(s) **Unit operating hour** means a clock hour during which any fuel is combusted in the affected unit. If the unitcombusts fuel for the entire clock hour, it is considered to be a full unit operating hour. If the unitcombusts fuel for only part of the clock hour, it is considered to be a partial unit operating hour.

(t) **Excess emissions** means a specified averaging period over which either:

1. The NO\textsubscript{X} emissions are higher than the applicable emission limit in §60.332;
2. The total sulfur content of the fuel being combusted in the affected facility exceeds the limit specified in §60.333; or
3. The recorded value of a particular monitored parameter is outside the acceptable range specified in the parameter monitoring plan for the affected unit.

(u) **Natural gas** means a naturally occurring fluid mixture of hydrocarbons (e.g., methane, ethane, or propane) produced in geological formations beneath the Earth’s surface that maintains a gaseous state at standard atmospheric temperature and pressure under ordinary conditions. Natural gas contains 20.0 grains or less of total sulfur per 100 standard cubic feet. Equivalents of this in other units are as follows: 0.008 weight percent total sulfur, 680 parts per million by weight (ppmw) total sulfur, and 338 parts per million by volume (ppmv) at 20 degrees Celsius total sulfur. Additionally, natural gas must either be composed of at least 70 percent methane by volume or have a gross calorific value between 950 and 1100 British thermal units (Btu) per standard cubic foot. Natural gas does not include the following gaseous fuels: landfill gas, digester gas, refinery gas, sour gas, blast furnace gas, coal-derived gas, producer gas, coke oven gas, or any gaseous fuel produced in a process which might result in highly variable sulfur content or heating value.

(v) **Duct burner** means a device thatcombusts fuel and that is placed in the exhaust duct from another source, such as a stationary gas turbine, internal combustion engine, kiln, etc., to allow the firing of additional fuel to heat the exhaust gases before the exhaust gases enter a heat recovery steam generating unit.

(w) **Lean premix stationary combustion turbine** means any stationary combustion turbine where the air and fuel are thoroughly mixed to form a lean mixture for combustion in the combustor. Mixing may occur before or in the combustion chamber. A unit which is capable of operating in both lean premix and diffusion flame modes is considered a lean premix stationary combustion turbine when it is in the lean premix mode, and it is considered a diffusion flame stationary combustion turbine when it is in the diffusion flame mode.

(x) **Diffusion flame stationary combustion turbine** means any stationary combustion turbine where fuel and air are injected at the combustor and are mixed only by diffusion prior to ignition. A unit which is capable of operating in both lean premix and diffusion flame modes is considered a lean premix stationary combustion turbine when it is in the lean premix mode, and it is considered a diffusion flame stationary combustion turbine when it is in the diffusion flame mode.

(y) **Unit operating day** means a 24-hour period between 12:00 midnight and the following midnight during which any fuel is combusted at any time in the unit. It is not necessary for fuel to be combusted continuously for the entire 24-hour period.

§60.332 **Standard for nitrogen oxides.**

(a) On and after the date on which the performance test required by §60.8 is completed, every owner or operator subject to the provisions of this subpart as specified in paragraphs (b), (c), and (d) of this section shall comply with one of the following, except as provided in paragraphs (e), (f), (g), (h), (i), (j), (k), and (l) of this section.

1. No owner or operator subject to the provisions of this subpart shall cause to be discharged into the atmosphere from any stationary gas turbine, any gases which contain nitrogen oxides in excess of:
Environmental Protection Agency

§ 60.332

\[
STD = 0.0075 \left( \frac{14.4}{Y} \right) + F
\]

where:

\(STD\) = allowable ISO corrected (if required as given in §60.335(b)(1)) NO\(_X\) emission concentration (percent by volume at 15 percent oxygen and on a dry basis),
\(Y\) = manufacturer’s rated heat rate at manufacturer’s rated load (kilojoules per watt-hour) or, actual measured heat rate based on lower heating value of fuel as measured at actual peak load for the facility. The value of \(Y\) shall not exceed 14.4 kilojoules per watt-hour, and
\(F\) = NO\(_X\) emission allowance for fuel-bound nitrogen as defined in paragraph (a)(4) of this section.

(2) No owner or operator subject to the provisions of this subpart shall cause to be discharged into the atmosphere from any stationary gas turbine, any gases which contain nitrogen oxides in excess of:

\[
STD = 0.0150 \left( \frac{14.4}{Y} \right) + F
\]

where:

\(STD\) = allowable ISO corrected (if required as given in §60.335(b)(1)) NO\(_X\) emission concentration (percent by volume at 15 percent oxygen and on a dry basis),
\(Y\) = manufacturer’s rated heat rate at manufacturer’s rated peak load (kilojoules per watt-hour), or actual measured heat rate based on lower heating value of fuel as measured at actual peak load for the facility. The value of \(Y\) shall not exceed 14.4 kilojoules per watt-hour, and
\(F\) = NO\(_X\) emission allowance for fuel-bound nitrogen as defined in paragraph (a)(4) of this section.

(3) The use of \(F\) in paragraphs (a)(1) and (2) of this section is optional. That is, the owner or operator may choose to apply a NO\(_X\) allowance for fuel-bound nitrogen and determine the appropriate \(F\)-value in accordance with paragraph (a)(4) of this section or may accept an \(F\)-value of zero.

(4) If the owner or operator elects to apply a NO\(_X\) emission allowance for fuel-bound nitrogen, \(F\) shall be defined according to the nitrogen content of the fuel based on the most recent performance test required under §60.8 as follows:

- \(N \leq 0.015\):
  - \(F = 0\)
- \(0.015 < N < N_0\):
  - \(0.1\) \(N\)
- \(0.1 \leq N < 0.25\):
  - \(0.004 + 0.0067(N - 0.1)\)
- \(N \geq 0.25\):
  - \(0.005\)

Where:
\(N\) = the nitrogen content of the fuel (percent by weight).

Manufacturers may develop and submit to EPA custom fuel-bound nitrogen allowances for each gas turbine model they manufacture. These fuel-bound nitrogen allowances shall be substantiated with data and must be approved for use by the Administrator before the initial performance test required by §60.8. Notices of approval of custom fuel-bound nitrogen allowances will be published in the Federal Register.

(b) Electric utility stationary gas turbines with a heat input at peak load greater than 107.2 gigajoules per hour (100 million Btu/hour) based on the lower heating value of the fuel fired shall comply with the provisions of paragraph (a)(1) of this section.

(c) Stationary gas turbines with a heat input at peak load equal to or greater than 10.7 gigajoules per hour (10 million Btu/hour) but less than or equal to 107.2 gigajoules per hour (100 million Btu/hour) based on the lower heating value of the fuel fired shall comply with the provisions of paragraph (a)(2) of this section.

(d) Stationary gas turbines with a manufacturer’s rated base load at ISO conditions of 30 megawatts or less except as provided in §60.332(b) shall comply with the provisions of paragraph (a)(2) of this section.

(e) Stationary gas turbines with a heat input at peak load equal to or greater than 10.7 gigajoules per hour (10 million Btu/hour) but less than or equal to 107.2 gigajoules per hour (100 million Btu/hour) based on the lower heating value of the fuel fired and that...
§ 60.333 Standards and allowable exceptions.

have commenced construction prior to October 3, 1982 are exempt from paragraph (a) of this section.

(f) Stationary gas turbines using water or steam injection for control of NO\textsubscript{X} emissions are exempt from paragraph (a) when ice fog is deemed a traffic hazard by the owner or operator of the gas turbine.

(g) Emergency gas turbines, military gas turbines for use in other than a garrison facility, military gas turbines installed for use as military training facilities, and fire fighting gas turbines are exempt from paragraph (a) of this section.

(h) Stationary gas turbines engaged by manufacturers in research and development of equipment for both gas turbine emission control techniques and gas turbine efficiency improvements are exempt from paragraph (a) on a case-by-case basis as determined by the Administrator.

(i) Exemptions from the requirements of paragraph (a) of this section will be granted on a case-by-case basis as determined by the Administrator in specific geographical areas where mandatory water restrictions are required by governmental agencies because of drought conditions. These exemptions will be allowed only while the mandatory water restrictions are in effect.

(j) Stationary gas turbines with a heat input at peak load greater than 107.2 gigajoules per hour that commenced construction, modification, or reconstruction between the dates of October 3, 1977, and January 27, 1982, and were required in the September 10, 1979, Federal Register (44 FR 52792) to comply with paragraph (a)(1) of this section, except electric utility stationary gas turbines, are exempt from paragraph (a) of this section.

(k) Stationary gas turbines with a heat input greater than or equal to 10.7 gigajoules per hour (10 million Btu/hour) when fired with natural gas are exempt from paragraph (a)(2) of this section when being fired with an emergency fuel.

(l) Regenerative cycle gas turbines with a heat input less than or equal to 107.2 gigajoules per hour (100 million Btu/hour) are exempt from paragraph (a) of this section.

40 CFR Ch. I (7–1–11 Edition)

§ 60.333 Standard for sulfur dioxide.

On and after the date on which the performance test required to be conducted by §60.8 is completed, every owner or operator subject to the provisions of this subpart shall comply with one or the other of the following conditions:

(a) No owner or operator subject to the provisions of this subpart shall cause to be discharged into the atmosphere from any stationary gas turbine any gases which contain sulfur dioxide in excess of 0.015 percent by volume at 15 percent oxygen and on a dry basis.

(b) No owner or operator subject to the provisions of this subpart shall burn in any stationary gas turbine any fuel which contains total sulfur in excess of 0.8 percent by weight (8000 ppmw).

§ 60.334 Monitoring of operations.

(a) Except as provided in paragraph (b) of this section, the owner or operator of any stationary gas turbine subject to the provisions of this subpart and using water or steam injection to control NO\textsubscript{X} emissions shall install, calibrate, maintain and operate a continuous monitoring system to monitor and record the fuel consumption and the ratio of water or steam to fuel being fired in the turbine.

(b) The owner or operator of any stationary gas turbine that commenced construction, reconstruction or modification after October 3, 1977, but before July 8, 2004, and which uses water or steam injection to control NO\textsubscript{X} emissions may, as an alternative to operating the continuous monitoring system described in paragraph (a) of this section, install, certify, maintain, operate, and quality-assure a continuous emission monitoring system (CEMS) consisting of NO\textsubscript{X} and O\textsubscript{2} monitors. As an alternative, a CO\textsubscript{2} monitor may be used to adjust the measured NO\textsubscript{X} concentrations to 15 percent O\textsubscript{2} by either
