APPENDIX D TO PART 835—SURFACE CONTAMINATION VALUES

For any single radionuclide not listed above with decay mode other than alpha emission or spontaneous fission and with radioactive half-life less than two hours, the DAC value shall be 6 E–06 Ci/mL (2 E+04 Bq/m³).

APPENDIX D TO PART 835—SURFACE CONTAMINATION VALUES

The data presented in appendix D are to be used in identifying the need for posting of contamination and high contamination areas in accordance with §835.1101 and 835.1102.
Surface Contamination Values \(^1\) in DPM/100 CM\(^2\)

\(\text{Removable}^{2,3} = \text{amount of removable radioactive material per 100 cm}^2 \text{of surface area should be determined by swiping the area with dry filter or soft absorbent paper, applying moderate pressure, and then assessing the amount of radioactive material on the swipe with an appropriate instrument of known efficiency. (Note—The use of dry material may not be appropriate for triturn.)}\)

\(\text{Total (Fixed + Removable)}^{3,4} = \text{the sum of the activity of all isolated spots or particles in any 100 cm}^2 \text{area exceeds three times the applicable value.}\)

\(\text{Removable}^{2,3} = \text{the amount of removable radioactive material per 100 cm}^2 \text{of surface area should be determined by swiping the area with dry filter or soft absorbent paper, applying moderate pressure, and then assessing the amount of radioactive material on the swipe with an appropriate instrument of known efficiency. (Note—The use of dry material may not be appropriate for triturn.)}\)

\(\text{Total (Fixed + Removable)}^{3,4} = \text{the sum of the activity of all isolated spots or particles in any 100 cm}^2 \text{area exceeds three times the applicable value.}\)

\(\text{Removable}^{2,3} = \text{the amount of removable radioactive material per 100 cm}^2 \text{of surface area should be determined by swiping the area with dry filter or soft absorbent paper, applying moderate pressure, and then assessing the amount of radioactive material on the swipe with an appropriate instrument of known efficiency. (Note—The use of dry material may not be appropriate for triturn.)}\)

\(\text{Total (Fixed + Removable)}^{3,4} = \text{the sum of the activity of all isolated spots or particles in any 100 cm}^2 \text{area exceeds three times the applicable value.}\)

\(^1\) The values in this appendix, with the exception noted in footnote 6 below, apply to radioactive contamination deposited on, but not incorporated into the interior or matrix of, the contaminated item. Where surface contamination by both alpha- and beta-gamma-emitting nuclides exists, the limits established for alpha- and beta-gamma-emitting nuclides apply independently.

\(^2\) As used in this table, dpm (disintegrations per minute) means the rate of emission by radioactive material as determined by the instrumentation.

\(^3\) The levels may be averaged over one square meter provided the maximum surface activity in any area of 100 cm\(^2\) is less than three times the value specified. For purposes of averaging, any square meter of surface shall be considered to be above the surface contamination value if: (1) From measurements of a representative number of sections it is determined that the average contamination level exceeds the applicable value; or (2) it is determined that the sum of the activity of all isolated spots or particles in any 100 cm\(^2\) area exceeds three times the applicable value.

\(^4\) Tritium contamination may diffuse into the volume or matrix of materials. Evaluation of surface contamination shall consider the extent to which such contamination may migrate to the surface in order to ensure the surface contamination value provided in this appendix is not exceeded. Once this contamination migrates to the surface, it may be removable, not fixed; therefore, a "Total" value does not apply. In certain cases, a "Total" value of 10,000 dpm/100 cm\(^2\) may be applicable either to metals, of the types which form insoluble special tritium compounds that have been exposed to tritium; or to bulk materials to which particles of insoluble special tritium compound are fixed to a surface.

\(^5\) These limits only apply to the alpha emitters within the respective decay series.

\(^6\) These limits only apply to the alpha emitters within the respective decay series.
