§ 27.151 Flight controls.

(a) Longitudinal, lateral, directional, and collective controls may not exhibit excessive breakout force, friction, or preload.

(b) Control system forces and free play may not inhibit a smooth, direct rotorcraft response to control system input.

(2) At a speed of 1.1 \( V_{NE} \) (power-off), the margin of cyclic control must allow satisfactory roll and pitch control with power off.

(3) Throughout the full range of altitude for which certification is requested, with the throttle and collective pitch held constant during the maneuvers specified in § 27.175(a) through (d), the slope of the control position versus airspeed curve must be positive. However, in limited flight conditions or modes of operation determined by the Administrator to be acceptable, the slope of the control position versus airspeed curve may be neutral or negative if the rotorcraft possesses flight characteristics that allow the pilot to maintain airspeed within \( \pm 5 \) knots of the desired trim airspeed without exceptional piloting skill or alertness.

§ 27.171 Stability: general.

The rotorcraft must be able to be flown, without undue pilot fatigue or strain, in any normal maneuver for a period of time as long as that expected in normal operation. At least three landings and takeoffs must be made during this demonstration.

§ 27.173 Static longitudinal stability.

(a) The longitudinal control must be designed so that a rearward movement of the control is necessary to obtain an airspeed less than the trim speed, and a forward movement of the control is necessary to obtain an airspeed more than the trim speed.

(b) Throughout the full range of altitude for which certification is requested, with the throttle and collective pitch held constant during the maneuvers specified in § 27.175(a) through (d), the slope of the control position versus airspeed curve must be positive. However, in limited flight conditions or modes of operation determined by the Administrator to be acceptable, the slope of the control position versus airspeed curve may be neutral or negative if the rotorcraft possesses flight characteristics that allow the pilot to maintain airspeed within \( \pm 5 \) knots of the desired trim airspeed without exceptional piloting skill or alertness.
Federal Aviation Administration, DOT § 27.241

(4) The landing gear retracted; and
(5) The rotorcraft trimmed at 0.8 \( V_{NE} \) or \( V_{H} \), whichever is less.

(c) \( V_{NE} \). Static longitudinal stability must be shown at speeds from \( V_{NE} - 20 \) kt to \( V_{NE} \) with—
(1) Critical weight;
(2) Critical center of gravity;
(3) Power required for level flight at \( V_{NE} - 10 \) kt or maximum continuous power, whichever is less;
(4) The landing gear retracted; and
(5) The rotorcraft trimmed at \( V_{NE} - 10 \) kt.

(d) \textit{Autorotation}. Static longitudinal stability must be shown in autorotation at—
(1) Airspeeds from the minimum rate of descent airspeed – 10 kt to the minimum rate of descent airspeed + 10 kt, with—
   (i) Critical weight;
   (ii) Critical center of gravity;
   (iii) The landing gear extended; and
   (iv) The rotorcraft trimmed at the minimum rate of descent airspeed.
(2) Airspeeds from best angle-of-glide airspeed – 10 kt to the best angle-of-glide airspeed + 10 kt, with—
   (i) Critical weight;
   (ii) Critical center of gravity;
   (iii) The landing gear retracted; and
   (iv) The rotorcraft trimmed at the best angle-of-glide airspeed.

(See secs. 313(a), 601, 603, 604, and 605 of the Federal Aviation Act of 1958 (49 U.S.C. 1354(a), 1421, 1423, 1424, and 1425); and sec. 6(c) of the Dept. of Transportation Act (49 U.S.C. 1655(c))).

§ 27.241 Ground and Water Handling Characteristics

(a) The rotorcraft must have satisfactory ground and water handling characteristics, including freedom from uncontrollable tendencies in any condition expected in operation.

§ 27.235 Taxing condition.

The rotorcraft must be designed to withstand the loads that would occur when the rotorcraft is taxied over the roughest ground that may reasonably be expected in normal operation.

§ 27.239 Spray characteristics.

If certification for water operation is requested, no spray characteristics during taxiing, takeoff, or landing may obscure the vision of the pilot or damage the rotors, propellers, or other parts of the rotorcraft.

§ 27.241 Ground resonance.

The rotorcraft may have no dangerous tendency to oscillate on the ground with the rotor turning.
