Environmental Protection Agency

revising paragraph (d)(1)(iv). Since both paragraphs (a) and (d) of §86.129–00 are reserved and contain no text, these amendments could not be made. For the convenience of the user, the revised text is set forth as follows:

§ 86.129–00 Road load power, test weight, and inertia weight class determination.

* * * * *

(a) * * *

* * * * *

(d) * * *

(1) * * *

(iv) Small-volume manufacturers, as defined in §86.094–14(b)(1) or §86.1838–01 as applicable, may use an alternate method for generating fuel temperature profiles, subject to the approval of the Administrator.

* * * * *

§ 86.129–80 Road load power, test weight, and inertia weight class determination.

(a) [Reserved]

(b) Power absorption unit adjustment—light-duty trucks. (1) The power absorption unit shall be adjusted to reproduce road load power at 50 mph true speed. The indicated road load power setting shall take into account the dynamometer friction. The relationship between road load (absorbed) power and indicated road load power for a particular dynamometer shall be determined by the procedure outlined in §86.118 or other suitable means.

(2) The road load power listed in the table above shall be used or the vehicle manufacturer may determine the road load power by an alternate procedure requested by the manufacturer and approved in advance by the Administrator.

(3) Where it is expected that more than 33 percent of a car line within an engine-system combination will be equipped with air conditioning per §86.088–24(g)(2), the road load power listed above or as determined in paragraph (b)(2) of this section shall be increased by 10 percent, up to a maximum increase of 1.4 horsepower, for testing all test vehicles representing that car line within that engine-system combination if those vehicles are intended to be offered with air conditioning in production. The above increase for air conditioning shall be added prior to rounding off as instructed by notes 2 and 3 of the table.

(c) Power absorption unit adjustment—light-duty vehicles. (1) The power absorption unit shall be adjusted to reproduce road load power at 50 mph true speed. The dynamometer power absorption shall take into account the dynamometer friction, as discussed in §86.118.

(2) The dynamometer road load setting is determined from the equivalent test weight, the reference frontal area, the body shape, the vehicle protuberances, and the tire type by the following equations.

(i) For light-duty vehicles to be tested on a twin roll dynamometer.

\[ Hp = aA + P + tw \]

where:

- \( Hp \) = the dynamometer power absorber setting at 50 mph (horsepower).
- \( A \) = the vehicle reference frontal area (ft²).
- \( P \) = the protuberance power correction factor (horsepower).
- \( W \) = vehicle equivalent test weight (lbs) from the table in paragraph (a).
- \( a = 0.43 \) for fastback-shaped vehicles; \( a = 0.50 \) for all other light-duty vehicles.
- \( t = 0.0 \) for vehicles equipped with radial ply tires; \( t = 3 \times 10^{-4} \) for all other vehicles.

A vehicle is considered to have a fastback shape if the rearward projection of that portion of the rear surface \( (A_b) \) which slopes at an angle of less than 20°...
