(1) An operator must notify PHMSA of any of the following events not later than 60 days before the event occurs:
   (i) Construction or any planned rehabilitation, replacement, modification, upgrade, uprate, or update of a facility, other than a section of line pipe, that costs $10 million or more. If 60 day notice is not feasible because of an emergency, an operator must notify PHMSA as soon as practicable;
   (ii) Construction of 10 or more miles of a new hazardous liquid pipeline; or
   (iii) Construction of a new pipeline facility.
(2) An operator must notify PHMSA of any following event not later than 60 days after the event occurs:
   (i) A change in the primary entity responsible (i.e., with an assigned OPID) for managing or administering a safety program required by this part covering pipeline facilities operated under multiple OPIDs.
   (ii) A change in the name of the operator;
   (iii) A change in the entity (e.g., company, municipality) responsible for operating an existing pipeline, pipeline segment, or pipeline facility;
   (iv) The acquisition or divestiture of 50 or more miles of pipeline or pipeline system subject to this part; or
   (v) The acquisition or divestiture of an existing pipeline facility subject to this part.
   (d) Reporting. An operator must use the OPID issued by PHMSA for all reporting requirements covered under this subchapter and for submissions to the National Pipeline Mapping System.

§ 195.102 Design temperature.
   (a) Material for components of the system must be chosen for the temperature environment in which the components will be used so that the pipeline will maintain its structural integrity.
   (b) Components of carbon dioxide pipelines that are subject to low temperatures during normal operation or during the initial fill of the line must be made of materials that are suitable for those low temperatures.

§ 195.104 Variations in pressure.
   If, within a pipeline system, two or more components are to be connected at a place where one will operate at a higher pressure than another, the system must be designed so that any component operating at the lower pressure will not be overstressed.

§ 195.106 Internal design pressure.
   (a) Internal design pressure for the pipe in a pipeline is determined in accordance with the following formula:
   \[ P = \frac{2S_tD}{t}E_F \]
   \( P \) = Internal design pressure in p.s.i. (kPa) gage.
   \( S \) = Yield strength in pounds per square inch (kPa) determined in accordance with paragraph (b) of this section.
   \( t \) = Nominal wall thickness of the pipe in inches (millimeters). If this is unknown, it

Subpart C—Design Requirements

§ 195.100 Scope.
This subpart prescribes minimum design requirements for new pipeline systems constructed with steel pipe and for relocating, replacing, or otherwise changing existing systems constructed with steel pipe. However, it does not apply to the movement of line pipe covered by §195.424.

§ 195.101 Qualifying metallic components other than pipe.
Notwithstanding any requirement of the subpart which incorporates by reference an edition of a document listed in §195.3, a metallic component other than pipe manufactured in accordance with any other edition of that document is qualified for use if—
   (a) It can be shown through visual inspection of the cleaned component that no defect exists which might impair the strength or tightness of the component; and
   (b) The edition of the document under which the component was manufactured has equal or more stringent requirements for the following as an edition of that document currently or previously listed in §195.3:
      (1) Pressure testing;
      (2) Materials; and
      (3) Pressure and temperature ratings.

§ 195.102 Design temperature.
   (a) Material for components of the system must be chosen for the temperature environment in which the components will be used so that the pipeline will maintain its structural integrity.
   (b) Components of carbon dioxide pipelines that are subject to low temperatures during normal operation because of rapid pressure reduction or during the initial fill of the line must be made of materials that are suitable for those low temperatures.

[Amdt. 195–45, 56 FR 26925, June 12, 1991]

§ 195.104 Variations in pressure.
If, within a pipeline system, two or more components are to be connected at a place where one will operate at a higher pressure than another, the system must be designed so that any component operating at the lower pressure will not be overstressed.

§ 195.106 Internal design pressure.
   (a) Internal design pressure for the pipe in a pipeline is determined in accordance with the following formula:
   \[ P = \frac{2S_tD}{t}E_F \]
   \( P \) = Internal design pressure in p.s.i. (kPa) gage.
   \( S \) = Yield strength in pounds per square inch (kPa) determined in accordance with paragraph (b) of this section.
   \( t \) = Nominal wall thickness of the pipe in inches (millimeters). If this is unknown, it
