§ 121.213 [Reserved]

§ 121.215 Cabin interiors.
(a) Except as provided in §121.312, each compartment used by the crew or passengers must meet the requirements of this section.
(b) Materials must be at least flash resistant.
(c) The wall and ceiling linings and the covering of upholstering, floors, and furnishings must be flame resistant.
(d) Each compartment where smoking is to be allowed must be equipped with self-contained ash trays that are completely removable and other compartments must be placarded against smoking.
(e) Each receptacle for used towels, papers, and wastes must be of fire-resistant material and must have a cover or other means of containing possible fires started in the receptacles.

§ 121.217 Internal doors.
In any case where internal doors are equipped with louvres or other ventilating means, there must be a means convenient to the crew for closing the flow of air through the door when necessary.

§ 121.219 Ventilation.
Each passenger or crew compartment must be suitably ventilated. Carbon monoxide concentration may not be more than one part in 20,000 parts of air, and fuel fumes may not be present.

§ 121.221 Fire precautions.
(a) Each compartment must be designed so that, when used for storing cargo or baggage, it meets the following requirements:
(1) No compartment may include controls, wiring, lines, equipment, or accessories that would upon damage or failure, affect the safe operation of the airplane unless the item is adequately shielded, isolated, or otherwise protected so that it cannot be damaged by movement of cargo in the compartment and so that damage to or failure of the item would not create a fire hazard in the compartment.
(2) Cargo or baggage may not interfere with the functioning of the fire-protective features of the compartment.
(3) Materials used in the construction of the compartments, including tie-down equipment, must be at least flame resistant.
(4) Each compartment must include provisions for safeguarding against fires according to the classifications set forth in paragraphs (b) through (f) of this section.
(b) Class A. Cargo and baggage compartments are classified in the “A” category if—
(1) A fire therein would be readily discernible to a member of the crew while at his station; and
(2) All parts of the compartment are easily accessible in flight.
There must be a hand fire extinguisher available for each Class A compartment.
(c) Class B. Cargo and baggage compartments are classified in the “B” category if enough access is provided while in flight to enable a member of the crew to effectively reach all of the compartment and its contents with a hand fire extinguisher and the compartment is so designed that, when the access provisions are being used, no hazardous amount of smoke, flames, or extinguishing agent enters any compartment occupied by the crew or passengers. Each Class B compartment must comply with the following:
(1) It must have a separate approved smoke or fire detector system to give warning at the pilot or flight engineer station.
(2) There must be a hand fire extinguisher available for the compartment.
(3) It must be lined with fire-resistant material, except that additional service lining of flame-resistant material may be used.
(d) Class C. Cargo and baggage compartments are classified in the “C” category if they do not conform with the
requirements for the “A”, “B”, “D”, or “E” categories. Each Class C compartment must comply with the following:

1. It must have a separate approved smoke or fire detector system to give warning at the pilot or flight engineer station.
2. It must have an approved built-in fire-extinguishing system controlled from the pilot or flight engineer station.
3. It must be designed to exclude hazardous quantities of smoke, flames, or extinguishing agents from entering into any compartment occupied by the crew or passengers.
4. It must have ventilation and draft controlled so that the extinguishing agent provided can control any fire that may start in the compartment.
5. It must be lined with fire-resistant material, except that additional service lining of flame-resistant material may be used.

(e) Class D. Cargo and baggage compartments are classified in the “D” category if they are so designed and constructed that a fire occurring therein will be completely confined without endangering the safety of the airplane or the occupants. Each Class D compartment must comply with the following:

1. It must have a means to exclude hazardous quantities of smoke, flames, or noxious gases from entering any compartment occupied by the crew or passengers.
2. Ventilation and drafts must be controlled within each compartment so that any fire likely to occur in the compartment will not progress beyond safe limits.
3. It must be completely lined with fire-resistant material.
4. Consideration must be given to the effect of heat within the compartment on adjacent critical parts of the airplane.

(f) Class E. On airplanes used for the carriage of cargo only, the cabin area may be classified as a Class “E” compartment. Each Class E compartment must comply with the following:

1. It must be completely lined with fire-resistant material.
2. It must have a separate system of an approved type smoke or fire detector to give warning at the pilot or flight engineer station.
3. It must have a means to shut off the ventilating air flow to or within the compartment and the controls for that means must be accessible to the flight crew in the crew compartment.
4. It must have a means to exclude hazardous quantities of smoke, flames, or noxious gases from entering the flight crew compartment.
5. Required crew emergency exits must be accessible under all cargo loading conditions.

§121.223 Proof of compliance with §121.221.

Compliance with those provisions of §121.221 that refer to compartment accessibility, the entry of hazardous quantities of smoke or extinguishing agent into compartments occupied by the crew or passengers, and the dissipation of the extinguishing agent in Class “C” compartments must be shown by tests in flight. During these tests it must be shown that no inadvertent operation of smoke or fire detectors in other compartments within the airplane would occur as a result of fire contained in any one compartment, either during the time it is being extinguished, or thereafter, unless the extinguishing system floods those compartments simultaneously.

§121.225 Propeller deicing fluid.

If combustible fluid is used for propeller deicing, the certificate holder must comply with §121.255.

§121.227 Pressure cross-feed arrangements.

(a) Pressure cross-feed lines may not pass through parts of the airplane used for carrying persons or cargo unless—
1. There is a means to allow crew members to shut off the supply of fuel to these lines; or
2. The lines are enclosed in a fuel and fume-proof enclosure that is ventilated and drained to the exterior of the airplane.

However, such an enclosure need not be used if those lines incorporate no fittings on or within the personnel or cargo areas and are suitably routed or protected to prevent accidental damage.
