§ 178.705 Standards for metal IBCs.

(a) The provisions in this section apply to metal IBCs intended to contain liquids and solids. Metal IBC types are designated:

1. 11A, 11B, 11N for solids that are loaded or discharged by gravity.
2. 21A, 21B, 21N for solids that are loaded or discharged at a gauge pressure greater than 10 kPa (1.45 psig).
3. 31A, 31B, 31N for liquids or solids.

(b) Definitions for metal IBCs:

1. Metal IBC means an IBC with a metal body, together with appropriate service and structural equipment.
2. Protected means providing the IBC body with additional external protection against impact and abrasion. For example, a multi-layer (sandwich) or double wall construction or a frame with a metal lattice-work casing.

(c) Construction requirements for metal IBCs are as follows:

1. Body. The body must be made of ductile metal materials. Welds must be made so as to maintain design type integrity of the receptacle under conditions normally incident to transportation.
   - The use of dissimilar metals must not result in deterioration that could affect the integrity of the body.
   - Aluminum IBCs intended to contain flammable liquids must have no movable parts, such as covers and closures, made of unprotected steel liable to rust, which might cause a dangerous reaction from friction or percussive contact with the aluminum.
   - Metals used in fabricating the body of a metal IBC must meet the following requirements:
     - For steel, the percentage elongation at fracture must not be less than 10,000/Rm with a minimum of 20 percent; where Rm = minimum tensile strength of the steel to be used, in N/mm²; if U.S. Standard units of psi are used for tensile strength then the ratio becomes 10,000 × (145/Rm).
     - For aluminum, the percentage elongation at fracture must not be less than 10,000/(6Rm) with an absolute minimum of eight percent; if U.S. Standard units of psi are used for tensile strength then the ratio becomes 10,000 × 145/(6Rm).
     - Specimens used to determine the elongation at fracture must be taken transversely to the direction of rolling and be so secured that:
       \[ L_o = 5d \]
       or
       \[ L_o = 5.65 \sqrt[3]{A} \]
       where:
       \[ L_o = \text{gauge length of the specimen before the test} \]
       \[ d = \text{diameter} \]
       \[ A = \text{cross-sectional area of test specimen} \]

2. Minimum wall thickness:
   - For steel, the minimum wall thickness is the greater of 1.5 mm (0.059 inches) or as determined by use of the following equivalence formula:
   \[ e_1 = \frac{21.4 \times e_0}{\sqrt[3]{Rm_1 \times A_1}} \]

<table>

</tbody>
</table>

(B) For metals other than the reference steel described in paragraph (c)(1)(iii)(A) of this section, the minimum wall thickness is the greater of 1.5 mm (0.059 inches) or as determined by use of the following equivalence formula:
§ 178.706 Standards for rigid plastic IBCs.

(a) The provisions in this section apply to rigid plastic IBCs intended to contain solids or liquids. Rigid plastic IBC types are designated:

1. 11H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are loaded or discharged by gravity.
2. 11H2 freestanding, for solids which are loaded or discharged by gravity.
3. 21H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are loaded or discharged under pressure.
4. 21H2 freestanding, for solids which are loaded or discharged under pressure.
5. 31H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for liquids.
6. 31H2 freestanding, for liquids.

(b) Rigid plastic IBCs consist of a rigid plastic body, which may have structural equipment together with appropriate service equipment.

(c) Rigid plastic IBCs must be manufactured from plastic material of known specifications and be of a strength relative to its capacity and to the service it is required to perform. In addition to conformance to §173.24 of this subchapter, plastics materials must be resistant to aging and to degradation caused by ultraviolet radiation.

1. If protection against ultraviolet radiation is necessary, it must be provided by the addition of a pigment or inhibitor such as carbon black. These additives must be compatible with the contents and remain effective throughout the life of the IBC body. Where use
