§ 179.500–5

(b) Calculations to determine the maximum marked test pressure permitted to be marked on the tank shall be made by the formula:

\[ P = \frac{10S(D^2 - d^2)}{7(D^2 + d^2)} \]

Where:

\[ P = \text{Maximum marked test pressure permitted;} \]
\[ S = \frac{U}{3.0} \]

Where:

\[ U = \text{Tensile strength of that specimen which shows the lower tensile strength of the two specimens taken from the tank and tested as prescribed in §179.500–7(b).} \]
\[ 3 = \text{Factor of safety.} \]
\[ (D^2 - d^2)/(D^2 + d^2) = \text{The smaller value obtained for this factor by the operations specified in §179.500–4(c).} \]

(c) Measure at one end, in a plane perpendicular to the longitudinal axis of the tank and at least 18 inches from that end before necking-down:

\[ d = \text{Maximum inside diameter (inches) for the location under consideration; to be determined by direct measurement to an accuracy of 0.05 inch.} \]
\[ t = \text{Minimum thickness of wall for the location under consideration; to be determined by direct measurement to an accuracy of 0.001 inch.} \]

Take \( D = d + 2t \).

Calculate the value of \( (D^2 - d^2)/(D^2 + d^2) \)

(1) Make similar measurements and calculation for a corresponding location at the other end of the tank.

(2) Use the smaller result obtained, from the foregoing, in making calculations prescribed in paragraph (b) of this section.

(a) Each necked-down tank shall be uniformly heat treated. Heat treatment shall consist of annealing or normalizing and tempering for Class I, Class II and Class III steel or oil quenching and tempering for Class III steel. Tempering temperatures shall not be less than 1000 °F. Heat treatment of alternate steels shall be approved. All scale shall be removed from outside of tank to an extent sufficient to allow proper inspection.

(b) To check uniformity of heat treatment, Brinnel hardness tests shall be made at 18 inch intervals on the entire longitudinal axis. The hardness shall not vary more than 35 points in the length of the tank. No hardness tests need be taken within 12 inches from point of head to shell tangency.

(c) A magnetic particle inspection shall be performed after heat treatment on all tanks subjected to a quench and temper treatment to detect the presence of quenching cracks. Cracks shall be removed to sound metal by grinding and the surface exposed shall be blended smoothly into the surrounding area. A wall thickness check shall then be made of the affected area by ultrasonic equipment or other suitable means acceptable to the inspector and if the remaining wall thickness is less than the minimum recorded thickness as determined by §179.500–4(b) it shall be used for making the calculation prescribed in paragraph (b) of this section.
