Pt. 430, Subpt. B, App. J1

Where:

\[ E_{of} = \text{conventional oven fan-only mode energy consumption, in kilowatt-hours, as measured in section 3.2.1.2 of this appendix.} \]

\[ S_A = \text{representative number of annual conventional oven cooking cycles per year, which is equal to 219 cycles for a conventional electric oven without self-clean capability, 204 cycles for a conventional electric oven with self-clean capability, 183 cycles for a conventional gas oven without self-clean capability, and 197 cycles for a conventional gas oven with self-clean capability.} \]

\[ T_{TOT} = \text{the total number of inactive mode and off mode hours per year.} \]

\[ E_{RTLP} = \left( P_{IA} \times S_{IA} \right) + \left( P_{OM} \times S_{OM} \right) \times K \]

Where:

\[ P_{IA} = \text{conventional range inactive mode power, in watts, as measured in section 3.1.3.1 of this appendix.} \]

\[ P_{OM} = \text{conventional range off mode power, in watts, as measured in section 3.1.3.2 of this appendix.} \]

\[ S_{TOT} = \text{the total number of inactive mode and off mode hours per year.} \]

If the conventional oven component of the conventional range has fan-only mode, \( S_{TOT} \) equals \( \left( 8,329.2 - \left( t_{of} \times 60 \right) \right) \) hours, where \( t_{of} \) is the conventional oven fan-only mode duration, in minutes, as measured in section 3.2.1.2 of this appendix, and 60 is the conversion factor for minutes to hours; otherwise, \( S_{TOT} \) is equal to 8,329.2 hours.

If the conventional range has both inactive mode and off mode, \( S_{IA} \) and \( S_{OM} \) both equal \( S_{TOT}/2 \);

If the conventional range has an inactive mode but no off mode, the inactive mode annual hours, \( S_{IA} \), is equal to \( S_{TOT} \), and the off mode annual hours, \( S_{OM} \), is equal to 0;

If the conventional range has an off mode but no inactive mode, \( S_{IA} \) is equal to 0, and \( S_{OM} \) is equal to \( S_{TOT} \);

\[ K = 0.001 \text{ kWh/Wh conversion factor for watt-hours to kilowatt-hours.} \]

The annual energy consumption for other combinations of ovens and cooktops will also be treated as the sum of the annual energy consumption of each of its components. The energy factor of a combined component is the sum of the annual useful cooking energy output of each component divided by the sum of the total annual energy consumption of each component. The integrated energy factor of other combinations of ovens and cooktops is the sum of the annual useful cooking energy output of each component divided by the sum of the total integrated annual energy consumption of each component.

APPENDIX J1 TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF AUTOMATIC AND SEMI-AUTOMATIC CLOTHES WASHERS

Manufacturers may use Appendix J1 to certify compliance with existing DOE energy conservation standards until the compliance date of any amended standards that address standby and off mode power consumption for residential clothes washers. After this date, all residential clothes washers shall be tested using the provisions of Appendix J2.

1. Definitions and Symbols

1.1 Adaptive control system means a clothes washer control system, other than an adaptive water fill control system, which is capable of automatically adjusting washer operation or washing conditions based on characteristics of the clothes load placed in the clothes container, without allowing or requiring consumer intervention or actions.

1.2 Adaptive water fill control system means a clothes washer water fill control system which is capable of automatically adjusting the water fill level based on the size or weight of the clothes load placed in the clothes container, without allowing or requiring consumer intervention or actions.

1.3 Bone-dry means a condition of a load of test cloth which has been dried in a dryer at maximum temperature for a minimum of 10 minutes, removed and weighed before cool down, and then dried again for 10 minute periods until the final weight change of the load is 1 percent or less.

1.4 Clothes container means the compartment within the clothes washer that holds the clothes during the operation of the machine.
1.5 **Compact** means a clothes washer which has a clothes container capacity of less than 1.6 ft³ (45 L).

1.6 **Deep rinse cycle** means a rinse cycle in which the clothes container is filled with water to a selected level and the clothes load is rinsed by agitating it or tumbling it through the water.

1.7 **Energy test cycle** for a basic model means (A) the cycle recommended by the manufacturer for washing cotton or linen clothes, and includes all wash/rinse temperature selections and water levels offered in that cycle, and (B) for each other wash/rinse temperature selection or water level available on that basic model, the portion(s) of other cycle(s) with that temperature selection or water level that, when tested pursuant to these test procedures, will contribute to an accurate representation of the energy consumption of the basic model as used by consumers. Any cycle under (A) or (B) shall include the agitation/tumble operation, spin speed(s), wash times, and rinse times applicable to that cycle, including water heating time for water heating clothes washers.

1.8 **Load use factor** means the percentage of the total number of wash loads that a user would wash a particular size (weight) load.

1.9 **Manual control system** means a clothes washer control system which requires that the consumer make the choices that determine washer operation or washing conditions, such as, for example, wash/rinse temperature selections, and water time before starting the cycle.

1.10 **Manual water fill control system** means a clothes washer water fill control system which requires the consumer to determine or select the water fill level.

1.11 **Modified energy factor** means the quotient of the cubic foot (or liter) capacity of the clothes container divided by the total clothes washer energy consumption per cycle, with such energy consumption expressed as the sum of the machine electrical energy consumption, the hot water energy consumption, and the energy required for removal of the remaining moisture in the wash load.

1.12 **Non-water-heating clothes washer** means a clothes washer which does not have an internal water heating device to generate hot water.

1.13 **Spray rinse cycle** means a rinse cycle in which water is sprayed onto the clothes for a period of time without maintaining any specific water level in the clothes container.

1.14 **Standard** means a clothes washer which has a clothes container capacity of 1.6 ft³ (45 L) or greater.

1.15 **Temperature use factor** means, for a particular wash/rinse temperature setting, the percentage of the total number of wash loads that an average user would wash with that setting.

1.16 **Thermostatically controlled water valves** means clothes washer controls that have the ability to sense and adjust the hot and cold supply water.

1.17 **Uniformly distributed warm wash temperature selection(s)** means (A) multiple warm wash selections for which the warm wash water temperatures have a linear relationship with all discrete warm wash selections when the water temperatures are plotted against equally spaced consecutive warm wash selections between the hottest warm wash and the coldest warm wash. If the warm wash has infinite selections, the warm wash water temperature has a linear relationship with the distance on the selection device (e.g., dial angle or slide movement) between the hottest warm wash and the coldest warm wash. The criteria for a linear relationship as specified above is that the difference between the actual water temperature at any warm wash selection and the point where that temperature is depicted on the temperature/selection line formed by connecting the warmest and the coldest warm wash selections is less than ±5 percent. In all cases, the mean water temperature of the warmest and the coldest warm wash selections must coincide with the mean of the “hot wash” (maximum wash temperature ≤135 °F (57.2 °C)) and “cold wash” (minimum wash temperature) water temperatures within ±3.8 °F (±2.1 °C); or (B) on a clothes washer with only one warm wash temperature selection, a warm wash temperature selection with a water temperature that coincides with the mean of the “hot wash” (maximum wash temperature ≤135 °F (57.2 °C)) and “cold wash” (minimum wash temperature) water temperatures within ±3.8 °F (±2.1 °C).

1.18 **Water use** means all wash temperature selections that are below the hottest hot, less than 135 °F (57.2 °C), and above the coldest cold temperature selection.

1.19 **Water factor** means the quotient of the total weighted per-cycle water consumption divided by the cubic foot (or liter) capacity of the clothes washer.

1.20 **Water-heating clothes washer** means a clothes washer where some or all of the hot water for clothes washing is generated by a water heating device internal to the clothes washer.

1.21 **Symbol usage.** The following identity relationships are provided to help clarify the symbology used throughout this procedure.

- E—Electrical Energy Consumption
- H—Hot Water Consumption
- C—Cold Water Consumption
- R—Hot Water Consumed by Warm Rinse
- ER—Electrical Energy Consumed by Warm Rinse
- TUF—Temperature Use Factor
- HUF—Hot Water Usage Factor
- Q—Total Water Consumption

349
Clothes washers with thermostatically controlled water valves. The temperature of the hot water supply shall be maintained at 135 °F (57.2 °C) and the cold water supply shall be maintained at 60 °F±5 °F (15.6 °C±2.8 °C). A water meter shall be installed in both the hot and cold water lines to measure water consumption.

2.4 Water pressure. The static water pressure at the hot and cold water inlet connection of the clothes washer shall be maintained at 35 pounds per square inch gauge (psig) ±2.5 psig (241.3 kPa±17.2 kPa) during the test. The static water pressure for a single water inlet connection shall be maintained at 35 psig±2.5 psig (241.3 kPa±17.2 kPa) during the test. A water pressure gauge shall be installed in both the hot and cold water lines to measure water pressure.

2.5 Instrumentation. Perform all test measurements using the following instruments, as appropriate:

2.5.1 Weighing scales.
2.5.1.1 Weighing scale for test cloth. The scale shall have a resolution of no larger than 0.2 oz (5.7 g) and a maximum error no greater than 0.3 percent of the measured value.
2.5.1.2 Weighing scale for clothes container capacity measurements. The scale should have a resolution no larger than 0.50 lbs (0.23 kg) and a maximum error no greater than 0.5 percent of the measured value.
2.5.2 Watt-hour meter. The watt-hour meter shall have a resolution no larger than 1 Wh (3.6 kJ) and a maximum error no greater than 2 percent of the measured value for any demand greater than 50 Wh (180.0 kJ).
2.5.3 Temperature measuring device. The device shall have an error no greater than ±1 °F (±0.6 °C) over the range being measured.
2.5.4 Water meter. The water meter shall have a resolution no larger than 0.1 gallons (0.4 liters) and a maximum error no greater than 2 percent for the water flow rates being measured.
2.5.5 Water pressure gauge. The water pressure gauge shall have a resolution of 1 pound per square inch gauge (psig) (6.9 kPa) and shall have an error no greater than 5 percent of any measured value.

2.6 Test cloths.  
2.6.1 Energy Test Cloth. The energy test cloth shall be made from energy test cloth material, as specified in 2.6.4, that is 24 inches by 36 inches (61.0 cm by 91.4 cm) and has been hemmed to 22 inches by 36 inches (55.9 cm by 91.4 cm) before washing. The energy test cloth shall be clean and shall not be used for more than 60 test runs (after preconditioning as specified in 2.6.3 of this appendix). All energy test cloth must be permanently marked identifying the lot number of the material. Mixed lots of material shall not be used for testing the clothes washers.

2.6.2 Energy Stuffer Cloth. The energy stuffer cloth shall be made from energy test cloth material, as specified in 2.6.4, and shall consist of pieces of material that are 12 inches by 12 inches (30.5 cm by 30.5 cm) and
have been hemmed to 10 inches by 10 inches (25.4 cm by 25.4 cm) before washing. The energy stuffer cloth shall be clean and shall not be used for more than 60 test runs (after preconditioning as specified in 2.6.3 of this appendix). All energy stuffer cloth must be permanently marked identifying the lot number of the material. Mixed lots of material shall not be used for testing the clothes washers.

2.6.3 Preconditioning of Test Cloths. The new test cloths, including energy test cloths and energy stuffer cloths, shall be pre-conditioned in a clothes washer in the following manner:

2.6.3.1 Perform 5 complete normal wash-rinse-spin cycles, the first two with current AHAM Standard detergent Formula 3 and the last three without detergent. Place the test cloth in a clothes washer set at the maximum water level. Wash the load for ten minutes in soft water (17 ppm hardness or less) using 27.0 grams + 4.0 grams per pound of cloth load of AHAM Standard detergent Formula 3. The wash temperature is to be controlled to 135 °F ± 5 °F (57.2 °C ± 2.8 °C) and the rinse temperature is to be controlled to 60 °F ± 5 °F (15.6 °C ± 2.8 °C). Repeat the cycle with detergent and then repeat the cycle three additional times without detergent, bone drying the load between cycles (total of five wash and rinse cycles).

2.6.4 Energy test cloth material. The energy test cloths and energy stuffer cloths shall be made from fabric meeting the following specifications. The material should come from a roll of material with a width of approximately 63 inches and approximately 500 yard of material with a width of approximately 50 percent cotton and 50 percent polyester.

2.6.4.1 Nominal fabric type. Pure finished bleached cloth, made with a momie or granite weave, which is nominally 50 percent cotton and 50 percent polyester.

2.6.4.2 The fabric weight shall be 5.60 ounces per square yard (190.0 g/m²), ±5 percent.

2.6.4.3 The thread count shall be 65 × 57 per inch (warp × fill), ±2 percent.

2.6.4.4 The warp yarn and filling yarn shall each have fiber content of 50 percent ±4 percent cotton, with the balance being polyester, and be open end spun, 15/1 ±5 percent cotton count blended yarn.

2.6.4.5 Water repellent finishes, such as fluoropolymer stain resistant finishes shall not be applied to the test cloth. The absence of such finishes shall be verified by:

2.6.4.5.1 American Association of Textile Chemists and Colorists (AATCC) Test Method 79–2000, Oil Repellency: Hydrocarbon Resistance Test (reaffirmed 2000), of each new lot of test cloth (when purchased from the mill) to confirm the absence of Scotchgard™ or other water repellent finish (time to absorb one drop should be on the order of 1 second).

(a) The above standards incorporated by reference are available for inspection at:

(i) National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(b) Copies of the above standards incorporated by reference can be obtained from the American Association of Textile Chemists and Colorists, P.O. Box 12215, Research Triangle Park, NC 27709, telephone (919) 549–3526, fax (919) 549–8933, or email: orders@aatcc.org.

2.6.4.6 The moisture absorption and retention shall be evaluated for each new lot of test cloth by the Standard Extractor Remaining Moisture Content (RMC) Test specified in 2.6.5 of this appendix.

2.6.4.6.1 Repeat the Standard Extractor RMC Test in 2.6.5 of this appendix three times.

2.6.4.6.2 An RMC correction curve shall be calculated as specified in 2.6.6 of this appendix.

2.6.5 Standard Extractor RMC Test Procedure. The following procedure is used to evaluate the moisture absorption and retention characteristics of a lot of test cloth by...
measuring the RMC in a standard extractor at a specified set of conditions. Table 2.6.5 of this appendix is the matrix of test conditions. The 500g requirement will only be used if a clothes washer design can achieve spin speeds in the 500g range. When this matrix is repeated 3 times, a total of 48 extractor RMC test runs are required. For the purpose of the extractor RMC test, the test cloths may be used for up to 60 test runs (after preconditioning as specified in 2.6.3 of this appendix).

2.6.6.1 The standard extractor RMC tests shall be run in a Bock Model 215 extractor (having a basket diameter of 19.5 inches, length of 12 inches, and volume of 2.1 ft³), with a variable speed drive (Bock Engineered Products, P.O. Box 5127, Toledo, OH 43611) or an equivalent extractor with same basket design (i.e., diameter, length, volume, and hole configuration) and variable speed drive.

2.6.6.2 Test Load. Test cloths shall be preconditioned in accordance with 2.6.3 of this appendix. The load size shall be 8.4 lbs., calculated in 2.6.6.1 of this appendix.

2.6.6.3 Procedure.

2.6.6.3.1 Record the “bone-dry” weight of the test load (WI).

2.6.6.3.2 Soak the test load for 20 minutes in 10 gallons of soft (<17 ppm) water at 60 °F ± 5 °F.

2.6.6.3.3 Remove the test load and allow water to gravity drain off of the test cloths. Then manually place the test cloths in the basket of the extractor, distributing them evenly by eye. Spin the load at a fixed speed corresponding to the intended centrifugal acceleration level (measured in units of the acceleration of gravity, g) ± g for the intended time period ±5 seconds.

2.6.6.3.4 Record the weight of the test load immediately after the completion of the extractor spin cycle (WC).

2.6.6.3.5 Calculate the RMC as (WC-WI)/WI.

2.6.6.3.6 The RMC of the test load shall be measured at three (3) g levels: 100g; 200g; and 350g, using two different spin times at each g level: 4 minutes; and 15 minutes. If a clothes washer design can achieve spin speeds in the 500g range then the RMC of the test load shall be measured at four (4) g levels: 100g; 200g; 350g; and 500g, using two different spin times at each g level: 4 minutes; and 15 minutes.

2.6.6.4 Repeat 2.6.6.3 of this appendix using soft (<17 ppm) water at 60 °F ± 5 °F.

2.6.6 Calculation of RMC correction curve.

2.6.6.1 Average the values of 3 test runs and fill in Table 2.6.5 of this appendix. Perform a linear least-squares fit to determine coefficients A and B such that the standard RMC values shown in Table 2.6.6.1 of this appendix (RMC_corr) are linearly related to the RMC values measured in section 2.6.5 of this appendix (RMC): RMC_corr = A * RMC + B where A and B are coefficients of the linear least-squares fit.

2.6.6.2 Perform an analysis of variance with replication using two factors, spin speed and lot, to check the interaction of speed and lot. Use the values from Table 2.6.5 and Table 2.6.6.1 of this Appendix in the calculation. The “P” value of the F-statistic for interaction between spin speed and lot in the variance analysis shall be greater than or equal to 0.1. If the “P” value is less than 0.1, the test cloth is unacceptable. “P” is a theoretically based measure of interaction based on an analysis of variance.

2.6.7 Application of RMC correction curve.

2.6.7.1 Using the coefficients A and B calculated in 2.6.6.1 of this appendix:

2.6.7.2 Substitute RMC_corr values in calculations in 3.8 of this appendix.

2.6.7.3 Where:

\[ \text{RMC}_{\text{corr}} = A \times \text{RMC} + B \]

Table 2.6.6.1 of this appendix.

2.6.8 Use of Test Loads. Table 2.8 defines the test load sizes and corresponding water fill settings which are to be used when measuring water and energy consumptions. Adaptive water fill control system and manual water fill control system are defined in section 1 of this appendix:

**TABLE 2.8—TEST LOAD SIZES AND WATER FILL SETTINGS REQUIRED**

</tbody>
</table>

2.8.1 The test load sizes to be used to measure RMC are specified in section 3.8.1.
Department of Energy

Pt. 430, Subpt. B, App. J1

2.8.2 Test loads for energy and water consumption measurements shall be bone dry prior to the first cycle of the test, and dried to a maximum of 104 percent of bone dry weight for subsequent testing.

2.8.3 Load the energy test cloth by grasping them in the center, shaking them to hang loosely and then put them into the clothes container prior to activating the clothes washer.

2.9 Pre-conditioning.

2.9.1 Non-water-heating clothes washer. If the clothes washer has not been filled with water in the preceding 96 hours, pre-condition it by running it through a cold rinse cycle and then draining it to ensure that the hose, pump, and sump are filled with water.

2.9.2 Water-heating clothes washer. If the clothes washer has not been filled with water in the preceding 96 hours, or if it has not been in the test room at the specified ambient conditions for 8 hours, pre-condition it by running it through a cold rinse cycle and then draining it to ensure that the hose, pump, and sump are filled with water.

2.10 Wash time setting. If one wash time is prescribed in the energy test cycle, that shall be the wash time setting; otherwise, the wash time setting shall be the higher of either the minimum or 70 percent of the maximum wash time available in the energy test cycle, regardless of the labeling of suggested dial locations. If the clothes washer is equipped with an electromechanical dial controlling wash time, reset the dial to the minimum wash time and then turn it in the direction of increasing wash time to reach the appropriate setting. If the appropriate setting is passed, return the dial to the minimum wash time and then turn in the direction of increasing wash time until the setting is reached.

2.11 Test room temperature for water-heating clothes washers. Maintain the test room ambient air temperature at 75 ± 2.5 °F (23.9 ± 5 °C).

3. Test Measurements

3.1 Clothes container capacity. Measure the entire volume which a dry clothes load could occupy within the clothes container during washer operation according to the following procedures:

3.1.1 Place the clothes washer in such a position that the uppermost edge of the clothes container opening is leveled horizontally, so that the container will hold the maximum amount of water.

3.1.2 Line the inside of the clothes container with 2 mil (0.0051 mm) plastic sheet. All clothes washer components which occupy space within the clothes container and which are recommended for use with the energy test cycle shall be in place and shall be lined with 2 mil (0.0051 mm) plastic sheet to prevent water from entering any void space.

3.1.3 Record the total weight of the machine before adding water.

3.1.4 Fill the clothes container manually with either 60 °F±5 °F (15.6 °C±2.8 °C) or 100 °F±10 °F (37.8 °C±5.5 °C) water to the maximum amount of water. Measure and record the weight of water, W, in pounds.

3.1.5 The clothes container capacity is calculated as follows:

\[ C = \frac{W}{d} \]

where:

\[ C \] = Capacity in cubic feet (liters).
\[ W \] = Mass of water in pounds (kilograms).
\[ d \] = Density of water (62.0 lbs/ft³ for 100 °F (999 kg/m³ for 37.8 °C) or 62.3 lbs/ft³ for 60 °F (998 kg/m³ for 15.6 °C)).

3.2 Procedure for measuring water and energy consumption values on all automatic and semi-automatic washers. All energy consumption tests shall be performed under the energy test cycle(s), unless otherwise specified. Table 3.2 defines the sections below which govern tests of particular clothes washers, based on the number of wash/rinse temperature selections available on the model, and also, in some instances, method of water heating. The procedures prescribed are applicable regardless of a clothes washer’s washing capacity, loading port location, primary axis of rotation of the clothes container, and type of control system.

3.2.1 Inlet water temperature and the wash/rinse temperature settings.

3.2.1.1 For automatic clothes washers set the wash/rinse temperature selection control to obtain the wash water temperature desired (extra hot, hot, warm, or cold) and cold rinse, and open both the hot and cold water faucets.

3.2.1.2 For semi-automatic washers: (1) For hot water temperature, open the hot water faucet completely and close the cold water faucet; (2) for warm inlet water temperature, open both hot and cold water faucets completely; (3) for cold water temperature, close the hot water faucet and open the cold water faucet completely.

3.2.1.3 Determination of warm wash water temperature(s) to decide whether a clothes washer has uniformly distributed warm wash temperature selections. The wash water temperature, Tw, of each warm wash wash selection shall be calculated or measured.

For non-water-heating clothes washers, calculate Tw as follows:

\[ Tw(°F) = \frac{(Hw×135 °F)+(Cw×60 °F)}{(Hw+Cw)} \]

or

\[ Tw(°C) = \frac{(Hw×57.2 °C)+(Cw×15.6 °C)}{(Hw+Cw)} \]

where:

\[ Hw \] = Hot water consumption of a warm wash
\[ Cw \] = Cold water consumption of a warm wash

353
For water-heating clothes washers, measure and record the temperature of each warm wash selection after fill.

3.2.2 Total water consumption during the energy test cycle shall be measured, including hot and cold water consumption during wash, deep rinse, and spray rinse.

3.2.3 Clothes washers with adaptive water fill control system and alternate manual water fill control systems

3.2.3.1 Clothes washers with adaptive water fill control system and alternate manual water fill control systems. If a clothes washer with an adaptive water fill control system allows consumer selection of manual controls as an alternative, then both manual and adaptive modes shall be tested and, for each mode, the energy consumption (HE), water consumption (QW), and water consumption (QH) shall be calculated as set forth in section 4. Then the average of the two values (one from each mode, adaptive and manual) for each variable shall be used in section 4 for the clothes washer.

3.2.3.2 Clothes washers with adaptive water fill control system.

3.2.3.2.1 Not user adjustable. The maximum, minimum, and average water levels as defined in the following sections shall be interpreted to mean that amount of water fill which is selected by the control system when the respective test loads are used, as defined in Table 2.8. The load usage factors which shall be used when calculating energy consumption values are defined in Table 4.13.

3.2.3.2.2 User adjustable. Four tests shall be conducted on clothes washers with user adjustable adaptive water fill controls which affect the relative wash water levels. The first test shall be conducted with the maximum test load and with the adaptive water fill control system set in the setting that will give the most energy intensive result.

The second test shall be conducted with the minimum test load and with the adaptive water fill control system set in the setting that will give the least energy intensive result. The third test shall be conducted with the average test load and with the adaptive water fill control system set in the setting that will give the most energy intensive result for the given test load. The fourth test shall be conducted with the average test load and with the adaptive water fill control system set in the setting that will give the least energy intensive result for the given test load.

The energy and water consumption for the average test load and water level, shall be the average of the third and fourth tests.

3.2.3.3 Clothes washers with manual water fill control system. In accordance with Table 2.8, the water fill selector shall be set to the maximum water level available on the clothes washer for the maximum test load size and set to the minimum water level for the minimum test load size. The load usage factors which shall be used when calculating energy consumption values are defined in Table 4.13.

1 Only applicable to machines with warm rinse in any cycle.
2 This only applies to water heating clothes washers on which the maximum wash temperature available exceeds 135 °F (57.2 °C).

3.3 “Extra Hot Wash” (Max Wash Temp >135 °F (57.2 °C)) for water heating clothes washers. Water and electrical energy consumption shall be measured for each water fill level and/or test load size as specified in 3.3.1 through 3.3.3 for the hottest wash setting available.

3.3.1 Maximum test load and water fill. Hot water consumption (Hm), cold water consumption (Cm), and electrical energy consumption (Em) shall be measured for an extra hot wash/cold rinse energy test cycle, with the controls set for the maximum water fill level. The maximum test load size is to be used and shall be determined per Table 5.1.

3.3.2 Minimum test load and water fill. Hot water consumption (Hm), cold water consumption (Cm), and electrical energy consumption (Em) shall be measured for an extra hot wash/cold rins energy test cycle, with the controls set for the minimum water fill level. The minimum test load size is to be used and shall be determined per Table 5.1.

3.3.3 Average test load and water fill. For clothes washers with an adaptive water fill control system, measure the values for hot water consumption (Hm), cold water consumption (Cm), and electrical energy consumption (Em) for an extra hot wash/cold...
rinse energy test cycle, with an average test load size as determined per Table 5.1.

3.4  **“Hot Wash”** *(Max Wash Temp)135 °F (57.2 °C)*. Water and electrical energy consumption measured at each water fill level or test load size as specified in 3.4.1 through 3.4.3 for a 135 °F (57.2 °C) wash, if available, or for the hottest selection less than 135 °F (57.2 °C). The minimum test load size is to be used and shall be determined per Table 5.1.

3.4.1 **Maximum test load and water fill.** Hot water consumption (Hw), cold water consumption (Cw), and electrical energy consumption (Ew) shall be measured for a hot wash/cold rinse energy test cycle, with the controls set for the maximum water fill level. The maximum test load size is to be used and shall be determined per Table 5.1.

3.4.2 **Minimum test load and water fill.** Hot water consumption (Hh), cold water consumption (Ch), and electrical energy consumption (Eh) shall be measured for a hot wash/cold rinse energy test cycle, with the controls set for the minimum water fill level. The minimum test load size is to be used and shall be determined per Table 5.1.

3.4.3 **Average test load and water fill.** For clothes washers with an adaptive water fill control system, measure the values for hot water consumption (Hh), cold water consumption (Ch), and electrical energy consumption (Eh) for a hot wash/cold rinse energy test cycle, with an average test load size as determined per Table 5.1.

3.5  **“Warm Wash.”** Water and electrical energy consumption shall be determined for each water fill level and/or test load size as specified in 3.5.1 through 3.5.2.3 for the applicable warm water wash temperature(s).

3.5.1 **Clothes washers with uniformly distributed warm wash temperature selections.** The reportable values to be used for the warm water wash setting shall be the arithmetic average of the measurements for the hot and cold wash selections. This is a calculation only, no testing is required.

3.5.2 **Clothes washers that lack uniformly distributed warm wash temperature selections.** For a clothes washer with fewer than four discrete warm wash selections, test all warm wash temperature selections. For a clothes washer with four or more warm wash selections, test at all discrete selections, or test at 25 percent, 50 percent, and 75 percent positions of the temperature selection device between the hottest hot (≤135 °F (57.2 °C)) and the coldest wash. If a selection is not available at the 25, 50 or 75 percent position, in place of each such unavailable selection use the next warmer setting. Each reportable value to be used for the warm water wash setting shall be the arithmetic average of all tests conducted pursuant to this section.

3.5.2.1 **Maximum test load and water fill.** Hot water consumption (Hw), cold water consumption (Cw), and electrical energy consumption (Ew) shall be measured with the controls set for the maximum water fill level. The maximum test load size is to be used and shall be determined per Table 5.1.
For clothes washers with cold rinse only:

3.8.2.1 Record the actual “bone dry” weight of the test load (WI\text{max}), then place the test load in the clothes washer.

3.8.2.2 Set water level selector to maximum fill.

3.8.2.3 Run the energy test cycle.

3.8.2.4 Record the weight of the test load immediately after completion of the energy test cycle (WC\text{max}).

3.8.2.5 Calculate the remaining moisture content of the maximum test load, RMC\text{max}, expressed as a percentage and defined as:

\[ RMC_{\text{max}} = \frac{(WC_{\text{max}} - WI_{\text{max}})}{WI_{\text{max}}} \times 100\% \]

3.8.3 For clothes washers with cold and warm rinse options:

3.8.3.1 Complete steps 3.8.2.1 through 3.8.2.4 for cold rinse. Calculate the remaining moisture content of the maximum test load for cold rinse, RMC\text{cold}, expressed as a percentage and defined as:

\[ RMC_{\text{cold}} = \frac{(WC_{\text{max}} - WI_{\text{max}})}{WI_{\text{max}}} \times 100\% \]

3.8.3.2 Complete steps 3.8.2.1 through 3.8.2.4 for warm rinse. Calculate the remaining moisture content of the maximum test load for warm rinse, RMC\text{warm}, expressed as a percentage and defined as:

\[ RMC_{\text{warm}} = \frac{(WC_{\text{max}} - WI_{\text{max}})}{WI_{\text{max}}} \times 100\% \]

3.8.3.3 Calculate the remaining moisture content of the maximum test load, RMC\text{max}, expressed as a percentage and defined as:

\[ RMC_{\text{max}} = RMC_{\text{cold}} \times (1 - TUF) + RMC_{\text{warm}} \times (TUF) \]

where:

- TUF is the temperature use factor for warm rinse as defined in Table 4.1.1.

3.8.4 Clothes washers which have options that result in different RMC values, such as multiple selection of spin speeds or spin times, that are available in the energy test cycle, shall be tested at the maximum and minimum extremes of the available options, excluding any “no spin” (zero spin speed) settings, in accordance with requirements in 3.8.2 or 3.8.3. The calculated RMC\text{max extraction} and RMC\text{min extraction} at the maximum and minimum settings, respectively, shall be combined as follows and the final RMC to be used in section 4.3 shall be:

\[ RMC = 0.75 \times RMC_{\text{max extraction}} + 0.25 \times RMC_{\text{min extraction}} \]

4. Calculation of Derived Results From Test Measurements

**4.1.5 Per-cycle machine electrical energy consumption**

To calculate the total per-cycle machine electrical energy consumption for all maximum, average, and minimum test load sizes. Calculate the total per-cycle machine electrical energy consumption for the maximum water fill level, ME<sub>max</sub>, the minimum water fill level, ME<sub>min</sub>, and the average water fill level, ME<sub>avg</sub>, expressed in kilowatt-hours per cycle and defined as:

(a) ME<sub>max</sub> = [Em<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Er<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup>

(b) ME<sub>avg</sub> = [Em<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Er<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup>

(c) ME<sub>min</sub> = [Em<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Er<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>a</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>c</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>r</sup> + [Eh<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup> + [ER<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup> + [Ew<sub>n</sub> × TUF<sub>n</sub>]<sup>h</sup>

**4.1.4 Total per-cycle hot water energy consumption using gas-heated or oil-heated water.**

Calculate the total per cycle test energy consumption for the hot water test cycle, the warm water test cycle, and the cold water test cycle, and the total per cycle load size weighted energy consumption, M<sub>E</sub>, expressed in kilowatt-hours per cycle and defined as:

\[ \text{M}_E = \text{ME}_{\text{avg}} \times \text{TUF}_{\text{avg}} + \text{ME}_{\text{min}} \times \text{TUF}_{\text{min}} + \text{ME}_{\text{max}} \times \text{TUF}_{\text{max}} \]

Where:

- TUF<sub>n</sub> = Temperature rise = 75 °F (41.7 °C).
- K = Water specific heat in kilowatt-hours per gallon degree °F = 0.00240 (0.00114 kWh/L-°C).
- V<sub>b</sub>, V<sub>h</sub>, and V<sub>r</sub> are as defined in 4.1.1.

(10 CFR Ch. II (1–1–13 Edition))

**4.1.3** Calculation of the maximum, average, and minimum per-cycle water consumption, expressed in gallons per cycle and defined as:

\[ Q_{\text{max}} = (Hc + Cc) \times F_{\text{max}} \]

\[ Q_{\text{avg}} = (Hc + Cc) \times F_{\text{avg}} \]

\[ Q_{\text{min}} = (Hc + Cc) \times F_{\text{min}} \]

where:

- \( H_c \): As defined in 4.1.6.
- \( C_c \): As defined in 4.1.3.

**4.2** Water consumption of clothes washers.

4.2.1 Per-cycle water consumption. Calculate the total per-cycle water consumption, \( E_{\text{wc}} \), using electrical heated water, expressed in kilowatt-hours per cycle and defined as:

\[ E_{\text{wc}} = \frac{C}{E} \]

where:

- \( C \): As defined in section 4.2.2.
- \( E \): As defined in section 4.1.3.

**4.3** Per-cycle energy consumption for removal of moisture from test load. Calculate the per-cycle energy required to remove the moisture of the test load, \( D_e \), expressed in kilowatt-hours per cycle and defined as:

\[ D_e = (LAF) \times (\text{Maximum test load weight}) \times (\text{RMC—4%}) \times (\text{DEF}) \times (\text{DUF}) \]

where:

- \( LAF \): Load adjustment factor = 0.52.
- \( RMC \): As defined in 3.8.2.5, 3.8.3.3 or 3.8.4.
- \( DEF \): Nominal energy required for a clothes dryer to remove moisture from clothes = 0.5 kWh/lb (1.1 kWh/kg).
- \( DUF \): Dryer usage factor, percentage of washer loads dried in a clothes dryer = 0.84.

**4.4 Modified energy factor.** Calculate the modified energy factor, \( MEF \), expressed in cubic feet per kilowatt-hour per cycle (or liters per kilowatt-hour per cycle) and defined as:

\[ MEF = \frac{C}{(E_{\text{wc}} + D_e)} \]

where:

- \( C \): As defined in 3.1.5.
- \( E_{\text{wc}} \): As defined in 4.1.7.
- \( D_e \): As defined in 4.3.

6. Waivers and Field Testing

6.1 Waivers and Field Testing for Non-conventional Clothes Washers. Manufacturers of nonconventional clothes washers, such as clothes washers with adaptive control systems, must submit a petition for waiver pursuant to 10 CFR 430.27 to establish an acceptable test procedure for that clothes washer. For these and other clothes washers that have controls or systems such that the DOE test procedures yield results that are so unrepresentative of the clothes washer’s true energy consumption characteristics as to provide materially inaccurate comparative data, field testing may be appropriate for establishing an acceptable test procedure. The following are guidelines for field testing which may be used by manufacturers in support of petitions for waiver. These guidelines are not mandatory and the Department may determine that they do not apply to a particular model. Depending upon a manufacturer’s approach for conducting field testing, additional data may be required. Manufacturers are encouraged to communicate with the Department prior to the commencement of field tests which may be used to support a petition for waiver. Section 6.3 provides an example of field testing for a clothes washer with an adaptive water fill control system. Other features, such as the use of various spin speed selections, could be the subject of field tests.

6.2 Nonconventional Wash System Energy Consumption Test. The field test may consist of a minimum of 10 clothes washers already being distributed in commerce (“base clothes washers”) and 10 clothes washers that have not been distributed in commerce (“test clothes washers”). The tests should include a minimum of 50 energy test cycles per clothes washer. The test clothes washers and base clothes washers should be identical in construction except for the controls or systems being tested. Equal numbers of both the test clothes washers and the base clothes washer should be tested simultaneously in comparable settings to minimize seasonal or consumer laundering conditions or variations. The clothes washers should be monitored in such a way as to accurately record the average total energy and water consumption per cycle, including water heating energy when
electrically heated water is used, and the energy required to remove the remaining moisture of the test load. The field test results should be used to determine the best method to correlate the rating of the test clothes washer to the rating of the base clothes washer.

6.3 Adaptive water fill control system field test. Section 3.2.3.1 defines the test method for measuring energy consumption for clothes washers which incorporate control systems having both adaptive and alternate cycle selections. Energy consumption calculated by the method defined in section 3.2.3.1 assumes the adaptive cycle will be used 50 percent of the time. This section can be used to develop field test data in support of a petition for waiver when it is believed that the adaptive cycle will be used more than 50 percent of the time. The field test sample size should be a minimum of 10 test clothes washers. The test clothes washers should be totally representative of the design, construction, and control system that will be placed in commerce. The duration of field testing in the user’s house should be a minimum of 50 energy test cycles, for each unit. No special instructions as to cycle selection or product usage should be given to the field test participants, other than inclusion of the product literature pack which would be shipped with all units, and instructions regarding filling out data collection forms, use of data collection equipment, or basic procedural methods. Prior to the test clothes washers being installed in the field test locations, baseline data should be developed for all field test units by conducting laboratory tests as defined by section 1 through section 5 of these test procedures to determine the energy consumption, water consumption, and remaining moisture content values. The following data should be measured and recorded for each wash load during the test period: wash cycle selected, the mode of the clothes washer (adaptive or manual), clothes load dry weight (measured after the clothes washer and clothes dryer cycles are completed) in pounds, and type of articles in the clothes load (e.g., cottons, linens, permanent press). The wash loads used in calculating the in-home percentage split between adaptive and manual cycle usage should be only those wash loads which conform to the definition of the energy test cycle.

Calculate:

\[ T = \text{The total number of energy test cycles run during the field test} \]

\[ T_a = \text{The total number of adaptive control energy test cycles} \]

\[ T_m = \text{The total number of manual control energy test cycles} \]

The percentage weighting factors:

\[ P_a = \left( \frac{T_a}{T} \right) \times 100 \] (the percentage weighting for adaptive control selection)

\[ P_m = \left( \frac{T_m}{T} \right) \times 100 \] (the percentage weighting for manual control selection)

Energy consumption \((E_a, M_a, D_a)\) and water consumption \((Q_a)\), values calculated in section 4 for the manual and adaptive modes, should be combined using \(P_a\) and \(P_m\) as the weighting factors.

APPENDIX J2 TO SUBPART B OF PART 430—UNIFORM TEST METHOD FOR MEASURING THE ENERGY CONSUMPTION OF AUTOMATIC AND SEMI-AUTOMATIC CLOTHES WASHERS

Manufacturers may use Appendix J1 to certify compliance with existing DOE energy conservation standards until the compliance date of any amended standards that address standby and off mode power consumption for residential clothes washers. After this date, all residential clothes washers shall be tested using the provisions of Appendix J2.

1. DEFINITIONS AND SYMBOLS

1.1 Active mode means a mode in which the clothes washer is connected to a mains power source, has been activated, and is performing one or more of the main functions of washing, soaking, tumbling, agitating, rinsing, and/or removing water from the clothing, or is involved in functions necessary for these main functions, such as admitting water into the washer or pumping water out of the washer. Active mode also includes delay start and cycle finished modes.

1.2 Active washing mode means a mode in which the clothes washer is performing any of the operations included in a complete cycle intended for washing a clothing load, including the main functions of washing, soaking, tumbling, agitating, rinsing, and/or removing water from the clothing.

1.3 Adaptive control system means a clothes washer control system, other than an adaptive water fill control system, which is capable of automatically adjusting washer operation or washing conditions based on characteristics of the clothes load placed in the clothes container, without allowing or requiring consumer intervention or actions. The automatic adjustments may, for example, include automatic selection, modification, or control of any of the following: Wash water temperature, agitation or tumble cycle time, number of rinse cycles, and spin speed. The characteristics of the clothes load, which could trigger such adjustments, could, for example, consist of or be indicated in
