(iii) Brain or trigeminal ganglia. Skulls that enter the AMR system have tissues of brain or trigeminal ganglia.

(iv) Spinal cord. Vertebral column bones that enter the AMR system have tissues of spinal cord, or the product that exits the AMR system contains spinal cord.

(v) DRG. The product that exits the AMR system contains DRG.

(2) If product that may not be labeled or used as ‘‘meat’’ under this section meets the requirements of § 319.5 of this subchapter, it may bear the name ‘‘Mechanically Separated (Species)’’ except as follows:

(i) If skulls or vertebral column bones of cattle younger than 30 months of age that enter the AMR system have tissues of brain, trigeminal ganglia, or spinal cord, the product that exits the AMR system shall not be used as an ingredient of a meat food product.

(ii) If product that exits the AMR system contains spinal cord or DRG from bones of cattle younger than 30 months of age, it shall not be used as an ingredient of a meat food product.

(iii) If product derived from any bones of cattle of any age does not comply with (c)(1)(i) or (ii), it may bear a common or usual name that is not false or misleading, except that the product may not bear the name ‘‘Mechanically Separated (Beef).’’

(3) Spent skulls or vertebral column bone materials from cattle younger than 30 months of age that exit the AMR system shall not be used as an ingredient of a meat food product.

Subparts B–F [Reserved]

Subpart G—Canning and Canned Products

Source: 51 FR 45619, Dec. 19, 1986, unless otherwise noted.
Food Safety and Inspection Service, USDA

§ 318.301

Containers and closures.

(a) Examination and cleaning of empty containers. (1) Empty containers, closures, and flexible pouch roll stock shall be evaluated by the establishment to ensure that they are clean and free of structural defects and damage

(b) Net headspace. The vertical distance between the level of the product (generally the liquid surface) in an upright rigid container and the inside surface of the lid.

(c) Hermetically sealed containers. Airtight containers which are designed and intended to protect the contents against the entry of microorganisms during and after thermal processing.

(i) Rigid container. A container, the shape or contour of which, when filled and sealed, is neither affected by the enclosed product nor deformed by external mechanical pressure of up to 10 pounds per square inch gauge (0.7 kg/cm²) (i.e., normal firm finger pressure).

(ii) Semirigid container. A container, the shape or contour of which, when filled and sealed, is not significantly affected by the enclosed product under normal atmospheric temperature and pressure, but can be deformed by external mechanical pressure of less than 10 pounds per square inch gauge (0.7 kg/cm²) (i.e., normal firm finger pressure).

(iii) Flexible container. A container, the shape or contour of which, when filled and sealed, is significantly affected by the enclosed product.

(d) Seals. Those parts of a semirigid container and lid or of a flexible container that are fused together in order to hermetically close the container.

(e) Incubation tests. Tests in which the thermally processed product is kept at a specific temperature for a specified period of time in order to determine if outgrowth of microorganisms occurs.

(f) Initial temperature. The temperature, determined at the initiation of a thermal process cycle, of the contents of the coldest container to be processed.

(g) Low acid product. A canned product in which any component has a pH value above 4.6.

(h) Process schedule. The thermal process and any specified critical factors for a given canned product required to achieve shelf stability.

(i) Process temperature. The minimum temperature(s) of the heating medium to be maintained as specified in the process schedule.

(j) Process time. The intended time(s) a container is to be exposed to the heating medium while the heating medium is at or above the process temperature(s).

(k) Processing authority. The person(s) or organization(s) having expert knowledge of thermal processing requirements for foods in hermetically sealed containers, having access to facilities for making such determinations, and designated by the establishment to perform certain functions as indicated in this subpart.

(l) Program employee. Any inspector or other individual employed by the Department or any cooperating agency who is authorized by the Secretary to do any work or perform any duty in connection with the Program (see §301.2(f)).

(m) Retort. A pressure vessel designed for thermal processing of product packed in hermetically sealed containers.

(n) Seals. Those parts of a semirigid container and lid or of a flexible container that are fused together in order to hermetically close the container.

(o) Shelf stability. The condition achieved by application of heat, sufficient, alone or in combination with other ingredients and/or treatments, to render the product free of microorganisms capable of growing in the product at nonrefrigerated conditions (over 50 °F or 10 °C) at which the product is intended to be held during distribution and storage. Shelf stability and shelf stable are synonymous with commercial sterility and commercially sterile, respectively.

(p) Thermal process. The heat treatment necessary to achieve shelf stability as determined by the establishment’s processing authority. It is quantified in terms of:

(1) Time(s) and temperature(s); or

(2) Minimum product temperature.

(q) Venting. The removal of air from a retort before the start of process timing.

(r) Water activity. The ratio of the water vapor pressure of the product to the vapor pressure of pure water at the same temperature.

§ 318.301

Containers and closures.

(a) Examination and cleaning of empty containers. (1) Empty containers, closures, and flexible pouch roll stock shall be evaluated by the establishment to ensure that they are clean and free of structural defects and damage
