§ 25.1309 Equipment, systems, and installations.  
(a) The equipment, systems, and installations whose functioning is required by this subchapter, must be designed to ensure that they perform their intended functions under any foreseeable operating condition.  
(b) The airplane systems and associated components, considered separately and in relation to other systems, must be designed so that—  
   (1) The occurrence of any failure condition which would prevent the continued safe flight and landing of the airplane is extremely improbable, and  
   (2) The occurrence of any other failure conditions which would reduce the capability of the airplane or the ability of the crew to cope with adverse operating conditions is improbable.  
(c) Warning information must be provided to alert the crew to unsafe system operating conditions, and to enable them to take appropriate corrective action. Systems, controls, and associated monitoring and warning means must be designed to minimize crew errors which could create additional hazards.  
(d) Compliance with the requirements of paragraph (b) of this section must be shown by analysis, and where necessary, by appropriate ground, flight, or simulator tests. The analysis must consider—  
   (1) Possible modes of failure, including malfunctions and damage from external sources.  
   (2) The probability of multiple failures and undetected failures.  
   (3) The resulting effects on the airplane and occupants, considering the stage of flight and operating conditions, and  
   (4) The crew warning cues, corrective action required, and the capability of detecting faults.  
(e) In showing compliance with paragraphs (a) and (b) of this section with regard to the electrical system and equipment design and installation, critical environmental conditions must be considered. For electrical generation, distribution, and utilization equipment required by or used in complying with this chapter, except equipment covered by Technical Standard Orders containing environmental test procedures, the ability to provide continuous, safe service under foreseeable environmental conditions may be shown by environmental tests, design analysis, or reference to previous comparable service experience on other aircraft.  
(f) EWIS must be assessed in accordance with the requirements of § 25.1709.  
§ 25.1310 Power source capacity and distribution.  
(a) Each installation whose functioning is required for type certification or under operating rules and that requires a power supply is an ‘‘essential load’’ on the power supply. The power sources and the system must be able to supply the following power loads in probable operating combinations and for probable durations:  
   (1) Loads connected to the system with the system functioning normally.  
   (2) Essential loads, after failure of any one prime mover, power converter, or energy storage device.  
   (3) Essential loads after failure of—  
      (i) Any one engine on two-engine airplanes; and  
      (ii) Any two engines on airplanes with three or more engines.  
   (4) Essential loads for which an alternate source of power is required, after any failure or malfunction in any one power supply system, distribution system, or other utilization system.  
(b) In determining compliance with paragraphs (a)(2) and (3) of this section, the power loads may be assumed to be reduced under a monitoring procedure consistent with safety in the kinds of operation authorized. Loads not required in controlled flight need not be considered for the two-engine-inoperative condition on airplanes with three or more engines.  
  [Amdt. 25–123, 72 FR 63405, Nov. 8, 2007]  
§ 25.1316 Electrical and electronic system lightning protection.  
(a) Each electrical and electronic system that performs a function, for
§ 25.1317 High-intensity Radiated Fields (HIRF) Protection.

(a) Except as provided in paragraph (d) of this section, each electrical and electronic system that performs a function whose failure would prevent the continued safe flight and landing of the airplane must be designed and installed so that—

(1) The function is not adversely affected during and after the time the airplane is exposed to lightning; and

(2) The system automatically recovers normal operation of that function in a timely manner after the airplane is exposed to lightning.

(b) Each electrical and electronic system that performs a function, for which failure would reduce the capability of the airplane or the ability of the flightcrew to respond to an adverse operating condition, must be designed and installed so that the function recovers normal operation in a timely manner after the airplane is exposed to lightning.

(d) Before December 1, 2012, an electrical or electronic system that performs a function whose failure would prevent the continued safe flight and landing of the airplane may be designed and installed without meeting the provisions of paragraph (a) provided—

(1) The system has previously been shown to comply with special conditions for HIRF, prescribed under §21.16, issued before December 1, 2007;

(2) The HIRF immunity characteristics of the system have not changed since compliance with the special conditions was demonstrated; and

(3) The data used to demonstrate compliance with the special conditions is provided.

§ 25.1321 Arrangement and visibility.

(a) Each flight, navigation, and powerplant instrument for use by any pilot must be plainly visible to him from his station with the minimum practicable deviation from his normal position and line of vision when he is looking forward along the flight path.

(b) The flight instruments required by §25.1303 must be grouped on the instrument panel and centered as nearly as practicable about the vertical plane of the pilot’s forward vision. In addition—

(1) The instrument that most effectively indicates attitude must be on the panel in the top center position;

(2) The instrument that most effectively indicates airspeed must be adjacent to and directly to the left of the instrument in the top center position:
