equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).

NOTE: For hours where a fuel is combusted for only part of the hour, use the fuel flow rate or mass flow rate during the fuel usage time, instead of the total fuel flow or mass flow during the hour, when calculating heat input rate using Equation F–19 or F–20.

4. QUALITY ASSURANCE/QUALITY CONTROL PLAN

Include a section on the NO\textsubscript{X} emission rate determination as part of the monitoring quality assurance/quality control plan required under §75.21 and appendix B of this part for each gas-fired peaking unit and each oil-fired peaking unit. In this section present information including, but not limited to, the following: (1) a copy of all data and results from the initial NO\textsubscript{X} emission rate testing, including the values of quality assurance parameters specified in section 2.3 of this appendix; (2) a copy of all data and results from the most recent NO\textsubscript{X} emission rate load correlation testing; (3) a copy of the recommended range of quality assurance- and quality control-related operating parameters.

4.1 Submit a copy of the recommended range of operating parameter values, and the range of operating parameter values recorded during the previous NO\textsubscript{X} emission rate test that determined the unit’s NO\textsubscript{X} emission rate, along with the unit’s revised monitoring plan submitted with the certification application.

4.2 Keep records of these operating parameters for each hour of operation in order to demonstrate that a unit is remaining within the recommended operating range.

APPENDIX F TO PART 75—CONVERSION PROCEDURES

1. APPLICABILITY

Use the procedures in this appendix to convert measured data from a monitor or continuous emission monitoring system into the appropriate units of the standard.

2. PROCEDURES FOR SO\textsubscript{2} EMISSIONS

Use the following procedures to compute hourly SO\textsubscript{2} mass emission rate (in lb/hr) and quarterly and annual SO\textsubscript{2} total mass emissions (in tons).

2.1 When measurements of SO\textsubscript{2} concentration and flow rate are on a wet basis, use the following equation to compute hourly SO\textsubscript{2} mass emission rate (in lb/hr):

\[
E_h = K C_h Q_h \left(100 - \%H_2O\right) / 100
\]

Where:
- \(E_h\) = Hourly SO\textsubscript{2} mass emission rate during unit operation, lb/hr.
- \(K = 1.660 \times 10^{-7}\) for SO\textsubscript{2}, (lb/scf)/ppm.
- \(C_h\) = Hourly average SO\textsubscript{2} concentration during unit operation, stack moisture basis, ppm.
- \(Q_h\) = Hourly average volumetric flow rate during unit operation, scfh as measured (wet).
- \%H\textsubscript{2}O = Hourly average stack moisture content during unit operation, percent by volume.

2.2 When measurements by the SO\textsubscript{2} pollutant concentration monitor are on a dry basis and the flow rate monitor measurements are on a wet basis, use the following equation to compute hourly SO\textsubscript{2} mass emission rate (in lb/hr):

\[
E_h = K C_h Q_h \left(100 - \%H_2O\right) / 100
\]

2.3 Use the following equations to calculate total SO\textsubscript{2} mass emissions for each calendar quarter (Equation F–3) and for each calendar year (Equation F–4), in tons:
Environmental Protection Agency

\[ E_q = \frac{\sum_{h=1}^{n} E_h t_h}{2000} \]

(Eq. F–3)

Where:

- \( E_q \) = Quarterly total SO\(_2\) mass emissions, tons.
- \( E_h \) = Hourly SO\(_2\) mass emission rate, lb/hr.
- \( t_h \) = Unit operating time, hour or fraction of an hour (in equal increments that can range from one one-hundredth to one quarter of an hour, at the option of the owner or operator).
- \( n \) = Number of hourly SO\(_2\) emissions values during calendar quarter.

\[ E_a = \sum_{q=1}^{4} E_q \]

(Eq. F–4)

Where:

- \( E_a \) = Annual total SO\(_2\) mass emissions, tons.
- \( E_q \) = Quarterly SO\(_2\) mass emissions, tons.
- \( q \) = Quarters for which \( E_q \) are available during calendar year.

2.4 Round all SO\(_2\) emission rates and totals to the nearest tenth.

3. PROCEDURES FOR NO\(_X\) EMISSION RATE

Use the following procedures to convert continuous emission monitoring system measurements of NO\(_X\) concentration (ppm) and diluent concentration (percentage) into NO\(_X\) emission rates (in lb/mmBtu). Perform measurements of NO\(_X\) and diluent (O\(_2\) or CO\(_2\)) concentrations on the same moisture (wet or dry) basis.

3.1 When the NO\(_X\) continuous emission monitoring system uses O\(_2\) as the diluent, and measurements are performed on a dry basis, use the following conversion procedure:

\[ E = K C_h F C\frac{100}{\%C0_2} \]

(Eq. F–5)

where,

- \( K \), \( E \), \( C_h \), \( F \), and \( \%C0_2 \) are defined in section 3.3 of this appendix. When measurements are performed on a wet basis, use the equations in Method 19 in appendix A–7 to part 60 of this chapter.

3.2 When the NO\(_X\) continuous emission monitoring system uses CO\(_2\) as the diluent, use the following conversion procedure:

\[ E = K C_h F \frac{20.9}{20.9 - \%C0_2} \]

(Eq. F–6)

where:

- \( K \), \( E \), \( C_h \), \( F \), and \( \%C0_2 \) are defined in section 3.3 of this appendix.

When CO\(_2\) and NO\(_X\) measurements are performed on a different moisture basis, use the equations in Method 19 in appendix A–7 to part 60 of this chapter.

3.3 Use the definitions listed below to derive values for the parameters in equations F–3 and F–6 of this appendix, or (if applicable) in the equations in Method 19 in appendix A–7 to part 60 of this chapter.

3.3.1 \( K = 1.194 \times 10^{-7} \) (lb/dscf)/ppm NO\(_X\).

3.3.2 \( E = \) Pollutant emissions during unit operation, lb/mmBtu.

3.3.3 \( C_h = \) Hourly average pollutant concentration during unit operation, ppm.

3.3.4 \( \%C0_2 = \) Oxygen or carbon dioxide volume during unit operation (expressed as percent O\(_2\) or CO\(_2\)).

3.3.4.1 For boilers, a minimum concentration of 5.0 percent CO\(_2\) or a maximum concentration of 14.0 percent O\(_2\) may be substituted for the measured diluent gas concentration value for any operating hour in which the hourly average CO\(_2\) concentration is < 5.0 percent CO\(_2\) or the hourly average O\(_2\) concentration is > 14.0 percent O\(_2\). For stationary gas turbines, a minimum concentration of 1.0 percent CO\(_2\) or a maximum concentration of 19.0 percent O\(_2\) may be substituted for measured diluent gas concentration values for any operating hour in which the hourly average CO\(_2\) concentration is < 1.0 percent CO\(_2\) or the hourly average O\(_2\) concentration is > 19.0 percent O\(_2\).

3.3.4.2 If NO\(_X\) emission rate is calculated using either Equation 19–3 or 19–5 in Method 19 in appendix A–7 to part 60 of this chapter, a variant of the equation shall be used whenever the diluent cap is applied. The modified equations shall be designated as Equations 19–3D and 19–5D, respectively. Equation 19–3D is structurally the same as Equation 19–3, except that the term “\( \%C0_2 \)” in the denominator is replaced with the term “\( \%C0_2 \times [(100 - \%\text{H}_2\text{O})/100] \)”, where \( \%C0_2 \text{c} \) is the diluent cap value. The numerator of Equation 19–3D is the same as Equation 19–5; however, the denominator of Equation 19–5D is simply “\( 20.9 - \%C0_2\text{c} \)”, where \( \%C0_2\text{c} \) is the diluent cap value.

3.3.5 \( F \), \( F_{\text{ea}} \) factor representing a ratio of the volume of dry flue gases generated to the caloric value of the fuel combusted (\( F \)), and a factor representing a ratio of the volume of CO\(_2\) generated to the caloric value of the fuel combusted (\( F_{\text{ea}} \)), respectively. Table 1
lists the values of F and F
c factors for different
fue.

| Fuel          | F-factor (dscf/mmBtu) | F
c -factor (scf CO
c/mmBtu) |

</table>

\[ F = 3.64 (\% H) + 1.53 (\% C) + 0.57 (\% S) + 0.14 (\% N) - 0.46 (\% O) \times 10^6 \]

(Eq. F–7a)

\[ F_c = \frac{321 \times 10^3 (\% C)}{GCV} \]

(Eq. F–7b)

3.3.6.1 H, C, S, N, and O are content by weight of hydrogen, carbon, sulfur, nitrogen, and oxygen (expressed as percent), respectively, as determined on the same basis as the gross calorific value (GCV) by ultimate analysis of the fuel combusted using ASTM D3176–89 (Reapproved 2002), Standard Practice for Ultimate Analysis of Coal and Coke, (solid fuels), ASTM D291–92, Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants, (liquid fuels) or computed from results using ASTM D1945–96 (Reapproved 2001), Standard Test Method for Analysis of Natural Gas by Gas Chromatography, or ASTM D1946–90 (Reapproved 2006), Standard Practice for Analysis of Reformed Gas by Gas Chromatography, (gaseous fuels) as applicable. (All of these methods are incorporated by reference under §75.6 of this part.)

3.3.6.3 For affected units that combust a combination of a fuel (or fuels) listed in Table 1 in section 3.3.5 of this appendix, prorate the F or F
c factors determined by section 3.3.5 or 3.3.6 of this appendix in accordance with the applicable formula as follows:
Environmental Protection Agency

Pt. 75, App. F

\[ F = \sum_{i=1}^{n} X_i F_i \quad F_c = \sum_{i=1}^{n} X_i (F_i)_1 \]  (Eq. F-8)

Where,

- \( X_i \) = Fraction of total heat input derived from each type of fuel (e.g., natural gas, bituminous coal, wood). Each \( X_i \) value shall be determined from the best available information on the quantity of fuel combusted and the GCV value, over a specified time period. The owner or operator shall explain the method used to calculate \( X_i \) in the hardcopy portion of the monitoring plan for the unit. The \( X_i \) values may be determined and updated either hourly, daily, weekly, or monthly. In all cases, the pro-rated \( F \)-factor used in the emission calculations shall be determined using the \( X_i \) values from the most recent update.

- \( (F_i)_1 \) = Applicable \( F \) or \( F_c \) factor as described in section 3.3.6.4 of this appendix, a "worst-case" \( F \) or \( F_c \) factor shall be the highest \( F \) or \( F_c \) value for any of the fuels values from the most recent update.

4. PROCEDURES FOR \( \text{CO}_2 \) MASS EMISSIONS

Use the following procedures to convert continuous emission monitoring system measurements of \( \text{CO}_2 \) concentration (percentage) and volumetric flow rate (scfh) into \( \text{CO}_2 \) mass emissions (in tons/day) when the owner or operator uses a \( \text{CO}_2 \) continuous emission monitoring system (consisting of a \( \text{CO}_2 \) or \( \text{O}_2 \) pollutant monitor) and a flow monitoring system to monitor \( \text{CO}_2 \) emissions from an affected unit.

4.1 When \( \text{CO}_2 \) concentration is measured on a wet basis, use the following equation to calculate hourly \( \text{CO}_2 \) mass emissions rates (in tons/hr):

\[ \dot{E}_h = K C_h Q_h \]  (Eq. F-11)

Where:

- \( \dot{E}_h \) = Hourly \( \text{CO}_2 \) mass emission rate during unit operation, tons/hr.
- \( K \) = 5.7 x 10^{-7} for \( \text{CO}_2 \), (tons/scfh)/% \( \text{CO}_2 \).
- \( C_h \) = Hourly average \( \text{CO}_2 \) concentration during unit operation, wet basis, either measured directly with a \( \text{CO}_2 \) monitor or calculated from wet-basis \( \text{O}_2 \) data using Equation F-14b, percent \( \text{CO}_2 \).
- \( Q_h \) = Hourly average volumetric flow rate during unit operation, wet basis, scfh.

4.2 When \( \text{CO}_2 \) concentration is measured on a dry basis, use Equation F-2 to calculate the hourly \( \text{CO}_2 \) mass emission rate (in tons/hr) with a \( K \)-value of 5.7 x 10^{-7} (tons/scf) percent \( \text{CO}_2 \), where \( E_h \) = hourly \( \text{CO}_2 \) mass emission rate, tons/hr and \( C_{dh} \) = hourly average \( \text{CO}_2 \) concentration in flue, dry basis, percent \( \text{CO}_2 \).

4.3 Use the following equations to calculate total \( \text{CO}_2 \) mass emissions for each calendar quarter (Equation F-12) and for each calendar year (Equation F-13):

\[ E_{\text{CO}_2q} = \sum_{h=1}^{H} E_{h} t_h \]  (Eq. F-12)

Where:

- \( E_{\text{CO}_2q} \) = Quarterly total \( \text{CO}_2 \) mass emissions, tons.
- \( E_h \) = Hourly \( \text{CO}_2 \) mass emission rate, tons/hr.
- \( t_h \) = Unit operating time, in hours or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
- \( H \) = Number of hourly \( \text{CO}_2 \) mass emission rates available during calendar quarter.
where:

- \( E_{\text{CO}_2a} \) = Annual total \( \text{CO}_2 \) mass emissions, tons.
- \( E_{\text{CO}_2q} \) = Quarterly total \( \text{CO}_2 \) mass emissions, tons.
- \( q \) = Quarters for which \( E_{\text{CO}_2q} \) are available during calendar year.

4.4 For an affected unit, when the owner or operator is continuously monitoring \( \text{O}_2 \) concentration (in percent by volume) of flue gases using an \( \text{O}_2 \) monitor, use the equations and procedures in section 4.4.1 and 4.4.2 of this appendix to determine hourly \( \text{CO}_2 \) mass emissions (in tons).

4.4.1 If the owner or operator elects to use data from an \( \text{O}_2 \) monitor to calculate \( \text{CO}_2 \) concentration, the appropriate \( F \) and \( F_c \) factors from section 3.3.5 of this appendix shall be used in one of the following equations (as applicable) to determine hourly average \( \text{CO}_2 \) concentration of flue gases (in percent by volume) from the measured hourly average \( \text{O}_2 \) concentration:

\[
\text{CO}_2 = 100 \frac{F \cdot 20.9 - \text{O}_2}{F_c \cdot 20.9} \quad \text{(Eq. F-14a)}
\]

where:

- \( \text{CO}_2 \) = Hourly average \( \text{CO}_2 \) concentration during unit operation, percent by volume, dry basis.
- \( \text{O}_2 \) = Hourly average \( \text{O}_2 \) concentration during unit operation, percent by volume, dry basis.
- \( F, F_c \) = F-factor or carbon-based \( F_c \)-factor from section 3.3.5 of this appendix.
- 20.9 = Percentage of \( \text{O}_2 \) in ambient air.

For any hour where Equation F–14a or F–14b results in a negative hourly average \( \text{CO}_2 \) value, 0.0% \( \text{CO}_2 \) shall be recorded as the average \( \text{CO}_2 \) value for that hour.

4.4.2 Determine \( \text{CO}_2 \) mass emissions (in tons) from hourly average \( \text{CO}_2 \) concentration (percent by volume) using equation F–11 and the procedure in section 4.1, where \( \text{O}_2 \) measurements are on a wet basis, or using the procedures in section 4.2 of this appendix, where \( \text{O}_2 \) measurements are on a dry basis.

5. Procedures for Heat Input

Use the following procedures to compute heat input rate to an affected unit on an hourly basis, except as provided in sections 5.5 through 5.5.7. The owner or operator may choose to use the provisions specified in §75.16(e) or in section 2.1.2 of appendix D to this part in conjunction with the procedures provided in sections 5.6 through 5.6.2 to apportion heat input among each unit using the common stack or common pipe header.

5.2 For an affected unit that has a flow monitor (or approved alternate monitoring system under subpart E of this part for measuring volumetric flow rate) and a diluent gas (\( \text{O}_2 \) or \( \text{CO}_2 \)) monitor, use the recorded data from these monitors and one of the following equations to calculate hourly heat input rate (in mmBtu/hr).

\[
\text{HI} = Q \cdot \frac{1}{F_c} \cdot \frac{\% \text{CO}_2}{100} \quad \text{(Eq. F-15)}
\]

where:

- \( \text{HI} \) = Hourly heat input rate during unit operation, mmBtu/hr.
- \( Q \) = Volumetric flow rate of flue gases, cubic feet per hour.
- \( \% \text{CO}_2 \) = Hourly average \( \text{CO}_2 \) concentration during unit operation, percent by volume, dry basis.
- \( F_c \) = F-factor or carbon-based \( F_c \)-factor from section 3.3.5 of this appendix.
- 20.9 = Percentage of \( \text{O}_2 \) in ambient air.
Environmental Protection Agency

Pt. 75, App. F

Q_w = Hourly average volumetric flow rate during unit operation, wet basis, scfh.

F_c = Carbon-based F-factor, listed in section 3.3.5 of this appendix for each fuel, scf/mmBtu.

\[ \%CO_{2w} = \text{Hourly concentration of CO}_2 \text{ during unit operation, percent CO}_2 \text{ wet basis.} \]

5.2.2 When measurements of CO_2 concentration are on a dry basis, use the following equation:

\[ HI = Q_h \left( \frac{100 - \%H_2O}{100F_c} \right) \left( \frac{\%CO_{2d}}{100} \right) \]  \hspace{1cm} (Eq. F-16)

Where:

HI = Hourly heat input rate during unit operation, mmBtu/hr.

Q_h = Hourly average volumetric flow rate during unit operation, wet basis, scfh.

F_c = Carbon-based F-Factor, listed in section 3.3.5 of this appendix for each fuel, scf/mmBtu.

\[ \%CO_{2d} = \text{Hourly concentration of CO}_2 \text{ during unit operation, percent CO}_2 \text{ dry basis.} \]

\[ \%H_2O = \text{Moisture content of gas in the stack, percent.} \]

5.2.3 When measurements of O_2 concentration are on a wet basis, use the following equation:

\[ HI = Q_w \frac{1}{F} \left( \frac{20.9(100 - \%H_2O) - \%O_{2w}}{100 - \%H_2O} \right) \]  \hspace{1cm} (Eq. F-17)

Where:

HI = Hourly heat input rate during unit operation, mmBtu/hr.

Q_w = Hourly average volumetric flow during unit operation, wet basis, scfh.

F = Dry basis F-factor, listed in section 3.3.5 of this appendix for each fuel, dscf/mmBtu.

\[ \%H_2O = \text{Moisture content of the stack gas, percent.} \]

\[ \%O_{2w} = \text{Hourly concentration of O}_2 \text{ during unit operation, percent O}_2 \text{ wet basis.} \]

5.2.4 When measurements of O_2 concentration are on a dry basis, use the following equation:

\[ HI = Q_w \left( \frac{100 - \%H_2O}{100F} \right) \left( \frac{20.9 - \%O_{2d}}{20.9} \right) \]  \hspace{1cm} (Eq. F-18)

Where:

HI = Hourly heat input rate during unit operation, mmBtu/hr.

Q_w = Hourly average volumetric flow during unit operation, wet basis, scfh.

F = Dry basis F-factor, listed in section 3.3.5 of this appendix for each fuel, dscf/mmBtu.

\[ \%H_2O = \text{Moisture content of the stack gas, percent.} \]

\[ \%O_{2d} = \text{Hourly concentration of O}_2 \text{ during unit operation, percent O}_2 \text{ dry basis.} \]

5.3 Heat Input Summation (for Heat Input Determined Using a Flow Monitor and Diluent Monitor)

5.3.1 Calculate total quarterly heat input for a unit or common stack using a flow monitor and diluent monitor to calculate heat input, using the following equation:

\[ HI_q = \sum_{\text{hour}=1}^{n} HI_t \]  \hspace{1cm} (Eq. F-18a)

Where:

HI_q = Total heat input for the quarter, mmBtu.
HI = Hourly heat input rate during unit operation, using Equation F-15, F-16, F-17, or F-18, mmBtu/hr.

\( t_i \) = Hourly operating time for the unit or common stack, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).

5.3.2 Calculate total cumulative heat input for a unit or common stack using a flow monitor and diluent monitor to calculate heat input, using the following equation:

\[
HI_c = \sum_{q=1}^n HI_q \quad (\text{Eq. F-18b})
\]

Where:

- \( HI_c \) = Total heat input for the year to date, mmBtu.
- \( HI_q \) = Total heat input for the quarter, mmBtu.

5.4 [Reserved]

5.5 For a gas-fired or oil-fired unit that does not have a flow monitor and is using the procedures specified in appendix D to this part to monitor \( \text{SO}_2 \) emissions or for any unit using a common stack for which the owner or operator chooses to determine heat input by fuel sampling and analysis, use the following procedures to calculate hourly heat input rate in mmBtu/hr. The procedures of section 5.5.2 of this appendix shall not be used to determine heat input from a coal unit that is required to comply with the provisions of this part for monitoring, recording, and reporting \( \text{NO}_x \) mass emissions under a State or federal \( \text{NO}_x \) mass emission reduction program.

5.5.1 (a) When the unit is combusting oil, use the following equation to calculate hourly heat input rate:

\[
HI_o = M_o \cdot \frac{GCV_o}{10^6} \quad (\text{Eq. F-19})
\]

Where:

- \( HI_o \) = Hourly heat input rate from oil, mmBtu/hr.
- \( M_o \) = Mass rate of oil consumed per hour, as determined using procedures in appendix D to this part, in lb/hr, tons/hr, or kg/hr.
- \( GCV_o \) = Gross calorific value of oil, as measured by ASTM D240-00, ASTM D5865-01a, or ASTM D4890-00 for each oil sample under section 2.2 of appendix D to this part, Btu/unit mass (all incorporated by reference under §75.6 of this part).
- \( 10^6 = \text{Conversion of Btu to mmBtu.} \)

(b) When performing oil sampling and analysis solely for the purpose of the missing data procedures in §75.36, oil samples for measuring \( GCV \) may be taken weekly, and the procedures specified in appendix D to this part for determining the mass rate of oil consumed per hour are optional.

5.5.2 When the unit is combusting gaseous fuels, use the following equation to calculate heat input rate from gaseous fuels for each hour:

\[
HI_g = \frac{Q_g \times GCV_g}{10^6} \quad (\text{Eq. F-20})
\]

Where:

- \( HI_g \) = Hourly heat input rate from gaseous fuel, mmBtu/hour.
- \( Q_g \) = Metered flow rate of gaseous fuel combusted during unit operation, hundred standard cubic feet per hour.
- \( GCV_g \) = Gross calorific value of gaseous fuel, as determined by sampling (for each delivery for gaseous fuel in lots, for each daily gas sample for gaseous fuel delivered by pipeline, for each hourly average for gas measured hourly with a gas chromatograph, or for each monthly sample of pipeline natural gas, or as verified by the contractual supplier at least once every month pipeline natural gas is combusted, as specified in section 2.3 of appendix D to this part) using ASTM D1826-94 (Reapproved 1996), ASTM D3588-96, ASTM D4891-89 (Reapproved 2006), GPA Standard 2172-96 Calculation of Gross Heating Value, Relative Density and Compressibility Factor for Natural Gas Mixtures from Compositional Analysis, or GPA Standard 2261-00 Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography, Btu/100 scf (all incorporated by reference under §75.6 of this part).
- \( 10^6 = \text{Conversion of Btu to mmBtu.} \)

5.5.3 When the unit is combusting coal, use the procedures, methods, and equations in sections 5.5.3.1-5.5.3.3 of this appendix to determine the heat input from coal for each 24-hour period. (All ASTM methods are incorporated by reference under §75.6 of this part.)

5.5.3.1 Perform coal sampling daily according to section 5.5.2.2 in Method 19 in appendix A to part 60 of this chapter and use ASTM D2234-00, Standard Practice for Collection of a Gross Sample of Coal, (incorporated by reference under §75.6 of this part) Type I, Conditions A, B, or C and systematic spacing for sampling. (When performing coal sampling solely for the purposes of the missing data procedures in §75.36, use of ASTM D2234-00 is optional, and coal samples may be taken weekly.)

5.5.3.2 All ASTM methods are incorporated by reference under §75.6 of this part. Use ASTM D2013-01, Standard Practice for Preparing Coal Samples for Analysis, for
preparation of a daily coal sample and analyze each daily coal sample for gross calorific value using ASTM D5865-01a, Standard Test Method for Gross Calorific Value of Coal and Coke. On-line coal analysis may also be used if the on-line analytical instrument has been demonstrated to be equivalent to the applicable ASTM methods under §§ 75.23 and 75.66.

5.5.3.3 Calculate the heat input from coal using the following equation:

\[
HI_c = M_c \frac{GCV_c}{500} \quad \text{(Eq. F–21)}
\]

(Eq. F–21)

where:
- \(HI_c\) = Daily heat input from coal, mmBtu/day.
- \(M_c\) = Mass of coal consumed per day, as measured and recorded in company records, tons.
- \(GCV_c\) = Gross calorific value of coal sample, as measured by ASTM D3176–89 (Re-approved 2002), or ASTM D5865–01a, Btu/lb. (incorporated by reference under §75.6 of this part).
- 500 = Conversion of Btu/lb to mmBtu/ton.

5.5.4 For units obtaining heat input values daily instead of hourly, apportion the daily heat input using the fraction of the daily steam load or daily unit operating load used each hour in order to obtain \(HI_i\) for use in the above equations. Alternatively, use the hourly mass of coal consumed in equation F–21.

5.5.5 If a daily fuel sampling value for gross calorific value is not available, substitute the maximum gross calorific value measured from the previous 30 daily samples.

5.5.6 If a monthly fuel sampling value for gross calorific value is not available, substitute the maximum gross calorific value measured from the previous 3 monthly samples.

5.5.7 If a fuel flow value is not available, use the fuel flowmeter missing data procedures in section 2.4 of appendix D of this part.

5.6 Heat Input Rate Apportionment for Units Sharing a Common Stack or Pipe

5.6.1 Where applicable, the owner or operator of an affected unit that determines heat input rate at the unit level by apportioning the heat input monitored at a common stack or common pipe using megawatts shall apportion the heat input rate using the following equation:

\[
HI_i = HI_{CS} \left( \frac{t_{CS}}{t_i} \right) \left( \frac{\sum_{i=1}^{n} MW_i t_i}{\sum_{i=1}^{n} MW_i} \right) \quad \text{(Eq. F–21a)}
\]

Where:
- \(HI_i\) = Heat input rate for a unit, mmBtu/hr.
- \(HI_{CS}\) = Heat input rate at the common stack or pipe, mmBtu/hr.
- \(MW\) = Gross electrical output, MWe.
- \(t_i\) = Unit operating time, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
- \(t_{CS}\) = Common stack or common pipe operating time, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
- \(n\) = Total number of units using the common stack or pipe.
- \(i\) = Designation of a particular unit.

5.6.2 Where applicable, the owner or operator of an affected unit that determines the heat input rate at the unit level by apportioning the heat input rate monitored at a common stack or common pipe using steam load shall apportion the heat input rate using the following equation:
HI_1 = HI_{CS} \left( \frac{t_{CS}}{t_i} \right) \left[ \frac{\sum_{i=1}^{n} SF_i t_i}{n} \right] \quad (Eq. F-21b)

Where:

- HI = Heat input rate for a unit, mmBtu/hr.
- HI_{CS} = Heat input rate at the common stack or pipe, mmBtu/hr.
- SF = Gross steam load, lb/hr, or mmBtu/hr.
- t_i = Unit operating time, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
- t_{CS} = Common stack or common pipe operating time, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
- n = Total number of units using the common stack or pipe.
- i = Designation of a particular unit.

5.7 Heat Input Rate Summation for Units with Multiple Stacks or Pipes

The owner or operator of an affected unit that determines the heat input rate at the unit level by summing the heat input rates monitored at multiple stacks or multiple pipes shall sum the heat input rates using the following equation:

\[ HI_{Unit} = \frac{\sum_{i=1}^{n} HI_i t_i}{t_{Unit}} \quad (Eq. F-21c) \]

Where:

- HI = Heat input rate for a unit, mmBtu/hr.
- HI_i = Heat input rate for the individual stack, duct, or pipe, mmBtu/hr.
- t_i = Unit operating time, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
- t_{Unit} = Common stack or common pipe operating time, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
- n = Total number of units using the common stack or pipe.
- i = Designation for a particular stack, duct, or pipe.

5.8 Alternate Heat Input Apportionment for Common Pipes

As an alternative to using Equation F-21a or F-21b in section 5.6 of this appendix, the owner or operator may apportion the heat input rate at a common pipe to the individual units served by the common pipe based on the fuel flow rate to the individual units, as measured by uncertified fuel flowmeters. This option may only be used if a fuel flowmeter system that meets the requirements of appendix D to this part is installed on the common pipe. If this option is used, determine the unit heat input rates using the following equation:

\[ HI_i = HI_{CP} \left( \frac{t_{CP}}{t_i} \right) \left[ \frac{\sum_{i=1}^{n} FF_i t_i}{n} \right] \quad (Eq. F-21d) \]

Where:

- HI = Heat input rate for a unit, mmBtu/hr.
- HI_{CP} = Heat input rate at the common pipe, mmBtu/hr.
- FF_i = Fuel flow rate to a unit, gal/min, 100 scfh, or other appropriate units.
- t_i = Unit operating time, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
- t_{CP} = Common pipe operating time, hour or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).
Environmental Protection Agency

n = Total number of units using the common pipe.
1 = Designation of a particular unit.

6. Procedure for Converting Volumetric Flow to STP

Use the following equation to convert volumetric flow at actual temperature and pressure to standard temperature and pressure.

\[ F_{\text{STP}} = F_{\text{act}}(T_{\text{act}}/T_{\text{std}})(P_{\text{act}}/P_{\text{std}}) \]

where:
- \( F_{\text{STP}} \) = Flue gas volumetric flow rate at standard temperature and pressure, acfh.
- \( F_{\text{act}} \) = Flue gas volumetric flow rate at actual temperature and pressure, acfh.
- \( T_{\text{act}} \) = Standard temperature = 29.92 inches of mercury.
- \( T_{\text{std}} \) = Flue gas temperature at flow monitor location + flue gas static pressure, inches of mercury.
- \( P_{\text{act}} \) = Standard pressure = 29.92 inches of mercury.

The owner or operator shall use Equation F–23 to calculate hourly SO\(_2\) mass emissions in accordance with §75.11(e)(1) during the combustion of gaseous fuel, for a unit that uses a flow monitor and a diluent gas monitor to measure heat input, and that qualifies to use a default SO\(_2\) emission rate under section 2.3.1.1, 2.3.2.1.1, or 2.3.6(b) of appendix D to this part. Equation F–23 may also be applied to the combustion of solid or liquid fuel that meets the definition of very low sulfur fuel in §72.2 of this chapter, combinations of such fuels, or mixtures of such fuels with gaseous fuel, if the owner or operator has received approval from the Administrator under §75.66 to use a site-specific default SO\(_2\) emission rate for the fuel or mixture of fuels.

\[ E_h = (ER)(HI) \]  
(Eq. F-23)

Where:
- \( E_h \) = Hourly SO\(_2\) mass emission rate, lb/hr.
- \( ER \) = Applicable SO\(_2\) default emission rate for gaseous fuel combustion, from section 2.3.1.1, 2.3.2.1.1, or 2.3.6(b) of appendix D to this part, or other default SO\(_2\) emission rate for the combustion of very low sulfur liquid or solid fuel, combinations of such fuels, or mixtures of such fuels with gaseous fuel, as approved by the Administrator under §75.66, lb/mmBtu.
- \( HI \) = Hourly heat input rate, determined using the procedures in section 5.2 of this appendix, mmBtu/hr.

8. Procedures for NO\(_x\) Mass Emissions

The owner or operator of a unit that is required to monitor, record, and report NO\(_x\) mass emissions under a State or federal NO\(_x\) mass emission reduction program must use the procedures in section 8.1, 8.2, or 8.3 of this appendix, as applicable, to account for hourly NO\(_x\) mass emissions, and the procedures in section 8.4 of this appendix to account for quarterly, seasonal, and annual NO\(_x\) mass emissions to the extent that the provisions of subpart H of this part are adopted as requirements under such a program.

8.1 The owner or operator may use the hourly NO\(_x\) emission rate and the hourly heat input rate to calculate the NO\(_x\) mass emissions in pounds or the NO\(_x\) mass emission rate in pounds per hour, (as required by the applicable reporting format), for each unit or stack operating hour, as follows:

8.1.1 If both NO\(_x\) emission rate and heat input rate are monitored at the same unit or stack level (e.g., the NO\(_x\) emission rate value and the heat input rate value both represent all of the units exhausting to the common stack), then (as required by the applicable reporting format) either:

(a) Use Equation F–24 to calculate the hourly NO\(_x\) mass emissions (lb).

\[ M_{\text{NOX,h}} = ER_{\text{NOX,h}} HI_h t_h \]  
(Eq. F-24)

Where:
- \( M_{\text{NOX,h}} \) = NO\(_x\) mass emissions in lbs for the hour.
- \( ER_{\text{NOX,h}} \) = Hourly average NO\(_x\) emission rate for hour h, lb/mmBtu, from section 3 of this appendix, from Method 19 in appendix A–7 to part 60 of this chapter, or from section 3.3 of appendix E to this part. (Include bias-adjusted NO\(_x\) emission rate values, where the bias-test procedures in appendix A to this part shows a bias-adjustment factor is necessary.)
- \( HI_h \) = Hourly average heat input rate for hour h, mmBtu/hr. (Include bias-adjusted flow rate values, where the bias-test procedures in appendix A to this part shows a bias-adjustment factor is necessary.)
- \( t_h \) = Monitoring location operating time for hour h, in hours or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator). If the combined NO\(_x\) emission rate and heat input are monitored for all of the units in a common stack, the monitoring location operating time is equal to the total time when any of those units was exhausting through the common stack; or
- (b) Use Equation F–24a to calculate the hourly NO\(_x\) mass emission rate (lb/hr).
HI emission rate at the common stack level and at the unit level according to the following formula:

\[ E_{\text{NOX}_h} = \text{ER}_{\text{NOX}_h} \times H_{I_h} \]  

(Eq. F-24a)

Where:
\[ E_{\text{NOX}_h} = \text{NOX mass emissions rate in lb/hr for the hour.} \]
\[ \text{ER}_{\text{NOX}_h} = \text{Hourly average NOX emission rate for hour } h, \text{ lb/mmBtu, from section 3 of this appendix, from Method 19 in appendix A to part 60 of this chapter, or from section 3.3 of appendix E to this part. (Include bias-adjusted NOX emission rate values, where the bias-test procedures in appendix A to this part shows a bias-adjustment factor is necessary.)} \]
\[ H_{I_h} = \text{Hourly average heat input rate for hour } h, \text{ mmBtu/hr. (Include bias-adjusted flow rate values, where the bias-test procedures in appendix A to this part shows a bias-adjustment factor is necessary.)} \]

8.1.2 If NOX emission rate is measured at a common stack and heat input is measured at the unit level, sum the hourly heat inputs at the unit level according to the following formula:

\[ H_{I_{CS}} = \sum_{u=1}^{p} H_{I_u} t_u \frac{t_{CS}}{} \]  

(Eq. F-25)

where:
\[ H_{I_{CS}} = \text{Hourly average heat input rate for hour } h \text{ for the units at the common stack, mmBtu/hr.} \]
\[ t_{CS} = \text{Common stack operating time for hour } h, \text{ in hours or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).} \]
\[ t_u = \text{Unit operating time for hour } h, \text{ in hours or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).} \]
\[ p = \text{Number of units that exhaust through the common stack.} \]
\[ u = \text{Designation of a particular unit.} \]

Use the hourly heat input rate at the common stack level and the hourly average NOX emission rate at the common stack level and the procedures in section 8.1.1 of this appendix to determine the hourly NOX mass emissions at the common stack.

8.1.3 If a unit has multiple ducts and NOX emission rate is only measured at one duct, use the NOX emission rate measured at the duct, the heat input measured for the unit, and the procedures in section 8.1.1 of this appendix to determine NOX mass emissions.

8.1.4 If a unit has multiple ducts and NOX emission rate is measured in each duct, heat input shall also be measured in each duct and the procedures in section 8.1.1 of this appendix shall be used to determine NOX mass emissions.

8.2 Alternatively, the owner or operator may use the hourly NOX concentration (as measured by a NOX concentration monitoring system) and the hourly stack gas volumetric flow rate to calculate the NOX mass emission rate (lb/hr) for each unit or stack operating hour, in accordance with section 8.2.1 or 8.2.2 of this appendix (as applicable). If the hourly NOX mass emissions are to be reported in lb, Equation F–26c in section 8.3 of this appendix shall be used to convert the hourly NOX mass emission rates to hourly NOX mass emissions (lb).

8.2.1 When the NOX concentration monitoring system measures on a wet basis, first calculate the hourly NOX mass emission rate (lb/hr) during unit (or stack) operation, using Equation F–26a. (Include bias-adjusted flow rate or NOX concentration values, where the bias-test procedures in appendix A to this part shows a bias-adjustment factor is necessary.)

\[ E_{\text{NOX}_h} = \text{NOX mass emissions rate in lb/hr.} \]
\[ K = 1.194 \times 10^{-7} \text{ for NOX, (lb/acf)/ppm.} \]
\[ C_{\text{av}} = \text{Hourly average NOX concentration during unit operation, wet basis, ppm.} \]
\[ Q_h = \text{Hourly average volumetric flow rate during unit operation, wet basis, scfh.} \]

8.2.2 When NOX mass emissions are determined using a dry basis NOX concentration monitoring system and a wet basis flow monitoring system, first calculate hourly NOX mass emission rate (in lb/hr) during unit (or stack) operation, using Equation F–26b. (Include bias-adjusted flow rate or NOX concentration values, where the bias-test procedures in appendix A to this part shows a bias-adjustment factor is necessary.)

\[ E_{\text{NOX}_h} = K \times C_{\text{av}} \times Q_h \]  

(Eq. F-26a)

Where:
\[ E_{\text{NOX}_h} = \text{NOX mass emissions rate in lb/hr.} \]
\[ K = 1.194 \times 10^{-7} \text{ for NOX, (lb/acf)/ppm.} \]
\[ C_{\text{av}} = \text{Hourly average NOX concentration during unit operation, wet basis, ppm.} \]
\[ Q_h = \text{Hourly average volumetric flow rate during unit operation, wet basis, scfh.} \]

8.2.2 When NOX mass emissions are determined using a dry basis NOX concentration monitoring system and a wet basis flow monitoring system, first calculate hourly NOX mass emission rate (in lb/hr) during unit (or stack) operation, using Equation F–26b. (Include bias-adjusted flow rate or NOX concentration values, where the bias-test procedures in appendix A to this part shows a bias-adjustment factor is necessary.)

\[ E_{\text{NOX}_h} = K \times C_{\text{av}} \times Q_h \]  

(Eq. F-26a)

\[ E_{\text{NOX}_h} = K \times C_{\text{av}} \times Q_h \]  

(Eq. F-26b)
Environmental Protection Agency

Where:

\[ E_{\text{NOX}} = \text{NOX mass emissions rate, lb/hr.} \]

\[ K = 1.194 \times 10^{-7} \text{ for NOX, (lb/scf)/ppm.} \]

\[ C_d = \text{Hourly average NOX concentration during unit operation, dry basis, ppm.} \]

\[ Q_h = \text{Hourly average volumetric flow rate during unit operation, wet basis, scfh.} \]

\[ \%H_2O = \text{Hourly average stack moisture content during unit operation, percent by volume.} \]

8.3 When hourly NOX mass emissions are reported in pounds and are determined using a NOX concentration monitoring system and a flow monitoring system, calculate NOX mass emissions (lb) for each unit or stack operating hour by multiplying the hourly NOX mass emission rate (lb/hr) by the unit operating time for the hour, as follows:

\[ M_{\text{(NOX)}} = E_h t_h \quad (\text{Eq. F-26c}) \]

Where:

\[ M_{\text{(NOX)}} = \text{NOX mass emissions for the hour, lb.} \]

\[ E_h = \text{Hourly NOX mass emission rate during unit (or stack) operation from Equation F–26a in section 8.2.1 of this appendix or Equation F–26b in section 8.2.2 of this appendix (as applicable), lb/hr.} \]

\[ t_h = \text{Unit operating time or stack operating time (as defined in § 72.2 of this chapter) for hour “h”, in hours or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).} \]

8.4 Use the following procedures to calculate quarterly, cumulative ozone season, and cumulative yearly NOX mass emissions, in tons:

(a) When hourly NOX mass emissions are reported in lb., use Eq. F-27.

\[ M_{\text{(NOX)}} = \frac{\sum_{h=1}^{p} M_{\text{(NOX)}} h}{2000} \quad (\text{Eq. F-27}) \]

Where:

\[ M_{\text{(NOX)}} = \text{NOX mass emissions in tons for the given time period (quarter, cumulative ozone season, cumulative year-to-date).} \]

\[ E_h = \text{NOX mass emissions in lb for the hour.} \]

\[ t_h = \text{Monitoring location operating time for hour h, in hours or fraction of an hour (in equal increments that can range from one hundredth to one quarter of an hour, at the option of the owner or operator).} \]

\[ p = \text{The number of hours in the given time period (quarter, cumulative ozone season, cumulative year-to-date).} \]

(b) When hourly NOX mass emission rate is reported in lb/hr, use Eq. F-27a.

\[ M_{\text{(NOX)}} = \frac{\sum_{h=1}^{p} E_h \cdot t_h}{2000} \quad (\text{Eq. F-27a}) \]

Where:

\[ M_{\text{(NOX)}} = \text{NOX mass emissions in tons for the given time period (quarter, cumulative ozone season, cumulative year-to-date).} \]

\[ E_h = \text{NOX mass emission rate in lb/hr for the hour.} \]

\[ p = \text{The number of hours in the given time period (quarter, cumulative ozone season, cumulative year-to-date).} \]

8.5 Specific provisions for monitoring NOX mass emissions from common stacks. The owner or operator of a unit utilizing a common stack may account for NOX mass emissions using either of the following methodologies, if the provisions of subpart H are adopted as requirements of a State or federal NOX mass reduction program:

8.5.1 The owner or operator may determine both NOX emission rate and heat input at the common stack and use the procedures in section 8.1.1 of this appendix to determine hourly NOX mass emissions at the common stack.

8.5.2 The owner or operator may determine the NOX emission rate at the common stack and the heat input at each of the units and use the procedures in section 8.1.2 of this appendix to determine the hourly NOX mass emissions at each unit.
9. (RESERVED)

10. MOISTURE DETERMINATION FROM WET AND DRY O\textsubscript{2} READINGS

If a correction for the stack gas moisture content is required in any of the emissions or heat input calculations described in this appendix, and if the hourly moisture content is determined from wet- and dry-basis O\textsubscript{2} readings, use Equation F-31 to calculate the percent moisture, unless a “K” factor or other mathematical algorithm is developed as described in section 6.5.7(a) of appendix A to this part:

\[
\%\text{H}_{2}\text{O} = \left( \frac{O_{2d} - O_{2w}}{O_{2d}} \right) \times 100 \quad (\text{Eq. F-31})
\]

Where:

\(\%\text{H}_{2}\text{O}\) = Hourly average stack gas moisture content, percent H\textsubscript{2}\text{O}

\(O_{2d}\) = Dry-basis hourly average oxygen concentration, percent O\textsubscript{2}

\(O_{2w}\) = Wet-basis hourly average oxygen concentration, percent O\textsubscript{2}

APPENDIX G TO PART 75—
Determination of CO\textsubscript{2} Emissions

1. APPLICABILITY

The procedures in this appendix may be used to estimate CO\textsubscript{2} mass emissions discharged to the atmosphere (in tons/day) as the sum of CO\textsubscript{2} emissions from combustion and, if applicable, CO\textsubscript{2} emissions from sorbent used in a wet flue gas desulfurization control system, fluidized bed boiler, or other emission controls.

2. PROCEDURES FOR ESTIMATING CO\textsubscript{2} EMISSIONS FROM COMBUSTION

Use the following procedures to estimate daily CO\textsubscript{2} mass emissions from the combustion of fossil fuels. The optional procedure in section 2.3 of this appendix may also be used for an affected gas-fired unit. For an affected unit that combusts any nonfossil fuels (e.g., bark, wood, residue, or refuse), either use a CO\textsubscript{2} continuous emission monitoring system or apply to the Administrator for approval of a unit-specific method for determining CO\textsubscript{2} emissions.

2.1 Use the following equation to calculate daily CO\textsubscript{2} mass emissions (in tons/day) from the combustion of fossil fuels. Where fuel flow is measured in a common pipe header (i.e., a pipe carrying fuel for multiple units), the owner or operator may use the procedures in section 2.1.2 of appendix D of this part for combining or apportioning emissions, except that the term “SO\textsubscript{2} mass emissions” is replaced with the term “CO\textsubscript{2} mass emissions.”

\[
W_{\text{CO}_2} = \frac{(MW\text{C} + MW\text{O}_2) \times W_c}{2,000 MW\text{C}} \quad (\text{Eq. G-1})
\]

Where:

\(W_{\text{CO}_2}\) = CO\textsubscript{2} emitted from combustion, tons/day.

\(MW\text{C}\) = Molecular weight of carbon (12.0).

\(MW\text{O}_2\) = Molecular weight of oxygen (32.0)

\(W_c\) = Carbon burned, lb/day, determined using fuel sampling and analysis and fuel feed rates.

2.1.1 Collect at least one fuel sample during each week that the unit combusts coal, one sample per each shipment or delivery for oil and diesel fuel, one fuel sample for each delivery for gaseous fuel in lots, one sample per day or per hour (as applicable) for each gaseous fuel that is required to be sampled daily or hourly for gross calorific value under section 2.3.5.6 of appendix D to this part, and one sample per month for each gaseous fuel that is required to be sampled monthly for gross calorific value under section 2.3.4.1 or 2.3.4.2 of appendix D to this part. Collect coal samples from a location in the fuel handling system that provides a sample representative of the fuel bunkered or consumed during the week.

2.1.2 Determine the carbon content of each fuel sample using one of the following methods: ASTM D3178-89 (Reapproved 2002) or ASTM D5373-02 (Reapproved 2007) for coal; ASTM D5291-92, Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants, ultimate analysis of oil, or computations based upon ASTM D3238-95 (Reapproved 2000) and either ASTM D2502-92 (Reapproved 1996) or ASTM D2503-92 (Reapproved 1997) for oil; and computations based on ASTM D1945-96 (Reapproved 2001) or ASTM D1946-90 (Reapproved 2006) for gas.
