§ 98.221 Reporting threshold.
You must report GHG emissions under this subpart if your facility contains a nitric acid train and the facility meets the requirements of either §98.2(a)(1) or (a)(2).

§ 98.222 GHGs to report.
(a) You must report N$_2$O process emissions from each nitric acid production train as required by this subpart.
(b) You must report under subpart C of this part (General Stationary Fuel Combustion Sources) the emissions of CO$_2$, CH$_4$, and N$_2$O from each stationary combustion unit by following the requirements of subpart C.

§ 98.223 Calculating GHG emissions.
(a) You must determine annual N$_2$O process emissions from each nitric acid train according to paragraphs (a)(1) or (a)(2) of this section.
(1) Use a site-specific emission factor and production data according to paragraphs (b) through (i) of this section.
(2) Request Administrator approval for an alternative method of determining N$_2$O emissions according to paragraphs (a)(2)(i) and (a)(2)(ii) of this section.
(i) You must submit the request within 45 days following promulgation of this subpart or within the first 30 days of each subsequent reporting year.
(ii) If the Administrator does not approve your requested alternative method within 150 days of the end of the reporting year, you must determine the N$_2$O emissions for the current reporting period using the procedures specified in paragraph (a)(1) of this section.
(b) You must conduct an annual performance test for each nitric acid train according to paragraphs (b)(1) through (3) of this section.
(1) You must conduct the performance test at the absorber tail gas vent, referred to as the test point, for each nitric acid train according to §98.224(b) through (f). If multiple nitric acid production units exhaust to a common abatement technology and/or emission point, you must sample each process in the ducts before the emissions are combined, sample each process when only one process is operating, or sample the combined emissions when multiple processes are operating and base the site-specific emission factor on the combined production rate of the multiple nitric acid production units.
(2) You must conduct the performance test under normal process operating conditions.
(3) You must measure the production rate during the performance test and calculate the production rate for the test period in metric tons (100 percent acid basis) per hour.
(c) Using the results of the performance test in paragraph (b) of this section, you must calculate an average site-specific emission factor for each nitric acid train “t” according to Equation V–1 of this section:

\[
EF_{N2O_t} = \frac{\sum_{i=1}^{n} C_{N2O} \times 1.14 \times 10^{-7} \times Q}{P \times n}
\]  

(Eq. V-1)

where:

- $EF_{N2O_t}$ = Average site-specific N$_2$O emissions factor for nitric acid train “t” (lb N$_2$O/ton nitric acid produced, 100 percent acid basis).
- $C_{N2O}$ = N$_2$O concentration for each test run during the performance test (ppm N$_2$O).
- $1.14 \times 10^{-7}$ = Conversion factor (lb/dscf-ppm N$_2$O).
- $Q$ = Volumetric flow rate of effluent gas for each test run during the performance test (dscf/hr).
- $P$ = Production rate for each test run during the performance test (tons nitric acid produced per hour, 100 percent acid basis).
- $n$ = Number of test runs.

(d) If nitric acid train “t” exhausts to any N$_2$O abatement technology “N” after the test point, you must determine the destruction efficiency for each N$_2$O abatement technology “N” according to paragraphs (d)(1), (d)(2), or (d)(3) of this section.
(1) Use the manufacturer’s specified destruction efficiency.
(2) Estimate the destruction efficiency through process knowledge. Examples of information that could constitute process knowledge include calculations based on material balances, process stoichiometry, or previous test results provided the results are still relevant to the current vent stream conditions. You must document how process knowledge (if applicable) was used to determine the destruction efficiency.
(3) Calculate the destruction efficiency by conducting an additional performance test on the emissions stream following the N\textsubscript{2}O abatement technology.

(e) If nitric acid train “t” exhausts to any N\textsubscript{2}O abatement technology “N” after the test point, you must determine the annual amount of nitric acid produced on train “t” while N\textsubscript{2}O abatement technology “N” is operating according to §98.224(f). Then you must calculate the abatement utilization factor for each N\textsubscript{2}O abatement technology “N” for each nitric acid train “t” according to Equation V–2 of this section.

\[
AF_{t,N} = \frac{P_{t,N}}{P_t} \quad \text{(Eq. V-2)}
\]

where:
- \(AF_{t,N}\) = Abatement utilization factor of N\textsubscript{2}O abatement technology “N” at nitric acid train “t” (fraction of annual production that abatement technology is operating).
- \(P_t\) = Total annual nitric acid production from nitric acid train “t” (ton acid produced, 100 percent acid basis).
- \(P_{t,N}\) = Annual nitric acid production from nitric acid train “t” during which N\textsubscript{2}O abatement technology “N” was operational (ton acid produced, 100 percent acid basis).

(f) [Reserved]

(g) You must calculate N\textsubscript{2}O emissions for each nitric acid train “t” according to paragraph (g)(1), (g)(2), (g)(3), or (g)(4) of this section.

(1) If nitric acid train “t” exhausts to one N\textsubscript{2}O abatement technology “N” after the test point, you must use the emissions factor (determined in Equation V–1 of this section), the destruction efficiency (determined in paragraph (d) of this section), the annual nitric acid production (determined in paragraph (i) of this section), and the abatement utilization factor (determined in paragraph (e) of this section) according to Equation V–3a of this section:

\[
E_{N20t} = \frac{EF_{N20t} * P_t}{2205} * \left(1 - \left(DF * AF\right)\right) \quad \text{(Eq. V-3a)}
\]

where:
- \(E_{N20t}\) = Annual N\textsubscript{2}O mass emissions from nitric acid production unit “t” according to this Equation V–3a (metric tons).
- \(EF_{N,20t}\) = Average site-specific N\textsubscript{2}O emissions factor for nitric acid train “t” (lb N\textsubscript{2}O/ton acid produced, 100 percent acid basis).
- \(P_t\) = Annual nitric acid production from the train “t” (ton acid produced, 100 percent acid basis).
- \(DF\) = Destruction efficiency of N\textsubscript{2}O abatement technology N that is used on nitric acid train “t” (percent of N\textsubscript{2}O removed from vent stream).
- \(AF\) = Abatement utilization factor of N\textsubscript{2}O abatement technology “N” for nitric acid train “t” (percent of time that the abatement technology is operating).
- 2205 = Conversion factor (lb/metric ton).

(2) If multiple N\textsubscript{2}O abatement technologies are located in series after your test point, you must use the emissions factor (determined in Equation V–1 of this section), the destruction efficiency (determined in paragraph (d) of this section), the annual nitric acid production (determined in paragraph (f) of this section), and the abatement utilization factor (determined in paragraph (e) of this section), according to Equation V–3b of this section:
§ 98.223

40 CFR Ch. I (7–1–12 Edition)

\[ E_{N2O_t} = \frac{EF_{N2O} \times P_t}{2205} \times \left(1 - (DF_1 \times AF_1)\right) \times \left(1 - (DF_2 \times AF_2)\right) \times \ldots \times \left(1 - (DF_N \times AF_N)\right) \]  
\text{(Eq. V-3b)}

where:
- \( E_{N2O_t} \) = Annual \( N_2O \) mass emissions from nitric acid production unit “\( t \)” according to this Equation V-3b (metric tons).
- \( EF_{N2O} \) = \( N_2O \) emissions factor for unit “\( t \)” (lb \( N_2O \)/ton nitric acid produced).
- \( P_t \) = Annual nitric acid produced from unit “\( t \)” (ton acid produced, 100 percent acid basis).
- \( DF_t \) = Destruction efficiency of \( N_2O \) abatement technology 1 (percent of \( N_2O \) removed from vent stream).
- \( AF_t \) = Abatement utilization factor of \( N_2O \) abatement technology 1 (percent of time that abatement technology 1 is operating).

\[ DF_N = \text{Destruction efficiency of } \text{\( N_2O \) abatement technology } \text{\( N \)} \text{(percent of } \text{\( N_2O \)} \text{removed from vent stream).} \]
- \( AF_N \) = Abatement utilization factor of \( N_2O \) abatement technology \( N \) (percent of time that abatement technology \( N \) is operating).
- \( FC_N \) = Fraction control factor of \( N_2O \) abatement technology “\( N \)” (percent of total emissions from unit “\( t \)” that are sent to abatement technology “\( N \)”).
- \( 2205 \) = Conversion factor (lb/metric ton).
- \( N \) = Number of different \( N_2O \) abatement technologies.

(3) If multiple \( N_2O \) abatement technologies are located in parallel after your test point, you must use the emissions factor (determined in Equation V–1 of this section), the destruction efficiency (determined in paragraph (d) of this section), the annual nitric acid production (determined in paragraph (f) of this section), and the abatement utilization factor (determined in paragraph (e) of this section), according to Equation V–3c of this section:

\[ E_{N2O_t} = \frac{EF_{N2O}}{2205} \times \sum_{1}^{N} \left(1 - (DF_N \times AF_N)\right) \times FC_N \]  
\text{(Eq. V-3c)}

where:
- \( E_{N2O_t} \) = Annual \( N_2O \) mass emissions from nitric acid production unit “\( t \)” according to this Equation V-3c (metric tons).
- \( EF_{N2O} \) = Average site-specific \( N_2O \) emissions factor for nitric acid train “\( t \)” (lb \( N_2O \)/ton acid produced, 100 percent acid basis).
- \( P_t \) = Annual nitric acid production from nitric acid train “\( t \)” (ton acid produced, 100 percent acid basis).
- \( 2205 \) = Conversion factor (lb/metric ton).
- \( N \) = Number of different \( N_2O \) abatement technologies with a fraction control factor.

(4) If nitric acid train “\( t \)” does not exhaust to any \( N_2O \) abatement technology after the test point, you must use the emissions factor (determined in Equation V–1 of this section), and the annual nitric acid production (determined in paragraph (i) of this section) according to Equation V-3d of this section:

\[ E_{N2O_t} = \frac{EF_{N2O} \times P_t}{2205} \]  
\text{(Eq. V-3d)}

where:
- \( E_{N2O_t} \) = Annual \( N_2O \) mass emissions from nitric acid production unit “\( t \)” according to this Equation V-3d (metric tons).
- \( EF_{N2O} \) = Average site-specific \( N_2O \) emissions factor for nitric acid train “\( t \)” (lb \( N_2O \)/ton acid produced, 100 percent acid basis).
- \( P_t \) = Annual nitric acid production from nitric acid train “\( t \)” (ton acid produced, 100 percent acid basis).
- \( 2205 \) = Conversion factor (lb/metric ton).
- \( N \) = Number of different \( N_2O \) abatement technologies.

(h) You must determine the annual nitric acid production emissions combined from all nitric acid trains at your facility using Equation V–4 of this section.
Environmental Protection Agency § 98.224

\[ N_2O = \sum_{t=1}^{m} E_{N2Ot} \]  

(Eq. V-4)

Where:

- \( N_2O \) = Annual process \( N_2O \) emissions from nitric acid production facility (metric tons).
- \( E_{N2Ot} \) = \( N_2O \) mass emissions per year for nitric acid train “t” (metric tons).
- \( m \) = Number of nitric acid trains.

(i) You must determine the total annual amount of nitric acid produced on nitric acid train “t” for each nitric acid train (tons acid produced, 100 percent acid basis), according to §98.224(f).

§ 98.224 Monitoring and QA/QC requirements.

(a) You must conduct a new performance test according to a test plan as specified in paragraphs (a)(1) through (3) of this section.

(1) Conduct the performance test annually. The test should be conducted at a point during the campaign which is representative of the average emissions rate from the nitric acid campaigns. Facilities must document the methods used to determine the representative point of the campaign when the performance test is conducted.

(2) Conduct the performance test when your nitric acid production process is changed, specifically when abatement equipment is installed.

(3) If you requested Administrator approval for an alternative method of determining \( N_2O \) emissions under §98.223(a)(2), you must conduct the performance test if your request has not been approved by the Administrator within 150 days of the end of the reporting year in which it was submitted.

(b) You must measure the \( N_2O \) concentration during the performance test using one of the methods in paragraphs (b)(1) through (b)(3) of this section.

(3) An equivalent method, with Administrator approval.

(c) You must determine the production rate(s) (100 percent basis) from each nitric acid train during the performance test according to paragraphs (c)(1) or (c)(2) of this section.

(1) Direct measurement of production and concentration (such as using flow meters, weigh scales, for production and concentration measurements).

(2) Existing plant procedures used for accounting purposes (i.e. dedicated tank-level and acid concentration measurements).

(d) You must determine the volumetric flow rate during the performance test in conjunction with the applicable EPA methods in 40 CFR part 60, appendices A–1 through A–4. Conduct three emissions test runs of 1 hour each. All QA/QC procedures specified in the reference test methods and any associated performance specifications apply. For each test, the facility must prepare an emission factor determination report that must include the items in paragraphs (d)(1) through (d)(3) of this section.

(1) Analysis of samples, determination of emissions, and raw data.

(2) All information and data used to derive the emissions factor(s).

(f) You must determine the annual amount of nitric acid produced. You must also determine the annual amount of nitric acid produced while \( N_2O \) abatement technology (located...
