SUPPLEMENT NO. 2 TO PART 783—MANUFACTURING ACTIVITIES

The following constitute manufacturing activities that require the submission of a report to BIS, pursuant to § 783.1(a)(2) of the APR:

1. The manufacture of centrifuge rotor tubes or the assembly of gas centrifuges. Centrifuge rotor tubes means thin-walled cylinders as described in section 5.1.1(b) of supplement no. 3 to this part. Gas centrifuges means centrifuges as described in the introductory Note to section 5.1 of supplement no. 3 to this part.
2. The manufacture of diffusion barriers. Diffusion barriers means thin, porous filters as described in section 5.3(1)(a) of Supplement No. 3 to this Part.
3. The manufacture or assembly of laser-based systems. Laser-based systems means systems incorporating those items as described
Bureau of Industry and Security, Commerce

Pt. 783, Supp. 3

in section 5.7 of Supplement No. 3 to this Part.

(4) The manufacture or assembly of electromagnetic isotope separators. Electromagnetic isotope separators means those items referred to in Section 5.9.1 of supplement no. 3 to this part containing ion sources as described in section 5.9.1(a) of supplement no. 3 to this part.

(5) The manufacture or assembly of columns or extraction equipment. Columns or extraction equipment means those items as described in sections 5.6.1, 5.6.2, 5.6.3, 5.6.5, 5.6.6, 5.6.7, and 5.6.8 of Supplement No. 3 to this Part.

(6) The manufacture of aerodynamic separation nozzles or vortex tubes. Aerodynamic separation nozzles and vortex tubes means separation nozzles and vortex tubes as described, respectively, in sections 5.5.1 and 5.5.2 of Supplement No. 3 to this Part.

(7) The manufacture or assembly of uranium plasma generation systems. Uranium plasma generation systems means systems for the generation of uranium plasma as described in section 5.8.3 of supplement no. 3 to this Part.

(8) The manufacture of zirconium tubes. Zirconium tubes means tubes as described in section 1.6 of supplement no. 3 to this Part.

(9) The manufacture or upgrading of heavy water or deuterium. Heavy water or deuterium means deuterium, heavy water (deuterium oxide) and any other deuterium compound in which the ratio of deuterium to hydrogen atoms exceeds 1:5000.

(10) The manufacture of nuclear grade graphite. Nuclear grade graphite means graphite having a purity level better than 5 parts per million boron equivalent and with a density greater than 1.50 g/cm³.

(11) The manufacture of flasks for irradiated fuel. A flask for irradiated fuel means a vessel for the transportation and/or storage of irradiated fuel that provides chemical, thermal and radiological protection, and dissipates decay heat during handling, transportation and storage.

(12) The manufacture of reactor control rods. Reactor control rods means rods as described in section 1.4 of supplement no. 3 to this Part.

(13) The manufacture of critically safe tanks and vessels. Critically safe tanks and vessels means those items as described in sections 3.2 and 3.4 of supplement no. 3 to this Part.

(14) The manufacture of irradiated fuel element chopping machines. Irradiated fuel element chopping machines means equipment as described in section 3.1 of supplement no. 3 to this Part.

(15) The construction of hot cells. Hot cells means a cell or interconnected cells totaling at least 6 cubic meters in volume with shielding equal to or greater than the equivalent of 0.5 meters of concrete, with a density of 3.2 g/cm³ or greater, outfitted with equipment for remote operations.

Supplement No. 3 to Part 783—List of Specified Equipment and Non-Nuclear Material for the Reporting of Imports

1. Reactors and Equipment Therefor

1.1. Complete Nuclear Reactors

Nuclear reactors capable of operation so as to maintain a controlled self-sustaining fission chain reaction, excluding zero energy reactors, the latter being defined as reactors with a designed maximum rate of production of plutonium not exceeding 100 grams per year.

Explanatory Note: A "nuclear reactor" basically includes the items within or attached directly to the reactor vessel, the equipment which controls the level of power in the core, and the components which normally contain or come in direct contact with or control the primary coolant of the reactor core. It is not intended to exclude reactors which could reasonably be capable of modification to produce significantly more than 100 grams of plutonium per year. Reactors designed for sustained operation at significant power levels, regardless of their capacity for plutonium production, are not considered as "zero energy reactors."

1.2. Reactor Pressure Vessels

Metal vessels, as complete units or as major shop-fabricated parts therefor, which are specially designed or prepared to contain the core of a nuclear reactor, as defined in section 1.1, and are capable of withstanding the operating pressure of the primary coolant.

Explanatory Note: This is the list that the IAEA Board of Governors agreed at its meeting on 24 February 1993 would be used for the purpose of the voluntary reporting scheme, as subsequently amended by the Board. A top plate for a reactor pressure vessel is covered by this section 1.2 as a major shop-fabricated part of a pressure vessel. Reactor internals (e.g., support columns and plates for the core and other vessel internals, control rod guide tubes, thermal shields, baffles, core grid plates, diffuser plates, etc.) are normally supplied by the reactor supplier. In some cases, certain internal support components are included in the fabrication of the pressure vessel. These items are sufficiently critical to the safety and reliability of the operation of the reactor (and, therefore, to the guarantees and liability of the reactor supplier), so that their supply, outside the basic supply arrangement for the reactor itself, would not be common practice. Therefore, although the separate supply of these
