§ 98.140 Definition of the source category.
(a) A glass manufacturing facility manufactures flat glass, container glass, pressed and blown glass, or wool fiberglass by melting a mixture of raw materials to produce molten glass and form the molten glass into sheets, containers, fibers, or other shapes. A glass manufacturing facility uses one or more continuous glass melting furnaces to produce glass.

(b) A glass melting furnace that is an experimental furnace or a research and development process unit is not subject to this subpart.

§ 98.141 Reporting threshold.
You must report GHG emissions under this subpart if your facility contains a glass production process and the facility meets the requirements of either § 98.2(a)(1) or (2).

§ 98.142 GHGs to report.
You must report:
(a) CO\textsubscript{2} process emissions from each continuous glass melting furnace.
(b) CO\textsubscript{2} combustion emissions from each continuous glass melting furnace.
(c) CH\textsubscript{4} and N\textsubscript{2}O combustion emissions from each continuous glass melting furnace. You must calculate and report these emissions under subpart C of this part (General Stationary Fuel Combustion Sources) by following the requirements of subpart C.
(d) CO\textsubscript{2}, CH\textsubscript{4}, and N\textsubscript{2}O emissions from each stationary fuel combustion unit other than continuous glass melting furnaces. You must report these emissions under subpart C of this part (General Stationary Fuel Combustion Sources) by following the requirements of subpart C.

§ 98.143 Calculating GHG emissions.
You must calculate and report the annual process CO\textsubscript{2} emissions from each continuous glass melting furnace using the procedure in paragraphs (a) and (b) of this section.
(a) For each continuous glass melting furnace that meets the conditions specified in § 98.33(b)(4)(ii) or (iii), you must calculate and report under this subpart the combined process and combustion CO\textsubscript{2} emissions by operating and maintaining a CEMS to measure CO\textsubscript{2} emissions according to the Tier 4 Calculation Methodology specified in § 98.33(a)(4) and all associated requirements for Tier 4 in subpart C of this part (General Stationary Fuel Combustion Sources).
(b) For each continuous glass melting furnace that is not subject to the requirements in paragraph (a) of this section, calculate and report the process and combustion CO₂ emissions from the glass melting furnace by using either the procedure in paragraph (b)(1) of this section or the procedure in paragraphs (b)(2) through (b)(7) of this section, except as specified in paragraph (c) of this section.

(1) Calculate and report under this subpart the combined process and combustion CO₂ emissions by operating and maintaining a CEMS to measure CO₂ emissions according to the Tier 4 Calculation Methodology specified in §98.33(a)(4) and all associated requirements for Tier 4 in subpart C of this part (General Stationary Fuel Combustion Sources).

(2) Calculate and report the process and combustion CO₂ emissions separately using the procedures specified in paragraphs (b)(2)(i) through (b)(2)(vi) of this section.

(i) For each carbonate-based raw material charged to the furnace, obtain from the supplier of the raw material the carbonate-based mineral mass fraction.

(ii) Determine the quantity of each carbonate-based raw material charged to the furnace.

(iii) Apply the appropriate emission factor for each carbonate-based raw material charged to the furnace, as shown in Table N–1 to this subpart.

(iv) Use Equation N–1 of this section to calculate process mass emissions of CO₂ for each furnace:

\[
E_{CO2} = \sum_{i=1}^{n} MF_i \cdot \left( M_i \cdot \frac{2000}{2205} \right) \cdot EF_i \cdot F_i \quad \text{(Eq. N-1)}
\]

Where:
- \( E_{CO2} \) = Process emissions of CO₂ from the furnace (metric tons).
- \( n \) = Number of carbonate-based raw materials charged to furnace.
- \( MF_i \) = Annual average mass fraction of carbonate-based mineral \( i \) in carbonate-based raw material \( i \) (percentage, expressed as a decimal).
- \( M_i \) = Annual amount of carbonate-based raw material \( i \) charged to furnace (tons).
- 2000/2205 = Conversion factor to convert tons to metric tons.
- \( EF_i \) = Emission factor for carbonate-based raw material \( i \) (metric ton CO₂ per metric ton carbonate-based raw material as shown in Table N–1 to this subpart).
- \( F_i \) = Fraction of calcination achieved for carbonate-based raw material \( i \), assumed to be equal to 1.0 (percentage, expressed as a decimal).

(v) You must calculate the total process CO₂ emissions from continuous glass melting furnaces at the facility using Equation N–2 of this section:

\[
CO_2 = \sum_{i=1}^{k} E_{CO2i} \quad \text{(Eq. N-2)}
\]

Where:
- \( CO_2 \) = Annual process CO₂ emissions from glass manufacturing facility (metric tons).
- \( E_{CO2i} \) = Annual CO₂ emissions from glass melting furnace \( i \) (metric tons).
- \( k \) = Number of continuous glass melting furnaces.

(vi) Calculate and report under subpart C of this part (General Stationary Fuel Combustion Sources) the combustion CO₂ emissions in the glass furnace according to the applicable requirements in subpart C.

(c) As an alternative to data provided by the raw material supplier, a value of 1.0 can be used for the mass fraction \( MF_i \) of carbonate-based mineral \( i \) in Equation N–1 of this section.
