§ 98.206 Data reporting requirements.

In addition to the information required by §98.3(c), each annual report must include the following information at the facility level:

(a) Emissions of each cover or carrier gas in metric tons.
(b) Types of production processes at the facility (e.g., primary, secondary, die casting).
(c) Amount of magnesium produced or processed in metric tons for each process type. This includes the output of primary and secondary magnesium production processes and the input to magnesium casting processes.
(d) Cover and carrier gas flow rate (e.g., standard cubic feet per minute) for each production unit and composition in percent by volume.
(e) For any missing data, you must report the length of time the data were missing for each cover gas or carrier gas, the method used to estimate emissions in their absence, and the quantity of emissions thereby estimated.
(f) The annual cover gas usage rate for the facility for each cover gas, excluding the carrier gas (kg gas/metric ton Mg).

(g) If applicable, an explanation of any change greater than 30 percent in the facility's cover gas usage rate (e.g., installation of new melt protection technology or leak discovered in the cover gas delivery system that resulted in increased emissions).

(h) A description of any new melt protection technologies adopted to account for reduced or increased GHG emissions in any given year.

§ 98.207 Records that must be retained.

In addition to the records specified in §98.3(g), you must retain the following information at the facility level:

(a) Check-out and weigh-in sheets and procedures for gas cylinders.
(b) Accuracy certifications and calibration records for scales including the method or manufacturer's specification used for calibration.
(c) Residual gas amounts (heel) in cylinders sent back to suppliers.
(d) Records, including invoices, for gas purchases, sales, and disbursements for all GHGs.

§ 98.208 Definitions.

All terms used in this subpart have the same meaning given in the Clean Air Act and subpart A of this part. Additionally, some sector-specific definitions are provided below:

Carrier gas means the gas with which cover gas is mixed to transport and dilute the cover gas thus maximizing its efficient use. Carrier gases typically include CO₂, N₂, and/or dry air.

Cover gas means SF₆, HFC–134a, fluorinated ketone (FK 5–1–12) or other gas used to protect the surface of molten magnesium from rapid oxidation and burning in the presence of air. The molten magnesium may be the surface of a casting or ingot production operation or the surface of a crucible of molten magnesium that feeds a casting operation.
Environmental Protection Agency

§ 98.213 Reporting threshold.

You must report GHG emissions from miscellaneous uses of carbonate if your facility uses carbonates as defined in §98.210 of this subpart and the facility meets the requirements of either §98.2(a)(1) or (a)(2).

§ 98.212 GHGs to report.

You must report CO₂ process emissions from all miscellaneous carbonate use at your facility as specified in this subpart.

§ 98.213 Calculating GHG emissions.

You must determine CO₂ process emissions from carbonate use in accordance with the procedures specified in either paragraphs (a) or (b) of this section.

(a) Calculate the process emissions of CO₂ using calcination fractions with Equation U–1 of this section.

\[
\text{ECO}_2 = \sum_{i=1}^{n} M_i \times EF_i \times F_i \times \frac{2000}{2205} 
\]

Where:

- \( E_{CO2} \) = Annual CO₂ mass emissions from consumption of carbonates (metric tons).
- \( M_i \) = Annual mass of carbonate type i consumed (tons).
- \( EF_i \) = Emission factor for the carbonate type i, as specified in Table U–1 to this subpart, metric tons CO₂/metric ton carbonate consumed.
- \( F_i \) = Fraction calcination achieved for each particular carbonate type i (decimal fraction).

As an alternative to measuring the calcination fraction, a value of 1.0 can be used.

- n = Number of carbonate types.
- 2000/2205 = Conversion factor to convert tons to metric tons.

(b) Calculate the process emissions of CO₂ using actual mass of output carbonates with Equation U–2 of this section.

\[
\text{ECO}_2 = \left[ \sum_{k=1}^{m} (M_k \times EF_k) - \sum_{j=1}^{n} (M_j \times EF_j) \right] \times \frac{2000}{2205} 
\]

Where:

- \( E_{CO2} \) = Annual CO₂ mass emissions from consumption of carbonates (metric tons).
- \( M_k \) = Annual mass of input carbonate type k (tons).
- \( EF_k \) = Emission factor for the carbonate type k, as specified in Table U–1 of this subpart (metric tons CO₂/metric ton carbonate input).
- \( M_j \) = Annual mass of output carbonate type j (tons).
- \( EF_j \) = Emission factor for the output carbonate type j, as specified in Table U–1 of this subpart (metric tons CO₂/metric ton carbonate input).

- m = Number of input carbonate types.
- n = Number of output carbonate types.
