§ 493.1264 Standard: Parasitology.
(a) The laboratory must have available a reference collection of slides or photographs and, if available, gross specimens for identification of parasites and use these references in the laboratory for appropriate comparison with diagnostic specimens.
(b) The laboratory must calibrate and use the calibrated ocular micrometer for determining the size of ova and parasites, if size is a critical parameter.
(c) Each month of use, the laboratory must check permanent stains using a fecal sample control material that will demonstrate staining characteristics.
(d) The laboratory must document all control procedures performed, as specified in this section.
§ 493.1265 Standard: Virology.
(a) When using cell culture to isolate or identify viruses, the laboratory must simultaneously incubate a cell substrate control or uninoculated cells as a negative control material.
(b) The laboratory must document all control procedures performed, as specified in this section.
§ 493.1267 Standard: Routine chemistry.
For blood gas analyses, the laboratory must perform the following:
(a) Calibrate or verify calibration according to the manufacturer’s specifications and with at least the frequency recommended by the manufacturer.
(b) Test one sample of control material each 8 hours of testing using a combination of control materials that include both low and high values on each day of testing.
(c) Test one sample of control material each time specimens are tested unless automated instrumentation internally verifies calibration at least every 30 minutes.
(d) Document all control procedures performed, as specified in this section.
§ 493.1269 Standard: Hematology.
(a) For manual cell counts performed using a hemocytometer—
(1) One control material must be tested each 8 hours of operation; and
(2) Patient specimens and control materials must be tested in duplicate.
(b) For all nonmanual coagulation test systems, the laboratory must include two levels of control material each 8 hours of operation and each time a reagent is changed.
(c) For manual coagulation tests—
(1) Each individual performing tests must test two levels of control materials before testing patient samples and each time a reagent is changed; and
(2) Patient specimens and control materials must be tested in duplicate.
(d) The laboratory must document all control procedures performed, as specified in this section.
§ 493.1271 Standard: Immunohematology.
(a) Patient testing.
(1) The laboratory must perform ABO grouping, D(Rho) typing, unexpected antibody detection, antibody identification, and compatibility testing by following the manufacturer’s instructions, if provided, and as applicable, 21 CFR 606.151(a) through (e).
(2) The laboratory must determine ABO group by concurrently testing unknown red cells with, at a minimum, anti-A and anti-B grouping reagents. For confirmation of ABO group, the unknown serum must be tested with known A1 and B red cells.
(3) The laboratory must determine the D(Rho) type by testing unknown red cells with anti-D (anti-Rho) blood typing reagent.
(b) Immunohematological testing and distribution of blood and blood products. Blood and blood product testing and distribution must comply with 21 CFR 606.160(b)(12); 606.160(b)(3)(ii) and (b)(3)(v); 610.40; 610.5(a), (b), (c), and (e); and 640.11(b).
