(3) The oxygen dispensing equipment for the flight crewmembers must be:
   (i) The diluter demand or pressure demand (pressure demand mask with a diluter demand pressure breathing regulator) type, or other approved oxygen equipment shown to provide the same degree of protection, for airplanes to be operated above 25,000 feet.
   (ii) The pressure demand (pressure demand mask with a diluter demand pressure breathing regulator) type with mask-mounted regulator, or other approved oxygen equipment shown to provide the same degree of protection, for airplanes operated at altitudes where decompressions that are not extremely improbable may expose the flight crew to cabin pressure altitudes in excess of 34,000 feet.
   (4) Portable oxygen equipment must be immediately available for each cabin attendant. The portable oxygen equipment must have the oxygen dispensing unit connected to the portable oxygen supply.

§ 25.1450 Chemical oxygen generators.
   (a) For the purpose of this section, a chemical oxygen generator is defined as a device which produces oxygen by chemical reaction.
   (b) Each chemical oxygen generator must be designed and installed in accordance with the following requirements:
      (1) Surface temperature developed by the generator during operation may not create a hazard to the airplane or to its occupants.
      (2) Means must be provided to relieve any internal pressure that may be hazardous.
   (c) In addition to meeting the requirements in paragraph (b) of this section, each portable chemical oxygen generator that is capable of sustained operation by successive replacement of a generator element must be placarded to show—
      (1) The rate of oxygen flow, in liters per minute;
      (2) The duration of oxygen flow, in minutes, for the replaceable generator element; and
      (3) A warning that the replaceable generator element may be hot, unless the element construction is such that the surface temperature cannot exceed 100 degrees F.

§ 25.1453 Protection of oxygen equipment from rupture.
   Oxygen pressure tanks, and lines between tanks and the shutoff means, must be—
   (a) Protected from unsafe temperatures; and
   (b) Located where the probability and hazards of rupture in a crash landing are minimized.

§ 25.1455 Draining of fluids subject to freezing.
   If fluids subject to freezing may be drained overboard in flight or during ground operation, the drains must be designed and located to prevent the formation of hazardous quantities of ice on the airplane as a result of the drainage.

§ 25.1457 Cockpit voice recorders.
   (a) Each cockpit voice recorder required by the operating rules of this chapter must be approved and must be installed so that it will record the following:
      (1) Voice communications transmitted from or received in the airplane by radio.
      (2) Voice communications of flight crewmembers on the flight deck.
      (3) Voice communications of flight crewmembers on the flight deck, using the airplane’s interphone system.
      (4) Voice or audio signals identifying navigation or approach aids introduced into a headset or speaker.
