it.

(The page follows:)

Justifications by object class—Summary of request by object class

[In thousands]

	1963 actual	1964 estimate	1965 estimate	Increase (+) or decrease (−)
11 Personnel compensation	$8,904	$10,010	$10,990	+$980
12 Personnel benefits	639	713	835	+122
21 Travel and transportation of persons	387	379	433	+54
22 Transportation of things	41	20	20	
23 Rent, communications, and utilities	174	212	381	+169

25 Other services	147	227	239	+12
26 Supplies and materials	133	145	160	+15
31 Equipment	212	34	135	+101
Total cost	10,793	11,850	13,335	+1,485
Change in selected resources	+208			
Total obligations	11,001	11,850	13,335	+1,485

PERSONAL SERVICES

Mr. THOMAS. Put page 85 in the record concerning personal services.
(The page follows:)

Personal services and benefits—Summary of estimates

	1963 actual	1964 estimate	1965 estimate	Difference
11 Personnel compensation:				
Permanent positions	$8,642,314	$9,846,550	$10,912,000	+$1,065,450
Temporary positions	113,315	48,450		−48,450
Consultants	22,154	40,000	40,000	
Payment over 52-week base	125,950	75,000	38,000	−37,000
Total	8,903,733	10,010,000	10,990,000	+980,000

Personnel compensation has been estimated on the basis of 1,148 permanent positions for 1964 and 1,234 for 1965.

Cost of permanent positions

	1963 actual	1964 estimate	1965 estimate	Difference
Total permanent (Gross)	$9,740,570	$10,364,800	$11,046,280	+$681,480
Lapse	−958,378	−275,250	−134,280	+140,970
(Terminal leave payments)	(34,000)	(50,000)	(41,020)	
Decrease for lower pay scales part of year	−139,878	−243,000		+243,000
Total net permanent	8,642,314	9,846,550	10,912,000	+1,065,450

Mr. THOMAS (reading):

The total increased personnel compensation of $980,000 includes $474,000 for new positions and $506,000 to continue the authorized staff of the 1,148 through 1965, including provision for increased salary costs under Public Law 87-793 and within-grade promotions.

I note in your agency your within-grade promotions are on a parity with 2½ or 2⅞ percent of your payroll. Your in-grade promotion will be with you all along.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. That act ought to be a tremendous stimulus to your people, to get in and try to do a better job and get better employees. It is quite sizable.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. It is a good thing. We think the legislative committee came up with a good idea. Certainly, the agencies ought to show some benefits from it, too.

Mr. SWIDLER. I would hope so, sir, but as you know, we have limited discretion about these within-grade promotions.

Mr. THOMAS. That is exactly right. You have some discretion about whether you think you are getting your money's worth from it or not.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. That is what we are concerned with.

CONSULTANTS

You have 10 consultants. Consultants will be required in 1965 at the same level.

This specialized service is intermittently needed by the Commission.

Put the last part of page 86 and page 87 in the record.

(The material referred to follows:)

Summary of request

	1963 actual		1964 estimate		1965 estimate	
	Number	Cost	Number	Cost	Number	Cost
Consultants	9	$22,154	10	$40,000	10	$40,000

Consultants will be required in 1965 at the same level as programed for 1964, and about twice the 1963 experience due to the greater need of expert advice in the increasingly complex operations.

This specialized advice is intermittently needed by the Commission in the engineering, economic, financial, and accounting fields individually or collectively for the solution of many technical problems beyond the scope of skills possessed by Commission personnel.

We expect to use consultants to help us perfect criteria to enable us to provide incentives for greater efficiency for the companies we regulate. Consultants are needed because of the dynamic technological changes taking place in the power and gas industries. Since we could not possibly retain full-time employees in each of these new fields, consultants are invaluable to keep the Commission advised of new developments and their impact on the industries.

The development of economic and statistical models required for the equitable solution of economic problems relating to natural gas and electric power producers, buyers, and sellers requires the services of expert consultants.

Study of special technical matters such as evaluation of underground distribution systems, use of higher voltages in homes and use of synthetic insulations, require the services of consultants.

The estimate provides for 400 consultant days at $100 per day. The estimated 10 consultants will average 40 days each.

CONSULTANT RATE

Mr. THOMAS. What is the rate paid the consultant?

Mr. SWIDLER. It varies. The highest is $100 a day.

Mr. THOMAS. It provides for $100 a day for 400 consultant days. Is there any limitation?

Mr. SWIDLER. That is the limitation.

Mr. THOMAS. I mean the number of days.

Mr. SWIDLER. No, sir.

Mr. THOMAS. Where is your authority for $100 a day? Get out the act.

Mr. SWIDLER. It is in the act.

Mr. THOMAS. When did we raise this? It used to be $50. When was this put in?

Mr. SWIDLER. Two years ago.

CONSULTANTS USED BY FPC

Mr. JONAS. While we are on this subject, would you furnish a list of the consultants used this year with a brief statement of their qualifications?

Mr. SWIDLER. Yes, sir. This year or last year.

Mr. JONAS. The current year.

Mr. SWIDLER. So far this year.

(The information follows:)

PAUL A. SWEENEY: L.L.B., Georgetown University; 1933–60, Chief, Appellate Section, First Assistant and Acting Assistant Attorney General, Department of Justice; 1960–61, Commissioner, Federal Power Commission.

WALTON SEYMOUR: A.B., University of Wisconsin; 1929–47, economist, North America Co. and Tennessee Valley Authority; 1947–50, Director, Power and Program Staff, Department of Interior; 1958, present, Vice President, Development and Resources Corp.; served as consultant in various capacities on power resources development, both national and international.

MERRILL DEMERIT: B.S., University of Wisconsin; 1922–40, various engineering and managerial positions with West Penn Power Co.; 1940–60, Chief, Power Engineer, in charge of planning, design, and construction of distribution facilities, Tennessee Valley Authority.

Harold H. Wein: Ph. D., University of Pittsburgh; 1945–51, economist, Anti-Trust Division, Department of Justice; 1951–53, consultant and executive assistant, Slick Airways; 1954–59, associate professor of economics, Carnegie Institute of Technology; 1959–61, professor, business administration, Michigan State University; 1962–63, Chief, Office of Economics, Federal Power Commission; 1963 to present, professor, business administration, Michigan State University.

Richard C. Henshaw, Jr.: Ph. D., University of Texas; 1948–57, associate professor of business statistics, University of Texas; 1957–58, visiting associate professor of statistics, Stanford University; 1958 to present, professor of quantitative methods, Michigan State University.

Morris Mendelson: Ph. D., Cornell University; 1950–56, associate professor of economics, Pennsylvania State University; 1956–59, research staff, National Bureau of Economic Research; 1959–61, research associate, Harvard University; 1959–61, visiting lecturer, Massachusetts Institute of Technology; 1961 to present, associate professor, University of Pennsylvania.

Clifford Hildreth: Ph. D., Indiana State University; 1946–48, associate professor of economics, Indiana State University; 1949–52, associate professor of economics, University of Chicago; 1953–55, professor of agriculture and economics, North Carolina State University; 1955–58, professor of agriculture and economics, Michigan State University; 1958–60, professor of economics, Michigan State University; 1960 to present, professor of economics and agriculture, Michigan State University.

Edwin Mansfield: Ph. D., University of London (Fulbright scholar); 1955–60, assistant and associate professor of economics, Carnegie Institute; 1960–61, consultant to Westinghouse Electric and New York Central Railroad; 1961–63, visiting professor, Yale and Harvard Universities; 1963 to present, professor of economics, University of Pennsylvania.

Nathaniel B. Guyol: M.S., University of Chicago; 1935–42, geographer and regional planner, Tennessee Valley Authority; 1942–56, economist, Department of State and United Nations; 1956–63, staff economist, Standard Oil Co. of California.

Albert Stevens Fry: M.S., University of Illinois; 1913–31, engineer, Morgan Engineering Co.; 1931–33, engineer, Corps of Engineers; 1933–61, Chief, Hydraulic Data Branch, Tennessee Valley Authority.

Arnold C. Meltzer: M.S., George Washington University; 1955–61, student trainee and regulatory engineer, Federal Power Commission; 1961 to present, assistant professor of engineering and applied science, George Washington University.

Roland A. Kampmeier: M.S., State University of Iowa; 1933–62, hydraulic engineer, Chief, Power Economics Division, Director of Power Utilization and Assistant Manager of Power, Director of Power Supply, Tennessee Valley Authority; presently in consulting practice for various companies and governments.

TRAVEL

Mr. THOMAS. Put the table on the bottom of page 88 in the record. This deals with travel.

(The table follows:)

Travel and transportation of persons—Summary of request

	1963, actual	1964, estimate	1965, estimate	Difference
Natural gas industry	$179,901	$164,000	$174,000	+$10,000
Electric power industry	43,832	57,000	65,000	+8,000
Non-Federal hydroelectric projects	119,030	120,000	151,000	+31,000
Federal river development projects	15,921	13,000	18,000	+5,000
Administration	28,262	25,000	25,000	
Total	386,946	379,000	433,000	+54,000

Mr. THOMAS. It is up $54,000 this year. It is broken down between the electric power, gas, non-Federal, et cetera. You left out the Commission. How much does the Commission spend? They tell me the biggest travelers are the Commission. What do you spend?

Mr. SWIDLER. Do we have that broken down?

Mr. O'CONNOR. $10,000 for the five Commissioners.

Mr. TRAINOR. It is in the $25,000. There is no increase. It is the last item. It is part of that.

Mr. SWIDLER. The big increase, sir, is in connection with——

Mr. THOMAS. What does administration cover?

Mr. TRAINOR. That covers anything not covered by the functions above. It could be attending a meeting, or it could be travel by the Commissioners.

Mr. THOMAS. What is the policy of the Commission on travel?

This travel is too much. Let's reduce this. You have the natural gas industry, $174,000; electric power industry, $65,000; non-Federal hydroelectric projects, $151,000. What is that? Let's see your detail.

"The travel funds requested are necessary for field investigation." That is for the electric industry. These are done out of your regional offices?

Mr. SWIDLER. Most of it.

Mr. THOMAS. Your big item is non-Federal electric projects. [Reading:]

Travel required in this activity is devoted primarily to the supervision of licensed operations the investigation of unlicensed projects, and licensed project accounting.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS (reading):

Over 300 projects will require nearly 600 inspections in 1964 and 1965.

The fees collected are——

Mr. SWIDLER. Self-reimbursing.

Mr. THOMAS. You collected a million and a half dollars?

Mr. SWIDLER. No, sir. I think something like $2 million. About two and a quarter million for 1963.

Mr. THOMAS. How much for this particular project?

Mr. SWIDLER. All of these costs are reimbursable.

Mr. THOMAS. How much did you collect? I am trying to compare your travel cost with what you collect.

Annual fees from license, $2 million. Will that cover it?

Mr. SWIDLER. Yes, sir. Whatever the costs are we will get them back because under our new regulations, we allocate the costs, whatever they may turn out to be, among the licensees.

Mr. THOMAS. You spend a third of what you take in for travel. How many people are in this travel status? Let's see what their salary is. I am trying to show you by your own figures you are spending more than you get out of it. If you spend $433,000 for travel what are your salary costs?

Mr. O'CONNOR. Mr. Chairman, that would not be quite correct on the reimbursable part. It would be only $151,000 for travel on non-Federal hydroelectric projects.

Mr. THOMAS. What is your salary cost again? You are right. What is your other objects? You have about one-eleventh of it back. Where does the other ten-elevenths go?

Your travel costs ought not to be more than 5 percent of your salary costs.

Mr. CAPAR. The non-Federal activity cost was $1,749,590.

Mr. THOMAS. That is fees collected?

Mr. CAPAR. That is salary and other costs.

Mr. THOMAS. $1.7 million?

Mr. CAPAR. Yes, sir, in 1963.

Mr. O'CONNOR. Salaries and expenses includes this figure.

Mr. THOMAS. It looks like you lost money. You spent around $2 million to get back $1.7 million.

Mr. SWIDLER. Yes, sir. In the past we have. I tried to explain we have just revised our regulations so that we no longer base our fees on estimates of costs and then find out that we haven't estimated high enough. We now distribute among our licensees the actual costs whatever they prove to be.

NON-FEDERAL HYDROELECTRIC PROJECTS TRAVEL

Mr. THOMAS. Non-Federal hydroelectric projects: This is your big one.

Put pages 90 and 91 in the record.

(The pages follow:)

NON-FEDERAL HYDROELECTRIC PROJECTS TRAVEL

Travel required in this activity is devoted primarily to the supervision of licensed operation, the investigation of unlicensed projects, and licensed project accounting.

Over 300 projects will require nearly 600 inspections in 1964 and 1965. These inspections are made primarily by regional office personnel at various frequencies to insure that construction and subsequent operation of the licensed projects conform with approved plans and good engineering practice, and that constructed projects are operated and maintained in accordance with accepted safety and efficiency standards and in line with the terms of the Federal Power Act and the license granted by the Commission.

The investigation of unlicensed projects requires travel, principally by regional office engineers, to investigate unauthorized occupancy of streams and to obtain field data needed to determine Commission jurisdiction. Many hydroelectric projects continue to be operated without a license. The owners of some of these constructed projects are submitting applications for licenses, many are still studying the jurisdictional aspects involved and others have indicated that will resist making application. Show cause proceedings and hearings may be necessary in some cases. These, and every case where there is a question regarding jurisdiction will require field investigation.

The Federal Power Act requires that determinations be made of the legitimate original cost of licensed project property. Determining these costs requires an examination of the books and supporting records of the licensees maintained in the companies' offices located throughout the country. Accounting determinations which must be made include original cost, changes in plant costs, initial depreciation, changes in depreciation, and the nature and extent of amortization reserves. As the number of licenses increases, the workload for the accountants, who must examine the companies' accounts and records, also increases. Every new licensee must file an original cost statement within 6 months. Delay in examination of the companies' records complicates their examination, in that valuable records become lost or misplaced, or are destroyed, and new company personnel are unfamiliar with the companies' past operations.

We have estimated that we will need $151,000, an increase of $31,000 over our 1964 allowance, to make more and more adequate safety inspections of licensed projects as well as to investigate unlicensed project facilities. Also, we need to continue our effort to become more current in our licensed project accounting which was delayed in 1964 because of shortage of funds. This total amount of $151,000 is reimbursed by the licenses under part I of the Federal Power Act, and is not an additional cost to the Government.

Mr. THOMAS. This is your big one. You spend on that $151,000 and you want to increase it by $31,000.

Mr. SWIDLER. From $120,000 to $151,000. That is an increase of $31,000.

Mr. THOMAS. In 1963, you had $386,000; last year it was $379,000.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. I thought we reduced that 15 percent last year. You didn't even reduce it 5 percent. What was the general limitation in the bill last year?

Did you live up to the limitation in this year's bill on travel?

Mr. CAPAR. We don't have a limitation in our appropriation language. The travel estimate is much lower than the 15 percent under the general provision of our act though, sir.

Mr. THOMAS. What was your estimate for 1964?

Mr. CAPAR. It was $520,000.

Mr. THOMAS. How much?

Mr. CAPAR. $520,000 was our estimate in the 1964 budget.

Mr. THOMAS. Look at page 91. [Reading:]

We have estimated that we will need $151,000, an increase of $31,000 over our 1964 allowance, to make more, and more adequate, safety inspections of licensed projects as well as to investigate unlicensed project facilities. Also, we need to continue our effort to become more current in our licensed project accounting which was delayed in 1964 because of shortage of funds.

Mr. O'CONNOR. In Part I there is some work we have to do presently for municipalities that isn't completely reimbursable. There is a

small part that probably represents the discrepancy between the income and expenses.

Mr. THOMAS. Let's take a look at transportation of things, rents, utilities, printing, reproduction, and other services. You are getting up into the money in other services. You have employee training, research, power survey, $35,000.

AUTOMATIC DATA PROCESSING

Here is your ADP consulting and contracting, $180,000 last year down to $150,000, minus $30,000. Are you renting a machine?

Mr. SWIDLER. Not yet, sir.

Mr. THOMAS. Are you going to buy it? Does it fit your needs?

Mr. SWIDLER. We are planning to rent.

Mr. THOMAS. Is this the first time you bought one of these?

Mr. SWIDLER. I do not think we have bought one.

Mr. THOMAS. Is this the first time you have rented it? This present year is the first year, is it not?

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. 1964?

Mr. CAPAR. 1964 will be the first year, sir.

Mr. THOMAS. What did you use the $180,000 for last year?

Mr. CAPAR. That is contractual services in which machine rental was included as part of the cost of the contract.

Mr. THOMAS. 1964 was your first year, then?

Mr. CAPAR. Yes, sir.

Mr. THOMAS. Do you have a contract to buy it?

Mr. CAPAR. No, sir. We do not. We plan to rent it.

Mr. THOMAS. Have you studied it carefully? Is it cheaper to rent it than it is to buy it? Which is the cheapest?

Mr. CAPAR. The studies which have been made show that purchase would be to our advantage but the decision has been made to rent a machince until we are sure our choice is correct. Then we will buy the machine in possibly 1966 or 1967.

Mr. THOMAS. What is the cost of operating the machine? How many employees, in other words?

Mr. CAPAR. About $150,000 worth.

Mr. THOMAS. How many employees do you have, 17, 18 to 20?

Mr. CAPAR. We have 17 in the EAM operation now.

Mr. THOMAS. Are they saving you any administrative costs or any help any place? I don't know as there is a reduction here.

Mr. SWIDLER. The principal use of this machine is in pulling together the data for the area rate proceedings. Without ADP equipment it would be pretty hard to conduct such a proceeding, which involves such masses of information from so many parties.

This ADP equipment is essential to this kind of proceeding.

Mr. THOMAS. How did you get along without it in 1963?

Mr. SWIDLER. Well, I think that the delay in using it probably accounts for some part of the time lag.

Mr. O'CONNOR. We started with the Permian Basin case.

Mr. THOMAS. Your budget shows you started in 1964 rather than 1963.

Mr. O'CONNOR. There was a little bit there in 1963.

Mr. THOMAS. Does it fit your needs? That is the primary thing.

Mr. SWIDLER. Yes, sir.

Mr. THOMAS. If you do buy it, be sure it fits your needs. Don't be like some of these other agencies. They find year after a year they have a white elephant around their neck. Be sure it fits your needs. It has been our observation throughout the agencies, and that is correct, is it not, gentlemen, that it is cheaper to buy them than rent them?

Mr. BOLAND. Provided you have some experience to make sure it fits your needs.

Mr. SWIDLER. That is what we are trying to do this year.

We will have a much better idea next year. In our present opinion we should buy, but we would rather not recommend that big expenditure before we have had a year's experience.

Mr. JONAS. I think you can lease it with a provision that what you pay out on lease will apply on the purchase price if you later buy it.

Mr. SWIDLER. We have such a provision.

Mr. THOMAS. I do not understand why you paid $180,000 last year for the same machine you are getting for $150,000 this year.

Mr. TRAINER. We did not have a machine last year. That was paid to use other people's machines.

Mr. BOLAND. I think it would be well to insert pages 99 through 102 in the record.

(The pages follow:)

AUTOMATIC DATA PROCESSING

FEASIBILITY AND SYSTEM APPLICATION

During 1962 the Commission completed an automatic data processing feasibility study. A determination was made that there exists a need for a medium-class computer to process the voluminous data for both the natural gas and electric power activities. The feasibility study concentrated on data processing which would directly support and expedite the case workload of the Commission.

On the basis of the feasibility study, more detailed systems analyses and designs of potential applications were initiated. ADP specifications were completed during 1963, and were released to manufacturers. Proposals were submitted to the Commission during December 1963. Selection of a computer that will most adequately and economically serve the needs of the Commission will be made early in 1964.

REASON FOR COMPUTER CAPABILITY

The underlying, ultimate objective in the use of automatic data processing equipment in the Federal Power Commission is to enable the Commission accurately to analyze and evaluate on a current basis data related to the electric and natural gas industries, and to use the results of these evaluations in regulatory proceedings, preparation of statistical data, and the development of regulatory policies.

OBJECTIVES OF THE COMPUTER

The immediate objectives of the computer systems which have been designed are (*a*) to provide effective support of the new regulatory concept—independent producer natural gas area rate proceedings, and (*b*) to make available to the Commission current and vital information and technical analyses about the electric and natural gas industries. The systems, as currently designed, will permit the Commission to make the maximum use of information much of which is already available in its files. Whenever possible, it is also planned to use a computer to improve the administrative processes within the Commission in areas such as workload controls and reporting status of production goals.

COMPUTER SYSTEMS

The current systems are designed to collect, analyze, and evaluate substantial quantities of data dealing with natural gas reserves; provide for computer analysis of natural gas rates; and summarize and correlate with cost data information pertaining to natural gas well drilling activity. The data will also be used in preparing exhibits for area rate proceedings. Emphasis will be placed on the maintenance of continuing systems for keeping delays in processing data to a minimum, thereby increasing the quality of production and permitting expeditious rate regulation.

The systems designed for electric power provide for establishing files reflecting the scheduled and proposed powerplants which will be constructed in the United States during the next 5 years. Summaries of peakloads, generating capacity and computation of indicated reserves will be prepared. Programs to determine the probability of electric power outages and load combinations for various geographic areas have been prepared and used. In addition, a proposed system for the computation of energy gains for headwater benefits is under study.

Improved management also calls for establishing mechanized time-distribution reporting in order to improve management control and manpower utilization throughout the agency. Incidental to time-distribution reporting, there will be the preparation of payrolls by computer.

Whenever economically advantageous, electric accounting machines applications, such as preparation of natural gas and electric power statistics, will be included in the computer systems.

COST

In order to implement automatic data processing most effectively during 1965, it is planned to lease ADP equipment to process the enormous quantities of data related to new area rate proceedings, economic and statistical data, certificate proceedings of natural gas pipelines, electric power engineering computations, and reporting and other Commission requirements. The estimated cost of leasing a computer for the period is $146,000. The alternative to Commission leasing would be a substantial cost increase in contractual services to allow computer processing by contractors during fiscal year 1965.

In-house capability will help to keep total data processing costs at a minimum.

Additional costs of $15,000 are estimated for materials and supplies for the computer installation. This includes items such as paper, magnetic tapes, and punched cards.

The increased cost of ADP rental during 1965 will be offset partially by a decrease in the projected needs for funds for service contractors. It is also planned to increase the ADP staff by one programer providing a staff increase from five to six employees.

The overall financial plan for ADP calls for keeping total costs for the entire program at a minimum, utilizing the advantages of contractor services only when it is most economical for the Commission. ADP consulting and contracting services are estimated at $150,000 during fiscal year 1965, compared to $180,000 during 1964. The services will be principally systems design and programing.

A comparative cost analysis of the economic gains of ADP for the Commission is extremely difficult in view of the fact that almost all applications in the systems design described above are new, especially those pertaining to area rate proceedings. However, the systems that have already been tested by using contractor services indicate that without ADP the Commission would need to recruit a substantial number of trained people to make the correlations required for rate analysis, the summaries and analyses provided for natural gas supply studies and the regression analyses which are basic to economic studies. The extreme accuracy and speed of the computer outputs as compared to the efforts of clerical personnel is needed to meet Commission work schedules. The utilization of a computer for the designed systems will help level off the increasing requirements for personnel.

Mr. THOMAS. You have increases in other services. You have maintenance and repair. That is not sizable. That is about $5,000. It is up to $13,000.

OFFICE SPACE

Construction and alteration is $28,500. What is that for? I thought Mr. Boutin took pretty good care of you.

Mr. TRAINOR. As we move we have consolidation of space and other arrangements that we have to perform.

Mr. THOMAS. What is the expenditure of $28,000?

Off the record.

(Discussion off the record.)

Mr. SWIDLER. The major advantage is for the commissioners to have adjoining offices. We are now a block apart. It will enable us to bring our staff nearer to us and enable us to dispatch our business without a lot of dead time. We are now getting the cooperation of GSA and consolidating our staff within the GAO building. As you know, we surrendered whatever claim we had to sharing in FOB No. 9 and instead of that we are trying to do our best to make efficient use of the space within the GAO building.

PRINTING AND REPRODUCTION

Mr. THOMAS. Let's look at printing and reproduction. It shows an increase of $32,000.

Insert the printing breakdown on pages 93 and 95.

(The material follows:)

Printing and reproduction

	1963 actual	1964 estimate	1965 estimate	Increase (+) or decrease(−)
Public use forms	$11,501	$9,000	$9,000	----------
Publications	96,345	62,300	80,400	+$18,100
Maps	9,734	3,100	10,000	+6,900
Binding	1,364	500	500	----------
Legal briefs	10,341	15,000	15,000	----------
Field requirements	4,577	4,600	4,600	----------
Miscellaneous	22,336	15,500	22,500	+7,000
Subtotal	156,198	110,000	142,000	+32,000

PRINTING AND REPRODUCTION

Although an increase of $32,000 over 1964 will be required in 1965, experience has shown that actual cost is invariably higher than the estimates. The 1963 estimate for printing, shown in the 1964 budget, was $117,700 but actual cost amounted to $156,198 by the end of the year. The 1965 estimate is $14,198 under the actual amount for 1963. The estimate for recurring publications of $80,400 is based on foreseeable demands. While it is $18,100 over 1964, it is $15,945 less than 1963. Estimates for public use forms, maps, binding, legal briefs, and field requirements are at approximately the 1963 rate. Miscellaneous printing costs are estimated at $22,500, which is $7,000 over 1964, for IBM forms, punchcards, gas reports, and supplies.

NUMBER AND COST OF PUBLICATIONS

Mr. THOMAS. Also supply a a breakdown of the $80,400 for publication.

(The breakdown referred to follows:)

FPC publications—Fiscal year 1965

	Sales price	Cost to produce	Number of copies for FPC
Electric publications:			
Typical Electric Bills	$0.60	$800	1,000
All-Electric Homes, Annual Bills	.20	1,200	1,500
National Electric Rate Book (50 State sections)	(1)	4,100	225
Electric Power Statistics (monthly)	(2)	2,000	225
Includes: Production of electric energy and capacity of generating plants in the United States, monthly and annually; electric utility system loads, monthly; consumption of fuel for production of electric energy, monthly; sales of electric energy by class of service, monthly.			
Steam-Electric Plant Construction Costs and Annual Production Expenses	1.25	1,300	350
Hydroelectric Plant Construction Costs and Annual Production Expenses	.60	700	750
Statistics of Electric Utilities in the United States, Privately Owned	2.25	3,500	375
Statistics of Electric Utilities in the United States, Publicly Owned	1.00	1,000	500
Total, electric publications		14,600	
Gas publications:			
Statistics of Natural Gas Companies	1.00	1,600	550
Sales by Producers of Natural Gas to Gas Pipeline Companies	1.25	800	1,000
Regulations Under Natural Gas Act	1.25	800	2,000
Natural Gas Act	.25	400	1,000
Uniform System of Accounts—Natural Gas Companies	.50	400	1,000
Natural Gas Rate Book (annual)	(1)	2,000	225
Rates for Gas Delivered at City Gate of Major Cities	.60	400	1,000
Total, gas publications		6,400	
Other publications:			
Consumption of Fuel—Annual Summary	.35	400	500
Rules of Practice and Procedure	1.00	1,000	2,000
Annual Report of Federal Power Commission	.65	2,500	1,200
Opinions and Decisions:			
Advanced sheets of vols. 32 and 33 for the period July 1964–June 1965	(3)	42,000	250
Binding vols. 27 and 28 for calendar year 1962	3.50	9,500	300
Water Resources Appraisals Studies		4,000	500
Total, other publications		59,400	
Grand total, publications		80,400	

[1] $0.25 each; $8 subscription.
[2] $2.50 subscription.
[3] $6 year.

Mr. THOMAS. The total bill is $142,000. Rents and utilities go up $169,000. Here is rent on ADP equipment, $183,400. Why? You have $150,000 down here and $183,000. There is $333,000.

Mr. PILCHER. That is actual rent of the new computer proposed for 1965. It is carried in the item as "Rent, EMA and ADP equipment."

For the actual rental of the new computer when we make the decision on which equipment fits our needs, it will be the amount shown here, an increase of $133,000 for new equipment plus some $49,000 for the equipment we presently have, which is not computer, but simply tabulating equipment.

Mr. THOMAS. As I see it, you have consulting and contracting, $150,000, under other services you have $183,000, under "Rents and utilities" and "Rent of Xerox equipment" you have about $26,000. Where is your offset in savings and manpower?

Mr. PILCHER. Xerox is a printing-type equipment.

The item under "Other services" of $180,000 is our present method of securing computer service where we contract for the actual preparation and processing of the program.

Mr. THOMAS. We understand exactly what you are doing with it. We are asking you, Do you have any offset saving in personnel costs here? Without Xerox you would have to have somebody over there doing the same job. Xerox is supposed to do the job of about—what, 10 or 12 people; isn't it?

Mr. PILCHER. I see what you are getting at. The Xerox has permitted our present printing plant without an increase in staff to carry out the additional printing work that has resulted from the Commission's activities.

TELECOMMUNICATIONS SERVICE

Mr. THOMAS. TWX and telephone goes up $8,500. What experience are you having with Mr. Boutin's crowd and his division of utilities? You have common telephone, long line, spoken word. Is that running up your communication bill or reducing it?

Mr. PILCHER. I think the new system has cost us about $1,000 more a year. We are not heavy users of this long-distance telephone service.

Mr. THOMAS. You are not in Mr. Boutin's system yet?

Mr. PILCHER. Yes, sir. We are in the Federal telecommunications system.

Mr. THOMAS. Do you find it saves you any money?

Mr. BOLAND. We are talking about long lines; the communications system set up by GSA.

Mr. PILCHER. I do not have the figures.

Mr. TRAINOR. I do not think we have used it enough to tell.

Mr. THOMAS. Have you had a chance to look into this, Commissioner?

Mr. SWIDLER. No, sir.

Mr. BOLAND. Did GSA ask you to put an item in the budget for the telecommunications system? Did they specifically tell you to put in so much in this budget?

Mr. PILCHER. No, sir.

Mr. BOLAND. They have asked other agencies.

Mr. O'CONNOR. I think our largest expense is probably telegraph because we have to send out notices of meetings and filings.

RENT

Mr. BOLAND. Where is the item on renting additional space? What is the $16,200 item for, rent of additional space?

Mr. TRAINOR. That is part of the first year's rent that GSA has not budgeted for and this will be transferred to GSA. That is because we will be getting more space this year.

Mr. BOLAND. I have no more questions on this. Do you have any questions?

Mr. JONAS. I do not have any questions.

REDUCTION IN FORCE

Mr. SHIPLEY. I am asking these questions for Mr. Evins, because he cannot be here this afternoon as he is presiding over the House at the request of the Speaker.

Mr. Chairman, I am sure you are acquainted with the Jerry Klutz article in the Washington Post, February 6, 1964, and also the Evening Star editorial by Joseph Young of December 16, 1963, where they say in text, and if I may quote:

> Layoffs at the Federal Power Commission, where employees with as much as 30 years of Federal service are being rifted, will be investigated by a congressional committee.

And then in the Washington Post they say:

> For a relatively small agency, Federal Power is having more than its share of personnel problems and the House Manpower Subcommittee is prepared to investigate.

It goes ahead to say:

> First, the agency has fired 39 employees shortly before Christmas, old timers among them, and there are those who charge new employees have been brought in since and that most of the layoffs were unnecessary.

Would you like to comment on this, please?

Mr. SWIDLER. Yes. I would be glad to.

I think you know the circumstances of the reduction in force. The appropriation that was made available in December 1963 was less than enough to enable us to maintain our staff.

Because of the problem of payment for accrued leave, terminations have to be effected as early as possible in the fiscal year or you don't save any money on them in that fiscal year.

We had the problem of somehow bringing our budget within the amount Congress had appropriated for us.

The terminations were greater because of the fact that with the 30-day notice requirement the earliest they could be put into effect was as of the beginning of the calendar year, January 1.

Had we delayed giving those notices until after the holidays instead of doing it about December 1, we would have had to lay off a significantly greater number of employees. This was the reason that we gave the notices as promptly as we could. Every day that we saved in the issuance of notices reduced the number of affected employees.

Mr. SHIPLEY. How many changes did you make?

Mr. SWIDLER. There were 56 changes in all. We prepared reduction in force registers and went through the procedures prescribed by the civil service regulations.

On December 5 and 6, reduction in force letters were issued to 39 employees. The other 17 positions to be reduced were obtained from resignations, retirements, and other separations. Of the 39 to whom the RIF letters were issued, 6 submitted retirement papers and 2 were reassigned to lower grades. Of the 31 persons remaining, 7 held temporary appointments. This left 24 permanent employees and of course with respect to these employees we did our best to find other positions for them.

We forwarded résumés of their experience to 22 Federal agencies seeking their assistance in placing them.

Mr. THOMAS. What was your turnover in your agency last year? I asked you that before. You are bound to have 15 or 20 percent vacancies. You could not fill vacancies and not fire anybody.

Mr. SWIDLER. Our turnover ratio is currently about 17 percent annually.

Mr. THOMAS. What part of the people did you let go?

Mr. SWIDLER. None as far as I know.

Mr. THOMAS. What were their grades?

Mr. SWIDLER. I don't have that breakdown here, sir.

Mr. THOMAS. Any further questions, gentlemen?

Mr. SWIDLER. We have released 19 permanent and 5 temporary employees to report to other Government agencies and 3 with outside firms. I think we have succeeded in replacing almost all of these employees.

Mr. SHIPLEY. Mr. Chairman, if it is all right with the committee, if you would care to extend that or correct the record that will be fine.

Mr. SWIDLER. I would appreciate that.

(The following was submitted for the record.)

In October 1963 when the action of the House indicated that our 1964 appropriation request would be severely cut, we had 1,143 permanent employees on the Federal Power Commission payroll, the same number as were employed at the end of the 1963 fiscal year. With increased salary and other costs, the $11,850,000 which was appropriated in December 1963 was insufficient to meet the salaries of 1,143 for the full year. Based on our best estimates, we concluded that it would be necessary to reduce our force at once by about 56 positions to keep our expenditures for fiscal 1964 within the funds appropriated by Congress. We could not delay because, with the required notice period, we had less than a half year to effect the required savings. Any delay would have increased the number to be reduced. The effect is more than proportional to the delay because of the leave factor. Many of the incumbents had substantial accrued leave which must be paid upon separation. For example, no savings would result if a person were separated at the end of March, and had 90 days' accumulated leave.

During the period in November, December, and early January, 17 people resigned, retired, or were separated. These positions were deducted from the 56 required to be reduced, since the positions were not to be filled. This left 39 additional positions to be eliminated to provide funds sufficient to carry us through the balance of the fiscal year. Of these 39 of whom reduction notices were issued, 6 retired and 2 were reassigned to lower grades. Of the 31 persons remaining, 7 held temporary appointments. Twenty of the 39 people reduced had been hired during the 1963 fiscal year, and 2 were hired early in fiscal year 1964. All reductions were made in accordance with procedures established by the Civil Service Commission. We have attempted to find positions in other agencies for the people involved, and all but four are now employed in positions comparable to those which they held with us.

Upon completion of our reduction in force as of the end of January 1964, we had 1,078 employees on the rolls, which was a net reduction of 65 from the October 30, 1963, figure of 1,143. We have 1,069 employees on our rolls as of February 24, 1964, which is a further reduction of 9 from the January 31, 1964, figure.

The only employees we have hired during this period are 12 people to replace others who have resigned. They are included within 1,069 employees now on board so that there has been a net decrease in total employees since the reduction in force.

GS–3	clerk-typists	2
GS–4	clerk-stenographers	3
GS–6	secretary	1
GS–9	secretary to Commissioner	1
GS–11	economist	1
GS–12	training officer	1
GS–16	Assistant General Counsel	1
GS–16	chief of division (engineer)	1
GS–18	chief accountant	1
	Total	12

The money to finance these will be from attrition to June 30, 1964.

Any reduction in force is difficult and painful, but I believe that our employees understand the necessity for the reduction in force and that morale in the FPC has not been materially affected.

Mr. JONAS. Before we leave this, have you had any hires since December 1?

Mr. SWIDLER. Hirings?

Mr. JONAS. Yes.

Mr. SWIDLER. I think there may have been some replacements. We have not had any expansion.

Mr. TRAINOR. We had a few replacements mostly at the clerical level.

Mr. SWIDLER. How many people have you taken on since December 1, 1963?

Mr. TRAINOR. December 1, 1963—I have it from October 7.

Mr. JONAS. I just wanted to know how many you hired since you sent out the RIF notices.

Mr. TRAINOR. I will get you that figure. I am sure it is quite small.

(NOTE.—12 employees have been hired during this period. See statement on p. 914.)

Mr. JONAS. That is one of the criticisms that appeared in the paper. I was sure you would know that. The question I want answered is why you hired any to replace those you fired or forced to quit?

Mr. SWIDLER. Well, sir, if you need a secretary you cannot count her against someone in an entirely different category.

Mr. JONAS. You said you disposed of these people, not because they were inefficient or unsatisfactory but only because you were limited by the money that was available.

Mr. Thomas asked you to state the amount of turnover you have normally, thinking that you could have absorbed the cut, or could have taken care of this by attrition. You weren't willing to risk that, you said, so you sent out notices to 39 people that they were fired, solely on the grounds that you would not have enough money.

That is a little inconsistent, if the record shows you have hired some people since.

Mr. SWIDLER. What I am trying to say is that these people are not interchangeable. I didn't intend to imply that any 39 people would do. If you get a resignation from a position that has to be refilled, you have got to refill it.

Mr. JONAS. What are you going to pay this secretary with that you say you have had to hire? If you had to have a secretary, you couldn't use a secretary to replace a technical man. What are you going to do for money to pay this secretary or these people you hired if the only reason you fired people is because you did not have enough money to pay them?

Mr. SWIDLER. We brought our budget down to a point where we could maintain it and if we later got resignations we could replace people. That is all we have done.

Mr. JONAS. You have 17 resignations but you have sent notices out to 39 people that you were going to fire them and then 6 elected to retire.

You actually fired about 30.

Mr. SWIDLER. Yes, sir.

Mr. JONAS. Now I want to know how many you have hired since.

Mr. SWIDLER. We are going to give that figure, sir.

Mr. JONAS. And where are you getting the money to pay them.

Mr. SWIDLER. We are getting the money from the fact that we

have brought our number of employees down to the number that we could continue to the end of the fiscal year.

Mr. JONAS. Plus the additions. You have added to it.

Mr. SWIDLER. There have been no net additions, sir.

Mr. JONAS. There have been no net additions but you have replaced some of those you fired with new hires.

Mr. SWIDLER. Yes, sir.

Mr. JONAS. That doesn't answer the question. Certainly if you fire 39 and hire 10, you have got a net reduction, but you could have fired 10 fewer than you did.

Mr. SWIDLER. If you could count on the future resignations coming where you could spare the people, but we had to be sure that we would be able to the best of our ability to carry on our workload with a reduced staff when these people left.

Mr. JONAS. That is all.

Mr. BOLAND. Off the record.

(Discussion held off the record.)

Mr. BOLAND. Thank you very much, gentlemen. This has been very helpful.

THURSDAY, FEBRUARY 20, 1964.

Mr. THOMAS. Will the committee come to order?

This is a very happy occasion for the committee. We welcome with great interest and sincerity our many friends from the Federal Trade Commission. It is nice to have with us the very able and genial Chairman, Mr. Dixon, Commissioner Elman, Mr. MacIntyre; we have our very handsome and new Commissioner, Brother Reilly.

We will have to induct him and confirm him later. Have we inducted him and confirmed him yet, gentlemen? His position is really

not legal until we confirm him. We have with us Mr. Buffington, assistant to the Chairman. Where is Brother Wheelock?

Mr. WHEELOCK. Right here, Mr. Chairman.

Mr. THOMAS. It is good to see you look so good, Judge. We have Brother Layton, the program review officer. Where is Brother Glendening?

Mr. GLENDENING. Right here, sir.

Mr. THOMAS. Nice to see you, sir.

Mr. THOMAS. Where is Mr. Shea?

Good to see you, Mr. Shea. We have Mr. Delaney, Director, Office of Administration, and Mr. Henderson, from north Texas, General Counsel. He comes up in this country and complains he cannot get black-eyed peas. Where is Brother Sheehy?

Mr. SHEEHY. Right here, sir.

Mr. THOMAS. Judge, we were worried about you last year. We are delighted to have you back. We hope you are well, feeling better and have your strength back.

Mr. SHEEHY. Thank you very much, Mr. Chairman.

Mr. THOMAS. Mr. Murphy is Director of the Bureau of Deceptive Practices; Mr. Stringer, Director, Bureau of Textiles and Furs; and Mr. Williams, Director, Bureau of Field Operations. Where is Dr. Mueller, Bureau of Economics? Doctor, good to see you. You know, every crowd is entitled to at least one Ph. D.

We have Mr. Snow, Assistant Director, Bureau of Industry Guidance.

Mr. JONAS. To look at Mr. Snow you wouldn't think I was once his counselor at a boys' camp, would you?

Mr. THOMAS. Good to see you.

Mr. SNOW. That was many years ago.

Mr. JONAS. He is a good old North Carolinian.

Mr. THOMAS. Mr. Snow, you will remember, we set you up in business about 12 or 15 years ago. Maybe you were down in Mr. Jonas' camp about that time. We look over your activities with great interest.

Where is Mr. Gotschall?

Mr. GOTSCHALL. Right here, Mr. Chairman.

Mr. THOMAS. How are you doing, Judge?

Mr. GOTSCHALL. Fine, thank you.

Mr. THOMAS. You don't have any headaches, do you?

Mr. GOTSCHALL. Only a few.

Mr. THOMAS. Mr. Irish is with us; Chief, Division of Scientific Opinions, Bureau of Deceptive Practices. Where is he? He has his hands full.

How are you feeling, Judge?

Mr. IRISH. Pretty good.

Mr. THOMAS. Mr. Sweeny, Chief of the Division of Food and Drug Advertising in the Bureau of Deceptive Practices; and Mr. Gercke, Chief, Division of Compliance, Bureau of Restraint of Trade, and where is Brother Snyder?

Mr. SNYDER. Right here, Mr. Chairman.

Mr. THOMAS. You had better get your feet under the table here.

Mr. DIXON. We do not have listed Miss Hardy behind me here.

Mr. THOMAS. We certainly do not want to overlook the young lady. We are delighted and honored to have her. Have I overlooked her name?

Mr. DIXON. I don't think she is on here. She is not on here. She should be on here.

Mr. THOMAS. Let's put her first on the list. What is her job over there?

Mr. GLENDENING. Senior budget analyst.

Mr. THOMAS. Off the record.

(Discussion off the record).

BIOGRAPHY OF COMMISSIONER REILLY

Mr. THOMAS. Mr. Chairman, do you and your fellow Commissioners want to talk to us? We are anxious to talk with you. Tell us something about what is going on. Before we get into that, let's induct our new Commissioner, our distinguished friend. He is well and favorably known to most of the committee. Tell us something about yourself, Mr. Commissioner.

Mr. REILLY. Mr. Chairman, I have been on the Commission approximately 2 weeks. I am not sure how much I will be able to add today.

I am pleased to be here.

Mr. THOMAS. Anyway, we are delighted to have you.

Mr. REILLY. I am pleased to be here.

Mr. THOMAS. Tell us your background.

Where did you go to school, et cetera?

Mr. REILLY. I was born in Dubuque, Iowa, in 1928.

Mr. THOMAS. What town?

Mr. REILLY. Dubuque.

Mr. THOMAS. I am from Iowa, myself.

Mr. REILLY. On the Mississippi.

Mr. THOMAS. You and Congressman Ben Jensen have been doing business for a long time, have you not?

Mr. REILLY. He is from the other side.

Mr. BOLAND. I do not think Jack has ever talked to him.

Mr. THOMAS. Doesn't he have that Mississippi country or is it the Missouri?

Mr. BOLAND. He has the Missouri.

Mr. REILLY. I was educated in the University of Iowa, went to law school there, graduated in 1955. I went into the Antitrust Division of the Justice Department in Chicago and spent 3 years there as trial attorney. I went from there to the Council of State Governments, an organization of State officials, and worked primarily for the National Association of Attorneys General. Mr. Wyman at the time was president, I believe, of the association; also, the Conference of Chief Justices. I left the Council of State Governments and went into the campaign for President Kennedy; worked for Larry O'Brien and the Attorney General.

After the election I went to the Justice Department as the head of the Executive Office for U.S. Attorneys.

I think at this point I should go back to the Council of State Governments. Mr. Ostertag was one of the founders, I believe; weren't you, sir?

Mr. OSTERTAG. Yes.

Mr. THOMAS. You will be confirmed right off the bat.

Mr. OSTERTAG. I was the first Chairman of the Board.

Mr. REILLY. Then I was in the Justice Department as head of the Executive Office for U.S. Attorneys and nominated by President Kennedy in October, renominated by President Johnson in January, confirmed and took office 2 weeks ago.

Mr. THOMAS. How old are you?

Mr. REILLY. Thirty-five, sir.

Mr. THOMAS. Just about our age. We are delighted and honored to have you. We wish you well.

Mr. REILLY. Thank you very much.

Mr. THOMAS. Go ahead, Mr. Chairman. You and the Commissioners talk to us. You haven't talked to us in a long time.

Mr. DIXON. He will be grayheaded pretty soon, sir.

Mr. OSTERTAG. You mean you get that way?

Mr. DIXON. I think that happens.

Mr. THOMAS. Look at him. The Chairman hasn't lost a hair. He has sprouted hair since he has been over there.

GENERAL STATEMENT

Mr. DIXON. Mr. Chairman, it is good to be back here again and to report to you and ask for some funds to continue our work.

"In 1964 and beyond," President Johnson said in his Economic Report to the Congress, "we seek a free and growing economy which encourages free enterprise, innovation, and competition by citizens in all walks of life." The Federal Trade Commission is a law enforcement agency directed toward maintaining the free play of competition in the effective functioning of our free competitive economy. The fiscal 1965 Commission budget has been guided by three principles—to protect the American consumer and small business from unfair business practices, to promote vigorous competitive business activity, and to do this vital job by practicing frugality through real economies in Commission operations.

The budget request for the FTC in fiscal 1965 totals $13,270,000 which, while an increase of $1,055,250 over the 1964 appropriation, only provides for an increase of 27 positions and $171,000 for new positions and $159,000 in increased operating costs. The balance of $725,000 will be required for necessary costs in 1965 over which this agency has only limited control. Included in this total is $250,000 for a half year cost of the pay raise that went into effect on January 5, 1964, restoration of reductions required in our enforcement programs in 1964 amounting to $106,250 in personal services and $115,000 in travel funds, $114,000 to purchase the electronic computer now on a rental basis, which will result in a saving to the Government of $41,000 per year beginning 2 years after purchase, in addition to a $29,000 saving of rental costs in 1965, and $140,000 for within-grade promotions and to protect the Government's investment in young attorneys on our staff by reducing uneconomical turnover through a promotion program in line with their demonstrated abilities and salary scales comparable with private law firms and private industry.

This budget request for fiscal 1965 provides the Commission with the minimum of personnel required to function under its legal obligations to protect the American people from hazardous consumer products, price-fixing agreements, and product misrepresentations. This budget covers preventive measures involved in our programs to advise and guide businessmen on the requirements of the law entrusted to the Commission, in order that costly legal investigations and formal hearings might be avoided whenever practicable, thereby saving money for the public, business firms, and the Government.

The Commission's budget makes provision for a long-delayed necessary program to check up and determine compliance with the Commission's outstanding cease and desist orders against violators of laws it administers, particularly where resumed violations might increase significantly the cost of essential goods and services which consumers must purchase.

Mr. THOMAS. Might I interrupt you on that point? I notice on page 50 of your justifications you go into quite some detail, saying you will wind up your activities at the tail end of 1964 and transfer your people over to the Bureau on a permanent basis. That is, the Bureau of Deceptive Practices. It slipped our attention. What was the original number of people assigned to that work? Was it 60 or 75? We cannot put our finger on it in our hearings. It was 3 years ago. Was it 60 or 75?

Mr. DIXON. It was 70, sir.

Mr. THOMAS. You asked for 90.

Excuse me. Go ahead.

Mr. DIXON. The millions of dollars invested in obtaining these Commission orders against unlawful business practices are wasted unless such orders are obeyed by companies covered, and checked by the Commission for compliance. The purpose here is to shore up our previous investment in investigation and litigation, and to save larger expenditures which would be involved later in prosecuting widespread violations likely to result from inadequate enforcement of existing orders.

COMPARISON OF FTC GROWTH TO NATIONAL ECONOMY

Mr. Chairman, at this point I am going to digress a moment and pass to each of you a chart and ask you if you will look because it has been my experience when I have come here you have been most kind to this agency, in my opinion since I have been there, but I have been trying to explain to you what our real problem is in workload.

The chart I have given you was just handed to me this morning. I asked that it be made up. This is a comparison of the Federal Trade Commission employment with other significant series, 1936–40.

If you will notice that black line at the bottom, that represents the number of Federal Trade Commission employees from 1936 to 1963. You will notice the growth of corporations, active corporations, in comparison to Federal Trade Commission employees and you will also notice the increase of the gross national product, which is shown on the next line.

Mr. THOMAS. This is a very good argument. We are not going to say we are two jumps ahead of you, but we are riding along with you. You just cannot make a valid comparison on that basis.

What you are saying is you catch one for one. Every time you go after a corporation you have a certain number of employees to go along and police them.

Mr. DIXON. I hope you don't interpret it that way. That is one of the factors here. The number of corporations we are required to pay attention to, notice how it is listed. The most interesting thing is over at the end in very small print.

Mr. THOMAS. Go one step further. The country has gained how many millions?

Mr. DIXON. We are a $600 billion gross national product as of the last quarter.

Mr. THOMAS. We have 180 million people. We have gained something like 15 or 20 million people in the last 7 or 8 years.

Mr. DIXON. There are three times the number of people. The number of businesses that are within this $600 billion package that we are supposed to protect and keep unfair practices and deception away from the consumer are astronomical but over at the end is the figure I wanted to point to your attention. Since this period started the Congress has passed four basic consumer laws in addition to the Clayton Act Amendment, section 7. If you will deduct the number of employees that we have assigned to those programs, we have 389 employees, and you will find that this leaves 789 employees for the work that the Commission has been doing constantly as this increased. This was interesting to me. It pictures what I have been trying to say to you, Mr. Chairman.

INCREASED COST OF PERSONAL SERVICES

I notice another thing, that we get less for our dollar. I merely ran back to 1950. Starting in 1951 this Congress gave the Commission $3,891,695. This supported 684 employees. In 1952 we got $4,314,000 and we lost 12 employees.

In 1953 it was $4,178,000. We lost another 30 employees. We had 642 that year. In 1954, $4,053,000; the employment went down to 596. This is what money would buy you. In 1955, $4,129,000 supported 584.

Mr. THOMAS. We are quite familiar with those figures, maybe more so than you are. The more pertinent question is—you are making it more obvious as you go along—Why have you increased your budget so much?

Mr. DIXON. This is what I am trying to illustrate. With the more increases we get we seem to find ourselves more behind. I have a feeling that I am swimming upstream standing still, sir, but we are doing the best we can, because for the past 2 years we have had no increase, for instance, in the restraint of trade work, not one penny. That work is still mounting. This year we get an increase in the deceptive practice work, primarily for the textile and fur work.

RECENT GROWTH IN EMPLOYMENT

Mr. OSTERTAG. But your budget has tripled since the time that you mentioned in your comparison?

Mr. DIXON. You are quite correct. For instance, in 1952, when we had 672 employees, it was $4,314,000 and we got $12 million last year.

Mr. THOMAS. Forget the dollars for a moment. Since he has been head of the FTC, he has added about 400 employees. He took it over with about 800 employees and he has something better than 1,200 jobs now.

Mr. DIXON. We have only 1,150 on board today.

Mr. OSTERTAG. That is a substantial number.

Mr. DIXON. That is true, sir.

Mr. OSTERTAG. Within the last 10 years you have more than doubled your employees and you have tripled your budget.

Mr. DIXON. The last 10 years?

Mr. OSTERTAG. You were speaking in terms of 500 some employees.

Mr. DIXON. 1954, 596. We now have 1,150. That is somewhere about correct. It was $12 million in 1964.

Mr. OSTERTAG. You should not have too much complaint on that comparative figure.

Mr. DIXON. When I came to the FTC, sir, there were 33 trial lawyers to enforce the whole antitrust program. What was happening, it was thinning down; what money would buy you and the things Congress had assigned us to do, you could put bodies in so many places.

Mr. OSTERTAG. Yes, and 10 years ago, according to your own figures, there was a reduction in the number of employees in 2 or 3 years during the period of the early 1950's.

Mr. DIXON. As you appropriated more money the employees went down.

Mr. OSTERTAG. That is right. Today you are up to the $13 million mark, asking for an increase. You had an increase last year, did you not?

Mr. DIXON. Last year we got a decrease, sir. Since you appropriated our money finally in December I have had to cannibalize more than 27 positions and I am trying to make up $100,000 between now and July to keep from having a reduction in force.

Mr. OSTERTAG. You are asking for an increase of 27 this year.

Mr. DIXON. Twenty-seven bodies but with the million dollars I hope to be able to raise the ceiling back up and replace the people that we have had to cannibalize to meet the budget that we were allowed by the Congress.

Mr. OSTERTAG. You say "bodies" and in your statement you refer to it as "positions." I do not know what the difference is.

Mr. DIXON. They are the same thing, sir. I should call them positions.

ANNUALIZED POSITIONS

Mr. THOMAS. How many jobs do you have annualized in the 1964 and 1965 budget? In other words, if you want to put it on a full annual basis in your 1964 appropriation you would be short considerable money, would you not?

Mr. DIXON. That is correct.

Mr. THOMAS. How many are you carrying over into 1965? Instead of having 27 increased jobs, it is carried as 60 or 65 on an annual basis, is it not?

Mr. DIXON. It would be slightly under 60, sir.

I understand the allowance of the ceiling, as I was told here and in the Senate last year, there wasn't an intention to cut anybody off but to leave us where we were. We found that we had to drop back in order to make ends meet as this fiscal year finishes out. In the money we are asking for we, of course, would replace those personnel, go back up to the 1,178. If you allow us the money for the 27 new positions it will be a ceiling of 1,205, which has been set for us by the Budget Bureau and the President.

Mr. JONAS. Will the chairman yield?

Mr. THOMAS. Yes.

Mr. JONAS. I understood Mr. Dixon to say that you took a cut last year. Instead of that you had a $740,000 increase over the previous year.

Mr. DIXON. The pay raise increase, sir. This is total money paid.

Mr. JONAS. You did not have any cut. You got three-quarters of a million more than you had the previous year.

Mr. DIXON. In money you are correct, sir; in positions is what I was referring to because when Congress passed the pay raise of course they had to create money to pay it and on our total appropriation it is an increase but it was not sufficient to offset the actual costs. There have been several increases in pay during this period 1954 through 1964.

Mr. OSTERTAG. Didn't the President indicate to all agencies that they were to absorb as much as possible of the pay raise?

Mr. DIXON. This is exactly right. We did absorb part of the pay raise. This is where some of this cannibalization started taking place and then the lateness in the final determination of what money the agencies got, we all sat there and operated as frugally as we could.

PERSONNEL TURNOVER

Mr. JONAS. What is your annual turnover average?

Mr. DIXON. I have these figures here, sir. I go back to 1962, 1963, 1964 for you. I have it for 1962, appointments: In 1962 I appointed 163 attorneys, 68 law clerks, and 275 other positions. These would range from clerks and stenographers and supporting people. There is a total of 506. That year we had these separations: 67 attorneys, 8 law clerks, and 148 others, for a total of 223.

In 1963 appointments, 72 attorneys, 25 law clerks, and 189 others, for a total of 286. The separations, 57 attorneys, 6 law clerks, 166 others, for a total of 229.

Up to December 31, 1963, and 1964, I have only hired 7 attorneys, 7 law clerks, and 50 others for a total of 64. There has been, separations, 14 attorneys, no law clerks, and 83 others, a total of 97.

You will notice, Mr. Jonas, that is tending down. I think that is good because I had a feeling that in 1962 we would take two steps forward and one back with this turnover. It is expensive because when you get young, bright attorneys out of law school, put them

in our training program, assign them full responsibility, and in about 2 or 3 years they are ready to produce and then they are offered better positions on the outside. Thank God this is slowing down. Some of these young men that we have hired in the last 2 or 3 years are outstanding boys. I am very proud of them. They are meeting head to head lawyers that make a million dollars. I gave an example last year of an attorney that had a case before us that publicly said he made a million-dollar fee. The boy that beat him got $8,000. I am very proud of him.

Mr. THOMAS. Is that right?

Mr. DIXON. I gave him a raise, Mr. Chairman.

Mr. OSTERTAG. Of course your point there is well taken, but at the same time it is not exclusively with the Trade Commission.

Mr. DIXON. That is right.

Mr. OSTERTAG. It is throughout Government, particularly in many specialized fields.

COST OF PROMOTIONS

Mr. DIXON. When I say I want some money for pay raises, I am not referring to the automatic within-grade pay raises that cost us about $80,000 a year.

Mr. THOMAS. That is good money well spent.

Mr. DIXON. I agree with you. The other $60,000 is better money well spent to me because when a young man is a grade 7, 9, or 11 and he has done an outstanding job during the year, I want to move him a grade at the end of the year so he can take care of his wife and kids.

Mr. THOMAS. How many promotions do you have in your budget, not within grade, but say if he is going from a 12 to 13 or 9 to 11?

Mr. DIXON. I asked for $60,000.

Mr. THOMAS. How many will that cover?

Mr. DIXON. It will nearly take care of my situation, sir.

Mr. THOMAS. What is the number?

Mr. GLENDENING. It will take care of about 60 to 70 individuals. It costs a little over a thousand dollars a year to promote them.

Mr. THOMAS. Do they question your promotions for attorneys?

Mr. DIXON. Not attorney promotions. They look over my shoulder. I only had one problem last year when they wouldn't permit me to promote my bureau heads and chiefs and I thought I would give them quality within-grade increases. They came over and ordered me to cancel them. They said I was quite a slick guy but would have to start over again and promote them on an individual basis.

SUPERGRADES

Mr. THOMAS. What is the status of your supergrades? Did you get any additional ones out of the last go round?

Mr. DIXON. I got one, Mr. Shea, some hearing examiners and medical officers.

Mr. THOMAS. How many supergrades do you have now?

Mr. DIXON. Thirty-six, sir. I can name them for you if you want them.

Mr. THOMAS. Where is your big chart where you set it out?

Mr. GLENDENING. In the back of the book, Mr. Chairman. It is clear in the back.

Mr. THOMAS. It is the very last page in your book. It is page 138.

Mr. DIXON. If you will look at that chart, I will name them for you, sir. Here is the number.

Mr. Chairman, if you will look at that chart, I will go right down and make it easy for you, starting at the hearing examiners here. These are not charged to us.

Mr. THOMAS. We would like to take a look at the entire personnel.

Mr. DIXON. We will furnish it.

(The information supplied follows:)

NUMBER OF SUPERGRADES IN THE FEDERAL TRADE COMMISSION

Chairman's Office: 1 GS–17, assistant to the Chairman.
Office of the Executive Director:
1 GS–18, Executive Director.
1 GS–16, Program Review Officer.
Office of the General Counsel:
1 GS–18, General Counsel.
1 GS–16, Assistant General Counsel, Appeals.
1 GS–16, Assistant General Counsel, Consent Orders.
1 GS–16, Assistant General Counsel, Legislation.
Hearing Examiners:
1 GS–17, Director.
6 GS–16, hearing examiners.
Bureau of Restraint of Trade:
1 GS–17, Director.
1 GS–16, Assistant Director.
1 GS–16, Chief, Division of Mergers.
1 GS–16, Chief, Division of General Trade Restraints.
1 GS–16, Chief, Division of Discriminatory Practices.
1 GS–16, Chief, Division of Compliance.
Bureau of Deceptive Practices:
1 GS–17, Director.
1 GS–16, Assistant Director.
1 GS–16, Chief, Division of Food and Drug advertising.
1 GS–16, Chief, Division of Scientific Opinions.
3 GS–16, medical officers.
Bureau of Textiles and Furs:
1 GS–17, Director.
1 GS–16, Assistant Director.
Bureau of Field Operations: 1 GS–17, Director.
Bureau of Industry Guidance:
1 GS–17, Director.
1 GS–16, Assistant Director.
1 GS–16, Chief, Division of Advisory Opinions.
1 GS–16, Chief, Division of Trade Regulation Rules.
Bureau of Economics:
1 GS–17, Director.
1 GS–16, Assistant Director.

GS–18	2
GS–17	8
GS–16	36
Total number of supergrades in FTC	36

Mr. THOMAS. Maybe you have the information in your files and you can pass it out to us.

We would like to look from grade 11 up by bureaus.

Mr. DIXON. By bureaus and everything, grades 11 up throughout the Commission.

Mr. THOMAS. Yes.

Mr. GLENDENING. This summary by grades appears in the budget at the back of each bureau.

Mr. THOMAS. Go ahead with your statement, please.

Mr. DIXON. The Commission's proposed fiscal 1965 enforcement programs are condensed in the following:

DECEIPTIVE PRACTICES PROGRAM

One of the most important of the Commission's responsibilities is the law violation in the field of deceptive advertising that warrant a full-scale drive to keep them from making a farce out of law enforcement as well as abusing the consuming public and undermining the credibility of all advertising. At the top of the list comes a galaxy of products advertised as beneficial for the health, digestion, weight, and beauty of credulous citizens. Here the deception is achieved not by the labeling of the products advertised but by their advertising. Here, by lack of forceful action, the FTC is exhibited to the advertisers of all other products as an agency incapable of dealing even with obvious exaggerations and falsehoods.

The Commission's enforcement program planned in the fiscal 1965 budget provides for the launching of a showdown on the validity of advertised claims for consumer health protection. It will be a difficult undertaking, for this industry is not lacking in adroitness nor resources. Last year, sales of packaged medications totaled almost $2 billion and advertising of principal drugs and health aids exceeded a quarter of a billion dollars. Cosmetic and toiletry sales also totaled almost $2 billion while the advertising of the principal brands ran to more than $300 million. Other equally impressive expenditures are cited in the accompanying text, but there need be no doubt that the response to FTC probings will be fast, furious, and with all the legal competence that money can buy.

CLINICAL TESTING

The funds requested by the Bureau of Deceptive Practices will also be used to overcome present handicaps in manpower and clinical testing vital to a successful challenge of exaggerated claims for a wide variety of products. These include pain-relieving drugs of furiously competing speeds being sold at a $360 million annual rate; arthritis and rheumatism concoctions being sold to 12 million sufferers for "cure" or "quick relief;" a host of impressive claims for vegetable oils and margarine products as heart attack insurance; air filters and purifiers that will remove any germ that worries a buyer; and, of course, the nasal sprays, mouth washes, liniments, syrups, and tablets that have conquered the common cold or, at least, its unpleasant features.

Also to be given a hard look will be the advertising of dentifrices and oral hygiene products to determine how much meaningful fact underlies the various scientific and pseudoscientific tests which establish each as superior to the other. Not only the public but even the industry can't be sure where bona fide tests stop and copywriters' pencils continue.

Mr. JONAS. Will you yield?

Mr. DIXON. Yes.

Mr. JONAS. I understand the difference between your responsibility and that of the Pure Food and Drug people, but it seems to me you do overlap in your clinical testing activities. You are concerned primarily, I thought, with the advertising aspect of this problem and the Pure Food people would do the testing and make the determination as to whether the product is safe and what not. Do you consider there is any overlapping there in your clinical work?

Mr. DIXON. No, I do not, sir, because we are very careful to eliminate that possibility through our liaison arrangement as far as humanly practicable. You are correct. Although our law is broad enough to pick up labels as well as advertising——

Mr. THOMAS. That is what he asked——

Mr. DIXON (continuing). That is his question—we have by arrangement with them deferred and left to them the principal responsibility for the labeling. Now, of course, this does not include economic claims that occasionally get on the label. They are very happy and they want us to take that job over but beyond that point we pick up on foods, drugs, devices, and cosmetics. We frequently rely upon the clinical tests that they make, even when we go into our advertising field. We draw upon that, sir, wherever humanly possible if they have made any tests. Very often they will not have made a test for the labeling. You see an advertiser, sir, could be perfectly legal and meet their responsibility on the label.

Mr. JONAS. How much money is used for clinical testing?

Mr. DIXON. A very small amount, about $30,000 last year.

DIFFERENCE OF FTC–FDA JURISDICTION

Mr. OSTERTAG. Mr. Chairman, what is your prime responsibility in this field as compared with Food and Drug? Getting back to Mr. Jonas' point, it seems that the Food and Drug Administration has first responsibility in these matters of drugs and foods. They are designed, equipped and authorized to establish enforcement of means for marketing and the use of these matters.

It is a highly specialized field. It seems to me that there is a certain amount of overlapping.

While I believe that there is a relationship in the field of advertising and perhaps some other aspects of this, it is really hard to understand how one could put it together.

Mr. DIXON. I think I can explain this to you, sir.

In 1938 the Wheeler-Lea Act was passed by the Congress which added sections 12, 13, 14, 15, to the Trade Commission Act and actually bolstered the Food and Drug Administration. A debate was held on the floor of the Congress as to whether these responsibilities should all be placed in one agency. I think the Congress very wisely chose the course at that time that Food and Drug be given the responsibility for health and safety and that the Federal Trade Commission be given the responsibility for the economic features, the advertising, the selling, and the promotion of products.

All of the expertise of the Federal Trade Commission is built up in the area of health and safety. Before the cow gets out of the barn

and gets killed you try to stop it, find out what is in the product, whether it is safe and what should be on the label and what directions for use. That is their job.

Mr. JONAS. We agree with that. We are trying to find out who makes that determination.

Mr. DIXON. The Food and Drug does that, on the label and brochure. This is their job, sir.

NEED FOR CLINICAL TESTS

Mr. JONAS. Why do you have a big clinical testing operation?

Mr. DIXON. Because when we proceed against the advertising, for instance, of analgesics, we are in this area and have been chasing it for some time, in order for us to get the necessary proof, the type of scientific evidence that will stand up in a court of law, we have to go to the outside and pay for it. Very often Food and Drug must do this if they go to a court of law themselves. Now, we call upon the Food and Drug for their expertise that they have in this field and they do help us. If you talk about the $30,000 or $40,000 or $60,000 or $75,000 that we have expended, it would be minutia compared to what you are giving them to run the Bureau of Medicine and carry out their own clinical testing program.

Mr. JONAS. I know they spend more on it than you do but I am trying to get you to put in the record some excuse for you spending any money at all on that when they are equipped, have the facilities and the laboratories and the experts and the scientists available to give testimony, if you need it. I just cannot quite see why you need to be in the field of drug testing.

Mr. OSTERTAG. If a drug is something that is harmful to the health and well-being of the people, the Food and Drug Administration is responsible for determining that and they make certain it is off the market. If there is false and misleading advertising, there is where I think you come in. It seems to me that there is a bit of overlapping in determining the question of enforcing the trade and advertising aspects as compared with what really is good and what is not.

Mr. BOLAND. If the gentleman will yield, I would think the wonder is there isn't more overlapping. If they only spend $60,000 in this area I think it is rather small. As he indicated they give to the Food and Drug Administration the jurisdiction and overseeing of the labels, which they could take on themselves if they wanted it, I suppose. Actually, the amount they spend is so little.

Mr. DIXON. There are two types of drugs. There is the prescription drug; the law that Congress passed recently on prescription drug products for all practical purposes removes them from our primary responsibility. Then the so-called proprietary drugs that are sold across the counter—take aspirin; it says it has 5 grains on it, U.S.P. This is all it says. It doesn't even have to have a warning because it hasn't been considered dangerous enough to have a warning put on it, but you go out to sell those aspirin and you go out and say: "Look, if you will take aspirin it will cure arthritis." That is not the label. That is advertising for sale. That is our responsibility. How do you prove that it won't cure arthritis? How do you prove it? Not because I think it won't cure arthritis but because a competent medical doctor has to take the stand and swear to it.

Now if it is necessary for him to buffer his testimony by a clinical test we must pay him for it. That is where the costs arise.

RELATION TO FOOD AND DRUG ADMINISTRATION

Mr. OSTERTAG. Wouldn't the Food and Drug Administration be responsible for determining what it will cure and what it won't, rather than the Trade Commission? That is what I am driving at.

Mr. DIXON. This is advertising and not labeling. You are getting down into a very narrow construction of the Food and Drug Act.

Mr. OSTERTAG. You said a moment ago the label did not make such claims.

Mr. DIXON. That is right. They have no responsibility for the advertising within their law. They have none. They are beginning to proceed in some type of cases to where, if the court will go with them and say that even advertising is directions for use——

Mr. THOMAS. Mr. Chairman, I think you can clarify the position. When you need that expert medical testimony you go to the Food and Drug Administration and they furnish it to you.

They send you a bill for it and you reimburse them for it; isn't that your general practice?

Mr. DIXON. I do not think usually we have to reimburse them. We can get their testimony without paying for it.

Mr. THOMAS. Don't you usually call upon them to furnish the expert testimony?

Mr. DIXON. We usually do, because it is considered——

Mr. THOMAS. They have the people, don't they?

Mr. DIXON. I will put it another way.

Mr. THOMAS. You would rather have an outside man? For trial psychology you want a man from the public rather than a Government bureau?

Mr. DIXON. This helps, but beyond that there is a more practical problem. They say: "We need all of the talent we have for our own problems and if we do this for you we have to stop something that we are required to do." That is usually the answer. It is a very understandable answer.

Mr. JONAS. Not very understandable to me.

Mr. DIXON. I do want to make this plain. We go to the National Institutes of Health; we go to the Surgeon General; we tried the Veterans' Administration. We make use of all of this talent, sir, that we can. I might say that it is encouraging at times the way they come to our help, aid, and assistance. As I go along I will reach a point where I will show you that this is quite important.

Mr. EVINS. The labeling may be a very small and minor part. The public has already been conditioned to the purchase of the item because of the tremendous, fabulous, extensive advertising.

Mr. DIXON. That is right.

Mr. EVINS. They do not read the label. They have already read the ads.

Mr. DIXON. That is right. It is a misrepresentation. This is a very troublesome point to try to understand, the relationship between Food and Drug and Federal Trade in this general area.

The Commission has developed an expertise in this area that they do not have. They proceed by seizures. They go over to the Depart-

ment of Justice and use their talent to go in and seize things and condemn and attempt to obtain permanent injunctions following that.

Mr. JONAS. I understand that.

Mr. OSTERTAG. I, for one, would say that the Federal Trade Commission has an important role in all of this when you get down to the very basis of the Bureau of Deceptive Practices, but there is a line, it seems to me, that has to be divided, between the responsibility of the Food and Drug Administration as against yours. If it is deceptive practice and false and misleading advertising, that is one thing; but the determination of what drugs and other items contained, and whether they are good or bad, I believe belongs properly to the Food and Drug Administration.

Mr. DIXON. I think it does, sir. Congress put it in there. It has been there all the time, unless you change it. It is very clear, there is a responsibility unless Congress takes it away, and I think it should be left there, because——

Mr. JONAS. That was not my point. I was not questioning your jurisdiction. I think that is clear. I was just raising the question whether you couldn't use the same information that the Pure Food and Drug people compile in order to handle their injunction cases, their seizure cases, and the other actions that they take.

I was just trying to get you to explain to what extent you engage in clinical testing on your own and out of your own funds.

Mr. DIXON. We do use their information. They use ours. Very often we will have a case underway and they will come along and start a seizure action. We give them the information we have. This is a very close relationship.

Mr. JONAS. You only spend $30,000 on it. That is a small amount. I couldn't find any breakout under your "Deceptive practices" tab that would show how much you were spending on that. That amount is important, of course, but it is not of major significance.

Mr. OSTERTAG. For example, take your last item in this paragraph with regard to deceptive practices in which you make reference, Mr. Chairman, to tablets that have conquered the common cold. I have heard it told that there isn't any absolute cure for the common cold.

Mr. DIXON. I have heard doctors swear to it. This is true; there is no known cure today.

Mr. JONAS. You get pneumonia and they can cure pneumonia.

Mr. DIXON. They stand out in the rain and catch pneumonia.

Mr. OSTERTAG. But there are literally thousands of products on the market that perhaps afford relief for symptoms associated with the common cold. Therefore, the question is, should they be prohibited from being on the market?

Mr. DIXON. No, sir. I think they should have to adhere to truth and not deceive the public. Tell the truth.

Mr. OSTERTAG. That is it.

Mr. DIXON. That is our job.

Mr. OSTERTAG. That is your job?

Mr. DIXON. That is all it is, sir.

Mr. OSTERTAG. That is my point. I am for it.

Mr. DIXON. I am not trying to keep them off the market, sir. It is Food and Drugs responsibility to get that off the market, but mine is to get them to tell the truth.

Mr. OSTERTAG. That is exactly what I am trying to say and the point I am trying to make, as between your responsibilities and theirs.

Mr. DIXON. I think that you did a better job than I did, sir.

VITAMINS AND HEALTH FOODS

This budget also would make possible an intensification of FTC's efforts to protect consumers from fanciful claims for the health benefits of vitamin and mineral preparations, special dietary foods, and so-called health foods. More than $200 million worth of over-the-counter preparations of this type were sold last year. Significantly, the broader and more extravagant claims were made in the advertising of these products; their labeling was more circumspect.

Another and very large area of questionable advertising affecting the consumer health is directed at the nearly one-fourth of the U.S. population who is overweight.

Mr. THOMAS. May I interrupt? I have been listening to Geritol ads. It has all those vitamins in it. It contains calves' liver. Is that just sales talk? What will it cure, old age or anything like that?

Mr. DIXON. We are suing them right now. I think we will decide that pretty soon.

Mr. THOMAS. Do you have a suit against them?

Mr. DIXON. Yes, they have a lot of your money invested in this.

Mr. THOMAS. They don't have any of my money.

Mr. DIXON. It is one of the largest advertisers on TV, Geritol.

Mr. EVINS. They have ceased using the words "tired blood."

Mr. DIXON. Maybe we have made some progress. We will determine the whole case pretty soon, sir.

Mr. OSTERTAG. Has it been determined that it is absolutely worthless?

Mr. DIXON. I don't know, sir, what the determination will be.

Mr. OSTERTAG. Is that the point?

Mr. DIXON. We are off the record, now.

REDUCING DEVICES

The FTC already has underway an industrywide investigation of reducing devices, such as girdles, vibrators and exercisers, but due to shortage of manpower we have been virtually powerless to investigate the more inviting exaggerations of how to lose weight with a drug or an easy dietary plan including food supplements.

You will remember reading in the paper recently about Food and Drug's action in Richmond. Here is something that was worthless. They seized it.

Here again consumer deception and danger lurk far more in the advertising of the products than in their labeling.

CIGARETTE ADVERTISING

The consumer health area of current national concern today involves the smoking of cigarettes. The January report of the Surgeon General's Advisory Committee found, on the basis of prolonged study and evaluation of many lines of converging evidence, that

"cigarette smoking is a health hazard of sufficient importance in the United States to warrant appropriate remedial action." Protection of the consuming public from false, misleading or unfair advertising (including labeling) of products that may endanger human health or safety is a prime duty of the Commission. Therefore, the Commission has determined that the public interest requires initiation of a trade regulation rule proceeding for immediate corrective action of advertising and a public hearing is scheduled for March 16, 1964.

Although the advertising of all the foregoing products (as well as others discussed in the text) has serious implication for public health, the FTC has been able to correct only a very little of that which is false and misleading. The reason: lack of money and manpower. Indeed, there are other product areas, such as analgesics and germicides, that haven't even been touched by the FTC even though their advertising clearly invites regulatory attention.

Here is an interesting one when you get to Food and Drug and Federal Trade. In the late forties, after the Wheeler-Lea amendment was passed, the Federal Trade Commission, proceeding under section 13, went into the Federal court and sought an injunction. We got a determination by the court that a cigarette was not a drug within the meaning of that law.

I think Food and Drug about the same time attempted to proceed, and they were told it was not a drug within the meaning of their law. Therefore, it is a product. It comes under section 5 of the Federal Trade Commission Act, which Congress said we had to proceed against unfair and deceptive advertising.

Mr. EVINS. Some of us have read the press releases of the Federal Trade Commission's views following the Surgeon General's report to the effect that you proposed to have a warning placed upon the labels of the packages of all cigarette manufacturers. I suppose you were immediately deluged with opposition to this proposal. This is not an order, this is a proposal that the Commission advanced. Is this the situation?

Mr. DIXON. Mr. Evins, I might say that I read some of the views of the Commission for its proposed action, but I have not felt any pressure or any interference from any source. I think that we are standing there with our obligation to carry out our responsibility, and what we have announced here is, in my opinion, the most sensible and the fairest way to approach it, instead of one at a time, approaching the whole problem.

What we have done is, we announced the basis and purpose or reasoning for our procedure that we have announced. We have tentatively, in connection with the announcement, issued what we think are tentative rules so that when the hearings occur, all interested parties will have something to talk about, something that we can center on.

The Surgeon General's Advisory Committee states they found some direct causal connections with some very serious things that kill people, like cancer, emphysema, chronic bronchitis, and various other things. This Committee was chosen from a distinguished panel. They were submitted to the tobacco industry themselves. They approved these people, these 12 doctors. These 12 doctors that made that Committee report were unanimous. There was no dissent. They called for

remedial action. We knew that this Committee had been working because in the past various people had called upon us asking why did we not do something about the various advertising going on over the air, principally with respect to cigarettes. We said we thought the time had come that this should certainly be looked at from a competent scientific standpoint. We early suggested that someone should do something about this and then rather applauded the Surgeon General's attempt to look at it.

Mr. JONAS. You are going to have a public hearing on March 16. Is that a hearing at which all cigarette manufacturers will be heard?

Mr. DIXON. Every interested party, which certainly will include cigarette manufacturers. They will be given a full and adequate hearing.

USE OF INDUSTRY GUIDANCE DIVISION

Mr. JONAS. Are you bypassing your Industry Guidance Division?

Mr. DIXON. This is completely within our Industry Guidance Bureau because this is one of our avenues we have tailored our new procedures for.

Mr. JONAS. I thought the Commission was going to sit.

Mr. DIXON. We thought it was important enough for us to sit:

Mr. JONAS. I thought when you got a problem the first thing you did was turn your Industry Guidance people loose on it.

Mr. DIXON. The Industry Guidance Division is handling it at the staff level, but instead of a member of the staff being delegated to hear and then we review it, we are going to listen ourselves. This means at all times at least three Commissioners will be sitting when there is testimony.

Mr. JONAS. I made a speech recently in which I praised the Industry Guidance part of your activities because I thought it made a lot of sense to talk to people before you bring them up for public hearings or start proceedings, to see if you cannot have a meeting of the minds and work things out on that level before going to court.

Mr. DIXON. This is no different fundamentally from other types of hearings that we hold. The only thing different here is the Commission will be sitting.

Through our so-called guidance, we have four basic approaches: one, we do issue guides. We give them to the public. This is no enforcement program. It tells them if you do not follow the guides, we will proceed against you.

Then we have the trade practice conference procedure where usually the industry comes to us and we sit down with them and develop, in a sense, trade rules or guides. Then we have the advisory opinions which we have adopted where we will give binding advisory opinions, where practical.

In addition to that, we have this fourth method, the general trade rule procedure that we have adopted. We adopted this one from the standpoint of accomplishing two things, not only to guide but at the other end of the road we would have something that will have a bite if it is not followed. That is what we have there. We think it will save everyone's time and give all the guidance necessary.

Mr. EVINS. It seems to me this is a question of such magnitude and importance concerning the public health that the Commission would be wise to give it priority and early consideration and not let it be

dragged out through a long process like the Commission has been charged with doing on some other matters.

Mr. DIXON. Mr. Evins, I daresay had we followed the usual procedures we followed in Carter's Little Liver Pills, we would have had another case like Carter's Little Liver Pills 16 years in length.

Mr. EVINS. This is a controversial matter. I understand the tobacco industry employed its own technicians and doctors and will come forward with its own report, which will probably counter the Surgeon General's report.

Mr. DIXON. I suggest they give it to us at that time because that is the purpose of these hearings. That is the reason we have announced them, because at the end of these hearings we must have some kind of record where this Commission can make a finding of fact and a conclusion that section 5 has been violated. We must have that type of record, sir.

I think we have moved with expedition in this matter. Perhaps some of the criticism has been that we moved too expeditiously. I think it confounded somebody to think that the "Old Lady of Pennsylvania Avenue" could move with due haste on a problem. Within 1 week we announced this procedure. I tell you we were ready. We knew it was going on. I assigned a staff task force who brought all the advertising up to date. We were in my office, the Commissioners, waiting for that report. I did not know what was going to be in that report any more than you, sir, no earthly idea until it was handed to the Commission.

Mr. THOMAS. How long have people been smoking?

Mr. EVINS. The Indians were smoking before we came here.

Mr. DIXON. When I read that report, I threw my last package of cigarettes away and got these things.

Mr. THOMAS. Proceed with your statement.

FALSE AND MISLEADING ADVERTISING

Mr. DIXON. Additionally, the Commission will intensify its monitoring of advertising to detect filching of money from the consumer through the use of flagrant deception in the sale of products such as food, mineral, and vitamin preparations, household equipment and home improvements, and necessities of life of special significance to low income families and the aged. Promotional practices or misrepresentations as to the cost of credit charges which divert trade from, or otherwise injure, small businessmen and consumers will be given close scrutiny by the Commission during fiscal year 1965. The Commission's responsibility to prevent deception extends, with few exceptions, to all goods and services sold in commerce.

TELEVISION ADVERTISING

Mr. OSTERTAG. Mr. Chairman, let me ask you this, if I may. With regard to this whole question of deception and false and misleading advertising and possibly mislabeling; which medium seems to be the most potent in that regard? As of today, would you say it is television? Has television blown this whole picture of deception up more than any other medium? This is a broad question.

Mr. DIXON. I have not really thought about it, but I am quite sure that this is the newest of all mediums, and what you see seems to impress you even more than what you read or what you hear. It is a very vital and forceful means of advertising the giant productivity of America.

Mr. OSTERTAG. You people who are responsible for this must have some estimate of where your real problems are developing and which is the most serious.

Mr. DIXON. I would hate to shoot from the hip on that one, sir, because it is a pretty broad question.

Mr. OSTERTAG. As you indicate, Mr. Chairman, there might be a considerable difference in an advertisement in a newspaper as compared with something that is very vividly blown up to you in action on a television screen.

Mr. DIXON. You have your finger on something, Mr. Ostertag, that we ourselves as the five Commissioners have discussed in the not too distant past. We are trying continually to get out of this morass of everything that comes by us and kind of move back and away, to try to determine what is more in the public interest.

If the full purport of your question is understood, I think the most effective is television advertising, in my own personal opinion.

Mr. OSTERTAG. That would be mine, but I do not know.

Mr. DIXON. This may be one of the ways we will turn to in order to determine how we will use the limited resources we have. What is more in the public interest when you have a limited force? Would you go to this type advertising or this one here? Today we are across the board. We are examining newspapers, periodicals, radio scripts, television continuity, as well as watching and observing. Very often national advertisers will use all mediums and the same representation will appear much the same in nearly all mediums.

Mr. OSTERTAG. I do not want to delay or consume time in connection with this hearing, but the thought occurred to me in this connection: We were just a moment ago discussing this whole issue of smoking and cigarettes and cigarette advertising and what you plan to do in that regard. This brings to mind the fact that cigarette advertisers or tobacco companies are probably one of the most extensive advertisers in television.

Recognizing, as we must, that there is also this question of our system of television in this country as compared with, say England, of the issue as between pay TV as against our regular commercial free television. The cigarette manufacturers and many of these other producers that have been mentioned here today are the most extensive television advertisers. This situation may lend itself to the argument for the establishment of pay television as against the system of commercial television.

Mr. DIXON. Whether they pay for it or not, the advertising would not be different, in my opinion. They would still be trying to sell the product, whatever it is. I think advertising is here to stay.

Mr. OSTERTAG. I believe advertising is here to stay, but if you had a complete and absolute system of pay TV, television would not be an advertising medium.

Mr. DIXON. I have heard this discussed.

Mr. THOMAS. Repeat that again.

Mr. OSTERTAG. Off the record.
(Discussion off the record.)
Mr. THOMAS. Proceed.
Mr. DIXON. It is true that this long-delayed drive calls for additional money, but the alternative is ineffective action in this vital and explosive area of advertising affecting the health of consumers. Moreover, these are products whose advertising all but saturates the airwaves and is prominent, indeed, in the printed media. To millions of Americans, this advertising creates the character of all advertising. If it offends credibility, then other advertising also becomes suspect. Thus, for the FTC to be ineffective in regulating such widely disseminated advertising of products so important to consumers has far reaching implications. And not the least is that the Nation's 12 billion advertising dollars are substantially devaluated in their purpose to stimulate business. Certainly real economy dictates spending the small amount the FTC asks to alleviate this situation.

ENFORCEMENT OF THE WOOL, FUR, AND TEXTILE ACTS

The only substantial increase for additional manpower and funds requested by the Commission in 1965 is for additional enforcement of the Wool, Fur, and Textile Acts.
The Wool, Fur, and Textile Acts each require affirmative labeling disclosures. The Fur Act further requires affirmative invoicing, while disclosures made in the advertising under the Fur and Textile Acts are regulated. The Flammable Fabrics Act prohibits the introduction or movement in interstate commerce of dangerously flammable wearing apparel and fabrics intended for use therein.
Unlike other statutes administered by the Commission, compliance with the terms of these acts must be continuously policed to assure that members of industry are living up to their requirements and consumers are afforded the protection intended by Congress.
Mr. EVINS. Is a baby blanket wearing apparel, or how do you classify that?
Mr. DIXON. We have ready a proposed press release. We finally ruled on the infant baby blanket question. The majority of the Commission held that this is not within the Flammable Fabrics Act and if anything should be done about it, it should more properly be addressed by Congress toward amending the act itself. That basically is what we have done as a commission. That was done upon a very careful review of the legislative history of the Flammable Fabrics Act, as such.
Mr. EVINS. Is the Commission making any legislative recommendations for amendments in this area?
Mr. DIXON. We have not as yet, sir. I do not know whether we will or not. The task of administering the Wool, Textile, and Fur Acts is reflected by the tremendous size of the textile industry. Over 100 different industries are engaged in the manufacture of textile products subject to the provisions of these statutes. Each year the sales of textile products covered by the acts run into billions of dollars. Next to food and shelter, textile products including wearing apparel and household furnishings, constitute the most important segment of our national economy. Additionally approximately 175,000 distributors of fur products are subject to the Fur Act.

This country is importing tremendous quantities of wool and non-wool fabrics and garments. The foreign mills and manufacturers are not always cognizant of the labeling and invoicing requirements under our Textile Act, and as a result a constant check must be made of these products. Since foreign manufacturers are outside the jurisdiction of the Federal Trade Commission, we must work closely with the Bureau of Customs in policing foreign imports. As a result of this cooperation the entries of many misbranded items have been stopped and corrected before the merchandise entered the American market.

For the past year simulated fur fabrics made from natural and man-made fibers have been extremely popular. The advertising and labeling of garments made from these fabrics has presented a problem as some manufacturers have concocted trade names and descriptions for their products that are misleading to the public.

FUR AND TEXTILE INSPECTION

It should be noted that the day-to-day inspection of these products is of real concern to consumers, particularly women, for furs can be skillfully dyed or otherwise treated to appear to be of better quality or from more desirable animals than is the fact. Therefore, truthful labeling assumes a far greater importance than fur products whose quality is more easily appraised. The same situation obtains for textiles where the percentages of new and reused wool can, without proper labeling, trick even the sophisticated buyer, and, of course, the new synthetic fibers would have anybody guessing, were it not for proper policing of the labels.

There are only 37 investigators to do this trenmedous inspection job throughout the entire United States. Some of these investigators are located in field offices of the Commission, but others are located in field stations, in some of which only one or two men are assigned. Some of these field stations have responsibilities for regional inspections covering several States. The field investigation staff, in addition to carrying on routine inspections and industry counseling in all phases of manufacturing, processing and distribution of textile and fur production, also performs most of the investigations in formal cases leading to complaints under the direction of the Bureau of Field Operations.

RELATIONSHIP WITH STATE AUTHORITIES

Mr. OSTERTAG. I have one point with regard to labeling. What is the situation and your relationship between your enforcement and policing of this whole field you have just described, and that of the several States? They have a number of labeling laws and requirements. How is that coordinated?

Mr. DIXON. I know of no conflict between our statutes and any State statute.

Mr. STRINGER. There are no State statutes in these areas. There is a Fur Labeling Act in Wisconsin and a Wool Labeling Act in Wyoming, but other than that there are no State laws on the subject.

Mr. OSTERTAG. Does the State of New York have a labeling law on any of these?

Mr. STRINGER. No, sir.

Mr. DIXON. They have a general law that Mr. Lefkowitz has done much with. He should be congratulated, in my opinion. This law is kind of patterned after the general Federal Trade Commission law that is a broad and breathtaking type of approach to deception, as such, and unfair practices.

Mr. OSTERTAG. As Commissioner Reilly knows, back in the days when some of us served in the State governments and particularly in the field of interstate relations or cooperation, one of our jobs happened to be that of bringing about some uniformity with regard to these laws and possibly bringing them in line with, let us say, Federal requirements or Federal statutes. I was wondering if you had any problems between State jurisdiction and State laws and enforcement and your problem?

Mr. DIXON. The only problem is I see too little State enforcement in this area. I think one of the things you will see generally developed in the next few years is more of an understandable relationship with these various State attorneys general and their various State officials that are responsible. I think we must do more and more of this so we can get some help.

Mr. OSTERTAG. Thank you.

Mr. DIXON. Despite continuing and earnest endeavor to carry on as best it can, the Division's investigators are able to inspect only a mere sampling of the hundreds of thousands of concerns engaged in some phase of the textile and fur industry. This includes the fiber producers, spinners, processors of natural and manufactured fibers, mills, manufacturers, importers, wholesalers, and retailers involved in production and distribution.

During fiscal year 1963 only 14,682 inspections could be made by this small staff. While these inspections, by sampling methods (except furs), covered some 50 million products, more than 4 million labeling or other deficiencies were found which resulted in 101 formal complaints, 113 cease-and-desist orders, and 1,400 assurances of discontinuance.

We do tremendous good here as these men go along, straightening things out at that level. This is our hope. We usually only go to the formal complaint when we have a pretty bad record of experience with the party that just will not pay any attention to it.

To insure that the public shall receive the protection intended by Congress, it is obviously necessary to police the manufacture and distribution of products subject to these laws. Without question, 100 percent inspection of all the concerns involved in all these industries in the textile and fur field would be impossible. Therefore, it is necessary that the policing the staff is physically able to do shall be carried on in strategic areas and in strategic industries.

It is obvious that the staff available for enforcement of these statutes is wholly inadequate and the Commission is requesting 25 additional attorneys and investigators which will require $127,000 and $35,000 for travel.

INDUSTRY GUIDANCE PROGRAM

The guidance of industry by voluntary means as an alternative to costly adversary actions whenever possible is being given greater emphasis than at any time in the FTC's 49-year history. Whether

the voluntary procedure involves a request for guidance from an individual firm or whether the industrywide problem can be lessened by the issuance of rules or guides, far more compliance with the law can be achieved with the same amount of enforcement money. But there can be no question that the guidance program places a very considerable burden on the Commission and its staff. Even though it is cheaper to avert a violation than to correct it, the work involved in averting it calls for competent manpower.

Consider first the FTC's program for the issuance of advisory opinions, a program which has been in effect only 19 months. Requests for opinions totaled 326. The Commission disposed of 71 by formal action. The number of requests for advisory opinions during the fourth quarter of calendar year 1963 increased by almost 70 percent over the preceding quarter. The widespread dissemination of information on our advisory services, as indicated by requests for 45,000 copies of the Commission's booklet describing these services, will result in further substantial increases in business requests for advisory opinions from the Commission.

The opinions sought were not on simple questions. Many dealt with such complex matters as whether proposed mergers would violate the law, the legality of cooperative advertising plans, and whether functional, quantity, and cumulative discount plans would be legal.

There can be no doubt that as this advisory opinion service becomes more widely known, particularly to small businessmen, the volume of work will rise sharply. (The first to appreciate it were the big law firms and their clients, but efforts are underway to spread the word to businessmen generally.) Also plans are underway for issuing digest of previously rendered opinions given to individual applicants with, of course, due regard for protecting trade secrets.

A significant increase in demand is being made for the issuance of trade regulation rules, a companion innovation looking to industry's guidance. They are proving to be of great interest to businessmen inasmuch as they spell out clearly what the Commission considers the requirements of the law to be as it relates to a particular subject. Their preparation involves extensive study and public hearings for the FTC will rely upon them in adverary actions. A year ago the staff assigned to this work had 8 proceedings pending; today 20, and the staff, still the same size, is, of course, overloaded. Here again the inevitability of delay will sabotage the program unless the staff is enlarged.

In other major areas of FTC's industry guidance work, namely the industry guides and trade practice conference programs, one need is the very obvious one of protecting the investment of time, money, and business confidence in the rules and guides that already have been issued, and another need is to tackle industry problems by these broad scale voluntary methods whenever possible as an alternative to the more costly litigation method.

There are now 168 industries under rules, with 4 more to be issued by this fiscal year's end. The four are for the fresh fruit and vegetable, the gypsum, the hard surface floor covering, and the braided rug industries. All 172 rules, of course, will have to be administered and kept up to date. The same is true of the 10 guides

now outstanding, and the 2 more for mail-order insurance and for room air conditioners, to be added this year. Altogether, 1,100 compliance matters had to be handled during fiscal 1963.

Plainly the workload here is cumulative; for, the more rules and guides that are in effect, the heavier becomes the task of administering them.

COMPLIANCE PROGRAM

Although not included with industry guidance work, a far-reaching decision which serves this purpose was made last August 1 by the Commission. This was the decision to offer advice to those bound by FTC orders on whether any course of action they propose to take will violate the particular cease-and-desist order to which they are subject. The Commission was aware that this amendment of its rules of practice might well prompt a flood of requests for such advice from respondent firms who have no appetite for any future litigation with the FTC. Yet, elemental fairness demanded that these respondents be given opportunity to find out by some means other than facing a penalty suit whether (1) they have succeeded in complying with FTC's order, or (2) whether a future course of action would contravene it. It is, of course, too early to determine exactly how much additional work for the staff this rule change will generate, but that it will be substantial there can be no doubt whatever. Particularly difficult will be the reviews of compliance reports filed in connection with antimonopoly orders, for many of these would require analyses of new pricing policies, cost data, competitive effects, and other complex matters. The task would fall most heavily on the compliance divisions, the Division of Accounting and the field offices.

The entire subject of compliance with outstanding orders has been given the most careful consideration in preparing our 1965 operating programs. The time has come to pull it out of the back room and face up to the fact that it has been neglected, most particularly in the field of antitrust.

The FTC has issued about 1,250 restraint-of-trade orders, many involving multiple respondents and affecting significant markets and segments of the national economy; yet, the Commission has no way of knowing with any degree of certainty whether they are being obeyed. No systematic check of compliance with these orders is being made.

Simply to handle current cases, the Compliance Division of the Bureau of Restraint of Trade already is overloaded to the extent that each attorney has responsibility for 30 current cases at the same time. These are active cases on which action within 60 days after their issuance is legally mandatory. And this was the situation before the previously mentioned rule change entitling respondents to opinions on whether their revised or proposed practices comply with cease-and-desist orders against them. Nevertheless, the Commission is firmly convinced that a thorough compliance check of its outstanding orders must be undertaken, for the very good reason that an unenforced order is worse than none. The cost will be considerable. Of course, this badly needed compliance check might have been meat-axed out of the budget under the guise of economy. But real econmy demands that the millions of dollars spent in obtaining these orders be not wasted.

In the field of deceptive practices, the problem of ascertaining compliance with old orders is less serious, for the reason that both the public and business competitors are not slow to detect and report when a respondent is violating an order against him. (Violations of restraint of trade orders on the other hand are far harder to detect.) Even so, there must be vigilance in policing compliance with deceptive practice orders or they, too, become nullified. The number of deceptive practice orders requiring surveillance has increased every year, but there has been no increase in the professional staff for the past 3 years, with the result that nine attorneys are now weighed down by a workload averaging 63 active cases each. Obviously they cannot, without the additional manpower, be expected to carry the new compliance program with its far heavier responsibilities.

Fortunately for the FTC's program to revitalize its outstanding orders is that another difficult and costly responsibility in the field of compliance is drawing to a close. This is the Justice Department's mandatory request in early 1961 that the FTC investigate compliance with 56 of its older antimonopoly orders. These were tough cases to investigate; most of them involved multiple corporations, including some of the biggest. To handle this extra work, the FTC was given an extra appropriation of $915,000 in 1962, whereupon commenced the difficult task of hiring and training new attorneys and integrating them into the staff so that competent attorneys could be assigned to the Justice Department cases. (Progress in the handling of these is described in the text of this budget request.) Attorneys who gained experience on the Justice Department assignment can provide a strong nucleus for the FTC's own and much more extensive compliance check.

As a matter of plain fact, this badly needed compliance check can not be undertaken without the $15,000 that has provided the additional staff for the Justice Department work. This money—and the staff strength and expertise in antitrust investigations that it has bought (currently more than a $2 million investment of Government funds)—must be retained or FTC's own outstanding orders must continue to be neglected and, alas, many of them ignored. A planned reassignment of manpower to the most pressing Federal Trade Commission compliance matters will be instituted as fast as the Attorney General's work is completed.

It might well be pointed out here that the problem of integrating young lawyers into FTC's staff is no small one, and to retain them under an overload of work—which too often involves night and weekend work without pay—when those who reveal ability can make far more money under less arduous conditions in private industry presents an even graver problem. Time and again, the FTC is forced by lack of manpower to pit fledgling attorneys against many times their number of experienced and highly paid defendants' lawyers in the trial of cases. Thus, it should be obvious that there is no economy in so overloading an FTC attorney that his enthusiasm for public service wears too thin, for if he reveals ability, his Government salary will be no inducement for him to stay. Indeed, real economy dictates the need to advance competent young attorneys as fast as they can meet greater responsibilities. A too-tight budget could be costly indeed to FTC's manpower, as well as to public service.

RESTRAINT OF TRADE WORKLOAD

Badly hit by the loss of experienced manpower due to a rising overload of work and understaffing is FTC's Bureau of Restraint of Trade. Here uncompensated overtime for its attorneys is the rule not the exception. Moreover, during this fiscal year and in fiscal year 1965, the situation can only worsen, for no additional manpower can be made available.

The unvarnished fact is that the Bureau of Restraint of Trade can only attempt to keep the FTC from falling hopelessly behind in its effort to keep small firms from being driven out of business by the illegal use of buying power by their big competitors. Indeed, regardless of the financial strength of those who employ unfair and discriminatory methods, the unfavored suffer just as much.

The ultimate loser, of course, is the consumer, for as business competition dwindles and disappears in one area after another, he awakens too late to the meaning of those uninteresting words, "trade restraints" and "antimonopoly." At that point, all he can do is to fume at the new higher prices he must pay for life's necessities and sadly remember the old price that was set by free and fair competition.

The number of formal antimonopoly complaints issued by the Commission has increased from 36 in fiscal 1955 to 230 in fiscal 1963 or fivefold, and the number of cease and desist orders increased nearly ninefold from 30 in fiscal 1955 to 261 in fiscal 1963. These substantial increases in Commission antimonopoly actions relate to Commission policy of moving against violations of law on an industrywide basis, after investigation uncovers that large numbers of industry members use the same illegal trade practices.

In enforcing section 2(a) of the Clayton Act as amended by the Robinson-Patman Act, prohibiting the giving of discriminatory prices to favored buyers (usually the biggest) the investigative and litigation workload amounted to 34 cases per attorney or more than 3 times the number he could be expected to handle efficiently. In addition, the 40 available attorneys were called upon to process 4,500 correspondence matters relating to applications for complaint and pending cases.

Such is the workload of the Bureau's Division of Discriminatory Practices whose vitally important job is to enforce section 2 of the Clayton Act as amended by the Robinson-Patman Act and its prohibitions against price and other forms of discrimination that favor big buyers at the expense of their little competitors. The Division also has responsibility for bringing cases against the inducement of these discriminations, as well as cases involving exclusive dealing.

Complicating the work of this Division—but necessarily in the interest of effective law enforcement—is the Commission's policy of attacking violations wherever feasible on an industrywide basis, rather than following the former "squirrel gun" approach that could pick off only scattered violators.

Just 16 attorneys, representing 40 percent of the Division's available trial staff, are straining to shoulder the staggering job of industrywide enforcement actions against (1) processors and retail chainstore distributors of fluid milk, (2) manufacturers of wearing apparel, (3) department stores and grocery chainstores, and (4) automotive replacement parts.

The Bureau of Restraint of Trade is currently analyzing the results of its milk price war investigations, based on small business complaints and investigational hearings on charges that milk was used as a loss leader in various sections of the grocery chains, and that the price of milk was cut temporarily to drive out the competition of the small milk producer-distributor. The Bureau was also active in enforcement of section 7 merger cases in the milk industry.

The Bureau has several merger and price discrimination investigations underway in the cement industry. The industrywide cement program launched by the Bureau in fiscal 1963 has resulted in formal complaints against four major companies. This industry program serves as a potent deterrent in halting substantial mergers in the concentrated cement industry, and in slowing down illegal merger invasions by cement producers into the small business ready-mixed concrete industry which uses cement.

There are also some 10 complaints at various stages of litigation involving mainly pricing practices of major oil companies. The Bureau is also conducting several other investigations into gasoline prices, and also into competitive practices in the apparel industry. The Commission has obtained orders against suppliers of men's, women's and children's wearing apparel, and in fiscal 1965 the Bureau of Restraint of Trade will continue its investigations into large chain department stores and other large apparel buyers to find out the extent of their participation in inducement of discriminatory prices, allowances, and/or services.

BUREAU OF ECONOMICS

The Bureau of Economics contributes an increasingly important role in the Commission's law-enforcement program. Economists in the Division of Economic Evidence during fiscal 1963 gave economic assistance on 70 investigations and 30 formal cases, mainly mergers. This Division screened more than 1,200 mergers, prepared analyses of the economic effects of significant mergers on competition, and compiled quarterly and annual merger statistics. Economists also supplied assistance on compliance cases; more demands in this area are likely where decisions under amended section 7 of the Clayton Act require divestiture of acquisitions, often an examination of the merger record and scope of business operations of the proposed corporate purchaser requires an economic analysis of the markets and small business competitors affected by the divestiture. In addition, the Division of Economic Evidence supports the Commission's enforcement program in analyses of significant alleged or suspected false claims based on statistical sampling, in assisting the advisory opinions' staff on complex economic issues usually involved in proposed mergers, and in planning and in conducting section 6 surveys for the collection of data relating to the investigation and trial of merger cases.

For half a century the economic reporting functions of the Federal Trade Commission have constituted one of the Nation's most important instruments of antimonopoly action. The legislative history of our organic act establishes congressional intent that reporting functions should be extensively used as one of the principal means of curbing monopoly power. The Bureau of Economics has underway a study of the effects of Commission merger cases upon competition and

concentration in the dairy industry, and it is examining the problem of vertical integration in the rubber tire industry.

The Bureau is also investigating and analyzing competitive conditions in the manufacture and sale of polyethylene-polypropylene resins and products. During fiscal 1965 the Bureau will complete an economic report on this complex and expanding part of the plastics industry. Finally, in anticipation of increasing national concern with oversea trade and competition posed by the Common Market, the Bureau of Economics is making a study and report on export trade associations to enable the Commission to better assess its responsibilities under the Webb-Pomerene (Export Trade) Act of 1918.

DECEPTIVE PRICING GUIDES

I am very happy about one thing. We issued some guides under our new procedure, as we say, against deceptive pricing. I am very pleased at the response from industry as we met with NAM and the chamber of commerce. Here they are applauding us to high heaven. The Association of National Advertisers just issued a statement on these guides that is very laudatory. This morning from the chamber of commerce, they stated they have reprinted 10,000 of these guides and are sending them out themselves to the business people and are highly complimentary of what we did. We sat as a body 3 days and listened to the consumer, the businessman, and everyone on this problem before we issued these guides.

ELECTRICAL SUPPLY PRICE FIXING

Mr. THOMAS. Mr. Chairman, a situation recently has come to light that maybe the Federal Trade Commission had a part in. It was brought to light by the Justice Department that certain segments of the electrical supply busines had been practicing conspiracy to maintain a certain level of prices in certain of their products. Several of the big companies in the country entered a plea of nolo contendere. Just what part did the Justice Department play in that?

Mr. DIXON. They played practically the entire part in that electrical equipment industry that I think you are talking about.

Mr. THOMAS. Certainly a conspiracy there to uphold the price of a product is within your jurisdiction.

Mr. DIXON. This is correct, sir.

Mr. THOMAS. The only information the public had on it was given by the Department of Justice. What part did the Federal Trade Commission play?

Mr. DIXON. None, sir.

Mr. THOMAS. You had no part in it?

Mr. DIXON. Not this one. These hearings started with a hearing which Senator Kefauver held on Capitol Hill.

Mr. THOMAS. In that case it was brought to light that it cost more money than all the salts, pills, oils, and Serutan put together and multiplied by a hundred. Why chase rabbits when you have these lions?

Mr. DIXON. I will lay one beside it. We just finished this one. I will not debate its merits. We rendered our final decision on the American Cyanamid drug case on the product tetracyclin, probably the largest single component in the sale of all so-called miracle drugs in America. We found a law violation. Part of our order will require, if it is held up, that this be licensed to anyone.

Mr. THOMAS. What is that drug to cure, fallen arches, flat feet, or what?

Mr. DIXON. This is the true miracle drug.

Mr. THOMAS. What is the name?

Mr. DIXON. Tetracyclin, the broad spectrum. There are many names.

Mr. THOMAS. It is one particular pill?

Mr. DIXON. Tetracyclin is a drug that has been grown from a mold, an antibiotic. It can be given to you intravenously, it can be taken in capsule or pill.

Mr. THOMAS. I thought I had taken all of them. I overlooked that one.

Mr. DIXON. You have probably taken tetracyclin. It is the generic name. There are five specific sellers.

Mr. THOMAS. What are the five specifics? Where do they come from?

Mr. DIXON. The generic term is tetracyclin.

Mr. THOMAS. What are the five drugs, trade names, aureomycin?

Mr. DIXON. All the mycin drugs. Pfizer has one, American Cyanamid——

Mr. THOMAS. What did the Commission say?

Mr. DIXON. The Commission found that this patent was obtained by fraud and deception, and as part of our remedy we found that they had maintained some prices, and we have issued an order that would prohibit that, but we have gone beyond that.

Mr. THOMAS. What about the value of the drug? That is the thing the public is interested in. They do not much care whether they got it by fraud or what, if the drug is good. What did you hold about the drug?

Mr. DIXON. We required that anyone who wants to manufacture and sell this product, if he will apply to these people, they will have to give him a license. Of course, this party will have to pay a royalty, the same royalty they would charge each other.

Mr. THOMAS. Are you not getting into the field of copyrights and patents rather than fraud as to the value of the drug, which is your job? I want to get my money back. I used to take a lot of those pills. What did you hold on that, that it is no good?

Mr. DIXON. I do not want to go too far here because the court has to rule.

Mr. THOMAS. Off the record.

(Discussion off the record.)

INDUSTRY GUIDANCE GROUP

Mr. DIXON. I think we are making progress in the industry guidance group. Guidance work has progressed. We have outstanding 172 such industry rules now. There are guides.

Mr. THOMAS. We have put limitations on money which tell you not to curtail activities in restraint of trade. This year you ask for a three-man decrease. Time and time again we put it in the language and in the report. When you say you have been short handed, you have to assume some of the responsibility yourself.

Mr. DIXON. I start at the Budget Bureau, I tell them my problem and ask for enough money to do it with. They make the recommendation. I come here to you for the third consecutive year with no recommendation for any increase in this work. I am telling you still my problem. My problem is mounting, but I have no recommendation.

Mr. THOMAS. We are going to listen to you with great interest. Go ahead.

COMPLIANCE WITH COMMISSION ORDERS

Mr. DIXON. I think part of this work, of course, as we go along is this compliance work that we want to get into. We have, of course, now, in the restraint of trade field probably 2,000 or so orders. Some of our orders, in my opinion, are more important or certainly equally important to those sent over to us by the Department of Justice. We have not had the manpower or the force to even look into it. In addition to that, as we increase our production with the new people you have given us, we are turning out more formal orders. They either come by consent or by litigation.

When you come to the end of the case, by statute within 60 days we must have compliance with that order. So these must be dealt with. We do not have the force to go back to do anything about our own orders.

As we are phasing out the Justice work, I went to the Bureau of the Budget and I come here with their approval in saying we want to take this talent we have developed here and as they phase out move straight into checking our work on a continuing basis, plus one other thing. We recently have extended our advisory opinion service to the businessman in this respect. To everyone that we have under an outstanding cease-and-desist order, we have said that if there is any question in their minds as to whether what they propose to do might violate the law, or "if you want to know whether what you are doing is in compliance, ask us and we will tell you 'Yes' or 'No'." This keeps a man from running afoul of $5,000 per day for each violation. With that invitation, they are accepting it. I think the businessman is entitled to this service by his Government.

Mr. EVINS. Has it not always been the traditional concept of the Bureau and the Commission that the competitors in the industry are going to keep on their toes to see whether or not their competitor is violating an order once it has been issued by the Commission? These are your best policemen, your best informers. They are checking them.

Mr. DIXON. I agree with you, but let us take an order that said to you, as an individual, you have been found in violation of section 2(b) of the Clayton Act of granting, on an unequal basis, promotional allowances to competing customers of yours. You have this order.

It is against you. It is running. You want to know whether what you propose to do, a new plan, whether it will violate that order. Your competitor might not know whether it violates it or not, he might not even know about it.

If you wanted to be double-barreled sure, you can come to the Federal Trade Commission and get a "Yes" or "No," and you are home free. I say to you this is something that the businessman should have had a long time ago.

Mr. EVINS. You have amended your rules to provide for that?

Mr. DIXON. We have, sir. This is what I want this talent to do. I tell you they are coming in droves. The businessman is applauding us for it. I just hope we do not get inundated. I think they are entitled to it.

Mr. EVINS. Can you not assign some people to sift through these 2,000 orders in restraint of trade in order to find out how many are out of business, how many passed the statute of limitations, and get it down to a limited and workable number?

Mr. DIXON. There is no statute of limitations on us. You are correct, sir; we can and we will do it, but what I am saying here is that the only thing different in the Restraint of Trade Bureau's problem that we were not having here before is that I want to move these people right straight on into this phase of the work.

Mr. EVINS. I think you did an important job. I was all for you with respect to the compliance orders. Now you come up with a proposition of checking your own orders. I thought the Commission had been checking on its own orders all along.

Mr. DIXON. You have been misinformed. If anybody has been telling you we have been doing it, they have been misinforming you because we have not been doing it. There is nobody down there to do it with. That is all there is to it.

Mr. EVINS. I looked through your budget here and I saw this picture. Go ahead.

Mr. DIXON. I say this to you: that we still have about 13 of these Justice things to finish and probably there will be three or four hanging over into the next fiscal year. But we did this work. We had to spread this through the whole organization because it comes through the whole organization, a lot of work. But I beg of this committee to be understanding on this problem because if you say to this Federal Trade Commission, "All right, we gave you $900,000 to do this job with, you are through, we are going to take it away from you"; if you were to do that, I do not know how I could get along down there.

What we have done is this. I told the Bureau of the Budget this. I said to them, well, if we lose this amount of money, I ask you to give me the same amount of money back. Any way you want to do it, I want to put it out in the open so the Appropriations Committee will look at this. We are destitute for it, we need it, we have the trained personnel, I do not want to lose them.

Mr. JONAS. You told that same story to the Bureau of the Budget, yet they cut you.

Mr. DIXON. They did not do that to me on this. They went along.

REDUCTION BY THE BUREAU OF THE BUDGET

Mr. JONAS. You asked for more money than they approved this year.

Mr. DIXON. That is right.

Mr. JONAS. How much did they cut you?

Mr. DIXON. I asked them for a total of $15,178,000.

Mr. JONAS. They cut you $3 million.

Mr. DIXON. They gave me $1 million, which puts us up to $13,270,000.

Mr. JONAS. Did you tell them you could not operate on less than $15 million?

Mr. DIXON. I told them I wanted somebody to take responsibility. I said I want to tell you my problem and what we need to do it with. I described all the things we needed and the estimate we thought would conservatively put us in business. They said, we will go a million. That is what they did.

Of course, at this time the President came in with his budget proposal, and when this came through, I said, we will do our share and do the best we can within this limitation. I fully am in accord with it. I am not asking for more than the million granted.

Mr. JONAS. You will do the same good, expert job, whatever they give you.

Mr. DIXON. We will do our best. That is the best we can do.

Mr. JONAS. That is all anybody can do.

ECONOMIC PROGRAM

Mr. DIXON. Our Bureau of Economics program is instrumental in our merger work. A good deal of power and strength we have there is in development of economic evidence to consider mergers. Also there are some studies going on looking forward to some economic reports. We are now in the polyethylene film industry investigation.

Mr. BOLAND. How many studies are going on with respect to what industries by the Bureau of Economics?

Mr. DIXON. It has underway a study of——

Mr. BOLAND. How many employees?

Mr. DIXON. Allocated 126; no increase allowed here.

Mr. MUELLER. 112 positions at the present time. The 126 mentioned includes the positions which we were allocated last year, but because of the budget cost for salary increases throughout the Commission we only actually have funds at the present time for 112. Of that, we have 37 in the Division of Financial Statistics, which has a continuing program, together with SEC, which provides quarterly profit information used by the Federal Reserve, the Council of Economic Advisers, other Government agencies and business organizations.

We have in the Division of Economic Reports 13 professional persons and a supporting group of clerical and statistical personnel. The remainder of the employees are in the Division of Economic Evidence.

Mr. THOMAS. Doctor, who wrote that questionnaire?

Mr. MUELLER. This was prepared in our Division of Economic Reports in consultation with the Bureau of the Budget.

Mr. THOMAS. I want you to tell me what it means. I have never seen anything like it.

Mr. BOLAND. How did you happen to pick out this industry? How do you pick out particular industries for economic surveys?

Mr. MUELLER. The Federal Trade Commission has been interested in the polyethylene industry since at least 1957.

Mr. BOLAND. Why?

Mr. MUELLER. We issued a complaint against Union Carbide for making one of the most important acquisitions, challenged by the Commission, the Visking Co. Subsequent to the issuance of this complaint, this case was tried before the Commission. In 1962 the Commission rendered its decision, finding this acquisition in violation of Section 7 of the Clayton Act.

At that time the Federal Trade Commission had three formal and seven informal investigations going on in this industry, dealing primarily with additional mergers which were transforming it at that time. The Commission decided that before it would go ahead and issue additional complaints or make additional investigations, that it would direct the Bureau of Economics to conduct a study of this industry to insure that in making the public policy decision as to whether to investigate a particular company or pursue a particular type of investigation, it would have a better understanding of the whole economics and dynamics of this industry. The industry itself is the leading segment of the plastics industry.

Mr. BOLAND. What is?

Mr. MUELLER. The polyethylene-polypropylene segment.

Mr. BOLAND. Is it the feeling of the Commission that what they are trying to do is restrict competition in this field? Do you know how many companies actually manufacture polyethylene and how many companies actually manufacture polypropylene? How many companies are engaged in the manufacture of these products?

Mr. MUELLER. For conventional polyethylene the number is 10, I believe.

Mr. BOLAND. Would you say this is competitive if 10 companies are manufacturing this product? Also let me ask: Is there an overabundance of supply of this particular product in the United States? Is there some marketing difficulty being experienced by these companies who manufacture this product?

Mr. MUELLER. There are at least two potential problems here. One is there are, as I said, about 10 companies producing conventional polyethylene film which is at the present time a fairly competitively structured and behaving industry.

Mr. BOLAND. Why do you have to investigate those that are fairly competitive?

Mr. MUELLER. There are new developments here. It is somewhat similar to what happened in antibiotics. The reason polyethylene film is a competitive industry today is that in 1952 the Justice Depart-

ment signed a consent decree with Du Pont and Imperial Chemical Industries requiring compulsory licensing of the other American companies. Dow and a number of other large chemical companies entered. As a result, prices declined over the succeeding years.

There have been important technological developments since then in so-called high density polyethylene resin which is a superior resin, and in polypropylene resin.

Mr. BOLAND. What is it used for?

Mr. MUELLER. It is one of the most widely used and diversified types of plastics; for films, wrapping materials, coating paper cartons, molded plastic articles, and so forth.

The latest development is polypropylene plastic, and in both the polyethylene resin and polypropylene resin you have this kind of industry structure, which is not too uncommon in American industry—we at least hear of a good many complaints that——

RESTRAINING EFFECT ON INDUSTRY

Mr. THOMAS. If you will yield, Mr. Boland; you have a young industry here, do you not?

Mr. MUELLER. That is right.

Mr. THOMAS. These are the organic chemists. They keep on developing and changing and coming forward with something new. Why do you not turn them loose and see what happens? Every year they come up with something a little different, do they not, something advantageous to John Public? Are not your actions in the final analysis putting a brake on their activity, on their inventive genius, so to speak? This is a chemical product, a result of what these organic chemists come up with, is it not?

Mr. MUELLER. Yes, sir.

Mr. THOMAS. What is your feeling?

Mr. MUELLER. As to whether we are putting a brake on?

Mr. THOMAS. Yes.

Mr. MUELLER. We certainly are not putting a brake on competition in this industry. The past legal actions of the Justice Department and the Commission have contributed to competition.

Mr. THOMAS. Since that action have you not had a lot of inventions and improvements in the industry? They are growing by leaps and bounds. They come up with improvements every year, too, do they not?

Mr. MUELLER. Potentially there are some very serious bottlenecks to competition. One again is at the patent level. There is complete uncertainty in this area.

Mr. THOMAS. Can you not rely upon the patent lawyers to straighten that out? You know the patent lawyers like business.

Mr. MUELLER. The Commission found that in the case of antibiotics, patent laws were not a sufficient protection to competition.

The other side of the coin is the kind of dual distribution system that exists here. At the present time you do have a small handful of companies. At the film level you have a fairly large number, something on the order of 60 to 70. We have seen develop here a vertically integrated structure. Again, we do not think anything is necessarily wrong with this.

Mr. THOMAS. What is the basis of your complaint? Is the price out of line? Certainly, the industry has done a remarkable job in improving the product.

QUESTIONNAIRE TO POLYETHYLENE INDUSTRY

Mr. BOLAND. Polyethylene is in oversupply and they are having a very difficult job marketing it.

Mr. DIXON. May I say this. There may not be a problem. The only thing we are doing is trying to get basic information so we will understand if there is.

Mr. BOLAND. If there is no problem, I do not think you have any business at all sending the kind of questionnaire you have sent to these companies. I take it that the Federal Trade Commission is engaged in the problem of taking care of those cases where there are problems, where there are violations of the law, where there is deceptive advertising and that sort of thing; but when you start to harass business, as you have in this instance, this is a different matter. I think Congress has the right to make an inquiry into just exactly why you do it here.

I am reading from the December 3, 1963, statement of President Johnson. I quote:

> Much too much of our people's time and talent and energies are being absorbed by the demands of Government when it should be dedicated to greater and better service. A progressive society finds oppressive, distracting, irritating, and ultimately intolerable the heavy hand of complacent bureaucratic regulation.

I think that is what you are doing here. To buttress my statement I point to this questionnaire which you sent. It is not an easy matter to fill out a questionnaire like this. This is a very difficult job.

Mr. THOMAS. Read section 5.

Mr. BOLAND. One particular question they object to is question 5, which reads:

> For the period January 1, 1959, to December 31, 1963, furnish a copy of all studies prepared or received by your company which are included within the following categories:
>
> (*a*) Each market study covering low density polyethylene, high density polyethylene, polypropylene or products made therefrom.
>
> (*b*) Each study showing investments made or considered in low density polyethylene, high density polyethylene, polypropylene or products made therefrom.
>
> (*c*) Each study showing costs of research, development, production, or marketing of low density polyethylene, high density polyethylene, polypropylene or products made therefrom.
>
> (*d*) Each study showing profits made or estimated from production or sale of low density polyethylene, high density polyethylene, polypropylene or products made therefrom.
>
> Do not include regular or periodic accounting tabulations or reports unless there is no other source of cost or profit information for your production of low density polyethylene, high density polyethylene, polypropylene or products made therefrom.

Mr. THOMAS. Repeat the first part of your question 5. What did it say?

Mr. BOLAND. Each study showing investments made or considered.

Mr. THOMAS. What is the purpose of your inquiring what studies they are making? Are you trying to tell them they should not do research?

Mr. MUELLER. No, sir.

Mr. THOMAS. Your people are economists, not organic chemists. Are you going to criticize their talents and their efforts in making the study? What is the purpose of that outlandish questionnaire?

Mr. MUELLER. That is not all studies; it is all studies relating to the three major factors.

Mr. THOMAS. What are the three factors?

Mr. MUELLER. Investments and profits——

Mr. THOMAS. What else?

Mr. MUELLER. Market studies.

Mr. BOLAND. You are asking for information that is highly confidential. This is something which, if these companies start to give this information to a Government regulatory agency, about the profits and research, this becomes almost public property despite what the Commission might say about protecting the information given to it.

Mr. THOMAS. How many people are engaged in this particular line of work?

Mr. MUELLER. Two senior persons and a supporting staff.

Mr. THOMAS. You do not mean to say two people could think up such a questionnaire as that. It would take two or three dozen.

Mr. MUELLER. The reason we have asked for this information in this form is this: In every past study of the Federal Trade Commission dealing with an industry such as this, we have asked for and received profit and investment data. An example is the antibiotics study which was published in 1958. In that case the Commission obtained such information.

Mr. THOMAS. Why are you interested in profit if there is a surplus of their product on the market and they allege hard times? Do they not say that if you want this product, here it is, nobody is buying it, we have a surplus of it? What is the purpose of it? What do you expect to gain? Has not the industry benefited and served the public well? Is there any complaint about anybody being sandbagged for prices?

Mr. BOLAND. Or price fixing?

Mr. MUELLER. There are complaints and problems here.

Mr. BOLAND. I did not ask about problems. I asked if there were complaints from anyone with respect to price fixing in this industry. Have you complaints in your files from people or any source accusing this industry of price fixing?

Mr. MUELLER. No, sir.

Mr. THOMAS. That ends all the argument.

Mr. WYMAN. I just want to ask, has anybody refused to answer your questionnaire?

Mr. MUELLER. No; they have not.

Mr. WYMAN. Not a single industry has refused to answer an isolated question on your questionnaire?

Mr. MUELLER. This is what has happened on this question: A number of companies have expressed great concern with respect to the way in which the Commission might disclose the information as to question 5. We have discussed this matter with several companies and think we have arrived at a mutually satisfactory arrangement.

Mr. THOMAS. All right. Let us not harass the industry. We will recess at this time and come back at 1 o'clock.

AFTERNOON SESSION

Mr. THOMAS. Gentlemen, will the committee please come to order?

Mr. Chairman, had you just about completed your statement? Did you have anything further that you wanted to add? If you do not, we will take a look at the budget.

Mr. DIXON. I wanted to make one simple comment on what we were talking about when we left here, Mr. Chairman.

Mr. THOMAS. That was on the economic subject.

Mr. DIXON. Yes, sir. We knew at the Commission level that not only did we have the formal matter against Union Carbide, which involved a merger situation with the Visking Co., but as we disposed of that matter we had several other problems developing in this industry. With mergers, very rarely, if at all, does anyone come and complain? This is clearly the responsibility of the Commission, together with Justice, to stay alert in this field.

We knew that as this industry was developing, sir, that starting with the gas—they had come back into petroleum and gas, and were moving on into resins, and on into the polyethylene film and the other end products—there was an indication that there the industry would become completely vertically integrated, either by merger, where we already had some problems under study, or by internal development.

In order to measure and determine how we should treat future problems in this field, we determined, upon the recommendation of the staff, to initiate this economic inquiry into this industry.

CONFIDENTIAL NATURE OF INFORMATION REQUESTED

We thought we would be in a better position to determine whether or not to institute any new formal proceedings. It was in that connection that the questionnaire was first sent out and then ultimately supplemented by the form requesting profit and cost information. Some industry members objected to providing such costs and profit figures, which many people do consider, as you say, Congressman Boland, the highest type of confidential information.

In the past when the Commission has deemed it necessary to ask for this type information it has been handled in such a way to where confidentiality was respected. After the staff had consulted with several companies and discussed this problem with them, the Commission gave these companies certain assurances. First, it agreed that the information obtained would not be reported in a fashion disclosing the operations of individual companies, and, furthermore, as soon as the Commission has completed its evaluation of the information contained in company documents, the documents would be returned.

That is where it is as of today. Most companies apparently feel that this gives them the protection they need.

There is one other problem in this respect.

Mr. THOMAS. Mr. Chairman, you are a practical man. It goes back to the old expression and saying, "Two people cannot keep a secret." If these people send their confidential information over there, trade secrets, whatever you may call it, and you have 127 people just within the Division alone, if it gets there Monday morning, the trade papers or the press will have it before Saturday night. No one will ever know how it got out but they will have it. That is the way it

works. When we say we will keep it quiet, that cannot be done. Two people cannot keep a secret.

Mr. DIXON. Congress took care of that in the FTC because they wrote into the law that this would be considered a misdemeanor for anybody at the FTC to reveal such information.

Mr. THOMAS. I know anybody over there wouldn't do it. They just won't do it.

Mr. DIXON. It has not happened in the past.

Mr. THOMAS. A little bird will fly over and get it and leak it to the press.

Mr. DIXON. It hasn't happened in the past, in the many times we have had it. I want to take one more step. You heard Dr. Mueller.

BASIS FOR USING QUESTIONNAIRES

Mr. THOMAS. It ought to be placed on a different basis than that. If it has merit, it ought to be done; if it is punitive or a fishing expedition, or if there is no danger of restraint of trade or developing of monopoly in any of its various aspects, as Mr. Boland pointed out and Dr. Mueller apparently agreed, that you have a surplus of products; they are begging on the market. You ought to consider those things. We do not want to tell you how to run your business.

Mr. DIXON. We are certainly aware of the attitude of the Congress on this problem. We do not go into these things very lightly. I know we did not go into this very lightly. We studied it quite a while.

Mr. THOMAS. Look at the questionnaire. A Philadelphia lawyer could not figure out what you want in that.

Mr. DIXON. They do not have any trouble figuring it out.

Mr. BOLAND. I wouldn't have any objection to a questionnaire when you are considering some phase of the American industry where you have a complaint on price fixing, where you have a specific complaint that ought to be looked into. This committee has oftentimes given specific money to this agency to do this sort of thing. We are in favor of this. We are against mergers which stifle competition. We want you to enforce the Robinson-Patman Act, the Clayton Act. This is one of the greatest jobs we do. I think it is different when it goes into an industry that you are harassing. There isn't any question about it. If there was some real logical reason for conducting the survey, if they were guilty of something and you needed the information, this is fine. I would then have no objection to it. I do have objection to this.

Mr. DIXON. There is one other problem in this respect, Mr. Chairman, and then I am going to stop on it because I know you are tired of it, but Dr. Mueller mentioned the dual distribution problem that is developing here. I want to take you back to a study under your committee, or one of your subcommittees, Congressman Evins, that Congressman Roosevelt has conducted on the overall problem of dual distribution. Is the law adequate? Should something be done, if so, what? Today, after appearing before that subcommittee, each of the individual Commissioners is trying to arrive at his individual answers to a whole series of questions.

Fundamentally, when we were there we suggested that we would be in a better position to discuss the overall problem of dual distribution if we had several pilot studies.

It is clear that you could not reasonably make any kind of rational evaluation of a dual distribution situation unless you had costs and profits.

Now to do this it would have to be done practically speaking in an economic study, not one where you had in the beginning reason to believe that the law was already being violated; one that should be done very carefully. You should have complete information to do it.

I understand the chairman said we ought to be reasonable people here. I am trying to interpret this to mean that we ought to do this in the extreme situations where we deem that it is absolutely necessary. But I guarantee to you the instant that we do it, you are going to hear about it. They will tell you that we are mischievous and should not do these things.

Mr. THOMAS. We hear all that. We think about 99 percent of your actions are right on the button. I do not think anybody can bat any better than 99 percent, do you?

Mr. DIXON. That is a mighty good average. As I reported to you in the past, we do have and are expected, especially by the Budget Bureau——

Mr. THOMAS. You just had somebody calling you over long distance complaining the bottom fell out of the cattle market. A lot of people phone complaining about chainstores, getting too many chickens and butter. The price of sweet milk is going down. You have a lot of complaints. Why don't you put some time on those items?

Mr. DIXON. I assure you we do.

Mr. THOMAS. You have really broad authority, there, do you not?

Mr. DIXON. Mr. McIntyre brought them to my office, a delegation of Western producers of beef.

Mr. THOMAS. Off the record.

(Discussion off the record.)

Mr. THOMAS. Are there any further general questions? This has been very instructive and very helpful, Mr. Chairman. We are grateful to you and your colleagues and your very genial staff for advising and helping us.

Did you and Mr. Boland come to any conclusions?

Mr. DIXON. Sir, I would hope so. I would like to sum up by just saying this——

Mr. THOMAS. Did you come to a conclusion?

Mr. DIXON. I do not know.

Mr. BOLAND. The reason we have a direct concern is we have plants in our area who employ people. I know Monsanto laid off 65 people in this particular segment of the industry. They were not able to find a market. This is a major concern, when an industry is harassed over a survey that ought not to take place. If there was violation of the law or price fixing, all right. Mr. Mueller has suggestions that come from the industry. I think you ought to agree with them. They should answer questions, except question 5. I think you ought to take their safeguards and not yours.

Mr. DIXON. We will certainly look at that. We believe that we have reached that conclusion, but if it isn't perfectly worked out——

Mr. THOMAS. How many people were laid off?

Mr. BOLAND. Sixty-five. This is a small marketing section for this.

Mr. DIXON. We will keep you advised on this.
Mr. BOLAND. Thank you.

SUMMARY OF BUDGET ESTIMATES

Mr. THOMAS. Let's put the general statement in the record. It more or less rehashes the chairman's statement.
(The statement follows:)

SUMMARY OF 1965 BUDGET REQUEST—FEDERAL TRADE COMMISSION

"In 1964 and beyond," President Johnson said in his Economic Report to the Congress, "we seek a free and growing economy which encourages free enterprise, innovation, and competition by citizens in all walks of life." The Federal Trade Commission is a law-enforcement agency directed toward maintaining the free play of competition in the effective functioning of our free competitive economy. The fiscal year 1965 Commission budget has been guided by three principles—to protect the American consumer and small business from unfair business practices, to promote vigorous competitive business activity, and to do this vital job by practicing frugality through real economies in Commission operations.

The budget request for the FTC in fiscal year 1965 totals $13,270,000 which, while an increase of $1,055,250 over the 1964 appropriation, only provides for an increase of 27 positions and $171,000 for new positions and $159,000 in increased operating costs. The balance of $725,000 will be required for necessary costs in 1965 over which this Agency has only limited control. Included in this total is $250,000 for a half-year cost of the pay raise that went into effect on January 5, 1964, restoration of reductions required in our enforcement programs in 1964 amounting to $106,250 in personal services and $115,000 in travel funds, $114,000 to purchase the electronic computer now on a rental basis which will result in a saving to the Government of $41,000 per year beginning 2 years after purchase in addition to a $29,000 saving of rental costs in 1965, and $140,000 for within-grade promotions and to protect the Government's investment in young attorneys on our staff by reducing uneconomical turnover through a promotion program in line with their demonstrated abilities and salary scales comparable with private law firms and private industry.

This budget request for fiscal 1965 provides the Commission with the minimum of personnel required to function under its legal obligations to protect the American people from hazardous consumer products, price-fixing agreements and product misrepresentations. This budget covers preventive measures involved in our programs to advise and guide businessmen on the requirements of the law entrusted to the Commission, in order that costly legal investigations and formal hearings might be avoided whenever practicable, thereby saving money for the public, business firms, and the Government.

The Commission's budget makes provision for a long-delayed necessary program to check up and determine compliance with the Commission's outstanding cease-and-desist order against violators of laws it administers, particularly where resumed violations might increase significantly the cost of essential goods and services which consumers must purchase. The millions of dollars invested in obtaining these Commission orders agaisnt unlawful business practices are wasted unless such orders are obeyed by companies covered, and checked by the Commission for compliance. The purpose here is to shore up our previous investment in investigation and litigation, and to save larger expenditures which would be involved later in prosecuting widespread violations likely to result from inadequate enforcement of existing orders.

The Commission's proposed fiscal 1965 enforcement programs are condensed in the following:

One of the most important of the Commission's responsibilities is the law violation in the field of deceptive advertising that warrant a full-scale drive to keep them from making a farce out of law enforcement as well as abusing the consuming public and undermining the credibility of all advertising. At the top of the list comes a galaxy of products advertised as beneficial for the health, digestion, weight, and beauty of credulous citizens. Here the deception is achieved not by the labeling of the products advertised but by their advertising. Here, by lack of forceful action, the FTC is exhibited to the advertisers of all other products as an agency incapable of dealing even with obvious exaggerations and falsehoods.

The Commission's enforcement program planned in the fiscal 1965 budget provides for the launching of a showdown on the validity of advertised claims for consumer health protection. It will be a difficult undertaking, for this industry is not lacking in adroitness nor resources. Last year, sales of packaged medications totaled almost $2 billion and advertising of principal drugs and health aids exceeded a quarter of a billion dollars. Cosmetic and toiletry sales also totaled almost $2 billion while the advertising of the principal brands ran to more than $300 million. Other equally impressive expenditures are cited in the accompanying text, but there need be no doubt that the response to FTC probing will be fast, furious and with all the legal competence that money can buy.

The funds requested by the Bureau of Deceptive Practices will also be used to overcome present handicaps in manpower and clinical testing vital to a successful challenge of exaggerated claims for a wide variety of products. These include pain-relieving drugs of furiously competing speeds being sold at a $360 million annual rate; arthritis and rheumatism concoctions being sold to 12 million sufferers for "cure" or "quick relief"; a host of impressive claims for vegetable oils and margarine products as heart attack insurance; air filters and purifiers that will remove any germ that worries a buyer; and, of course, the nasal sprays, mouth washes, liniments, sirups, and tablets that have conquered the common cold or, at least, its unpleasant features.

Also to be given a hard look will be the advertising of dentifrices and oral hygiene products to determine how much meaningful fact underlies the various scientific and psuedoscientific tests which establish each as superior to the other. Not only the public but even the industry can't be sure where bona fide tests stop and copywriters' pencils continue.

This budget also would make possible an intensification of FTC's efforts to protect consumers from fanciful claims for the health benefits of vitamin and mineral preparations, special dietary foods, and so-called health foods. More than $200 million worth of over-the-counter preparations of this type were sold last year. Significantly, the broader and more extravagant claims were made in the advertising of these products; their labeling was more circumspect.

Another and very large area of questionable advertising affecting the consumer health is directed at the nearly one-fourth of the U.S. population who is overweight. The FTC already has underway an industrywide investigation of reducing devices, such as girdles, vibrators, and exercises, but due to shortage of manpower we have been virtually powerless to investigate the more inviting exaggerations of how to lose weight with a drug or an easy dietary plan including food supplements. Here again consumer deception and danger lurk far more in the advertising of the products than in their labeling.

The consumer health area of current national concern today involves the smoking of cigarettes. The January report of the Surgeon General's Advisory Committee stated that cigarette smoking is a substantial cause of the increasing death rate. Protection of the consuming public from false, misleading, or unfair advertising (including labeling) of products that may endanger human health or safety is a prime duty of the Commission. Therefore, the Commission has determined that the public interest requires initiation of a trade regulation rule proceeding for immediate corrective action of advertising and a public hearing is scheduled for March 16, 1964.

Although the advertising of all the foregoing products (as well as others discussed in the text) has serious implication for public health, the FTC has been able to correct only a very little of that which is false and misleading. The reason: lack of money and manpower. Indeed, there are other product areas, such as analgesics and germicides, that haven't even been touched by the FTC even though their advertising clearly invites regulatory attention.

Additionally, the Commission will intensify its monitoring of advertising to deter filching of money from the consumer through the use of flagrant deception in the sale of products such as food, mineral, and vitamin preparations, household equipment, and home improvements, and necessities of life of special significance to low income families and the aged. Promotional practices or misrepresentations as to the cost of credit charges which divert trade from, or otherwise injure, small businessmen and consumers will be given close scrutiny by the Commission during fiscal 1965. The Commission's responsibility to prevent deception extends, with few exceptions, to all goods and services sold in commerce.

It is true that this long delayed drive calls for additional money, but the alternative is ineffective action in this vital and explosive area of advertising affecting the health of consumers. Moreover, these are products whose advertising all but saturates the airwaves and is prominent, indeed, in the printed media. To millions of Americans, this advertising creates the character of all advertising. If it offends credibility, then other advertising also becomes suspect. Thus, for the FTC to be ineffective in regulating such widely disseminated advertising of products so important to consumers has far-reaching implications. And not the least is that the Nation's 12 billion advertising dollars are substantially devaluated in their purpose to stimulate business. Certainly real economy dictates spending the small amount the FTC asks to alleviate this situation.

The only substantial increase for additional manpower and funds requested by the Commission in 1965 is for additional enforcement of the Wool, Fur, and Textile Acts.

The Wool, Fur, and Textile Acts each require affirmative labeling disclosures. The Fur Act further requires affirmative invoicing, while disclosures made in the advertising under the Fur and Textile Acts are regulated. The Flammable Fabrics Act prohibits the introduction or movement in interstate commerce of dangerously flammable wearing apparel and fabrics intended for use therein.

Unlike other statutes administered by the Commission, compliance with the terms of these acts must be continuously policed to assure that members of industry are living up to their requirements and consumers are afforded the protection intended by Congress. The task of administering the Wool, Textile, and Fur Acts is reflected by the tremendous size of the textile industry. Over 100 different industries are engaged in the manufacture of textile products subject to the provisions of these statutes. Each year the sales of textile products covered by the acts run into billions of dollars. Next to food and shelter, textile products, including wearing apparel and household furnishings, constitute the most important segment of our national economy. Additionally, approximately 175,000 distributors of fur products are subject to the Fur Act.

This country is importing tremendous quantities of wool and nonwool fabrics and garments. The foreign mills and manufacturers are not always cognizant of the labeling and invoicing requirements under our Textile Act, and as a result a constant check must be made of these products. Since foreign manufacturers are outside the jurisdiction of the Federal Trade Commission, we must work closely with the Bureau of Customs in policing foreign imports. As a result of this cooperation the entries of many misbranded items have been stopped and corrected before the merchandise entered the American market.

For the past year simulated fur fabrics made from natural and manmade fibers have been extremely popular. The advertising and labeling of garments made from these fabrics has presented a problem as some manufacturers have concocted trade names and descriptions for their products that are misleading to the public.

It should be noted that the day-to-day inspection of these products is of real concern to consumers, particularly women, for furs can be skillfully dyed or otherwise treated to appear to be of better quality or from more desirable animals than is the fact. Therefore, truthful labeling assumes a far greater importance than fur products whose quality is more easily appraised. The same situation obtains for textiles where the percentages of new and reused wool can, without proper labeling trick even the sophisticated buyer, and, of course, the new synthetic fibers would have anybody guessing were it not for proper policing of the labels.

There are only 37 investigators to do this tremendous inspection job throughout the entire United States. Some of these investigators are located in field offices of the Commission, but others are located in field stations, in some of which only one or two men are assigned. Some of these field stations have responsibilities for regional inspections covering several States. The field investigation staff, in addition to carrying on routine inspections and industry counseling in all phases of manufacturing, processing, and distribution of textile and fur production, also performs most of the investigations in formal cases leading to complaints under the direction of the Bureau of Field Operations.

Despite continuing and earnest endeavor to carry on as best it can, the Division's investigators are able to inspect only a mere sampling of the hundreds of thousands of concerns engaged in some phase of the textile and fur industry. This includes the fiber producers, spinners, processors of natural and manufactured fibers, mills, manufacturers, importers, wholesalers, and retailers involved in production and distribution.

During fiscal year 1963 only 4,619 inspections could be made by this small staff. While these inspections, by sampling methods (except furs), covered some 50 million products, more than 4 million labeling or other deficiencies were found which resulted in 101 formal complaints, 113 cease-and-desist orders, and 1,400 assurances of discontinuance.

To insure that the public shall receive the protection intended by Congress, it is obviously necessary to police the manufacture and distribution of products subject to these laws. Without question, 100 percent inspection of all the concerns involved in all these industries in the textile and fur field would be impossible. Therefore, it is necessary that the policing the staff is physically able to do shall be carried on in strategic areas and in strategic industries.

It is obvious that the staff available for enforcement of these statutes is wholly inadequate and the Commission is requesting 25 additional attorneys and investigators which will require $127,000 and $35,000 for travel.

The guidance of industry by voluntary means as an alternative to costly adversary actions whenever possible is being given greater emphasis than at any time in the FTC's 49-year history. Whether the voluntary procedure involves a request for guidance from an individual firm or whether the industrywide problem can be lessened by the issuance of rules or guides, far more compliance with the law can be achieved with the same amount of enforcement money. But there can be no question that the guidance program places a very considerable burden on the Commission and its staff. Even though it is cheaper to avert a violation than to correct it, the work involved in averting it calls for competent manpower.

Consider first the FTC's program for the issuance of advisory opinions, a program which has been in effect only 19 months. Requests for opinions totaled 326. The Commission disposed of 71 by formal action. The number of requests for advisory opinions during the fourth quarter of calendar year 1963 increased by almost 70 percent over the preceding quarter. The widespread dissemination of information on our advisory services, as indicated by requests for 45,000 copies of the Commission's booklet describing these services, will result in further substantial increases in business requests for advisory opinions from the Commission.

The opinions sought were not on simple questions. Many dealt with such complex matters as whether proposed mergers would violate the law, the legality of cooperative advertising plans, and whether functional, quantity, and cumulative discount plans would be legal.

There can be no doubt that as this advisory opinion service becomes more widely known, particularly to small businessmen, the volume of work will rise sharply. (The first to appreciate it were the big law firms and their clients, but efforts are underway to spread the word to businessmen generally.) Also plans are underway for issuing a digest of previously rendered opinions given to individual applicants with, of course, due regard for protecting trade secrets.

A significant increase in demand is being made for the issuance of trade regulation rules, a companion innovation looking to industry's guidance. They are proving to be of great interest to businessmen inasmuch as they spell out clearly what the Commission considers the requirements of the law to be as it relates to a particular subject. Their preparation involves extensive study and public hearings, for the FTC will rely upon them in adversary actions. A year ago the staff assigned to this work had 8 proceedings pending; today 20, and the staff, still the same size, is, of course, overloaded. Here again the inevitability of delay wil sabotage the program unless the staff is enlarged.

In other major areas of FTC's industry guidance work; namely, the industry guides and trade practice conference programs, one need is the very obvious one of protecting the investment of time, money, and business confidence in the rules and guides that already have been issued, and another need is to tackle industry problems by these broad-scale voluntary methods whenever possible as an alternative to the more costly litigation method.

There are now 168 industries under rules, with 4 more to be issued by this fiscal year's end. The four are for the fresh fruit and vegetable, the gypsum, the hard-surface floor covering, and the braided rug industries. All 172 rules, of course, will have to be administered and kept up to date. The same is true of the 10 guides now outstanding, and the 2 more for mail-order insurance and for room air conditioners, to be added this year. Altogether, 1,100 compliance matters had to be handled during fiscal 1963.

Plainly the workload here is cumulative; for the more rules and guides that are in effect, the heavier becomes the task of administering them.

Although not included with industry guidance work, a far-reaching decision which serves this purpose was made last August 1 by the Commission. This was the decision to offer advice to those bound by FTC orders on whether any course of action they propose to take will violate the particular cease-and-desist order to which they are subject. The Commission was aware that this amendment of its rules of practice might well prompt a flood of requests for such advice from respondent firms who have no appetite for any future litigation with the FTC. Yet, elemental fairness demanded that these respondents be given opportunity to find out by some means other than facing a penalty suit whether (1) they have succeeded in complying with FTC's order or (2) whether a future course of action would contravene it. It is, of course, too early to determine exactly how much additional work for the staff this rule change will generate, but that it will be sustantial there can be no doubt whatever. Particularly difficult will be the reviews of compliance reports filed in connection with antimonopoly orders, for many of these would require analyses of new pricing policies, cost data, competitive effects, and other complex matters. The task would fall most heavily on the Compliance Divisions, the Division of Accounting, and the field offices.

The entire subject of compliance with outstanding orders has been given the most careful consideration in preparing our 1965 operating programs. The time has come to pull it out of the backroom and face up to the fact that it has been neglected, most particularly in the field of antitrust.

The FTC has issued about 1,250 restraint-of-trade orders, many involving multiple respondents and affecting significant markets and segments of the national economy; yet, the Commission has no way of knowing with any degree of certainty whether they are being obeyed. No systematic check of compliance with these orders is being made.

Simply to handle current cases, the Compliance Division of the Bureau of Restraint of Trade already is overloaded to the extent that each attorney has responsibility for 30 current cases at the same time. These are active cases on which action within 60 days after their issuance is legally mandatory. And this was the situation before the previously mentioned rule change entitling respondents to opinions on whether their revised or proposed practices comply with cease-and-desist orders against them. Nevertheless, the Commission is firmly convinced that a thorough compliance check of its outstanding orders must be undertaken, for the very good reason that an unenforced order is worse than none. The cost will be considerable. Of course, this badly needed compliance check might have been meat axed out of the budget under the guise of economy. But real economy demands that the millions of dollars spent in obtaining these orders be not wasted.

In the field of deceptive practices, the problem of ascertaining compliance with old orders is less serious, for the reason that both the public and business competitors are not slow to detect and report when a respondent is violating an order against him. (Violations of restraint-of-trade orders on the other hand are far harder to detect.) Even so, there must be vigilance in policing compliance with deceptive practice orders or they, too, become nullified. The number of deceptive-practice orders requiring surveillance has increased every year, but there has been no increase in the professional staff for the past 3 years, with the result that 9 nine attorneys are now weighed down by a workload averaging 63 active cases each. Obviously they cannot, without the additional manpower, be expected to carry the new compliance program with its far heavier responsibilities.

Fortunately for the FTC's program to revitalize its outstanding orders is that another difficult and costly responsibility in the field of compliance is drawing to a close. This is the Justice Department's mandatory request in early 1961 that the FTC investigate compliance with 56 of its older antimonopoly orders. These were tough cases to investigate; most of them involved multiple corporations, including some of the biggest. To handle this extra work, the FTC was given an extra appropriation of $915,000 in 1962, whereupon commenced the difficult task of hiring and training new attorneys and integrating them into the staff so that competent attorneys could be assigned to the Justice Department cases. (Progress in the handling of these is described in the text of this budget request.) Attorneys who gained experience on the Justice Department assignment can provide a strong nucleus for the FTC's own and much more extensive compliance check.

As a matter of plain fact, this badly needed compliance check cannot be undertaken without the $915,000 that has provided the additional staff for the Justice

Department work. This money—and the staff strength and expertise in antitrust investigations that it has bought (currently more than a $2 million investment of Government funds)—must be retained or FTC's own outstanding orders must continue to be neglected and, alas, many of them ignored. A planned reassignment of manpower to the most pressing Federal Trade Commission compliance matters will be instituted as fast as the Attorney General's work is completed.

It might well be pointed out here that the problem of integrating young lawyers into FTC's staff is no small one, and to retain them under an overload of work—which too often involves night and weekend work without pay—when those who reveal ability can make far more money under less arduous conditions in private industry presents an even graver problem. Time and again, the FTC is forced by lack of manpower to pit fledgling attorneys against many times their number of experienced and highly paid defendants' lawyers in the trial of cases. Thus, it should be obvious that there is no economy in so overloading an FTC attorney that his enthusiasm for public service wears too thin, for if he reveals ability, his Government salary will be no inducement for him to stay. Indeed, real economy dictates the need to advance competent young attorneys as fast as they can meet greater responsibilities. A too tight budget could be costly indeed to FTC's manpower, as well as to public service.

Badly hit by the loss of experienced manpower due to a rising overload of work and understaffing is FTC's Bureau of Restraint of Trade. Here uncompensated overtime for its attorneys is the rule not the exception. Moreover, during this fiscal year and in fiscal year 1965, the situation can only worsen, for no additional manpower can be made available.

The unvarnished fact is that the Bureau of Restraint of Trade can only attempt to keep the FTC from falling hopelessly behind in its effort to keep small firms from being driven out of business by the illegal use of buying power by their big competitors. Indeed, regardless of the financial strength of those who employ unfair and discriminatory methods, the unfavored suffer just as much.

The ultimate loser, of course, is the consumer, for as business competition dwindles and disappears in one area after another, he awakens too late to the meaning of those uninteresting words, "trade restraints" and "antimonopoly." At that point, all he can do is to fume at the new higher prices he must pay for life's necessities and sadly remember the old price that was set by free and fair competition.

The number of formal antimonopoly complaints issued by the Commission has increased from 36 in fiscal 1955 to 230 in fiscal 1963 or fivefold, and the number of cease-and-desist orders increased nearly ninefold from 30 in fiscal 1955 to 261 in fiscal 1963. These substantial increases in Commission antimonopoly actions relate to Commission policy of moving against violations of law on an industry-wide basis, after investigation uncovers that large numbers of industry members use the same illegal trade practices.

In enforcing section 2(a) of the Clayton Act as amended by the Robinson-Patman Act, prohibiting the giving of discriminatory prices to favored buyers (usually the biggest) the investigative and litigaton workload amounted to 34 cases per attorney or more than three times the number he could be expected to handle efficiently. In addition, the 40 available attorneys were called upon to process 4,500 correspondence matters relating to applications for complaint and pending cases.

Such is the workload of the Bureau's Division of Discriminatory Practices whose vitally important job is to enforce section 2 of the Clayton Act as amended by the Robinson-Patman Act and its prohibitions against price and other forms of discrimination that favor big buyers at the expense of their little competitors. The Division also has responsibility for bringing cases against the inducement of these discriminations, as well as cases involving exclusive dealing.

Complicating the work of this Division—but necessarily in the interest of effective law enforcement—is the Commission's policy of attacking violations wherever feasible on an industrywide basis, rather than following the former "squirrel gun" approach that could pick off only scattered violators.

Just 16 attorneys, representing 40 percent of the Division's available trial staff, are straining to shoulder the staggering job of industrywide enforcement actions against (1) processors and retail chainstore distributors of fluid milk, (2) manufacturers of wearing apparel, (3) department stores and grocery chainstores, and (4) automotive replacement parts.

The Bureau of Restraint of Trade is currently analyzing the results of its milk price war investigations, based on small business complaints and investi-

gational hearings on charges that milk was used as a loss leader in various sections of the grocery chains, and that the price of milk was cut temporarily to drive out the competition of the small milk producer-distributor. The Bureau was also active in enforcement of section 7 merger cases in the milk industry.

The Bureau has several merger and price discrimination investigations under way in the cement industry. The industrywide cement program launched by the Bureau in fiscal 1963 has resulted in formal complaints against four major companies. This industry program serves as a potent deterrent in halting substantial mergers in the concentrated cement industry, and in slowing down illegal merger invasions by cement producers into the small-business ready-mixed concrete industry which uses cement.

There are also some 10 complaints at various stages of litigation involving mainly pricing practices of major oil companies. The Bureau is also conducting several other investigations into gasoline prices, and also into competitive practices in the apparel industry. The Commission has obtained orders against suppliers of men's, women's, and children's wearing apparel, and in fiscal 1965 the Bureau of Restraint of Trade will continue its investigations into large chain department stores and other large apparel buyers to find out the extent of their participation in inducement of discriminatory prices, allowances and/or services.

The Bureau of Economics contributes an increasingly important role in the Commission's law enforcement program. Economists in the Division of Economic Evidence during fiscal 1963 gave economic assistance on 70 investigations and 30 formal cases, mainly mergers. This Division screened more than 1,200 mergers, prepared analyses of the economic effects of significant mergers on competition, and compiled quarterly and annual merger statistics. Economists also supplied assistance on compliance cases; more demands in this area are likely where decisions under amended section 7 of the Clayton Act require divestiture of acquisitions, often an examination of the merger record and scope of business operations of the proposed corporate purchaser requires an economic analysis of the markets and small business competitors affected by the divestiture. In addition, the Division of Economic Evidence supports the Commission's enforcement program in analyses of significant alleged or suspected false claims based on statistical sampling, in assisting the advisory opinions' staff on complex economic issues usually involved in proposed mergers, and in planning and in conducting section 6 surveys for the collection of data relating to the investigation and trial of merger cases.

For half a century the economic reporting functions of the Federal Trade Commission have constituted one of the Nation's most important instruments of antimonopoly action. The legislative history of our organic act establishes congressional intent that reporting functions should be extensively used as one of the principal means of curbing monopoly power. The Bureau of Economics has underway a study of the effects of Commission merger cases upon competition and concentration in the dairy industry, and it is examining the problem of vertical integration in the rubber tire industry.

The Bureau is also investigating and analyzing competitive conditions in the manufacture and sale of polyethylene-polypropylene resins and products. During fiscal 1965 the Bureau will complete an economic report on this complex and expanding part of the plastics industry. Finally, in anticipation of increasing national concern with oversea trade and competition posed by the Common Market, the Bureau of Economics is making a study and report on export trade associations to enable the Commission to better assess its responsibilities under the Webb-Pomerene (Export Trade) Act of 1918.

STATUTORY AUTHORITY

Mr. THOMAS. For the record, we will include pages 2 through 4 on the statutory authority of the Commission.

(The pages follow:)

STATUTORY AUTHORITY AND DUTIES OF THE FEDERAL TRADE COMMISSION

STATUTORY AUTHORITY

The Federal Trade Commission, an administrative agency, created by the act of September 26, 1914, is charged with the enforcement of the Federal Trade Commission Act as amended by the Wheeler-Lea Act, approved March 21, 1938

(52 Stat. 111–117); section 2 of the Clayton Act, as amended by the Robinson-Patman Act, approved June 19, 1936 (49 Stat. 1526), and sections 3, 7 as amended and 8 of the Clayton Act of October 15, 1914 (38 Stat. 730); the Export Trade Act, approved April 10, 1918 (40 Stat. 516); the Wool Products Labeling Act, approved October 14, 1940 (54 Stat. 1128); the Insurance Regulation Act, approved March 9, 1945 (59 Stat. 33), the Lanham Trademark Act of 1946, approved July 5, 1946 (60 Stat. 427); the Fur Products Labeling Act, approved August 8, 1951 (65 Stat. 175); the Flammable Fabrics Act, approved June 30, 1953 (67 Stat. 111); amendment to the Packers and Stockyards Act, 1921, approved September 2, 1958(72 Stat. 1749); and the Textile Fiber Products Identification Act, approved September 2, 1958 (72 Stat. 1717).

DUTIES

The principal duties of the Commission under the above-mentioned statutes are:

(1) *The Federal Trade Commission Act.*—Under this act, the Commission is charged with (a) the prevention of unfair methods of competition in commerce and unfair or deceptive acts or practices in commerce; (b) the conduct of investigations relating to (1) alleged violations of the Antitrust Acts, (2) the manner in which decrees in antitrust suits brought by the United States have been carried out, and (3) the organization, business, conduct, practices, and management of corporations engaged in commerce (with certain statutory exemptions) and their relation to other enterprises; (c) the making of reports and recommendations to the Congress with respect to legislation; and (d) the conduct of trade conferences of industries for the elimination of unlawful and unethical business practices.

(2) *Clayton Act.*—Under sections 3, 7, and 8 of this act the Commission is charged with the duty of preventing and eliminating unlawful tying contracts. corporate mergers and acquisitions and interlocking directorates. Under the Clayton Act, as amended by the Robinson-Patman Act, which greatly enlarged and increased the jurisdiction and duties of the Commission in respect to unlawful price discriminations, the Commission is charged with the prevention of certain specific practices; i.e., unlawful price and related discriminations.

(3) *Amendment to Packers and Stockyards Act.*—The provisions of this amendment extend the Commission's jurisdiction to cover certain matters previously subject to the exclusive jurisdiction of the Secretary of Agriculture.

The amendment, in effect, grants the Commission jurisdiction over the activities of packers not related to livestock, meats, meat products, and the like. The Commission is granted additional power and jurisdiction over all transactions in commerce in margarine and olemargarine and over retail sales of meat and related products. Other matters involving meat and related products are made subject to the Commission's jurisdiction where the Secretary requests the Commission to investigate and report or where, under certain circumstances, action by the Commission is necessary to exercise effectively its power or jurisdiction with respect to retail sales of meat and related products.

(4) *Export Trade Act.*—The Commission is responsible for receiving and filing articles of association or incorporation of "associations" organized under the Export Trade Act; investigating their operations which may adversely affect competition within the United States; making recommendations to the associations for readjustments deemed necessary therein; and, where considered appropriate, making recommendations to the Attorney General for penal action.

(5) *Wool Products Labeling Act.*—Under this statute the manufacture for introduction into commerce, or the introduction, sale, transportation or distribution, in commerce, of misbranded wool products, is unlawful, and constitutes an unfair method of competition and an unfair and deceptive act and practice under the Federal Trade Commission Act. The Commission is authorized to make inspections, analyses, tests, and examinations of all wool products subject to the act and to make such rules and regulations as may be necessary and proper for the administration and enforcement of the act. In addition, the Commission is also empowered under the statute to prevent the movement of misbranded wool products in commerce by injunction and to proceed by libel action in certain cases for condemnation of such products.

(6) *Insurance Regulation Act of 1945.*—The provisions of this Act limit the application of the Federal Trade Commission and Clayton Acts, as amended, to practices in the insurance field which have not been regulated by the States.

This has imposed upon the Commission the task of not only determining whether any given matter concerning insurance violates any of the acts it administers, but also whether the practices involved have been regulated by the States within the intent and meaning of this act.

(7) *Lanham Trademark Act of 1946.*—Under this statute it is the duty of the Commission to make applications for the cancellation of registered trademarks under certain specified conditions. The Commission, as applicant, must secure the proper evidence on which the application for cancellation is based, prepare the application, stating the grounds relied upon, be represented at the hearing before a Patent Office examiner for the purpose of presenting such evidence and otherwise prosecute the matter to a conclusion.

(8) *Fur Products Labeling Act.*—The Commission is charged with the administration and enforcement of this consumer legislation which requires the mandatory labeling of fur articles of wearing apparel, as well as truthful invoicing and advertising of furs and fur products to show, among other things, the true English name of the animal from which the fur was taken. The Commission is also charged with issuing a Fur Product Name Guide and is authorized and directed to cause compliance inspections, analyses, tests and examinations to be made of furs and fur products subject to the act and to prescribe rules and regulations governing the manner and form of disclosing required information under the act. In addition to administrative enforcement, injunctive and condemnation proceedings are also provided for.

(9) *Flammable Fabrics Act.*—Under this act which became effective July 1, 1954, the Commission is directed to prevent the marketing in commerce of all wearing apparel and fabrics intended for use in wearing apparel which when tested under the prescribed standard set forth in the act is so highly flammable as to be dangerous when worn by individuals. Its enforcement is to be carried out through administrative procedures provided for under the Federal Trade Commission Act as well as injunction, condemnation, and criminal proceedings in the Federal courts.

(10) *Textile Fiber Products Identification Act.*—This additional truth-in-fabrics" legislation takes up where the Wool Products Labeling Act leaves off. It became law September 2, 1958, and covers the broad field of mandatory content disclosure in labeling and advertising of textile fiber products. Under its terms, misbranding as well as false and deceptive advertising of textile fiber products is unlawful.

The Commission is authorized, under the act, to make inspections, analyses, tests, and examinations of all textile fiber products subject to the statute, and further, to make such rules and regulations as may be necessary and proper for administration and enforcement of the act. In addition, the Commission is directed to establish generic names for those man-made fibers which have not as yet attained one.

Its enforcement is to be carried out through administrative procedures provided for under the Federal Trade Commission Act, together with injunction and criminal proceedings in the U.S. district courts.

SUMMARY OF POSITIONS AND AMOUNTS REQUESTED

Mr. THOMAS. Put the summary table of positions in the record. It breaks down the $13,270,000 requested. You have executive office, Office of Director, Office of the Comptroller, Office of the General Counsel, Hearing Examiners, Bureau Restraint of Trade, Bureau Deceptive Practices.

(The page follows:)

Comparative summary—Salaries and expenses, fiscal year 1964, with requested funds, 1965

	Allotment fiscal year 1964		Funds requested fiscal year 1965		Increase requested fiscal year 1965	
	Positions	Amount	Positions	Amount	Positions	Amount
Commissioners' Offices	41	$453,000	41	$466,000		$13,000
Office of Executive Director	83	599,500	83	620,000		20,500
Office of Comptroller	30	258,500	30	242,500		−16,000
Office of Secretary	48	301,500	48	311,500		10,000
Office of General Counsel	55	588,000	55	619,500		31,500
Hearing Examiners	39	501,000	39	527,000		26,000
Bureau Restraint of Trade	202	2,070,000	199	2,173,000	−3	103,000
Bureau Deceptive Practices	124	1,337,000	127	1,459,000	3	122,000
Bureau Textiles and Furs	95	831,000	120	1,033,000	25	202,000
Bureau Field Operations	288	2,566,250	288	2,717,500		151,250
Bureau Industry Guidance	47	505,000	49	559,000	2	54,000
Bureau Economics	126	930,500	126	999,500		69,000
General operating expenses (not included above)		1,273,500		1,542,500		269,000
Total	1,178	12,214,750	1,205	13,270,000	27	1,055,250

Mr. THOMAS. There are four big Bureaus. Here are Textiles and Furs, 95 to 120; Bureau of Field Operations, 288 and the same in 1965; Bureau of Industry Guidance, 47 to 49; Bureau of Economics, 126. Then you have your "General operating expense" which is "Other objects." We will take that up later. This is a beautiful table. For the fiscal year 1964 you had 1,178 jobs. He wants to increase this by 27, plus the annualized jobs and the way I figure it out it is around 65. What it amounts to on a full year basis is 65?

Mr. DIXON. The replacements, you mean?

Mr. THOMAS. No; if you had to pull it on a full annual basis.

Mr. DIXON. I see.

Mr. THOMAS. You show an increase in dollars and cents in personal services and other objects, an increase of $667,250 for your 27 jobs, with a total cost of $13,270,000, against $12,214,750. It is broken down into your elements of cost. You have a two and a half percent pay increase, your in-grade promotions and then you have your statutory benefits, which you cannot control. You cannot control any one of the three.

It adds up to an increase over last year of about $667,000, or an increase of 27 jobs. Is that a fair statement?

Mr. DIXON. Yes.

COMMISSIONERS AND COMMISSIONERS' OFFICES

Mr. THOMAS. Let's take a look at the Commissioners' offices. Put page 16 in the record.

(The page follows:)

Commissioners and Commissioner's Offices

	Allotment, fiscal year 1964		Requested, fiscal year 1965		Increase, fiscal year 1965	
	Positions	Amount	Positions	Amount	Positions	Amount
Commissioners	5	$100,000	5	$100,000		
Commissioners' Offices	36	345,000	36	355,000		$10,000
Total personal services	41	445,000	41	455,000		10,000
Travel		8,000		11,000		3,000
Total	41	453,000	41	466,000		13,000

Mr. THOMAS. We have one vacancy?

Mr. DIXON. Governor Anderson is resigning as of March 1.

Mr. THOMAS. Is he going to run for Governor?

Mr. DIXON. Yes, sir. It is in the paper. We haven't seen him since he handed it in. We will see him tomorrow.

Mr. THOMAS. The Commissioners have 56 employees. That is a total of 41. What do you set out here? You set out your travel and everything. What is the staff of the Commission? You have one grade 17. Does each Commissioner have one grade 17?

Mr. DIXON. No, sir, only my assistant.

Mr. THOMAS. And you have 10 grade 15's, 1 grade 14, 1 grade 13, et cetera.

We are not going to question on your need of your immediate offices. That is a general pattern. It figures out about six or seven employees to the Commissioner?

Mr. DIXON. A total of 41—that is about correct, Mr. Chairman.

OFFICE OF EXECUTIVE DIRECTOR

Mr. THOMAS. Tell us about our distinguished Executive Director. You need 83 positions, no increase over 1964. In his immediate office he has six. He has 5 in the Office of Information, 10 in administration, personnel, 11, housekeeping activities, 51, a total of 83 (reading):

The Executive Director, as the Commission's chief operating official, directs the Federal Trade Commission's activities to achieve effective and economical operations.

Why not say he is the chief executive officer and directs the Federal Trade Commission's activities? You would save a few words.

Mr. DIXON. We might save a few words.

Mr. THOMAS (continuing reading):

He has responsibility for operational and administrative direction of all the Commission's Bureaus and field offices. The Office of the Executive Director includes the Office of Information.

What is that limitation on your Office of Information?

Mr. DIXON. We are not violating it. We only have one. That is vacant now.

Mr. THOMAS. How many people do you have in your Information Office?

Mr. DIXON. Five.

Mr. GLENDENING. We have actually three on board but there are five set up.

PERSONNEL TURNOVER

Mr. THOMAS. You had appropriated how many full-time jobs for 1964? What was that figure?

Mr. DIXON. 1,178.

Mr. THOMAS. How many people do you have aboard as of February 1?

Mr. DIXON. 1,150.

Mr. THOMAS. There are no vacant slots? You have already pointed out five.

Mr. DIXON. There are 28 really that we are short. There are vacancies.

For instance, my information officer, I am short now, but I don't intend to fill it until after——

Mr. THOMAS. Agencywide, how many vacancies?

Mr. DIXON. Twenty-eight.

Mr. GLENDENING. We do not have the money to fill them. That is why they are vacant.

Mr. DIXON. That is the only reason.

Mr. THOMAS. Nobody quits over there?

Mr. GLENDENING. We lost 28. We cannot fill them because we do not have the money.

Mr. THOMAS. What is the total on resignations, where they do not like you and they quit? What is the total figure, 20 percent?

Mr. DIXON. It is slowing down. I read those into the record.

We have hired 64 and lost 97 this part of the fiscal year 1964. It has slowed down in 1963.

Mr. THOMAS. You only lost 64 out of your 1,400?

Mr. GLENDENING. No, 1,400; our budget only provides a maximum of 1,178.

Mr. DIXON. We appointed 64 and by separations we lost 97 out of 1,178.

Mr. THOMAS. What is your turnover on an annual basis throughout the agency, regardless of causes?

Mr. DIXON. I went back and read those into the record, 1962, 1963, and 1964.

Mr. THOMAS. In round figures here, 1,178 will make it 1,180 jobs for 1964. What is your turnover? What does it look like it will be? Sixteen percent is the figure they use throughout Government prior to this year. Now they are using 14 percent. Are you any different from any other agency?

Mr. DIXON. Not much, sir. That is about right.

Mr. THOMAS. In round figures, that would be a vacancy of less than 1,800 on an annual basis throughout the agency. You do not have to fire anybody.

Mr. DIXON. That is the reason I didn't have to have a reduction in force when you didn't give me enough money for 1964. That is the reason I am sweating it out. I do not want to have one.

Mr. THOMAS. Let's put pages 19 and 20 in the record.

(The pages follow:)

OFFICE OF THE EXECUTIVE DIRECTOR

The Executive Director, as the Commission's chief operating official, directs the Federal Trade Commission's activities to achieve effective and economical operations. He has responsibility for operational and administrative direction of all the Commission's bureaus and field offices. The Office of the Executive Director includes the Office of Information.

The program review officer is included in the Office of the Executive Director although he reports directly to the Commission on all phases of his work. The program review officer has been charged with the responsibility for continuously reviewing the substantive programs of the Commission, such as, restraint of trade (mergers, price discriminations, etc.) and deceptive practices, and for making recommendations with respect to how and where its functions should be exercised in order to best serve the public interest. The program review officer also acts for the Executive Director in the latter's absence.

The additional $19,500 for personal services for the Office of the Executive Director will provide no additional positions and will be required to restore the $9,000 reduction in 1964 plus $10,500 for the 6 months' pay increase costs. A restoration of $1,000 for travel is also requested.

OFFICE OF ADMINISTRATION

The Office of Administration gives policy guidance and general supervision to the management and organization programs, administrative services activities and personnel programs of the Federal Trade Commission. Plans for effective organization and administration of the Commission's management programs. Formulates and puts into effect basic administrative policies. Develops long-range plans relating to needs for personnel, space, supplies, equipment, etc. The Office of Administration includes the Division of Personnel, the Division of Administrative Services and staff assistants.

The staff assistants in the Office of Administration conduct management surveys, recommend organizational and procedural changes, develop operating manuals, report on the operations of the Commission and coordinate policy issuances.

DIVISION OF PERSONNEL

The Division of Personnel initiates, develops, and administers personnel policies and programs in the spheres of recruitment, appointment and placement, training, position classification, performance evaluations, employee relations, welfare, and health and recreation.

This Division is responsible for conducting board of examiners programs for economists and attorneys. For the former it supplies the secretary to a Civil Service board from which selections of individual economists are made by the Federal Trade Commission and the Department of Justice. For the attorneys it has the full responsibility of developing a recruitment program and for examining, rating, and maintaining registers of qualified candidates for submission to operating officials of the Commission for selection. Approximately 1,500 applications from attorneys are received annually and on all of these this Division must do the full job of a Civil Service Commission and an operating personnel office.

DIVISION OF ADMINISTRATIVE SERVICES

The Division of Administrative Services is a central administrative unit established for the purpose of publishing the material made public under section 6(f) of the Federal Trade Commission Act; for the procurement of supplies and equipment; and for supplying other services essential to the functioning of the Federal Trade Commission. The Commission's library is also located in this Division.

The Publication Branch of the Division of Administrative Services clears for format, economy of reproduction, and distribution, all material printed or duplicated by the Federal Trade Commission within the limitations of the laws and regulations as applicable thereto. This Branch also operates a class A printing plant established under the provisions of the regulations by the Joint Committee on Printing of the U.S. Congress; and provides photo-

graphic, photostat, and drafting services. These services are performed by the following sections:

The Stenograph and Composition Section edits for format and typography material to be printed by the Government Printing Office or printed or duplicated in the Federal Trade Commission printing plant and provides stenographic services when bureau pools are overburdened. During fiscal year 1963 over 5,000 pages of copy were produced by this activity for lithographic reproduction in the printing plant.

Office of the Comptroller

Mr. Thomas. Let's put page 23 in the record.
(The page follows:)

Office of the Comptroller

	Allotment, fiscal year 1964		Requested, fiscal year 1965		Decrease, fiscal year 1965	
	Positions	Amount	Positions	Amount	Positions	Amount
Office of the Comptroller	4	$46,500	4	$48,000	.....	$1,500
Division of Budget and Finance	15	99,000	15	101,000	.....	2,000
Division of Data Processing	11	57,500	11	63,500	.....	6,000
Total, personal services	30	203,000	30	212,500	.....	9,500
Travel	.....	500	.....	1,000	.....	500
Other expenses	.....	55,000	.....	29,000	.....	−26,000
Total	30	258,500	30	242,500	.....	−16,000

Mr. Thomas. That does not change appreciably. It has 30 employees [reading]:

The Office of the Comptroller includes the Division of Budget and Finance and the Division of Data Processing, thus placing all budget, fiscal, and data processing work in one office.

FIELD OFFICES

How many regional offices do we have now?
Mr. Dixon. Eleven.
Mr. Thomas. Where are they located?
Mr. Dixon. Field offices we are talking about. There is one here in Falls Church and we have one in New York, Chicago, Atlanta, New Orleans, Kansas City, Seattle, San Francisco, Los Angeles, Boston and Cleveland.
Mr. Thomas. What is the total?
Mr. Evins. Ten besides Washington.
Mr. Thomas. What is the total?
Mr. Dixon. A total of 11.
Mr. Thomas. I mean total employment.
Mr. Dixon. Currently 264.
Mr. Thomas. Washington has 40, New York, 71, Chicago, 34, Kansas City, 10, San Francisco, 16, Seattle 18, Cleveland, 13, Boston, 15, Los Angeles — man, you have got 4 offices on the Pacific coast right on the water line—27 in New Orleans, Atlanta 14. You have Seattle, San Francisco——
Mr. Dixon. And Los Angeles.
Mr. Thomas. And Los Angeles.

Put pages 24 and 25 in the record.
(The pages follow:)

DIVISION OF DATA PROCESSING

This Division is responsible for all data processing in the Commission. In addition to preparing payroll, fiscal, and management reports, the Division processes and prepares data for the corporate financial reports program, compiles evidentiary data for use in law enforcement cases and economic data for the Commission's economic reports.

During fiscal years 1963 and 1964, the Commission conducted a study as to the feasibility of installing a low-cost card oriented computer in place of the inadequate EAM equipment then in use. It was concluded that the renting of additional EAM equipment and the hiring of additional personnel to operate the expanded EAM facilities, would increase costs by $20,000 a year, and the equipment still would not render the services demanded by management and the legal and economic staffs for timely and qualitative reports and analyses. The expanded workload and responsibilities of the Commission in the legal, economic, and management areas clearly pointed to the need for an ADP program within the Commission. During this period the Commission obtained the services of outside experts in the field of ADP to conduct a study that would give an impartial opinion as to the feasibility of entry by the Commission into the area of automatic data processing. This study was conducted by National Archives and Record Service of the General Services Administration and gave full approval of the Commission's study which had in itself justified the installation of the automatic data processing equipment.

It was ascertained during the studies that the present staff of the Division of Data Processing would be adequate, and no increase in personnel would be required to operate the computer system. As a result of these studies, the Bureau of the Budget gave full approval of the system installation.

In September 1963 a card oriented Burroughs B–280 computer system was completely installed which was operational by the Commission on October 1. As a result of the installation seven IBM calculating and accounting machines have been released. During fiscal year 1965 the Commission proposes to purchase this computer and requests that $114,000 be appropriated for this purpose. This will result in a net saving of $26,000 in machine rental costs in 1965, as follows:

Machine rental cost allocated in 1964 and continued in 1965	$55,000
1965 costs:	
Equipment retained on rental after release of EAM equipment (punches, verifiers, sorters, collators, etc.)	19,670
Computer rental, 3 months	9,330
Total	29,000
Net saving, 1965	26,000

In addition to the projected savings in personnel and equipment costs, it was clearly shown that it would be advantageous to the Government to purchase the computer 1 year after installation. The direct savings to the Government would amount to $41,000 per year beginning 2 years after purchase. This cost savings after 2 years of purchase is well below the cost-saving period of 5 to 7 years after purchase recognized by the Comptroller General of the United States. The chart and summaries that follow reflect the financial details as to the cost savings effected by the purchase of the computer system.

Appropriation of the $114,000 purchase price of the computer is actually only $88,517 more than the funds required if purchase is not authorized as follows:

Cash cost of computer (net) in October 1964 (fiscal year 1965)	$114,517
Reduction in 1965 equipment rental costs	26,000
Net additional funds	88,517

Mr. THOMAS. What does it all boil down to? I tried to figure it out from your other objects. I will read from your other objects.

Take a look at "Other objects" in conjunction with page 25. You will see he is spending this year $55,000. Look on page 135. Look at IBM rental and Xerox. You come up with $86,000. Xerox is a duplicating machine but it falls in the field of mechanical devices. We do not find anyplace in here where there is an offset expenditure for these funds. In addition to that, turn over to the last page under "Other objects." He wants about $114,000 to spend with the Burroughs Corp. for purchase of computers set forth in the justifications for the Office of the Comptroller. My next question is "What did you get for that $55,000 you are spending this year?" It looks like you are junking your machine and going to a different one.

Is that the situation?

Mr. GLENDENING. We have had IBM equipment on a rental basis. We have been paying some $47,000 or $48,000 a year rental for it. This past year——

Mr. THOMAS. What did you get for these $55,000?

Mr. GLENDENING. We are getting Burroughs computer equipment and in 1965 we will turn back about $26,000 rental on an annual basis——

Mr. THOMAS. Did Burroughs make both of your machines?

Mr. GLENDENING. No, sir.

Mr. THOMAS. You did not get any credit from Burroughs? What did you get for the $55,000 you spent with this crowd?

Mr. GLENDENING. The total rental for tabulating and computing equipment this year is $55,000.

Mr. THOMAS. Will you answer the question? Did you make a bad buy?

Mr. GLENDENING. No.

Mr. THOMAS. You did not make a bad buy—a bad rental?

Mr. GLENDENING. No. We have had the IBM card equipment on a lease basis for years. This is computer equipment. We have had tabulating equipment. This is a conversion to computer equipment which this year will save more than $5,000.

Mr. THOMAS. What was the $55,000 for?

Mr. GLENDENING. Machine rental costs this year.

Mr. THOMAS. What type of machine was it?

Mr. GLENDENING. It was leased tabulating equipment called EAM electric accounting machines.

Mr. THOMAS. It is outmoded, out of date? How long did you have it?

Mr. GLENDENING. We have had that equipment, well, we have tried to update it from time to time. We have had it on board for 15 years.

Mr. THOMAS. How much rent have you paid on it? You have been paying rent on it for 15 years. You should have bought it 14 years ago.

Mr. GLENDENING. We have been paying machine rental. I do not believe the purchase of this type of equipment is a good investment.

Mr. THOMAS. You would save $200,000 or $300,000, would you not?

Mr. GLENDENING. It was only 1952 or later that the courts forced IBM to sell their equipment. Prior to that time it was all rental.

Mr. THOMAS. You couldn't have bought it from anybody else?

Mr. GLENDENING. We couldn't have bought it from anybody else.

Mr. THOMAS. We are wondering why you did not take them over the hurdles. Instead of that you were nice, meek, docile, and paid them all of these large sums of money. You never did go after them. You knew better than anybody that you were stretched over a barrel there.

Mr. DIXON. Mr. Chairman, I was not there then and neither was anybody else here.

Mr. THOMAS. That answers the question.

Mr. DIXON. I wanted to tell you that I started asking that question and after about six surveys we bought the thing.

Mr. THOMAS. That is the best answer I can imagine.

COMPUTER PURCHASE

Tell us about this $114,000. Are you satisfied you are getting the right machine? You are buying this.

Mr. GLENDENING. This is an outright purchase, yes, sir.

Mr. THOWAS. You are not getting a white elephant?

Mr. GLENDENING. No, sir. This is the best equipment. We have it installed on rental this year. We want to buy it the first of the year.

Mr. THOMAS. You know you are getting your money's worth?

Mr. GLENDENING. Yes, sir.

Mr. THOMAS. We are urging all of your friends——

Mr. GLENDENING. If you will look on page 26——

Mr. THOMAS. Let me finish. We have looked at that page.

We are urging our friends to go on and go into this field. We think it is a big saving but we caution you to be sure and do not get a white elephant. Know what you are buying. We have seen some of our friends who will go out and buy one a little hurriedly and wake up 6 months from now and find it is not what they need.

Mr. DIXON. Mr. Chairman, the Budget Bureau has outstanding orders where this has to be proven. We had to prove this. We had a bunch of experts from the Archives come in there and make this study and approve it.

(Discussion off the record.)

COMPUTER MAINTENANCE CONTRACT

Mr. EVINS. Do you have a repair contract after you buy these outright?

Mr. GLENDENING. A maintenance contract.

Mr. EVINS. How much is this? You buy the machine outright and then put the manufacturer on the payroll.

Mr. GLENDENING. No, sir.

Mr. EVINS. How much do you pay them to come in and brush it up?

Mr. GLENDENING. We pay a sliding scale depending on how old the equipment is. It goes up a little. It runs a couple of thousand a year.

Mr. EVINS. That is what I do not like. You buy the equipment from them and then they come in and oil it a little bit. They are the same as though they were on the payroll.

Mr. GLENDENING. They are on call 24 hours a day, literally.

Mr. EVINS. Can't you get the service free from them?

Mr. DIXON. You don't have to do it. Where else would you go to get it repaired?

Mr. EVINS. Your colleague calls it a time sale here.

Mr. THOMAS. There are a lot of good repairmen around.

Mr. GLENDENING. We do not have to buy a repair contract. We could pay them probably $25 an hour down there on an hourly rate.

Mr. EVINS. Do you have to buy the grease and the oil and brushes?

Mr. GLENDENING. They take care of all that.

Mr. DIXON. That is what usually happens when a man has a patent on a thing. In America you get a patent and it is yours.

Mr. THOMAS. Let's spell this out. This is a nice table on page 28. It breaks down the $114,000 and gives you a little more information on it.

Mr. Evins, you will like that because it has some rental money in it; $3,835 per month. That is not cheap rental; it is?

Mr. GLENDENING. We get a credit out of that.

OFFICE OF THE SECRETARY

Mr. THOMAS. Put page 30 in the record.

(The page follows:)

Office of the Secretary

	Allotment, fiscal year 1964		Requested, fiscal year 1965		Increase, fiscal year 1965	
	Positions	Amount	Positions	Amount	Positions	Amount
Office of the Secretary	10	$92,500	10	$95,000	----	$2,500
Legal and public records	38	208,500	38	215,500	----	7,000
Total personal services	48	301,000	48	310,500	----	9,500
Travel	----	500	----	1,000	----	500
Total	48	301,500	48	311,500	----	10,000

Mr. BOLAND. I do not know how the Secretary gets along with all of these responsibilities. He certainly has an awful lot of work to do. He does it very well, let me say.

Mr. DIXON. I think he does, too.

Mr. THOMAS (reading):

The Secretary and his immediate office receive and handle mail on all phases of the Commission's work. He signs all orders and certain other official papers. He also is responsible for liaison with the Congress and Government agencies and for decisions on informal cases not submitted to the Commission.

The Assistant Secretary for Minutes takes the minutes of, and records the executive meetings of the Commission, prepares directives for the signature of the Secretary, and keeps the docket of pending matters before the Commission.

Additional funds of $2,500 are required for pay-raise costs. Restoration of $500 in travel funds is also requested.

Here is "Legal and public records." Can't you reduce your housekeeping activities? This is not all your housekeeping activities by any means?

Turn back to table 9. Can't you reduce that and put these people in Antimonopoly?

What page is your box chart on?
Mr. DIXON. On page 138, the last page.
Mr. THOMAS. Can't we reduce that?
Mr. GLENDENING. No, sir.

COMMISSION ORGANIZATION

Mr. THOMAS. Look at page 138, gentlemen. Here is a pretty good breakdown of the activities. Here is your hearing examiner, General Counsel, Executive Director, Office of the Comptroller, Office of the Secretary, Bureau of Restraint, et cetera. Then you have your field offices and everything else.

The Secretary has 51, Comptroller, 29. I thought it was 30.

The Executive Director has 82.

Mr. DIXON. Mr. Chairman, I have people marching back and forth through those places, and every time I think I find somebody who is not doing something down there, I find out he is overworked.

You know we are fundamentally a law office, a law shop. We have professional personnel and then supporting clerical.

Mr. THOMAS. What part of your staff is lawyers? At least a fourth or fifth of them or more?

Mr. DIXON. More than that. We have about 500 lawyers.

Mr. EVINS. 50 percent.

Mr. THOMAS. Half of your staff in each of your Bureaus is a lawyer.

Mr. DIXON. Supporting the Bureau of Restraint of Trade are accountants. The medical scientific group supports the deceptive side. Every time you allow us to grow, we cause more problems in the Secretary's Office. The distinguished Congressman from Tennessee was our Secretary once.

Mr. EVINS. There used to be an Executive Secretary, Comptroller, and Director as all one. Now you have three separate positions.

Mr. DIXON. This is a trick that the Republicans did and left me.

Mr. THOMAS. You mean that happened when you weren't there?

Mr. DIXON. That is right.

Mr. THOMAS. Mr. Evins, is that a slight amount of featherbedding?

Mr. JONAS. You might have been better off if you had followed some of the other examples.

Mr. BOLAND. Actually this works better this way. When was this reorganized into the three levels?

Mr. GLENDENING. At the time of the Republican reorganization in 1954.

Mr. BOLAND. I thought it was a pretty good reorganization.

Mr. DIXON. I continued it this way. I thought it made sense, sir.

Mr. EVINS. Couldn't you put all of this under Mr. Shea, with one secretary and let him run the whole thing?

Mr. THOMAS. Each one of them has a main assistant.

Mr. JONAS. Don't you know the general rule, every time an agency reorganizes it costs more money and adds personnel?

Mr. THOMAS. The costs always go up.

COST OF ADMINISTRATION

Mr. JONAS. If I may make an observation, Mr. Chairman, to lay all jokes aside, I do not believe I know of any agency in the Govern-

ment—and we look at over 20 budgets in here—that has as high a percentage of personnel engaged in housekeeping and executive direction as yours. I cannot see why you would need to have 15 or 18 percent of your people engaged in executive direction.

Mr. DIXON. Actually we do not. Maybe I could move some of these things around and they would fit a little better but primarily under my Executive Director are the General Services, Personnel, the Information Office.

I think the Comptroller should direct the data processing activity because basically the information must come from all the bureaus. I thought it well to have it that way. My secretary is the clerk of the court, plus the liaison responsibilities that he carries on. There is a very small amount there. We have less than 10 percent in this category. I think, Mr. Congressman, that we would look pretty good by comparison but I might be shocked.

Mr. EVINS. Mr. Chairman, I look around and see a lot of old friends and very familiar faces and operations here.

OFFICE OF THE GENERAL COUNSEL

I believe we will turn to the next division, General Counsel's Office. We will place in the record the table on page 33.

(The page follows:)

Office of the General Counsel

	Allotment, fiscal year 1964		Requested, fiscal year 1965		Increase, fiscal year 1965	
	Positions	Amount	Positions	Amount	Positions	Amount
Office of General Counsel	14	$100,000	14	$102,500	----------	$2,500
Division of Appeals	29	330,000	29	350,500	----------	20,500
Division of Consent Orders	6	85,000	6	87,500	----------	2,500
Division of Legislation	4	42,000	4	43,000	----------	1,000
Division of Export Trade	2	22,000	2	23,000	----------	1,000
Total, personal services	55	579,000	55	606,500	----------	27,500
Travel	----------	9,000	----------	13,000	----------	4,000
Total	55	588,000	55	619,500	----------	31,500

Mr. EVINS. You have 55 positions and no more requested for next year.

Place in the record pages 34 through 38 showing some of the work of the Office of General Counsel.

(The pages follow:)

OFFICE OF THE GENERAL COUNSEL

As the Commissioner's chief law officer, the General Counsel is principal legal adviser to the Commission and its staff. His office:

Handles the preparation of briefs and oral arguments before the courts of appeals taken from decisions of the Commission.

Collaborates with the Office of the Solicitor General in preparing and presenting Commission cases before the U.S. Supreme Court.

Handles matters before U.S. district courts concerning enforcement of Commission supenas and seeking injunctions.

Prepares opinions on matters of law for the Commission and the staff.

Analyses new legislation, prepares the Commission's reports thereon and represents the Commission before congressional committees.

Supervises and directs all functions of the Commission in operation of the Webb-Pomerene (Export Trade) Act of 1918.

Handles the negotiation of consent orders.

Handles cancellation proceedings of trademarks under the Lanham Trade-Mark Act of 1946.

Advises the Chairman of the Commission on clearance of voluntary industry agreements sponsored by other agencies in carrying out the Defense Production Act and the Small Business Act of 1953, as amended.

Passes upon trade practice rules, trade practice guides, and trade regulation rules.

Examines from the standpoint of enforcibility investigational demands for access, demands for special reports and subpenas duces tecum.

Prepares legal manuals and studies for staff use.

The increase in the work of the Appellate Division and in the field of legislative activity which has occurred during the recently past fiscal years is expected to continue at an accelerated rate during fiscal 1965. The increased legal enforcement activity of the Commission, the initiation of industrywide type investigations, and the greatly expanded use of demands for special reports and investigational subpenas, enforcible in the courts, will result in a material increase in the work of this Office in the courts.

The recent greater congressional interest in trade regulation, relating both to trade restraints and to deceptive practices, has resulted in an increase in legislative proposals.

The Legal Research and Reporting Section, located in the Office of the General Counsel, is responsible for the preparation and publication of the volumes of "Federal Trade Commission Decisions" which presently number 58. It also compiles, prepares, and publishes the "Statutes and Court Decisions Relating to the Commission." The latter covers not only court decisions to which the Commission was a party but also court decisions to which the Commission was not a party but which construe statutes administered by the Commission. The section likewise prepares the headnotes or syllabuses for the decisions of the Commission as they are published in the Federal Register.

The Commission's expanded program has greatly enlarged this work of the section and because of lack of additional staff, the work has fallen much in arrears.

Besides producing monthly the interoffice reporter of cases in trade regulation and antitrust fields, the section has the further responsibility of preparing and maintaining the cumulative legal digest of Federal Trade Commission decisions. This work is of major importance because of its need by the trial and appellate staffs of the Commission, also because it constitutes source material for the guidance of business itself. Its educational value for the assistance of consumer groups is large.

In spite of the increased workload and responsibility and critical shortage of manpower no new employees are requested for operations in the Office of General Counsel. The total increase of $31,500 requested will provide only $6,000 restoration of 1964 reductions in personal services, $16,500 for required pay raise costs, $5,000 for attorney promotions and a restoration of $4,000 in travel funds.

DIVISION OF APPEALS

The Division's principal function is to represent the Commission in court. It does so both directly and in participation with the Office of the Solicitor General in matters reaching the Supreme Court, and with offices of the U.S. attorneys in certain other court cases affecting the Commission. It also is called upon to render advice to the Commission and the staff and to assist in preparing proposed reports to the Congress and the Bureau of the Budget.

Workload, fiscal 1963

During fiscal 1963 the Division handled 127 cases, an increase of 41 over the previous year. It completed litigation in 57 cases, 16 of which were restraint-of-trade matters, 16 involved deceptive business practices, 8 concerned the Commission's subpena powers, 13 were suits for injunction or declaratory judgment brought against the Commission, 2 concerned the enforcement of Commission cease-and-desist orders, 1 was a criminal contempt proceeding, and 1 case involved a petition by the Commission to obtain access to evidence adduced before a grand jury.

The Division represented the Commission in 10 of the 11 U.S. courts of appeals, and in 11 U.S. district courts. It prepared and filed 29 briefs and memorandums and assisted in the preparation of 26 other briefs filed on the Commission's behalf by the Department of Justice. Twenty-nine arguments were made by the Division staff and it assisted in the presentation of 11 others by the Department of Justice. In addition, the Division was involved in 8 proceedings to obtain court orders enforcing Commission subpenas, initiated 1 prosecution for criminal contempt, and prepared and filed approximately 225 other court papers.

Current workload

The workload of the Division is variable, and since most of it results from actions initiated by other parties, the timing is determined by factors over which it has little control. As in each of the recent prior fiscal years, the load in fiscal 1963 was heavier than in the previous year, and reached a new high. There was a maximum of 19 attorneys on the staff to handle the work, and as a result much night and weekend overtime was needed.

At the beginning of fiscal 1964 the workload included 70 pending court cases, an increase of 14 over the previous year. These included 57 in courts of appeals and 13 in district courts, consisting of 39 restraint of trade, and 14 deceptive practice cases, 12 suits for injunctive or other relief against the Commission, 1 suit by the Commission to compel compliance with an order requiring a special statistical report, 1 criminal contempt proceeding, 1 subpena enforcement action, 1 civil penalty proceeding, and 1 suit by the Commission for a temporary injunction under section 13(a) of the Federal Trade Commission Act.

They included *Luria Brothers and Company*, docket 6156, with 17,000 pages of transcript and 1,300 exhibits; *Union Carbide*, docket 6826, with 11,800 pages of transcript and over 2,100 exhibits; *Firestone Tire & Rubber Co.*, docket 6487, with 8,000 pages of transcript and 700 exhibits; *Goodyear Tire & Rubber Co.*, docket 6486, with 5,500 pages of transcript and 500 exhibits; *The B. F. Goodrich Company*, docket 6485, with 4,500 pages of transcript and 375 exhibits; *Foremost Dairies*, docket 6495, with 5,500 pages of transcript and 1,500 exhibits; *The Borden Company*, docket 7129, with 4,000 pages of transcript and 5,600 pages of exhibits; *Brown Shoe Company, Inc.*, docket 7606, with 2,600 pages of transcript and 500 exhibits.

Workload expected in fiscal 1965

Information of a type which in the past has proved to be a reliable basis for predicting the future workload of the Division indicates that there will be a further large increase in fiscal 1965, resulting from these factors:

1. The long established steady increase in the number of cases processed by the Commission, together with increases in the investigational and trial staffs, which forecast further increases in the amount of litigation before the Commission. Since a fairly constant proportion of respondents in routine cases seek appellate review of adverse decisions, their increase is followed by a proportionate increase in the Division's appellate work.

2. The Commission's increased use of compulsory processes to obtain information, and its emphasis upon their enforcement. The present volume of such work is more than enough to occupy the full time of one Division attorney.

3. The steadily increasing number of injunction and declaratory judgment suits brought against the Commission in U.S. district courts, collaterally attacking its interlocutory actions in investigations and formal procedings. During the past fiscal year the Division has had to devote the equivalent of the full time of two attorneys to defense against such attacks.

The expenditures of this office unquestionably will be increased, and already have been increased by the new provision, 28 U.S.C. 1361, which permits such suits against the Commission in U.S. district courts other than the U.S. District Court for the District of Columbia. Since the enactment of this provision, on November 5, 1962, suits have been filed against the Commission in U.S. district courts in Dayton, Ohio, and Beaumont, Tex., which have required additional time and travel.

4. The large number of "big cases" expected to be undergoing court review during fiscal 1965. These cases are distinguished by voluminous records, complex and vigorously disputed legal and factual issues, masses of economic data, conflicting expert opinions, novel questions of law, and great financial importance to the respondents. It is the Division's experience and it is naturally to be expected that, because of the last mentioned factor, almost every respondent will exhaust appellate review of any adverse decision, no litigation expense will be spared, and review will entail intensive study and reanalysis of the entire record and reargument of every factual conclusion and legal proposition.

WORKLOAD ASSIGNMENT

Mr. EVINS. I note the work of your Division of Consent Orders was formerly carried on by trial examiners. You have put this in the General Counsel's Office?

Mr. DIXON. We did that for the primary reason, that the Commissioners could stay in these negotiations and free the hearing examiners to do the formal caseload, which gave us much better results. My goodness, we get better control and better orders, continuity, and everything.

Mr. EVINS. How many cases do you have in district courts and how many in appellate courts?

Mr. DIXON. About 71. They are listed there in the Appellate Section.

There are 55 in the appellate courts and 25 in the district courts.

Mr. EVINS. What is the status of your merger casework? This is an area of great importance. We have emphasized this several years. Do you have a lot of merger cases?

Mr. DIXON. Yes, we have, sir. We are always constantly reevaluating them so that we are hopeful we are using our talents where it is more in the public interest. We can keep so many of them alive. We are always behind in this area.

Mr. EVINS. If you took this work out of the Office of Trial Examiners the trial examiners would have less work.

Mr. DIXON. They are ready, sir. They do have less work but where we had a lag of 2 or 3 years to finish a 4- or 5-day hearing, now we are getting hearings completed, all the way to the Commission, within a year. We have killed much of the lag. The thing that President Kennedy talked about, regulatory lag, we pretty well have under control.

Mr. EVINS. I notice on page 41 you say:

> As of June 1963, there were 3,064 investigations pending in your operating bureaus. This represents an increase of 6.6 percent over the previous years.

You have told us about the cases in the court. What about the Division of litigation?

Mr. DIXON. The Division of Legislation?

Mr. EVINS. That is one of the amendments on the Hill?

Mr. DIXON. Yes, sir; we have an Assistant General Counsel that assists us in the preparation of our views on all pending legislation.

Mr. EVINS. Do you really have much to do in the way of the Trade Agreement Act? Do you really have much work to do in that Division?

Mr. DIXON. We do not at the current time, sir. We have a chief in charge of this thing. We have centered it because we only have 30-some-odd associations registered in the whole history of this act, but with this increased activity that is taking place in Europe we do not know which way this is going. As you know, there have been studies—the White House Conference on Export Trade that we participated in and I have been going to Europe at the request of the President and the Secretary of State twice a year, trying to stay abreast of the EEC and the OECD, but what is going to happen in this field, I cannot tell you.

HEARING EXAMINERS

Mr. EVINS. We will turn to hearing examiners.

We will place in the record pages 46, 47, and 48.

(The pages follow:)

Hearing examiners

	Allotment, fiscal year 1964		Requested, fiscal year 1965		Increase, fiscal year 1965	
	Positions	Amount	Positions	Amount	Positions	Amount
Personal services	39	$481,000	39	$492,000	----	$11,000
Travel	----	20,000	----	35,000	----	15,000
Total	39	501,000	39	527,000	----	26,000

HEARING EXAMINERS

Hearing examiners have complete charge of cases from the time the Commission issues its complaint until the initial decision is rendered. It is the duty of the examiners to hold pretrial conferences, conduct hearings, rule upon offers of proof, admissibility of evidence, and all procedural and other interlocutory motions; and make and file initial decisions in each proceeding.

The Commission's Rules of Practice have resulted in acceleration of trials, reduced the number of case assignments per hearing examiner and provided him the opportunity to hold consecutive hearings and continue to final disposition of the cases.

No increase in staff is requested in fiscal year 1965. However, an additional $11,000 is requested to provide for increased pay costs and $15,000 for restoration in travel funds.

Hearing examiners—Personnel as of Jan. 5, 1964

	Total	Attorneys	Clerical
Professional:			
GS-17	1	1	----
GS-16	6	6	----
GS-15	15	15	----
Stenographic, clerical, etc.	18	----	18
Total	40	22	18

Total annual salaries $488,245

Mr. EVINS. Here, again, I emphasize that you had 39 allotted positions and you are requesting 39.

You just testified you have taken some of the work away from the hearing examiners and transferred it to the Legal or Trial Division.

Mr. DIXON. There are 22 hearing examiners.

Mr. EVINS. You have 22 hearing examiners?

Mr. DIXON. That is correct, sir.

Mr. EVINS. How busy are they kept? Are they up with their dockets?

Mr. DIXON. Mr. Evins, our docketis becoming more current. Some of the older, more complicated cases still remain in spite of our tightened rules, which occasionally require extensions of time. However, as a general rule our hearing examiners are today in a position so that when a case goes to formal litigation it can be readily put on one of the examiners' dockets and once it gets there he is obligated to finish it completely.

Mr. EVINS. Who draws consent orders; hearing examiners?

Mr. DIXON. This is drawn in the operating bureau at the time we draw and send out a complaint. Going with that complaint is a proposed order. If the negotiations take place, they take place before this Consent Order Division, which is under our General Counsel, by and between the Commission's Counsel and the outside counsel. Then it is reported to us.

The Commission itself determines yes or no.

Mr. EVINS. Are there fewer assignments to hearing examiners today than a year ago?

Mr. DIXON. By all means, because we are settling more and more cases and the only thing left to them, Mr. Evins, are the litigable cases.

Mr. EVINS. You are asking for $11,000 to provide for pay increases in this Division, a $15,000 increase for travel funds. There is less assignment and less work.

Mr. DIXON. We had to curtail their travel from now in to July; we have had to be very careful with our money or else we would have to fire someone.

Mr. THOMAS. Give us a little bird's-eye view of the workload in there.

You have 22 trial examiners and 18 secretaries. What is the workload? Where is your sheet on that? It ought to be in the justification but it isn't.

Mr. DIXON. My chief hearing examiner——

Mr. GLENDENING. There are about 120 cases in litigation at the moment assigned to the hearing examiners.

Mr. THOMAS. How many cases each did your hearing examiners finish last year? Hearing examiners are indispensable. They are high grade men. Their civil service status is set by the Civil Service Commission. This group has played some favorable part in getting them upgraded. That was a couple of years ago. How many cases did they dispose of last year?

Mr. DIXON. I am remiss for not bringing it. I will send it to you. I get a monthly report on the status of where they are. You take a merger case that has lasted 5 years——

Mr. THOMAS. The secretary is overworked with those 45 people. You couldn't get that information together to put it in this budget.

Mr. DIXON. That is my fault. I have it on my desk. My chief hearing examiner is in the hospital. He would have given it to you today.

Mr. THOMAS. It ought to be in the budget.

Mr. DIXON. We will see that it is furnished.

(The information supplied follows:)

Office of Hearing Examiners disposition of cases

Consent settlements	10
Other disposition	14
Fiscal year 1963 total dispositions	128

BUREAU OF RESTRAINT OF TRADE

Mr. THOMAS. You have 202 people in this Bureau in 1964. You are asking for 199, a reduction of 3, but an increase in funds from $2,070,000 to $2,173,000; $103,000 increase. Why is this necessary?

Mr. DIXON. This would be to restore the reduction of funds for travel required this year and the restoration of funds for personal services that were necessarily cut this year. Also the additional cost of the pay raise in fiscal 1965.

Mr. EVINS. Division of Mergers goes up $117,000, Division of Restraint of Trade, $16,000, Division of Discriminatory Practices, up $24,000 and your compliance is up $16,000.

We have less personnel but the appropriations go up.

Mr. DIXON. That is correct, sir.

Mr. EVINS. Place in the record the text, pages 49 through the middle of page 53.

BUREAU OF RESTRAINT OF TRADE

This Bureau has the responsibility for all preliminary investigational activity in the antimonopoly field which includes general trade restraints under section 5 of the Federal Trade Commission Act and violations of sections 2, 3, 7, and 8 of the Clayton Act. All correspondence relating to these matters and all preliminary applications for complaint are received and processed by the Bureau. Decisions are made by this Bureau as to the matters which warrant investigation. Several techniques are used in conducting these investigations: (1) In some instances memorandums are forwarded to the Bureau of Field Operations outlining in detail the scope and area of investigations; (2) members of the staff of the Bureau of Restraint of Trade conduct field investigations for the purpose of interviewing and ascertaining the availability of prospective witnesses and obtaining documentary material; (3) they conduct investigations by informal questionnaires and correspondence; and (4) conduct investigations by the use of investigational hearings under the subpena power of section 9 of the Federal Trade Commission Act and the use of special reports under section 6(b) of that act.

As a result of the reorganization plan of July 1, 1961, this Bureau was also assigned the task of securing compliance with orders to cease and desist issued by the Commission. In this function, this Bureau passes upon reports of compliance filed initially and maintains surveillance over final orders for the purpose of assuring the continuance of compliance, conducts or supervises investigations of violations of orders, prepares such cases for civil penalty actions and assists in the penalty proceedings.

On March 23, 1961, the Attorney General of the United States forwarded to the Commission 56 cases in which decrees had been obtained by the Department of Justice under the Sherman Act. The Commission was requested to conduct appropriate investigations and report thereon to the Attorney General. These judgments, in most instances, involved multiple corporate defendants of major size. Twenty-four of these investigations have been completed and reports

with findings and conclusions of law have been forwarded to the Department of Justice. Eleven additional investigations have been completed and are now under study and review. In the remaining 21 field investigations are in various stages of completion.

It is contemplated that the major portion of the work on the remaining cases will be completed during the fiscal year 1964 and as this occurs the trained and experienced manpower will be shifted to compliance work on FTC cases which have been almost completely neglected during the past years. This neglect has not been by choice but by necessity.

The Division of Compliance, Bureau of Restraint of Trade, is faced with a staggering workload. Over 1,200 orders in the restraint-of-trade field have been issued which cover every conceivable type of trade restraint and antitrust violation and which transcend practically every industry and business of significance in our economy. These orders have been procured at tremendous expense to the taxpayer and unless they are militantly and periodically spot checked and enforced, where appropriate, the multimillion dollar cost which the public has had to withstand in the procurement of these orders is a total waste. This Division has an unmanageable workload in excess of 40 active cases assigned to any given attorney. The volume of complaints and inquiries received on an almost daily basis with respect to outstanding orders would in and of themselves practically consume the time of the presently available manpower in this area. Superimposed on this, however, is the demanding task of reviewing complex and technical reports of compliance, writing advisory opinions, conferring with interested parties and their counsel, the initiation and review of field investigations, the conduct of investigational hearings, and the preparation and trial of civil penalty cases. The tragic waste and inefficiency of having an undermanned and ineffective Compliance Division must be eliminated by the reassignment of attorneys experienced in this highly technical field as fast as the work on Attorney General cases is completed.

The Bureau is continually faced with the problem of policing outstanding orders directed against trade restraints. Violations of antitrust orders are not readily apparent to competitors and rarely discernible to consumers. As a result, investigating compliance with orders is a task which falls squarely upon the Bureau itself. Policing of such orders furthermore is a formidable task since such orders cover extremely complex pricing and distribution practices generally by multiple respondents. Consequently, the processing of reports of compliance is the key factor in insuring that respondents subject to orders eliminate from their methods of operation those acts and practices prohibited by the Commission's orders. The procurement and processing of compliance reports is a continual process which insures that future business methods will be consistent with the provisions of the orders.

In addition to directing more vigorous compliance measures with respect to matters involving possible violation of the Clayton Act as amended and restraint-of-trade matters under section 5 of the Federal Trade Commission Act, the Commission's "Procedure and Rules of Practice," effective August 1, 1963, provide for (1) advice to each respondent whether actions as set forth constitute compliance with the Commission's order and (2) that any respondent subject to a Commission order may request advice from the Commission as to whether a proposed course of action, if pursued by it, will constitute compliance with such order.

Accordingly, the Commission will be required to examine all of the facts and conduct investigations, where appropriate, of the activities of the respondents under order.

WORKLOAD, FISCAL YEAR 1963–64

During 1963, 1,309 applications for complaint were received. This was a reduction of about 10 percent from the previous year, but was substantially in excess of other recent years.

A concerted effort to reduce the backlog produced about a 10-percent reduction in pending investigations. These were brought down from a high of 1,694 to 1,531 at the close of the fiscal year.

The number of formal complaints issued by the Commission is increasing. Such increase is related to the policy of striking at violations of law on an industrywide basis, after investigation discloses that large numbers of industry members are following the identical practices.

A few of the principal industries which this Bureau has investigated, and on the basis of such investigation, will keep under close scrutiny, on an industry-

wide basis include the following: (1) processors and retail chain grocery distributors of fluid milk; (2) manufacturers of men's, women's, and children's wearing apparel; (3) the buying practices of chain department stores; (4) the practices in the gasoline industry; and (5) the trends and practices in the cement industry.

The Bureau began investigations of milk price wars as a result of numerous complaints from various sections of the country that milk was being used as a "loss leader" by grocery chains and that the price of milk was temporarily decreased for the purpose of driving out the competition of the small producer-distributors. Field investigations were made and were followed by investigational hearings in numerous metropolitan areas throughout the country. The results of the milk price war investigations are currently being analyzed by the staff. A continuing surveillance of milk price structures is maintained and investigations in the critical areas will be subjected to immediate investigation to protect the public interest.

In addition to the milk price wars, the Bureau has been active in proscribing price discriminatory practices by certain of the major milk companies. As a result, the Commission issued cease and desist orders in *Foremost Dairies, Inc.*, docket No. 7475, in which Foremost was prohibited from discriminating in the price of fluid milk to favored customers and against the *Borden Company*, docket No. 7129, in which Borden was prohibited from discriminating in price between purchasers of its Borden label and private label brand evaporated milk. The attempted changes in the milk industry, by accretions of markets through mergers and acquisitions, as a result of an industrywide approach, have been slowed down. The Bureau's responsibility in the enforcement of section 7 of the Clayton Act continues in its rightful emphasis.

In the milk industry, which has experienced numerous acquisitions, the Commission had previously issued complaints against four of the major companies. During the fiscal year 1962, the case against *Foremost Dairies*, resulted in an order of divestiture. In fiscal year 1963 after completion of the Commission's case-in-chief in *National Dairy Products Corporation*, the respondent entered into a consent order settlement. In addition to divestiture, the orders prohibit for a period of 10 years the making of any acquisition without prior approval of the Commission. The case against *Beatrice Foods Co.*, the trial of which was finished in fiscal year 1963, is awaiting the hearing examiner's decision. In the last of the four cases, the *Borden Company*, the Commission completed its case-in-chief during fiscal year 1963. Thus, after considerable expenditure of effort by the Bureau, an industrywide program is approaching its hoped-for results and completion.

During the fiscal year 1963 an industrywide program involving the cement industry and industries using cement was under development. The Commission has already found reason to believe that a substantial number of companies in this industry have engaged in practices violative of the law. The hearing examiner in *Permanente Cement Co., et al.*, issued an order of divestiture on November 30, 1963. This case challenged the acquisition by Permanente of another cement company and of a ready-mix concrete and aggregate business. Further, in this industry, the Commission issued a formal complaint against *Diamond Alkali Co.*, which concerned the merger of two cement companies. In still another case, the Commission issued its formal complaint against *Lone Star Cement Corp.*, charging illegal acquisitions in the cement industry. An earlier case against *Martin-Marietta*, was settled by consent agreement with an order of divestiture. Other investigations in this industry are underway and are being completed as rapidly as possible. This industry, as well as others, continues to receive close scrutiny. There is substantial basis for consideration of industry programs of this type in that effective relief may be obtained. More importantly, there is reason to believe that industry programs of this type may effectively stop merger trends and unlawful price discriminations.

The Bureau has pending at various stages of litigation some 10 complaints involving, with one exception, pricing practices of major oil companies. These are as follows:

(*a*) Sun Oil Co. (Jacksonville, Fla.), (*b*) Pure Oil Co., (*c*) Texaco, Inc., (*d*) Humble Oil & Refining Co., (*e*) American Oil Co., (*f*) Shell Oil Co., (*g*) Atlantic Refining Co., (*h*) Sun Oil Co. (Norfolk, Va.), (*i*) Standard Oil Co. (Indiana), (*j*) Crown Central Petroleum Corp.

COMPLAINTS

Mr. EVINS. We will insert the two tables at the bottom of page 54 on complaints and orders.

(The page follows:)

Although there is a slight increase in personnel in the current period 1960 through 1963, the increase in the number of complaints and orders issued is far greater in proportion than the increase in personnel. In fact, the activities by the staff in the restraint-of-trade field for the past several years have been tremendous as indicated by the number of complaints and orders issued during this period as follows:

	1963	1962	1961
COMPLAINTS			
Total [1]	230	49	121
FTC Act, section 5	10	8	18
Clayton Act, sec. 2	219	41	100
Clayton Act, sec. 3	0	0	2
Clayton Act, sec. 7	2	1	5
Clayton Act, sec. 8	0	0	1
ORDERS			
Total [1]	261	91	103
FTC Act, sec. 5	10	9	10
Clayton Act, sec. 2	250	74	91
Clayton Act, sec. 3		1	3
Clayton Act, sec. 7	5	8	2
Calyton Act, sec. 8			

[1] 2 or more acts may be included in 1 complaint or order.

Mr. THOMAS. Off the record.

(Discussion off the record.)

Mr. EVINS. This is interesting on page 56 [reading:]

During the course of the year, 943 acquisitions and mergers were given a preliminary examination by the Division of Mergers in cooperation with the Bureau of Economics. Such examinations consist principally of analyzing published financial, economic, and industrial data.

Mr. JONAS. Before you get too far away from the question, I asked the chairman, will you yield?

Mr. EVINS. Yes.

Mr. JONAS. Off the record.

(Discussion off the record.)

DIVISION OF GENERAL TRADE RESTRAINTS

Mr. EVINS. On Division of General Trade Restraints we will place in the record pages 57 and 58.

(The pages follow:)

DIVISION OF GENERAL TRADE RESTRAINTS

This Division has the responsibility for actions to be taken for all inquiries and applications for complaints which pertain to possible illegal restraints of trade under section 5 of the Federal Trade Commission Act. These duties have resulted in basic responsibility for investigation of said matters and the full responsibility for litigated matters evolving from the investigations.

The workload of this Division has increased substantially during the past year and is expected to continue in the future.

Current workload

One hundred and seventy investigations are now assigned to the Division for handling. Fifty-nine of these investigations are now undergoing review by the staff or awaiting final Commission action. The remaining 108 investigations have been forwarded to field offices for investigation.

It is thus apparent that at the beginning of fiscal year 1965 the Division of General Trade Restraints will have a substantially larger number of outstanding complaints. Whereas 10 complaints were issued in fiscal year 1963, there were at the close of that period 6 new complaints awaiting issuance. With the increase in number of investigations being returned from the field offices in fiscal year 1964 and with new investigations being initiated the caseload of investigations and pending complaints should be greatly increased during fiscal year 1964 and again in fiscal year 1965. It is anticipated that there will be 60 to 65 complaints being prosecuted by the Division in fiscal year 1965.

Increases requested fiscal 1965

Funds allocated to this Division for personal services were reduced by $30,000 in fiscal year 1964 and no restoration is requested in 1965, resulting in a reduction of three positions. However, the increased pay costs will require $9,000 and staff promotions $7,000, making a total of $16,000.

DIVISION OF DISCRIMINATORY PRACTICES

Mr. EVINS. On the Division of Discriminatory Practices, you talk about the workload of 1963 and 1964 and you say no increase in jobs in 1965 and an increase in funds of $24,000.

Mr. DIXON. We are loaded. This is one of our real prolific fields where we have a tremendous backlog.

Mr. EVINS. As to your workload which you have in 1963 and 1964, you say no increases in 1965.

Mr. DIXON. We asked for an increase from the Budget Bureau but did not receive it.

Mr. EVINS. We will place pages 59 through 61 into the record.

(The pages follow:)

DIVISION OF DISCRIMINATORY PRACTICES

The Division of Discriminatory Practices is responsible for the investigation and trial of cases involving violations of sections 2 and 3 of the Clayton Act, as amended, and cases brought under section 5 of the Federal Trade Commission Act against buyers for knowingly inducing and receiving discriminatory advertising and promotional allowances and services or facilities from suppliers.

The following are representative of some sections 2 and 5 (inducing and receiving discriminatory allowances) cases pending in various stages of litigation:

Moore Business Forms, Inc., the largest producer of business forms products in the United States, has been charged with discriminating in the prices charged to different purchasers of its products. It is alleged that unfavored customers of this concern are charged prices which exceed by 15 to 20 percent the prices charged to favored customers.

The following two complaints charging leading manufacturers of asphalt roofing materials with price discrimination were issued by the Commission:

In the first, it is alleged that the Lloyd A. Fry Roofing Co., a manufacturer of asphalt roofing and dry felt, has charged different prices to purchasers of its products of like grade and quality. These tactics have caused diversion of the business or substantial impairment of the profit of Fry's competitors. Net sales of this concern were $50,823,413 during 1958.

A related complaint has been filed against Celotex Corp., a manufacturer of building and insulating materials and one of the major producers of asphalt roofing products in the United States, with sales in excess of $10 million annually. In addition to charging that this concern has engaged in area price discrimination, the complaint alleges a violation of section 5 of the Federal Trade Commission Act.

Southern Bakeries Co., a concern with sales in 1958 of approximately $28 million, has been charged with granting discounts up to 10 percent from regular price to favored restaurant and food-serving customers and up to 8 percent from regular price to favored food-retailer customers, including large interstate chains.

Cannon Mills Co., whose sales exceeded $175 million in the year ending December 31, 1957, has allegedly discriminated in price between different purchasers of its products of like grade and quality.

In a recent complaint, National Dairy Products Corp., is charged with discriminating in price in the sale of jellies, preserves, and other products. The company's total sales of all products in 1960 were in excess of $1,000 million. The complaint alleged that National Dairy, through its Kraft Foods Division, sold jellies and preserves in four selected markets at a discount of 50 percent from the prices at which these products were sold throughout the country.

Furr's, Inc., a large retail grocery chain with stores located in Texas and New Mexico, having sales in excess of $90 million annually, is charged in a recent complaint with violation of section 5 of the Federal Trade Commission Act by knowingly inducing and receiving discriminatory promotional payments from some of its suppliers.

The Commission's policy of attacking violations on an industrywide basis continues to make substantial demands on the staff of this Division. No less than 16 attorneys, representing 40 percent of the available trial staff, are devoting full time to concentrated enforcement activities in industries involving (1) processors, and retail chainstore distributors of fluid milk; (2) manufacturers of men's, women's, and children's wearing apparel; (3) department stores and grocery chainstores; and (4) automotive replacement parts.

Workload fiscal year 1963

As a result of complaints from independent dairies and retailers of fluid milk throughout the country, investigational hearings were conducted in five large market areas. At these hearings, over 175 witnesses, representing dairies, retail grocery chains, and independent retailers, testified and presented documentary evidence concerning discriminatory pricing and the use of fluid milk as a "loss leader." In addition, field investigations concerning similar practices were conducted in 11 other areas.

As a result of extensive investigations and proceedings against discriminatory practices in the apparel industry, the Commission offered 248 manufacturers the opportunity to consent to a cease-and-desist order. Of this number, 163 manufacturers executed consent agreements which the Commission approved and orders prohibiting payment of discriminatory allowances in violation of section 2(d) have been issued. However, the effective dates of the orders have been postponed pending completion of investigations of 75 additional manufacturers. The manufacturers who refused to avail themselves of the consent order procedure will be the subject of formal proceedings.

In addition to their normal duties, the attorneys assigned to the wearing apparel cases have expended a considerable amount of time to advising, assisting, and processing compliance problems and reports submitted by the 163 consent manufacturers. Many of these manufacturers were without any clear conception of what constituted compliance with the law.

The magnitude of the caseload of the Division of Discriminatory Practices is reflected in the following statistical summary:

On June 30, 1963, there were pending in various states of investigation and review, 1,018 section 2 cases and 256 section 5 cases, involving charges of knowingly inducing and receiving discriminatory allowances by buyers.

During the fiscal year 1963, 76 section 2 cases were closed following investigation and review.

During fiscal year 1963, 219 section 2 complaints were issued as compared with 42 complaints issued in the previous year. This represents an increase of 421 percent. One section 5 complaints was issued charging a buyer with knowingly inducing and receiving discriminatory allowances.

In the fiscal year 1963, 249 section 2 cease-and-desist orders were issued, as compared with 74 similar orders issued in the previous year. This represents an increase of 236 percent.

Caseload for 1964

On July 1, 1963, there were pending in various stages of investigation or review, 1,018 section 2 cases and 256 section 5 cases involving inducing and receiving discriminatory allowances by buyers. A total of 90 section 2 cases

were pending in various stages of litigation. If the total caseload, consisting of 1,364 formal and informal cases, were equally divided among the 40 available attorneys, the average caseload per attorney would number 34 cases. This average is three to four times the caseload which an attorney can efficiently handle. The majority are obliged to and do put in many hours overtime, including Saturday, Sunday, and holidays, at home or at the office.

The attorneys, in addition to their normal duties relating to cases in investigation or litigation, handle a large volume of correspondence pertaining to applications for complaint and pending cases. It is estimated that during the year an excess of 4,500 correspondence matters were processed.

The length of time required to process a section 2 case, through investigation and trial, is frequently the cause of criticism by businessmen who seek relief from unlawful practices engaged in by competitors. Such criticism is understandable in view of the severe competitive disadvantage under which the law-abiding businessman must operate. When prompt relief is not forthcoming, the law-abiding businessman is confronted with two possible choices: (1) continued compliance with the law with resulting substantial business loss, or (2) adoption of the same illegal practices. If many businessmen in a given industry adopt the same practices, the Commission is then confronted with undertaking costly and time-consuming investigations and proceedings on an industrywide basis.

DIVISION OF COMPLIANCE

Mr. EVINS. Division of Compliance. The responsibilities of this Division encompass generally the insuring of compliance through procurement and processing of complete reports of compliance. We talked about this earlier. You propose to move into checking on compliance to more extensive degree in the next year than in the past.

Mr. DIXON. It would be wrong for me to leave any other impression other than to say to you that by the movement of these funds permanently over into here to do our work, that this is in some degree an increase. It is there, but we have been doing the work for somebody else. We want to keep on doing it but do it within our own responsibilities which we are not doing.

Mr. EVINS. You mention that the attorneys you had with the Department of Justice work are to be reassigned in compliance matters.

Mr. DIXON. That is correct, sir, in addition to the load I tried to describe on giving advice on outstanding orders.

Mr. EVINS. You could assign compliance matters in the Northwest Division and those in New Orleans, for instance, to another Division. You could use present personnel.

Mr. DIXON. This is what I want to do. Under good management practices, at any time when we are loaded here I can funnel these in and keep these people moving at full speed.

Mr. EVINS. How long would it take a man in New York to check on whether a company is complying with an order which was issued 5 years ago?

Mr. DIXON. It would depend on the type of order. In the case of price discrimination, not too long. Deceptive practices, not too long. But to check all producers, whether they are fixing prices, or the cement order of 1948——

Mr. EVINS. How many cases did you check on for the Department of Justice?

Mr. DIXON. Fifty-six, but many were more than one.

Mr. EVINS. How long did it take to check on those 56.

Mr. DIXON. This is the third year, sir.

Mr. EVINS. Those are extremely big and important cases.

Mr. DIXON. They were the important cases they had tried within the last 20 years and it cost literally millions of dollars to build the cases.

Mr. EVINS. After you have done that, have you not broken the back of this compliance checking work?

Mr. DIXON. For Justice we did this. I have a clipping I should show you. This shows you that there is a grand jury indicting a contractor's group in New Orleans. This came out of the money you gave us. This has been sitting there for years. We developed it. This is the grand jury indictment. Examples are coming like this.

Mr. EVINS. How many cases did you investigate for Justice?

Mr. DIXON. Fifty-six.

Mr. EVINS. One in New Orleans is in the courts. How many actions has Justice taken?

Mr. DIXON. I do not know, sir. They have written us letters on some. We found nothing on some. Of course, in those they did nothing. We made some reports of them. Others are in stages of study before going to the grand jury.

Mr. THOMAS. They ought to do their own investigation. Why all this lost motion? Let them do their own investigating. People who tried the case are best qualified to check. If you take it up, your judgment does not prevail, it is their judgment. Let us get rid of this and get it back to Justice. It makes sense, you know it, I know it.

BUREAU OF DECEPTIVE PRACTICES

Mr. EVINS. Bureau of Deceptive Practices. In 1964 you had a total of 124 employees in the Division, and for 1965 you are requesting 127 employees, an increase of 3, with an increase of $122,000. You again point out mandatory pay increases, staff promotions, and travel are the reasons for these increases.

Mr. DIXON. Three additional employees. That is where the three extra come in.

Mr. EVINS. Insert pages 69 through 73.

(The pages follow:)

Bureau of Deceptive Practices

The Bureau of Deceptive Practices performs the investigative, prosecutive, and compliance functions involved in the enforcement of sections 5 and 12 of the Federal Trade Commission Act, to prevent false advertising, misbranding, and other unfair methods of competition and unfair or deceptive acts or practices in commerce. The responsibility to prevent use of deceptive practices extends to all types of goods and services and all business concerns engaged in commerce, excepting those which by specific statute are regulated by other Federal agencies. The Bureau also has specific responsibility to prevent false advertising of goods, drugs, therapeutic devices and cosmetics and monitors radio, television, and printed advertising to detect false and misleading advertisements.

Consumers and small businessmen are protected from being injured by unfair and deceptive commercial practices.

The Bureau consists of the Office of the Director and five divisions: Division of Food and Drug Advertising, Division of General Advertising, Division of General Practices, Division of Scientific Opinions, and Divison of Compliance. The consumer relations representative of the Commission is in this Bureau.

The Bureau's work arises mainly from letters of complaint from members of the public who feel they have been deceived, or businessmen who are aggrieved by practices of their competitors. Many such matters originate through correspondence from Members of Congress, congressional committees, better business bureaus, trade associations, or other governmental agencies. Much of the Bureau's work arises from advertisements observed and set aside as questionable in the Bureau's continuing scrutiny of radio, television, and printed advertising.

Notwithstanding large additional areas of indicated consumer deception needing attention, backlogs of work, and the limited staff not able to achieve prompt and equitable corrective actions, especially in dealing with industrywide practices, requested increases in 1965 provide mainly for restoration of 1964 reductions, mandatory pay raise costs, staff promotions, travel, and other cost restorations and only three additional positions—two attorneys in the Division of Food and Drug Advertising and one medical officer in the Division of Scientific Opinions. The critical need for these new positions is heightened by the Commission's responsibilities and program concerning the advertising and labeling of cigarettes.

Increases requested for Bureau operations are summarized in the following table:

Personal services:	
Restoration of reductions in 1964	$17,000
Pay increase costs in 1965	31,000
Staff promotions	19,000
Increased positions—2 attorneys and 1 medical officer	24,000
Total personal services	91,000
Restoration of 1964 reduction in travel funds	13,000
Restoration of 1964 reduction for clinical testing, witness fees, and stenographic reporting	18,000
Total increase	122,000

Program for Fiscal Year 1964 and 1965

To prevent representations which, if false, could cause injury to the health or personal safety of the uses of the advertised product will be the No. 1 target of the Commission's deceptive practices program during the remainder of fiscal year 1964 and fiscal year 1965. Filching of money from the consumer's pocketbook through use of flagrant deception in the sale of products such as food, household equipment, home improvements, and other necessaries of life of special significance to low-income families and the aged, will be next in priority. National and regional advertising will be given close scrutiny since it affects larger numbers of the public. Flagrancy of practice and any past history of violation will be considered in allocating effort. Advertising or promotional practices which, through deception, divert trade from or otherwise injure small businessmen also will be given priority of attention. Projects now underway or planned to be pursued during this period include the following:

Health hazards of smoking cigarettes

Under its statutory authority and responsibility to prevent "unfair or deceptive acts or practices in commerce" the Commission has undertaken trade regulation rule proceedings in regard to the advertising and labeling of cigarettes. This action may result in requiring the cigarette industry to disclose the dangers to health risked by smokers. The Commission undertook this action because it has reason to believe that much current cigarette advertising may be unlawfully misrepresenting or concealing the health hazards of smoking cigarettes any may prevent or hinder large numbers of consumers from recognizing and appreciating the nature and extent of the substantial health hazard of cigarette smoking. This project is expected to require a massive effort by legal and scientific personnel of the Bureau of Deceptive Practices.

Arthritis, rheumatism, and pain relief drugs

Arthritis, rheumatism, and headache sufferers continue to be barraged with what are suspected to be grossly false and misleading advertisements as to efficacy of pain-relieving drugs. It would be difficult to estimate how much of the $360 million annually spent by consumers for such products is a waste, in the sense that the products do not provide the advertised benefits. The Commission desires to continue its aggressive program of testing and evaluating these products, to bring this type of advertising under control.

Air-purifier advertising

Filters offered to purify the air and thus remove germs and prevent disease are being investigated on an industrywide basis. This investigation is nearing completion, with determination soon to be made as to whether formal action will be undertaken; it is expected that such action would, if contested, extend into fiscal year 1965.

Hemorrhoid-product advertising

An industrywide investigation of advertising of hemorrhoid products is nearing completion, with decision soon to be made on whether formal action will be undertaken; this action probably would, if contested, extend into fiscal year 1965.

Food-supplement advertising

Quackery in the advertising of food supplements has reached mammoth proportions, with some $200 million of such products being sold annually. An industrywide project to curb such advertising is underway, with major litigation now in progress and additional cases of this type being investigated. The purpose is to prevent the offering of such products, especially mineral and vitamin preparations, with exaggerated claims of benefit to sufferers from nervousness, tiredness, and anemia.

Monitoring of advertising

The Commission will intensify its monitoring of advertising to detect unwarranted claims affecting the public health and safety, and advertising of questionable character involving economic deception, concentrating on advertisements of regional or national coverage. Ninety investigations were instituted from this source during fiscal year 1963, and 43 thus far in fiscal year 1964; in addition, advertisements observed in the survey were of inestimable help in large numbers of other investigations.

Safety of products

The Commission is becoming increasingly concerned with its role in protecting the public from undisclosed hazards in use of toys and other mechanical products. It is expected that a larger proportion of its casework will be in this area during the coming year. We have relied upon consumer complaints to apprise us of such dangers, as no inspection staff to detect potential violations has been provided.

Radio and television ratings

A considerable part of the staff continues to be involved on cases involving indicated misrepresentations as to reliability and meaning of radio and television ratings. These ratings to a considerable extent influence the types and quality of programs that will reach the public. This work will extend through fiscal year 1965.

Insurance advertising

With the Commission's jurisdiction over mail-order advertising of insurance having been clearly established, an increasing proportion of staff time must now be devoted to this work; and it is expected that this trend will continue through fiscal year 1965.

Home-improvement products

Homeowners and small businessmen continue to be the victims of widespread deception in their purchases of paints, roof coatings, storm windows, awnings, carports, patios, and other home repair and home improvement products. This type of action will continue to require large expenditures of staff time through fiscal year 1965.

Correspondence schools and vending machines

Exaggerated earnings claims and false offers of employment to lure the poor and the aged into buying correspondence courses or vending-machine routes are a continuing problem. Appreciable numbers of such cases are expected to be brought to completion in fiscal year 1965.

Quality, quantity, composition, and performance of products

Misrepresentations of the nature, quality, quantity, performance, or other characteristics of products, or the conditions of the offer, come to the attention of the Commission by the hundreds each year. We expect this to continue through fiscal year 1965. We will endeavor to deal with all such matters but only when they involve substantial use of the questioned practice in commerce and when it appears that substantial numbers of the public are likely to be deceived. As you know, the Commission's responsibility to prevent deception in the public interest extends, with few exceptions, to all goods and services sold in commerce.

Bureau of Textiles and Furs

Mr. Evins. Bureau of Textiles and Furs. The chart on page 95 shows you had 95 personnel last year, you want 120 next year, a 25 increase for textiles and furs.

Mr. Dixon. That is correct.

Mr. Evins. How long does it take to send an investigator out to check whether or not there is an apparent violation of the Wool Products Labeling Act?

Mr. Dixon. This is a constant thing. I tried to describe the location across the country where they are going at all levels of the industry—the manufacturer, the wholesaler, the retailer—seeing if the labels are properly attached and are descriptive, and investigating required invoicing procedures. If we pick up the information that indicates there is a violation, we will develop it up to the point where we have a complaint.

Mr. Thomas. I suggest you read the last two paragraphs into the record on page 100.

Mr. Evins (reading):

Only 40 cases were reopened to check on the respondents' compliance with Commission orders. Reports of routine inspections coming in from the Bureau's inspectors in the field frequently suggest the need for detailed compliance investigations. In some instances where reports are filed showing apparent compliance, a check should be made to ascertain actual compliance. In these two areas effective enforcement requires a substantial increase in activity.

Of the 135 compliance matters on hand at the close of fiscal 1963, 54 of them represent a backlog from the 141 cases which were pending at the time the Bureau was set up in July 1961. Though the backlog was reduced substantially during the year, most of the 54 cases are in the category of voluminous investigations which require detailed study and analysis. The limited staff of this Division has not been able to find the time necessary to effect such study and analysis.

Mr. THOMAS. It is a pretty small workload for 100 people.

Mr. EVINS. Forty cases.

Mr. JONAS. Fifty-four carried over from 1961.

Mr. DIXON. That is just some of the compliance matters needing attention.

Mr. THOMAS. I know, but it looks like a small workload. You only have 135 complaints. It looks to me like you are doing pretty well.

Mr. DIXON. 135 compliance matters, not complaints. We have only one man available for assignment to this work. We had more complaints than that.

Mr. THOMAS. That is only 135 that you have to take some positive action on. You point out something to the people and they come up with a reasonable answer for you.

Mr. DIXON. We are not talking about inspections, we are talking about after orders to cease and desist have been issued, checking back to see if that order has been lived up to.

Mr. EVINS. You want 8 personnel in the Division of Enforcement and 17 in the Division of Regulations. Who are they under?

Mr. DIXON. Mr. Stringer. These are 8 lawyers, 17 inspectors.

Mr. EVINS. We will place pages 95 through 100 and 102 and 105 in the record.

(The pages follow:)

BUREAU OF TEXTILES AND FURS

The Bureau is charged with the administration and enforcement of four separate and important pieces of consumer legislation; the Wool Products Labeling Act of 1939, the Fur Products Labeling Act of 1951, the Flammable Fabrics Act of 1953, and the Textile Fiber Products Identification Act of 1958.

The wool, fur, and textile acts each require affirmative labeling disclosures. The fur act further requires affirmative invoicing, while disclosures made in the advertising under the fur and textile acts are regulated. The Flammable Fabrics Act prohibits the introduction or movement in interstate commerce of dangerously flammable wearing apparel and fabrics intended for use therein.

Unlike other statutes administered by the Commission, compliance with the terms of these four acts must be continuously policed by the Bureau to assure that members of industry are living up to their requirements and consumers are afforded the protection intended by Congress. The task of administering the wool, textile, and fur acts is reflected by the tremendous size of the textile industry. Over 100 different industries are engaged in the manufacture of textile products subject to the provisions of these statutes. Each year the sales of textile products covered by the acts run into billions of dollars. Next to food and shelter, textile products, including wearing apparel and household furnishings, constitute the most important segment of our national economy.

Additionally, approximately 175,000 distributors of fur products are subject to the fur act.

At present, as for some years past, this country is importing tremendous quantities of wool and nonwool fabrics and garments. The foreign mills and manufacturers are not always cognizant of the labeling and invoicing requirements under our textile act, and, as a result, a constant check must be made of these products. Further, outside of the United States the generic names of fibers sometimes differ from those set forth in our laws and regulations. Since foreign manufacturers are outside the jurisdiction of the Federal Trade Commission, insofar as inspection of plants and records are concerned, this Bureau must work closely with the Bureau of Customs officials in an examination and sampling program of imported textile products. As a result of this cooperation the entries of many misbranded items have been stopped and corrected before the merchandise entered the American market.

For the past year, simulated fur fabrics made from natural and manmade fibers have been extremely popular. The advertising and labeling of garments made from these fabrics has presented a considerable problem to the Bureau as some manufacturers have concocted trade names and descriptions for their products that are misleading to the public, and are contrary to the Textile Fiber Products Identification Act, and the Commission decisions under the Federal Trade Commission Act.

Compliance with the Fur Products Labeling Act and the regulations thereunder has shown an improvement over the past year but there is still a vast amount of education necessary before full compliance can be expected. The use of fictitious and false comparative prices is still prevalent among many retail furriers.

In carrying out its enforcement under the Wool, Fur, Flammable Fabrics, and Textile Acts the Bureau drafts substantitive rules and regulations under each of these statutes. Under the Textile Act, generic names for manmade fibers are established. Also, it maintains a fur products name guide under the Fur Act,

Nearly 38,000 registered identification numbers have been issued under the Wool, Fur, and Textile Acts for identification purposes in connection with the required labeling of products subject to these statutes. In addition, a public register is maintained containing thousands of continuing guarantees filed with the Commission under these four acts.

The Bureau plans and supervises a large nationwide compliance, inspection, and industry counseling program in its administration of these consumer laws. It furnishes expert legal and technical advice regarding the requirements of the laws and their respective rules and regulations. It renders opinions and interpretations to industry and the consuming public under the various statutes. An effective educational and orientation program is carried on in an effort to acquaint industry with the requirements of the laws and with consumers regarding the benefits of the legislation.

Every effort is made to maintain voluntary compliance with the laws without the need of costly litigation. However, when circumstances indicate voluntary compliance cannot be obtained or that violations appear deliberate, an effective and firm enforcement program leading toward the issuance by the Commission of cease-and-desist orders is followed.

In addition, the Bureau handles the compliance work of all orders to cease and desist issued under these acts. The Commission now has outstanding more than 850 cease-and-desist orders against concerns charged with violating the Wood, Fur, Flammable Fabrics, and Textile Acts.

These important functions are carried out under the direction of the Bureau Director by two divisions: the Division of Regulation and the Division of Enforcement.

The Textile Fiber Products Identification Act has been in effect since March 3, 1960, and it is most necessary that a highly effective enforcement program of this important legislation be carried on. The scope of the textile act is far broader than the combined scope of the other three pieces of consumer legislation administered by the Commission. Generally speaking, the act extends to all textile transactions throughout the United States and its territories. From past experience under the Wool, Fur, and Flammable Fabrics Acts, the first few years are the most difficult in administering an act of this type and this Bureau is still assisting the textile industry to get its house in order.

Increase requested for travel

An increase of $35,000 is requested for travel funds for the entire Bureau of Textiles and Furs which is a restoration of a reduction necessary in 1964 because of increased pay costs.

OFFICE OF THE DIRECTOR

The Office of the Director is requesting no increase in its staff for fiscal year 1965. An increase of $1,000 is requested for the cost of the pay raise and $4,000 to restore reduction in funds made necessary by reduced appropriations.

DIVISION OF ENFORCEMENT

This Division is charged with the responsibility of investigation and prosecution of serious violations of the Wool, Fur, Textile, and Flammable Fabrics Acts. Further, the Division of Enforcement includes a compliance section which polices all of the Commission's cease-and-desist orders under each of these acts.

Violations of the acts discovered through inspection procedures of the Bureau of Textiles and Furs or received by complaint from sources outside of the Commission, which when analyzed appear to be of a serious nature, are assigned an investigational number and the matter is referred to this Division. This case is assigned to a trial attorney who is responsible for the subsequent prosecution of the case. Generally, the case is forwarded via the Bureau of Field Operations to trained field investigators with a detailed memorandum outlining the scope and details of the investigation. When the report of investigation is received from, the field, a determination is made as to whether there is sufficient evidence to justify a recommendation to the Commission that a complaint issue. If the necessary evidence is lacking, a recommendation is made that the matter be closed. If a complaint is recommended and issued, the trial attorney prepares and handles the litigative phases of the matter before the Commission.

In those cases in which a consent order is offered to the respondent this Division assists the Office of Consent Orders in settlement negotiations. Further, in those instances where injunctions and condemnation proceedings are believed necessary, such are recommended to the Commission and upon approval of the recommendation the attorneys of the Enforcement Division handle these matters in the U.S. district courts. In addition, if the violations are willful and a criminal prosecution appears to be warranted, such recommendations are made to the Commission. If the Commission concurs and the case is referred to the Department of Justice, a trial memorandum is prepared, forms of information and other essential papers and the attorneys assist the Department of Justice and the U.S. attorneys in every way possible with the prosecution of the matter.

Attention is called to the fact that in most instances, the consuming public is the direct beneficiary of the efforts of this Division since most of the cases processed under the acts administered involve misrepresentation of the consuming public of the contents or characteristics of wool, textile, or fur products. During the past year increasing attention has been given to the use of fictitious prices or false and deceptive comparative prices and savings claims. Orders issued correcting such violations have the effect not only of protecting the immediate customers of the respondent against whom the order was issued but also the customers of competitive firms since these orders serve as a guide and notice to other firms to correct their practices. Increasing the staff would have an immediate effect on the consuming public in that the area of enforcement could be broadened and the direction of enforcement expanded to include practices which at present cannot be adequately policed. As an example, it is pointed out that the importation of woolen fabrics and textile fabrics during the past few years has increased significantly. Such importations have placed a tremendous competitive burden upon the domestic producers of woolen and textile fabrics. When imported fabrics arrive in this country misbranded as to the fiber content and are placed upon the market, this burden is compounded and immeasurable damage is done to domestic industries and to the consuming public. While this

Division has attempted to curb these practices the importation of misbranded fabrics is increasing so rapidly that we are unable to properly police this phase with our present staff.

Workload, fiscal year 1963

During fiscal year 1963, the Division of Enforcement processed 189 cases either by the issuance of an order, a recommendation for complaint, or by a closing recommendation. In the first 6 months of fiscal year 1964 there were 54 cases in which the Commission issued an order or complaint in addition to 53 cases that were forwarded with a recommendation that they be closed making 107 matters disposed of as against 189 during the 12 months of fiscal year 1963.

During fiscal year 1963 the Commission issued 193 deceptive practice cease-and-desist orders. This includes 10 under the Wool Act, 47 under the Fur Act, 9 under the Textile Act, and 9 under the Flammable Fabrics Act, for a total of 75 cases. The Bureau of Textiles and Furs accounted for 38.3 percent of the deceptive practice orders issued by the Commission during the period.

The Commission issued 8 orders under the Wool, 30 under the Fur, 3 under the Textile, and 13 under the Flammable Fabrics Acts, for a total of 54 orders during the first 6 months of fiscal year 1964 as against 75 orders in the whole of fiscal year 1963. Further, during this period 125 new cases were docketed for investigation as against 154 new cases for full fiscal year 1963.

The Compliance Section of the Division of Enforcement consists of three attorneys engaged in obtaining compliance with all new orders as they are issued under the four statutes administered by the Bureau as well as in policing such old orders as require checking in special circumstances.

At the commencement of fiscal 1963, there were pending 187 active compliance cases in various categories. To this there were added during the year 75 new orders and 40 cases which were reopened, a total of 302 compliance matters. Striking from this latter figure the cases which were closed during the year the Division commenced fiscal 1964 with 135 active compliance matters, a net decrease of 28 percent for the year. Whereas the fiscal year of 1963 closed with 135 active compliance matters pending there were 152 at the end of the first 6 months of fiscal year 1964, although 44 cases were disposed of during this period. The backward slide in this Section is due to the fact that three attorneys cannot handle the volume of work arising from Commission orders under the Wool, Fur, Textile, and Flammable Fabrics Acts. Many matters that would ordinarily be investigated by the Compliance Section presently must be passed over due to lack of personnel.

Though in numbers there has been a decrease in caseload, some areas of the Division's compliance activity have necessarily suffered for want of additional personnel. As of July 1, 1963, there were on hand 48 compliance investigations to be analyzed, 20 of them being completed civil penalty investigations. During the year four civil penalty cases were prepared with drafts of complaint and fully documented trial memorandums, reported to the Commission and certified to the Department of Justice, but that represented but a small percentage of the civil penalty cases which could have been completed had the personnel been available.

Only 40 cases were reopened to check on the respondents' compliance with Commission orders. Reports of routine inspections coming in from the Bureau's inspectors in the field frequently suggest the need for detailed compliance investigations. In some instances where reports are filed showing apparent compliance, a check should be made to ascertain actual compliance. In these two areas effective enforcement requires a substantial increase in activity.

Of the 135 compliance matters on hand at the close of fiscal 1963, 54 of them represent a backlog from the 141 cases which were pending at the time the Bureau was set up in July 1961. Though the backlog was reduced substantially during the year, most of the 54 cases are in the category of voluminous investigations which require detailed study and analysis. The limited staff of this

Division has not been able to find the time necessary to effect such study and analysis.

Bureau of Field Operations

Mr. Evins. The Bureau of Field Operations. We discussed this earlier. There are 10 branch offices and one in the Washington area, making 11. You have 288 in the field now and you are asking for 288 in the field, no increase in personnel. You ask an increase of $151,250. It seems to me this is an area where if there were an increase, it would be in the field. Could you not do your checking of your compliance in the field?

Mr. Dixon. That is where it is.

Mr. Evins. Those operations do not show an increase.

Mr. Dixon. We did not get any approved. That is the reason it does not show any. We want these compliance people that are in the field now to move on to compliance work for the Commission. We will keep them there and we will use them there as teams.

Mr. Evins. We will put pages 107 through 111 in the record.

(The pages follow:)

BUREAU OF FIELD OPERATIONS

The Bureau of Field Operations, through staffs of attorneys located in 11 field offices and 1 suboffice, performs all field investigative work for the Commission, including the holding of investigational hearings and the taking of depositions. In addition to this work, attorneys in the field offices are required to (1) negotiate for the settlement of cases by administrative treatment under rule 1.21 of the Commission's Rules of Practice; (2) negotiate with proposed respondents for consent settlement of cases at the investigational stage under rule 1.42 of its rules; (3) participate in the trial of litigated cases; and (4) act as trial counsel in some instances under the general supervision of the enforcement bureaus. Every investigation conducted by the Bureau of Field Operations is based upon a request received from the Bureaus of (1) Restraint of Trade; (2) Deceptive Practices; (3) Textiles and Furs; and (4) from the Commission itself. Files are submitted to this Bureau for the purpose of having its legal staff develop all facts, evidence, and information essential to a proper determination as to whether there has been a violation or violations of any of the statutes administered by the Commission and, if so, the exact nature and extent of such violations.

The Bureau of Field Operations, in addition to carrying out the functions described above, conducts investigations to determine whether respondents named in formal cease-and-desist orders are complying with the provisions of such orders. Wherever violations are discovered this Bureau has the responsibility for acquiring information and evidence in suitable form (usually affidavits and attached documents) for certification to the Attorney General for initiation of civil penalty action in the U.S. district courts under section 16 of the Federal Trade Commission Act. Investigations of this nature (compliance) are being requested of this Bureau in ever-increasing volume, primarily due to the responsibility of the Commission for the policing and enforcement of the more than 3,000 orders to cease and desist entered by it over the past 20 years. Many such orders involve whole industries and prohibit the usual restraints of trade, such as price fixing, boycott, allocation of customers, etc.

Work performed, fiscal year 1963

The fiscal year 1963 began with a pending workload of 839 cases in the field offices. During the year 1,184 cases were added to those already pending. Thus, there was a total of 2,023 numbered cases pending in the field offices for investigation under the Federal Trade Commission, Clayton, Textile, Wool, Fur, and Flammable Fabrics Acts. Many of these matters required complete investigations of the practices of an entire industry. Such investigations are extremely time consuming and require use of extensive manpower. Of the 1,235 investigations completed during fiscal 1963, 456 were in the restraint-of-trade field, and 779 were in the deceptive-practices and textile-and-fur fields.

At the close of the fiscal year 788 cases were pending in the field offices, 361 of which were in the restraint-of-trade field, 371 in the deceptive-practice field, and 56 in the field of textiles and furs. During the first 6 months of fiscal year 1964, 569 of these cases were completed.

In addition to performing the foregoing investigational functions, attorneys on the staff of the Bureau of Field Operations conducted negotiations for consent settlements in 27 cases, participated directly in 17 investigational hearings and in the trial of a number of litigated cases. They also assumed responsibility for the trial of 54 cases in the restraint-of-trade field.

Workload in fiscal year 1964

It is estimated that the Bureau of Field Operations will be called upon to conduct approximately 2,200 investigations during fiscal 1964, in addition to which it must assume responsibility for the settlement of many cases by administrative treatment and the negotiation of consent settlements. Staff members will be required o engage in the preparation of proposed complaints and orders, to participate in the trial of an increasing number of litigated cases, and to assume primary responsibility for the trial of a limited number of cases. During the first 6 months of fiscal 1964, with its present personnel, the Bureau has completed 569 investigations, 45 of which entailed negotiations for consent settlement. In addition to this, the present personnel of this Bureau have participated in 10 hearings, assisted in the preparation of trial briefs in 8 matters, and have assumed primary responsibility for the trial of approximately 54 cases.

The increase in the number of cases for investigation in 1964 and 1965 will result from new plans and programs adopted by the Commission, particularly with reference to its duties and obligations in the enforcement of prohibitions contained in cease-and-desist orders already in existence.

Since it is now the policy of the Commission to attempt to obtain compliance with the laws administered by it on an industrywide basis, rather than on a basis of proceeding against individual firms, it can be expected that the requests for industrywide investigations will increase. An application for complaint involving only the alleged practices of a single firm may have to be expanded into an industrywide inquiry of the practices of all members of any industry who may be engaged in substantially similar practices. Such investigations necessarily expand the amount of work required in direct proportion to the number of firms competing in a single industry. However, industrywide action will unquestionably provide more equitable treatment to all members of the industry involved and result in far greater benefit to the public.

It is not reasonable to expect an increase in production of investigational cases by attorneys in the field offices, because of additional functions which they are now required to perform. With the staff available for the fiscal year 1964 it can be anticipated that an investigational case backlog of 800 to 1,000 cases will remain in the field offices at the end of that period.

Increases requested, fiscal year 1965

The Bureaus of Restraint of Trade, Deceptive Practices, and Textiles and Furs have initiated plans for intensified programs to effect more efficient, widespread, and uniform enforcement of laws administered by the Commission, particularly through industrywide action and vigorous surveillance of existing cease-and-desist orders. Additional manpower and travel funds will be required to carry out these programs and reduce an expected backlog of between 800 and 1,000 cases, and particularly since attorneys in the field offices are required to expeditiously handle investigations, including those of an industrywide nature, settle cases by administrative treatment, negotiate for consent settlements, participate in the trial of litigated cases, and in many instances assume full responsibility for the trial of cases in their area.

It may be expected that the vigorous and expanded programs of cease-and-desist-order enforcement already underway will result in increasing the number of requests for investigations of this nature. The courts, the Attorney General of the United States, and the Commission, require evidence in the form of documents and affidavits in all enforcement investigations intended to be used in civil penalty proceedings in the U.S. district courts. For this reason, such investigations are generally more time consuming and require a more extensive use of manpower than initial investigations where affidavit evidence is not required. Furthermore, many of these investigations are industrywide in nature.

Under the Commission's current rules for the conduct of litigated cases (sec. 3.16(d)) hearings must be promptly begun, held at one place, and continue without suspension or interruption until concluded. There is no opportunity to postpone, suspend, or delay hearings for the purpose of obtaining or developing, through investigation, additional facts and data to support any allegation of the

particular complaint involved. It is therefore imperative that in all investigations a compete set of facts be developed which not only will give the Commission reason to believe (as required by statute) that a violation has occurred, but will fully establish during an uninterrupted and continuous trial that a violation did occur. The facts established by the investigation must be sufficient to support any charge which may be stated in a complaint. A policy and procedure of this nature is desirable and results in the expedition of hearings conducted in adversary proceedings. However, attorneys in the field offices must assume a much heavier burden in establishing by oral and documentary evidence ample proof of violations in all cases, except those which they may be able to settle by administrative-treatment or consent-settlement procedure.

Field offices serve as a convenient local point to which businessmen in the area may go to seek and obtain advice, information, and counseling on suitable methods for effecting voluntary compliance with the laws administered by the Commission. The legal staffs of these offices not only render such services in the field offices of the Commission where they are located, but, as a result of their travels throughout the territory, they are in a position to and do render such service to innumerable businessmen at their places of business wherever located. No doubt such advice and counseling is invaluable to businessmen located in the area of each field office, and enables them to conduct their business in compliance with the trade regulation laws administered by the Commission.

No additional positions are requested in 1965 to accomplish the investigational needs of the enforcement programs heretofore mentioned during fiscal year 1965, although $126,250 for personal services is required to provide $12,250 restoration of the 1964 reduction, $59,000 for required pay-raise costs, and $55,000 for staff promotions in order that we may retain and utilize our current staff of trained attorneys.

In addition, a restoration of $25,000 for travel is requested.

Bureau of Industry Guidance

Mr. Evins. We will turn to Division of Industry Guidance. Who is the Chief of this Division?

Mr. Dixon. Mr. Yarley. Mr. Snow is here, the Assistant Director.

Mr. Evins. Are you giving good advice and guidance?

Mr. Snow. We try to.

Mr. Evins. You want two additional personnel in your Division next year?

Mr. Snow. Yes, sir.

Mr. Evins. You have 47 in 1964 and you want 49 in 1965. What are these two to be used for? Why are they necessary? Give us a quick justification?

Mr. Snow. They are requested for the Division of Trade Regulation Rules. The trade regulation rules procedure is a new procedure. To set up this new Division we stripped the staff of the older Trade Practice Conference Guides Division to furnish the nucleus of experienced attorneys. But as more and more matters were referred to the Division for handling under this new procedure, there is a dire need for additional attorneys. We now have 21 prospective proceedings pending, which would mean a workload that the present staff would not be able to handle.

Mr. Evins. Do you travel much with your staff in your Division?

Mr. Snow. No, sir.

Mr. Evins. You are requesting $4,000 increase for travel.

Mr. Snow. We feel there will be more travel necessary as a result of the expanded operations of the Bureau.

Mr. DIXON. This $4,000 is a restoration of funds we took away from him in 1964.

Mr. JONAS. I think you would need diplomats instead of lawyers.

Mr. SNOW. We do. It is sort of a combination job, it is public relations—educational as well as legal. However, the advice we give is legal advice.

Mr. EVINS. Mr. Reporter, place pages 114 and 115 in the record.

(The pages follow:)

Bureau of Industry Guidance

	Allotment, fiscal year 1964		Requested, fiscal year 1965		Increase, fiscal year 1965	
	Positions	Amount	Positions	Amount	Positions	Amount

Total	47	505,000	49	559,000	2	54,000

The Bureau of Industry Guidance administers the Commission's program for obtaning widespread voluntary law observance. This is accomplished through procedures designed to furnish guidance to businessmen as to legal requirements and to afford them opportunity to discontinue unlawful practices voluntarily without the expense and delay of litigation. More specifically, these procedures provide for (1) the promulgation of trade regulation rules upon which the Commission may rely in litigated cases, (2) the preparation of advisory opinions which are binding upon the Commission, and (3) the issuance and administration of trade practice conference rules and guides interpreting statutory provisions as applicable to practices of particular industries or practices common to many industries. These procedures are administered, respectively, by the Division of Trade Regulation Rules, the Division of Advisory Opinions, and the Division of Trade Practice Conferences and Guides.

Increases requested, fiscal 1965

Funds in the amount of $7,000 are requested for restoration of the reduction necessary in 1964, $13,000 for increased pay raise costs, $10,000 for staff promotions and $20,000 for two additional attorneys, a total of $50,000 for personal services.

In order to carry out this advisory and voluntary compliance program effectively, it is necessary to make a restoration of $4,000 for travel funds.

BUREAU OF ECONOMICS

Mr. EVINS. We will turn to the Bureau of Economics. This is under Dr. Mueller. We discussed his work this morning. There is no increase in personnel but an increase of $69,000 requested for next year. We will place pages 126, 127, and 128 in the record.

(The pages follow:)

Bureau of Economics

	Allotment, fiscal year 1964		Requested, fiscal year 1965		Increase, fiscal year 1965

BUREAU OF ECONOMICS

The functions of this Bureau are to give economic assistance and advice to the Commission in its investigational and trial work and to conduct economic studies in response to requests by the Congress, the President, or the Commission. This Bureau plays an increasingly important part in all phases of the Commission's law enforcement program and renders economic assistance to all of the operating bureaus of the Commission.

Increases requested, 1965

Funds in the amount of $43,000 are requested for restoration of required reduction in 1964, $19,000 for increased pay raise costs, and $3,000 for staff promotions.

An increase of $4,000 is requested for travel which is only a restoration of the reduction necessary in 1964.

OFFICE OF THE DIRECTOR

This Office exercises general supervision over the Bureau's three divisions. These responsibilities are exercised by the Director who is also the Commission's chief economist.

Also in this Office are the Bureau's Stenographic Section and Statistical Services Section. The latter unit, in addition to providing statistical assistance to the Bureau's Division of Economic Evidence and Division of Economic Reports, provides statistical and clerical assistance to other divisions of the Commission.

The increased costs for the pay raise will be $4,000 and $14,000 is requested to restore reduction in funds necessitated by reduced appropriations in 1964.

DIVISION OF ECONOMIC EVIDENCE

The Division of Economic Evidence has primary responsibility for providing economic assistance to the legal bureaus and divisions in connection with the investigation and trial of cases. In addition, the Division is responsible for identifying, recording, and developing information regarding mergers and acquisitions. The Division also reviews all section 6 surveys made in connection with merger investigations and cases and assists with the processing of such surveys.

During fiscal 1963, economists in the Division rendered economic assistance on 70 investigations and 30 formal cases. Of the 70 investigations, 63 were section 7 of the Clayton Act, 5 were section 5 of the Federal Trade Commission Act, and 2 were section 2 of the Robinson-Patman Act. Of the 30 formal cases, 24 were merger cases under section 7 of the Clayton Act, 2 were under section 5 of the Federal Trade Commission Act, and 4 involved both sections 2(a) of the Robinson-Patman Act and section 5 of the Federal Trade Commission Act.

As a part of the Commission's enforcement of section 7 of the Clayton Act more than 1,200 mergers are screened each year by the Division of Economic

Evidence. The preliminary steps in processing these mergers include the preparation of merger sheets containing some preliminary basic information showing products, sales, assets, etc., for the acquiring and acquired companies. The Division also compiles merger statistics which give some indication of the trend and the degree of merger activity in the economy.

Economic assistance is also required by attorneys working on general trade restraint matters, i.e., matters involving unfair methods of competition under section 5 of the FTC Act. Much of the work in this field involves problems of monopolies and restraint of trade where economic analysis may be of considerable assistance. In the past the Division of Economic Evidence has been able to meet less than one-half of the demand for economic assistance in section 5 work. There are at the present time several major monopoly and restraint of trade investigations in key industries where it has not been possible to assign any economists to assist attorneys despite repeated requests for such assistance in this area.

Assistance to attorneys working on price discrimination cases (Robinson-Patman) is another area where economic assistance has been insufficient to meet the Commission's needs. In this area economic analysis can serve as a valuable tool in connection with the selection of cases, and in the analysis and presentation of economic evidence.

As discussed above, (see discussion of compliance under restraint of trade) the Division of Compliance is confronted with an enormous volume of compliance matters relating to past Commission actions. Relief is obviously one of the most important considerations in the Commission's work, and, to be accomplished effectively, often requires a sophisticated economic analysis of both the firms and the relevant industries. Economic assistance is required on substantially all compliance matters relating to merger and other important antimonopoly cases.

The Division is called upon increasingly to assist in the analysis of alleged or suspected false claims of respondents based upon statistical sampling surveys. To meet current requirements in this field at least one member of the economics staff should be working in the area on a full-time basis.

The Division also is responsible for analyzing the economic and statistical data contained in respondents' applications for advisory opinions concerning the legality of various types of contemplated business conduct, as well as provide assistance in trade practice conference and other industry guidance programs of the Commission.

Other Expenses

Mr. Evins. On other expenses, we will put pages 133 through 137 in the record.

(The pages follow:)

Other Expenses

The sum of 2,311,000 is required for costs other than salaries. These costs are itemized in the following table:

Item of expense	Allotment fiscal year 1964	Requested fiscal year 1965	Increases fiscal year 1965
Personnel benefits	$763,500	$814,500	$51,000
Travel and transportation of persons	490,000	605,000	115,000
Transportation of things	8,000	22,000	14,000
Rent, communications, and utilities	256,500	229,500	−27,000
Printing and reproduction	100,000	130,000	30,000
Other services	146,000	175,000	29,000
Supplies and materials	150,000	171,000	21,000
Equipment	15,000	164,000	149,000
Total	1,929,000	2,311,000	382,000

It was necessary to reduce general operating expenses during fiscal year 1964 by $299,000 because of reduced appropriations. In order to avoid a reduction-in-force we were compelled to transfer this amount to personal services. The overall increase of $382,000 requested in fiscal year 1965 represents a restoration

of the reduction of $299,000. The difference of $83,000 represents a $39,000 increase in civil service retirement funds resulting from the pay increase and the remaining $44,000 represents necessary increased operating costs.

PERSONNEL BENEFITS

The sum of $814,500 is required for personnel benefits as shown in the following table. These benefits are statutory and the cost reflects the Commission's pro rata share for these items.

Personnel benefits	Allotment fiscal year 1964	Requested fiscal year 1965	Increases fiscal year 1965
Employee life insurance contributions	$35,000	$38,000	$3,000
Civil service retirement costs	655,000	694,000	39,000
Social security taxes	9,000	9,000	
Health benefits contributions	63,000	72,000	9,000
Public health services (first aid)	1,500	1,500	
Totals	763,500	814,500	51,000

TRAVEL AND TRANSPORTATION OF PERSONS

The amount of $605,000 is required for travel expenses in 1965. This amount will provide for the payment of transportation expenses, rental of automobiles, subsistence, incidental expenses and mileage costs for the use of privately owned automobiles for official travel. In order to absorb the increased pay raise costs it was necessary to reduce travel funds in 1963 by $50,000 and in 1964 by an additional $100,000. Therefore, this request represents a restoration of only $115,000 of the total reduction of $150,000 in travel funds over the 2-year period.

It is necessary to allocate $35,000 of this $115,000 restoration to the Bureau of Textiles and Furs in order to provide a minimum of 60 days of travel for the present staff and the additional employees requested in that Bureau, mainly for the investigators in the Division of Regulation.

TRANSPORTATION OF THINGS

Funds in the amount of $22,000 are requested for this item in 1965. This represents a restoration of the reduction required in 1964. It is contemplated that this amount will be needed to defray the costs of moving household goods of field employees who are transferred during the year as well as freight and express charges incurred during the year.

RENTS, COMMUNICATIONS, AND UTILITIES

Rents and utility services

Funds in the amount of $59,000 are requested for fiscal year 1965. This represents a decrease of $27,000 from the 1964 allocation. IBM and computer rental is reduced by $26,000 (this is explained in detail under Office of the Comptroller) and Xerox equipment rental by $1,000.

There is set forth below a summary itemizing the estimated rental costs for 1965:

	Allocation fiscal year 1964	Request fiscal year 1965	Decrease fiscal year 1965
IBM and computer rental	$55,000	$29,000	−$26,000
Haloid, Copyflo, and Xerox equipment	31,000	30,000	−1,000
Total	86,000	59,000	−27,000

Communication services

Funds in the amount of $170,500 are requested for communication services which represents no increase over the allocation for fiscal year 1964. This represents the additional cost of telephone, telegraph, and postal services which will be required in 1965.

PRINTING AND REPRODUCTION

Funds in the amount of $130,000 are requested for printing of the Commission's volumes of decisions, statutes, court briefs, photoduplications, and miscellaneous administrative printing. This represents a restoration of the $30,000 reduction in 1964 which will be effected mainly through deferring until 1965 the printing of a volume of the Commission's decisions.

OTHER SERVICES

This account includes all services not otherwise classified. The items included under "Other services" are shown in the following table:

	Allotment, fiscal year 1964	Requested, fiscal year 1965	Increase, fiscal year 1965
Repairs and building alterations	$31,500	$36,500	$5,000
Stenographic reporting services	35,000	50,000	15,000
Corporate statistics (BOASI)	3,500	3,500	
Internal Revenue, corporate statistics	5,000	5,000	
Clinical testing	71,000	80,000	9,000
Totals	146,000	175,000	29,000

Details concerning the requested increase of $9,000 for clinical and scientific testing will be found in the justification for the Division of Scientific Opinions, Bureau of Deceptive Practices.

SUPPLIES AND MATERIALS

Funds in the amount of $171,000 are requested for supplies and materials representing an increase of $21,000 over the allocation for 1964. This is the estimated increased cost based upon the current prices being paid for supplies.

Included in this request is the cost of the annual library order for subscriptions and publications amounting to approximately $28,000 which is no increase over the actual cost for 1964.

EQUIPMENT

Funds in the amount of $164,000 are requested for new equipment in the fiscal year 1965. This represents an increase of $149,000 over the allocation for 1964. The increase requested consists of the following items:

Desk, chairs, and miscellaneous furniture (replacement—no longer serviceable)	$10,000
Typewriters, exchange for worn and obsolete machines	23,000
Calculators	4,500
Adding machines	5,000
(The amounts requested for calculators and adding machines is for replacement of obsolete machines over 20 years old.)	
Dictaphones, replacement	7,000
Total for furniture and office machines	49,500
Burroughs Corp., purchase of computer as set forth in justification for Office of the Comptroller	114,500
Total	164,000

The above equipment estimates for furniture are extremely conservative and are dependent on securing a large amount of excess property from other Government sources.

Mr. EVINS. "Travel and transportation" is up to $605,000, an increase of $115,000; "Transportation of things" is to be increased by $14,000.

PRINTING COSTS

"Printing and reproduction" is up $30,000 from $100,000 to $130,000. Why $30,000 more printing bill?

Mr. GLENDENING. We have one case coming up in appeals next year that we estimate the cost for printing the record will be $70,000 just in the one case. The printing costs of appeals records are extremely high. We have several big cases that we know will be coming up next year. For example, *Luria Brothers* case, our share of the printing of the record will be in the neighborhood of $70,000. We have no control over that. In most instances we share the record printing costs on a pro rata basis with the respondents.

Mr. EVINS. Off the record.

(Discussion off the record.)

Mr. EVINS. Travel costs go up. Printing costs go up.

Mr. DIXON. The President's letter directed all agencies to reexamine all printed matter.

Mr. GLENDENING. The cost of legal printing, briefs, and transcripts of records, et cetera, last year cost us almost $52,000.

Mr. THOMAS. You go up from $100,000 to $130,000 in one year.

Mr. DIXON. We are trying more cases.

Mr. THOMAS. You want $20,000 or $25,000 for printing Commission decisions. We suggested you hold it, last year, in abeyance. Did it wreck anybody to hold the printing in abeyance? How much did it cost this year?

Mr. GLENDENING. About $20,000 this year.

Mr. EVINS. We have already discussed the IBM equipment. Are there any other questions on "Other objects"?

COMMUNICATIONS

Mr. BOLAND. How about communications? That figure remains the same for 1965. Do you participate in the GSA telecommunications setup?

Mr. GLENDENING. No, only to the extent that some of our field office phone costs are billed by GSA. We are not on the big board in Washington. We deal directly with the Chesapeake & Potomac Telephone Co. and do not go through the GSA board in Washington.

Mr. BOLAND. Is there any reason for not going through it?

Mr. GLENDENING. Yes. It would cost us more money. Secondly most of our attorneys do not have secretaries assigned and as they travel a great deal throughout the country, our telephone operators operate a sort of secretarial service for our attorneys who are out of town. Law firms and attorneys call in and want to talk to Frank Black, an attorney, and he is trying a case in Kansas City, for instance. The caller can leave word with the telephone operator and she then tells them he will be back in town on such-and-such a date. Otherwise his phone would ring and nobody would answer. They would say, that fellow is probably wandering around the city someplace.

We find that we are getting along very well and are very happy with our own switchboard.

Mr. THOMAS. Regardless of being happy, what Mr. Boland is trying to find out is your relationship with GSA. You made the statement a while ago that it would cost you a little bit more money. Is that in conjunction with the saving of additional secretarial force, forgetting your secretarial courtesy?

Mr. GLENDENING. No. We are saving money by not going on the GSA automated board.

Mr. BOLAND. Off the record.

(Discussion off the record.)

Mr. EVINS. Are there any further questions?

Mr. JONAS. I meant to ask this while we were discussing the Bureau of Economics. You moved so fast I could not do it then.

EXPORT TRADE RESPONSIBILITIES

Does the Commission have responsibility under the Export Trade Act of 1918?

Mr. DIXON. We have sole responsibility for enforcement of the Webb-Pomerine Act.

Mr. JONAS. What does it consist of and what is your responsibility?

Mr. DIXON. Fundamentally, after World War I, I am satisfied that the Congress was worried about exposing our growing trade to a world of cartel and monopoly. So Webb-Pomerine was passed by the Congress as an avenue of encouragement where the domestic traders could join together in an association and register with the Federal Trade Commission and then have the immunity to go abroad as a body, you might say, go abroad with common purposes, so long as they did not have any restrictions at home.

Mr. THOMAS. They could practice it overseas but not at home?

Mr. DIXON. Exactly. They are doing it in Europe, and that is what we are doing here.

Mr. EVINS. That is all, Mr. Chairman. Thank you very much gentlemen.

Mr. THOMAS. Thank you very much, gentlemen. It is always nice to see you all. We enjoy seeing you.

Mr. THOMAS. The committee will please come to order.

It is always a most pleasant and noteworthy occasion to have our friends from the Selective Service System with us, our distinguished Director, Gen. Lewis B. Hershey. It is always very nice to have his very able assistants, Col. William S. Iliff, Jr., and Lt. Col. Maxwell O. Jensen, of the Office of Legislation and Liaison.

How long have you been on the job, Colonel Jensen?

Colonel JENSEN. About 6 years.

Mr. THOMAS. This is the first time you have been in to see us, is it not?

Colonel JENSEN. On one other occasion I was along very briefly.

Mr. THOMAS. It is very nice to have you gentlemen.

Mr. Shipley has kindly consented to work out the budget with you. So, will you conduct the examination, Mr. Shipley?

Mr. SHIPLEY. Thank you very much, Mr. Chairman.

General, have you a statement you would like to present to the committee?

GENERAL STATEMENT

General HERSHEY. Mr. Chairman and members of the committee, I believe this morning I would like to comment a little bit on the whole situation of Selective Service, because I do not want to leave the impression that we are going through any revolution or any great dy-

namic change, but this past year has been materially different from any year that we have gone through in the last 10, and the year ahead of us is not only different but is uncertain and, at the present time, subject to considerable speculation. Our budget is based on facts and not on what may happen to us.

I should like to go back just a second to last summer, when our act was extended for 4 years without any material interference. I think sometimes it may have lulled the public into believing that we were completely accepted in the way we are operating. I have no illusions that was far from the fact. I think we are going through a tremendous change in the world and in the life of the Selective Service System, and a great many worries of the past are changing. We used to know what war and peace are, but they have become all clouded. We used to know what civilians were and what military were, and that is very clouded at the present time. That affects our operation a great deal because we are caught in a place where we must decide, where civilians are involved in survival, whether or not participation by them is great enough that it ought to be almost accepted in lieu of military service.

CHANGES IN INDUCTION REQUIREMENTS

Complicating the picture a little more, we started this fiscal year, as I am sure the members of the committee will remember, with quite a little discussion of how many people we were to induct. I cannot blame the Department of Defense for always being more optimistic about what they can enlist than turns out to be the case. Therefore, their budgets generally are rather large on what they can enlist, which tends, of course, to contract us on how many we need to induct.

I believe we started off talking about 100,000 to be inducted last year, but by the time we came over it had been raised to 129,000. Now we are faced with 165,000.

The difference between the 129,000 inductions and the 165,000, I am not theoretically at liberty to talk about this morning because I am not here representing the supplemental, but I am talking about the whole picture.

So, in the first place, the number inducted went up from about 130,000 to about 165,000. In addition——

Mr. THOMAS. Then it dropped back to 143,000 for 1965.

General HERSHEY. That is right. That is, it has now.

Last year when I came over here it was 129,000, and it ended up at 165,000. That is one of the things that makes life a little uncertain for everybody concerned.

So, the next thing that happened was that last May the Armed Forces raised their acceptability, particularly intellectually or educationally, and a great many people who were in the pool of those examined and accepted were rejected when they were submitted because the standards had changed between the time they were accepted on preinduction examination and the date of their induction.

ACCEPTANCE STANDARDS

Mr. JONAS. What do you mean by general standards?

General HERSHEY. Standards of the Armed Forces. In other words, suppose the Armed Forces would say that they will accept

people with a certain educational level. That is, with a soft lead pencil you take this questionnaire and mark on it and then it is recorded electronically. Those who were examined before May last year were accepted on a lower level than those examined after May. The result is that we had many examined and accepted and in our pool, and when we submitted them they were rejected.

In other words, in a 6-month period from July 1 to December 1, I think we submitted about 89,000 examined and accepted, and we lost over 10,000 of them. In other words, we had spent money to examine and to accept the ones who were accepted, and then when we sent them up for induction they were rejected.

The point I am trying to make is that that costs us money. So, the change of standards made a great deal of difference in the cost to us to induct 78,000 in the first 6 months of this fiscal year.

Mr. JONAS. Of course, we can understand that, and I also understand you do not have anything to do with establishing the physical and mental standards of the armed services, but it seems a little bit ridiculous to me to exempt or disqualify for any form of military service, thousands and probably hundreds of thousands of people who should be able to perform some service in the Military Establishment. They do not have to be Phi Beta Kappas or college graduates. Is that not putting an unusual burden on the superior, mentally qualified people, and relieving from any obligation a lot of people who should be able to contribute something?

General HERSHEY. Yes, sir, that is true. This may not be the place to say so, but I do not believe that we at the present time have sufficient methods of testing to provide individuals who would be most suitable for the Armed Forces.

The thing that worries me is that in that three-quarters of an hour that boy with a soft lead pencil marks "multiple choice," "yes," and "no," and a great many other things, so it can be handled electronically. I am on the record as saying it is not the fault of the Armed Forces. They have had to accept what science presents. Colleges have the same problems. Colleges will not be able to maintain for too long the acceptance and rejection of people by some of their methods of testing.

EVALUATION OF STANDARDS

Mr. OSTERTAG. The point is that the Armed Services more or less dictate or determine the standards and the means by which you operate in the administration of the Selective Service. In that connection, take a young man who is subject to call and is registered under the draft, he has a certain amount of education. Do you know whether he was a good scholar or not? Do you know whether he went through just 3 years of high school or completed high school and was a good student or a poor one?

General HERSHEY. We in the Selective Service do not know that.

Mr. OSTERTAG. Then how do you evaluate the standards that are required?

General HERSHEY. The Congress delegated completely to the Department of Defense the acceptability determination. I have nothing to do with that, but I do know something about how long some of these boys went to school. I do not pretend to know too much about their grades, although we are being forced into that.

Mr. OSTERTAG. Those they do not choose to accept, they send back to you.

General HERSHEY. That is right. I would say I have been compelled to try to save some money, and rather dangerously. We are, in a good many States, not sending up boys that have not finished the 8th and in some cases the 9th grade because our acceptability runs only 2 out of 100 in those lower grades. I have been caught so close and even short, trying to meet calls. I do not like to spend money sending people up that you know will fail. It is a dangerous thing, but we do it.

INDUCTION OF MARRIED MEN

Mr. OSTERTAG. I would like to ask another question which naturally would come up in any discussion of your problem. Now the armed services have determined that no married men will be called. Is that not correct?

General HERSHEY. Let us try to keep the responsibility where it belongs. In the first place, the Armed Forces had nothing to do with that.

Mr. OSTERTAG. Who did?

General HERSHEY. The President issues the Executive order, but let us be honest with the President. I recommended to him that he do that. I am bringing trouble on myself in this area, but I want to be perfectly honest with you. I made that recommendation, and I will tell you why.

In the first place, our problem for quite some time has been that our age of induction was high. That receives the criticism that boys do not know where they are for too late, and everybody I talked to was willing to see the age of induction fall. The only way you have it fall is by having less people that you take in. What do you take them in for? You take them in order for the Armed Forces to use them and, presumably, effectively.

A married man in the grade of private many times is more expensive than a noncommissioned officer who is single. Therefore, one of the most expensive is a man with dependents; and not only that, as Red Cross chairman, the trouble you have all the time with people in the service is with those who have dependents.

I want to be honest with everybody. The President who issued the order is dead, but he issued it after I recommended it. I presume he was in favor of it or he would not have issued it.

Mr. OSTERTAG. He is responsible and he is Commander in Chief.

General HERSHEY. That is right.

Mr. OSTERTAG. In other words, it was not an action of the Selective Service. It was an action of the executive branch through the Commander in Chief of the Armed Forces.

Mr. JONAS. If you will permit me to interrupt, I do not think that is true, Mr. Ostertag, because the Selective Service Act says men will be selected by the President, not necessarily by the Commander in Chief. I think his action here was in pursuance of his right to promulgate regulations.

Mr. OSTERTAG. All right.

Mr. JONAS. Not necessarily as head of the armed services.

General HERSHEY. I think he issued that as President of the United States.

I have been criticized over on the Hill on this very question, and it is so. Therefore, I do not want to be leaving any impression that I am trying to run behind anybody else, because I am not. It did create a pretty big job.

Mr. OSTERTAG. That is my point, General. I was not concerned about who was responsible, but that is the situation today.

General HERSHEY. That is right.

Mr. OSTERTAG. My whole question is that you are talking about standards and the Armed Forces requirements. A large percentage of those who are registered under Selective Service are married men. That means an added screening on your part, an added separation. You must separate the married men in the first instance before you can get to the men who meet the standards and requirements they are calling for, is that not correct?

General HERSHEY. That is correct. If we knew about it we would not physically examine either the fathers or the husbands, and thereby save whatever money is saved. But, you see, I had them examined before the order was issued, and I got caught.

Mr. OSTERTAG. In that connection, say a young man is classified I–A, and he is called or is about to be called, and he takes it upon himself to marry. Does that automatically disqualify him or eliminate him from the call?

General HERSHEY. I would not like to say quite automatically, because I think some have been called and were inducted, but by and large we have not inducted them because we were trying to carry out the order literally, and we have tried very hard not to induct married men. Regardless of when they got married, they still have a wife when they get in there, to bedevil the company commander and everybody concerned.

Mr. OSTERTAG. Have you found it a problem or a situation where you were unable to determine to what extent you were going to have men available by virtue of this marriage picture? In other words, is it not probable that many of these young men are getting married perhaps a little in advance of when they would ordinarily get married, in order to escape call?

General HERSHEY. Yes, that is true. Of course, with our first pool that we got caught with in September, we had losses all the way from 25 to 40 percent, but that is not happening now. That is one of those things that happened because we had a pool with a lot of married men in it.

That is one of the things that causes me to be over here perhaps with some tears on how I have had an awful bad year and it has cost me a lot of money. That problem is behind us. I will agree that if somebody gets married we will not send him up for preinduction examination nearly as likely as we did in the past.

EXTENSION OF LIABILITY FOR COLLEGE STUDENTS

You bring up a good question, but it is the same question I get caught with not only with the married men, but with the fellow who shows up in college and has not told us he is in college until we begin to get close to him, and there are some reasons he does not want to tell us because, if he tells us he is in college in order to get

deferred and gets deferred, he gets his liability extended to 35. Therefore, if he can play it cool, as he would say, and not tell us he is in college, he does not get his liability extended. The first thing you know, he is ordered up, and then, of course, he rushes in and says, "I have been in college all the time."

DEFERMENT OF COLLEGE STUDENTS

Mr. OSTERTAG. Is it a practice or policy to defer these young men until they complete their college education?

General HERSHEY. Yes, sir. Again, there is a question of trying to get the pool down under the assumption that we had more people than we could put in the Armed Forces, and if anybody was doing anything allegedly constructive, you tried, if you could, to leave him to do it, with the idea of using him when he had greater capacity.

We have been very liberal for several years in our deferments.

NUMBER OF MARRIED MEN DEFERRED

Mr. OSTERTAG. Getting back for one moment to the nonconscription of married men, have you any estimate as to the number who have been deferred by virtue of having been married or who have married since that order came in, and those who would have been selected otherwise?

General HERSHEY. No. We would have to guess at it. Of the 100,000 that we had on hand at the time the order came out, I suppose at least 30,000 of them either were married or married afterward. A good many of these were married before, because we were taking them before that time.

Mr. OSTERTAG. That is right.

General HERSHEY. It is a little hard to tell the number of people who just married. Sometimes a fellow goes to college and gets married. That did not used to be the rule, but now a good many of them both go to college and get married.

Not everybody has gone out and done that. There is a little flurry, but after the flurry is over they settle down. Some of them do, it is true.

PROBLEM OF DEPENDENTS

On the other hand, it does not make any difference why a fellow got married, the way we respect a marriage, the Armed Forces has to pay allowances and they have the fellow on their hands who has something that is distracting him. He gets overseas and his wife gets sick over here. If we let them take dependents overseas, even if they pay for it, it is a very unfortunate situation.

I had a son-in-law in the 504th Infantry that left Fort Bragg. They had 1,400 men in the outfit, and 700 dependents. Just imagine going over in a country where the line is very thinly held, and here you are with all your dependents. I saw General Handy in 1951 when he was commanding in Europe, and I said, "What is your biggest problem?" And he said, "Forty thousand dependents," knowing if he had to fight at any time, what in the world would he do with 40,000 dependents scattered around there.

Mr. OSTERTAG. Is that the basic reason for this order?

General HERSHEY. There are two reasons. First of all, it was to try to reduce the pool so you could lower the age of induction so you could give certainty to a youngster whether or not he would have to go. Secondly, you eliminate people the Armed Forces would rather not have. That is just about as succinctly put as I can say it.

Mr. OSTERTAG. Many of these married men possess high standards of qualification. So, on the one hand, they are reducing the number of qualified people very substantially as against the responsibility of taking additional people with dependents.

General HERSHEY. I think that is true, sir. Of course, you can also argue that the fellow who ran into matrimony to get away from getting in might run away from everybody else after he got in. I do not know that that is true, but that is arguable.

REENLISTMENT INCENTIVES

Mr. OSTERTAG. The military, and the Congress partially, have been responsible for the advancement of programs which provide fringe benefits and other means to encourage reenlistments and career service. That has played a role, has it not, in the overall requirements under selective service?

General HERSHEY. Yes, because the longer you keep an individual in, as you have only one slot, the less people can be in it. On the other hand, it depends on whom you encourage to stay in. If you encourage your top noncommissioned officers to stay in, you are bettering the organization. If you encourage your privates to stay in, I think you are doing a very unfortunate thing, because any man who gets into the Armed Forces and stays 3 years and is still in the lower grades, I do not think ought to be allowed even to reenlist. You had better start with a fresh one. You do not know what the new one will do. He is a possibility of being more than a private.

I do not believe the Armed Forces ought to furnish an incentive and I do not know that the Armed Forces have furnished an incentive for a fellow to stay in when he is only a so-so soldier or sailor or airman or marine. I do not think that ought to be encouraged.

NEED TO TRAIN MORE MEN

I think we ought to train more people. The thing that frightens me is when I look at the picture and see boys between 18 and 26, 8 million of them, and only 2 million have ever had any training. The other 6 million have not. It is dangerous.

REENLISTMENT INCENTIVES

Mr. OSTERTAG. Also there is the question of proficiency pay and proficiency with regard to reenlistment. Admiral Smedberg, of the Navy, in a recent discussion of this very matter before the Defense Appropriations Subcommittee, pointed out that he believed that it would be practical, sensible, and in the best interests of the service to have a liberal bonus with regard to reenlistments and proficiency. That would be somewhat different from our present system as you know.

There is this problem, if I understand it correctly: When we have such a large establishment as our Armed Forces, made up of upward of 3 million officers and men, there is such a thing as balance. They should not be all chiefs and no Indians, or all Indians and no chiefs. One of the problems has been promotions or advancements. You cannot have more colonels than you have captains. You cannot have more captains than lieutenants.

Then in the military forces the picture has changed as to the requirements, operations, and functions of the ordinary serviceman. We are in electronics and many other highly specialized fields today. Back in the old days of World War I and even through World War II, the average serviceman would dig ditches, be on kitchen police, and carry on functions of that kind which many are not required to do today because there are many highly specialized operations.

Again, Selective Service is closely associated with all that and with the balance or imbalance that might exist. Am I correct?

General HERSHEY. There is no doubt about it. I think very highly of Admiral Smedberg. I have known him a very long time and knew his father before him. I would go along with him on some bonus. The only worry about the bonus is as soon as you start it, you are bonusing a man in that you ought to have thrown out.

I realize Denmark is a very small country, but in Denmark 9 years is the most you can serve as an enlisted man in the army. They are trying to keep the army young. You cannot go in for the second term unless you are a middle-class noncommissioned officer, and you have to be the highest noncommissioned officer to enlist for the final 3 years.

I do not advocate that completely, but I certainly say you do not want all leaders and no followers, nor do you want all 30-year or 20-year and no 1-year men. The baseball teams develop to greatness, and suddenly a year comes that they are all too old.

Mr. OSTERTAG. On the other hand, is it not true, General, that by the time a man has been trained and becomes efficient and has some idea of his responsibilities, he is eligible for release from the service?

General HERSHEY. I think that is probably true. We have the same problem everywhere in education. The surgeon is almost to senility by the time he gets to the place that he really has it made. We are going in more and more for longer and longer preparation and younger and younger retirements. I do not know just where they are going to cross.

Mr. OSTERTAG. Military retirement today is getting to the astronomical figure of about $1.5 billion a year.

Mr. THOMAS. That is not the end of it, either.

General HERSHEY. I hope you do not get frightened out of it.

Mr. BOLAND. Is it that high now?

Mr. OSTERTAG. Not quite, but it will be within a year or two.

Mr. THOMAS. It will be higher than that in another 5 years.

DEFERMENT OF MARRIED MEN

Before you leave this subject, General, will you summarize this question which is uppermost in the minds of a good many people. What is the status of a young married man and what is the status of a young married man with children? Here is a college student who

has been deferred while he is going to college, and following the old human desire to get married, the first day some of these youngsters finish college they get married. Are they permanently deferred, and what is their status if they have a child a year or two after that?

General HERSHEY. The fathers we have deferred. The college students we have deferred. The married men at the present time have what amounts to a deferment because they are in low order of priority. In other words, we are taking all single men first.

If we should go on as we are going now, these deferments will amount to permanency, but everybody must remember that if we take the history of even the last 15 years, we have had times when suddenly we found ourselves calling a great many people who thought they had been forgotten.

Again I repeat, the college student is deferred if he is satisfactory, the father is actually deferred, and the husband is put in a lower priority of induction so it amounts almost to deferment.

ACCELERATION OF MARRIAGES DUE TO DEFERMENT

Mr. BOLAND. Has the order exempting the married man from being drafted accelerated marriages among that group of students who have been deferred until they get out?

Genral HERSHEY. We have no figures on that, sir. It is a little early for them. I think normally it probably accelerates marriages, but in the District of Columbia it fell off. I do not have the slightest idea why, but that happened here. I do not think it has any bearing on it one way or the other. It goes to show you can be easily misled by figures.

SUMMARY OF BUDGET ESTIMATE

Mr. SHIPLEY. Mr. Reporter, would you insert in the record pages 1 through 4 of the general statement?

(The pages follow:)

SELECTIVE SERVICE SYSTEM, FISCAL YEAR 1965

GENERAL STATEMENT

There is presented herewith justification for the request of $43,020,000 with which to operate the Selective Service System, the National Advisory Committee on the Selection of Physicians, Dentists, and Allied Specialists, and the National Selective Service Appeal Board during the fiscal year 1965.

The Selective Service System is organized to carry out the primary functions of registration, classification, selection, and presentation for induction in the Armed Forces of the men necessary for maintenance of those forces at the determined strength and by means of deferment, urges men into those occupations and activities necessary to the maintenance of the national health, safety, or interest. It also determines the availability of men for a selective callup from the Standby Reserve. The collateral functions of administration, planning, training, and records management are also performed by this agency.

The use by the Selective Service System of the services of over 48,000 uncompensated officials is unique in Government. These patriotic citizens give the strength to the Selective Service System.

It is inevitable that these uncompensated citizens will become less enthusiastic in their giving of service unless adequate clerical personnel is provided. The request for fiscal year 1965 includes the provision for such services in Project 30.

The Selective Service System, which is decentralized, is organized on a pyramidal structure, the broad base of which is the local and appeal board element

where the contact is maintained with over 27½ million registrants by the uncompensated members of the System and the local and appeal board clerks who staff the 4,046 local boards and the 94 appeal boards. The next largest group is composed of the 56 State headquarters; the relatively small group which comprises the national headquarters is the apex.

The strength of the Selective Service System lies in the fact that classification is the responsibility of those uncompensated civilians living in the communities with the registrants. They have no pecuniary interest in their position but perform their tasks as a patriotic service.

The size of the calls or the number of inductions in any given period directly affects only one cost factor; namely, selectee travel. This estimate for fiscal year 1965 is based on the induction of 100,000 registrants.

Executive Orders Nos. 10166 and 10185 created the National Advisory Committee on the Selection of Physicians, Dentists, and Allied Specialists. Pursuant to these orders, the Selective Service System is required to furnish funds for its operation and provision is included herein.

Executive Order No. 9988 created the National Selective Service Appeal Board. The Selective Service System is required to pay the members of the Board and "to furnish suitable office space and other necessary facilities and service." This requires more personnel in national headquarters to the extent necessary to meet this requirement. This budget includes a request for funds to accomplish this purpose.

The principal factors in this request for an increase in 1965 over 1964 are: (1) The unprecedented increase in new registrations as estimated in the table below based on Bureau of Census figures related to experience. (2) Administrative increases in pay to local board clerks has been provided comparable to those given to classified employees by the pay act. For 1963, this was 18½ pay periods. For 1964, it is provided for the full year plus the additional increase in pay to be effective January 1, 1964, and for 1965 on the basis of the last half of fiscal year 1964. (3) Within grade pay raises for classified employees. Pay act increases are included for classified employees. No additional positions are provided for classified employees.

The following 10-year table shows the experience and projection of the number of new registrations in future years:

Fiscal year	Age 18, year of birth	Census estimate in thousands	Selective Service registration
1962	1944	1,402	[1] 1,512,980
1963	1945	1,397	[1] 1,506,857
1964	1946	1,414	[2] 1,525,847
1965	1947	1,955	[2] 2,109,836
1966	1948	1,811	[2] 1,954,431
1967	1949	1,813	[2] 1,956,590
1968	1950	1,857	[2] 1,980,305
1969	1951	1,902	[2] 2,027,832
1970	1952	1,768	[2] 1,885,395
1971	1953	1,850	[2] 1,972,840

[1] Actual.
[2] Estimated.

Since the submission of the 1964 appropriation, several factors have increased our workload: (1) Department of Defense estimate of 129,000 was revised in August to 147,000; (2) On September 10, childless husbands other than volunteers were put in a delayed call status; and (3) in May of 1963 the standards for acceptance of certain registrants were raised. No official approval of a supplemental has been given, however, if goals are to be met, it is expected that a supplemental appropriation for 1964 will be required.

A request is included for the replacement of motor vehicles. In fiscal year 1964, 22 vehicles will be replaced. For 1965, 13 are being requested for the amount of $23,100. These are: (1) Five automobiles to replace those which have passed both the age and mileage requirements; and (2) eight station wagons, all of which have met the age and mileage requirements.

Our fleet consists of 1 heavy sedan replaced in 1961 and scheduled to be replaced again in 1964, 44 other automobiles, 27 station wagons, and 12 trucks; one of which is 1½ tons, the balance 1 ton or less. The heavy sedan is located

in Washington, D.C., assigned to the Director of Selective Service. The balance of the equipment is in areas where there are no General Services motor pools available. They are principally used by the State directors and the officials of State headquarters for contact with local boards within their respective States. The station wagons are used also to deliver light equipment and supplies to local boards.

HIATUS BETWEEN CENSUS FIGURES AND REGISTRATIONS

Mr. SHIPLEY. General, at the bottom of page 3 you say (reading):

The following 10-year table shows the experience and projection of the number of new registrations in future years.

In 1965, age 18, year of birth, born in 1947, would you explain the differential between the figure 1,955,000 and the number under Selective Service registration, 2,109,836? What makes up the difference?

Colonel ILIFF. The 1,955,000 is the Bureau of the Census figure, their estimate of those males who will turn 18 during the fiscal year. We, under certain circumstances, register aliens. They would not be included in this count.

Mr. SHIPLEY. Are they not registered up to date or kept up to date? Do you not know how many there will be?

Colonel ILIFF. Our estimate is based upon our experience in comparison to the past. Going back to 1962, we had 1,402,000 in the estimate, and we actually registered 1,512,980.

Mr. SHIPLEY. I noticed that, and that is the reason I am asking about this. Is this due to lack of information, or is it strictly due to aliens?

Colonel ILIFF. It is also due to what our statisticians call underenumeration.

Mr. SHIPLEY. Explain that.

Colonel ILIFF. In other words, the figure of the Bureau of the Census is an unevaluated figure, what they would call a raw figure. In other words, they simply projected the count they got when they took the census. They do not take account of the fact they might have underenumeration.

Mr. SHIPLEY. There is a great gap there.

General HERSHEY. We register more than they count. I do not know why, but we do.

Mr. SHIPLEY. We spend a lot of money on the census, and they have all the equipment in the world. I do not see why they could not give you more accurate figures.

General HERSHEY. Even when they counted them, we registered more people in the age group than they counted in the age group.

Mr. SHIPLEY. What is the reason for that? Is it the lack of information?

Mr. BOLAND. It is failure to count all of them, I suppose.

General HERSHEY. A fellow who has an obligation to come in is a little more certain than a fellow you might or might not find.

SUMMARY OF BUDGET BY OBJECT CLASS

Mr. SHIPLEY. Mr. Reporter, please insert in the record page 5.

(The page follows:)

Consolidated summary of objective classification

		1963 actual	1964 estimate	1965 estimate
11	Personnel compensation:			
	Permanent positions:			
	Civilian	$22,714,627	$23,261,638	$28,153,144
	Military	2,812,267	3,006,000	3,341,780
	Positions other than permanent	3,393,847	3,628,098	3,896,905
	Other personnel compensation	35,031	232,444	162,298
	Total personnel compensation	28,955,772	30,128,180	35,554,127
12	Personnel benefits:			
	Civil service retirement contributions	1,550,238	1,677,900	1,882,020
	Group life insurance contributions	84,855	90,440	93,121
	Federal Insurance Contributions Act taxes	67,371	76,375	78,380
	Health benefits contributions	203,465	214,180	216,580
	Employee suggestion awards	21,786	4,500	
21	Travel and transportation of persons:			
	Administrative travel	675,756	707,000	707,000
	Travel of selectees	1,206,273	2,479,000	1,945,000
	Rental of passenger vehicles	43,148	64,200	63,000
22	Transportation of things:			
	Freight, express, and drayage	69,265	74,500	54,500
	Rental of trucks	2,404	4,100	4,100
	Parcel post (penalty indicia)	49,000	49,000	49,000
23	Rent, communications, and utilities:			
	Communication services	602,575	654,775	654,100
	Rents and utilities	26,961	27,000	275,322
	Penalty mail	694,925	772,050	772,050
24	Printing and reproduction	173,966	189,600	191,400
25	Other services	128,175	118,700	118,200
26	Supplies and materials	223,652	227,000	226,800
31	Equipment	660,074	146,500	135,300
	Total obligations	35,439,661	37,705,000	43,020,000

Mr. SHIPLEY. This is the consolidated summary of objective classification which shows the estimate in 1964 of $37,705,000, and in 1965 of $43,020,000. This makes a total increase of $5,315,000. Is that correct, Colonel?

Colonel ILIFF. Yes, that is correct, roughly.

PROGRAM AND PERFORMANCE

Mr. SHIPLEY. Let the record show the program and performance on page 11.

(The page follows:)

PROGRAM AND PERFORMANCE

The primary purpose of the Selective Service System is effective manpower utilization through classification under the Universal Military Training and Service Act. The System is responsible for supplying men to keep the Armed Forces at their authorized strength and to the extent that their needs are not met by voluntary enlistment. It will be required to supply an estimated 100,000 men for this purpose in 1965 as compared to approximately 147,000 in 1964 and 75,000 in 1963.

1. *National administration, planning, training, and records management.*—The overall administration of the act, including planning, training, and records management, is accomplished by the national headquarters and six regional field offices.

2. *State administration.*—Administration of the act within the several States is the responsibility of the 56 State headquarters operating under the policies determined by national headquarters.

3. *Registration, classification, and induction.*—These functions affecting over 27,500,000 registrants are accomplished by the over 48,000 uncompensated citizens assisted by about 6,000 clerks at over 4,000 boards. These citizens determine who shall be deferred and for how long in the national interest of agriculture, industry, or other pursuits. They also determine the availability for military service of members of the Standby Reserve.

4. *Special boards.*—

(*a*) National advisory committee on the selection of physicians, dentists, and allied specialists: This committee acts in an advisory capacity to the Selective Service System. It is separately administered, but funds are furnished by the Selective Service System from its appropriation.

(*b*) National Selective Service Appeal Board: This Board acts on the classification of registrants which have been appealed to the President. It is under separate administration but the Selective Service System provides funds for its operation.

CONSOLIDATED PERSONNEL SUMMARY

Mr. SHIPLEY. Insert pages 15 through 17 of the green sheets, which is the detail of personnel compensation, listing the number of positions, grades, and salaries.

(The pages follow:)

SALARIES AND EXPENSES

Detail of personnel compensation

	1963 actual		1964 estimate		1965 estimate	
	Number	Total salary	Number	Total salary	Number	Total salary
Grades and ranges:						
Special positions at rates equal to or in excess of $18,000: Director	1	$20,000	1	$20,000	1	$20,000

Positions other than permanent		3,393,847		3,628,098		3,896,905
Other personnel compensation:						
Regular pay above 52-week base				186,010		120,226
Overtime and holiday pay		6,475		7,500		9,000
Cost differentials and cost-of-living allowance		28,556		38,934		33,072
Total personnel compensation		28,955,772		30,128,180		35,554,127

ADDITIONAL POSITIONS REQUESTED

Mr. SHIPLEY. The jobs listed on page 15 show no change in number of positions, only in salary. These are your top positions. The changes made on page 16 are below grade GS–13. No new classified positions are listed here. You have upgraded some. Is that true, General?

Colonel ILIFF. I think that is true, yes.

Mr. SHIPLEY. I wish you would turn to page 17 briefly, if you will. I see that you have requested 1,672 new positions. Is this correct?

Colonel ILIFF. We have requested that number of positions. However, the lapses from there would mean they would not all be filled for the full year.

Mr. SHIPLEY. But you want 1,672 new positions at any rate. Where will the bulk of these go?

Colonel ILIFF. They all go to local boards. This is due to a 38-percent increase in new registrants.

Mr. SHIPLEY. What grades would these be, mostly?

Colonel ILIFF. They are are not graded employees in our local boards, sir. These are exempt from the Classification Act.

Mr. SHIPLEY. They are paid in comparison to what?

Colonel ILIFF. The pay is set up on the basis of the local pay scales. Sometimes they are high. In the cities where you have a lot of Federal employment, they tend to get to the grades of civil service in their pay scales.

Mr. SHIPLEY. Would you say it was comparable to civil service grades——

Colonel ILIFF. Grades 4 and 5.

Mr. SHIPLEY. That would be a total increase in personnel compensation of $5,426,000, is that correct?

Colonel ILIFF. Yes.

Mr. SHIPLEY. This provides a good list of the grades and salaries.

Mr. THOMAS. The ungraded positions are three-fourths of the employment, and they range around grades 4 and 5. What do they average? Roughly $5,000 per year?

Colonel ILIFF. No, they do not go that high. On page 14 the average salary of ungraded positions is shown as $4,334.

Mr. THOMAS. You set that out on page 14?

Colonel ILIFF. Yes, the last line of the page.

Mr. THOMAS. Average salary of ungraded positions, $4,334 for 1965.

Mr. SHIPLEY. On project 30 on page 23, that is again employees for the local board?

Colonel ILIFF. Yes; that is correct.

Mr. SHIPLEY. The breakdown of the personnel compensation schedule can be picked up as we go into the various projects.

NATIONAL ADMINISTRATION, PLANNING, TRAINING, AND RECORDS MANAGEMENT

Let the record show page 33, a summary of objective classification of Project 10. This shows an overall increase in total obligations from 1964 to 1965 of $86,000.

(The page follows:)

Summary of object classification, project 10

	1963 actual	1964 estimate	1965 estimate
11 Personnel compensation:			
Permanent positions:			
Civilian	$811,745	$916,198	$962,897
Military	702,275	736,752	803,160
Positions other than permanent	4,240	2,000	2,143
Other personnel compensation	3,482	13,250	9,800
Total personnel compensation	1,521,742	1,668,200	1,778,000
12 Personnel benefits:			
Civil service retirement contributions	52,003	59,900	62,770
Group life insurance contributions	2,676	2,800	3,230
Federal Insurance Contributions Act taxes	181	100	100
Health benefits contributions	5,120	5,900	6,300
Employee suggestion awards	2,500	2,500	
21 Travel and transportation of persons:			
Administrative travel	70,402	83,000	83,000
Travel of selectees			
Rental of passenger vehicles	2,045	4,200	3,000
22 Transportation of things:			
Freight, express, and drayage	175	500	500
Rental of trucks	493	600	600
Parcel post (penalty indicia)	1,000	1,000	1,000
23 Rent, communications, and utilities:			
Communication services	27,185	30,000	30,000
Rents and utilities	3,671	4,000	4,000
Penalty mail	31,500	35,000	35,000
24 Printing and reproduction	3,593	17,000	4,000
25 Other services	9,974	5,000	5,000
26 Supplies and materials	24,052	21,500	21,500
31 Equipment	39,975	15,800	5,000
Total obligations	1,798,287	1,957,000	2,043,000

Mr. SHIPLEY. Project 10, beginning on page 34, is the National Administration, Planning, Training and Records Management. We will insert pages 34 through 38.

(The pages follow:)

NATIONAL ADMINISTRATION, PLANNING, TRAINING AND RECORD MANAGEMENT

PROJECT 10

The national headquarters is charged with the overall administration of the act, with preparation of plans for future emergencies, with the designing and putting into effect of a training program and with the management of records required to be kept. To perform these functions the national headquarters has been organized into offices and divisions, each subdivision being charged with certain responsibilities. Included in the following costs are those of the six regional field offices and the fiscal auditors operating in the field.

	1963 actual	1964 estimate	1965 estimate
11. Personnel compensation	$1,521,742	$1,668,200	$1,778,000

The principal cause of the increase in 1965 over 1964 is the increase in the pay of military personnel in effect for the full year. This rate, effective October 1, 1964, is not shown because no supplemental is authorized at the time this request is prepared. The increase for 1965 amounts to $69,000.

No new positions, either civilian or military, are included in this request.

Also included is the civilian pay rate increase effective for only part of 1964 and all of 1965.

	1963 actual	1964 estimate	1965 estimate
12. Personnel benefits:			
Civil service retirement contributions	$52,003	$59,900	$62,770
Group life insurance contributions	2,676	2,800	3,230
Federal Insurance Contribution Act taxes	181	100	100
Health benefits contributions	5,120	5,900	6,300
Employee suggestion awards	2,500	2,500	----------
Total	62,480	71,200	72,400

These benefits are largely tied to civilian payrolls. Most items are based on actual payroll.

	1963 actual	1964 estimate	1965 estimate
21 Transportation of persons:			
Administrative travel	$70,402	$83,000	$83,000
Travel of selectees	----------	----------	----------
Rental of passenger motor vehicles	2,045	4,200	3,000
Total	72,447	87,200	86,000

The principal use of administrative travel is by our fiscal auditors and regional field officers.

The rental of passenger motor vehicles is from GSA. The principal use is in the Washington, D.C. area. However, our 12 regional field offices also use them on occasion. The $1,200 in 1964 over 1965 is for use by the regional field officers in connection with the biennial selective service conferences.

	1963 actual	1964 estimate	1965 estimate
22 Transportation of things:			
Freight, express and drayage	$175	$500	$500
Rental of trucks	493	600	600
Parcel post (penalty indicia)	1,000	1,000	1,000
Total	1,668	2,100	2,100

Rental of trucks is from GSA motor pools in Washington, D.C.

We reimburse the Post Office Department for this amount for parcel post (penalty indicia).

	1963 actual	1964 estimate	1965 estimate
23 Rent, communications, and utilities:			
Communication services	$27,185	$30,000	$30,000
Rents and utilities	3,671	4,000	4,000
Penalty mail	31,500	35,000	35,000
Total	62,356	69,000	69,000

Communication services is largely telephones for national headquarters and the six regional field offices. The increases for 1964 and 1965 reflect the more than doubling of charges on GSA net wire service.

Rents are rental of IBM equipment in national headquarters.

Penalty mail charge is the amount we reimburse the Post Office Department

for carrying our penalty indexes mail. The increases reflect the rate increase for 1964 and 1965.

	1963 actual	1964 estimate	1965 estimate
24 Printing and reproduction	$3,593	$17,000	$4,000

The principal item in this expense is the annual report of the Director to Congress. The increase for 1964 is for publishing monograph No. 18, the last of the series.

	1963 actual	1964 estimate	1965 estimate
25 Other services	$9,974	$5,000	$5,000

A substantial part of this cost is normally for repairs and services on equipment. However, 1963 included having material run from the 1 percent sample survey to furnish information to the Department of Defense in support of their request for extension of the general authority to induct.

	1963 actual	1964 estimate	1965 estimate
26 Supplies and materials	$24,052	$21,500	$21,500

No substantial change is contemplated.

	1963 actual	1964 estimate	1965 estimate
31 Equipment	$39,975	$15,800	$5,000

1964 includes the sedan at $3,000 for the use of the Director.

Mr. SHIPLEY. This activity is carried on in the offices and the regions and national headquarters. There are six regional field offices. There is an increase of $69,000 for the pay of military and some civilian pay raise effective for a part of 1964 and all of 1965. There are no new positions.

Colonel ILIFF. That is correct.

Mr. SHIPLEY. On page 35, you list the personnel benefits. The increase there is $1,200 based on the increased payroll of the civilians.

TRAINING PROGRAM

Mr. THOMAS. How valuable is your training program? How long do the courses last and what courses do you have? You have had this training program every year, year in and year out. What are you training them to do? Let us get a record on this.

General HERSHEY. We have about 1,500 earmarked individuals who are paid by the Armed Forces, but we do have to pay the trainers, purchase the material, and so on. First of all, we run extension courses which require some personnel and some paper. It is not a very expensive method of education. Our earmarked officers are required to meet minimum standards of completing at least a course a year or we do not retain them.

In addition to that, each year the Armed Forces furnish the money to have these individuals have 1 drill night a week, and 2 weeks on active duty. We supervise the program. This year happens to be what we call a conference year.

Mr. THOMAS. Are these all Reserve officers?

General HERSHEY. They are, including the National Guard. About 500 of them are in the National Guard. They are Reserves.

Mr. THOMAS. You figure you give them active training about 2 or 3 weeks a year?

General HERSHEY. Two weeks.

Mr. THOMAS. It is all by extension courses?

General HERSHEY. No. The extension courses are separate.

Mr. THOMAS. In addition to the 2 weeks of active duty.

What does it cost you to train one of these?

General HERSHEY. What it costs us?

Mr. THOMAS. Yes. Do you reimburse the military?

General HERSHEY. No.

Mr. THOMAS. What do you pay?

General HERSHEY. We pay the people who train them, and their mileage.

Mr. THOMAS. But you do not pay the National Guard or the Reserves?

General HERSHEY. No.

Mr. THOMAS. You pay the cost of operating the extension courses and the instructors?

General HERSHEY. That is right.

Mr. THOMAS. What does that cost you per trainee?

General HERSHEY. We have about 1,500.

Colonel ILIFF. I do not have the training figure broken down, but we can see roughly what it costs, for example, to have the faculty at these conferences. That costs in the neighborhood of $20,000.

Mr. THOMAS. You have about $1.8 million set up here for it.

Colonel ILIFF. But that includes all the other things that national headquarters does, sir.

General HERSHEY. This is the management, also.

ITEMS INCLUDED IN PROJECT 10 BUDGET

Mr. THOMAS. Break it down. Give us a little idea how much money you are spending for each one of these. You have two or three projects here.

General HERSHEY. I think we had better furnish that, because if we go to shooting from the hip here, we may not be accurate.

Mr. THOMAS. What are you getting for your $1.8 million?

General HERSHEY. I would be glad to speak to that.

In the first place, any time we have to expand——

Mr. THOMAS. Does this cover all your recordkeeping?

Colonel ILIFF. In the national headquarters, yes.

Mr. THOMAS. Where is the field office expense covered?

Colonel ILIFF. That is part of the national headquarters project, sir.

General HERSHEY. We have 12 regional officers.

Mr. THOMAS. Six or twelve?

General HERSHEY. Six places, but 12 officers. There are two officers in each.

Mr. THOMAS. What is the cost for the six field offices and the headquarters offices?

General HERSHEY. The salaries of the national headquarters are shown. The field offices are included because they are part of national headquarters.

Mr. THOMAS. In order to get the complete picture, you have to summarize projects 10 and 20, do you not?

Colonel ILIFF. Not 20. Project 20 is our State headquarters setup.

Mr. THOMAS. What part does your State headquarters play with the national headquarters in this project?

General HERSHEY. Every other year we send officers to be trained in the State headquarters, but I would not consider the State headquarters cost much money to train these officers.

Mr. THOMAS. In other words, the function is not intermingled with the State and national headquarters?

General HERSHEY. What little we get out of the State I would not consider a factor.

Mr. THOMAS. In order to break down the functions of the national headquarters, you have to go back and complete the record, is that it? Your overall cost in round figures is about $1.758 million this year, which is a little increase over last year, and it includes the operation——

General HERSHEY. Of the national headquarters, all of our regional offices, and the training.

Mr. THOMAS. Correspondence courses?

General HERSHEY. The training. Not only that, all the planning that goes on with other agencies of government. That is all in here.

Mr. THOMAS. What do you figure your overall personnel load is? I do not see that figure here.

Colonel ILIFF. The national headquarters has 185 people.

Mr. THOMAS. In the regional offices, too?

Colonel ILIFF. Yes, sir.

REGIONAL OFFICES

Mr. THOMAS. How many people are in your six field offices?

Colonel ILIFF. We have 12 officers.

Mr. THOMAS. Twelve of your 185?

Colonel ILIFF. We have 18 including civilians.

Mr. THOMAS. Where are those field offices? I remember going to one. I think it was in New York. That is about the only one I have been to.

General HERSHEY. There is one, which we should probably name first, in Dallas. There is one in San Francisco, one in Chicago, one in Atlanta, one in Hagerstown, Md. I never can think of the little town up in New Hampshire—Lebanon. It was in Boston, but when we got into this abandoning business we moved it out to Lebanon and left it there.

Mr. THOMAS. What is the function of those regional offices?? The one in New York is over on Wall Street, as far as I can recall.

Colonel ILIFF. That was probably the city headquarters, sir.

General HERSHEY. The regional office is not in New York. It is in Lebanon. These two offices have two officers and one clerk.

First of all, if you divide 6 into 1,500, you get 200-and-some officers in each of these areas who are reservists and are being trained. That is the responsibility of this field officer.

Mr. THOMAS. Exactly what is the course of instruction? We have gone into this time and time again.

General HERSHEY. If we order these officers to active duty tomorrow, these men should be able to take a secondary position in any division and operate it without further instruction, because that is what they are trained for.

Mr. THOMAS. If you were to call them, where would they be? In the National headquarters or State headquarters?

General HERSHEY. Our State headquarters would have to expand anywhere from 100 to 200 percent. Our field offices would get some additional, and national headquarters would get a few of them.

One of the things we have worried about, maybe unnecessarily——

Mr. THOMAS. Would these people go to the State or National headquarters?

General HERSHEY. Both. They are the backup of all of them.

Mr. THOMAS. They are supposed to be able to do anything that is to be done in the field?

General HERSHEY. That is right. Many of them have already served on active duty.

Mr. SHIPLEY. We are on page 36, transportation of persons, under national administration, planning, training, and records management.

SELECTIVE SERVICE CONFERENCES

The administrative travel is the same as it was in 1964. There is a reduction of $1,200 in the rental of passenger motor vehicles. The reason for this reduction in 1965 is that this was for the use of the regional field officers in connection with the bienniel selective service conferences. What do they do at these conferences, General?

General HERSHEY. This is back to the training. These are the 2-week conferences. For instance, one just finished last week in San Diego. We had about 100 officers there. We sent out three or four instructors.

They are talking about saving a little money next year because these people will be sent to State headquarters and therefore no instructors will be going out.

We run a program trying to illustrate different phases. I might give you one example. This year we have had the last two conferences working on how the Selective Service System would run a series of evaluations or examinations of 18-year-olds if we happened to be stuck with that after the 1st of July of this year. That is pressing on us at the present time. One part of the business of these two conferences was to set up the machinery by which the Selective Service System would attempt, with unpaid people, to get examinations, physically and mental, done on the 18-year-olds if we should find them in our laps, with the Armed Forces not having enough money to examine them.

This is not a trip to the moon. This is something that I am a little afraid we will be caught with.

We have tried at times at State headquarters to put a group of these people in and tell them, "You are the State headquarters, and what

would you do if the State headquarters had been wiped out by a bomb or something else and you tried to reconstruct the State headquarters?

OTHER EXPENSES—PROJECT 10

Mr. SHIPLEY. "Transportation of things" remains the same as it was in 1964, $2,100.

Under "Rent, communications and utilities," you show $30,000 for communication services. Is the increase from 1963 to 1964 due to GSA?

Colonel ILIFF. No. This rental is rental of equipment in national headquarters. It is not a space rental figure.

Mr. SHIPLEY. The figure is $69,000 for 1965, the same as it was in 1964, under "Rent, communications and utilities."

In "Printing and reproduction," you have a $13,000 decrease this year because you finished publishing monograph No. 18, the last of the series.

"Other services" is $5,000 and that remains the same. A substantial part of this cost is normally for repairs and services on equipment.

SURVEY FOR DEPARTMENT OF DEFENSE

The year 1963 included having material run from the 1-percent sample survey to furnish information to the Department of Defense in support of their request for extension of the general authority to induct. What did you learn from this survey?

Colonel ILIFF. They asked us to determine certain questions for them in connection with their request. This covers the cost of having the material run to get the figures.

Mr. SHIPLEY. Did you learn anything from the survey? What kind of questions did you ask?

General HERSHEY. We ran it during the time there was a request for extension of the legislation. I do not remember exactly what it was.

Mr. SHIPLEY. You just furnished the material for it?

General HERSHEY. Yes. I think they asked three or four specific questions. One was to make a 1-percent survey of our System on those 1-percent things.

Mr. SHIPLEY. I was aware of the survey. I wondered what the questions were.

General HERSHEY. We can furnish that.

(The information supplied follows:)

About every 6 months the Department of Defense makes a study of Selective Service registrants by year of birth. It does this among other things to determine the current and expected yield for military service for each year of age. Of value also to Defense is the year-of-birth picture for men examined and found qualified or not qualified for active duty with the Armed Forces, and the deferment situation by age. All of these analyses are of present and potential significance in the field of military and civilian manpower.

The most readily available data for these studies of registrants and their classifications by the local boards of the System, are those of the agency's 1-percent sample inventory. In fact, the electric accounting machine, keypunch cards and electronic computer magnetic tape of this inventory are the only source for such information outside of the 100-percent coverage of men in the local boards.

Mr. SHIPLEY. "Supplies and materials" stays the same, $21,500. There is no substantial change contemplated in these funds.

Under equipment you have a reduction of $5,000.

Colonel ILIFF. One was a $3,000 reduction because of the Director's car to be purchased this year. This shows odds and ends of equipment.

Mr. SHIPLEY. What is the remaining $2,000 for? I refer to $2,000 of the $5,000.

Colonel ILIFF. Equipment for 1965 is $5,000; the cars are to be purchased in 1964. That is why it would be reduced to $12,800. It results from purchase of equipment. We are not buying new equipment.

STATE ADMINISTRATION, PLANNING, TRAINING, AND RECORDS SERVICING

PROJECT 20

The Universal Military Training and Service Act of 1951, as amended, in section 10(a)(2) requires the establishment of at least one State headquarters in each State, territory, and possession of the United States. There have been established 56 such headquarters. The function of State headquarters is to administer the act within the respective States in compliance with the law, regulations, and directives of national headquarters. In general, the primary administration and responsibilities of each State headquarters are as follows:

(1) To establish and maintain local boards and appeal boards including arranging for office space, office equipment, securing competent personnel, and the selection for recommendation by the Governor of potential local board and appeal board members for either original appointment or as replacements for members lost.

(2) To inform and instruct new local and appeal board members and clerks in the existing regulations, policies, and administrative procedures; then to continually inform and instruct local and appeal board members and clerks concerning local manpower situations and changes in regulations, policies, and administrative procedures.

(3) To allocate calls to the local boards within the State on the basis of availability and quotas established from records of manpower available for service and those already in the service. To do this records must be maintained

of men available for service, men already delivered for service, men deferred in all classes and credits to the various communities for men in the armed services. Records must also be maintained to insure the deferment of men needed in agriculture, industry, and the national health, safety or interest. Such problems vary in the several States. To know the needs of agriculture, industry, etc., it is necessary that close liaison be maintained between the State headquarters and these various fields of employment.

(4) To allocate funds received and operate within the fiscal limitations so established. To pay all liabilities incurred by both State headquarters and the local boards within the State. To process all personnel appointment papers. To arrange for the most economical method of transportation for registrants and arrange for delivery of men to the examining and induction stations in numbers not exceeding the daily capacity of the station. This may only be accomplished by the proper coordinating of schedules with the Armed Forces and the assigning of delivery dates to the various local boards.

(5) To act as custodian and servicing agent of records. There are 54 Federal record depots in which are housed the remaining records of all registrants of World War II operations. The work of the depot consists of (1) answering requests for information, (2) the servicing of records, and (3) the destruction of records when authorized.

(6) To receive from the several services the notification of transfers of personnel to the Standby Reserve; to locate the local board of jurisdiction within the State; to assign the reservist to the appropriate local board and to maintain a record of the availability for selective callup of reservists as established by the local board pursuant to Public Law 305, 84th Congress.

(7) To plan for manpower procurement in general conformity with the national program as adapted to the unique problems within the State.

(8) To maintain and keep current a plan for the operation of the State headquarters and local and appeal boards in event of a catastrophe, including cooperative planning with adjoining States. Also to maintain a plan for an all-out emergency expansion. The number and location of the additional local boards, which would be required under such an emergency, have been established, lists of potential local board members are maintained, records of present registrants are so numbered that should expansion become necessary the records to be transferred to any particular local board are readily identifiable.

(9) To develop and maintain a fully adequate program of training to provide a reserve of officers and civilians who will be able and willing to fill a position in the System should it become necessary to expand.

	1963 actual	1964 estimate	1965 estimate
11 Personnel compensation:			
Permanent positions:			
Civilian	$3,597,265	$3,814,252	$3,972,056
Military	2,109,992	2,269,248	2,538,620
Positions other than permanent	73,157	75,000	85,000
Other personnel compensation	22,001	57,800	42,324
Total personnel compensation	5,802,415	6,216,300	6,638,000

The increase in military personnel costs for 1965 is due to the pay raise effective October 1, 1964, for military personnel. This is not included in 1964 because no supplemental is authorized at the time this request is prepared. The increase for 1965 amounts to $248,000.

Also included is the civilian pay rate increase effective for only part of 1964 and all of 1965. No new positions either civilian or military are included.

Mr. SHIPLEY. On page 43 we have "Personnel compensation." We have an increase in the total dollars in permanent positions. In civilian employment there is an increase of $158,000. The military increase is $269,000. Are both of these items due to pay increases?

Colonel ILIFF. They both involve pay increases. There are no new positions.

PAY ACT COSTS

Mr. THOMAS. What did you figure the pay increase cost you, $248,000? Is that a firm figure?

Colonel ILIFF. That is for the military personnel.

General HERSHEY. Within the States.

Colonel ILIFF. Within the States; yes, sir.

Mr. THOMAS. We are talking about the headquarters. Break down the costs now for the State headquarters, National headquarters, and the local draft boards. What did the pay increase cost you this year?

Colonel ILIFF. 1964 or 1965, sir?

Mr. THOMAS. 1964 is water over the dam unless you are coming for a supplemental. You indicate you may come in for a deficiency.

Does this amount to 2 percent of the payroll for 1965?

Colonel ILIFF. No, sir; the pay increase is based upon the actual grades.

Mr. THOMAS. I am talking now about the civilians. You gave them the same as the civil service employees got, did you not?

Colonel ILIFF. These are civil service employees. This is State administration.

Mr. THOMAS. What is the total pay increase in the 1965 budget? Break it down in the three component parts. Can you do that? Is $248,000 correct?

General HERSHEY. That is the military increase.

Mr. THOMAS. How about the civilian?

Colonel ILIFF. It would be the difference between the two.

Mr. THOMAS. We are talking about one item alone now, the pay increase. Are the military personnel subject to the pay increase, too?

General HERSHEY. Yes; two bills passed last fall.

Colonel ILIFF. Civilian pay increase shows $158,000.

Mr. THOMAS. That covers what, military and civilian?

Colonel ILIFF. Civilian; it is $248,000 for the military.

Mr. BOLAND. $258,000 for the national headquarters alone?

Colonel ILIFF. This is State headquarters alone.

Mr. THOMAS. You came up with a figure in the neighborhood of $416,000 just for pay increase. That is a little high. You had better check the figures again.

Colonel ILIFF. It is $158,000 for the civilian; the military is $248,000.

General HERSHEY. That is in the States alone.

Mr. SHIPLEY. What would be the other? There must be more money there, then.

Mr. THOMAS. About twice as high as the civilians, so that may account for it.

What was the military pay increase?

Colonel ILIFF. $248,000.

Mr. THOMAS. Percentagewise?

Colonel ILIFF. It was not a percentage, sir; but based on the different grades.

General HERSHEY. About 5 percent.

Mr. THOMAS. Most of the civilian agencies come to about two and a half percent of the civilian payroll.

The military pay is about twice as high as the civilian, almost twice as high, and the number is considerably less, is it not?

What is the number of military in the State headquarters?

Colonel ILIFF. 190 in the State headquarters.

Mr. THOMAS. Military?

Colonel ILIFF. Yes, sir.

Mr. THOMAS. How many civilian?

Colonel ILIFF. 675.

Mr. THOMAS. Three times the number of civilians as you have military. Yet the military pay is about 40 percent higher than the civilian.

Colonel ILIFF. The one military pay increase for 6 years is shown. There have been three civilian increases.

Mr. THOMAS. We are not questioning that. We want the figures.

General HERSHEY. One is about two and a half percent and the other about 5. That makes a difference.

Mr. THOMAS. Excuse me, Mr. Shipley; go ahead.

OTHER EXPENSES—PROJECT 20

Mr. SHIPLEY. On page 44 you show personnel benefits. There is a small change there. This is due to benefits tied to civilian payrolls.

I see you have nothing for the employee suggestion awards for 1965.

Travel and transportation of persons, on page 45, shows no change.

Administrative travel is shown and no increase requested over 1964. There is a limitation item distributed in 56 different places.

There are no questions on this.

There is no change in transportation of things, $8,500.

There is rental of trucks which covers GSA rentals and not many offices requires this truck service.

COMMUNICATIONS COST

Rent, communications, and utilities is the same as last year, $216,000. You state 95 percent of communications services is telephone cost. Telephone rates continue to increase and the GSA net has more than doubled wire charges.

Colonel ILIFF. GSA has the teletype communication network that all departments use.

Mr. SHIPLEY. Yes; GSA handles that.

Colonel ILIFF. We have to pay GSA double what we used to pay.

Mr. BOLAND. What amount is put in this item as a result of that?

Colonel ILIFF. I can furnish the figure.

(The information supplied follows:)

Commencing on May 1, 1963, the General Services Administration charge for traffic via their circuits was 0.015 (15 mills) per text word. The new proposed rate commencing July 1, 1964, will be 0.033 (33 mills) per text word.

Mr. BOLAND. You say the amount has doubled?

Colonel ILIFF. Yes, sir; the rate has doubled; let us put it that way.

Mr. BOLAND. Are you talking more these days?

General HERSHEY. There is no question about the fact that in the last 6 months you do not send 400,000 people to induction stations with the same amount of talk as you did with 10,000, 15,000, or 20,000. We have people telephoning from Congress and a hundred other places where people are being touched. Whenever you have a mass of people going in there is a lot of talking.

Mr. BOLAND. That is right. You think we should say that the telecommunications system is actually saving your agency money?

Colonel ILIFF. Yes.

Mr. BOLAND. Have you any idea of the saving?

Colonel ILIFF. As I recall it is about one-third of the cost of commercial service, even at these advanced rates. I think they were not getting full reimbursement. That is why they put up their rates.

Mr. SHIPLEY. There was considerable comment on this and I wanted your views on it.

On printing and reproduction there is no change, $12,000 for 1965. This is basically for franked envelopes.

Other services is next, and it is the same as in 1964. This item is mostly repairs on equipment, miscellaneous repairs.

I see $1,200 for reimbursement to the Department of Labor for payments from the workmen's compensation fund. How does that come about?

Colonel ILIFF. Where we have reimbursement under workmen's compensation funds, the Department of Labor pays it and they bill us.

Mr. SHIPLEY. Supplies and materials stays the same. This will provide only for current replacement of supplies.

For equipment you request $30,000, the same as for 1964. The principal item requirements for 1965 are 200 five-drawer filing cabinets at $11,000; 100 storage cabinets at $5,000; 6 calculating machines at $3,000; 250 filing shelves at $6,975, and over 100 miscellaneous items at $4,025.

REGISTRATION, CLASSIFICATION, AND INDUCTION

Next we go to page 49, which is Project 30. You show an overall obligation increase of $4,803,000. Is that right, Colonel Iliff?

Colonel ILIFF. That is correct.

Mr. SHIPLEY. Insert pages 49 through 53 in the record.

(The pages referred to follow:)

	Total obligations	26,970,037	28,649,000	33,452,000

REGISTRATION, CLASSIFICATION, AND INDUCTION

PROJECT 30

The Selective Service System, operating under the provisions of the Universal Military Training and Service Act, as amended, exists for the primary purpose of making possible the most effective utilization of the manpower resources of the United States. The accomplishment of this mission requires varied and sundry functions, the most important of which are registration, classification, selection, and delivery for induction of the male citizens of the United States who by age are subject to the requirements contained in the act.

The above functions are carried on in the local boards which are composed of little groups of neighbors on whom is placed the responsibility to determine who is to serve the Nation in the Armed Forces and who is to serve in industry, agriculture, and other deferred classifications. These members of the local board serve in an uncompensated capacity and are assisted by other uncompensated citizens known as advisers to registrants, Government appeal agents, and medical advisers, totaling in all 47,000. The function of classification in certain cases is carried over to the State appeal boards whose members are also uncompensated citizens of the communities they represent and at present number nearly 600. To assist these 48,000 uncompensated citizens in the performance of their duties, it is necessary to provide clerical help, space, supplies, etc., which are the supporting facts of this portion of the budget estimate.

In studying the funds requirements for Project 30, it is most necessary that full realization be secured of the unique use by the Selective Service System of the services of some 48,000 uncompensated citizens who under the law make the classification and selection of those who are to serve in the Armed Forces and select those whose military obligation is to be postponed in support of the

national health, safety, or interest. There are 4,166 local and appeal boards, including appeal board panels, at which these people serve giving the necessary part of their time to serve the Nation with realization of such service being their only reward. To retain that service, it is a fundamental precept that adequate clerical assistance must be furnished.

In May 1963 a carefully supervised work measurement study, developed with the assistance of the Bureau of the Budget staff, was conducted in nine States. A similar study was made in Colorado, Georgia, and Michigan in 1960 and in Georgia in 1958. The results of these studies serve as a basis for the following estimate of work units, man-years required to process them, and the personnel costs for local boards of the entire Selective Service System.

On the basis of this study, it will be seen that in order to meet the workload requirements, it was necessary to secure in 1963 from local board clerks, 35 man-years of time for which they could not be compensated.

	1963 actual	1964 estimate	1965 estimate
11 Personnel compensation:			
Permanent positions:			
Civilian	$18,260,987	$18,472,728	$23,158,771
Military			
Positions other than permanent	3,311,243	3,532,388	3,789,912
Other personnel compensation	9,548	161,134	110,044
Total	21,581,778	22,166,250	27,058,727

The table on the following page shows the requirements as related to the work measurement study. The amounts reflect the administrative pay raises given to local board clerks comparable to those of the pay raise granted classified employees by the Congress. Traditionally this has been done. Usually the civilian pay raises have been retroactive and the Congress has granted authority for retroactive pay to those not being paid under the Classification Act.

The positions other than permanent cover part-time employees and WAE payments.

Other personnel compensation covers differential in the States of Alaska and Hawaii and possessions. This item also covers overtime pay and, in the years in which they occur, extra days' pay.

In the study of the nine States, a report was made of the official work performed by local board clerks for which they were not compensated. It amounted to 1.1 percent of the amount of time for which compensation was paid.

In order to handle the workload for 1963, clerks gave 35 man-years of of uncompensated time. It will be noted that in the comparative summary statement by function that this was taken into account in arriving at the total amount.

In view of the increased workload for 1964, financing of which is planned by a supplemental appropriation not yet approved, the compartive statement shows on the next to the last line 483 man-years of clerical time contributed at a value of over $2 million.

In 1965, again, 480 man-years are shown with a value of over $2 million.

Mr. SHIPLEY. This is the justification for "Registration, Classification and Induction, Project 30."

Please insert the green sheets for Project 30.

(The material referred to follows:)

PROJECT NO. 30

Detail of personnel compensation

	1963 actual		1964 estimate		1965 estimate	
	Number	Total salary	Number	Total salary	Number	Total salary
Grades and ranges:						
GS-11. $8,410 to $10,650	2	$18,475	2	$16,242	2	$19,900
GS-10. $7,690 to $9,985	1	7,780	1	8,455	1	8,455
GS-9. $7,030 to $9,100	11	81,525	11	86,990	11	88,600
GS-8. $6,390 to $8,280	25	176,440	25	187,260	25	188,940
GS-7. $5,795 to $7,550	63	410,070	63	436,295	64	446,395
GS-6. $5,235 to $6,810	25	141,929	25	157,825	25	158,525
GS-5. $4,690 to $6,130	28	143,980	28	155,338	28	158,011
GS-4. $4,215 to $5,475	9	42,649	9	46,900	9	45,915
GS-3. $3,880 to $4,900	7	29,985	7	30,919	7	31,310
GS-2. $3,620 to $4,565	2	7,645	2	7,870	2	7,975
Ungraded positions at annual rates:						
Less than $13,615	4,169	17,676,065	4,169	18,001,342	5,841	25,316,470
Total permanent	4,342	18,736,543	4,342	19,135,436	6,015	26,470,496
Deduct: Lapses	59	−475,556	110	−662,708	764	−3,311,725
Net permanent (average number, net salary)	4,283	18,260,987	4,232	18,472,728	5,251	23,158,771
Positions other than permanent		3,311,243		3,532,388		3,789,912
Other personnel compensation:						
Regular pay above 52-week base				145,000		100,544
Overtime and holiday pay		1,335		1,500		1,500
Cost differentials and cost-of-living allowance		8,213		14,634		8,000
Total personnel compensation		21,581,778		22,166,250		27,058,727

Mr. BOLAND. Can we get the cost of the pay increase? You said $158,000 was for State boards. That does not include local boards?

Colonel ILIFF. That is right.

Mr. BOLAND. This is the large activity in the System. What is the cost of the pay increase for 1965 as a result of this activity, Project 30? What will it cost in 1965 for the pay increase for local boards, just the civilians? We are not interested in military.

General HERSHEY. There are no military.

Colonel ILIFF. There is no military involved here.

The big increase is the increased workload through registration.

Mr. BOLAND. We want to know what the pay increase is. It should be simple to determine that.

Colonel ILIFF. If we take the 1964 figure on the employees and how much their increase is——

Mr. BOLAND. Give us both figures.

General HERSHEY. The difference between these 2 figures is accounted for by the increase of those we already have and the hiring of about 1,000 additional positions. That accounts for the difference between $18,472,000 and the $23,158,000.

Colonel ILIFF. That is correct.

Mr. BOLAND. What will the pay increase cost you in 1965 for the number of people who are on board now, the number of employees you now have without additional personnel added in 1965? What is the cost of the pay increase in 1965?

BREAKDOWN OF INCREASED PERSONNEL COSTS

Mr. JONAS. Before he answers that, may I ask you to yield to let me suggest that they add something else?

I would like that same information, and then I would like to know what the additional employees are going to cost, and I would like you to put in a little table, with your permission, Mr. Boland, at the end of the testimony, breaking down the $5 million increase being asked for.

It is in the justification but it is not assembled at one particular point.

Would you be willing to have him do that?

Mr. SHIPLEY. Yes, that would be fine.

Colonel ILIFF. $553,000 covers those presently on board.

Mr. BOLAND. $553,000 is the figure which indicates the salary increase as a result of the pay increase of those who are now on board?

Colonel ILIFF. Yes, sir.

Mr. BOLAND. Then Mr. Jonas wants the salary increase—you anticipate putting on 1,000 more on local boards?

Colonel ILIFF. Yes.

Mr. BOLAND. What is the average salary?

General HERSHEY. It was $4,300.

Mr. JONAS. How much of this $5 million increase do you allocate for new employees? How much do you allocate for the automatic pay increase? How much do you allocate for the ingrade promotions? How much do you allocate for travel? Break the $5 million increase down into one table.

Can you do that?

Colonel ILIFF. Yes, very easily.

Mr. BOLAND. Supply it for the record.

Colonel ILIFF. Yes, I will have to do that.

(The information supplied follows:)

Personnel cost increases, 1965 over 1964

	P-10	P-20	P-30	P-40	P-50	Total
Military pay rate	$69,000	$248,000				$317,000
Civilian pay scale	$19,129	$82,227	$186,477	$1,300	$670	$289,803
Civilian within-grade raises	$26,671	$74,473				$101,144
Man-years	(−1.5)	(4.5)	(1,076)			(1,079)
Added employment	−$5,000	$17,000	$4,706,000			$4,718,000
Total	$109,800	$421,700	$4,892,477	$1,300	$670	$5,425,947

NOTE.—The small increase in man-years in State headquarters is due to increase in part-time employment and represents increased employment of present employees.

Increases and decreases by project and object, 1965 over 1964

		P-10	P-20	P-30	P-40	P-50	Total
11	Personnel compensation	$109,800	$421,700	$4,892,477	$1,300	$670	$5,425,947
12	Personnel benefits	1,200	4,300	201,201		5	206,706
21	Travel and transportation of persons	−1,200		−534,000			−535,200
22	Transportation of things			−20,000			−20,000
23	Rent, communications, and utilities			248,322	−400	−275	247,647
24	Printing and reproduction	−13,000		15,000	−100	−100	1,800
25	Other services				−400	−100	−500
26	Supplies and materials				−100	−100	−200
31	Equipment	−10,800			−300	−100	−11,200
	Total	86,000	426,000	4,803,000			5,315,000

Mr. SHIPLEY. Project 30 covers all the local boards and their functions, advisers to the registrants, medical advisers, and so on. These people total 47,000. They are not compensated in any way.

Colonel ILIFF. That is right.

REQUEST FOR INCREASED EMPLOYMENT

Mr. SHIPLEY. I believe you are asking for an 1,020 increase in average employment for these local boards. Why do you request this many employees within such a short time?

General HERSHEY. One of the things we have been through in these last 6 months has been ordering for preinduction examination 400,000. We have been driven for several years to have these people work a great many hours for which they are not compensated. It has been true that the calls up until this year have been—well, a year ago there were some 70,000. This year we will probably hit 165,000. The result is that the situation in our local boards has been quite serious in the past 6 or 8 months. These individuals have had to work overtime. They do happen to be very closely tied in with unpaid people and you will not get unpaid people to work unless we furnish them clerical hire.

I believe we have said each year when we come up here that we are very much embarrassed by the amount we have had these people do for nothing. We are faced with these 600,000 new registrations next year. It is on the basis of that we are defending this 1,000 people.

Unfortunately we are faced now with things we didn't even imagine when we got this thing because this referral program——

Mr. THOMAS. General, if I may interrupt you. Your board members are certainly doing an outstanding job and they have been uncompensated. They have been doing this since the inception of the program. Your clerks are fine, patriotic, loyal people, too. Aren't they pretty well satisfied with their local employment by and large?

General HERSHEY. I would like to say that I think the morale among our clerks is very high.

Mr. THOMAS. I have been to several of your offices and I know of no finer any place.

Mr. BOLAND. Off the record.

(Discussion held off the record.)

Mr. THOMAS. As the matter stands, gentlemen, the general comes in and says he has to have about 1,600 new employees. He ends up with

about 1,000 new ones, but we want to know how many of these will be annualized next year or the year after next in the budget, and rather than having 1,000 you will have 1,700 or 1,800.

Can you help the general straighten this out? That is what it looks like.

The sheet clearly shows the new employment is in excess of 1,600.

Mr. SHIPLEY. 1,672.

Mr. THOMAS. Through annualization it comes down to 1,000. But the year after next he will come back with 1,600 to 1,700. Can anybody help the general straighten that out for the record?

General HERSHEY. Well, the general is in a rather difficult position.

Mr. THOMAS. We don't want to put you in that kind of position.

(Discussion held off the record.)

General HERSHEY. I was in San Diego and Los Angeles in the last week. When you see 2,000 cases piled up in the Los Angeles offices, people who migrated to California and want to make a transfer, it is a difficult situation.

Mr. JONAS. Is it possible that you have differing conditions around the country?

General HERSHEY. That is right.

Mr. SHIPLEY. How many employees do you have in your local boards who are compensated?

General HERSHEY. Depending on the size of the local boards. If there are 40,000 to 50,000 registered there may be 3.

Mr. SHIPLEY. I refer to the total.

Colonel ILIFF. 4,400 full time and 1,750 part time.

OVERTIME

Mr. SHIPLEY. On page 53 you state:

> In the study of the nine States, a report was made of the official work performed by local board clerks for which they were not compensated. It amounted to 1.1 percent of the amount of time for which compensation was paid.

How long would they have to work at 1.1 percent to put in an hour's overtime? Would they have to work a couple of weeks to put in an hour of overtime?

Colonel ILIFF. What we are speaking of is what happened last May. What we have today is something quite different because of the fact we had this low——

Mr. SHIPLEY. That may be true, but you are justifying that with this justification. You did not change the number of employees since the justification was submitted; did you?

Colonel ILIFF. No.

Mr. SHIPLEY. Can you give me that figure for which I asked? How long would it take an employee to work an hour's overtime at 1.1 percent?

General HERSHEY. About two and a half weeks. You figure a 40-hour week, two and a half weeks would be 100 hours, and that is about what it is.

Mr. SHIPLEY. That is the point I was trying to bring out. If an average employee puts in 1 hour every 2 weeks this figure is accurate, then.

General HERSHEY. That is right.

KANSAS STATE UNIVERSITY LIBRARY
MAY 26 196
MANHATTAN, KANSAS

Mr. SHIPLEY. Any questions on this portion, gentlemen?

Mr. JONAS. I was not quite clear about the nervous breakdowns you referred to off the record in the local boards. Is that widespread, in certain areas?

General HERSHEY. In the past 6 months—and mind you, this is not war, and it is not what we went through during World War II and in Korea, but fortunately in those days we had younger clerks than we have now. When you have to get 10, 15, or 20 individuals set up to go in for induction, and then 2 or 3 are married, and a couple others turn up in school, and on short notice you have to find 5 or 6 more to send; those are the things that makes some of these elderly girls nervous. Perhaps they should not be, but——

TURNOVER

Mr. JONAS. What is your turnover in the compensated personnel? What is the rate of turnover per year?

Colonel ILIFF. I do not have it.

General HERSHEY. It is not great. It might be surprisingly great, but I will go on record as saying it is not great.

Mr. JONAS. Governmentwide it is 14 or 15 percent. Is yours that high?

General HERSHEY. I don't think so.

Colonel ILIFF. Last time I checked, it was five.

General HERSHEY. For the last 4 years I have led every governmental agency on the buying of bonds. The only people available to buy bonds are local board clerks because my military personnel have it charged against them. We have 200 or 300 in the States that are civilians. Of the 4,000 most are local board clerks. We have 97.8 percent of those buying bonds, and for 4 years I have led the parade.

We don't have much turnover. If we did have we would not have these new ones buying bonds so quickly.

Mr. JONAS. How many clerks did you say, 6,000?

Colonel ILIFF. A total of 6,150, including part time.

General HERSHEY. About 1,700 are part time, but some of the part time are just as permanent.

Mr. JONAS. Can you tell us how many of those have been with the organization since World War II ended?

General HERSHEY. We can get together and send it over.

Mr. THOMAS. Gentlemen, let me refer you to page 54. Compare page 54 with the green sheets on page 23. Page 23 is the green sheet for project 30. Here is an overall sheet on page 54 dealing with project 30.

On page 54 you say you have local clerks numbering 6,227 against 5,151 for 1964. That is an increase of what?

General HERSHEY. One thousand plus.

Colonel ILIFF. That is man-years.

Mr. THOMAS. You want to put it on that basis, 1,700.

Go back to the green sheets on project 30 dealing with the clerks of the local boards. You have 4,232 against 6,015, which is a difference of about 1,800.

Then you try to lapse out 764. I don't know what it means. Do you know what this means? What is the turnover in the local boards?

Is it old age, death, nervous breakdowns? What is the turnover in the local boards? That is over three-quarters of your employment, close to 90 percent. What is the rate of turnover?

Colonel ILIFF. I don't know what the current rate is, sir. At one time I checked it and it was around 5 percent.

Mr. THOMAS. Would say it is 5 percent now?

Colonel ILIFF. I would think it would not be much more than that.

Mr. THOMAS. What is the average rate of turnover in the Government?

Colonel ILIFF. 14 percent I am told.

Mr. THOMAS. I understand it is 14 percent. Why is yours so low and the rest of the Government so high? Do you have a happy situation, overwork, nervousness?

General HERSHEY. In the first place, Mr. Chairman, I don't see people quitting anywhere because of overwork.

Mr. THOMAS. Maybe you can explain it to us. Why do so few people resign? It is three times that high throughout the Government.

General HERSHEY. It would not be very dignified of me to think we have an organization that is different from those governmental organizations.

Mr. THOMAS. What do you mean dignified of you?

General HERSHEY. Because somebody might think that as long as I have been in it all I would claim credit for the fact we have an effective organization. I think the lack of turnover proves it.

Mr. THOMAS. Don't be too timid about it.

General HERSHEY. I don't think overwork drives people away. I am glad not to have people who quit because of too much work. I don't want them.

Mr. THOMAS. What is some reason with some meat on it that the rate in Government turnover is about three times as high as your rate?

General HERSHEY. Most of those women are older. Most of them are widows or wives. Also, they can work in the area where they live.

Mr. THOMAS. That is no different from 95 percent of the Federal employees. They all work in the area in which they live. You will have to come up with a better reason that.

Mr. BOLAND. They are alone. They have their own offices.

General HERSHEY. They are executives and not clerks.

Mr. BOLAND. It is pretty nice.

Mr. THOMAS. Did Mr. Boland put his finger on it? It is satisfactory employment, they like it, and if they didn't they would quit.

Mr. SHIPLEY. The clerk in my hometown is retiring because of bad eyesight. I have had 20 people in the last month and a half contact me on how to get this job. I know you have no trouble recruiting personnel for this type of job, and evidently in some areas it must be a very attractive job or you would not have this many inquiries from a town the size of mine.

General HERSHEY. If it is a small place, and it depends on the employment level, sure. I cannot do too much in my own home community. We have the same girl who started in 1940. She has two local boards now and drives 30 miles a day, but it is all right. In my community any amount of money is welcome,

Mr. SHIPLEY. Do you pay the same amount of money for the same job?

General HERSHEY. Some other agencies outbid us. On the other hand we have had people who didn't leave when they were offered more money, and others went and then came back.

Mr. Boland put his finger on it. There are a lot of people who if they can be the boss are a great deal more satisfied than if they are merely somebody who is a link in a chain.

Mr. SHIPLEY. Off the record.

(Discussion held off the record.)

JUSTIFICATION MATERIAL—PROJECT 30

Mr. SHIPLEY. Enter in the record pages 54 through 79.

(The pages referred to follow:)

COMPARATIVE SUMMARY STATEMENT BY FUNCTION

Project 30, local board clerks

	1963 actual		1964 authorized		1965 estimate	
	Man-years	Cost	Man-years	Cost	Man-years	Cost

Administrative time	1,085	4,380,360	1,035	4,452,475	1,165	5,143,606
Subtotal	5,381	21,728,075	5,634	24,242,187	6,707	29,142,494
Less uncompensated man-years	−35	−147,261	−483	−2,075,937	−480	−2,083,767
Total	5,346	21,580,814	5,151	22,166,250	6,227	27,058,727

	1963	1964	1965
Registering:			
Work units	1,506,857	1,525,847	2,109,836
Man-years	875	863	1,193
Cost	$3,533,580	$3,712,386	$5,166,988
Unit cost	$2.345	$2.433	$2.449

All male citizens of the United States (and alien males in the United States) who are over 18 years of age are required by law to register with the Selective Service System for possible military service. The registration is conducted by local board clerks who normally interview each registrant as part of the preparation of several forms, assign selective service numbers and prepare necessary file documents. The function also includes issuance of duplicate replacement registration certificates and the work involved in the cancellation of a registration when necessary.

Estimates of work units to be processed are based on census estimates of the number of men who will turn 18. These estimates are adjusted on the basis of actual numbers registered. (See p. 3 of this justification.)

	1963	1964	1965
Classification:			
Work units	6,803,610	7,325,218	9,561,222
Man-years	1,915	2,009	2,620
Cost	$7,735,705	$8,643,757	$11,349,171
Unit cost	$1.137	$1.137	$1.187

Classification is the act of declaring a registrant either available for military service or not available for service for any of several prescribed reasons, including dependency and employment in vital industry. The procedure is necessary to comply with a provision of the law which requires a selection system which is fair and just and which is consistent with the maintenance of an effective national economy. Accordingly, all men who register must be placed in one of the several classification categories as soon as practicable. In addition, registrants must be reclassified as changes occur in their family, employment, or health status. Classification determinations are made by uncompensated members of the local board but substantial clerical work is also involved.

This item covers the work of the local board clerk in preparing and mailing the classification questionnaire and associated documents, reviewing them when they are returned, securing such additional information as may be required, attending board meetings, and preparing various postmeeting forms.

There is some timelag between registration and classification and all who register in a particular year may not be classified during that year. However, these estimates are made by correlation of the new registration figure and the induction requirements.

	1963	1964	1965
Appeals:			
Work units	7,410	7,984	10,412
Man-years	38	40	52
Cost	$152,379	$170,363	$223,822
Unit cost	$20.564	$21.338	$21.476

A registrant, his dependent, or any person who has filed a request for his deferment may appeal any classification actions except those placing the registrant in classes I–C, I–W, IV–F, or V–A. These appeals go first to appeal boards in the States but may, under certain circumstances, ultimately be carried to the National Selective Service Appeal Board which is located in Washington, D.C.

This item covers the work of the local board clerks and the appeal board clerks in processing these appeals. It includes the making of necessary notations in various records, preparation of necessary forms, and notification to interested persons that an appeal has been taken and informing them of the result of the appeal.

The estimated volume of appeals for 1964 and 1965 is calculated as a portion of the number of classifications.

	1963	1964	1965
Physical examination (local board):			
Work units	38,624	90,952	60,420
Man-years	17	38	26
Cost	$67,630	$165,260	$110,508
Unit cost	$1.751	$1.817	$1.829

While most physical examinations are conducted by the medical staff at Armed Forces examining stations, medical interviews are conducted at the local boards to screen out registrants who may have obviously disqualifying physical or mental conditions. This interview is usually conducted by a medical adviser to the local board. Its purpose is to save the cost of transportation to an examining station of the men concerned.

The local board clerk is involved in these examinations in preparing notices for registrants to report for medical interview, completing pertinent forms, making necessary notations on records, etc.

The work measurement study shows that the percentage of registrants who are handled in this manner is 15.42 percent of the total who undergo Armed Forces physical examinations. On the basis of 391,829 forwarded for Armed Forces physical examinations in 1965, it is therefore anticipated that there will be 60,420 local board physical examinations.

	1963	1964	1965
Physical examinations (examining stations):			
Work units	250,559	589,829	391,829
Man-years	125	288	191
Cost	$506,881	$1,238,051	$827,035
Unit cost	$2.023	$2.099	$2.113

Most registrants are examined at Armed Forces installations where there is available equipment for X-ray, laboratory tests, etc.

In preparing groups of registrants to be sent to these installations, it is necessary to issue orders to the individual registrants, prepare various documents for each (and file them on return), instruct group leaders, etc.

Two factors are involved in estimating work units for this item; the number of men called for induction and the condition of the manpower pool.

The calculations upon which this is based are covered under the justification for selectee travel in this project. The 1964 estimate is based on 147,000 inductions and the 1965 estimate on 100,000 inductions.

	1963	1964	1965
Inductions:			
Work units	103,703	204,764	139,295
Man-years	62	119	81
Cost	$250,339	$512,934	$351,163
Unit cost	$2.414	$2.505	$2.521

Registrants in sufficient number are sent to induction stations for induction into the Armed Forces in numbers requested by each service. Registrants are under the control of Selective Service until inducted but from that point on they are the responsibility of the appropriate service. In recent years the Navy, Air Force, and Marine Corps have filled all personnel needs through enlistment and only the Army has been using inductees. It is anticipated that this situation will continue through 1964 and 1965.

Workload for this item depends entirely on manpower requirements of the Armed Forces and the rejection rate of induction. The work unit is the number of men forwarded for induction. Calculations upon which this is based are covered under the justification for selectee travel in this project.

	1963	1964	1965
Civilian work assignments:			
Work units	964	1,904	1,295
Man-years	3	5	4
Cost	$11,275	$23,107	$15,818
Unit cost	$11.696	$12.136	$12.215

Registrants who are conscientious objectors to military service are allowed under the law to do certain types of civilian work in lieu of such service. This

work must contribute to the maintenance of the national health, safety, or interest and must be in the employ of the United States, a State government or a subdivision thereof, or of a nonprofit organization engaged in an activity benefiting the general public. The registrant must do such work for a period equal to the time he would spend in military service had he been inducted. The local board must approve the employment of each registrant performing civilian work in lieu of military service.

This item covers the work of the local board clerk in locating suitable work for the conscientious objector, ordering him to report for such work, referring to the State director of selective service cases in which the registrant and the local board are unable to agree on suitable work, making arrangements for travel of the registrants, making necessary notations on records, etc.

The number of civilian work assignments varies with the number forwarded for induction.

	1963	1964	1965
Enlistment in the Ready Reserve:			
Work units	1,025	85	
Man-years	2	0	
Cost	$7,534	$648	
Unit cost	$7.350	$7.626	

Registrants who possess certain critical skills and who were engaged in civilian occupations in a critical defense-supporting industry or in research affecting national defense were permitted by law to enlist directly in the Ready Reserves of the Armed Forces. Following enlistment they served 6 months of active duty for training and were then required for the balance of their period of military liability to engage in all of the activities of the Ready Reserve.

This item reflects the work of processing registrants' requests for enlistment in the Ready Reserve, notifying registrants and employers of disposition of these requests, and notifying the appropriate armed service when a registrant ceases to be employed in a critical industry.

The provision of the law establishing this critical skills program lapsed on August 1, 1963. For fiscal year 1964 1 month's operation is shown. Nothing is requested for 1965.

	1963	1964	1965
Delinquents:			
Work units	13,835	14,870	19,409
Man-years	19	20	26
Cost	$76,787	$85,532	$112,358
Unit cost	$5.543	$5.752	$5.789

Any registrant who fails to perform any duty required of him by the Universal Military Training and Service Act may be declared a delinquent. In some cases delinquents may be ordered for immediate induction. Failure to respond to an order to report for induction can result in a delinquent being reported to the U.S. attorney for prosecution under applicable statutes. Local boards make all reasonable efforts to secure compliance of delinquents before ordering them for induction or reporting them to the U.S. attorney.

This item includes the time local board clerks spend in attempting to locate and secure compliance of delinquents, correspondence with the U.S. attorney, other local boards and registrants and making necessary notations on appropriate records.

The number of delinquents represents 0.203 percent of classification actions.

	1963	1964	1965
Initial processing of Standby reservists:			
Work units	983,989	985,000	984,000
Man-years	232	226	226
Cost	$937,742	$974,165	$979,080
Unit cost	$0.953	$0.989	$0.995

The Armed Forces Reserve Act of 1952, as amended, provides that no member of the Standby Reserve can be recalled to active duty until he has been found by the Director of Selective Service to be available for such duty. In order to meet the responsibility thus placed upon it the Selective Service System must maintain records of the membership of the Standby Reserve and determine for each member whether he is available for active duty or not available by reason either of dependency or employment in an essential industry.

This item describes the function of establishing the original records on standby reservists. It includes the receipt from State headquarters of orders transferring men to the Standby Reserve, preparing locator cards and folders, mailing questionnaires, locating reservists whose proper address has not been supplied and, where necessary, transferring them to other local boards in whose jurisdiction they live. In these respects the function is much like that of registering.

Work receipts for this item depend upon the rate at which the Armed Forces screen men to the Standby Reserve. There were 983,989 processed in 1963. There still remains a backlog in State headquarters, part of which should be cleared up in 1964. In 1965 it is anticipated there will be 984,000 processed, which is the approximate number processed in 1963.

	1963	1964	1965
Categorizing of standby reservists:			
Work units	1,633,008	1,480,000	1,342,000
Man-years	414	365	331
Cost	$1,670,567	$1,568,800	$1,433,256
Unit cost	$1.023	$1.061	$1.068

A process similar to classification is necessary before Selective Service is able to declare a reservist available or not available for recall to active duty. This process is referred to as categorizing to avoid confusion with classification and is somewhat simpler than the latter in that only four categories are used. These are I–R (available for order to active duty); II–R (not available because of civilian occupation); III–R (not available because of dependency) and IV–R (not found available and not found qualified for II–R or III–R).

Responsibilities of the local board clerk in this process include review of the questionnaire when it is returned, attendance at board meetings, preparation of notices of availability to the reservists and to the Armed Forces, and maintenance of pertinent forms and records.

An annual contact to secure current information on availability is made with all standby reservists. The statutory requirement for an annual contact by the services is now being satisfied by Selective Service furnishing the several components with the result of this annual contact. Reconsideration of status is made as a result of the information received from this contact. It is included in categorization.

	1963	1964	1965
Removal from Standby Reserve:			
Work units	842,168	940,000	984,000
Man-years	90	97	102
Cost	$362,132	$419,240	$441,816
Unit cost	$0.430	$0.446	$0.449

Reservists may be removed from the Standby Reserve upon completion of their period of military liability and are removed by death, or upon development of a disqualifying physical or mental defect.

In all of these cases it is necessary to post information to records and notify the Armed Forces when required and the registrant (except in case of death). The number is related to intake 2 years prior.

	1963	1964	1965
Answering inquiries:			
Work units	6,021,194	6,482,818	8,461,687
Man-years	504	529	690
Cost	$2,035,164	$2,275,469	$2,986,973
Unit cost	$0.338	$0.351	$0.353

Inquiries come to local boards from registrants, employers, the general public, other offices of the Selective Service System and other agencies of Government. These inquiries cover all phases of selective service operation and are in both written and oral form.

This item accounts for the time of local board clerks in answering all inquiries except those which are part of another workload item.

Inquiries are related to classification actions and in number represent 88.5 percent of such actions.

	1963	1964	1965
Administrative time:			
Man-years	1,085	1,035	1,165
Cost	$4,380,360	$4,452,475	$5,143,606

Time spent at meetings of local board clerks, with representatives of State or National headquarters in training other clerks, preparing reports, general reading of informational media, opening and sorting mail, etc. It is not possible to reduce these functions to a unit measure since the costs cannot be related to processing count nor work units. It is, however, shown on the comparative summary statement by function.

	1963	1964	1965
Maintaining files:			
Man-years	126	135	163
Cost	$509,934	$581,717	$705,445

This item accounts for the time of local board clerks spent in reviewing, purging, and rearranging files of their offices. This cost has been allocated in the proportion of other items where unit costs can be secured and is not an additional cost factor in this request.

NONPRODUCTIVE TIME

In addition to the time spent on the various functions performed in local board offices, there are two classes of nonproductive time. These are:

(1) Paid leave: This includes sick leave, annual leave, and holidays.

(2) Staff time: Selective Service is required by law to maintain at least one local board office in each county in the United States. Many of these offices generate very little business and these are operated on a part-time basis, some being open only 1 or 2 days a week. There are, nonetheless, occasions when a clerk is present in an office but has no work to do. Time so represented is reported in this item.

Time spent on the above item is spread across the productive functions of local board clerks on a percentage basis. It is reported below for information purposes only and is not intended as an additional cost factor in this budget request:

	1963	1964	1965
Paid leave:			
Man-years	861	747	896
Cost	$3,477,053	$3,210,988	$3,893,949
Staff time:			
Man-years	108	104	112
Cost	$434,701	$448,226	$485,757

	1963 actual	1964 estimate	1965 estimate
12 Personnel benefits:			
Civil service retirement contributions	$1,267,448	$1,364,000	$1,560,450
Group life insurance contributions	70,203	74,500	76,251
Federal Insurance Contribution Act taxes	64,658	73,000	75,000
Health benefit contributions	172,537	180,000	182,000
Employee suggestion awards	15,038	1,000	----------
Total	1,589,884	1,692,500	1,893,701

These items, except employee suggestion awards and health benefit contributions, vary with the payroll amounts.

	1963 actual	1964 estimate	1965 estimate
21 Travel and transportation of persons:			
Administrative travel	$504,805	$485,000	$485,000
Travel of selectees	1,206,273	2,479,000	1,945,000
Rental of passenger motor vehicles	23,151	33,000	33,000
Total	1,734,229	2,997,000	2,463,000

For administrative travel the request for 1965 has been increased to cover the expanding travel requirements. It covers the travel of local and appeal board members (which is exempt from the limitation but is increasing with greater activity), the travel of local board auditors and the travel of clerks when serving more than one board or when attending group meetings. They also occasionally are required to answer a subpena in cases of court trials involving delinquents being prosecuted for violation of the selective service law.

The travel of selectees is directly affected by the number induced into the Armed Forces. Calls to be filled by induction are placed on Selective Service by the Department of Defense. Selective Service does not participate in the determination of the size of the call. In 1963 there were 75,333 inducted. For 1964 at the time of the budget request, we received notice from the Bureau of the Budget that we were to use an estimate of 129,000. Our selectee travel allowance was based on that figure. The most recent figure furnished us is for 147,000 inductions in fiscal year 1964. We have shown the cost for this larger figure on the following table. Also included is the loss to the pool reflected in the increased percentage rate occasioned by the change in acceptable standards of the category IV inductees. This indicates a shortage of $437,000 in the selectee travel account as presented to Congress for fiscal year 1964. Our estimate for 1965 is based on current rejection rates and 100,000 inductions.

Rental of passenger motor vehicles is from GSA motor pools.

Selectee travel, 1964

	Number	Cost per selectee	Amount
Number to be forwarded for Armed Forces physical examination	589,829	[1] $4.26	$2,512,672
Mental and physical rejections at Armed Forces PIE (52.60 percent)	310,252		
Number put in I–A examined and acceptable	279,577		
Losses by enlistment and reclassification (26.76 percent)	74,811		
Number to be forwarded for induction	204,766	1.97	403,389
Rejected at induction station (28.21 percent)	57,766		
Number to be inducted	147,000		
Total			2,916,061

[1] 2 1-way trips, at $1.97 each, plus 32 cents for meals and lodging.

Selectee travel, 1965

	Number	Cost per selectee	Amount
Number to be forwarded for Armed Forces physical examination	391,829	[1] $4.26	$1,669,192
Mental and physical rejections at Armed Forces PIE (52.60 percent)	206,102		
Number put in I–A examined and acceptable	185,727		
Losses by enlistment and reclassification (25 percent)	46,432		
Number to be forwarded for induction	139,295	1.97	274,411
Rejected at induction station (28.21 percent)	39,295		
Number to be inducted	100,000		
Total			1,943,603

[1] 2 one-way trips at $1.97 each plus 32 cents for meals and lodging.

	1963 actual	1964 estimate	1965 estimate
22 Transportation of things:			
Freight, express and drayage	$65,186	$70,000	$50,000
Rental of trucks	1,468	2,000	2,000
Parcel post (penalty indicia)	45,000	45,000	45,000
Total	111,654	117,000	97,000

This object covers the charges for distribution of supplies, materials, and equipment to local boards and appeal boards. The small increase in 1964 is due to delayed delivery of local board equipment purchased in late 1963.

Truck rental from GSA is used when it is determined to be more economical than other means of transportation.

The amount appropriated for parcel post (penalty indicia) is paid to the Post Office Department.

	1963 actual	1964 estimate	1965 estimate
23 Rent, communications and utilities:			
Communication services	$488,812	$525,000	$525,000
Rents and utilities	13,492	10,000	258,322
Penalty mail	568,125	631,250	631,250
Total	1,070,429	1,166,250	1,414,572

Telephone costs are 95 percent of the communications services expenses. The increases reflect the rising costs of telephones and the 100-percent increase in GSA service charges on the net.

Due to changes in the handling of the budget for rents, there is shown a substantial increase in 1965 and 1964. The principal item of this expense is for reimbursement to GSA by transfer—for 1964 (not shown here) the amount is $210,000 and for 1965 $248,000. The remaining is to pay for local board expense in Guam, Puerto Rico, and the Virgin Islands, as well as charges for garage rental wherever used and charges for utilities in rent-free space.

Penalty mail is to reimburse the Post Office Department for use of penalty indicia.

	1963 actual	1964 estimate	1965 estimate
24 Printing and reproduction	$161,517	$160,000	$175,000

The object class provides for contractual printing and repreduction by the Government Printing Office and by commercial printers.

The principal requirements are for forms for local board use; the most costly of which are the questionnaire (SSS form No. 100), which is an eight-page document and is a part of the record of every registrant, and the cover sheet (SSS form No. 101) which is heavy file folder stock and on which is placed pertinent data covering the status of the registrant. It is used as a file folder and is part of the permanent record of each registrant. Between 1½ to 2 million are required annually. Registration cards (SSS form No. 1) and registration certificates (SSS form No. 2) will be required in increasing numbers due to the large increase in the number of new registrations.

Stocks of forms required for classification, physical examination, and induction are in good supply because of the induction rate dropoff in 1963.

Printing of the regulations is also charged to this account.

	1963 actual	1964 estimate	1965 estimate
25 Other services	$77,783	$75,000	$75,00

This item includes the cost of repairing and painting local board offices where GSA does not furnish the service (over 500 local boards occupy rent free quarters) and repairs of office equipment, principally typewriters. It also includes reimbursement to the Department of Labor for $7,000 in 1964 and $12,000 in 1965 for workmen's compensation payments.

	1963 actual	1964 estimate	1965 estimate
26 Supplies and materials	$144,788	$175,000	$175,00

This object class provides for all commodities which are ordinarily consumed or expended within a comparatively short period of time. The supplies consist of paper, envelopes, and other miscellaneous office material required to carry out day-to-day operations. It also includes forms, other than selective service forms which are purchased.

Cupboard stocks are maintained in over 4,000 offices and local supply stocks for issue to local boards at 56 State headquarters. It fluctuates from year to year but runs in the neighborhood of $200,000.

	1963 actual	1964 estimate	1965 estimate
31 Equipment	$497,975	$100,000	$100,000

Under the simplified obligation report approved by the Bureau of the Budget several years ago, no records of cost are maintained on the principal items of

equipment. The estimates are based on centrally adjusted estimates of requirements submitted by the several State headquarters.

The principal items are: Five-drawer file cabinets ($8,000), typewriters for replacement ($50,000), typewriter desks ($4,000), office tables and chairs ($6,000).

These items are for replacement, to provide for expanding file needs or to furnish new local board offices where boards have been so large that they are unwieldy. The new registrants account for most of the file cabinets. The use of uncompensated board members requires that the workload on them must be maintained at a reasonable level. As boards divide, it is an opportunity to get a board office closer to its registrants, thus requiring a new board set up.

In addition to the office equipment, the request for five station wagons and eight passenger cars is included.

COST AND WORKLOAD BY ACTIVITY

Mr. SHIPLEY. This all has to do with the local board clerks.

Page 55 shows the increase in cost, $1,454,000 over 1964, gentlemen.

Under classification there is quite a jump, $1,700,000 over 1964. You touched on this. Would you like to go into it further?

General HERSHEY. Our new registrations will be approximately 600,000 more. Classification will be more than that because heretofore we have not classified down. With the new things we are facing we will have to classify at 18 to make them available for this examination business.

Mr. SHIPLEY. Page 57 shows $53,000 more more for appeals.

General HERSHEY. The more classifications you get the more appeals you have.

Mr. SHIPLEY. Page 58, physcial examinations, there is a reduction from 1964.

General HERSHEY. When we set up this budget we were going to induct less people this year than we did last year. We still are, but in addition to that now we will have to examine the 18 year olds and this budget was not set up to take care of that. There will be 700,000 examinations that this budget does not cover.

Mr. SHIPLEY. What does this amount to in dollars?

General HERSHEY. About $4 each.

Colonel ILIFF. That is transportation.

It is roughly $1,275,000 for that, and $426,000 for the cost of transportation.

Mr. SHIPLEY. Examining stations show a reduction.

General HERSHEY. Because we will induct less people.

Mr. SHIPLEY. Inductions show a reduction of $161,000. Again this goes back to the same reason?

General HERSHEY. That is right, because we will take in 165,000 this year and next year it will be——

Colonel ILIFF. 100,000 next year is what this budget is based on.

General HERSHEY. Last year's budget is based on 130,000 and we are taking in 165,000.

Colonel ILIFF. I used 147,000, which was the then current figure, to make the comparison.

Mr. SHIPLEY. You have a reduction of $7,300 from last year, bringing the total to $15,800 for civilian work assignments. What is this item for?

Colonel ILIFF. This is conscientious objectors who do work in lieu of military service. This is work of national importance.

Mr. SHIPLEY. Why the reduction?

Colonel ILIFF. That is based on the number of inductions. When you reach a man's number he lines up here.

Mr. SHIPLEY. Delinquents show an increase over 1964. This is for the delinquent inductee?

Colonel ILIFF. This is a man who becomes delinquent and it is reported to the U.S. attorney for prosecution. This varies with the number of classification actions. It is not a large item but it varies with the number of classification actions.

Mr. SHIPLEY. Is this percentage of 203 high or low?

Colonel ILIFF. That is about an average.

Mr. SHIPLEY. Page 64, initial processing of standby reservists, a total of 983,989 processed in 1963.

Here is an item categorizing standby reservists.

Removal from Standby Reserve is up some $25,000 over 1964. Reservists may be removed from the Standby Reserve upon completion of their period of military liability and are removed by death, or upon development of a disqualifying physical or mental defect.

What is the reason for this increase?

Colonel ILIFF. The number is related to those who went in 2 years prior to this time.

Mr. SHIPLEY. Page 67 shows a request of $711,000 over 1964 for answering inquiries. Where do these inquiries come from?

Colonel ILIFF. Inquiries are related in numbers to the classification actions of 88.5 percent of such actions. This is something we determine from our studies. Inquiries come from every place.

Mr. SHIPLEY. Where do the bulk of them come from?

Colonel ILIFF. Registrants and their families comprise the bulk.

Mr. SHIPLEY. That is quite an increase. This goes along with more classifications?

Colonel ILIFF. That is right.

General HERSHEY. And it has nothing to do with the 17- or 18-year-olds you are going to tackle.

Mr. THOMAS. Would it help the record if at some point we have a complete breakdown and a table showing the work units—call it whatever you want to, General—setting out the work units, the number to be classified and inducted, and then the other activities on the same sheet? The table will show that 40 to 50 percent is induction, and you equal that much work in the other field of activities with the Reserves and keeping up with your people.

Why not put it on one sheet and show it all together? Show the work unit on one sheet.

Colonel ILIFF. We have it in man-years and cost. It is shown on page 54.

Mr. THOMAS. Let us check page 54. This is it, right here. This is already in the record.

Colonel ILIFF. This represents man-years.

Mr. THOMAS. This gets it, though. What is the biggest activity from this table?

Colonel ILIFF. Classifications.

Mr. THOMAS. It takes what part of your man-years?

General HERSHEY. About a third.

Mr. THOMAS. And your other activities show two-thirds and your registration and classification is one-third of your workload?

Colonel ILIFF. Yes, sir.

Mr. THOMAS. This table sets it out very clearly. Here it is—registration and classification people. They say "Do away with the draft boards. You are not taking too many people," and so on.

By doing away with it you would be doing away with only one-third of the entire workload. Is that correct?

Colonel ILIFF. That is right.

Mr. THOMAS. Go ahead.

Mr. SHIPLEY. Page 68 shows $691,000 more than in 1964 for administrative time. You say time is spent at meetings of local board clerks with representatives of State or National headquarters in training other clerks, preparing reports, general reading of informational media, opening and sorting mail, and it is not possible to reduce these functions to a unit measure since the costs cannot be related to processing count or work units. It is, however, shown on a comparative summary statement by function.

Colonel ILIFF. That is page 54 again.

Mr. SHIPLEY. Would you go into this a little, General? Why this increase and why is it so great?

Colonel ILIFF. This increases greatly because it in turn is related to the other things you do.

MAINTAINING FILES

Mr. SHIPLEY. Maintenance of files shows a large increase. Is this also justified? It is just more work to do?

Colonel ILIFF. Yes, sir.

General HERSHEY. You have to open 600,000 more files, Mr. Shipley.

Colonel ILIFF. More than we opened in previous years.

Mr. THOMAS. How much of that money is being paid for rent to take care of the files? How current are your files? What do you do with the old files? How much rent are you paying for storage space of the files throughout the country? How much business are you doing with the Archives?

We have been to many of your offices and I find at least half of your records should be in the Archives, anyway.

General HERSHEY. Congress gave us some responsibilities. Of course, we destroyed all the World War II business. We still have the files for Korea and subsequently.

Mr. THOMAS. How much money do you spend a year for storage of your files, active or inactive?

Colonel ILIFF. Dead files or the files in the offices themselves?

Mr. THOMAS. Yes. Can you figure that out? How often do you let General Services come in and help you out in eliminating some of your files or putting them in storage?

General HERSHEY. We have been destroying them right along.

Mr. THOMAS. We are not talking about destroying. There is a difference between destroying them and warehousing them.

General HERSHEY. Yes; but if you happen to get anybody who is one of our people for 18 years who have remained live after he has been deferred you cannot transfer his file somewhere else. As soon as

you do, then if anything comes up about this individual—you see, Congress said anybody deferred had their liability extended until they are 35. That gives us a boy active from 18 to 35.

Mr. THOMAS. If you destroy his record someone is liable to come up for his record after 18 years. About three-fourths of them should be in the General Services warehouse rather than destroyed.

That gets back to the question of the rental in the 4,100 to 4,200 local boards. Is that where most of the files are kept?

Colonel ILIFF. The bulk of the files are those of the individual registrant; yes, sir.

RENTAL SPACE FOR FILES

Mr. THOMAS. What part of the files are in Government space or uncompensated space?

Colonel ILIFF. About 25 percent in uncompensated space at the present time.

Mr. THOMAS. Owned by Government?

Colonel ILIFF. No; uncompensated space, space we get for nothing.

Mr. THOMAS. You get it for nothing if it is Government-owned, too?

General HERSHEY. Most of our space is either unpaid for or paid for by General Services. We pay for it at Hawaii or other places where you do not have General Services.

Mr. THOMAS. General Services picks up about 60 percent of the bill? General Services is paying storage on your files?

Colonel ILIFF. That is right.

Mr. THOMAS. Did you ever figure out how many square feet of filing space you have in all the 4,100 to 4,200 local boards?

Colonel ILIFF. I am sure we have it but not here, sir. We have a record of what our files are.

Mr. THOMAS. How often do you reduce the space by turning files over to the General Services Administration? This is not a new subject. We have gone into this with you before.

General HERSHEY. When we have done it it has been on a bloc basis as it was when we took our World War II records. We destroyed them. The Congress made the Director of Selective Service responsible——

Mr. THOMAS. Congress didn't say you had to keep the records 18 years if you had to pay $1.50 a square foot for them.

General HERSHEY. I am sure they didn't. What I am trying to get at is this: The taking over of selective service files is under a different law from taking over the records of some other agency because Congress passed a law specifically in 1947 for the preservation of selective service records. They appointed a Director. When they passed the law in 1948 they bestowed on the Director of Selective Service the responsibility of selective service records, so our turning anything over to the GSA is not like other agencies.

Mr. THOMAS. We disagree with you.

General HERSHEY. We will not quarrel with the theory.

Mr. THOMAS. You are not destroying them but turning them over to reduce the rent. They are still available to you whenever you want them.

Colonel ILIFF. We could put them in cheaper rent spaces. We have done some of that.

However, I think we should be clear that we do not get rid of records. I am supposed to destroy them when I am through with them.

There are some things that will be——

Mr. THOMAS. Where are the three records depots now?

General HERSHEY. Three?

Mr. THOMAS. You have three, have you not?

General HERSHEY. No.

Mr. THOMAS. How many do you have?

General HERSHEY. Records are in the States.

Mr. THOMAS. All in the State headquarters?

General HERSHEY. Some have gotten cheaper space.

Mr. THOMAS. How often do you do a job of decreasing the number from the local boards to the State boards?

General HERSHEY. In the smaller areas you do not. A local board with 1,200 is a lot different from one with 40,000. There are a lot of reasons why in Indianapolis or in New York City, Dallas, or Houston that you would——

Mr. THOMAS. Does GSA pay for your record centers in State headquarters or do you?

General HERSHEY. They do. With few exceptions they pay all our rental except what we get for nothing. We are still able to get some of the States and some of the counties to give us some space.

RENT BILL PAID BY GSA

Mr. THOMAS. Do you have direct information on what the rent bill is that General Services picks up for you?

Colonel ILIFF. We have it in the office, Sir.

Mr. THOMAS. Insert it in the record at this point, please.

(The information supplied follows:)

The General Services Administration reports the amount of rent which they picked up for us was at an annual rate of $3,321,535 as of January 31, 1964.

SPACE FURNISHED BY LOCAL COMMUNITIES

Mr. THOMAS. Also give us the best estimate of the dollar value of the rent that the local communities furnish to the Selective Service System free of charge.

(The information supplied follows:)

Local communties—largely State, county and municipal governments—furnish rent-free space at an estimated annual value of $625,000.

Mr. THOMAS. You do not have the amount of square footage?

General HERSHEY. We can furnish that, also.

Mr. THOMAS. Do that, too, please.

(The information supplied follows:)

Selective Service still has 533 local boards in non-Federal rent-free space, or 13 percent of the boards. Based on experience in the loss and replacement of this type of space, it will average 450 square feet per office (total 250,000 square feet) at $2.50 per annum per foot—a value of $625,000.

In addition, 17 percent or 700 local boards are in federally owned office space. It is estimated that 500 of these are in Federal buildings managed by GSA and 200 (5 percent) in Federal buildings under military, Post Office or other Federal agency (not GSA) management and control.

OTHER EXPENSES—PROJECT 30

Mr. SHIPLEY. Page 69 shows the nonproductive time. Paid leave, annual leave, holidays, and so on, and the fact you are to maintain at least one local board office in each county of the United States.

Page 70 shows an increase in each item except employee suggestion awards. Health benefit contributions vary with the payroll amounts.

Next item, travel and transportation of persons, is on page 71.

You have administrative travel which stays the same as 1964, $485,000.

You request an increase of $534,000 for travel of selectees.

Colonel ILIFF. It is a decrease, sir.

Mr. SHIPLEY. That is right. This goes back to the amount of work.

General HERSHEY. Yes, and we will be red faced with supplementals.

Mr. SHIPLEY. You cover that again on page 72. Also included is the loss to the pool reflected in the increased percentage rate occasioned by the change in acceptable standards of the category 4 inductees. This indicates a shortage of $437,000 in the selectee travel account as presented to Congress for fiscal year 1964.

You have a table on page 73 and one on page 74 going into the selectee travel.

You had $2,916,000 total for 1964 for this purpose.

Colonel ILLIFF. That is estimated cost based on 147,000 inductions which was not the budget figure. The budget figure was less.

Mr. SHIPLEY. What was that?

Colonel ILIFF. $2,479,000 is what we had money for. This indicates we will be short again.

Mr. SHIPLEY. And selectee travel for 1965, $1,943,000.

Colonel ILIFF. That is right.

Mr. SHIPLEY. Transportation of things on page 75 shows a reduction of $20,000. This object covers the charges for distribution of supplies, materials, and equipment to local boards and appeal boards. The small increase in 1964 is due to delayed delivery of local board equipment purchased in late 1963.

Page 76, rent, communications, and utilities, shows a reduction this year.

Questions on this item, gentlemen?

Printing and reproduction, an increase of $15,000 over 1964. What will this be used for?

Colonel ILIFF. More registration cards because of increased registrations, so many more cover sheets, and so on.

Mr. SHIPLEY. Under "other services" you have $75,000 this year, the same as 1964. This is for repairing and painting local board offices where GSA does not furnish the service.

Is space made available in some of the smaller boards, various courthouses?

Colonel ILIFF. Yes, and some municipal buildings.

Mr. SHIPLEY. How closely is this looked into by the State board? Who is responsible for the space?

General HERSHEY. We got the space. This is what we have not lost.

You must remember that in 1940 you had quite a surge——

Mr. THOMAS. He asked a specific question.

General HERSHEY. State headquarters, but unfortunately they do not gain very much. We are fighting a losing battle because everybody is getting so they want their space.

Mr. SHIPLEY. I know of three places in my district where they rent space. In many areas the old courthouses have three stories, but simply because it is three stories the local boards do not want to move in. I think there could be some savings in this area. If you have 4,100 boards, how many are in rural areas and county seats? There is bound to be space available. I know there is space available in my hometown. I don't know what their rent is but I am sure it is $100 to $150 where they are, and the courthouse would be available for about $50.

General HERSHEY. GSA rents this space.

Mr. SHIPLEY. I want to know if anyone in your agency looks after this?

General HERSHEY. I guess I don't get around as often as I should.

Mr. SHIPLEY. Under supplies and materials the request for 1965 is the same as for last year.

Mr. SHIPLEY. Under equipment you have the same as requested in 1964. Is all the equipment listed here?

General HERSHEY. Yes, sir.

Mr. SHIPLEY. What other equipment will you buy?

Colonel ILIFF. Passenger cars.

Mr. SHIPLEY. How much is for automobiles?

Colonel ILIFF. $20,500.

Mr. SHIPLEY. Out of the $100,000?

Colonel ILIFF. That is right.

PERSONNEL COMPENSATION—PROJECT 30

National Advisory Committee on the Selection of Physicians, Dentists, and Allied Specialists

PROJECT 40

The President, by Executive Order No. 10166, dated October 4, 1950, established the National Advisory Committee on the Selection of Physicians, Dentists, and Allied Specialists. This Committee is composed of 12 members. There are also committees and committee chairmen in each State, the cities of New York, Los Angeles, and the District of Columbia, with advisory members of local committees in various counties and districts in each State. There is a national office and 51 field offices.

The Armed Forces fill their requests for physicians, dentists, and allied specialists by commissioning, and only then to active duty, if sufficient numbers do not apply. A special call for members of the profession required is placed on selective service and they are called from our regular registrants who are members of that profession.

The National Advisory Committee has 12 members and an Executive Secretary. Under the terms of the Executive order, Selective Service pays the consultants' fees of each of the members, pays the Executive Secretary who also is reimbursed on a consultant basis and all types of services, supplies, material, and equipment are also furnished. No change is requested in 1965 from the 1964 request.

Mr. SHIPLEY. There is no change here. We went into this last year in great detail. This is where the board determines who should be inducted and who should not.

Colonel ILIFF. This is an advisory committee.

Mr. SHIPLEY. They advise you and you do as you want. Is that right?

Colonel ILIFF. That is right.

Mr. SHIPLEY. Questions on this item, gentlemen?

PERSONNEL COMPENSATION

Please insert page 25, the detail of the personnel compensation on this project.

NATIONAL SELECTIVE SERVICE APPEAL BOARD

PROJECT 50

The President, by Executive Order No. 9988, dated August 20, 1948, as amended, created an established the National Selective Service Appeal Board. This Board is composed of three members and has been delegated the power authorized the President to determine all claims or questions with respect to, inclusion for, or exemption or deferment from training and service under the Universal Military Training and Service Act, as amended, and its determination is final.

An appeal to the President (National Selective Service Appeal Board) may be taken by the Director of Selective Service; by a State director of selective service; or in cases of a decision by a State appeal board wherein one or more members dissented, appeal may be made to the President by the registrant, his employer, or his dependents. The National Board may take jurisdiction of any case upon its own motion.

To accomplish the processing of appeals, it is estimated there will be needed in addition to the three board members a total of five employees. Board members are employed on a WAE basis and paid at the salary rate of GS–15. It is estimated they will be employed 75 percent of the time. No change is requested from the 1964 authorized funds.

PROJECT 50

Mr. SHIPLEY. This is governed by Executive Order 9988.

Questions, gentlemen?

Mr. BOLAND. What is the turnover in the personnel of the local boards, the membership itself?

General HERSHEY. Pretty small, although we will have to face some increases. Many people came in in World War II. They are getting old. I have given out hundreds of 20-year certificates. You have to do well to get a 20-year certificate.

Mr. BOLAND. They have been a very dedicated group of people.

I have no questions.

Mr. OSTERTAG. It has been a sound system, in a sense, has it not, General?

General HERSHEY. I am prejudiced but unequivocally, yes. We do things where they happen and we let the people down there run their own business.

Mr. OSTERTAG. Here we have a national law which is to a large extent administered on the local level with local people.

General HERSHEY. That is right.

Mr. THOMAS. Anything further?

Mr. JONAS. Your increase is $5.3 million. That is your asking price?

General HERSHEY. Pardon?

Mr. JONAS. The 5.3 million is the asking price. Do you have a settling price?

General HERSHEY. Yes, at least $5 million more than that.

I am not trying to be facetious. I am facing some very terrible situations. We are starting to refer people. Every person rejected is to be referred so we can try to do something with him.

Starting the 1st of July we will have to examine at least some of the 18-year-olds. We will have to classify them.

If the Armed Forces cannot handle them I will be caught with trying to examine those people because we promised them we would make at least a temporary determination on whether they would have to serve or not. I haven't the slightest idea where it will take us.

I am trying to go there unpaid. In World War II we had 14 million physical examinations made for nothing. I wish I thought we could do it again.

Mr. THOMAS. Thank you, General. It is always nice to have you distinguished gentlemen come here.

We like you and we like the way you do business. We also like the way you talk.

General HERSHEY. Thank you very much.

TUESDAY, FEBRUARY 25, 1964.

ROBERT H. WILLEY, ASSISTANT ADMINISTRATOR FOR PERSONNEL AND TRAINING
ARVIN O. BASNIGHT, REGIONAL DIRECTOR, SOUTHERN REGION
DAVID M. MUNSON, DEPUTY DIRECTOR OF BUDGET

Mr. THOMAS. Gentlemen, will the committee please come to order? We are delighted and honored to have with us today our distinguished friends from the Federal Aviation Agency.

We have with us our able and genial Administrator, Mr. Halaby; Deputy Administrator Lt. Gen. Harold W. Grant; Associate Admin-

istrator for Administration, Mr. Dean; Associate Administrator for Development, Mr. Shank; Associate Administrator for Programs, Mr. Thomas; Director of the Budget, Mr. Alexander; Mr. Warren, Director of the Air Traffic Service—you have done a big job, Mr. Warren. We are delighted to see you.

We have Mr. Harvey, Chief, Program Control Division, Air Traffic Service; Mr. Moore, Director of Flight Standards Service; Mr. Morrow, Director of the Airports Service; Dr. White, the Federal Air Surgeon.

The doctor has more employees scattered all over the lot—for the first time he put them in one place in the budget but they are scattered all over the country. They are scattered over a total of 406 places.

Doctor, it is nice to have you.

Dr. WHITE. Thank you, sir. It is nice to be here.

Mr. THOMAS. We have Mr. Hobbs, Director of the Bureau of National Capital Airports; Mr. Bacon, Assistant Director for Financial Management, Bureau of National Capital Airports; Mr. Blatt, Director of Systems Research and Development Service. Where is our scientist, here?

Mr. BLATT. Right here, sir.

Mr. THOMAS. It is good to see you again. What are you working on now?

Mr. BLATT. Resolving some of these problems and presenting to you some of the products of our research and development in the implementation budget.

Mr. THOMAS. You have nothing hot, have you?

Mr. BLATT. Yes; sir; we really do.

Mr. THOMAS. Mr. Bates, Acting Director, Aircraft Development Service.

We have Mr. Leng, Director of Installation and Materiel Service; Mr. King, Deputy Director, Installation and Materiel Service; Mr. Vierling, Director, Systems Maintenance Service. We have Mr. Goodrich, the general counsel.

Are you lawyers doing all right?

Mr. GOODRICH. We are doing our best.

Mr. THOMAS. We have Mr. Provan, Director of Management Services; Mr. Willey, Assistant Administrator for Personnel and Training; our old friend Mr. Basnight, regional director, southern region. Judge Basnight, we are delighted to have you. How did you get up here?

Mr. BASNIGHT. On scheduled airline, sir, tourist ticket.

Mr. THOMAS. We have Mr. Munson, Deputy Director of the Budget.

Mr. Halaby, it is good to see some of your regional directors here. Why don't you bring two or three every year? I think it would be money well spent. I understand you have a few planes on which they can thumb a ride. I think it would be good for them, good for the Agency, and good for the committee to have them in here and let them see how things operate. It would help them and help us all. We are delighted to have all of you.

We like to talk to you. Your subject is a very interesting one. You hold in the palms of your hands, so to speak, the lives of thousands of people every year, and we have great respect for you.

It is not often we disagree with you.

What became of our old friend who was out in Los Angeles?

Mr. HALABY. Mr. Tippets.

Mr. THOMAS. How is he doing?

Mr. HALABY. He seems to be doing very well, Mr. Chairman. As you know, there has been a practice of rotation instituted, rotating our best people from field to headquarters in order to refresh both areas. Mr. Tippets was sent there and Mr. Basnight sent to Atlanta.

Mr. THOMAS. That makes sense.

WESTERN REGION HEADQUARTERS SPACE

Did Mr. Tippets get a big office there? What became of that property across the street there that was federally owned? Are you renting that building he was in, where we spent $200,000 to revamp it? Who owns the vacant property across the street and how did you let that get away from you?

Mr. HALABY. The headquarters now is in a World War II Government-owned plant which was occupied at that time by Douglas Aircraft Corp.

Mr. THOMAS. Is that the building which was remodeled?

Mr. HALABY. Right across the street from that plant there is a modern building.

Mr. THOMAS. This was not modern. It was an old building and $200,000 to $300,000 was used to patch it up and it was leased.

Mr. HALABY. That is right.

Mr. THOMAS. That was 4 or 5 years ago. The money already had been spent. It might have been spent by your predecessor, though.

Mr. HALABY. I will get the exact date we leased that building.

Do we have that with us?

Mr. DEAN. The building across the street was provided about 3 years ago and I believe it is a GSA-provided building to augment the space in that old converted hangar, which is Government property. We can give you all the facts on it.

Mr. HALABY. It is interesting that you would bring this out at this time because we are right in the midst of trying to get a decent modern building to replace both of them, and there is a considerable amount of Government property around the Los Angeles International Airport.

For example, we have been able to obtain from the Navy a hangar on the airport which was Government property. We have rehabilitated that as the headquarters of all our aircraft and maintenance operations in the Los Angeles area.

In fact, President Johnson met President Mateos on the ramp of that area, which is next to North American on the south side of the field.

GSA at the moment is considering how to provide modern space for the Agency there and we are hopeful that they can come up with an answer.

As you know, it has been under consideration for several years.

Mr. THOMAS. Have you a statement for us, Mr. Chairman?

Mr. HALABY. Yes, sir.

If it pleases the committee I would like to open with the first two pages of this statement and then give the committee something we

have failed to give in the past—a kind of general background for the committee to consider, and with the Chairman's concurrence we will ask the committee briefly to go in the adjoining room where we have a display.

Mr. THOMAS. Whatever you want to do, we shall be glad to see it.

Mr. HALABY. The display was prepared by some of our own employees, and shows how the system works and what it looks like.

Many of you gentlemen have been to some of our facility sites—you know what they are, and you are fully familiar with their purpose. However, one or two of you have not had an opportunity to visit one of our facilities and we feel we really should let you see something rather than just hear our words.

GENERAL STATEMENT

I am happy to appear again before the Committee on Independent Offices—this time to present the budgetary requirements of the Federal Aviation Agency for the 1965 fiscal year. This is the fourth time that I have been privileged to present our estimates. It is of particular meaning this year since the President's budget is the tightest and tautest budget ever presented by the FAA, calling as it does for a reduction in both positions and new obligational authority. This means that the assurances which I have previously given the committee that the Agency's growth would level off have in fact been realized and documented in cold print this year.

DECREASE IN POSITIONS

You will recall that when I appeared before you in defense of our 1962 fiscal year appropriations we requested 2,629 additional positions. In 1963 we sought an additional 3,998 positions. By last year we had substantially checked the Agency's rate of growth, but we still requested an additional 1,030 positions. For 1965 the Agency not only plans to meet its obligations to the public and the aviation community without additional employees, but it is in fact proposing 754 positions fewer than authorized for the current fiscal year.

Mr. THOMAS. Give us one figure in our minds.

Mr. HALABY. Yes, sir.

Mr. THOMAS. With regard to your budget, I think it is by far the most comprehensive we have seen. It is excellent. We have enough information there to satisfy everybody's desire.

COST OF PAY INCREASE

Tell us what your overall pay increase cost is. It cost you about 2½ percent. Also give us three other figures—the last increment of the pay increase, the ingrade promotion, and your consultants and other WAE employees. Pull that together in one spot. Can you do it right now?

Mr. HALABY. Yes, sir. The second phase of the overall pay increase was effective for a period of 6 months in fiscal year 1964. For fiscal 1965 the increased requirement is $9.3 million.

Mr. THOMAS. Are you sure that is not for operations alone? I refer to agencywide. The justifications are clear in each section of

the budget, what the pay act cost you. I am talking about a wrap-up figure for all of them.

Mr. HALABY. That was for operations; you are right, sir.

May we have just a moment to work that out?

Mr. THOMAS. Yes.

Mr. HALABY. The figure for operations as a building block——

Mr. THOMAS. That is already in the record. We will get to that and we know what that is.

Give us the overall figure and get it in the record now because I cannot find it in your justifications.

Operations is about 90 percent of all of it so it would not be difficult to get the rest of it.

Mr. HALABY. For fiscal 1965 the increase for phase 2 pay increase for operations is $9.3 million. There is an additional amount of $900,000 for other accounts, or a total of $10.2 million.

Mr. THOMAS. We will get it segment by segment. The justification is clear. We want a wrap-up figure agencywide as to what it cost you.

Mr. HALABY. That is agencywide——

Mr. THOMAS. The other $900,000 covers it agencywide?

Mr. HALABY. Yes.

Mr. THOMAS. A total of $10.2 million?

Mr. HALABY. Yes.

Mr. THOMAS. That is about a 2½-percent increase. What will the ingrade promotion cost you agencywide? Those are important figures and matters you cannot control. Not all ingrade promotions are mandatory but the largest portion of them are.

Mr. HALABY. We have them by separate account and we will have to add them up.

The third category was consultants?

Mr. THOMAS. WAE, when actually employed, consultants, or whatever it is. It is a third classification.

M. HALABY. They are the same as last year so there is no additional request for any part-time consultants or others.

Mr. THOMAS. What is the horseback opinion?

Mr. HALABY. A little more than $10 million. We have it under "Other pay adjustments" in the separate accounts.

Mr. THOMAS. That is right. We want it all together.

Mr. HALABY. We will correct this figure and give it more precisely. However, roughly it is about——

TOTAL PAY ACT AND PROMOTIONS

Mr. THOMAS. Pay increase is about $10.2 million. What is the ingrade promotion cost?

Mr. HALABY. Within grade it is $6.6 million in fiscal 1965, and grade to grade in fiscal 1965 it would be $4.6 million.

Mr. THOMAS. That is $12 million, then?

Mr. HALABY. Yes, sir.

Mr. THOMAS. That is the pay increase over which you have no control.

Mr. ALEXANDER. This is in addition to the Pay Act of 1962 figure.

Mr. THOMAS. We understand that. We are talking about the actual increase by operation of law for 1965.

Mr. HALABY. That is right.

Mr. THOMAS. Ingrade it is $6.6 million. Pay act, which is about 2½ percent, amounts to another $10.2 million, so you have $16.8 million.

Mr. HALABY. Then grade to grade—going from one grade to a higher grade, normal promotion.

Mr. THOMAS. What did that cost you?

Mr. HALABY. $4.6 million. We have $10.2 million of regular pay increases regardless of promotion; $6.6 million within grade; we have $4.6 million advancing from one grade to the next higher grade.

Mr. THOMAS. $21.4 million, then?

Mr. HALABY. Yes, sir.

Mr. JONAS. Increase?

Mr. THOMAS. $21.4 million. The $4.6 million is a grade jump. How many people are involved in that?

Mr. HALABY. As you know, Mr. Chairman, this is a competitive merit system. We can only make an estimate as to how many people would merit promotion. Our estimate for the fiscal year 1965 is that 3,737 people would merit a promotion from one grade to another.

Mr. THOMAS. That is an administrative determination. Civil service has nothing to do with that. You do your own promoting.

Mr. HALABY. If qualified by the civil service regulation.

Mr. THOMAS. That is in the neighborhood of 8 percent of your total personnel load. They got a promotion, and then a large percentage get an in-grade promotion in addition to that, so the Agency is doing all right.

So far so good. We will go into that in detail later.

Go ahead with your statement. I just wanted that in the record at this point.

ADJUSTMENTS IN BUDGET

Mr. HALABY. I think it is fair to say that the categories the chairman has just covered, within grade, grade to grade, and pay raises due to the Salary Reform Act, plus the commissioning of additional facilities which are ready to come into the system in fiscal 1965, account for the increases in the budget. The way we have been able to reduce the total budget is to decrease the number of personnel in the rest of the budget.

Mr. THOMAS. You have decreased it by 750 employees and increased it dollarwise by about $20 million. You have two programs here for which you have no funds and are not seeking funds for.

You have a little summary page here.

Mr. HALABY. Six has an overall summary and then there is another on page 9.

Mr. THOMAS. Turn to page 6 of the summary book and get a bird's-eye view of it.

It shows here that you come up with a reduction of 754 employees and a reduction of $75 million. That $75 million, however is a bookkeeping figure. When you get through I am sure you have the reduction of 754 employees, but instead of having a minus $75 million, in truth and in fact you have a plus $20 to $25 million, so we will have to straighten that out later.

Mr. HALABY. If we go right down the items, Mr. Chairman, the increase is in operations. Where we have a reduction in number of employees but an increase in appropriation; a reduction in employees and appropriation which offsets the operations——

Mr. THOMAS. Go ahead with the statement and we will straighten this out.

Mr. HALABY. Comparing them category by category our budget, sir, is less by 754 employees.

Mr. THOMAS. There is no argument about that. We are talking about the dollars.

Mr. HALABY. And less in total dollars by $15 million.

Mr. THOMAS. There is a difference between $15 and $75 million.

Mr. HALABY. All right, sir.

Mr. THOMAS. Go ahead. There is no argument there. We all understand each other.

Mr. HALABY. The Agency has been most appreciative of the support which the Congress has given to its programs since its establishment in 1958. We have, therefore, felt a special obligation to hold positions and expenditures to lower levels than those approved by the Congress, if any means to do so could be found. Although the Agency continued to grow during the 1962–64 period, fewer employees were added in those 3 years combined than in the 1961 fiscal year alone.

The effect of Federal pay increases and the need to maintain and operate additional facilities scheduled for commissioning during the 1965 fiscal year has made it extremely difficult to reduce our total funding needs. We have, however, asked for total appropriations of $15 million less than approved by the Congress for the 1964 fiscal year, for comparable appropriations.

GROWTH IN AVIATION

We are thus coming before the Congress asking for fewer positions and less money in the face of a continued steady growth in aviation. During the 1963 calendar year total operations handled by FAA air traffic control towers increased 7 percent, instrument operations increased 3 percent, revenue-passenger-miles increased about 6 percent, and jet fuel consumption increased 20 percent. Our forecasts for 1964 and 1965 indicate a continued growth in virtually every aspect of aviation.

If the committee pleases, I would like to run through some charts we have taken out of our regular management information center. I will try to give trends only because it is not possible to read them from across the table.

Briefly, revenue passengers from 1946 to the present have increased from about 20 million to approximately 70 million in this period.

Passenger-seat-miles available versus revenue-miles flown shows a steady increase, with the actual seats occupied rising almost in parallel with those available.

*Includes: Single Engine 3-place or less; Turbocraft; Balloons; Gyroplanes and Gliders

Mr. HALABY. The same is true of total revenue-ton-miles flown against available ton-miles.

This chart showing passenger-miles flown in turbine aircraft versus piston aircraft shows that until about 1957 there were no turbine powered aircraft and by 1968 the fleet will be almost 100 percent turbine—a transfer from piston to turbine aircraft.

Then we look at what the air carrier industry has been doing in terms of adding to stockholders' equity. In 1946 it was around $225 million. In 1962, end of year, it was almost $2 billion, about $1,850 million.

The net income after taxes and special items, such as depreciation, from 1946 showed a steady rise. Then there was a cyclical rise and fall in 1956 and 1957, and then due largely to the writeoff of investment through depreciation in 1961, 1962, 1963 there were deficit years in 1961 and 1962.

Now there is a steady rise until in the year 1963 the airlines have had the best net income in their history.

That is a very brief picture of the growth in air carrier aviation. Now we would like to refer to the noncarrier, nonmilitary aviation. This is the total number of aircraft in January of 1956, about 60,000 commercial, private, and personal aircraft.

That number has grown so that at the first of the year 1964, there were about 86,000 total aircraft. This compares with 2,000 air carrier aircraft, or some 43 times——

Mr. THOMAS. If you would yield briefly. You say 86,000 aircraft. They are all American made, or most of them?

Mr. HALABY. About 95 percent.

Mr. THOMAS. Does that indicate a tremendous volume of aviation? That has nothing to do with military planes?

Mr. HALABY. That is right.

Mr. THOMAS. Does that mean, then, that the general aviation industry is on its feet and could be self-supporting outside of Government business, outside of military planes? In the early days the Government bought the land, built the buildings, bought the tools, and so on for the aircraft industry. Is that correct?

Mr. HALABY. Yes, sir; in World War II and the Korean war there was a very heavy investment of public funds into the airframe and engine industry.

Mr. THOMAS. World War II was a buildup of what already had been placed in status quo by the Federal Government for the military industry.

Mr. HALABY. Yes, sir.

Mr. THOMAS. You mean to say that this aviation complex we have now can stand on its own feet without Government business?

Mr. HALABY. I think you have to analyze it by company and by segments of the industry.

For example, Mr. Chairman, the industry which produces these aircraft is the industry composed of Beach, Cessna, Piper, and other companies which build single and smaller multiengine aircraft. They built about 7,000 aircraft in the year 1963.

Mr. THOMAS. Do those people enjoy some Government and military business, too?

Mr. HALABY. They make trainers and do subcontracting for military contractors. These companies are earning something on the order of $150 million a year off business and commercial purchases of aircraft.

The big boys in the industry, such as those who build the military fighters, bombers, and reconnaissance aircraft——

Mr. THOMAS. Name them.

Mr. HALABY. Starting at the coast, those companies are companies like Boeing, Lockheed, North American, Douglas, Convair, McDonald in the Middle West, and then the engine manufacturers such as United Aircraft, General Electric, and Curtis-Wright. Those large companies, now known as areospace companies, have a few aircraft in their production line and more and more space and satellite vehicles. Those contracts are usually cost-plus-fixed-fee contracts, little or no risk contracts.

The contracts for these general aviation aircraft, of course, are fixed price commercial contracts.

Mr. THOMAS. Highly competitive, then?

Mr. HALABY. Highly competitive.

FOREIGN COMPETITION

I might add in both categories, general aviation aircraft and air transport aircraft, we are getting increasing competition from British, French, German, Italian, and Japanese industry whose labor costs are lower, whose engineering is quite ingenious, and whose governments, either through nationalization or other subsidy, are continuing to support them, so we have a mixed picture of a relatively prosperous private, commercial small plane——

Mr. THOMAS. As good as ours?

Mr. HALABY. In some respects as good and in a few respects better than ours. In the French, British, and German area they have been in airplane production as early, and in some cases, longer than the United States.

Mr. THOMAS. We were led to believe that by virtue of our 65 or 70 air tunnels, big ones, little ones, and so on, scattered throughout the United States we were able to design and test and come out with a better airplane than anybody else in the world. We have fewer accidents due to more thorough testing and better engineering based upon testing.

How true is that?

Mr. HALABY. I believe we have that capability. What I am referring to is this: Due to lower labor costs and their concentration on particular segments of the market they are just as able to compete as we are and in some respects outdo us.

Mr. THOMAS. We are talking about two things. One is cost and the other is safety.

Mr. HALABY. Yes, sir. The safety record of foreign built aircraft which we have accepted into our fleet is comparable with our own. For example, the Viscount——

Mr. THOMAS. There is added attraction of lower cost?

Mr. HALABY. Lower cost, even after paying duty.

The Viscount for a long time led the turbine-powered fleet in the United States.

The Electra came along and began to outsell it in the U.S. air fleet. Their overall accident record is not too different. There were a lot more spectacular Electra accidents but over the years that accident rate has come down, as I will show you in a moment.

NUMBER OF U.S. AIRCRAFT

I think the main thing here, Mr. Chairman, is that the ratio of aircraft is important and often forgotten. There are only 2,000 scheduled airliners. There are about 23,000 active military aircraft, but all the rest of aviation is more than three times as numerous; namely in the personal, single and multiengine small aircraft where we have 86,000. It is rapidly growing until we see in 1968 100,000 and in 1975 about 105,000.

Mr. THOMAS. In other words, you have 86,000 active private planes in the air. You have 23,000 military planes in the air, and you have 2,000 scheduled commercial?

Mr. HALABY. Airliners, yes, sir.

Mr. THOMAS. How many planes is that; 111,000 in the air?

Mr. OSTERTAG. That is in continental United States.

Mr. HALABY. Yes. Some of these fly abroad but they are based here in the United States. This shows the hours flown by the general aviation aircraft in a year. The hours went from about 11 million in 1957 to approximately 15 million in 1963. We estimate it will go on up to 17 million in 1968.

I believe it is significant that this most rapidly growing segment of aviation is private and commercial and it is not fully appreciated.

AIRCRAFT OPERATIONS

Here is the total number of aircraft operations at airports having FAA control service.

The air carriers have steadied at about 7 million operations per year during the years 1961, 1962, 1963.

The general aviation aircraft have steadily increased from approximately 8 million at this point to a present total of 20 million.

In the military operations at these predominantly civil airports, where there is a FAA tower, there has been a decline and at the present time they are only about 3½ or 4 million. That does not include their operations, of course, at military airports.

Growth rates as you can see from this chart shows a rapid increase in the general aviation, a decrease in military, and a level air carrier rate.

AIRPORTS SYSTEM

This shows number of airports in the United States, a total of 8,000. Only about 3,500 are in what we call the national airport plan.

TOTAL AIRPORTS RECEIVING FAAP FUNDS FROM 1946 TO 12/31/63 - 1887

Mr. HALABY. We have some 1,600 projects in the Federal aid program, of which 436 were added last year. This gives us the most numerous, the safest, and perhaps the best airport system of any country.

Mr. EVINS. Why is the percentage of those not in the Federal Aviation Airport plan so low as compared to the total airports in the country?

Mr. HALABY. The principal reason is that many are privately owned airports. The Federal Airport Act, up for extension and now before conference between the House and Senate, provides that it must be a publicly sponsored airport to receive aid, so that the first hurdle of being a public airport eliminates more than half of the airports which are strips and private airports run for profit.

The second criterion is the formula for State-Federal allocation which eliminates some more, and then we have a hard core of about 276 airports with towers, about 600 airports with local service airline operation, and about 65 where jets now operate.

JURISDICTION OVER PRIVATE AIRPORTS

Mr. THOMAS. Have you any jurisdiction over private airports when the commerce in and out is interstate?

Mr. HALABY. Yes, sir. If the airport is used by airplanes in interstate commerce the airplane and the airman who flies it and maintains it are subject to regulation by the Federal Aviation Agency.

The Civil Aeronautics Board, of course, regulates carriers for hire out of private airports, and there are some cases of the——

Mr. THOMAS. Confine it now. Don't get into carriers. I have one in mind.

Off the record.

(Discussion held off the record.)

Mr. OSTERTAG. What about traffic control?

Mr. HALABY. I was coming to that. The pilot must have a license from the FAA. The airplane must have a registration and an airworthiness certificate from FAA.

The mechanic who maintains it must have a certificate.

Mr. THOMAS. Are you dealing with personnel? We are talking about the physical property and the equipment on that property.

Mr. HALABY. Well, with respect to that there is a section of the Federal Aviation Act of 1958, section 309, to which you may be referring. I quote:

> In order to assure conformity to plans and policies for allocations of airspace by the Administrator under section 307 of this act, no airport or landing area not involving expenditure of Federal funds shall be established, or constructed, or any runway layout substantially altered unless reasonable prior notice thereof is given the Administrator, pursuant to regulations prescribed by him, so that he may advise as to the effects of such construction on the use of airspace by aircraft.

Mr. THOMAS. That was passed when?

Mr. OSTERTAG. Is that the original act?

Mr. THOMAS. Setting up FAA.

Mr. HALABY. This was first in the act establishing the Federal Aviation Agency in 1958.

Mr. OSTERTAG. I am not sure of the point the chairman was trying to arrive at or the answer he was seeking, but in my mind, Mr. Adminis-

trator, there is a question of how you control and regulate the airspace and all safety aspects where it is privately owned and privately operated, without associated facilities to do that. How does that work?

Mr. HALABY. The air traffic rules are prescribed for pilots and crewmen regardless of where they take off and land. In other words, once they get into airspace, they must conform to rules. If there is a privately owned tower—and they are very rare—the tower operator must have an airman's certificate just as though it were a Government-operated tower.

Mr. THOMAS. That is true, but the airport I have in mind has its own tower. Does he work hand in glove with your center, and does the pilot work with your center? Does your center hand off this particular plane that this pilot will land at the airport? It appears to me he is operating over and beyond and outside of your jurisdiction and, if he does, he is certainly muddying the water from the safety point of view; is he not? He is not in your pattern, in other words.

Mr. HALABY. I shall ask Mr. David Thomas to supplement this answer, Mr. Chairman, but the first answer is that this man, because he has a certificate and because he must follow the Federal air regulations, is always subject to the surveillance and enforcement of the FAA. It is a fact that most of the pilots who fly out of these private airports fly what we call visual flight rules, and they are not under instrument flight rules. When they do fly under instrument flight rules, Mr. Thomas will explain how they come into the pattern and into the system.

Mr. DAVID THOMAS. Mr. Chairman, the pilots operating off that field, and others like them, are under the same identical rules as they are when they operate off a field with FAA facilities. If they fly in good weather without a flight plan, they conform with what we call the rules of the road. That is, they give way——

Mr. THOMAS. "See and be seen."

Mr. DAVID THOMAS. "See and be seen." If the weather is bad and they take off there, they file a flight plan with the FAA.

Mr. THOMAS. Under your rules and regulations, if the weather is bad, if you had your own tower, you would not let him take off. Suppose he does take off.

Mr. DAVID THOMAS. If he takes off below minimums or under conditions which he should not, he would be in violation. The question is whether or not we would catch him, of course.

Mr. OSTERTAG. Mr. Thomas, in most aircraft operations that you regulate and control, you give them flight space, do you not? There is a certain altitude that they must follow, and that is one way that you avoid accidents, collisions, and conflicts, because they have a certain level that they are granted by you people. Is that right?

Mr. DAVID THOMAS. Yes, sir. In case of what we call instrument flight rules where you cannot see out the cockpit due to cloud or rain, we do control them, regardless of where the aircraft takes off from or what his destination was.

Mr. OSTERTAG. But they have no such instructions from you?

Mr. DAVID THOMAS. Yes, sir; they do.

Mr. OSTERTAG. Where do they get those instructions, those flight spaces, and so on?

Mr. HALABY. Mr. Ostertag, when the tower says to the pilot, "You are cleared to taxi out to runway 18," and he taxis out, the next thing he usually says on a routine day is, "Cleared for takeoff." That is the only instruction he frequently gives him, particularly at the smaller airports. At the ones where there are no towers at all, all he does is taxi out, look around and take off. You might say those are his tactical monetary instructions. Behind, in his head, is a big, thick book of regulations about the rules of the air. He must observe those at all times.

For example, he must not descend below a certain altitude over a metropolitan area. When he is flying on a course of 0 to 179°, he must fly at a prescribed altitude plus 500 feet. There are traffic rules that guide him, no matter where he takes off and lands.

Mr. OSTERTAG. How is that prescribed to him in a case where there is no tower and no control? It is a private operation. Surely, he follows the rules, and there are certain requirements, but how do you regulate him? Is that from a distant tower many miles away?

Mr. HALABY. If he is flying the "see and be seen" rules, which is normal for this kind of pilot, then we assume, until he is proved guilty, that he is obeying the rules, to save his own neck and to save others. We then work, on the controlled part of the system, those aircraft that are under instrument flight rules and under positive controls. We tell them altitudes that are available. Then we advise them of this uncontrolled traffic. They are frequently told, "We have an unidentified aircraft at 12 o'clock to your flight path, slow, nonbeacon." That means usually a low-altitude, smaller aircraft. Then the airline pilot and the military pilot looks down to see it. That is the way we segregate the controlled and the uncontrolled.

PATTERN OF AIR TRAFFIC

On any one day, for example, in fiscal year 1963, we have these kinds of aircraft in our system. The red dots are large air traffic hubs, such as Houston, Dallas-Fort Worth, Los Angeles, San Francisco, Seattle, and these heavy red portions show there are more than 10 instrument flights per day in that area.

The blue or medium hubs, show 50 to 99 instrument flights. There will be, in addition to this, 1 million flights on VFR in the relatively uncontrolled part of the system.

ACCIDENT STATISTICS

Coming to the accident record, it is very hard to get really meaningful statistics because what we are most interested in is preventing accidents, not recording them after they have happened. Here is one statistical way of presenting it, perhaps the harshest, the most skeptical, and rigorous way to present them, for air carrier accident rates of fixed-wing aircraft, calendar years 1957–63. The rate of accidents per 100,000 hours. This is not the rate of fatal accidents. This is the rate of accidents, all accidents.

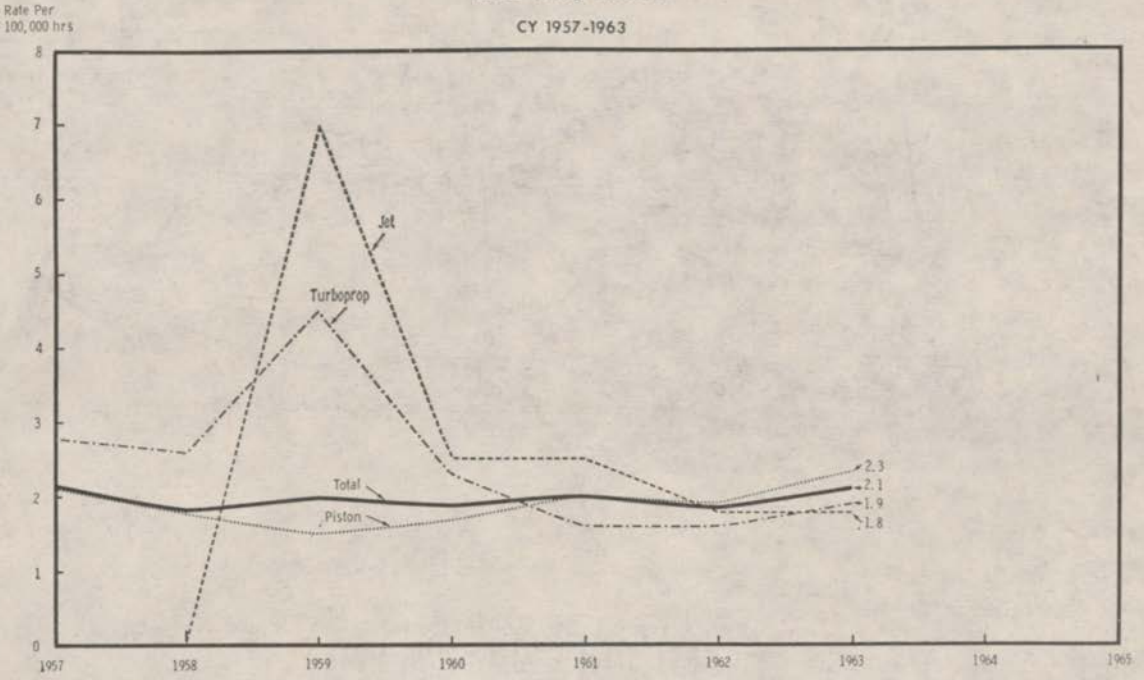
AIR CARRIER ACCIDENT RATE

Fixed Wing Aircraft

CY 1957-1963



NOTE: Includes all certificated carriers except helicopters.
Excludes accidents not incident to flight.

Mr. HALABY. You will notice a very interesting trend here. You will notice that from 1958, when the jets were introduced, the rate went up to as high as 7 for 100,000 flying hours, and then began to descend until in 1960 it had dropped to less than 3 and it reached a low in 1962 of about 2. This rate in 1963 continued to descend for the jets to 1.8 in 1963.

For the turboprop or the prop-jet aircraft, the rate in 1957 was about 2.8, went up to a high of 4.8, descended to a low of about 1.8 in 1961, and has increased slightly to 1.9 in 1963.

For the piston aircraft which have been in the fleet for years, the rate in 1957, was 2.1; it went down to a low of about 1.85 in 1959, and it has remained pretty steady until the last year, when it went from 2.0 to 2.3 accidents.

You see this does not show how many passengers are involved. This chart shows how many accidents related to hours flown. So, one aircraft could be flying with five people in it in one of these 100,000 hours. So, there is no relationship to the demand or the occupancy.

Here is a presentation of roughly the same period showing fatalities domestic scheduled air transport planes per 100 million passenger-miles. That is the number of miles flown multiplied by the number of passengers.

In 1957, it was 0.1 accidents per 100 million passenger-miles. It went up to 0.4 in 1958, 0.7 in 1959, and 1.0 in 1960. It has come down to 0.38, 0.35, 0.11 in 1963.

Obviously, comparing these two charts, the reason for this is the very much higher speed and range and, therefore, the millions of more miles flown and passengers carried. We do not put our faith in that. That looks great, but the accidents per 100,000 flying hours is what we observe.

I am sure on a day like today, when we have awakened—some of us have been up since 4—concerned about a particular accident that will make the headlines, it is interesting to look at the comparative accident data—that is, deaths, fatalities per 100 million passenger-miles. The source of this information is the National Safety Council. We compare here railroad passenger trains, buses, and domestic scheduled air transport planes. Because passenger automobiles and taxis have such a high fatality rate that they will not even go on this chart, we have put them up here on a separate chart.

Using the railroad passenger train and going back again to 1957, you will notice that the rate is about 0.08 here, and the bus is 0.18, and the airplane is for this period 0.1 fatalities per 100 million passenger-miles.

In 1958, the train went up to 0.24, the bus to 0.18, and the aircraft up to 0.4.

In 1959, the passenger train was down about 0.03, buses 0.21, and the domestic scheduled air transport all the way up to 0.65.

The worst comparative year for aviation was 1960. Passenger trains, 0.18, buses about 0.12, and the domestic scheduled air transport planes, 1.0.

Comparatively, the years 1961, 1962, and 1963 show that it is nearly as safe, certainly in 1963, and perhaps safer, to go by air rather than surface.

Mr. THOMAS. What brought that accident rate down so appreciably from 1959 and 1960 to 1963? In 1959 and 1960 it was terribly high. In 1963 it is comfortably low. What did that job?

FEDERAL AVIATION AGENCY

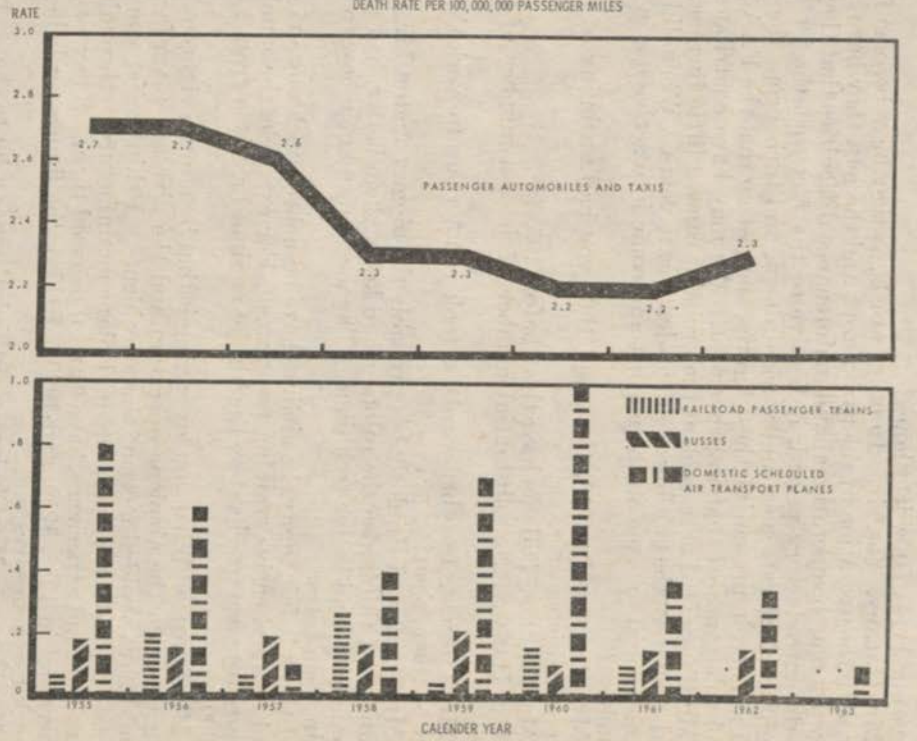
COMPARATIVE ACCIDENT DATA

DEATH RATE PER 100,000,000 PASSENGER MILES



*Not yet available

Mr. HALABY. I think a whole series of things happened in these years, Mr. Chairman. I think the most important thing is that there was a period of time in which the bugs and the operational difficulties were worked out and framed out by the pilots, the engineers, the mechanics, and the managers of the airlines. Remember, we are talking about the air carrier industry here.

Second, I believe——

Mr. THOMAS. 1959 and 1960 are the years the airlines began to use large numbers of new jet planes?

Mr. HALABY. Yes, sir. In other words, as they have become familiar with the operation of the turboprops and the jets, they have begun to work out the operational and maintenance difficulties that they had in the introductory period, indicative of the fact that the jet had a high accident rate here and worked down, and turboprops the same.

I am not, in presenting these figures, suggesting that the FAA is the probable cause of that improvement. We may have contributed.

Mr. THOMAS. Let us look at the probable cause a little further; 1959 and 1960 were the two big accident-death-rate years. When did these planes begin to come on the market and come into active use in large numbers?

Mr. HALABY. In 1958, 1959, and 1960 you had an influx of turboprops and jets.

Mr. THOMAS. Did you have them before 1958?

Mr. HALABY. No substantial number of jets; a number of turboprops.

Mr. THOMAS. In other words, it took you 3 years to work the bugs out of them, then?

Mr. HALABY. I think that is probably the biggest factor, Mr. Chairman, but I think also the pilots got to know them better, had greater confidence, and better technique. The mechanics knew how to maintain them better.

I think it fair to say the airlines have launched much more vigorous and comprehensive training programs. For example, the number of hours between overhaul on the big jet engines has risen from 1,000 to 4,600.

Mr. THOMAS. What you are saying is that by a more vigorous training program the airplane operators and the airplane manufacturers could have avoided most of these accidents. I think what you say is true. In 1963, the operators and plane manufacturers, through combined use and experience, have learned to avoid them. They went into operation in 1958, 1959, and 1960. I think the figures and the years speak for themselves.

Mr. HALABY. Mr. Chairman, I think there is a lot to that. I think we need to look also at each year in terms of the accidents. For example, the year 1963 was encouraging in that the number of fatalities was relatively low compared to other years, such as 1960 when there were 500 people killed in air carrier fatal accidents. In 1961, there were 312, and in 1963 there were approximately 280. But the number of accidents in 1963 was 16, and in 1961 it was 12.

We had thought the trend would be the other way; that there would be more fatalities per accident because of the bigger planes, but in 1963, fortunately, there were fewer fatalities than in 1961, and there were more accidents.

Mr. THOMAS. Then our theory is not accurate; is it? It was due to lack of training.

Mr. HALABY. I would take some credit for the FAA, and I think this committee is entitled to take some credit for appropriating for the jet specialists who inspect the jet crewmen, because that program started in 1961 and has continued in 1962 and 1963. It was initiated by my predecessor, and the men got their training on the big jets for which you appropriated and which we now have in our inventory.

These men are qualified. Each of the jet pilots have been given checks and proficiency tests ever since. I do not think that is anything but a secondary aspect, but I think it has paid off.

AIRCRAFT OVERHAUL STANDARDS

Mr . OSTERTAG. Mr. Administrator, this may or may not be apropos of the discussion here at the moment, but have you any criteria or standards with regard to the life of an aircraft that can be used in commercial service?

Mr. HALABY. Yes, sir. I shall ask Mr. Moore to answer that question. I have recently had him and his staff prepare an estimate of the time actually flown by various aircraft in the jet fleet. As I said earlier, we investigate incidents just about as vigorously as we do accidents. Our theory is that that will help us prevent more accidents.

We look at the Boeing fleet of 707/720, and we asked the operators—Eastern, Pan American, United, TWA, and American—the airplanes with the most flying time on them, and we found that at the time we requested this information in January, Pan American had one with 16,000 hours, TWA with 15,000 hours, and all the rest were lower in time.

With regard to the DC–8, United had one with 13,000 hours. With regard to the Convair 880–990, Delta had one with 10,000 hours.

We also made a special study of whether any structural problems—fatigue cracks, and the like—were developing. We have those data in depth, as you can see from this large folder.

I would like Mr. Moore now to state a more specific answer to your question of how we set up standards for the life of the airplane.

Mr. MOORE. Before the airplane is introduced into scheduled service, inspection times are developed to be used to inspect the various components of the aircraft periodically. For example, the powerplant on the aircraft will have to be inspected and completely torn down before 1,500 hours computed flight time. As you gain in experience and as you look at the various components periodically, the times may be increased.

The way the times are increased, of course, is that there must be a satisfactory service record and, using the powerplant as an example, you must not have had more than a certain number of premature removals of that powerplant before you can extend the overhaul time limit.

As the aircraft progresses along the line we have found that times between inspection of certain components may be increased, and others remain substantially the same. For example, one of the best and most reliable powerplants we have right now is what we call the JT–3 turbine powerplant which is used on the DC–8 and the 707's, and the

time between overhauls on that particular powerplant is up to 5,000 hours.

Mr. THOMAS. You mean you do not require a general overhaul under 5,000 hours?

Mr. MOORE. Not the basic powerplant itself. We may pull the various components off in between, but what we call the hot section, and so on, can go to 5,000 hours.

The interesting thing, sir, is that the reliability rate of that particular powerplant which I am using as an example is better now than it was when the times were down around 1,000 to 1,500 hours.

In answer to your question specifically, sir, we do have a program on each aircraft, and we do inspect the machines periodically as we go up the learning curve.

Mr. THOMAS. How do you account for the fact that it is a better powerplant at 5,000 than it was at 1,500 hours? What makes it a better powerplant? What makes it so much better that you can safely extend the period for complete overhaul from 1,500 to 5,000 hours?

Mr. MOORE. The learning curve, sir, of the people who operate it. The manufacturer will probably say we could have started off at 2,000, anyway, but the way we look at it, we want to be very certain that the powerplant is reliable, so we start it at the lower time.

It is partially learning and, as we go along the learning curve, we may decide to change a certain valve or circuit or pump which has proven to be more reliable and you replace it as you go along.

Mr. Halaby has mentioned the look we have taken at the aircraft that had considerable time on them. It is very apparent to us in analyzing these figures that our inspection process is a good one because we are not finding many things on the high-time aircraft that we do not find on the low-time aircraft.

Mr. OSTERTAG. Then, there is no across-the-board limitation on the life of an aircraft that would be permitted to be flown or used commercially or otherwise?

Mr. MOORE. That is essentially correct, sir. We have some DC–3's——

Mr. OSTERTAG. But you spoke about the powerplant particularly. You did not speak about the frame. Is it our understanding that the frame outlives the engine?

Mr. MOORE. Generally speaking, certain parts of the frame do. In other words, as you go through your inspection process, you do from time to time replace certain components. Generally speaking, the old DC–3 which you see sitting out on the line here at National Airport is not the one physically that was in being when it started. It will have replacements of various parts.

Mr. HALABY. Some of the aircraft have more added new parts than old parts. I suppose some DC–3's are up around 60,000 hours of flight.

Mr. THOMAS. Is the frame essentially the same frame, though?

Mr. HALABY. For example, about 18 months ago the Governor of the State of Montana was flying in an Air National Guard DC–3 in turbulent air up one of the mountain canyons. I believe it has been established and recorded that this wing spar attach angle, failed, the airplane fell, and he perished. That, of course, resulted in a teardown and inspection of all of these kinds of aircraft and their

attach angles, and replacement of some of them. In most cases there was no similar defect shown.

The President's jet, Air Force No. 1, has about 3,000 hours on it. Of course, it is very heavily, frequently and thoroughly inspected. I think it fair to say that the airlines are very scrupulous about these airplanes. If they even show up a hairline crack in any part of the structure, they go into it and fix it and replace it.

If we ever find that they have not, of course we take enforcement action.

The manufacturer is very proud of his product and very much concerned about warranties that he has made on it. He puts out service bulletins when any kind of defect shows up.

For example, on the five jet models, we have put out what we call airworthiness directives during the life of these five airplanes. We have put out about 100 airworthiness directives relating to the tail, the wing ribs, the spars, et cetera.

Mr. THOMAS. What is a spar?

Mr. HALABY. The main spar is like the main beam of a house. It is the long member, like the bone in the wing of a bird, that goes out.

Mr. THOMAS. It is part of the wing? It is the main support of the wing?

Mr. HALABY. Yes, sir; the main support.

AIRCRAFT FATALITIES

Mr. OSTERTAG. Just one more question on your aircraft fatalities. Have you any comparison, figures or percentages, of the total number of people who travel by air and the ratio of fatalities to that number?

Mr. HALABY. We can get you the data on those charts we showed you. Of course, the number using automobiles and taxis is very much greater than the number in airplanes. There is no way of knowing exactly, but we think there are some 10 million individuals who fly in an airplane per year, but many of them make repeated flights. So, we are not just sure how many people fly every year. It is a low number. It is certainly no more than 10 million people.

Of course, many more use buses, railroads, and trains. These are the death rates per 100 million passenger-miles. You might say the individual on the surface has more intersections and more opportunities for collision.

Mr. EVINS. These figures all relate to commercial transportation, surface and air, in the lower figure?

Mr. HALABY. Yes, sir; the upper one includes private passenger vehicles.

ARTICLE IN "THE PILOT" MAGAZINE

Mr. JONAS. Before you leave accidents and fatalities, Mr. Administrator, may I ask you to comment on a statement appearing in the Pilot, a magazine with which I am sure you are familiar, last May and June, published by the Aircraft Owners and Pilots Association. You read their analysis of your budget request last year?

Mr. HALABY. Yes, sir.

Mr. JONAS. It was a rather detailed analysis. I must confess when I read it, it shook me up considerably. If what they say is so, it does not appear that we are getting value received for the fantastic increases in money that have been provided.

May I ask you to comment on the following statement in this article:

> We have watched since 1950 the FAA appropriations for its basic functions of operations, facilities, equipment, research, and development grow at the average rate of 15 percent per year. We have watched the safety record continue its prior improvement through the first half of the decade of the 50's and then level out so that since that time no significant change is apparent. During this same period from 1950 on, the number of civil aircraft has increased at the rate of 3 percent per year, the number of airmen at 3½ percent per year, and the number of plane-miles in civil aviation at 7 percent per year. In the 1950's, the cost of basic FAA functions grew from $1,510 to $4,375 per civil aircraft registration, from $230 to $624 per pilot, and from 8 to 17 cents per aircraft-mile. We have watched the number of controllers quadruple from 4,000 to 17,000 in the last 10 years, and the FAA now employs 1 man for every 2 active civil aircraft.
>
> * * * * * * *
>
> We have watched larger sums of money justified to improve safety while the general aviation safety record has remained almost constant for 6 years and the air carrier rate, due to numbers too small for valid statistical purposes, has fluctuated in an inconclusive manner.

One of the charts would certainly bear out that the accident rate has leveled off or has been fairly constant during the last 6 years. Yet, the cost of operations, allocations of money for safety, has increased fantastically.

I would like your comment on the record about this statement.

Mr. HALABY. Yes, sir. I am very pleased to have the opportunity to comment, Mr. Jonas, because, as any public official knows, the facts catch up with the headlines long after and are often unnoticed.

First, I think we must consider the source of this statement, and I shall try to be as objective as I can be in describing it. As you said, it is the editor of a magazine subscribed to by a group of aircraft owners and pilots. The association is a corporation with several directors and officers who are not elected, and its membership, according to its own statement, is on the order of 80,000 or 90,000 members. They sell "memberships" to the pilots and provide them with low-cost insurance and free services. It is something like the AAA. It is not an association that votes or resolves. The average price of the airplanes of the members is in the range of $10,000 to $50,000, and the association is devoted to furthering the views of its membership.

They are one segment——

Mr. JONAS. May I interrupt to ask, would it be safe to say that the people who belong to this association are vitally interested in safety because their own lives and property are involved?

Mr. HALABY. Yes, they are very much interested in safety. They are also interested in taxes. They are also fearful of user charges and Federal control.

Mr. JONAS. I might add that this article is critical of the failure to impose user charges and critical of you for providing services they say the industry should provide. That would indicate that at least all of the article is not based on selfish motives. I might add that we all should be interested in taxes and saving money wherever possible.

Mr. HALABY. I did not say any of it was based on selfish motives.

Mr. JONAS. You did not use the word "selfish," but that was the implication.

Mr. HALABY. I said you and I must examine the source and the interest of these individuals in this association. That was the first point.

The second point, which they do not cover in the slightest, is how many accidents would there have been if there had been no such vigorous effort by FAA as this committee has supported over these years. This apparently is not as important as cutting FAA down to the strength the publisher desires.

Mr. JONAS. It would be impossible to do anything except speculate about that, would it not?

Mr. HALABY. If you wish to go into details on it, I believe we can show that as a result of the money this committee has appropriated, we have more airports in good shape, we have more towers directing traffic, we have more radars, we have more centers. But, you see, some people do not want any more Federal control of the airspace. They want less. They believe that in their individual judgment rests individual security, and they feel if you have maybe 100,000 people in the airspace from week to week, those individuals can be relied upon to discipline themselves. They feel it is not necessary to have a large system of control. Some even resent a control tower operator. This is a small minority of people.

Mr. JONAS. May I interrupt again. Forgive me for interrupting your trend of thought.

That is fantastic to me. It is inconceivable that the thousands of people flying up in the air would be critical of the cost of safety measures for their own protection, if the measures are actually necessary or helpful. They disclaim any such motivation as you have indicated in this article. They say they are more interested in safety than almost anybody else because they are flying these planes. They say you are wasting money.

Mr. HALABY. On that, I think we could have a very legitimate debate with these gentlemen.

By the way, we do debate at many meetings across the country, because I think it is honest to say, Mr. Jonas, the general aviation pilots get more out of the system and pays less in for the service than any other group. I would like to show you the statistics on this matter. I think you will find in the association's editorial policy a feeling against big Government, against controls, against taxes, but for Federal services.

CLOSING OF FLIGHT SERVICE STATIONS

Mr. THOMAS. Will you let me interject one point here, and then you continue your discussion, because it is good.

I notice the Administrator is about to close down, or whatever you call it, about 40 small flight stations. How does this fit into the discussion that you and Mr. Jonas are having now? Is anybody complaining about that?

Mr. HALABY. I think you will find, Mr. Jonas, that an anti-FAA budget statement, which was some 40 pages long, was circulated last year to every Member of Congress prior to the authors ever having seen the FAA budget, because under the rules of this committee the budget is not published until later. So, they were commenting on a budget they had not seen except in the President's large budget book, and in that blast they proposed to eliminate the funding of some $11 or $12 million, to modernize and equip these flight service stations. Now that we have announced the consolidation of 42 stations out of

approximately 300, we have had representations from these same gentlemen, this same association, that we are being unfair, arbitrary, and not pursuing safety in cutting down these stations to which they have become accustomed and familiar and, I might say, quite possessive.

RADIO CONTACTS WITH FLIGHT SERVICE STATIONS

Mr. JONAS. They comment in here upon an order that you issued requiring every plane operating close to these stations to use its facilities, irrespective of whether they were needed or not. I do not remember exactly what the recommendation was about these service stations, but here is what they say:

> In a more coercive vein, the FAA adopted a rule requiring pilots within 5 miles of a station to use its facilities if the aircraft was equipped to do so. Thus, much of the recent increase in the activity of flight service stations results from an administrative fiat to make work rather than a demand from pilots for more service. And much of the increase over the years results from pure promotion.

Mr. HALABY. I would regard that as a kind of political attack, Mr. Jonas. Maybe I should let a technical man rather than a political appointee answer that. Mr. David Thomas, I think, since it came up from his career service who believes that this would enhance safety although it might annoy a few individual preferences, could answer it better than I.

Mr. JONAS. I shall be glad for him to do that. Before we get to that, I would say this article is complimentary of Mr. Halaby. They were gratified at many of the things you have done. I would say many of its references to you were complimentary. But they did not hesitate to criticize some of the programs.

I will get into the medical one, which we have been rather critical of, also.

Mr. HALABY. Mr. Jonas, I appreciate your quoting from the article. There are some compliments in there. I told the man who is in charge of this association that it was sort of like having a warm pat on the back while your right arm was being severed. It was a kind of strange compliment that you get from "friends." You cannot have a man being complimented for the work he is doing for safety and economy in aviation and then propose a 36-percent cut arbitrarily in the budget that the proposer has never seen, and be a very strong and faithful supporter of him.

Mr. JONAS. I would not say it was undetailed. It is not a blanket cut that they recommended. They pinpoint their suggested cuts. They document them. So far as I am concerned, I was very pleased to get the material. I think you should have been, too——

Mr. HALABY. Yes, sir.

Mr. JONAS (continuing). Because I do not know of anybody who is a superman in this field. There are bound to be some questions and differences of opinion. I would thing the views of the people who fly these planes, on the question of safety and flight standards and all of these other technical questions, certainly would be important.

They even say that somebody put in a director of flight standards who was not a certified pilot. They did not say you did that. I do not even know who it was. That and this service station business were

about the only specific criticisms of what I would say would be policy. The others were of a technical nature.

Mr. HALABY. I would appreciate it, Mr. Jonas, if you would permit me to put my reply to their article before you at a suitable time. Secondly, I should like to make two points, and then I see Mr. Thomas is very eager to make his point about flight service stations.

Mr. THOMAS. We put this in its entirey in the record last year, and we discussed it at some length, but it is very important and I do not think it ought to be brushed under the table. I think we ought to spend as much time as everybody wants to take to go into it.

I personally am anxious to hear Mr. Thomas' explanation to Mr. Jonas' criticism on featherbedding as far as the flight service stations are concerned. When a man gets up in the air, I do not care who he is, I do not think he can be foolish enough to want to break his own neck or to do anything that will endanger his own safety. As far as these general criticisms are concerned, we have considered that the group generally wanted less regulation, but why they want it, I do not know. I am not clear on that.

The discussion between you and Mr. Jonas and Mr. Thomas ought to continue at some length and some detail.

Excuse me for interrupting. Go ahead.

NUMBER OF PERSONNEL VERSUS NUMBER OF AIRCRAFT

Mr. JONAS. Before Mr. Thomas discusses this, are they correct in their statement which I first read about the growth of the Agency? Have you now one employee for every two civilian aircraft flying? Is that a correct statement?

Mr. THOMAS. 86,000 plus 2,000. That is 88,000. He has about 46,000 employees. That is just about it.

Mr. HALABY. It is terribly important here for the committee to understand the author of this article is talking only about his part of the airways system. He is talking about the small, personal plane owner and his problems. He has omitted to consider the military, of which there have been as high as 30,000 and there are now around 23,000 aircraft. So, he omits those. He omits the airliners. In fact, if the airliners could be put in another place, he would prefer it. So, he omits to consider those.

The number of aircraft is not the key thing. It is the number of aircraft operations that is important. That is on the order of 15 million. So, if you want to make a more legitimate comparison than the one he has made—by the way, he used to clobber General Quesada, day after day, with even more venomous attacks on the same subject, about his budget and his activities—that would be a good comparison, 46,000 personnel versus 15 million operations might make some sense.

But to answer your question, sir, the number is right.

I think it also important to note what this man is proposing be done is after 5 years being done on a precise, careful, responsible basis. That, to me, is the best answer to this kind of criticism, some of it sincere, some of it quite biased. And as economy measures come, he doesn't like them insofar as they affect him.

TRENDS IN PERSONNEL AND APPROPRIATIONS

Mr. JONAS. I would make only one other comment, and then I will invite Mr. Thomas to go ahead. What he seemed to be doing, whoever prepared this article, was recommending, not that you abolish safety, not that you abolish standards, not that you abolish these activities, but that you discontinue empire building; that you cut back to a level of a year or so ago, on the theory that the Agency had a good, efficient, effective operation then and it is not necessary to keep expanding it.

Mr. HALABY. Yes, sir.

INCREASE IN APPROPRIATIONS AND FORECAST FOR FUTURE

If I could show you the last two charts I had intended presenting here, the personnel roster went down to its bottom in 1954. Then it was built up from a total of 15 thousand personnel in 1954 to a total in January 1961 of 40,000 personnel. From January 1961 to a peak this past summer at today's level of approximately 46,500.

I am sorry it took me 3 years to get this much control of the personnel expansion, which in the fiscal year 1961 was more in 1 year than the 3 years of 1962, 1963, and 1964.

Here is the way the trajectory looks on the money, Mr. Jonas. The economy trough of 1954, where the total budget of the Agency was approximately $115 million. It expanded to 1961 to $690 million, and on to a peak of $813 million, including the supersonic transport, $60 million. Now, sir it is going down by 754 positions and $15 million.

I know that is in the direction you want, and I know it is in the direction that this association wants.

Mr. JONAS. Is it down because you recommended lower figures, or is it down because the Bureau of the Budget reduced your request?

Mr. HALABY. It is down, sir, because the President of the United States sent a budget up here that is lower——

Mr. JONAS. I know, but how much did you ask the Budget Bureau for?

Mr. HALABY. I can give you that figure in just a moment. The fact is that we have been able to do this. Whether the President, who is responsible, or the Budget Bureau or I get credit for it is not the most important thing. The fact is that we are down, and we are providing for safety. We believe that we have done quite a job.

Mr. JONAS. My point is, how can you go down in 1965 and take care of safety when you said you could not go down when these people recommended it last year and take care of safety?

Mr. HALABY. We were going down last year.

Mr. JONAS. No; you were not.

Mr. HALABY. Yes, sir. We closed 8 out of 29 air route traffic control centers.

Mr. JONAS. You were not going down in money.

Mr. HALABY. Sir, in people——

Mr. JONAS. Or in people.

Mr. HALABY. As I said, sir, in August for the first time in the history of the Agency we had fewer employees one month than the previous month. We now have a smaller budget after 5 years than the previous

1098

budget. We are closing 8 out of 29 air route traffic control centers. The reactions to that are still with us. We are closing 42 flight service stations. The numbers of letters and the numbers of representations to me are very numerous.

I guess, sir, I have to say that economy is our aim and our practice, and the fact is that when it affects some particular interest, that interest comes back and says, "OK, economize on them but not us."

FUNDS REQUESTED OF BUDGET BUREAU

Mr. JONAS. How much did you ask the Budget Bureau for 1965?

Mr. HALABY. For the fiscal 1965 program, we asked $821 million.

Mr. JONAS. So, this cutback did not originate in the Agency. You intended to continue to expand, but you were restricted by the Budget Bureau and by the President. Is that right?

Mr. HALABY. I would put it this way: In the course of the budget hearings and the President's approval, the President sent up a budget of this nature, and we are going to work with it and live with it. We are going to save what we can.

Mr. JONAS. Do you think you can provide all the safety that is necessary with this reduced budget?

Mr. HALABY. Yes, sir.

Mr. JONAS. Why did you ask for more than $800 million, then?

Mr. HALABY. I think what goes on within the executive branch in preparing the budget is important, but I think what comes out of the preparation is the most important thing.

Mr. JONAS. Of course, you know we have the right in here to recommend appropriations higher than the budget figures.

Mr. HALABY. Yes, sir.

Mr. JONAS. We want to know what is absolutely necessary to take care of safety requirements and how little those things can be accomplished with, and why you asked for so much more money than you finally got into the budget. Do you think you are sacrificing safety?

Mr. HALABY. Mr. Jonas, the request for facilities and equipment and for research and development is the margin between the request and the allowance, and that is simply a question of how rapidly we move toward the modern system. They disallowed $38 million in facilities and $14 million in R. & D. That is simply a deferral of putting in the automation and modernization equipment over into another year. We believe we can live with that and get the job done. Mr. Jonas, could I go off the record just a second and then come back on?

Mr. JONAS. Yes.

(Off the record.)

COMMUNICATION WITH FLIGHT SERVICE STATIONS

Mr. DAVID THOMAS. Mr. Chairman and Mr. Jonas, the question was asked as to why we have a regulation that requires a communication with one of the flight service stations within 5 miles of the airport of landing or destination. It was indicated that this apparently is a make-work program.

As you probably know, we run 15 to 20 midair collisions a year, and typically they are within the traffic pattern of the airport without a

control tower or without any communications. In fact, we had one such collision in North Carolina, at Hickory, between an air carrier and one of a furniture company's aircraft, both of which had communications equipment and we had a communications station on the ground, but neither of the aircraft was in communication there. So, we had all the elements of advising each other of the traffic, and they were not so advised, and there was a collision and some fatalities. This was some 3 or 4 years ago.

In an examination of this accident, it became quite apparent that if the Federal Government did have such facilities available, we should use them.

We published, I think, the mildest sort of regulation, and that is, if one does have a two-way radio, not that he must have it, but if he in fact does have it, simply use it in a situation where radio is available to get information.

This does not require additional people on the part of the Government. It does not require any additional equipment on the part of the airplane. But it does require commonsense use of facilities that are now available. The regulation has, we think, been quite effective.

I would like to point out that the flight service stations have provided a great deal of service to the general aviation public. In fact, during the calendar year 1963, we provided flight assistance to nearly 1,200 aircraft, such things as: 104 were caught on top of clouds in weather and could not get down without some assistance. Ninety-two of them had lost navigational assistance, and here we gave them direction finding or sent out another aircraft to steer them in. Around 900 were lost. This sort of thing.

Contrary to the regulation adding either personnel or workload, we think we simply used the workload that is available, and we will still continue to provide assistance services in the consolidated method even after we have closed out some of the other stations.

VFR FLIGHT PLANS

Mr. JONAS. They said they had seen an increase in the number of VFR flight plans filed. Do you require one to be filed?

Mr. DAVID THOMAS. No, sir. That is purely voluntary. If you are flying over the swamps or in desolate country, we recommend it, but it is voluntary.

Mr. JONAS. They say the FAA has had its flight service stations promote and provide more services to general aviation pilots who do not normally participate in the IFR traffic control system. They say we have seen the number of VFR flight plans filed soar, a sevenfold increase in 8 years.

That is where they went on to state the quotation I read a while ago.

Mr. DAVID THOMAS. Yes, sir; there has been an increase, but it is a voluntary program to file a flight plan, to obtain weather and navigation information before you go. The principal reason for filing a flight plan is that it does not help to navigate, but in case the aircraft does not show up, it alerts research and rescue facilities.

I would say one of the saddest jobs that I have, which happens frequently, is to get a call from someone asking us to initiate a search

for someone who has been missing 3 or 4 days or a week, and no one is really sure where they were going, except the family just missed them and they did not show up.

If a flight plan is filed and a person does not show up, search and rescue is initiated immediately, and in some cases it saves lives if we can get to them in time.

Mr. JONAS. Thank you.

Mr. HALABY. Would it please the committee to await lunch to look at this little exhibit?

Mr. EVINS. I think we might want to have it just after lunch when we would have a little more time.

Can we say, Mr. Thomas, it looks as though some of the critics of the program—wanting service stations and not wanting them removed, and wanting all the protection and all the safety, yet wanting it at little or no cost—are in the situation of wanting their cake and eating it, too? Would that be your observation?

Mr. DAVID THOMAS. Yes, sir.

MEDICAL STANDARDS

Mr. BOLAND. I would be interested in some comment, also, on their opposition to your medical standards. I do not know how severe their opposition is. They have some quarrel with some of the standards that have been laid down by FAA. This, of course, would be engendered by the feeling of individual pilots and aircraft owners who are affected by these rulings. I would think maybe you could give us a little briefing on that after lunch. Is your opposition considerable on this score?

Mr. HALABY. It is considerable and ceaseless. The basis of it is that they feel they have a direct, intimate relationship with the family physician, and that our requirement that every 2 years the private pilot must go to a physician designated and given some training and a constant stream of information by the FAA about aviation medicine, is an invasion of their privacy and an unnecessary restriction.

This requirement has been rigorously carried forward. We do not know how many lives it has saved, but we believe it to be sound. No individual, whether a pilot or not, likes to be forced to have a physical examination, and in particular he dislikes having it with a strange physician. I guess, as a personal feeling, I have the same feeling. I would rather have my own personal physician examine me than a stranger. But it takes only a medical degree and a nurse who can type and a reasonable record with the local medical association to become a designated medical examiner.

For example, my physician obtained a designation several years ago, and although he does not make any money on these physical examinations, he does an excellent job at his clinic. Maybe Dr. White could carry on from there.

Mr. BOLAND. I think that probably satisfies my question. They just do not like a rule requiring them to go to a designated physician. They would rather go to their own. Their own probably would be more lenient than a strange physician. This is human nature, you know. If you want your family doctor to clear you, he may clear you because of family association and friendship, whereas a strange physician might not.

Mr. HALABY. This is particularly so, Mr. Boland, with respect to psychotic disorders and mental illness.

Mr. BOLAND. And heart conditions.

Mr. HALABY. And heart conditions.

Mr. THOMAS. Gentlemen, let us recess and return at 1:05.

AFTERNOON SESSION

Mr. THOMAS. The committee will please come to order. Mr. Jonas, will you continue your discussion? This is what the committee needs. You are making a fine record.

Go ahead and complete it.

POSITIVE CONTROL OF AIRCRAFT

Mr. JONAS. I will ask Mr. Halaby whether he still feels as he felt in 1962 when he responded to a question asked by Chairman Thomas, that in effect he was aiming toward full, positive control of all aircraft?

Mr. HALABY. I very much appreciate the opportunity to answer that. I would refer back to the full context of the colloquy between the chairman and myself at that time. This sentence has been jerked out of context for the purpose of misrepresenting my view.

The context of that testimony, and the chairman was asking the questions, was that in the upper air congested air space were we working toward full, positive control.

The answer, both as to intent and substance, was "Yes." The fact is that during the last 3 years we have been able, through the appropriations of this committee, to buy the equipment and train the men and improve the facilities so that all traffic above 24,000 feet is under constant positive radar control.

We have a plan to bring that level of positive control down to 18,000 feet where high speeds make "see-and-be-seen" a precarious rule of safety.

As the writer of the article has been told in numerous public meetings, we never will be capable of, nor do we intend to, positively control each and every flight in the American air space. This is just physically impossible short of perhaps trebling our appropriations and personnel.

Our system calls for an area of uncontrolled VFR traffic, at low altitude in the uncongested areas. It calls for certain traffic in certain areas which have more congestion to be controlled, and then it calls for instrument flight rule traffic under positive control, so that what we are trying to do is to have a safe, sane, and realistic mixture of uncontrolled, partially controlled, and positively controlled traffic.

Mr. JONAS. Let me read the queston into the record right here:

Chairman THOMAS. Does it add up to this: That you are working toward and hope to eventually control every plane from the minute it takes off in continental United States until it sets down, using all the equipment that is necessary? Is that the ultimate control in safety? Is that what you are working toward?

Mr. HALABY. That is almost exactly right, Mr. Chairman. There are a few categories of flight that we do not need to control, and I would hope never try to control.

Then you enumerated—the duster dusting the field, the rancher going back and forth from his ranch to a small country airport. [Reading:]

> On the other hand, if the rancher wanted to come into Phoenix in the midst of air carrier and military traffic he would have to enter the system and subject himself to control.

I would take it from that question and answer that you were aiming toward ultimate positive control of all aircraft other than those who are flying around presumably on a man's own ranch or dusting a field. Those are the only exceptions you listed.

They are very quick to point out that you have not made such statements in public but that you made them to this committee and were careful never to make such statements in the presence of airplane flyers because they know that would be impossible without, as you say, spending far more money than is contemplated in this budget.

Mr. HALABY. Well, sir, I respect deeply the judgment of this committee. I never once thought that anything I said here was not a matter of public record. I would certainly not ever say one thing here and say another thing in another public record.

What I think this publication is attempting to do is to define the word "control" in a way that its members find both unpopular and unpalatable.

You see, one of my difficulties, Mr. Jonas, and perhaps the reason for some of the heat of my reply this morning, is that I come from this private plane area. I am not an airline man, and except during the war I was not a military man. My flying, which has been over the last 30 years, except for the military phase, has been in small private planes. I feel a kinship with these pilots, but having the task of providing for the airliner, the military and the private pilots and the people on the ground, I have to look at it in terms of what is in the total public interest rather than in the interest of this private pilot, so when they tell me that I am trying to obtain and enforce positive control over every flight that is not what I think, is not what I intend, is not what the public record is, and what they have done is to just take a series of questions between the chairman and myself and put them out of context and suggest that we want that kind of huge dictatorial system. We don't.

Mr. JONAS. May the subcommittee now understand from what you say today that that is not your objective?

Mr. HALABY. It is not.

Mr. JONAS. It is not your aim and it is not toward that eventual complete control that you are working.

Mr. HALABY. And it never has been.

Mr. JONAS. The question as it was asked and the response would be calculated to leave such an inference, would it not?

Mr. HALABY. I think what the understanding turns on is the word "control."

We hope within another 3 or 4 years to have a system for safe and efficient utilization of the airspace that will permit uncontrolled VFR flying where it is safe and sane, controlled VFR and then positive-control IFR.

Some would say that all flights were under control, you see. However, what I think they are attempting to show is that we want a controller controlling every flight of every aircraft in the continental United States, which is the case in Russia, by the way. That is the way the Soviet Union does it. Every flight is dispatched by a controller. We call him a controller and they call him a dispatcher. No Soviet flight may take off, no flight of any kind, without his control. I think this is part of the technique of suggesting that the Government wants to take over every individual action so as to promote restriction on the Government's legitimate action in the public interest as it impinges upon a particular individual or group.

The claim is an extravagant one. It misinterprets our public plan, and it tends to place the dialog in a different context from the one which was here in the committee.

MEDICAL PROGRAM

Mr. JONAS. One other comment, and that is the one to which I alluded this morning in connection with the criticism of your medical research program. They do not give any specifics other than to say you are building a medical research empire in the absence of any evidence that medical standards are deficient or that the accident record can be improved by tightening these standards or changing personnel by whom candidates for medical certificates are examined.

I would like to give you an opportunity to respond to that if you care to.

Mr. HALABY. Yes, sir. First, I believe it is fair to say that every private pilot who can afford to fly and who lives to fly feels that he is healthy, sane, and sensible, and that he can trust himself and others can trust him in the air. Most of them have their own private family medical man and they trust him to tell them whether or not they are physically fit, and they feel that in a free world that is enough, and they should not be forced to have a medical examination every 2 years for a private pilot's license and every year for a commercial pilot's license and every 6 months for an air transport pilot's license.

Second, they feel they should not be forced to get this medical certificate from a doctor designated by the Federal Aviation Agency and who might not be their own private physician. They feel that this designation is an invasion of their freedom of choice and their relationship to the family doctor.

I feel often the way they do. I do not like to go take that annual physical. They might find something wrong with me. It might deprive me of the pleasure and profession of flying.

However, my personal physician has obtained a designation. We have some 5,800 American physicians who, having a degree from a medical school, having no record of improper practice before the local medical association, and having agreed to take a kind of refresher course in the peculiar aspects of aviation medicine, have been designated. My doctor has so been designated. In fact, just a few weeks ago when I took my annual physical he was going the next day on his own money at his own cost from practice for 3 days to learn about developments in aviation medicine since he had been designated. He is a very conscientious, thorough man. He is one of the principal

partners in a clinic of high reputation. He wanted to find out what it is that fliers do in being exposed to hazards and exposing others to hazards which were peculiar, what we have learned in the medical research program, and so forth.

Our men came from Oklahoma City, Georgetown, and so on, and presented the developments in aviation medicine.

When a man takes an antihistamine to prevent or ameliorate a respiratory problem he has and he drives 50 miles he is exposed to one set of conditions.

When he takes off and flies over an 8,000-foot mountain range and bumpy air he is exposed to a different set of physical conditions.

Some of the research that Dr. White now heads up is devoted to finding out the effects of antihistamines, of sedatives, various tranquilizers on the human body in flight, so these designated doctors are not aviation medical specialists but they do know what to look for.

We are finding that they are better and better and better able to do a job for an individual. Of course, it still does not make him happy, because he has to take a physical, pay for it, and often it is not his personal, long-time family physician.

Mr. JONAS. That is all I have, Mr. Chairman.

Mr. THOMAS. Mr. Halaby, had you finished your statement?

Mr. HALABY. I had just about finished these charts, Mr. Chairman.

Mr. THOMAS. You go ahead.

Mr. HALABY. I was hopeful that I could just present one more here and then the committee would permit us about 10 minutes over these little displays in the outer office. Naturally we will do what the committee prefers.

Mr. THOMAS. Go ahead and do this in your own way.

RECENT FAA ACCOMPLISHMENTS

Mr. HALABY. We would like to offer to the committee some of the things we have done with the money you have given us over the last 3 years. We have a document, which after you have had a chance to skim, if you wish to put in the record we would be very pleased. We feel accountable to this committee. We feel we are acting within the scope of what it has authorized and appropriated, and these show simply a number of the things which have been done in the 3 years of this particular administration of the program.

I do not mean to go into these in detail now, but if the committee wishes to put that in the record it does give a background of some of the things which have been done.

(The material referred to follows:)

FAA MILESTONES 1961–63

INTRODUCTION

In a very large and a very busy organization it is easy to forget what has been accomplished in the past because of the constant stream of pressing new demands. It is clear that no organization in government or out has more demands on it, or more compelling demands on it, than the Federal Aviation Agency. So it is likely that results of the Agency's work in the last 3 years are already largely forgotten by even the men and women who achieved the results. In the hope, and expectation, that a partial list of some of the Agency's accomplishments in the last 3 years will be a source of inspiration and confidence to you for the big task ahead, this summary has been prepared.

Project Horizon report, prepared by a high-level task force, was issued in May 1961. It defined the Nation's long-range aviation goals and included recommendations to review our objectives in international aviation and to begin immediately a study to develop the supersonic transport.

The report of the Project Beacon task force in October 1961 made recommendations for modernizing the air traffic control system for evolutionary construction of a system capable of handling demands of the supersonic era.

The System Design Team formed late in 1961 drew up a comprehensive, overall design plan for the national airspace to implement recommendations in the Project Beacon report issued June 1962. (Specific projects are listed separately.)

The FAA launched a reorganization program in July 1961 to delegate broader operational responsibilities to the regional offices—to place Agency people with authority and responsibility close to the point of service. Under the decentralization concept, authority has been concentrated in regional directors, and the Washington headquarters staff has been reduced by some 600 positions.

Policymaking, planning, and programing has been centralized in Washington, D.C. Three top-level management positions were established—(1) Associate Adiministrator for Administration, (2) Associate Administrator for Development, (3) Associate Administrator for Programs—to assist the Administrator and Deputy Administrator in the executive direction and coordination of the various Washington offices and services.

An independent Audit Division was established in the Office of Management Services to assure the soundness of the financial, accounting, and management controls of the Agency.

The Office of Appraisal was established to assure the Administrator of the adequacy of all Agency operations.

To improve internal communications, a management information center, an alert bulletin, and a communications duty watch officer system were established.

Agency Order 74 was issued on November 7, 1961, which directed increased attention to the need for maximum efficiency and economy in Agency activities, and intensified requirements for realistic reporting and follow up on actions to achieve the desired improvements.

New regional offices were established, including a southern region to take over operational responsibility for a large section of the southwest area, and an office in London to handle FAA affairs in Europe-Africa and the Middle East.

Related functions were consolidated in the spring of 1962 under the following new offices: Aircraft Development Service, Installation and Materiel Service, and Systems Maintenance Service. Services related to each other with respect to the development of a national aviation system were placed under appropriate assistant administrators for a closer coordination of projects aimed at a mutual goal.

The added importance given to general aviation was centralized in the newly created Office of General Aviation Affairs placed under an Assistant Administrator. To better serve general aviation needs, three major purposes have been established—aviation education, liaison with private aviation organizations, and congressional liaison.

New emphasis was given to the airport program with the establishment of airports service as a separate department under a service director.

A program to reduce the number of air traffic control centers through a consolidation program represents a potential saving of more than $116 million in the next 16 years. Proposed by the previous Administrator, the program was postponed and carefully reevaluated by the present Administrator before it was implemented.

The FAA and the Department of Defense have integrated operational communications facilities, a program which represents an annual saving of $6.3 million.

The supersonic transport program was established and placed under a Deputy Administrator to bring supersonic flight to the Nation's air travelers in the 1970's. Discussed for many years and explored by the previous administration, the program took form when $11 million was appropriated in fiscal year 1962 and $20 million in fiscal 1963 to finance preliminary feasibility studies. Three airframe and three engine manufacturing companies submitted initial design proposals to FAA January 15, 1964. The proposals are being evaluated by a team of Government experts and by the airlines. In addition to FAA experts, the 210-member Government group will include personnel from NASA, CAB, the Air Force, the Navy, and the Department of Commerce.

By the end of 1963, the FAA had received delivery reservations, accompanied by partial royalty payments, from seven airlines.

The FAA called for limited design competition to produce detailed specifications and cost data for a small, practical short-haul transport to replace the aging DC–3 which still dominates the short-haul market in this country and abroad. A number of competitive aircraft designs are to be ready for evaluation during 1964.

FAA engaged in 14 joint military projects in 1963 to develop new kinds of V/STOL aircraft. In one project, prototypes offered by three different manufacturers competing in the Army's light observation helicopter program underwent initial flight tests; FAA's schedule calls for completing certification of these aircraft for civil use by the end of 1964.

Project Searchlight, started earlier and completed in 1961, indicated that with vastly increased engineering efficiency there was not as large a need for additional maintenance manpower as previously thought.

Project Pipeline, started earlier and completed in 1961, thoroughly evaluated the Agency's supply system, and tested the introduction of advanced operation research in FAA administrative management problem solving.

Project Tightrope, a task force appointed by the Administrator to review FAA's rulemaking and enforcement procedures, completed its report in November 1961. As a result, an Agency Regulatory Council was established to serve as a central rulemaking forum; a new policy was established to permit trial-type hearings using independent regional hearing officers before revoking airmen's certificates.

A rules codification program resulted in rewriting existing regulations so airmen can use and understand them more easily.

FAA dockets on proposed safety rules have been opened during the comment period so interested parties can learn what comments have been submitted before the deadline for comments have closed.

A program was established to continuously update technical instructions for maintenance technicians who maintain the airways system. The purpose is to improve performance and reduce the chance for error.

Project Score, initiated in 1962, involved the study of the use of manpower in air traffic service. Preliminary information indicates the development of techniques that will permit facility chiefs to achieve increased efficiency in the utilization of manpower, and confirmation of the methods used by the Agency to attain continuing increases in manpower productivity.

An intensive Agency-wide economy campaign conducted in mid-1962 stimulated more than 5,700 suggestions for improving organization structure, procedures, and operations.

OPERATIONAL ACCOMPLISHMENTS

A high-speed aircraft maintenance communication system went into operation in March 1962. It permits summarized information concerning the mechanical reliability of the air carrier fleet to be returned to all carriers within 24 hours after the information is received. Teletype links have been established in the five regional offices in the contiguous United States and in eight selected air carrier district offices to make information regarding malfunctions and significant incidents quickly available to all air carriers.

New emphasis has been placed on the role of the aviation mechanic by hangar sessions initiated by the Administrator and by the introduction of an FAA annual awards program for both general aviation and airlines mechanics who make the most outstanding contribution to air safety.

Certification and airworthiness regulations were revised for route air carriers engaging in oversea and foreign air transportation and transportation within Hawaii and Alaska. Blue ribbon systems-worthiness inspections were made of domestic and American-flag air carriers, surveillance of supplemental air carriers was increased, and a financial audit for supplemental air carriers was introduced.

The FAA now flight checks navigational aids of all U.S. Government-operated navigation systems on a worldwide basis. While Army and Navy aids were already being flight checked by FAA before the present administration, some 1,600 Air Force aids have been added increasing the FAA workload from some 50,000 to 70,000 flight check hours annually. In addition to being a further step toward a common civil-military system, the process promotes a greater economy and efficiency. Part of the previous administration's friendship plan, this phase began in September 1962.

INTERNATIONAL ACTIVITIES

FAA's international activities were strengthened by the establishment of the Office of International Aviation Affairs and by delegating operations responsibilities to the regions.

Symbolic of the FAA's desire to assist the newly developing nations, an International Field Office has been established in Brazzaville, Congo, to assist in promoting the influence of the free world.

The FAA International Field Office in Miami controlled and directed clearance of commercial aircraft in the Cuban area during the Cuban crisis in October 1962. A prototype airline disaster control plan and an airplane decontmination manual were published; action was taken to protect U.S. carriers by restricting flights in Cuban airspace.

The FAA supported legislation to train peace officers to prevent highjacking of air transports.

NAVIGATION

A program to require the installation of distance measuring equipment (DME) to assist pilots in navigating air carrier aircraft was begun during the previous administration and implemented and accelerated by the present administration.

The number of basic navigational aids, VOR/VORTAC's, was increased during the last 3 years by about 10 percent.

The FAA flight checked the North Atlantic to verify Doppler performance to provide separation criteria for ocean-crossing aircraft; approved cockpit navigation concept using Doppler radar over North Atlantic routes for TWA on February 22, 1962.

"Operation Accordion" was inaugurated in late 1961. This data-gathering project involving 15 international air carriers was aimed at improving North Atlantic navigation and communication to determine the feasibility of reduction of ATC separation standards over North Atlantic routes for the conservation of airspace.

Spanat (systems planning approach to the North Atlantic). Studies have been initiated to develop and implement an FAA/US systems planning program and to initiate international actions for an improved system for the provisions of air traffic control and related services between North America and Europe to meet long-term technical, operations, and economic requirements.

Lower cost ILS ground equipment has been developed and is being field tested preparatory to implementation on a national basis.

TERMINAL ACTIVITIES

While parallel instrument landings have been under study for many years, a parallel instrument landing approach system was put into operation at Chicago's O'Hare.

Postive radar separation in a terminal area began on a test basis in November 1962 for planes landing at Atlanta. The program is to be expanded to perhaps a dozen busy terminals within the next 2 or 3 years.

Radar service for VFR aircraft began under the previous administration and has been expanded to Kennedy, Houston, and El Paso. Traffic advisory information is provided on identified targets as well as on unidentified targets, workload permitting.

A runway visibility program was started in February 1963 at O'Hare, Kennedy, and Los Angeles as a backup to visibility-measuring instruments in the event of failure of instruments. Service also provided during low visibility conditions on runways not equipped with automatic visibility-reporting devices. The programs is to continue until sufficient automatic equipment becomes available for the busiest terminals.

The need for a change in rules for operating in and around tower-equipped airports was apparent to the previous administration. Issued earlier in the year, the change requiring that planes flying in and out of such airports be equipped with two-way radio became effective December 26, 1961.

Radar handoffs of aircraft has increased so that practically all ATC radar approach facilities have attained 93-percent capability and centers 100 percent. In October 1961 less than half the centers and only 16 approach control facilities had the capability to provide this service.

EN ROUTE ACTIVITIES

The use of the radar beacon system was improved in January 1963 making it unnecessary for pilots to change codes every time they entered a new center sector. Pilots now have three code changes to make: climb, cruise, and descent.

Test equipment for direct controller/pilot communications has been installed at two experimental locations representing considerable improvement in range and reliability over present equipment.

The concept of increasing the number of remote air-ground sites, born prior to the present administration, has been implemented and expanded. The number of sites was increased from 278 in June 1961 to 336 in June 1963.

Air traffic control adopted a procedural innovation requesting that pilots report altitude whenever they change frequency to signify the transfer of control from one controller to another. The purpose is to assure that the aircraft's altitude is known to the receiving controller.

A program to train flight service station personnel as weather briefers, begun under the previous administration, was completed in June 1962. This training makes more extensive weather information available to pilots from FAA flight service stations.

Pilot-to-weather forecaster service began on a test basis in July 1961. Conditions actually encountered by pilots is sent back to the forecaster for relay to other pilots, providing them with information on the area they are entering or approaching.

The installation and use of ATC and navaid equipment, begun many years ago, has been accelerated. The availability of long-range radar increased from 46 units in June 1961 to 83 in June 1963. The number of surveillance radars in towers increased from 58 in June 1961 to 74 in June 1963. Instrument landing systems were increased from 207 in June 1961 to 243 in June 1963 (reliability and accuracy has also increased). As to airport landing facilities, approach light systems increased from 140 in June 1961 to 197 in June 1963, sequence flasher lights from 106 to 195.

Area positive control above 24,000 feet started on a trial basis over some 110,000 square miles in October 1960. The program has been expanded to cover all of the continental United States except for portions of the New England States and areas of light activity in Montana and North and South Dakota.

A target date of July 1964 has been established for the modification of the present three-level airway/route structure. An airway structure will exist from 1,200 feet or higher above the ground to 18,000 feet; a jet route structure will exist from 18,000 feet to 45,000 feet; and a high-altitude area will exist above 45,000 feet for flights capable of conducting a point-to-point direct operation.

Rulemaking actions associated with the implementation of the provisions of amendments 60–21 and 60–29 to the former Civil Air Regulations, part 60 (now pt. 91 of the Federal Aviation Regulations), began in December 1962 with anticipated completition during the third quarter of fiscal year 1965. This program provides for the release of portions of controlled airspace for the benefit of the VFR user.

AIRPORT ACTIVITY

The Federal aid to airport program, once left to wither away, has been rejuvenated. Since January 1, 1961, according to estimates, 988 airports involving $291,390,000 in Federal funds have participated in the program, or are planning to participate, included in this amount is $41,601,000 in Federal funds allocated to assist in the establishment and construction of 163 new airports. In 1961 the Federal aid to airport program was extended for another 3 years and appropriations were increased from $63 to $75 million annually.

Guidelines have been developed on heliport site evaluation for use by FAA engineers to aid in airspace actions.

A new range of criteria have been adopted to permit the development of minimum airport facilities to meet the aeronautical needs of smaller communities.

Airport owners seeking to participate in the FAAP program have been assisted by the publication of the criteria used to determine the eligibility of touchdown zone, centerline, and taxi turn-off lighting.

Thirty-three conveyances were made on 43 applications from local public agencies for federally owned land to be used for public airport purposes during the past 3 years under a program continued from the past administration.

The FAA and CAB jointly inaugurated in 1961 the regional airport concept, a prime purpose of which is to formulate a national system of airports designed to offer adequate airport facilities to all communities having a true requirement while avoiding duplication and overdevelopment. To carry out this policy, FAA has participated in 21 CAB proceedings requiring airport studies of about 100 locations.

Some 50 economic and operational analyses of individual community requirements for airports have been developed. In 1961–63 under a program initiated earlier.

A working group on airport policy and planning has been established to review and recommend improvements in the current airport planning methods and concepts. The basic purpose is to get the right type of airports in the right locations.

Arrangements were worked out with the National Park Service for joint participation in locating airports at national park sites. The First Flight Airport was dedicated at Kill Devil Hill near Kitty Hawk, N.C., on the 60th anniversary of powered flight, December 17, 1963; airport construction is under way at West Yellowstone, and bids are being sought for an airport at Grand Canyon.

Local communities were furnished revised standards to encourage the development of airports. They covered site evaluation, airport configuration, design considerations, and construction phases.

A "blue seal" program was activated to encourage general aviation pilots to acquire minimum instrument capability in the event of inadvertently flying into bad weather. Under the plan a blue seal is imprinted on the new ticket of qualifying pilots.

Periodic nationwide meetings with general aviation pilots were inaugurated on the grassroots level in October 1961 to exchange ideas on improving safety through better flying techniques, operating practices, and emergency procedures. There were 12 of these meetings, with attendance ranging from 350 to 920. (Similar meetings were held with aviation mechanics.)

A flight-following service designed to monitor flights from departure to arrival at destinations was conceived by the previous administration and implemented in mid-1961 by FAA flight service stations.

RESEARCH AND DEVELOPMENT PROJECTS

Evaluation tests of arresting gears have been conducted and the feasibility for air transport category aircraft has been demonstrated. The idea of arresting gear for civil aircraft has, of course, been considered for many years.

Studies have been made relating to the crew complement for medium jet aircraft, new aircraft, i.e., BAC–111, DC–9.

The initial study phase of Project Little Guy was completed in March 1963. Aimed at the development of an efficient, economical, and simplified cockpit configuration for general aviation pilots, the study is to result in the development of an experimental mockup that could be developed into the light plane instrument panel of the future.

The advanced radar air traffic control system, which will present identification and altitude on the radarscope, is expected to go into operation in late 1964 as a result of continuing achievement in the last 3 years.

The first inexpensive model of SLATE (small light-weight altitude transmitting equipment) was developed for small aircraft at NAFEC where it has been undergoing tests.

The concepts of the national airspace system were validated and further developed through laboratory test bed facilities for the en route ATC at Bedford, Mass., and for the terminal phase of ATC at NAFEC.

Delivery is expected in the spring of 1964 on initial equipment for the engineering model of the air traffic control subsystem. A $1.8 million contract was signed with Burroughs for the radar video digital processor.

A mosaic generator is being developed to provide composite radar displays, that is, a single enlarged picture derived from inputs of two radars to facilitate radar handoffs from one en route sector to another.

A category II (RVR 1,300 feet) all-weather landing system has been defined and the ground equipment proven. Surveys preparatory to installation of the necessary ground facilities are now underway at 23 airports.

The broad requirements for a category III (zero zero) all-weather landing system have been defined and the proper approach indicated. The requirements will be refined as experience with the category II system is gained.

VORTAC improvements were initiated for easier siting, accuracy, and system utilization, and a low-cost DME was developed and put in use. Parts of earlier programs, they were given a large impetus by the present administration.

Plans for the design of a common aviation weather system were established by the previous administration and carried forward by the present administration. Techniques are being developed and equipment for pilot-forecaster is being evaluated.

Log periodic and wire grid Luneburg lens antennas were installed and evaluated in 1963 to improve the reliability of high-frequency point-to-point circuits that link vital communications between the continental United States and oversea locations.

Extensive tests using two new tropospheric communications facilities near Cape Cod and San Juan have indicated that it may be economically feasible to provide reliable air-ground communications over distances more than triple those spanned by conventional equipment in use at other major gateways to the United States.

MILITARY ACTIVITIES

Progressive steps have been taken to maintain a high degree of cooperation between the Air Traffic Service and the military while keeping national defense requirements in balance with those of other airspace users.

The aerial refueling program, essential to the mission requirements of the Strategic Air Command (SAC), Tactical Air Command (TAC), and the U.S. Navy (USN) was revised in 1963 from an area to a track concept permitting the assignment by air traffic control of altitudes/flight levels along established tracks, thereby providing better management of airspace than was previously possible.

Flight operations at and below 1,500 feet in excess of 300 knots for the purpose of low-altitude navigation and bombing in visual flight rule weather conditions have been accomplished since 1961 essentially on published routes under criteria supplementing the Federal aviation regulations.

The all-weather low-level navigation training requirements of the U.S. Navy and SAC are being satisfied under a program in effect since 1959 titled "Operation Oil Burner." Success of this program is due in part to the civil users' recognition of an urgent military requirement.

A program to provide air traffic control service to interceptor aircraft was undertaken in 1963 by the Air Traffic Service. The program objectives are (1) elimination of the control of aircraft by two independent agencies in the same airspace, and (2) provision of technical assistance in support of the military in those instances when interceptor operations cannot be accomplished within the ATC system.

DISASTER AREA REGULATION

Flight of nonessential aircraft was prohibited in the airspace below 2,000 feet above the surface and within 5 miles of an aircraft or train accident, forest fire, earthquake, flood, or other disaster of considerable magnitude, to reduce the hazard to essential aircraft operating over these areas and to congregating sightseeing aircraft. Identified "news" flights are regarded as essential aircraft.

Mr. THOMAS. You might summarize it quickly for us.

Mr. HALABY. Right quick, it indicates that we have gotten a very sound group of outside systems engineers to come in and help us develop a scheme for the use of the airspace.

We then set up a special group of design men and we have had now for 2 years a consistent stable research development and installation program.

Mr. Shank, Mr. Leng, and General Grant are three people who have come into the Agency in the past 2 years. In Mr. Blatt we have a career man in charge of the R. & D. Those men have been at it now month after month after month, and we have not had the ups and downs, the frolics and detours that were prevalent in the 1950's in this program.

As a result we feel that the system is moving forward very well. We think we have the foundation well laid and now we are beginning to build the upper story.

We have progressed with the integration of military and civil flying to a very encouraging, although not complete, extent.

For example, recently we were able to come into agreement with the Air Force whereby we provide air traffic service to interceptors as they leave the military airbases and enter the system. In the past they controlled themselves until they were well out into the system, and we feel some progress has been made there.

The only way we can come to you with a request for less money and fewer positions is because of internal productivity increases, and that means first that management has to want to do it and, second, knowing how to measure it and implement it. There is encouragement there.

There are quite a number of things, including the reinvigoration of the airport program, which we think this committee has been most helpful in doing. These 3 years have seen a very fine combination of four factors. First, they have been three of the safest years in aviation. Second, they have been marked by improved air transportation services—more routes, more frequencies and, as a result, more profits for the carriers and their employees, and at the same time the fares have been coming down. There has been less labor-management controversy. Those four things have combined during this period not as a result solely of FAA's activity but that of CAB and, most of all, the individuals and corporations in the business.

One area of great concern to us is the near-miss area. By way of introducing our facilities and equipment in the research and development program I would like to point out on this chart which, if agreeable to the committee, we can put in the record, if we could put selectively some of those other charts in. It might be helpful along with the dialog.

NEAR MID-AIR COLLISIONS

This shows for calendar years 1959 through 1963 we have had a series of reports of near misses. The statistics are very difficult to weigh.

(The table referred to follows:)

Near midair collision incidents reported, calendar years, 1959–63

Degree of hazard	Calendar year 1959		Calendar year 1960		Calendar year 1961		Calendar year 1962		Calendar year 1963	
	Number	Percent	Number	Percent	Number	Percent	Number	Percent	Number	Percent
Critical	172	15.5	82	17.5	63	12	62	11.29	85	13.7
Potential	224	20.0	85	18.0	118	23	153	27.86	241	38.7
No hazard	716	64.5	303	64.5	335	65	334	60.83	296	47.6
Total	1,112		470		516		549		622	

Mr. HALABY. For example, in the calendar year 1959 there were 1,112 near misses, 470 in 1960, 516 in 1961, 549 in 1962, and 622 in 1963.

There is no steady rate of reporting these near collisions. It seems to go in cycles. A lot depends on the attitude of the pilot community at the time, as well as what they think will happen if they report a near miss from the Agency.

What we do with each of these reports of near miss air collisions is to get a statement from the pilot reporting, get a statement from the pilot of the other aircraft where it has been identified if the pilot is available for reporting, and then determine on the basis of all the evidence we have been able to get whether it is critical, whether it was a potential accident, or whether it was no hazard at all but simply, you might say, a report of another airplane in the sky.

Here is the record on verified critical near misses—in 1959 there were 172, in 1960 there were 82; in 1961 there were 63; in 1962 there were 62; in 1963 there were 85.

We are not satisfied with uncontrolled flight or with the present level of control. We think we have to move forward from here, and we would like, if the committee wills, to take you to the other room and just off the record explain the situation as it is now and show you how we would like to advance the system from here.

I think the testimony there would be very difficult to report and I can sum it up in one paragraph which would show you the present system and then the level of improvement we seek with these appropriations.

Mr. THOMAS. All right.

(Discussion held off the record.)

Mr. THOMAS. Mr. Halaby, had you finished with your charts?

Mr. HALABY. Yes, sir.

Mr. THOMAS. Anything further?

ALTITUDE AND IDENTIFICATION TRANSMITTER

Mr. HALABY. Two quick things. I wanted to show Mr. Jonas these two devices. These two devices, Mr. Jonas, we have developed in our research and development program.

This is what is called an altitude and identification transmitter. In the airplane it sends a signal down to the center which says this is N–145, the license plate, and it says "We are at 8,000 feet."

That comes off this box in the plane, and the pilot cranks in his identification. It is fed out of this altimeter which goes through this electronic box and transmits the altitude downstairs.

There, through what we call an alpha-numeric generator, which is the principal item calling for new money for new type equipment in this budget, presents it on the radar scope to the controller, and instead of just having a little blip there whose identity he has determined from a flight plan on another part of his console, he now will have a blip with its license plate, with its altitude, and ultimately any collision prediction that might be presented.

He then would really be able to assure from his scope that some of these high speed targets would not have any near miss.

Mr. THOMAS. Exactly what does it show him now which he does not already know? VORTAC will give him the distance from where he is to his destination.

Mr. HALABY. That is right.

Mr. THOMAS. How about these gadgets?

Mr. HALABY. The pilot will see on his receiver in the cockpit the distance to his next station and the direction, the bearing he should fly to reach that station.

On the controller's scope when these are installed he will see the bearing and distance and altitude and identification. He will then know for sure——

Mr. THOMAS. Covers it all, then?

Mr. HALABY. He will know for sure what he is controlling in the controlled airspace.

One of the problems here is that these are expensive to buy, and the private plane pilots do not want to buy these and do not want to be forced to buy them as the price of their going into controlled airspace.

We would like a serene, uncongested airspace where you did not need this, but with the rapid increase in speeds and in numbers of airplanes, we have to have some kind of system like this, and I think it is fair to say that a lot of private pilots fear that this is coming and want to, you might say, defer, or limit it to only where they think it is absolutely essential.

BUILDUP OF FAA

In terms of the buildup of the FAA, I submitted a chart showing that over the years from a bottom in 1954 of $115 million for the CAA to an increase in 1961 to $690 million, we went in 1964 to a peak of $753 million, excluding the supersonic transport, and we are now requesting for the first time in the 5-year history of the FAA a reduction—down to $751 million.

In terms of personnel, we went from a bottom of 15,000 in 1954 to 39,000 in 1962, a peak of 46,432 last year, and we reached the peak and now we are providing for the total in this budget of 45,700, I believe.

I would also point out, and I am bragging about this a little, when I came in in 1961, and it will be 3 years next week, the 5-year projection for this Agency which was handed me, the 5-year plan showed 59,000 jobs. We have been able, therefore, to reduce the projection by 10,000-plus jobs.

Obviously, one can say that was too high a projection, but the fact is that by management, by training, and by automation, we have dropped the projection to a little less than at present for the same period of time.

USER CHARGES

If we could spend just one word on these user charges. This is not before this committee, but I believe that the committee feels that if this system providing this safety and efficiency of flight, providing for less danger, less delays, less diversions, fewer cancellations of flights, if it is going to appropriate half a billion dollars a year for the airways systems that it would like to be able to say that the beneficiaries, the users of the system, are paying back in a fair share to the Treasury. It won't reduce the appropriation but this committee can say to the public that all of the appropriated funds are needed and they are being paid back at a proper ratio.

TAXES

The present revenue from aviation-type taxes in the current year is $136 million, of which the passenger ticket tax is $119 million and the gasoline tax is $17 million. About $7 million of the gasoline tax is paid by the private and commercial aircraft and about $10 million is paid by the airlines.

There is now no tax on kerosene.

Mr. THOMAS. That is the jet fuel, too, is it not?

Mr. HALABY. That is the jet fuel. If you will recall from the earlier chart, we are almost converted from piston aircraft using gasoline to jet and turboprop aircraft using kerosene.

It is rather odd for an aviation agency to be presenting this case, but I feel that it is important because it is not easy for you to go to the floor year after year and say you need three-quarters of a billion dollars for this agency. If you attribute some of the cost to the military and eliminate those costs, and then attribute some of the cost to public protection, such as reclamation, flood control, Coast Guard, and other public services, then there is some remainder that ought to be paid by the users.

I feel that this committee and the public in general is interested in this because it shows that a good public safety service is attributable partially to the military and national defense; partially to general public protection; however, also to the users.

To the extent that we can, and the President has so proposed——

Mr. THOMAS. Where does the Coast Guard and the other agencies fit into the picture? You refer to protection of the public. What do you mean by that?

Mr. HALABY. We do not charge the riparian owners on the Mississippi for flood control projects. We feel they are owed Federal protection through reclamation and flood control and therefore we should not charge the general public for protection, let us say, from falling objects from the sky. We are in that sense reclaiming the airspace and conserving it and preserving life through that.

Mr. THOMAS. What about the Supreme Court decision which puts the liability on the airports for damage caused, for the broken windows, and so forth?

Mr. HALABY. The *Griggs* v. *Allegheny County Supreme Court* decision provided that if an air carrier is able to come within 12 feet of the roof of a private dwelling in approaching a county airport that is a taking of private property which should be reimbursed by the county airport which is obtaining the service of the aircraft. That was a noise case, taking without just compensation case.

As I will point out later in the testimony, we have a number of suits filed against the FAA in accident cases. The most enormous liability is related to the Brooklyn midair collision of December 1960.

Coming back here, sir, we believe under the President's program that there should be a tax on kerosene. In fiscal 1965 a jet fuel tax would yield $57 million. There should be a passenger tax which would yield $127 million. There should be a tax on cargo which would yield $10 million, and there should be a tax on gasoline. Incidentally, this would be a 1-cent increase.

Mr. THOMAS. Were any of these taxes eliminated from the present tax bill?

Mr. HALABY. Several of them expired this year, and I do not believe any of them——

Mr. THOMAS. The big ones. Would it renew the tax on passenger fares?

Mr. HALABY. That will expire July 1 if not renewed. This is not concerned with income tax.

If I may make one last point, I will have completed this.

The gasoline tax would be $18 million in fiscal 1965, of which I think $11 million would fall on the small planes and commercial planes.

Mr. JONAS. The Senate amendment added the following deduction which the House bill eliminated and which the conferees accepted in the confernce report. "State and local taxes on the sale of gasoline, diesel fuel, and other motor fuels."

Mr. THOMAS. The income tax and the excise tax is a different matter, is it not?

Mr. JONAS. That is right. The excise tax extension bill will be up later on.

Mr. THOMAS. So it will have to be reenacted in July, or else it will go by the board.

Mr. JONAS. That is right.

Mr. EVINS. Has the President made these recommendations for these tax revenues?

Mr. HALABY. Yes, sir; for the last 2 years.

Mr. THOMAS. How much would his recommendation raise it compared to what is on the books now?

Mr. HALABY. It would go from $136 million, the present level, to a rate of $212 million in 1965.

COST OF MAINTAINING AIRWAYS

Mr. THOMAS. What does it cost the taxpayers to maintain the airways? Around $850 million?

Mr. HALABY. No. The airway cost alone is about half a billion dollars, rising to about $550 million. This does not, of course, include the whole FAA budget or the CAB budget or the NASA budget, all of which have aeronautical services.

Mr. THOMAS. It would run around a billion dollars, not quite a billion dollars, around $900 million or $850 million. That runs into money. We get about a fourth of it back under the present plan.

APPROPRIATIONS VERSUS WORKLOAD

Mr. HALABY. To go back to the statement, Mr. Chairman, I have tried to show in these graphic presentations and in the models which the committee looked at in the other room, that we are serving an increasing fleet of aircraft. We are providing services to air traffic control towers at a 7-percent increase per year, instrument operations 3 percent per year, revenue passenger-miles up 6 percent last year, and jet fuel consumption up 20 percent.

In other words, we have a growing workload, but we have a reducing number of personnel and dollars.

I think Mr. Jonas asked for what happened at the Budget Bureau, and he indicated that the committee was interested not only to see how much of the savings were our own, but how much had been cut that should be restored.

I guess it is natural to ask the question how FAA can cope with further increases in workload with reduced appropriations and manpower. To put it another way, you might ask: Have you in your zeal to be efficient managers of public safety service risked too much? I

think we have to be completely candid and say we think it has been stretched taut but not beyond the limit.

As I told Mr. Jonas earlier, the principal cut at the Budget Bureau was in deferred facilities and equipment, deferred research and development, and there was a very small cut in the other accounts.

If there are more savings in this budget that we can find, we will realize them. Our President not only has us under that mandate, but has shown and performed a great record of achieving these economies, and we are working hard to provide them for him.

If we have been unrealistic in our economy, we will come back and advise this committee and tell you so, and we earnestly seek the respect of the committee. There are two principal reasons why it is possible to proceed prudently on this budget if you do not cut it any deeper than it has been cut.

First, we have been able to reduce significantly our request for facilities and equipment due to the substantial completion of funding of important elements of the air traffic control and navigation system. The funds you have provided the Agency during its first 5 years have enabled us to overcome much of the neglect of the 1950's. We have already completed the funding of the program for new buildings for air route traffic control centers. We have installed or funded a total of 890 VORTAC's and terminal VOR's to provide navigation assistance to aircraft using the Nation's airways. The installation of long-range radars has been substantially funded, and future costs should be largely limited to linkage tying additional radars to our centers.

We are also now essentially current in the installation of air traffic control towers, instrument landing systems, and approach light systems for those locations meeting high-activity criteria for these aids. Funds will be needed for these purposes only when additional locations become eligible as the result of growth in aviation activity.

There are still gaps in the total system which remain to be filled. We must continue to develop and install more efficient and reliable systems, such as those required to improve our landing capabilities under bad weather conditions. Our centers and certain of our towers urgently need automated systems for the display of radar data showing the location and altitude of aircraft.

ALPHA-NUMERIC RADAR BEACON

A significant portion of the facilities and equipment funds requested in this budget will be used to move ahead with the ground installations required for this important part of the national airspace system.

Mr. THOMAS. That is the $33 million item?

Mr. HALABY. Yes.

Mr. THOMAS. How far along will that $33 million carry you? How many of those instruments will it buy?

Mr. HALABY. These gadgets were developed with R. & D. funds totaling $200,000. They would be purchased by the aircraft owner and installed, first voluntarily and later mandatorily, for certain parts of the controlled airspace system. This would not, therefore, cost the Government, except in the fitting of military and other Government-owned aircraft.

The ground system——

Mr. THOMAS. You are making an expenditure on the ground system at your centers, though, are you not?

Mr. HALABY. Yes. The ground system to use this information by displaying it to the controller in order to enhance his safety assurance ability is the matter in this budget. This provides, first, for a system in Indianapolis——

Mr. DAVID THOMAS. In 10 centers.

Mr. HALABY (continuing). And nine other centers.

Mr. THOMAS. You have 24. So, it will cost about $75 million when you get through with it?

Mr. DAVID THOMAS. No, Mr. Chairman. The first portion of it covers the high altitude, which is the most densely traveled. Just for this portion, for the alpha numeric, for the radar beacon at high altitude, would run us close to $50 million by the time we have completed it.

(Off the record.)

Mr. HALABY. The $33 million, Mr. Chairman, would go into Leesburg, Cleveland, New York, Kansas City, Chicago, Atlanta, Jacksonville, Denver, Oakland, and Los Angeles. The total cost of that system that we showed you in there, where you build from the blip and the shrimp boat to the 4096 license plate identification to the altitude transmission to the computed flight path for the full system, is a complicated estimate, because we hope to reduce the total number of centers as we learn more how to automate this system.

(Off the record.)

Mr. HALABY. Our centers and towers urgently need automated systems for the display of radar data, as I said. We believe that through this equipment and semiautomation we can save jobs and money.

PRODUCTIVITY IMPROVEMENTS

The next reason the Agency expects to carry out its 1965 program with fewer positions than during the current year is largely attributable to the striking progress which the FAA has made in developing an effective management system, fostering cost-consciousness at every level, and improving the productivity of individual employees by motivation of the individual, by improved administrative processes, and by the provision of technical training and better equipment for the traffic controller and the maintenance technician.

I think this is a startling figure, Mr. Chairman. During the period 1961 through 1963, the productivity of both air traffic control and systems maintenance personnel improved about 8 percent and 4 percent, respectively. We are expecting to achieve an improvement of 10 percent in employee productivity in these activities during 1964 and 1965. We think that compares with some of the best productivity improvements in private industry. In fact, most of the companies in the Bell System have as their goal about this amount, and of course that is a semiautomated system. About 4 to 6 percent per year improvement in output per employee is their goal. This makes it possible for the Agency to ask for a lower total position level in spite of workload growth.

Mr. THOMAS. The nearest private industry to your business is the telephone business when it comes to repair and operation, is it not?

Mr. HALABY. Yes, sir.

Mr. THOMAS. You say you are approaching their figure on efficiency?

Mr. HALABY. Their published figure; yes, sir.

Mr. THOMAS. It appears to me that the area which perhaps offers to you the greatest opportunity for improvement is the installation and repair of equipment.

Mr. HALABY. The total personnel engaged in air traffic control and systems maintenance is about three-quarters of our total complement, so any positions or hours or dollars we can save there is a very important saving.

I think we should give credit particularly to Mr. Leng and his associates in getting this equipment at a lower price. In the past, we have overspecified some of our equipment by making it do too many things and under too many conditions. He and his associates and Mr. Thomas have been working on refined but simplified specifications. Mr. Shank advises me it looks as though he and these men have been able to produce an instrument landing system which a couple of years from now will cost $90,000 instead of $270,000. So, we are not just reducing the number of people; we are also reducing the price by more up-to-date specifications and engineering.

Mr. THOMAS. In going through your budget, have you clearly separated all your employment? Do you have your employment figures consolidated on maintenance, separated from purchasing, equipment, and so forth?

Mr. DEAN. We have done that this year for the first time.

STAFF AND SUPPORTING SERVICES BUDGET

Mr. OSTERTAG. Mr. Halaby I assume this is the appropriate place to raise a question with regard to your overall management service and other administrative departments where you show no decrease. Since you have had a reduction in the overall staff within the Agency, what about the proportionate decrease in such departments as management service?

Mr. HALABY. Mr. Ostertag, the people in the Agency ask me about that question, too, because I guess they feel maybe the reduction in operating people has been disproportionately larger than the staff people.

We have had a 3-percent reduction between fiscal 1964 and fiscal 1965, approximately 119 people. This is, I think, a worthwhile reduction, and I think it fair to say we are still working on it.

I shall ask Mr. Dean to comment further on that, since this is his area of the Agency.

REDUCTION IN POSITIONS

Mr. DEAN. Mr. Ostertag, as Mr. Halaby has pointed out, the total reduction in staff services is 119, of which 84 were in the management services area. This compares very favorably with the overall position decrease.

There is an increase in funds for management services purposes, but the great bulk of that is due to the cost of space, such as the Aviation Records Building at the Aeronautics Center, and the colocation of space in regions. These space costs are charged against support and overhead, but are not for personal services.

DEFINITION OF "STAFF SERVICES" AND "SUPPORTING SERVICES"

Mr. OSTERTAG. What is the ratio of staff-type personnel to operating personnel, and what is included in each category? You have partially answered that, I believe, but what is the ratio of staff personnel to operating personnel, and what is the difference?

Mr. DEAN. Mr. Ostertag, if you will look at page 105 of the summary book, the thin book, the very last sheet, it shows the activities of the Agency which are listed as "Staff services" and those that are indicated as "Supporting services," together with the total positions and total amounts of money being requested.

In answer to your question as to what is meant by "staff services," the term includes the overall central direction of the Agency such as the Administrator's Office and the regionl directors' offices under the heading "Executive Direction." It includes our island and station managers and certain area coordinators in the Agency who have an overall management responsibility. It includes our public affairs and internal information people. It includes a small staff concerned with congressional liaison, relationships with aviation organizations and aviation education. It includes management services, which covers the accounting, audit, central administrative services, management improvement, and general administrative staff activities.

It includes the personnel function other than technical training; the compliance and security function, which is concerned with loyalty, suitability, prevention of corruption, security of documents; our legal offices; the Office of Budget, which prepares these voluminous documents you have today; the international aviation affairs staff office, which gives assistance to the Administrator and to other Agency officials in international functions; a very small office engaged in the development of policy and economic studies; a small office appraising the total effectiveness of programs; and our regulatory council, which assists in regulatory functions.

RATIO OF STAFF AND SUPPORT TO TOTAL BUDGET

All of those important functions are listed under "Staff Services." Under "Staff Services" are about 6.8 percent of the Agency's positions, but the cost is only 3.91 percent of the obligations that the Agency is estimated to incur in 1965.

The reason here is that the average staff services salary tends to be somewhat lower than in other fields.

Mr. OSTERTAG. The ratio is about 5 to 1, is it not?

Mr. DEAN. No, sir. Taking all positions in the Agency, the ratio is 6 percent of Agency employment in 1965 for all of these purposes, and that 6 percent——

Mr. OSTERTAG. I mean the ratio between supporting and management services.

Mr. DEAN. Between total staff services and management services, about two-thirds would be management services.

Mr. OSTERTAG. I was going by the sheet, page 105, where your staff services show, for fiscal 1965, 2,902; as compared with supporting services of 587. Maybe I am on the wrong track on the difference.

Mr. DEAN. I misunderstood your question. Most of the 587 additional supporting services positions are for the maintenance of physical plants, such as the Aeronautical Center and NAFEC.

Mr. THOMAS. To get a clear picture of it, you will have to show three factors. One is location, how many you have in the District of Columbia. You have to divide it between your housekeeping activities and your staff people. Mr. Ostertag wants a breakdown of two of them.

Mr. OSTERTAG. First of all, what is the ratio of staff-type personnel to operating personnel? The figures on page 105 of the justifications do not disclose that. I gave a wrong comparison because I was going by the figures there. As I see it, that does not actually reflect staff as compared with operating personnel.

Mr. HALABY. Taking total number of personnel in the Agency, the staff personnel would be 6.8 percent; in other words, about 7 out of 100, against the total number of positions. Then of the total appropriation request, the cost of the staff services would be 3.9 percent.

Mr. OSTERTAG. What about the question of assignment to various operating services and the performance of tasks similar to those that are carried on in management service? Is there any picture you can disclose in that regard?

Mr. DEAN. Yes, sir. The Federal Aviation Agency, I think, is unusual in the degree to which it places in its staff and service officers the responsibility for the functions of the whole Agency. We are not, like many large agencies, divided into administrations or bureaus, each one of which has its own personnel office, accounting organization, legal staff, et cetera. When we talk about personnel offices in FAA, we are referring to those in regions, the centers, and the headquarters, all of which appear under staff support in our budget justification. There is only one General Counsel's Office for the Agency, with regional counsels under the regional director. They also all appear under staff and supporting services.

So, when we given you these statistics, both as to funds and as to positions, we are giving you a very complete picture of our staff and supporting activities. Obviously, there will be some people assisting operating managers who will be advising on personnel matters or advising on program needs, but there will not be accounting, personnel staff, or anything of that sort.

ASSUMPTION OF MILITARY FUNCTIONS

Mr. OSTERTAG. While we are on this subject, I have one more point that I would like to raise, Mr. Chairman. That has to do with military functions that formerly were performed by the military in this fiscal year, that you are taking over.

Can you show what the additional costs might be and what the picture really is? I assume that you have gradually moved into more and more responsibility for the military, and I think there is need for

separation and determination of what that cost and function might be.

Mr. HALABY. Yes, sir. I would like to get at that, because it is a very important issue.

Just in terms of going back a little over 5 years ago, when the Federal Aviation Act was passed and the Agency was set up, you remember it was no longer called the Civil Aeronautics Administration, but the Federal Aviation Agency, and provided for an integration of military flight control, navigation and communications, with civil. It did not provide for the full unification of them.

It also made specific provisions that there would be military personnel in FAA. In fact, the first Administrator was an Air Force lieutenant general. The personnel employed in the Agency reached a peak in January 1960 of 131, and it is now, in January 1964, 78 personnel. The Deputy Administrator is an active duty Air Force lieutenant general assigned by the Secretary of Defense with the approval of the President.

Over these 5 years there has been a gradual assumption of some of the military functions, navigation, communications, and traffic. For example, last year you funded us for the aircraft movement information service. As I remember, it was $3.2 million. You also provided $7.5 million in fiscal 1963 to take over flight inspection of all military and civil facilities here and at certain oversea military bases. We have taken over maintenance of certain military long-range radars, and that is in here for approximately $7 million, over $1 million for 12 of them in fiscal 1965.

We find that military flight information service of about $3 million is being performed by the FAA.

The total of all of these accounts that I have just given you is about $29 million since 1959. This is the annual amount for takeover of these functions.

Mr. OSTERTAG. You have told us there is an increase in that function and responsibility.

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. Can you give us an estimate of what the additional cost might be in this budget for this fiscal year with regard to the military responsibilities?

Mr. HALABY. I think it is fair to say of those total airways——

Mr. OSTERTAG. Do you separate it, in other words?

Mr. HALABY. We do not have a separate military budget. We have a table which I think we prepared for you for the first time last year, in which we show the civil-military distribution of the 1964 estimates, summary of all FAA appropriations. We break it down into three categories: Operations, fiscal 1965 estimate, $549 million, of which we attribute $139 million as the military share, approximately 25.4 percent in operations. In facilities and equipment, the total military share we believe to be about $18 million, which is 24.7 percent of the fiscal 1965 estimate of $75 million. On research and development we attribute $9 million to the military for 21 percent. This is an estimate of the share of the Agency effort which supports military and civil aviation. It is based upon the usage of our services and facilities by both civil and military.

Mr. OSTERTAG. I was thinking primarily in terms of operations and operating costs. Do you believe that this additional cost and re-

sponsibility you are assuming should normally be a reduction on the part of the military? Are these functions that they normally have performed?

Mr. HALABY. If we did not perform them as part of an integrated system and they had to perform them for themselves, we think this allocation is reasonable. Another way of saying it would be if you wished to say that about 20 to 25 percent of this budget was for national defense usage, it would be accurate.

Mr. THOMAS. Mr. Ostertag, the question that troubles me is, Does this complete your takeover of the military, so to speak?

Mr. HALABY. No.

Mr. THOMAS. How much more do you have?

Mr. HALABY. You have to look at all the things they do in comparable activities.

For example, each one of the SAC bases has a tower and has an approach and departure control.

Mr. THOMAS. But you are not going to get into the day-to-day and minute-to-minute operation of every plane they have?

Mr. HALABY. That is right. They have approach and departure and landing control.

Mr. THOMAS. Blending it into a single system, have you not gone just about as far as you can go?

Mr. HALABY. I would say under the present arrangements, policies, and realities of the situation, we are coming pretty close to that point.

Mr. THOMAS. Let us see exactly what you are doing. Three years ago you took over the inspection of all the installations, inspection from the air. Now you are operating some of their centers. You took over some of their personnel last year. It was about 340 of their personnel. You are using their equipment.

I had in mind a third thing that you are doing.

Mr. HALABY. In that same category, flying over their facilities and inspecting them.

Mr. THOMAS. Yes.

Mr. HALABY. We have joined with them at one site, at Great Falls, Mont.

Mr. THOMAS. That was last year.

Mr. HALABY. It was last fall. We took over the aircraft movement information service, which was a new item last year.

Mr. THOMAS. Have you any other steps or plans in view in the next year or the year after next?

Mr. HALABY. This year we are providing service, without any new equipment or people, for the interceptors from the Air Defense Command bases, which we were not doing in fiscal 1963. We have already set up the tower and approach and departure control at Andrews Air Force Base. There may be other bases where it would make sense on both operational and economic grounds to do so.

Mr. THOMAS. If you do that at all their big bases, you really have some more money coming to you, have you not?

Mr. HALABY. If the decision was made by the President, the Secretary of Defense, and FAA to go into a single system—for example, MATS bases but not SAC bases—that could be another step. The problem is that we find we would not save much money, and the military are very loathe to have civilian control.

Mr. THOMAS. Have you not gone about as far as you can go to preserve the individual service within the armed services, whether Army, Navy, or Air Force, to preserve their individual identity? As far as the general public is concerned, when you blend in all of their operations with a civilian operation, have you not just about done that?

Mr. HALABY. If you accept the present situation——

Mr. THOMAS. You have laid down flight standards. You say this type of plane, whether civilian or military, must fly at a certain altitude. You cannot duck in here and out of there without giving warning or maybe you cannot do it at all, whatever your rules and regulations are. You set certain rules. That just about covers it, does it not, unless you go in and take over the complete operation of every plane they have?

Mr. HALABY. There is a halfway house, and we are moving in the direction of what we call a joint surveillance system. In other words, we do not take over the control tower on the Offutt Air Force Base where SAC is based.

Mr. THOMAS. How many does the military have that you have not taken over?

Mr. DAVID THOMAS. I do not know, sir, but I guess 16,000 to 17,000.

Mr. OSTERTAG. Are you reimbursed in any way by the military for your services?

Mr. HALABY. No, sir. Under the act we are supposed to provide a common system, and they say: "You are just carrying out your responsibilities. You can attribute 24 percent of the cost to national defense, but we do not reimburse you for it."

Mr. THOMAS. Gentlemen, excuse us until 10 in the morning.

This has been very helpful.

WEDNESDAY, FEBRUARY 26, 1964.

Mr. EVINS. The committee will come to order.

We will be glad to have the Administrator proceed with his statement.

COST OF MILITARY SERVICES ASSUMED

Mr. HALABY. Yes, sir. I wanted to complete my answer to Mr. Ostertag's question of yesterday about the assumption of military services. Overnight, Mr. Ostertag, we prepared a list showing seven categories of military services assumed, beginning in fiscal year 1959, which was the first year of the FAA, and coming up through the present. That accumulative list shows that there are approximately 2,258 positions and $29.4 million in our present fiscal year 1965 estimate attributable to those services which have been assumed, and if the chairman wishes, I will put that, together with an explanatory note, in the record at this point.

Mr. OSTERTAG. I would so request.

Mr. EVINS. It may be included.

(The information follows:)

Fiscal year 1965 estimated cost of military services assumed beginning fiscal year 1959

	Positions	Amount
AMIS program (including $137,000 leased communications)	236	$2,522,000
Military flight service (including $112,000 service B communications)	379	3,018,000
Military approach control (18 facilities)	513	7,367,000
Maintenance assumption of military long-range radars (14 facilities)	686	7,464,000
Andrews AFB facilities	56	598,000
Height finder radar (5), including logistic support (ADC reduction program)	38	321,000
Flight inspection of military facilities	350	8,100,000
Total	2,258	29,390,000

FLIGHT SERVICES

At the time the military flight service program was transferred, savings were estimated at $1.5 million.

AMIS

AMIS positions were reduced by 106 because of:

(1) Center consolidation;
(2) Reduced overall workload;
(3) Integration of these functions with normal duties of controllers.

FLIGHT INSPECTION OF MILITARY FACILITIES

The initial budget estimate in fiscal year 1963 was $9.3 million. By integration of militray workload with normal FAA workload and by flying additional hours in DC–3 as opposed to T–29 aircraft, the total additional cost allocated to military facilities is now estimated at $8.1 million.

Comparable costs of maintenance of long-range radar, approach control, and other facilities transferred from the DOD, are not available.

Mr. OSTERTAG. It is not quite clear to what extent this is going to extend beyond present-day operations and services and it is not clear what the ultimate cost might be. Do you project that, Mr. Administrator, in your tabulation?

Mr. HALABY. First, if you go back 5½ years to the debate over the Federal Aviation Act, you find that there were some who favored a complete, unified, single system, and there were others who felt there should be a gradual integration into a common system and the act in section 103 states the policy of the United States with regard to the common system.

It says:

The Administrator shall consider the following, among other things, as being in the public interest.

(e) The development and operation of a common system of air traffic control and navigation for both military and civil aircraft—

and in other parts of the bill it states that, in section 307:

The Administrator is authorized and directed to develop plans for, formulate policy with respect to, the use of the navigable air space under such terms and conditions and limitations as he may deem necessary in order to assure the safety of aircraft, the efficient utilization of such airspace. He may modify or revoke such assignment when required in the public interest.

In 306 it said:

In exercising the authority granted in and discharging the duties imposed by, this act, the Administrator shall give full consideration to the requirements of national defense, and of commercial and general aviation, and to the public right of freedom of transit through the navigable airspace.

Then it makes some exceptions. Among others it says, in section 307(f):

When it is essential to the defense of the United States because of a military emergency or urgent military necessity, and when appropriate military authority so determines, and when prior notice thereof is given to the Administrator, such military authority may authorize deviation by military aircraft of the national defense forces of the United States from air traffic rules issued pursuant to this title. Such prior notice shall be given the Administrator at the earliest time practicable, the extent and circumstances permit.

CIVIL—MILITARY TRAFFIC CONTROL SYSTEMS

The first Administrator began working these matters out and I followed along and continued working them out with the military. At the present time we have two systems—I should say two programs of air navigation, communication and traffic control. One is the civil program which we administer and the other is the military.

There are some 13,000 military officers, enlisted men and civilians who man the towers, who maintain the facilities and the radars directly concerned with Air Force and Navy and Army navigation, communication and traffic control. They have thousands of facilities at military bases. For example——

Mr. OSTERTAG. Of their own?

Mr. HALABY (continuing). Of their own. Now, where the common system begins is in the common use of the airspace and in the joint use of certain equipment, such as radars. For example, the most nearly common single system is at Andrews Air Force Base, where we man the tower, the radar approach and departure control and it is literally a single unified system of air traffic control in the Washington area because all of the towers, all of the departures and approaches are under FAA control.

Another case would be in the use of a military radar. During the period 1959–65 we will have been maintaining 14 military long-range radars. In the 1965 estimates these will require 686 men and $7½ million to maintain those long-range radars.

Of course, we could have set up an FAA radar to cover the same sky but it did not make any sense to do so. By using these 14 military installations, we have saved a lot of money in procurement of radar.

Mr. OSTERTAG. I do not want to labor the question of the military relationship to FAA but we are concerned here with your requirements, your budget, and your appropriations. You are performing a service for another agency of Government and you are not reimbursed for that service. Therefore, the burden or the responsibility, costwise and otherwise, is reflected in your budget; is that true?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. The thought comes to my mind with regard to your communications systems, BUIC and SAGE and also the question of an emergency situation. If the chips are down will the military suddenly take from you that control or that jurisdiction?

Mr. HALABY. Under section 307(f) they have that authority and can advise me after the fact that they have had to on account of military reasons, urgent military necessity, as it said, to proceed, regardless of the rules.

I think a very significant trend is this: As you know, Secretary McNamara is closing, I believe, six of the SAGE centers and perhaps later he wil close more because the military threat is changing from predominantly a bomber, a massed bomber attack from the north to a missile and bomber attack. The SAGE system is of very little significance with respect to missile attack.

Mr. OSTERTAG. But you are in the same system now; aren't you?

COMMON SURVEILLANCE OF AIR SPACE

Mr. HALABY. We are, in this sense: That we have one joint location out in Great Falls on an experimental basis. We use the same radar antenna that give them data; and pipe it into our centers. But there is a trend developing in the air defense system where they are moving away from these large SAGE sector centers into a more decentralized backup, interceptor kind of situation. When that happens it may be that gradually they will have with us a kind of common or joint surveillance of everything that flies through the airspace and then they will have a separate fire control kind of system where they direct fighters and missiles to incoming enemy targets, so in answer to the chairman's question yesterday we have moved slowly in these seven categories toward integration of the military with the civil. It is far from a complete, unified system. The trend, however, is toward a common surveillance of the airspace, as the manned bomber threat dissipates and as a threat from excessive air congestion increases.

Mr. OSTERTAG. Some of these functions are strictly military and others are joint or a dual operation.

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. Are you able to separate cost between the two by virtue of what it actually costs you to perform this service for the military as against what it costs you to carry on otherwise?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. That is what your table shows.

Mr. HALABY. The table we just put in the record shows the cost of assuming certain services. Then the other table that we mentioned yesterday shows that about 21 to 26 percent, depending on the category of our appropriation, is attributable to military use of our system.

FUNDING RESPONSIBILITY FOR MILITARY FUNCTIONS

Mr. OSTERTAG. I have one more question. That is whether or not the cost for this service should be a responsibility of the military so far as the budget is concerned, with reimbursement to the FAA for whatever the exact amount might be.

In other words, you are assuming costs that belong to them. Has it ever been considered; has it ever been a matter of administrative concern?

Mr. HALABY. I think when the responsibility and the authority are separated from the funds, nothing but mischief ensues in the administration of a Government program. If we are held responsible for the

common system, as we are, then we must have the funds and the authority to carry out our safety responsibility.

Now it is true that when you go on the floor and explain the bill for air traffic control, you can very clearly, in my judgment, say that $150 to $200 million of this total budget is really for national defense. That is honest, accurate, and complete, and that the Congress in voting it has every right to recognize that, like in many other programs—atomic energy, foreign aid, many, many programs that are of a civil-military nature—there is a net addition to the national security budget. But I think it would be, at least from where I sit, more unwise to have them, and they would certainly consider this at the margin of this budget, have them request and defend the amount of money, some $170 or $180 million and then turn it over to another agency for administration. No agency, and in particular the military, likes to do things that way.

Mr. OSTERTAG. Well, there is a relationship with the military in the space field. There is a coordination or there is a transfer of funds to support it.

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. One agency performs the service for the other, that is the sort of thing I had in mind. I am thinking in terms of an expenditure for a service here that is reflected in your budget, which is being performed for another agency without their reimbursing you for the cost.

Mr. HALABY. That is right.

Mr. OSTERTAG. That is my only point.

Mr. HALABY. I understand.

Mr. OSTERTAG. I was wondering how you reacted to the idea.

Mr. HALABY. I think you should certainly allocate and attribute and show that some 25 percent of this airways budget of ours is for military uses.

Mr. OSTERTAG. I think it is important.

Mr. HALABY. Just like a substantial percent of the atomic energy program is attributable to defense.

Mr. OSTERTAG. I think it is important that we show, Mr. Administrator, that this entire cost and operation is not solely a civilian or a commercial cost or entirely the Federal Aviation Agency's responsibility in that you are performing the service for the military, and the funds are reflected in your budget.

Mr. HALABY. Yes, sir.

Mr. JONAS. Would the gentleman yield?

Mr. OSTERTAG. Surely.

JOINT USE FACILITIES OPERATED BY FAA

Mr. JONAS. Would you show in the record how many installations in the world are similar to the situation that exists at Andrews, where you have complete control?

Mr. HALABY. In the world?

Mr. JONAS. Yes. I do not mean identify them, but how many would you say, first in continental United States?

Mr. HALABY. In the continental United States it is the only one.

Mr. JONAS. It is the only one that you have complete control over use of airspace?

Mr. HALABY. Yes, sir; the airspace right over the runway and throughout.

Mr. OSTERTAG. Where it is exclusively military?

Mr. HALABY. Yes, sir. Of course, that is not exclusively military. As you probably know, it is one of the busiest airports in the world. It is predominantly military, but in addition to military flights there are a large number of flights of civilians. You, yourselves have flown in and out of there. The Presidential flights are in and out of there. There are logistical and commercial charter flights in and out of there and it is right next to two major civil airports and surrounded by several small civil airports, so it is quite a unique situation. That is why we have there the tower and the maintenance of the tower and the radar departure and approach control. That is why we have in our budget money for modernizing that tower. I think some of the legislators have been concerned that we would start doing that for all military bases. We certainly do not have that intention or appropriations for that purpose.

Mr. JONAS. How many airfields that are used commonly by civilian planes and the military do you have complete control over?

Mr. HALABY. There are quite a number of Air National Guard and Reserve unit fields.

Mr. JONAS. But there are none that are used at military bases other than Andrews where you have complete control?

Mr. HALABY. I would say that Mr. Thomas can supplement this.

Mr. DAVID THOMAS. There are some joint use, where the base is jointly used by the airlines and the military, like Charleston, S.C., which is a MATS base.

Mr. JONAS. That is used by the service.

Mr. DAVID THOMAS. They are jointly used.

Mr. HALABY. I think you are thinking of the combat units, aren't you, Mr. Jonas?

Mr. JONAS. I was just trying to get in the record how many installations that are used jointly by the military services, the regular services and civilians at which you have exclusive control, similar to the Andrews situation, although not exactly, because that is predominantly military.

Mr. DAVID THOMAS. Mr. Jonas, I think there are about 40 such locations, like Albuquerque, Kirtland Field, and the Charleston situation, where we do have joint use of an airbase, usually with military buildings on one side of the field and a civilian terminal on the other side.

Mr. JONAS. You control the tower?

Mr. DAVID THOMAS. In all such locations we control the civil tower, instrument landing system, and the radar where there are joint civil-military uses.

Andrews is the only situation where the principal use is military, where we exercise control.

Mr. JONAS. Thank you.

Mr. OSTERTAG. One more question: Do you have any conflict with the military over the fact that you regulate and control? Do they resist this layer of supervision over them?

Mr. HALABY. I think that resistance has diminished with time. In 1958, when there had been some military collisions with civil aircraft, and when the act was passed, I think there was a feeling of reluctance

or opposition. I think it has diminished with time and I think that, as the chairman pointed out yesterday, we have reached the point where any further integration would come very hard and would have to be based upon proof that there were operational advantages, that there were economies, and that those controlling military traffic on a military base were subject to courts-martial.

Mr. JONAS. Would you yield again?

Mr. OSTERTAG. Surely.

PARACHUTISTS ACCIDENT AT FORT BRAGG

Mr. JONAS. Do you have any information about what happened at Bragg yesterday when four parachutists were killed by a plane flying through them while they were parachuting?

Mr. HALABY. That was strictly a military operation and I have no more knowledge, sir, than the newspaper report. I would undertake to get from the military a report and give it to the committee tomorrow if that was your desire.

Mr. JONAS. I am interested, not as a member of the committee, but as a citizen.

Mr. OSTERTAG. Do you investigate?

Mr. HALABY. No, sir.

Mr. JONAS. I cannot imagine any more tragic thing happening than for a plane being allowed to fly through a bunch of soldiers parachuting and cutting them to pieces.

Somebody should have had some control over that airplane.

Mr. OSTERTAG. Where is the lack of control in a case like that?

Mr. HALABY. In those training and field exercises of the military, they exercise complete local control and we have no responsibility. I might say that during the past couple of years we have, for the first time, promulgated regulations regarding civil parachuting in relation to the airspace and, as you know, this sport of sky diving has become more and more prevalent, so we are having more difficulty. Fortunately, to my knowledge, we have not yet had a collision between a civil aircraft and a civil parachutist.

Mr. JONAS. If it is not too much trouble for you, I would like to have a report.

Mr. HALABY. Yes, sir.

Mr. EVINS. Your civil record is very good in this regard, then.

Mr. HALABY. So far as I know.

Mr. DAVID THOMAS. We have had no real problems.

Mr. HALABY. We have had no accidents.

Mr. DAVID THOMAS. We have had a few complaints. We have had a few people jump in violation where they shouldn't, but we have had no accidents.

MILITARY VIOLATION OF FEDERAL AIR REGULATIONS

Mr. HALABY. Where there is a violation of the Federal air regulations by the military, as there were in 1962, 162 reported in 1962 and 91 recorded in 1963, we make the case, verify the evidence, and present it to the military commander as required by the Federal Aviation Act and he takes action on it within his command.

Mr. OSTERTAG. That is a thought that disturbed me. Despite the fact that you have jurisdiction, regulation, and controls, there is a difference between other operations and military operation and if the military violate and do not adhere to the regulations or to the controls, what can you do about it?

You have means of taking action against other than military but what steps can you take with the military?

Mr. HALABY. In the course of a violation—that is, while it is going on—we can guide and direct the individual pilots involved. For example, if in an almost unbelievable case where a military pilot would refuse to accept vector from an air traffic controller, we would, of course, vector the other aircraft. In our work in separating aircraft in avoiding collisions, we always have two aircraft involved.

After the event we simply get all of the evidence together and must rely upon his military superiors to take action. There have been very, very few violations, and I don't think there is much evidence of defiance or contemptuous activity. It is more often human mistakes and accidental misunderstandings than any kind of military active resistance. On the other hand, in these pilot reports of near midair collisions over the last period—for example, in fiscal years 1963 and 1964, we find that the reports of near midair collisions are more than a third involving military aircraft, more than a third of the total number of reported near midair collisions, involve military aircraft.

Mr. DAVID THOMAS. Yes, sir; I think it might be helpful if we would also point out that many of these military maneuvers, which are unusual, such as intercepting aircraft, or parachute jumping, or assault, or actual gunnery, divebombing, and many other maneuvers that they must practice, we provide for restricted airspace to protect that operation from other civilian and military operations. I believe such was the case at Fort Bragg yesterday, that they were actually doing maneuvers within airspace protected from other aircraft going through.

Mr. EVINS. In any event, all of these matters are spelled out by the statute. They have been rather well firmed up and agreed upon over the years. The FAA issues the regulations. When violations occur, the Department of Defense is notified. They, in turn, take action. Is that about the summation?

Mr. HALABY. Yes, sir.

PERCENTAGE OF BUDGET RELATED TO MILITARY OPERATIONS

Mr. EVINS. With respect to this budget you have said several times that 22 to 25 percent of the cost should be attributable to military operations or defense purposes?

Mr. HALABY. Yes, sir.

Mr. EVINS. Would you spell that out again, dollarwise?

Mr. HALABY. We take three categories—operations, facilities and equipment, research and development, and the percentages are 25.4 percent, 24.7 percent, 21.2 percent, respectively, and the total amounts are $140 million, $19 million, $9 million, respectively. It rounds off at about $168 million.

Mr. EVINS. About $168 million, total?

Mr. HALABY. Yes, sir.

Mr. EVINS. Attributable to defense support or national defense?

Mr. HALABY. The usage of our system.

Of course, you know that we would completely go under the Secretary of Defense in wartime, and there as a potential military usage, we are potentially, almost 100 percent.

Mr. OSTERTAG. You do remain a civilian agency, but you would be subject to their direction?

Mr. HALABY. Yes, sir.

STATUS OF INTEGRATION WITH MILITARY SYSTEM

Mr. EVINS. There exists a fine spirit of cooperation and working together at the present time. You state that you have just about reached the maximum of your integration of these control operations?

Mr. HALABY. On the present system in the present operations. In the future it will work over into the area of a common system of surveillance, as I see it. Maybe you will—ultimately someday, all of facilities might be maintained and most of them manned.

I think this has brought out a very important point, Mr. Chairman, because I think there are still some Congressmen who feel they turned over the whole thing to the FAA in 1958, and they didn't. I think this is the impression held by quite a few members and others.

Mr. EVINS. Before we continue, Mr. Administrator, if you have not already done so, will you supply a table showing the numbers of operations that FAA controls exclusively, those that you control in conjunction with the Department of Defense or some other category if required? We will have the numbers, not necessarily the amounts of money or the numbers of personnel, but the numbers of stations individually maintained and in cooperation with the Defense. We will have this for the record?

Mr. HALABY. Yes, sir.

(The information supplied follows:)

Air traffic control tower services

	Number of towers	Total operations, fiscal year 1963		
		Total	Military	Civil
		Thousands	*Thousands*	*Thousands*
Towers operated by Federal Aviation Agency	[1] 273	29,104.6	3,685.3	25,419.3
Towers operated by military (worldwide):				
Air Force	190	12,067.8	11,342.7	725.1
Army	133	4,511.8	4,141.4	370.4
Navy	84	7,285.3	6,926.5	358.8
Subtotal	407	23,864.9	22,410.6	1,454.3
Total	680	52,969.5	26,095.9	26,873.6

[1] Includes 12 towers located on Air Force bases and 84 towers at civil airports with military operations, Reserve training, or other such activity thereon.

Mr. EVINS. Did you wish to continue further your statement or to highlight some of it, or discuss some of the big problems with which your Agency is confronted?

Mr. OSTERTAG. Off the record.

(Discussion off the record.)

General Statement of Mr. Halaby

Mr. Evins. Can you summarize or highlight the remaining portions of your statement and include it all in the record?

(The prepared statement follows:)

Statement by Mr. Najeeb E. Halaby, Administrator, Federal Aviation Agency

I am happy to appear again before the Committee on Independent Offices, this time to present the budgetary requirements of the Federal Aviation Agency for the 1965 fiscal year. This is the fourth time that I have been privileged to present our estimates. It is of particular meaning this year since the President's budget is the tightest and tautest budget ever presented by the FAA, calling as it does for a reduction in both positions and new obligational authority. This means that the assurances which I have previously given the committee that the Agency's growth would level off have in fact been realized and documented in cold print.

You will recall that when I appeared before you in defense of our 1962 fiscal year appropriations we requested 2,629 additional positions. In 1963 we sought an additional 3,998 positions. By last year we had substantially checked the Agency's rate of growth, but we still requested an additional 1,030 positions. For 1965 the Agency not only plans to meet its obligations to the public and the aviation community without additional employees, but it is in fact proposing 754 positions fewer than authorized for the current fiscal year.

The Agency has been most appreciative of the support which the Congress has given to its programs since its establishment in 1958. We have, therefore, felt a special obligation to hold positions and expenditures to lower levels than those approved by the Congress, if any means to do so could be found. Although the Agency continued to grow during the 1962–64 period, fewer employees were added in those 3 years combined than in the 1961 fiscal year alone.

The effect of Federal pay increases and the need to maintain and operate additional facilities scheduled for commissioning during the 1965 fiscal year has made it extremely difficult to reduce our total funding needs. We have, however, asked for total appropriations of $15 million less than approved by the Congress for the 1964 fiscal year, for comparable appropriations.

We are thus coming before the Congress asking for fewer positions and less money in the face of a continued steady growth in aviation. During the 1963 calendar year total operations handled by FAA air traffic control towers increased 7 percent, instrument operations increased 3 percent, revenue-passenger-miles increased about 6 percent, and jet fuel consumption increased 20 percent. Our forecasts for 1964 and 1965 indicate a continued growth in virtually every aspect of aviation.

The question will naturally arise as to how FAA can cope with further increases in workload with reduced appropriations and manpower. Or, to put it another way, you might ask have you in your zeal to be efficient managers of public safety service risked too much? We think we have stretched it taut, but not beyond the limit. If there are more savings we will realize them. If we have been unrealistic in our economy, we will come back and advise this committee whose respect and confidence we earnestly seek. There are two principal reasons why it is possible to proceed prudently on this budget if you do not cut it any deeper.

COMPLETION OF FUNDING OF MAJOR INSTALLATION PROGRAMS

We have been able to reduce significantly our request for facilities and equipment due to the substantial completion of funding of important elements of the air traffic control and navigation system. The funds you have provided the Agency during its first 5 years have enabled us to overcome much of the neglect of the 1950's. We have already completed the funding of the program for new buildings for air route traffic control centers. We have installed or funded a total of 890 VORTAC's and terminal VOR's to provide navigation assistance to aircraft using the Nation's airways. The installation of long-range radars has been substantially funded, and future costs should be largely limited to linkage tying additional radars to our centers. We are also now essentially current in the installation of air traffic control towers, instrument landing systems, and approach light systems for those locations meeting high-activity criteria for

these aids. Funds will be needed for these purposes only when additional locations become eligible as the result of growth in aviation activity.

There are still gaps in the total system which remain to be filled. We must continue to develop and install more efficient and reliable systems such as those required to improve our landing capabilities under bad weather conditions. Our centers and certain of our towers urgently need automated systems for the display of radar data showing the location and altitude of aircraft. A significant portion of the facilities and equipment funds requested in this budget will be used to move ahead with the ground installations required for this important part of the national airspace system.

IMPROVEMENTS IN MANAGEMENT AND PRODUCTIVITY

The fact that the Agency expects to carry out its 1965 program with fewer positions than during the current year is largely attributable to the striking progress which the FAA has made in developing an effective management system, fostering cost consciousness at every level, and improving the productivity of individual employees by motivation of the individual, by improved administrative processes, and by the provision of technical training and better equipment for the traffic controller and the maintenance technician. During the period 1961 through 1963, the productivity of both air traffic control and systems maintenance personnel improved about 8 and 4 percent, respectively. We are expecting to achieve an improvement of 10 percent in employee productivity in these activities during the 2-year period, 1964 and 1965. It is the projection of these improvements in output per employee which makes it possible for the Agency to ask for a lower total position level in spite of workload growth.

Many of the positions to be eliminated during fiscal year 1965 are now filled by well-trained, competent people who represent our most valuable asset. To the fullest extent possible, we will reassign rather than eliminate competent employees, and thus avoid losing our investment in their training and experience which averages about $15,000 per technician. To the extent it is economical and in the public interest, these employees will be offered retraining, reassignment, and relocation to jobs where they can continue to make important contributions.

We have also been able to achieve additional savings by a number of specific reforms in our management and in our way of carrying on Agency activities. I should like to cite a number of the more successful efforts to conserve public funds which are reflected in the estimates before you.

(*a*) During the fiscal year 1964 our decentralization had progressed to the point where we were able to reduce our Washington headquarters staffing by 610 jobs, or aproximately 16 percent. The reduction was accomplished without increasing the number of regional personnel and will save the Agency about $5 million during the 1965 fiscal year. This saving reflected in this budget was a direct result of the improved efficiency resulting from placing in our regions operational authority formerly exercised in the headquarters.

(*b*) We have recently strengthened the management of the National Aviation Facilities Experimental Center at Atlantic City, N.J., and have instituted new staffing authorizations which produced substantial savings in manpower. The result has been a reduction of 248 in authorized personnel strength and an annual saving of $2.5 million per year.

(*c*) During fiscal year 1963 we combined our long-haul technical communications with those of the Department of Defense. These "telepak" arrangements have resulted in savings to the FAA of more than $6 million with further economies accruing to the Department of Defense.

(*d*) Several years ago the Agency was operating more than 460 flight service stations. Improvements in communications and technology have made it possible to reduce progressively the number of such facilities until there remained 335 at the end of the 1963 fiscal year. In the hearings on our 1964 estimates we stated our belief that there were opportunities to save money by further consolidations of flight service stations. In the report on the 1964 independent offices bill, your committee wisely asked that we take a further look at the number and cost of such stations. The Senate committee subsequently agreed with the House, and urged the reduction and consolidation of manned stations. We have done this and have recently announced plans to convert another 42 stations to an unmanned basis by placing them under the remote control of stations in other locations. These consolidations will reduce our requirements by 162 positions, of which

about 50 will be saved late in the 1965 fiscal year. Additional remotings and relocations will be announced in the future.

(c) Revisions in our supply and support system have eliminated centralized storage and redistribution operations for Alaska and Hawaii and have reduced inventory requirements for our aircraft maintenance bases. These improvements have produced savings of more than $900,000 in inventory stocks and about $300,000 annually in personnel, transportation, and storage costs.

The productivity improvements and the specific economy measures which I have described above are a tribute to the dedication of the employees of the Agency and their supervisors to the President's philosophy of frugality in Government. The FAA will always seek the funds required to render essential services to aviation and to buy and install the modern equipment required for the safe and efficient control of today's aircraft. We shall, however, continue every effort to make certain that no dollar is wasted and that the largest measure of benefit is realized from the resources entrusted to our care. The productivity improvements which we expect to achieve over the next 18 months will not be easily realized. We might even be asked if we should take the risk of asking the Congress for fewer positions than we now have authorized. My answer is that the record of the past 3 years shows what the Agency can do through improved management. We are convinced that what is necessary and urgent can be achieved within the limits of the estimates presented by the President. We hope and pray you will reward our thrift and candor with the full allowance of our request.

It is clear, however, that what the President's budget calls for is a minimum adequate figure both in terms of positions and money. Within the amounts requested, the Agency will be presented with a challenge, but one we will strive to meet. Any lower level would seriously jeopardize essential services by imposing on the Agency a requirement for productivity improvement beyond that which can reasonably be expected under even the most frugal and determined management.

I also wish to again remind the committee that the services rendered by the Agency are essential not only to civil aviation but also to the national defense. I should like to stress again the close relationship between the FAA and the military services. Almost a third of our traffic control effort is devoted to military flying. We are jointly sharing the output of more than 50 long-range radars. We are working closely with them in the procurement of communications lines to obtain the greatest operational flexibility at the most favorable possible rates for such services. By utilizing to the fullest extent possible the same air traffic control and navigation systems for both civil and military purposes we gain the utmost in total safety as well as higher cost efficiency.

Turning to the details of the estimates for 1965, we are requesting appropriations of $758.2 million as compared to $773.3 million authorized in 1964 for the same appropriations. The 1965 figures include the proposed supplemental of $75 million for grants-in-aid for airports. The comparisons exclude any provision for civil supersonic aircraft development in either year. Also included in 1965 is $7 million to complete the liquidation of contract authorization provided under prior Federal airport acts.

Agency position totals also show a decrease—46,357 positions for 1965 compared to the 47,111 authorized for 1964. Although the total budget reflects these decreases, provision is made for the operation and maintenance of new air traffic control and air navigation facilities authorized under "Facilities and equipment" appropriations of prior years and provides additional funds for employee pay increases authorized for 6 months only in the fiscal year 1964.

OPERATIONS

The estimate includes $549 million for the "Operations" appropriation, which includes the cost of the continuing programs of the Agency as well as the program direction and administrative support costs of the Federal airport program, the facilities and equipment program, and the research and development program. The 1965 estimate is $21 million higher than the 1964 appropriation. This increase is partly attributable to the expenses associated with the expected commissioning of facilities now being constructed under prior years' appropriations for facilities and equipment and partly to meet the costs of the January 1, 1964, pay increases authorized by the Salary Reform Act of 1962, and other salary adjustments made pursuant to law. Included are the funds needed to finance within-grade promotions and certain changes in the classification of air traffic

control positions, primarily to reflect the higher level of traffic being handled by our air traffic control centers and our busier towers.

The cost of operating and maintaining the new facilities added to the air traffic control and navigation system is substantial. Many new equipments and installations are being installed from funds appropriated in 1964 and prior fiscal years. As they are readied for use the Agency must provide for their operation and maintenance, for essential supplies, and for utilities. These unavoidable expenses must be met if new facilities are to be commissioned. The feeling of the committee against requesting funds for annualizing the costs for new facilities is recognized and respected and we are requesting no additional funds for this purpose. We are making offsetting reductions to compensate for the continuing costs of the added facilities. While it is true that outmoded or unnecessary facilities are constantly being removed from the system, it is doubtful if the savings from decommissioned facilities will ever offset the cost of new additions to the system due to the increasing complexity of new equipments. Therefore, we are striving to minimize increasing costs by every economy measure we can devise consistent with the maintenance of an adequate level of safety and efficiency in aviation.

We have the responsibility for reliability of 24-hour service and the potential liability that goes with such responsibility. At yearend 1963 we had 371 suits pending against the Government for total claimed liability of $153.6 million. Since we were last before your committee, about half (57) of the suits arising out of the 1960 New York midair collision have been settled, but the remainder (52) involve substantial exposure from this one accident wherein the Civil Aeronautics Board found the probable cause did not rest upon FAA but with the operation of the aircraft. Unless we advance our system of safety with improved personnel and modern equipment our liability in such cases can be enormous.

FACILITIES AND EQUIPMENT

We are requesting $75 million for the facilities and equipment appropriation, which is $25.2 million less than the amount appropriated for fiscal year 1964.

The bulk of this appropriation—$65.5 million—is for the procurement and installation of new equipment required for the improved utilization of the national airspace. The largest single item is $40 million for equipment that will electronically display the identification and altitude of aircraft on radarscopes used by traffic controllers. This is a major step in the installation of the equipment called for by the Project Beacon report of 3 years ago. By the use of this equipment we expect to improve significantly the effectiveness, safety, and reliability of the air traffic control system.

Approximately $2 million is included in the estimate for the purchase of light, twine-engine aircraft and to buy equipment used in the conduct of facility flight inspections. Another $7.5 million will finance the second stage of the modernization of the National Aviation Facilities Experimental Center. Last year the Congress approved $5 million to permit the Agency to initiate a program for the replacement of inadequate facilities constructed more than 20 years ago.

As I indicated earlier in my statement, we have been able to achieve a significant reduction in the level of this appropriation in 1965, first, by a reevaluation of projects previously approved and, second, through completing the funding of certain major portions of the air traffic control and navigation system. Whether this lower level of apropriation will suffice in future years is doubtful, but the actual requirements in the years to come will depend heavily upon the progress made in the research and development aimed at the increased automation of the air traffic control system and other improvements. The $65.5 million requested for air navigation and traffic control equipment amounts to only about 5 percent of the value of assets in place in the national airspace system, and this seems to me a most conservative level considering the rapid change in aviation technology.

RESEARCH AND DEVELOPMENT

The estimate includes $42 million for the research and development appropriation, an increase of $2 million over the amount appropriated for the fiscal year 1964. The Federal Aviation Agency must engage in research and development activities since aviation is a dynamic industry largely dependent upon advances in technology. FAA is responsible for the national air navigation and traffic control system and as such the Agency is charged with the efficient operation of this system and the assurance of safety in flight. We are obligated, therefore, to

assure that our system keeps pace with the national defense requirements, the aviation industry, and the state of the art. We must assure ourselves that the aircraft, the men who fly them, and the operators of the airspace system meet the standards set by the Congress, the Federal Aviation Act and regulations.

As in the past, more than half of the total amount requested will be directed toward projects designed to improve the air traffic control system. As indicated in the preceding discussion of the facilities and equipment program, the successful development of electronic equipment under the research and development program has paved the way for a major step in the implementation of a more effective and efficient airspace system.

Future efforts will be devoted to developing equipment needed to permit more flexibility in the display of radar information, the automatic prediction of conflicts in flight paths, and the performance of other services designed to relieve the individual traffic controllers of manual computation and leave them more time to make the critical decisions which cannot be done by machines.

More effort will be directed to the development of equipment which will permit landings and takeoffs under near zero visibility conditions at major airports throughout the Nation. Other projects will be aimed at the development of lower cost landing aids for smaller airports and improvements in the accuracy of existing instrument landing system components. Success in these projects will not only significantly improve the reliability of aircraft schedules and eliminate many costly flight postponements, cancellations, and reroutings due to weather, but will increase safety under all bad weather conditions.

About $1.5 million is requested for research in communications and display techniques for weather information needed by the air traffic control system. The estimates also include $5 million for an aircraft safety program. This program will point the way to improved safety standards of aircraft construction and operation, as well as to new developments in vehicles and components. This program includes efforts in fire prevention, crash impact survival, improved noise criteria, and lightning protection. The $1.8 million for aviation medicine will finance exactly the same number of employees approved for the 1964 program and will support long-term projects begun in prior years.

The total research and development appropriation amounts to less than 6 percent of our budget estimate, and is less than 4 percent of the value of the capital plant operated by the FAA. We are convinced that the appropriation requested is the minimum research and development level required to keep the airspace system and aviation safety abreast of the needs of an expanding industry. The level of effort appears reasonable in comparison with amounts expended by industrial ventures engaged in expanding technological fields.

GRANTS-IN-AID FOR AIRPORTS

Because the Congress has not completed action on legislation extending the Federal Airport Act, as amended, no funds have been requested at this time for grants-in-aid projects for the fiscal year 1965. As indicated in the President's budget a request for funds for both the 1965 and 1966 fiscal years will be forwarded upon passage of the pending bill, thus preserving the forward-funding principle established by the Congress in 1963. We are requesting $7 million to complete the liquidation of obligations incurred under the contract authority authorized for the grants-in-aid program through the 1962 fiscal year. This money will thus be used to pay bills which constitute legal obligations for the Government.

OPERATION AND MAINTENANCE, NATIONAL CAPITAL AIRPORTS

The estimate includes $3,631,000 for "Operation and maintenance, Washington National Airport"; and $4,619,000 for "Operation and maintenance, Dulles International Airport." The estimates for WNA would provide for the operation of a new sewage pretreatment plant and a new centerline lighting installation on the major north/south runway. An additional 29 positions are included for DIA, principally for maintenance and operation of new buildings and for services being conducted for the first time in fiscal year 1965. In addition, the completion of DIA and its becoming fully operational requires a shift in the allocation of costs of consolidated functions between the WNA and DIA appropriations. A corresponding shift of funds is reflected in the estimates. These functions include overall airport direction, accounting, payroll, procurement, engineering, and other services performed on a common basis for both airports in the interest of economy and efficiency.

CONSTRUCTION, NATIONAL CAPITAL AIRPORTS

The budget provides $1,800,000 for the replacement of hangar No. 10 at WNA. The old hangar is designed in such a way that its usefulness in handling modern aircraft is limited, with the result that its earning capacity is sharply limited. The new hangar will be self-supporting over its useful life and will produce a net revenue to the Government. An additional $200,000 is being requested for financing improvements at DIA of internal roads used for emergency vehicles, snow removal, police patrol, and similar purposes. Present unfinished roads need a hard, all-weather surface for proper utilization.

CIVIL SUPERSONIC AIRCRAFT DEVELOPMENT

In accordance with the plan previously discussed with the committee for the development of a civil supersonic aircraft, no funds have been requested for fiscal year 1965, pending completion of the detail design phase. We are now evaluating design proposals from three airframe manufacturers and three engine manufacturers. If the results are sufficiently promising, we expect to let contracts for a detail design competition in accordance with the schedule previously established. These contracts would be financed by the $60 million appropriated for this purpose for the current fiscal year. The timing and amount of the next appropriation and, indeed, the necessity for the next appropriation, will be determined on the basis of the design evaluation and the outcome of the detail design studies. We do not foresee a need for additional appropriations during this session of Congress, assuming that, if necessary, very early action by Congress can be accomplished next session.

USER CHARGES

The President has again recommended legislation to require the users of the airspace to pay a larger share of the cost of the Government's aviation programs. The proposed taxes on air freight, passenger tickets, gasoline, and kerosene used in aviation would recover approximately one-third of the total cost of operating the airways. If the cost of services to the military departments is eliminated from the calculation, the user charges recommended by the President would bring in revenues approximating one-half the cost of air traffic control and airways services. As in the past, we strongly support this legislation and believe it is a good principle that the direct beneficiaries of special services should pay a larger share than the general taxpayers.

SUMMARY

Last November 1, the FAA observed its fifth anniversary; 5 years after the Congress established the Agency at a time which might have become—had you not acted so decisively—a full crisis in air transportation. These were five "high boost" building years; expensive, sometimes contentious, but productive years. There was nearly a decade of technological foot dragging on modernization of the Nation's airways to make up for, while at the same time, trying to keep ahead of the jets, which were then beginning to streak the high altitudes.

With the money and men you made available to us during this building period, we have very nearly completed the foundation—the centers, towers, long-range radars, the navigation and communications subsystems—the expensive base of the national airspace system. The men, and women, who came to us in great numbers in those years have matured in their technical skill, their management capacity and philosophy, their determination to use intelligently, and in the broadest public interest, the resources entrusted to them.

The tense, catchup, hurry-up days are mostly behind us. Safety and traffic volume records for the last 3 years show that the threat of full crisis is abating somewhat too. We are moving steadily into the Agency's next stage of development—getting set for the long pull. It is this that permits us for the first time to come before you and ask for less in both money and men than we asked the year before.

Perhaps it can be thought of as the beginning of a jet flight. Five years ago it was like a jet thundering down the runway, full throttle, everything pulling to get airborne. We got off because you gave us what we needed.

Up came the landing gear, the flaps. The jet was steadier, stronger on its wings. We swung around to our true course and kept climbing on out.

The Agency still has a long way to go in this era of changing traffic and technology, but we're now able to throttle back, conserve fuel, to travel fast and far, and at peak efficiency. The budget request before you reflects what has been accomplished in 5 years, our position now, and what we believe we must have for the job ahead. It reflects careful study and precise setting of the controls—as lean as we think we can pull it and still stay on course, and on time.

Mr. HALABY. I will try to hit the highlights. That will enable you to get to your questions as soon as you wish.

We have an investment of about $15,000 per technician in our people and after 5 years, I think it is fair to say that the Agency thinks that these individual men and women who have been trained and motivated and are learning more and more about management and how to be managed, and, in particular, getting some ideas about cost consciousness and output per day per man, are the real heart and guts of the agency.

REDUCTION IN WASHINGTON HEADQUARTERS STAFFING

As we told you, during the fiscal year our decentralization had progressed to the point where we were able to reduce our Washington headquarters staffing by 610 jobs, or approximately 16 percent. This reduction was accomplished without increasing the number of regional personnel and will save the Agency about $5 million during the 1965 fiscal year.

Mr. JONAS. May I interrupt there?

Mr. HALABY. Yes, sir.

Mr. JONAS. Did you do that by attrition, or did you actually let anybody go?

Mr. HALABY. I was just coming to that, sir.

Mr. JONAS. I beg your pardon.

Mr. HALABY. We did it by combination but the largest bulk of the induction was by transferring Washington headquarters people into regional and field facility vacancies so that the total number of positions eliminated was 610 and the total number of people actually eliminated was much smaller because many of them took the jobs in the field.

Some of them refused the jobs in the field and went with other agencies and finally there was some retirement and transfer elsewhere.

PERSONNEL TURNOVER

Mr. JONAS. What is your turnover rate agencywide?

Mr. HALABY. Our turnover rate agencywide I guess is about the lowest in the Government. It is about 9 percent.

Mr. JONAS. We had an agency in here the other day who claimed to have the record on that.

Mr. EVINS. I believe you refer to the Selective Service System.

Mr. JONAS. Government-wide the rate is about 14 percent.

Mr. HALABY. Maybe I should say, the lowest for a large agency.

Mr. JONAS. Government-wide the rate is about 14 percent this year. Last year it was 16 percent.

Mr. OSTERTAG. That is right.

Mr. HALABY. We have the lowest rate for a large agency. I have a table that the Assistant Administrator for Personnel and Training has worked up that shows that for Government-wide it is 20.6 percent for

fiscal year 1963 and for our agencywide it is 9.1 percent. In some categories we are down to——

Mr. JONAS. That 20-percent rate is the highest rate we have heard stated in here. The Civil Service people told us it was about 14.

Mr. OSTERTAG. What does this transfer have to do with your training program? Doesn't that reduce your training requirements?

Mr. HALABY. The reduction of personnel generally has the effect of having fewer people to be trained, but the technological changes in the system, with more radars, more computers, more displays, require the people in the work force to be retrained and their training upgraded.

I wanted to just mention a couple of other turnover rates, Mr. Jonas. For example, in the field of electronic technicians the turnover rate is 3.6. In the aircraft operations it is 2.2.

Among our flight standards inspectors it is 2.4. Among all air traffic controllers it is 3.7.

Of course, part of this is that this is a kind of work——

Mr. JONAS. You are not competing with industry?

Mr. HALABY. Yes, sir. It is highly specialized.

Mr. JONAS. And the salary scale is higher on the average?

Mr. HALABY. It is higher than the military and since there isn't anything to compare with in civil, that accounts for that very low turnover.

I won't claim it is entirely because we have better management or better morale or you have given them adequate appropriations——

Mr. EVINS. Proceed, Mr. Chairman.

SAVINGS BY REDUCTIONS IN POSITIONS

Mr. HALABY. I think those factors bear upon it, so in explaining to you that we have achieved this 16-percent reduction in headquarters positions, I also wanted to point out that we accomplished it in a rather unique way. We did not have to go to the ruthless and arbitrary reduction in force whereby people are just separated willy-nilly, despite their great capacity for particular work. We also avoided the use of this technique with regard to our center consolidation program in which a total of 700 positions was involved, and that is, of course, a continuing program.

We have reduced the authorized personnel strength at the Atlantic City Experimental Center by 248 and saved $2½ million per year there. Largely through the efforts of General Grant and Mr. Dean and Mr. Provan we thought up the idea and worked it out with Defense to combine our long-haul technical communications, the communications with our centers and towers and radar facilities and by telpaking, we have achieved with Defense $6 million of savings and, of course, the telephone company is that much lighter, you might say.

CURRENT EMPLOYMENT LEVEL

Mr. EVINS. Do you want to give us one wrap-up figure of the actual number of fewer on board than you had at this time last year?

You have had some transfers and reassignments. You have created some new jobs. Some people have resigned. Others have retired. Can you give us a wrap-up figure as to the number of employees less this year than last year in all of your operations?

Mr. HALABY. The number of bodies since a year ago is higher at the present time because you authorized additional personnel to man the incoming new facilities.

Now, what are the figures? From June 30, last year, we are down from 44,447 to 44,223 in full-time employees. The figure for February 1963 was 43,905.

Mr. EVINS. You say there is a 754 reduction in positions.

Is that really an accurate picture of the situation?

Mr. HALABY. We are talking about fiscal year 1965, positions appropriated for, 754.

You asked for how many people actually were on board.

Mr. EVINS. What is the number of positions reduced?

Mr. HALABY. Let me give you two figures, sir. One, the number of actual full-time employees, June 30, 1963, 44,447; the number of employees actually employed by FAA on January 31, 1964, 44,223, a decrease of 224.

The number of full-time positions authorized and programed for those same dates, June 30, 1963, 45,935 and 46,600 as of January 1964.

Now, we were going on to projections of the yearend 1964 to some 47,111. We are now stabilizing at the figure in this budget, which is 754 positions less than you authorized for 1964. Those are full-time positions.

Mr. JONAS. That is less than 45,945?

Mr. HALABY. No, sir. That is 754 less than authorized for 1964.

Mr. JONAS. That was 45,945.

Mr. HALABY. Currently, fiscal year 1964, which was what——

Mr. JONAS. 45,935.

Mr. HALABY. No, sir. That is what we were authorized as of June 30, 1963. The number we were authorized for the full year, fiscal year 1964, is 47,111, and we are now asking for 754 positions less than that.

Mr. OSTERTAG. It is less than the 47,000——

Mr. HALABY. 111.

Mr. OSTERTAG (continuing). 111. That was your top figure for 1964.

Mr. HALABY. That you appropriated for, yes, sir.

Mr. OSTERTAG. What will be your yearend strength at the end of fiscal year 1964? You are phasing down even in 1964, are you not?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. That is the point I think that is important.

Mr. HALABY. That is the point I was trying to make. We have less actual employment and we have less authorized employment in fiscal year 1964 than we were permitted by this committee last year. So we have got an actual position decrease and an authorized position decrease.

Mr. OSTERTAG. There is a difference, too, between average employment and yearend strength.

Mr. HALABY. Exactly

Mr. OSTERTAG. My point is, What will your average employment be in fiscal year 1965, beginning July 1?

Mr. EVINS. Average employment.

Mr. HALABY. Average employment for fiscal year 1965.

Mr. ALEXANDER. The major item is the operations appropriation—about 90 percent of the total.

Mr. OSTERTAG. Would you furnish that for the record?

Mr. ALEXANDER. For fiscal year 1964 it would be 41,400, about——

Mr. OSTERTAG. Average?

Mr. ALEXANDER. Average. This is the operations appropriations alone.

Mr. OSTERTAG. That cannot be right, can it?

Mr. HALABY. He wants all appropriations. We do not have the number for all appropriations. We will get it. Let me approximate it, sir. The total authorized for fiscal year 1964 was 47,111. We will not reach that by our own management action. The level which we will not exceed is 46,400. That we would not exceed during the year so the average employment will be between 46,400, which we seek your authorization, and 44,223, which we actually had in January.

Mr. JONAS. You are asking for fewer people than were authorized last year, but for more people than you actually had.

Mr. HALABY. Yes, sir.

Mr. JONAS. So you should wind up with a substantial unobligated balance in June. You were authorized to fill 45,935 positions.

Mr. HALABY. We were authorized that many positions and, as you know, we fill them as the need for the position arises and positions authorized have always exceeded during this period the number actually employed because we phase them in as the equipment becomes available, so what we are asking you to do is to authorize the positions we need, which are 754 less than you found we needed last year and to permit us to employ in a phased program basis up to the number that you have authorized.

In the past, as we have showed with that chart yesterday, we have always been expanding. Now we are consolidating. For the first time the positions authorized will match the positions employed within the regular normal governmental margin.

For example, in January, when I gave you the figure of 44,223, there were 257 commitments that were being processed by the personnel people. We estimate that on June 30 we will have about 45,210 people actually employed.

Mr. ALEXANDER. Occupying full-time positions.

Mr. JONAS. Authorized 47,111 people.

Mr. ALEXANDER. The 47,111 figure is not people, it is positions.

Mr. JONAS. You are asking for 754 fewer positions, or 46,357 positions; is that correct?

Mr. HALABY. Yes, sir; 46,357.

Mr. OSTERTAG. There is a difference between positions and the total employment?

Mr. HALABY. Always; yes, sir.

AVERAGE EMPLOYMENT

Mr. OSTERTAG. I was trying to get at what your average employment will be as compared with what your average employment was a year ago.

Mr. HALABY. We started at 44,447 at the beginning of fiscal year 1964. We are programing to go to 45,210 at the end of fiscal year 1964. So the average was between 44,400 and 45,200, which, if you take the middle number would be 44,850.

We now propose to start with 45,210 at the end of fiscal year 1964, the beginning of fiscal year 1965, and go up to 45,290 people on board.

Mr. OSTERTAG. At the end of fiscal year 1965?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. How do you arrive at your average?

Mr. HALABY. The average doesn't mean anything, Mr. Ostertag.

Mr. OSTERTAG. I think the average employment would be the basis of what your requirements are.

Mr. HALABY. All we can give is the beginning and the end. The average would be hit in accordance with the day somebody came on board.

We can give you a computed average. For example, in the summer it rises with some summer employees. In September it dips, with some of those people off the rolls.

Mr. OSTERTAG. You don't budget on this highest point of your employment; do you? You don't budget on the basis of the end strength. You ought to budget, I should think, on the basis of what the average number is going to be during the year.

Mr. ALEXANDER. That is correct.

Mr. OSTERTAG. Is that how you have budgeted?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. Then why can't you supply it?

Mr. HALABY. What amount do you mean? This chart shows end 1963, beginning the last half of calendar year 1964. It shows, sir, that the line goes from 44,447 down to 44,223, up to 45,210 and across to 45,290, in actual employment. It shows that the authorized positions went from 45,935 to 47,111 at the end of fiscal year 1954 and then descends to 46,357 in authorized positions. So we have it charted out but when you say "average" it throws me a little as to what you want, whether you want halfway between any one of these figures or in any particular month.

DIFFERENCE BETWEEN AUTHORIZED POSITIONS AND ACTUAL EMPLOYMENT

Mr. JONAS. It seems to me we authorized more positions than were filled and therefore we ought to take a look at that and make some substantial reductions this year.

Mr. DEAN. I might clarify two things, Mr. Jonas. When we were rescheduling the actual employment during the current year, 1964, we took into account the month the appropriations bill was available and what our employment was at that time, and therefore the new schedule reflects the reductions and adjustments in our 1964 appropriation. So we did, for the most part, adjust all of our employment levels to take into account actual money and actual average months that employees would be on board.

What we have given you for 1965 is our projection of employment and the funding in the budget is only for the positions that we expect to be filled. We do not ask money for all of the authorized positions, only the number we think can actually be filled.

Mr. OSTERTAG. Certainly, and that would be the basis on how you arrived at your averages between your end strength and the point at which you started, plus the lapses that take place by virtue of unfilled positions. But what you actually need in terms of dollars certainly shouldn't be predicated on the total number of positions that are in existence at the beginning of the year, it shouldn't

be predicated on what the end figure might be. It seems to me if you have budgeted properly, according to what would be your requirements, it would be on the average strength and your total dollar requirements to meet it during the course of the year.

Mr. ALEXANDER. This is precisely how we budget. These position figures are complicated in these 2 years because of the definition of a position that guides the whole Government budget presentation, and that is, as the job is filled anytime during the year, it is shown as a position. For example, the 47,111 include the 860 jobs that were vacated in Washington and Atlantic City during the year, and as of midnight July 1 they would drop out of the total.

There are hundreds of jobs in the 46,357 at the end of 1965 in the same category. The average employment or the man-years are calculated and remain, in total, fairly steady between the 2 years.

Mr. JONAS. I am confused now.

As I understand it, you had on board on January 30, 1964, 44,223 people.

Mr. HALABY. With 257 coming in.

Mr. JONAS. You are proposing to increase that next year by 2,134, or up to 46,357. Am I correct?

Mr. ALEXANDER. No, sir.

Mr. HALABY. Now let's stick to actual employment, because that is what that is. We propose to have 45,210, on June 30 of this year, and 45,300 on June 30 of next year. We are requesting that you authorize a total position level of 46,357.

Mr. JONAS. Even your projection of people you expect to have on board at the end of this year, which is 45,210, is substantially up from 44,447, on June 30, 1963.

Essentially, what I am trying to determine is, if my suspicion is correct, that you are going to have more people employed in the Agency at the end of this June than you had at the end of June 1963.

Mr. ALEXANDER. Mr. Jonas, during the fiscal year 1964 we were authorized the commissioning of new air navigation facilities and the takeover of aircraft movement information service. This is the reason for the buildup from June 30, 1963, to June 30, 1964.

Mr. OSTERTAG. But there has been a buildup.

Mr. ALEXANDER. It was included in the fiscal year 1964 appropriation.

Mr. JONAS. Seven hundred and sixty-three more?

Mr. ALEXANDER. We justified to the committee last year 1,030 new jobs for the new programs. Three hundred of them were for this AMIS function and 600 for new facilities. This is the reason for the buildup during this fiscal year. Until January 1, because of the continuing resolution, the late passage of the appropriations, we could not hire to achieve any net increase in the people, so our buildup, sir, is limited to the last 6 months.

Mr. JONAS. But you tell us in another place you have a decrease of 750.

Mr. ALEXANDER. Authorized positions.

Mr. HALABY. That is the appropriations and the number of other people you authorized us. No agency is ever right on the numbers you authorize and appropriate for, because it goes up every few hours.

Mr. ALEXANDER. We budget in any event——

Mr. JONAS. Let's get that clear. The reduction to which you refer of around 700 is reduced requested authorization?

Mr. HALABY. Exactly.

Mr. JONAS. But you don't intend to tell the committee that you will have fewer people employed at the end of the year than you had last year?

Mr. HALABY. No, sir.

Mr. JONAS. The contrary is true, you will have more.

Mr. HALABY. Yes, sir.

We do intend to say that between October and January we had a reduction in actual employment, though, and that was due to dropping the 850 positions and several hundred full-time employees during that period.

I might also point out, sir, that the difference between actual and authorized reached a peak in about February 1 of this year. The difference was between about 44,223 and 46,600.

That was a difference between actual and authorized of 2,350 positions. It will reach the lowest in, I believe the history of the agency——

Mr. EVINS. Oh, no.

Mr. HALABY (continuing). On June 30, 1965. This is the gap between actual—the lowest gap between actual and authorized, of 1,067 on June 30, so we will have halved the difference by the end of this year. All that shows is, instead of going up, the agency has now leveled off and is consolidating these at a lower figure.

Mr. JONAS. I have the wrong figures down if you are leveling off. You are going up. You explain it by saying that you had additional responsibilities, but still you are going up and I don't see how you can have a chart to show you are going down.

Mr. HALABY. We are talking about two different things. Actual employment—here we are going up a little.

Authorized positions for what you have appropriated, are coming down.

Mr. JONAS. I accept that; and it shows we have been authorizing too many.

Mr. EVINS. The difference between actual employment and authorized has been rather wide over the years.

Mr. HALABY. Yes, sir; for a rapidly expanding agency.

Mr. EVINS. When you tell us you are tightening the gap, you are tightening the belt between authorized and the actual positions filled?

Mr. OSTERTAG. Mr. Chairman, as we get into the justification I think probably it will unfold a little bit.

Mr. EVINS. He is giving us an overall picture, and we will break it down into separate operations.

Will you proceed now, Mr. Administrator?

CONSOLIDATION OF FLIGHT SERVICE STATIONS

Mr. HALABY. The next highlight I would like to touch on is the flight service stations and I am going to show a couple of charts, here, that indicate the situation.

Some of you have actually been in the flight service stations.

Back in 1950 there was a total of 460 of these flight service stations. At that time, the aircraft fleet was composed of DC–3's, DC–4's, DC–6's, and a large number of smaller aircraft, but a reduced number of small aircraft.

Our system, as Mr. Thomas will point out in a moment, was largely four-course ranges and two-way, frequentally low frequency air-to-ground, ground-to-air communications. By 1963, a total of 335 of these stations were operating. At the same time we had modernized and equipped with wider ranging communications a large number of centers and combined radar approach and departure control and in some cases combined tour and service stations. We were giving more communications with fewer facilities that were of a more complicated and modern nature.

We now foresee the day when we can reduce the number of these flight service stations by consolidating their services with adjacent stations and actually ultimately perhaps with some of the centers.

Now, the result is that we have announced within the last 2 weeks a list of 42 flight service stations that are to be converted in the following manner:

In the past a pilot, more often than not a private pilot, because the airlines use the telephone, rather than our counter service, he would drive to what we call a flight service station. It is often in the terminal near the Weather Bureau and he would go there, and there is usually a map and there are some documents and there are weather reports on the teletype and there is a man there who will take a written flight plan. So he gets flight briefing and files a flight plan. He then goes out and gets in his airplane, usually on the same airport, and takes off, and he talks to the flight service station through a voice line from that device we showed you in the other room yesterday, the VORTAC. He doesn't know where that station is, really, because all it is, is a voice to him. As he goes over one station he says, "What's the weather at the next station?" Then they give it to him.

If he is on a flight plan he says:

I am now reporting on an IFR flight plan from A to B. I estimate to be over B at such and such a time.

That is prior to the consolidation. There are two stations. There are two VORTAC's and the man goes to the counter if the station isn't in his town.

Now he has grown to enjoy that crosscounter service. About 1 out of 10 contacts are across the counter, face to face. He likes those fellows because they are usually neighbors of his. He likes to feel that he has a Government station in his town. The airport operator and the airport manager very much enjoy having that Federal facility there. It helps them in many ways.

Also, there is a payroll involved, anywhere from 5 to 50 people are on the local payroll in this city where the flight service station is located.

What we now propose to do and have been doing for years at a sort of an easy rate, is to say to this man, now, "We are moving your flight service station in your town over to another town. We are consolidating. We are going to give you the same service, except we are not going to give you the personal, across-the-counter contact."

So we say, "We will set up a special telephone line at your airport. Instead of going into a Federal facility that is rented and lighted with a lot of equipment maintained each year, and 8 to 15 or so people, we are going to put a telephone in. You go into the booth, call over to this station and get the same information. Instead of writing out the flight plan, talk it out with him." That is what we call consolidation.

Mr. OSTERTAG. Where is that telephone located? At the airport?

Mr. HALABY. Yes. The same airport where he used to walk into the FAA office. He now walks into a telephone.

Mr. OSTERTAG. There is a direct line?

Mr. HALABY. Yes.

Mr. DAVID THOMAS. In some of the cases they are going into the large cities but most, I think, are not, really. Toledo, Wash., is going into Portland; Ely, Nev., into Elko, Nev.; Imperial, Nebr. into North Platte.

Some of these larger ones that are going in, just on the reverse, is Rochester, Minn., going to Minneapolis; Jackson, Mich., to Detroit; Bluefield, W. Va., is going into Charleston.

Mr. EVINS. Wouldn't it be a safe thing if you were flying into Detroit, to have communication at Jackson, Mich.?

Mr. DAVID THOMAS. You will have the same communications. The air-ground communications will be identical.

ESTABLISHMENT OF FLIGHT SERVICE STATIONS

Mr. OSTERTAG. What is your criteria for establishing these stations in the first place? Are there areas where there are no airports or then are long distances between aviation facilities? Why were they established where they are in the first place?

Mr. DAVID THOMAS. The criteria was principally to have air-ground coverage over the airspace and along the major routes, and originally to be associated with the air navigation facilities which were the old low frequency facilities.

It was cheaper at that time—in fact, the only way we knew then—to assign a man to a microphone at that facility in order to get the voice out from that point on the surface to cover the airspace.

As landlines and other communications have become more economical and more available and salaries have gone up—this is generally true in all walks of life—we can provide precisely the same communications from the same spot on the surface of the earth to cover the same volume of airspace by consolidating several of these locations at one desk.

A lot of the 24 hours of the day at some of these locations, they only talk to two or three airplanes. Yet we still have a man there. We could run five or six lines into a single center, to a central desk, and have him talk over all these radios and keep him reasonably busy and a much more efficient operation.

In fact, it is more efficient because he knows more of the weather, he knows more of the aircraft, and he has a wider range to cover.

Mr. HALABY. For purpose of illustration, let's say this is in Elko, Nev., and this is in Ely, Nev. I forget the exact distance, but my hunch is it would be around——

Mr. DAVID THOMAS. Most of them are less than a hundred miles. About 200, out there.

Mr. HALABY. 200 miles. In the old days this man on his mike here could only reach this pilot a few miles on either side of the station, so there was no communication at all for perhaps 150 of the miles between the stations. Now, through the VHF technology and through our new ability over the landlines to have a remote transmitter—in other words, the transmission is from here, although the voice in the microphone is over here, and we can say the same words on the same frequency from here, 250 miles away, as was done from the original location. In a sense this is just automation.

Mr. BOLAND. The same information is available and the service is exactly the same?

Mr. HALABY. Yes, except there is no across-the-counter service for certain locations. He cannot go in and talk to him as though he were the druggist or a friend.

Mr. OSTERTAG. You spoke a few moments ago about reports advising pilots on weather and other conditions. How can the second station, which is some 100 miles or 200 miles beyond give a pilot advice or reports on conditions or circumstances behind him or even in front of him for that distance?

Mr. HALABY. That is a very important point, because in many of these stations that we have already closed, and some 30 more, there is both a Weather Bureau station and an FAA station. So we have had to coordinate very closely with the Weather Bureau so that we wouldn't move out and they would move in. That would be no economy. That weather is put on a teletype by the Weather Bureau and comes out on one teletype, here, instead of a teletype at each location.

Now, just to give you an idea of what I have been shooting for, here, can we estimate how much each of these calls cost the taxpayers?

Mr. DAVID THOMAS. Each one right now costs the taxpayer about $2 or $2.50.

Mr. HALABY. $2.50 per radio contact from the pilot to the station, and the pilot isn't paying anything for it.

Mr. OSTERTAG. This is radio. What makes up that cost? Isn't it just the instrumentation?

Mr. HALABY. The cost includes the hundreds of people managing the stations, it is the rent of the building——

Mr. OSTERTAG. You are talking about the cost of all of the personnel involved. You are not talking about the actual cost of the call?

Mr. HALABY. No, sir. That is in cents, but the total cost of being able to make the calls, day after day, year after year.

Some of my feathered brethren say that I am a traitor, that the taxpayers ought to provide that $2.50 call for free because it enhances their convenience and safety. I am just saying, "OK, you ought to have a call for safety purposes, but you don't need to have one from so many places."

Mr. OSTERTAG. Are you satisfied that this move and these changes will in no way impair safety?

Mr. HALABY. Yes, sir. The one meritorious objection is that there are pilots who like to go and talk across the counter for

sometimes half an hour before they decide whether to take off or not, and they won't be as thorough in their preparations from this telephone booth, here, as they would from across the counter with the man—some of whom have been there 15 or 20 years——

Mr. EVINS. Isn't that a laudable objection? Isn't that bona fide? Doesn't that have some merit?

Mr. HALABY. It does; yes, sir. The question is, actually, whether it overpowers all the other arguments.

Mr. EVINS. If you consolidate a station you will have a teletype tape saying, "The weather is good, today. OK." You could play a record for them, so you have no employees at either place. This is an extension of automation.

Mr. OSTERTAG. Actually, you can pick up the telephone now and get the weather report.

Mr. HALABY. Yes, sir.

Mr. WYMAN. Did you discuss this program with industry representatives before you determined what locations to assign a priority to for discontinuance in the sense of taking the list of 42 and going over each site and location?

Mr. HALABY. Mr. Wyman, the answer is "No." We are continuously in contact with the various aviation interests and we try to take their views into account as well as the views of the Congress, but we felt the moment we mentioned a particular location, two things would happen: One, our own employees would go into a state of confusion and in some cases shock about an impending relocation and change in their family life, and second, all of the people in both the cities involved, the city getting additional Federal employees would receive it favorably; the one losing Federal employees would receive it unfavorably.

Mr. JONAS. It should be said right at this point that the system is not designed for airline use, but for individual airplane operators, is that not correct?

Mr. HALABY. To a considerable extent that is correct, although the airlines do call in to this radio for a particular weather report or something else, particularly when they lose contact with the center.

Mr. JONAS. I mean this over-the-counter discussion.

Mr. HALABY. Only in a few local service airline cases does the airline pilot go into the counter. That is very rare. He has his own airline weather service, his own airline dispatch service for which he is paying, and passing on the cost to the traveler.

Mr. EVINS. This is a program of making the big bigger and the small smaller. I am against the whole trend.

Mr. WYMAN. Mr. Chairman, are you going to leave this subject at this moment?

Mr. EVINS. I think not.

Mr. WYMAN. Could I ask a couple questions?

Mr. EVINS. Yes.

NUMBER OF FLIGHT SERVICE STATIONS AFTER REDUCTION

Mr. WYMAN. How many will you have after the latest reductions, Mr. Halaby?

Mr. HALABY. After the latest reduction of 42 in the domestic United States, we will have 257—I am talking about domestic United

States. There are only 299 in the domestic United States. There are 36 outside the 48 States. It is 257 in the domestic United States, and 293 worldwide. Some of these are in places like Balboa and the Canal Zone; San Juan, P.R.; Charlotte Amalie, V.I.; Alaska; and other places.

Now, we haven't a list for the ultimate number. We are still debating that within the Agency. We have to work it out with the Weather Bureau because we don't want to reduce available weather services, but if the Weather Bureau—if the committee would support us as it directed us, or let's say "urged" us in its last report in which the Senate shared, we would, on a gradual deliberate basis, trying to avoid the danger you see, Mr. Evins, of making the big bigger and the small smaller, to the extent that we can, we would like to proceed with, not the total automation of these systems——

SAVING DUE TO CLOSING FLIGHT SERVICE STATIONS

Mr. EVINS. Mr. Administrator, you have indicated this has been before this committee several years and it has been in the report and I have expressed my own personal views on it before, but let's not make it a crash program. Use a little flexibility.

You have indicated that even the funding is relatively small in the matter. There are some major areas of your operations in which you could really save some money, some big money; millions of dollars. But you choose to go at great length on the small items.

Mr. BOLAND. It may be small for the first year, but it is not small over the long haul. I believe you said $3 million a year into perpetuity.

Mr. OSTERTAG. Do you have a breakdown of the savings? I realize, too, as Mr. Boland has just indicated, that the difference will not take place overnight, that there is a matter of phasing the consolidations and transfer of personnel, but have you any estimate of what the ultimate savings might be based on your present program?

Mr. HALABY. Proceeding from the present where we are consolidating 42 stations and eliminating 162 positions as is reflected in the budget before you, after absorbing the relocation costs, the net annual savings is $1,800,000. So if we doubled——

Mr. EVINS. The saving is not in the staff in Washington, not in some of the other operations, but it is in reducing employment in these small stations. This is where he has made his savings. This is where he has been able to show some reductions in his staff.

Mr. HALABY. I am sorry, Mr. Chairman, the biggest reduction has been in Washington, where we have transferred positions into the field, so the big is getting smaller in that case.

We have taken a 16-percent reduction in the number of headquarters positions and put those people in vacancies in the field.

The total amount, if we went on, Mr. Evins, to close 40 more——

Mr. EVINS. Close some, Mr. Administrator. Use your good judgment and use flexibility. I just said don't have a crash program.

Are there further questions?

CLOSING OF ADDITIONAL STATIONS

Mr. WYMAN. Do you have at this time, Mr. Halaby, with respect to further closings of flight service stations in this automation program, have you arrived at a firm policy target of approximately how

many additional flight service stations you think you probably may close in the next year or two?

Mr. HALABY. Could I say a substantial additional number, but not all of these stations. We believe there will always be a need for a hard core of flight service stations. It will be at least 150 stations.

Mr. OSTERTAG. Remaining?

Mr. HALABY. Remaining. And that this would take place on a gradual, deliberate basis and it is not a crash program. They will take account of safety or efficiency or the morale and personal interests of our people.

Mr. EVINS. That is fine.

That ought to make everybody comfortable.

Mr. HALABY. Except me.

SAVINGS ON CLOSING FLIGHT SERVICE STATIONS

Mr. BOLAND. Mr. Chairman, would you permit him to finish his answer on the question of costs? I do not think he quite gave what the savings would be. You said after absorbing the consolidation costs that you would actually have a savings of $1,800,000.

Mr. HALABY. If we closed 40 more, there would be a saving of about $2 million additional. If we went on later to an additional closing of 40 it would be about another $2 million; and the net for closing 120 stations, if we could ever do that, would be around $6 million and 400 positions.

Mr. BOLAND. An annual saving?

Mr. HALABY. Yes, sir.

Mr. EVINS. Mr. Halaby, these small savings you have now built into large amounts. If you multiplied that by 10 years, you could make it larger and if you multiplied by 50, you could make it even larger. You could make the figure astronomical.

Gentlemen, let's return to the Administration's statement.

INCREASED PRODUCTIVITY

Mr. HALABY. I am at the bottom of page 7 and I am about to make a plea, Mr. Chairman, that we have really cut this as tight as we could and then as Mr. Jonas brought out yesterday, the Budget Bureau and the President have pruned it further and that we are counting upon a 4-percent or 5-percent increase in the output per man and woman in the coming year.

If, for some reason, we have overestimated the ability of our people to provide more service in the same time each day, then we are off.

If, secondly, the equipment as installed gives us more trouble than we anticipate, there will be need for more maintenance than we have calculated due to the reliability and the complexity of the equipment.

A third point is that we have made projections about the increase in the workload and if those are low, if we have not adequately planned for the amount of flying there will be by the military, by the airlines, by general aviation, again we would be off and we would have to come back.

So there are all kinds of possibilities that we have got this thing too taut; also, I have to honestly tell you that there is no cut insurance in here.

We have not padded this against an expected 5-percent cut. It is just not in here.

Mr. EVINS. The Administrator is a very able man and a very skilled man and I judge by an examination of his budget that while it looks promising on the surface and there is a reduction that I anticipate and fear supplemental requests.

SUPPLEMENTAL FOR AIRPORT PROGRAM

Mr. HALABY. The only supplemental that we anticipate, and we have alerted you to it in this statement is that because the Federal Airport Act is now in conference—in fact, it was reported out of conference yesterday afternoon at 5 o'clock—and will come before the two Houses perhaps while this committee is still considering our request, that there would be a supplemental for the Federal airport program.

If anything, I am hoping that the President can come to you with additional reductions. They would relate to things that we have had in the mill for some time and things like this flight service station program.

So, far from coming to you for a deficiency or supplemental for our regular operations, already authorized, we do not anticipate any.

Now, what the President will do with respect to the supersonic transport program is a completely different, independent matter.

Mr. DEAN. When the Federal airport supplemental comes down, there will be no requests for additional positions or any type of administrative costs. It will be the grant money alone that will be requested.

Mr. HALABY. On only one occasion in 3 years have I recommended to the President a deficiency or supplemental, and that was with respect to the Pay Act of 1962.

POSSIBILITY OF ADDITIONAL BUDGET REDUCTIONS

Mr. JONAS. I did not quite understand and it seems a little inconsistent to several of your other statements; you gave us a strong pitch for this full budget. You said there was no fat in it. You hadn't taken out any insurance.

Mr. HALABY. Yes, sir.

Mr. JONAS. Then almost in the next breath you said we might anticipate a reduction proposed by the President.

Mr. HALABY. Yes, sir.

Mr. JONAS. If there are any places in here that reductions can occur why should not we make the cuts ourselves instead of waiting on the prospect of Executive action?

Mr. HALABY. Well, sir, as you know, it is the President's budget. I am a member of the executive branch and the President makes the budget estimates and the budget request.

Mr. JONAS. If further reductions are "proposed" it will be his responsibility, then, to propose them. I recognize that he has that right.

We have the responsibility to make some cuts too, if they are justified.

Mr. HALABY. Yes, sir.

Mr. EVINS. Any further questions?

Mr. JONAS. No.

Mr. EVINS. Gentlemen, let us go to lunch and come back at 1 o'clock.

AFTERNOON SESSION

Mr. EVINS. The committee will come to order.

Mr. HALABY. If I could request permission—I think Mr. Jonas put his finger on a very important, and I might say sensitive, point about how can you in one breath say this is a taut budget and in the other breath say if there are any savings, the President will announce them.

What I was trying to say, not very well, was that we have got this budget as taut and as tight as we knew how to make it when it was submitted last fall and when the President submitted it in January. What I was pleading for was your confidence and respect, that if we find any savings in here of any kind we are going to make them. We are not just going to sit on them and pad it out. If there is anything we have tried to do in these past few years, it is to get management control over people and costs.

Whether we have done it or not, of course, is for you to judge. The second thing is, in that chart I showed you I did not want you to think that we had the funds for all of these jobs.

Mr. JONAS. I am glad you are clearing that up.

FUNDING VERSUS EMPLOYMENT

Mr. HALABY. The funds we have available are to pay the people who are actually employed. Of course, as you gentlemen know, there is a whole variety of reports on people.

For example, the Civil Service Commission report in August on form 113, which is total employment, including full-time people, part-time people, consultants, when actually employed people, and so forth—that is the total number; that number for us began to come down in August.

This is Mr. Willey; perhaps he could mention those numbers for whatever period he has.

Mr. WILLEY. I just have 6-month dates but as for June 30, 1963, the total employment of all kinds was 46,432, whereas, as of January 31, the total employment of all kinds was 45,546.

Mr. HALABY. When you start comparing those with these figures you can see there is another distinction because they have included anybody who is, in any sort of a pay status during a month, so that in January 1964 we show 44,223 full time and 45,546 in total.

The difference is the definition of employment.

I did want you to know that we are funded for——

Mr. OSTERTAG. That is the point.

Mr. HALABY. That I think is important to this committee. We are funded for the lower of those two lines on the chart that I gave you, sir.

In the past we have had this wide gap, due to the number of facilities being commissioned and the continuing expansion of the Agency.

We now have this closing gap here due to the fact that the Agency is consolidating and reducing. There is no intention of suggesting that we have achieved more savings that we have but at the same time the savings are real.

Mr. OSTERTAG. You have referred several times to "authorized."
Mr. HALABY. Yes, sir.

FUNDED AND AUTHORIZED POSITIONS

Mr. OSTERTAG. What is the difference between funded and authorized?

Mr. HALABY. I am going to ask Mr. Alexander, the Budget Officer, to explain that.

I think I know, but I think his technical language is probably more precise than mine.

Mr. ALEXANDER. The authorized job is the established complement, like a manning table in the military services. It is the total number of positions which may be filled for any facility, a station or division in Washington or anywhere else. It is a complete manning table.

Funded is that portion of the total authorization that we would expect to have filled. Try as one might, he can only fill up to within 97 or 98 percent of his authorized because of turnover, because of problems in finding the right people.

There is always a gap between the total you are trying to fill and the total you are able to fill.

Our experience has shown that even in a nonexpanding continuing operation, that the filled jobs will be about 2 percent below authorized.

Mr. EVINS. I think when Mr. Ostertag refers to authorized, he means that which is authorized by the Bureau of the Budget, the number of slots.

Mr. ALEXANDER. That is right.

Mr. EVINS. The Bureau says that you are authorized so many positions, so many slots. If you can get the men for them go ahead and fill them.

Mr. ALEXANDER. That is right. We budget up to about 98 percent of that on the average by year end and if you are building-up in a year, the financing is somewhat less than 98 percent, if the program is level it is about 98 percent.

Mr. OSTERTAG. The authorization you speak of is one that exists as between the executive branch and the Bureau of the Budget rather than the law?

Mr. ALEXANDER. That is right. It is the same as the total number of permanent positions that show up in the tables in the committee print for example.

Mr. OSTERTAG. The point is that some programs and some agencies operate under annual authorizations. The law itself grants the authorization where that does not exist in your case. You have an agency with a responsibility, so the number of positions is not a matter of annual authorization.

Mr. ALEXANDER. That is correct.

Mr. OSTERTAG. It is a matter of what is budgeted and approved through the Bureau of the Budget; am I correct?

Mr. ALEXANDER. And as acted on by the Congress through appropriation action.

Mr. OSTERTAG. That follows.

Mr. ALEXANDER. For example, we could not authorize any positions without——

Mr. OSTERTAG. All I wanted to clear up was your reference to the term "authorized."

Mr. EVINS. You are authorized by the Bureau of the Budget for 1965, 46,351 positions.

Mr. ALEXANDER. That is right.

Mr. EVINS. How many positions did you request of the Bureau of the Budget?

Mr. ALEXANDER. About 400 more than that.

Mr. EVINS. The point is, while there is a gap between the authorized number and the funded amount, there is no actual reduction by the Administrator in requests for positions. The Administrator asks the Bureau of the Budget for more positions than was permitted.

Mr. ALEXANDER. No, sir. Our request to the Bureau of the Budget was below what our 1964 authorization is. It was below the 47,111 figure. It was in the neighborhood of 46,750.

Mr. HALABY. Then they cut that about 400.

Mr. EVINS. I think we have that pretty well described.

Mr. HALABY. If we can do better than that, we will. That is all I was trying to get across.

LEGAL SUITS IN AIRCRAFT ACCIDENTS

I have had one experience during the last year that is worth highlighting for just a moment and that is the realization through some court actions in which as much as $600,000 has been granted in a negligence suit to a single plaintiff killed in an aircraft accident. In other words, the amount authorized the next of kin is now in very, very high figures.

Second——

Mr. JONAS. Will you elaborate a bit on that? You mean they sued the Government?

Mr. HALABY. They sued. They almost always sue the airline if there is a collision, the other airline, the individual operators, and the Government. Sometimes they include an airport where there is a landing accident.

The judgments awarded have been steadily moving up in these tort claim actions. I would say a couple of years ago we were looking at about 300,000 or 400,000. There was one awarded in the New York Supreme Court for $600,000 last Friday, and in California, $943,000 2 months ago.

These were quite accomplished individuals and they did have earnings expectancies that were quite high.

The second thing is that the Department of Justice, after very careful examination of the New York midair collision, which occurred you will recall in December 1960—I think one of the first things General Quesada told me about when I was appointed was this accident in which he and the FAA to this day have taken the position, that the FAA was not culpable. One carrier flew down through one of the FAA fixes or you might say, intersections, or stop signs, and rammed into the other carrier. Of course, the plaintiffs, of which there are 104, sued the airline that rammed the airline that was

rammed, and the FAA because it was under our instrument flight rule controller. We believe that the FAA was not responsible; that you could not hold the FAA responsible for an operator who went through and passed the holding instructions and then struck another airplane.

The Department of Justice, after carefully looking over that case, said that the litigation risk of the judge and/or jury holding the Government culpable indicated that we had better settle, and so the judge got the parties together—that was United Airlines, TWA, and of course, they were represented by insurers, and the FAA represented by the Department of Justice—and worked out a formula. The formula was 61 percent United, 24 percent Federal Government, and 15 percent TWA.

You say, "My Lord, TWA was innocently flying in and landing at LaGuardia, fully on course. Everything was fine." The FAA controlers had told the other man to stop and he went through the stop light, so why isn't United fully liable? The answer from the Department of Justice was—perhaps to you technicians that is clear, but with a judge and a jury the risk is that they might find the United States entirely liable for not having taken some affirmative action to vector the innocent aircraft away or to vector the overtaking aircraft away.

My only point in raising this is that to a much greater extent than I had hitherto realized, the FAA can, through either omission or commission, subject the U.S. Government to financial liability greater than you and I might have expected. For example, in the calendar year 1963 there were filed against the United States, in the form of the FAA, 102 cases, and 36 others previously filed were closed.

There are now pending, as of December 31, 1963, 371 cases in which we are being sued for $153 million.

These totals are caused by two things: First, individual claims for wrongful death are greatly increasing and juries are giving greater judgments; and second, more people are suing the Federal Government because of their either real or imagined mistakes. Thank God we have not had any major collision since 1960. They have been small ones, terrible to those involved, but not major.

Mr. EVINS. How many cases in the past 2 years have judgments been entered by the courts against the FAA?

Mr. HALABY. I am going to ask the General Counsel to answer that question, Mr. Goodrich.

Mr. GOODRICH. Mr. Evins, I do not think I have that precise figure in terms of the last 2 years' totals. The outstanding series of cases in which we have been involved, however, those that the Administrator described, are the cases arising out of the New York midair collision. In 58 cases, 1 of which was tried and 57 of which were settled so far, a total liability of $7,347,400 has been incurred, 24 percent of which will be the Federal Government's share.

I would like to have your permission to get a complete summary of cases in the last 2 years involving the Government and the liability we have incurred.

Mr. EVINS. It will be included in the record at this point.

(The information supplied follows:)

JUDGMENTS AGAINST UNITED STATES INVOLVING FAA OPERATIONS, 1962–63

In 1962 judgments were entered against the United States and United Air Lines in 24 of the lawsuits arising out of the Las Vegas United/Military collision. These judgments totaled $2,675,295. The decision with respect to the United States was based on findings of negligence on the part of the Air Force and the FAA. These decisions are currently on appeal.

In addition, during 1962, two suits were terminated by compromise settlement entered into by the Department of Justice for amounts totaling $5,500.

In 1963, one suit resulted in judgment against the United States in the amount of $83,000 (*Franklin* v. *U.S.*). This decision is currently being appealed. Additionally, in 1963, four suits were terminated by compromise settlement by the Department of Justice for amounts totaling $11,000.

Mr. HALABY. My only point is that you can truthfully say that when you are voting funds for the FAA, you are voting insurance because the untold numbers of collisions that have been prevented by the FAA save the United States from enormous liabilities.

It has grown more serious even in the last 2 years.

Mr. EVINS. Most of the lawsuits have grown out of one accident; is that correct?

Mr. HALABY. No, sir. There are a number of accidents over the 5 years' life of the FAA. We can list those. For example, Brunswick, Md., Las Vegas——

Mr. EVINS. The General Counsel, of necessity, concurs with the judgment of the Solicitor General of the Departments of Justice in entering this consent decree and all of these consent decrees? We know the Department of Justice reperesents the Government, but there might be a precedent case in which your Counsel might want to make a test case to exonerate the FAA.

Mr. HALABY. Yes, sir. In this particular case—may we put this list in the record of the cases?

Mr. EVINS. Yes.

(The list follows.)

Litigation arising out of major aircraft accidents

AS OF DEC. 31, 1963

Case	Number open	Amount
Brunswick, Md. (Capital Airlines/ANG jet, May 20, 1958)	16	$12,868,858.38
Las Vegas, Nev. (UAL/Air Force Apr. 21, 1958)	40	18,606,110.12
Miami Internal Airport (Braniff, Mar. 25, 1958)	9	3,830,000.00
Boston, Mass. (EAL, Oct. 4, 1960)	54	16,773,500.00
Staten Island, N.Y. (TWA/UAL, Dec. 16, 1960)	104	70,398,107.15
Toledo, Ohio (Arctic Pacific, Oct. 29, 1960)	26	4,520,500.00
Agana, Guam (World Airways, Sept. 19, 1960)	39	1,801,840.00
Boston, Mass. (AAL, Sept. 24, 1961)	1	50,000.00
Boston, Mass. (NE/Nat'l, Nov. 15, 1961)	4	520,000.00
Atlanta, Ga. (Beechcraft Bonanza, Nov. 10, 1961)	3	2,408,950.00
Idlewild Airport, N.Y. (Aeronaves de Mexico, Jan. 19, 1961)	2	1,200,000.00
Idlewild Airport, N.Y. (EAL DC–7, Nov. 30, 1962)	12	5,730,000.00
Shemya, Alaska (Alaska Airlines, July 21, 1961)	8	3,151,000.00
Avoca, Pa. (Piper Aztec, Nov. 20, 1962)	2	1,000,000.00
ADDITIONAL CASES RECEIVED IN JANUARY 1964		
Idlewild, N.Y. (EAL DC–7, Nov. 30, 1962)	2	$650,000.00
Elkton, Md. (Pan Am, Dec. 8, 1963)	7	12,655,058.00

Mr. HALABY. In this particular case, the New York midair collision, we disagreed with the Department of Justice. We felt that we should proceed to exonerate, as you say, our air traffic controllers in this case. We did not feel they were culpable. However, we do not make that final decision and although I had a very frank and full discussion with the Attorney General about it, he felt in his judgment, from the point of view of the whole Government, to save the taxpayers from the risk of litigation, that he should settle and he did.

Mr. OSTERTAG. Have there been any instances where you have actually lost the case by virtue of court action?

Mr. HALABY. In the 3 years that I have been in office, I do not believe that we have had a major negligence case arising out of a major accident. There have been some individual cases, small aircraft accidents, et cetera, where they sue us and have collected, but they are in small amounts and of small significance. There have been no landmark cases and no major judgments.

Mr. OSTERTAG. Does the Justice Department have the right to determine whether or not you go to trial or settle?

Mr. HALABY. Yes, sir.

Of course, they have to take into account a lot of things that we are not able to take into account. However, the judgments, if recovered, have to be budgeted in the FAA budget. If they are tried and lost, they are paid by Justice out of their budget. If they are settled, they have to be paid out of our budget.

PAYMENT OF JUDGMENTS FROM FAA FUNDS

Mr. OSTERTAG. What do you budget for that sort of thing?

Mr. HALABY. We do not, sir. Our function and aim is to prevent such accidents, and they are rare. If one comes up we have to come in and request funds where they are unavailable.

Mr. OSTERTAG. How have you settled these several cases——

Mr. HALABY. The Brooklyn accident?

Mr. OSTERTAG. Such as that one. Do the funds come through FAA or some other source?

Mr. GOODRICH. Since these cases are being settled by agreement the funds will have to be paid out of FAA appropriations eventually.

Mr. OSTERTAG. You do not budget for it, but after a court decree has been handed down, then you will come in and ask for it?

Mr. GOODRICH. That will be the practice, yes, sir. This will be the first occasion to my recollection since I have been with the agency of any need to budget for or request funds for payment of settlement.

Mr. OSTERTAG. Are there funds in this budget for settlement of this one case?

Mr. GOODRICH. No, sir.

Mr. OSTERTAG. When will that come to a head?

GOVERNMENT LIABILITY IN BROOKLYN ACCIDENT

Mr. GOODRICH. When all of the 104 cases are disposed of by settlement or trial we will know the total liability of the Government. At that time we will know what the total liability will be. At the moment the liability of the Government is approximately $1,763,000, based on the 58 cases that have been settled, including one that was tried. There

are another 46 cases remaining to go and the total amount of liability is a matter of conjecture, but probably it will be in the neighborhood of about $12 million, because the 58 cases settled so far involve a total liability of $7,347,000.

Mr. OSTERTAG. Would that be without trial?

Mr. GOODRICH. Fifty-seven without trial, one tried in the New York State Supreme Court, not involving the United States as a party, but in which the United States will participate by virtue of the agreement to settle.

Mr. HALABY. Did they omit us from the action so as to keep it in the New York State court?

Mr. GOODRICH. In a manner of speaking. They omitted us from the action so as to have it tried before a jury. Court actions against the United States are not tried before juries. For that reason, this plaintiff did not go into the Federal courts, but sued only in the State courts.

Mr. OSTERTAG. I don't want to take issue with the Justice Department and their judgment or wisdom in settling, but it seems to me that where you do that you establish a precedent whereby it may plague you for many years to come. Has that occurred to you?

Mr. HALABY. Yes, sir. I guess that was the core of our strong feeling about this case.

Mr. EVINS. $57 million, without the case being adjudicated. That is a compromise.

Mr. HALABY. In other words, our share of the total is, of course, small. That is only one of the 371 cases that are outstanding, so what would be your guess as to the total exposure of the Brooklyn air collision, based upon the settlement?

Mr. GOODRICH. Roughly $3 million, as the probable total amount.

It is interesting that one of the cases, Mr. Ostertag, did go to trial in New York and resulted in a $600,000 verdict by a jury. It went to trial because the widow of the man who died heard of the verdict in a California court about 8 weeks ago in favor of the estate of a rather well-known pianist who died in 1951 in an accident. The award there was $943,000 and in contrast with those two figures, some of the New York cases that have been settled so far have been settled for amounts such as the following: $247,000; $225,000; $320,000; $140,000; $135,000 and others in much lower amounts, such as $55,000 or $97,000.

Mr. EVINS. Off the record.

(Discussion off the record.)

Mr. HALABY. We have had a precedent in the collision between a Bolivian military pilot in a P–38—this was in 1950—and Eastern Air Lines. There was an accident right out here near the river. The judgment was $900,000 and this was paid out of "Facilities and equipment" money which had not been obligated and the amount was added to the subsequent budget.

Mr. OSTERTAG. From FAA?

Mr. HALABY. Yes, sir—CAA.

Mr. OSTERTAG. Did you have authority to do that?

Mr. HALABY. I am advised by counsel and the budget people that unobligated funds are available for the purpose of paying our share of settlements or judgments.

Mr. GOODRICH. That is the practice.

Mr. OSTERTAG. Is that the practice, or is that for this one particular case?

Mr. GOODRICH. The 1950 case? The practice is permitted by statute, 28 U.S.C.A. 2672, and approved by the Comptroller General, 38 Comptroller General Decisions 338.

Mr. HALABY. I have just one more highlight, Mr. Chairman, and then we can go, if you wish, to the books.

RESEARCH AND DEVELOPMENT

Mr. HALABY. As Mr. Thomas pointed out earlier, we have had research and development funds spent in the agency over its 5-year lifetime. This $42 million is one of the lowest requests we have made for new obligation authority. It is a slight increase over the amount appropriated last year, a $2 million increase. I guess I feel that it is where we are tightest and it is where, as Mr. Thomas said, we are liable to get the highest yield in keeping up with national defense requirements, the aviation industry, and the state of the art.

It seems to me we have to assure ourselves that the aircraft, the men who fly them, the operators of the airspace system, meet the standards set by Congress.

I will show you if I may a chart entitled "Research and development appropriation, 1958–65." Starting from an amount of about $15 million, the total available reached a peak in 1962 of $80 million. At about that period, we were able to obtain the help of Mr. Blatt, one of our outstanding career men in the CAA–FAA, and two men from industry, Mr. Robert Shank and a little later Mr. Richard Leng.

Together these men have been able, after holding up funds for a period of several months, to be sure we were applying them in the most effective, high-yield way, to bring the obligations, the total available and the new obligational authority into a balance. In other words, instead of having a lot of unobligated funds that made it appear that we didn't have anything to do with them, we have now, afer a period of taking a breath and very carefully husbanding the funds, brought it into balance. Whether or not this $42 million level is high enough for a system as full of risk and liability as we now have is a question that the committee will want to debate. More than half of the money is, as we showed you yesterday by our little models, devoted to modernizing the air traffic control system and to all-weather landings and in communication and display of the weather.

RESEARCH AND DEVELOPMENT CONTRACTS

Mr. EVINS. Mr. Administrator, if you will permit an interruption, is all of this money for research expended at your center in New Jersey, or is it farmed out in contracts for specific jobs throughout the country with private industry?

Mr. HALABY. A substantial amount of it, sir, is contracted out in jobs to industry and reimbursed to other Federal agencies for work performed in their laboratories.

In the aircraft safety program, which offers great yield in fire prevention, crash, impact survival, noise abatement, and suppression and

protection from lighting, we do a great deal of that. In connection with the medical research, which we are holding to the number of employees last year, most of that work is done at the medical laboratory at Oklahoma City and in Georgetown University here.

Mr. EVINS. Since you are running so many services for the Department of Defense for which you are not reimbursed, can you not call upon them to give you the benefits of their research—and it is tremendous. Can't you call for the knowledge and information in the field that you need it?

Mr. HALABY. Yes, sir; for example, when you and I went down to see that great Arnold development center at Tullahoma, Tenn., I stood there with you in the throat of that fabulous tunnel, where much of the work on engines and high-speed airframes, and now missiles, has been done—a great creative establishment that has echoed and benefited all around the world. That is the kind of facility, along with the one at Ames, at Moffett Field, and Langley Field of NASA, that we not only need to but do utilize. For example, Tullahoma is one of the few places in the world where you could test a big high-thrust supersonic engine. In fact, military engines have been tested there. Some foreign countries indicated an interest in testing there.

I think they were a little bit afraid of what those people in Tennessee might find out about their engine though, so they haven't come through with that request. But to me the fact that we spend $23 million outside of the Government and $19 million inside the Government, if you give us the $42 million, is a pretty good balance; and also to me, this R. & D. appropriation request is pretty close to the bottom, if not below the bottom, because it is only 6 percent of the budget estimate. It is less than 4 percent of the value of our capital plant, which this committee has helped us install over the several years.

RELATIONSHIP OF R. & D. FUNDS TO TOTAL BUDGET

I would say if I were in a corporation with as much traffic volume and technological change as FAA, I would want considerably more. I would want 5 to 10 percent devoted to R. & D. Of course, when you compare our 6 percent of the budget estimate to the Atomic Energy Commission, to the DOD, you find it is much lower and when you, of course, compare it to NASA, it is infinitesimal. We are making a strong plea for research and development.

Mr. EVINS. It is really not criteria, is it, to match your figures percentagewise with DOD, AEC, or NASA, but really the test should be what are our needs, what are our requirements, what specific projects did we need research and testing on?

Mr. HALABY. Of course, Mr. Chairman, and I am simply by analogy pointing out that the R. & D. request here is, as you can see, tiny. We are defending the skies from death, delay, and diversion. The Defense Department is defending the skies from our enemies. We are proposing $42 million for the day-in, night-out protection of the people in the sky and down below.

Over there in the Defense Department they are proposing to spend $7 billion to defend us from our foreign enemies. I am just putting

those two alongside of each other; that is all I am doing. The R. & D. in NASA is $5 billion.

Mr. EVINS. The Congress has been increasingly concerned about the cost of research and development, so much so that they have set up a special select committee to look into all aspects of research and development. This committee wants to be assured that the funds which we appropriate for your Agency are wisely used.

ACCIDENT AT ELKTON, MD.

We think research is important, and specifically alluding to one headline accident in which a jet over here in Maryland was alleged to have been destroyed by lightning, what has your laboratory been able to develop in the way of research to prevent, if possible, accidents caused by lightning?

Mr. HALABY. Yes, sir; at Elkton, Md. The hearings are underway under the leadership of that very wise and fine man, Mr. Alan Boyd, up in Philadelphia this week. We have a task force in the FAA composed of some of the best experts in the field of meteorology, of static electricity, of materials; and we are bringing together all of the tests of all of the work that has been done over the last couple of decades on lightning and then the engineering and research work on how, once lightning strikes, the people and the materials in the airplane can be protected. Since that accident, the probable cause of which will be determined by the CAB, we have taken several steps to see that such an accident does not recur. I am going to ask Mr. Thomas and Mr. Moore to mention those, but in particular I should point out that this is probably the first accident on an airliner that will be pinned down as to having been caused by lightning.

Mr. OSTERTAG. Actually, your study is to determine cause, rather than research with regard to what needs to be done in the field?

Mr. HALABY. No, sir. For example, we had a contract about a year ago, which was to study the kind of vents from fuel tanks. That work has been underway. We have just let a contract through the aircraft development service to a company down in Florida called Lightning & Transients Research, and there they are going to take a wing, donated to us at our request by the Boeing Corp., and expose it to various levels of lightning bolts, various levels of strength and we are going to see just how the flame propagates through the tank.

Are we going to put some fuel in that tank or not, Mr. Bates?

Mr. BATES. Yes, sir. Actually, we will put fuel in it and what we are trying to do there is to determine whether or not lightning striking on the exterior of the tank can cause internal sparking, which might ignite a fuel mixture. Then we are going further and working with Lightning & Transients Research and the Atlantic Research Corp. over in Virginia to develop special flame arrestors that would stop flame from propagating through a vent pipe. It is a going program to determine what happens inside the wing and to assure that lightning can be stopped from starting a flame front through a vent pipe.

Mr. HALABY. The number of lightning strikes is somewhere around one strike per 2,500 hours on the piston aircraft flying in the lower altitudes, and around one per 10,000 hours reported in the higher altitudes of the jets and the higher flying turbine aircraft. Here is one, after years and years, where it appears to have been caused by a strike. We, also, are carefully researching the fuel in that wing and the way the wing tank and vents were constructed—what they may have had to do with it. We have a whole series of R. & D. projects related to that kind of aircraft safety.

Mr. Chairman, I have hit the highlights in the statement. We would welcome questions about the book.

PLACING OF R. & D. CONTRACTS

Mr. EVINS. Most of your research will be contracted out?

Mr. HALABY. Some in NASA and some outside. I would say on this that more than half of it is outside. It is 60 percent.

Mr. OSTERTAG. There are certain aspects of this that I would like to get into when we get into the justifications.

DEVELOPMENT OF SUPERSONIC TRANSPORT

If I understand correctly, and R. & D. you have excluded the supersonic requirements?

Mr. HALABY. Yes, sir. That is a separate autonomous program in the FAA. We feel that it is properly independent of the regular operations of the Agency. You know the theory of that program is to get it started, get a couple of them built and tested in partnership with the manufacturers, and then get out of it so that the normal free enterprise relationship between the airline and the airplane manufacturer would be continued.

Mr. OSTERTAG. This is in your justifications; is it not?

Mr. HALABY. No, sir. There is nothing in the budget request for the supersonic transport.

Mr. OSTERTAG. You are not asking for any money this year?

Mr. HALABY. No, sir.

Mr. OSTERTAG. Perhaps, Mr. Chairman, this would be the time for us to discuss it then, because when we get into the justifications, it will not appear there. Therefore, there is no way by which we can discuss it.

As you know, Mr. Administrator, I, along with Mr. Boland of this committee, joined you at one time last year in a conference with the British and the French on the supersonic air transport. We supported you last year with regard to funds and authority to proceed.

I think the committee should know where you stand in this whole picture. The President has indicated that this is a joint venture. It is properly the responsibility of private industry as well as the Government. You indicated to us last year that you were going to proceed along the lines of agreements for a cost-sharing responsibility.

What can you tell us has happened and where do you stand in this matter of supersonic air transport development?

Mr. HALABY. Mr. Ostertag, I know of your great interest in this program. I recall our appearing together in a telecast, in which you asked some very searching and extremely important questions about the program.

Mr. OSTERTAG. Perhaps what you have to say, Mr. Administrator, will disclose why there is no requirement for funds in this budget for this purpose.

Mr. HALABY. Yes, sir.

The program that we outlined to you last year has unfolded precisely as we represented it to you. You reported, and the House voted, and the Senate committee reported, and the Senate voted $60 million to conduct phase 2 of the program, which was described to you as a detailed design competition in which competing manufacturers would be given a year in which to compete for the final prize, an award of a contract for the construction, which would be phase 3, of two models and test them in the course of the program.

If you will remember, President Kennedy sent the program up with some very severe constraints in it. First, he offered the Government's putting in 75 percent of the cost of development, which was estimated to be $1 billion worth of total development costs, so that the Government's share would be as much as $750 million, on condition that the manufacturers would put up 25 percent, which was estimated to be $250 million divided between the airframe and the engine manufacturer.

He also proposed that there be severe penalties for cost overrun of these contracts, because, as you know, the military projects in this field—and I do not know about the NASA—have a habit of overrunning. In fact, over the 10 years, from about 1950 to 1960, I believe, the projects overran on an average of about 300 percent, so it said that every dollar over the contracted development cost would be 75 percent manufacturer's money and 25 percent Government money on the first $100 million of any overrun, and 100 percent manufacturer's money on that portion of an overrun in excess of $100 million.

The third point, and I think the most important to this committee, was that the entire development investment of the taxpayer would be recovered out of royalty on the earnings of the airlines using the supersonic transport.

Mr. OSTERTAG. Providing it was economically feasible.

Mr. HALABY. Yes, sir. We would not, according to the President's letter, proceed with construction and test unless it appeared economically feasible.

The President's proposal was sent to Congress in May 1963. That program was heard by you, was heard by the House Commerce Committee, was discussed in the Elliott committee, to which Mr. Evins referred a moment ago—incidentally, Mr. Evins, the transcript of our appearance before the Elliott committee will show some rather extraordinary support for the kind of research and development FAA was doing and several of the members indicated their support for our kind of R. & D. program. But leaving that parenthetical remark, we were heard by the House Commerce Committee, and finally by the Senate Commerce Committee, in extenso, with all kinds of other

witnesses. In that presentation we said we would put out a request for proposals on August 15.

Some doubted that Mr. Bain—with a tiny staff—and I could get that out. We not only got it out, but we got it out with the concurrence of the airlines and comment by the manufacturers on August 15. We called for proposals to come in January 15.

Mr. Evins. Did the Elliott committee endorse the supersonic transport research program?

Mr. Halaby. I don't believe, sir, they endorsed anything in their first preliminary report.

I believe it just came out the other day.

Mr. Evins. You say they favored the type research we are doing in FAA. Did that include supersonic transports?

Mr. Halaby. I don't believe they spoke to the point, sir.

Mr. Ostertag. Wouldn't the Elliott committee be involved in a study of the overall problems, possible duplication, and matters of that kind? Is it too early for them to have any, what might be termed "conclusions" with regard to this or any other matter?

Mr. Halaby. I think this was just their first preliminary report.

Mr. Evins. Mr. Ostertag, we were talking about the reductions in the budget and on page 9, volume 1. The appropriation for supersonic transport was shown for $60 million for 1964 and no funds are requested in the budget for this year, which brings about a $60 million reduction in the overall appropriation estimate.

Mr. Ostertag. I think it is important that testimony at this time give us some indication of what progress has been made. Also, perhaps we might have some indication as to what is new with regard to the competitive aspects; namely, the development between the British and the French.

Mr. Evins. Mr. Reporter, will you please place in the record at this point, the bottom of page 17 of the Administrator's statement with respect to civil supersonic aircraft development, that half of the page.

(The information is as follows:)

Civil Supersonic Aircraft Development

In accordance with the plan previously discussed with the Committee for the development of a civil supersonic aircraft, no funds have been requested for fiscal year 1965, pending completion of the detail design phase. We are now evaluating design proposals from three airframe manufacturers and three engine manufacturers. If the results are sufficiently promising, we expect to let contracts for a detail design competition in accordance with the schedule previously established. These contracts would be financed by the $60 million appropriated for this purpose for the current fiscal year. The timing and amount of the next appropriation and, indeed, the necessity for the next appropriation, will be determined on the basis of the design evaluation and the outcome of the detail design studies. We do not foresee a need for additional appropriations during this session of Congress.

Mr. Halaby. Could I also, Mr. Chairman, request that you put into the record a paragraph from page 104 of the President's budget which simply says:

The joint industry-Government program to develop a civil supersonic transport aircraft for which $60 million was appropriated in 1964 is proceeding on schedule. Design proposals have been received from prospective manufacturers and will shortly be evaluated for technical and economic feasibility. Expenditures for this program are estimated to increase in 1965 by $42 million. All

other expenditures of the FAA, taken together, are estimated to decline slightly from 1964 to 1965, despite increase in air and in related workloads.

PROPOSALS RECEIVED FROM U.S. CORPORATIONS

Mr. HALABY. We have received now six proposals from six American corporations: Boeing, Lockheed, North American, airframe proposals; Pratt & Whitney Division of United Aircraft, General Electric, and Curtiss-Wright, proposals from powerplant corporations.

We did not receive proposals from other major airframe manufacturers.

First, McDonnell indicated they were fully involved in military work. Second, Douglas indicated that they had stretched their transport division resources by undertaking the DC-9; and third, Convair indicated that they did not propose because they were fully engaged in the TFX contract. So we got three airframe manufacturers. Those proposals are now being evaluated under the capable and energetic direction of Mr. Bain, who has been made a Deputy Administrator of FAA, and given a small autonomous unit way out, so there would be no conflict of interest, so the two budgets could be kept separate and so it could be a self-liquidating project, and not the sort that would grow into the woodwork of FAA.

Mr. EVINS. Do you consider Mr. Bain's operation similar to that of a separate, independent agency?

SUPPORTING SERVICES FOR SUPERSONIC PROGRAM

Mr. HALABY. It is a semi-independent agency; yes, sir. I think you actually gain all of the advantages of having our general counsel, our financial and administrative support and his feeling that although he is out there, he is still a member of the family that has to develop the airways, that have to work on airports, that have to do the air traffic control, and so on.

Anyway, he is there, he has on temporary assignment 210 men. There are about 25 military officers and the remainder are civilians from NASA, DOD, CAB, etc.

Mr. OSTERTAG. Does that come out of this $60 million?

Mr. HALABY. This is of very little cost because they are all assigned by their respective bosses for this evaluation period, but the costs that are incurred by the evaluation do come out of the $60 million.

Now, they are about halfway through the evaluation and we are not in the position—because we haven't completed the work and because of competitive aspects and the need for very discreet and objective and therefore confidential dealing with these bids, to state the results of the evaluation.

COST SHARING

I can make one statement that I think Mr. Ostertag is particularly interested in and that is, although the six manufacturers propose to share costs in phase 2, which is a 12-month period from May 1964 to June 1965, where they detail out their designs and build mockups and produce some pieces of property on type components, they have offered to share in that phase, but they have declined to offer to share

25 percent in phase 3 construction and test of two prototype aircraft.

I think I said to this committee last year that it was very unlikely that they would put up 25 percent but we would try our very best, for two reasons:

1. This is a commercial project and should stand on a normal free enterprise commercial basis, and

2. Every dollar that the manufacturer puts into this project tends to give him an incentive to reduce its cost.

Mr. OSTERTAG. Wasn't there included in President Kennedy's message to the Congress, a provision that private industry must participate in the cost sharing by at least 25 percent, or the development would not proceed?

Mr. HALABY. I would like to put President Kennedy's letter in the record for the benefit of the committee.

Mr. EVINS. It may be included.

(The letter follows:)

THE WHITE HOUSE,
June 14, 1963.

DEAR MR. SPEAKER: The Congress has laid down national aviation objectives in the Federal Aviation Act of 1958. These include the development of an air transportation system which will further our domestic and international commerce and the national defense. These objectives, when viewed in the light of today's aviation challenges, clearly require the commencement of a national program to support the development of a commercial supersonic transport aircraft which is safe for the passenger, economically sound for the world's airlines, and whose operating performance is superior to that of any comparable aircraft.

Our determination that the national interest requires such a program is based on a number of factors of varying weight and importance:

A successful supersonic transport can be an efficient, productive commercial vehicle which provides swift travel for the passenger and shows promise of developing a market which will prove profitable to the manufacturer and operator.

It will advance the frontiers of technical knowledge—not as a byproduct of military procurement, but in the pursuit of commercial objectives.

It will maintain the historic U.S. leadership in aircraft development.

It will enable this country to demonstrate the technological accomplishments which can be achieved under a democratic, free enterprise system.

Its manufacture and operation will expand our international trade.

It will strengthen the U.S. aircraft manufacturing industry—a valuable national asset—and provide employment to thousands of Americans.

The cost of such a program is large—it could be as great as $1 billion for a development program of about 6 years. This is beyond the financial capability of our aircraft manufacturers. We cannot, however, permit this high cost, nor the difficulties and risks of such an ambitious program to preclude this country from participating in the logical next development of a commercial aircraft. In order to permit this participation, the United States, through the Federal Aviation Agency, must proceed at once with a program of assistance to industry to develop an aircraft.

The proposed program, though it will yield much technological knowledge, is principally a commercial venture. Its aim is to serve, in competition with others, a substantial segment of the world market for such an aircraft. While the magnitude of the development task requires substantial Government financial participation, it is unwise and unnecessary for the Government to bear all of the costs and risks. Consequently, I propose a program in which (1) manufacturers of the aircraft will be expected to pay a minimum of 25 percent of the development costs, and, in addition, (2) airlines that purchase the aircraft will be expected to pay a further portion of the Government's development costs through royalty payments.

The requirement for cost sharing by the manufacturers will assure that the cost of the program will be held to the absolute minimum. In no event will the Government investment be permitted to exceed $750 million. Moreover, the Government does not intend to pay any production, purchase, or operating subsidies to manufacturers or airlines. On the other hand, this will not exclude

consideration by the Government of credit assistance to manufacturers during the production process.

Although the Government will initially bear the principal financial burden in the development phase, participation by industry as a risk-taking partner is an essential of this undertaking. First, the development of civil aircraft should be a private enterprise effort, a product of the interaction of aircraft manufacturers and their prospective customers. We wish to change this relationship as little as possible, and then only temporarily. If the Government were the full risk taker, the degree of control and direction which it would have to give to the program, to the expenditure of funds, to the selection of designs, to the making of technical decisions, would of necessity be too great. If however, private industry bears a substantial portion of the risk, the degree of Government control and the size of the Government staff required to monitor the program can be held to a minimum.

Secondly, our objective is to build a commercially sound aircraft, as well as one with superior performance characteristics. This will require, at a relatively early stage, a determination whether the aircraft's cost and characteristics are such that it will find a commercial market. This is a difficult task, and our decision that we have succeeded in developing such a commercially sound aircraft will, in a large measure, be attested to by industry's willingness to participate in the risk taking.

If at any point in the development program, it appears that the aircraft will not be economically sound, or if there is not adequate financial participation by industry in this venture, we must be prepared to postpone, terminate, or substantially redirect this program.

Our first concern, however, must be to get the program launched. I am convinced that our national interest requires that we move ahead in this vital area with a sound program which will develop this aircraft in an efficient manner. For that reason I commend this proposal to your early attention.

I will shortly submit to the Congress a request for funds to meet the immediate requirements of this program, such as the detailed design competition. Then we will be started on the task of marshaling the funds of Government and the ingenuity and management skills, as well as funds, of American industry to usher in a new era of commercial flight.

Sincerely,

JOHN F. KENNEDY.

Mr. HALABY. I would also refer to the committee's report of last year—this committee's report to the full House—and finally to recall that just about this time last year I indicated off the record to the committee serious doubts that we could obtain a 25-percent contribution because this would risk the total net worth of any one of these three companies if the project failed after they had put in $250 million.

I recall Mr. Evins saying, "Well, you ought to try to get 35 percent."

Mr. OSTERTAG. Aside from the fact that this is a far-reaching project of development, the point remains that under the Government-industry relationship in America, as compared with other nations in the world, the aircraft industry and the airlines are on a private enterprise basis and the Government is not directly related to the operation as a business. Yet the project and the cost of development was far beyond the reach of any segment of our private enterprise, or even combinations of it, to the point where this never could happen if the Government didn't go into it. But the development is still basically within the scope of our free enterprise system here in this country. If private enterprise cannot or does not go into it to at least the tune of 25 percent, then it resolves itself into a complete Government operation. What are we going to do if we are going to pay all the costs for the benefit of the free enterprise system? Although there will be royalties involved and other benefits involved, it never will return to the U.S. Government what it has put into it. Am I right or wrong?

Mr. HALABY. The situation is, at the time, on the basis offered by President Kennedy, there is likelihood of agreement on about 25-percent industry cost sharing between the Government and the manufacturers on phase 2, only. There is no likelihood of agreement between the Government and the manufacturers on phase 3 at 25 percent. And, therefore, we are in a state of completing the evaluation to see if the projects are technically sound. Then, whether they are economically sound. And, third, the President must consider whether or not he wishes to change the formula that President Kennedy presented last summer.

You will recall that this committee——

Mr. OSTERTAG. May I say I wholeheartedly supported President Kennedy's policy on it.

Mr. HALABY. I know you did.

You said in your report to the full committee last year:

> The overall development cost is estimated to be from $700 million to $1 billion, and the Administrator is trying to work out a program whereby the industry will contribute up to 25 percent.

Then the Senate in the light of your judgment on this stated the following, and this is a sentence out of a paragraph on page 8:

> If aviation manufacturers will not assume approximately 25 percent of the development cost and the Administrator still believes it is in the public interest to proceed with the program, he is requested to advise the committee 30 days prior to the awarding of any contracts for the detailed design phase of the program.

INDUSTRY POSITION ON COST SHARING

Now, they, of course, had had the benefit of testimony subsequent to your hearings, here, by the manufacturers who frankly said they would not pay 25 percent of the total development cost. And the hearings, of course, were published and their main point is that $250 million would risk the entire net worth of one of these companies on a single project and that they felt it was unwise, an unwise risk of their stockholders' equity.

Mr. EVINS. Mr. Administrator, you are a wonderful man and we all admire you and we have great confidence in you. We hoped you would persuade them to take up 25 percent when we suggested 35, and now we have press reports that they won't pick up 10 percent. They want the Government to take 90 or 100 percent.

Mr. HALABY. I have to tell you before President Kennedy made his proposal, an industry advisory group of mine, under Gen. Orval Cook, had recommended that this formula be a much more flexible one and felt that it should be worked out in the light of how successful the test airplane proved to be.

Then Mr. Kennedy, because he wanted to bring to bear the best financial and technical talent he could locate, got Mr. Eugene Black who brought in an associate, Mr. Stanley Osborne, and they have given the President a report which I hope will be published very shortly. It is all but published now, because of many quotations from it, all of them unauthorized by the President.

Both these reports say that it is unrealistic to expect a $250 million gamble by the plane makers. So we are completing the evaluation, we are under the guidance from you and the Senate committee to re-

port and we will await the completion of the evaluation before coming to a decision.

Mr. OSTERTAG. May I add this: You have passed through zero phase and phase 1.

Mr. HALABY. Yes, sir; the study phase for which you gave us $31 million.

Mr. OSTERTAG. And you have had funds for this general purpose prior to this last year's appropriation?

Mr. HALABY. Research and study.

Mr. OSTERTAG. What I was particularly reaching for was, what has happened since a year ago when we discussed this matter and the President submitted his message and we approved your $60 mililon? It seems to me that the picture ought to be cleared up:

First of all, has the timetable of this project changed? Has the final cost of this development changed? There are many aspects to go into. For example, a recent newspaper reporter, a statement made by a prominent airline official said, "The supersonic transport program currently under study by the FAA will very likely be kept flexible for several years."

STATUS OF SST SCHEDULE

Mr. HALABY. Yes, sir. I think first with regard to the timetable we published last August 15 requests for proposals that went out to a large number of companies. We laid down a calendar in there and I am proud to say that due to the indefatigable efforts of a brilliant public servant who has worked out his heart on this, Mr. Bain, every deadline has been met to date.

We said that on September 15 we would brief the manufacturers. We did.

We said that on September 10 the airframe and engine manufacturers would tell us whether or not they were going to bid. They did. Six of them said they would.

We said that on November 15 the engine people should give the airframe people their preliminary engine designs. They did.

December 13, the airlines would tell us as to whether or not they wanted to evaluate the proposals, because we feel we are arm in arm with the airlines. They are the buyers and we, the Government, ought to be a temporary investor, only. We did. Some 10 airlines said they would like to evaluate.

On December 20 we told the manufacturers who these airline evaluaters would be.

We said back in August that the deadline for the receipt of these proposals from the airframe and engine people would be January 15. They came in. All six of them.

Mr. EVINS. You have met all of your target dates?

EVALUATION OF SST PROPOSALS

Mr. HALABY. We have met every single one and the next important one, Mr. Chairman, is the airlines evaluation of the six proposals. The are going to weigh heavily with me just as will that of my good colleagues, 200 strong down here, in their evaluation, because who is going to buy this airplane? Not the taxpayer, as I see it. The airline

stockholders are going to buy it. The stockholder will risk his money in search for profit from the operation of these aircraft.

Now, on the development cost estimates I think I can say properly without violating my responsibility, that of the three airframe proposers, one estimates the development cost lower than our $1 billion; one somewhat higher, and one substantially higher, which suggests that we were not far off. In fact, on the average of the three——

Mr. OSTERTAG. What was that $1 billion?

Mr. HALABY. $1 billion total development-and-test cost. On the average of the three we are slightly below the average estimated development cost. So we are not far off on that.

DEPOSITS RECEIVED FOR SUPERSONIC AIRCRAFT

Now, you say, "What has happened since?" Well, the most favorable thing that has happened is that TWA came in one day early last fall with a check for $600,000 and they said, "We want to make a deposit on an SST. These other fellows, Pan American, are going to France and England. We want to make a deposit with our own Government and get the first delivery positions."

Well, we never had dreamed that anybody would put down hard cash for an airplane whose construction hadn't either been authorized or appropriated or designed, but they wanted to be the first. And in the subsequent months, up to last weekend, 72 delivery positions have been sought and authorized and we have deposited in a special account of the U.S. Treasury, $7,200,000.

Now, we did this, which is normally between the airline and the manufacturer and one into which we did not want to trespass, but we did this for two reasons: The British and French were running away with the market, and as you and Mr. Boland recall, last spring, when we were there, there wasn't anyone else in the field and they were running away with it. This has blunted that program so that we now have about twice as many reservations as the British and French.

Mr. OSTERTAG. Contracts?

Mr. HALABY. No, sir. I will explain that these are not orders. We call them reservations. They are really options to purchase. They make a $100,000 deposit. They get no interest on their money.

Mr. BOLAND. Do they lose the deposit?

Mr. HALABY. They lose the deposit after November 1965, if they do not add another $100,000 at that point. They can recall it at any time up to then, but we are getting a number of complaints from those who do not like the delivery that has been allocated and they say we should never be doing this. And I say we will do it only for two reasons, to blunt the British-French sales effort and second, to set up a delivery schedule that is in the taxpayer's interest.

You say, "Who are you to judge what is in the taxpayer's interest?"

I say that one of the reasons for doing this program is to maximize our exports. So that this list is designed, sir, so as to get the maximum number of foreign sales across the Atlantic and across the Pacific.

The second reason is to show that this country can sell these aircraft, and incidentally, we did this with the full concurrence of the manufacturers. They were kind of relieved that we set up such a list, which they agreed with, so that they wouldn't have to do so painfully at a later date.

Mr. OSTERTAG. Isn't the Concorde going to be available on the market long before this development is achieved?

Mr. EVINS. No; it has been delayed.

Mr. OSTERTAG. The point is that many, or at least several American companies have negotiated business with them; isn't that true:

Mr. HALABY. Yes, sir. TWA, American, and Continental at least have placed reservations with the British-French combination, but we understand their total of reservations to be six or seven, and BOAC and France, with the concurrence of the British and French Governments, came in 2 weeks ago and handed me two checks for a total of $1,200,000.

The second thing, sir, that has occurred is that the manufacturers have formally and officially said that they could not and would not meet 25 percent of the cost of phase 3.

ADDITIONAL FUNDS AND AUTHORIZATION FOR SST

Mr. OSTERTAG. Just one more question: Last year when you requested the $60 million which we approved, did you at that time indicate or have in mind that you would require additional funds in fiscal year 1965?

Mr. HALABY. This is a very difficult question to answer. I believe I indicated informally to you—I don't recall exactly the testimony, but I believe in informal conversations I might and probably did say to you sir, that there would probably be need for a request in the fiscal year 1965 period to fund—to forward fund—the construction for the two test airplanes so that there wouldn't be any delay in the competition with the British and the French. And the President, President Johnson, not having ruled on this program since he became President, of course, is free to make whatever kind of request he decides upon.

It is possible in the light of the situation as we see it now, to go through this detailed design phase and if the Congress would act as early as April 1 of next year, could go on into phase 3 without losing any appreciable time.

Mr. OSTERTAG. What do you mean if Congress should act?

Mr. HALABY. If they would authorize and appropriate for what is estimated to be about $175 million in the first fiscal year of construction, that is, fiscal year 1966. Then it could go ahead and keep on schedule.

Mr. OSTERTAG. I think the Committee on Interstate and Foreign Commerce, as a result of their hearings on this question, determined that you had complete authority under the basic act to proceed with this development without any additional authority. Is that right?

Mr. HALABY. Chairman Harris held hearings and he listened to our statement and our General Counsel's opinion that there is in the Federal Aviation Act full authority to proceed, he discussed with the Parliamentarian whether a point of order would lie against the $60 million. The Parliamentarian felt no point of order would lie against the appropriations bill. The Commerce Committee expressed no objection and we took silence as confirming our authority to proceed. Some of the Senators, on the other hand, feel it would be desirable to have an authorizing bill. Others feel that it is unnecessary to have an authorizing bill. Of course, that is up to the Congress.

Mr. OSTERTAG. Do you mean that would be beyond the $60 million?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. From this point it might well require congressional authorization?

Mr. HALABY. The Congress might desire to have a formal authorization. It is not required.

Mr. OSTERTAG. Where does that leave us? Suppose you were here requesting another $60 million? Under the circumstances we would be in the dark as to whether we were right or wrong in making it available. I thought the whole issue was clear.

Mr. EVINS. It is always good to discuss this subject with you, sir, but it is moot in that there are no funds requested for the supersonic, at this time, and that is what I alluded to earlier. There could be a supplemental submitted later. But there are no funds in this budget at this time.

Mr. OSTERTAG. I am aware of that.

Mr. EVINS. Mr. Wyman.

AMERICAN SUPERSONIC TRANSPORT VERSUS CONCORDE

Mr. WYMAN. Mr. Halaby, are the proposals that have come in and that you are in the process of evaluating now—remembering the discussions last year with respect to a mach 3 or a mach 2—looking for an aircraft that is substantially superior to the Concorde, if it should go into production?

Mr. HALABY. If these aircraft are economically sound—that is if they will make money for the airliners who operate them—there is no question but what they are technically superior. First, they are faster. The limit of the Concorde is about mach 2.2 and even at that speed, extended cruising day after day, week after week, they will have to prove that aluminum will withstand it. Second, they are larger. The least seat capacity is 160 seats. The most is 220. Third—and these are published data, sir—the third, and I think the point that attracts the airlines who have made the reservations with us, is that the range is quite a bit longer. Our manufacturers have made or exceeded the requested range of 4,000 miles.

Now, Mr. Evins mentioned a moment ago that the Concorde was in some trouble, and there is a recent speech from the Britisher who is on the committee developing this Concorde that suggests he is trying to get more thrust out of the engines, larger wing area so that more fuel can be carried to get the longer range. We do not know but we are assuming that they are doing an outstanding job so we must, you might say, do our most outstanding work, but technically and operationally they appear to be—the best of these proposals appears to be substantially better than the French-British job.

Mr. WYMAN. Have you arrived at an opinion yourself with respect to whether there should be any reduction in the contribution from private industry in the percentage, from 25 to 15 or 15 or 10?

Mr. HALABY. I guess my personal opinion does not matter. It is what the President's decision is and what the Congress' decision is. There is one very important thing to consider in the equation. If you will recall we had a kind of situation where there were three parties. The airlines who would buy and operate the airplane and charge the

travelers for their tickets; the manufacturer who would build the airplane and deliver it to the airlines; and the Government. The principle of the proposal is a sound one, I think, in that the man who stands to gain profit from its sale should risk some of his money. That is our democratic capitalistic free services system. And usually the rule of thumb in business is you risk in accordance with your expected yield.

MARKET FOR SST

We think there will be at least a $6 billion market. Two hundred airplanes at around $30 million apiece. So he should risk something.

The taxpayer should risk something also because as Mr. Ostertag said, no individual corporation has $1 billion to risk on this. But both he and we the taxpayers get it back from the beneficiaries, the airlines and their travelers.

Mr. OSTERTAG. On royalties.

RETURN ON INVESTMENT

Mr. HALABY. Yes, sir. You might be skeptical. How would we ever get it back? I cite you two programs. The Vickers Viscount was handled this way. It is my understanding that the British Government got back its development cost and Vickers got back its total cost, plus a profit; and I have even heard, though, it was never confirmed, that the Government got a little bit of its interest on the money back. I do not know that. It would be hard to prove. We have a device, Mr. Blatt over here has developed a device, that is now being sold by the manufacturer who enjoyed FAA's investment and we are receiving royalties back from the sales to private buyers of that navigational device. So those who say it is impossible for a government ever to do anything right or to do anything in a hard, businesslike way, are just wrong, as proved by those two cases.

Now, if you believe that the royalty system is going to work, then the proportion of manufacturer's money is not as important as if you do not believe we will get it back. If you think it is going to be a flop, well, first you should not do it, but if you do, it is clear that no manufacturer is going to invest stockholders' money in a flop, and then Government would be left holding the bag.

Mr. WYMAN. If this program is ever to become a reality, assuming the evaluations show practicability, and the commercial side of it works out, this question of what the participation is to be is going to be upon us and pretty soon; is it not?

Mr. HALABY. Yes, sir. I think some of the Senators feel that before we go beyond phase 2 that the Congress should write the formula.

In other words, it should say, "We authorize not to exceed $1 billion, or $750,000 million, to be spent for the development of the supersonic transport, and the private manufacturers should contribute not less than so-and-so and so-and-so."

I guess the people who would manage such a program, and I know the industry, would not be pleased with such a rigid formula.

Mr. OSTERTAG. Perhaps we should have done that last year.

Mr. HALABY. Well, as you know, the $60 million has not been spent and it will be spent only if the evaluation, as we said before, proves that it is technically sound, economically feasible.

Mr. EVINS. All of this discussion has been very helpful and it has been informative for the members.

AGENCY TO ADMINISTER SST PROGRAM

My personal view is if we are going to go forward with this program, and this committee has already initiated it, we should not go up the hill and down the hill, we should make a firm decision and stand by it; that if we are to go forward with it, it should be under Federal Aviation Agency administration because the Department of Defense has indicated no enthusiasm for it and NASA is engaged in other activities and other work and anything succeeds, in my formula, depending upon the individual. And if you have an agency that is wrapped up in it and is enthusiastic about it and believes in it, then you can almost guarantee success. But if you have some agency that is not dedicated and not committed, then it might really be a flop and a waste. I think it is properly lodged, in my own view, in the right agency. Others may disagree.

Mr. BOLAND. Is it so that Defense is not interested any longer, or is Defense really interested now?

Mr. HALABY. Mr. Boland, I have had various discussions with the Secretary of Defense and he does not have in his current list of requirements a supersonic transport.

The moment we get the U.S. Government into buying commercial transport airplanes, we are up to not our hips, but over our ears in the thing. I do not regard it a procurement program.

Mr. BOLAND. The Congress is not going to make the final judgment here. Won't the President make the final judgment on what agency will handle this problem?

Mr. HALABY. Of course. The President in the present state of affairs, within the present laws and appropriation bills, would make the decision as to where he wanted to administer such a program.

Mr. OSTERTAG. I thought you were responsible and I thought it was delegated to FAA. Isn't that clear yet?

Mr. HALABY. At this time I am responsible for the program; yes, sir.

Mr. OSTERTAG. He has the authority under the law?

Mr. HALABY. Not only under the law, but by virtue of the President's determination.

Mr. EVINS. May I read a letter which I saw in the New York Times yesterday? It is related to this subject. It is written by Mr. William Barclay Harding.

It says:

> Both the Department of Defense and NASA for their own reasons are spending a great deal of money on the development of materials and components without which there could be no supersonic transport.

They have work that is complementing this and the article recommends the projects go forward and that FAA is the logical Agency. It is from an investment banker in New York and it can be included in the record at this point.

(The article follows:)

SUPERSONIC AIRCRAFT—COST OF FURTHER DEVELOPMENT DECLARED BEYOND INDUSTRY'S MEANS

To the Editor of the New York Times:

As a member of the Supersonic Transport Advisory Group appointed by Federal Aviation Administrator Halaby on November 21, 1961, I was exposed to all aspects of the program between the date of my appointment and May 15, 1963, when the Advisory Group turned in its report. Your editorials opposing Government-financed SST development have stimulated me to call the following facts to your attention:

Throughout the history of the United States early development and service testing of aircraft have mostly been financed by the Government through the military budget or through the National Advisory Committee on Aeronautics (NACA), now a part of the National Aeronautics and Space Agency (NASA).

This development was undertaken primarily for reasons related to national defense. When the development was sufficiently advanced, the aircraft manufacturers and the airlines applied it to the manufacture of commercial aircraft.

BEFORE COMMERCIAL PRODUCTION

The development of supersonic aircraft has not yet reached a point which would justify the manufacturers and the carriers applying it to the commercial production of SST aircraft. Further development is required and the cost of such development is beyond the means of the manufacturers and the airlines.

Both the Department of Defense and NASA, for their own reasons, are spending a great deal of money on development of materials and components, without which there could be no supersonic transport.

The Secretary of Defense and the Director of NASA do not wish to spend the additional amount required to build a flying prototype because they are concerned that Congress would take the necessary funds out of appropriations required for higher priority items—hence the SST (supersonic transport) project was assigned to FAA with the "subsidy" label clearly affixed to it.

Commercial transport aircraft have been among our most important exports in recent years. These exports have helped our balance of payments and their manufacture and sale have contributed importantly to the national economy. The SST project is urgent because our leadership is being challenged by other nations. It is important that the United States be in the forefront of commercial air transport development, whatever course it may take.

CONNOTATION OF SUBSIDY

Subsidy in this country is associated in the public mind with political support of unsound projects and unwarranted Government interference in private enterprise.

Because it has devised a theoretical formula for getting back the Government's investment, the FAA contends that subsidy is not involved in this program.

Certainly the Government does not lack the means of extracting its share of the profits of any successful venture; but there is no way of recouping the Government's investment in an unsuccessful project. Most authorities agree that this project will be successful if aggressively pursued and properly managed.

The factor which should concern us most now is the time factor. If we procrastinate too long, we shall either have to spend a lot more to make up for lost time, or we shall risk missing the market altogether.

WM. BARCLAY HARDING.

NEW YORK, *February 20, 1964.*

The writer of the above is an investment banker.

SONIC BOOM TESTS AT OKLAHOMA CITY

Mr. JONAS. Are any of these tests you are making in Oklahoma connected with this?

Aren't you running into a little trouble out there?

Mr. HALABY. Yes, sir. We will report on this program. One of the technical and operational problems of the supersonic transport is the phenomenon called the sonic boom. Whenever an aircraft exceeds approximately 100 percent of the speed of sound which at sea level is 765 miles an hour at 60° F., which is about 660 miles an hour at 30,000 feet, it emits or radiates a sound wave or pressure wave and that wave goes to the ground in the form of a sound that is like thunder. When you reach 1 pound per square foot, it is like distant thunder. When it is 1½ pounds per square foot, it is like near thunder and at 2 pounds per square foot, it is like a thunder clap right in the vicinity. At 3-plus pounds per square foot you break plate glass windows and china and plaster.

If one knew that aircraft operating across the United States would make more than 2 pounds per square foot, it would inhibit and perhaps even deter the project.

We made some tests 2 years ago, very brief and sporadic tests in the city of St. Louis. The Air Force boomed St. Louis, I think with some B–58's. Subsequently we made tests out in the desert at Edwards Air Force Base where we boomed structures and airplanes and, incidentally, Mr. Bair, we took Mr. Black and his committee out there. It was felt that we needed a more current, live test in a major metropolitan area. We went down and discussed it with the leaders of the city of Oklahoma City, their public officials and their private community leaders and they said, "Fine. We are willing. This is an air-minded city. It is a pioneering kind of city."

We worked up a program extending over 26 weeks, starting out with 1 pound per square foot by an Air Force fighter. We instrumented several houses to have a reference point to see whether any plaster was really being broken and so on, and so forth. We have some psychologists and opinion gatherers down there. We have had the cooperation of the community and we have been at it now some 3 weeks.

The day before yesterday the city council which had previously declined a motion to resolve to discontinue these tests, voted a tentative resolution that the FAA cease and desist. We have not received that resolution and we understand that other parts of the community are now protesting this resolution.

We have had one, as of my last knowledge, lawsuit. A petition for injunction by a man, I think he is a local plumber, who incidentally ran against Senator Monroney in the primary of 1962 and his petition says that his daughter's hearing was impaired by these 1-pound-per-square-foot booms. We have a man on the spot to receive claims. As far as I know we have not had a formal claim for damages and at the 1-pound-per-square-foot level we believe we can prove that the boom would not cause damage or injury.

Mr. JONAS. The plane you have in mind, what would it produce?

Mr. HALABY. We propose that it not exceed 1½ pounds per square foot.

Mr. WYMAN. Is there any possibility that after you went through your $1 billion, if it was to cost that figure and actually produced a supersonic transport, and found that in flight there might be enough of a boom problem developed to render it economically unfeasible, it is possible that you could not have tested this out in a wind tunnel or otherwise?

Mr. HALABY. I could not guarantee, Mr. Wyman, that this could not happen. I can say that all of the tests so far—and they are very extensive—both in wind tunnels at NASA, at Ames, and at Langley where they have extrapolated data, the military flights, all of the manufacturers' estimates are that 1½ pounds, which will be like thunder, would be the maximum that it should be designed to make in climb and cruise and that that would be tolerable.

What the public will tolerate in 1975 is awfully hard for any individual to gage in 1964.

SUMMARY OF BUDGET ESTIMATES

Mr. EVINS. This has all been very fine and we thank you very much. Let us now get into the working parts of the budget.

TOTAL FAA EMPLOYMENT AND PERSONNEL COSTS

We will place in the record, Mr. Reporter, page 2, volume 1; this is the summary sheet on personnel.

(The page follows:)

Schedule of permanent positions

Grade	1964		1965	
	Department	Field	Department	Field
Statutory	2		2	
Special	18	3	18	3
Scientific	11	4	11	4

Total	3,756	43,355	3,150	43,207

Total cost of personal services

	1964	1965
Operations	$401,301,000	$418,398,600
Research and development	12,891,600	12,825,700
Facilities and equipment	15,853,000	17,480,144
Operation and maintenance, Washington National Airport	2,583,900	2,567,600
Operation and maintenance, Dulles International Airport	2,696,400	3,214,000
Construction, Washington National Airport	119,608	125,601
Construction, Dulles International Airport	19,763	20,203
Civil supersonic aircraft development	639,000	1,465,000
Total	436,104,271	456,096,848

GENERAL STATEMENT

Mr. EVINS. The general statement on pages 4, 5, 6, and 7 will be included.

(The pages follow:)

GENERAL STATEMENT

Aeronautical services are provided by the Federal Aviation Agency under authority of several statutes, the more important of which are identified below:

1. The Federal Aviation Act of 1958 created the Federal Aviation Agency and provides for the regulation and promotion of civil aviation so as to foster its development and safety and to assure the safe and efficient use of the airspace by both civil and military aircraft.

2. Public Law 674, 76th Congress, authorizes the operation of the Washington National Airport, and Public Law 762, 81st Congress, authorizes the construction and operation of Dulles International Airport.

3. Public Law 377, 79th Congress, Public Law 211, 84th Congress, Public Law 86-72, and Public Law 87-255 provide for Federal aid in the development of public airports.

4. The International Aviation Facilities Act enacted to encourage the development of an international air transportation system adapted to the needs of the foreign commerce of the United States, of the postal service, and of the national defense, and for other purposes.

The declaration of policy for the Administrator, which is section 103 of the Federal Aviation Act, summarizes effectively the objectives we wish to attain.

SEC. 103. In the exercise and performance of his powers and duties under this act the Administrator shall consider the following, among other things, as being in the public interest:

(*a*) The regulation of air commerce in such manner as to best promote its development and safety and fulfill the requirements of national defense;

(*b*) The promotion, encouragement, and development of civil aeronautics;

(*c*) The control of the use of the navigable airspace of the United States and the regulation of both civil and military operations in such airspace in the interest of the safety and efficiency of both;

(*d*) The consolidation of research and development with respect to air navigation facilities, as well as the installation and operation thereof;

(*e*) The development and operation of a common system of air traffic control and navigation for both military and civil aircraft.

In performing services essential to present-day aviation and its growth, the Agency operates and maintains a national network of air navigation aids and controls civil and military air traffic 24 hours a day; regulates the use of navigable space; certifies as to the competency of airmen and airworthiness of aircraft; procures and installs improved aids to the air navigation; conducts research and development to improve and modernize aviation facilities and procedures; administers a Federal grant-in-aid program for a national system of airports; promotes and regulates the mental and physical fitness of airmen; conducts aviation medical research; constructs and operates airports in the National Capital area and certain other special locations; and carries on other related activities designed to promote air commerce and safe and efficient aviation.

The enactment of the Federal Aviation Act and the creation of the Federal Aviation Agency have provided the framework and authority needed to deal effectively with the needs of aviation. The effectiveness of these measures are, however, dependent upon the continued provision of the resources required to keep pace with an evermore demanding job. Beginning in 1957, the level of appropriation for functions now carried on by the Federal Aviation Agency has been increased to provide facilities and services at a rate which has permitted substantial and encouraging progress in improving and augmenting present air navigation and traffic control systems and in rendering services essential for safety and efficiency in air operations.

Further, the role of the Federal Government with respect to research and development has been recognized and implemented with appropriations support. This concerted effort must be continued and its success is also heavily dependent on the availability of adequate resources.

Aviation is one of the major industries of the United States. The workload of the Federal Aviation Agency as generated by this industry is not controllable by the Agency, but in large measure results from the requirements associated with air-defense and with the growth of civil aviation. Increasing density of air traffic and the increasing use of high performance aircraft pose serious problems, and we must be continuously increasing our capabilities to handle the workload. All Agency workload indicators continue to reflect increases in 1965 and 1963. Some of the more significant of these are: an increase of 11 percent in aircraft operations at FAA towers; a 6-percent increase in IFR aircraft handled through air route traffic control centers. Another indicator of aviation activity is that of fuel consumed, as this is a reflection of the numbers of aircraft in the system as well as the size and complexity of the aircraft. This indicator reflects a 15-percent growth in 1965 over 1963. It is also expected that the public will fly 53 billion passenger miles in 1965, which is an increase of 15 percent over 1963.

The 1965 request contains estimates for all Agency appropriations except those for civil supersonic aircraft development and for new obligational authority for Federal aid to airports. No additional funding is being requested for the supersonic program until completion and evaluation of the design phase of the program. For the grant-in-aid program, the 1965 request contains $7 million for funds to liquidate obligations incurred under contract authorization previously approved. However, no funds have been requested at this time for new obligational authority for the 1965 program. At present, enabling legislation is before the Congress which will authorize a continuation of the Federal-aid-to-airports program for the years 1965 through 1967. As soon as this legislation is enacted, a request will be transmitted to the Congress for additional funding for the years 1965 and 1966. This would again get the Agency on a 2-year advance funding basis.

The budget presented herein is intended to meet the ever-continuing demands of the aviation industry and of the military for air traffic control and navigation services. However, through the improvement of manpower utilization, the Agency hopes to effect economies which will reduce to a minimum the requirements for the proper execution of responsibilities placed upon this Agency. For those appropriations for which funds have been requested in both 1964 and 1965, the Agency is requesting $15 million less in 1965 than was appropriated in 1964. In addition, the estimate contains a request for over 750 fewer positions than will be required in fiscal year 1964.

These estimates, which have been prepared to reflect the firm requirements for meeting the Agency's statutory responsibilities, are influenced by the following principal factors:

Commissioning certain new facilities and services authorized for establishment under prior years' "Facilities and equipment" appropriations.

2. Savings in manpower and cost associated with the Washington staffing reduction and with planned improvements in employee productivity.

3. Implementation of the revised pay scale under phase II of the Federal Salary Reform Act of 1962.

4. Continuing effort in research, development, and testing to improve the equipments and techniques being utilized in assuring safety in aviation.

5. Establishing additional facilities in phase with the Federal Aviation Agency long-range program.

In the discharging of Agency responsibility, the Federal Aviation Agency must be responsible to the needs of the aviation activity of the Nation. The following data reflects some of the activity which has an impact upon the Agency workload and which has had an impact upon Agency estimates contained in this submission.

SUMMARY OF APPROPRIATIONS

Mr. EVINS. We have discussed this at length but we will go over some of the items hurriedly. The number of permanent positions in operation for 1964 is shown at 42,979, and for 1965, 42,386, or a difference of 593 positions. This is page 9. There is a decrease of 593 positions in operations, whereas the appropriation is up from $528 to $549 million, or a $21 million increase.

I believe this has been attributed in part to the pay raise increase. Are these other factors beyond that? Salary increases, in-grade promotions.

Mr. HALABY. Yes, sir. The other item is $11.7 million for maintaining and operating new facilities coming into our system as the result of prior year purchases with prior year "Facilities and equipment" appropriations, and the assumption of costs for military facilities transferred to FAA for common system use.

Mr. EVINS. The facility budget is reduced from $100,250,000 to $75 million, or a decrease of $25,250,000.

Mr. HALABY. Yes, sir.

Mr. EVINS. The research and development budget is up $2 million as previously discussed.

Then regarding the Washington National Airport, the number of permanent positions remain the same. But here again we have an appropriation estimate increase from $3,581, to $3,631, or about a $50,000 increase.

Mr. OSTERTAG. That is primarily due to the pay raise, is it not?

Mr. ALEXANDER. That is correct.

COMPARISON OF 1964 AND 1965 BUDGETS

Mr. EVINS. Insert the summary of budget estimates on pages 9 and 10.

(The pages follows:)

Summary of budget estimates, fiscal year 1965

Appropriation	1964	1965	Difference
Operations:			
Number of permanent positions	42,979	42,386	−593
Appropriation or estimate	$528,000,000	$549,000,000	+$21,000,000
Facilities and equipment:			
Number of permanent positions	1,925	1,925	
Appropriation or estimate	$100,250,000	$75,000,000	−$25,250,000
Research and development:			
Number of permanent positions	1,279	1,089	−190
Appropriation or estimate	$40,000,000	$42,000,000	+$2,000,000
Operation and maintenance, Washington National Airport:			
Number of permanent positions	417	417	
Appropriation or estimate	$3,581,500	$3,631,000	+$49,500
Operation and maintenance, Dulles International Airport:			
Number of permanent positions	408	437	+29
Appropriation or estimate	$3,985,000	$4,619,000	+$634,000
Construction, Washington National Airport:			
Number of permanent positions	12	12	
Appropriation or estimate	$2,075,000	$1,800,000	−$275,000
Construction, Dulles International Airport:			
Number of permanent positions	2	2	
Appropriation or estimate	$450,000	$200,000	−$250,000
Civil supersonic aircraft development:			
Number of permanent positions	89	89	
Appropriation or estimate	$60,000,000		−$60,000,000
Grants-in-aid for airports (liquidation of contract authorization): Appropriation or estimate	$20,000,000	$7,000,000	−$13,000,000
Total, all appropriations:			
Number of permanent positions	47,111	46,357	−754
Appropriation or estimate	$758,341,500	$683,250,000	−$75,091,500
Grants-in-aid for airports: Appropriation or estimate	[1] $75,000,000		−$75,000,000

[1] $75,000,000 appropriated in permanent legislation for 1964. Legislation for 1965 proposed for separate transmittal.

Mr. EVINS. The operation of the Dulles International Airport goes up in personnel and in amounts; 408 people are employed out there and you are projecting 437 people for next year, 1965, or a 29 increase in positions.

Mr. HALABY. Part of that, sir, is pay raise and part of it is 29 additional people to maintain the airport. We budgeted fewer than Mr. Hobbs has found that he needed.

Mr. EVINS. We will go into the details of the Dulles Airport later.

Washington National Airport, the positions remain the same. Construction at Dulles remains the same. On the supersonic transport program you are employing 89 people. This is under the direction of Mr. Gordon Bain.

Mr. OSTERTAG. I don't mean to return to the supersonic issue, but I notice here it shows an assignment of 89 positions. I thought you gave a higher figure than that.

Mr. HALABY. I gave the figure of 210 temporarily assigned from January 15 to about March 15 for evaluation. They are all assigned by other Government agencies.

Mr. OSTERTAG. They are not on your payroll?

Mr. HALABY. No, sir; they are not.

Mr. OSTERTAG. But there are 89 directly for permanent positions?

Mr. HALABY. Yes. Our actual employment is lower than that. We only have 28 people now at the end of January and we seek authorized strength of 89 and that would not be reached until later in the year.

Mr. EVINS. Grants-in-aid for airport liquidation funds is shown at $7 million as against $20 million last year or a reduction of $13 million. We understand additional legislation in this field will be considered perhaps during this session and this was another item that indicates there might subsequently be a supplemental.

Mr. HALABY. We understand there is a possibility of the Senate and the House taking the matter up tomorrow, but we don't know. The conferees agreed last night.

Mr. OSTERTAG. You mean on the airport bill?

Mr. HALABY. The Federal airport bill. We hope we will be able to present the case before you make your report.

Mr. OSTERTAG. That legislation is necessary to be enacted into law before we could make the supplemental funds available.

Mr. HALABY. Yes, sir.

Mr. EVINS. The item referred to liquidation of contract authorization and the other would be new authorization.

This brings us again to the number of permanent positions reduced from 47,111 to 46,357 or a reduction of 754 for a total appropriation estimate of $683,250,000 as against $758,341,500 for last year, or a reduction of $75 million.

The supersonic transport, the grants-in-aid to airports and contract liquidations are the items that make up the reductions whereas other items are increased.

We will move into operations.

Appropriation (adjusted)	488,187	527,864	549,000

Mr. Evins. Mr. Reporter, place the table on page 22, and pages 23 through 29 in the record.

(The pages follow:)

General Statement

This estimate provides for the continuing requirements for the Federal Aviation Agency, primarily: (1) the operation on a 24-hour daily basis of a national air traffic management system; (2) the maintenance of a national system of aids to air navigation, and the direction and engineering for the establishment of air navigation facilities; (3) flight standards activities to assure compliance with the civil air regulations designed to assure safety in aviation; (4) the development of standards, rules, and regulations governing the physical fitness of airmen, and the direction and administration of an aviation medical research program; (5) the direction, evaluation, and administration of the research and development program; and (6) the Federal efforts to develop a national system of airports, including supervision of grants-in-aid for airport construction.

The 1965 estimates for the "Operations" appropriation are designed to effectively fulfill the Agency's responsibilities outlined above and to assure public safety as it is affected by aviation. A determined effort has been made, however, to accomplish these objectives as economically as possible, both in terms of staffing and funding resources.

The following table reflects the program as proposed in this budget:

	1964	1965	Difference
Positions	42,979	42,386	−593
Amount (in millions)	$527.9	$549.0	+$21.1

Specifically, the 1965 Agency estimates reflect a staffing decrease of 593 positions from 1965. This reduction in staffing is to be accomplished through concerted management efforts to improve employee productivity and to eliminate all but essential operations. To this end the Agency has curtailed Washington headquarters staffing by a total of 610 positions, deleted more than 1,000 positions for continuing activities in regions and field establisments in anticipation of increased employee productivity, and has not requested new positions for additional workload arising from increased aviation activity. Thus, despite the added requirements associated with the commissioning of new facilities, the Agency estimates have for the first time since 1954 shown a reduction in positions from those required in the previous year.

The funding request for 1965 reflects an additional requirement of $21 million. This amount is needed to finance the operating and maintenance costs of new facilities which are to become operative during fiscal year 1965. The request also includes additional funding to finance phase II of the salary increases authorized under the Salary Reform Act of 1962. Because of a manpower savings identified above, and through other economies in overtime, training, travel, and aircraft operating costs, the Agency has been able to offset all added costs associated with the continuation in 1965 of the new facilities and programs started in 1964 and added salary costs arising from the reclassification of employees to higher grades and within-grade salary increases effective in 1965. The following table highlights the major areas of change affecting the fiscal year 1965 request for funding of the operations appropriation.

	In millions
1964 appropriation (adjusted for GSA transfer)	$527.9
New programs	11.7
Phase II pay increases	9.3
Other pay adjustments	5.8
Other cost adjustments	—5.7
1965 request	549.0

The new programs, amounting to $11.7 million, involve the assumption of operating and maintenance costs associated with 10 long-range radars, 8 of which are currently operated by the Department of Defense, which will be used on a common-system basis for both civil and military purposes in fiscal year 1965. Also included under the new program are necessary resources for the maintenance and operation of towers and other terminal facilities to be commissioned during 1965 and which have been funded under congressional approval granted in prior years under the facilities and equipment appropriations. The important new facilities that will be commissioned, including those military facilities which will be transferred to FAA during 1965, are the following:

	Number
Long-range radars	10
Terminal radars	6
Air traffic control radar beacons	33
Traffic control towers and combined station/tower	20
Remote air-ground peripheral communications outlets	25
Doppler direction finder equipments	103
Limited remote communications outlets	29
Short-range navigation facilities	247
Instrument landing systems	8
Approach light systems	22
Runway end identification lights	32
Visual approach slope indicators	12
Low/medium frequency facilities	12

The other major cost element requiring increased funds in our 1965 request for this appropriation is phase II of the Salary Reform Act of 1962. General salary increases which went into effect in January of 1964 add $9.3 million to the Agency's "Operations" appropriation requirements.

This estimate also includes four positions and associated funding for emergency procedures functions assigned to the FAA by Executive Order 11003, dated February 16, 1962. These functions were funded in 1964 by an allocation from the Office of Emergency Planning.

In summary, this operations appropriation estimate is geared to the proper fulfillment of the Agency's responsibilities in meeting the demands for service arising from the civil and military aviation community. The estimates have undergone careful scrutiny, reflecting major economies already instituted and demanding further stringent cost-reducing actions. They strike a prudent balance between achievement of cost reductions and maintaining adequate levels of service to assure safety and efficiency in the air transportation system.

Summary of program requirements by activity

Activity	1964 appropriation		1965 estimate		Difference	
	Positions	Amount	Positions	Amount	Positions	Amount
Operation of traffic control system	20,069	$209,790,000	19,965	$217,054,000	−104	$7,264,000
Facility installation and technical support	3,288	70,981,000	3,056	74,147,000	−232	3,166,000

Other pay adjustments		2,481,000
Other cost adjustments	−345	−1,733,000
Staff and supporting services	−21	705,000
Total changes	−104	7,264,000

General Justification

This activity covers the operation of a national system of air traffic control and flight service facilities on a 24-hour basis to assure safety, reliability and regularity of all weather flight operations. In fiscal year 1963, this system controlled a daily average of 80,000 landings and takeoffs; 27,900 instrument rule flights; and 52,900 flight services. In addition, the system was responsible for the safety of an average of 193,700 revenue passengers daily in the United States.

Principal air traffic control and flight service facilities whose operations are financed by this estimate are:

	Operating June 30, 1963	Operating June 30, 1964	Operating June 30, 1965
1. Air route traffic control centers for the control of air traffic under instrument flight rule conditions over extensive geographical areas:			
Air route traffic control center	28	27	24
Combined center/tower	1	1	1
Combined center/radar approach control	3	3	3
Long-range radar [1]	72	[2] 82	92
Center computer equipment	5	5	5
2. Airport traffic control towers for the control of aircraft on and around airports:			
Airport traffic control tower	205	210	229
Combined station/tower	67	66	66
Airport surveillance radar [3]	71	76	80
Precision approach radar	30	31	32
Radar approach control	38	36	35
Long-range radar [4]	1	1	1
3. Flight service stations to relay air traffic control information and provide other flight assistance to pilots, including military flight service: Flight service stations	335	332	332
4. International flight service stations to relay air traffic control information and provide other flight assistance for flights along international routes: International flight service stations	11	13	13

[1] Includes facility at Honolulu which is maintained by military in fiscal years 1963 and 1964. Joint DOD/FAA maintenance responsibility fiscal year 1965.
[2] Includes military facility at Saratoga Springs, N.Y., assumed for maintenance in 1965.
[3] Excludes terminal radar (ASR) service at Raleigh-Durham which is provided from Benson long-range radar.
[4] Provides terminal radar service at Norfolk.

AIR TRAFFIC ACTIVITY

Air traffic activity for centers and towers during fiscal year 1963 continued to increase slightly, although somewhat behind earlier Agency forecasts, while flight service station activity increased at a faster rate. Overall trends in activity are reflected in the table below.

Volume of activity

[In millions]

Facility	Type of activity	Fiscal year				Average percent change		
		1962	1963	1964 [1]	1965 [1]	1962–63	1963–64 [1]	1964–65 [1]
Centers	IFR aircraft handled.	10.1	10.2	10.6	10.8	+1	+4	+2
Towers and combined station/towers.	Aircraft operations	27.4	29.2	30.9	32.5	+7	+6	+5
	Instrument operations.	6.8	7.0	7.3	7.6	+3	+4	+4
Station and combined station/towers.	Flight services	17.8	19.3	20.6	21.7	+8	+7	+5

[1] Forecast.

Mr. EVINS. Control towers have an increase in positions by 127. An increase from $64.7 to $69 million.

Isn't that a little high, Mr. Administrator, when you are supposed to be leveling off?

Mr. HALABY. Well, sir, if the traffic that we have to serve would level off, I would say we would not need additional people, but as we pointed out, it is increasing at a rate of 5 to 10 percent and therefore the operations are coming in and the number of new sites that we need to man has increased. If you look at the bottom of page 33, and if the committee wills, I would urge that that table be put in the record, because that is the basis for the increase, the increased volume of activity. It is simply as the demand for services increases, there is a need for additional people. For example, the 19 new towers that are now around the country use 135 people. These towers you would find listed at page 41 in the presentation.

Mr. EVINS. We will place page 40 in the record at this point.

(The page follows:)

Airport traffic control towers

	1964 appropriation	1965 estimate	Difference
Permanent positions	6,248	6,375	+127
Amount	$64,710,000	$69,512,000	+$4,802,000

The terminal area subactivity has as its basic facility the airport traffic control tower. Other facilities at the terminal areas (although not at all terminal areas) include airport surveillance radar, precision approach radar, approach lighting, instrument landing systems, and various visual aids and radio navigation facilities. The objective of the terminal air traffic control system is to provide for the safe, orderly, and expeditious movement of air traffic in the immediate vicinity of the airport.

The 1965 estimate for this activity requires an increase of 127 positions and $4,802,000 in order to provide $641,000 and 169 positions for new program, $1,604,000 for salary costs required by phase II of the Salary Reform Act of 1962, $1,165,000 for within-grade and grade-to-grade increases effective in 1965, and a net increase of $1,392,000 required chiefly with additional man-years of workload associated with new towers and radars commissioned in 1964, as well as for added costs associated with reallocations, within-grade and grade-to-grade salary increases effective in 1964. These salary increases have been offset in part by savings relating to an improvement in employee productivity and other reasons. Further detail concerning the new program follows:

New programs, 169 positions, $641,000

New terminal control facilities scheduled for operation in fiscal year 1965 will require 169 positions—135 positions for 19 new towers at airports where the volume of traffic meets or is expected to meet the established criteria of 24,000 annual itinerant operations and 34 positions for 4 new airport surveillance radars.

Mr. EVINS. The Administrator wishes to state for the record that there will be 19 new towers at airports needed to handle the volume of traffic in the next year. Look at the table at the bottom of page 33. This is already in the record. This relates to the activity of the entire air traffic control system.

Explain this table please, Mr. Administrator.

Mr. HALABY. This means that the first line, at the bottom of page 33 in the table, it shows that the centers handled IFR aircraft in terms

of 10,100,000 services in 1962 and estimated 10,800,000 services in fiscal year 1965; that the towers and combined service stations and towers handled in 1962, 27 million aircraft operations and in 1965, 32½ million aircraft operations, a 5-percent increase, and the flight service stations which we talked about earlier performed 17,800,000 services in 1962 and 21,700,000 services in 1965.

Mr. EVINS. You are going to open 19 new towers and reduce how many service stations?

Mr. HALABY. Well, we will open 19 new towers with the fiscal year 1965 money. We recently announced the closing of 42 service stations. We believe there are some additional service stations, the number not yet decided upon, which could be consolidated.

Mr. EVINS. You state on page 34 that there is an overall net reduction of 104 positions for operation of the traffic control system.

I do not quite see that when you are asking for 127 more in this particular work; 127 position increases are asked on page 31 and on page 34 you say there is an overall reduction of 104 positions. They do not gibe. Can you reconcile those two figures?

Mr. HALABY. In the area of centers we reduced positions by 5; flight service stations by 37; system supervision and services, 58 decreases; direction, planning and evaluation, 93 decreases; centralized training, 17 less; staff and supporting service, 21 less; and then we add 127 in the control towers because they are needed at new locations. The net decrease is 104.

Mr. EVINS. You are right.

We will place in the record pages 38, 42, 43, 44, 45, 47, and 83, and turn next to the "Facilities installations and technical support."

(The pages follow:)

Air route traffic control centers

	1964 appropriation	1965 estimate	Difference
Permanent positions	6,950	6,945	−5
Amount	$71,787,000	$71,970,000	+$183,000

The en route air traffic control subactivity has as its major elements the air route traffic control centers, long-range radars, and direct controller-pilot voice communications. The objective of the en route air traffic control system is to provide for the safe, orderly and expeditious movement of instrument flight rules (IFR) air traffic, along the airways and in positive control areas.

The 1965 change in requirements for traffic control centers reflects a net increase of $183,000 resulting from added costs associated with pay requirements and new program costs offset by savings due chiefly to center consolidations and to manpower savings through the increased use of computers in centers. Included in the salary increases is $1,774,000 to provide necessary salary adjustments required by phase II of the Salary Reform Act of 1962, and $459,000 for within-grade salary increases effective in 1965. In addition, new programs require an additional 86 positions and $327,000. The new program requirements will be described below.

Offsetting these increases is a net saving of 91 positions and $2,377,000 resulting chiefly from savings due to (1) the consolidation of centers, and (2) the more widespread use of computers with a resultant saving in manpower.

New programs, 86 positions, $327,000

This item provides for the additional personnel needed to man 10 new long-range radar outlets which will be ready for service during fiscal year 1965. The radar locations and the control center to which radar information will be remoted are as follows:

Flight service stations

	1964 appropriation	1965 estimate	Difference
Permanent positions	4,616	4,579	−37
Amount	$42,083,000	$44,617,000	+$2,534,000

The flight service station portion of the enroute air traffic control system consists of an extensive network of landline teletypewriter circuits, point-to-point radio circuits, air-ground radio channels, and related equipment for the exchange of air traffic control information and flight assistance services. In addition to their primary function of air-ground communication to provide flight assistance service, the stations control and monitor the national air navigation system and the point-to-point communication systems essential to the national air traffic control system and the safe and expeditious movement of all air traffic. Additional functions include flight assistance services such as preflight pilot briefing; issuance of information and advice to aircraft during flight; assistance of aircraft in difficulty; initiating search and rescue action; issuance of information to aircraft using airports where airport traffic control service is not provided (airport advisory service); the handling of flight plan and arrival messages; issuance of "Notices to Airmen," and participation in the U.S. Weather Bureau weather observation program.

The increase of $2,534,000 for 1965 provides seven positions and $26,000 for new programs, $1,041,000 for salary costs associated with phase II of the Salary Reform Act of 1962, $769,000 for grade-to-grade and within-grade salary increases effective in 1965, and a net increase of $698,000 related chiefly to (1) additional man-years of workload associated with high-speed teletypewriter centers commissioned in 1964 and (2) added salary costs associated with grade-to-grade and within-grade promotions effective in 1964. The increase of $698,000 reflects a reduction of 44 positions and associated costs through an estimated improvement in employee productivity as well as facility remotings.

New programs, seven positions, $26,000

This item provides additional operations personnel necessary to man a separate domestic station where a combined station/tower facility now exists.

System supervision and services

	1964 appropriation	1965 estimate	Difference
Permanent positions	685	627	−58
Amount	$10,496,000	$10,135,000	−$361,000

Under this heading are included personnel, primarily in the regional headquarters offices, who perform facility supervisory functions of a day-to-day nature, and other personnel who perform operational coordinating functions having national implication. Services performed by these personnel include, but are not specifically limited to (1) matters dealing with utilization of the airspace; (2) the writing of regulations and procedures; (3) arranging for airport and airways obstruction surveys; (4) collecting, validating, and disseminating flight information media; (5) maintaining liaison with military commands; and (6) investigation of accidents involving the military.

The 1965 estimate reflects a reduction of 58 positions and $361,000. This decrease is largely the result of savings forecast as a result of improvement in employee productivity. The decreases of 58 positions and $620,000 under this subactivity have been in part offset by the requirement for an additional $206,000

for salary increases required by phase II of the Salary Reform Act of 1962 and $53,000 for within-grade salary increases effective in 1965. No new program items are requested under this heading.

Direction, planning, and evaluation

	1964 appropriation	1965 estimate	Difference
Permanent positions	331	238	−93
Amount	$3,963,000	$3,429,000	−$534,000

Washington headquarters personnel who are responsible for providing top level planning and direction, defining program objectives, formulating standards, and evaluating the effectiveness of regional operations are included under this heading.

The 1965 request reflects a reduction of 93 positions and $534,000. This saving is largely due to the reduction in Washington staffing. The estimated total savings of $642,000 has been partly offset by an increased requirement of $85,000 for salary costs associated with phase II of the Salary Reform Act of 1962, and $23,000 for within-grade increases. No new program items are requested under this heading.

Centralized training program

	1964 appropriation	1965 estimate	Difference
Permanent positions	203	186	−17
Amount	$3,219,000	$3,154,000	−$65,000

The FAA mission requires that the Agency hire a work force of highly skilled, specially trained technicians for its predominantly technical work programs. Generally personnel possessing skills for and familiarity with Agency programs and equipment are not available outside the Agency. Formalized training courses, which span virtually all fields of the aviation industry in which the Agency is involved, are conducted largely on a centralized basis at the FAA Academy located at Oklahoma City, Okla., but training facilities are provided also at certain other geographic locations where there are significant concentrations of employees. In support of its technical work programs the Agency also conducts a management and general training program, and a program for development and improvement of instructional methods, procedures, and techniques. In summary, the major items of cost which are consolidated in the centralized training program include the following: cost of instructor staff and related services, facilities, supplies, and equipment; student travel costs; out-of-agency training costs; and cost of planning, supervision, and direction of training programs.

That portion of the centralized training program which has been established for the training of employees in air traffic control specialties is financed directly under this heading. Included also is a proportionate share of the cost of conducting management/general training and training developmental activities, and the indirect costs related to planning, supervision, and direction of training programs.

The portion of the centralized training program included in the operation of air traffic control activity provides for a net reduction of 17 positions and $65,000 from the 1964 level. This decrease is the net savings after program decreases totaling $184,000 have been offset by an increase of $66,000 for new program costs, $41,000 for salary costs associated with phase II of the Salary Reform Act of 1962, and $12,000 for within-grade and grade-to-grade promotions anticipated in 1965. The requirements for the new program increase are described below.

New program, $66,000

Employee turnover and new programs in 1965 will generate a requirement for training a higher number of employees at the FAA Academy in ATC terminal operations and in facility administration. With partially offsetting reductions in other course enrollments, there remains a requirement for $66,000 in additional travel funds to provide training at the required level.

Staff and supporting services

	1964 appropriation	1965 estimate	Difference
Permanent positions	1,036	1,015	−21
Amount	$13,532,000	$14,237,000	+$705,000

This program reflects the proration to this activity of the consolidated costs and staffing of those functions dealing with the direction and control of programs and policies; coordination of international civil aviation programs; legal services management improvement; budgeting; financial reporting; accounting for funds; payrolling of employees; personnel activities; security; and other services of a general housekeeping nature, including mail distribution, printing, and duplicating. In addition this item provides for headquarters space costs, administrative supplies, communications, and telephone expenses at regional and Washington headquarters operations.

The programs categorized under this activity are wholly financed under the operations appropriation. The basic services performed by the various program units extend to all agency operations including those programs funded under operations as well as the appropriations for facilities and equipment, grants-in-aid for airports, research and development.

Workload formulas are used for determining staffing needs in a number of operations, such as payrolling, accounting, and auditing. In those areas where the work performed is primarily of a nonrepetitive nature the determination of manpower requirements is based on workload trends, past performance, as well as foreseeable new requirements. In the past these factors have been used to maintain a reasonable balance in the growth of staff and supporting activities.

The 1965 increase for this function will provide $189,000 for required pay increases associated with phase II of the Salary Reform Act of 1962, and $58,000 for additional within-grade costs. Also included are 18 positions and $594,000 for the pro rata share of the new program costs financed under this heading. The above costs have been in part offset by a reduction of $136,000 and 39 positions resulting largely from improvement in employee productivity.

JUSTIFICATION BY OBJECT

Summary

	1964 appropriation	1965 estimate	Difference
Permanent positions	20,069	19,965	−104
Personnel compensation and benefits:			
Personnel compensation	$185,307,300	$192,107,800	$6,800,500
Personnel benefits	13,267,400	13,871,300	603,900
Total, personnel compensation and benefits	198,574,700	205,979,100	7,404,400
Other objects:			
Travel and transportation of persons	3,708,700	3,634,200	−74,500
Transportation of things	1,015,000	981,000	−34,000
Rent, communications, and utilities	2,722,900	2,939,100	216,200
Printing and reproduction	374,700	373,500	−1,200
Other services	963,100	850,400	−112,700
Services of other agencies	1,638,400	1,533,700	−104,700
Supplies and materials	627,000	628,400	1,400
Equipment	535,900	505,000	−30,900
Total, other objects	11,585,700	11,445,300	−140,400
Deduct quarters and subsistence charges	−370,400	−370,400	
Total, all objects	209,790,000	217,054,000	7,264,000

Facility Installation and Technical Support

Mr. Evins. We will place the chart on page 98 in the record and the justification on pages 99 through 101. This is facility installation and technical support still under the Operations appropriation.

(The pages follow:)

Facility Installation and Technical Support

Requirements

	1964 appropriation		1965 estimate		Difference	
	Positions	Amount	Positions	Amount	Positions	Amount
Engineering	711	$8,228,000	613	$7,525,000	−98	−$703,000
Materiel and procurement	1,985	34,148,000	1,862	35,705,000	−123	+1,557,000
Leased commercial services	.....	20,940,000	.....	23,272,000	.....	+2,332,000
Planning, direction, and evaluation	185	2,058,000	181	2,128,000	−4	+70,000
Centralized training program	62	1,101,000	62	775,000	.....	−326,000
Staff and supporting services	345	4,506,000	338	4,742,000	−7	+236,000
Total	3,288	70,981,000	3,056	74,147,000	−232	+3,166,000

Facility Installation and Technical Support

General Justification

The major objectives of this activity are to provide for (1) direction of engineering services related to the acquisition, installation and modification of air traffic control and air navigation facilities and equipment, and (2) the Agency's procurement, contracting, and materiel management programs. This activity also includes the supply support and leased commercial services for the traffic control system and supply support for Agency aircraft except for aircraft related to the research and development program.

The FAA and the Department of Defense have cooperated in an effort to reduce the cost of communications services. Estimated Agency savings of $6.3 million have been reflected in leased line costs due to telpak arrangements.

The estimate of $74,147,000 for the fiscal year 1965 provides for services necessary to the support of operating air navigation and air traffic control facilities and equipment, and additional resources for leased commercial services and the procurement of supplies and materials for the facilities being added to the traffic control system and the operation of new aircraft. This estimate contemplates savings resulting from increased productivity and manpower utilization and reductions resulting from discontinuance of nonessential facilities and services.

The fiscal year 1965 funding requirements to provide for continuation of the facility installation and technical support program are summarized below:

	1964	1965	Difference
Positions	3,288	3,056	−232
Amount	$70,981,000	$74,147,000	+$3,166,000

The 1965 staffing for the program will be reduced by 232 positions, including 7 positions in staff and support. However, a net funding increase of $3,166,000 will be required. This increase is largely for new programs required to support the air traffic control and navigation program. However, additional funds are also required for pay increases and within-grade and grade-to-grade salary increases. These added requirements have been in part offset by a substantial decrease due to such items as the reduction in Washington staffing and the non-

recurring installation costs of leased communications services. Changes in the 1965 program are summarized in the following table and discussed in detail in the following pages.

	Positions	Amount
Direct costs:		
New programs		$3,799,000
Phase II pay increases		493,000
Other pay adjustments		237,000
Other cost adjustments	−225	−1,599,000
Staff and supporting services	−7	236,000
Total	−232	3,166,000

New programs, +$3,799,000

The 1965 request includes an additional $3,799,000, which is chiefly required for funding of leased commercial services and for supply support related to new air traffic control and navigation aids. The request includes $2,143,000 for leased services and $1,171,000 for supply support. Details concerning the new program requirements may be found in the subsequent justification under this activity.

Phase II pay increase, +$493,000

This category of cost represents the amount required to meet the cost of that portion of the pay increases authorized by Public Law 87–793 and becoming effective in January 1964. The estimate is based on employment in general schedule grades as of January 1, 1964, and was computed on a grade-by-grade basis to give proper weight to the different amount of increase for each grade level. The amount included in this estimate represents the difference between the total yearly value of the increase and the amount which was payable in 1964. On the average, this estimate is 51.5 percent of the total yearly costs.

Other pay adjustments, +$237,000

During the fiscal year 1965, $237,000 will be required to finance within grade salary increases and additional salary costs of personnel who will be qualified for and promoted to higher grade levels than positions occupied during 1964. The cost of within-grade salary increases will amount to $176,000 after adjusting for savings in within-grade costs due to turnover. This estimate is based on present grade levels of employees in this activity and the length of time they have been in present grade levels. In addition, it is anticipated that upgrading of employees who will be qualified for promotion will amount to $61,000 in 1965.

Other cost adjustments, —$1,599,000

Reflected in this category are estimated savings of $3,100,000. These savings result from items such as: (1) projected improvements in employee productivity; (2) a reduction in Washington staffing; (3) transfer of funding responsibility for training of installation personnel from the operations to the facilities and equipment appropriation; (4) nonrecuring costs associated with installation of leased communications services; (5) closing of an Agency supply office in Seattle; and (6) other decreases such as a reduction in overtime, one less workday, etc. These savings have been in part offset by increased costs amounting to $1,501,000. This increase will be required to fund the program in operation at the end of June 1964.

Staff and supporting services, +$236,000

Staff and supporting service costs allocated to this activity in 1965 will increase by $236,000 because of increases arising primarily from additional rents and communications costs, pay increases and other salary increases. These additional costs exceed savings resulting from employment reductions in the staff and support activities which permit a reduction of seven in the number of positions allocated to the activities.

Mr. EVINS. For engineering you are asking for 98 less positions; planning direction and evaluation, 4 less positions and staff and supporting services in this Department, 7 less; or a reduction of 232, in-

cluding 123 in material and procurement. With this large reduction still the funding requirement goes up from $70,981,000 to $74,147,000.

Mr. Administrator, how many positions would you have to reduce in that facility installations to keep your budget at the $70 million level as of last year?

Mr. HALABY. Approximately 300 additional personnel, sir. That would be a 10 percent cut. We have already achieved about an 8 percent reduction, or 7 percent.

Mr. EVINS. On your justification on page 99 you speak about the reductions and say, "The new funding increase of $3,166,000 will be required for new programs." You do not state that it is required because of salary increases and pay raise increases, but you say for new programs. What are the new programs?

Mr. HALABY. That amount breaks down, sir, on page 100 into $3,799,000 for new programs, $493,000 for phase II pay increase, $237,000 for other pay adjustments, a reduction of $1,599,000 for other pay adjustments and a $236,000 increase for staff and supporting service.

Mr. EVINS. What are the new programs?

Mr. HALABY. The new programs are supply requirements for new traffic control and air navigation facilities, $1,171,000, contractual services and supplies for operation and maintenance of new aircraft, $243,000, parts and supplies for overhaul and repair programs, $242,000. Then, in the category of leased commercial interphone, teletypewriter, radar remoting and control circuits we have the amount of $2,143,000, and that totals for new programs, $3,799,000.

Mr. EVINS. Who is in charge of this Division, the Division of Facility Installations?

Mr. HALABY. This is Mr. Richard Leng, who is not as familiar to you as some of our associates. He comes to us from the presidency of his own firm and formerly with Sylvania and Packard, Bell Corp. I guess he is one of those rare and wonderful individuals who is willing to come to the Government after success, both financial and professional in his field, simply because he thinks he ought to do his duty to his country. He has done a marvelous job in pulling together this organization, getting the loyalty of the career men, working on better buying, better control of our facilities. He has a kind of chart, showing how industry and good organization is going to revolutionize our work. I think he has just begun to do the things that this committee would want a man in that job to do.

Mr. EVINS. Mr. Leng is a fine man and we are pleased that he is serving the Government.

Mr. LENG. I just hope I can answer your questions as well, Mr. Chairman.

Mr. EVINS. My question was, with Sylvania and the telephone company, could you reduce your personnel by 233 and at the same time raise your budget by $5 million? How do you do that? Did you operate that way in private industry?

Mr. LENG. Yes, sir. As the facilities expanded and we have added this year something in the neighborhood, in fiscal year 1965, of 179 new VORTAC's scattered throughout the country and each takes additional supplies and spare parts, and 15 additional radars, and whereas we are making reductions in our regular items, as we add these addi-

tional facilities, sir, we have to provide the supply support for them.

Mr. EVINS. Are there any questions?

Mr. JONAS. What does one of these VORTAC systems cost?

Mr. LENG. It is broken up into two types of cost, VOR and the TACAN.

NEW PROGRAMS

Mr. JONAS. I want to have a little more information about these new programs. You have them lumped together for $3,799,000. That does not give us much information without a breakdown. Can you spell that out in more detail? Tell us what makes up that $3,799,000?

Mr. LENG. On page 105 we have a breakdown of the communication part of that and $1 million or a good deal more than half of it is tied in with these additional radar remotings.

Mr. DEAN. Mr. Chairman, by looking at page 21 of the small summary book, you can quickly see every one of the new cost items adding up to the $3,166,000. Those figures appear, beginning on page 100, and indicate that supply requirements, radar remoting, and peripheral communications, none of which are personal services items, but reflect the larger number of facilities in the system, are the producers of the increased cost. This cost is only $3,166,000 in excess of the previous year. In terms of manpower, the "Installation and materiel" organization is very sharply reduced.

Mr. JONAS. I think that table on page 21 would help the record. It is all on one page.

Mr. EVINS. Mr. Reporter, we will place page 21 of the justification summary at this point in the record.

(The page follows:)

Facility installation and technical support

	Changes from 1964	
	Positions	Amount
NEW PROGRAM		
Material and procurement:		
Supply requirements for new traffic control and air navigation facilities		$1,171,000
Contractual services and supplies for operation and maintenance of new aircraft		243,000
Parts and supplies for overhaul and repair programs		242,000
Total material and procurement		1,656,000
Leased commercial services:		
Interphone circuits		725,200
Telewriter circuits		87,600
Center peripheral communications circuits		49,300
Radac remoting systems		1,092,200
Air navigation facility control circuits		188,700
Total leased commercial services		2,143,000
Total new program		3,799,000
Phase II pay adjustment		493,000
Other pay adjustments		237,000
Other cost adjustments		−1,599,000
Staff and supporting services	−225	236,000
	−7	
Total change	−232	3,166,000

LEASED COMMERCIAL SERVICES

Mr. EVINS. Insert page 105 on leased commercial services.
(The page follows:)

Leased commercial services

	1964 appropriation	1965 estimate	Difference
Amount	$20,940,000	$23,272,000	+$2,332,000

Included under this subactivity is the funding for the leasing of (1) full-time long-distance telephone lines (interphone) used to transmit messages pertaining to the flow and control of air traffic operating under instrument flight rule weather conditions; (2) lines for the collection and distribution by teletypewriter of weather data and reports, notices to airmen concerning field conditions, inoperative air navigation aids, etc., flight progress reports and aircraft arrival reports; (3) lines (peripheral communications circuits) to connect the air route traffic control centers with remote air/ground transmitters and receivers to provide controllers with direct radio comunications to aircraft under their control; (4) lines from control points to adjacent air navigation facilities; (5) radar remoting systems for the transmission of intelligence and voice communications from radar sites to air route traffic control centers; and (6) automatic data processing equipment for air route traffic control centers.

The 1965 request for this subactivity reflects an increase of $2,332,000 of which $2,143,000 is associated with new programs and is described below. The additional $189,000 is the net result of a savings of $402,000 for nonrecurring installation costs offset by an increase of $591,000 for additional months lease charges for communications services initiated in 1964.

New program, $2,143,000

There follows a breakdown of increases for leased services by type of service:

Interphone circuits	$725,200
Teletypewriter circuits	87,600
Center peripheral communications circuits	49,300
Radar remoting systems	1,092,200
Air navigation facility control circuits	188,700
Total	2,143,000

Mr. EVINS. This page shows some of the breakdown of the new program—intertelephone circuits, teletypewriter circuits, center peripheral communications circuits.

Mr. JONAS. Are these recurring items?

Mr. LENG. This is first-year costs.

Mr. JONAS. This will be a recurring cost.

Mr. LENG. That is right.

This will be a communications cost for the additional radars that are being installed, for example.

Mr. EVINS. Mr. Leng, can this work be tightened up? Your personnel has been reduced but your costs go up substantially.

Mr. LENG. We are making every effort, negotiating with the various companies that are supplying this service to us to reduce it and we think that next year we can show you some nice savings on this.

Mr. EVINS. Are these interphone circuits in the service stations that you will tie into?

Mr. LENG. No, sir. Most of this is the centers and the towers to which reference was made before.

Mr. ALEXANDER. On page 106 it shows the breakdown of locations and further breakdown of the operational requirements.

Mr. OSTERTAG. What is the cause of the increased mileage per center?

Mr. LENG. This is just total increase in mileage for the additional subsections that are being brought into the centers. As we tie in additional radars and get this coverage reduced, it requires additional communication mileage.

Mr. EVINS. You mentioned besides the salary increase for supporting services, page 113 that there is $198,000 for prorated share of the new program costs. You do not tell us what this is.

Mr. DEAN. In our budget you will find that under each major activity, flight standards, aircraft engineering, et cetera, there is a prorated share of the total staff and support costs.

Mr. EVINS. Where in that summary page?

Mr. DEAN. You will get to that on page 494, volume I. Then we can cover all of the staff and support for the record.

Mr. EVINS. We haven't come to that yet.

Mr. Reporter, place in the record pages 102, 103, 111, 112, and 113 which is the justification for each of the subheadings under "Facility Installation and Technical Support" section.

(The pages follow:)

Engineering

	1964 appropriation	1965 estimate	Difference
Permanent positions	711	613	−98
Amount	$8,228,000	$7,525,000	−$703,000

This subactivity provides for engineering and management of programs for the construction, installation, improvement, dismantling and relocation of facilities comprising the air traffic control and air navigation system.

The decrease of $703,000 in the 1965 requirement for this subactivity is the net result of an estimated reduction of $892,000 and 98 positions offset by an increase of $134,000 for salary costs associated with implementation of phase II of the Salary Reform Act of 1962, and an increase of $55,000 for within-grade salary increases. The decrease of $892,000 results from savings due to a reduction in Washington staffing, an estimated improvement in employee productivity and a transfer of funding responsibility for training of installation personnel from the "Operations" to the "Facilities and Equipment" appropriation. These decreases which total over $1,100,000 are offset in part by added costs required to support the 1964 employment level. No new programs are included under this subactivity.

Materiel and procurement

	1964 appropriation	1965 estimate	Difference
Permanent positions	1,985	1,862	−123
Amount	$34,148,000	$35,705,000	+$1,557,000

This subactivity provides for the accomplishment of procurement, warehousing, distribution, transportation, and materiel management functions necessary to furnish and control equipments, supplies, spare parts, and facility components required for the establishment, maintenance, and operation of air navigation

and air traffic control facilities, supply support for Agency aircraft (other than aircraft utilized for research and development), and for the supply support of all other Agency programs. It provides shop operations at the Installation and Materiel Depot, Oklahoma City, for the repair and overhaul of navigational aids, air traffic control and communications equipments and components. It includes acquisition of the Agency requirements for real property, building space, services and public utilities, and management of the Agency's materiel assets.

The 1965 estimate reflects a decrease of 123 positions and a net increase of $1,557,000. The increase reflects a new program requirement of $1,656,000, as well as $310,000 for salary costs arising from implementation of phase II of the Salary Reform Act of 1962, and $167,000 for within-grade and grade-to-grade salary increases. These increases have been in part offset by a net savings of 123 positions and $576,000 due in large measure to improvement in employee productivity, reductions in Washington staffing and discontinuance of Agency facilities. The new program requirement mentioned above is described below in detail.

New program, +$1,656,000

This item includes $1,171,000 to provide materiel and supply requirements for new traffic control and air navigation facilities scheduled for operation in 1965. The major facilities included are 15 long-range radars and associated link repeaters, terminals, beacons, and bright display equipment; 25 center air/ground peripheral communications outlets; 20 airport traffic control towers; 6 terminal area radars; 18 ATC radar beacons; 103 Doppler direction finder equipments; 29 limited remote communications outlets; 54 VHF omnidirectional radio ranges; 189 Tacan equipments; 8 instrument landing systems; 19 standard approach light systems with sequence flashing; 32 runway end; 12 visual approach slope indicators; 3 short approach lights; 5 fan markers; and 7 radio homing beacons. The locations of these facilities are included in the tables under the activity "Maintenance of Traffic Control System," pages 146 to 159.

An increase of $243,000 is requested for contractual services and supplies required for the operation and maintenance of eight new aircraft.

Funds in the amount of $242,000 are required to provide components and other supply support for the overhaul and repair of Doppler direction finder equipment, modification of repair shops, and the procurement of equipment and other operating items required for materiel warehousing, distributing, and supply functions.

Planning direction and evaluation

	1964 appropriation	1965 estimate	Difference
Permanent positions	185	181	−4
Amount	$2,058,000	$2,128,000	+$70,00

Funded under this subactivity are Washington and regional headquarters personnel responsible for providing top-level planning and direction, defining program objectives, formulating standards, and evaluating the effectiveness of total operations.

The 1965 program reflects an increase of $70,000 which will provide $35,000 for salary costs arising from implementation of phase II of the Salary Reform Act of 1962, $12,000 for additional within-grade salary increases and $23,000 largely due to the funding of additional man-years of effort in 1965. No new programs are included under this subactivity.

Centralized training program

	1964 appropriation	1965 estimate	Difference
Permanent positions	62	62	
Amount	$1,101,000	$775,000	−$326,000

The FAA mission requires that the Agency hire a work force of highly skilled, specially trained technicians for its predominantly technical work programs. Generally, personnel possessing skills for and familiarity with, Agency programs and equipment are not available outside the Agency. Formalized training courses, which span virtually all fields of the aviation industry in which the Agency is involved, are conducted largely on a centralized basis at the FAA Academy located at Oklahoma City, Okla., but training facilities are provided also at certain other geographical locations were there are significant concentrations of employees. In support of its technical work programs the Agency also conducts a management and general training program, and a program for development and improvement of instructional methods, procedures, and techniques. In summary, the major items of cost which are consolidated in the centralized training program include the following: Cost of instructor staff and related services, facilities, supplies, and equipment; Student travel costs; Out-of-Agency training costs; and Cost of planning, supervision, and direction of training programs.

That portion of the centralized training program which has been established for the training of installation and technical support specialists who are responsible for the installation of the numerous facilities and equipments which make up the national network of air traffic control system and navigation aids, is financed directly under this heading. Included also is a proportionate share of the cost of conducting management general training and training developmental activities, and the indirect costs related to planning, supervision, and direction of training programs.

The training program for this activity provides a reduction of $326,000 for 1965. The saving is chiefly related to a reduction in training travel costs for facility installation specialists. These costs are now budgeted in the facilities and equipment appropriation. This saving has been in part offset by $14,000 of added salary costs associated with the implementation of phase II of the Salary Reform Act of 1962, and $3,000 for within-grade and grade-to-grade promotions to become effective in 1965. No new program is proposed for 1965.

Staff and supporting services

	1964 appropriation	1965 estimate	Difference
Permanent positions	345	338	−7
Amount	$4,506,000	$4,742,000	$236,000

This program reflects the proration to this activity of the consolidated costs and staffing of those functions dealing with the direction and control of programs and policies; coordination of international civil aviation programs; legal services management improvement; budgeting; financial reporting; accounting for funds; payrolling of employees; personnel activities; security; and other services of a general housekeeping nature, including mail distribution, printing and duplicating. In addition this item provides for headquarters space costs, administrative supplies, communications and telephone expenses at regional and Washington headquarters operations.

The programs categorized under this activity are wholly financed under the "Operations" appropriation. The basic services performed by the various program units extend to all Agency operations including these programs funded under "Operations" as well as the appropriations for "Facilities and equipment," "Grants-in-aid for airports," "Research and development."

Workload formulas are used for determining staffing needs in a number of operations, such as payrolling, accounting, and auditing. In those areas where the work performed is primarily of a nonrepetitive nature the determination of manpower requirements is based on workload trends, past performance, as well as foreseeable new requirements. In the past these factors have been used to maintain a reasonable balance in the growth of staff and supporting activities.

The change in this activity between fiscal years 1964 and 1965 for staff and supporting services is a reduction of seven positions and a dollar increase amounting to $236,000. The 1965 increase for this function will provide $62,000 for required pay increases associated with implementation of phase II of the

Salary Reform Act of 1962, and $20,000 for additional within-grade costs. Also included are six positions and $198,000 for the pro rata share of the new program costs financed under this heading. The above costs have been in part offset by a reduction of $44,000 and 13 positions resulting largely from improvement in employee productivity.

BREAKDOWN OF EXPENSES, FACILITY INSTALLATION AND TECHNICAL SUPPORT

Mr. EVINS. Let's turn to other objects under this section.
Mr. Reporter, insert pages 118 and 119.
(The pages follow:)

Facility installation and technical support—Justification by object

SUMMARY

	1964 appropriation	1965 estimate	Difference
Permanent positions	3,288	3,056	−232
Personal services and benefits:			
Personnel compensation	$25,466,100	$25,108,700	−$357,400
Personnel benefits	1,913,400	1,901,500	−11,900
Total, personal services and benefits	27,379,500	27,010,200	−369,300
Other objects:			
Travel and transportation of persons	1,462,100	1,191,000	−271,100
Transportation of things	843,800	852,700	8,900
Rent, communications, and utilities	3,307,800	3,070,700	−237,100
Printing and reproduction	170,900	170,900	
Other services	2,163,900	2,295,800	131,900
Services of other agencies	84,700	76,100	−8,600
Supplies and materials	16,158,500	17,214,500	1,056,000
Equipment	584,200	721,000	136,800
Total, other objects	24,775,900	25,592,700	816,800
Deduct quarters and subsistence charges	−62,400	−64,900	−2,500
Total, all objects, FAA	52,093,000	52,538,000	445,000

ALLOCATION TO DEPARTMENT OF DEFENSE

Permanent positions	41		−41
Personal services and benefits:			
Personnel compensation	$241,850		−$241,850
Personnel benefits	17,016		−17,016
Total, personal services and benefits	258,866		−258,866
Other objects:			
Rent, communications, and utilities	18,600,000	$21,609,000	3,009,000
Supplies and materials	29,134		−29,134
Total, other subjects	18,629,134	21,609,000	2,979,866
Total allocation to DOD	18,888,000	21,609,000	2,721,000
Total obligations	70,981,000	74,147,000	3,166,000

Mr. EVINS. Transportation of things is up by about $9,000; printing and reproduction remains the same, $170,900, other services increase from $2.1 million to $2.2 million. That is $131,900.

Did you go over every one of these item justifications from all of your stations or did you adopt just what your fieldmen sent in and requested?

Mr. LENG. No, sir; in collaboration with Mr. King, we have both gone over each of these items in detail.

Mr. EVINS. Do you make the judgment on whether these needs actually exist or do you follow their recommendations?

Mr. LENG. I think I can honestly say that it is a case of reviewing their recommendations and using whatever business judgment and spot checks that one would ordinarily make, but I will take responsibility for the figures that are here.

Mr. EVINS. Regarding "Supplies and materials," this goes up from $16.1 million to $17,214,500, a million dollar increase there. This is page 131. You indicate that this is for additional traffic and air navigation facilities to be commissioned in 1965, offset by some reductions as a result of supply items available from existing warehouse stock.

Mr. LENG. We have additional facilities, as I have said, mainly these additional radars and additional VORTAC's which require the facilities stocks and stores entries.

Mr. OSTERTAG. Will the chairman yield?

Mr. EVINS. Mr. Ostertag.

DECREASE IN NUMBER OF SECURITY INVESTIGATIONS

Mr. OSTERTAG. Returning just for a moment to page 130, which deals with services of other agencies. I notice that there is a $7,000 reduction under "Security investigations."

How is that determined, by Civil Service? That is a reimbursement to the Civil Service Commission, is it not?

Mr. DEAN. That is correct, Mr. Ostertag, and we will have fewer such investigations during 1965.

Mr. OSTERTAG. In other words, it is based on fewer investigations, caused perhaps by reduction in personnel.

Mr. DEAN. Reduction in total number of additional people who will require full field investigation.

Mr. OSTERTAG. I notice you have an $8,600 reduction.

That is all.

Mr. EVINS. We will place in the record pages 131, 132, and 133.

(The pages follow:)

Supplies and materials

	1964 appropriation	1965 estimate	Difference
Facility stock and stores	$13,687,200	$13,902,500	$215,300
Aircraft stock and stores	1,800,300	2,606,000	805,700
Operating and working supplies	306,300	370,300	64,000
Maintenance and operation vehicles and off-road automotive equipment	13,700	13,700	
Supplies for messhall operation	88,800	77,400	−11,400
Supplies for training program	15,900	14,700	−1,200
Office and miscellaneous supplies	94,700	76,600	−18,100
Staff and supporting service	151,600	153,300	1,700
Total FAA	16,158,500	17,214,500	1,056,000
Allocation to Department of Defense	29,134		−29,134
Total	16,187,634	17,214,500	1,026,866

EXPLANATION

The maintenance and operation of traffic control and air navigation facilities require items of expendable stock such as electronic tubes, engine generator parts, teletypewriter parts and paper, transformers, resistors, training and administrative supplies (facility stocks and stores). Supplies and parts are required for the maintenance of aircraft and airborne electronic equipment (aircraft stocks and stores). Included are supplies necessary to the operation of warehouse and repair shops. The Government provides facilities including messhall operation for bachelor employees at certain remote locations where public facilities are not available.

The increase of $215,300 under facility stocks and stores consists of $1,171,200 for supply items required for the additional traffic control and air navigation facilities to be commissioned in 1965; offset by reductions of $228,000 due to the planned discontinuance of facilities, $200,000 resulting from the closing of supply operations at Seattle, and a decrease of $527,900 as a result of supply items available from existing warehouse stock.

An increase of $805,700 is required under "Aircraft stock and stores" for procurement of supplies and parts utilized in the overhaul and modification of aircraft and avionics equipment relating to the additional flight hours and increase in the aircraft fleet. An increase of $64,000 is required to provide for shop operations.

The reduction in funds allocated to the Department of Defense represents cost to the FAA during 1964 for supply items utilized in the administration of the integrated leased communications procurement program which will be financed by the DOD in 1965.

Equipment

	1964 appropriation	1965 estimate	Difference
Off-road automotive equipment	$23,000	$55,800	$32,800
Working equipment	174,400	241,800	67,400
Office equipment	184,200	126,000	−58,200
Test equipment	36,800	111,200	74,400
Household equipment	37,300	57,100	19,800
Training equipment	24,800	19,100	−5,700
Staff and supporting services	103,700	110,000	6,300
Total	584,200	721,000	136,800

EXPLANATION

Requirements in this classification include funds for replacement of equipment for air traffic control field facilities; new and replacement tools, working, and test equipment required in the repair shops and warehouse operation; aircraft and airbone electronic equipment including ground handling equipment; and technical equipment for the conduct of training programs.

The increase of $136,800 provides for procurement of new and replacement items of test and working equipment including the warehouse guide-o-matic tractor system, analyzers, tuning units, and generators and replacement of forklift automotive equipment utilized in materiel and shop operations; and replacement of household equipment at Government-owned quarters at isolated locations in Alaska and the Pacific Islands.

Systems Maintenance

Mr. Evins. If there are no further questions, we will turn to "Systems maintenance." Let's take a look at the chart on page 136. This is one of your big divisions, for which you are asking an increase of 162 new positions.

In 1964 you had 11,449 and for 1965 you are requesting 11,611 positions, or an increased budget from $139,522,000 to $148,673,000, an increase of $9,151,000.

Mr. Ostertag. And 162 positions.

Mr. EVINS. And 162 positions. This is broken down according to the chart by activities. You have an increase in field maintenance of 245 positions and then you reduce your other activities so that you have a net increase of 162.

Is your equipment becoming obsolete? Is it new work or new facilities?

Mr. HALABY. About 560 or more new facilities are involved and they are of the most modern, frequently more complicated nature. That is what requires the additional personnel.

Mr. EVINS. We will place the chart on page 136 and the statement on page 137 in the record.

(The pages follow:)

MAINTENANCE OF TRAFFIC CONTROL SYSTEM

Requirements

	1964 appropriation		1965 estimate		Difference	
	Positions	Amount	Positions	Amount	Positions	Amount
Field maintenance	9,507	$113,326,000	9,752	$122,103,000	245	$8,777,000
System supervision and services	384	4,144,000	348	3,918,000	−36	−226,000
Planning, direction, and evaluation	157	1,620,000	140	1,745,000	−17	125,000
Centralized training program	450	8,016,000	440	7,843,000	−10	−173,000
Staff and supporting services	951	12,416,000	931	13,064,000	−20	648,000
Total	11,449	139,522,000	11,611	148,673,000	162	9,151,000

GENERAL CLASSIFICATION

The major objective of this activity is to assure effective, economical maintenance and reliable operation of installed air navigation, air traffic control, and aeronautical communication facilities and auxiliary equipment in the traffic control system; and that maintenance of the system is responsive to operational needs, the requirements of aviation safety, and national defense.

The principal facilities included in the traffic control system are—

(1) Air route traffic control centers and long-range radar for control of air traffic over extensive geographical areas and for the provision of security control of air traffic;

(2) Airport traffic control towers and terminal area radar for control of traffic on and around airports;

(3) Flight service stations to relay air traffic control information and provide other flight assistance to pilots;

(4) International flight service stations to relay air traffic control information and provide other flight assistance for flights along international routes;

(5) Air navigation facilities (VORTAC), a short-range navigation system which defines the location of principal airways and furnishes pilots distance and direction from ground stations;

(6) Instrument landing systems to provide pilots with direction, distance, and glide slope information necessary for making an approach to a runway under conditions of poor visibility;

(7) Lighting systems composed of a row of lights extending outward from a runway to aid pilots during landing, as well as visual signaling devices which aid the pilot in alining with the runway and following a predetermined glide slope during this final approach;

(8) Air navigation facilities (L/MF ranges and markers) to provide pilots with direction information and define the location of low/medium frequency airways; and

(9) Intermediate fields and beacons, fields for emergency landing on certain routes where adequate facilities cannot be furnished by local governing bodies, and beacons (lights) for visual guidance along airways over rough terrain.

Mr. EVINS. It is stated on page 141, new positions, 162 are required. Without telling us more in detail, this is a general statement and we can take it on face value.

Mr. HALABY. We would refer the chairman to the list of new facilities on 146, 147, and 148. I guess also we would make the point that but for an increase of about 4 to 5 percent in the output per man per year we would have to ask for a substantial additional number of people to handle these over 500 new facilities. The productivity index at the bottom of page 141 shows fiscal year 1963 at 100 percent, fiscal year 1964 at 106 percent, a 6 percent improvement in productivity, and fiscal year 1965 another 4 percent improvement in productivity. We are very proud of that and we will have the new and more complicated, and we hope more useful facilities coming into our system in fiscal year 1965.

Mr. JONAS. Will the chairman yield?

Mr. EVINS. Yes.

NATURE OF INCREASED PRODUCTIVITY

Mr. JONAS. I wish you would spell out that increase in productivity a little bit. How do you rate these people? How do you go about it?

Mr. HALABY. This is in the maintenance area. I am going to ask Mr. Vierling, who, again, is a newcomer to this committee and to FAA. He has the responsibility of seeing that this systems maintenance program works. He had his own firm. He was formerly a vice president of Capital Airlines, where he was in charge of engineering and maintenance. He, too, has been bringing to us some of the experience in the business and industrial field.

First, he has been very insistent that we have a cost accounting. Go ahead, Mr. Vierling.

Mr. VIERLING. To begin with, Mr. Jonas, we had to break down maintenance costs associated with all of the facilities that we have. In order to be able to use good judgment in the staffing and the maintenance of these facilities, several years ago we developed what was known as a personal services workload formula. This workload formula, as you can see, is rather substantial. It breaks down the actual costs to maintain the various standard types of facilities including the actual amount of workload and travel time required to properly maintain these facilities.

These workload formulas still apply.

Based on these we have developed what is called a standard facility year, in ascertaining the total output that we must meet each year in maintaining the present system, plus the added facilities and added systems which are included each year.

We then determined the number of inputs that we make in man-years of input to maintain these facilities and then determined from that the ratio of the output to the input to determine the productivity which has been achieved by us in maintaining these facilities.

As we go along maintaining these various equipments we make improvements to them. We also determine, as Mr. Moore described yesterday, that the airlines do in maintaining aircraft, that we can improve the procedures that we use. We can change, sometimes, the

period, or the frequency with which we perform certain maintenance operations. In doing this we are able to stretch out our manpower. We are able to increase the utilization of our manpower and thus come up with this productivity index.

Mr. JONAS. All of that means that you have managed to have your people turn out a little more work than they previously turned out, is that right?

Mr. VIERLING. We have had a substantial program of training our personnel, not only training them to do a better job with current equipment, but as we have gone along with more sophisticated equipment we have had a continuing training program of upgrading those people to be able to do these more sophisticated jobs.

Mr. HALABY. To translate positions into dollars that increase in productivity of 4 percent between 1964 and 1965 equals just a little less than 400 positions and about $3,200,000.

If you go back to fiscal year 1960 and compare with 1965, the productivity increases amount to about 1,500 jobs and $13 million.

Mr. JONAS. Doesn't that mean that as men obtain experience, with close supervision they naturally will be able to turn out more work?

Mr. HALABY. Yes, sir; exactly, and add training to that and that is the answer.

Mr. EVINS. It makes good sense, with all your equipment and facilities to maintain it. You do not want it to deteriorate out in the remote spots throughout the world.

ASSUMPTION OF MILITARY FACILITIES

I notice that you claim to be taking over some maintenance responsibility for the military radar facilities involving control of civilian traffic. Where is this and how extensive is it? Did they assign it to you?

Mr. HALABY. Yes, sir: 12 new locations from the military; for example, Bucks Harbor, Maine, Fallon, Nev., Amarillo, Tex., and the others marked with footnote 1 on page 146. We have taken these over and they are part of the money that we referred to in the table this morning where, with 686 people and $7,464,000, since 1959 we have done this. I am happy to report that I think not only were they agreeable to this, but I think they would agree that we are doing it at a lower cost than it was being done before.

Mr. EVINS. You state on page 145, under field maintenance, that you are taking over some new air navigation facilities and assuming a financial responsibility for 12 military long-range radar and beacon facilities. Where are they located?

Mr. ALEXANDER. On page 146, Mr. Evins, the items in that top list, Panama City, Fla., Tampa, Alexandria, La.

Mr. HALABY. All of the ones asterisked with "1" are military and the others are joint maintenance responsibility or FAA facilities.

Mr. EVINS. Place in the record pages 145, 146, 147, and 148.
(The pages follow:)

Field maintenance

	1964 appropriation	1965 estimate	Difference
Permanent positions	9,507	9,752	+245
Amount	$113,326,000	$122,103,000	+$8,777,000

This subactivity provides for the funding necessary to the maintenance and repair of air navigation aids, traffic control, communications, and plant facilities to assure the reliability and accuracy of all installed equipment for operational needs and aviation safety.

The net additional requirements of 245 positions and $8,777,000 will provide for maintaining new facilities calling for 532 positions and $4,249,000, and institution of a new center building guard program involving 115 positions and $299,000. Details of the new requirements are discussed in detail below. Provision is also made for salary increases resulting from Phase II of the Salary Reform Act of 1962, $1,702,000; other salary requirements for within-grade salary increases and promotions resulting primarily from revised classification standards for electronic maintenance technicians, $2,028,000; and a net increase of $499,000 related chiefly to (1) additional costs for continued operation of facilities and services implemented in 1964; and (2) added salary costs associated with grade-to-grade and within-grade promotions effected in 1964. The increase of $499,000 reflects a reduction of 402 positions and associated costs through an estimated improvement in employee productivity as well as discontinuance of facilities.

New program, 647 positions, $4,548,000

An increase of $4,249,000 and 532 positions is required for maintenance of new facilities previously approved under the appropriation for construction of new air navigation facilities and for the assumption of finacial responsibility for the maintenance of 12 military long-range radar and beacon facilities involving control of civil traffic. The establishment of security guards at 23 air route traffic control center locations will require an increase of $299,000 and 115 positions in 1965. Detailed analysis of these items follows.

New facilities, $4,249,000

The additional facilities scheduled for operation in 1965 will require increased funding of $4,249,000 to provide for the additional staffing and costs such as rents, utilities, local communications charges, contractual services, and working supplies required for the maintenance of the facilities.

Air route traffic control centers and long-range radar ($2,017,000)

These facilities and associated equipment are utilized in the control of air traffic over extensive geographical areas; the long-range radar provides positive control by displaying the position of aircraft. Additional facilities and associated equipments scheduled for service in 1965, requiring 96 positions and funding of additional man-years for 264 positions available in 1964 for recruitment and training of personnel in advance of the operation of the facilities, are as follows:

EXPLANATION OF NET REDUCTION

Mr. OSTERTAG. There is an increase in new programs, is there not, of $4,249,000 and 532 positions in connection with the new air traffic control and navigation aids. That is offset to a certain extent.

Mr. ALEXANDER. Yes, sir. We offset it by the productivity savings that we discussed earlier, by closing some facilities which were being replaced by more modern ones and by a position decrease in the staff and supporting activities.

Mr. OSTERTAG. I am now looking at page 142 under "Operations," and more particularly maintenance of traffic control systems. Under "New programs," you have 647 positions. Those are all new positions?

Mr. ALEXANDER. Yes, sir. These are the personnel who will be needed for the listed facilities.

Mr. OSTERTAG. Under other cost adjustments there is a decrease of 465 positions, but dollarwise it only shows a reduction of $64,000.

Mr. ALEXANDER. Yes, sir. This is offset mostly by within-grade promotions and the cost of major reclassification in this activity that occurred in fiscal year 1964, principally, so that the need to meet those costs offset the savings from the people who are being eliminated.

Mr. DEAN. Once before we referred to the summary book. Again, page 31 of that summary book will give the committee a very quick consolidation of what takes several pages in the large book.

Mr. OSTERTAG. That is pretty much the same.

What I could not understand is that when you put the two figures together under other cost adjustments, there is a reduction of 465 positions with only the net reduction of $64,000.

Mr. ALEXANDER. I can give you additional detail if you wish on this. This is made up of a number of items. This is summarized in the middle of page 143. You can follow it there. Three hundred and eighty-one jobs and $3,209,000 are involved in this productivity reduction. These are positions of people who would go off the rolls. There is a reduction of the value of 1 day's pay because there is no leap year involved in fiscal year 1965. There are discontinued facilities—that is, replaced and obsolescent facilities—65 positions at $907,000, reductions in the number of employees who were changing locations, moving of household goods and the like, $545,000. These are all

minuses to this point. The plus cost of $3,799,000 is for those new facilities which we commissioned for the first time in fiscal year 1964.

We got a late start this year. Everything is going in after the first of January.

Mr. OSTERTAG. Is that the proper place for that?

Mr. ALEXANDER. This is cost of maintaining and operating those that are going in between January 1 and June 30 of the present fiscal year.

Mr. OSTERTAG. Maintenance of new facilities?

Mr. ALEXANDER. Yes, sir. This is a plus.

Mr. OSTERTAG. So in these other costs of adjustments, the decrease in the number of positions is one thing, but it is offset by a certain amount of expense or cost with regard to maintenance of facilities?

Mr. ALEXANDER. Yes, sir.

Mr. OSTERTAG. That is the sum and substance of it?

Mr. ALEXANDER. That is correct, plus within-grade promotions and this reclassification program of the staff that took place in the current fiscal year and will cost more in 1965.

Mr. OSTERTAG. We might, Mr. Chairman, put page 31 of the summary book in the record.

Mr. EVINS. It may be included at this point.

(The page follows:)

Maintenance of traffic control system

	Change from 1964	
	Positions	Amoun
New programs:		
New facilities:		
Air route traffic control centers and long-range radar	96	$2,017,000
Airport traffic control towers and terminal area radar	71	430,000
Flight service stations	61	264,000
Air navigation facilities (VORTAC)	250	1,261,000
Instrument landing systems	17	82,000
Approach lighting	31	145,000
Miscellaneous	6	50,000
Total, new facilities	532	4,249,000
Center building guards	115	299,000
Total, new programs	647	4,548,000
Phase II pay adjustments		1,932,000
Other pay adjustments		2,087,000
Other cost adjustments	−465	−64,000
Staff and supporting services	−20	648,000
Total change	162	9,151,000

Mr. EVINS. Mr. Reporter, some of these other pages should be in the record. Insert pages 160, 161, 162, and 163.

(The pages follow:)

System supervision and services

	1964 appropriation	1965 estimate	Difference
Permanent positions	384	348	−36
Amount	$4,144,000	$3,918,000	−$226,000

Under this subactivity are included regional headquarters personnel who (1) plan, develop, coordinate, and supervise programs for maintenance and technical operation of all installed system facilities within the respective regions; (2) prescribe administrative and technical standards supplementary to national standards; (3) inspect, analyze, and evaluate regional performance and program accomplishments and institute corrective actions as required; and (4) furnish system and program performance feedback information to national headquarters.

Improved utilization of regional headquarters employees will permit elimination of 36 positions in 1965 (a 9-percent reduction). Savings resulting from this action permit a net reduction of $226,000 for this subactivity after providing increases amounting to $100,000 for pay raises under the Salary Reform Act of 1962 and within-grade salary increases.

Planning direction and evaluation

	1964 appropriation	1965 estimate	Difference
Permanent positions	157	140	−17
Amount	$1,620,000	$1,745,000	+$125,000

Funded under this subactivity are Washington-headquartered personnel who are responsible for the formulation of national system maintenance objectives, plans, and policies; development of standards and procedures for accomplishment of these objectives and plans; and evaluation of performance effectiveness, productivity, and economy of the overall systems maintenance function.

An increase of $125,000 will be required for this subactivity in 1965 after taking account of savings resulting from the elimination of 17 positions in Washington headquarters staff. Phase II pay increases under the Salary Reform Act of 1962 and within-grade salary increases account for most of this increase.

Centralized training program

	1964 appropriation	1965 estimate	Difference
Permanent positions	450	440	−10
Amount	$8,016,000	$7,843,000	−$173,000

The FAA mission requires that the Agency hire a work force of highly skilled specially trained technicians for its predominantly technical work programs. Generally, personnel possessing skills for and familiarity with Agency programs and equipment are not available outside the Agency. Formalized training courses, which span virtually all fields of the aviation industry in which the Agency is involved, are conducted largely on a centralized basis at the FAA Academy located at Oklahoma City, Okla., but training facilities are provided also at certain other geographical locations where there are significant concentrations of employees. In support of its technical work programs the Agency also conducts a management and general training program, and a program for development and improvement of instructional methods, procedures, and techniques. In summary, the major items of cost which are consolidated in the centralized training program include the following: Cost of instructor staff and related services, facilities, supplies, and equipment; student travel costs; out-of-Agency training cost; cost of planning, supervision, and direction of training program.

That portion of the centralized training program which has been established for the training of facilities maintenance specialists who are responsible for the reliable functioning of the numerous facilities and equipments which make up the national network of air traffic control systems and navigation aids, is financed directly under this heading. Included, also, is a proportionate share of the cost of conducting management, general training and training developmental activities, and the indirect costs related to planning, supervision, and direction of training programs.

The 1965 estimate reflects a decrease of $173,000 and 10 positions from the 1964 program. This decrease results from savings of $296,000, mainly in the area of contractual training and nonrecurring training equipment costs. The savings have been offset in part by additional salary requirements of $97,000 associated with phase II of the Salary Reform Act of 1962, and $26,000 for required within-grade and grade-to-grade promotions effective in 1965.

Staff and supporting services

	1964 appropriation	1965 estimate	Difference
Permanent positions	951	931	−20
Amount	$12,416,000	$13,064,000	+$648,000

This program reflects the proration to this activity of the consolidated costs and staffing of those functions dealing with the direction and control of programs and policies; coordination of international civil aviation programs; legal services management improvement; budgeting; financial reporting; accounting for funds; payrolling of employees; personnel activities; security; and other services of a general housekeeping nature, including mail distribution, printing, and duplicating. In addition this item provides for headquarters space costs, administrative suplies, communications, and telephone expenses at regional and Washington headquarters operations.

The programs categorized under this activity are wholly financed under the Operations appropriation. The basic services performed by the various program units extend to all Agency operations including those programs funded under "Operations" as well as the appropriations for "Facilities and equipment," "Grants-in-aid for airports," and "Research and development."

Workload formulas are used for determining staffing needs in a number of operations, such as payrolling, accounting, and auditing. In those areas where the work performed is primarily of a nonrepetitive nature the determination of manpower requirements is based on workload trends, past performance, as well as forseeable new requirements. In the past these factors have been used to maintain a reasonable balance in the growth of staff and supporting activities.

The change in this activity between fiscal years 1964 and 1965 for staff and supporting services is a reduction of 20 positions and a dollar increase amounting to $648,000.

The 1965 increase for this function will provide $173,000 for required pay increases associated with phase II of the Salary Reform Act of 1962, and $54,000 for additional within-grade costs. Also included are 16 positions and $545,000 for the pro rata share of the new program costs financed under this heading. The above costs have been in part offset by a reduction of $124,000 and 36 positions resulting largely from improvement in employee productivity.

OTHER OBJECTS—SYSTEM MAINTENANCE

Mr. Evins. Gentlemen, turn to other objects on page 175 which we will place in the record.

(The page follows:)

MAINTENANCE OF TRAFFIC CONTROL SYSTEM—JUSTIFICATION BY OBJECT

Summary

	1964 appropriation	1965 estimate	Difference
Permanent positions	11,449	11,611	162
Personal services and benefits:			
Personnel compensation	$92,642,600	$99,396,200	$6,753,600
Personnel benefits	6,806,500	7,340,800	534,300
Total, personal services and benefits	99,449,100	106,737,000	7,287,900
Other objects:			
Travel and transportation of persons	7,993,100	8,140,100	147,000
Transportation of things	3,490,300	3,699,000	208,700
Rent, communications, and utilities	16,410,200	17,771,900	1,361,700
Printing and reproduction	359,100	357,300	−1,800
Other services	4,912,900	4,994,500	81,600
Services of other agencies	305,800	263,100	−42,700
Supplies and materials	3,748,800	3,913,800	165,000
Equipment	3,262,900	3,225,800	−37,100
Lands and structures	31,000	16,200	−14,800
Total, other objects	40,514,100	42,381,700	1,867,600
Deduct quarters and subsistence charges	−441,200	−445,700	−4,500
Total, all objects	139,522,000	148,673,000	9,151,000

INCREASED COSTS FOR MAINTENANCE OF FACILITIES

Mr. EVINS. We notice personnel compensation and other benefits are increased about $7 million, from $99 to $106 million, and the other objects are up another $2 million. Travel and transportation is up $147,000; transportation of things, $208,700; rents, utilities, and communications, up $1,361,700. Why this increase Mr. Budget Officer?

Mr. ALEXANDER. These are attributable to the lists of the new facilities that are going to be in maintenance and operation for the first time. With the 162 net increase in people, these are maintenance technicians who are mostly in a travel status, moving from the location of the quarters to remote facilities so that the travel goes up as we add people. The same with all the other supporting costs of transportation, training costs, supply, mostly associated with the increased people. Plus the allocation of a large amount, for new space which we will discuss under staff and support services.

Mr. EVINS. With your new building your rent costs automatically ought to go down.

Mr. ALEXANDER. This is in the field, sir. Oklahoma City and other places in the field.

Mr. EVINS. We always want to try to hold down your transportation, your utilities, your printing, your supplies, and so forth. Substantial savings could be made in these areas, Mr. Alexander, if there is a determination to do so. There is an increase of $9,151,000 over last year. That is getting into money for this one operation alone.

Mr. ALEXANDER. It is an expensive operation and we have reduced travel from the last year's estimate. You will recall that in the report you asked us to look at this.

RENTAL COSTS FOR NEW BUILDINGS

Mr. OSTERTAG. You have increased rent, communications, and utilities by $1,381,000.

Mr. DEAN. We have some new buildings, Mr. Ostertag. The aviation records building in Oklahoma City, for example, and in several other locations where we must pay the rent and these come into the operations for 1965.

Mr. OSTERTAG. This is a reimbursement to GSA?

Mr. DEAN. There is some reimbursement to GSA, under the present regulations, during the first year that space is provided, that is until GSA can pick up the rental cost in its regular budget. Until then, our agency must pay for it. In Oklahoma City we permanently pay the rent and we have a substantial increase there, because of a brandnew building which this committee considered a couple of years ago will be ready early in the next fiscal year.

Mr. OSTERTAG. In a few words, how do you account for the increase of $1,361,000?

Mr. ALEXANDER. One portion of that, Mr. Ostertag, that I failed to mention, as a facility is installed, a radar on a mountaintop or on somebody's farmland, there is a land-use cost that goes with it. The major part of the rentals here, are for the 4,000 or 6,000 locations where we pay land-use rent.

Mr. OSTERTAG. This item sticks out like a sore thumb in connection with the rest of your "Other objects."

Mr. ALEXANDER. $382,000 of the total increase, for example, is in land rent, $657,000 for utilities; this budget also pays for the power that it takes to operate the facilities.

The amount of $58,000 for communications—all this is in that one object. This $124,000 for the space that Mr. Dean was talking about. But the major item is for the power and land use for the operating facilities in remote locations.

CENTER GUARDS

Mr. EVINS. On page 159 you indicate you want $300,000 for 115 guard positions. Where are they? What have you done before? You had no guards before.

Mr. HALABY. No, sir; we have not. As we move into these new centers which are at relatively remote locations so that there is no local police and fire force. For example, one is in Palmdale, Calif., which is out in the desert area. Almost all of them are remote, because in the previous administration when these were being sited, there was a very great concern about dispersion, about the defensibility of the

system. Most of them were put in relatively remote places. Leesburg is along a road. There is no local community, none of which to rely for the preservation of order. We are finding pilferage and there is no local police force.

Mr. EVINS. Do you man them 24 hours a day?

Mr. HALABY. Yes, sir.

Mr. EVINS. What did you do about it before?

Mr. HALABY. We have been without guards and we have been incurring risks and some damage and pilfering. The second thing that is happening is that the military are encouraging us to put into these centers cryptographic equipment. For example, the operations that were initiated on a standby basis by the President and the Secretary of Defense at the time of the Cuban crisis in October. The word would go out to our men in these centers in a secure manner, but we didn't have the cryptographic equipment so that has had to be put in and you might say that we now are able to carry out our national security role. Now, we have several instances in the last year of damage to our facilities where there has been breaking and entering, actually some equipment stolen. We have had at least one apparent sabotage incident where a cable into the Kansas City area traffic control center sometime ago was cut at a pole located about 200 feet from the center building and through this the whole center suddenly and completely went out of business.

Finally, Mr. Chairman, I guess I feel that this country is entering into a period of greater anxiety and greater tension and that the likelihood of spectacular or criminal attempts on our facilities is growing. Therefore, we proposed and the Budget Bureau, with military support, have allowed this limited number. This would not by any means guard all our facilities. It would guard what you might call a hard core of the system and the codes and cryptographic and decrypting machinery in those centers.

OTHER OBJECTS—SYSTEM MAINTENANCE

Mr. EVINS. You have a further breakdown of travel by categories on page 179. Discuss this briefly for the committee please, Mr. Alexander.

Mr. ALEXANDER. The one item of decrease is travel that would be conducted by the regional and Washington office. Supervision-type people.

A total of $89,200 of the increase is by field people. These people, located outside the regional headquarters for the maintenance of facilities and the most immediate supervisory and inspection personnel. Because of an increase in training, particularly training on newer types of gear being brought into this system, $35,900 additional will be required for training travel.

Mr. EVINS. You speak of an increase of $1,141,000 for new facilities for reporting weather facilities. My question is, isn't this being done now? An increase of $48,700 for rental of additional equipment, which will provide transmission of weather information. I thought you had been doing this all along. This is on page 182.

Mr. DAVID THOMAS. Mr. Chairman, I believe you are referring to the increased rental on the telephone and telegraph service which relates to our weather networks.

Mr. EVINS. Is it absolutely necessary to have it? Of course it is.

Mr. DAVID THOMAS. Yes, sir.

Mr. EVINS. You are renting additional facilities. Haven't you been doing this all along? What new are you going to be doing next year that you didn't do last year which would justify the increase?

Mr. DAVID THOMAS. The additional costs are for the lease of some electrowriter or telautograph equipment in traffic control facilities in order to bring to the controller weather information observed at another point. For example, the Weather Bureau may make an observation and this is a device that the weather observer can write on at his observing station and it will appear directly in written form in front of the comptroller who is talking to the airplane. This will bring more timely information into the system for the control of traffic.

Mr. OSTERTAG. There again utilities is the largest item of the increase.

Mr. DAVID THOMAS. Yes, sir. Virtually all the increase, here, and the increases previously talked about on the technical support are in the field of increased facilities.

ADMINISTRATION OF FLIGHT STANDARDS

Mr. EVINS. We will turn next to flight standards and place in the record page 193.

(The page follows:)

ADMINISTRATION OF FLIGHT STANDARDS PROGRAM

Requirements

	1964 appropriation		1965 estimate		Difference	
	Positions	Amount	Positions	Amount	Positions	Amount
Engineering and manufacturing	605	$7,083,000	566	$7,260,000	−39	$177,000
Operations and maintenance	1,747	20,685,000	1,651	20,999,000	−96	314,000
Safety regulations	16	281,000	16	288,000		7,000
Records servicing and analysis	318	3,578,000	300	3,134,000	−18	−444,000
Flight programs and management of aircraft	2,444	34,690,000	2,335	35,917,000	−109	1,227,000
Direction and evaluation	118	1,464,000	107	1,427,000	−11	−37,000
Centralized training program	489	10,136,000	491	9,790,000	2	−346,000
Staff and supporting services	502	6,554,000	490	6,895,000	−12	341,000
Total	6,239	84,471,000	5,956	85,710,000	−283	1,239,000

DECREASED POSITIONS AND INCREASED COSTS

Mr. EVINS. For 1964 you had 6,239 employed in flight standards. In 1965 you are asking for 5,956, or a decrease of 283 positions. You have an increase of $1,239,000 in funding; from $84,471,000 to $85,710,000. It follows the same pattern with some less personnel, but an increase in cost.

Mr. ALEXANDER. Mr. Evins, this increase, in total, is attributable to the phase 2 pay increase which is $1,247,000.

Except for the pay increase, all other costs are offset by our decreases, here.

Mr. OSTERTAG. If it were not for the pay increase——

Mr. ALEXANDER. This would be at a slightly less dollar cost.

Mr. OSTERTAG. If the pay increase accounts for $1,247,000——

Mr. ALEXANDER. That is summarized at page 198.

Mr. OSTERTAG. But you have decreased the number of positions by 283.

Mr. ALEXANDER. By this and other measures we have saved $1,312,000.

Mr. OSTERTAG. What I am getting at is you have an increase of $1,239,000, in spite of a decrease in personnel of 283.

Mr. ALEXANDER. There are the in-grade costs, promotions, and other built-in costs, which were offset by this decrease of jobs.

Mr. BOLAND. It would have cost you $1,312,000 more if you didn't have these reductions.

Mr. ALEXANDER. That is correct.

Mr. DAVID THOMAS. Page 37 in the little book gives a fairly good breakdown.

Mr. EVINS. Under Flight Standards you say (reading):

> The Federal Aviation Agency develops and promulgates standards and regulations applicable to the design of performance characteristics of aircraft, aircraft engines, propellers, and appliances; approves the materials and methods used in the manufacture of aircraft and aircraft components; and makes determinations regarding the original airworthiness of complete aircraft. In addition, the Agency issues certificates indicating compliance with safety standards and regulations for generic types, systems or models of aircraft, aircraft engines, propellers, and appliances (type certification); monitors factory operations and quality control systems (production certification); and approves individual aircraft as originally manufactured, or as modified in conformance with supplemental type certificates (aircraft worthiness certification).

AIRCRAFT MANUFACTURING INSPECTION

In 1960 you only inspected 383 aircraft manufacturers. Next year it rose to 475, the next year to 506. In 1963 it rose to 863; in 1964 to 955; and 1965 estimates that you will have 1,017 aircraft manufacturers that you will inspect.

What is the nature of the inspections, what type inspections, how long does it take, and what do they do? Do you go in and make a visit, have a cup of coffee and look around?

Mr. MOORE. We go to every one, including a small appliance manufacturer who may be making some radio equipments or instruments, up to an organization such as the Boeing Co., the Douglas Co., and so on. These inspectors are so assigned to the factories for purposes of quality control to see how the manufacturer is complying with our standards. These people are also pilot types who actually do the test flying of the aircraft and they are engineers who go over the details, designs, and specifics of the article itself, be it a small piece of equipment or a large.

Mr. EVINS. You have a checklist and they check each one of them out?

Mr. MOORE. No, sir; we do not check each commodity or each piece of equipment as it comes out. With the limited size of the staff we

have, we monitor and spot check to see that the standards we have developed are complied with, sir.

Mr. EVINS. Is there this many more airplane manufacturers, from 300 to 1,017?

Mr. MOORE. There has been, sir, a considerable increase, particularly in the appliance manufacturers.

We have seen in the last couple of years, as you can see from the statistics, a tremendous growth in that particular aspect of the business.

Mr. EVINS. FAA men are really in and out of the manufacturing plants all the time?

Mr. MOORE. They can't be in all of them, sir. We just don't have enough people, but they do spot check them; yes, sir.

Mr. EVINS. You anticipate being in 1,017 plants next year.

Mr. MOORE. Yes, sir. Not full time, though, sir.

Mr. EVINS. The number of aircraft types, certification projects of record, 334, up 1,132. What do these figures mean?

Mr. MOORE. Those figures are the number of projects, sir, that we have knowledge of and have requests for a certification of approval of some kind. They can be anything from aircraft, aircraft components, powerplants, propellers, any components on the airplane.

Mr. EVINS. Now, we want these jets and turboprops and piston types and helicopters all inspected and we want to know that they are in first-class order and made with the finest precision equipment, but doesn't the manufacturer do this?

Mr. MOORE. The manufacturer, of course, sir, has a very huge responsibility to see that his product complies with the standard. We monitor the manufacturer's activity to see that he does in fact comply with the standards that we have developed.

Mr. EVINS. You are going to be checking more of the various types of motors next year except helicopters and piston types. You come down in those two categories.

Mr. MOORE. What page are you referring to, 196?

DEPARTURES FROM FAA STANDARDS

Mr. BOLAND. Do you find many departures from the standards FAA has established, by manufacturers?

Mr. MOORE. We do find departures.

Mr. BOLAND. Where do most of the departures from standards established by FAA occur? You say you go from Boeing down to a little subcontractor at the end of the line. Where do most of your departures from your standards occur, away down below?

Mr. MOORE. I would say they occur through all periods of the manufacturing process. The most outstanding ones, though, the ones that come to our attention with the most impact, are the types that we find when we get ready to issue a type certificate. That is, when you actually do some final testing and you see a piece of equipment that has already been put together and our engineers see, for example, that it is not properly installed, that it will not, after a rigid flight test, sustain the type of stresses we require to be put on.

Mr. BOLAND. Of course, the manufacturer is interested in getting the best piece of equipment in the air that he can and he wants to make sure he abides by the standards, doesn't he?

Mr. MOORE. That is correct.

Mr. OSTERTAG. This general justification deals in part with the future and progress and developments and changes that are taking place in the aviation field; isn't that correct?

Mr. MOORE. It involves today's projects as well.

Mr. OSTERTAG. Well, you are looking ahead, too?

Mr. MOORE. Yes, sir.

Mr. OSTERTAG. The number of passengers, the different new types of aircraft. You have even mentioned the supersonic transport which is a long way off.

Mr. HALABY. That's right.

Mr. OSTERTAG. I think there is some very enlightening and some very pertinent information here, Mr. Chairman, on these pages 194, 195, 196, and 197. I think they are very revealing and might well go in the record at this point.

Mr. EVINS. The pages will go in the record.

(The pages follow:)

ADMINISTRATION OF FLIGHT STANDARDS PROGRAM

GENERAL JUSTIFICATION

The primary objective of this program is to assure the highest possible degree of aviation safety. Within the framework provided by title VI, Federal Aviation Act of 1958, the administration of flight standards program provides for the development, promulgation, and administration of the safety standards, rules, and regulations (other than those involving the physical fitness of airmen and the control of air traffic) applicable to the airmen, aircraft, and operations involved in all U.S. civil aviation throughout the world. As part of its safety program, this program provides for the operation and maintenance of a fleet of aircraft to continually monitor the accuracy of signals emitted by the aids to air navigation in the common system and to develop flight procedures for use by U.S. civil and military aviation and foreign air carriers operating into the United States. It also provides for a system of registration and recordation of airmen and aircraft under title V, Federal Aviation Act of 1958.

Continuing growth in the aviation industry has been stimulated by an expanding economy, shifts and increases in population, public education and approval of jet-powered and V/STOL aircraft, and the ever-increasing use of aircraft in air taxi, executive, agricultural, and industrial operations. The impact of this expansion has been intensified and compounded by the rates at which jet-powered and V/STOL aircraft have been added to the fleets of both the air carriers and general aviation. A major portion of program activity is continuing to be devoted to the revision of safety rules, regulations, and standards to cope with increasingly complex problems.

Jet-powered cargo aircraft have now been introduced into supplemental air carrier service. This has created new and unique training and operational problems for the supplemental carriers and has required increased surveillance of this particular type of operation. The development, production, and operation of supersonic transport aircraft and a short-haul DC–3 replacement aircraft are now priority projects of the Agency. These aircraft will eventually have a major impact upon all flight standards programs.

ENGINEERING AND MANUFACTURING

The Federal Aviation Agency develops and promulgates standards and regulations applicable to the design and performance characteristics of aircraft, aircraft engines, propellers, and appliances; approves the materials and methods used in the manufacture of aircraft and aircraft components; and makes determinations regarding the original airworthiness of complete aircraft. In addition, the Agency issues certificates indicating compliance with safety standards and regulations for generic types, systems, or models of aircraft, aircraft engines, propellers, and appliances (type certification); monitors factory operations and quality control systems (production certification); and approves in-

dividual aircraft as originally manufactured, or as modified in conformance with supplemental type certificates (airworthiness certification). Some indicators of trends in engineering and manufacturing are:

	1960	1961	1962	1963	1964	1965
Number of manufacturers subject to FAA inspection	383	475	506	803	955	1,017
Number of all type certification projects of record	342	701	800	965	1,116	1,290
Number of aircraft type certification projects of record	334	620	720	838	974	1,132

AIR CARRIER AVIATION

This program is primarily concerned with the development, promulgation, and enforcement of safety standards and regulations applicable to the qualifications and technical proficiency of the airmen who operate and maintain the air carrier fleet and the procedures used by the air carriers in the operation and maintenance of their aircraft.

The growing utilization of jet-powered aircraft has had its greatest impact upon air carrier aviation. Preflight planning, airborne operations, and maintenance of jet aircraft are far more complex and sensitive to the slightest errors than reciprocating aircraft. These circumstances have required much more stringent safety regulations and standards than those applicable to piston-powered aircraft. Since the effectiveness of a safety standard is directly related to the degree of conformity by industry, it has become necessary to maintain closer surveillance and perform more frequent inspections of air carrier operations to assure this conformity. Also, because of the complexities of the many types of aircraft and powerplants, it has become necessary to train and utilize inspection personnel to greater degrees of specialization. Continuing emphasis will be placed on developing standards and procedures for the lowering of air carrier weather minimums.

A continuing expansion is anticipated in the use of V/STOL aircraft in air carrier operations. The interests of safety require revised rules, regulations, and standards, and higher degrees of surveillance in this type of operation. Some indicators in trends in air carrier aviation are:

	1960	1961	1962	1963	1964	1965
Air carrier fleet:						
Jet	84	202	319	397	437	554
Turboprop	216	230	261	264	267	270
Piston	1,812	1,678	1,505	1,368	1,310	1,226
Helicopters	23	25	19	20	16	18
Total fleet	2,135	2,135	2,104	2,049	2,030	2,068
Number of passengers (in millions)	62.2	61.8	66.6	70.7	76.1	78.7

GENERAL AVIATION

"General aviation" is the term used in grouping all types of flying activity other than that performed by air carriers and the military. Included in general aviation are aerial application of agricultural chemicals, all types of business and industrial flying such as transportation of executive personnel, aerial photography and pipeline patroling, air-taxi service, flight instruction, and all pleasure and recreational flying.

All classes of general aviation have been expanding during recent years and their growth is expected to continue. Business flying is presently the most substantial segment of general aviation accounting annually for over 5 million flying hours. The business fleet includes more than 7,000 multi-engine aircraft and business executives are making increasing use of jet-powered aircraft manned by professional crews.

One area of general aviation which has expanded at a faster rate than the industry as a whole is air-taxi service. With jet airports being located further from metropolitan centers and with congestion of ground transportation increasing, it is anticipated that the growth of air-taxi service will continue.

General aviation continues to acquire and operate turbojet, turboprop, and large piston-engine aircraft which are new to them. In this process, the interests of safety require that rules and regulations be reviewed and revised, that the proficiency of the airmen to fly and maintain the general aviation fleet meet prescribed standards which will assure safe operations, that a continuing program of safety education be conducted by upgrading airman standards, skills and knowledge, and that the flight procedures and maintenance facilities used by general aviation be monitored at sufficiently frequent intervals to assure compliance with the standards applicable to heavier and more complex aircraft. Some indicators of trends in general aviation are:

	1960	1961	1962	1963	1964	1965
Active aircraft	68,727	76,549	80,632	84,121	87,500	90,000
Active pilots	359,875	348,062	352,860	360,000	373,000	385,000
Certificated air-taxi operators	2,624	2,695	2,810	3,010	3,250	3,500
Certificated repair stations	722	824	940	1,075	1,150	1,230

FLIGHT PROGRAMS AND MANAGEMENT OF AIRCRAFT

Inherent in the discharge of Agency responsibilities is the availability of a fleet of aircraft for use in the divergent and complex functions for which they are required. This program provides for the management, operation, and maintenance of these aircraft, which range from the single engine to the high-performance, multiengine jet types and in total number exceed 125. The major part of the resources and aircraft included herein are required by the Agency, as part of its general flight safety program, for performing facility flight inspection to certify the reliability of signals emanating from ground electronic equipment as aids to air navigation. These inspection flights are made to calibrate newly installed, relocated, or modified air-navigational facilities, with periodic surveillance to assure continued accuracy.

Mr. OSTERTAG. Perhaps the Administrator has referred to this in his earlier discussion, but at page 196 there is a table comprising the number of passengers that will be using air traffic and air aviation during the next year. There is an increase of 2,600,000 over last year and there has been an increase since 1960 of 16,500,000 passengers.

REPAIR STATIONS AND FLIGHT SERVICE STATIONS

Mr. EVINS. The next table on 197 is also interesting. It shows the active aircraft increases from 68,000 in 1960 to 90,000 in 1965 and active pilots from 359,000 to 385,000 in 1965. And air taxi operators from 2,624 in 1960 to 3,500 in 1965; and certified repair stations, 722 in 1960 to 1,230 in 1965. This all ties in with what we were discussing earlier about the general growth in aviation, the number of pilots, the number of airplanes, the number of miles traveled. And yet the Administrator wants to cut down the flight service stations.

You refer to repair stations and service stations. There is a great difference between a service station and a repair station.

Mr. HALABY. At the flight service station you get service primarily related to weather, flight information, flight planning, and occasionally as you know, from some experiences down in Tennessee, we save people by talking them down through the weather or through the hills. That is the flight service station. The certificated repair station is a private enterprise. Sometimes it is a substantial company, sometimes a small business with a handful of certificated

airplane mechanics. Because they have demonstrated over the years their reliability, we give them a certificate. A man can go in there and have his airplane fixed with confidence that if it is signed off by one of our certificated mechanics, it is acceptable.

Mr. EVINS. That is fine. Let's maintain and preserve these small business enterprises.

Mr. JONAS. That is where you assume some liability, though?

Mr. HALABY. We have not had too many law suits as a result of careless or negligent maintenance by one of the private companies we have certified. There have been some complaints by individuals who say, "I bought this airplane, or had this airplane maintained at one of your stations, and therefore you are liable," but I do not believe many judgments have been rendered or many claims have been paid.

Mr. JONAS. As you do assume more and more responsibility you increase the liability?

Mr. HALABY. Yes, sir. We are not assuming any higher level of responsibility. We are stating that there is an increasing number of these stations which require people to go and inspect them and certificate them and we are doing it with the same or fewer personnel in toto.

FLIGHT PROGRAMS AND MANAGEMENT OF AIRCRAFT

Mr. EVINS. We will place in the record page 204.

(The page follows:)

Flight programs and management of aircraft

	1964 appropriation	1965 estimate	Difference
Permanent positions	2,444	2,335	−109
Amount	$34,690,000	$35,917,000	+$1,227,000

This program includes funds for: (1) operating costs such as fuel and line maintenance of Agency-owned and specified rental aircraft (except those utilized in research and development and training activities); (2) major maintenance of Agency-owned aircraft (except those utilized in research and development); (3) flight crews required to perform flight inspections and procedures functions; (4) flight procedures specialists; (5) analysis of flight inspection data; and (6) personnel associated with the management of the aircraft fleet.

The types of aircraft operated range from relatively simple single-engine rental aircraft to long-range multiengine aircraft. These aircraft are used: (1) for in-flight inspection and evaluation of air traffic control and flight procedures; (2) for in-flight inspection of the electronic aids employed in the civil and military systems of air navigation; and (3) by personnel in performance of their inspection duties and other assigned job functions.

The 1965 requirements for this function reflect the need for an increase in funding of $1,227,000 over 1964. Also reflected is a reduction in staffing of 109 positions. Major cost elements which affect the change in requirements for 1965 are $458,000 for salary increases required by phase II of the Salary Reform Act of 1962, $193,000 for within-grade increases and grade-to-grade promotions to be reflected in 1965. In addition, an increase of $576,000 and decrease of 109 positions in necessary. These amounts reflect the net change resulting from decreases, due chiefly to staffing reductions resulting from anticipated improvements in employee productivity and Washington reductions, offset by a necessary increase in 1965 funding required chiefly for additional aircraft overhauls scheduled in 1965 and for additional high-altitude facility flight check hours scheduled in fiscal year 1965.

OTHER OBJECTS—FLIGHT STANDARDS

Mr. EVINS. Now we will turn to the justification of other objects, 218, 219.

(The pages follow:)

ADMINISTRATION OF FLIGHT STANDARDS PROGRAM—JUSTIFICATION BY OBJECT

Summary

	1964 appropriation	1965 estimate	Difference
Permanent positions	6,239	5,956	−283
Personal services and benefits:			
Personnel compensation	$54,292,800	$56,521,000	$2,228,200
Personnel benefits	4,138,900	4,454,400	315,500
Total, personal services and benefits	58,431,700	60,975,400	2,543,700
Other objects:			
Travel and transportation of persons	4,326,600	4,261,600	−65,000
Transportation of things	658,700	672,200	13,500
Rent, communications, and utilities	2,808,000	2,810,600	2,600
Printing and reproduction	277,400	289,200	11,800
Other services	6,647,500	6,119,900	−527,600
Services of other agencies	1,674,300	1,965,300	291,000
Supplies and materials	7,472,300	7,441,200	−31,100
Equipment	2,181,000	1,181,100	−999,900
Total, other objects	26,045,800	24,741,100	−1,304,700
Deduct quarters and subsistence charges	−6,500	−6,500	
Total, all objects	84,471,000	85,710,000	1,239,000
Personnel compensation:			
Permanent positions:			
Number of positions	6,239	5,956	−283
Base pay	57,654,926	56,472,778	−1,182,148
Lapse	−5,394,926	−1,756,578	3,638,348
Base pay, less lapse	52,260,000	54,716,200	2,456,200
Positions other than permanent	181,600	154,900	−26,700
Other personnel compensation:			
Pay in excess of 52-week base	428,500	214,500	−214,000
Overtime and holiday pay	720,200	729,000	8,800
Nightwork differential	96,200	96,600	400
Additional pay for service abroad	221,700	221,700	
Compensation of witnesses	8,300	8,200	−100
Cost-of-living allowance	376,300	379,900	3,600
Total, personnel compensation	54,292,800	56,521,000	2,228,200
Personnel benefits:			
Government contribution to employee insurance programs:			
Group life and accidental dismemberment	159,400	171,500	12,100
Health benefits	327,600	325,000	−2,600
Government contributions to employee retirement programs:			
Civil service retirement fund	3,246,100	3,484,200	238,100
Social security	13,800	13,100	−700
Employee awards	118,400	142,100	23,700
Uniform allowance	200	200	
Quarters allowance	199,100	213,300	14,200
Dependents education allowance	74,300	105,000	30,700
Total, personnel benefits	4,138,900	4,454,400	315,500
Total, personal services and benefits	58,431,700	60,975,400	2,543,700

DISTRICT OFFICES

Mr. BOLAND. With regard to the general safety and district offices, are you going to abolish the district offices under this program?

Mr. HALABY. We have, I think, over the last 3 years, consolidated a few of them, Mr. Boland. We do not have a program at this time

for any additional consolidations of those offices. They are pretty tightly consolidated, now. As you know, they survey a particular carrier or group of carriers at generally their headquarters.

Mr. EVINS. Government insurance and employees allowances and quarters and other benefits are shown on page 219. There is an increase from a total of $58,400,000 to $60,975,000, two and a half million increase in personnel services and benefits. You give the explanation on the following page. Are there any questions?

This brings us down gentlemen to medical standards, and we will stand adjourned until 10 o'clock tomorrow and start with medical program tomorrow, Doctor.

THURSDAY, FEBRUARY 27, 1964.

ADMINISTRATION OF MEDICAL STANDARDS

Mr. EVINS. The committee will come to order and we will take up this morning the administration of medical standards.

Mr. Administrator, we will place in the record pages 234, 235, 236, 239, 240, 243 and 244 the summary of aviation medicine activities.

(The pages are as follows:)

ADMINISTRATION OF MEDICAL STANDARDS

GENERAL JUSTIFICATION

The objective of this activity is to apply aviation medicine knowledge to the safety and promotion of civil aviation. These functions include the development of standards and regulations governing the mental and physical fitness of airmen and other persons associated with safety in flight; medical certification of airmen; clinical, occupational, and employee health program; medical participation in the investigation of civil aircraft accidents; supervision of a medical education program and development of a medical plan in support of the Agency's defense readiness program; and directing and supervising a research program needed for the solution of aeromedical problems.

A designated aviation medical examiner program is directed and supervised under this activity. This program involves (1) the designation of approximately 5,800 practicing physicians with authority to perform annually an estimated 400,000 medical examinations of civil airmen, and (2) the participation in investigation of aircraft accidents. Specific functions of the office include the training of the examiners through such means as seminars, monitoring the performance of the examiner, and seeking additional and/or replacement of examiners.

The continued growth in the civil aviation population generates a yearly workload increase in this program. The primary concern relates to the medical certification of airmen and assuring that the standards and procedures used to qualify airmen are kept current. The necessity for renewal, reevaluation, and redirection of medical standards activities is a vital and lasting requirement. At the same time, the program is looking forward to furnishing educational and other material to the general public that will improve their safety in flight. The supersonic transport aircraft will present new and highly technical medical problems that must be evaluated and resolved in the foreseeable future.

Special efforts are continually being made to absorb the normal rate of growth by reevaluation of current operating procedures and implementing new and better management practices which assure maximum production. An example of improved management techniques, implemented to conserve manpower and make wider use of available information at reasonable cost, was the conversion of medical records to automatic data processing. Through the use of computer services, new procedures are being used which furnish better and more timely

service to airmen. It is contemplated that through the implementation of management improvement procedures the aviation medical program will be conducted without increased manpower in 1965.

The fiscal year 1965 funding requirements for the administration of medical standards program, set forth above, are summarized as follows:

	1964	1965	Difference
Positions	277	277	
Amount	$3,950,000	$4,195,000	+$245,000

The increase of $245,000 provides chiefly for required pay increases, mandatory within-grade increases, and funding for additional average employment necessary to carry out the program outlined above. No new staffing is requested for 1965 under this activity. Changes in the 1965 program are summarized in the following table and discussed in detail in the following pages:

	Positions	Amount
Direct costs:		
Phase II pay increases		$68,000
Other pay adjustments		21,400
Other cost adjustments		105,600
Staff and supporting services		50,000
Total		245,000

Phase II pay increases, +$68,000

This category of cost represents the amount required to meet the cost of that portion of the pay increases authorized by Public Law 87-793 and becoming effective in January 1964. The estimate is based on employment in general schedule grades as of January 1, 1964, and was computed on a grade-by-grade basis to give proper weight to the different amount of increase for each grade level. The amount included in this estimate represents the difference between the total yearly value of the increase and the amount which was payable in 1964. On the average, this estimate is 51.5 percent oof the total yearly costs.

Other pay adjustments, +$21,400

During the fiscal year 1965, $21,400 will be required to finance within-grade salary increases and additional salary costs of personnel who will be qualified for and promoted to higher grade levels than positions occupied during 1964. The cost of within-grade salary increases will amount to $14,900 after adjusting for savings in within-grade costs due to turnover. This estimate is based on present grade levels of employees in this activity and the length of time they have been in present grade levels. In addition, it is anticipated that 11 employees will qualify for initial grade-to-grade promotions after acquiring sufficient on-the-job experience to meet position qualifications established by the Civil Service Commission. The costs during 1965 of these grade-to-grade promotions will amount to $6,500.

Other cost adjustments, +$105,600

An increase of $105,600 is required chiefly for financing the cost of increased average employment in 1965.

Staff and supporting services, +$50,000

Staff and supporting services costs allocated to this activity in 1965 will increase by $50,000 because of increases arising primarily from additional rents and communications costs, pay increases, and other salary increases.

Summary of aviation medical activities under congressional limitation

	1964 appropriation		1965 appropriation		Difference	
	Positions	Amount	Positions	Amount	Positions	Amount
Administration of medical standards activity:						
Operations appropriation:						
Washington and Aeronautical Center:						
Medical standards	132	$1,470,000	132	$1,645,000	.....	$175,000
Research direction	23	994,000	23	980,000	.....	−14,000
Regional operations: Medical standards	67	778,000	67	812,000	.....	34,000
Total, operations	222	3,242,000	222	3,437,000	.....	195,000
Aviation medicine activity:						
Research and development appropriation:						
Direct research:						
Civil Aeromedical Research Institute (Aeronautical Center)	75	1,440,000	75	1,420,000	.....	−20,000
Washington (Georgetown facility)	25	400,000	25	430,000	.....	30,000
Total, research and development	100	1,840,000	100	1,850,000	.....	10,000
Total, direct program	322	5,082,000	322	5,287,000	.....	205,000
Staff and supporting services	55	708,000	55	758,000	.....	50,000
First aid stations, Dulles International and Washington National Airports	8	64,700	8	68,800	.....	4,100
Employee health program, NAFEC	2	24,000	2	24,300	.....	300
Public and employee health facilities, Wake and Canton Islands	5	60,000	5	67,200	.....	7,200
Employee health program (payment to Department of State)	.....	5,500	.....	5,500	.....	.....
Employee health program (payment to Panama Canal Company)	.....	11,200	.....	12,600	.....	1,400
Automatic data processing of airmen medical certification records	14	118,200	14	120,600	.....	2,400
Total	406	6,073,600	406	6,344,000	.....	270,400

EXPLANATION OF LIMITATION CHANGE

The 1965 estimate for programs included under the limitation on aviation medical activities does not reflect any position change but does provide for an increase of $270,400. This amount includes $195,000 for the medical standards activity and $50,000 for the staff and supporting services activities, described in detail on the preceding pages. The remainder of the increase, $25,400, is required to finance the additional salary costs arising from the phase II increment of the Salary Reform Act of 1962.

ADMINISTRATION OF MEDICAL STANDARDS—JUSTIFICATION BY OBJECT

Summary

	1964 appropriation	1965 estimate	Difference
Permanent positions	277	277	
Personal services and benefits:			
Personnel compensation	$2,199,500	$2,410,600	$211,100
Personnel benefits	159,600	177,500	17,900
Total, personnel services and benefits	2,359,100	2,588,100	229,000
Other objects:

Total, personal services and benefits	2,359,100	2,588,100	229,000

Mr. EVINS. We have Dr. M. S. White, the Air Surgeon.

Dr. White, are you a new man with the Federal Aviation Agency?

Dr. WHITE. Yes, sir.

Mr. EVINS. How long have you been with the Agency?

Dr. WHITE. Five months, sir.

Mr. EVINS. Will you give us a little bit of your background and tell us something about yourself? We are glad to see you and welcome you and wish you success and good luck. You have already been confirmed. Tell us something about your background.

Dr. WHITE. Thank you, sir. I entered the military service and have been a member of the military service for 32 years. I have had a varied experience in the military service in various command jobs and educational jobs and professional work. I have been a flight surgeon in aviation medicine since 1935.

Mr. EVINS. What is your medical college?

Dr. WHITE. University and Belleview Hospital Medical College, which is now called New York University Medical College.

Mr. EVINS. You have had a distinguished career in the military service, more than 30 years.

Dr. WHITE. Thank you, sir.

Mr. HALABY. Mr. Chairman, he may be a little modest in his statement of his qualifications. Among other things, he was one of the three top men in aerospace medicine in the Air Force, and he was willing to take this job at the peak of his Air Force career with all of the civilian and social and political problems that he finds here that he didn't find there.

He has also been active in the Aerospace Medical Association and he was selected after we convened a panel of the top aerospace medical men in the country, and they went over a number of candidates and nominated him to me. We are fortunate in getting the Secretary of the Air Force and Sam White to concur in this. I can see even in these 5 months he has taken hold of this activity and done an excellent job. He knows all that is going on in the other aviation medical research fields and therefore he brings to it a kind of protection in which this committee has been interested, that there be the least possible duplication or overlap between this medical research and that going on in the Air Force and the Navy and in the National Institutes of Health and elsewhere.

Mr. EVINS. Very fine.

Mr. JONAS. Dr. White, are you a retired Air Force officer?

Dr. WHITE. No, sir; I am on active duty, loaned to the Federal Aviation Agency.

Mr. JONAS. Has your experience in medicine been in the Air Force?

Dr. WHITE. Yes, sir; since 1935. It was Army Air Corps at that time. It became Air Force in 1949.

Mr. JONAS. Mr. Administrator, how do you get a service to lend somebody to you? Whose payroll is he on, the Air Force or the FAA?

AUTHORITY FOR ASSIGNMENT OF MILITARY PERSONNEL

Mr. HALABY. The Federal Aviation Act, which converted the Civil Aeronautics Administration into the Federal Aviation Agency, contains a specific provision for the assignment of military personnel, and there have been as many as a couple of hundred at any one time.

The arrangement is a request from me to the Secretary of the Air Force. The Secretary of the Air Force then assigns him and orders are prepared by the Chief of Staff of the Air Force, and we pay General White by reimbursing the U.S. Air Force.

I think it is fair to point out General White has made a sacrifice in coming here. He had a very important position in his post in San Antonio. He had quarters and other appropriate requisites of his rank. He has given all that up and come here at the same salary, which, of course, is far below what he, as a private practitioner would be earning. And of course, that is what makes it difficult to obtain men in these jobs when they can earn at least three times as much in private medical practice.

There has been some criticism of my asking a military officer to assume this position. I have answered that criticism by saying that the important thing here is the merit, is the quality of the individual, and not what kind of clothes he wears. He has lived with pilots and engineers and mechanics and airmen all of his medical professional life, and that is the important thing.

Mr. EVINS. The Doctor has eminent qualifications and experience. We wish you well, Doctor.

PROBLEMS IN AVIATION MEDICAL PROGRAM

What are your main problems and what are you proposing to do in your division?

Dr. WHITE. Our main problems have been principally the organization of our capabilities to provide the medical support required to improve safety in civil aviation. We have been working under a limitation for medical activities for the last few years and in fact, this probably has been pretty healthy as far as I am concerned, in order to get me oriented to our real problems in the Agency, because immediately upon being faced with this limitation I had to make a careful analysis to determine where we could function best with the personnel and what we have. We have done that and we feel we can function, as we have indicated in the presentation of the budget for this fiscal year, at the same position level that we have under the current limitation in order to permit us to regroup and actually analyze in a clear-cut fashion the problem areas and our true requirements.

ACTIVITIES OF PHYSICIANS

Mr. EVINS. Your general justification says that your programs involve approximately 5,800 practicing physicians with authority to perform annually an estimated 400,000 medical examinations of airmen, and also participation in investigation of aircraft accidents. I thought the CAB investigated accidents. I didn't know the medical division did that. Are you actually engaged in investigation of accidents?

Dr. WHITE. Yes, sir; there is a great deal being done, particularly by this group of 5,800 aviation medical experts who are a dedicated group of civilian physicians designated by the Federal Aviation Agency to conduct the examination of the airmen.

Mr. EVINS. Before they fly, or during their flights or qualifications for flying?

Dr. WHITE. Their qualifications, and in addition to that, these examiners have volunteered to participate in the investigation of aircraft accidents, particularly in general aviation. As you know, the CAB has delegated to the Federal Aviation Agency investigations of the light craft accidents in most instances and to indicate the importance of this with the great number we have, I just had reported preliminarily for calendar year 1963, 156 pathological, or post mortem examinations that we have had on individuals involved in general aviation light craft where the flight inspectors considered that alcohol was only suggestive in about 3 of these 156 cases. Through work of our aviation medical examiners and pathological investigations, we found that over one-third had levels of alcohol in their blood which indicated they were legally intoxicated. This is just one form of investigation that is done. We investigate the individual in the aircraft, the type of trauma that has occurred. For instance, we have found in our pathological investigations that many individuals don't demonstrate any outward trauma but inwardly when an autopsy is done we find they have had shearing of large blood vessels of the body due to various forces being exerted in the deceleration of the crash.

Mr. EVINS. Your certified physicians examine civilian pilots and also participate in a local accident if it is in their area?

Dr. WHITE. Yes, and this is without cost to the Government. These men volunteer their own time and their own secretarial work in preparing reports and performing this form of function.

Mr. EVINS. This is an auxiliary report that goes into the compilation of reports?

REEVALUATION OF MEDICAL STANDARDS

Dr. WHITE. These are the reports that come in to us and this is one of our problem areas, because of the limitations we have not been able to analyze all these reports. We have had a wealth of material that is being developed in the aircraft accident field that will be tied in with the status of the airman and his other pilot activities, where physical status should eventually contribute to the standards that are required for safe flying.

Mr. EVINS. You speak of the necessity for renewal and reevaluation and redirection of medical standards. What are you doing in this area?

Dr. WHITE. This is directly related to aircraft accident reports as I have mentioned, and to determine whether our standards are safe enough without undue restrictions. We find, for instance, because of a capability that has just been developed in the last 2 years of transferring all our examination records to automatic data processing techniques, that we have over 20,000 third-class airmen flying now with vision in one eye which is considered industrially, legally blind—20/200 in one eye. And they are doing fairly well. We haven't been able to analyze this, yet, with reference to aviation accidents, but because of this it possibly may be that our standards can be relaxed.

Mr. EVINS. Suppose you have a good airman or a pilot—we will call him "X"—and a couple of years later he develops some eye impairment or shows evidence of drinking and you keep on certifying him for flying. How do you revoke his license? How do you stop him from flying? He loves to fly and wants to keep it up. What powers do you have to prevent him from continuing? He was a good man at one time, but he shows weaknesses at other times. What do you do?

Dr. WHITE. If the disqualification is of such nature that it will not interfere with his performances as a safe airman, this is noted on his records and examination and processed through proper channels and the individual is in most cases usually qualified. If he has a deficiency such as you have mentioned which could be considered unsafe, such as alcoholism, and this is definitely documented, the individual's certificate is denied. This being done by one of the 5,800 aviation medical examiners.

Mr. EVINS. If you have evidence that he still owns his plane after his certificate has been denied and he still is flying, what can you do?

Dr. WHITE. This then becomes an administrative matter which must be handled through legal channels that are not concerned with the medical operations. We would report this to the proper section of our Flight Standard Service.

MEDICAL STANDARDS INVOLVED IN SUPERSONIC AIRCRAFT

Mr. EVINS. What are your problems with respect to the supersonic aircraft and high altitude flying, and what are you doing? What advances have you made? What progress are you making?

Mr. OSTERTAG. Mr. Chairman, in this budget Administration of Medical Standards is one thing, but this is not directly applicable to medical research. Isn't that correct?

Dr. WHITE. No, sir. I think definitely that is an excellent point you have just presented, because we have the question before us of what we are doing in the supersonic transport. Our medical research cannot be taken in the context of being research alone. All the medical research that is being performed in the Federal Aviation Agency must be tied in with the entire medical picture which is related to certification, particularly of the air crews, and with standardization. That is, the standardization is required in aircraft for proper environmental health for air crews and passengers. All our research is directed toward civil aviation progress related to safety standards.

Mr. OSTERTAG. According to your justification the program involves the designation of a certain number of positions with authority to perform annually an estimated 400,000 medical examinations of civil airmen and the participation in investigation of aircraft accidents, and so on. Then subsequent to that you point out that the supersonic air transport will present new and highly technical medical problems that must be evaluated and resolved in the foreseeable future.

I grant you that is true, but does that actually come under the Administration of Medical Standards, rather than under research looking toward the future problems in supersonic operations? I grant you that there is a need for that, but does it properly come under Medical Standards?

Mr. HALABY. I think what Mr. Ostertag is interested in, the budget is divided up in terms of Administration of Medical Standards under "Operations" at page 234. There are, I believe, 23 jobs in there that constitute the leadership and executive direction of both the Administration of Medical Standards and the top supervision of the research program. He just wanted to be sure to clarify the point that here under this Administration of Medical Standards there are some jobs that also relate to medical research. For example, your own. Isn't that the point?

Mr. OSTERTAG. Yes; that is the point.

Dr. WHITE. I thought perhaps I could clarify it, also, by indicating in the development of standards we don't know yet what type of requirement should be established for the pilot who flies the supersonic transport. When we determine this, probably through research efforts and other investigations, then standards—physical standards—would be set with reference to the pilot. We don't know the type of environment or protective devices to be written into the airworthiness standards for the protection of the passenger in the supersonic transport, yet. With proper research directed along these lines, the standards can then be written that will prescribe these for industry.

DUPLICATION IN MEDICAL RESEARCH

Mr. OSTERTAG. The military carry on a considerable amount of medical research. Are you coordinated with them in any sense?

Dr. WHITE. Yes, sir.

Mr. OSTERTAG. Are you duplicating the same effort?

Dr. WHITE. I share your concern. Everyone has directed their attention toward this so-called wasteful duplication of research in certain agencies and even in industry and civilian medicine. We can assure you that we have very fine techniques to guarantee there is no duplication in the Federal Aviation Agency of research carried on by any other Government department or even civilian industry or institutions.

We have a Council of Research Advisers that meets two or three times a year that is composed of representatives of each of the military services, as well as numerous other scientists from throughout the country, who review all our research projects and determine the priority, whether they should be terminated or whether they should be continued. This is just one technique. Another is through the Scientific Information Exchange in which we list all research projects undertaken by the Federal Aviation Agency. Another is with our closely coordinated liaison with various other professional personnel, and in the very fine Federal office building where we are located, we are located right close to the NASA building. We have fine cooperative relationships with the medical people in NASA to assure our research is being directed along individual channels and is not duplicative. But actually in civil aviation medicine, research has been untouched. This is one of the deplorable conditions that existed prior to the Federal Aviation Act of 1959 in which it was recognized that something needed to be done for the establishment of the then Civil Air Surgeon's Office.

Interestingly, I was a member of the committee, the national committee that represented the American Medical Association at that time, that determined that the military and the other agencies were not touching the research required in civil aviation.

Mr. OSTERTAG. Thank you.

EMPLOYMENT FOR MEDICAL ACTIVITIES

Mr. EVINS. We notice you have 222 in the administration of medical standards and you have 100 in research direction; 75 at the Aeronautical Center, and 25 at Georgetown University.

On page 240, in addition to those, you have 55 in staff-supporting services; first-aid station at Dulles, 8, and 2 people in NAFEC. You have five in the employee health program at Wake and Canton.

What does this ADP mean? What do these 14 people do? You have automatic data processing and 14 people besides the machines.

Dr. WHITE. Yes, sir. There are presently 250,000 physical examination records that are processed annually at the Oklahoma City Center. That is to say, we receive over a thousand of these physical examinations a day. These must be coded by individuals who then process them through the machine as indicated here. These are individuals who work in those positions.

Mr. EVINS. In 1964, 406 personnel and 406 estimated for 1965. There is no personnel increase, but the budget jumps from $6,073,600 to $6,344,000, an increase of $270,400.

And $205,000 of this increase is in the direct program. Is most of this for salary increases?

Dr. WHITE. About half of this is for phase 2 pay increases and other pay adjustments. This is shown on page 235. The other pay adjustments, or rather the $105,000, "Other cost adjustments," includes the employment of additional personnel who were not on board at the end of the last year, due to the uncertain, or rather the upheaval of the Federal Air Surgeon's Office. There was quite a bit of uncertainty. We had no one aboard, there were many vacancies that needed to be filled. Finally, when I started organizing the Office to determine our needs, we now have 15 employees being advertised for and are now taking on 3 additional.

VACANT MEDICAL POSITIONS

Mr. HALABY. What happened was that Capt. James Goddard, who was the Civil Air Surgeon, was offered a career advancement in the Public Health Service in the Epidemiological Center at Atlanta and he felt that he had to accept the Surgeon General's request for this, and there ensued a period of searching for a man like Dr. White. We froze the positions until we found him and that, therefore, accumulated these vacancies and these costs for the full-year employment of these people whom Dr. White is now recruiting.

I might say, he has been even more successful than I expected. He recently acquired a senior medical man from the Boeing Co., very experienced in the area of research, and he has others coming.

Mr. JONAS. It is a little difficult for me to understand how, with the loss of a Director, you would be so poorly organized with nobody to

take his place, that you have to practically go into a tailspin for a period of months. You must have a second in command in these departments who can take over in emergencies. What if the Director would die? Is the program going to be jeopardized every time you make a change in the directorate?

Mr. HALABY. No, sir. There was an Acting Air Surgeon while we were recruiting Dr. White. The program did go forward, but we felt we should save the money and save the mistakes that might be made in an interim situation until we had a full-fledged Federal Air Surgeon. So we felt it was prudent to give him the opportunity to recruit high-quality staff, rather than just filling up vacancies without his leadership.

The examinations went on, the accident investigation support of CAB went on. The program of research continued under the direction of Dr. Mohler, but we were temporarily without a full-fledged Federal Air Surgeon and all I can say is, the deep-seated problem is that we are not paying people and giving them enough incentive to bring men into the Federal Government in this kind of medical job and keep them there. If the incentives were there, the turnover would be far less.

Mr. JONAS. What class of employment constituted the vacancies, Doctor? What were the vacancies? In what activities, what categories?

Dr. WHITE. These were concerned with professional personnel. For instance, in the Aircraft Accident Division which we discussed a little earlier they would rate GS–14 and GS–15 types of grades.

Mr. JONAS. Are they medical school graduates?

Dr. WHITE. Yes, sir.

Mr. JONAS. They are doctors and physicians?

Dr. WHITE. Yes, sir.

Mr. JONAS. All of them?

Dr. WHITE. No, sir; not all of them. Just the 15 we are discussing.

Mr. JONAS. Is that the number that were frozen? The Administrator said employment was frozen. Were all that you needed to recruit professional people?

Mr. HALABY. He is speaking of the breakdown of that 15. How many are professional M.D.'s approximately?

Dr. WHITE. I would have to go through the actual list but approximately I can state five would be physicians.

Mr. HALABY. And some are medical technicians?

Dr. WHITE. Yes, sir; principally.

Mr. HALABY. How many clerical?

Dr. WHITE. There would be about four clericals.

Mr. JONAS. How long did this hiatus exist?

Dr. WHITE. Actually, for about a year and a half.

Perhaps I should go back and explain a little what happened.

Mr. JONAS. Why can you do without them for a year and a half and have to have them now?

Dr. WHITE. If I go back a little, sir, and explain the organization of the Civil Air Surgeon's Office as it had existed prior to my arrival, this may be of some assistance.

Mr. HALABY. I do not think that Dr. White should have to answer for any period of time before he came into official responsibility. I think I should.

The answer to your question, Mr. Jonas, is that without a full-fledged Air Surgeon the program suffered. It was understaffed and the men who were in charge of it were waiting for the appointment of a full-fledged Air Surgeon. The Acting Surgeon incidentally had a heart attack in the course of this 15 or 18 months that Dr. White is speaking about. He had been the No. 2 man under Dr. Goddard. He was incapacitated. Dr. Reighard, the No. 3 man, stepped right into his place.

There was a period, a very unfortunate one and one for which I take full responsibility, in which we did not have a full-fledged Air Surgeon. The fact that money was saved during that period by people who were actively absorbing the workload I think is a tribute to the organization rather than a deficiency. The fact that Dr. White has come in, has surveyed the whole situation and is recruiting to fill those positions is also, it seems to me, a positive accomplishment rather than a negative one.

Mr. JONAS. That does not answer the question I asked. Maybe it cannot be answered. I still cannot understand how you got along so well for a year and a half without these extra people and now suddenly you have to have them. They weren't employed under his predecessor. They still haven't been employed, but you are now recruiting and either some work was neglected or you were able to get along without the additional people.

Mr. HALABY. The committee authorized and in fact limited the organization and funding deliberately. Now due to the absence of the leader of the organization, we deferred filling that until Dr. White came in. We justified these to you the last 2 years and I think we can justify them again.

I think the only question is whether we were wise to defer action and save money then, or not.

NATURE OF INCREASED PRODUCTIVITY

Mr. JONAS. You had presented to us yesterday a number of tables breaking out units of work. Do you have such a table with respect to this activity?

Mr. HALABY. No, sir; we do not. I do not think it is possible with doctors, but maybe Dr. White can answer that question.

Dr. WHITE. We are approaching a technique to determine work evaluations; yes, sir. We can give you specifically one productivity increase. This is on the certification of airmen which is the bread and butter of the whole medical activity.

Mr. JONAS. You could certainly show us how many you certified last year.

Dr. WHITE. Exactly. We have 250,000 and we are going up to 400,000 next year because of requirements for additional examinations. So that means where we had 1,000 of these physical examinations being processed, today we effect a more than 50-percent increase.

I might add, you stated that there must be some indication that the work was not properly being done; you are exactly right. We had a backlog of close to 4 weeks of these certification problems. That means over 16,000 of these were backlogged and we were not performing the public service needed by the airman in expediting his denial or

certification of his medical record. This is where, although we have been performing adequately, we have not been performing as well as could be done with just the addition of a few extra personnel.

Mr. JONAS. One other comment, Mr. Chairman.

Notwithstanding the fact that the table on 240 shows no increase in positions, the record shows you are going to spend $105,000 for increases in employment. That is quite aside from in-grade promotions, salary adjustments, or anything. That is additional employment, is it not?

Mr. HALABY. It is the difference we discussed yesterday between the actual employment and the funded employment; yes sir.

Mr. JONAS. It shows $105,000 increase in average employment.

Mr. HALABY. Yes; additional man-years.

Mr. EVINS. Because of the vacancies you feel you can live well within the limitation set by this committee without suffering?

RESPONSIBILITIES AT WAKE ISLAND

Dr. WHITE. I think we can perform adequately while I regroup but I know there are many areas that are untouched. I have a letter, here, from one doctor we have at Wake Island, taking care of a permanent population of 1,400, and a thousand transient population a day—over 30,000 a month pass through there and this poor doctor had three fracture cases in 2 days, including a ruptured spleen that he was able to diagnose without any additional laboratory support, at all. Now there is an instance where perhaps they should have another individual and we know they should have a dentist out there, but we are within limitations where we cannot provide a dentist.

Mr. EVINS. Doctor, you are an experienced airman and you had 32 years service with the military and the medical profession is usually pretty conservative and we just want to express the hope that you will not be building an empire because you can call on the Air Force and the Army for all of their medical knowledge and you know how to apply that. You have had experience.

Mr. JONAS. A comment by the doctor leads me to ask this question to clarify the record: Who are the 1,400 people served by the doctor on Wake Island? Are you providing medical service for that many people?

Mr. DEAN. Wake Island is an island entrusted to the Federal Aviation Agency by Executive order and agreement with Department of Interior. It is our responsibility to administer all community services. It is an important stopping point for trans-Pacific aircraft. We are the Government of Wake Island. We have the schools and we have the responsibility for utilities. Among our functions is included the furnishing of all medical support. Virtually everyone there is an employee of the Federal Aviation Agency or a dependent, or an employee of the Department of Defense or a dependent, or is associated with aeronautical activities.

Mr. EVINS. That is good information to spell out on the record.

(The information referred to follows:)

[From the Federal Register, Thursday, Sept. 6, 1962]

FEDERAL AVIATION AGENCY

CIVIL ADMINISTRATION OF WAKE ISLAND

AGREEMENT BETWEEN THE FEDERAL AVIATION AGENCY AND THE UNITED STATES DEPARTMENT OF THE INTERIOR

This Agreement is entered into by and between the United States Department of the Interior (hereinafter referred to as Interior), and the Federal Aviation Agency (hereinafter referred to as FAA).

Whereas it is contemplated that Interior will be vested with executive and legislative authority necessary for the civil administration of Wake Island, and all judicial authority respecting that Island other than that contained in the Act of June 15, 1950, as amended (48 U.S.C. 644(a)), and

Whereas the FAA has primary use, jurisdiction, control, responsibility and interest in the facilities on Wake Island;

Now, therefore, in consideration of the above, Interior and FAA hereby covenant and agree as follows:

(a) *Exercise of authority.* All executive, legislative and judicial authority for the civil administration of Wake Island, now or hereafter vested by law in the Secretary, of the Interior, shall be exercised by such person or persons (which shall include a position or positions) as may be designated by the Administrator of the FAA. This authority shall be exercised in accordance with such directives as may be prescribed by the Secretary of the Interior.

(b) *Rules and regulations.* All authority invested by law in Interior to make necessary rules and regulations for the orderly maintenance and the civil administration of Wake Island shall be exercised by the person or persons designated pursuant to paragraph (a), and in accordance with such directives as may be prescribed by the Secretary of the Interior.

(c) *Reports.* The FAA shall submit annual reports to Interior outlining the rules and regulations adopted pursuant to this Agreement and covering administrative action with respect to such rules and regulations.

(d) *Funding.* The FAA assumes responsibility for the administration of Wake Island and assumes the necessary funding obligations for such purposes. It is further agreed that the administration of and operation on Wake Island shall be without expense to Interior, except that expenses incurred by Interior in discharging functions not delegated pursuant to this Agreement shall be at Interior's expense.

(e) *Facilities.* Since, under the International Aviation Facilities Act, as amended, 49 U.S.C. 1151, et seq., FAA possesses exclusive authority in all matters relating to the installation, consolidation, operation, protection, maintenance, improvement, and administration over all facilities, structures and equipment on Wake Island, which are or may hereafter become the property of FAA, it is hereby agreed that Interior will take no action that may be in derogation of this authority, and no action or directive of Interior will be construed to be in derogation of this authority.

(f) *Support.* Interior will provide such assistance to FAA as may be mutually determined upon in the future.

(g) *Law enforcement.* Interior and FAA shall cooperate to obtain the appointment of persons to such positions as United States Commissioner, and Deputy United States Marshal, and to other positions as may be necessary at Wake Island not within the appointing authority of Interior or FAA.

(h) *Duration.* This Agreement shall become effective upon the vesting of the authority for the civil administration of Wake Island in the Secretary of the Interior, and shall continue in force for five years following such date. This Agreement may be renewed or modified thereafter, as Interior and FAA may mutually agree.

Dated: December 22, 1961.

N. E. HALABY,
Administrator, Federal Aviation Agency.

Dated: February 5, 1962.

STEWART L. UDALL,
Secretary of the Interior.

EXECUTIVE ORDER 11048—ADMINISTRATION OF WAKE ISLAND AND MIDWAY ISLAND

By virtue of the authority vested in me by section 48 of the Hawaii Omnibus Act (approved July 12, 1960; 74 Stat. 424; P.L. 86-624) and section 301 of title 3 of the United States Code, and as President of the United States, it is hereby ordered as follows:

PART 1—WAKE ISLAND

SECTION 101. The Secretary of the Interior shall be responsible for the civil administration of Wake Island and all executive and legislative authority necessary for that administration, and all judicial authority respecting Wake Island other than the authority contained in the act of June 15, 1950 (64 Stat. 217), as amended (48 U.S.C. 644a), shall be vested in the Secretary of the Interior.

SEC. 102. The executive, legislative, and judicial authority provided for in section 101 of this order (1) may be exercised through such agency or agencies of the Department of the Interior, or through such officers or employees under the jurisdiction of the Secretary of the Interior, as the Secretary may direct or authorize, (2) may be exercised through such agency or agencies, other than or not in the Department of the Interior, or through such officers or employees of the United States not under the administrative supervision of the Secretary, for such time and under such conditions as may be agreed upon between the Secretary and such agency, agencies, officers or employees of the United States, and (3) shall be exercised in such manner as the Secretary, or any person or persons acting under the authority of the Secretary, may direct or authorize.

SEC. 103. Executive Order No. 6935 of December 29, 1934, to the extent that it pertains to Wake Island, is hereby superseded.

PART II—MIDWAY ISLAND

SECTION 210. The Secretary of the Navy shall be responsible for the civil administration of Midway Island and all executive and legislative authority necessary for that administration, and all judicial authority respecting Midway Island other than the authority contained in the act of June 15, 1950 (64 Stat. 217), as amended (48 U.S.C. 644a), shall be vested in the Secretary of the Navy.

SEC. 202. The executive, legislative, and judicial authority provided for in section 201 of this order shall be exercised through such agency or agencies of the Navy Department, or through such officers or employees under the jurisdiction of the Secretary of the Navy, as the Secretary may direct or authorize, and shall be exercised in such manner as the Secretary, or any person or persons acting under the authority of the Secretary, may direct or authorize.

SEC. 203. Such public lands on the Midway Islands, Hawaiian group, between the parallels of 28°5′ and 28°25′ North latitude, and between the meridians of 177°10′ and 177°30′ West longitude, as were placed under the jurisdiction and control of the Navy Department by the provisions of Executive Order No. 199-A of January 20, 1903, are hereby continued under the jurisdiction and control of that Department. Executive Order No. 199-A is hereby superseded.

PART III—MISCELLANEOUS PROVISIONS

SECTION 301. The provisions of each of the foregoing Parts of this order shall continue in force until the Congress shall provide for the civil administration of the affected Island or until such earlier time as the President may specify.

SEC. 302. As used herein, the terms "Wake Island" and "Midway Island" include the reefs appurtenant to, and the territorial waters of, Wake Island and Midway Island, respectively.

SEC. 303. To the extent that any prior Executive order or proclamation is inconsistent with the provision of this order, this order shall control.

SEC. 304. This order shall not be deemed to affect Executive Order No. 9709 of March 29, 1946, or Executive Order No. 9797 of November 6, 1946.

SEC. 305. Nothing in this order shall be deemed to reduce, limit, or otherwise modify the authority or responsibility of the Attorney General to represent the legal interests of the United States in civil or criminal cases arising under the provisions of the act of June 15, 1950.

JOHN F. KENNEDY

THE WHITE HOUSE,
September 4, 1963.

Mr. OSTERTAG. Are there military personnel at Wake?

Mr. DEAN. Yes, they are associated with MATS and there are some ballistic missile range personnel.

Mr. HALABY. It is almost endless, Mr. Jonas, the number of things that you all placed upon this Agency. I never dreamed 3 years ago we would be in charge of an island and its government and medical services.

Mr. EVINS. An Executive order did that, and not this committee.

Mr. HALABY. I should not have attributed it to this committee. I meant the things loaded onto the FAA. This is one of the more difficult ones. I think Dr. White's point is that because the Federal Government holds us responsible for supporting that island, here is one doctor with all these people and that is within this limitation.

Mr. JONAS. What is the ratio in the United States of doctors to population?

Dr. WHITE. Approximately 1 to 750.

Mr. JONAS. That is countrywide?

Dr. WHITE. This physician at Wake requires technical support—he needs technical support of a secretary and a lab assistant. Perhaps a dentist would be better. At the present time the large number of children there have to be returned to Hawaii for dental treatment.

Mr. EVINS. All your other objects are up, Doctor. Try to hold them down. Last night at the signing of the tax bill the President stated they were going to submit to the Congress an estimated reduction of 7,500 jobs. This is the direction in which we are trying to move, in reducing and practicing economy.

RESEARCH ON TIME ZONE EFFECTS

Mr. OSTERTAG. I have some questions that I would like to submit to the Administrator concerning research on time zone effects that I would like to have answered at this point in the record.

(The questions and answers follow:)

The following paragraph appeared in the November 1963 issue of Fortune magazine:

"Serious investigation of the time zone effect has really just begun. The Federal Aviation Agency has recently undertaken a study that will involve flying half a dozen volunteer scientists from FAA's medical research base at Oklahoma City to Tokyo and return, and later from Oklahoma City to Frankfurt and return. Before, during, and after the flights the volunteers will be given psychological and physiological tests so that FAA can find out, first, the magnitude of the problem, and, second, the range of variation in the tests. Later, under FAA's Dr. George Hauty, more elaborate experiments will be carried out. One such, to be made with a University of Minnesota group, will try to find out if there is any way to schedule flight departure times so that the disruption of circadian rhythms can be kept at a minimum."

Could you furnish the committee with the details of the total program? What will it cost? Are the results to be achieved commensurate with expenditures? If this must be done couldn't the same objective be accomplished by checking airline crews on normal flights? Wouldn't that be much more realistic and practical?

INFORMATION ON FAA BIOMEDICAL RESEARCH ON EFFECTS OF INTERCONTINENTAL FLIGHT

1. Could you furnish the committee with the details of the total program?

(*a*) Background to problem: High-speed jet travel exposes aircrew and passengers to rapid changes in time zones. Man, as well as many other forms of life, maintains a time-oriented equilibrium with his environment. When man is suddenly placed in an environment with a day-night cycle significantly different from that to which he has become accustomed, he suffers a disruption of numerous important functions. The degree to which measurable functions are affected and the rate at which they adjust to the new time sequence is known to be different for various functions. The extent to which the performance of humans is impaired by these effects, and the duration of impairment, are not clearly known.

(*b*) Objective: The purpose of FAA studies in this area is to determine (1) the effect of time zone change on human proficiency and reliability and (2) the length of the period required to regain the former, or an adequate, level of functioning and proficiency.

(*c*) Method: 1. Numerous physiological, biochemical, and performance measurements will be made on six research subjects for 72 consecutive hours on three occasions at 60-day intervals, prior to the change in time zones.

2. Subjects will be transported by jet aircraft across six or more time zones. Selected physiological, biochemical, and performance measurements will be carried out in flight.

3. Comparative measurements will be continued for a period of 2 to 4 weeks at destination, until stability of the various functions has occurred.

4. Subjects will be returned to point of origin with inflight and postflight measurement as before.

5. A second trip, in a direction opposite to the first, will be made with the same subjects and under the same conditions as for the first trip. The same preflight, inflight, and postflight measurements will be made.

IV. If this must be done, couldn't the same objective be accomplished?

6. The study, now in process, is being conducted jointly by researchers at the FAA Civil Aeromedical Research Institute and researchers of the University of Minnesota.

7. Research subjects are selected from the researchers of the two institutions conducting this study.

II. What will it cost?

1. To cover equipment, data processing, and per diem for research subjects	$12,500
2. To cover transportation expenses for subject and equipment	16,000
3. To cover the cost of a contract with University of Minnesota for the preliminary study and a portion of the ongoing study	8,600
Total	37,100

III. Are the results to be achieved commensurate with expenditures?

Yes. The necessity for and the value of such studies, in terms of safe performance of aircrew personnel and the well-being of passengers, has been confirmed by airline medical directors, the Air Line Pilots Association, and other knowledgeable medical scientists. By making use of the extensive background of knowledge and experience in this field possessed by Dr. Hauty of the Civil Aeromedical Research Institute and Dr. Halberg of the University of Minnesota, the study has been precisely tailored to obtain the desired result at very nominal cost.

IV. If this must be done, couldn't the same objective be accomplished checking airline crews on normal flights? Wouldn't that be much more realistic or practical?

No. The protracted preflight and postflight testing period and the nature of inflight tests to be performed would be impossible without major disruption in crew scheduling and performance of normal inflight duties. It should be

pointed out that a team of researchers is required to perform the measurements involved and would require transportation and per diem in either case. By the present plan the researchers themselves serve as the subjects.

Research Direction

Mr. Evins. Mr. Reporter, insert pages 257, 258, and the table on the top of 259. This has already been discussed.

(The material referred to follows:)

Research Direction

Requirements

	1964 approparition		1965 estimate		Difference	
	Positions	Amount	Positions	Amount	Positions	Amount
Direction and administration	372	$4,446,000	306	$3,940,000	−66	−$506,000
Staff and supporting services	539	6,353,000	484	6,247,000	−55	−106,000
Total	911	10,799,000	790	10,187,000	−121	−612,000

Research Direction

GENERAL JUSTIFICATION

The research direction activity provides for direction of the Federal Aviation Agency's research and development program (excluding that relating to aviation medical).

There are two subactivities under this activity: Direction and administration and staff and supporting services.

Direction and administration provides for the personal services and supporting costs associated with the planning, directing, monitoring, and coordinating of the research, development, experimentation, evaluation, and applications engineering effort.

Staff and supporting services include base operations and maintenance of the National Aviation Facilities Experimental Center at Atlantic City, N.J., as well as a proportional share of staff and supporting services relating to the major operating programs of the Agency.

The 1965 program for this activity will reflect a significant reduction in both staffing and funding when compared with the 1964 program. These reductions have been accomplished both in Washington and at the National Aviation Facilities Experimental Center (NAFEC).

The fiscal year 1965 funding requirements to provide for the direction of the Agency research program are summarized as follows:

	1964	1965	Difference
Positions	911	790	−121
Amount	$10,799,000	$10,187,000	−$612,000

In fiscal year 1965 staffing for the direct program for research direction will be reduced by 66 positions and $506,000. Likewise, staff and supporting positions will be reduced by 55 and funding by $106,000. These savings are the result of management decisions to reduce staffing in this area at both Washington and NAFEC.

Changes in the 1965 program are summarized in the following table and discussed in detail on the following pages.

	Positions	Amount
Direct costs:		
New programs		$13,000
Phase II pay increases		75,000
Other pay adjustments		15,000
Other cost adjustments	−66	−609,000
Staff and supporting services	−55	−106,000
Total	−121	−612,000

STAFF AND SUPPORTING SERVICES

Mr. EVINS. For "Staff and supporting services," you have in 1964 539 positions. For 1965, 484 positions, 55 less. You have a reduction in funding of $106,000.

Insert page 262, Mr. Reporter.

(The page follows:)

Staff and supporting services

	1964 appropriation	1965 estimate	Difference
Permanent positions	539	484	−55
Amount	$6,353,000	$6,247,000	−$106,000

Included under this heading are two categories of cost. First, it includes the personnel and associated overhead costs for maintaining the National Aviation Facilities Experimental Center and indirect support for research and development programs.

Funds are provided for necessary travel of the staff of the National Aviation Facilities Experimental Center. Costs for transportation provides for the movement of household goods for new employees recruited from outside the Atlantic City, N.J., area, and for the transportation of materials required for projects at the test facility. All communication services, rents and utilities, supplies and materials, and equipment not directly associated with research and development projects at the test facility are funded here. In addition, funds are provided for building repair and rehabilitation; erosion control; and repair and maintenance of roads, runways, and taxiways. Funding is also provided for the management and operation of a library and information retrieval service. The responsibility for managing the airport is assigned to this function.

Support activities, such as garbage collection; custodial and janitorial service; the operation of the water and sewage plant, the heating and steam plant; and the cafeteria are performed by contract.

Secondly, this program reflects the proration to this activity of the consolidated costs and staffing of those Agency functions dealing with the direction and control of programs and policies; coordination of international civil aviation programs; legal services; management improvement; budgeting; financial reporting; accounting for funds; payrolling of employees; personnel activities; security; and other services of a general housekeeping nature, including mail distribution, printing and duplicating. In addition this item provides for headquarters space costs, administrative supplies, communications and telephone expenses at regional and Washington headquarters operations.

The programs categorized under this activity are wholly financed under the "Operations" appropriation. The basic services performed by the various program units extend to all Agency operations including those programs funded under "Operations" as well as the appropriations for "Facilities and equipment," "Grants-in-aid for airports," and "Research and development." Further detail of these functions may be found under "Staff and supporting services" of the traffic management activity.

Mr. OSTERTAG. Is this under "Research and development"?

Mr. BLATT. This heading, "Research Direction," is under the "Operations" appropriation and under this heading we administer and monitor the research and development activities.

This is the Systems Research and Development Service's and the Aircraft Development Service's management and supervision budget.

I think that you are referring to the specific program areas under the research and development appropriation.

GENERAL AVIATION ACCIDENTS

Mr. HALABY. Something Mr. Jonas read yesterday which one of his constituents sent him set me to thinking hard last night about whether we have made any progress with respect to general aviation safety in the last several years and I got some data that I think both Mr. Jonas and his constituent would be interested in. If I could just read it into the record, it will take me just 1 second.

In the year 1946 there were 7,618 general aviation accidents. In the year 1964, there were 5,050, a decrease of approximately a third.

In fatal accidents in the year 1946 there were 690 and there were last year 477.

In the number of fatalities in 1946 there were 1,009, and last year there were 898.

In hours flown, 9.8 million in 1946 and about 14 million in 1963.

The accident rate per hundred thousand hours flown dropped from 77.73 to 37.38—the rate dropped to less than half.

The fatal accident rate, which I believe the author of the paper which was sent to you, Mr. Jonas, stated had remained stable, descended from 7 fatal accidents per hundred thousand hours flown in 1946 to about 3½ for 1963.

The number of midair collisions in 1947, which is the last date I have, was 50 and last year it was 15.

Now you quoted this article as saying that the rate had leveled off, even though the FAA was still building up. I think that part of the argument is valid.

It appears at the present time that for the last 3 years the fatal accident rate per hundred thousand hours flown has varied between 3.38—3.1, which was 1962, the best year on record, back up to 3½. It is in that category. It seems to be at a kind of plateau. My only point is that is less than half the rate of 1946, so some progress has been made. I do not say it is the FAA, it is the whole aviation effort.

Mr. JONAS. It might be but in order to have your statistics mean

anything, you would have to show a curve. Most of this reduction may have occurred before your buildup so we need to have that material per year.

Mr. HALABY. I agree with you, but just reading that article, you would think that no progress had been made at all.

Mr. JONAS. I did not gather that when he said it had leveled off and there was no appreciable decline since 1957.

I wonder how much trouble it would be to prepare a table year by year showing the variation.

Mr. HALABY. We will have a try at it, Mr. Jonas.

(The table supplied follows:)

Accidents, rates, general aviation, 1946–63

Calendar year	Hours flown [1]	Total accidents	Rate	Fatal accidents	Rate	Total fatalities	Rate
1946	9,788	7,618	77.8	690	7.0	1,009	10.3
1947	16,334	9,253	56.6	882	5.3	1,352	8.3
1948	15,130	7,850	51.8	850	5.6	1,384	9.1
1949	11,031	5,459	49.4	562	5.0	896	8.1
1950	9,650	4,505	46.6	499	5.1	871	9.0
1951	8,451	3,824	45.2	441	5.2	750	8.9
1952	8,186	3,657	44.6	401	4.8	691	8.4
1953	8,527	3,232	37.9	387	4.5	635	7.4
1954	8,963	3,381	37.7	393	4.3	684	7.6
1955	9,500	3,343	35.1	384	4.0	619	6.5
1956	10,200	3,474	34.0	356	3.4	669	6.6
1957	10,938	4,200	38.4	438	4.0	800	7.3
1958	11,700	4,584	39.2	384	3.2	717	6.1
1959	12,000	4,576	38.1	450	3.7	823	6.9
1960	12,203	4,793	39.2	429	3.5	787	6.4
1961	12,650	4,625	36.5	426	3.3	761	6.3
1962	13,450	4,650	36.0	430	3.2	857	6.4
1963	[2] 14,000	5,050	36.1	477	3.4	898	6.4

[1] Source: FAA. Rates per 100,000 flying hours.
[2] Estimated.

NOTE.—1946–62 CAB data; 1963 (preliminary) FAA data.

Mr. HALABY. I am just making the point that over the last 15 or 20 years real progress has been made but in the last 2 or 3 years we have reached a kind of plateau and I think we ought to be encouraged that that plateau is much, much better, at least twice as good as it was in the distant past.

Mr. OSTERTAG. Don't you have such a record year by year?

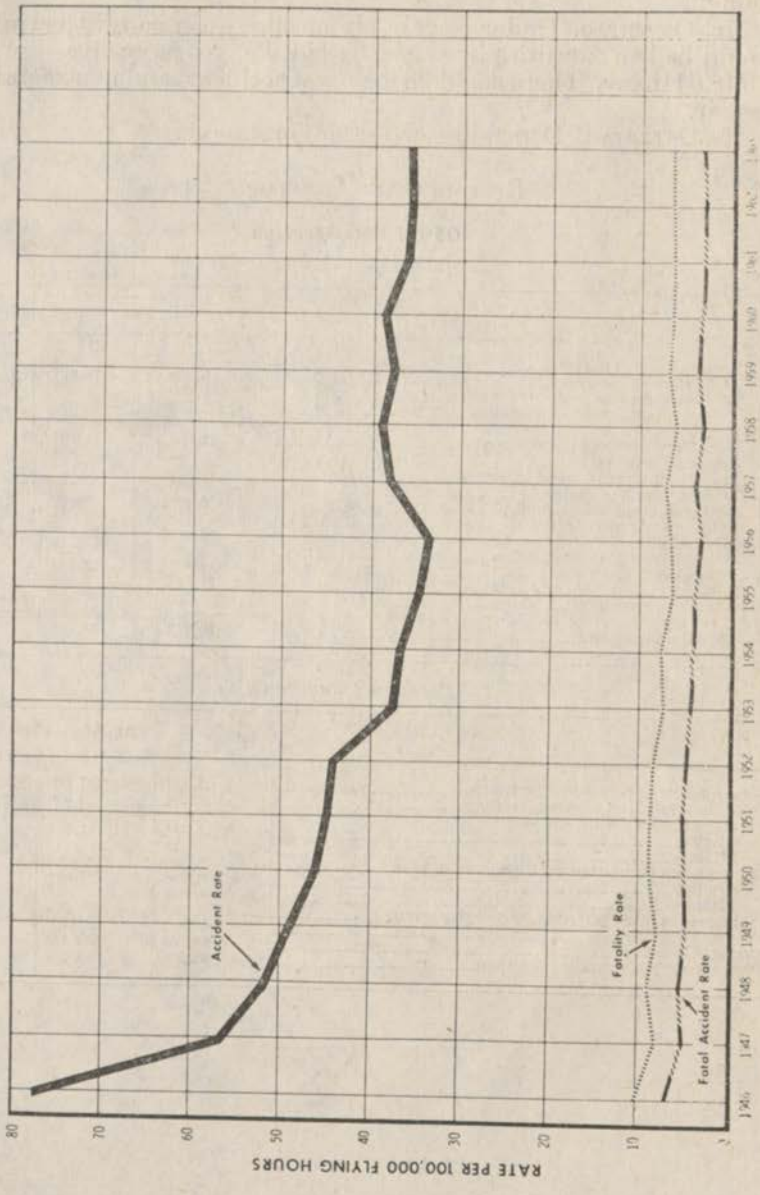
Mr. HALABY. Yes, sir.

Mr. OSTERTAG. Why wouldn't it be appropriate to use that at this point in the record?

Mr. HALABY. We will try to put a chart in.

(The chart supplied follows:)

GENERAL AVIATION ACCIDENT RATES



Mr. HALABY. I am not denying that there is a plateau and there is no direct relationship between the buildup of the FAA budget in personnel and the number of accidents. I am saying there has been real progress in general aviation safety but it isn't anywhere near good enough.

Mr. OSTERTAG. Under certain circumstances in certain years there would be less fatalities by way of accidents, yet more lives lost.

Mr. HALABY. There could be less fatal accidents and more fatalities; yes, sir.

Mr. OSTERTAG. Depending on the circumstances.

RESEARCH AND DEVELOPMENT

GENERAL STATEMENT

The research and development program is conducted under the activities of (1) air traffic control, (2) navigation, (3) aviation weather, (4) aircraft safety, (5) airports, and (6) aviation medicine. The objectives are modernization of the national aviation system through improvements in facilities, equipment, techniques, and procedures, and increased safety in civil aviation through improvements in aircraft, aircraft engines and airborne equipment. A sound, integrated program of research, development, experimentation and evaluation is vital to safety and the efficient use of the Nation's airways.

The technical program for fiscal year 1965 continues to emphasize the expeditious development and implementation of the national airspace system, an automated air traffic control system which will comprise numerous subsystems now under development in the fields of air traffic control, navigation, aviation weather and airports. Development of an all-weather landing system, and development and evaluation of devices to enhance the safety of aircraft within the system also will continue to be emphasized.

A second type of effort included in the technical program is inservice improvements aimed at continual modernization of the equipment and procedures currently being used in the common system. Inservice improvement projects are initiated at the request of the operating units of the Agency and are concerned with specific problems encountered in the field.

A third type of effort included in the technical program is long-range research, directed toward system improvement in the post-1975 period. Long-range research projects for fiscal year 1965 include studies of airport design problems, future navigation systems and traffic and economic analyses of future system requirements.

The 1965 program also provides for continuing an aeromedical research effort directed toward the identification and elimination of those physical, physiological, and psychological factors which may jeopardize safety in flight.

Summary of requirements by activity

	1965 request
1. Air traffic control:	
a. Air traffic control operations	$1,000,000
b. Data display	8,080,000
c. Data processing	10,075,000
d. Data acquisition	2,770,000
e. Data transfer and communications	1,980,000
Total	23,905,000
2. Navigation:	
a. Approach and landing	4,525,000
b. Short-distance navigation	1,390,000
c. Long-distance navigation	410,000
d. Flight inspection	1,175,000
Total	7,500,000
3. Aviation weather:	
a. Weather data handling	30,000
b. Weather data presentation	1,275,000
c. Weather applications to air traffic management and research program	165,000
Total	1,470,000
4. Aircraft safety:	
a. Airframe	1,092,000
b. Propulsion	885,000
c. Noise suppression	710,000
d. Equipment	350,000
e. Flight	742,000
f. General aviation cockpit display	716,000
g. Subsonic aircraft development	500,000
Total	4,995,000
5. Airports:	
a. Airport design	480,000
b. Airport visual aids	1,800,000
Total	2,280,000

Summary of requirements by activity

6. Aviation medicine:	
a. Air traffic controllers and aircrew members: Physiological stress, fatigue, and aging factors relating to proficiency	$490,000
b. Air traffic controllers and aircrew members: Psychological stress, fatigue, and aging factors relating to proficiency	140,000
c. Air traffic controllers: Proficiency, selection factors, and optimum characteristics of air traffic working environment	135,000
d. Civil aviation: Passenger and crew emergency procedures, oxygen equipment, and safety measures	200,000
e. Civil aviation personnel: Drug effects on performance and safety of aircrew and ground support personnel	100,000
f. Aerial applicators: Effects of toxic chemicals upon health and safety	90,000
g. Injury prevention in light- and heavy-aircraft accidents	244,000
h. Civil aviation generated biological stresses in the general population	21,000
i. Physiologic age rating for pilot certification eligibility	236,000
j. Prognostic studies of diseased states influencing flying safety	194,000
Total	1,850,000
Total research and development	42,000,000

Mr. EVINS. Mr. Blatt, you are in charge of research and direction and on page 258 it shows you need $10,187,000 for research direction. Then you get over to research and development where you want $42 million. Tell us about your problems and why you have to have all this money. Why is it needed? Why is it necessary? Justify it to the committee.

SURVEY OF FEDERAL AIRWAYS SYSTEM

Mr. BLATT. Mr. Chairman, as we have previously testified, back in 1961, the President appointed a committee to investigate and make a detailed survey of the air-traffic control and navigation system. This survey disclosed some specific system deficiencies. This very, very competent task force came to the conclusion that the attainment of both safety and efficiency was an extremely difficult task to accomplish. They concluded that the system-in-being was inefficient in the utilization of the airspace itself, and that in fact we were procuring safety at the expense of efficiency. We were buying safety with delays.

They made very specific recommendations for correcting these deficiencies and if I might add, in fact outlined a complete guide for research and development programs.

Mr. EVINS. When was this report made?

Mr. BLATT. I believe this report was made in October or November 1961.

Mr. EVINS. You have been living under that ever since?

Mr. BLATT. Yes, sir; and I think this, as the Administrator has indicated, is a most unique accomplishment in that since the publication we have had consistent and continuous management of the research and development program. We have kept our sights fixed at a well-defined goal and we are attempting to accomplish the goal. I feel quite proud to say that we are well along the way toward accomplishment.

RESEARCH DIRECTION

Mr. EVINS. You indicate on research direction your staffing will be reduced and that you are having some consolidations and less funding in research direction.

Mr. BLATT. Yes, sir. Research and development is always in the vanguard and therefore I feel we are leading in economy and efficiency in operations. We are able to accomplish this reduction in personnel and money through detailed management studies of the operations of our organization. We have realined our scientific and technical personnel by organizing them in program areas, such as air traffic control, navigation, communications, weather, et cetera, rather than organizing them along traditional research and development lines——

Mr. EVINS. You feel you fully need $10,187,000 for 790 people to direct your research program?

Mr. BLATT. Yes, sir; we feel this is a very, very minimum program, but adequate.

Mr. HALABY. We took off 18 percent in personnel and 11 percent in dollars between 1964 and 1965.

Mr. EVINS. Place pages 258, 259, and 260 in the record, Mr. Reporter.

(The pages follow:)

RESEARCH DIRECTION

GENERAL JUSTIFICATION

The Research direction activity provides for direcion of the Federal Aviation Agency's research and development program (excluding that relating to Aviation Medical).

There are two subactivities under this activity: Direction and Administration and Staff and Supporting Services.

Direction and Administration provides for the personnel services and supporting costs associated with the planning, directing, monitoring, and coordinating of the research, development, experimentation, evaluation, and applications engineering effort.

Staff and Supporting Services include base operations and maintenance of the National Aviation Facilities Experimental Center at Atlantic City, N.J., as well as a proportional share of staff and supporting services relating to the major operating programs of the Agency.

The 1965 program for this activity will reflect a significant reduction in both staffing and funding when compared with the 1964 program. These reductions have been accomplished both in Washington and at the National Aviation Facilities Experimental Center (NAFEC).

The fiscal year 1965 funding requirements to provide for the direction of the Agency research program are summarized as follows:

	1964	1965	Difference
Positions	911	790	−121
Amount	$10,799,000	$10,187,000	−$612,000

In fiscal year 1965 staffing for the direct program for research direction will be reduced by 66 positions and $506,000. Likewise, staff and supporting positions will be reduced by 55 and funding by $106,000. These savings are the result of management decisions to reduce staffing in this area at both Washington and NAFEC.

Changes in the 1965 program are summarized in the following table and discussed in detail on the following pages.

	Positions	Amount
Direct costs:		
New programs		$13,000
Phase II pay increases		75,000
Other pay adjustments		15,000
Other cost adjustments		−609,000
Staff and Supporting Services	−66	−106,000
	−55	
Total	−121	−612,000

New programs, +$13,000

Included in this category is $13,000 associated with transportation costs related to oversea personnel rotation, and with the procurement of a small amount of new equipment.

Phase II pay increases, +$75,000

This category of cost represents the amount required to meet the cost of that portion of the pay increases authorized by Public Law 87–793 and becoming effective in January 1964. The estimate is based on employment in general schedule grades as of January 1, 1964, and was computed on a grade-by-grade basis to give proper weight to the different amount of increase for each grade level. The amount included in this estimate represents the difference between the total yearly value of the increase and the amount which was payable in 1964. On the average, this estimate is 51.5 percent of the total yearly costs.

Other pay adjustments, +$15,000

During the fiscal year 1965 $15,000 will be required to finance within-grade salary increases and additional salary costs of personnel who will be qualified for and promoted to higher grade levels than positions occupied during 1964. This estimate reflects the net cost after adjusting for savings in within-grade costs due to turnover. This estimate is based on present grade levels of employees in this activity and the length of time they have been in present grade levels.

Other cost adjustments, —$609,000

This reduction of $609,000 is chiefly the result of a reduction in the direct funded program of 50 positions in Washington and 16 in NAFEC.

Staff and supporting services, —$106,000

The decrease in this function is chiefly the result of a decrease in staffing in the staff and supporting area at NAFEC. This decrease has been partially offset by added costs resulting chiefly from salary increases as well as new plant maintenance requirements at NAFEC.

Mr. HALABY. Mr. Shank and Mr. Blatt are entitled to quite a bit of credit for this reduction in overhead.

Mr. EVINS. On your research program you are up $2 million. We discussed that somewhat yesterday. Air traffic control increase about $637,000. Aviation weather increases about $277,000. Aircraft safety increases by $1,086,000. Airports, whatever that means, $810,000, and aviation medicine is increased by $10,000. You have aviation medicine over in research.

Mr. BLATT. Yes, sir. That is the actual research and development program of the Office of Aviation Medicine.

Mr. OSTERTAG. Mr. Blatt, many of your projects that you have undertaken under the R. & D. program are, of course, directed toward improvements which if successful will be primarily beneficial to a particular segment of the aviation industry. For example, your project "Little Guy," and general aviation.

EVALUATION OF PROPOSED RESEARCH AND DEVELOPMENT PROJECTS

Would you identify each of these projects and inform the committee whether or not these particular projects and this program is coordinated or endorsed or supported by the industry and aviation interests generally? Have you any conflict there?

Mr. BLATT. I don't believe that there is any conflict, in the basic sense of the word. I gather you are asking the question, Are we doing things that people don't want being done?

Mr. OSTERTAG. Well, no, not exactly, but go ahead.

Mr. BLATT. I don't think there is any conflict.

I would like to tell you that when we go through the process of evaluating proposals that come into our organization—and you recognize that a research and development organization is the recipient of many, many proposals solicited and unsolicited—when we evaluate proposals, we form evaluation teams and these evaluation teams consist not only of members of the research and development organizations, not only of members of other services of the Federal Aviation Agency, but include on the team itself, when appropriate, members of the military organizations and members of industry. That is, representatives of both the air carrier industry and general aviation are on these teams. And in this way we do get an input with respect to the requirements of the ultimate users of the services we are trying to develop.

Mr. HALABY. I don't think all segments of aviation agree with all of our projects. As you know, this is a very competitive, individualistic aviation world we live in, and thank God for it. Each association and group has a particular interest. What is good for the airline pilots isn't always what the airline flight engineers want. What is good for the private plane owner may be disagreeable to the air taxi operator. We have several controversial projects and in that sense, some people in the aviation community disagree with this or that project. For example, one of the best projects that we showed you the results of, the small altitude and identification transmitting beacon, has been a great success in that it will enable us to go on with the program to give the controller identification and altitude as we showed you on the simulated scope yesterday. But there are people who say we shouldn't be doing that, because all this means is another piece of equipment they will force us to buy at great expense and put in our airplanes. So that segment disagrees with our having this project. They don't want us to develop a piece of equipment that will transmit to the controller if they have to buy it and put it in the airplane.

Now, the military are insistent on that, because they all have beacons and they want other aircraft in the air to be identifiable. The airlines are very much for that project because they want every aircraft in the air to have the beacon. So we find as with almost all aspects of the Agency, some one or more groups disagree over some one or more projects.

We have another project to proceed with a kind of design contest to see what the U.S. manufacturer can design for local service transport service to take over when the DC–3's phase out of the picture. Some say that we shouldn't be in it at all, that the Federal Government should leave this to the manufacturer and the airline. The Federal Government has left it to them. They haven't produced. They are in space, rather than on the bus stops. So we have a limited design concept.

Other say, "You ought to buy this airplane for $20 million and then give it to the local service carriers."

Again, we have conflict from the different points of view.

We have a relatively small project for a cockpit that would reduce the number of these weather flying accidents from 5,000, killing 900 people last year, most of them around airports or in weather, and if this could be proved out, like this altitude transmitting beacon, we think it would be simpler and safer to fly. But some of the people who would rather just sell airplanes in volume are not happy about our conducting an investigation into a prototype cockpit. They also fear we might federally standardize it, which we haven't in mind in the slightest, but the research work can be very helpful in safety, we think.

Mr. OSTERTAG. I was getting at all segments of aviation. They have a definite interest and relationship to this thing. After all is said and done, what you are doing in research is going to lend itself toward greater safety, so how can anyone quarrel with it?

After all, they have just as much at stake as you have, if not more. But the point is that many of these things have cropped up without regard to unified support and I wondered about the reasoning for this conflict or differentiation of position with regard to things our people are doing in this field.

Mr. HALABY. I think the point you make and the one Mr. Jonas made yesterday is that everyone has a stake in surviving. He has an instinct for self-survival. He is interested in safety. The difficulty is that there are competing and conflicting ways of achieving safety. For example, you could have a three dimensional radar every hundred miles, all the way across the airways of the United States and put all the cost of separating aircraft on the taxpayer for this ground installation. Or you could build a small transponder to go in a small aircraft and put the cost in the cockpit and on the owner of the plane, rather than the taxpayer. Naturally, the airplane man would rather not buy anything and get safety through Federal equipment and expenditure. The FAA man, the Government man says, "We can't afford to put 3-D radars at every intersection," and say you have this kind of conflict; not over whether there should be safety, but how we achieve it.

Mr. EVINS. They are pleased to have you do the research, as long as you don't require the manufacturers to put something on this aircraft?

Mr. HALABY. I think that hits it right on the nose.

Mr. EVINS. In the aviation industry I suppose there are some who oppose safety features. We have State laws requiring safety belts be put in cars. Some people want it and some people don't want them, at all.

Mr. SHANK. There was a time when they opposed dual tail lights.

RESEARCH OVERHEAD

Mr. JONAS. Mr. Halaby, I don't believe you want to leave this record as it is, because persons who are unfamiliar with the program will get the impression that you are asking to spend $10 million to conduct a $40 million research program, and that is 25 percent for overhead. Now, my recommendation would be that you or Mr. Blatt try to justify such a tremendous cost of overhead.

Mr. BLATT. I would appreciate the opportunity, Mr. Jonas. The $10 million for "Research Direction," you will note, is divided into two parts. One part is titled "Direction and Administration," which amounts to $3,940,000, and the second part, "Staff and Supporting Services," for $6,247,000.

Under the "Staff and Supporting Services" portion of the "Research Direction" heading, we maintain and operate the plant and facilities for NAFEC, our National Aviation Facilities Experimental Center, which is located at Atlantic City, N.J. Here we maintain and operate

in fact a complex municipal airport and the total operation and maintenance of that facility is included in the "Research Direction" heading.

Mr. OSTERTAG. Your point, as I understand it, is that direction is not entirely the proper definition, because to a certain extent it is operation?

Mr. BLATT. Yes, sir. This is our "Base-operations" appropriation, as well as our "Administration and direction" appropriation.

Mr. JONAS. Where do your receipts show up?

Mr. BLATT. The receipts that we receive, the landing fees that we receive?

Mr. JONAS. Yes.

Mr. BLATT. I have a record of them, sir.

Mr. JONAS. Do they go straight to the Treasury?

Mr. BLATT. They go straight to the Treasury.

Mr. JONAS. You better let us have the amount. It would somewhat offset that $10 million.

Mr. BLATT. It isn't very great, sir. I have the amount.

NATIONAL AVIATION FACILITIES EXPERIMENTAL CENTER

Mr. HALABY. While he is getting that, Mr. Jonas, the true direction and administration costs for the $42 million program are $3.9 million or about 9 percent, rather than the 25 percent, and we appreciate your enabling us to clarify the record. The $6,247,000 is for this whole experimental laboratory and center. It happens to double as an airport through which people fly into the Atlantic City area. There are charter flights, there are business flights, and I believe there is one airline—Allegheny—serving that region. The rest—the receipts from the landing fees for commercial airliners are quite small and of course they get only the benefit of using the runway and taxiway. They have built their own terminal, there, a municipal terminal. This is an old naval base and there are some 6,000 acres involved and there are over a thousand people at work there.

Mr. OSTERTAG. I visited your facility at Atlantic City.

TOTAL RESEARCH AND DEVELOPMENT PROGRAM

It strikes me that there is a relationship between your justification under "Research Direction" and that under "Research and Development." There is a question of whether it should all go in here or go under research. In any event, it is a part of the combination as between "Research Direction" and "Research and Development," is that correct?

Mr. HALABY. If you look at page 246, Mr. Chairman, you see the consolidated total of everything. "Facilities and Equipment," "Research and Development," and "Operations."

Mr. EVINS. Place 264 in the record, Mr. Reporter.

(The page follows:)

Research and development program [1] *(New obligational authority)*

	1964 appropriation		1965 estimate	
	Positions	Amount	Positions	Amount
Operations appropriation:				
Direction and administration	372	$4,446,000	306	$3,940,000
Staff and supporting services:				
NAFEC	424	4,855,000	372	4,671,000
Agency	115	1,498,000	112	1,576,000
Total	911	10,799,000	790	10,187,000
Research and development appropriation:				
Air traffic control		23,268,000		23,905,000
Navigation		8,320,000		7,500,000
Aviation weather		1,193,000		1,470,000
Aircraft safety		3,909,000		4,995,000
Airports		1,470,000		2,280,000
Total	1,179	38,160,000	989	40,150,000
Facilities and equipment appropriation:				
Research, test, and evaluation facilities:				
Buildings, construction, and improvements		5,943,000		6,780,000
Equipment		4,081,000		720,000
First article equipment		1,740,000		
Total		11,764,000		7,500,000
Total research and development program	2,090	60,723,000	1,779	57,837,000

[1] Does not include aviation medicine research and development program.

Mr. HALABY. I agree with you, Mr. Ostertag, it is a bookkeeping problem, because I think the basic point is the overhead cost; the leadership and direction are still $3.8 million for a total R. & D. budget of $42 million, and a consolidated agencywide research and development program of $57,837,000.

TYPES AND NUMBER OF POSITIONS

Mr. JONAS. Have you any green sheets showing the personnel in research direction? I would like to know what proportion of your 306 people are technical, supervisory, and what proportion you would say, or the number you would say, are directly concerned with what I would call housekeeping.

Mr. HALABY. We could ask you, sir, to look in your summary book, I believe about the eighth page. It is a fold-out. The information is shown under the box in the middle right "Systems research and development."

Mr. JONAS. "Systems maintenance service?"

I am surprised to see the small number of what I would call, not necessarily supergrades, but what I would estimate would be technical people and your heavy overbalance of employees under grade 12.

Mr. BLATT. Well, sir, the mass of employees, that is the employees would fall into two categories.

It must be remembered that we have a large number of low-grade employees maintaining the plant at NAFEC.

Mr. JONAS. We are not talking about that now. We are talking about direction. NAFEC is staff.

Mr. BLATT. What you see here under the 1965 fiscal year heading are both appropriations, the 322 plus the 1,114 are both the operations and the R. & D. appropriation.

Mr. HALABY. In other words, there are 80 less people in the Washington category than last year and there are 228 less in the field category. The departmental stands for Washington headquarters and the field is almost entirely at Atlantic City.

Mr. JONAS. My point is that your table shows that you only have four people that you call scientific.

Mr. SHANK. No, sir.

Mr. JONAS. Read your own table.

Mr. SHANK. That stands for a particular category.

Mr. JONAS. Scientific?

Mr. SHANK. It is a civil service label that covers the Public Law 313's but most of those people, all the way down to 13, would be scientific people.

Mr. HALABY. That category of scientific refers to Public Law 313 appointments, the law under which you made special exceptions to the regular civil service. It is really a scientific supergrade.

Mr. JONAS. Your 115 in the department and your 969 in the field are certainly not scientific. They are what I would call administrative, is that right?

Mr. SHANK. No, sir; they are for the most part skilled people, the expert technician, the expert wireman, the mechanics, the various skills. Any well run technical organization will be less than half of what we would call scientists and engineers. Somewhere in the neighborhood of half will be of the various supporting technicians.

It is not efficient to have engineers do their own wiring or do their own manual task.

Mr. JONAS. You would not call that direction, would you?

Mr. SHANK. No, sir.

Mr. JONAS. I was talking about research direction. You have 306 people in it. It is nearly $4 million. I wanted you to have an opportunity to put on the record some justification for that amount of what I would call housekeeping.

Mr. HALABY. What you would like is a breakdown of the research direction and administration category in terms of grades and types of personnel.

Mr. JONAS. I think that would help your record.

Mr. HALABY. We will provide that table for the record.

(The table follows:)

PORTION OF RESEARCH AND DEVELOPMENT FUNDS TO BE CONTRACTED

Mr. JONAS. One other question, Mr. Chairman, and then I won't have any more on this.

Of your $42 million, how much are you spending in-house? Is it all of it?

Mr. HALABY. No, sir.

Mr. JONAS. What proportion?

Mr. BLATT. Of the research and development appropriation?

Mr. JONAS. Yes.

Mr. BLATT. 60 percent of the research and development appropriation is contracted out.

Mr. JONAS. With whom are you contracting? Do you have a record of those?

Mr. BLATT. Yes, sir. There are quite a number of contractors.

PROJECTS UNDER CONTRACT

Mr. JONAS. Just name a few and what kind of research they are doing for you.

Mr. BLATT. All right.

We have have a contract with Airborne Instrument Laboratories, of Mineola, Long Island. They are producing a new radar instrument landing system. We have a contract with the Burroughs Corp., of Paoli, Pa., producing a radar and beacon digital processor. This device will detect and process the primary and secondary radar information so that we can put it into a data processor to provide the alphanumerics that you saw on the simulated radar display that the Administrator showed you the first day of these sessions.

There is the contract with the Hazeltine Corp. of Little Neck, N.Y., that is producing the alphanumeric generator itself. There is a contract with the Raytheon Corp. that is producing the pictorial display. the scan-converted display on which we will show these alphanumerics and beacon responses.

TYPES OF CONTRACTS

Mr. JONAS. Are these specific contracts for given amounts of money or are they cost plus? What kind of contracts are they?

Mr. BLATT. We operate under a whole spectrum of contract types. We operate with cost plus fixed fee, we operate with cost plus an incentive fee when time is of the essence; we operate under a fixed-cost type of contract when we can procure off-the-shelf type equipment, or when Research and Development is not involved in a particular component that we require in our system.

For the most part, when we are attempting to procure an advancement in the state of the art, we are forced to go into a cost-plus-fixed-fee type of contract.

Mr. EVINS. On page 490 there is a comprehensive table on total research and development for the agency, which shows contracts, $27,720,000. This consumes a large portion.

This is nearly $28 million in contracts, there is $32 million in in-house costs of all types.

COMBINING JUSTIFICATION FOR RESEARCH DIRECTION AND RESEARCH AND DEVELOPMENT

I think it would be advisable, at least from my point of view, Mr. Administrator, and Mr. Blatt, next year to have your research direction and research development all in one justification section. I do not see why it is scattered in three or four places. If you put it all together it would be helpful.

Mr. OSTERTAG. And medical standards and medical research ought to go with it. It would seem to me that anything associated with research should be centralized in your justification.

Mr. EVINS. There is a lot of detailed information.

Mr. HALABY. We have that, sir, on page 98 of the small book. It is all together, aviation, medical, facilities equipment, operations. We will try to do it better next year.

Would it be helpful, Mr. Jonas, if we provided a list of the principal contractors and locations for the record?

Mr. JONAS. Unless you want it. It will be all right with me. I just wanted to get a general idea.

Mr. OSTERTAG. Do you show here a list of your projects?

Mr. BLATT. No, not a list of the projects. We break it down into program areas only, sir.

Mr. OSTERTAG. I see that. That is program areas.

Mr. BLATT. I can supply a detailed list of the specific subprograms in each program area. In fact, I can read them. I have them all here.

Mr. EVINS. In view of the $42 million request and in view of the Special Committee on Research I believe supplying a list for the record, will be valuable.

Mr. OSTERTAG. Will you insert that in the record at this point?

Mr. HALABY. It will be a very voluminous list. Can we submit it to you for consideration as to whether you want that much volume in the record?

(Discussion off the record.)

Mr. EVINS. You detailed about six. How many in numbers would it involve approximately?

Mr. BLATT. I would judge it would be roughly a listing of 80 subprograms.

Mr. OSTERTAG. That is not bad.

Mr. HALABY. Then you have Dr. White, Mr. Bates. You decide whether you want to use it.

Mr. BLATT. It will be about 130 items.

Mr. JONAS. Send it up and we can determine whether we want it.

Mr. EVINS. Submit it for the committee.

(The material supplied follows:)

Research and development, fiscal year 1965

	In thousands
Total research and development appropriation	$42,000
I. Air traffic control program area	23,905
A. ATC operations program	1,000
Development of ATC separation criteria.	
Advanced ATC system concept studies.	
Traffic analysis.	
Economic analysis.	
B. Data display program	8,080
Modifications to en route data display system.	
Data display subsystem—NAS.	
Modifications to terminal displays.	
C. Data processing program: Data processing subsystem—NAS	10,075
D. Data acquisition program	2,770
Interference, elimination, and reduction.	
FAA radar beacon transmitter site equipment.	
High reliability interrogator.	
Beacon code processors.	
Improved DF and cooperating DF systems.	
Data acquisition technique compatibility.	
System characteristics of ADSA system for general aviation use.	
Systems characteristic of a complete ADSA system.	
System characteristics of ADSA for over-ocean use.	

Research and development, fiscal year 1965

H. Civil aviation generated biological stresses in the general population	21
I. Physiologic age rating for pilot certification eligibility	236
J. Prognostic studies of diseased states influencing flying safety	194

REVENUES FROM LANDING FEES

Mr. BLATT. I did not have an opportunity to complete the record. There is a question as to what we received in landing fees.

Mr. EVINS. Supply that for the record also.

Mr. BLATT. I have it here. We received $11,696.47 in landing fees last year.

Mr. OSTERTAG. That was which fiscal year?

Mr. BLATT. Calendar year 1963.

Mr. JONAS. Is that landing fees, rent, everything, all receipts?

Mr. BLATT. The only receipts we have are landing fees. The city of Atlantic City——

Mr. HALABY. Don't we charge Atlantic City a dollar or some small amount?

Mr. BLATT. The city of Atlantic City owns the land upon which their terminal building and ramp is constructed. This was part of a negotiated deal.

Mr. EVINS. You will find plenty of cities in the country that will furnish the land if you will build a facility and maintain it.

Come down to our area.

CONTRACT CLAUSE FOR RECOVERY OF DEVELOPMENT COSTS

Mr. BLATT. I would like to indicate as the Administrator indicated in the first day that we are doing something that I feel is quite forward in Government contracting. When we do a research and development project that has commercial possibilities we insert a clause in the contract for the recovery of our research and development costs, and this recovery is normally stipulated at 5 percent of the contractor's gross revenue.

I would like to give an example of a successful venture in this area. We let a contract with the Wilcox Electric Corp., of Kansas City, Mo., in the amount of $65,040 for the development of a general aviation transponder. This contract had in it the recovery-of-development-costs clause. We have recovered to date from that $65,000 venture, $22,063 returned to the Government. They have sold an additional 60 units at $1,392 each, indicating that there is an additional return due us of approximately $4,000.

Mr. EVINS. You have done pretty well.

Mr. BLATT. We have received back better than $26,000 from that $65,000 investment.

Mr. EVINS. You are not building any wind tunnels up there; are you?

Mr. BLATT. No, sir.

PROJECT "LITTLE GUY"

Mr. OSTERTAG. Will you give us a quick rundown on Project "Little Guy"?

Mr. HALABY. We are kind of running out of time, here. Could I give a quick rundown, Mr. Ostertag, because I am personally responsible for this project? Mr. Bates is supervising it. This is a project to provide for the first time a fully systemed engineered cockpit for light planes.

It is the first major attempt to design from scratch an instrument panel that would enable the fledgling pilot to learn how to fly on instruments with greater simplicity and security. It is based upon 10 years of Army and Navy integrated instrumentation research; amounting to about $50 million worth of investment of military funds, and an attempt to translate that into the cockpit of a small plane.

What it would provide is a prototype of a cockpit that would display to the pilot something that looks like the normal display he sees in good weather. We are not going to make it a standard item.

We are simply offering it to the industry in the hopes that it will be used and will make it easier and safer to fly.

Mr. OSTERTAG. I do not want to take any more time with this. Off the record.

(Discussion off the record.)

Mr. EVINS. If there are no further questions on research we will turn to airports.

Airports Program

Under that I find research and development of airports. This is another item that probably could be included in your research.

Mr. Blatt. Yes, sir.

Mr. Evins. Mr. Reporter, here again we will consolidate the two. Place in the record pages 282, 283, 285, 286 through 289, and then jump over and place in the record page 471.

(The pages follow:)

Administration of Airport Program

Requirements

	1964 appropriation		1965 estimate		Difference	
	Positions	Amount	Positions	Amount	Positions	Amount
Airport planning	179	$1,853,000	177	$2,074,000	−2	$221,000
Airport standards development and applications	189	2,096,000	182	2,185,000	−7	89,000
Airport development	158	1,572,000	156	1,790,000	−2	218,000
Program management	40	483,000	40	516,000		33,000
Staff and supporting services	180	2,347,000	176	2,469,000	−4	122,000
Total	746	8,351,000	731	9,034,000	−15	683,000

GENERAL JUSTIFICATION

Activity under the "Administration of the airport program" consists of the planning and development of the Nation's system of public airports to serve the needs of civil aviation in the 50 States, Puerto Rico, and the Virgin Islands. The principal activities include administration of the Federal-aid airport program; preparation of the annual revision of the National Airport plan, development and application of planning, engineering, and airport safety standards; furnishing of planning and engineering advisory services; and assuring compliance of sponsoring public agencies with laws governing the use Federal funds for airport construction.

AIRPORT USE TRENDS

Airport utilization will continue to increase as a result of increases in (1) enplaned passengers, (2) passenger-miles flown, (3) aircargo, (4) general aviation flying, and (5) numbers of aircraft in use. Enplaned passengers in fiscal year 1969 are expected to exceed fiscal year 1963 by 30 percent; there were 63.3 million in 1963, and will be 82 million by 1969. Passenger-miles will increase during this period by 40 percent, from 35.1 billion in fiscal year 1963 to 49 billion in fiscal year 1969. Cargo will increase by 64 percent, from 1.1 billion ton-miles in fiscal year 1963 to 1.8 billion ton-miles in fiscal year 1969. Total general aviation aircraft in use are expected to increase by 21 percent, from 84,121 in fiscal year 1963, to 102,000 in fiscal year 1969.

These increases in aviation activities will result in increased aircraft operations at airports; i.e., landings and takeoffs. Statistics on aircraft operations are available only for the 274 airports with FAA air traffic control service. In fiscal year 1963 at such airports, there were 29.2 million operations, and in fiscal year 1969 there are expected to be 36.9 million, an increase of 26 percent. To this data must be added the aircraft operations at the approximately 2,700 public airports that do not have FAA air traffic control services and for which operations statistics are not available.

The table below shows that most of the operations, as well as most of the expected increase, is accounted for by general aviation. Increasing emphasis will continue to be given to the development and improvement of airport facilities for general aviation. However, air carrier operations will also continue to rise, with a 15-percent increase expected over the period. These operations will be flown by larger, more sophisticated aircraft that make greater demands on airport facilities.

PROGRAM PLANS

The continued increase in volume of all aviation activity, and the expanding use of commercial jet aircraft, has resulted in a heavy demand for (1) development of new and revision of existing airport planning and engineering standards, and (2) provision of advisory services and assistance to the aviation industry and public agencies concerned with airport development. Program plans include continued development of standards and guides to govern airport planning, design, construction, maintenance, and airport safety practices, and improvement in the techniques of preparing annual national airport plan which identifies the need for development of the Nation's airports. Greater emphasis will also be given to assuring compliance in the use of airports in accordance with Government agreements.

The fiscal year 1965 funding requirements to provide for continuation of the administration of airport program is set forth in the above program plans are summarized as follows:

	1964	1965	Difference
Positions	746	731	−15
Amount	$8,351,000	$9,034,000	+$683,000

In 1965 direct staffing for administration of the airport program will be reduced by 11 positions. However, net additional funds of $683,000 are required for pay increases, mandatory within-grade salary increases, and additional average employment to carry out the program plan discussed above. In addition, costs of rent, communications, and utility services allocated to this activity will require a net increase of $122,000, after taking account of savings from a reduction of four staff and support positions allocated to this activity. Changes in the 1965 program are summarized in the following table and discussed in detail in the following pages.

	Positions	Amount
Direct costs:		
Phase II pay increases		$150,000
Other pay adjustments		55,000
Other cost adjustments		356,000
Staff and supporting services	−11	356,000
	−4	122,000
Total	−15	683,000

Phase II pay increases, +$150,000

This category of cost represents the amount required to meet the cost of that portion of the pay increases authorized by Public Law 87–793 and becoming effective in January 1964. The estimate is based on employment in general schedule grades as of January 1, 1964, and was computed on a grade-by-grade basis to give proper weight to the different amount of increase for each grade level. The amount included in this estimate represents the difference between the total yearly value of the increase and the amount which was payable in 1964. On the average, this estimate is 51.5 percent of the total yearly costs.

Other pay adjustments, +$55,000

During the fiscal year 1965, $55,000 will be required to finance within-grade salary increases and additional salary costs of personnel who will be qualified for and promoted to higher grade levels than positions occupied during 1964. This estimate is based on present grade levels of employees in this activity and the length of time they have been in present grade levels, as well as costs to promote 24 employees who will be qualified for the first time for grade promotions.

Other cost adjustments, +$356,000

Increased costs of $356,000 are required for additional workload for expanded emphasis on airport planning and small increases for revision and updating technical airport development standards, direct administration of the grant agree-

ments with sponsors, and general supervision. This increase is a net amount after a reduction of 11 positions and $109,000 for Washington headquarters staffing based on improved productivity.

Staff and supporting services, +$122,000

Staff and supporting services costs allocated to the airports program in 1965 will increase by $122,000 because of increases arising primarily from additional rent and communications costs, pay increases, and other salary increases. These additional costs exceed savings resulting from employment reductions in staff and support activities which permit a reduction of four in the number of positions allocated to the airports activities.

Airport planning

	1964 appropriation	1965 estimate	Difference
Permanent positions	179	177	−2
Amount	$1,853,000	$2,074,000	+$221,000

This activity provides for: (1) carrying out the Agency's responsibilities for planning a national system of airports; (2) the preparation and application of criteria, standards, and guidelines for identifying and evaluating the need for airport development; and (3) the coordination of airport-airspace matters.

The current edition of the national airport plan includes 3,559 airports, and identifies $1,082,439,000 in development needs for the fiscal years 1963–67 period. A revision of the national airport plan will be published in the last half of fiscal year 1964.

During the past year, the Agency initiated a searching review of the techniques used for airport planning. The results of this review will provide new tools with which to more accurately forecast the need for airport facilities in specific communities. In addition, new contracts and coordination procedures were worked out with other Federal agencies, such as the Housing and Home Finance Agency and Bureau of Public Roads, whose programs have a potential relationship to airport development.

Another important function funded under this activity is the collection of data on facilities at the Nation's airports; this data is essential to the support of a broad range of aeronautical information and charting services conducted by FAA and other organizations. Currently data is collected, primarily through airport inspections, at 8,084 airports on record as of December 31, 1962.

The change in requirements for 1965 reflects an increase of $221,000 required for airport planning work in order to provide $45,700 for salary costs arising from the Public Law 87–793; $17,000 for additional within-grade salary increases and net additional man-years of workload devoted to stepped-up planning efforts, $158,300. This additional workload cost reflects requirements after adjusting for a reduction of two positions in the Washington staff. No new programs are included.

Airport standards development and application

	1964 appropriation	1965 estimate	Difference
Permanent positions	189	182	−7
Amount	$2,096,000	$2,185,000	+$89,000

This activity provides for: (1) the development of engineering standards that govern the design, construction, and maintenance of airports; (2) the development of airport safety standards; (3) the application of these engineering and airport safety standards through the engineering review of Federal-aid airport projects; and (4) rendering of advice to non-Federal-aid airport program airport development projects.

During fiscal year 1963, considerable progress was made on the revision and updating of technical standards, and on the integration of such material with the Agency's comprehensive advisory circular system. In addition to being

generally available to the airport industry, these standards are applied by district office airport engineers in the review and approval of federally aided airport development projects. As of June 30, 1963, 341 such projects were in a process of formulation, and 555 were under construction; in these stages, there are extensive demands for engineering skills in the application of FAA technical standards. To these were added 452 new projects in the fiscal year 1964 program, and an estimated 455 new projects will be added in fiscal year 1965.

The 1965 increase of $89,000 required for the development and application of airport standards provides $52,500 for salary costs resulting from the phase II requirement of the Salary Reform Act of 1962, $19,200 for within-grade salary increases and a net additional requirement of $17,300 for additional man-years of effort in this area. This latter amount reflects the requirements after adjusting for a reduction of seven positions in the Washington staff. No new programs are included.

Airport development

	1964 appropriation	1965 estimate	Difference
Permanent positions	158	156	−2
Amount	$1,572,000	$1,790,000	+$218,000

This activity provides for the development of policies, standards, criteria, and guidelines that goven the airport developmental programs of the Agency. These include the Federal-aid airport program (FAAP), the land transfer, and the surplus property programs. The activity also provides for: (1) the conduct of activities related to achieving compliance of sponsors with existing grant agreements; (2) coordination of civil-military use of airport facilities; (3) liaison with industry and with other Federal agencies on airport use and development; and (4) development of guidance material on zoning, land use, land acquisition for noise and obstruction abatement, and on the economics and service aspects of operation of airports.

As of June 30, 1963, there were 1,386 active FAAP projects. In August of 1963, 452 additional projects were announced for the fiscal year 1964 program, and it is expected that by June 30, 1964, there will be 1,588 active projects. With the expected extension of the Federal Airport Act, active project workload will grow to an estimated 1,743 by June 30, 1965.

As of June 30, 1963, there were 1,966 airports subject to agreement with the United States. The FAA is charged with assuring compliance of airport owners with such agreements. This requires airport inspection and review, as well as dealing with complaints from the public regarding alleged violations of grant agreements.

The increase of $218,000 for 1965 provides $39,400 for salary increases required under the Salary Reform Act of 1962 and $15,200 for within-grade salary increases, and a net increase of $163,400 chiefly for additional man-years of workload. This additional workload cost reflects requirements after an adjustment for a reduction of two positions in the Washington staff. No new programs are included.

Airports, $2,280,000

Research and development efforts conducted under this activity are directed toward increasing the capacity, efficiency, and safety of the Nation's airports. Particular emphasis is placed on improving basic airport design and developing new equipment and techniques in the fields of airport lighting systems and airport safety equipment.

The airports activity includes two programs:

(*a*) *Airport design program, $480,000.*—This program is directed toward improving airport design standards and the development of new equipment and techniques for airport use. The program for fiscal year 1965 provides for the continuation of two major efforts. Arresting gear pendant supports will be installed and tested in a joint effort with the Navy and the Air Force to provide improved arresting gear for civil-military airports. Tests and evaluation will be continued on the equipment and techniques used in airport firefighting.

(*b*) *Airport visual aids program, $1,800,000.*—This program provides for improving the equipment and techniques used for lighting and marking airports.

The fiscal year 1965 program includes two major projects aimed at developing and testing new lighting systems for instrument operations. One system is intended for use under all weather landing conditions. The second system is less complex and will be used for general instrument operations.

Mr. EVINS. First is airport planning. In 1964 you had 179 employees. You want 177, or a reduction of 2 in airport planning; airport standards, 189 to 182, a reduction of 7; airport development, 158 to 156, again, a reduction of 2 personnel, in the staff and supporting services, 180 to 176, a reduction of 4 or a total reduction of 15 personnel. Your appropriation goes up from $8,351,000 to $9,034,000, or an increase of $683,000, with 15 reduced personnel.

Page 471 says your research involves studies directed toward increasing the capacity, efficiency and safety of the Nation's airports, and in airport design you propose to spend $480,000, and airport visual aid programs, $1,800,000, or for research on improvements of airports, a total of $2,280,000.

There is a lot of information on airport trends.

Pay increases and other pay adjustments and other pay costs account for probably a large part of the $680,000 increase.

Mr. HALABY. Yes, sir.

Mr. EVINS. These are all made necessary by statute.

The increase of $218,000 for "airport development" for 1965 provides $39,400 for salary increases under the Salary Reform Act and $15,200 for within-grade increases and a net increase of $162,000, chiefly for additional man-years of workload. This appears on page 289.

You have also a justification by objects, on page 295.

"Personnel and benefits" are on page 296.

FAA AND AIRPORT SPONSORS ROLE IN AIRPORT PROGRAM

Mr. Administrator, tell us what you do as compared with what the municipalities are required to do in building and development of the airport. We are not taking over building everything for them, are we? I would think that your aid programs ought to be somewhat limited and not have them look to FAA and Uncle Sam for everything.

Tell us the line of these divisions.

Mr. HALABY. The municipalities put together a list of airport facility needs each year and it is somewhat over a billion dollars of accumulated needs over the coming 4 or 5 year period. Based on present authorizations the Federal Government would meet about $375 million of that total of $1.1 or $1.2 billion that has been presented.

The way it is limited is in this fashion: The municipality initiates a project. They select a site. They do some advance planning and surveying. They estimate costs and they then seek our assistance, technical planning assistance at this stage.

Then they proceed to get their approvals, usually their county or city approvals and then proceed to develop a funding mechanism.

They come to us then with an application. Our district airport engineer, our regional airport division and Mr. Morrow look at these applications. There are some 1,600——

Mr. MORROW. Nearer 1,700.

Mr. HALABY. 1,700 active projects at the present time and there are some 400 new projects each year.

GOVERNMENT'S SHARE BASED ON SAFETY FEATURES

They ask for half of the cost of the runways, the taxiways, the lighting, and the safety features to be matched by Federal money, in accordance with the Federal Airport Act.

In some categories they can go up as high as 75 percent on certain safety items. There is no provision for terminal building assistance as there used to be. There is no provision for convenience and highways and other features. It is concentrated on the safety features and it is always local initiative matched on a fractional basis by Federal assistance.

Mr. EVINS. Yours is technical assistance as to the land locations, after a survey, as to whether it is a desirable locality for development of an airport.

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. Or expansion?

Mr. HALABY. Or expansion or improvement.

Mr. EVINS. Hangar developments are provided locally?

Mr. HALABY. Yes, sir.

Mr. EVINS. What about fire protection and fire prevention?

Mr. MORROW. We participate only in the portion of the cost of developing the buildings, to house the fire and rescue equipment. We do not participate with Federal aid in the acquisition of the equipment that is put on the airport. A fire engine for example, is considered a piece of equipment, the same category as a snow plow or a mower or other piece of equipment for the airport.

Mr. EVINS. Any further questions on airports?

Mr. JONAS. Yes, sir. I have one, if Mr. Ostertag does not.

Mr. OSTERTAG. I have on grants but not on this.

Mr. JONAS. Here, again, Mr. Administrator, you have 25 percent of the total cost of this program charged up to overhead, housekeeping, administration, or $2.5 million out of $9 million. That seems awfully high to me. You have 175 people doing it.

NUMBER OF AIRPORT PROJECTS

Mr. HALABY. At any one time there may be a total of how many projects in the program, Mr. Morrow?

Mr. MORROW. We have at the present time as active projects about 1,650.

Mr. HALABY. 1,650 projects and there are a number of airports which were part of the surplus program——

Mr. MORROW. 614.

Mr. HALABY. 614 World War II surplus airports for which we have an auditing and surveillance responsibility, so that at any one time there may be as many as 2,000 projects under the cognizance of the program.

That entails very heavy legal and auditing responsibility, as well as the substantive engineering role that we have to take in caring for about $80 million a year that may be available in the program. We have reduced the number of positions as you will notice by 15 in the total program and we have reduced the number of overhead positions by 2.

Mr. JONAS. Four, is it not?
Mr. HALABY. Yes, sir, I am sorry, four.

OVERHEAD COSTS—AIRPORT PROGRAM

Mr. JONAS. One of your activities listed is management improvement but you have a separate section on program management. You have 40 people in there. That costs $516,000. You have these people in this staff and supporting activity. They handle your budgeting, financial reporting, payrolling, personnel activities, security, and other services of a general housekeeping nature, including mail distribution, printing, and duplicating.

My point is that 25 percent of the total program spent on housekeeping seems high. You have people engaged in every program doing some of that, too.

Mr. DEAN. Mr. Jonas, when we get to page 495, it will show how the total staff and support has been broken down by the seven program activities, including the airport service. Most of them have, as you correctly pointed out, a much lower ratio of staff and support than airports; the reason for the relatively high assignment to airports is not only does it get its share of all of the normal payroll, executive direction and other costs of the Agency, but it eats up half the total audit staff of the entire Agency and it eats up a very heavy portion of the legal staff.

Mr. JONAS. How many of these 176 people are actually engaged in what we call housekeeping activity—that is, making up payrolls, personnel records, budgeting, mail distribution, printing and duplication, and how many lawyers do you have in it who are handling the legal business?

How many engineers do you have; how many auditors do you have to break that down?

Mr. HALABY. Could we look at either page 105 in the small book——

Mr. JONAS. That is the point. We have to look in too many places.

Mr. HALABY (continuing). Or 495 in the big book if you prefer.

Mr. JONAS. I looked at that. I cannot get answers from that.

Mr. HALABY. That is total staff and supporting services of the whole Agency, of which the amount attributed to the airport program is $2,469,000.

Mr. JONAS. How many of your 176 people in the staff and supporting services are engaged in what we refer to as housekeeping activities and how many are engaged in technical services, such as legal and auditing?

Mr. DEAN. We will have to put a precise answer in the record. We examine this each year in assigning the number of positions to this function but I can tell you roughly it will be about 40 audit positions.

Mr. Goodrich could give you the legal requirements, but it is one of the heaviest demanders of legal support because every grant agreement must be legally examined. Every payment made to a community in connection with a grant must be individually audited in order to assure protection of the Government.

Possibly 70 of these positions are involved in the legal and audit functions and are not included in just the normal overhead.

Mr. JONAS. That would leave a hundred.

Mr. DEAN. It might be.

Mr. JONAS. They would be in housekeeping, to supervise—to handle 700 people—to handle personnel and payroll records. That is one out of seven.

Mr. DEAN. There is a heavy accounting burden from the airport function. They have their vouchers. We will break this overhead figure down and put it in the record, but the airports activity does place heavy demand on the accounting, audit, and legal functions.

(Note: The Agency subsequently confirmed that 98 employees are engaged in accounting, audit, and legal services for the airports activities.)

Mr. JONAS. Don't you think this would be a good place to take a pretty sizable cut?

Mr. DEAN. I would think, Mr. Jonas, when we get to the general review of staff and support, on page 495, we can look at that entire picture. Certainly we would reduce a few positions in this particular area if we could curtail some of these types of support, but we have to protect the public interest when we are dealing with local communities.

Mr. JONAS. I know the public interest has to be protected but using one out of seven employees to handle the personnel records, it seems to me you ought to be able to standardize that and get a better workload arrangement and reduce some of those. I know you reduced it by four but the total cost goes up.

Mr. OSTERTAG. Of course, bearing in mind there is a total of 731 positions in the overall administration of the airport program; isn't that correct?

Mr. HALABY. Yes. The overall administration, the technical, administrative, engineering, regulations, planning, and this item that Mr. Jonas has focused on is the allocation from the total staff and supporting service to the airport service.

Mr. OSTERTAG. That is right.

Mr. HALABY. In other words, $2.4 million out of a total $48 million is laid on them.

Mr. JONAS. I fail to understand how you need 177 people planning airports.

Mr. HALABY. Mr. Jonas, I guess——

Mr. JONAS. 182 are developing standards. Don't you ever get all the standards developed? Do they all work on every change? How do you utilize that many people developing airport standards?

Mr. HALABY. Let Mr. Morrow answer the second question. On the first one, like in many businesses, we have lumped all of the overhead items on this page 495. These are the overhead, staff, and supporting services and they total $48 million this year, with 3,489 people; last year it was 3,608 people.

We have, in other words, saved over 100 and we are hoping to save more in this area. This is only 3.9 percent in dollars and 6.8 percent in the number of positions in the agency, which is a very low overhead ratio for Government agencies.

Now, Mr. Morrow does not have much to say about how much of this $48 million we attribute to him. In fact, he is unhappy to see $2,469,000 attributed to him because he says, "I do not have any 176 people in my shop," and he doesn't, but he does have that proportion

according to our own management decision of the work that goes on in the administrative support shop.

This argument goes on in every company I have ever counseled or been an officer of. The line people say, "I can do without that staff," except when they need them. If they want to hire somebody then they go to personnel. If they get themselves in hot water they want a lawyer real quick, but they do not like this allocation of overhead cost to them. They just want to deal with the direct costs.

Mr. JONAS. Where on page 495 do you have these other staff people listed?

Mr. HALABY. You see, sir, if we gave him 20 lawyers for airports program and then we gave Mr. Blatt 5 lawyers for R. & D., and we gave Mr. Thomas 25 lawyers for air traffic control suits, we would have about 15 law firms in there, but what we do is we set up one law firm under Judge Goodrich here and then he allocates work out to each of these divisions, as in a company, and they therefore are able to get along, for example, with fewer lawyers, six fewey lawyers this year than last year but they serve the whole Agency.

We have to pool all of this administrative money and then charge it out on the basis of periodic workload analyses. Brother Morrow gets $2,469,000 out of it because he, we believe, places very large burdens on it.

AIRPORT PLANNING

Mr. JONAS. Comment briefly about your need for 177 people for airport planning. Will we ever catch up with airport planning? Is that a permanent cost that we will have to sustain?

Mr. MORROW. We are required under section 2 of the Federal Airport Act to prepare annually what is called the national airport plan which is a document setting forth the needs for airport development for the forthcoming 5 years.

The purpose of this plan is to identify the needs for airport development so that an orderly system of airports can be provided and that these airports will be consistent with the safety standards and air space utilization standards that must be attained in the development of the system of airports.

Mr. EVINS. Let's place at this point in the record page 287 of the justifications relating to operations.

(The page follows:)

Airport planning

	1964 appropriation	1965 estimate	Difference
Permanent positions	179	177	−2
Amount	$1,853,000	$2,074,000	+$221,000

This activity provides for (1) carrying out the Agency's responsibilities for planning a national system of airports; (2) the preparation and application of criteria, standards, and guidelines for identifying and evaluating the need for airport development; and (3) the coordination of airport-airspace matters.

The current edition of the national airport plan includes 3,559 airports, and identifies $1,082,439,000 in development needs for the fiscal years 1963–67 period. A revision of the national airport plan will be published in the last half of fiscal year 1964.

During the past year, the Agency initiated a searching review of the techniques used for airport planning. The results of this review will provide new tools with which to more accurately forecast the need for airport facilities in specific communities. In addition, new contracts and coordination procedures were worked out with other Federal agencies, such as the Housing and Home Finance Agency and Bureau of Public Roads, whose programs have a potential relationship to airport development.

Another important function funded under this activity is the collection of data on facilities at the Nation's airports; this data is essential to the support of a broad range of aeronautical information and charting services conducted by FAA and other organizations. Currently data is collected, primarily through airport inspections, at 8,084 airports on record as of December 31, 1962.

The change in requirements for 1965 reflects an increase of $221,000 required for airport planning work in order to provide $45,700 for salary costs arising from Public Law 87-793; $17,000 for additional within-grade salary increases, and net additional man-years of workload devoted to stepped-up planning efforts, $158,300. This additional workload cost reflects requirements after adjusting for a reduction of two positions in the Washington staff. No new programs are included.

Mr. MORROW. There are listed in the plan the development of 3,559 airports in the United States out of which I believe 1,887 have actually received Federal aid. Not all of these airports that are listed are new airports. There is a great deal of improvement to existing airports that has been identified and that is needed.

The airport planning activity is the real foundation of development of our entire airport system. Certainly without a unified and coordinated planning effort by the Federal Government we would not be able to develop a system of airports. We would have a hodgepodge of individual ideas and types of airports and we certainly would not be able to develop what we call a system of airports. Suppose every city proceeded with a development of a highway system without any coordinated State and Federal system plan.

The system of airports is somewhat like a system of highways, except that they are connected; that is, the concrete portion is connected by a ribbon of airspace rather than a continuing ribbon of concrete. The purpose of the planning activity is the collection of the data on all of these airports, the anticipation of the requirement, and the identifying of the needs to meet these requirements.

These 177 positions are divided between Washington and the field. The majority of them are out in the field. The Washington headquarters organization only provides 22.

BASIS FOR SELECTION OF AIRPORT PROJECTS

Mr. EVINS. What is the criteria by which you determine whether a particular airport receives equipment X for safety as against another airport that does not receive it?

Mr. MORROW. This is sort of a Solomon job we have to go through every year when our requests are double the amount of funds we have available.

Mr. EVINS. Would you say it would be judged on the amount of public interest?

Mr. MORROW. No, sir.

Mr. EVINS. You do not consider the public interest?

Mr. MORROW. Maybe I do not understand exactly what you mean by the public interest.

Mr. EVINS. I thought everything was determined on the basis of public interest.

Mr. MORROW. If the public interest is consistent with the public need, then I guess it does.

Mr. EVINS. Need and interest would be the two criteria?

Mr. MORROW. Yes, sir.

Mr. HALABY. Wait a minute, Mr. Morrow. The word "interest" has a lot of connotation.

Mr. EVINS. Use the words "public interest."

Mr. HALABY. The public interest criteria for the granting of the funds are in the act; the Federal Airport Act sets forth a criteria. It also sets the State formula, which is based upon the geography and population, and then those criteria which the Agency applied are set forth in the Agency policies and regulations and they relate to the urgency and priority as between competing projects, since the demands are almost always twice what the funds are. The first criterion is safety and the second is efficiency of the operation of the airport, whether it is a new airport, expansion or improvement of an old airport.

Mr. EVINS. I asked the Corps of Engineers a similar question. They have thousands of projects in the pigeonholes. They come forward and recommend development of certain projects. I asked, "On which basis do you select certain projects to move forward and others to allow them to lie in the pigeonhole," and the answer was, "Public interest."

How much public interest is there in this project?

Mr. MORROW. We don't have that same situation.

Mr. EVINS. You do not consider the public interest?

Mr. MORROW. Yes, sir. I do not know what the Corps of Engineers meant by public interest. We do not have a pigeonhole of projects that we can pull out. The Federal aid to airports program is used as a grant-in-aid program to assist the local communities. The local communities have the literal control of the initiative, so that the participation of the Federal Government is in the area of assisting the local community to carry out its program rather than the Federal Government having control of the initiative.

STATISTICS ON ACCIDENTS

Mr. EVINS. Do you have any statistics as to where most of the accidents occur? I understand it is taking off and landing. It is at the airports.

Mr. MORROW. That is right.

Mr. HALABY. Mr. Moore can give you the breakdown of the accidents in the form of a pie chart, sir. They are primarily operational accidents. They are primarily in and around airports. We could, if you desired, with respect to air carrier accidents, give you these charts, which show that for jets, for example, 12½ percent are approach, 12½ percent landing, 12½ percent takeoff, 62 percent en route. On turboprop, on the other hand, 40 percent in approach, 40 percent in landing and only 20 percent en route; for the piston engine, 25 percent in approach, 33 percent landing, 12½ on the ground, 12½ taxi, 4 percent takeoffs, so that if that were desired for the

record it would be available and it shows that for the three categories most accidents are operational accidents in and around airports.

Mr. EVINS. Mr. Ostertag?

AIRPORT SYSTEMS PLANNING

Mr. OSTERTAG. Mr. Administrator, of course, your planning activities are directly associated with the grant-in-aid program. Isn't that correct?

Mr. MORROW. Yes, it is.

Mr. OSTERTAG. Does that mean that the FAA is responsible for the cost and development of all plans for airports?

Mr. MORROW. No, sir.

Mr. OSTERTAG. What is the relationship? Maybe you can clear that up.

Mr. MORROW. I think the use of the word "planning"—this does not necessarily mean plans for the airports.

Mr. OSTERTAG. Planning does not mean plans?

Mr. MORROW. No. This is the type of planning that is related, I suppose, to comprehensive metropolitan planning and systems planning, but it does include in our activity the approval of what is called master plans for individual airports, which is a blueprint type of layout of the airport, and it includes the investigation and approval of all of the airspace problems that may be associated with that airport or the configuration of the airport and the method on which that airport will be operated.

PENDING AMENDMENT TO FEDERAL AIRPORT ACT

Mr. HALABY. The new bill, as passed by the Senate last night and agreed with the House conferees, has a provision in it for advanced planning whereby 50 percent——

Mr. OSTERTAG. Sixty-six.

Mr. MORROW. Eligibility will be up to 50 percent for advance planning.

Mr. HALABY. It comprises at 50.

Mr. MORROW. And preliminary engineering of airport development.

Mr. HALABY. If anything we are going to push deeper into this planning activity.

Mr. OSTERTAG. That will come out of the airport grant fund.

Mr. MORROW. Yes; it is not part of this.

Mr. OSTERTAG. In other words, under the new arrangement the FAA will be responsible for 50 percent of the cost of plans, et cetera, but you still have the responsibility of approving them before any grants are made. Isn't that correct?

Mr. MORROW. That is the main purpose of that provision; to give us that capability.

Mr. OSTERTAG. Haven't you had capability before, or responsibility, or the authority for approving plans?

Mr. HALABY. Yes, sir; for approving.

Mr. OSTERTAG. Doesn't that come under this?

Mr. HALABY. But not for financing half of their planning money. We haven't had that before.

Mr. OSTERTAG. I understand that. I mean haven't you been responsible for approving the plans before and doesn't that come directly under this aspect of administration?

Mr. MORROW. Master plan approvals have been our responsibility and part of this appropriation covers the administrative activities in connection with that.

The actual work by the engineer firms or the consultants or the cost of preparing detailed construction plans is not part of this. This is only FAA costs. There are no costs of the local community or the costs of their contracts under which the detailed construction plans are prepared. They are not included in here.

Mr. OSTERTAG. I understand.

Mr. MORROW. The purpose of the new provision in the act is to enable us to get better and more complete data in advance of making an allocation of funds, in order that both the community and the FAA can have more specific detailed information available as to the extent and costs of these projects.

The aviation systems have been advancing technologically at a terrafic rate and this has had a terrific impact on airports. Mr. Jonas mentioned airport standards. We are in a constantly changing technology. There is a constant change in the requirement for the standards to be upgraded, obsolete ones to be eliminated, new ones to be identified and developed. The same thing is true in the planning of airports. The airports are changing.

Mr. OSTERTAG. That is right, but the point remains that you have the responsibility and authority to approve any plans which might be associated with any airport development.

Mr. EVINS. In the applications submitted to them?

Mr. MORROW. Where Federal funds are involved; yes.

ALLOCATION FOR NEW AND EXISTING AIRPORTS

Mr. EVINS. How much of your funds are expended, Mr. Morrow, initially on development and how much are expended on subsequent improvements and later development?

Mr. MORROW. How much on new airports?

Mr. EVINS. Percentagewise? If you start a new airport or develop one that has been in existence for 20 years, how much is that?

Mr. HALABY. Let us take the last 3 years. I think we have had about——

Mr. MORROW. 294 new airports.

Mr. HALABY. The total funds for the last 3 years has been about $190 million, something like that. We have had how many new airports?

Mr. MORROW. 294 new public airports, but I want to identify.

Mr. HALABY. Just the ones we have aided, 294.

Mr. MORROW. That is what I am talking about.

Mr. HALABY. And then the number we have improved is about——

Mr. MORROW. I can tell you exactly how many.

Mr. EVINS. You said about 1,600.

Mr. MORROW. That is the total since the program started in 1946. In fiscal year 1962 program we had 327; in 1963 we had 426.

Mr. EVINS. These are improvements?

Mr. MORROW. Total projects. We had 426 in 1963; in fiscal year 1964 we had 452. When we add that up we get, out of more than 1,200 projects in the last 3 years, 294 have been new public airports.

Mr. HALABY. About 25 percent.

Mr. MORROW. The largest number was in fiscal year 1964, which was the most recent program, where there is 121 new public airports, out of 452 projects.

Mr. EVINS. After the airport is built and you have made the grant it is not the Federal responsibility to maintain it?

Mr. MORROW. We do not maintain it; no, sir. We give no Federal funds for maintenance, only for development to meet increased operational requirements or to expand the capability of the airport.

Mr. EVINS. The point I am trying to find out: Are you spending money to make the big bigger or are you developing new ones?

Mr. HALABY. About 25 percent for new ones and of the total number of active commercial transport fields, roughly 700, most of them are smaller, medium-sized airports. There are only 62 big airports in your sense of the word; that is, 62 airports are used by the big jets.

Mr. OSTERTAG. Where you have facilities associated with airports do you compensate the local airport for space and other usage?

Mr. MORROW. At some airports where the Federal aid program was used to develop the terminal building or other buildings on the airport, we are accorded free rent, but since 1961 there have been no Federal funds available for the development of terminal buildings or similar facilities on an airport and in those cases we have to rent the space. The extent of that I am not acquainted with, just how much it is, but we do not get free space in terminal buildings any more.

GRANTS-IN-AID FOR AIRPORTS

Program and financing

[In thousands of dollars]

	1963 actual	1964 estimate	1965 estimate
Program by activities: Grants for construction of airports (total obligations) (object class 41)	10,098	3,272	
Financing:			
Unobligated balance brought forward (contract authorization)	−13,370	−3,272	
Unobligated balance carried forward (contract authorization)	3,272		
New obligational authority (contract authorization)			

Status of unfunded contract authorization

[In thousands of dollars]

Unfunded balance brought forward	47,000	27,000	7,000
Unfunded balance carried forward	−27,000	−7,000	
Appropriation to liquidate contract authorization	20,000	20,000	7,000

Mr. EVINS. Next we will turn to grants-in-aid for airports, liquidation of contract authorization. Mr. Reporter, place in the record pages 481 and 482.

(The pages follow:)

Summary of appropriation requirements

Appropriation, 1964 (regular bill)				$20,000,000
Net difference—1965 over 1964:				
Activity	1964 appropriation	1965 estimate	Difference, increase (+) decrease (−)	
Liquidation of prior year contract authorization	$20,000,000	$7,000,000	−$13,000,000	−13,000,000
Total estimate of appropriation, 1965				7,000,000

GRANTS-IN-AID FOR AIRPORTS (LIQUIDATION OF CONTRACT AUTHORIZATION)

The Federal Airport Act, as amended in 1955, provided for contract authorization of $42.5 million for fiscal year 1956 and $63 million for each of the succeeding fiscal years 1957 through 1961. Under these authorizations the FAA provides grants to public agencies to assist them in the development and improvement of a national system of airports to serve civil aviation.

To pay obligations incurred under contract authorization provided by Public Laws 211 and 86–72, $7 million will be required for fiscal year 1965. This estimate provides for the payment of Federal matching funds to public agencies for airport construction projects undertaken in line with grant agreements entered into under prior contract authority.

Under contract authority provided in these two public laws, total obligations under the Federal-aid airport program by the end of fiscal year 1964 are estimated to reach $357,500,000. Since inception of contract authorizations in fiscal year 1956, total cash appropriated through fiscal year 1964 for the liquidation of obligations entered into under this authority amounts to $350,500,000. At the end of fiscal year 1964 the unliquidated obligations will amount to $25,338,500. It is estimated that for fiscal year 1965, an additional liquidation appropriation of $7 million is required to pay outstanding obligations. This will complete funding requirements for liquidation of contract authorization under the grants-in-aid for airports program.

	Cumulative through 1964	1965 estimate	Total
Contract authorization	$357,500,000		$357,500,000
Obligations	357,500,000		357,500,000
Expenditures	332,161,500	$25,300,000	357,461,500
Liquidation cash appropriated	350,500,000	7,000,000	357,500,000

Mr. EVINS. This is repeating what we said earlier. For 1964, $20 million was appropriated. Next year you estimate your needs will be $7 million. There is a $13 million decrease to carry out your contract authorizations. These are contracts that have been entered into and Uncle Sam has to live up to his obligations under the contracts.

Mr. MORROW. One thing, Mr. Chairman——

Mr. HALABY. This is the old program.

Mr. MORROW. This finishes it.

FUNDING FOR PRIOR CONTRACT AUTHORIZATION

Mr. OSTERTAG. This will finish the liquidation of contract authority under the old program and is not directly associated with the proposed supplemental?

Mr. HALABY. These are just liquidation of contracts made under the program prior to fiscal year 1962. This completes, you might say, the 1946 to 1961 program and this does not bear upon the extension of the Federal Airport Act at all. When that act is passed, as we hope it will pass in the House shortly, we would then come to the committee with a supplemental estimate of $75 million for this year and a forward funding amount of $75 million for next year, as we did in fiscal year 1962.

We are not yet formally in that position, although we have shown in these budget figures what would be requested.

Mr. OSTERTAG. In other words, you need $7 million to complete your obligations under the old program.

Mr. HALABY. That is the 1946-to-1961 program.

Mr. OSTERTAG. But as you find yourself today, you anticipate asking for a supplemental for fiscal year 1964 of——

Mr. HALABY. Fiscal year 1965. We already have 1964.

Mr. OSTERTAG. In other words, it will supplement this appropriation?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. Not one that has already been enacted?

Mr. MORROW. No, sir.

Mr. HALABY. The President will request, sir, a new obligational authority of $75 million for fiscal year 1965, and $75 million for fiscal year 1966, so that there is a 2-year forward funding period.

Now, the expenditures for 1965 out of the program that you voted prior to fiscal year 1962 will be $25 million and the requirements for liquidation of the old 1946-to-1961 program will be $7 million. Those are expenditures that are shown on page 482.

ADVANCED FUNDING FOR AIRPORT PROGRAM

Mr. OSTERTAG. We have always provided funds in advance in order that you can program your requirements in an orderly and efficient manner.

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. That is the reason we gave you 2 years of funds instead of one at first.

Mr. HALABY. Yes, sir.

Mr. MORROW. The first year was 2 years. Then we got 1 year each year after that.

Mr. HALABY. We requested 5-year contract authorization and you gave us 3-year authorization and 2 years' forward funding. We hope you will continue that practice. It is the minimum period in which not only the Federal Government but the local government can plan and finance.

Mr. OSTERTAG. We do not want you spending through the back door.

Mr. HALABY. That door is locked shut, I am sure.

SUPPLEMENTAL BUDGET REQUEST

Mr. OSTERTAG. The point is you are going to ask for a supplemental of $75 million. That is all you will have for 1 year. You are going to ask for $75 million more on top of that. When will you do that?

Mr. HALABY. This year.

Mr. OSTERTAG. Then you are going to actually ask for $150 million?

Mr. HALABY. But $75 million of it can only be obligated in fiscal year 1966.

Mr. OSTERTAG. That is the point.

CONTRACT AUTHORIZATION AND OBLIGATIONS

Can we put this table on 483 in the record?

Mr. EVINS. Yes.

(The page follows:)

Grants-in-aid for airport program

CONTRACT AUTHORIZATION AND OBLIGATIONS

Fiscal year	Contract authorization	Obligations	Cumulative unobligated authorization
1956	$42,500,000	$9,205,897	$33,294,103
1957	63,000,000	37,491,306	58,802,797

Distribution to direct activities:				
Traffic control	1,036	13,532,000	1,015	14,237,000
Installation and technical support	345	4,506,000	338	4,742,000
System maintenance	951	12,416,000	931	13,064,000
Flight standards	502	6,554,000	490	6,895,000
Medical standards	55	708,000	55	758,000
Airports	180	2,347,000	176	2,469,000
Research direction	539	6,353,000	484	6,247,000
Total	3,608	46,416,000	3,489	48,412,000

Staff and Supporting Services

The items financed under this heading consist of two major programs which are prorated to each major activity and justified therein. The first is for certain direct costs of operation which are included under "Staff and supporting services" as they can be more effectively managed as a single program. These costs are primarily for rents, communications, administrative supplies, printing services and other joint-use items at our headquarters locations including Oklahoma City.

Secondly, this program provides staff and supporting services to all of the major operating programs of the Agency, except the National Capital airports. This activity includes executive direction, area management, information services, general aviation affairs, personnel, compliance and security, budget, international aviation affairs, general counsel, policy development, appraisal, regulatory council, and management services which provides accounting, auditing, management analysis and operations research, and administrative services. These programs, which are wholly financed within the operations appropriation, provide the staff function and support services required by the programs financed from the appropriations for operations, facilities and equipment, research and development, and Federal-aid to airports.

In 1965 the staff and supporting program, including only the usual housekeeping and administrative-type functions, represent 4.5 percent of the total of all Agency appropriations receiving services from this program.

Fiscal year 1965 funding requirements for staff and supporting services are summarized as follows:

	1964	1965	Difference
Positions	3,608	3,489	−119
Amount	$46,416,000	$48,412,000	+$1,996,000

For the total Agency staff and supporting functions, the 1965 estimate represents a reduction of 119 positions, coupled with a requested increase of $1,996,000. This change reflects a net decrease of 174 positions and $853,000, resulting mainly from staffing reductions. This decrease has, however, been offset by required program increases of 55 positions and $2,849,000 required for salary increases resulting from implementation of Phase II of the Salary Reform Act of 1962, added cost of within-grades, additional costs of an increase in average employment and some new program cost associated mainly with space costs.

	Positions	Amount
New program	55	$2,011,000
Phase II pay increases		618,000
Other pay adjustments		220,000
Other cost adjustments	−174	−853,000
Total	−119	+1,996,000

Housing, utilities, and miscellaneous facilities	1,639,000	2,198,000	+559,000	
Total	100,250,000	75,000,000	−25,250,000	−25,250,000

Total estimate of appropriation, 1965 75,000,000

Facilities and Equipment

GENERAL STATEMENT

This program provides for the acquisition, establishment, and improvement of facilities comprising the air navigation and traffic control system as authorized under section 307(b) of the Federal Aviation Act of 1958.

It further provides for the construction of permanent support facilities at the National Aviation Facilities Experimental Center (NAFEC). Additionally, funds are included to procure equipment supporting the research and development effort. This equipment, along with the present equipment, will be installed in accordance with the NAFEC facilities improvement program.

This program also provides for the procurement of aircraft and related equipment required to continue facility flight inspection, flight training, research studies, and logistic support.

Although this budget continues the orderly expansion of the air traffic control system, the program presented is designed to meet only the more urgent needs of the air navigation system and traffic management activities with primary emphasis being placed on the introduction of a national system of radar alpha-numerics modification in the en route and terminal control areas.

The primary objectives of this program are:

1. Implementation of the first step toward the national airspace system by providing equipment which will display aircraft identity and altitude in alpha-numeric form directly on scopes used to control aircraft in the most heavily trafficked high altitude positive control areas and in three high density terminal areas.

2. Provision of FAA tower services at qualifying locations.

3. Acceleration of the program to convert flight service stations to unmanned limited remote communications outlets to provide a more economical operation while maintaining essential air/ground communications services.

4. Improvement of performance of instrument landing systems to permit authorization of lower minimums at major hub airports.

5. Provision of electronic and visual landing aids for locations under existing planning standards.

6. Procurement of avionics equipment required to continue facility flight inspection necessary in certifying the reliability of signals emanating from ground electronic equipment used in aids to air navigation; and procurement of aircraft, presently under lease, used for job performance and other flight functions.

7. Construction of permanent support facilities at the National Aviation Facilities Experimental Center, located at Atlantic City, N.J. This includes soil erosion control and construction of roads and streets, aircraft maintenance hangar and operations building, fire and crash station, fire pumphouse and reservoir, and central heating plant.

8. Acquisition of equipment for general purpose use in the support of the research and development program, including (*a*) replacement of obsolete display equipment—computer driven simulation environment; (*b*) additional beacon identity and altitude display buffer capacity, (*c*) procurement of avigation easements, and (*d*) correction of airfield wiring deficiencies.

The following table lists the major facilities funded and those budgeted in fiscal year 1965:

	Funded		Proposed fiscal year 1965	Total through 1965
	Through fiscal year 1963	In fiscal year 1964		
Provide alpha-numeric display in centers	----------	----------	10	10
Establish ATC towers	296	7	8	311
Provide alpha-numeric display in towers	----------	----------	3	3
Establish terminal VOR's	91	30	----------	121
Standard approach lighting systems	222	4	----------	226
Short approach lighting systems	6	----------	5	11
Visual approach slope indicators	53	----------	14	67
Runway end identifier lights	66	----------	17	83

Project	Locations unless specified [1]	Amount
1. Air traffic control centers	----------	$36,920,000
(*a*) Long-range radars:		
(1) Substitute Jackson, Miss., radar for Meridian, Miss., radar	1	202,000
(2) Improve ATC beacon systems	----------	3,018,000
Total	----------	3,220,000
(*b*) Automation equipment:		
(1) Provide alpha-numeric display, 4096 mode 3 A. & C. on bright displays	[2] 10	33,066,000
(*c*) Other center facilities:		
(1) Establish RCAG facility, Gooding, Idaho	1 (1)	77,000
(2) Improve ARTC center air/ground communications	50	325,000
(3) Provide resectoring of Atlanta ARTC Center	1	53,000
(4) Improve ARTC center operating positions	----------	179,000
Total	----------	634,000

Footnotes at end of table.

Project	Locations unless specified [1]	Amount
2. Airport traffic control towers		$13,528,000
(a) Terminal area radar:		
(1) Remote Travis AFB ASR to McClellan RAPCON	1	558,000
(2) Improve performance of ASR's	11	440,000
(3) Provide bright displays for operational evaluation	3	38,000
(4) Improve ATC beacon system		4,279,000
(5) Replace ARSR-1 consoles with ASR-4 consoles in IFR room, Atlanta, Ga	1	71,000
Total		5,386,000
(b) Other tower facilities:		
(1) Establish tower facilities	8	4,317,000
(2) Expand radar approach control, Bedford, Mass	1	193,000
(3) Relocate towers	5	3,510,000
(4) Provide local FAA phone system	8	78,000
(5) Replace obsolete voice recorders	6	32,000
(6) Install security fence (peripheral) El Paso, Tex	1	12,000
Total		8,142,000
3. Flight service stations		5,190,000
(a) Domestic:		
(1) Separate CS/T and establish FSS, Fairbanks, Alaska	1	353,000
(2) Relocate FSS's	11	1,448,000
(3) Convert FSS's to LRCO's	50	1,767,000
(4) Discontinue RCO's	3	29,000
(5) Establish a remote transmitter receiver facility, St. Louis, Mo	1	43,000
(6) Provide and relocate teletypewriters	45	508,000
(7) Improve FSS quarters		492,000
(8) Provide voice identification and automatic weather read-out for VOR	1	65,000
Total		4,705,000
(b) International:		
(1) Provide automatic error-correcting equipment (ARQ)	[3] 6	317,000
(2) Reimburse USAF for cryptographic equipment	4	109,000
(3) Provide teletypewriters at San Juan	1	29,000
(4) Improve IFSS receiver control station at Wake Island	1	26,000
(5) Increase transmission rate radioteletypewriter landline circuits	3	4,000
Total		485,000
4. Air navigation facilities		7,685,000
(a) VORTAC:		
(1) Provide VOR monitoring equipment	120 (1)	703,000
(2) Replace obsolete nonregulating amplifiers at VOR/VORTAC's	205	104,000
(3) Modernize VOR, Montebello, Va	1	9,000
(4) Install fan markers for VOR approaches	8	110,000
(5) Provide dual equipment at TVOR	3	223,000
(6) Relocate VORTAC facilities	2	470,000
Total		1,619,000
(b) Low and medium frequency facilities:		
(1) Dismantle L/MF facilities	40	299,000
(2) Provide improved TWEB coverage	33	562,000
(3) Relocate L/MF facilities	6	84,000
Total		855,000
(c) Instrument landing systems:		
(1) Improve ILS	14 (2)	1,591,000
(2) Provide far-field monitors for waveguide localizers	26 (1)	698,000
(3) Relocate ILS components	4	109,000
(4) Provide ILS monitor indicator units for IFR room	17	63,000
Total		2,461,000

Footnotes at end of table.

Project	Locations unless specified [1]	Amount
(d) Approach lighting systems:		
(1) Establish SALS/SFL	5	$713,000
(2) Establish VASI	14	892,000
(3) Establish REIL	17	377,000
(4) Backfit VASI with new regulators	40	228,000
(5) Backfit ALS/SFL with improved monitor control panels	212	406,000
(6) Establish cut reference lights, Juneau, Alaska	1	22,000
(7) Improved flush SFL fixtures	1	51,000
(8) New flash tubes (for SFL and REIL)	1	5,000
(9) Improved ALS flush lights	1	26,000
(10) Low-cost REIL	1	10,000
(11) Visual guidance monitor	1	20,000
Total		2,750,000
(e) Intermediate fields		0
5. Aircraft and related equipment		1,979,000
(a) Facilities flight inspection:		
(1) Signal Evaluation Airborne Laboratory (SEAL)		750,000
(2) Procurement of hangar, line shop, and test equipment		130,000
(3) Procurement of ILS/VOR test equipment		165,000
(4) Procurement and installation of Sel-Cal units in KC-135 aircraft		5,000
Total		1,050,000
(b) Logistic, administrative, and other:		
(1) Procurement of 8 light twin aircraft		929,000
6. Research, test, and evaluation facilities		7,500,000
(a) Buildings, construction and improvements		1,065,000
(b) Equipments		720,000
(c) NAFEC facilities improvement program		5,715,000
7. Housing, utilities, and miscellaneous		2,198,000
(a) Housing:		
(1) Construct and furnish living quarters	2	459,000
(2) Rearrange and expand living quarters, Drummond, Mont.	1	22,000
(3) Rehabilitate living quarters	6	106,000
(4) Relocate living quarters, Unalakleet, Alaska	1	20,000
Total		607,000
(b) Utilities and miscellaneous:		
(1) Provide resistance loads for standby engine generators	42	54,000
(2) Improve water supplies		270,000
(3) Surface and repair roads	2	134,000
(4) Improve sewer system, Cold Bay, Alaska	1	7,000
(5) Miscellaneous construction		84,000
Total		549,000
(c) Emergency projects: (1) Restore funds for emergency projects		1,042,000
Total		75,000,000

[1] Bracketed units represent requirements for training use at Oklahoma City. The bracketed units are in addition to the nonbracketed operational units, and are included in the dollar estimates.
[2] Centers.
[3] Terminals.

Mr. EVINS. You were appropriated for 1964, $100,250,000 and for 1965 you are estimating a need of $75 million, or $25,250,000 less.

This is broken down into facilities and equipment for long-range radar, from $10.1 million down to $3.2 million.

AUTOMATION EQUIPMENT

There is a tremendous increase for automation equipment, from $265,000 to $33,066,000, an increase of $32,810,000.

Mr. Administrator, you will have to do some talking on this.

Mr. HALABY. Yes, sir. I would appreciate a moment on that, particularly since some of the members were out of the room for a moment yesterday when we explained the need for this equipment.

I would like to just very briefly go over this item of automation equipment.

It is broken down on page 516 and subsequently. I am sorry to repeat for some of you, but at the moment our controller looks at a scope like that, all those little blips are aircraft and he sees them as a little bright bug going across the scope. He doesn't know what kind of aircraft, he doesn't know what the name and number of the aircraft is, he doesn't know its altitude, he doesn't know its position.

Over each one of those the controller puts a little shrimp boat that looks like this [indicating]. It is made of plastic. He takes off a written flight plan that is on another part of his console and he writes on there the number and altitude by that blip.

Now, the thing we have given him recently is that black, brighter light, which is either a single slash or a double slash, and then the controller can now interrogate the aircraft—the military aircraft and the Army aircraft—and then he knows positively what that blip is, whether it is an airliner, military, or a small plane. Then he asks them to confirm that they are at a certain altitude and if they are in fact at the altitude they say they are, he then writes down identification—Eastern Air Lines 503, 18, meaning 18,000 feet. That is all he has. That is why we have these near misses, because some of them are on flight plans, some of them are on military missions and there we have the conflictions.

We want to give him in addition to that identification, we want to give him identification plus altitude. We want it not on a little piece of plastic that an elbow can push off the scope, but electronically shown on the scope on an alpha-numeric basis. That is an alphabetical, numerical designation, United 456, 31,000 feet, going to 35,000. We think the controller must have that for all of these high-speed targets.

Now, you have funded us up through the two phases. You have given us the radars, you have given us the ability to read those beacons. Here is what we want, the automation equipment that is to be able to read the transmission from the aircraft as to altitude and identification.

That is what the $33 million is for. It is the most important breakthrough and step forward that the controller will have had since radar and the new centers and displays.

Now we go on from there to be able to track. You see that little square there and the little black line from United 456. That shows where he is going. That sort of anticipates for us where he is going to be, and then next, through the use of computers, we will be able, when we back up the controller with the computer capability, we will get on the scope not only where he is, who he is, what altitude he is, but where he is going, and whether there is going to be any conflict between his forecasted flight and someone else's. That comes later. That is not included in this budget. Only with this $33 million do we go on to that point, give him altitude which he literally gasps without.

We have all kinds of safeguards in here. We delay flights. We have a lot of extra communications. We do a lot of things that are undesirable, and at times, risky, without the altitude information.

It is true that the Budget Bureau has very substantially cut our

request for this appropriation. We would have liked to have put more of the automation and computing kind of gear into this budget, but it has been deferred to a subsequent year. We believe we could tolerate that.

NUMBER OF CENTERS PROVIDED COMPUTING EQUIPMENT

Mr. OSTERTAG. How far does this procurement take you?

Mr. HALABY. This takes us through identity code and altitude.

Mr. OSTERTAG. I mean, in the overall application.

Mr. HALABY. On page 518, it gives us some—I think we ought to use 516, 517, and 518; it provides 10 centers out of the intended, presently intended total of 21 centers, so it would be alpha-numeric generators in about half of the centers in our system.

If we go on as we intend to go on to the computerized system in all of the critical centers the next step is to go on from these 10 centers to additional centers in fiscal year 1966—the additional amount would be about $20 million.

COST OF AUTOMATION

We are still in line with the estimates we gave you 3 years ago. We said, based on the Beacon report, that it would cost something like a half billion dollars to automate or semiautomate our system.

Mr. OSTERTAG. That is the wrap-up figure and includes everything?

Mr. HALABY. Yes, sir. We are not telling you anything substantially new or different. It is just unfolding, wouldn't you say, Mr. Thomas, fairly much on the predicted schedule?

ROLE OF TRAFFIC CONTROLLER

For those of you who haven't ever been to a center you will see here what it would mean to these wonderful and often anxious men who control the traffic. Here is what he is seeing now: His microphone, his headset. He is speaking. He says, "Are you United at 31,000 going to 35,000," and United says, "Affirmative," so he feels reassured. But he has got this little plastic strip here following along this blip. Here is where we want to take him with these bright displays, and in some of our new centers we have this improvement. Then finally we want to get him down here, not with this little shrimp boat, not with this two-way conversation, which sometimes breaks off, due to atmospheric conditions, but we want him to be positively identified as to altitude, as to type of aircraft and follow him with this capability. Then later, down here in fiscal year 1966, 1967, or 1968, the computer would compute the future course of his flight.

ALTITUDE AND IDENTIFICATION EQUIPMENT

Mr. JONAS. How will you feed that information into the computer?

Mr. HALABY. The aircraft owner will buy the gadget that we showed you yesterday, an altitude and identification transmitting transponder. It will constantly send that single signal to us on the ground and it is in the devices on the ground that we put the money and they read out and generate into the tube and then display on the scope all of that information.

Later, when we are fully computerized, it feeds into the computer both radar video and that data from the transponder. The computer stores it in the memory, feeds it out and gives this controller a prediction of things to come. He can interrogate the computer at any time.

Mr. OSTERTAG. Are they required to have these instruments?

Mr. EVINS. Not at the present time.

Mr. HALABY. At the present time the military require of their aircraft and the airlines are required to have them under this condition: When they enter the airspace above 24,000 feet over the continental United States, where we have what we call an area of positive control, they are required to have them. As a matter of fact they voluntarily installed them because it is such an aid to the controller, it is such a reassurance to them.

When we come down to 18,000 feet area of positive control, there is a new class of owners that would need to buy them and those are the high priced, high speed, high altitude business aircraft.

Mr. Jonas and I were discussing the first day about whether the small plane pilot would be forced to buy these and I explained, that is far off. We have the equipment developed. We would not require it, except in the highly congested areas of area positive control and someday, not tomorrow, they will be required as the price of going on the high speed system to buy this so that it can transmit their position, altitude, and identity to the ground.

PRIORITY FOR INSTALLATION

Mr. OSTERTAG. Until you have provided and installed this equipment across the board, of course there will be only certain locations where it could be used.

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. There would be no point in requiring an airline or an aircraft to provide the responding equipment if they are not associated with the locations. Isn't that the truth?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. So this is a matter of progression?

Mr. HALABY. It is a matter of progression. I just hope that our friends in aviation will trust us to do it gradually and deliberately.

Here is the highly congested traffic area of the United States and so we are installing this, quite logically, in those areas where there is the densest high-speed, high-altitude traffic, so if you give us this money, we can give the controllers in these centers—Oakland, Los Angeles, Kansas City, Chicago, and so forth, the alpha-numeric capability first.

Mr. OSTERTAG. You picked out the largest centers?

Mr. HALABY. We picked out the ones that have the most urgent need for it.

PROCUREMENT OF EQUIPMENT

Mr. JONAS. You invited our attention to page 518. I would like to ask you—surely I am misinterpreting this table showing large sums amounting up to $29 million. They are under a tab saying "Washington office." You don't mean what that seems to say, do you?

Mr. HALABY. That is the part of the Agency that buys the equipment. In other words, the procurement headquarters is in the Washington office.

Mr. SHANK. This would be a single, centralized procurement.

Mr. OSTERTAG. Why do you break it down that way? I would think that what the figure shown under the Washington office is would be in the other column.

Mr. HALABY. This could easily be stated to be "Equipment and installation." In other words, "Field" is the amount of money they need in the field to install and check out the equipment; "Washington office" just happens to be the location of the procurement headquarters.

This equipment, which Mr. Warren and Mr. Blatt have here in a circuit diagram would all be bought centrally by our procurement officer, Mr. Leng, in Washington. It would be delivered to the field and installed there, so the "Washington office" column means the procurement cost of $29,282,000; the "Field" column of $3,784,000 is what is spent at the site in these 10 locations in the field.

Mr. OSTERTAG. Out of the $33 million, $29 million is procurement?

Mr. HALABY. Yes, sir.

Mr. JONAS. That is satisfactory. I was scared for a minute.

Mr. OSTERTAG. Would that be a single contract that would have nationwide application? Explain that further.

Mr. HALABY. Sir; if you will look at that for 1 second, it is very complicated. I hate to go into such great detail, but you will see there a kind of circuit diagram.

The alpha-numeric generator, the computer, module, the beacon digitizer and the input modules would be part of a single subsystem that would probably be bought from a single contratcor. Is that not correct?

Mr. SHANK. No, sir. It will involve at least three.

Mr. HALABY. At least three contractors. You see, we already have the scan converter and the decoder. We have already got the display that the man is sitting in front of down at the bottom, but we need this beacon monitor panel, which I guess would be purchased from——

Mr. SHANK. Probably one of the companies that has been developing it.

Mr. HALABY. But it would be one of the three or a fourth contractor?

Mr. SHANK. That will be the third.

Mr. HALABY. That will be the third of the four contractors. These are already under development and have had a lot of work done on them.

Mr. BLATT. They have had evaluation.

Mr. OSTERTAG. Is that all under research?

Mr. HALABY. Yes, sir. Over these last 3 years.

Mr. BLATT. This is a product of it.

Mr. OSTERTAG. Mr. Chairman, I would suggest we include at this point in the record pages 516 and 517, which explain the problem, consequence, and solution.

Mr. EVINS. Those pages may be included in the record at this point.

(The information is as follows:)

AUTOMATION EQUIPMENT

Provide alpha-numeric display—4096 Mode 3 A. & C. on bright displays, 10 centers, $33,066,000. Typical system cost, $720,000.

BASIS

FAA implementation of Project Beacon report which recommended, in part, with regard to en route control areas: (a) "The radar display and radio communication with pilots should be the primary tools used by the controller of IFR and CVR en route traffic. The radar display would show the video from radar or beacon, and in alpha-numeric symbols, the identification and altitude of aircraft," and (b) "With continuously displayed position information and provisions for radar and computer aided handoff, together with the customary flight plan, only infrequent communication with the pilot should be required." This program is the first implementation of the above system improvements.

STATUS

Programed through fiscal year 1963, none; programed in fiscal year 1964, none; proposed in fiscal year 1965, 10.

PROBLEM

In the present mode of operation, a movable plastic marker containing the required data for a particular aircraft is placed on the flat surface of the horizontal radar display and manually moved across the display to keep the marker associated with the radar target. At center operating positions where only vertical displays are used, the controller mentally associates the radar target appearing on the display with information appearing on a flight progress strip adjacent or near the display. The aircraft identity and the assigned or verbally reported altitude is marked on the plastic marker and the flight progress strip. The altitude is updated as required by manually changing the figures. This results in increased concentration and attention by the controller thereby limiting or reducing his available time for performance of his primary air-traffic-control functions.

CONSEQUENCE

As long as the controller must correlate aircraft identity and altitude by manual means, his availability for performance of his primary control functions will be limited. In the present manual system a number of traffic control incidents and near misses are caused by misidentification, altitude error or confusion, coordination errors, and position errors or confusion. Specifically, there were 99 "near misses" reported by pilots in the en route control area above 24,000 feet during calendar year 1962. In addition, there were 40 control errors reported in this airspace which resulted in aircraft being separated by less than approved minimums. Of these, 43 percent involved misidentification on the part of the controller and, over all, detailed analysis revealed that 80 percent could have been avoided had radar beacon alpha-numeric been available to the controller. Also, in the present system, users experience a significant economic penalty when the flight path between two points is increased because of inability of the present system to provide the controller with continuously current three-dimensional information on aircraft population in his area of jurisdiction. As a result, aircraft are often needlessly vectored around unknown targets.

SOLUTION

The proposed system provides for identification and altitude of mode A. & C. transponder-equipped aircraft to be displayed in alpha-numerics adjacent to the radar target on controllers' displays. This information will remain in correlation with the associated radar target as it progresses across the scope. The equipment basically consists of a digitizer, computer, and alpha-numeric generator. The computer will provide the alpha-numeric generator with information which will result in the generation of aircraft identity and altitude information in a form which can be displayed on the radar display adjacent to and associated with the beacon radar target. In addition to providing the controller with positive, continuous identification of beacon-equipped aircraft, other sig-

nificant benefits accrue; e.g., reduction in volume of pilot/controller air/ground communications because identification is automatically maintained and altitude information is automatically reported; provides for better utilization of airspace by eliminating the need for reserving blocks of airspace for training and test activity; significantly reduces the amount of coordination between controllers; and, reduce the propensity for error and the time required to execute transfer of control (radar handoff) between controllers, because identity and altitude in association with the radar target is displayed on all cognizant scopes.

The selection of place-name locations for inclusion in the fiscal year 1965 program provide for radar beacon alpha-numeric implementation in those areas of highest traffic density and the greatest number of ATC incidents and near collisions. It also takes into account the Agency installation capabilities on a regional basis and therefore the order listed below may require modification to provide plan continuity (avoid islands) and to accommodate regional capabilities. Another premise used in the plan provides that if one radar in a center area is required, all radars in that center will be equipped with the beacon alpha-numeric capability. This is in the interest of standardization and to avoid confronting controllers with grossly different equipment capability and operating equipment at different center positions.

Our decision to begin this program in the high-altitude airspace is based on the fact that the users operate aircraft with the greatest performance capability, the heaviest per unit financial investment, and, in the case of passenger-carrying airplanes, the largest potential risk in terms of lives and equipment in the event of airborne collision. Further, these users have agreed with our determination that radar beacon is the logical way of reducing the potential risk, and have expressed willingness to equip their aircraft with the required airborne equipment.

ARTC centers	Number of radars	Estimated cost		
		Installation	Equipment	Total
California:				
Los Angeles	6	$296,000	$3,356,000	$3,652,000
Oakland	6	302,000	3,950,000	4,252,000
Colorado: Denver	6	296,000	3,374,000	3,670,000
Florida: Jacksonville	4	270,000	3,043,000	3,313,000
Georgia: Atlanta	4	270,000	2,534,000	2,804,000
Illinois: Chicago	5	279,000	2,647,000	2,926,000
Missouri: Kansas City	4	266,000	2,464,000	2,730,000
New York: New York	4	264,000	2,412,000	2,676,000
Ohio: Cleveland	4	777,000	3,090,000	3,867,000
Washington: District of Columbia	4	764,000	2,412,000	3,176,000
Total	47	3,784,000	29,282,000	33,066,000

USE OF AUTOMATION EQUIPMENT

Mr. WYMAN. You must have come up with the conclusion there were some pretty serious gaps or potential gaps in security at these flight levels to warrant your recommending the installation of this equipment; is that right?

Mr. HALABY. Yes, sir. We went over yesterday the number of critical verified near midair collisions, which is one measure of the risk, as you say, a gap in the security. What I think is the important thing for the committee to understand, and I hope be convinced of, is that we are putting too much of a load on the individual man in the system. We ought to transfer some of that load to the machine—not all of it—because the man must continue to make final decisions; but we ought give him the mechanization and the semiautomation that puts some of the load on the system, not just on the nerves and mind and memory.

Mr. WYMAN. With his equipment now, after he verifies the altitude—does he just figure the bugs on the screen are approaching each

other and there might be a collision and then by manual contact with the operator of the plane, et cetera, tell them what to do? Is that how he manages the situation now?

Mr. HALABY. His problem is most often where there is uncontrolled VFR traffic mixing with controlled IFR traffic. There he doesn't even know what kind of aircraft it is or what altitude or what direction he is flying the uncontrolled aircraft. He does have a flight plan for the IFR aircraft. His second problem is as between two IRF aircraft where he must check and doublecheck and triplecheck to assure that the flight plans as filed do not conflict and as actually made good do not conflict. Is that an accurate statement, Mr. Thomas?

Mr. DAVID THOMAS. Yes, sir. In addition, on this present system, we had one yesterday, as a matter of fact, where the assistant controller copied down incorrectly 20,000 for 22,000 and passed it on to the controller. He looked at the two aircraft. There apparently was adequate separation, 2,000 feet between them, where, as a matter of fact, we were fortunate that here there was a lateral separation between them, but not actually altitude separation.

This new system would give the controller automatically, directly from the altimeter of the airplane what the altitude is without this chance of human error.

We have had situations where just the microphone cord had moved one of these little plastic slips, the plastic shrimp boats and then a human picked it up and reattached it to the wrong blip. We had a radar misidentification. This is the only sure way we know of passing through all the human hands and coming up with the right altitude on the right airplane.

Mr. WYMAN. This system applies, regardless of weather conditions?

Mr. DAVID THOMAS. The system would operate, regardless of weather conditions. He would always get this information from the equipped airplanes. We would still leave a great deal of the airspace free that would not require either the equipment or the flight plan, so there will be some VFR operations in it, but it will help the controller greatly by sorting out those who are equipped and are known from the unknowns.

Mr. HALABY. The most dramatic case, Mr. Wyman, in recent experience, was in December 1960. A TWA Constellation, turning to land on course at La Guardia, a United DC–8 descending over New Jersey. He had been given instructions to hold at a certain electronic fix. He passed through that fix and rammed the TWA on course into La-Guardia.

The LaGuardia approach controller saw a blip coming, but he didn't know but that it was at 35,000 feet, going right over LaGuardia. He didn't realize that it was coming down to about 2,500 feet and ram this airplane.

That is one situation where, if both of those controllers, the New York Center controller and the LaGuardia controller, for example, knew what this alpha-numeric generator would show them, we would have had a completely different situation.

To sum up on it, one function is identification. At present it is manual. If you give us this money it would be automatic.

The second function: If the radio fails, there is a complicated procedure that most private pilots don't even remember about making turns and doing a lot of things for identification. Here you would have what we call beacon tracking to tell us where the airplane is.

The altitude reporting is the third function. Now it is by voice. There are often a babble of voices in the late afternoon in these busy areas. It would be automatic under this scheme. The display filter is now coarse. It would be fine grain for a much clearer presentation to the controller. The radar handoff is now by voice. It would be semiautomatic, as these controllers watch these identified altitude confirmed blips going across.

The cruise climb condition is now stepped. Climb to 32,000 feet and hold. Then 34,000. We could make it a continuous climb and save time and fuel.

The flight tests are now made by reserving huge blocks of airspace. Under the new system it can be monitored by continuous tracking, without tying up nearly as much airspace.

Traffic advisories now are quite inefficient. Here we can reduce the number of radiovectors with this equipment. Finally, you get rid of this absolutely essential but primitive shrimp boat. You go from manual to automatic identification.

Finally, Mr. Chairman, it isn't something we have just dreamed up in the last year. This is a logical, deliberate progression from where we said we would be 3 years ago to where we want to be in a couple of more years.

Mr. Evins. On that point I think we had better adjourn until about 1:15.

AFTERNOON SESSION

Mr. Evins. The committee will come to order.

We will resume consideration of the facilities and equipment budget.

UNOBLIGATED BALANCE—FACILITIES AND EQUIPMENT

The Administrator was explaining the need for the automated equipment. I wanted to point out that our records show you have $126 million in unobligated carryover in 1965.

Mr. Halaby. Yes, sir; I am going to ask Mr. Leng to give you his analysis of the carryover and his programed use of it and his estimated end of year 1965 amount.

Mr. Leng?

Mr. Leng. Yes, sir. We have taken the carryover that we had and it was sort of a planned carryover because one of the big items was the procurement of Tacan. Our contractor had been very, very late in delivering and we did not want to give another contract at the time, so of all the single items, that is probably the biggest item that was included in the carryover. We have taken this figure of the carryover and split it down into each and every item and have a planned expenditure this year in the air navigation facility part of it of approximately $126 million. The aircraft and R. & D. expenditures will bring the figure up to $156 million.

Mr. Evins. Do you consider commitments and obligations for all of this amount in the next year?

Mr. Leng. Not within the next year, because on the full-funding basis some final installation programs spread over a 4-year period, but the vast majority of this will be in this fiscal year.

ESTIMATES OF AUTOMATED EQUIPMENT

Mr. EVINS. One further question: How firm are the estimates of this $33,066,000 for your automation equipment? Have you checked this out with a lot of suppliers or is there only one or two suppliers?

Mr. LENG. We are attempting to get competition in every portion of it. We have broken this down by each center where this item is to go, specify how many of each item, and assume a complete degree of competition to the extent we can.

FAA SYSTEM VERSUS NASA SYSTEM OF CONTROL

Mr. EVINS. The centers for the NASA flight missile shots—this may be somewhat far fetched—but these centers to my mind are amazing in that they can tell you to the precise moment and location as to where a missile is going to come down in the Pacific or the Atlantic. The ships are all there at rendezvous to pick them up, after having been to the far distance of outer space.

Do you envision that your centers with this new equipment will in some way be comparable to this, in bringing down and assisting in bringing down safely aircraft in flight? Is it anyway comparable to the centers of our space centers?

Mr. HALABY. I would say that we have quite a different kind of system but that our radar, plus alphanumeric, plus computer backup being sufficiently precise to bring the airplane down to the approach in a satisfactory manner. When we get our all-weather landing subsystem added to that we will have a kind of tracking and flight navigating system that is very, very suitable. Of course, it wouldn't cost anywhere near per flight what space flight costs.

Now, Mr. Shank would add to that I am sure.

Mr. SHANK. The kinds of equipment we use tend to be somewhat similar; that is, the digital computer is common to both of the systems. We both use a great deal of radar equipment. We both use communications. They generally call it telemetering because in general there is not a man on both ends. It is only one end. The technology is quite common.

There is one really large difference and that is that what NASA does is very precise control. When we talk about the FAA control, it is really a comparatively less precise tracking and identification of the aircraft designed to help him to destination and avoid conflicting traffic.

Mr. EVINS. There is a difference but there is a comparable situation. There is some degree of comparability?

Mr. SHANK. There is some comparability, yes. We try to find out and help him do something, whereas in the NASA case they preplan it, carry it out to meticulous detail and if it departs by a very small fraction, then it is a failure.

NUMBER OF CENTERS TO BE PROVIDED AUTOMATED EQUIPMENT

Mr. EVINS. Mr. Administrator, in how many centers would this $33 million worth of equipment be located?

Mr. HALABY. This $33 million would be in 10 of our intended 21 centers, so it is about half of the ultimate requirement.

Mr. SHANK. It is somewhat more than half of the radars. We picked the centers in such a way as to get 47 of the radars, and there are about 81 total.

FUTURE REQUIREMENT FOR AUTOMATED EQUIPMENT

Mr. EVINS. Does this mean in a subsequent budget we may anticipate another $30 to $35 million request for other centers for similar equipment?

Mr. DAVID THOMAS. Mr. Chairman, we would expect to complete the high-altitude portion that we are planning here, with about $20 million more making a total of $53 million to equip all the radars and centers in the United States at the high altitude. As we add control areas at lower altitudes, provide more coverage, there will be additional costs in forthcoming years.

Mr. EVINS. Is this already in the planning stages within the agency?

Mr. DAVID THOMAS. Yes, sir.

Mr. HALABY. Ever since we came in 3 years ago we have had a single goal and a developing design and each year as we have come before you we have presented what we have learned during the previous year. It is all within that total general plan.

This morning I pointed out that the Budget Bureau deferred some of the research and development and deferred some of the facilities and equipment into fiscal year 1966. We have accepted that. We believe we can live with it.

Mr. JONAS. This was one of the items we were talking about the other day.

Mr. HALABY. Yes, sir. It accounts for the bulk of the difference between what we submitted and what the President allowed.

Mr. JONAS. Sort of a stretch out of the program over a couple of years.

Mr. EVINS. Mr. Boland?

COST OF INSTRUMENT LANDING SYSTEM

Mr. BOLAND. What is the cost of a radar approach system for an airport?

Mr. HALABY. The instrument landing system whereby the pilot approaches an airport by his instruments is called an ILS and the average installation cost is about $250,000. We believe as a result of work Mr. Blatt and Mr. Leng are doing we are going to be able to bring that down to around $100,000; but right now until we have proved out a new system we have worked on, it is around $250,000 to $275,000.

CRITERIA FOR INSTRUMENT LANDING SYSTEM

Mr. BOLAND. What criteria do you use for an airport to get this system or to come in on radar approach?

Mr. DAVID THOMAS. We have the criteria for the instrument landing system. This is a demonstrated need at a tower airport with at least 700 instrument approaches a year. As far as the radar approach is concerned, I believe this is now 50,000 instrument operations.

Mr. HARVEY. It is a hundred thousand itinerant operations and 20,000 instrument operations at an FAA tower airport having an instrument landing system.

Mr. BOLAND. Do you ever depart from this?

Mr. HARVEY. As part of the planning standard criteria, exceptions can be made if properly justified and approved. These have been very few and very rare.

Mr. HALABY. There are two different systems. One is instrument landing system, which is on the ground and the pilot uses his instruments to fly down, from the localizer, the gadget we showed you yesterday, and there have been recently a couple of cases where we are installing the new system, the experimental system on a limited basis while proving it out in practice.

COST OF RADAR APPROACH CONTROL

On the radar approach control, how many do we have total, Mr. Harvey?

Mr. HARVEY. Including the military RAPCON's, 114.

Mr. BOLAND. What is the cost of radar approach control? You say the ILS costs $250,000 to $275,000. You are working to get it down to $100,000. What does the regular radar approach cost?

Mr. HALABY. The ones we have at civil airports such as Washington National here——

Mr. BOLAND. I know. Just a small airport.

Mr. HALABY. About a million dollars.

Mr. BOLAND. I mean a much smaller airport.

Mr. HALABY. That would be an average installation.

Mr. HARVEY. It is in the neighborhood of $750,000 to $850,000 for a complete ASR installation.

Mr. HALABY. We have how many of those now?

Mr. HARVEY. We have 74 ASR's located at civil airports in the 50 States as of the end of this year. Additionally there are 40 RAPCON's and RAP-TCC—military radar surveillance systems jointly used by both the civil and military, making a total of 114.

Mr. EVINS. Mr. Ostertag?

Mr. OSTERTAG. No questions.

Mr. EVINS. Mr. Jonas?

Mr. JONAS. No questions.

Mr. EVINS. Mr. Wyman?

CONTROL OF AIR TRAFFIC

Mr. WYMAN. Following up what we discussed this morning, should you have this new type automation equipment in operation and a plane flies into the area to which it applies, is the pilot authorized or will he be authorized under your regulations to break the orders that he gets from the automated source should there be an emergency visible to him?

Mr. HALABY. Federal air regulations provide that a pilot may at any time declare an emergency in flight and if requested by the Administrator must supply a statement of facts concerning the reasons and conditions for declaring an emergency.

Mr. EVINS. Very good.

Mr. HALABY. The occasions when a pilot refuses to accept a clearance or a vector are very rare. There are mavericks in the air, as in other areas of human activity, and sometimes they speak back to the controller by saying, "I will fly the airplane. You fly the radar." It is "needling" and it occurs occasionally. It is unfortunate. Sometimes it is an irritable person. Sometimes our controller may have brought it on a little bit. But we have been very active in the last year in particular, working with the pilot groups to get them to understand why these vectors are necessary. They do not have to accept them. They can declare an emergency, or they can say, "Prefer heading of 30° to the left," and, if there is no traffic conflict the controller will say, "You are cleared for 30° to the left."

These are occasions where the pilot on his radarscope may see a thunderstorm cell and prefer to go farther away from it. So there is a cooperative arrangement. We, unlike the Soviet system, do not dispatch aircraft, direct them, or fly them by wire, so to speak. We have a cooperative system where we give a clearance, it is accepted normally, where we give a vector and it is accepted normally.

Sometimes there is a dialog back and forth and it is almost always worked out. Where it isn't, we bring an enforcement action for a person who has violated the air rules. It is very rare. I do not know how many cases there have been, Mr. Goodrich.

Mr. GOODRICH. They would be almost infinitestimal.

Mr. HALABY. It is a handful each year, Mr. Thomas.

Mr. DAVID THOMAS. It is so rare it usually makes the headlines when it does happen.

Mr. WYMAN. But a commercial airline pilot receiving an instruction from one of your controllers, coming into an international or national airport, has the right, if he wishes, subject to his obligation to explain why afterward, to say, "No, I am going to take different altitude"?

Mr. HALABY. He has the right by declaring an emergency and reporting on it afterward to take action to avoid an emergency. I think that is correct. Your statement is just about that. It is exercised very, very rarely and if it is exercised negligently or carelessly, of course, we would have to bring a violation against him.

Mr. Thomas has a comment.

Mr. DAVID THOMAS. The only other comment I wanted to add is that even though this new system provides automatic altitude and identify reporting, all instructions still come from the controller. Decisionmaking and instructions are still from the controller, and not from the machine.

Mr. EVINS. You would have both the automated equipment and the individual for a double safety protection?

Mr. DAVID THOMAS. The automatic equipment does not do any controlling. It simply assists the controller by providing altitude and identify in front of his automatically.

Mr. HALABY. The decision is still made by the controller. The communication to the pilot is still by voice to the pilot and from the pilot to the controller. It is not an automatic system in that sense and it never will be as far as we can see.

DIFFERENCE BETWEEN CENTERS, TOWERS, AND STATIONS

Mr. EVINS. Mr. Administrator, we are going to turn over to your "Aircraft request." Before we do that I want to spell out real quickly for the record the difference between your centers, towers, and your stations.

Mr. HALABY. Yes, sir.

The center is technically known as an air route traffic control center. There are a total domestic and overseas of some 32 centers, coming down to 28 centers; 25 domestically coming down to 21 domestically.

These are in locations which we can list for you, but they are in the areas of the United States, over which the traffic flies.

They control enroute traffic, traffic between two points. The second is a tower of which there are about 270. The tower controls traffic, usually within a 5-mile radius of the airport iself. However, some of them, some 76 of them, have radar approach control facilities and they control traffic up to 50 miles out from the airport on which the tower is located.

A flight service station is an office, with teletype, communications, direction-finding equipment, and weather reporting and observing capabilities where men communicate with airmen in the air and across the counter on the ground.

CONSOLIDATION OF FLIGHT SERVICE STATIONS

The number of flight service stations has been as high as 450 when the system was quite primitive and manual; the number has come down to 335 in the last several years, and recently we have announced a consolidation of the 299 domestic stations into a total of 257.

We have also indicated to the committee that if the results are as safe and as economical as we believe, there can be additional consolidations.

The one who is hurt is the one who deals across the counter, but 90 percent of the pilots will get the same service as they get from the present system.

Mr. EVINS. Some of the members of the committee rather gain the impression that you have a very low regard for flight stations.

Mr. HALABY. That is not so, sir. We have no intention of eliminating them. We do feel that some economy with safety can be achieved by consolidating some of them.

The reason is simply that the technology and the traffic have changed from 1934, when they were beginning to be installed, until 1964. We have more communications, more radars, a more centralized and efficient system. Therefore, we can combine, due to technology and automation, some of these flight service stations.

Mr. EVINS. You are also reducing and consolidating some of your centers; are you not?

Mr. HALABY. Yes, sir.

Mr. EVINS. How about your towers? Do you regard them as important to the system?

Mr. HALABY. We do very much regard the towers as important and there are a total of 277 towers in the 700 air-carrier airports of the United States.

We add towers as we are providing this year to add 19 towers, I believe, when the operations at the field exceed 24,000. This device, of

course, is very important. It is very important because it permits the control of traffic around the airport where most accidents occur in takeoff or landing situations.

Mr. EVINS. Would there be any advantage or any service to a commercial airline carrier from a flight service station?

Mr. HALABY. There are two kinds of service stations that he constantly uses. One is the station on the airport that he serves and the other is a station which may be at another location than the airport he serves. In the one case where he is flying into an airport with the service station he can go to the counter, although he only does that about 10 percent of the time. In most cases commercial carriers, such as airlines, never go to the station.

Mr. EVINS. I was referring to the possibility of being in flight and communicating with the station.

Mr. HALABY. Yes, sir. In flight he would not know the difference between communicating with two separate stations or one consolidated station. Communications would be exactly the same.

Mr. EVINS. But there could be service in flight to a commercial carrier?

Mr. HALABY. Yes, sir.

Mr. EVINS. There could be service to private plane operators where there are flight service stations both on the ground and in flight?

Mr. HALABY. Yes, sir. They serve all alike and in an equal way and what we are trying to do is to maintain the high quality and quantity of service, but to do it with fewer people and fewer stations.

AIRCRAFT AND RELATED EQUIPMENT

Mr. EVINS. We will turn next to aircraft. Insert pages 596 and 597 in the record.

(The pages follow:)

AIRCRAFT AND RELATED EQUIPMENT, $1,979,000

(a) *Facilities flight inspection, $1,050,000*

(1) *Signal evaluation airborne laboratory (SEAL), $750,000.*—The continuous updating and improvements being made to ground facilities in the common system requires comparable updating of the facility flight inspection system and aircraft in order to provide the capability for accurate flight checking of these facilities. It is, therefore, necessary that a signal evaluation airborne laboratory be developed and installed for thorough flight evaluation as a production model of an improved flight inspection system. The development and evaluation of this model follows systems research and development requirements studies, development of complete system and equipment specifications, and the development and assembly of an engineering prototype model for laboratory and limited flight tests.

(2) *Procurement of hangar, line, shop, and test equipment, $130,000.*—Avionic test equipment, workbench cabinet racks, and mockups are required to provide additional capability necessary for implementation of a national program for scheduled maintenance, overhaul, and calibration of avionic test equipment; to provide additional work space in avionics shops; and to provide spare mockups for use as replacements since none are available in the event of a major breakdown in any mockup. Cost breakdown is as follows:

Test equipment	$99,000
Workbench cabinet racks	5,000
Mockups	26,000
Total	130,000

(3) *Procurement of ISL/VOR test equipment, $165,000.*—Improved ILS/VOR receivers have been approved for the basic altitude flight inspection aircraft.

However, the accuracy of ILS/VOR test sets currently employed is not compatible with the new receivers. Therefore, higher accuracy test equipment is required to provide the maintenance shops with the necessary capability. Thirty units at $5,500 are needed for this purpose.

(4) *Procurement and installation of Sel-Cal units in KC–135 aircraft, $5,000.*—A visual and aural alarm system is required in the cockpit of overwater flight inspection aircraft to provide for the selective calling of aircraft by ground stations via HF radio and to assure the reception of necessary inquiries from ground stations. Without this equipment, flight inspection aircraft crews will be subjected to many communications not directed to them with the possibility of not receiving many which concern them.

(*b*) *Logistic, administrative, and other, $929,000*

(1) *Procurement of eight light twin aircraft, $929,000.*—Eight light twin aircraft, obtained under a lease-purchase contract, are essential to the Agency to maintain general aviation inspectors current and proficient in modern aircraft, to fulfill long-trip requirements of air traffic in-flight evaluation programs, and to provide adequate aircraft for headquarters and regional administrative travel. Since these aircraft are currently being leased, a comparison of the relative cost between continuation of the lease and exercise of the purchase option as soon as practicable demonstrates the savings to be realized if the aircraft are purchased. A cost breakdown is as follows:

Acquisition cost of 8 aircraft (total)	$1,375,110
Less Government equity, Dec. 31, 1964, under terms of lease-purchase contract	−446,110
Purchase cost, Dec. 31, 1964	929,000

AIRCRAFT PROCUREMENT

Mr. EVINS. I notice that for test of equipment you are seeking $165,000. You have the acquisition cost of eight aircraft, $1,357,110.

Mr. HALABY. I am going to ask Mr. Moore to——

Mr. EVINS. Less Government equity, trade-in allowance, I suppose, $446,000 for a total purchase cost of $929,000 for eight aircraft. Mr. Reporter——

Mr. HALABY. Just one slight modification, Mr. Chairman. It is not trade in FAA old aircraft for a new, it is the equity which we have already invested in the lease-purchase contract.

Mr. EVINS. That was not the technical terminology that I used. Do not old aircraft have some value?

Mr. HALABY. Yes, sir. We already are using these and have some $446,000 invested through rental payments.

SIZE OF PRESENT AIRCRAFT FLEET

Mr. EVINS. How many aircraft does the FAA own at the present time? What is the status of your fleet?

Mr. MOORE. At the present time, sir, the Agency owns 70 aircraft. We have 44 aircraft on military loan and we have commercial leases on 16 aircraft, for a total of 130 aircraft.

PURCHASE OF AIRCRAFT

Mr. EVINS. You need eight more?

Mr. MOORE. Well, I am including, sir, the 8 that we would like to purchase in this total of 130.

Mr. EVINS. You have already added them to the fleet?

Mr. HALABY. They would move over from leased aircraft to owned aircraft.

Mr. EVINS. You are going to purchase 8 of the 16 that are leased?
Mr. MOORE. Yes, sir.
Mr. EVINS. Why not purchase 10 instead of 16?
Mr. MOORE. Well, we feel that eight is all we need to purchase at this time, sir.

In looking at the rest of the aircraft that are leased, it wouldn't be in the best interest of the Agency in our judgment to purchase them at this time. We are referring to a couple of Piper PA–24's and an Aero Commander, and so forth which is such equipment that we will not have a long-term need for as we will for these others.

Mr. EVINS. The 70 you own I suppose is a good fleet.
Mr. MOORE. We think it is a good fleet, sir.
Mr. EVINS. These 44 that are on loan are from the Air Force?
Mr. MOORE. Yes, sir. Let me correct that. Most of them are from the Navy. There are 39 DC–3's in that group. We use those in our flight inspection of the airway navigation system.
Mr. EVINS. If the Navy can loan you 44, why can't they loan you 8 more?
Mr. MOORE. Well, they are entirely different types of equipment, sir. I might point out the type the Navy loaned us are obsolete to their needs which the Navy is not operating in any quantity these days, but they do suit our needs for the flight inspection of navigational aids.
Mr. EVINS. How many aircraft has the FAA been purchasing over the past 2 or 3 years on an average?
Mr. MOORE. Never more than three. I believe the committee last year authorized the purchase of a 727 jet and 2 Gulfstreams. The year before that I am not sure if we did have purchases but there were some purchases in 1961 and 1962 for our training program that we have at Oklahoma City.
Mr. EVINS. Any questions on the purchase of new aircraft needs?
Mr. BOLAND. No questions.
Mr. EVINS. Mr. Ostertag?
Mr. OSTERTAG. No.
Mr. EVINS. Mr. Jonas?

AIRCRAFT RENTAL

Mr. JONAS. How much are you paying in rent for these planes that you will purchase?
Mr. HALABY. The annual rent for those aircraft is——
Mr. MOORE. $87.25 per hour.
Mr. HALABY. The total annual rent for the eight aircraft. We will have $446,110 equity in them by December 31, 1964. We have had them a year and a half.
Mr. MOORE. We picked them up last year, sir.
Mr. HALABY. A year and a half?
Mr. MOORE. $409,000 per year is the annual lease cost.
Mr. HALABY. Yes.
Mr. JONAS. How long do you have the option to apply rental on purchase?
Mr. MOORE. It is an open contract, sir. We could continue to——
Mr. JONAS. You could substitute this $929,000, pay out another $409,000 for another year's rent and then purchase them next year for the difference, if you wanted to defer the purchase?

Mr. MOORE. But we would lose considerable nonrecoverable moneys by doing that.

Mr. JONAS. What would you lose?

Mr. MOORE. If we were able to pick these aircraft up December 31, 1964, we would have $322,818 nonrecoverable. If we waited a year we would have a total nonrecoverable of $408,750.

Mr. HALABY. He wants to know what is being lost, as you put it. In other words, this is the carrying charge and the interest and he would like that broken down so he could judge whether or not to permit it this year or next year.

Mr. MOORE. I don't have that breakdown, sir, but I can get it.

Mr. JONAS. Then what would the nonrecoverable cost consist of?

Mr. MOORE. Interest and insurance.

Mr. HALABY. The two main items are interest and insurance.

Mr. JONAS. Aren't you a self-insurer?

Mr. HALABY. Not on these leased aircraft, we don't own them.

Mr. JONAS. You don't insure the ones you own. They don't require you to insure them. Isn't the Government's contract good without insurance?

Mr. ALEXANDER. This is the part of the lease price not applied toward the ultimate purchase and represents the cost to the owner of the aircraft for carrying them until such time as they are purchased.

Mr. JONAS. Will you give us a brief description of the 130 aircraft? What are the types you own?

Mr. HALABY. They appear at pages 486 and 487.

Mr. EVINS. Mr. Wyman.

Mr. WYMAN. No questions.

Mr. EVINS. Mr. Moore, why do you need these eight aircraft at this time?

Mr. MOORE. We use them for familiarizing our general safety inspectors with the latest equipments. We use them for our air traffic control specialists to evaluate the airways system and we also use them for administrative transportation purposes.

Mr. EVINS. Next we have two other items, "Operation and maintenance of Washington National Airport" and "Construction of Washington National Airport." I want to consolidate these two together.

Mr. Reporter, will you please place in the record 626, 627, 628, and 629, and also the construction budget, which is 684 through 686.

(The pages follow:)

OPERATION AND MAINTENANCE, WASHINGTON NATIONAL AIRPORT

Summary of appropriation requirements

Appropriation, 1964 (regular bill)				$3,581,500
Net difference, 1965 over 1964:				
Activity	1964 appropriation	1965 estimate	Difference, increase (+) or decrease (−)	
Washington National Airport	$3,027,300	$3,163,000	+$135,700	
Consolidated functions	554,200	468,000	−86,200	
Total	3,581,500	3,631,000	+49,500	+49,500
Total estimate of appropriation, 1965				3,631,000

OPERATION AND MAINTENANCE, WASHINGTON NATIONAL AIRPORT

GENERAL JUSTIFICATION

Activities financed under this appropriation include the operation, maintenance, and protection services of the airport, as well as staff assistance from Bureau headquarters. Costs of the central headquarters are added to airport operating costs to provide an accurate base on which to establish airport use rates and charges. Outlays for operating equipment and maintenance projects are also financed under this appropriation, while major construction projects are financed under a separate "Construction, Washington National Airport," appropriation.

The fiscal year 1965 appropriation request of $3,631,000 will provide $3,270,500 for direct operating expenses and $360,500 for capital outlays. Capital outlays will permit the acquisition of necessary operating and working equipment and also provide for the replacement or renovation of deteriorated or inadequate facilities.

Despite known workload increases requiring 14 new positions, no new positions have been requested for fiscal year 1965. This action assumes a 5-percent productivity increase. The positions which would have been requested, such as the firemen to man new equipment and utility workers for the new sewage treatment plant, will be reprogramed within existing personnel ceilings. To do this, a conscientious program of review and analysis will be maintained to insure the optimum use of all available manpower.

During fiscal year 1965, Washington National Airport will continue to serve as the principal air terminal in the metropolitan area of Washington, D.C. In fiscal year 1964, aircraft and passenger activities are expected to increase. Aircraft movements are anticipated to stabilize at a level of approximately 300,000 in fiscal year 1964 and beyond. During the same period, passenger activity will decrease approximately 100,000 per year from the fiscal year 1964 level. These estimates reflect the growth of general aviation, offsetting minor reductions in commercial activities as Dulles International Airport assumes more of the Metropolitan Washington air traffic.

The following table represents a projection of operational activities expected at Washington National Airport:

	1963 actual	1964 estimate	1965 estimate
Traffic movements	279,007	300,000	300,000
Passenger movements	5,007,993	5,300,000	5,200,000

Business policies of the Bureau of National Capital Airports are based upon the recovery, through appropriate and equitable fees and charges, of all out-of-pocket operating expenses, plus the realization of a fair yield on the Government's investment computed on a basis comparable to that used by other major commercial airports. Generally, those policies recognize the following principles:

(*a*) All airports under the jurisdiction of the Bureau of National Capital Airports will be operated on a self-sustaining business enterprise basis. Rates will be set at levels which will provide sufficient revenues to recover all expenses in each area.

(*b*) Concession contracts will normally contain a provision requiring a minimum annual guarantee which will equal or exceed the rental rate for the space occupied, in addition to the standard provision of a percentage of gross receipts.

(*c*) The Bureau will select responsible contractors to furnish appropriate support services and concessions. They will be required to provide good service and products at fair prices to the public.

(*d*) The Bureau will select concessionaires and operators who will contribute to the appearance of the airport and will provide a quality operation commensurate with the decor of the first-class airport serving the Nation's Capital.

Fiscal year 1965 funding requirements for operation and maintenance of the Washington National Airport are summarized as follows:

	1964	1965	Difference
Positions	383	366	−17
Amount	$3,581,500	$3,631,000	+$49,500

In 1965 there is a requirement for a net additional amount of $49,500 in this appropriation. This requirement reflects the need for an additional $180,400 partially offset by a decrease of $130,900 and 17 positions. These added funds are chiefly needed for operating costs of new facilities, salary increases, additional within-grade salary costs, and additional man-years of workload in 1965. The reduction of $130,900 and 17 positions represents an adjustment between WNA and DIA. This adjustment is necessary to allow each airport to pay its appropriate share of the consolidated costs associated with running the two airports. Changes in the 1965 program are summarized in the following table and discussed in detail in the following pages.

	Positions	Amount
Operating requirements:		
Direct costs:		
New program		$34,800
Phase II pay increases		22,000
Other pay adjustments		32,400
Other cost adjustments		10,500
Consolidated functions	−17	−86,200
Subtotal	−17	13,500
Capital outlay: Direct costs		36,000
Total	−17	49,500

New program, +$34,800

This increase is essentially for supplies and utilities associated with the operation of the new sewage pretreatment plant, and new centerline lighting on runway 18–36. More detail on these increases will be found in subsequent pages.

Phase II pay increase, +$22,000

This category of cost represents the amount required to meet the cost of that portion of the pay increases authorized by Public Law 87–793 and becoming effective in January 1964. The estimate is based on employment in general schedule grades as of January 1, 1964, and was computed on a grade-by-grade basis to give proper weight to the different amount of increase for each grade level. The amount included in this estimate represents the difference between the total

yearly value of the increase and the amount which was payable in 1964. On the average, this estimate is 51.5 percent of the total yearly costs.

Other pay adjustments, +$32,400

During the fiscal year 1965 $32,400 will be required to finance within-grade salary increases and additional salary costs of personnel who will be qualified for and promoted to higher grade levels than positions occupied during 1964. The estimate represents a net cost after adjusting for savings in within-grade costs due to turnover, and is based on present grade levels of employees in this activity and the length of time they have been in present grade levels.

Other cost adjustments, +$10,500

An increase of $10,500 is required for additional workload associated with the direction, operation, and maintenance of the Washington National Airport.

Consolidated functions, −$86,200

This decrease in the WNA appropriation reflects an increase of $44,700 offset by a decreasing 1965 adjustment of $130,900. This adjustment between WNA and DIA appropriations will allow proper distribution of these costs between the two appropriations. An offsetting adjustment has been made in the DIA appropriation. The increase of $44,700 is the WNA share of the proration of consolidated services and will provide $9,700 for salary costs associated with implementation of the Salary Reform Act of 1962, $5,200 for within-grade salary costs, $5,900 for new programs and $23,900 for financing of additional man-years of effort in 1965.

Capital outlay, +$36,000

Total WNA requirements for planned major maintenance, structural repair and capital equipment result in an increase of $36,000 in 1965. Details of the specific projects may be found under "Capital outlay" in the subsequent justification.

Construction, Washington National Airport

Summary of appropriation requirements

Appropriation 1964 (regular bill)				$2,075,000
Net difference, 1965 over 1964:				
Project	1964 appropriation	1965 estimate	Difference, increase (+) or decrease (−)	
Runway strengthening and centerline lighting (main runway 18-36)	$1,938,000		−$1,938,000	
Parking lot lighting and expansion	137,000		−137,000	
Replace hangar No. 10		$1,800,000	+1,800,000	
Total	2,075,000	1,800,000	−275,000	−275,000
Total estimate of appropriation, 1965				1,800,000

GENERAL STATEMENT

This appropriation finances major capital improvement projects at Washington National Airport. The construction programs have been developed with the assistance of a firm of consulting engineers to insure an integrated program balancing the needs of the Washington metropolitan area with the potential capabilities of both Washington National Airport and Dulles International Airport.

The replacement of hangar No. 10 will provide modern facilities which will be leased to a second fixed base operator. The lease charges will recover the capital investment, with appropriate charges for interest and maintenance, within the useful life of the hangar.

PROJECT JUSTIFICATION

Replacement of hangar 10, $1,800,000

The existing barrel arch hangar considered for replacement will not accommodate present-day tricycle gear commercial-type aircraft with their extremely high vertical stabilizer. The barrel arch by virtue of its design has very low clearance heights along the sidewalls. This situation precludes maneuvering of large aircraft inside the hangar. The center section only can accommodate maintenance activities with the balance of space being literally wasted.

The present trend in general aviation, the intended user for the proposed hangar, is toward the larger type aircraft in corporate use, i.e., the Vickers Viscount, Convair 440's, Fairchild F-27, the Lockheed Jet Star.

The replacement hangar to be constructed under this program will conform to the other existing hangars at this airport and will provide adequate facilities for servicing of present and future aircraft. The ability to maintain a number of large aircraft simultaneously with a minimum of maneuvering problems will add materially to the hangar operator's ability to conduct work in any given period, thereby making the rental of hangar space more lucrative.

The breakdown of the cost estimate is as follows:

A. Demolition of existing structure, 45,000 square feet at $2 per square foot	90,000
B. Hangar replacement:	
1. Base structure, 35,300 square feet at $23	812,000
2. Office area, 30,000 square feet at $26	778,000
3. Design fee, 5 percent of construction costs	80,000
4. Supervision, 2½ percent of construction costs	40,000
Subtotal	1,710,000
Total estimate	1,800,000

Mr. EVINS. For Operations of the Washington National Airport in 1964 you had $3,581,500 and you are asking for $3,631,000, or $49,500 increase. Why is this increase necessary for the operation of this airport which we thought was getting on a self-sustaining, self-maintaining basis?

Mr. HALABY. Could we ask Mr. Hobbs to speak for a moment? I asked him if he could summarize very briefly.

Mr. EVINS. Mr. Hobbs is the General Manager of Washington and Dulles both. We are delighted to have you.

Mr. HALABY. Thank you, sir.

Mr. EVINS. I thought he had a big enough job at Dulles.

Mr. HOBBS. I do, indeed, but I welcome them both. They are a lot of fun.

Mr. EVINS. Tell us all about Washington, first, Mr. Hobbs. Why do you need this money and what are your construction items?

Mr. HOBBS. I will be mighty glad to, Mr. Chairman.

1963 AIRPORT OPERATIONS

Mr. Chairman, Washington National Airport in the year 1963, calendar, deposited in the Treasury of the United States $4,323,000. We originated out of Washington National Airport 5,303,655 warm bodies. For 1963, we estimated that airport would realize only 4,500,000 people, so it exceeded its expectations in 1963 over 17 percent,

despite the fact that we had forecast that Washington National Airport, with the advent of Dulles, would probably decrease. Now, let's look at the 1963 calendar year for Dulles.

In that year we deposited in the Treasury $1,090,000, including $3,470 realized by operating our mobile lounges at 25 cents a head on weekends, taking people for rides.

PASSENGER TRAFFIC

The Dulles International and Washington Airport has turned out to be quite a monumental sightseeing center. It is not only an airport. For example, Washington National Airport had 310,000 parked cars for the year 1963, while Dulles Airport had 378,000 parked cars. This shows that the visitor volume is substantial. Of more significance, however, is how did we do in relation to our passenger estimate? We estimated that Dulles would realize 1,016,000 passengers. We handled 611,000 people in 1963.

We thought some additional traffic would move over from Washington National into Dulles. This did not happen. To the contrary, Washington National increased in both volume of flights and in people.

We did not meet our forecasts, but I do not think that fact should be viewed pessimistically. We realized 611,000 passengers during the calendar year in Dulles, and I am proud to say in comparison, that it took the John F. Kennedy Airport, Idlewild Airport, 4 years to reach that level. It took Washington National Airport 5 years to reach that level.

I think we would have done much better at Dulles Airport if we too, had a promotional budget like our good friends in Baltimore.

They have enjoyed an extraordinary budget and have put a full page ad in Time magazine.

Mr. EVINS. Mr. Hobbs, I asked you to tell us about Washington and you have gone to Dulles and Friendship. Tell us about Dulles and why you need this money.

INCREASE REQUESTED FOR WASHINGTON NATIONAL AIRPORT

Mr. HOBBS. The National O. & M. budget is $49,500 over that in 1964. We now have a 25-year installation at Washington National Airport. And as a result we have a continuing maintenance program requiring refinishing of our hangars by weatherizing and painting them.

We must also remove the ceiling in the main concourse of the main terminal building where the pipes in the ceiling are sweating and have stained it considerably. You will note we have not asked for any more people at Washington National but we need the additional funding to accomplish our increasing maintenance workload.

Mr. EVINS. Now what about Dulles?

Mr. HOBBS. In our Dulles budget we are asking for 29 people and a $634,000 increase over the O. & M. appropriation for 1964. In this respect, it is difficult to come in and be the only one in Mr. Halaby's budget asking for additional people, but we do have a 10,000-acre and a very complex installation at Dulles. We have an electrical system, for instance——

Mr. EVINS. Mr. Reporter, at this point we will place in the record justification for the operation of Dulles and the construction of Dulles. Let's place in the record at this point page 655, which calls for $4,619,000 for funding for Dulles for next year, or an increase of $634,000, including the text at 656 and 657, and the "Construction" page 687, which is $200,000 for construction.

(The material follows:)

OPERATION AND MAINTENANCE, DULLES INTERNATIONAL AIRPORT

Summary of appropriation requirements

Appropriation, 1964 (regular bill)				$3,985,000
Net difference—1965 over 1964:				
Activity	1964 appropriation	1965 estimate	Difference, increase (+) or decrease (−)	
Dulles International Airport	$3,691,000	$4,149,300	+$458,300	
Consolidated functions	294,000	469,700	+175,700	
Total	3,985,000	4,619,000	+634,000	+634,000
Total estimate of appropriation, 1965				4,619,000

GENERAL JUSTIFICATION

Activities financed under this appropriation include the operation, maintenance, and protection services of the airport, as well as staff assistance from Bureau headquarters. Costs of the central headquarters are added to airport operating costs to provide an accurate cost base in which to establish airport use rates and charges. Capital outlays for operating and working equipment and maintenance projects are also financed from this appropriation, while major construction projects are financed under a separate "Construction, Dulles International Airport" appropriation.

The fiscal year 1965 appropriation request of $4,619,000 will provide $4,332,800 for direct operating expenses and $286,200 for capital outlays. Included in this request is an increase in staffing of 29 positions at a cost of $93,300. The proposed capital outlays will permit the acquisition of necessary operating and working equipment, the majority of which is for replacement, and will allow for modification of a few operational facilities.

Although Washington National Airport will continue to serve during fiscal year 1965, as the principal air terminal in the metropolitan area of Washington, D.C., in relation to passenger and aircraft volumes, it is expected that operational activities at Dulles International Airport will continue to expand substantially as indicated on the following table:

	Fiscal year 1963 actual	Fiscal year 1964 estimate	Fiscal year 1965 estimate
Traffic movements	$50,359	$95,000	$120,000
Passengers	377,738	1,200,000	2,000,000

Business policies of the Bureau of National Capital Airports are based upon the recovery, through appropriate and equitable fees and charges, of all out-of-pocket operating expenses, plus the realization of a fair yield on the Government's investment computed on a basis comparable to that used by other major

commercial airports. Generally, those policies recognize the following principles:

(*a*) All airports under the jurisdiction of the Bureau of National Capital Airports will be operated on a self-sustaining business enterprise basis. Rates will be set at levels which will provide sufficient revenues to recover all expenses in each area.

(*b*) Concession contracts will normally contain a provision requiring a minimum annual guarantee which will equal or exceed the rental rate for the space occupied, in addition to the standard provision of a percentage of gross receipts.

(*c*) The Bureau will select responsible contractors to furnish appropriate support services and concessions. They will be required to provide good service and products at fair prices to the public.

(*d*) The Bureau will select concessionaires and operators who will contribute to the appearance of the airports and will provide a quality operation commensurate with the decor of the first-class airports serving the Nation's Capital.

The fiscal year 1965 funding requirements for operation and maintenance of the Dulles International Airport are summarized as follows:

	1964	1965	Difference
Positions	442	488	+46
Amount	$3,985,000	$4,619,000	+$634,000

In 1965, the program for operation and maintenance of the Dulles International Airport will require an additional 46 positions and $634,000. Of this amount 17 positions and $130,900 results from a redistribution between WNA and DIA of consolidated services costs. This DIA increase has been offset by a like decrease in WNA. The remaining increase of 29 positions and $503,100 is required for new program requirements necessary to adequately operate, maintain and police the airport, as well as for required salary increases, additional within-grade salary costs and additional average employment in 1965.

Changes in the 1965 program are summarized in the following table and discussed in detail in the following pages.

Operating requirements

	Positions	Amount
Direct costs:		
New program	29	$244,200
Phase II pay increases		29,000
Other pay adjustments		45,000
Other cost adjustments		173,100
Consolidated Functions	17	176,300
Subtotal	46	667,600

Construction, Dulles International Airport

Summary of appropriation requirements

Appropriation 1964 (regular bill)				$450,000
Net difference—1965 over 1964:				
Project	1964 appropriation	1965 estimate	Difference, increase (+) or decrease (−)	
Expanded auto parking facilities	$398,000		−$398,000	
Modifications to utility building	52,000		−52,000	
Interior management roads		$200,000	+200,000	
Total	450,000	200,000	−250,000	−250,000
Total estimate of appropriation, 1965				200,000

GENERAL STATEMENT

This appropriation finances the orderly expansion of Dulles International Airport to provide the service facilities required for the predicted aircraft and passenger activity increases.

The planned development has been based upon the use of private capital for the construction of many of the required public or commercial service facilities. To keep pace with these expanded private service facilities and forecasted passenger and aircraft activity, the airport must of necessity expand its own facilities. The fiscal year 1965 request provides for essential roadways within the airfield to facilitate the access of maintenance and safety vehicles.

PROJECT JUSTIFICATION

Interior management roads, $200,000

During the original construction a road network to serve emergency vehicles, maintenance vehicles, snow removal equipment, and operation patrol vehicles, was provided. The roadbeds were graded, drainage provided, and a gravel base course applied. No hard surface such as blacktop or macadam was provided.

The airport has been operational now for over 13 months, and the breakdown of equipment caused by rough and rutted roads has necessitated the expenditure of many man-hours in vehicular repair. Although every effort is made to keep the roads in a well-graded condition, the miles of roadways and in winter the frozen rutted surface often preclude satisfactory maintenance within acceptable standards. Surfacing of the roadways will materially reduce vehicle failures, permit easier access to navaid and airport equipment, and relieve the manpower workload associated with constant road grading.

CONSTRUCTION—DULLES

Mr. EVINS. Tell us why you need this $1.8 million in construction?

Mr. HOBBS. The $1.8 million in construction is at Washington National for replacement of hangar 10. We have one round roof hangar at Washington National which was put up in World War II and it is not a modern hangar. It will not house the airplane of today, with its tail height. We are asking for this money to replace that hangar.

The $200,000 construction at Dulles International Airport is requested to pave the airport's service roads which serve the air cargo trucks and the airline trucks entering from Route 50 en route to the service gates.

EMPLOYMENT—DULLES

Mr. EVINS. You have had a decline of 17 personnel at Washington National Airport but you are asking for an increase from 34 to 51 new jobs for positions at Dulles. You are just transferring the 17 positions out to the other airport, is that about it?

Mr. HOBBS. Yes, sir; they are not new positions, Mr. Chairman. We are transferring the funds that go with those positions and what we are doing is centralizing functions in the Bureau which support both airports. As you know, we are phasing out of the construction area, to the operating area. Therefore, with Mr. Halaby's guidance, we reorganized the Bureau by pulling out common functions from both airports into the headquarters support functions, accounting, payroll, lease negotiations, et cetera. All of the business activities of both airports have been pulled into 800 Independence Avenue. This is a shifting of funding. During 1964, Washington National is financing 55 percent of such support, and Dulles 45 percent. We are now shifting and making each airport support the headquarters on a 50–50 basis.

MANAGEMENT OF AIRPORTS

Mr. EVINS. Are you the manager of both these important fields here in the Nation's Capital?

Mr. HOBBS. Yes, sir.

Mr. EVINS. You sit down here on Independence Avenue and you don't go out and run them?

Mr. HOBBS. Thank you for bringing that up, sir. In our new organization we have organized like a corporation in which we have an Assistant Director for Business Management, Mr. Bacon, who is with me here. Also, we were very fortunate in obtaining Mr. Arvin Saunders, a very capable airport manager from Cincinnati, to be our Assistant Director for Operations, who is the on-site general manager for both airports, reporting to me. We have a supporting service for engineering—thus, a three-headed organization instead of the former five-headed organization.

The airports are now purely, and rather cleanly, operational.

PASSENGER TRAFFIC

Mr. BOLAND. You say that in calendar year 1963 you anticipated you would carry 1,016,000 passengers out of Dulles, and you actually carried 611,000?

Mr. HOBBS. Yes, sir.

Mr. BOLAND. And you are very proud of the fact that it has reached this level when it took 5 years for the JFK Airport?

Mr. HOBBS. For the JFK it was 4 years and 5 for Washington National.

Mr. BOLAND. How many people were flying in the years they reached this level?

Mr. HOBBS. They did not reach it until after the 4-year period at JFK and the 5-year period at National.

Mr. BOLAND. How many people were flying in those days, as compared with the people flying today? I don't think that is a very important statistic. How many people do you have flying today?

Mr. OSTERTAG. Seventy-seven million.

Mr. BOLAND. How many people were flying when Washington National reached 611,000 at the end of their 4 years? What year was this?

Mr. HOBBS. 1943.

Mr. BOLAND. How many people were flying in 1943?

Mr. HOBBS. I don't have an answer to give you.

(The following was subsequently supplied for the record:)

Enplaned passengers in 1943 totaled 3.3 million.

Mr. BOLAND. Then this statistic isn't a very important one, really? It is a beautiful airport and I hope it makes money and I would love to see it out of the red, but we didn't build an airport to supply mobile lounges to cart people around at 25 cents. This is fine. I have no objection. You made $3,470, which is a lot of money and you parked 378,000 cars and maybe 350,000 were visitors out there, and it is a great place to visit, but we really didn't build it as an entertainment attraction. We are building the Kennedy Cultural Center for that type of thing.

Mr. HOBBS. Mr. Boland, it is an attraction and we are trying to do the best we can with it.

Mr. BOLAND. I think you are. It is a magnificent airport and I think it should be the finest in the world. It is. But we built it as an airport and not a visitors' gallery.

Mr. HOBBS. I do not disagree with you, but after promising a return of the Government investment over 30 years, if I didn't pick up two bits for the mobile lounge——

Mr. BOLAND. I agree. I applaud you and I agree that you have some wonderful personnel. I think Mr. Saunders, who incidentally is from my hometown, is a very able administrator and I think you are very fortunate to have him.

Mr. HOBBS. We are very proud to have him.

Mr. BOLAND. Is he an Assistant Director of Operations for both airports?

Mr. HOBBS. Yes.

Mr. BOLAND. Let's not justify Dulles on the basis of the fact that it is a visitors' gallery. It really isn't. It is just a wonderul, magnificent airport that we hope will pay off in 30 years—and you are trying to do it—I am sure you are trying to do that and you are heading for it slowly. Imperceptibly, but surely.

AMORTIZATION OF DULLES AIRPORT

Mr. THOMAS. Mr. Hobbs, are you on schedule with regard to amortization, lock stock, and barrel, in 30 years?

What did we request, 25 or 30 years?

Mr. HOBBS. Thirty years. Last year we said to you that during the first 10 we would lose. The second 10 we would realize operating expenses. The third 10 we would——

Mr. THOMAS. What did you do in the last calendar year?

Mr. HOBBS. In the last calendar year when we estimated 1,016,00, we realized 611,000 passengers.

Mr. THOMAS. It doesn't look like you will amortize it in 30 years, then, does it?

Mr. HOBBS. I have a hard time trying to assure you of that, today, sir.

LOSS AT DULLES IN 1963

Mr. THOMAS. As a matter of fact, what did we lose last year?

Mr. HOBBS. $6.9 million for fiscal year 1963.

Mr. THOMAS. $6,067,000 you have here on operation and maintenance alone.

Mr. HOBBS. We lost $6.9 million total in the last year.

Mr. HALABY. How much of that was operating loss?

Mr. HOBBS. $2.1 million.

Mr. HALABY. So $2.1 million was a net operating loss and $6.9 million was the total loss, including depreciation.

Mr. HOBBS. And interest, yes, sir.

Mr. THOMAS. Your operating loss was about a third of your loss—you are charging interest and you are not charging any taxes; are you? You are charging interest.

Mr. HOBBS. Interest, yes, sir.

Mr. THOMAS. Depreciation on the building and your equipment?
Mr. HOBBS. Yes, sir.

DULLES ROAD MAINTENANCE

Mr. THOMAS. How much did that highway going through good old Virginia cost, and how much are you spending per year maintaining it, and how much do you have in capital equipment? It is a beautiful beautiful thing, I know. I am just wondering what it cost us. Whatever it is, I think it is worth the money, but I imagine it comes a little bit high.
Mr. HOBBS. For maintaining it for the year?
Mr. THOMAS. Where do you start maintaining the roads?
Mr. HOBBS. From the airport to Route 123, sir.
Mr. HALABY. It is about 12½ miles, sir.
Mr. THOMAS. When you turn off to your right, that is where you start paying?
Mr. HOBBS. Yes, sir.
Mr. THOMAS. What does that 12½ miles cost you? What did it cost last year?
Mr. HOBBS. $240,000, roughly.
Mr. THOMAS. The Bureau of Public Roads paid for the highway?
Mr. HOBBS. No, sir; we paid for it.
Mr. THOMAS. It came out of these funds?
Mr. HOBBS. Yes, sir.
Mr. HALABY. $18 million.
Mr. THOMAS. It wasn't out of the Bureau of Public Roads?
Mr. HALABY. One of Mr. Hobbs' problems is——

COST OF ROAD EQUIPMENT

Mr. THOMAS. How much do you have tied up in equipment there? I go by there lots of times—that is my favorite road on Sundays. I see 12 or 15 tractors parked out there with big blades on them, 6- and 7-foot blades.
Mr. HOBBS. I haven't separated it for the access highway, but we have $1.8 million tied up in equipment.
Mr. HALABY. That is for the airport and the highway, snowplows, bulldozers.
Mr. HOBBS. Lawnmowers, trucks, allied equipment.

REPLACEMENT OF SHRUBBERY AT DULLES

Mr. THOMAS. You have had some hard luck with your shrubbery out there. I hope you didn't have a cost-plus-fixed-fee contract.
Mr. HOBBS. We are protected by our contract, Mr. Chairman.
Mr. THOMAS. On all the shrubbery you have to dig up?
Mr. HOBBS. Yes, sir.
Mr. THOMAS. About a third of your big trees died and about a fifth of your small ones and I didn't get to count all of your azaleas. Will you get those replaced, too?
Mr. HOBBS. Yes, sir; all of it replaced.

Mr. THOMAS. Well, you have the most functional airport that I ever saw. I don't know whether you can justify it in terms of the money or not, but just as sure as the world, it is the coming-type airport of the future.

GROWTH RATE AT DULLES

Mr. JONAS. Mr. Hobbs, can you furnish us a table showing the growth rate at Dulles by month?

Mr. HOBBS. Yes, sir; I can read it to you right now, sir, if you would like. I would be glad to.

From opening of 1963, schedules or passengers?

Mr. JONAS. Passengers. That is the figure you used before of 600,000.

Mr. HOBBS. In January 1963, 45,423; February, 43,588; March, 53,662; April, 58,208; May, 55,777; June, 66,340; July, 57,589; August, 65,337; September, 57,924; October, 57,848; November, 49,821; December, 49,930; for a total of 661,448.

It may be interesting to note, gentlemen, in January 1963 where we had 74 daily flights and carried 45,000 people, in January of 1964 we had 10 less flights, 65 daily flights, and carried 47,450; more people but less flights.

Mr. BOLAND. And less money to the airport.

Mr. HOBBS. And less money.

Mr. HALABY. But the fact is, to sum it up, you are behind your schedule for the year 1963 about 40 percent?

Mr. HOBBS. Yes, sir.

Mr. HALABY. The reason is you overestimated the traffic coming into Dulles?

Mr. HOBBS. Yes, sir.

Mr. HALABY. Particularly in that you thought there would be more traffic transferring from Washington National to Dulles as a terminal and you estimated there would be less traffic going into Baltimore and that more of the Baltimore traffic would be coming into Dulles?

Mr. HOBBS. Absolutely.

Mr. HALABY. So you had the difficult problem of estimating between three airports used as gateways to the Washington area and you missed.

Now, whether you can get back on your investment and recovery schedule or not depends on the next 9 years when you estimated you could get into the break-even point—10 years from last year, 9 years from this year. So you have to generate some more business out there.

Mr. HOBBS. Yes, sir.

DRIVING TIME TO DULLES

Mr. JONAS. What is the travel time by limousine from the Congressional Hotel to Dulles?

Mr. HOBBS. The travel time from downtown, sir, as you can see right here [showing a chart]——

Mr. HALABY. Move over by the mirror, because you can't look against the light very well.

Mr. HOBBS. This is computed on daily schedules for 1 month and it turns out that the driving time to Dulles averaged 42 minutes. The

driving time to Friendship was 50 minutes, which is an 8-minute saving in favor of Dulles. The distance in miles, as you can see, is at the top. This was not done during a slow period nor during a rush period. It was done for 1 month all through the day and averaged out.

DROP IN ESTIMATED TRAFFIC

Mr. HALABY. Is it fair to say, Mr. Hobbs, that when you made the estimate you did not anticipate that the community leaders from Baltimore would conduct a vigorous campaign to gain flights and passengers at Friendship at the expense of Dulles?

Mr. HOBBS. Exactly, Mr. Halaby, and I wanted to touch further on that.

Mr. HALABY. Are you inhibited in any way from promoting that airport in the face of this kind of campaign?

Mr. HOBBS. We have no way of fighting back, only appearing on television, together. Mr. Crane and I are good friends, but there is no doubt that it has affected public opinion and has affected the airlines. They are in the quandry of not knowing exactly where to go.

Mr. JONAS. We can't really complain about them promoting their own airport.

Mr. HOBBS. Not at all, sir. It is proper of them. I am very fond of those people.

Mr. HALABY. The only problem is Mr. Hobbs cannot promote his airport because that is not part of Federal Government activity and it is the only airport probably in the country that can't promote its own profit.

Mr. EVINS. Do you allow the commercial carriers to select which of the airports they prefer to operate from?

Mr. HALABY. Of course. That is up to the public in the end. They choose where they want to take off and land, but they do it through the airlines who should and must, if they want to make a profit, reflect the public demand.

Mr. EVINS. How successful have you and others been in persuading the carriers to use Dulles' facilities?

Mr. HALABY. We have not tried to persuade them to use Dulles facilities. We have simply offered them the free and equitable opportunity and one of the grave difficulties is that the cost of using that airport is more than twice as high per thousand pounds of landing weight as the Friendship airport.

Mr. EVINS. One of the purposes of Dulles Airport was to divert traffic from Washington National, which was overcrowded and becoming a traffic hazard.

Mr. OSTERTAG. Isn't it true there is just so much traffic, Mr. Halaby, and when you start cutting it up between Friendship and Dulles, you have a situation over which you cannot exercise any great control? You have a problem, of course, of the airlines choosing Friendship as against Dulles in many instances. What can you do about it? That is where the traffic is and that is the way they use it.

CONCESSION CONTRACTS

Mr. HALABY. We also, I think, should point out that we have some pretty favorable—for the Government—concession contracts at Dulles

and they have proved to be less favorable to the concessionaires than the concessionaires hoped for. We warned them that this first decade would be a difficult one. Before they bid on the concessions we did this, but I think it is fair to say that more than half of them are disappointed at the realization on their investment to date. One of the concessionaires, the one that runs the restaurant out there, of course, is very anxious to see more passengers, but he is also more anxious than ever to get a liquor license and the lack of a liquor license he feels presents him with a problem. It prevents him from making a profit on his restaurant, attracting people who are not travelers but are visitors to the airport and so on. So this has been a very tough row for Mr. Hobbs and I don't think it is going to get any easier until we have a very great buildup of traffic in this area. If we are to allow jets into Washington National as many carriers, now that they are operating the Boeing 727, will insist upon, I believe, this would further alter the balance at Dulles.

Mr. EVINS. One further question, Mr. Hobbs.

REPLACEMENT OF HANGAR AT WASHINGTON NATIONAL AIRPORT

Why is it necessary to replace this hangar at Washington National Airport this year? Can't this be deferred? Is this an emergency item?

Mr. HOBBS. Yes, sir, I feel it is an emergency item, because we are in dire need of a second fixed base operator at Washington National Airport. Our general aviation from 1957 has moved from 28,000 flights to 73,000.

Mr. EVINS. You are not getting another hangar, you are replacing an existing one.

Mr. HOBBS. I am replacing it so it will accommodate larger airplanes. This hangar cannot take a big airplane, sir.

Mr. EVINS. You think you need to proceed with it now?

Mr. HALABY. How much are you going to make, a year, off of it?

Mr. HOBBS. Well, Mr. Halaby, I don't think at this moment that we can definitely give a figure here to the committee for rent plus percentage. We changed fixed base operators last year as you know, and presently enjoy a very good contract, receiving better than 8 cents a gallon on gasoline and a good percentage from their fixed base operation. Now, the aviation fuel that has been poured out there in the first few months of this operation, has been at an annual rate of over 3,200,000 gallons, which will exceed any quantity that has been poured before. We know, based on this fixed base operator's experience, a new hangar should bring us similar results.

Mr. HALABY. If you build a new hangar you lease space in it and you will recover your investment with interest.

Mr. HOBBS. Plus about 6 percent; yes, sir.

Mr. HALABY. And I hope a margin for reinvestment on that hangar. So it is a business investment. It is not just a public facility, there.

Mr. HOBBS. That's right. It will be a self-liquidating business investment.

Mr. EVINS. Thank you, Mr. Hobbs. Thank you Mr. Halaby and your very fine staff.

USER CHARGES

Mr. OSTERTAG. We discussed user charges before.

Mr. Halaby, did you call attention to the fact if we took into account the cost of services from the military and certain proposed taxes, users charges which were invoked, that your operations would be more or less self-sustaining?

Mr. HALABY. I don't thnk I can claim quite that much, Mr. Ostertag, but I think you have a very important point:

If we attributed to the military let's say $175 million worth of total FAA services year after year and we attributed to them a mobilization standby capability—that is readiness for defense operations of some amount, let's say another $75 million, that would be $250 million.

Now, if you say we recover from the revenues from the air carriers and other aviation operations $136 million, we then can fairly argue that we have approximately $390 million or $400 million of the budgets attributed to national defense or recovered in revenues.

If you were to pass the President's program for jet fuel tax, for passenger tax, for aviation gasoline tax, in the fiscal year 1965 you would increase that amount to $178 million and in fiscal year 1966 it would be about $212 million.

So I think you could state fairly, either by attributing to national defense, or revenues, that there is some half, or maybe 55 percent of this budget is covered.

Mr. OSTERTAG. It is a question of the method by which this revenue might be realized. Yet the point is that there are many services performed by the Federal Government in other areas wherein a direct service charge is applied against the beneficiaries or the users. Take, for example, the matter of bank examinations and things of that kind. There are many areas wherein the cost is charged back. But you are proposing, or the President has recommended specific excise-type taxes, which, of course, has been subject to elimination or reduction by the Congress in recent years. For example, transportation tax, hasn't that been reduced?

Mr. HALABY. It was reduced from 10 to 5; yes, sir. We do charge for title searches and for some of the work that we do specifically for the users. We think that the most equitable way to recover some of our costs is in the form of additional revenues on fuel.

GENERAL SUMMARY OF BUDGET REQUEST

If I could just sum up very briefly, Mr. Chairman, I would say this is our tightest and tautest budget yet. We have a 1.6 percent fewer positions in the overall. We have 3.3 percent less in staff and supporting services. We are searching for additional savings and when we find them we will make them, on your behalf. The only significant personnel increase is 162 positions in maintenance to maintain 550 new facilities. We can do that only because we are getting 4 percent more output per man in the maintenance service. There is a $15 million decrease in the request over 1964, in comparable appropriations. This would exclude the supersonic transport, of course.

It is true, as Mr. Jonas brought out, that this is lower than we sought from the Budget Bureau. They proposed and we have ac-

cepted the deferral of a substantial amount of money in the order of $60 million in facilities and equipment and research and development and that that be deferred until next year.

We have made a pledge to the committee over the last 3 years that we would bring our operations under management and cost control. We think we have done it by some very tough and painful measures such as consolidating centers and flight service stations.

We have reduced employment in the Washington headquarters level by 16 percent. In other words, one out of six positions in the Washington headquarters was eliminated in the last 6 months. I make only this plea, that you give us a credit for this effort and that if possible you not give us an arbitrary percentage cut but take into account the cuts that we have made, the pledge which we have kept to run you a lean, clean, and keen outfit.

Mr. JONAS. Mr. Chairman, could I ask a question?

Mr. EVINS. Mr. Jonas.

GAO REPORT ON OKLAHOMA CITY REPAIR OPERATIONS

Mr. JONAS. First, do you accept the findings of GAO about this reimbursable cost at Oklahoma City?

Mr. HALABY. No, sir.

Mr. JONAS. You disagree with them?

Mr. HALABY. Yes, sir.

Mr. JONAS. You cite a Budget Bureau circular and they do not construe it the same as you do.

Mr. DEAN. There is a fundamental difference between the Agency and GAO. This relates to how much charge we will impose upon other Federal agencies and others who might have their aircraft repaired at Oklahoma City.

We have been billing them only the additional cost to the Agency. GAO says we should also bill them partly for the nucleus cost.

Mr. JONAS. They say Budget Circular A–25 specifically states that—

> Direct and indirect costs, including depreciation of buildings and equipment and a proportionate share of management and supervision costs shall be included in the determination of the reimbursable cost and that each agency shall establish fees in accordance with this policy.

Mr. DEAN. Mr. Jonas, our general counsel has reviewed this and has advised within the Agency that the authority in our act to make arrangements with other agencies, and reimbursable if appropriate, is the governing authority that gives flexibility to FAA.

Mr. THOMAS. Why should you want any flexibility? The other agencies have to go to the same trouble to get their money as you. Why do you want to play Santa Claus? Why not charge all their costs? If they go to private enterprise they have to pay. Why play Santa Claus? Have we been giving you more money than you need and you want to pass it out to the other agencies? Does it come down to that?

Mr. DEAN. No, sir.

Mr. THOMAS. Spell it out. Why should you take a loss on the work you do for another agency?

Mr. DEAN. We do not. We charge another agency what it costs our agency to furnish that particular service. We always have done that. The argument is whether we should also bill them for a part of some $300,000 of nucleus costs as GAO describes them, at the aeronautical center.

Mr. THOMAS. If the other agencies did a little work for you what would be their element of cost?

Mr. DEAN. We have had many arrangements with the Department of Defense and they have been handled on exactly the same relationship.

Mr. HALABY. Isn't it, Mr. Chairman, simply whether the full Appropriations Committee picks it up or whether one or the other picks it up? The taxpayers have to pay the total cost anyway. If you appropriate for us the supervisors who supervise the maintenance work for that other agency down there, if we do not charge that other agency whose airplane we are repairing for those supervisory costs, it is true you have given them, that other agency, a little benefit.

But there is another committee upon which maybe Mr. Ostertag sits, who has to pick up that cost through the other agency.

Mr. EVANS. Any further questions, Mr. Jonas?

Mr. HALABY. What is the view of the committee? We will do what you say.

Mr. THOMAS. I imagine Mr. Jonas has expressed the opinion of the committee. We want everybody to pay their own costs. I would not work for them for nothing. They are not going to work for you for nothing, don't worry about that.

Mr. HALABY. When we get work over at Tinker by the Air Force do they charge us full costs?

Mr. DEAN. Mr. Moore probably knows that specific case. They are only incremental costs.

Mr. MOORE. Yes.

Mr. THOMAS. The Air Force never worked for anybody without a profit.

Mr. HALABY. If that is the wish of the committee, that is what we will do.

Mr. EVINS. Mr. Halaby, we hope you make your scheduled flight to the center in Oklahoma on time.

Have a good flight and a happy landing and good luck. This has been a fine meeting and we thank you.

THURSDAY, MARCH 5, 1964.

Mr. THOMAS. Gentlemen, the committee will please come to order.

We have with us this morning our many distinguished friends from the Federal Communications Commission. We welcome our genial and able Chairman, E. William Henry, and the distinguished Commissioners: Rosel H. Hyde, our friend of many years' standing, Commissioner Bartley, likewise Commissioner Lee, Kenneth A. Cox, Frederick W. Ford, and Lee Loevinger.

We have also members of the staff: Ralph J. Renton, Deputy Chief Engineer; Hilburt Slosberg, Associate General Counsel; James B. Sheridan, Chief, Broadcast Bureau; James E. Barr, Chief, Safety and Special Radio Services Bureau; Bernard Strassburg, Chief, Common Carrier Bureau; George S. Turner, Chief, Field Engineering Bureau; Curtis B. Plummer, Executive Director; and Richard F. Solan, budget officer.

We shall ask this morning that Mr. Boland discuss with you your needs. We shall let Mr. Boland and Mr. Evins discuss your problems.

Mr. BOLAND. Have you a statement, Mr. Chairman? Do you want to tell us some of your problems? You may submit the statement for the record or you may give it to us verbatim, whichever you prefer.

STATUS AND PROBLEMS ON FEE SCHEDULE

What about your problem on fees? Were you up before the legislative committee on that?

Mr. HENRY. Yes, I testified yesterday before Chairman Rogers' subcommittee on H.R. 6697 which would prohibit the FCC from levying application fees which would take away our jurisdiction, which we think has been granted us by title V of the House Appropriations Act of 1952. We had what I would say was a fine meeting. We agreed that we had an honest difference of approach to the matter, and there was disagreement as to how it should be handled.

Mr. Rogers thinks that any fee schedules we impose should be imposed under a directive which originates in the Commerce Committee. We think that that may be a way to approach it and, if that is the way they feel the law should be amended, then we would be more than happy to have it done that way, but in the interim we should go ahead and impose the fee schedule, to which we have given a great deal of thought and have hammered out and which will go into effect March 17.

AMOUNT OF FEE COLLECTIONS

Mr. BOLAND. What is the total amount you anticipate collecting from fees?

Mr. HENRY. We anticipate collections the first year and pretty much on a regular basis, of $3,750,000. We will have approximately a $75,000 annual collection cost, which gives us a net of around $3,700,000.

EFFECTIVE DATE OF FEE SCHEDULE

Mr. BOLAND. Your present plans are to put the fee schedule in effect on March 17?

Mr. HENRY. March 17; that is correct.

Mr. BOLAND. Are you going to do this anyway, irrespective of the hearings before the legislative committee?

Mr. HENRY. Yes; we will do it anyway.

Mr. BOLAND. Proceed.

Mr. HENRY. If it suits your purposes, I do have a statement, and I would suggest that I just begin that statement and then, if there are questions along the way, we can take them up as they come, if that is satisfactory with you.

Mr. BOLAND. Fine.

Mr. HENRY. I will omit the first part about the fee schedule. As you indicated, that does go into effect March 17. The court stayed our original effective date 60 days because some of our licensees, the air transportation people, petitioned the seventh circuit, and that

circuit granted a 60-day stay. That now has been lifted. The court refused to grant a temporary injunction. They ordered us to wait a reasonable period before instituting the fee schedule, which we decided would be 45 days. They have also required that we hold all fees collected in escrow in the event our action is later overturned. That will be ruled on, we think, fairly soon.

General Statement

Our budget this year calls for $16,610,000, which is an increase of $1,010,000 over the appropriation approved by the Congress for the current year.

COST OF PAY INCREASE AND WITHIN-GRADE INCREASES

I might point out—and Mr. Solan can give you more specific figures—that of that $1,010,000, something like $270,000 is just for legislative pay increases. Periodic step increases due in 1965 result in new costs in fiscal 1965 of $115,000.

Annualizing periodic pay increases made effective during fiscal 1964 will result in $110,000 of increase.

So, quite a bit of it results from pay increases, rather than from increases in personnel or increases in other costs.

Mr. Jonas. Would you specify that a little clearer, Mr. Henry? You say $270,000.

Mr. Henry. Let me read you this item.

Mr. Jonas. Put a table in the record showing this. You have three different pay increases, you indicated.

Mr. Henry. Yes.

Mr. Jonas. I would like a little clearer statement.

Mr. Henry. The pay increases due to legislation made effective January 5, 1954, result in $270,000 of the $1,010,000.

Periodic pay increases effective in fiscal year 1965 resulting in new costs during fiscal year 1965, $115,000.

Mr. Jonas. By "periodic," you mean within-grade promotions?

Mr. Henry. Right.

Mr. Jonas. Proceed.

Mr. Solan. Required by law.

Mr. Henry. Periodic pay increases made effective during fiscal year 1964, in effect the full 12 months instead of a portion of the year, will increase the cost by $110,000.

Mr. Jonas. That is annualization of the $115,000?

Mr. Henry. That is correct. That is about the cost of those periodics in fiscal year 1964. In fiscal year 1965 they will cost another $110,000.

Mr. Jonas. That is all.

Mr. Henry. If I may, I will submit this table for the record.

(The table follows:)

The increase of $1,010,000 is made up of the following:

Pay increases due to legislation made effective Jan. 5, 1964, will cover full 12 months instead of 6 months, increased cost	$270,050
Periodic step increases effective in fiscal year 1965 resulting in new costs during fiscal year 1965	115,000
Periodic step increases made effective during fiscal year 1964 will be in effect for full 12 months instead of portion of year and will increase cost by	110,000
Quality pay increases made effective in fiscal year 1964 which will be in effect for full 12 months instead of part of the year, plus new increases for part of fiscal year 1965 will cost	18,000
Promotions of employees under training agreements, recruitment incentive plans, position reclassifications	59,250
Carrying forward for full 12 months, positions which were newly established in fiscal year 1964 (35 positions)	202,825
New positions for fiscal year 1965 (39 positions, 24.3 AE)	144,875
Total compensation	920,000
Benefits (retirement, life insurance, health plans)	52,000
Other obligations	38,000
Total	1,010,000

Mr. HENRY. We have covered the matter on the fees. That will result in the collection of almost 20 percent of our costs, recoverable net through the fee schedule.

STATUS OF COMPUTER PROGRAM

If I may, I would like to say a few words about our computer, our Univac III. We got that on October 22, 1963, and it was turned over to us in November for a 30-day check. I am pleased to report it was put to use immediately in testing out computer programs that were being developed during the past year and in converting FCC records from a variety of forms to magnetic tape.

On February 10, 1964, just about 1 month ago, we began the electronic processing of citizens radio applications and the printing of licenses. We now have a crash program underway to have the approximately 45,000 applications we had on hand in this service pushed through the computer to get us out from under the backlog. We expect that the pressures in this area will ease in 4 to 6 weeks.

Those can be done quite rapidly. I pushed the button on it the other day, and about 20 got through before I could turn it off.

This is a picture of the computer which we have spent approximately a million dollars on.

DELAYS IN PROCESSING APPLICATIONS IN SAFETY SERVICES

Mr. THOMAS. How far is Mr. Barr behind? He has this division.

Mr. HENRY. You mean in general?

Mr. THOMAS. Yes.

Mr. HENRY. He is pretty far behind.

Mr. THOMAS. I heard it was around 6 or 8 weeks. Is that a fact?

Mr. HENRY. It depends. It varies from service to service. You might interpret this for me as of the latest January report.

Mr. BARR. I do have that.

Mr. HENRY. What is the backlog in each area?

Mr. THOMAS. We are just talking of what we had in mind with respect to special services here.

Mr. BARR. It varies from a high in the amateur right now of around 85 to 90 days, which is because we are just getting ready to put them on the computer, down to a low on the order of 30 days, in public safety and aviation.

Mr. THOMAS. You had it down at one time to around 3 weeks, did you not?

Mr. BARR. It got up during December and January to near 3 months. We were concerned about it and are making special efforts.

Mr. THOMAS. Is this machine going to cut the timelag down?

Mr. HENRY. In citizens and amateur it will cut it down so we will be, for all intents and purposes, current. The amateurs, I am advised, go into the machine this morning, so that 85 days' delay will be reduced drastically.

Mr. THOMAS. That is certainly a step forward. Most of these people file it on Monday and want it the Saturday before Monday they file, and they cannot understand why they don't get it.

DELAY IN INDUSTRIAL SERVICE

Mr. BARR. The area you hear most about, probably is industrial applications. Those are the most complex. That is our major workload in terms of what we have to do with them, not in terms of number. They are highly important. Right now we have a rather extensive delay.

Mr. THOMAS. What is the delay? That is one that you really catch most of your grief on. It is important to industry and you worry about it. You want to give better service if it is at all possible, but, after all, it takes a little time. What is your timelag there?

Mr. BARR. It got up to 80 days in January.

Mr. THOMAS. That is too long. Can we get it back down to 3 weeks?

Mr. BARR. We are down to around 70 now.

Mr. THOMAS. Can you shift some of your personnel and cut down the backlog by teaching them how to use this computer? That is a thing that is talked about back in the districts in business circles, and it does not do any of us any good. You are a regulatory agency and your customers have to wait 3 or 4 months. Can you help us out there a little bit, Mr. Barr?

Mr. BARR. We are working on it, and we are getting some results already. As I say, it has come down from 90 to around 80. We will not hit the 30-day limit this year.

Mr. THOMAS. Those are hard words. We prefer to have your first words.

Mr. HENRY. We are well aware of the problem. We recently have taken some steps to ease the situation. I think when we get our computer in operation in other areas, this will free some people to get over into the ones that are not easily handled by the computer. We will get them substantially cut.

Mr. JONAS. Would you please, just for the record, explain exactly how you reduce time by the use of the computer? What part of the work does it accomplish?

Mr. HENRY. It is a long story, but I will try to shorten it as much as I can.

As I understand it, when we sought the computer and when we obtained it, we sought it on the basis that it would save, I think, 77 man-years over a 10-year period, and as time went along it would build up to more and more savings. Initially we are putting into it only the application processing type of material. We are beginning with the citizens band area, of which we get, I think, some 20,000 a month. We now have over 500,000 citizen band licenses. We are going to the amateur today. Following those are marine service in May, aviation service in July, and the public safety and industrial services later in fiscal 1965.

Mr. JONAS. I understand that.

Take the citizens applications which you are starting today. You feed these applications into the computer, and what does it come out with?

Mr. HENRY. It comes out with a license. It prints the license. The citizens band application comes in typed up or filled out in ink. We approve it and get a signature on it. All we do is feed that into the computer——

Mr. THOMAS. What do you mean by that?

Mr. PLUMMER. The basic theory behind it is that we put all the possible correct answers to the questions on an application on one tape. Then we take all the answers off the application and run them parallel and compare them.

Mr. THOMAS. What do you mean, take it off? What do you take it off with?

Mr. PLUMMER. The transfer device——

Mr. OSTERTAG. You mean you run it simultaneously with the correct answers?

Mr. PLUMMER. Yes.

Mr. OSTERTAG. If it does not have the correct answers, it does not come out?

Mr. PLUMMER. That is right. We get a license out on an answer that there are questions answered wrong on the particular application. The transfer device between the application and the computer is the standard IBM card puncher. You have seen them. It is something like this stenotype machine this gentleman is using here. All the data are transferred to IBM cards.

Mr. OSTERTAG. Do you have to look over these applications first before you feed them into the computer?

Mr. PLUMMER. We look over the applications for gross errors of things like the fellow forgot to sign it.

Mr. OSTERTAG. Would not the computer disclose that?

Mr. PLUMMER. No. This is an area that we look into very carefully. We could find no system whereby the computer would merely pick up the application and look at the particular answers and then

transfer data. The only system we saw was the Fosdick system that the Census Bureau uses. We felt that the error rate would be so high in the Fosdick system that manual transcribing from the application form to the computer was the only safe method.

Mr. JONAS. You have to look at every application and figure out all possible answers?

Mr. PLUMMER. All the possible answers that you can have are put on the tape ahead of time in the computer.

Mr. JONAS. You mean general answers?

Mr. PLUMMER. They are all "Yes" or "No" answers.

Mr. SOLAN. The questions are phrased so you get "Yes" or "No" answers or number answers, and the computer can determine if it is above a certain number or below a certain number. All the answers are stored in the computer?

Mr. PLUMMER. All the answers are stored in the computer, and we take off all the answers on each individual application and compare the two.

Mr. OSTERTAG. The computer is not like a lie detector. Suppose it is a dishonest answer?

Mr. PLUMMER. No. As Mr. Solan says, it compares "Yes" and "No" generally that are put on this tape.

ECONOMIES OF COMPUTER OPERATION

Mr. JONAS. That is really the only labor saving involved, then, is it not?

Mr. PLUMMER. It also does a lot of recordkeeping and saves copying, because you can get multicopies.

Mr. JONAS. We have been a little suspicious about that in here, because in most agencies they sell us on these computers on the basis that they are going to eliminate a lot of positions, and our experience is that employment keeps going up.

Mr. OSTERTAG. That is right.

Mr. HENRY. It does initially, because you have to have a computer division, which we have in Dr. Plummer's shop, which has new people.

Mr. JONAS. I am afraid I am not not going to be around here long enough to see you start down the other way.

Mr. HENRY. We planned it for 10 years.

Mr. THOMAS. Dr. Plummer, would you give Mr. Jonas an accurate answer. He wants to know about your time and energy and effort in handling that original application. Here it is, in the form of a letter or form. What do you have to do to it before you get the answer out of that? Do you not have to use just about as much labor feeding that information into that computer as you save? That is the question he is asking you.

Mr. PLUMMER. I would say it is a little less. We had to make a justification to the Budget Bureau——

Mr. HENRY. In other words, the answer is "No."

Mr. PLUMMER (continuing). For this computer, and we had to prove to them that on a long-term basis—I want to emphasize "long-term basis"—it would pay off.

MAN-YEAR SAVINGS

Our studies and the Budget Bureau studies came out that on about a 10-year basis it would save 77 man-years.

Mr. JONAS. You mean total, or per year?

Mr. PLUMMER. Total.

Mr. JONAS. A total of 77; that is about 7 a year.

Mr. SOLAN. That is 77 each year.

Mr. THOMAS. That is different.

Mr. JONAS. You do not reach that goal until 10 years.

Mr. OSTERTAG. How many did you have doing this in the first place?

Mr. SOLAN. We are not talking about just that much savings in Amateur alone. That would be in the broadcast areas, the records in the Chief Engineer's Office, the ownership files in broadcast. This covers the whole Commission.

Mr. OSTERTAG. I was trying to get your saving of 77 man-years out of a total of how many?

Mr. PLUMMER. 1,400.

Mr. HENRY. Once it gets built up to that, it will then save it every year it is in operation thereafter.

OTHER SIGNIFICANT ADVANTAGES OF COMPUTER

Mr. SOLAN. You might go into the computer program even though the computer might not save any money, because we are going to have records of all licensees which we do not have now. Manually we cannot keep records and provide the field stations with lists of who is authorized to be on the air. We will be able to provide monitoring stations with information as to who is licensed and when they are monitoring they will know. Now they do not have this information.

Mr. OSTERTAG. That is a different argument.

Mr. SOLAN. It is another argument. That is what I am saying.

Mr. JONAS. You might be able to sell it on that basis.

Mr. SOLAN. We did not overlook those arguments in our justification. We did not sell it on dollar savings alone.

Mr. HENRY. If I may, Mr. Chairman, I have a summary of the basis on which we justified the computer originally. If I may, I will insert that in the record at this point.

Mr. BOLAND. It may be inserted at this point.

(The statement follows:)

The purchase of a computer was justified to the Congress on four principal benefits.

(1) Saving in dollars over a 10-year period through reductions in staff. (We feel that this program would have been justified even if no dollar savings resulted because of other benefits.)

(2) Backlogs would be reduced in many areas because of the assistance provided by the computer in performing engineering compuations for AM, FM, and TV applications; producing automatic plotting of service and interference contours; automatic processing of many safety and special radio services applications; making easily possible the preparation of expiration notices to all licensees; and checking antenna data to insure air navigation safety.

(3) The Commission would have centralized magnetic tape files to provide easily accessible, current, and accurate data on all existing licensees and pending applications. (Information not presently available could be provided for frequency allocation problems and rules work).

(4) FCC field offices and monitoring stations could be provided with current information pertaining to all licensed communications facilities.

OTHER ADVANTAGES

(1) Insure uniform application of rules and regulations by eliminating inconsistencies of individual interpretations.
(2) Perform complex calculations otherwise impractical due to manpower limitations.
(3) Potential unlimited.
Areas of anticipated staff savings (some are evident in this budget because of estimates below fiscal year 1964 level and others reflected in the fact that increases that would have been requested have been omitted):

Safety and special radio services	31
Field Engineering Bureau	7
Office, Chief Engineer	6
Broadcast Bureau	33
Grand total	77

Mr. OSTERTAG. What does one of these computers cost?

Mr. HENRY. We have about a million dollars in it at the moment.

Mr. FORD. We never represented only that it would cut down employment. You have a summary there, so I will not belabor the point. We said we would be more efficient and could get our work done and could get an awful lot more work done with the same amount of money.

Mr. HENRY. It would keep us from adding employment. Slice it however you will, it is a true representation to say that it will save us 77 man-years, once it reaches its full potential; we hope.

Mr. THOMAS. It will sove more in later years. Take the Veterans Administration and its insurance division. We have gone through it with them. What they have done is overwhelming. We will give you gentlemen a little time, and it will do all right by you, too.

Mr. HENRY. Not to belabor it too much further, as Mr. Solan pointed out, it will enable us to keep a lot of records that we could not otherwise keep, and we think more accurately.

Further, it will eventually get into the predicting of service and interference contours. In fact, we have a glass window up there where the public, whoever finds their way into our building, can see the contours being drawn by the computer.

Mr. OSTERTAG. Does this apply to new applications as well as renewals?

Mr. HENRY. Yes. In fact, I would say it would first be used primarily for new applications.

BROADCAST ACTIVITIES

To get into the budget itself, I want to discuss first, if I may, the broadcast portion. It clearly reflects, we think, the direction of the President to hold budgetary requirements to the minimum. We are requesting an increase of only two positions for broadcast activities.

As we pointed out, we are relying in this area, as well as in the safety and industrial area, on the computer and automatic data processing. We are also relying on changes in Commission rules to facilitate processing, utilization of sampling techniques so that only a portion of renewal applications will be completely examined, and more selective participation of Broadcast Bureau counsel in hearing procedures. In

this way we are planning to bring down our backlogs, but we must have the staff requested in order to achieve these objectives.

For each of the broadcast services—AM, FM, and TV—we expect to have fewer applications pending at the end of fiscal 1965 than at the end of 1963 or 1964.

For example, in new and major changes in AM applications which appears at page 22 of the budget document, we had 464 applications pending at the close of 1963, mainly as a result of the AM freeze. This will be reduced to 110 by the end of this year. In fiscal 1965 we expect to lift the freeze, but we shall improve our allocation rules and have our computer assisting so that by the close of the year we expect to have the smallest backlog of AM applications for new and major changes in many years.

LIFT OF AM FREEZE

I might add, there is a possibility that we will lift the freeze before fiscal 1965, perhaps May or June, right at the end of this year in any event.

NUMBER OF AUTHORIZED STATIONS

Each year we have a growing number of authorized broadcast stations. In 1963 we had 6,199; and by the end of 1965 we expect to have issued authorizations for an additional 701 stations, for a total of 6,900. This steady yearly expansion affects our workload in many directions, resulting, for example, in a larger volume of renewals to be processed each year, and in a larger volume of required compliance activities.

NEW PROCEDURE FOR RENEWAL APPLICATIONS

I might add that it increases our workload in all areas of broadcast activities, transfers, changes or modifications, transmitter locations, and so on. Our overall workload rises along with the rise in the number of authorizations.

To cope with the annual growth in renewal applications, we are devising new procedures to separate items which must be reviewed in all renewal applications, such as ownership and complaints, financial situations, and so on, from other aspects, such as programing and commercial policies and practices, which we would examine for only a sample of the applications. An "in depth" examination of these latter items in a smaller percentage of the renewal applications may well prove to be both more effective and more economical of our very limited staff resources.

BROADCAST ENFORCEMENT ACTIVITY

In the enforcement area—again we are talking about the broadcast area—despite the increasing number of broadcast stations, we are proposing to maintain our complaints and compliance staff at about the present level. This staff is more than fully occupied in handling the complaints which the Commission receives and which require correspondence with licensees and occasionally on-the-spot investigations.

This procedure enables us to correct a number of significant violations of our rules, and such action will in time tend to bring about a general improvement in the level of compliance by all licensees.

Of course, this is in addition to the regular inspections made by our field bureaus. These are the investigations which result primarily from complaints. The number of complaints, the number of letters, is increasing, I think, as a result of increased public awareness of the FCC and its role, perhaps because of the increase interest in broadcasting in general and television in particular.

COMPLAINTS

Mr. BOLAND. What is the most common complaint?

Mr. HENRY. It varies. I suppose the most common complaint is about programing itself or commercials, which are not directly involved in the compliance division unless they allege some sort of infraction of the rules, which they usually do not. But it does not take very many complaints to keep our very limited staff available—how many do we have down there——

Mr. SHERIDAN. Thirty, I believe.

Mr. HENRY. We have very few field people who are qualified to go out and really handle something well to conclusion. It is a fairly complicated and sensitive matter, to begin with. They are constantly on the go.

Mr. OSTERTAG. Mr. Commissioner, are you speaking of complaints from the general public?

Mr. HENRY. Yes; primarily.

Mr. OSTERTAG. Or from within the industry?

Mr. HENRY. It varies. I do not know what the percentage would be. I would think they are primarily from the general public.

Mr. JONAS. How many, if you could estimate, of those who complain about commercials, advise that they would prefer pay TV?

Mr. HENRY. I would say almost none.

Mr. JONAS. Could you leave off "almost"?

Mr. HENRY. I have not examined them. If I examined them, I probably could say none.

Mr. OSTERTAG. They probably do not associate the two together. That is the reason.

AUTHORITY TO REGULATE CLOSED CIRCUIT TV

Mr. THOMAS. Since you raised the question, let us go into it. I would like to see that prizefight, but why in the world should I have to pay $2 or $3 or $4, which I did not do, to go out and see it? If you want to see Mr. Ruby shoot down some fellow in Dallas, Tex., all you have to do is turn it on and it is free. Perhaps one of the largest audiences in the world was looking at that.

Here is another matter which is of interest. Where do you draw the line? Why do you let the boxing people come in here and make a potful of money, and some other matter of interest as far as John Q. Public is concerned is all for free? What is the line of demarcation? I like that boxing business, but I do not like it well enough to get out of my chair and go downtown and pay $5.

Mr. OSTERTAG. Is your question, Mr. Chairman, associated with the FCC jurisdiction over closed circuit showings?

Mr. THOMAS. I do not know whether they have authority. I want them to express themselves on it.

Mr. HENRY. Theoretically, no, but in fact I think we could exert some jurisdiction in this field, for two reasons. One, it is carried over the facilities of the people we regulate, namely, the common carriers, and in practically every instance I would assume it was A. T. & T. facilities. Secondly, they use now not only the coaxial cable for television, but they have microwave links. Microwaves emit radio energy. Therefore, interstate communications under our act and, therefore, subject to our licensing jurisdiction. We license microwaves, not only for people who make a business of carrying television signals, but for general use, primarily through the common carriers. So, we do have substantial authority in this field.

As yet we have not exerted it. We are aware and are becoming more and more aware every day of the intertwining of microwave licenses, of the community antenna television situation, of subscription television possibilities with these, and so on. We are very much aware of it.

Mr. OSTERTAG. You have answered my question, but the chairman's question is pending.

FCC JURISDICTION OVER CLOSED CIRCUIT OPERATION

Mr. THOMAS. Let us talk about it generally. In comes the World Series. I guess there will be 50 or 75 million people in the United States watching the World Series. It is put on television free. Why do you not let those people charge a fee if you let the boxing people charge a fee? Where is the line drawn? What jurisdiction do you have? Can you say yes or no to the big broadcasting people? Have you that kind of authority any place in your act?

Mr. LOEVINGER. The issue has never arisen, Mr. Chairman. The boxing people did not seek or have any specific FCC authorization for their closed-circuit television. While Chairman Henry is quite correct in what he says, the FCC has up to now never exerted or tried to exercise any jurisdiction over what goes over common carrier cables.

Mr. OSTERTAG. Do you not have control over the rights to televise it?

Mr. HENRY. Over whom?

Mr. OSTERTAG. The promoters.

Mr. HENRY. Yes.

Mr. THOMAS. You have a delicate question of law there. What is the delicate point involved? Are you backing away on the theory you are attempting to regulate the program if you say you can or cannot charge a price? What is involved? What is indefinite in your act.

Will you read into the record at this point the act you rely upon if you maintain you have jurisdiction to say yes or no to the broadcasting firms?

Mr. HENRY. I do not know the specific section of the act, but it is the Communications Act of 1934.

Mr. THOMAS. What about it, Judge?

LIMITATIONS OF COMMISSION'S JURISDICTION

Mr. SLOSBERG. Under the act, we do not have jurisdiction of cable television which is transmitted within a State. The Commission exercises jurisdiction over interstate cable, as it does with the telephone company, but this has nothing to do with what is carried on the cable as such.

The fight that you mentioned was carried from the site on lines into theaters. As Judge Loevinger pointed out, there was no authorization from the Commission to do this. It was carried over the regular common carrier cable.

DECISION TO TELEVISE ON CLOSED CIRCUIT

Mr. OSTERTAG. But who decides whether or not it will be closed circuit or a general broadcast?

Mr. HENRY. Let me see if I can clear it up.

The proprietor does it. We have not backed away from the question. No one has come to us seeking a solution to it. It is really just developing. We are just now getting even ripples on the pond in this area.

The reason they did not come to us was the entrepreneur, the promoter, makes the original decision to carry the fight closed circuit. He makes the deal with the promoters and with the theater television people. They can go from the camera that televises the fight, all the way into the local theater without coming to the FCC, because it originally would come from the camera through some wires and out through the building and perhaps over a microwave. That microwave generally is licensed to the American Telephone & Telegraph Co. and carries a variety of content. It will carry a telephone message one day and then they will switch it to carry television, and then they will move it somewhere else and it will carry broadband data. No complaint has yet come to the FCC, saying: "I don't want the American Telephone & Telegraph Co., which is a common carrier, to carry a television signal on a closed circuit."

It is just now coming to the front. It is just now being called into question. It is a very complicated matter, and we just have not gotten around to discussing it seriously.

Mr. OSTERTAG. How about the right to broadcast generally rather than by closed circuit? Has anybody complained about the right of not being permitted to put this on television?

Mr. COX. No one has a right to use this show or this event without paying the people who control it for that right. At the same time the promoters were deciding to exhibit pictures of this on theater television, they agreed with ABC to broadcast it on radio. So, here advertisers who sponsored ABC's presentation of the fight paid ABC enough to enable it to bid for the rights to broadcast it orally, but apparently the networks either were not interested or felt they would have to go so high in order to get the rights that they could not recoup in one show the costs through advertising outlets, so they let it go by default.

For the world series, this is a matter which is much more traditional. It runs for a period of time. It builds up an interest. They

can insure the advertiser at least four games, maybe seven. So, there they have up to this point, at least, been able to command the situation. There is some danger if you got a national system of in-the-home pay television where millions of homes could be reached by wire, the pay promoters, the proprietors of the cryptic systems or the wire systems would go to the baseball leagues and would outbid the networks. Then you would have presented very directly the question of something that had been free being diverted to a pay scheme.

Up to now, the decisions have all been made by businessmen, advertisers, networks, broadcasters, people with facilities in theaters.

COMMISSION AUTHORITY OVER PAY TV

Mr. BOLAND. There is no question about your authority in the pay TV field.

Mr. COX. Not if it is over the air. There is no question there. I think, as perhaps the General Counsel's representative indicated, if they started presenting this interstate in a way which had a bearing on our efforts to develop and maintain a free television system, either we could find some jurisdiction or would come to you gentlemen and ask for it.

Mr. HENRY. I do not think there is any question that pay television, if it develops on a large scale, will be regulated. If we do not have authority, I am convinced the Congress will want to clarify the situation and probably give it to us.

Mr. OSTERTAG. You have no authority to regulate pay TV yet?

Mr. HENRY. Over the air we have. It was worked out with Congress, and the experiments were very limited in nature, and still are.

Mr. FORD. It boils down to the fact that the Government has never asserted the authority to direct that a public spectacle be put on one media or another. Once a particular media like free television or pay television or theater television or something else comes into play, then there are certain statutory and regulatory things that affect each media you may select. If you put it in a magazine, then the post office classes it as second-class matter. The Government has never undertaken the authority to direct that the owner of a particular event place it on one media or another.

I think that is the key to the whole thing.

METHODS OF TRANSMITTING PAY TV

Mr. BOLAND. Would pay TV be feasible in any other method except by over the air?

Mr. HENRY. Possibly by wire. Wire communications is now becoming cheaper and cheaper. When you get in highly dense areas of population, such as New York City or any large metropolitan area, you can wire an apartment house or even individual houses that are very close together, very economically. So if you can get the signal from the point of origin to that densely populated area, you are in business. This is what is going on in California at the moment. Although they have a plan out there to originate the local San Francisco Giants and Los Angeles Dodgers games, it is all closed circuit. It is all over wires. They are raising $25 million on this venture.

Mr. BOLAND. It will be a costly proposition to install this wire system?

Mr. HENRY. Yes; $25 million to do it. They feel they will get their monetary base through the sporting events. Then the field is wide open for the televising of any locally originated program in the areas which are wired.

POSSIBILITIES FOR PAY TV

Mr. BOLAND. It appears this type of athletic event, or an event which appeals largely to the public, sporting or otherwise, pro football, baseball, track meets, all this in the future would appear to be in the field of pay television?

Mr. HENRY. The potential is there. Nobody can say for sure. There is that potential, call it danger if you want to.

The matter is further complicated and the danger increased by the fact that now there are some 1.2 million homes, mostly small community homes, that are wired through community antenna systems. For example, Clarksburg, W. Va., is wired. It gets in signals from Pittsburgh, from Wheeling, and so on.

Mr. BOLAND. The signals on pay TV or closed circuit are carried from the camera to the viewer solely by wire?

Mr. HENRY. No. I would say for the most part they use microwave. Those microwaves——

Mr. BOLAND. I would think you would get authority here, then.

Mr. HENRY. That is right.

RIGHT TO REGULATE CONTENT OF MICROWAVE TRANSMISSIONS

The delicate point, if there is one, and it is not related to our feelings or desires in the matter, to be aware and alert to the situation, is that when you get into the use of a microwave by common carrier, traditionally they are common carriers by the fact they agree to serve everybody.

If they hold themselves out as available for service to everyone, then the regulatory body has not concerned itself with the content of what is carried.

In the same sense we are forbidden from censorship of free television. There are delicate questions of whether you regulate the content of the electronic transmission carried by the common carrier.

You also get into the question of directing a free broadcaster to carry or not to carry particular sporting events. There are many delicate areas involved, but it is all coming to the fore now.

TWO TYPES OF PAY TV

Mr. FORD. We should distinguish there are two kinds of pay television. There is one where the cable gives you all the programs for a monthly fee. The other kind charges for a specific program. The question was whether or not the specific program was feasible by cable.

I understand they have technically a means of scrambling and unscrambling when using wire just as they do scrambling and unscrambling a program that goes through the air.

You have to keep the two things in mind or you are confused.

Mr. LEE. I think this might be of some help. About a year ago the Stanford Research Institute made a study, one of their projections for subscribers, as to what would happen with pay television.

They concluded that by early 1970, and I speak now from memory, this would be a going operation at about a $3 billion level.

They also concluded that about 50 percent of the then nationwide pay TV systems would be by wire, the other 50 percent off the air.

They also concluded that the cost for off the air was only a fraction of the cost for wire, but that these people making these decisions were doing it on the basis of this—if we go wire we have no regulation. They may be wrong but this is part of their judgment.

They have to make a deal with the phone company to use the pole. They have to put the wire in there. Off the air you do not have to do that.

There are other research people who are agreeing in principle on the fact that this thing is coming whether or not you like it, and it will be a big thing, but are they disagreeing with the amount of it that will be by wire. They think it will be largely air.

Mr. COX. It costs you more to transmit the pay signal by wire. You have to stretch the wires and make the connection with the individual homes. It would be cheaper to install the set and broadcast.

On the other hand if you broadcast over the air you have to have a fairly extensive decoding device in the individual home.

When you get up to a certain level in a densely populated region you can very quickly overbalance the cost of installing the wire by the comparable costs you need at each installation if you are going to broadcast over the air; plus the fact that the wire system will permit you to offer a choice to the subscriber.

He can watch one of three or four things at the same time, whereas at the present time a single station can be broadcasting only one scrambled picture at a time. You take that or nothing.

There are some advantages to the wire system, in addition to the fact they do feel, at least initially, they can avoid regulation.

Mr. THOMAS. Regardless of the fine points of these research projects, picking out the advantages and disadvantages of one type over the other, what is the general consensus, if there is any at this time, as to the future of pay television generally as against free television?

(Discussion held off the record.)

Mr. HENRY. To get back to the original question, whether any complaints about commercials had been in favor of pay television, I think the answer is "No," and properly so. They are really not alternative matters. I think you can still complain about commercial television without advocating pay television as a substitute.

We do think there are some abuses there.

Mr. JONAS. Somebody has to pay for the program.

Mr. HENRY. There is no doubt about that.

Mr. OSTERTAG. Are you talking about your regulation of commercials, and so on?

Mr. HENRY. Not specifically. That is in the picture.

This highlights simply one of our many tough controversial, complex matters we have to deal with in the field of broadcasting. We

talked about pay television, community antenna television, and the interrelationship involved.

ALL-CHANNEL RECEIVER LAW

We are also in the process of implementing the all-channel receiver law which was enacted in 1962. We have put out a very complicated rule for adding channels to the nationwide allocation table for UHF.

In 1965——

Mr. OSTERTAG. I think it would be interesting to note just where you stand with regard to the all-channel receiver law, and when and how it is moving along.

Mr. HENRY. Commissioner Lee has been the engineer in charge of UHF. He has 10 speeches ranging from 5 hours down to 2 minutes.

If you could give him the 2 minutes.

Mr. LEE. Two minutes. The all-channel law gave us the authority to set regulations requiring that every set provide all channels. We worked out with the electronics industry, who oppose this legislation, by the way. After it was passed they did not appeal our action and agreed to work it out with us. We worked out rules whereby we agreed on the date of April 30, 1964, this year.

Mr. OSTERTAG. Are these rules for the manufacturer?

Mr. LEE. Yes; so every set shipped in interstate commerce after April 30 must be capable of receiving all channels.

We have gone to a great deal of pains to discourage so-called stockpiling, or any circumvention of the law. I personally visited all the plants. They are gradually building up so that, right at the moment, it might be 35 or 40 percent of production is all channel.

By April 30, they have all assured us in writing, they will comply, and that is how it will be.

REMOVAL OF EXCISE TAX ON TV SETS

We have also made quite a pitch, and the Commission in one of its rare moods agreed unanimously, without even a speech from Commissioner Ford, to support the removal of the excise tax from all-channel receivers for a temporary period.

The Chairman and I have had a series of conferences with the Treasury people. We have also visited the White House. We have stayed away from the Hill because we feel we should not lobby up here. We are anxiously awaiting to have somebody ask us about this.

Mr. OSTERTAG. Commissioner, are you saying that you favor the removal of the excise tax?

Mr. LEE. Right.

Mr. OSTERTAG. You have no jurisdiction over it?

Mr. LEE. That is right. We are supporting legislation that would take the impact from the public, from the consumer, because an act of Congress, which requires another gadget to go on, will mean that the man buying a set will be paying from $20 to $30 more, and 80 percent of the area of the country has no immediate possibility of UHF.

The people in Mr. Boland's district have been paying this extra $30 for all these years so they have been discriminated against.

We are asking for a temporary period, until these manufacturers can get their production up and reduce this cost, that the excise tax be

removed. It does not require the entire removal. It may be down to 5 percent instead of 10, for a temporary period. It would remove the impact to the public and hurry up the all channel receivers, put a lot of stations on the air, and create jobs and boom the economy.

Mr. HENRY. Then they will all be wiped out by pay television.

Mr. OSTERTAG. That would have to be done this year?

Mr. LEE. That is right.

Mr. OSTERTAG. If it were to mean anything it would have to be done this year?

Mr. HENRY. Not necessarily. There will be only a gradual implementation of everybody buying these.

Mr. LEE. We would like it to be as of April 30.

The Ways and Means Committee has announced they will have some hearings on all excise taxes. We think this is unique. We will get before them and make this strong pitch.

Mr. OSTERTAG. Let me say to you in that regard that as recently as yesterday the chairman of the Ways and Means Committee informed me that they were going to move ahead with a study of excise taxes but that there was little or no prospect there would be any major revision in the excise tax law this year.

Mr. LEE. That is generally true, and this is what Treasury says. We think this situation is unique. If they give us an early hearing, which we hope, we will make this presentation for this unique action to help us out for the 2-year period.

FUTURE OF UHF TV

Mr. OSTERTAG. When will this all-receiver matter actually become effective and where UHF is and will be as a result of it.

Is UHF coming in to any degree or will it follow?

Mr. HENRY. The receivers shipped in interstate commerce must be able to receive all channels after April 30, 1964.

There are many different views as to when and exactly at what rate UHF would develop.

We are doing everything we can to foster its development, to see that it is developed along the lines we have thought it should develop, to provide more choices to people, new stations to communities which now do not have them.

NUMBER OF UHF STATIONS

Mr. OSTERTAG. Are there applications for new stations?

Mr. HENRY. There has been a decided increase in applications for UHF stations, yes.

Mr. BOLAND. Have there been failures in the last couple years?

Mr. COX. In the last couple years, yes.

Mr. BOLAND. How many such stations are there in the United States?

Mr. LEE. Presently 90. There were, over the years, approximately 100 that folded up. Within the last year there is——

Mr. BOLAND. With a possibility of having how many?

Mr. LEE. If you say educational stations economically it is possible within the next 3 or 4 years to have perhaps 500 more stations on the air.

Mr. OSTERTAG. UHF?

Mr. LEE. Yes.

Mr. HENRY. That will be a big help to educational television. In Los Angeles it will be UHF for education.

Mr. LEE. It is technically feasible to have as many as 3,000. We have about 80 applications now in the top 50 markets.

We put a station on the air in Chicago within the last month. If it does not do very well there it will not go any place.

ALL-CHANNEL RECEIVERS ON MARKET

Mr. OSTERTAG. Are not these all-channel receiver sets on the market now?

Mr. LEE. Yes.

Mr. OSTERTAG. Why would anybody buy anything but an all-channel receiver at this point?

Mr. HENRY. They should not. We again have been working, as Commissioner Lee has stated, he is in charge of an inter-Government committee to make this clear to the retailers.

Mr. BOLAND. You can understand why they would buy it before the law. Some didn't have UHF. Who wanted it in New York?

Mr. LEE. When they can buy the set for perhaps $30 less, and they don't have the UHF station, anyway, this is what is bothering us and bothering the manufacturers.

Mr. OSTERTAG. Will this have a bearing on the price of existing sets? Will this affect the manufacturers and retailers and distributors? Aren't they going to have to take a loss on the existing sets?

Mr. HENRY. I think they will pretty well clear the pipelines and get rid of them and sell them VHF sets only.

I think you should buy a UHF set. You don' t know when such a station will come along even though there are no definite plans now.

Mr. BOLAND. They will not get rid of just the V receivers. They will sell them at a reduced price and get rid of them to people who are not interested in watching UHF or educational programing.

RESULTS OF UHF STATION EXPERIMENT IN NEW YORK CITY

This committee has given to the FCC considerable money, about $2 million for an experimental UHF station in New York.

I don't want to burden the committee now, and I don't want to burden you, either, but we would like to have for the record some indication of what you found out, and whether or not the expenditure of money was wise, and what it told you about UHF.

Mr. HENRY. We will be happy to provide you with a statement on that.

(The statement supplied follows:)

SUMMARY OF RESULTS FROM THE NEW YORK CITY UHF-TV STUDY

The New York City UHF-TV study of the technical and economic feasibility of UHF television coverage of a large, canyon-type metropolitan area has been completed. This project was conducted during fiscal years 1961, 1962, and 1963 under a $2 million appropriation by Congress.

A high-powered UHF-TV transmitter was operated on the Empire State Building with the antenna mounted on the same supporting tower as the local

VHF–TV stations. Operation commenced in October 1961 and ceased on November 1, 1962. On the latter date the Municipal Broadcasting System of New York City assumed ownership of the station and commenced regular TV serving using the call letters WNYC–TV.

Data were collected at about 3,860 locations within 25 miles of the Empire State Building, which area, being highly built up, was of principal concern. At each of these selected locations observations and measurements were made of picture quality and signal strength, not only on channel 31 (the UHF channel tested) but also on VHF channels 2 and 7 for comparison purposes. At 768 (nearly one-fifth) of the locations, actual home-type TV set installations complete with requisite antenna installations were used. Data were taken on observations by the installation crews as well as the householders.

In addition, two complete mobile signal level measurement surveys were made, one during the winter and the other during the summer. Each survey included measurements taken at a height of 30 feet for a distance of about 100 feet at about 340 locations on each of channels 2, 7, and 31. This information supplements that taken in the households, not only by overlapping the information obtained between 10 and 25 miles from the stations but also by furnishing data for greater distances.

Detailed reports which have been published on the project show that when using outdoor antennas there was very little difference in overall picture quality between channels 2, 7, and 31 within 25 miles of the Empire State Building. With indoor antennas, channel 31 gave acceptable service to slightly fewer locations than either channel 2 or 7.

At greater distances, as measured by the mobile vehicle, the signal from channel 31 diminishes more rapidly than those from the lower channels (2 and 7). In addition, behind obstruction the signal from channel 31 was affected more than signals from channels 2 and 7. This latter factor applies at all distances but is of little importance near the station (i.e., closer than about 25 miles) since there still remains adequate signal strength on channel 31 to provide acceptable service. At greater distances the effect of obstructions results in more locations on channel 31 where the signal is too weak to provide acceptable service (using normal types of home installations) than is the case on the lower channels.

As a byproduct of this project, additional data were collected which are being analyzed and further detailed reports will be issued from time to time.

EFFECT OF ALL-CHANNEL LAW ON UHF TV

Mr. OSTERTAG. This is a fundamental and basic change in the whole concept, recognizing that the answer grew out of the expansion of the so-called UHF system. You had a limitation on VHF and if you were going to go along with VHF you had to have some means by which it could be employed.

You finally arrived at this approach of all-channel receivers to further the development of UHF. Is that correct?

Mr. HENRY. Yes.

Mr. OSTERTAG. Do you still believe that you are on the right track and do you believe this was a good law and there are no disappointments up to now?

Mr. HENRY. I think we are convinced it was a good law and it was the best possible solution. It was a practical solution, and it has some drawbacks, however. Namely it imposes a requirement on the manufacturers which results in a price increase, at least initially.

I think we are all agreed that this was the best course to follow at the time.

Mr. THOMAS. Mr. Boland, are you going to have discussion with Commissioner Bartley about results of that New York experiment? They called it the Ford-Bartley-Lee experiment?

Mr. BOLAND. Commissioner Lee was almost like a voice crying in the wilderness.

(Discussion held off the record.)

COOPERATION IN PROMOTING UHF

Mr. LEE. I would like to say something about Bill Putnam, your constituent.

I would like to say in connection with the improvement in the UHF picture that we have had considerable help from your constituent, Mr. Bill Putnam, from Springfield, working on one of the industry committees with us and devoting a great deal of his time. He is a recognized leader in this UHF field and only a few years ago he had few people listening to him and now there are many.

Mr. BOLAND. I am glad to hear you say that. He has good programing on his station up there and I think he has done a good job. He was an embattled leader in this fight and had his difficulties a long time ago.

RESULTS OF UHF TV EXPERIMENT IN NEW YORK

Mr. THOMAS. Did Mr. Lee get his money's worth?

Mr. BOLAND. Can you give us a 2-minute capsule recitation on this New York experiment?

Mr. LEE. As I recall, Mr. Chairman, we asked for something in the neighborhood of $2.7 million, and the committee gave us $2 million. We turned back $300,000.

We were able to turn this money back by reason of the fact we worked out an arrangement with the city of New York, who took over the operation of the station. They are now running it as a very good municipal station. We were happy to return this money to the committee, and I think it reflects your expertise in knowing how much it would take even more than we did.

Mr. THOMAS. Did we get our money's worth?

Mr. BOLAND. Not out of the sale of the equipment in New York.

Mr. THOMAS. Was the experiment worth it?

Mr. LEE. As a generalization, and we can supply a technical analysis (see p. 1348) we concluded from some 5,000 measurements that were made under contract with Jerrold that within the 25-mile radius of the Empire State where the transmitter was located there was no significant difference between the U and the V signal. At something like 7 percent of the locations an outdoor antenna was required for the U where it was not for the V, but this is not a significant difference, and in all instances in New York everyone is better off with the outside antenna.

Beyond the 25-mile area we have not made any specific report although we have made some measurements. I think the maximum service people, the private group, are making some measurements outside the 25-mile radius.

We know it will drop off before the V signal drops off. Our significant conclusion was that it can serve well a highly built up metropolitan area with a good installation.

STATUS OF UHF–VHF DEINTERMIXTURE

Mr. BOLAND. One more question with respect to some thinking on the part of the Commission. A year or 2 years ago they were reducing V's and going to U's.

Mr. LEE. We have pretty much agreed with the Congress that we will not undertake that move which was part of the package, and in exchange for not undertaking that move we actually got the all-channel receiver legislation.

I would say we are committed for 5, 6, or 7 years to leaving these existing V's alone.

STATUS OF FEE SCHEDULE

Mr. EVINS. I would like to hear about the general monopoly picture in the industry and also tell us about the schedule of fees.

This committee has urged the FCC over the years to establish a set of fees. We don't want to go uphill one day and downhill the next.

You are giving valuable franchises and licenses. It seems to me reasonable fees would be in the public interest and they would be proper to defray some of your expenses.

Have some acquired monopoly control? What are the rules with respect to consolidation, integration, and acquiring monopolies in the field?

Mr. HENRY. Let me answer generally and then Commissioner Loevinger can add his comments.

First on the subject of fees, there was some dissension among the Commissioners as to the desirability of enacting a fee schedule without specific legislation on this point. The majority felt it should be done, however, but that it should be nominal, that it should not in any way be classified or construed as a revenue measure but simply as a method of collecting some reasonable amount of service charge for the cost to the Government, plus benefit rendered to the licensee.

We did institute the system and it will get us about 20 percent of our operating budget back this year.

We think it is reasonable, therefore, and we have no intention of changing that schedule in the near future.

The fees for the broadcasters in relation to the amount of money earned by the broadcasters generally speaking is very, very low, but there again we wanted to keep it nominal.

MONOPOLIES IN BROADCAST

In the field of monopoly and economic control, the number of stations per community is pretty well limited by technical considerations. We have an allocation plan which we think provides optimum service to the country as a whole. That pretty well determines which channels are assigned to which communities, so the question of monopoly gets down as to who shall own those channels.

There has been increased interest of late at the Commission on this subject. It was sparked recently by the transfer from Trans-Continent Co. to Taft Broadcasting Co., the Midwest Broadcasting Co., and to Time-Life Broadcasting Co. of several stations involving an overall price of around $38 million, I think.

Our staff has been directed to study this problem intensively and to make a report to the Commission. We expect that report will be before us for consideration in approximately 1 to 2 months. We will just take another long, hard look at it.

Mr. LOEVINGER. What Chairman Henry has said is certainly correct, and I concur with what he has said.

CONCENTRATION OF CONTROL

I have been concerned with the question not so much of technical monopoly, which I think does not yet exist in broadcasting, but with the concentration of control in fewer hands.

There is some tendency for the big, lucrative stations to come into the hands of large multiple owners, for these large multiple owners either to be or to become affiliated with or sell out to large national corporation with interests in other fields.

This tends toward an increasing concentration of economic control which is, I think, particularly sensitive in the communications field. It is the kind of thing which Congress has indicated as a governmental policy should be carefully watched and limited.

I think that the policy expressed by Congress in such things as the Celler-Kefauver Act certainly applies in the broadcasting field.

There are complex issues involved here. Sometimes the Commission disagrees in particular cases, but I think that in the last few months the Commission has fairly unanimously agreed that the entire subject does deserve and require examination. New aspects of the matter have either developed or been discovered quite recently within the last couple months in connection with intercorporate relations. A transfer was proposed to a large multiple owner which had widespread stock ownership.

It was discovered in the course of examination and probing and discussion about this transfer that there was a technical violation of Commission rules through cross-ownership of the stock of this corporation.

Apparently nobody had particularly thought about this aspect of it before because the ownership of licenses by widely held corporations is a relatively new thing and the transfer and trading in stock is a relatively recent thing, and this aspect simply had not come under examination.

There is a notice of public inquiry that the Commission is getting ready to issue with respect to this specific phase of it, and the entire question of multiple ownership and a concentration of control the Commission has agreed to review within the next few weeks.

I think we are faced with a situation which, while not perfect, is very hopeful. Speaking as one who has been an antitrust enforcement man, and is still deeply imbued with the free enterprise and antitrust velocity, I believe in broadcasting we are at a stage where it is still possible to prevent undue concentration of control. The concentration of control has not yet progressed to the point where we would have the very difficult situation of forcing the breakup of a lot of big enterprises.

Mr. THOMAS. Off the record.

(Discussion held off the record.)

Mr. OSTERTAG. As the Commissioner has described, there are circumstances wherein you have these intercorporate relations and you have these large corporations owning and operating other news media or means of communication like television or radio or a newspaper or a combination of the three. But what I think ought to be made clear, has there been any bad experience as a result of it? What has been so wrong about it? This is aside from the standpoint of monopoly because if you have a license you have a monopoly whether you are a corporation or a newspaper or anything else.

Mr. LOEVINGER. Not necessarily. If we license half a dozen in one town you have a fair degree of competition.

Mr. OSTERTAG. If you are talking about competition that is one thing, but if you are talking about big corporations owning these stations that is another thing. I am raising the question because you have expressed yourself on the other side of it. But has it been bad by experience or practice?

Mr. HENRY. There have been serious examples of abuses that have resulted from it, yes. A number of years ago we found examples of joint rates between the newspaper and the radio or television station, interdependence of advertising, and so on. We know of instances—I cannot recall any specific one at the moment—in which the editorial line is the same, and so on. The fact we do not know for sure is one of the big dangers.

Mr. JONAS. The potential is it can control the thinking of the whole community.

Mr. HENRY. The potential is there and we cannot possibly supervise it and we do not want to supervise it.

Mr. OSTERTAG. Would that be where the means of communication are exclusively in the hands of one corporation or group?

Mr. HENRY. Where in one community you have the newspaper and the television station or radio station all owned by the same group, then you have the instruments of expression within the control of one group. That is one aspect of it. Another aspect is if you have one group that controls television stations in the major markets across the country; they have access to millions and millions of American homes even though there is competition in each of the cities in which they operate. It is basically a philosophical approach rather than one based on documented abuses.

Mr. LEE. There is another argument with respect to newspaper ownership and that is that there has been a tendency over the years for more and more newspapers to fold up. If the only newspaper gets the only television station and the only AM station in a city, I am against that. However, a newspaper-owned station rarely changes hands. We do not have the trafficking problem. It becomes a part of the community and this is good. By and large they are operated very well and I suspect in many cases they are supporting the newspaper. A few years ago we had two morning newspapers in Washington, and the only who survived was the Washington Post, who had a facility.

Mr. OSTERTAG. You have two newspaper-owned stations in Washington, one by the Evening Star and the other by the Washington Post.

Mr. LOEVINGER. Washington is one of the few large cities that still has newspaper competition. Approximately 25 or 30 years ago every major city had competing newspapers. Today there are only 8 or 10 American cities that have competing daily newspapers. So if there is going to be any diversity in the expression of viewpoint and if there is to be any competition in bringing viewpoints to the public, it has to be brought by the broadcasting station.

Mr. FORD. We have about 1,800 daily newspapers and we have roughly 6,000 radio FM and television stations. The figures are roughly 37 percent of the licensees involved in newspapers, have radio or television, too, and so on. That figure has remained fairly constant in the last 20 years since Congress examined the whole question when the Commission was proposing to do something about it. I think the increased percentage is going down slightly now.

Mr. BARTLEY. If you take the major markets, I do not think those statistics would apply.

NEWSPAPERS AFFILIATED WITH BROADCASTING STATIONS

Mr. JONAS. Are statistics available to show how many daily newspapers in the country have close affiliations with broadcasting stations?

Mr. HENRY. We can get up a set of statistics for the record if you would like to have them.

Mr. JONAS. Yes; I would like to see that.

Mr. LOEVINGER. Congressman Celler is investigating that and I think some data can be gotten on that.

Mr. THOMAS. Let us put that in the record.

(The information supplied follows:)

There are 507 daily newspapers affiliated with broadcast stations. Of these, 336 are located in the same city as the broadcast station with which they are affiliated.

Mr. OSTERTAG. Off the record.

(Discussion off the record.)

Mr. BOLAND. Is there anything you would like to add?

Mr. HENRY. Not at this point. I was going to go ahead with the statement.

GENERAL STATEMENT OF CHAIRMAN HENRY

Mr. BOLAND. We will insert your complete statement at this point in the record.

(The statement follows:)

STATEMENT OF CHAIRMAN HENRY

Good morning, Mr. Chairman and members of the committee.

Our estimate calls for $16,610,000 or an increase of $1,010,000 over the appropriation approved by the Congress for the current year. The major staff increases proposed in this budget are for our common carrier and field engineering activities. In developing our budgetary requirements we have followed the wishes of the President to hold estimates of money and manpower to absolute minimums. We have applied a most stringent policy in the face of mounting workloads in many areas of the Commission's work.

It is our intention to do everything we can in the way of improving procedures, making better utilization of manpower, and eliminating low priority and nonessential operations, but notwithstanding our efforts in this regard, there is urgent need for increased appropriations.

FEE SCHEDULE

Before getting into a discussion of our budget request, I would like to bring you up to date on our proposed fee schedule. When we were here last year we told you that we had under consideration a proposed schedule of fees to be charged for filing applications for various types of licenses. Since that time the Commission approved a fee schedule and set January 1, 1964, as the effective date. In the interval between our approving the fee schedule and the January 1, 1964, effective date, action was taken by a group of Commission licensees to have the Commission's action stayed and on December 31, 1963, the U.S. Court of Appeals for the Seventh Circuit issued a 60-day stay of the Commission's order.

Subsequently, following oral argument in Chicago, the court of appeals denied a motion for interlocutory injunction pending disposition of the joint petition for review which was brought to set aside the Commission's action in adopting the fee schedule. The order of the court also dissolved the 60-day temporary restraining order it had imposed on December 31, 1963.

In its order the court directed that all funds collected prior to final disposition of the petition for review be held aside in a deposit fund account and provisions made for the Commission to return to the appropriate payors any fees which are found to be invalid by the court.

On February 14, 1964, the Commission considered the action of the court and issued a public notice that its schedule of fees will become effective on March 17, 1964. This is just 12 days from today.

DATA PROCESSING PROGRAM

Next I would like to say a few words about another significant development since we last met with you. This deals with our data processing program. On October 22, 1963, our Univac III computer was delivered to the Commission's office for installation, and on November 15, 1963, turned over to the Commission for a 30-day acceptance test. I am pleased to report that it was put to use immediately in testing out computer programs that were being developed during the past year and in converting FCC records from a variety of forms to magnetic tape.

On February 10, 1964, just about 1 month ago, we began the electronic processing of citizens' radio applications and the printing of licenses. We now have a crash program underway to have the approximate 45,000 applications we had on hand in this service pushed through the computer to get us out from under the backlog. We expect that the pressures in this area will ease in 4 to 6 weeks. weeks.

By the end of this week the computer will take over the processing of amateur applications and the printing of these licenses. Within a short time we should also be in pretty good shape in this service, too.

Also, on about February 20, we "computerized" the processing of applications for our antenna survey function; that is, the checking of proposed antennas as air navigaiton hazards.

FUTURE PROJECTS FOR COMPUTER

Future goals for the conversion of application handling to the data processing system are the marine service in May of this year, the aviation service in July, and the public safety and industrial services later in fiscal 1965. We also plan to have the broadcast station and individual ownership files on magnetic tape for use by the Commission's staff next month. In addition, our programs for performing engineering computations for AM, FM, and TV facilities, such as radiation and service contour patterns and channel studies, are also scheduled for late this month or early next month.

BROADCAST ACTIVITIES

Now back to the budget we are placing before you today, for your consideration. The broadcast portion of this budget very clearly reflects the directive

of the President to hold budgetary requirements to a minimum. We are requesting an increase of only two positions for Broadcast activities. However, to handle the increasing workload, we are relying on greater use of automatic data processing, changes in Commission rules to facilitate processing, utilization of sampling techniques so that only a portion of renewal applications will be completely examined, and more selective participation of Broadcast Bureau counsel in hearing procedures. In this way we are planning to bring down our backlogs but we must have the staff requested to achieve these objectives.

APPLICATION PROCESSING

For each of the broadcast services—AM, FM, and TV—we expect to have fewer applications pending at the end of fiscal 1965 than at the end of 1963 or 1964. For example, in new and major changes in AM application (p. 22 of budget document) we had 464 applications pending at the close of 1963; mainly as a result of the AM "freeze" this will be reduced to 110 by the end of this year. In fiscal 1965 we expect to lift the "freeze," but we shall improve our allocation rules and have our computer assisting so that by the close of the year we expect to have the smallest backlog of AM applications for new and major changes in many years.

INCREASE NUMBER OF AUTHORIZED STATIONS

Each year we have a growing number of authorized broadcast stations. In 1963 we had 6,199 and by the end of 1965 we expect to have issued authorizations for 701 additional stations for a total of 6,900. This steady yearly expansion affects our workload in many directions, resulting, for example, in a larger volume of renewals to be processed each year and in a larger volume of required compliance activities.

REVIEW OF RENEWAL APPLICATIONS

To cope with the annual growth in renewal applications, we are devising new procedures to separate items which must be reviewed in all renewal applications (such as ownership and complaints) from other aspects (such as programing and commercial policies and practices) which we would examine for only a sample of the applications. An indepth examination of these latter items in a small percentage of the renewal applications may well prove to be both more effective and more economical of our very limited staff resources in renewal work.

COMPLAINTS AND COMPLIANCE ACTIVITIES

In the enforcement area, despite the increasing number of stations, we are proposing to maintain our complaints and compliance staff at about the present level. This staff is more than fully occupied in handling the complaints which the Commission receives and which require correspondence with licensees and occasionally on-the-spot investigations. This procedure enables us to correct a number of significant violations of our rules, and such action will in time tend to bring about a general improvement in the level of compliance by all licensees.

PENDING POLICY MATTERS

In addition to expecting a steady growth in broadcast stations, we must face each year's inevitable quota of tough, controversial, complex policy issues. The outlook for 1965 is that we will have our full quota of such problems. We will be engaged, for example, in revising our nationwide UHF allocations, providing additional assignments for both educational and commercial stations. This new allocation plan will shape the growth of television service over the next decade and longer. We will be concerned too with the proliferation of the CATV operations and their effects on the development of healthy local broadcast stations. And we expect to be faced with petitions to permit subscription television to operate on a regular commercial basis. Also, we shall be examining our multiple ownership rules to determine whether they are sufficient to deal with the increasing extent of multiple ownership particularly in TV. Growing out of the network study which was authorized by Congress are a number of proposals before us to foster additional program sources and to increase the opportunities for UHF stations to obtain access to quality programing. Finally, in the first

4 months of 1965, I need hardly remind this committee, we shall be in an election year, and inevitably we shall have a peak of section 315 complaints to resolve equitably and with the least delay.

In the light of all these activities, our budgetary request in the broadcast area is indeed minimal.

COMMON CARRIER ACTIVITIES

In the area of common carrier regulation, the Commission's tasks continue to grow in volume and complexity. This, clearly, is the natural outgrowth of new and rapidly growing requirements for communications of all types. The industry has been enlarging and improving its plant and expanding its operations in order to satisfy this burgeoning public demand for more and better communication services., These activities generate for the Commission an ever-increasing volume of new and revised tariff filings and applications for authorizations to construct and operate radio and wire facilities. To keep our backlog in these areas from growing to unmanageable and intolerable proportions, requires that we continually devote added manpower to these matters.

DOMESTIC TELEGRAPH

However, many of the most significant regulatory activities generated by these developments in the industry cannot be measured by applications or tariff filings.. Thus, for example, conditions in the domestic telegraph industry compelled us to institute an investigation for the purpose of ascertaining the future requirements for message telegraph service in the United States and the ability of Western Union to satisfy that requirement. These proceedings, which are well underway, involve an intensive examination of the competitive relationship between Western Union and the Bell System in light of the charge that the Bell System has engaged in selective pricing policies to the detriment of Western Union.

DOMESTIC RATE REGULATION

In the field of domestic telephone rate regulation, we face a task which is now of staggering proportions and which continue to expand. The American public now pays more than $2 billion in charges for more than 1.2 billion domestic telephone calls it makes annually. We are charged with the responsibility of taking those steps which will assure to the public interstate telephone rates that are fair and just. We must examine the carriers' interstate operating costs, depreciation, investment, and earnings. We must examine the rates charged different classes of users to insure that there is fair and nondiscriminatory treatment. As we have stated on a number of occasions in the last several years, we are not satisfied with the level of regulatory effort we have been able to maintain in this area. We need to devote additional effort to it if the public is to have the assurance of reasonable and just treatment which the law requires.

SATELLITE PROGRAM

The communications satellite program is now well along. The Communications Satellite Corp., is established and on the threshold of a major financing program. It is also negotiating for the launching of an early satellite capability having the prospect of limited commercial service in 1965. The developments in this field bring into play the many new regulatory responsibilities assigned to the Commission by the Communications Satellite Act of 1962. For example, we have recently promulgated regulations designed to insure the maintenance of effective competition in the procurement of equipment and services required for the satellite system and its ground stations. We anticipate a filing this month of the first application by the Satellite Corp. for approval of the technical characteristics of the initial capability. The development of governmental policy with respect to future international participation in the global satellite system contemplated by the Satellite Act has required the Commission to devote substantial time and personnel to this important planning program. As the satellite system approaches the stage at which it will be furnishing commercial service, the Commission will, of course, also have numerous ratemaking and related responsibilities to fulfill—all of this, of course, in a relatively new and uncharted field of regulation.

INTERNATIONAL COMMON CARRIERS

The advent of satellites as a means of international communication has also underscored a need for a careful reexamination of the existing international common carrier industry to determine whether that industry, as now structured and operated, is fully compatible with the realization of the national communications policy objectives enunciated in both the Communications Act and the Satellite Act. This also involves the evaluation of proposals recently made by responsible industry spokesmen in favor of various kinds of mergers in the international common carrier field. This will be a major 1965 activity which will be conducted in cooperation with other interested Government agencies and we hope will culminate in a useful report with recommendations to the Congress from the executive branch.

STAFF INCREASE FOR COMMON CARRIER ACTIVITIES

The increase of 23 employees included in this budget for common carrier activities is a continuation of the 4-year program initiated in fiscal 1964 to bring the staff to a level that will more adequately support a continuing program of effective common carrier regulation.

SAFETY AND SPECIAL RADIO ACTIVITIES

In common with the electronic industry as a whole our safety and special radio services have had, and are continuing to have, a phenomenal growth. To illustrate this growth let me quote a few figures. In 1956 we had a total of 339,000 authorized stations and received some 170,000 applications during the year. The present-day total of stations is over 1¼ million, and applications are currently being received at a rate which will reach the 600,000 mark in 1964 and 616,000 in 1965.

Through the safety and special radio services which encompass all of the non-Government uses of radio for which a license is required, except broadcasting and common carrier operations, some 45 different communications services are provided, all of which play an indispensable part in the many activities making up our present-day civilization. Radio communication, navigational, and control devices are an integral part of air, land, and water transportation systems. Industrial operations, manufacturing, and public safety communications systems are finding new uses for radio every day.

As the number of authorizations and applications increase, the regulatory and enforcement problems also increase. Of particular concern is the fact that the demand for mobile communications systems in many areas has filled the limited spectrum space available. Ways and means to accommodate the increasing numbers must be found. This now constitutes one of the principal problems facing the Commission, and we are hard pressed to solve it.

FIELD ENGINEERING ACTIVITIES

The impact of the growth of these services is not felt in the Safety Bureau alone but the workload of the Field Engineering Bureau grows just about proportionately. During 1963 the Field Bureau issued over 300,000 operator licenses, issued approximately 17,000 interim ship station licenses, processed 25,000 applications for antenna markings and lightings, inspected over 1,600 broadcast stations, 8,000 other than broadcast stations, and received over 40,000 interference complaints.

The management survey report of Booz, Allen & Hamilton was critical of the Commission for not giving more attention to its enforcement problems and to the growth in interference complaints. In consequence, a material increase in personnel for the Field Engineering Bureau was recommended by the survey team. Although we are attempting in our budget to meet the principal objectives of the BAH recommendation, a number of increases previously scheduled are being further postponed.

STAFF INCREASES FOR FIELD ACTIVITIES

In total we are asking for an increase of 31 for the Field Engineering Bureau for fiscal 1965. Of this number 24 are related to enforcement work and 7 to monitoring. The increase under enforcement is intended to bolster our efforts to get

compliance with the Commission's licensing requirements and to handle the ever-increasing number of interference complaints. An indication of the seriousness of this problem is that an estimated 50 percent of the current cases are not being investigated because of lack of sufficient staff.

An increase of only seven is requested for monitoring. It is in this area particularly that we are postponing the implementation of the BAH recommendation to increase staff. The small increase requested is intended primarily to augment surveillance in those areas where the most serious disregard for the Commission's regulations exist.

In conclusion, Mr. Chairman, let me repeat that we fully realize the dimensions of the overall budgetary problem which the Federal Government faces. We have limited our requests for increased appropriations to areas of the most pressing need. We believe that the request now before you represents a sound and conservative judgment of the resources which we will need in fiscal 1965 if we are to carry out effectively the duties which the Congress has assigned to us.

Mr. OSTERTAG. Mr. Chairman, before you go into the justifications, may we raise other general questions?

Mr. BOLAND. Sure.

FCC AUTHORITY OVER ADVERTISING

Mr. OSTERTAG. There has been considerable concern about the use of television as a media of advertising. This raises the question of responsibility for false and misleading advertisements. I realize the Federal Trade Commission has a certain responsibility and jurisdiction in this area, but to what extent does the Federal Communications Commission exercise authority in connection with these practices which are obnoxious to the people or are detrimental to the people?

Mr. HENRY. Our basic jurisdiction arises from the part of the law that says we are to see that the stations are operated in the public interest and we are to decide on the nature of the service rendered by each classified licensee. On the other hand, section 326 of the law says we are specifically prohibited from censoring programs. So our efforts are couched in terms of seeing to it that the broadcasters serve the interests of the community. You can hardly get it any more specific than that. There are certain exceptions to that. The exceptions are obscenity, fraud, and so on, over which we have full power to prevent licensees from engaging in this sort of thing. If an instance of fraud or misrepresentation comes to us which has been perpetrated on the public, we can take a license away, and we have done so in two instances.

EXTENT OF COMMISSION MONITORING

Mr. OSTERTAG. Do you monitor the programs?

Mr. HENRY. Not to a meaningful degree. We have to rely on complaints from the industry or from the public. We monitor 75 percent of our broadcast licenses during the 3-year license period for 1 hour in the course of our 3-year inspection of that station, or triennial inspection of that station. We do not have the money or the manpower to monitor them to a meaningful degree.

When you leave the areas of fraud, deception, and obscenity, we get complaints about "disgusting" programs, programs in bad taste, programs that interrupt the dinner hour with deodorant commercials, undue violence that comes on the air at a time when children are watching. If the specific complaint is serious enough we bring it to the at-

tention of the licensee and ask what he will do about it. If it is a generalized complaint we note it and if we detect trends we try to deal with them on the written investigations of the networks, because they are the source of much of the programs.

We are very much concerned with everything that goes over the air, but we have limitations on our power, and rightly so, of course. We have continually and very effectively, between our Commission and the Trade Commission, controlled these abuses.

CENSORING RESPONSIBILITIES OF LICENSEE

Mr. OSTERTAG. The licensee is merely an operator. He does not create the commercials. That is something that is put on the air by the sponsor of the program.

Mr. HENRY. I would say no to that.

Mr. OSTERTAG. Clear it up, then.

Mr. HENRY. As a practical matter entertainment programs——

Mr. OSTERTAG. I am talking about the commercials.

Mr. HENRY. Commercials only? All right. Madison Avenue, we will say, originates much of it.

Mr. OSTERTAG. I know that.

Mr. HENRY. Much is originated by local advertising agencies for local advertising. But the broadcaster has a very clear responsibility to be thoroughly aware of that content and to keep off the air what he feels is not proper.

Mr. OSTERTAG. Is he responsible for censoring it before hand?

Mr. HENRY. Yes, indeed.

Mr. OSTERTAG. In other words, he is supposed to know exactly what will be carried?

Mr. HENRY. He is indeed.

Mr. OSTERTAG. Now, he has a station and a program originates through a central network and he is only a receiver and an outlet for it. How can he be held responsible for what originates with a network and is a nationwide program?

Mr. HENRY. Because he can refuse to carry the network programs he thinks should not be carried.

Mr. OSTERTAG. Does he have to police the programs originating with a network?

Mr. COX. He is entitled to rely on the network's established procedures and to assume normally there would be no problem. Therefore, if a commercial came through he thought was offensive or false and misleading, he would have no problem if he carried it the first time, because he had no advance notice. But if he continues to carry it, he would have a problem.

The Federal Trade Commission sends out a pamphlet showing decrees that have been entered, and so forth, so that they can find out when advertisers have been found guilty of unfair practices or have been accused of it, and a particular broadcaster who carries the dubious kind of advertisements, we would be concerned about.

We are also concerned about the broadcaster who advertises its own popularity and so on.

Mr. HENRY. As a practical matter they are associated with the network and they have a great deal of influence, and if a particular series

is unduly violent or in bad taste, after one or two episodes the licensee could refuse to carry it.

Mr. OSTERTAG. I was talking about where he was only an outlet for a commercial that originated with a network. Can you hold him responsible in that instance?

Mr. HENRY. When you say "hold him responsible," it is only the rare instance where the exercise of that responsibility is called into question because of this prohibition against our censoring programs. It is only the flagrant type of offense or the continuous carrying of some kind of offensive program that creates difficulties.

QUALITY OF TV PROGRAMS

Mr. OSTERTAG. Aside from the issue of your authority to exercise more jurisdiction over the time of commercials, I think the public, generally speaking, have been somewhat disappointed and there is a great concern with the way television has gone backward rather than forward in the general nature, class, and types of programs that are being advanced to the public today. In other words, instead of going into a higher grade and being of greater benefit to the public, they are getting worse. Do you agree with that?

Mr. HENRY. This is a matter of opinion. My personal opinion is that it is getting better. I think there are more programs devoted to news, for example, more hours devoted to news than heretofore. I think there are more hours devoted to public affairs than heretofore. I think there are more locally originated programs than heretofore. I think there is very much to be desired. I think there is much room for substantial improvement, but I do believe that television is going forward in the sense that you are talking about rather than backward.

Mr. OSTERTAG. That is all I have at the moment.

Mr. JONAS. Mr. Chairman, since it is just 15 minutes before the lunch hour, would you mind if I raised another question before going into the justifications?

Mr. BOLAND. No; that will be fine.

FAIRNESS DOCTRINE

Mr. JONAS. I am getting complaints about your so-called fairness doctrine.

Mr. HENRY. We have had a good deal of correspondence about it. As a result of some of the correspondence we had about it, some complaints and some instances that were brought to our attention, we issued a bulletin last July to bring to the attention of our licensees some of the areas concerning which we thought they should be reminded concerning the fairness doctrine. That resulted in some feeling on the part of some broadcasters that we had changed our policy and imposed new burdens on them. We have tried to make clear since then that we have not imposed new burdens on them; that their responsibilities are the same as they have been since 1949 when the fairness doctrine was adopted, and that their methods of operation should continue to be the same because their responsibilities are the same. We pointed out particular instances in which we thought they may have become lax. For example, we had a complaint that a broadcaster had refused to carry an unsponsored program dealing with one

side of a controversial issue on the sole ground that it was unsponsored and the program that had presented the other side of the controversial issue had been sponsored. We ruled that all other things aside, a broadcaster could not use this argument to prevent a contrasting point of view getting on the air.

METHODS OF PRESENTING CONTRASTING POINTS OF VIEW

Mr. JONAS. May I interrupt you there? How would he do that if he had a sponsored program on one side, paid for; do you mean he would be obligated to provide free time for the other side?

Mr. HENRY. Not necessarily. There would be a thousand and one ways for him to comply with the fairness doctrine without putting on another specific free program. Take, for example, the test ban treaty issue, which gave rise to this question. Let us say a station puts on 15 minutes of a program urging the Senate not to approve the test ban treaty. That does not mean, in and of itself, that the broadcaster has to put on 15 free minutes urging the contrary. But the broadcaster's overall responsibility is to present contrasting points of view. He could do so, perhaps, through newscasts or local discussion programs that were part of his regular schedule.

Mr. JONAS. You mean he would have to organize that himself?

Mr. HENRY. It might have been dealt with by the network.

Mr. JONAS. But suppose it is not. Are you not requiring him, if John Smith's associates pay for a program on one side of a controversial issue, would not this doctrine require, if no one volunteers to sponsor the other side, the broadcaster to organize and present the other side?

Mr. HENRY. Not necessarily. He could deal with it editorially on his own.

Mr. JONAS. Suppose he does not want to do that?

Mr. HENRY. He does not have to put on the original program.

Mr. JONAS. I think, personally, that is carrying it beyond the realm of reasonableness. If somebody in the community wants to hear the other side, why do they not sponsor it? Why is it incumbent on the broadcaster to organize a program on the other side?

Mr. HENRY. I might add the Commission was unanimous in this feeling and each Commissioner has his own ideas about this, but I think we are generally agreed that the fairness doctrine as such is a good policy. It is endorsed by the broadcasters, by their associations, and by the FCC. It gives the original choice to the broadcaster as to whether to discuss or not to discuss any issue of public importance. The doctrine says if he chooses to discuss an issue of public importance he has a duty to present contrasting points of view on that issue. As I said before, as a practical matter there are a thousand and one ways to comply with that doctrine. Each broadcaster has a lot of imagination and he can deal with the issue in any of a number of ways. If we were to say that if a controversial issue comes along and is sponsored and the broadcaster makes no effort to deal with it in any way, and is not obligated to do so, we would be saying, in effect, he could use his federally granted license to discuss on the air only one side of those issues that he himself chose, and the public would be denied what we think is a paramount right to be informed on both sides of the issue.

Mr. OSTERTAG. You are saying if he sponsors the original program?
Mr. HENRY. No; some advertiser or some foundation.

OBLIGATION OF BROADCASTER

Mr. THOMAS. Could I interrupt? Do you not have a parallel in the old tort law that this doctrine of fairness comes from? It seems like you have that old principle of tort law that if a man has an agency or instrumentality and through that he sets something in motion and damage flows from it, he is responsible. Is not the fairness doctrine a carryover from that old tort law? In other words, he does not have to give X, who wants to start this ruckus, an opportunity to do so, but if he does permit him to start it then he has to use some extra degree of care, maybe, to see that the other side of the question is brought to the public. Is that not the sum and substance of it?

Mr. LOEVINGER. I think that is precisely right.

Mr. HENRY. I think that is good analogy. If we were to hold otherwise we would be in effect saying that the public has no right to hear various sides of a question of importance.

Mr. THOMAS. You are saying he has some duty and some responsibility and maybe he will incur some liability if he does not see that John Q. Public gets the other side of it. I think your decision is eminently correct.

Mr. LOEVINGER. As an example, suppose some rich constituent of yours is persuaded you are a very poor representative of the people and he takes an hour on the air, and he makes a violent attack on you. You do not have the money to pay for time on the air. Do you not think you are entitled to an opportunity to respond and that the public is entitled to hear from you?

ANALOGY TO NEWSPAPERS

Mr. JONAS. If I requested such opportunity, I think it should be provided. But suppose he takes a full-page ad in the newspaper to denounce me; who will provide the money to reply?

Mr. LOEVINGER. There you can go and run off mimeographed sheets if you want to, and even if you cannot hire anybody, you and your family can go out on the street and pass them around. There is a greater accessibility to communication by printed means than there is by radio broadcasting. There is no way you can get on the air and answer him except by broadcasting.

FULFILLMENT OF BROADCASTER RESPONSIBILITY

Mr. JONAS. If somebody pays John Smith to denounce me on television or radio and I cannot get anybody to pay for 1 hour to defend me, your rule would require the station to give me 1 free hour?

Mr. HENRY. Not necessarily, and not necessarily the person attacked. Again there are many, many ways to satisfy this doctrine.

Mr. JONAS. You have not named but one. What are some of the other ways?

Mr. HENRY. Other than broadcasting a free program of exactly the same length, they could go back over the past year and if they had covered your views on the same issue you had been attacked on in news

broadcasts or in your regular reports to the people, this might well take care of it, for example.

Mr. JONAS. Off the record.

(Discussion off the record.)

EQUAL TIME IN POLITICAL BROADCASTS

Mr. THOMAS. I believe in the fairness doctrine, but Mr. Jonas has raised a question of a burden on somebody where it is not a matter of an exact equity, because you are putting the burden on him or somebody else, and I think it may be a little extreme if carried to the ultimate up and down the line, particularly when you get into elections where you have paid advertising.

Mr. COX. A different doctrine applies there. In the political area if one side pays, the other side has to pay.

Mr. OSTERTAG. That gets in the equal time question?

Mr. LOEVINGER. Yes. That is statutory.

Mr. HENRY. We think the fairness doctrine is fair and equitable. You have to make a judgment of whether you will let, for example, the people who can pay for time be unanswerable or not.

STATEMENT ON FAIRNESS DOCTRINE

Mr. BOLAND. Insert in the record at this point a complete statement on the fairness doctrine.

(The information supplied follows:)

BROADCAST LICENSEES ADVISED CONCERNING STATIONS' RESPONSIBILITIES UNDER THE FAIRNESS DOCTRINE AS TO CONTROVERSIAL ISSUE PROGRAMING

Several recent incidents suggest the desirability of calling the attention of broadcast licensees to the necessity for observance of the fairness doctrine stated by the Commission in its opinion of June 1, 1949, in docket No. 8516. The Commission adheres to the views expressed in that opinion and continues to apply that policy; namely, that the licensee has an affirmative obligation to afford reasonable opportunity for the presentation of contrasting viewpoints on any controversial issue which he chooses to cover.

The Commission has undertaken a study to consider what actions, perhaps in the form of a primer or rules, might be appropriate better to define certain of the licensee's responsibilities in this area. Without undertaking at the present time to specify all, or the most important, applications of the policy, it is appropriate to call attention to the Commission's view of its application in three currently important situations:

(*a*) When a controversial program involves a personal attack upon an individual or organization, the licensee must transmit the text of the broadcast to the person or group attacked, wherever located, either prior to or at the time of the broadcast, with a specific offer of his station's facilities for an adequate response (*Clayton W. Mapoles*, 23 Pike & Fischer, R.R. 586, 591; *Billings Broadcasting Company*, 23 Pike & Fischer, R.R. 951, 953).

(*b*) When a licensee permits the use of his facilities by a commentator or any person other than a candidate to take a partisan position on the issues involved in a contest for political office or to attack one candidate or support another by direct or indirect identification, he must immediately send a transcript of the pertinent continuity in each such program to each candidate concerned and offer a comparable opportunity for an appropriate spokesman to answer the broadcast (*Times-Mirror Broadcasting Co.*, 24 Pike & Fischer, R.R. 404, 405).

(*c*) When a licensee permits the use of his facilities for the presentation of views regarding an issue of current importance such as racial segregation, integration, or discrimination, or any other issue of public importance, he must offer spokesmen for other responsible groups within the community similar

opportunities for the expression of the contrasting viewpoints of their respective groups. In particular, the views of the leaders of the Negro and other community groups as to the issue of racial segregation, integration, or discrimination, and of the leaders of appropriate groups in the community as to other issues of public importance, must obviously be considered and reflected, in order to insure that fairness is achieved with respect to programing dealing with such controversial issues (*Editorializing Report*, 1 (pt. 3) Pike & Fischer, R.R. 201, 204–206; cf. *WBNX Bctg. Co., Inc.*, 4 Pike & Fischer, R.R. 242, 248).

In determining compliance with the fairness doctrine the Commission looks to substance rather than to label or form. It is immaterial whether a particular program or viewpoint is presented under the label of Americanism, anticommunism or States rights, or whether it is a paid announcement, official speech, editorial, or religious broadcast. Regardless of label or form, if one viewpoint of a controversial issue of public importance is presented, the licensee is obligated to make a reasonable effort to present the other opposing viewpoint or viewpoints.

The Commission does not seek to prevent the expression of any viewpoint by any licensee on any issue. It does seek to prevent the suppression of other contrasting viewpoints by any licensee on any issue when licensed broadcast facilities have been used for the presentation of one view of the issue. This is required by the public interest standard of the law.

Adopted: July 25, 1963.

Mr. THOMAS. Gentlemen, let us get some lunch and be back here at 1 o'clock.

AFTERNOON SESSION

Mr. BOLAND. The committee will come to order, please.

EQUAL TIME IN POLITICAL BROADCASTS

Mr. WYMAN. Mr. Chairman, I want to be educated just a little bit about this equal-time business.

Mr. HENRY. We will try.

Mr. WYMAN. Under the present rules and regulations and general statutory law, is a person who obviously is not a bona fide candidate for office but is running to get his name in the paper or as a straw, entitled to the same amount of time as anybody else?

Mr. HENRY. I think the answer is that if he is lawfully qualified under the laws of the jurisdiction in which he is running, then section 315 applies to him.

Mr. WYMAN. What is the obligation under section 315 upon a television station? If an announced candidate makes a 15-minute broadcast, not paid, can anybody else who is an announced candidate demand that the station should give him an equal amount of time for no cost?

Mr. HENRY. Basically, yes. The statute reads if anyone who is legally qualified is permitted to use the services of a broadcasting station, then that station shall afford equal opportunities to all other such candidates. Equal opportunities more or less means what it says. It means comparable time, time of day, an equal amount of time, and under roughly the same circumstances under which it was offered to the first candidate.

EXEMPTIONS TO EQUAL-TIME PROVISIONS

Mr. JONAS. Would it cover this case? If a station covers the laying of a cornerstone at a post office and shows the Congressman run-

ning for reelection making a dedicatory speech, or something of that sort, would the station have to give equal time to his opponent?

Mr. HENRY. No. There are four exemptions, bona fide newscasts, bona fide news interviews, bona fide news documentary, and on-the-spot coverage of bona fide news events. If a candidate appears on any of those kinds of programs, then the equal opportunities provision is not called into play.

Mr. WYMAN. Is this the reason so many of these political candidates do not become political candidates until the last minute, in the sense of announcing?

Mr. HENRY. I do not know what enters into their judgment on that.

Mr. BARTLEY. It could be.

Mr. HENRY. That may be part of it.

Mr. WYMAN. Even though a person is an incumbent, the fact of his making what might be construed to be an obviously politically appealing talk, disguised as a report to his people or one thing and another, if he is not an announced candidate, does not invoke the provisions of this section of the statute. Is that right?

Mr. HENRY. I do not think it invokes it until he is a lawfully qualified candidate, whatever that may be. If he had not filed his petition with the appropriate authority, then I think technically he is not covered by this section.

We have another part of our policy which we discussed earlier this morning, which is referred to in section 315, which says that nothing in the foregoing shall be construed as relieving broadcasters from the obligations imposed upon them under this chapter to operate in the public interest and to afford reasonable opportunity for the discussion of conflicting views on issues of public importance.

So, if an incumbent who was not a candidate got on the air and made a speech involving controversial issues of public importance, the station would have some responsibility to see that the other sides of those issues were aired.

That might not require them to put on a candidate with the same amount of time, necessarily, but they would still have to see that the public got the other side of the story.

Mr. WYMAN. If somebody takes, let us say, 15 minutes of time and pays for it, whether he is a candidate or not, this does not invoke any equal-time benefit, does it?

Mr. HENRY. We also discussed that this morning. It does not involve the equal-time requirements of section 315. It does involve our fairness doctrine, which says if you discuss a controversial issue of public importance, then you must make reasonable efforts to see that the contrasting points of view are presented. The question of whether it was paid for or not does not in and of itself control.

Mr. WYMAN. Suppose Johnny Jones buys a TV station and he is a complete devotee of one of the two major political parties and he says, "Except as to absolute minimum requirements, I am not going to give any time on this station, unless I have to, to anybody else except candidates and people who express a certain point of view." I know he is in trouble, but let us assume he does not say this specifically, and this is his unwritten policy. So, he has people who express this point of view on his station repeatedly, yet he flatly declines to

make available expense-free, costless time to the contrary point of view. What can you do about it?

Mr. HENRY. He would run aground of the rocky shoals of the fairness doctrine. If that came to our attention and somebody specifically requested that we deal with it, we would question him on it.

ACTION OF COMMISSION IN FAIRNESS DOCTRINE CASES

Mr. WYMAN. Then what would happen?

Mr. HENRY. It would depend on whether he could justify it. If he justified it basically in the terms that you have just expressed it, we would say he was not complying with our fairness doctrine and that this matter would be considered at the time his license came up for renewal.

Mr. WYMAN. For renewal but not for suspension.

Mr. HENRY. Not unless he just persisted in view of our admonishing him and it became such a flagrant violation of our policy that we should call it into question immediately.

USE OF CEASE-AND-DESIST ORDERS AND SHOW-CAUSE ORDERS

Mr. WYMAN. Have you, in your General Counsel's office, a procedure which might be analogous to cease-and-desist orders?

Mr. HENRY. Yes.

Mr. WYMAN. Suppose somebody does not cease and desist, would this invoke contempt procedings?

Mr. HENRY. Yes; it could invoke contempt proceedings ultimately, or it could result in our issuing a show-cause order as to why his license should not be revoked.

PERIOD OF TV LICENSE

Mr. WYMAN. How long a period does a fellow who has a TV station get his license for?

Mr. HENRY. Three years.

Mr. WYMAN. So, if the ownership should change to a straw, but you could not prove it was a straw, then unless it was a very aggravated situation, the facilities of a particular TV station under existing regulations and existing statutory law could be rather pointedly oriented before that 3-year period expired?

Mr. HENRY. Theoretically, it could. I think as a practical matter, nobody with a valuable franchise of this kind would just fly in the face of a Commission query and an indication from the Commission that he was, in fact, violating our policy.

Again, if he did choose to go this route, then the question would be whether we let him go it for the remaining time of his license. As I say, if it was serious enough, then I would assume we would consider issuing a show-cause order immediately.

EDITORIALIZING ON TV

Mr. JONAS. There is a growing trend toward editorializing in the television industry; is there not?

Mr. HENRY. I believe there is; yes.

Mr. JONAS. Is this an exception to this rule?

Mr. HENRY. No.

Mr. JONAS. The editor or the speaker for the station always says the views expressed are his own. Who is the judge of whether he is discussing a controversial issue in a manner that would require him to go out and solicit somebody to come on and rebut his editorial?

Mr. HENRY. Basically, the broadcaster makes this initial decision. If that is called into question, then we review the decision.

Mr. JONAS. Then you would have the right to determine whether that was taking sides in a controversial issue?

Mr. HENRY. We make the ultimate decision as to whether the station owner has discussed or broadcast or put forth only one side of a given controversial issue.

Mr. JONAS. That gives you censorship rights; does it not?

Mr. HENRY. No; because, again, it gets back to the broadcaster's choice originally to discuss or broadcast the matter dealing with this controversial issue. This is his choice to begin with. Once he makes that decision, then he has to live up to our fairness doctrine, but he knows that in advance.

Mr. JONAS. What about the commentators who are on the channels?

Mr. HENRY. The same thing applies.

Mr. JONAS. I do not know who is to be the one to decide. I have a view on that. Does the Commission contend it has the final authority?

Mr. HENRY. Yes; we have the final authority, but we have made it clear through any number of pronouncements and any number of specific rulings that the broadcaster's judgment in this area is extremely broad, and he has a great deal of discretion.

Mr. JONAS. You mean he would not carry the burden of proof? Somebody would have the burden to prove that he had violated the doctrine?

Mr. HENRY. I think that is a good analogy; yes. In other words, the area of his discretion and judgment is extremely broad, and we would make a ruling that his judgment was in error only in extreme instances.

Mr. JONAS. Have you ever denied the renewal of a license on this ground?

Mr. HENRY. No; not that I know of.

Mr. THOMAS. They did once, on one station. I think we failed to renew one, on all grounds. What is our record? Is it one or several?

Mr. HENRY. We have had several revocations recently, but not on this ground.

Mr. THOMAS. Years ago, I think they had one.

BROADCASTER'S RESPONSIBILITY IN FAIRNESS DOCTRINE CASES

Mr. HENRY. It is important to remember this: If we find there has been a violation of the fairness doctrine and that the broadcaster has in effect been one sided on a given issue, he usually has ample opportunity to correct this situation in future broadcasts, and it is entirely up to him as to how he will go about airing the other view. He can do it through carrying network shows that he had not been

carrying, or he can put on his own broadcast with his own personnel. He can hire talent. He can have a discussion program. He can call upon citizens in the community simply to talk. There is a limitless number of ways he can satisfy the doctrine.

Mr. JONAS. I certainly recognize the importance and even necessity of fair play and equal opportunity to present all sides. Where I question your doctrine is the requirement that responsibility should be placed on the station to go out and manufacture a program if no one requests or presents one. If there are people who do not like the point of view expressed by the station, I think the fairness doctrine—this is my idea of a fairness doctrine—would be met if those people requested an opportunity to present the other side, and I think they should have that opportunity.

Mr. HENRY. We have no rule and it is not part of the fairness doctrine to say that the broadcaster has to go out and manufacture a program. Basically, he has to take affirmative steps to let people know what is going out over his airways, and to make sure that they know that they do in fact have an opportunity to get on the air. That, I think, is probably the most important thing. As long as he satisfies that requirement, if they choose not to answer one or another program, then he has fully met the fairness doctrine.

Mr. JONAS. That is all, Mr. Boland.

SUMMARY OF BUDGET FOR 1965

Mr. BOLAND. We will turn to the justifications and put pages 1, 2, 3, and 4 in the record.

(The pages follow:)

SUMMARY OF JUSTIFICATIONS FOR 1965 BUDGET ESTIMATE

The Federal Communications Commission submits herewith its budget estimate in the amount of $16,610,000 for fiscal year 1965.

In developing our budgetary requirements we have made every effort to reflect the wishes of the President to hold budgetary requirements to absolute minimums. We have applied a most stringent policy in the fact of mounting workloads in many areas of the Commission's work. In spite of our efforts to avoid additional expenditures our program for 1965 calls for some increases in staff.

The following table provides a breakdown of the staff and dollar amounts requested for 1965 compared with actual figures for 1963 and estimates for 1964:

	1963 Actual	1964 Estimate	1965 Estimate	Increase
Average employment	1381.6	1473.4	1532.7	59.3
Personnel compensation	$11,336,534	$12,780,000	$13,700,000	$920,000
Personnel benefits	843,407	938,000	990,000	52,000
Other obligations	2,766,969	1,882,000	1,920,000	38,000
Total	14,946,910	15,600,000	16,610,000	1,010,000

In keeping with the wishes of the administration, we are, subject to approval of the courts, instituting for the first time a schedule of fees for the filing of numerous types of applications. It is hoped that the Federal Communications Commission will deposit $3,800,000 into the Treasury annually through this program.

We propose to develop further our manpower utilization program to uncover areas where more efficient utilization of our staff can be made. It is with the hope that some economies can be realized through this program that our estimates have been held to the levels recommended.

It is our aim, by the end of fiscal 1965, to reduce slightly many of the application processing backlogs that have been plaguing the Commission for years. We are relying on four factors to accomplish this even though our total application workload will increase in 1964 and 1965. The four factors we are relying on to help us are: (1) the installation of the computer, (2) revisions in rules that have been made and will continue to be made in 1964 and 1965, (3) improved manpower utilization and (4) some increases in staff for areas of processing work which are not compatible with computer operation.

The schedule under which we are operating calls for the computer to become operational in February 1964. Initially it will take over the large clerical operation of processing amateur and citizens applications in the safety and special radio services and engineering calculations and stock ownership records in the broadcast services. Other safety services (aviation, marine, etc.) will be converted to machine operation at intervals throughout the balance of fiscal 1964 and 1965. Complete and detailed licensee records will be maintained on the computer as each service is converted.

In the broadcast area we plan to continue our analysis and study of applications with respect to multiple owners, concentration of control factors, trade practices which may result in unfair competition, time brokerage contracts, excessive commercials, and programing; review the AM rules; and continue at approximately the same level our enforcement program in the complaints and compliance area.

The estimates in this budget propose the continuance of our program to gradually bring our staff up to the level recommended in the management report of Booz, Allen & Hamilton. It was pointed out in our budget submission of last year that 3-year programs were being undertaken in several areas to bring our staff up to the desired level. Our program for expansion has now been revised to provide smaller increases over a longer period.

The second phase of one of these programs is proposed for our Field Engineering Bureau where we propose to increase enforcement activities through additional inspections and interference investigations. Also, by making fuller use of monitoring facilities through the addition of a few employees to man monitoring stations we will provide a very small increase in monitoring activities.

This budget also provides the second phase of the stepped-up program in common carrier activities. This request is consistent with the recommendation of Booz, Allen & Hamilton that our staff be strengthened to permit the Commission to more adequately support a continuing program of common carrier regulation with particular emphasis on rate regulation work.

The distribution of manpower and the total cost of each activity including personnel compensation, benefits, and other obligations for 1964 and 1965 is as follows:

	1964		1965		Increase	
	Average employees	Total cost	Average employees	Total cost	Average employees	Total cost
I. Applied technical research and frequency allocation	91.4	$1,091,323	94.4	$1,149,489	3.0	$58,526
II. Broadcast	340.4	3,567,720	340.4	3,771,971	----------	204,251
III. Safety and special	160.5	1,563,107	154.5	1,537,430	−6.0	−25,677
IV. Field engineering	409.5	4,447,454	440.5	4,778,716	31.0	331,262
V. Common carrier	171.8	1,909,198	194.8	2,202,419	23.0	293,221
VI. Executive, staff, and service	299.8	3,021,198	308.1	3,169,615	8.3	148,417
Total	1,473.4	15,600,000	1,532.7	16,610,000	59.3	1,010,000

The following table shows the increases requested for personnel compensation for the various organization units of the Commission and the personnel benefits and other obligations requirements of the Commission as a whole:

	1964 estimate		1965 estimate		Increase	
	Average employees	Amount	Average employees	Amount	Average employees	Amount
Office of Commissioners	47.7	$575,000	48.0	$593,000	0.3	$18,000
Office of Executive Director	180.9	1,195,000	185.9	1,245,000	5.0	50,000
Review Board	25.8	275,000	25.8	293,000	.....	18,000
Office of Opinions and Review	20.0	207,000	20.0	220,000	.....	13,000
Office of Hearing Examiners	36.0	420,000	34.0	405,000	−2.0	−15,000
Office of Reports and Information	5.0	46,300	5.0	48,000	.....	1,700
Office of Secretary	37.2	235,700	37.2	236,000	.....	300
Office of Chief Engineer	91.4	913,000	94.4	985,000	3.0	72,000
Office of General Counsel	44.7	468,000	47.7	515,000	3.0	47,000
Field Engineering Bureau	409.5	3,279,000	440.5	3,589,000	31.0	310,000
Common Carrier Bureau	164.9	1,615,000	187.9	1,875,000	23.0	260,000
Safety and Special Radio Services Bureau	157.4	1,297,000	151.4	1,259,000	−6.0	−38,000
Broadcast Bureau	252.9	2,254,000	254.9	2,437,000	2.0	183,000
Total personnel compensation	1,473.4	12,780,000	1,532.7	13,700,000	59.3	920,000

	1964 estimate	1965 estimate	Increase (+) or decrease (−)
Total personnel benefits	$938,000	$990,000	$52,000
Other obligations:			
Travel and transportation of persons	245,000	245,000	.....
Transportation of things	50,000	50,000	.....
Rent, communications, and utilities	440,000	460,000	20,000
Printing and reproduction	145,000	145,000	.....
Other services	256,000	299,000	43,000
Supplies and materials	210,000	210,000	.....
Equipment	456,000	441,000	−15,000
Land and structures	80,000	70,000	−10,000
Total, other obligations	1,882,000	1,920,000	38,000
Grand total	15,600,000	16,610,000	1,010,000

COST OF PAY INCREASE AND PERIODIC STEP INCREASES

Mr. BOLAND. This page shows that you are asking $16,610,000, an increase of $1,010,000 over last year. In 1964 you have $15,600,000. What percent of the $1,010,000 is attributable to both the pay increases and the periodic increases you will have?

Mr. HENRY. We put that in the record. As I decipher it, and Mr. Plummer can correct me—it is $270,000——

Mr. PLUMMER. The periodic step increases, within-grade increases that will become due in 1965 will cost $115,000.

Mr. BOLAND. Is it $270,000 plus $115,000 plus $110,000?

Mr. PLUMMER. Yes, sir.

Mr. JONAS. $495,000.

Mr. PLUMMER. That is right.

Mr. HENRY. That seems like a lot to me.

Mr. BOLAND. $495,000 of the $1,010,000 is attributable just to pay increases?

Mr. HENRY. That is right.

ON-BOARD EMPLOYMENT

Mr. BOLAND. How many people had you aboard as of January 1?
Mr. SOLAN. 1,463.
Mr. BOLAND. What were you allowed?
Mr. SOLAN. 1,508.

STAFF INCREASE REQUESTED

Mr. BOLAND. You are asking in 1965 for 59?
Mr. SOLAN. 59.3.
Mr. BOLAND. You had only 1,463 aboard as of January 1?
Mr. SOLAN. That is right. We have 17 commitments. Actually, we are recruiting for 28 vacancies right now to bring us up to that 1,508.
Mr. HENRY. But the 59 increase is over the 1,473, not over the other.
Mr. BOLAND. Did you say 1,463 or 1,473?
Mr. HENRY. The table on page 3 shows 1,473 as the average 1964 employment.
Mr. JONAS. That is average. That is not yearend.
Mr. THOMAS. We will have to straighten out the difference between man-years and jobs. If you have man-years, you will have to add 5 or 6 percent to it to get jobs.
Mr. BOLAND. How about the actual bodies, getting away from the man-years? What is the total employment, the actual bodies?
Mr. SOLAN. We expect to have 1,508.
Mr. BOLAND. As of?
Mr. SOLAN. As of June 30.

RELATIONSHIP OF POSITIONS TO AVERAGE EMPLOYMENT

Mr. THOMAS. But you appropriated for 1,571 for fiscal 1963.
Mr. SOLAN. There would be positions which would be filled at one time or another during the year, but we would never have more than 1,508 at any one single time. Let me illustrate what I mean. If we took 25 positions of people who work on, say, safety and special applications, and we made them card-punch operators or something like that under the computer program, they are 25 different positions, even though half a year they are one, and half a year they are something else. The first half of the year they are application processing clerks, and the last half of the year they are card-punch operators. They are different positions.
Under the provsions of the budget circular, we have to report any position that is filled any time during the year. You always get more positions in that manner than you can have filled at any given time.

AMOUNT COLLECTED FROM FEES

Mr. JONAS. Before you leave the summary, you propose in your user charges to recoup $3,800,000.
Mr. HENRY. Approximately; yes.

Mr. JONAS. Would it be well right here to have a list of those charges?

Mr. BOLAND. The fees?

Will you submit for the record a schedule of fees?

Mr. SOLAN. I might point out, none of those fees go to the Commission.

Mr. JONAS. They go to the Treasury.

Mr. HENRY. Yes. We will submit a schedule of fees for the record.

(The information supplied follows:)

The schedule of fees for filing applications for the different categories of service follows:

Broadcast services

	AM	FM	TV	Translator	Auxiliary
Application for construction permit for new station or major change	$50	$50	$100	$30	$30
Application for renewal or assignment of license or transfer of control, exclusive of FCC form 316 applications (where more than 1 broadcast station license is involved, the application must be accompanied by the total amount of the fees prescribed for each license so involved)	50	50	100	30	30
Application filed on FCC form 316 (where more than 1 broadcast station license is involved, the application must be accompanied by the total amount of the fees prescribed for each license so involved)	30	30	30	(1)	(1)
Application for change of call letters for broadcast station	20	20	20	20	20
All other applications in the broadcast services (excluding television translator applications not specified above)	30	30	30	30	30

[1] No fee.

Fees are not required in the case of applications filed by tax-exempt organizations for the operation of stations providing noncommercial educational broadcast services, whether or not such stations operate on frequencies allocated for noncommercial educational use.

Common carrier services

Applications for initial construction permit. (No additional fee will be charged for application for license to cover. An application for authority to change location of a fixed station will be treated as an application for initial construction permit):

Domestic public land mobile radio service:	
Base station (includes associated mobile stations)	$100
Dispatch station, control station, or repeater station	25
Individual user mobile station	5
Point-to-point microwave radio service	30
Rural radio service:	
Central office station, interoffice station, or rural subscriber station	10
Rural subscriber station at temporary-fixed locations	10
Individual subscriber station	5
Local television transmission service	50
International fixed public radiocommunication services:	
International fixed public station:	
New station	100
Additional transmitter	100
Replacement of transmitter	50
International control station:	
New station	30
Additional transmitter	30
Replacement of transmitter	10
Other common carrier services	10

Common carrier services—Continued

Applications to make modifications or to supplement facilities at existing sites in the point-to-point microwave radio serivce	30
Applications for license for operation of a station at temporary-fixed locations in the point-to-point microwave radio service	30
Applications for modification of construction permit at an existing station location in the local television transmission service	50
Applications for license for operation of an STL, station at temporary fixed locations in the local television transmission service	50
Applications for license for operation of mobile television pickup station in the local television transmission service	50
Application for renewal of license:	
Domestic public land mobile radio service:	
Base station (includes associated mobile stations)	25
Dispatch station, control station, or repeater station	10
Individual user mobile station	5
Point-to-point microwave radio service	5
Local television transmission service	5
Rural radio service, all stations	5
International fixed public radiocommunication services:	
International fixed public station	75
International control station	10
Other common carrier services	5
All other common carrier radio applications	10
Application by communications common carriers for authorization to own stock in the Communications Satellite Corp	10
Sec. 214 applications by telephone companies	50
Sec. 214 applications by telegraph companies	10
Cable landing license applications	100
Sec. 221 applications	50
Interlocking directorate applications	10
All other common carrier nonradio applications	10

Safety and special radio services

Applications in the amateur radio service:	
For initial and renewed licenses	$4
For modification of license	2
Request for special call sign	20
Applications in the citizens radio service:	
For class A station authorization	10
For all other classes of stations in the citizens radio service	8
Applications for radio station authorizations or operational fixed microwave radio stations (no fee required for application for license to cover construction permit)	30
Applications for renewal only for which FCC Form 405A is prescribed	4
All other applications filed in the safety and special radio services	10

Fees are not required in the following instances:

(1) Applications filed in the police, fire, forestry-conservation, highway maintenance, local government, and State Guard radio services.

(2) Applications filed by governmental entities in any of the safety and special radio services.

(3) Applications filed by the following in the special emergency radio service: Hospitals, disaster relief organizations, beach patrols, and school buses, and nonprofit ambulance operators and rescue organizations.

(4) Applications filed in the disaster communications service.

(5) Applications for ship inspections pursuant to the Great Lakes Agreement, the Safety of Life at Sea Convention, and parts II and III, title III, of the Communications Act of 1934, as amended.

(6) Applications for novice class license in the amateur radio service, applications for amateur stations under military auspices, and applications filed in the radio amateur civil emergency service (RACES).

(7) Operational fixed microwave applications filed for closed circuit educational television service.

(8) Applications for Civil Air Patrol stations, aeronautical radionavigation stations, and for aeronautical search and rescue stations.

Commercial radio operators

Applications for commercial operator examinations:	
1st class	$5
2d class	4
3d class	3
Applications for commercial operator licenses (includes renewals, endorsements, duplicates, etc.)	2
Applications for restricted radiotelephone permits	2

Fees are not required for applications in the experimental radio services (other than broadcast).

Mr. BOLAND. It is our understanding the schedule of fees goes into effect March 17, irrespective of what has transpired in the legislative committee.

Mr. HENRY. That is correct.

Mr. JONAS. Do not these fees have to be impounded?

Mr. HENRY. They have to be held in escrow, in effect, until the court decides the matter.

Mr. BOLAND. The tables on 5, 6, 7, and 8 are all-embracive tables and are all covered under their respective activities. This is good information but we will pick up the figures as we go through the budget.

APPLIED TECHNICAL RESEARCH AND FREQUENCY ALLOCATION

We will turn to "Applied technical research and frequency allocation activity."

Here you are asking for an increase of $58,526 over 1964. This is occasioned by salary increases and 3 additional man-years. Your other obligations are reduced by $16,799 for 1965. Put pages 9, 10, and 11 in the record.

(The pages follow:)

APPLIED TECHNICAL RESEARCH AND FREQUENCY ALLOCATIONS ACTIVITY

INTRODUCTION

Directing, planning, and coordinating forward-looking and applied research programs and the allocation of radiofrequencies are carried out under this activity. Many of these programs are of national importance and others are necessary to improve service to the public. Radio propagation, radio measurements, experimental, type approval and acceptance, radiofrequency devices and systems and equipment are important areas of the work.

Financial requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Personnel compensation	$794,334	$913,000	$985,000	$72,000
Personnel benefits	59,020	68,580	71,905	3,325
Other obligations	67,492	109,743	92,944	−16,799
Total	920,846	1,091,323	1,149,849	58,526

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
1. Technical research and rulemaking	33.9	38.6	40.6	2.0
2. Experimenting, testing, and analysis	16.9	18.4	19.4	1.0
3. Frequency allocation and treaties	32.8	34.4	34.4	
Total	83.6	91.5	94.4	3.0

JUSTIFICATION BY ACTIVITY

Technical research and rulemaking

The Commission is kept advised on new developments in the communications field and expert consulting service is furnished the Commission and numerous other Government agencies by means of this activity which includes research on studies dealing with interfering effects and on uses of satellite communications; preparation of propagation curves based on data collected by the Commission and other organizations; studies of efficiency of various station assignment arrangements; participation in international technical conferences on communications; development of technical standards for new and improved radio systems and devices; type acceptance and certification of equipment for compliance with FCC standards, regulation of nonlicensed radiating devices for interference control, administration of all-channel TV receiver requirements, and licensing experimental stations.

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Research	12.5	16.1	17.1	1.0
Technical evaluations and rulemaking	21.4	22.5	23.5	1.0
Total	33.9	38.6	40.6	2.0

The above increase is needed to adequately perform the research functions as recommended by the BAH report. It is proposed to make a small annual increase in this function to arrive at what can be considered the best balance between FCC research and that done by other agencies and private industry, and to provide assistance in the development of technical standards and in equipment type acceptance and certification.

(*a*) *Research.*—A study has been initiated with regard to the need for more channels for the land "mobile services." The study will embrace a short term as well as a long-term solution of the problem.

Additional analysis of data from the UHF–TV project is going forward and will require considerable effort for at least another year. Several reports are planned on various phases of the project where data supplemental to the main aspects of the project were collected.

The feasibility of a manmade noise study throughout the radio spectrum is being considered at the present time. If it is determined that such a study should be made, further planning will be necessary to determine the best manner of conducting the study and the amount and type of equipment to be used.

Continuing work on studies regarding sharing between various types of satellite communications systems or between satellite systems and ground-based systems is essential. While the studies which have been made so far are sufficient for indicating the nature of the frequency allocations which will be required, further studies are necessary for actual station assignment practices.

Studies are going forward and will be continued into the various methods of conducting field strength measurements. In addition, studies are being conducted into the various methods of predicting field strengths with a view to improving the prediction technique.

Continual review of technical information from all available sources is required to keep the Commission and staff informed of promising developments, and

in order to supply expert consulting services to the Commission and to numerous other Government agencies including NASA, U.S. Coast Guard, Department of Defense, IRAC, FAA, and VOA.

A continuing investigation into computer programs for processing technical data is necessary to supply consulting service on computer technology to the Commission.

A cooperative project with the Electromagnetic Compatibility Analysis Center of the Department of Defense is planned to prevent any overlap in our efforts to reduce electromagnetic interference and to attempt greater compatibility between inputs to our respective computers.

Participation in the work of the International Radio Consultative Committee (CCIR) and other international technical organizations will continue so as to assure as much consistency as possible between their work and that of this agency.

(*b*) *Technical evaluations and rule making.*—This workload is increasing steadily due to advances in technology. New kinds of communications services, new equipment designs, and new nonlicensed apparatus must be evaluated and regulated. The resulting increased workload occurs principally in equipment-type acceptance and certification, and in development of technical standards for new systems and devices. The following table shows the increased equipment-type acceptance workload in recent years:

Fiscal year—	*Number of equipment types receiving type acceptance*
1956	65
1957	168
1958	249
1959	302
1960	249
1961	264
1962	414
1963	480

In addition to the numerical increase in type acceptances, there is a steady increase in complexity of equipment and the resulting work in evaluating equipment types. Type acceptance of equipment for licensing is based on evaluation of representations and test data submitted by the manufacturer.

Mr. BOLAND. Manpower requirements, top of page 10, and Research (reading):

A study has been initiated with regard to the need for more channels for the land "mobile services." The study will embrace a short term as well as a long term solution of the problem.

This explains some of the activities into which the Commission will go in respect to research in 1965. This is already in the record.

Mr. HENRY. Actually, all of our increases in manpower are for research.

EXPERIMENTING, TESTING, AND ANALYSIS

Mr. BOLAND. "Experimenting, Testing, and Analysis." You break this down into the number of employees engaged in this activity.

Put in page 13, and put in some of the studies and projects on page 14, the nine listed.

(The pages follow:)

Experimenting, testing, and analysis

Provides scientific and technical assistance to the Commission in the administration of the Communications Act. Includes making engineering tests of equipment and issuing certificates of type approval for equipment. Develops new measurement techniques and cooperates with professional societies in the establishment of standards and standard measurement techniques. Develops new monitoring and measuring equipment and systems for use by the Field Engineer-

ing Bureau and provides calibration service for the FEB, including calibrations for their Mobile TV monitoring units.

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	16.9	18.4	19.4	1.0

Type approval work is expected to increase and testing as a basis for enforcement of the recently enacted all-channel receiver legislation is also expected to reach a peak in 1965.

Type approval is the procedure whereby the Commission tests equipment at its Laboratory to determine that the equipment is capable of complying with the applicable technical standards. Type approval is required for certain classes of equipment, the performance of which is essential for safety, which is intended for use by unskilled persons, or which must meet very precise standards.

An increasing number of microwave stoves and ovens have been received during the last year and it appears that this may soon become an important venture, with rather large increases of type approval work in this area. There also appears to be developing an increase in the number and types of ultrasonic cleaners being submitted for type approval. Difficulties in obtaining compliance in type acceptance procedures in the Citizen's Radio Service and with regard to translators in the broadcast service also suggests that type approval procedures will have to replace type acceptance procedures in these areas, resulting in considerable more type approval work.

Calibration work is still lagging both with regard to the Laboratory and FEB equipment. The FEB is sometimes without needed equipment because of delays in calibration. Delays often make it necessary to ship equipment from one office to another to carry on FEB work. This is expensive in terms of both money and manpower. Although it is hoped that this situation can be improved within the next year, experience has shown that increasing time and effort per unit are needed in this area because of the increasing complexities of the equipment involved.

Sampling of type-accepted and type-approved equipment has been performed on a most urgent case basis and considerable noncompliance found.

Assuming that additional personnel are obtained in 1964, it is hoped that some of these problems may be reduced, and that progress may be made in the long-range studies and projects of broad significance, such as:

(1) noise and interference studies leading to interference measurement standards;

(2) transmission system studies, as for example, precision offset for TV stations;

(3) automated monitoring procedures and equipment;

(4) satellite and space communications and monitoring problems. These problems will probably have advanced to the operational stage requiring solution of interference problems by 1965;

(5) TV-sound power reduction;

(6) TV and FM—revision of oscillator radiation measurement methods;

(7) FM-stereo—development of test methods and procedures for enforcement of stereo rules—also requirements for stereo monitors;

(8) Marine—RTCM–CCIR selective calling system tests for marine radiotelephone for international standardization;

(9) automatic monitoring of channel occupancy.

During 1965, the Laboratory will work on projects including:

(1) development of loudness meter for the loud commercial problem;

(2) radiation from computers;

(3) determination of directional distortion on nondirectional FM antennas mounted on AM towers;

(4) study minimum power necessary for communication and methods for obtaining use of minimum power.

FREQUENCY ALLOCATION AND TREATIES

Mr. BOLAND (reading):

"Frequency Allocations and Treaties." This function is directed toward obtaining the most equitable distribution of radiospectrum space to best meet the critical frequency requirements of the various radio services * * *.

Put page 15 in the record.

(The page follows:)

Frequency allocation and treaties

This function is directed toward obtaining the most equitable distribution of radiospectrum space to best meet the critical frequency requirements of the various radio services such as broadcasting, public safety, etc., and promoting the most efficient frequency utilization with minimum harmful interference between assignments and services. In the worldwide shared use of the radio spectrum, close international and national cooperation and coordination are essential. Therefore, this requires frequent international telecommunication conference participation and international meetings. Domestically, continuous close coordination with all U.S. Government users of radio and with those responsible for U.S. telecommunication policy planning is essential to direct the development of our national communication system so as to meet our growing civil and governmental requirements.

Manpower requirements

	1963 actual	1964 estimate	1965 estimate	Increase
(a) Domestic frequency coordination and management	5.0	5.5	5.5	
(b) Major international conference activities	4.0	4.0	4.0	
(c) International interference and frequency coordination	4.0	4.0	4.0	
(d) International notification of frequencies	2.4	2.4	2.4	
(e) International conference information and records	2.0	2.0	2.0	
(f) Other international activities	1.0	1.0	1.0	
(g) Domestic frequency allocations	4.9	6.0	6.0	
(h) Frequency assignment records	7.5	7.5	7.5	
(i) Call signs	2.0	2.0	2.0	
Total	32.8	34.4	34.4	

INTERNATIONAL CONFERENCES

Mr. BOLAND. On page 16 you show "Major international conference activities." What conferences do you intend to have the Commission represented at in 1965?

Mr. LOEVINGER. I can tell him about one.

Mr. HENRY. There is one involving the aeronautical radio services. There is one in June, I believe.

Mr. RENTON. We have a conference in Stockholm. We have the International Telecommunication Union Extraordinary Administrative Radio Conference for Aeronautical. We have the ITU Administrative Radio Conference in Geneva in 1965. We have the ITU Plenipotentiary Conference in Geneva in 1965.

Mr. HENRY. That is the most important one. That is for a general examination of the ITU rules and regulations and agreements.

Mr. BOLAND. How many personnel do you take to that type of Conference?

Mr. HENRY. It depends. I attended one last October in Geneva, at which we had, I think, five Commission personnel. The people from

our Commission, I think, are the most knowledgeable and experienced in this field, and they are usually a great asset to the Conference. I would say at a big one, we would take five to six people.

Broadcast Activity

Mr. Boland. We shall turn to "Broadcast activity," one of your big services.

We shall put page 19 in the record.

(The page follows:)

Broadcast Activity

introduction

Broadcasting is a medium of radio transmission intended for reception by the general public.

Broadcasting includes both aural services (standard, or AM broadcasting, and frequency modulation, or FM broadcasting) and visual services (television and facsimile). Within these categories are contained several related auxiliary services.

The broadcast activity of the Commission in very general terms, consists of the licensing and regulatory functions of the broadcasting and associated auxiliary services.

The major portion of this work is handled by the Broadcast Bureau. In addition, the broadcast activity makes up the major workload of the Office of Hearing Examiners, Review Board, Office of Opinions and Review, and the Docket Division of the Office of the Secretary.

Total financial requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Personnel compensation	$2,839,033	$3,141,468	$3,339,969	$198,501
Personnel benefits	212,278	237,742	243,646	5,904
Other obligations	163,006	188,510	188,356	−154
Total	3,214,317	3,567,720	3,771,971	204,251

Total manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
(1) Application processing	124.4	126.3	127.3	1.0
(2) Hearings	110.2	118.9	116.9	−2.0
(3) Rules	25.4	24.1	23.8	−0.3
(4) Complaints and compliance	46.7	47.0	48.0	1.0
(5) Research and education	11.3	12 3	12.8	0.5
(6) Network	7.6	7.4	7.2	−0.2
(7) International	4.4	4.4	4.4	0
Total	330.0	340.4	340.4	0

Mr. Boland. The increase here is occasioned again by personnel compensation. The manpower requirements remain the same in 1965 as in 1964.

The table on page 20 is a breakdown of the requirements within the broadcast activity itself—Broadcast Bureau, Hearing Examiners, Review Board, Opinions and Review, Dockets Division.

Page 21 is a summary of the workload for various activities within the Broadcast Division.

APPLICATION PROCESSING

Page 22 is the "Application processing," and shows the manpower requirements broken down into requirements for AM, FM, TV, translators, and standard broadcast.

Put in the table indicating the workload of the AM activity, "Renewal applications, assignment and transfer" on page 23, and the table showing the actual and estimated authorized AM stations for the 10-year period 1955 to 1965, showing 2,840 10 years ago, and in 1965 you expect to have 4,300 AM stations fully authorized. Insert the narrative with respect to the "freeze" of May 10, 1962, "on the acceptance of standard broadcast applications for new stations and major changes in existing stations." (Reading:)

Because of the limited "freeze" on acceptance of new applications, the backlog of applications for new and major changes has been reduced substantially during 1963.

But it is expected to pick up after you lift the "freeze," I presume.

Mr. HENRY. Yes; we will. We will lift that "freeze," we hope, in June of this year.

(The material referred to follows:)

JUSTIFICATION BY ACTIVITY

Application processing

This portion of the broadcast activity budget covers all requirements for staff to process the various applications for construction permits and licenses in the AM, FM, TV, translator, and all other broadcast services.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
(a) AM	67.2	67.5	67.0	−0.5
(b) FM	14.2	14.4	14.6	.2
(c) TV	34.4	35.8	37.0	1.2
(d) Translators	4.9	5.0	4.9	−.1
(e) All others	3.7	3.8	3.8	0
Total	124.4	126.5	127.3	.8

(a) *Standard broadcast (AM).*—This activity involves the processing of applications for new stations, and modifications and changes in existing facilities. Processing of such applications includes consideration of questions such as multiple ownership, programing, violations of Commission rules and regulations in the operation of broadcast stations and trade practices which may be inconsistent with the duties and responsibilities of a broadcast licensee.

AM application workload

NEW AND MAJOR CHANGES

	1963 actual	1964 estimate	1965 estimate
Pending beginning of year	813	464	110
Received for processing	214	246	221
Designated for hearing	169	180	68
Disposed of without hearing	394	420	193
Pending end of year	464	110	70

AM application workload—Continued

SUPPLEMENTAL AND CONTINUING [1]

Pending beginning of year	633	472	468
Received for processing	2,032	2,600	2,600
Designated for hearing	3	4	4
Disposed of without hearing	2,190	2,600	2,600
Pending end of year	472	468	464

RENEWAL APPLICATIONS

Pending beginning of year	637	611	591
Received for processing	1,379	1,500	1,400
Designated for hearing	8	10	10
Disposed of without hearing	1,397	1,510	1,540
Pending end of year	611	591	441

ASSIGNMENT AND TRANSFER

Pending beginning of year	152	196	220
Received for processing	606	750	675
Designated for hearing	4	5	5
Disposed of without hearing	558	721	725
Pending end of year	196	220	165

[1] These applications include, for example, those for minor modification of permits, approval of transmitter site, extensions of time to construct, and license upon completion of construction, as well as applications for replacement or renewal of equipment, readjustment of antenna systems and minor change in transmitter locations, etc.—in essence, all those applications necessary to permit a station to go on the air following grant of an application for permit to construct, and to maintain a station on the air on a continuing basis.

The following table shows the actual and estimated authorized AM stations for the years 1955 to 1965:

1955	2,840	1961	3,757
1956	3,020	1962	3,886
1957	3,238	1963	3,997
1958	3,353	1964	4,150
1959	3,500	1965	4,300
1960	3,581		

On May 10, 1962, the Commission imposed a limited "freeze" on the acceptance of standard broadcast applications for new stations and major changes in existing stations. This action was the result of a recognition that assignments in the standard broadcast field were, as a matter of allocation, less efficient than desired. It was concluded that it would be necessary to revise many of the AM allocation rules to avoid compounding existing problems. A limited "freeze" was imposed while the matter was under study. A notice of proposed rulemaking was released May 17, 1963, and it is expected that new final rules will be adopted during fiscal year 1964.

Because of the limited "freeze" on acceptance of new applications, the backlog of applications for new and major changes has been reduced substantially during 1963.

It is estimated that in 1965, we will receive 221 applications for new stations and major changes in AM facilities. With adoption of new AM allocation rules and the data-processing program, we hope to be able to complete the necessary studies required and become reasonably current in this area.

The electronic data-processing procedures will facilitate and speed up many of the more tedious and time-consuming operations and will assist in reducing the delays in application processing.

DELAY IN APPLICATION PROCESSING

Mr. BOLAND (reading):

The electronic data-processing procedures will facilitate and speed up many of the more tedious and time-consuming operations and will assist in reducing the delays in application processing.

How long is the usual delay in the AM, FM, and standard activities?

Mr. HENRY. It is hard to say. It depends upon whether they have any uncorrected errors when they come in. We can get them out in as little time as 2 months if they are correct when they come in.

FREQUENCY MODULATION

Mr. BOLAND. Page 24, frequency modulation. This activity involves the processing of the various categories of applications in the FM service.

Put in the workload on frequency modulation application, new and major changes, and supplemental and continuing; and the table on page 25 indicating the 10-year period for FM, 679 stations in 1955, 1,800 in 1965.

(The material referred to follows:)

Frequency modulation (FM).—This activity involves the processing of the various categories of applications in the FM service as is explained on page 22 for the AM service.

FM application workload

NEW AND MAJOR CHANGES

	1963 actual	1964 estimate	1965 estimate
Pending beginning of year	239	276	250
Received for processing	335	550	575
Designated for hearing	0	30	50
Disposed of without hearing	298	546	575
Pending end of year	276	250	200

SUPPLEMENTAL AND CONTINUING [1]

Pending beginning of year	248	145	133
Received for processing	907	1,000	1,050
Designated for hearing	2	2	2
Disposed of without hearing	1,008	1,010	1,050
Pending end of year	145	133	131

RENEWAL APPLICATIONS

Pending beginning of year	178	278	260
Received for processing	616	525	550
Designated for hearing	0	1	1
Disposed of without hearing	516	542	559
Pending end of year	278	260	250

ASSIGNMENT AND TRANSFER

Pending beginning of year	33	62	84
Received for processing	219	225	225
Designated for hearing	3	3	3
Disposed of without hearing	187	200	225
Pending end of year	62	84	81

[1] These applications include, for example, those for minor modification of permits, approval of transmitter site, extensions of time to construct, and license upon completion of construction, as well as applications for replacement or renewal of equipment, readjustment of antenna systems and minor change in transmitter locations, etc., in essence, all those applications necessary to permit a station to go on the air following grant of an application for permit to construct, and to maintain a station on the air on a continuing basis.

The following table shows the actual and estimated authorized FM stations for the years 1955–65:

1955	679	1961	1,291
1956	682	1962	1,400
1957	709	1963	1,445
1958	791	1964	1,600
1959	934	1965	1,800
1960	1,093		

On July 25, 1963, the Commission adopted new rules for the FM broadcast service together with a table of FM assignment. As a result, it is expected that there will be a continuing upward trend in applications for new stations and for major changes in existing stations. Filing of applications by prospective licensees has undoubtedly been held up pending a decision in the FM rulemaking proceeding. With the rulemaking now completed it is expected a high level of applications should be filed in 1964 and 1965. With finalization of the new allocation rules, increased filings year by year is expected to resume.

The selective "spot check" procedure for in-depth processing of FM applications has been covered in the AM portion of this budget.

Since adoption of the new FM rules and allocation table, it is expected that manpower requirements for application processing will not increase proportionately with the expected increase in application receipts. The requested increase of 0.2 average employment for 1965 is requested to maintain a current status in the application processing area.

TV SERVICE

Mr. BOLAND. TV is shown at the bottom of page 25. This activity involves the processing of the various categories of applications in the TV service.

Can you give us a breakdown between the VHF and UHF with respect to the workload on page 26? Is there a breakdown on this?

Mr. HENRY. It depends on how you want it broken down. Of course, the total time devoted to television matters is not reflected in this table. That is just the number of applications. Television goes across all of the areas of broadcast activities, from application processing to rulemaking to hearings, and so on.

Mr. BOLAND. Put in the 10-year table, 1955–65, showing 610 in 1955 and 800 in 1965.

(The material referred to follows:)

This activity involves the processing of the various categories of applications in the TV service.

TV application workload

NEW AND MAJOR CHANGES

[1] These applications include, for example, those for minor modification of permits, approval of transmitter site, extensions of time to construct, and license upon completion of construction, as well as applications for replacement or renewal of equipment, readjustment of antenna systems and minor change in transmitter locations, etc.—in essence, all those applications necessary to permit a station to go on the air following grant of an application for permit to construct, and to maintain a station on the air on a continuing basis.

The following table shows the actual and estimated authorized television stations for the years 1955–65:

1955	610	1961	717
1956	650	1962	733
1957	700	1963	757
1958	718	1964	780
1959	726	1965	800
1960	717		

NUMBER OF UHF AND VHF STATIONS EXPECTED

Mr. BOLAND. What is the breakdown between UHF and VHF?

Mr. SHERIDAN. I would say probably 600 VHF.

Mr. BOLAND. I thought this morning somebody said there were only 90 UHF stations.

Mr. LEE. On the air, about 90.

Mr. BOLAND. That would be 100 between now and the end of fiscal 1965. You will not even come close to that.

Mr. SHERIDAN. Yes; 100 more.

Mr. HENRY. That would include educational stations, would it not?

Mr. SHERIDAN. Yes.

Mr. FORD. We have 54 applications pending now.

Mr. HENRY. We have some 80-plus educational stations now. They are not all UHF, of course.

TRANSLATOR DESCRIPTIONS AND WORKLOADS

Mr. BOLAND. Page 27 indicates the work on translators, VHF and UHF. Will you describe for the committee what a translator is?

Mr. HENRY. Mr. Sheridan is the expert in this field. The translator is a station which picks up a signal off the air and rebroadcasts it at a different frequency. It is usually low power and usually designed to serve an area which, due to reasons of topography, cannot pick up the signal of the regular broadcast station.

Mr. BOLAND. This extends the signal?

Mr. HENRY. Basically, that is correct. It fills in holes in the predicted contour.

Mr. BOLAND. The table at the bottom of page 27 shows 74 translators in 1957, and 2,100 in 1965.

Hearings, page 30. You have the hearings broken down: Broadcast Bureau, Hearing Examiners, Review Board, Opinions and Review, and Dockets Division.

The next table indicates the manpower requirements for those divisions.

Mr. HENRY. This is a total decrease of two people.

Mr. BOLAND. I do not know whether or not we need the next few pages, which indicate the hearings within the particular services, AM services, FM services, and so on.

Mr. HENRY. I might point out on page 35, toward the bottom, it says that the Commission has not made its final determination on whether it will permit the drop-in of VHF channels. We have made that decision, and the decision has been in the negative.

That will reduce the complexity of hearings that may occur in those areas.

Mr. BOLAND. Page 36, rules, covers the manpower required to handle all phases of rulemaking for the AM, FM, and TV services, and the narrative indicates there is a real need for a comprehensive revision of the rules in all of these services.

COMPLAINTS AND COMPLIANCE

Complaints and compliance, page 38. This is concerned with enforcement functions of the Commission in regard to broadcast stations' programing and other questions regarding compliance with the Communications Act. We went through this in the general statement.

You are asking for an increase of only one. You had 47 in 1964, 48 in 1965.

Put in the narrative on pages 39 and 40 on complaints.

(The pages follow:)

Complaints and compliance (enforcement)

This activity is concerned with the enforcement functions of the Commission. Complaints concerning the conduct of broadcast stations in their practices and programing, together with questions regarding compliance with the Communications Act, Commission rules and policies are analyzed, investigated as required, and proper corrective actions initiated, as appropriate. Most of the activity is centered in the Complaints and Compliance Division of the Broadcast Bureau.

Manpower requirements (average employment)

	Actual, 1963	Estimated, 1964	Estimated, 1965	Increase
AM	23.4	23.4	24.0	0.6
FM	1.8	1.8	1.8	
TV	21.5	21.8	22.2	.4
Total	46.7	47.0	48.0	1.0

The enforcement activities apply equally to television, standard broadcasting, and to FM. The Commission has by its enforcement actions in recent years demonstrated its intention to concern itself primarily with the actual performance of broadcast licensees rather than their promises, and to make sure that they fulfill their obligation to serve the public interest. The newly adopted enforcement procedures of the Commission have required the establishment of

a staff of Washington-based field investigators to investigate allegations of nontechnical violations by licensees as contrasted to the periodic technical inspections performed by the Field Engineering Bureau. The Intensified enforcement program of the Commission is beginning to show results in increased compliance by broadcast licensees.

Although a greater number of complaints are received from the public regarding television than regarding AM or FM broadcasting, thus requiring more correspondence regarding television, investigatory activities, on the other hand, are more largely devoted to AM licensees than either to TV or FM because a much greater number of AM stations are in operation. Additionally, many of the smaller AM stations involve marginal operations in which violations are more likely to occur than in the TV or larger AM stations.

The workload has steadily increased each year since the Complaints and Compliance Division was established in 1960, as the public has become more fully aware of the Commission's determination to regulate broadcasting in the public interest through stricter and more comprehensive enforcement. For example, whereas communications from the public (letters, telegrams, postal cards) averaged 1,000 per month in 1962, they averaged 1,660 per month in 1963. There was an equivalent increase in correspondence with licensees regarding such complaints, and a similar increase in the number of field investigations of cases which required on-the-spot investigation in order to ascertain the facts. The available staff has by no means been able to conduct field investigations of all cases meriting such investigation, nor has it been possible to put into effect the originally proposed program of audits-in-depth of selected stations on a regular and continuing basis for the purpose of providing information used in the processing of renewal applications, as well as to provide the Commission with general information as to the current practices of broadcast licensees.

Nor has the staff been able for the past 2 years to conduct any broad-scale investigations of general practices, as contrasted to investigations of specific complaints. For example, it is believed that, despite the activities of the House Legislative Oversight Committee in exposing the dishonest practices involved in payola; despite the Commission's own extensive investigation of this subject in 1960; and despite the adoption by the Congress of legislation imposing criminal penalties for such offenses, payola still is widespread in broadcasting and in certain fields may even have increased. Therefore, it is believed that a major, nationwide investigation of this and related practices, extending over a period of several months, is highly desirable.

The Commission recognizes that with almost 5,000 broadcasting stations in operation, it never will possess a staff of sufficient size to insure compliance by all licensees with all statutes and regulations. However, it is convinced that the establishment of an investigatory force of sufficient size and ability to enable the Commission to unearth and to punish a substantial number of major violations will in time bring about substantial general improvement in the level of compliance of all licensees.

For many years, the Commission lacked sufficient investigatory staff, with the result that few violations were detected, few sanctions were imposed, and a great many broadcasters became convinced that they would suffer no penalty if they refused to comply with the Communications Act and with the rules and regulations adopted under its authority. The Commission's present enforcement program has been in effect less than 3 years, but broadcasters in general already are giving evidence of their respect for the program. It is believed that continuation of this program on a scale approaching that originally contemplated will eventually bring about substantial compliance by almost all broadcasters. The 1.0 additional average employment requested will permit a more expeditious handling of the increased workload expected.

RESEARCH AND EDUCATION

Mr. BOLAND. Research and education.

CARROLL CASE

What was the Carroll issue, referred to in the second paragraph?

Mr. HENRY. That was a case involving a complaint from a station in a community that if we granted a new application in that community, the economic detriment to the existing station would be such

that its operation would be so severely reduced as to cause injury to the public; in effect, that the public interest, public affairs, and programs would be seriously reduced.

The court decided in that case that in light of that allegation, we could not grant the new station without an evidentiary hearing.

Mr. BOLAND (reading):

Booz, Allen & Hamilton in its recent appraisal of the Commission's activities, singled out as a key factor the need to strengthen the capacity of the Bureau to undertake economic and social analysis * * *.

Is there a request for additional personnel as a result of this paragraph?

Mr. SHERIDAN. Just one-half of a man-year.

Mr. BOLAND. Put page 41 in the record.

(The page follows:)

Research and education

This activity, centered in the Research and Education Division, is concerned with the compilation of data on the condition and status of the broadcast industry and the study of social and economic factors affecting broadcast communications. The development and promotion of both educational and commercial broadcast services is also of concern in this area.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
AM	3.6	3.9	3.9	
FM	1.1	1.2	1.2	
TV	6.6	7.2	7.7	0.5
Total	11.3	12.3	12.8	.5

During the past several years the Commission has been engaged in a growing number of proceedings requiring expert economic and statistical assistance. These include congressional hearings (viz, political broadcast surveys 1960 and 1962, ratings investigation, and newspaper ownership); rulemaking proceedings (AM allocations, FM allocations, UHF allocations, subscription TV, network inquiry); evidentiary hearings ("economic inquiry" cases under the Carroll issue); and application processing (development of revised minimum financial requirements, development of a scientific sample for in-depth processing of renewal applications).

Booz, Allen & Hamilton in its recent appraisal of the Commission's activities, singled out as a key factor the need to strengthen the capacity of the Bureau "to undertake economic and social analysis" and "to pursue lines of inquiry and develop recommendations on major matters of policy as they emerge." The Commission is faced with major policy decisions in a number of areas requiring detailed study and analyses of critical economic and social factors. In a number of these areas (superpower in AM, subscription TV, ratings, newspaper ownership, political broadcasting) direct congressional concern with the economic and social aspects is clearly evident. With the increased interest in educational broadcasting throughout the Nation, the new Educational Broadcasting Branch has received a great number of requests for information and assistance from educational organizations. This interest was stimulated particularly by congressional enactment of Public Law 87-447 which provides Federal matching grants to encourage the development of educational television. The Branch, working closely with the Department of Health, Education, and Welfare, developed the procedures to facilitate joint processing by FCC and HEW of applications for new or modified ETV facilities where such processing involves both agencies. The Branch participated with HEW in regional meetings to advise and assist on availability of ETV facilities and the rules governing their use.

NETWORK STUDY

Mr. BOLAND. Network study, on page 43. [Reading:]

The Office of Network Study is charged with overall responsibility to study, report on, and make appropriate recommendations, on a current basis, regarding policies and practices of radio and television network organizations, insofar as such policies and practices affect the ability of station licensees to operate in the public interest.

This activity has 7 people, and you ask for the same for 1965.

Mr. HENRY. I might add, they are quite active at this point, and will be on into the fiscal year. We are giving further consideration to taking some measures in the area of network control arising from our study of the networks which has been going on for some time. It is one of our major projects, and it relates back to the question which was raised earlier about the concentration of control and ownership and direction of what goes over the air, because the networks are more and more the three major sources of program supply.

We are studying whether there are not some means of loosening up this control so more creativity and different approaches, and so on, can be permitted into the system.

Mr. BOLAND. Are the problems just as severe in 1965 as they were in 1963?

Mr. HENRY. Yes.

Mr. BOLAND. You had 7.6 in 1963 and 7.2 in 1965.

Mr. HENRY. Yes. I do not know the exact reason for that. It is roughly the same. They have been quite active through the whole course of their existence.

Mr. BOLAND. Put page 43 in the record.

(The page follows:)

Network study

The Office of Network Study is charged with overall responsibility to study, report on, and make appropriate recommendations, on a current basis, regarding policies and practices of radio and television network organizations, insofar as such policies and practices affect the ability of station licensees to operate in the public interest.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965
AM	1.1	1.0	1.0
FM	.4	.2	.2
TV	6.1	6.0	6.0
Total	7.6	7.2	7.2

A comprehensive public inquiry concerning network television programing under Commission Docket No. 12782, spanning a period over the past 2 budget years, has been published by the Commission and adopted and published as a Report of the Committee on Interstate and Foreign Commerce of the House of Representatives. Certain of the recommendations included in the report relating to proposed Commission rules concerning ownership by networks of television programs and program syndication activities, are scheduled for early consideration by the Commission.

Other recommendations, if adopted, will require submission by the national television network organizations of comprehensive informational statements disclosing the whole range of their current policies and practices in the network television program procurement and exhibition process insofar as those policies

and practices relate to and affect the operations of the Commission's station licenses. Such statements will require study, analysis, and appropriate comment and recommendations.

Appropriate rules and regulations may be required should the Commission be empowered to regulate network organizations. Proposed legislation is currently before committees of the Congress covering this subject. Also contemplated within this activity is the establishment of liaison with universities and other academic groups, public and civic organizations, broadcast industry groups, and other interested and informed persons with the object of keeping the Commission informed on the broadest feasible basis of public opinion and attitude respecting broadcasting and particularly network-originated broadcasting.

Mr. BOLAND. Page 44, International. (Reading:)

This activity is concerned with international commitments and treaty obligations. * * *.

It shows you have the same request for personnel in 1965 as you had in 1964.

Are there any questions on this activity?

POPULATION AS A FACTOR IN TV ALLOCATION

Mr. JONAS. Have you any sort of rule of thumb which you follow as far as population is concerned, in granting a new license for a television station?

Mr. HENRY. In allocating a channel to that community?

Mr. JONAS. Yes.

Mr. HENRY. Population is one factor which is taken into consideration in establishing the overall allocation system; yes.

Mr. JONAS. It would not be the only factor?

Mr. HENRY. No; it would not be the only factor.

Mr. JONAS. What other considerations?

Mr. HENRY. Of course, the primary one is the technical one; that is, what frequencies will fit in where. We have established an FM allocation, the same way we have television. We are presently studying a revision of the AM rules to determine whether we should have some of these allocation concepts come over in to the AM field as well as FM and television.

They involve number of stations presently in existence, population, not only where the population is but what the population trends are, and so on.

ECONOMIC ISSUES IN CONSIDERING APPLICATIONS

Mr. JONAS. In considering the granting of a license for a new channel for television, do you take economic factors into consideration, such as profit and loss statements and the opportunities of the station in existence?

I am not making that very clear, but you see what I mean.

Mr. HENRY. There are a number of considerations. First of all, if someone seeks a license to operate a broadcast facility, he must establish basic financial qualifications.

Mr. JONAS. I mean do you consider the profitability of the existing station?

Mr. HENRY. We do if we are called on by a station or stations in the community.

Mr. JONAS. Which objects?

Mr. HENRY. Which objects. They cannot object on the sole ground that they might lose money because of a competitor coming into the market. They have to allege and substantiate that they will lose enough money, in effect, so their public service operations will be severely retarded.

Mr. JONAS. That is all.

SAFETY AND SPECIAL RADIO SERVICES

Mr. BOLAND. Let us turn to "Safety and special radio services activity," on page 45.

We discussed this a bit with Mr. Barr earlier today, and heard that in amateur applications there were delays of from 85 to 90 days; public safety and aviation, 30 to 40 days; industrial, 80 days last January. You are now cutting that down to 70 days (reading):

The safety and special radio services encompass the activities necessary for the discharge of the Commission's responsibility with respect to the licensing of stations for the purposes other than broadcasting or common carrier.

It is indicated you are asking for $1,537,430 in 1965, a decrease of $25,677 from the $1,563,107 that you had in 1964.

You are reducing the average employment in this activity by 6, 160.5 in 1964 and 154.5 in 1965.

Mr. HENRY. Of course, the principal reason for that is the installation of the computer to take up some of the application processing work.

Mr. BOLAND. We shall put page 45 in the record and the narrative at the top of page 46 and the table at the bottom, showing the total actual and estimated application workloads for all services and the average employment requested.

(The material follows:)

SAFETY AND SPECIAL RADIO SERVICES ACTIVITY

INTRODUCTION

The safety and special radio services encompass the activities necessary for the discharge of the Commission's responsibility with respect to the licensing of stations for the purposes other than broadcasting or common carrier. This group represents the use of radio by industry, business, forestry, ships, planes, police, etc. These estimates include the time of hearing examiners, review board, opinions and review, and the Docket Division of the Office of the Secretary devoted to these activities.

Financial requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease
Personnel compensation	$1,236,055	$1,323,728	$1,286,779	($36,949)
Personnel benefits	91,927	91,958	93,761	1,803
Other obligations	117,695	147,421	156,890	9,469
Total	1,445,677	1,563,107	1,537,430	(25,677)

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease
1. Application processing	120.0	101.5	94.5	−7.0
2. Regulatory activities	33.8	40.9	40.9	0
3. Legal, policy, and enforcement activities	9.3	12.2	13.2	1.0
4. Hearings	3.8	5.9	5.9	0
Total	166.9	160.5	154.5	−6.0

JUSTIFICATION BY ACTIVITY

Application processing

This section covers the requirements of the Safety and Special Radio Service Bureau for work related to the processing of applications for licenses in the various services regulated by this Bureau. It includes the clerical, and in many cases, the professional examination of applications, the preparation of all related correspondence, the maintenance of licensee records and files, the development of application forms and instructional material, and the handling of assorted inquiries and correspondence related to application filing fees, status of applications, etc.

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Decrease
Average employment	120.0	101.5	94.5	−7.0

Most of the changes and conversions necessary to permit a number of application processing procedures, notably in the amateur and citizens radio services, to be taken over by the computer will be completed in 1964. All the planned computer operations affecting the safety and special radio services are expected to be complete by the close of 1965. We, of course, lack experience on which to base staff requirements but estimate substantial reductions in staff in some of the areas such as the citizens and amateur services where the volume of applications is greatest. In other areas, such as the industrial and land transportation services, we do not foresee, because of the nature of the applications processed, the possibility of any such immediate reductions.

Application processing operations performed in the Safety and Special Radio Services Bureau are scheduled to be among the first to be adopted to electronic data processing techniques. Some of these operations were originally scheduled for July 1963 but there have been delays in installation of the computer and initial operations are now tentatively scheduled for February 8, 1964. The impossibility of assuring complete conversion to the new system on a fixed date, transition problems, and the extent of the rejects on cases which will require hand processing, all contribute elements of uncertainty to the prediction upon which estimates of 1965 requirements must be based. We have assumed however a schedule of conversion as follows:

Service	Percentage of applications to be processed by computer	Date of complete conversion
Citizens radio	85 percent	Feb. 8, 1964.
Amateur radio	90 percent	Do.
Marine radio	70 percent	May 1, 1964.
Aviation radio	60 percent	July 1964.
Public safety radio	The percentage is undetermined in these services at this time.	After July 1964.
Industrial		
Land transportation		

Application receipts in the safety and special radio services constitute by far the largest tangible and inescapable workload with which the Commission deals. Licensees in those services totaled 1,131,910 at the end of 1963; application receipts for that year reached 489,184 and are expected to reach 605,667 in 1964 and 616,395 in 1965.

The following table shows the total actual and estimated application workloads for all services and the average employment requested:

	Actual, 1963	Estimated, 1964	Estimated, 1965
Applications pending beginning of year	46,310	58,399	45,366
Applications received during year	489,184	605,667	616,395
Workload	535,494	664,006	656,483
Applications disposed of	477,095	623,978	643,941
Applications pending end of year	58,399	40,088	12,542
Personnel requirements	120	101.5	94.5

Mr. BOLAND. On page 47, "Amateur and disaster services." There is a decrease in the manpower requirements.

Put in the workload on page 48 for "Citizens radio service."

"Aviation radio services," page 49, the workload. "Industrial radio services," the manpower requirements. Put in the narrative at the bottom of page 49 and the workload on page 50.

For "Land transportation services," you are looking for two additional people in 1965. Put in the workload on page 50.

For "Marine radio services," manpower requirements and applications; you show a decrease in manpower requirements. For "Public safety services," you ask for no increase in the manpower requirements. Put in the workload on page 51.

(The material referred to follows:)

Amateur and disaster services

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Decrease
Average employment	13.4	5	3.3	−1.7

This service is scheduled for computer operation in February 1964 with a resulting staff reduction of 8.4 average employment in fiscal year 1964. A further decrease of 1.7 is expected in fiscal year 1965 because computer processing will be in effect for the entire year.

A slight decrease in receipts is anticipated due to the new procedure of issuing licenses for a full 5-year term when modified. We are estimating that the more complex and time-consuming applications, approximately 10 percent of the applications received, will require "off line" manual processing after conversion to computer operation.

	Actual, 1963	Estimated, 1964	Estimated, 1965
Applications pending, beginning of year	4,424	11,835	1,613
Applications received during year	119,971	119,590	117,690
Workload	124,395	131,425	119,303
Applications disposed of	112,560	129,812	118,878
Applications pending, end of year	11,835	1,613	425
Backlog in weeks	5.5	[1] 2	[1] 2
Personnel requirements	13.4	5	3.3
Productivity	8,400	([2])	([2])

[1] All applications received in good order which can be processed completely by computer will be disposed of within 1 week. The backlog in weeks represents the processing time for routine applications which are received in good order but require manual processing.

[2] Since processing will be done both manually and by computer methods, no productivity figure is shown.

Citizens radio services

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Decrease
Average employment	23.1	12.5	8.5	−4

A further decrease of 4 is made possible by computer processing during 1965. Application receipts are expected to rise during 1964 and 1965 resulting from the continuing growth of interest in this service, particularly for class D stations.

	Actual, 1963	Estimated, 1964	Estimated, 1965
Applications pending beginning of year	26,679	26,172	15,000
Applications received during year	221,332	314,972	325,000
Workload	248,011	341,144	340,000
Applications disposed of	221,839	326,144	339,280
Applications pending end of year	26,172	15,000	720
Backlog in weeks	6.1	[1] 4	[1] 3.0
Personnel requirements	23.1	12.5	8.5
Productivity	9,603	[2]	[2]

[1] All applications received in good order which can be processed completely by computer will be disposed of within 1 week. The backlog in weeks represents the processing time for routine applications which are received in good order but require manual processing.

[2] Since processing will be done both manually and by computer methods, no productivity figure is shown.

Aviation radio services

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Decrease
Average employment	11.1	11	8.6	−2.4

A decrease of 2.4 is expected due to computer processing which is adaptable to the aircraft and aeronautical fixed services. Of these, we estimate that we will have to continue to process by hand approximately 40 percent of the total receipts. A 60 percent reduction in original staff cannot be made because only the simple applications will go on the computer and the more difficult and time consuming ones will be done manually and will require engineering and legal review. Increases in overall application receipts will be generated by requirements for the use of type-accepted equipment, use of radio at controlled airports, modernization of equipment, increasing interest in aeronautical multicom service, and the normal growth pattern.

	Actual, 1963	Estimated, 1964	Estimated, 1965
Applications pending beginning of year	3,765	3,725	5,350
Applications received during year	38,380	40,125	42,475
Workload	42,145	43,850	47,825
Applications disposed of	38,420	38,500	46,925
Applications pending end of year	3,725	5,350	900
Backlog in weeks	5.0	[1] 13.8	[1] 2.0
Personnel requirements	11.1	11.0	8.6
Productivity	3,461	3,500	[2]

[1] All applications received in good order which can be processed completely by computer will be disposed of within 1 week. The backlog in weeks represents the processing time for routine applications which are received in good order but require manual processing.

[2] Since processing will be done both manually and by computer methods, no productivity figure is shown.

Industrial radio services

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	38.8	46.0	48.2	2.2

The increase will permit us to reduce the anticipated backlog to 6.9 weeks at the end of 1965. This backlog will still be higher than is desirable. Higher backlogs generate complaints and inquiries which have to be answered and which further reduce productivity. The complexity of applications in the industrial services increases yearly in proportion to the crowding of the spectrum thus requiring more processing time per application. As more effort is made to alleviate the congested bands by making more channels available and tightening specifications for equipment, application receipts tend to increase.

A number of rule revisions effective in 1964 requiring equipment changes will cause a considerable increase in filings for new stations and modifications in most of the industrial services. Small decreases in the power, petroleum, and special industrial services are anticipated, however. We expect to commence computer processing in the industrial services in fiscal year 1965 but so far, we do not foresee the possibility of eliminating many of the time consuming operations that the complex nature of these applications now require. Thus, the computer in these highly important services is not expected to greatly affect the speed of processing except in renewal of licenses and maintenance of files.

	Actual, 1963	Estimated, 1964	Estimated, 1965
Applications pending beginning of year	4,847	9,538	11,046
Applications received during year	43,331	56,676	55,000
Workload	48,178	66,214	66,046
Applications disposed of	38,640	55,168	58,322
Applications pending end of year	9,538	11,046	7,724
Backlog in weeks	12.8	10.4	[1] 6.9
Personnel requirements	38.9	46.0	48.2
Productivity	996	1,199	[2]

[1] All applications received in good order which can be processed completely by computer will be disposed of within 1 week. The backlog in weeks represents the processing time for routine applications which are received in good order but require manual processing.

[2] Since processing will be done both manually and by computer methods, no productivity figure is shown.

Land transportation services

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	4.2	4.3	6.0	1.7

This increase will enable these services to maintain a 4.3-week backlog. The assignment of new channels and withdrawal of others will cause an increase of filings beyond normal growth. As in the industrial services, the advent of computer processing will have little impact on the speed of processing. The slight

savings resulting from the computer maintaining all future licensee records will be offset by the need for staff to reduce backlogs to a more reasonable level.

	Actual, 1963	Estimated, 1964	Estimated, 1965
Applications pending beginning of year	456	431	1,835
Applications received during year	5,856	8,592	8,500
Workload	6,312	9,023	10,335
Applications disposed of	5,881	7,188	9,552
Applications pending end of year	431	1,835	783
Backlog in weeks	3.8	13.2	[1] 4.3
Personnel requirements	4.2	4.3	6.0
Productivity	1,400	1,671	[2]

[1] All applications received in good order which can be processed completely by computer will be disposed of within 1 week. The backlog in weeks represents the processing time for routine applications which are received in good order but require manual processing.
[2] Since processing will be done both manually and by computer methods, no productivity figure is shown.

Marine radio services

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Decrease
Average employment	18.6	11.9	9.1	−2.8

A decrease of 2.8 is expected, due to the impact of automatic data processing. An estimated 30 percent will be problem applications to be partially processed manually. As in 1964, the increase in receipts is expected to come from the continued growth of the pleasure boat industry.

	Actual, 1963	Estimated, 1964	Estimated, 1965
Applications pending beginning of year	5,195	5,546	2,000
Applications received during year	40,959	41,620	42,730
Workload	46,154	47,166	44,730
Applications disposed of	40,608	45,166	43,740
Applications pending end of year	5,546	2,000	990
Backlog in weeks	7.1	[1] 6	[1] 4
Personnel requirements	18.6	11.9	9.1
Productivity	2,183	[2]	[2]

[1] All applications received in good order which can be processed completely by computer will be disposed of within 1 week. The backlog in weeks represents the processing time for routine applications which are received in good order but require manual processing.
[2] Since processing will be done both manually and by computer methods, no productivity figure is shown.

Public safety services

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	10.7	10.8	10.8	0

The workload is expected to increase approximately 4 percent over 1964 due in part to the accelerated growth of the local government service induced by a change in frequency coordination. In addition, an extensive reorganization and expansion of raido systems will take place in 1964 and 1965. Beginning October 1964, a small percentage of applications will be processed by computer,

however, no reduction in the staff is proposed. We believe that these small savings will be offset by the workload increase.

	Actual, 1963	Estimated, 1964	Estimated, 1965
Applications pending beginning of year	944	1,152	3,244
Applications received during year	19,355	24,092	25,000
Workload	20,299	25,244	28,244
Applications disposed of	19,147	22,000	27,244
Applications pending end of year	1,152	3,244	1,000
Backlog in weeks	3.1	7.3	[1] 3.0
Personnel requirements	10.7	10.8	10.8
Productivity	1,789	2,037	[2]

[1] All applications received in good order which can be processed completely by computer will be disposed of within 1 week. The backlog in weeks represents the processing time for routine applications which are received in good order but require manual processing.
[2] Since processing will be done both manually and by computer methods, no productivity figure is shown.

REGULATORY ACTIVITIES

Mr. BOLAND. Regulatory activities. There is no change in requirements here. Put in the narrative on page 52.

(The page follows:)

Regulatory activities

These activities consist of the formulation of new and revised rules, policies, and engineering standards; the issuance of interpretations of such regulations; analysis and construction of statutes and treaties, participation in Government and industry conferences on radio matters, both national and international; conduct of studies and developmental programs looking toward the more effective use of radio in the public interest; administration of compulsory ship safety radio requirements; analysis of legislative proposals and preparation of legislative recommendations; administration of the radio services, including a forms and procedures program, and development and administration of an enforcement program.

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	38.8	40.9	40.9	0

In relation to the regulatory activities, the Commission's attention is being called more and more to what is often referred to as the deplorable state of frequency shortages and congestion in the highly important Land Mobile Radio Services. The problem is common to the public safety, industrial, land transportation, and the citizens radio services of the Safety and Special Radio Services Bureau and to the vehicular communications systems of the Common Carrier Bureau. In particular, the demand for frequencies suitable for use by the highly important land mobile public safety services (fire, police, local government, special emergency, etc.) and the myriad industrial vehicular communications systems has long exceeded their availability under present spectrum allocations and station assignment principles. Industry is demanding that both more spectrum space be assigned and that more efficient assignment principles and procedures be instituted. These problems of the Land Mobile Services are reflected in numerous rulemaking proceedings now open or requested which require much more time and attention than the present staff can give.

Additionally, the Commission is considering more basic courses of action all of which will involve study and research. The Electronic Industries Association is now engaged in a comprehensive study of present frequency utilization throughout the entire country which is expected to point up possible areas for fur-

ther investigations by Commission staff. The Commission is seriously considering institution of a large Government-Industry Committee to study and evaluate possible solutions. Commission staff will be expected to assume a substantial part of the burden in directing the activities of such a study. Additional regulatory problems in the aviation, marine, amateur, and citizens services are related to normal growth patterns, and the increasing complexity of the operations.

All in all, considering the magnitude of the problems, we believe there is adequate justification for at least maintenance of the present staff for regulatory activities.

LEGAL, POLICY, AND ENFORCEMENT ACTIVITY

Mr. BOLAND. On page 56, put in the "Legal, Policy and Enforcement Activity."

(The page follows:)

Legal, policy, and enforcement activity

This activity includes legal and policy matters of special complexity and/or Bureau-wide application and significance; coordination of all rulemaking initiated within the Bureau; legislative matters affecting the Bureau's responsibilities; and special projects. This function also involves analysis of complaints and violation reports; determination of what enforcement sanctions should be instituted; investigations by written interrogatories and/or field inquiries; handling formal and informal compliance actions; and an educational program. Sanctions include station license revocations; cease and desist orders; suspension of operator license; monetary forfeitures against station licensees, operators, ships, and ships masters; and letters requiring satisfactory explanations of corrections of violations. The educational program is handled by explanatory letters, distribution of notices of sanctions imposed, bulletins, etc.

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Legal and policy	2.6	4.1	4.6	0.5
Enforcement	6.7	7.1	7.6	0.5
Total	9.3	11.2	12.2	1.0

Here again the modest increase proposed (1) is predicated on additions to the staff in 1964. Violation cases and general legal, policy and regulatory problems involving these radio services continue to grow. Pursuant to the recommendations of the Booz, Allen & Hamilton report, more rule coordination work, and policy and planning problems have been assigned to this office. There continues to be an inflow of enforcement cases and legal and policy matters in excess of current manpower capabilities, and a backlog exists in both major areas of actvity. The effects of the frequency congestion to which we have already referred have been worsened by inadequate and often ineffective enforcement procedures.

A program of imposition of small monetary fines, authorized by Public Law 87-449, has been in force for about 5 months in fiscal 1963, and the inflow of cases in this area is beyond current capacity to handle. It is expected that some additional personnel, in accordance with the estimate for 1964, will permit us to bring this total activity to a fairly current level. In this connection, as recommented by the BAH report, it is expected that the addition of a senior engineer to be made in fiscal 1964 will help considerably in policy and rulemaking work.

The consistent upward growth pattern in the number of stations licensed stimulates a similar growth pattern in the number of violation cases and the scope and complexity of legal and policy problems involving the regulation and development of the safety and special radio services.

Mr. BOLAND. Now we shall turn to hearings, page 57.

The table on page 58 indicates the manpower requirements for the various activities under hearings.

Are there any questions on this service?

NUMBER OF AUTHORIZED TRANSMITTERS AND APPLICATIONS RECEIVED

Mr. HENRY. I might add, if I may, Mr. Boland, in this particular service we have the bulk of our licensees. One of the tables shows we now have in excess of 1½ million authorized transmitters. We are getting in applications at the rate of 600,000 per year in 1964, and we estimate over 615,000 in fiscal 1965. I figure, if you put this on the basis of working days, we get almost 2,500 applications every working day, which is a little over 300 per hour that we have to handle.

I think this is considerably more than any other independent agency that I know about. It does constitute a serious workload.

FIELD ENGINEERING ACTIVITY

Mr. BOLAND. We will turn to field engineering activity, page 59. This represents the biggest bulk of your employment, does it not?

Mr. HENRY. It does. It is an increase of 31 man-years.

Mr. BOLAND. An increase of $331,262 for 1965 over 1964. You are asking for $4,778,716. You had $4,447,454 in 1964.

The big increase is due to pay increase and the 31 new jobs.

Insert pages 59 through 64.

(The pages follow:)

FIELD ENGINEERING ACTIVITY

INTRODUCTION

Field engineering activity covers functions required (*a*) to properly administer and enforce the Communications Act, rules and regulations of the Commission, and international treaties, (*b*) to render the unduplicated service the public and industry require in interference elimination, location of lost planes and ships by radio direction finding; and (*c*) the performance of all other related services.

Twenty-four district, 4 sub and 2 marine offices, 19 monitoring stations, and 3 mobile FM–TV enforcement units represent the field plant through which the functions are accomplished. Control of activities is exerted through a headquarters staff in Washington, D.C., by means of a continental teletypewriter circuit, by radio, and other landline circuits making possible prompt and effective responses to radio workload problems. Moreover, the basic nature of the field engineering system makes it a valid adjunct to the national defense posture.

Financial requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Personnel compensation	$2,962,513	$3,279,000	$3,589,000	$310,000
Personnel benefits	220,615	243,240	254,000	10,760
Other obligations	852,994	925,214	935,716	10,502
Total	4,036,122	4,447,454	4,778,716	331,262

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
1. Enforcement	132.7	152.4	176.5	24.1
2. Monitoring	165.0	170.4	177.3	6.9
3. Application processing	86.7	86.7	86.7	
Total	384.4	409.5	440.5	31.0

JUSTIFICATION BY ACTIVITY

Enforcement

This relates to enforcement of radio laws, regulations and treaties applicable to Commission-licensed stations. A flexible enforcement program based on needs in the various radio services provides for determining compliance by licensed stations with both engineering standards and operational requirements. Inspections and concomitant engineering studies and measurements determine transmitting equipment capability. Monitoring observations establish operational procedures so as to insure legality and optimum frequency usage. Data resulting therefrom is utilized by the Commission in the application of sanctions and for rulemaking, frequency allocations, and in renewal licensing decisions. Investigations include location and suppression of unlicensed or clandestine stations and securing of evidence for prosecution where criminal laws have been violated. Sources of interference to licensed services, Government agencies, and to the public are located and eliminated with emphasis placed on the safety services.

Manpower requirements

	Actual 1963	Estimate 1964	Estimate 1965	Increase
Inspections	48.4	57.9	68.9	11.0
Investigations	84.3	94.5	107.6	13.1
Enforcement total	132.7	152.4	176.5	24.1
Inspections:				
Broadcast	25.1	30.3	33.3	3.0
Other	23.3	27.6	35.6	8.0
Total	48.4	57.9	68.9	11.0

Summary of increases: 3 inspection of broadcast stations (AM, FM, and TV); 8 inspection of other than broadcast stations including: 3 for growth in safety and special radio services (18 percent); 3 three microwave enforcement units; 2 small boat enforcement.

Broadcast

Inspection of broadcast stations (AM, FM, and TV) falls into three categories: initial, renewal, and special. Initial inspections are conducted after construction of the station has been completed but before a license is granted. The inspection provides a determination of compliance by the station with terms of the construction permit allowing the Commission to decide whether or not a license should be granted.

Renewal inspections of broadcast stations are conducted once during the license term to permit the Broadcast Bureau to act knowledgeably on renewal applications. A renewal inspection includes a detailed and comprehensive survey of a station's technical facilities, including engineering measurements, to determine whether the station is bing operated within the terms of the authorization. These inspections are essential to insure technically competent broadcasting service to the public. In addition, 50 percent of the standard broadcast station (AM) renewal inspections include checking pertinent areas of nontechnical operation (specifically, those with poor records). This data is used in analyzing performance of the station and making a determination as to whether the licensee has met his prelicensing promises and that license renewal is in the public interest.

The Commission in 1963 took enforcement action or applied sanctions against 58 broadcast stations which had been inspected in technical and nontechnical areas by the FEB.

Revocation actions instituted	5
Renewals designated for or continued in hearing	24
Short-term renewal licenses	9
Forfeiture actions[1]	20
Total	58

[1] Forfeiture actions resulted in assessments totaling $36,500.

The Commission's objective is to conduct renewal inspections of 75 percent of AM broadcast stations and renewal inspection of all FM and TV broadcast stations. The following table illustrates the Bureau's inability to meet these objectives because of lack of manpower.

	AM			FM			TV		
	1963	1964	1965	1963	1964	1965	1963	1964	1965
Total number of stations	3,997	4,150	4,300	1,445	1,600	1,800	757	780	800
Number of yearly renewal inspections necessary to attain Commission's objective	999	1,035	1,075	482	535	600	252	260	267
Number of renewal inspections	779	830	860	106	320	450	179	215	235
Number of inspections below objective	220	205	215	376	215	150	73	45	32
Percent of inspections below objective	22	20	20	78	40	25	29	17	12

Special inspections are generally made as a result of requests received from the Broadcast Bureau to determine whether previous conditions of noncompliance have been corrected by the licensee.

Operation of three FM–TV mobile enforcement units has proven of considerable value. In coordination with district office personnel the FM–TV units conduct inspections and engineering signal analysis of FM and TV broadcast stations. In addition to the enforcement aspect of the inspection, considerable technical guidance—based on technical observations—has been given to engineering personnel of the FM and TV stations. In nearly all cases the public has benefited directly through reception of better sound or pictures. This beneficial effect is greatly amplified when, as happened in one instance in 1963, signal analysis of a network television station by the FM–TV unit showed technical deficiencies resulting in poor quality monochromatic and color pictures. An investigation by the station and network traced the deficiency back to the common carrier system supplying the network. Correction of the condition resulted in improved reception for viewers in the entire southwest area of the country and a decision by the common carrier system to recheck the quality of program transmissions to other areas of the country.

The considerable increase in the number of FM stations broadcasting stereophonic transmissions requires, in the public interest, that increased attention be devoted to what has been categorized as generally poor technical performance by this class of station. It is important to note that complex engineering techniques and equipment are involved in making observations of transmissions by FM broadcast stations. It is planned to continue the FM–TV mobile enforcement unit program in 1965.

The estimated increase in manpower to perform the required broadcast inspections (initial, renewal, and special) for 1965 will be 3.0.

Other than broadcast

Safety and special radio services.—An optimum enforcement program is one where other than broadcast stations are inspected once during each 5-year license term. As there are approximately 3½ million licensed transmitters in operation, such a program is manifestly impossible due to cost and manpower requirements. A reasonable, and practical approach is to regulate the amount of enforcement devoted to each radio service on the basis of a continuing annual sampling and placing emphasis on services having a poor record of compliance.

A sampling inspection program of certain other than broadcast services was instituted in 1963 as recommended by the Booz, Allen & Hamilton management survey. The purpose was to determine the problem enforcement areas and project 1964 and 1965 manpower requirements based on such evaluation. The 1963 sampling survey specifically determined the degree of compliance with the Commission's rules in the following services: Fixed public (pt. 6), maritime land (pt. 7), public safety (pt. 10), industrial (pt. 11), land transportation (pt. 16), and domestic public (pt. 21). The survey included preinspection observation of the station's transmissions and followup inspection of technical facilities and station records. Two specific areas covered are described below:

In 1963 existing radio channels used by all land mobile services were split in

two so as to provide twice the number of channels in a given spectrum width. This frequency management technique is an attempt to meet the demands for more spectrum space by industry, small businessmen and State and municipal governments. The success of the "split channel" rules is necessarily dependent upon each station confining its signal to the assigned channel without causing interference to stations on adjacent channels by off-frequency operation or excessive modulation. During fiscal year 1963 16 percent of the stations checked were found to be operating off frequency or with excessive modulation. This is borne out on a practical basis by the number of complaints received from licensees reporting disruptive interference from stations on adjacent channels. It will therefore be necessary in 1965 to continue our efforts in making measurements of frequency and modulation.

The 1965 inspection program includes a continuation of inspection efforts in checking radio station towers installations to insure such towers satisfy license requirements as to height, location, painting, and lighting. This program is essential for the safe operation of aircraft, both military and civilian, and is particularly significant when a noncomplying radio tower is located near an airport. During 1963 inspections revealed 30 towers built in excess of authorized heights or at unauthorized locations. As a result of this information, the Federal Aviation Agency determined certain of the towers were hazardous and licensees were required to reduce tower height or relocate to the authorized location.

The 1964 and 1965 other than broadcast programs are based on findings of the 1963 sampling survey including degree of noncompliance observed, type of violation (inspection and monitoring), and required investment of man-hours to achieve the desired results. The survey has been expanded to include these services: Small boats (pt. 8), amateur (pt. 12), and citizens (pt. 19). In general a minimum sampling factor of 5 percent has been adopted. This factor, based on the 1963 sampling survey, has been increased in proportion to the degree of noncompliance observed as set forth in the following table:

Number of sampling inspections to inspect once per license term

Service	1963	1963 sampling inspections conducted (percent)	Noncompliance (percent)	1965	1965 sampling inspections percentage	Number
Maritime, land	415	16.0	49	500	26.0	130
Maritime, ship	28,000	6.0	62	32,000	9.0	2,800
Aviation	21,000			22,000	10.0	2,200
Public safety	8,500	10.0	57	10,000	19.0	1,900
Industrial	21,500	4.0	63	27,000	8.0	2,200
Amateur	51,000	.1	27	60,000	.2	120
Land transmitters	2,800	14.0	69	3,300	32.0	1,100
Citizens	89,000			158,000	.5	800
Domestic, public	1,200	5.0	49	1,600	8.0	130
Mobile transmitters	357,000			450,000	.5	2,200

Manpower requirements to meet the needs due to continuing growth in Safety and Special Radio Services stations will require an increase of 3.

Microwave enforcement units.—The growing importance of the microwave regions of the spectrum for space-to-ground as well as terrestrial applications, increase the possibility of interference resulting from sharing by space and ground systems of the same frequency bands. Mobile enforcement facilities are required for investigation of interference in the microwave regions because of the typical line-of-sight nature of microwave propagation and high directivity of antennas commonly used.

The Commission has had two mobile microwave enforcement units for several years (one each on the east and west coasts), but budgetary limitations imposed by other important programs curtailed their use. An engineer should be permanently assigned to each of these two cars. It is also proposed that a microwave unit and an engineer be furnished for the Great Lakes and gulf coast areas, or a total of four new positions. This will require an increase of 3 average employment in 1965.

Small boat enforcement.—Electronics, as we know it today, had its origin in the installation of wireless communications equipment aboard vessels, solely for the safety of lives. For the same reason, many operators of small boats today voluntarily equip their vessels with radio communication facilities as a safety measure and, additionally, as a convenience. However, a continuing disregard of communication laws by numerous small boat operators who engage in chitchat on frequencies intended for distress, safety, and operational frequencies seriously impairs the use of these frequencies for distress and safety purposes.

The above situation, bordering on the chaotic, is compounded by a considerable volume of unlicensed operation by small boat operators and gross failure to properly identify their ship station by transmission of assigned call signs. Effective enforcement includes monitoring of transmissions and boarding offending vessels upon their return to port. At times it has been necessary to obtain the assistance of U.S. Coast Guard vessels and helicopters in these enforcement operations. These efforts greatly increase the amount of manpower required for effective enforcement.

There were 137,000 outstanding licenses in the small boat field as of June 30, 1963, an increase of 15,000 during 1963. A total of 1,815 inspections of small boats was made during 1963, 62 percent of which were in noncompliance with communication laws. In an attempt to bring order to the area of small boat operations, it is proposed to make 2,800 inspections in 1965. An increase of 2 average employment is being requested for this purpose.

The estimated increase in manpower to perform the required other than broadcast inspection for 1965 will be 8.

FIELD WORKLOADS

Mr. BOLAND. Where are you to use the additional 31 employees?

Mr. HENRY. The additional 31 employees are broken down 24.1 for enforcement; 6.9 in monitoring.

I can give you a pretty good breakdown on that if you would like it. I think it is quite an important part of our operation.

Mr. BOLAND. Yes. Proceed.

Mr. HENRY. As you will recall, we are attempting to bolster our Field Engineering Monitoring Bureau over basically a 3-year period as recommended by the Booz, Allen, and Hamilton people who made the study some years ago. This Bureau not only inspects and monitors; it also issues licenses. Last year it issued over 300,000 operator's licenses, 17,000 interimship station licenses, 25,000 applications for antenna markings and lightings, in addition to its inspection and monitoring duties. It inspects and monitors or has the responsibility for inspecting and monitoring all of our stations.

FIELD INSPECTION ACTIVITIES

In the field of enforcement we can turn to page 60. There we get into 11 men for inspections and 13 men for investigations.

In the field of broadcasting, going down to small (a) on page 60, we are requesting three men in addition to what we now have.

Only 75 percent of our AM stations are inspected during their license period. These inspections, when made, average about one-half day, and of that 1 hour is spent on the program.

Mr. THOMAS. If you increase your activities it will take an army. These people have the certificate and they know the value of it better than you do. They will not willfully jeopardize their interest in it.

If you once start giving them the once-over here and there the request is modest, no question about it, but we lead up to a young army when you get into the inspection business.

We have one agency which wants to go to every manufacturer. It would take three armies. Out of the 800 stations, before you know it you will have to do a good job on this one, a better job on the competitor, you have people coming to you telling you about something a little out of line, and I doubt if you could do a better job with 300 to 400 more than you can with what you have here now.

What do you have now for AM and FM?

Mr. HENRY. 409.

Mr. THOMAS. In the field engineering it is about 400?

Mr. HENRY. 410. We are requesting 440.

Mr. THOMAS. That is one of the big increases.

Mr. HENRY. It is the largest.

Mr. THOMAS. You had better put the people in the special services and cut down that backlog and perhaps give some of your colleagues a little extra help in the long lines.

You are doing a good job, though.

Mr. HENRY. I think this is one of the areas where most of the people who have had anything to do with it, myself included, feel we do need some increase. It is true that while a broadcaster has a cerificate, many of them are in small areas. Many of them become careless. They know they will not be inspected.

Then they begin——

Mr. THOMAS. But they are afraid of that mail. Customers listen to them, write that letter, and they will get the letter to the Commission.

Mr. HENRY. We are speaking primarily of the technical violations, locating the transmitter in the wrong place, and so on. These are the things that pollute the spectrum, get us involved in any number of interference complaints.

I don't know how many we have. We will get into that when we talk about enforcement.

We have something like a 51-percent backlog of interference complaints not investigated. That is because of lack of manpower.

Mr. THOMAS. Through the years you have had no serious departure from the rules laid down. You have a fellow who goes into business for the first time and you give him a set of rules. You have no serious departure, do you?

Mr. LOEVINGER. I would like to say a word. I think there is a misunderstanding here, part of which arises from the fact that broadcasting as the showcase part of the FCC business occupies so much of the attention here.

A large part of field engineering and monitoring is not broadcasting but purely technical monitoring of frequency allocation.

I would like to explain this because I think it is important.

INTERFERENCE COMPLAINTS

Mr. BOLAND. How many complaints have you had with respect to interference?

Mr. HENRY. If you turn over to page 65 that deals with the investigative workload statistics. Interference complaints received was 48,000 in 1964. Again you have to separate the broadcasting interference complaints from the nonbroadcasting interference complaints.

Most of the interference results from transmitters in other than the broadcast field, and getting back now to enforcement, of the 11 men requested only 3 are in the field of broadcasting, 8 in the field of other than broadcasting, 3 involved in the normal increase in the safety and special bureau, which, as I said, has more than a million transmitters licensed to it; 3 are for a specific job of manning some microwave cars. These are cars which have very high quality equipment in them designed to inspect the operations of microwaves in this country which are becoming more and more numerous and more and more important; two men we are asking for small boat enforcement. Practically every boat that navigates now has a radio of some kind or another. Our staff is just woefully inadequate to enforce this.

If you take this one small area, the more licenses you get in violation of our technical requirements the less efficient becomes the use of the spectrum.

It is conceivable that if you had enough people, off-frequency and otherwise, in violation of the technical requirements of the rules, you might have as much as a 20- to 25-percent limitation on the use you could make of that frequency.

INCREASE IN NUMBER OF COMPLAINTS

Mr. OSTERTAG. According to your reference regarding enforcement and investigation workload, you anticipate a total number of complaints received of 59,215 for the next year as compared with 48,142 for fiscal 1964?

Mr. HENRY. That is correct.

Mr. OSTERTAG. That is a sharp increase. Do you really anticipate you will have that many complaints?

Mr. HENRY. Yes, because we issue 29,000 new citizens-band licenses every month. We issue 10,000 amateur, 4,600 aviation, 3,600 industrial, 2,000 marine, and we issue over 50,000 licenses a month. This is an increase. These are new licenses.

Although there is some attrition this is pretty much the number of new transmitters that come on to the airwaves every year. These additional transmitters create this additional interference, particularly if they are not supervised.

Mr. OSTERTAG. The number of investigations will go down, percentagewise.

Mr. HENRY. Yes, because we don't have the manpower.

Mr. OSTERTAG. In other words, you will investigate——

Mr. HENRY. More, but——

Mr. OSTERTAG (continuing). About 30,000 out of the 59,000, or slightly over 51 percent, as compared with 55.8 percent for last year?

Mr. HENRY. That is correct. Any increase in total number of inspections is a plus.

Mr. BOLAND. You indicate that the number of complaints involves technical complaints which requires an inspection?

Mr. HENRY. Yes. All the complaints we are talking about here we can consider as technical complaints. Those which would be of a nontechnical nature would arise almost entirely in the field of broadcasting, and they would be handled by the Complaints and Compliance Division in conjunction with the Field Engineering Bureau.

For the purposes of our discussion that would fall to the Broadcast Bureau itself.

Mr. OSTERTAG. Average employment has increased by 13 percent in the field of investigations according to the justification.

Mr. HENRY. Thirteen men. It is 13 additional man-years.

TYPICAL INTERFERENCE PROBLEM

Mr. LOEVINGER. I would like to explain this further to Chairman Thomas. This field engineering and monitoring is essentially not broadcast monitoring. These are not people who listen to broadcasts and decide programs are good or bad, or that the fairness doctrine of equal time is or is not being observed. This is a matter of technical monitoring, the greater part of which is not in broadcasting.

I remember one incident which occurred. There is a complaint from the telephone company that the link between California and Hawaii was ineffective. This was a microwave length and they were not able to get through. There was some sort of disturbance on the assigned frequency.

The field engineering and monitoring office went out and with direction-locating equipment traced this down to a nearby Army base where they found there was a defective transmitter that the Army had which was broadcasting a sort of steady emanation, a steady emission on this frequency.

The Army was glad to have it called to its attention. It was repaired immediately and telephone service was resumed.

Mr. BOLAND. Couldn't the telephone company find this?

Mr. LOEVINGER. They haven't this kind of equipment. They rely on us by and large.

I was at the conference in Geneva, talking about the allocation of aeronautical frequencies——

Mr. THOMAS. We appreciate that. We know you have a lot of activity, enforcement, monitoring, application process, and two or three activities there.

Mr. LOEVINGER. Yes, sir.

Mr. THOMAS. At times we have gone further than you have. We have suggested some better equipment, more laboratories, and so forth.

I was addressing myself to purely the one narrow segment, and that is the enforcement area, where you had an increase of 24 jobs.

If you get into the strictly enforcement business you could build up an army and I doubt if you could do a better job with 300 employees than with the 150 you have now.

Mr. LOEVINGER. I am sure I agree with you. I feel strongly field engineering is a service enterprise we must maintain.

Mr. THOMAS. There I agree.

INVESTIGATIONS

Mr. BOLAND. You have a table on manpower requirements on page 65, showing an increase of 13. Insert that, and insert the middle paragraph on page 66.

(The material referred to follows:)

Investigations

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	84.3	94.5	107.6	13.1

Summary of increases

The steady annual increase in investigative demands on the field offices must be met by a corresponding increase in investigative engineers to accomplish these demands. An increase in average employment of 13.1 is deemed necessary to meet the requirements of 1965 as indicated by the following table:

Investigative workload statistics

	Actual, 1963	Estimate, 1964	Estimate, 1965
Complaints:			
Total interference complaints received	39,140	48,142	59,215
Total number investigations of interference complaints	23,959	[1] 26,930	[1] 30,706
Percent of interference complaints investigated	61.3	55.8	51.8
Backlog of complaints not investigated by FCC personnel	15,181	21,222	28,509
Investigations accomplished per man by investigative personnel	285	[1] 285	[1] 285
Major cases:			
Interference	464	509	570
Unlicensed stations	518	645	724

[1] The estimated total number of investigations of interference complaints accomplished during 1964 and 1965 are based on the figure 285 investigations per year per man. This was the actual number accomplished in 1963 and believed to be a reasonable workload average.

It is not intended that the table convey the impression that 28,509 interference complaints will go completely unattended during 1965. At least half of this number of complaints will be handled by self-help interference committees. There has been an increase in the number of these committees formed throughout the country. When such a group is available locally and the nature of a complaint warrants the actions, it is referred to the committee immediately. There are approximately 500 such interference committees which are active—a number sufficient to materially reduce the backlog of uninvestigated interference complaints.

A large majority of the complaints received concern interference to nonvital communications or to the reception of television or radio signals or other entertainment media and are not, per se, of an urgent nature. However, a terrific public relations problem is usually involved to the extent that if reasonable prompt service is not forthcoming, petitions with sometimes hundreds of signatures are received, not to mention complaints directed to Members of Congress, all of which place an administrative burden on the Commission staff. The public is becoming more aware of the added significance given an interference complaint when brought to the Field Engineering Bureau's attention through their congressional representatives. Interference cases opened through referral by a Member of Congress increased 22 percent in 1963. Correspondence originated in the Investigative Branch and directed to Members of Congress relative to interference complaints increased from 84 to 146 pieces in 1963, or an increase of 75 percent. In such circumstances steps need frequently to be taken at the expense of other work of higher priority and not infrequently involving a disportionate expenditure of time and effort. We are requesting a sufficient number of investigative engineers to give each complaint prompt engineering attention commensurate with a priority schedule which can be reasonably supported.

MONITORING

Mr. BOLAND. You refer to monitoring on page 68, with 177 people in 1965, an increase of 6.9 percent over 1964.

Put in the narrative on page 68.
(The page follows:)

Monitoring

This is a basic enforcement and service function which provides surveillance of the radio spectrum to insure that radio stations operate in accordance with their authorizations; also as a means to locate sources of serious interference to authorized radio services. Specifically, monitoring is the process of observing radio transmissions at a distance and measuring various properties of signals to: enforce compliance with laws, regulations and treaties; detect and resolve interference; collect operating and technical data required for promulgating regulations; detect and locate illegal, clandestine, or subversive radio transmitters; and assist distressed aircraft and ships by direction finding positioning.

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	165	170.4	177.3	6.9

Summary of increases

To work toward completing the staffing of continental secondary monitoring stations	5.0
To provide a skeleton staff for the Santa Ana, Calif., VHF/UHF monitoring station	1.9
Total	6.9

Because of the enormous demand for radio frequencies and the heavy traffic load that the spectrum bears, the enforcement and service function supplied by radio monitoring is vitally necessary to achieve the greatest possible use of the radio spectrum by the greatest possible number of users at the least possible cost. Without rule and treaty enforcement, almost all of our radio services literally would become paralyzed in a chaotic cacophony. The end product of every radio station is the on-the-air signal, be it telegraph, teletype, voice, facsimile, television, telemetering, or remote control signals and the inherent intelligence with which it is invested. There is no better way to obtain continued compliance with rules governing radio emissions than by making on-the-air observations of signals under actual operating conditions. Moreover, only through on-the-air monitoring can many international treaty regulations be enforced to protect U.S. interests and assure that U.S. stations will receive the full benefits of frequency allocation to which they are entitled.

In accordance with the recommendations of Booz, Allen & Hamilton, the 1964 budget outlined the urgent needs for strengthening our monitoring effort. Implementing the recommendations of the BAH report, the 1964 budget therefore set forth a 3-year program to reinforce our monitoring staff to meet growing demands for more effecive enforcement and solution of radio interference by observation and measurement of radio transmissions, and for increased collection of engineering and operational monitoring data to aid in frequency allocations and rulemaking. For reasons of economy, the manpower requirements of 45 positions to meet these needs were stretched out over a period of 3 years.

INTERFERENCE COMPLAINTS

Mr. BOLAND. You have a table on major interference complaints on page 69. Insert that.

Also insert the tables on pages 70 and 71. Page 71 gives you an idea of the workload.

(The information referred to follows:)

Each year our workloads increase far beyond the manpower and facilities available to handle them. Interference complaints must be given prompt attention since, generally speaking, interference to radio circuits is economically detrimental to important segments of our economy, and, besides, in many cases, actually

involve safety of life and property. Major interference complaints received from various U.S. military, civil government, and commercial concerns, including airlines, increased 34 percent last year over the previous year.

	1962 actual	1963 actual	1964 estimate	1965 estimate
Major interference complaints	1,657	2,260	2,930	4,034

Because of limited manpower, an increase in work requirements in one area of work results in neglect to another. Although local interference cases solved by the individual monitoring stations increased by 22 percent over the previous year, in the area of general cruising of the spectrum, through which a good share of enforcement and knowledge of general spectrum conditions are obtained, we fell woefully behind in 1963. Monitoring network alerts on unidentified stations fell to less than half while case bearings fell to almost half of the 1962 level. Radio surveillance which is accomplished by means of general cruising of the spectrum is too valuable to our country's welfare to forgo without incurring serious technical and security problems and possibilities.

	1962 actual	1963 actual	1964 estimate	1965 estimate
Local interference cases	4,930	6,002	7,000	8,000
Monitoring network alerts	8,014	3,436	4,000	4,600
Case bearings	45,624	25,950	30,000	35,000
Citations issued for violations, all types	14,749	15,357	16,800	18,000

The following statistics represent the major items of present and estimated future monitoring activities:

Workload

	1963 actual	1964 estimate	1965 estimate
Major interference complaints (source):			
U.S. military agencies	619	700	800
Civil government agencies	322	400	500
Commercial companies	1,293	1,800	2,700
Foreign governments	26	30	34
Total	2,260	2,930	4,034
Cases monitored and developed:			
Coordinated network operation:			
Interference	2,372	2,800	3,300
Other than interference	283	300	325
Reported by field stations:			
Interference	6,002	7,000	8,000
Other than interference	4,667	5,000	5,500
Total	13,324	15,100	17,125
Type of action:			
Monitoring net alerts	3,436	4,000	4,600
Signals identified and indexed	77,150	80,000	85,000
Total	80,586	84,000	89,600
Citations for violations:			
FCC licensed stations	9,650	11,000	12,000
U.S. Government stations	723	800	900
Foreign stations	4,984	5,000	5,300
Total	15,357	16,800	18,200
Long-range radio bearings:			
Case bearings	25,950	30,000	35,000
Search and rescue bearings	502	[1] 502	[1] 502
Total	26,452	30,502	35,502

[1] Unpredictable; last year's workload used as a basis.

Mr. BOLAND. You refer to ship certification on page 72, and radio operator applications on page 73. We shall insert those pages, and insert the last paragraph on page 74. Also insert the workload on page 75.

(The information referred to follows:)

Application processing

Under this heading are included (*a*) certification of vessels that for safety purposes are required by law or treaty to be equipped with radio; (*b*) examination of applicants and issuance of radio operator licenses in accordance with standards established by law, treaty, or regulation; (*c*) issuance of interim licenses to radiotelephone and radar ship stations as a safety measure and public serivce; and (*d*) processing of station license applications from the standpoint of air safety insofar as radio antenna towers are concerned.

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increases or decreases
(*a*) Ship certification	35.1	36.8	36.2	−0.6
(*b*) Operator licensing	35.2	34.0	35.3	+1.3
(*c*) Interim ship	5.0	5.3	5.6	+.3
(*d*) Antenna applications	11.4	10.6	9.6	−1.0
Application processing, total	86.7	86.7	86.7	0.0

Ship certification

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increases or decreases
Average employment	35.1	36.8	36.2	−0.6

For safety purposes certain vessels and passenger-carrying boats are required to be equipped with radio in accordance with the provisions of title III, parts II and III, of the Communications Act, the Great Lakes Agreement with Canada and the Safety of Life at Sea Convention. The Commission's enforcement is the minimum required by law necessitating survey and certification either annually or biennially. In the absence of any material change in the law the program is expected to continue at approximately the same level through 1964 and 1965. The slight reduction in 1965 is due to the fact that more than half of the biennial surveys required by title III, part III, of the act occur on even years.

	Actual, 1963	Estimate, 1964	Estimate, 1965	Decreases
Vessel inspections	4,477	4,750	4,600	150
Violation notices	1,846	1,950	1,900	50
Certificate of compliance	2,613	2,800	2,670	130

Operator licensing

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increases
Average employment	35.2	34	35.3	1.3

Statute, international treaty, and the Commission's rules require an integrated system of radio operator licenses which establishes minimum standards for the physical operation of the various radio services and classes of stations licensed by the Commission. The development of examination material, examination of applicants, and issuance of operator authorizations to those that qualify are responsibilities of the Field Engineering Bureau. Also, the Bureau has the

responsibility to initiate suspension action or the application of other appropriate sanction in the case of operator licensees who violate the basic Communications Act or rules pursuant thereto.

It is expected that there will be some reduction in the total number of applications filed in 1964 because of the assessment of fees which requirement will become effective in January 1964. Another factor will be the elimination of operator license requirements in the case of certain base stations operating in the public safety radio services. On the other hand, this trend will be partially counterbalanced by the new rules effective in April 1964 which will require improved qualifying standards in the case of operators employed at standard and FM broadcast stations. The overall application workload is expected to resume its upward trend in 1965 as follows:

Radio operator applications

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increases
Restricted radio operator permits	225,098	195,000	205,000	10,000
Commercial (other than RP's)	100,825	105,000	110,000	5,000
Amateur	21,825	22,500	23,000	500
Total	347,748	322,500	338,000	15,500

Interim ship

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increases
Average employment	5	5.3	5.6	0.3

Interim ship station licenses are issued by all field offices to provide for immediate operation of ship radiotelephone and radar stations thereby aiding navigational safety and providing a public service. This on-the-spot issuance avoids the delay incident to processing of the application for regular 5-year license in Washington. There has been a steady increase each year in the number of applications for such licenses and this trend is expected to continue in 1965.

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increases
nterim ship licenses	16,415	17,400	18,400	1,000

Antenna applications

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Decreases
verage employment	11.4	10.6	9.6	1

Applications for radio station licenses proposing new or modified antenna structures must be processed from an air hazard viewpoint to determine whether the proposed structures will constitute a menace to air navigation. In view of the function of the Federal Aviation Agency with respect to such determinations, the Commission has a responsibility to determine whether applications requiring notification to FAA are submitted to FAA.

Pursuant to the provisions of section 303(q) of the Communications Act, it is the responsibility of the Commission to assign appropriate obstruction markings to proposed antenna structures when required by the Commission's regulations in order to minimize the potential hazard to air navigation of such structures. Selected field engineers are the Commission's liaison with FAA regional offices in matters relevant to antenna hazard evaluations conducted by those offices.

It is expected that the implementation of the automatic data processing program beginning in the latter half of 1964 will eliminate from manual processing those applications proposing towers less than 150 feet in height and outside of

areas critical to airports. Field engineers will continue to participate at 1963 levels in regional FAA hearings that evaluate hazard potentialities of proposed towers.

The number of applications processed during 1963 reached a record high of 24,558 due to the continuing surge of applications for safety and special radio services and exceeded the previous high of 22,991 applications in 1961. This increase was met only as a result of quite extensive paid overtime. Based on budget forecasts it is expected that the volume of applications requiring antenna processing during 1964 will exceed the 1963 figure by approximately 14 percent; during 1965 there will be a slight decrease due to a decline in nonbroadcast applications. Utilization of automatic data processing procedures during part of 1964 will permit a reduction of about 0.8 in average employment in 1964 instead of an increase of 0.5 which normally would have been required with manual processing. Full utilization of automatic data processing procedures during 1965 will effect a further reduction of about 1 in average employment.

The estimated workload during 1965 is indicated in the following table:

Activity	Actual, 1963	Estimate, 1963	Estimate, 1965
Applications:			
Pending start of year	799	1,216	1,583
Receipts	24,975	28,492	27,575
Total workload	25,774	29,708	29,158
Processed:			
Manual	24,558	19,125	[1] 10,158
Automatic		9,000	18,000
Processed total	24,558	28,125	28,158
Pending yearend	1,216	1,583	1,000
Towers requiring obstruction markings	2,297	2,355	2,410
Regional FAA hearings in which FCC field engineers participate	64	64	64

[1] This total represents the more difficult types of applications requiring special manual analyses and coordination with FAA that have been rejected by automatic data processing, which only handles the simpler types of applications.

MOBILE TV ENFORCEMENT UNITS

Mr. BOLAND. You have the mobile TV enforcement units, one in Maryland, one in Nebraska, and one in California.

What sort of a unit is this?

Mr. TURNER. These are specialized mobile units with expensive equipment which is designed particularly to cover the television inspections from a technical standpoint.

Because of the expense and because of the specialized knowledge required of the engineer in charge of this equipment in making these kinds of surveys we have only three.

Mr. BOLAND. What is the cost of one, unmanned? What is the cost of the vehicle itself fully equipped?

Mr. TURNER. Something under $50,000, including the truck.

SEARCH AND RESCUE OPERATIONS

Mr. THOMAS. Somebody told us they were out 30 to 40 miles from a big airport, a plane was off course and the towers could not bring it down. These people here found them, got a fix on them and directed them in. Does anybody remember that occasion?

Mr. TURNER. We are in that particular business in regard to the use of our direction-finding equipment at the monitoring station. We were called upon under search and rescue operations and we are called on for this particular service often.

Recently in Alaska within the past 30 days we had a helicopter that was down. They didn't know where it was. It didn't know where it was, it was bad weather——

Mr. THOMAS. You can find one when he is down as well as up?

Mr. TURNER. If his radio operates. We took a bearing on the signal, the planes followed the line of direction we gave them, and they found the plane in a matter of minutes practically.

They were out there and we got a favorable comment from the military with regard to the assist we gave them. This is customary and standard operating procedure.

Mr. THOMAS. This is one of your most important bureaus, particularly the technical end of it. We have no desire to cramp you in some of the finest work you do.

COMMON CARRIER ACTIVITIES

Mr. BOLAND. Turn to common carrier, activity No. 5.

As Commissioner Henry indicated in his statement, this is a problem which contiues to grow. You are seeking $2,202,419 in 1965 as against $1,909,198, an increase of $293,221.

You are looking for 194.8 average employment in 1965, an increase of 23 man-years.

Insert page 81 in the record and the chart on page 82.

(The material follows:)

COMMON CARRIER ACTIVITY

INTRODUCTION

This activity covers the regulation of the rates, services, and practices of communications common carriers which furnish interstate or foreign telephone or telegraph service for hire to the public by wire, radio, or space communication, and the licensing of all radio used in common carrier communications including intrastate communications.

This function is accomplished through the Common Carrier Bureau and its three field offices and those segments of hearing examiners, Opinions and Review, the Dockets Division of the Office of the Secretary, and the Review Board which deal with common carrier hearing matters.

Financial requirements

	Actual 1963	Estimate 1964	Estimate 1965	Increase
Personnel compensation	$1,440,871	$1,682,855	$1,945,506	$262,651
Personnel benefits	107,627	121,066	141,713	20,647
Other obligations	97,275	105,277	115,200	9,923
Total	1,645,773	1,909,198	2,202,419	293,221

Manpower requirements (average employment)

	Actual 1963	Estimate 1964	Estimate 1965	Increase
1. Domestic rate regulation	48.1	54.2	62.7	8.5
2. Domestic service regulation	22.6	22.1	23.1	1.0
3. Domestic radio regulation	24.8	26.8	31.3	4.5
4. Accounting regulation	29.6	31.8	36.3	4.5
5. International communications	14.6	16.6	17.1	.5
6. Space satellite communications	9.4	13.4	17.4	4.0
7. Hearings	6.7	6.9	6.9	0
Total	155.8	171.8	194.8	23.0

The following chart is illustrative of the increasing workload versus the decline in the Commission's regulatory staff:

Mr. THOMAS. Who heads up this division this year?
Mr. HENRY. Mr. Strasburg is now Chief of that Bureau.

MEMBERS OF TELEPHONE AND TELEGRAPH COMMITTEE

Mr. THOMAS. Which of the Commissioners sits with the Committee?
Mr. HENRY. Commissioner Hyde is the chairman of the Telephone and Telegraph Committee. Commissioners Bartley and Cox also are on that Committee.
Mr. THOMAS. They have been working in this specialized field for several years.
Mr. HENRY. All except Commissioner Cox, but he has a few ideas of his own.

DOMESTIC TELEGRAPH INVESTIGATION

Mr. BOLAND. The Commissioner has a statement in his presentation stating:

> These proceedings, which are well underway, involve an intensive examination of the competitive relationship between Western Union and the Bell System in light of the charge that the Bell System has engaged in selective pricing policies to the detriment of Western Union.

Have you moved against the Bell System at all?
Mr. HENRY. We are engaged in the investigation. We have a recent understanding with the Bell System to furnish us some cost studies for their various activities which we have never had before. It is a long, complicated proceeding, but so far I think it is proceeding satisfactorily.
Some of the questions involved in it are some of the same questions which arise in the international field; that is, what kind of competition there shall be in the furnishing of the relatively new services which involve new technology and new systems, that is the broad band data services and alternate voice records, and so on.
Mr. OSTERTAG. Do you investigate records of telephone companies?
Mr. HENRY. As part of the rate base? Yes.
Mr. OSTERTAG. Not so much as part of the rate base but their practices.
Mr. HYDE. We are asking for these studies so we can ascertain whether or not the different services are bearing their appropriate share of the costs.
Mr. HENRY. I think he is talking generally, though. What particular kinds of practices?
Mr. OSTERTAG. Well, I noticed that a complaint was filed against a certain company for overcharging on interstate toll calls and challenging the recordkeeping and billing for such calls. That falls within your jurisdiction and responsibility? That would be an investigation, would it not?
Mr. HENRY. That is correct. It is an adjudicatory hearing which we conduct from time to time.

RADIO USED BY COMMON CARRIERS

Mr. OSTERTAG. Of course, you are charged with regulation of rates and services and practices of communications common carriers which furnish interstate and foreign telephone and telegraph service for hire, and also the licensing of all radio used in common carrier communciations including intrastate.

What is the meaning of a radio used in common carrier communications? That is not the normal radio we think of.

Mr. HENRY. It is not broadcasting. That is microwave.

American Telephone & Telegraph Co., for example, in carrying telephone signals, television signals, or data signals from computer to computer will carry it on a narrow beam of radio energy from one hilltop to another. It will go from hilltop to hilltop via radio in the same way it would go if a cable were strung between those two points.

Also in the common carrier field we have the use of radio transmitters as we normally think of them to be used in connection with mobile telephones, paging services, and so on.

DOMESTIC RATE REGULATION—TELEPHONE

Mr. BOLAND. Insert page 83 and the narrative which continues for a number of pages here. This is telephone under domestic rate regulation.

(The information referred to follows:)

Domestic rate regulation

This activity relates to the regulation of domestic telegraph rates and tariffs and domestic and international telephone rates and tariffs, the revenue requirements of carriers, the cost of rendering services, and the depreciation rates used by carriers.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Telephone	38.3	43.9	50.9	+7.0
Telegraph	9.8	10.3	11.8	+1.5
Total	48.1	54.2	62.7	+8.5

An increase of 8.5 man-years is requested for domestic rate regulation to more adequately regulate the rapidly growing telephone and telegraph industry in such matters as the investigation of new service offerings, separation procedures, interstate operating results, postaudit of tariffs and rates, prescription of depreciation rates, and to deal with Western Union's new Datacom service, its expanding Telex service, its private-line offerings, and certain rate matters involved in the overall investigation of the domestic telegraph industry.

Telephone

An increase of 7 man-years in average employment is requested to enable the Commission to expand its telephone activities to cover some of the areas in which the Booz-Allen-Hamilton report indicated the Commission has not had sufficient staff to perform its assigned tasks in telephone rate regulation as fully as desired by the Commission.

The rapidly growing telephone industry, consisting of the Bell System and more than 2,800 independent telephone companies, has a gross investment in plant exceeding $33 billion at the end of 1962 and over 81 million telephones in service. Economic growth, technological advances, and new service offerings increase the workload relating to rate regulation.

With the keen competition among carriers and between carriers and private communications systems, it is expected that 1965 will produce more activity in new, revised, and improved tariff offerings. The rates for these offerings will need careful scrutiny both as to level and structure.

With regard to toll telephone service, the Commission took the initiative in urging the adoption of a new rate schedule whereby a 3-minute station-to-station interstate call can be made between any two points within the continental United States (excluding Alaska) during the period from 9 p.m. to 4:30 a.m., for $1 or less, a decrease ranging from 5 to 75 cents. A decrease in additional period rates ranged from 5 to 20 cents.

Also placed into effect were changes in rate structures including increases of 5 or 10 cents in person-to-person calls up to 800 miles. These calls had not borne their proportionate share of the cost of furnishing such services. Based upon 1962 traffic volume, it is estimated that the net effect of these rate changes will result in an annual savings to the public of about $30 million.

The "after 9" plan associated with interstate long-distance message toll service was put into effect April 4, 1963. The preliminary traffic data we have received since that time indicates that there has been a shift in the peak calling time. We have not yet been able to determine whether further studies will be necessary before final conclusions can be reached as to whether any further changes should be made in the rate structure.

Other revisions of American Telephone & Telegraph Co.'s message toll tariff include regulations and rates in connection with telephone service with ships of foreign registry and interconnection with systems of miscellaneous common carriers for through service.

A new public offering was made in the Telpak tariff for high-speed data channels at 40,800 and 105,000 bits per second.

A modernization program is underway by A.T. & T. to reduce the number, reorganize, and simplify the existing tariffs which, for the Bell System, consist of 68 tariffs of some 4,300 pages. It is expected that this program will be completed and submitted to the Commission for review during fiscal 1965. Including non-Bell filings, 776 tariffs were on file at the end of the fiscal year with 9,368 revised or new pages having been filed during the year.

As can be seen from the foregoing, there are a considerable number of initial and final decisions to be issued. Since other parties to these proceedings are known to have contrary positions, the staff will be required to continue to devote a large part of its time to such matters.

The tariff modernization program underway by A.T. & T. will require time-consuming review by the staff. With the rapid change in services and the institution of many new services, it is considered very important to conduct an overall review of all tariffs and rate structures for the various services. Cost studies and the increasing complex rate structure problems in new telephone service offerings, such as WATS, WADS, Telpak, Telex, etc., require consideration of such matters as economic pricings, market surveys, statistical analysis, diversion of traffic, stimulation of demand, etc. Certain tariffs and rates (particularly in service to military) for which adequate cost data were not available at the time rates were permitted to become effective, require postaudit.

There is presently a backlog of 8 or 10 cases, both hearing records and petitions. For example, the *Telpak* case for which an initial decision is now pending, has been in process since early in 1961. Two new major hearings have been designated in recent months. Private Line Press and WADS–TWX, and it does not appear that there will be any letup in the foreseeable future. Currently we have about 15 man-years assigned to the work of hearings and decision writing. Consequently, there is too long a period between the dates that the investigatory hearings are initiated and completed. Meanwhile, the tariffs, by law, become effective even though suspended by the Commission. It is urgent that we reduce the backlog in these matters, and we are therefore requesting an increase of 2 man-years in average employment.

Hearings have been completed in the investigation of A.T. & T.'s Telpak tariff offering, which covered bulk voice, teletypewriter, data, and other forms of communication. Rates for larger users are significantly lower than comparable private line charges. Many interested parties intervened in the proceedings, the hearings have been closed and the initial decision is now pending. Because of the many controversial issues in these proceedings, it is fully anticipated that even though the final decision may be issued there will be much followup work required during fiscal 1965.

In the investigation of A.T. & T.'s wide area telephone service or WATS, the hearings have been completed and the case is awaiting an initial decision. WATS is a long-distance, station-to-station telephone service which makes available limited (measured time) and unlimited (full time) interstate calling within a maximum of six zones or calling areas at flat monthly rates.

The Commission concluded in an initial decision in the wide area data service (WADS) proceedings that some form of a WADS offering may be justifiable. While accepting some aspects of the WADS design, the Commission concluded that certain of the flat-rate aspects of the tariff were unreasonably discriminatory. An opportunity was given A.T. & T. to submit a new WADS tariff reflecting various modifications suggested by the Commission. An investigation into the lawfulness of teletypewriter exchange service (TWX) rates was instituted at the same time by the Commission and consolidated with the WADS proceeding.

The final decision in the *Private Line* case generally ordered A.T. & T. and Western Union to lower rates as to voice channels and to raise rates in regard to the private line teletypewriter services. Revised rates were required to be filed effective August 1, 1963, and refunds are to be made in certain instances by both companies. The Commission, on reconsideration, affirmed the final decision with the exception of rates charged the press which are stayed, pending an investigation into those rates. The U.S. Court of Appeals for the Seventh Circuit on July 31, 1963, issued a stay order against the effect of the operation of the Commission's orders in the *Private Line* case. A new proceeding has been initiated as to the rates charged the press.

The final decision in the *Private Line* case will make it possible for the staff to proceed with initial decisions in two cases involving the Department of Defense. The SAGE rate case and the charges and regulations for the ballistic missile early warning system (BMEWS) and the Command Post Alerting Network (COPAN) services.

An initial decision was issued in the *Doniphan Telephone Co. of Missouri* case which involved a request for a change in points of interconnection with the Southwestern Bell Telephone Co. A final decision, on May 22, 1963, limited the initial decision to a denial of Doniphan's request.

A complaint filed by the Thornell Barnes Co. alleged that Illinois Bell Telephone Co was overcharging the Barnes Co. for interstate toll calls as well as challenging the Bell methods of recordkeeping and billing for such calls. After 24 days of hearings, the case is open pending further filings and an initial decision.

Since 1947 the separations manual has been rewritten several times to incorporate the revisions in the procedures including the changes made effective in April 1962, which had the effect of shifting approximately $46 million from intrastate to interstate revenue requirements. The April 1962, revision enabled the States to reduce intrastate rates and, as of June 30, 1963, resulted in 41 States reducing rates over $41 million on an annual basis. This has alleviated, to some extent, the existing disparities between interstate and intrastate message toll rates.

The problem of disparity in interstate and intrastate message toll telephone rates is of continuing concern to the Commission and, nationally, amounts to about $270 million annually, priced at current toll rates. On separations matters, the Commission is always working closely with representatives of the Bell System and the National Association of Railroad and Utilities Commissioners (NARUC) Committee on Communications Problems. The demands on FCC staff time will continue to grow in this regard.

In order to effect the equitable separations of plant, expenses, and revenues between the State and Federal jurisdictions, as contemplated by the Communications Act, continuous study must be given to such matters as the new types of plant introduced into telephone operations as well as new services such as WATS and WADS and their effect on separation problems. Other matters requiring consideration are the effect on separations problems of (*a*) extended area exchange service, (*b*) the change in the uniform system of accounts which reclassified and transferred the investment in certain local loops used in connection with toll private line service to the toll account from the exchange account, and (*c*) the increased use of automatic machine accounting. In order to carry on a more effective cooperative program with respect to continuing studies of the procedures for the allocation of the investment, expenses and revenues between interstate and intrastate, including toll settlement arrangements between Bell and independent telephone companies, will require an increase of 1 man-year.

The continued study of the level of earnings from Bell System's total interstate operations require a substantial amount of time. The return on interstate

earnings to net investment in plant amounted to 7.7 percent for the year 1962, on a flow-through basis (including the effect on net operating income of the investment credit from plant additions authorized by the Revenue Act of 1962). Representatives of the Bell System have discussed this matter before the Commission, including the various pertinent factors, such as the financing problems, the construction program, message volumes, economic factors and methods for determining an appropriate level of earnings. In this connection, more intensive and extensive staff studies are necessary in the matter of basic revenue requirement studies including cost of capital, capital structure, rate base, etc., to determine the reasonableness of the level of earnings. It should be remembered that all these studies are complex and very time consuming and must be prepared with the knowledge that they will be subjected to the closest scrutiny. Moreover, these factors to be studied are the very essentials of regulation and should never be given the short shrift that lack of manpower inevitably imposes. In order to carry out the Commission's responsibilities in this matter, we need an increase of 1 man-year.

Western Electric Co. in 1962 reduced its prices to the Bell telephone companies on products of its manufacture which resulted in a savings of $40 million annually. The Commission's cooperative review with the National Association of Railroad and Utilities Commissioners (NARUC) of Western's prices, earnings, and costs has continued. The impact of Western's prices to Bell System companies can be seen when it is realized that by far the largest single expense (other than income taxes, maintenance expenses and operator's wages) of an operating telephone company is the depreciation expense on its plant and equipment.

Further work should be done on a restudy and analysis, including a review of the telephone equipment manufacturers of the costs of sales of manufacturing, supplying, servicing, and holding companies affiliated with telephone carriers and the payments made for license contract services and research and development insofar as such costs are pertinent to the cost of providing telephone services. An increase of 1 man-year average employment will be required to achieve our objectives in these matters.

The Commission is required to prescribe depreciation rates for communications common carriers which come under its jurisdiction. Depreciation rates are established and under continuous review for each class of plant and equipment devoted not only to interstate and foreign communications but also to intrastate and local exchange telephone service. During fiscal 1963, new revised depreciation rates were prescribed for eight Bell companies. Comprehensive studies and investigations as to the appropriate service lives and net salvages for all the various classes of telephone plant and equipment are, in general, scheduled to cover each Bell company once in each 3 years.

The considerable growth in recent years of the business services in the telephone station-apparatus field has resulted in the establishment of a separate depreciation study category to include all apparatus other than regular residence and coin telephones. Thus far, studies indicate that this type of apparatus has only about half the life of regular telephones. Developments in the station-apparatus field are expected to have a serious impact on the lives of telephone equipment. These include touchtone telephones, console-type switchboards with solid state circuitry, and electronic central offices.

Work has barely started on the preparation of a manual on depreciation for engineers in cooperation with the National Association of Railroad and Utilities Commissioners. This is a substantial task and FCC personnel have been requested to assume a large part of it. The new shorter guideline lives for tax depreciation announced by the Internal Revenue Service in July 1962, specifically exempted telephone and telegraph companies. It provided that where depreciable lives or depreciation rates have been established by this Commission, such rates are to be used in the computation of depreciation for tax purposes. Depreciation studies, for certain non-Bell companies subject to our jurisdiction, including RCA Communications, Inc., in addition to the scheduled prescription of depreciation rates for the Bell System companies will require an increase of 2 man-years average employment. At the present time, only 6 man-years are applied to this work which is wholly inadequate to accomplish the objectives set forth above.

DOMESTIC TELEPHONE REGULATION

Mr. BOLAND. The rapidly growing telephone industry, consisting of the Bell System and more than 2,800 independent telephone companies, has a gross investment in plant exceeding $33 billion at the end

of 1962 and over 81 million telephones in service. Economic growth, technological advances and new service offerings increase the workload relating to rate regulation.

General Telephone picked up a number the other day I saw in the paper.

Mr. HENRY. I didn't see that. A.T. & T. this year is increasing over $3 billion itself, a new plant which is roughly one-twelfth of the total expenditures for new plant in the country.

NUMBER OF TELEPHONE COMPANIES

Mr. OSTERTAG. You describe it as one big system and 2,800 independent systems?

Mr. HENRY. That is other than the Bell System, General Telephone, and so one.

Mr. OSTERTAG. Is that an indication that the telephone communications system in our country is spreading out into small entities rather than consolidating?

Mr. HENRY. I think I am correct in saying that the rate of growth is higher among the independent telephone companies than is the rate of growth in the Bell System as measured by the number of telephones.

A.T. & T. of course, continues to have the bulk of the telephone service in this country.

Mr. BARTLEY. The independents are quite an industry now. There were 15 million phones in 1934. There are about that many independent telephone companies now.

Mr. BOLAND. No. 2 company is General Telephone?

Mr. BARTLEY. Yes.

Mr. HENRY. I think the chart on page 82 also is extremely interesting insofar as our workload is concerned. It shows the increasing ratio between billions of dollars invested in common carrier plant and staff which we have to regulate the industry.

DOMESTIC TELEPHONE RATE REGULATION—WESTERN ELECTRIC CO.

Mr. BOLAND. Page 89 makes good reading on Western Electric Co. You speak of a savings of $40 million annually. We hope this results in lower costs to the users of telephones. Does it?

Mr. HENRY. Yes; it does. I might add this would be one of the main areas we would be concerned with with the new personnel we hope to get under this budget.

Western Electric sales exceed $2.3 billion annually. We have an insufficient staff to really investigate that particular area. We would like to do more.

Mr. THOMAS. Off the record.

(Discussion held off the record.)

RESEARCH LABORATORIES

Mr. THOMAS. Is it true that the best laboratory in the country is Bell's Laboratory in New York?

Mr. LEE. With the exception of Government.

Mr. BARTLEY. There may be some larger ones. I think RCA Research may be greater than that of Bell.

Mr. THOMAS. We had a famous person and one of the outstanding scientists of the country here, Dr. Dryden. He gave a classical ex-

ample and we will never forget it—the value of spending money on research and development. He said: "I can give a good example. The railroads have spent nothing in the last 50 years and they are broke. Look at what Bell has spent and look at what they are doing."

He got no argument on that.

DOMESTIC RATE REGULATION—TELEGRAPH

Mr. BOLAND. We shall insert pages 90 and 91 with regard to telegraph.

(The pages follow:)

Telegraph

Western Union, as of December 31, 1962, had a gross investment of $541 milion in its landline system, an increase of $106 million during the year. However, gross landline operating revenue for the year 1962 amounted to $264 million, a decrease of $1.6 million from the high in 1961. This drop was due principally to the decline in public message volume which was only partially offset by increases in private line and Telex service revenue. Net income from Western Union's entire operations in 1962 was $10.6 million, compared with $12.2 million in 1961. Net income for 1962 reflects a Federal income tax credit of $3.5 million due principally to the use of accelerated depreciation in the calculation of Federal income tax.

The investigation of the domestic telegraph operations and services is now in progress, including among other things, a study of a number of areas pertinent to the need for message telegraph service. During the year at the request of the staff, both Western Union and the Bell System began collecting additional data and information which will be submitted at hearings to begin in September 1963. Despite the fact that this investigation is primarily concerned with telegraph services and operations, there are many rate aspects which must be dealt with during the course of, and subsequent to, the investigation.

On August 10, 1962, Western Union filed revised tariff schedules which would discontinue the company's practice of making certain reductions in its charges for each sent-paid messages filed by a customer over a tieline. The Commission suspended the proposed tariff schedules and instituted an investigation. Western Union later obtained special permission to substitute schedules reducing the effect of the discount but not eliminating it altogether. Western Union also filed revised tariff schedules effective November 23, 1962, increasing the charges for additional words (the words in excess of 15 in telegrams and in excess of 50 in day letter and night letter messages). On June 10, 1963, Western Union filed revised tariff schedules, effective July 10 and November 1, 1963, increasing rates for interstate message telegraph services and certain miscellaneous services.

New private line services for remote metering, supervisory control and miscellaneous signaling purposes have been established by Western Union in competition with similar A.T. & T. offerings. Also a new data-tape transmission service and a flat rate personal opinion message service have been established on an experimental basis for 1 year.

During the year Western Union filed 1,003 pages of domestic telegraph tariff material.

Domestic telegraph rate matters requiring attention of the Commission will include cost studies and rate structure problems in connection with Western Union's new data-com service and its expanding Telex service, as well as other new tariff offerings. Also the matter of basic revenue requirement studies (including cost of capital, capital structure, rate base, etc.) will require consideration. An increase of 1.5 man-years in average employment for domestic telegraph rate regulation will be required for the Commission to achieve an effective program in this matter.

STATUS OF WESTERN UNION

Mr. OSTERTAG. Western Union is the sole telegraph system in this country?

Mr. HENRY. Message telegraph, yes.

Mr. OSTERTAG. In other words, it is a monopoly in a sense that it is the only one?

Mr. THOMAS. They absorbed the other one, the other was about broke, and now both of them are broke.

Mr. LOEVINGER. They are having a tough time.

Mr. OSTERTAG. Is there a serious problem there? Of course, there is no competition. On the other hand, is it rapidly shrinking from the standpoint of being a lucrative means of communication?

Mr. HENRY. I would say the message telegraph service is not lucrative to the Western Union Co.

Last year we gave them a 10-percent price increase on message telegrams for interstate messages. They figured that the reduction in service that will result will gradually eliminate the increased revenue from that raise in about a year and a half, and I think they are counting on their other services to carry them through. It is on the other services they make their money.

Mr. THOMAS. What are their other services?

Mr. HENRY. Telex, the teletypewriter network, microwave services and private lines services. They bid on various jobs around the country. They are now building a $100 million investment in cross-country microwave systems.

Mr. BARTLEY. They find it necessary to close down certain offices. They go into drugstores, hotels, and so on.

Mr. THOMAS. They cannot close down a location without prior approval, can they?

Mr. BARTLEY. They come to the Commission.

Mr. OSTERTAG. You recognize their problem and you cannot get away from it. Is that right?

Mr. HENRY. That is in the message service. With respect to their company as a whole we think and they think that with their new investment in microwave plant and their contracts with defense, they are in a healthy condition at the moment, or soon will be.

DOMESTIC SERVICE REGULATION

Mr. BOLAND. Domestic service regulation is on page 91 indicating manpower requirements for telephone and telegraph, and you have a narrative on pages 92 and 93. Insert this material in the record.

(The information referred to follows:)

Domestic service regulation

The Commission regulates the services and practices of communications common carriers which furnish interstate or foreign telephone or telegraph service for hire to the public by wire, radio, or space communication. It acts on proposed mergers and acquisitions of properties, extensions, and reductions in service, and studies new techniques and engineering advancements in the communications art which are continually developing and presenting the Commission with new common carrier problems.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Telephone	8.8	7.8	8.3	0.5
Telegraph	13.8	14.3	14.8	.5
Total	22.6	22.1	23.1	1.0

An increase of 1 man-year is requested for domestic service regulation for processing applications for new telephone plant construction and expansion of facilities resulting from rapid growth and accelerated introduction of new technological developments and to deal with telegraph service problems resulting from continuing decline in public message volume and increased number of applications to discontinue or otherwise curtail telegraph service.

Telephone

Telephone companies are expected to continue their rapid expansion and improvement in services and facilities during fiscal 1965. Additional requirements for message toll, private line, and special services continue to become greater each year. To meet this demand the American Telephone & Telegraph Co. is providing new coaxial cable and microwave radio trunk routes which, in the interest of national defense, avoid critical target areas, assuring continuation of vital services in case of national emergency. In passing on applications to construct new plant, the Commission is charged with the responsibility of determining whether there is adequate justification for the facilities and must be satisfied that the proposed facilities will be compatible with existing plant and will provide reliable economical and efficient service. This requires the Commission's staff to keep abreast of new developments and engineering advancements in the communications art. During fiscal 1963, 331 applications were authorized for construction of cable, wire, and carrier systems costing $241,320,000.

The scope of the telephone industry's construction programs and the extent of the Commission's application processing activity are illustrated by the following table:

Estimated construction costs authorized by the Commission

Fiscal year	Cable facilities and channelizing equipment	Radio relay [1]
1961 actual	$153,000,000	$72,000,000
1962 actual	143,900,000	89,500,000
1963 actual	241,320,000	97,386,000
1964, estimated	140,000,000	160,000,000
1965, estimated	130,000,000	170,000,000

[1] Engineers engaged in domestic telephone service regulation review applications for microwave radio relay construction permits from the standpoint of public need for the proposed communication channels to be derived therefrom, and to assure that the resultant facilities are efficiently integrated with existing facilities.

The Commission works with the Department of Defense and other Government agencies in developing ways and means to insure priority of use and continuity of communication services at all times, handles service complaints from users, and endeavors generally to assure that quality telephone service is made available to all users.

Telephone service regulation activity also includes analyzing and processing applications for certificates to consolidate or acquire telephone properties, and on applications for interlocking positions of directors and officers in telephone carriers.

The Commission is charged with the responsibility of resolving controversies between the various telephone companies as to interchange of facilities and joint services and may, on complaint or petition or on its own motion, require telephone carriers to (1) furnish service on reasonable request therefor, (2) establish physical connections with other carriers, or (3) establish through routes and provide facilities and regulations for operating through routes.

Although service regulation work is expected to increase in fiscal 1965, only a small increase of manpower of 0.5 average employment is requested over that authorized for fiscal 1964.

Telegraph

By 1965, Western Union is expected to have substantially completed the largest building and expansion program in its history including its transcontinental microwave radio network, new private line systems for the Department of Defense, other Government agencies and private users, and development of new

voice and alternate record-voice services. The Commission approved 42 Western Union applications in fiscal 1963 for the supplementation and extension of wire facilities to meet the increasing needs of customers for private wire telegraph services and for extension of lines and improvement of message telegraph service. Approximately 60 such applications are expected in 1965.

ADDITIONAL STAFF FOR TELEGRAPH REGULATION

Mr. OSTERTAG. Why do you need increased manpower with regard to telegraph?

Mr. HENRY. I don't think it is an increase in manpower in order to deal with message telegraph as you know it. The main increase we need is to regulate the overall industry of which telegraph is part and to make the studies necessary for us to make policy decisions affecting the telegraph industry, primarily in its relationship to the telephone industry.

There again that relates to these newly developed so-called broad band services which furnish the communication links between computers.

Mr. THOMAS. Off the record.

(Discussion held off the record.)

Mr. BOLAND. Page 92 shows an interesting table. Equipment for 1964 was $140 million. You estimate for $130 million in 1965.

You have an interesting paragraph on page 93 referring to the largestprogram in this company's history.

I think that indicates they are going pretty strong.

DOMESTIC RADIO REGULATION

Page 95 refers to domestic radio regulation. You have an increase of 4 people, from 26 through 31.

Insert the narrative on pages 95 through 99.

(The pages follow:)

Domestic radio regulation

This subactivity consists of licensing and service regulation of domestic common carrier radio services, including developmental service, point-to-point microwave radio service, local television program transmission service, rural radio service, domestic public land mobile radio service, and jointly performing such functions with the Marine and Aviation Division of the Safety and Special Radio Services Bureau in connection with rendition of public service in Alaska and through land, maritime, and aeronautical stations.

Manpower requirements

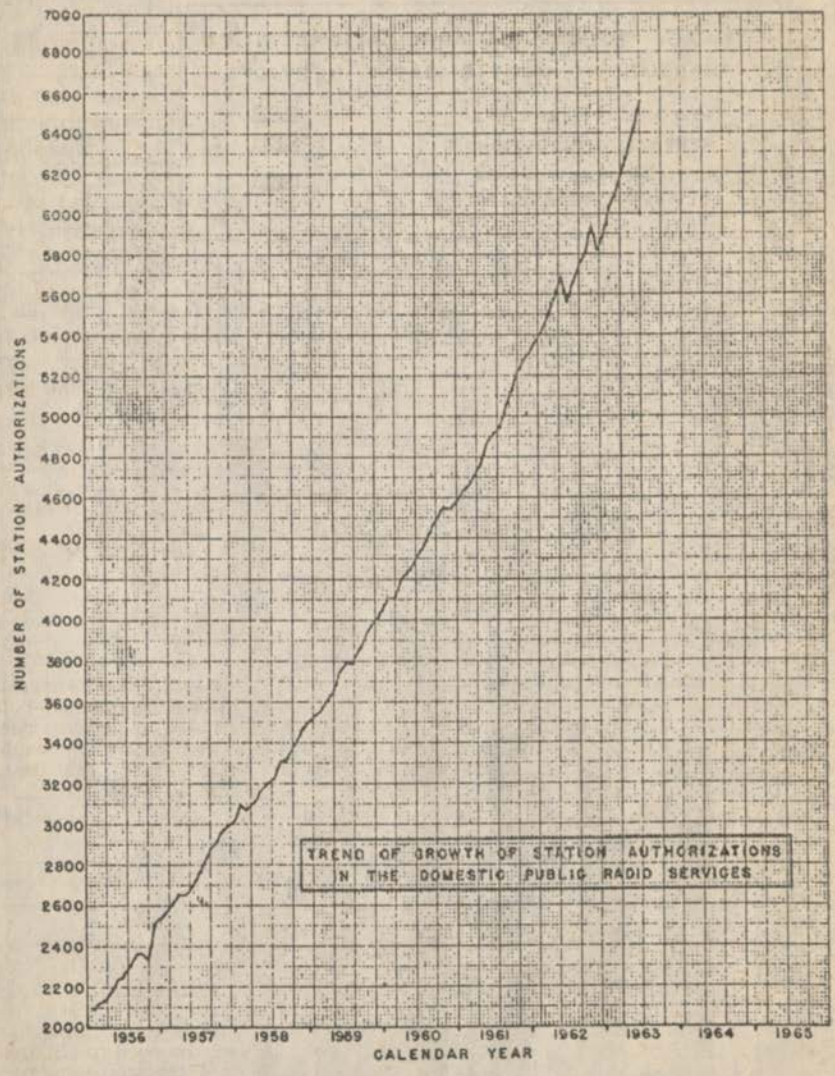
	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	24.8	26.8	31.3	4.5

An increase of 4.5 man-years of average employment is requested because of the increasing number of new applications filed each year, the need to eliminate the mounting backlog of applications waiting for processing, the increasing number of applications being set for hearing, and the increasing number of rule-making proceedings being instituted.

As the number of authorized stations increases, a greater number of more varied and complex problems are created for the Commission involving frequency allocations and assignments, development of new types of services, and maintenance and improvement of existing services. The amount of time required to

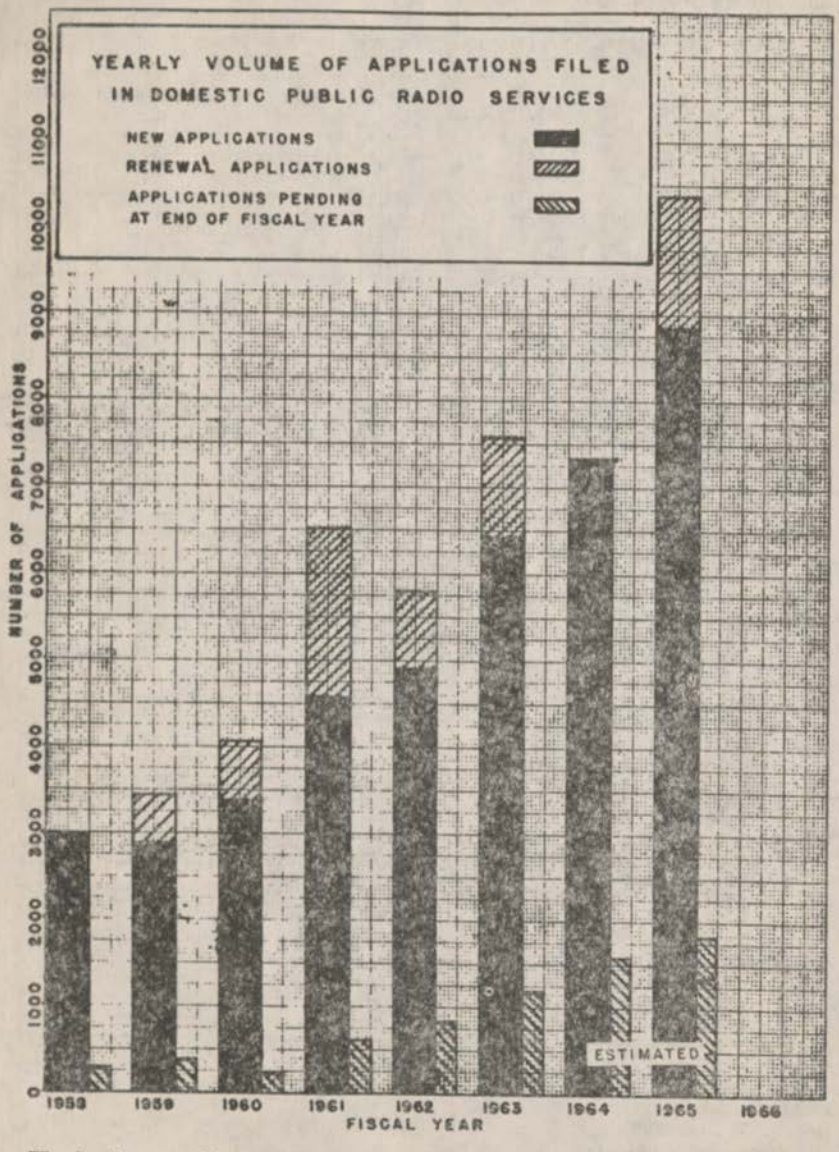
be spent by the staff in resolving these kinds of problems is also increasing and adds to the requirements. Furthermore, as both the number of applications filed and the number of station authorizations increase, there is a corresponding need generated for additional clerical help in the license branch, which is responsible for the paperwork connected with the receiving, classifying, and jacketing of applications and the issuance of the various Commission authorizations; e.g., construction permits and licenses.

The following graph shows the number of stations authorized each year from 1956 through June 1963:



During the 5-year period, July 1958 through June 1963, station authorizations increased more than 100 percent from 3,220 to 6,550. In 1963 the number of stations authorized increased approximately 17 percent over 1962. The same or a greater increase in the number of stations is expected to occur in both 1964 and 1965.

The following graph shows the actual number of applications received in each fiscal year, 1958 through 1963, and the estimated number of applications to be filed in 1964 and 1965:



The backlog pending at the beginning of 1964 represents a delay of approximately 5½ months in processing of new applications in the domestic public land mobile radio service and about 3¼ months delay in the point-to-point microwave service.

Although the graph shows a smaller total number of applications received in 1962 and 1964, it is significant that neither of these years was a renewal year, and that there is a constantly increasing number of new applications filed in each year over the preceding year. Renewal applications, with the exception of point-to-point microwave renewals of miscellaneous common carriers can generally be handled in routine fashion without any substantial need for additional professional personnel.

The graph indicates that the backlog continues to increase each year, but at a slower rate in 1964 and 1965 than the filing of new applications in those years. This results from an optimistic projection reflecting approximately 20-to 25-percent increase in efficiency in processing applications and an increase in productivity as a result of the hiring of additional personnel in accordance with this budget request. However, any attempt to substantially reduce the backlog must be based on the employment of additional personnel in excess of those requested in this budget.

In addition to the applications reflected in the graph for 1963 there also were 423 applications for special temporary authority filed, as contrasted with approximately 300 in 1962. The sharp increase in the filing of such applications stems from the increasing backlog of regular applications. Applications for special temporary authority are being used as a means of avoiding the delay incident to the backlog of regular applications by obtaining an interim or temporary authorization to operate. A substantial amount of man-hours is being expended in handling such requests and this diversion of man-hours from the processing of regular applications further aggravates and increases the backlog.

The increase in the number of applications for various types of common carrier radio facilities and frequencies is due to several factors. In the point-to-point microwave service as the reliability of radio facilities is improved, the landline telephone and telegraph companies employ a greater amount of less expensive radio facilities in place of coaxial cable and open wire. An indication of the expansion in radio facilities which is taking place is the amount of construction costs authorized or estimated to be authorized by the Commission for radio relay facilities: $89.5 million in 1962; $97.4 million in 1963; $160 million in 1964 (estimated); and $170 million in 1965 (estimated).

Many new service offerings are being made by both A.T. & T. and Western Union and these offerings such as WADS, TELPAK, and TELEX are designed to make extensive use of radio facilities when and if they either become fully effective or are finally approved by the Commission. The implementation of these services by the carriers will give rise to additional applications for radio facilities as well as create new problems.

In the domestic public land mobile radio service no great increase in the number of applications filed is forecast for 1964 because of the substantial occupancy of the channels currently available for such service in the major urban areas. However, several developments in this field, it is anticipated, will lead to a substantial growth in 1965. The narrow banding of radio equipment in order to make greater utilization of the frequencies available in this service will be substantially completed in 1964, and it appears that many of the obstacles in the way of interconnection between the facilities of miscellaneous common carriers and the facilities of the landline telephone companies are being eliminated. The greater realization in 1964 and 1965 of interconnection, which will permit direct conversations between mobile radio-telephone subscribers and telephone company survivors, will make this service more attractive to the public. Also the automation of mobile systems which are now manually operated should result in an improved and more attractive service. The combination of these factors together with an increasing demand by the public for all kinds of mobile services should produce a substantial increase in applications for construction permits and licenses in 1965 and add to the manpower requirement of the activity.

In connection with the development of a satisfactory air-to-ground telephone service the Commission has called for the design of an adequate system to meet the needs of the public by September 1964; otherwise a discontinuance of the developmental service will be required. In the event a satisfactory system is developed by or before September 1964 a substantial increase in the workload in processing applications and disposing of problems in connection with this new service will be experienced in 1965.

The amount of hearing work has been increased inordinately. In the point-to-point microwave service application by the miscellaneous common carriers, who use microwave primarily to carry television signals for customers who

generally are community antenna television (CATV) systems, have resulted in more hearing work than all the other types of domestic radio services. In fiscal 1963 there were 16 docketed proceedings before the Commission involving the licensing of microwave facilities and at the beginning of fiscal 1964 9 of these dockets were still open. It is estimated that in 1964 there may be as many as 12 additional cases set for hearing, representing about a 30-percent increase in hearing work over the preceding year.

ACCOUNTING REGULATION

Mr. BOLAND. There is accounting regulation on page 100 and the manpower regulation on page 101.

The primary purpose of accounting regulation is to insure basic data necessary for effective rate regulation.

Insert 101 and 102, and the bottom of page 103, International Communications, plus the table on page 104 and the narrative on that page.

(The information referred to follows:)

Accounting regulation

This subactivity relates to the prescription and policing of accounting, reporting, and preservation of records requirements necessary for effective rate regulation of telephone, wire telegraph, ocean-cable and radiotelegraph carriers engaged in interstate and/or foreign communications. This work is carried out by headquarters personnel in Washington and field personnel located in New York, St. Louis, and San Francisco; it is proposed that in 1965 a field office be opened in Atlanta, Ga. It also includes the statistical responsibilty in connection with gathering, studying, and publishing statistical data required by the Commission, other interested parties, and the public.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Systems	6.1	6.5	8.0	1.5
Compliance	18.8	20.6	23.6	3.0
Statistics	4.7	4.7	4.7	
Total	29.6	31.8	36.3	4.5

An increase of 4.5 man-years is requested to provide for compliance and systems work in order to more extensively and intensively police the accounts of the subject carriers. In addition this increase will permit us to deal more effectively with the complex accounting problems arising from (*a*) communication carrier industry expansion and (*b*) rapid technological advances in the communications art, including developments in the area of space satellite communication.

Compliance and systems

The primary purpose of accounting regulation is to insure that the basic data necessary for effective rate regulation are reflected accurately and in a uniform manner in the books of the carriers. The reporting requirements provide for keeping the Commission continuously and fully informed of the operations of the carriers. Rules are also prescribed to require that records be retained for specified periods in order to prevent the premature destruction of records required for regulatory purposes.

Dynamic growth being experienced in the telephone industry requires continued policing of the accounting for additions to plant.

Advances in the art necessitate continued review and frequently change in the prescribed accounting regulations in order to provide for the orderly accumulation to the maximum possible extent of data used and useful for regulatory purposes.

Due to its extremely controversial nature, the accounting for the investment tax credit has required a substantial amount of time for review and consideration.

The growth in volume of business in the telephone industry leads to the establishment of an increasing number of operating divisions or areas within the companies. Since in most instances, the accounts are maintained in a similar manner, this increases the number of operating units for which separate policing of the accounts is required.

During fiscal 1963, the accounts of 11 Bell telephone companies and 4 non-Bell telephone companies were subjected to limited review. The reviews were directed to such matters as accounting for additions to and retirements of telephone plant, the establishment and maintenance of continuing property records, and the accounting for the cost of the conversion of teletypewriters from manual to dial operation. In the case of 10 companies, travel was involved. These reviews were, therefore, limited generally to 1 or 2 man-weeks. Five of the largest Bell compaines have headquarters in or within commuting distance of our Common Carrier Bureau field offices. Therefore, continuing accounting reviews are made of the headquarters and local operating area accounts, records, and procedures of such companies which are American Telephone & Telegraph Co., New Jersey Bell Telephone Co., New York Telephone Co., the Pacific Telephone & Telegraph Co., and the Southwestern Bell Telephone Co.

In addition to reviewing the accounts of certain telephone carriers, review was also made in 1963 of the accounts of the only wire-telegraph carrier regulated by us; namely, Western Union Telegraph Co. Review was made of the accounts of the three ocean-cable carriers, including Western Union, as well as of four of the six radiotelegraph carriers.

A comprehensive audit of the accounts of Western Union will get underway in 1964. Work will continue on this assignment as time permits. This project it is expected will extend through fiscal 1965.

In the field, continued accounting reviews will be carried out in fiscal 1965 in the offices of those telephone, radiotelegraph, and ocean-cable carriers which have offices in or within commuting distance of those cities where our common carrier field offices are located; i.e., New York, St. Louis, and San Francisco.

It is anticipated that substantial time will be required to be devoted to writing accounting rules in the satellite communications field in 1965.

In 1965 it is contemplated that a substantial amount of time will be devoted to a study to modernize and otherwise revise the Commission accounting rules in order that the subject carriers may be better able to make full and effective utilization of machine accounting and electronic data processing.

Due to the continually rising price level of telephone equipment the accounting for purchases and exchanges of telephone properties is becoming both more complex and controversial.

Under currently projected plans further progress will be made in 1965 looking toward the placing of the review of telephone carriers' accounts on a scheduled basis where each company will be visited at least once every 5 years.

Statistics

The common carrier statistical responsibility is concerned primarily with gathering, studying, and publishing statistical data required by the Commission, other interested parties, and the public.

This includes (i) compilation annually of "Statistics of Communications Common Carriers," sold by the Government Printing Office, (ii) compilation and publication of monthly summaries of operating data of communication carriers, and (iii) receives annual reports of miscellaneous common carriers.

As a byproduct of this activity, information useful in enforcing compliance with the Commission's accounting and reporting requirements and in rate regulation is obtained. The data available in the reports of the miscellaneous or radio common carriers are valuable in the Commission's regulation and licensing activities relating to such carriers.

It is contemplated that the statistical activities will be maintained at substantially the same level through 1965. For this reason, no change in average employment is expected.

International Communications

This subactivity covers regulation of common carrier (*a*) point-to-point rates (except telephone) and services between United States and oversea points and (*b*) marine telegraph rates and services involving ships at sea; rate level and

structure, discriminations and preferences, licensing of expansions and curtailments in cable and radio facilities, radio frequency clearance, assignment and use; preparation for, and attendance at, international conferences relating to telecommunication matters, as well as implementation of decisions reached at such conferences.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Rate regulation	7.5	8.5	9.0	0.5
Service regulation	7.1	8.1	8.1	
Total	14.6	16.6	17.1	0.5

An increase of 0.5 man-year is requested to provide for increased regulatory activity which will accompany the expanding worldwide communications and the accommodation of rapid developments in the industry. Justification for the present and increase in manpower is given in detail in the following paragraphs.

Rate regulation

General.—The industry continues in its most dynamic phase in recent decades. The advent of new technological developments offering vastly increased capacity requires modifications and possible reconstruction of the institutional structure. Considerable study is required to assess the implications on rate policy which will result from the financial readjustments in this process. Establishment of the Communications Satellite Corp. creates a wholly different broad area of problems in international rate regulation, while another stems from use by telegraph carriers of broadband telephone cable facilities.

Study of international communications industry

A comprehensive study of the organizational framework of the international telecommunications industry is made necessary by two major developments (1) creation of the Communications Satellite Corp. and (2) the forthcoming transistorized overseas telephone cables. The great capacities and cost characteristics of translated cables of the telephone company could pose a serious survival problem for the Satellite Corp. and jeopardize the establishment of a global communications satellite system, as well as aggravate existing problems of the international telegraph carriers. The study will determine what changes, if any, should be effected in existing international communications policy and in the structure of the industry, and the steps, including legislation, which should be taken.

ROLE OF COMMISSION IN REGULATION OF SPACE SATELLITE COMMUNICATIONS

Mr. HENRY. What we will undertake there, Mr. Boland, is a study of the structure of international communications with some of the other interested agencies of Government. We do have some policy questions which need to be reconsidered with the development of transistorized international cables and satellites, and we do that at no additional cost to the Government, we hope.

Mr. OSTERTAG. The TELSTAR comes in under this, does it not?

Mr. HENRY. Yes.

Mr. OSTERTAG. It is rather confusing as to how you as a regulatory agency of our Government can provide joint regulation with foreign nations in this matter. Is that part of the picture insofar as your authority is concerned? How do you do it, by negotiation?

Mr. HENRY. That is in the future because there are no operating

commercial carriers at the moment in satellites. We have our Office of Satellite Communications. We are asking for four additional men there. We need them badly.

What we will do is this: We will regulate and fix the rates of the Communications Satellite Corp. The Communications Satellite Corp. will lease channels to the other common carriers operating internationally; that is, American Telephone & Telegraph, Western Union International, RCAC, and so on.

The Communications Satellite Corp. will participate under some sort of arrangement yet to be worked out.

Mr. OSTERTAG. The statute provides for that, does it not?

Mr. HENRY. We are required by the statute to fix the rates. The Communications Satellite Corp., under terms not yet determined, will operate the satellite system itself along with communication entities from other countries who will have made the decision to participate in the international global commercial satellite system. It will be, we think, a cost-sharing basis between these participants in the global system, or rather a revenue-sharing apportioned according to costs, which in turn will give revenue to the individual participants and we will use that to fix the rates they charge to people who lease channels from them.

It is a rather confusing method, I agree.

Mr. OSTERTAG. It is basically a private corporation?

Mr. HENRY. Totally private.

Mr. OSTERTAG. Subject to Federal regulation?

Mr. HENRY. Yes.

AUTHORITY OVER COMMUNICATIONS SATELLITES

Mr. OSTERTAG. I had the privilege the other day of communicating over the SYNCOM satellite which is in a 22,000-mile synchronized orbit somewhere over the Equator. I talked with a military officer in California over that satellite. What I am getting at, SYNCOM is only an example of future satellites in orbit that will be a means of communication. Perhaps it might be exclusively for military or Government use, but it is here; and it is going to play an increasingly important role in communications.

Do you people have any jurisdiction in that regard or will you eventually have any jurisdiction?

Mr. HENRY. We have full jurisdiction over the commercial satellite systems.

Mr. OSTERTAG. This one was put into orbit by NASA.

Mr. HENRY. The one you are talking about we have no jurisdiction over.

Mr. OSTERTAG. I agree that you do not on this one; but I am talking about what will be in the future.

Mr. HENRY. The answer is "Yes, we do have jurisdiction." We are required to exercise that jurisdiction by the communications satellite legislation, and yesterday the Communications Satellite Corp. filed with us an application for a satellite communications station which they hope to put up in the middle of calendar year 1965.

USE OF COMMUNICATIONS SATELLITES BY OTHER COUNTRIES

Mr. OSTERTAG. If we have such a communications satellite in orbit as the SYNCOM, would other nations be able to use that?

Mr. HENRY. Yes.

Mr. OSTERTAG. And you would not have any way of controlling it, would you?

Mr. HENRY. Yes. To give you an analogy, we have telephone cables now from New Jersey to France. That has to be an international operation because you have to have somebody to talk to. If I call from New York to Paris, the revenues collected as a result of that call are split between the French authorities and the U.S. companies, and it will be in the same manner, roughly.

INTERNATIONAL COORDINATION OF FREQUENCY ALLOCATIONS

Mr. OSTERTAG. We have problems with Canada, do we not, because after all they have licensed radio operators. How do you coordinate the frequencies and rights between Canada and the United States?

Mr. HENRY. The fundamental U.S. policy is that the commercial system will be a global system in which all nations of the world that want to participate will be able to participate. They will work out their own frequency arrangements for use within that system.

There is also an international agreement, completed last October in Geneva, which allocated frequencies for use in space, and that is broken down between commercial satellites, meteorological satellites, and so on.

Mr. OSTERTAG. I have had occasion to be concerned about some of these matters because my area is just across from Lake Ontario, Canada. I know you people have had to deal with that, but it is by virtue of certain allocations?

Mr. HENRY. Yes, internationally made, but very close cooperation will be required.

Mr. OSTERTAG. You do not run into problems where there is a conflict of rights between the other country and our country?

Mr. HENRY. I am sure there will be conflicts and disputes but the groundwork has been laid for their resolution.

APPLICATIONS FOR CABLE LANDING LICENSES

Mr. BOLAND. Page 108, "Applications for cable landing licenses." Put in the table on pages 108 and 109.

(The pages follow:)

Applications for cable landing licenses

The Commission continues to process an increasing number of applications for the installation of modern high-capacity submarine telephone cables. The

following is a summary list of the status of cable systems, existing and planned, owned wholly or partly by U.S. companies:

Cable	*Status*
Transatlantic 1 and 2	In service.
Washington-Alaska	Do.
California-Hawaii 1	Do.
New Jersey-Bermuda	Do.
Florida-Puerto Rico	Do.
Florida-Jamaica	Do.
Jamaica-Canal Zone	Do.
Transatlantic 3	Expected late 1963.
Transatlantic 4	Planned 1965.
Transatlantic 5	Planned 1967.
California-Hawaii 2	Expected late 1964.
Guam-Okinawa	Expected 1965.
Guam-Philippines	Do.
Puerto Rico-Antigua	Do.
Canal Zone-Colombia	Expected 1964.
Florida-Virgin Islands	Expected late 1964.
Virgin Islands-Venezuela	Planned early 1965.
Virgin Islands-Antigua	Planned 1965.
Virgin Islands-Panama	Do.
Panama-Costa Rica-Nicaragua-Guatemala	Planned 1966.
Canal Zone-Ecuador-Peru-Chile-Argentina-Brazil	Do.
Hawaii-Guam-Japan	Expected mid-1964.

In addition to the above, use is being made, or planned, of the worldwide British Commonwealth submarine telephone cable systems either by direct interconnection via Canada and Hawaii or by a connecting cable such as planned between Guam and Australia. It is expected that applications for landing licenses will continue to be filed in 1964 and 1965. Several of these applications, because of the competitive situation in the international telecommunications industry, may give rise to serious problems involving the financial stability of the international telegraph industry which must be resolved. In addition, the proposed interconnection of the United States and British cable systems at Hawaii and Australia will also involve difficult problems regarding routing of traffic, limitations on handling, and other related matters which also must be solved.

INTERNATIONAL CONFERENCES

Mr. BOLAND. Insert in the record the paragraph on page 111 on international conferences.

(The material follows:)

International conferences

It is expected that the conference workload will continue to remain high. A constantly increasing number of meetings is necessary to resolve the growing number of problems which arise because of the continued development in the art. Preparation for and attendance at these conferences, together with implementation of conference decisions, require a continuously larger proportion of staff time. Four conferences are scheduled during fiscal 1964 including the Third Plenary Assembly of the International Telegraph and Telephone Consultative Committee (CCITT) of the International Telecommunication Union; two CCITT study group meetings during fiscal 1965, and a plenipotentiary conference to be held in September 1965. Staff members are expected to attend each of these meetings and conferences as well as perform extensive preparatory and followup work in connection therewith. The staff is also active in the work of the International Radio Consultative Committee (CCIR) in preparing for and attending international meetings.

SPACE SATELLITE COMMUNICATIONS

Mr. BOLAND. Put in the material on "Space satellite communications" at the bottom of page 111 and the narrative on page 112 with respect to space satellites.

(The material referred to follows:)

Space satellite communications

The Commission is given specific responsibilities by the Communications Satellite Act of 1962 which provides for the establishment of a satellite corporation subject to Government regulation. Those responsibilities include approving the technical characteristics of the satellite system to be employed, licensing of satellite terminal stations, and assuring that all communications common carriers will have equitable access to the system on just and reasonable terms and conditions. The Commission is also required, among other things, to insure the maintenance of effective competition in procurement for the system and to pass upon the propriety of all security issues and borrowings of the corporation, except for the initial issue.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Rate regulation		2.0	5.0	3
Service regulation	9.4	11.4	12.4	1
Total	9.4	13.4	17.4	4

An increase of 4 man-years is requested to provide minimum staffing required to deal with complicated and novel ratemaking problems which will arise particularly at the initial stages of operation of a commercial satellite system and to insure "effective competition" in procurement of apparatus, equipment and services required for the establishment of a commercial communication satellite system.

Rate regulation

Rate schedules must be designed which will be compatible with the financial requirements of the corporation, on the one hand, and which, on the other hand, will be sufficiently attractive to potential users. This will entail appropriate economic and rate studies of the existing and prospective demand for oversea traffic of all types and of the comparative costs of meeting such demands by alternative communication media; i.e., cable, high-frequency radio and satellite systems. The total 5 man-years estimated for this activity will provide the minimum staffing necessary to study and evaluate rate structures and rate levels to be proposed and established by the satellite corporation for the use of its facilities by communication common carriers and other authorized entities.

Service regulation

The estimated total of 12.4 man-years will be devoted to carrying out the wide range of responsibilities vested in the Commission with respect to a determination of appropriate technical characteristics and standards for an operational system; the choice of entity or entities to be licensed for the construction and operation of satellite ground stations in the United States; the processing of applications by the corporation covering its financing program; and the myriad of problems that may be expected to arise and determinations that will have to be made in the process of integrating and interconnecting an operational satellite system into the conventional complex of communication facilities.

HEARINGS

Mr. BOLAND. Also insert the material on hearings on pages 112 and 113.

(The material follows:)

Hearings

This subactivity is comprised of the following functions:

Office of Hearing Examiners.—Hearing examiners preside at adjudicatory proceedings and independently prepare and issue initial decisions which look toward the disposition of such proceedings.

Review Board.—The Review Board decides all appeals for hearing examiners' initial decisions except in those few cases in which the Commission decides to hear the appeal itself. It also decides all appeals from interlocutory rulings by the examiner and acts for the Commission in ruling upon most other interlocutory requests.

Office of Opinions and Review.—The Office of Opinions and Review handles all petitions seeking reconsideration of Commission action designating common carrier applications for hearing. In addition, the Office prepares final decisions in adjudicatory common carrier cases which are not handled by the Review Board.

Dockets Division.—Maintains docket records on all pending hearing cases.

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Hearing examiners	3.4	3.0	3.0	
Review Board	1.1	1.2	1.2	
Opinions and Review	1.2	1.2	1.2	
Dockets Division	1.0	1.5	1.5	
Total	6.7	6.9	6.9	

No increase is requested for hearing matters which will require that this subactivity be maintained at the same level as 1964.

For the current year, 3 man-years are allocated to the Office of Hearing Examiners for common carrier activity. This will be necessary in view of the substantial amount of time which the hearing examiners will be required to devote to these cases with particular reference (*a*) to its increased activity in the microwave and television community antenna areas; and (*b*) to the fact that substantially all of the time of at least two of our employees throughout the current year, and for a portion of fiscal year 1965, will be devoted to the domestic telegraph investigation (docket No. 14650). We believe that 3 man-years will be required in 1965 for common carrier hearing activity.

No increases are requested for the Review Board, Office of Opinions and Review, or for the Dockets Division. It is believed that the workload estimated for 1964 will continue at approximately the same level in 1965.

MERGER OF COMMON CARRIERS

Mr. OSTERTAG. In reference to mergers, you refer to legislation. What type of mergers would that relate to? It is not clear to me as I read this.

Mr. HENRY. The legislation relates to legislation which would permit record carriers that now operate internationally to merge, as opposed to the voice carrier, which is A.T. & T.

EXECUTIVE, STAFF, AND SERVICE ACTIVITIES

Mr. BOLAND. Executive, staff, and service, activities begin on page 114. Put in the entire page 114 down to "Offices of Commissioners." We are familiar with the offices of Commissioners.

(The information follows:)

EXECUTIVE, STAFF, AND SERVICE ACTIVITIES

INTRODUCTION

This Section includes the adjudicatory, top policymaking, and decisionmaking activities for the Commission's basic functions, the direct costs of which have been presented in sections I through V; the coordination and supervisory responsibilities of the Executive Director; the central legal staff; the Secretary's

functions (except dockets); reports and information; and budget, manpower utilization, data processing, office services, and defense coordination activities.

For those organization units for which it is possible to calculate the amount of time and cost chargeable against the individual function the cost is so charged. For example, the Review Board and the Office of Opinions and Review are charged to the functions of the Commission on which that staff works. The same is true for hearing examiners and Dockets Division, Office of the Secretary. The units taken up in this section work on the Commission's several basic programs, but it has not been found worth the administrative effort involved to keep sufficiently detailed time and cost records to distribute their costs to the functions. Hence, they are carried here.

Financial requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Personnel compensation	$2,063,728	$2,439,949	$2,553,746	$113,797
Personnel benefits	151,913	175,414	184,975	9,561
Other obligations	1,468,507	405,835	430,894	25,059
Total	3,684,148	3,021,198	3,169,615	148,417

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
1. Offices of Commissioners	46.8	47.7	48.0	0.3
2. Office of Reports and Information	5.0	5.0	5.0	
3. Office of Executive Director	145.4	180.9	185.9	5.0
4. Office of General Counsel	43.8	44.7	47.7	3.0
5. Office of Secretary [1]	19.9	21.5	21.5	
Total	260.9	299.8	308.1	8.3

[1] Excluding Dockets Division.

DATA PROCESSING

Mr. BOLAND. The narrative on page 119 on data processing is interesting. You are asking for three more people for data processing in 1965.

We will put page 119 and the narrative on page 120 in the record.

(The pages follow:)

Data processing

Manpower requirements

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Average employment	36.9	55.0	58.1	3.1

The increase requested for 1965 is required to put the Data Processing Division staff on a full-year basis.

The Data Processing Division will mechanize the initial applications on the electronic computer and Dataplotter system in February 1964. This system is designed to improve service to the public by reducing radio application processing time, by performing engineering computations involving a depth of calculation and analysis not practical by any other method, by providing field offices and monitoring stations with up-to-date information on all communications facilities, and by furnishing a means to rapidly analyze licensee data for more effective regulation of the communications industry.

Our "in production" date for the computer system has been rescheduled from July 1963 to February 1964 because of unfortunate delays in preparing our computer site in the new post office building, and because of the fact that the scope and character of the work initially planned for the Broadcast and Safety and Special Radio Services Bureaus changed to the extent that many more man-days of systems design and computer programing have been required to build an optimum mechanized plan. The computer site was completed on October 22, 1963, and the equipment installed in the following month. Since mid-November the computer has been used to test and "debug" programs and to convert, from manual to magnetic tape files, masses of data pertaining to amateur radio licensees and broadcast engineering, stations and individual ownership.

In February 1964, the processing of citizens and amateur radio applications and the printing of licenses will be cut over to the computer.

Concurrently the computer will maintain, retrieve, and analyze data relating to broadcast station ownership for use by the Commission's legal staff. Also starting in February the system will make those computations necessary in all services to determine if proposed antenna towers will create hazards to aviation or cause harmful interference to existing towers.

In April 1964, many of the day-to-day complex engineering problems in connection with the processing of AM, FM, and TV broadcast applications will be performed by the computer. This will permit engineers to spend their time in technical analysis and evaluation of proposed and exisiting broadcast facilities. Also in April 1964, the system will provide for the maintenance and analysis of all frequency and other radio facility data for field offices and monitoring stations.

Starting in the last quarter of 1964 and continuing through 1965 the processing of radio applications in the remainder of the Safety and Special Radio Services, namely, marine, aviation, public safety, and industrial will be converted to the computer system on a phased basis.

An added value of this whole applications processing system, involving approximately 1 million licensees, is the fact that the Commission will have immediate availability to current, accurate information on all outstanding licenses and pending applications. In addition to the safety and special work, plans and programs will also be developed during 1965 for the conversion to the computer system of additional computational work now performed manually by engineers in the Broadcast Bureau and Office of Chief Engineer.

Of the 58.1 man-years requested in 1965, 3 will be concerned with the administration of the program; 13 will be engaged in systems design and programing the computer for the work described; and 42.1 man-years will be devoted to the direct day-to-day operation of the data processing system.

OFFICE OF GENERAL COUNSEL

Mr. BOLAND. Office of General Counsel, page 122, at the bottom of the page. You are asking for three additional people.

Put in the record the table in the middle of page 123 on manpower requirements.

(The table follows:)

Manpower requirements (average employment)

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
(a) Immediate Office	6.7	6.8	6.8	
(b) Litigation Division	11.7	10.7	10.7	
(c) Legislation Division	8.8	8.0	8.0	
(d) Administrative Law and Treaties Division	8.2	9.8	10.4	0.6
(e) Enforcement and Defense Division	8.4	9.4	11.8	2.4
Total	43.8	44.7	47.7	3.0

Other Objects of Expense

Mr. Boland. We will turn to page 129 which is your other objects. This remains fairly constant. What is the total increase?

Mr. Henry. $38,000.

Mr. Boland. And it is occasioned mostly by increases in other services. There is a $15,000 reduction in equipment; a $10,000 reduction in land and structures. Insert the summary on page 129.

(The pages follow:)

Consolidated Other Obligations Costs

This section covers all requirements of the Commission for other than personnel compensation and benefits.

The following schedules set forth the actual distribution of these costs for 1963 and estimates for 1964 and 1965 by object class and by major activity.

	1963 actual	1964 estimate	1965 estimate
By object class:			
21 Travel and transportation of persons	$232,851	$245,000	$245,000
22 Transportation of things	42,768	50,000	50,000
23 Rents, communications, and utility services	450,379	440,000	460,000
24 Printing and reproduction	115,948	145,000	145,000
25 Other services	496,526	256,000	299,000
26 Supplies and materials	183,981	210,000	210,000
31 Equipment	1,225,431	456,000	441,000
32 Land and structures	19,085	80,000	70,000
Total	2,766,969	1,882,000	1,920,000
By activity:			
I Technical research and frequency allocation	67,492	109,743	92,944
II Broadcast	163,006	188,510	188,356
III Safety and special radio services	117,695	147,421	156,890
IV Field engineering	852,994	925,214	935,716
V Common carrier	97,275	105,277	115,200
VI Executive, staff, and services	1,468,507	405,835	430,894
Total	2,766,969	1,882,000	1,920,000

Rents, Communications, and Utilities

Mr. Boland. What is the explanation of the increase in rents, communications, and utility services?

Mr. Turner. On rents and utility services, so far as the field is concerned, we do have land next to our monitoring stations that will be used for additional antennas.

Mr. Thomas. Rents, communications, and utility services, you have an increase of $20,000; you have a little minus of $15,000 in equipment; and you have a minus of $10,000 in land and structures. You have an increase of $38,000 altogether.

Mr. Solan. The mail cost is going up.

Mr. Boland. What accounts for the increase shown on page 133?

Mr. Turner. That will be related to the increase in utility costs generally and also in connection with property that is leased by the Commission adjacent to monitoring stations to expand our antenna system.

Mr. Thomas. Printing and reproduction is more or less constant.

Mr. Boland. Any questions?

Mr. Ostertag. Just one general question, Mr. Chairman. Putting the whole picture in a nutshell, with regard to your overall budget requirements, the sum and substance of it is you have an increase of

about $1 million over the last fiscal year and an increase of about 59 in average employment. The largest increase seems to be in the field of engineering. Is that correct?

Mr. HENRY. That is correct.

Mr. OSTERTAG. And of course some substantial part of this increase is due to the pay increase?

Mr. HENRY. That is a good bit of it.

Mr. OSTERTAG. I am just trying to put it all together.

Mr. THOMAS. That summarizes it very well.

Mr. BOLAND. Mr. JONAS?

Mr. JONAS. No questions.

Mr. BOLAND. Thank you, Mr. Chairman and other members of the Commission. It is always a pleasure to have you with us. You are one of our favorite commissions.

Mr. HENRY. You are one of our favorite committees. We thank vou very much for your courtesy here today.

MONDAY, MAY 4, 1964.

FEDERAL AVIATION AGENCY

WITNESSES

N. E. HALABY, ADMINISTRATOR, FAA
NATHANIEL H. GOODRICH, GENERAL COUNSEL, FAA
COLE MORROW, DIRECTOR, AIRPORTS SERVICE, FAA
H. B. ALEXANDER, DIRECTOR OF BUDGET, FAA
FRANK MILLS, CHAIRMAN, PLANNING AND CONTROLS BRANCH, AIRPORTS SERVICE, FAA

SUPPLEMENTAL ESTIMATE FOR GRANTS-IN-AID FOR AIRPORTS

Program and financing

[In thousands of dollars]

	1963 actual	1964 estimate	1965 estimate
Program by activities:			
1. Grants for construction of airports (total obligations) (object class 41)	65,182	82,004	80,000
Financing:			
Unobligated balance brought forward (−)	−33,186	−43,004	−36,000
Unobligated balance carried forward	43,004	36,000	31,000
New obligational authority (appropriation, permanent)	75,000	75,000	[1] 75,000

[1] $75,000,000 also requested for fiscal year 1966.

Mr. THOMAS. Gentlemen, will the committee please come to order?

We have with us this morning our very able and genial friends from the Federal Aviation Agency, headed by our very distinguished friend and partner, Mr. Halaby, the Administrator; Mr. Goodrich, the General Counsel; Mr. Morrow, the Director of Airports; Mr. Alexander, Director of the Budget; and Mr. Frank Mills.

Mr. Halaby is interested in an item for $150 million for grants-in-aid for airports, as contained in House Document 195.

This item was not transmitted with the regular 1965 budget since the authorization had not been extended. Public Law 88–280, signed March 11, 1964, extends the authorization for 3 years.

Mr. Reporter, at this point in the record will you insert the appropriating language and justifications?

(The material follows:)

AMENDED ESTIMATE OF APPROPRIATION, FISCAL YEARS 1965 AND 1966 GRANTS-IN-AID FOR AIRPORTS

APPROPRIATION LANGUAGE

"GRANTS-IN-AID FOR AIRPORTS

"For grants-in-aid for airports, pursuant to the provisions of the Federal Airport Act, as amended, $150,000,000, to remain available until expended, as follows: for the purposes of section 5(d)(4) of such Act, $66,500,000 for each of the fiscal years 1965 and 1966; for the purposes of section 5(d)(5) of such Act, $1,500,000 for each of the fiscal years 1965 and 1966; and for the purposes of section 5(d)(6) of such Act, $7,000,000 for each of the fiscal years 1965 and 1966" (49 U.S.C. 1101–1106, 1108–1119, as amended by Public Law 88–280).

JUSTIFICATION

The Federal Airport Act, 49 U.S.C. 1101, as amended, authorizes the Federal Aviation Agency to administer a grant-in-aid program that assists public agencies in the Development of the local components of a nationwide system of public airports. Previous authorizations carried this program through fiscal year 1964.

Congress has recently enacted legislation which further amended the Federal Airport Act to authorize additional appropriations of $225 million for grants-in-aid for airports for the fiscal years 1965, 1966, and 1967 with $75 million to be made available for obligation in each of these years. To carry out a program in accordance with the act, the Federal Aviation Agency requests appropriations for fiscal years 1965 and 1966 in the amount of $75 million each year.

Airport planning and development is a long-range undertaking. A major factor in the effectiveness of the Federal aid airport program is the ability of local public agencies, in cooperation with the Federal Government, to systematically plan and program needed airport development over a period of several years. Local agencies must arrange for financing, frequently through bond issues, and must formulate plans for land acquisition, engineering design, and construction. Such actions by local agencies must be supported by assurance that Federal funds will be available when they are needed. This need has in the past been recognized by the Congress through the appropriation of funds in advance of the fiscal year during which such funds will be obligated.

During recent congressional action extending the Federal Airport Act, the forward funding principle was again reaffirmed as being "essential to the realization of an orderly and effective program."

Under the act, the Administrator is required to announce by January 1 of each year the allocations for airport development for the next ensuing fiscal year. It is through these project allocations that commitments are made to the local public agencies that matching Federal funds will be available for specific items of airport development. The process of formulating the project allocations should begin about 9 months prior to the announcement of the program, and the final decisions on and actual announcement of the program cannot be made prior to the appropriation by the Congress of the funds to be obligated during the fiscal year in question. Thus, appropriation of funds at least 1 year in advance of the fiscal year in which such funds are to be obligated is essential to meet the requirements of the act and for the orderly and effective development of the national system of public airports.

The national airport plan, prepared annually by FAA in response to section 3a of the Federal Airport Act, specifies in terms of general location and type of development the projects considered by the Administrator to be necessary in the next 5 years to provide a system of public airports adequate to anticipate and meet the needs of civil aeronautics. The projects included are limited to development eligible for Federal aid under the act.

New airports, and items of development for existing airports, are included in the plan on the basis of criteria that are designed to establish the need for the recommended development. These criteria consider the area and population served by the airport, the number and types of aircraft expected to use the airport, as well as the role of air transportation in the community or area to be served. However, in the plan, projects are ranked in terms of priority for receipt of Federal aid, nor does inclusion of a new airport or an item of development in

the plan constitute a commitment by the Federal Government to participate financially in such projects. Rather, identification of need in the plan is one of the prerequisites for a community's receiving aid under the Federal aid airport program (FAAP).

Communities submit to the FAA specific requests for aid, in which they propose that specific development be undertaken, and demonstrate their own readiness to proceed with such development.

Over the past several years, the requested Federal share of projects proposed by the Nation's communities has amounted to about twice the Federal funds available. Thus, in considering the allocation of FAAP funds, the Agency carries out a formal programing process in which it further refines the application of criteria of aeronautical necessity, and assigns an essentiality rating to the work items, to assure that the available funds are channeled to those projects that have the highest priority in terms of their contribution to the development of an effective airport system.

The current edition of the plan shows that, at the 3,559 existing and proposed airports included in the plan, a total expenditure of $1.08 billion will be needed during the fiscal year period 1963–67 to provide the type of facilities that are eligible for Federal assistance. Of the total of $1.08 billion, $274 million will be needed for land acquisition, $269 million for site preparation, $404 million for paving, $51 million for lighting, $14 million for safety buildings, and $70 million for miscellaneous items of development.

The budget amendment set forth in this submission would provide a total of $150 million, of which $75 million would be available for allocation to the Nation's communities in each of fiscal years 1965 and 1966, as provided by congressional authorization of Public Law 88–280. It is estimated that the 2-to-1 ratio of requests to available funds will continue and thus approximately $310 million is expected to be requested during the 2 fiscal years for eligible items of development.

The following exhibits show—

Exhibit I: Estimated airport development needs during the fiscal year period 1963–67, by State, as shown in the national airport plan.

Exhibit II: Apportionment entitlement of the States of the authorized annual $75 million Federal aid airport program.

AIRPORT DEVELOPMENT INCLUDED IN 1963–67 5-YEAR NATIONAL AIRPORT PLAN

	Estimated cost of NAP development 5-year period		*Estimated cost of NAP development 5-year period*
Alabama	$21,754,000	New Mexico	$14,061,000

Virgin Islands	300,000
Territory total	1,500,000
General Aviation Discretionary fund	7,000,000
Regular discretionary	16,625,000
Grand total	75,000,000

[1] In addition to amount authorized by State apportionment for the State of Hawaii, the State receives 40 percent of special funds for territories or $600,000.

Mr. THOMAS. The authorization calls for a 3-year program of $225 million. What the Agency is seeking this morning is $150 million covering the first 2 years, and that is broken down into about three parts; one, $66,500,000 for general aviation; and, $1,500,000 for Hawaii, Puerto Rico, and the Virgin Islands; and then about $7 million for general aviation.

That last phrase, "general aviation" is a misnomer. It should be spelled out better. It is for what I call "ancillary airports" to serve private planes. Even though Butler Terminal out here at Washington National, as an example, is Government owned, it is on all fours with the proposition. Is that correct, or is it incorrect?

Mr. HALABY. The Butler Aviation Terminal out here at Washington National is part of Washington National Airport, and a very substantial amount of traffic comes through there which is, as you say, "private aviation."

This $7 million is designed to help airports that would draw traffic away from the bigger airports——

Mr. THOMAS. It is an ancillary field, and plays a very vital part.

Mr. HALABY. Yes, sir.

DISCRETIONARY ALLOCATION

Mr. JONAS. What is this $16 million discretionary item, as shown on exhibit II?

Mr. HALABY. As you will recall, Mr. Jonas, the money under the apportionment formula is distributed to each State by population and square miles of territory in each State, and is fixed in the act. There remains after that fixed apportionment, an amount of $16 million which can be allocated without regard to population or square mileage, and that is the portion that can be used, regardless of State boundaries. That has been the case for many years.

ANTICIPATED AMOUNT OF REQUESTED FEDERAL AID

Mr. JONAS. What do you mean by your last sentence in the narrative: "It is estimated that the 2 to 1 ratio will continue" and so forth, and $310 million is the figure requested?

Mr. HALABY. When you tote up all of the plans and programs of all of the airports, all the airport authorities throughout the United States, they tote up twice as much money as is available for grants so the point here is that we are funding about half of the stated airport requirements in the United States.

Mr. JONAS. But then you say $310 million is expected to be requested.

Mr. HALABY. In other words, the sponsors applying for Federal aid will ask for $310 million. We will have, if you approve, $150 million.

Mr. JONAS. I am glad you cleared that up. It isn't really very clearly stated. What you mean is that you expect to receive requests for $310 million, and if you get what you are asking for here, you can take care of half of the request?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. That is for 2 years?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. I see.

FORMULA FOR FUND ALLOCATION

Mr. JONAS. Just one other question: Of course I understand the formula. I understand the 50 States and the District are all interested in this money, but how do you arrive at these allocations, is it on the basis of population and square miles?

Mr. HALABY. Yes, sir.

Mr. JONAS. Without regard to need?

Mr. HALABY. Yes, sir.

Mr. JONAS. Regardless of whether one State needs more than its formula and another State needs less, you have to allocate it on the basis of the language in the statute, except for the discretionary fund?

Mr. HALABY. And the $7 million.

Mr. JONAS. Thank you, Mr. Chairman.

Mr. HALABY. As a result, sir, there is always a fairly large amount of this money locked up in the State apportionment, so that in effect it isn't all available, and it never is all used, because it is locked up in the apportionments to States that don't need it.

Mr. OSTERTAG. We went into this whole thing at the time of your regular hearings, as I recall, except that the law has been extended since that time, and this supplemental request is in keeping with the extension of the Airport Act of 1964.

Mr. HALABY. Yes, sir. We sort of presumptively justified the basic need, but we were not able to, at that time, justify the appropriation request, because it was not before the committee and could not be sent up by the President until the Congress passed the act on March 11, 1964.

Mr. OSTERTAG. On the question of this formula, Mr. Jonas raised, are you happy with that, on the basis of area and size?

Mr. HALABY. No, sir, we are not happy with that. We live with it because this is a tradition, and a practice, with regard to many Federal matching aid programs. What we would like, of course, as executives, is to have a considerably larger discretion to put the money where it is needed and not be forced to put it where it isn't needed. Now, we, of course, do not have to spend the money in a State, just because a substantial amount is allocated to that State, if they don't need it, but the effect of the program is to compartmentalize in the 50 States, to cause us to wait until discretionary funds are available through nonuse by a State to deal with the highly congested, densely traveled areas for which there isn't enough money.

Mr. OSTERTAG. Well, actually the allocation may be by States, but in effect, it is local, and airports serving the country know no State boundaries. Therefore, it seems there is a little bit of inequity in this whole system in the allocation of funds.

Mr. HALABY. Exactly as you say, we would like to see a national system of airports that do not respect State boundaries, but provide the best safety and service for all of the population. Sometimes the low priority items in one State get money whereas high priority items in another State have no money available.

Mr. OSTERTAG. Now, next year when FAA presents its budget for 1966, in the meantime, you will have had this $150 million for allocation, and at that point you will be in a position to give us the application of the extension of the following year?

Mr. HALABY. Yes, sir.

Mr. OSTERTAG. So it wouldn't be exactly a gray area; isn't that true?

Mr. HALABY. That's right. We would tell you what we had done with the fiscal year 1964 and fiscal year 1965 money. We would have given you and the public the national airport plan which the act requires us to do.

We would also note who had been able to fund and who had failed to get bonds funded.

LOCAL FUNDRAISING

For example, last week one of the major airports in the country, seeking an expansion, lost a bond funding vote, I think, by 42 out of some 100,000 votes, and I think the real tough problem here is that local taxpayers are often reluctant to spend any more money on the airport, when there are schools and other items that they feel more urgently about.

Mr. OSTERTAG. Let me ask you this: Before you approve new applications for funds for local airport construction, improvement, or development, do you require the local government to provide the financing on their part prior to your consideration of applications?

Mr. HALABY. Yes, sir.

In general we require that they show that their part of the funds will be available.

Mr. OSTERTAG. In practically all instances, is that a mtter of submitting their referendum to the people?

Mr. HALABY. Yes, sir.

Mr. THOMAS. Thank you gentlemen, very much.

Federal Aviation Agency 1066
Accidents (*See* Operations.)
Accomplishments 1105
Airways, cost of maintaining 1116
Appropriations, increase in 1096, 1098, 1114
Appropriations versus workload 1116
Budget for 1965:
Compared with 1964 1181
Reduction from 1964 ..... 1071, 1099, 1152
Summary of 1178, 1180, 1327
Buildup of 1096, 1098, 1114
Competition, foreign 1076
Dulles International Airport:
Concession contracts 1324
Construction 1315, 1318
Operation and maintenance 1314, 1317
Amortization of 1321
Losses 1321
Passenger traffic 1320, 1323, 1324
Roads 1322
Employment:
Authorized positions and actual employment 1143, 1154
Average 1142
History and forecast 1097
Level of, current 1140
Number of employees versus number of aircraft 1095
Personnel turnover 1139
Positions, decrease in 1069, 1119, 1140
Productivity of employees 1118
Total and personnel costs 1153, 1178
Facilities and equipment 1283
Aircraft and related equipment 1302
Rental of aircraft 1304
Airports in United States 1077
Airports, jurisdiction over private 1080
Air traffic, control of 1299
Automation equipment 1288, 1293, 1297
Altitude and identification equipment 1117, 1290, 1293
Centers to be provided 1290, 1297
Requirements, future 1298
Centers, towers, and stations, difference between 1301
Instrument landing system 1298
NASA system of control, comparison with 1297
Obligations 1296
Oklahoma City repair operations 1327
Procurement of equipment 1291
Radar approach control 1299
Flight service stations:
Communication with 1099
Consolidation of 1093, 1145, 1150, 1301
Number remaining after 1149
Savings due to 1150, 1151
Need for 1147
Grants-in-aid for airports 1278
Supplemental request for funds 1439
Growth in aviation 1072
Military functions 1121
Integration with military system, status of 1132
Percent of budget related to 1131
Violation of Federal air regulations by military services 1130
Operations 1183
Accidents, aircraft 1243
Brooklyn accident 1158
Elkton, Md 1162
Legal suits as result of 1155
Midair collisions 1112
Statistics 1082, 1084, 1244
