Related Controls: For AT reasons, to export or reexport items controlled for AT reasons in 1C350, a license is required, for AT reasons, to export or reexport items controlled for AT reasons in 1C350, a license is required, for AT reasons, to export Schedule 3 chemicals and mixtures identified in 1C350.c to States not Party to the CWC, unless an End-Use Certificate issued by the government of the importing country has been obtained by the exporter prior to export. A license is required, for AT reasons, to reexport Schedule 3 chemicals and mixtures identified in 1C350.c from a State not Party to the CWC to any other State not Party to the CWC. (See §742.18 of the EAR for license requirements and policies for toxic and precursor chemicals controlled for CW reasons. See §745.2 of the EAR for End-Use Certificate requirements that apply to exports of Schedule 3 chemicals to countries not listed in Supplement No. 2 to part 745 of the EAR.)

Related Controls: For AT reasons, to export or reexport items controlled by 1C350 to a country in Country Group E1 of Supplement No. 1 to part 740 of the EAR. (See part 742 of the EAR for additional information on the AT controls that
apply to Iran, North Korea, Sudan, and
Syria. See part 746 of the EAR for additional
information on sanctions that apply to Cuba,
Iran, North Korea, and Syria.)
LICENSE REQUIREMENT NOTES 1. Sample
Shipments: Subject to the following require-
ments and restrictions, a license is not re-
quired for sample shipments when the cumu-
lative total does not exceed a 55-gallon container or 200 kg of a sin-
gle chemical to any one consignee during a
calendar year. A consignee that receives
a sample shipment under this exclusion may
not resell, transfer, or reexport the sample
shipment, but may use the sample shipment
for any other legal purpose unrelated to
chemical weapons.
a. Chemicals Not Eligible:
A. [Reserved]
B. CWC Schedule 2 chemicals (States not
Party to the CWC). No CWC Schedule 2 chem-
ical or mixture identified in 1C350.b is eligi-
bale for sample shipment to States not Party to the
CWC (destinations not listed in Supple-
ment No. 2 to part 745 of the EAR) without
license.
b. Countries Not Eligible: Countries in Coun-
try Group E1 of Supplement No. 1 to part 740
of the EAR are not eligible to receive sample
shipments of any chemicals controlled by
this ECCN without a license.
c. Sample shipments that require an End-Use
Certificate for CW reasons: No CWC Schedule 3
chemical or mixture identified in 1C350.c is eligi-
bale for sample shipment to States not
Party to the CWC (destinations not listed in
Supplement No. 2 to part 745 of the EAR)
without a license, unless an End-Use Certifi-
cate issued by the government of the import-
ing country is obtained by the exporter prior
to export (see §745.2 of the EAR for End-Use
Certificate requirements).
d. Sample shipments that require a license for
reasons set forth elsewhere in the EAR: Sample
shipments, as described in this Note 1, may
require a license for reasons set forth else-
where in the EAR. See, in particular, the
end-use/end-user restrictions in part 746 of
the EAR, and the restrictions that apply to
embargoed countries in part 746 of the EAR.
e. Quarterly report requirement. The ex-
porter is required to submit a quarterly writ-
ten report for shipments of samples made
under this Note 1. The report must be on
company letterhead stationery (titled “Re-
port of Sample Shipments of Chemical
Precursors” at the top of the first page) and
identify the chemical(s), Chemical Abstract
Service Registry (C.A.S.) number(s), quan-
tity(ies), the ultimate consignee’s name and
address, and the date exported. The report
must be sent, via courier, to the U.S. Depart-
ment of Commerce, Bureau of Industry and
Security, 14th and Pennsylvania Ave., NW.,
Room 2099B, Washington, DC 20230, Attn:
“Report of Sample Shipments of Chemical
Precursors”.
2. Mixtures:
a. Mixtures that contain precursor chemi-
cals identified in ECCN 1C350, in concentra-
tions that are below the levels indicated in
1C395 or 1C995 and are subject to the licens-
ing requirements specified in those ECCNs.
b. A license is not required under this
ECCN for a mixture, when the controlled
chemical in the mixture is a normal ingre-
dient in consumer goods packaged for retail
sale for personal use. Such consumer goods
are designated EAR99. However, a license
may be required for reasons set forth else-
where in the EAR.
NOTE TO MIXTURES: Calculation of con-
centrations of AG-controlled chemicals:
a. Exclusion. No chemical may be added to
the mixture (solution) for the sole purpose of
circumventing the Export Administration
Regulations;
b. Percent Weight Calculation. When calculat-
ing the percentage, by weight, of ingredi-
ents in a chemical mixture, include all ingre-
dients of the mixture, including those that
act as solvents.
c. Compounds. Compounds created with any
chemicals identified in this ECCN 1C350 may
be shipped NLR (No License Required), with-
out obtaining an End-Use Certificate, unless
those compounds are also identified in this
entry or require a license for reasons set forth
elsewhere in the EAR.
4. Testing Kits: Certain medical, analytical,
diagnostic, and food testing kits containing
small quantities of chemicals identified in
this ECCN 1C350, are excluded from the scope
of this ECCN and are controlled under ECCN
1C395 or 1C995. (Note that replacement re-
agents for such kits are controlled by this
ECCN 1C350 if the reagents contain one or
more of the precursor chemicals identified in
1C350 in concentrations equal to or greater
than the control levels for mixtures indicat-
ed in 1C350.)
TECHNICAL NOTES: 1. For purposes of this
entry, a “mixture” is defined as a solid, liq-
uid or gaseous product made up of two or
more ingredients that do not react together
under normal storage conditions.

Note to Mixtures: Calculation of concentrations of CW-controlled chemicals:

a. Exclusion. No chemical may be added to the mixture (solution) for the sole purpose of circumventing the Export Administration Regulations;

b. Percent Weight Calculation. When calculating the percentage, by weight, of ingredients in a chemical mixture, include all ingredients of the mixture, including those that act as solvents.

2. Compounds: Compounds created with any chemicals identified in this ECCN 1C355 may be shipped NLR (No License Required), without obtaining an End-Use Certificate, unless those compounds are also identified in this entry or require a license for reasons set forth elsewhere in the EAR.

TECHNICAL NOTES: For purposes of this entry, a “mixture” is defined as a solid, liquid or gaseous product made up of two or more ingredients that do not react together under normal storage conditions.

Replacement agents for medical, analytical, diagnostic, and food testing kits described in 1C995.c are controlled by ECCN 1C350 if the replacement agents contain at least one of the precursor chemicals identified in that ECCN. In concentrations equal to or greater than the control levels for mixtures indicated in 1C350.d.

**ITEMS:**

a. Mixtures containing the following concentrations of precursor chemicals controlled by ECCN 1C350 (For controls on other mixtures containing these chemicals, see Notes 1 and 2 in the Related Controls paragraph of this ECCN.):

- a.1. Mixtures containing 10 percent or less, by weight, of any single CWC Schedule 2 chemical controlled by ECCN 1C350.b.
- a.2. Mixtures containing less than 30 percent, by weight, of:
  - a.2.a. Any single CWC Schedule 3 chemical controlled by ECCN 1C350.c or 1C350.d.
  - a.2.b. Any single precursor chemical controlled by ECCN 1C350.d.

b. Mixtures containing the following concentrations of toxic or precursor chemicals controlled by ECCN 1C355 (For controls on other mixtures containing these chemicals, see Note 3 in the Related Controls paragraph of this ECCN.):

- b.1. Mixtures containing the following concentrations of CWC Schedule 2 chemicals controlled by ECCN 1C355.a:
  - b.1.a. Mixtures containing 1 percent or less, by weight, of any single CWC Schedule 2 chemical controlled by ECCN 1C355.a (i.e., mixtures containing PFIB); or
  - b.1.b. Mixtures containing 10 percent or less, by weight, of any single CWC Schedule 2 chemical controlled by ECCN 1C355.a.
- b.2. Mixtures containing less than 30 percent, by weight, of any single CWC Schedule 3 chemical controlled by ECCN 1C355.b.
- c. “Medical, analytical, diagnostic, and food testing kits” (as defined in the Related Definitions for this ECCN) that contain precursor chemicals controlled by ECCN 1C350.d in an amount not exceeding 300 grams per chemical. (For controls on other such test

**B. “TEST”, “INSPECTION” AND “PRODUCTION EQUIPMENT”**

**TECHNICAL NOTES FOR 2B001 TO 2B009, 2B201, 2B290 AND 2B991 TO 2B999:**

1. Secondary parallel contouring axes, (e.g., the w-axis on horizontal boring mills or a secondary rotary axis the center line of which is parallel to the primary rotary axis) are not counted in the total number of contouring axes. Rotary axes need not rotate over 360°. A rotary axis can be driven by a linear device (e.g., a screw or a rack-and-pinion).
2. The number of axes which can be coordinated simultaneously for “contouring control” is the number of axes along or around which, during processing of the workpiece, simultaneous and interrelated motions are performed between the workpiece and a tool. This does not include any additional axes along or around which other relative motions within the machine are performed, such as:
   - 2.a. Wheel-dressing systems in grinding machines;
   - 2.b. Parallel rotary axes designed for mounting of separate workpieces;
   - 2.c. Co-linear rotary axes designed for manipulating the same workpiece by holding it in a chuck from different ends.
3. Axis nomenclature shall be in accordance with International Standard ISO 841, “Numerical Control Machines—Axis and Motion Nomenclature”.
4. A “tilting spindle” is counted as a rotary axis.
5. ‘Stated positioning accuracy’ derived from measurements made according to ISO 230/2 (2006) may be used for each specific machine model as an alternative to individual machine tests. ‘Stated positioning accuracy’ means the accuracy value provided to BIS as representative of the accuracy of a specific machine model.

**Note to Paragraph 5:** Determination of ‘Stated Positioning Accuracy’:
- a. Select five machines of a model to be evaluated;
- b. Measure the linear axis accuracies according to ISO 230/2 (2006);
- c. Determine the A-values for each axis of each machine. The method of calculating the A-value is described in the ISO standard;
- d. Determine the mean value of the A-value of each axis. This mean value A becomes the stated value of each axis for the model (x y z * *);
- e. Since the Category 2 list refers to each linear axis there will be as many stated values as there are linear axes;
- f. If any axis of a machine model not controlled by 2B001.a to 2B001.c. has a stated accuracy of 5 μm for grinding machines and 6.5 μm for milling and turning machines or better, the builder should be required to reaffirm the accuracy level once every eighteen months.

**2B001 Machine tools and any combination thereof, for removing (or cutting) metals, ceramics or “composites”, which, according to the manufacturer’s technical specifications, can be equipped with electronic devices for “numerical control”; as follows (see List of Items Controlled).**

N.B. This table should be read to control the technology of a particular ‘Coating Process’ only when the resultant coating in column 3 is in a paragraph directly across from the relevant ‘Substrate’ under column 2. For example, Chemical Vapor Deposition (CVD) ‘coating process’ technical data are controlled for the application of ‘silicides’ to ‘Carbon-carbon, Ceramic and Metal ‘matrix’ ‘composites’’ substrates, but are not controlled for the application of ‘silicides’ to ‘Cemented tungsten carbide (16), Silicon carbide (18)’ substrates. In the second case, the resultant coating is not listed in the paragraph under column 3 directly across from the paragraph under column 2 listing ‘Cemented tungsten carbide (16), Silicon carbide (18)’.

#### TECHNICAL NOTE TO TABLE ON DEPOSITION TECHNIQUES: Processes specified in Column 1 of the Table are defined as follows:

a. Chemical Vapor Deposition (CVD) is an overlay coating or surface modification coating process wherein a metal, alloy, “composite”, dielectric or ceramic is deposited upon a heated substrate. Gaseous reactants are decomposed or combined in the vicinity of a substrate resulting in the deposition of the desired elemental, alloy or compound material on the substrate. Energy for this decomposition or chemical reaction process may be provided by the heat of the substrate, a glow discharge plasma, or “laser” irradiation.

Note 1: CVD includes the following processes: directed gas flow out-of-pack deposition, pulsating CVD, controlled nucleation thermal decomposition (CNTD), plasma enhanced or plasma assisted CVD processes.

Note 2: Pack denotes a substrate immersed in a powder mixture.

Note 3: The gaseous reactants used in the out-of-pack process are produced using the same basic reactions and parameters as the pack cementation process, except that the substrate to be coated is not in contact with the powder mixture.

b. Thermal Evaporation-Physical Vapor Deposition (TE-PVD) is an overlay coating process conducted in a vacuum with a pressure less than 0.1 Pa wherein a source of thermal energy is used to vaporize the coating material. This process results in the condensation, or deposition, of the evaporated species onto appropriately positioned substrates. The addition of gases to the vacuum chamber during the coating process to synthesize compound coatings is an ordinary modification of the process. The use of ion or electron beams, or plasma, to activate or assist the coating’s deposition is also a common modification in this technique. The use of monitors to provide in-process measurement of optical characteristics and thickness of coatings can be a feature of these processes. Specific TE-PVD processes are as follows:

1. Electron Beam PVD uses an electron beam to heat and evaporate the material which forms the coating.

2. Ion Assisted Resitive Heating PVD employs electrically resistive heating sources in combination with impinging ion beam(s) to produce a controlled and uniform flux of evaporated coating species.

3. “Laser” Vaporization uses either pulsed or continuous wave “laser” beams to vaporize the material which forms the coating.

4. Cathodic Arc Deposition employs a consumable cathode of the material which...
forms the coating and has an arc discharge established on the surface by a momentary contact of a ground trigger. Controlled motion of arcing erodes the cathode surface creating a highly ionized plasma. The anode can be either a cone attached to the periphery of the cathode, through an insulator, or the chamber. Substrate biasing is used for non line-of-sight deposition.

**NOTE:** This definition does not include random cathodic arc deposition with non-biased substrates.

5. Ion Plating is a special modification of a general TE-PVD process in which a plasma or an ion source is used to ionize the species to be deposited, and a negative bias is applied to the substrate in order to facilitate the extraction of the species from the plasma. The introduction of reactive species, evaporation of solids within the process chamber, and the use of monitors to provide in-process measurement of optical characteristics and thicknesses of coatings are ordinary modifications of the process.

c. Pack Cementation is a surface modification coating or overlay coating process wherein a substrate is immersed in a powder mixture (a pack), that consists of:

1. The metallic powders that are to be deposited (usually aluminum, chromium, silicon or combinations thereof);
2. An activator (normally a halide salt); and
3. An inert powder, most frequently alumina.

**NOTE:** The substrate and powder mixture is contained within a retort which is heated to between 1,030 K (757 °C) to 1,375 K (1,102 °C) for sufficient time to deposit the coating.

d. Plasma Spraying is an overlay coating process wherein a gun (spray torch) which produces and controls a plasma accepts powder or wire coating materials, melts them and propels them towards a substrate, whereon an integrally bonded coating is formed. Plasma spraying constitutes either low pressure plasma spraying or high velocity plasma spraying.

**NOTE 1:** Low pressure means less than ambient atmospheric pressure.

**NOTE 2:** High velocity refers to nozzle-exit gas velocity exceeding 750 m/s calculated at 293 K (20 °C) at 0.1 MPa.

e. Slurry Deposition is a surface modification coating or overlay coating process wherein a metallic or ceramic powder with an organic binder is suspended in a liquid and is applied to a substrate by either spraying, dipping or painting, subsequent air or oven drying, and heat treatment to obtain the desired coating.

f. Sputter Deposition is an overlay coating process based on a momentum transfer phenomenon, wherein positive ions are accelerated by an electric field towards the surface of a target (coating material). The kinetic energy of the impacting ions is sufficient to cause target surface atoms to be released and deposited on an appropriately positioned substrate.

**NOTE 1:** The Table refers only to triode, magnetron or reactive sputter deposition which is used to increase adhesion of the coating and rate of deposition and to radio frequency (RF) augmented sputter deposition used to permit vaporization of non-metallic coating materials.

**NOTE 2:** Low-energy ion beams (less than 5 keV) can be used to activate the deposition.

g. Ion Implantation is a surface modification coating process in which the element to be alloyed is ionized, accelerated through a potential gradient and implanted into the surface region of the substrate. This includes processes in which ion implantation is performed simultaneously with electron beam physical vapor deposition or sputter deposition.

a.5.a.5. A resolution of more than 14 bit with an output rate greater than 20 million words per second.

TECHNICAL NOTES: 1. A resolution of n bit corresponds to a quantization of 2^n levels.

2. The number of bits in the output word is equal to the resolution of the ADC.

3. The output rate is the maximum output rate of the converter, regardless of architecture or oversampling.

4. For ‘multiple channel ADCs’, the outputs are not aggregated and the output rate is the maximum output rate of any single channel.

5. For ‘interleaved ADCs’ or for ‘multiple channel ADCs’ that are specified to have an interleaved mode of operation, the outputs are aggregated and the output rate is the maximum combined total output rate of all of the outputs.

6. Vendors may also refer to the output rate as sampling rate, conversion rate or throughput rate. It is often specified in megahertz (MHz) or mega samples per second (MSPS).

7. For the purpose of measuring output rate, one output word per second is equivalent to one Hertz or one sample per second.

8. ‘Multiple channel ADCs’ are defined as devices which have multiple ADC units that sample the same analog input at different times such that when the outputs are aggregated, the analog input has been effectively sampled and converted at a higher sampling rate.

9. ‘Interleaved ADCs’ are defined as devices which have multiple ADC units that sample the same analog input at different times such that when the outputs are aggregated, the analog input has been effectively sampled and converted at a higher sampling rate.

TECHNICAL NOTES: 1. ‘Spurious Free Dynamic Range’ (SFDR) is defined as the ratio of the RMS value of the carrier frequency (maximum signal component) at the input of the DAC to the RMS value of the next largest noise or harmonic distortion component at its output.

2. SFDR is determined directly from the specification table or from the characterization plots of SFDR versus frequency.

3. A signal is defined to be full scale when its amplitude is greater than –3 dBfs (full scale).

4. ‘Adjusted update rate’ for DACs is:

a. For conventional (non-interpolating) DACs, the ‘adjusted update rate’ is the rate at which the digital signal is converted to an analog signal and the output analog values are changed by the DAC. For DACs where the interpolation mode may be bypassed (interpolation factor of one), the DAC should be considered as a conventional (non-interpolating) DAC.
For interpolating DACs (oversampling DACs), the 'adjusted update rate' is defined as the DAC update rate divided by the smallest interpolating factor. For interpolating DACs, the 'adjusted update rate' may be referred to by different terms including:

- Input data rate
- Input word rate
- Input sample rate
- Maximum total input bus rate
- Maximum DAC clock rate for DAC clock input.

Reason for Control: NP, AT

LIST OF ITEMS CONTROLLED

Related Controls: (1) See ECCNs 3E001 (“development” and “production”) and 3E201 (“use”) for technology for items controlled under this entry. (2) Also see 3A001.e.2 (capacitors) and 3A001.e.3 (superconducting electromagnets). (3) Superconducting electromagnets “specially designed” or prepared for use in separating uranium isotopes are subject to the export licensing authority of the Nuclear Regulatory Commission (see 10 CFR part 110).

Related Definitions: N/A

Items:

a. Pulse discharge capacitors having either of the following sets of characteristics:

b.1. Voltage rating greater than 1.4 kV, energy storage greater than 10 J, capacitance greater than 0.5 μF, and series inductance less than 50 nH; or
b.2. Voltage rating greater than 750 V, capacitance greater than 0.25 μF, and series inductance less than 10 nH;

b. Superconducting solenoidal electromagnets having all of the following characteristics:

b.1. Capable of creating magnetic fields greater than 2 T;

b.2. A ratio of length to inner diameter greater than 2;

b.3. Inner diameter greater than 300 mm; and

b.4. Magnetic field uniform to better than 1% over the central 50% of the inner volume;

NOTE: 3A201.b does not control magnets “specially designed” for and exported “as parts of” medical nuclear magnetic resonance (NMR) imaging systems. The phrase “as part of” does not necessarily mean physical part in the same shipment; separate shipments from different sources are allowed, provided the related export documents clearly specify that the shipments are dispatched “as part of” the imaging systems.

c. Flash X-ray generators or pulsed electron accelerators having either of the following sets of characteristics:

c.1. An accelerator peak electron energy of 500 keV or greater, but less than 25 MeV, and with a “figure of merit” (K) of 0.25 or greater; or

c.2. An accelerator peak electron energy of 25 MeV or greater, and a “peak power” greater than 50 MW;

NOTE: 3A201.c does not control accelerators that are “parts” or “components” of devices designed for purposes other than electron beam or X-ray radiation (electron microscopy, for example) nor those designed for medical purposes.

TECHNICAL NOTES: (1) The “figure of merit” K is defined as: K = 1.7 × 10^3 V^2 μF μs. V is the peak electron energy in million electron volts. If the accelerator beam pulse duration is less than or equal to 1 μs, then Q is the total accelerated charge in Coulombs. If the accelerator beam pulse duration is greater than 1 μs, then Q is the maximum accelerated charge in 1 μs. Q equals the integral of i with respect to t, over the lesser of 1 μs or the time duration of the beam pulse Q = \int |i| dt, where i is beam current in amperes and t is time in seconds.

(2) “Peak power” = (peak potential in volts) × (peak beam current in amperes).

(3) In machines based on microwave accelerating cavities, the time duration of the beam pulse is the lesser of 1 μs or the duration of the bunched beam packet resulting from one microwave modulator pulse.

(4) In machines based on microwave accelerating cavities, the peak beam current is the average current in the time duration of a bunched beam packet.

Technical Note on “Adjusted Peak Performance” (”APP”)

“APP” is an adjusted peak rate at which “digital computers” perform 64-bit or larger floating point additions and multiplications.

ABBREVIATIONS USED IN THIS TECHNICAL NOTE

n number of processors in the “digital computer”

I processor number (i,...,n)

t processor cycle time (t = 1/Fi)

Fi processor frequency

Ri peak floating point calculating rate

Wi architecture adjustment factor

“APP” is expressed in Weighted TeraFLOPS (WT) in units of 10¹² adjusted floating point operations per second.

OUTLINE OF “APP” CALCULATION METHOD

1. For each processor i, determine the peak number of 64-bit or larger floating point operations, FPOi, performed per cycle for each processor in the “digital computer”.

Note: In determining FPOi, include only 64-bit or larger floating point additions and/or multiplications. All floating point operations must be expressed in operations per processor cycle; operations requiring multiple cycles may be expressed in fractional
results per cycle. For processors not capable of performing calculations on floating-point operands of 64-bits or more the effective calculating rate R is zero.

2. Calculate the floating point rate R for each processor.

\[ R = \frac{FPO}{t_i} \]

3. Calculate “APP” as

\[ “APP” = W_1 \times R_1 + W_2 \times R_2 + \ldots + W_n \times R_n \]

4. For vector processors, \( W_i = 0.9 \). For non-vector processors, \( W_i = 0.3 \).

NOTE 1: For processors that perform compound operations in a cycle, such as an addition and multiplication, each operation is counted.

NOTE 2: For a pipelined processor the effective calculating rate R of each contributing processor is to be calculated at its maximum value theoretically possible before the “APP” of the combination is derived. Simultaneous operations are assumed to exist when the computer manufacturer claims concurrent, parallel, or simultaneous operation or execution in a manual or brochure for the computer.

NOTE 3: The calculating rate R of each contributing processor is to be calculated at its maximum value theoretically possible before the “APP” of the combination is derived. Simultaneous operations are assumed to exist when the computer manufacturer claims concurrent, parallel, or simultaneous operation or execution in a manual or brochure for the computer.

NOTE 4: Do not include processors that are limited to input/output and peripheral functions (e.g., disk drive, communication and video display) when calculating “APP”.

NOTE 5: “APP” values are not to be calculated for processor combinations (inter)connected by “Local Area Networks”, Wide Area Networks, I/O shared connections/devices, I/O controllers and any communication interconnection implemented by “software”.

NOTE 6: “APP” values must be calculated for: (1) Processor combinations containing processors “specially designed” to enhance performance by aggregation, operating simultaneously and sharing memory; or (2) Multiple memory/processor combinations operating simultaneously utilizing “specially designed” hardware.

NOTE 7: A “vector processor” is defined as a processor with built-in instructions that perform multiple calculations on floating-point vectors (one-dimensional arrays of 64-bit or larger numbers) simultaneously, having at least 2 vector functional units and at least 8 vector registers of at least 64 elements each.

2. 'Flexible piezoelectric composite' sensing elements consist of piezoelectric ceramic particles or fibers combined with an electrically insulating, acoustically transparent rubber, polymer or epoxy compound, where the compound is an integral part of the sensing elements.

3. 'Hydrophone sensitivity' is defined as twenty times the logarithm to the base 10 of the ratio of rms output voltage to a 1 V rms reference, when the hydrophone sensor, without a pre-amplifier, is placed in a plane wave acoustic field with an rms pressure of 1 μPa. For example, a hydrophone of –160 dB (reference 1 V per μPa) would yield an output voltage of 10⁻³ V in such a field, while one of –180 dB sensitivity would yield only 10⁻⁹ V output. Thus, –160 dB is better than –180 dB.

All "specially designed" or modified "parts," "components," accessories, attachments, and associated equipment for "spacecraft" that have been determined by the Department of State through the commodity jurisdiction process to be under the licensing jurisdiction of the Department of Commerce, and that are not controlled by any other ECCN on the Commerce Control List, will be assigned a classification under this ECCN 9A004.

(6) Technical data required for the detailed design, development, manufacturing, or production of the international space station (to include specifically designed "parts" and "components") remains "subject to the ITAR" (see 22 CFR parts 120 through 130). This control by the ITAR of detailed design, development, manufacturing or production technology for NASA's international space station does not include that level of technical data necessary and reasonable for assurance that a U.S.-built item intended to operate on NASA's international space station has been designed, manufactured, and tested in conformance with specified requirements (e.g., operational performance, reliability, lifetime, product quality, or delivery expectations). All technical data and all defense services, including all technical assistance, for launch of the international space station, including launch vehicle compatibility, integration, or processing data, are "subject to the ITAR" (see 22 CFR parts 120 through 130).
