§ 23.1453 Protection of oxygen equipment from rupture.

(a) Each element of the oxygen system must have sufficient strength to withstand the maximum pressure and temperature, in combination with any externally applied loads arising from consideration of limit structural loads, that may be acting on that part of the system.

(b) Oxygen pressure sources and the lines between the source and the shut-off means must be:
   (1) Protected from unsafe temperatures; and
   (2) Located where the probability and hazard of rupture in a crash landing are minimized.

[Doc. No. 27806, 61 FR 5170, Feb. 9, 1996]

§ 23.1457 Cockpit voice recorders.

(a) Each cockpit voice recorder required by the operating rules of this chapter must be approved and must be installed so that it will record the following:
   (1) Voice communications transmitted from or received in the airplane by radio.
   (2) Voice communications of flight crewmembers on the flight deck.
   (3) Voice communications of flight crewmembers on the flight deck, using the airplane's interphone system.
   (4) Voice or audio signals identifying navigation or approach aids introduced into a headset or speaker.
   (5) Voice communications of flight crewmembers using the passenger loudspeaker system, if there is such a system and if the fourth channel is available in accordance with the requirements of paragraph (c)(4)(ii) of this section.
   (6) If datalink communication equipment is installed, all datalink communications, using an approved data message set. Datalink messages must be recorded as the output signal from the communications unit that translates the signal into usable data.

(b) The recording requirements of paragraph (a)(2) of this section must be met by installing a cockpit-mounted area microphone, located in the best position for recording voice communications originating at the first and second pilot stations and voice communications of other crewmembers on the flight deck when directed to those stations. The microphone must be so located and, if necessary, the preamplifiers and filters of the recorder must be so adjusted or supplemented, so that the intelligibility of the recorded communications is as high as practicable when recorded under flight cockpit noise conditions and played back. Repeated aural or visual playback of the record may be used in evaluating intelligibility.

(c) Each cockpit voice recorder must be installed so that the part of the communication or audio signals specified in paragraph (a)(1) of this section obtained from each of the following sources is recorded on a separate channel:
   (1) For the first channel, from each boom, mask, or handheld microphone, headset, or speaker used at the first pilot station.
   (2) For the second channel from each boom, mask, or handheld microphone, headset, or speaker used at the second pilot station.
   (3) For the third channel—from the cockpit-mounted area microphone.
   (4) For the fourth channel from:
      (i) Each boom, mask, or handheld microphone, headset, or speaker used at the station for the third and fourth crewmembers.
      (ii) If the stations specified in paragraph (c)(4)(i) of this section are not required or if the signal at such a station is picked up by another channel, each microphone on the flight deck that is used with the passenger loudspeaker system, if its signals are not picked up by another channel.
   (5) And that as far as is practicable all sounds received by the microphone listed in paragraphs (c)(1), (2), and (4) of this section must be recorded without interruption irrespective of the position of the interphone-transmitter key switch. The design shall ensure that sidetone for the flight crew is produced only when the interphone, public address system, or radio transmitters are in use.

(d) Each cockpit voice recorder must be installed so that:
   (1)(i) It receives its electrical power from the bus that provides the maximum reliability for operation of the
