LIST OF ITEMS CONTROLLED

Related Controls: High explosives and related equipment “specially designed” for military use are “subject to the ITAR” (see 22 CFR parts 120 through 130). This entry does not control detonators using only primary explosives, such as lead azide. See also ECCNs 6A601, 3A229, and 3A232. See 1E001 for “development” and “production” technology controls, and 1E001 for “use” technology controls.

Related Definitions: N/A

Items: a. Explosive detonator firing sets designed to drive explosive detonators specified by 1A007.b; b. Electrically driven explosive detonators as follows: b.1. Exploding bridge (EB); b.2. Exploding bridge wire (EBW); b.3. Slapper; b.4. Exploding foil initiators (EFI).

Technical Notes

1. The word initiator or igniter is sometimes used in place of the word detonator.

2. For the purpose of 1A007.b the detonators of concern all utilize a small electrical conductor (bridge, bridge wire, or foil) that explosively vaporizes when a fast, high-current electrical pulse is passed through it. In nonslapper types, the exploding conductor starts a chemical detonation in a contacting high explosive material such as PETN (pentaerythritoltetranitrate). In slapper detonators, the explosive vaporization of the electrical conductor drives a flyer or slapper across a gap, and the impact of the slapper on an explosive starts a chemical detonation. The slapper in some designs is driven by magnetic force. The term exploding foil detonator may refer to either an EB or a slapper-type detonator.

Carbon or aramid “fibrous or filamentary materials” having a “specific modulus” of 12.7 × 10⁶ m or greater or a “specific tensile strength” of 235 × 10⁶ m or greater except Aramid “fibrous or filamentary materials” having 0.25 percent or more by weight of an ester based fiber surface modifier;

LIST OF ITEMS CONTROLLED
Related Controls: N/A

Related Definitions: The Commerce Country Chart is not designed to determine licensing requirements for items controlled for CW reasons. A license is required, for CW reasons, to export or reexport Schedule 2 chemicals and mixtures identified in 1C350.b to States not Party to the CWC (destinations not listed in Supplement No. 2 to part 745 of the EAR). A license is required, for CW reasons, to export Schedule 3 chemicals and mixtures identified in 1C350.c to States not Party to the CWC, unless an End-Use Certificate issued by the government of
the importing country has been obtained by the exporter prior to export. A license is required, for CW reasons, to reexport Schedule 3 chemicals and mixtures identified in 1C350 and to a Country Group E:1 Party to the CWC to any other State not Party to the CWC. (See §742.18 of the EAR for license requirements and policies for toxic and precursor chemicals controlled for CW reasons. See §745.2 of the EAR for End-Use Certificate requirements that apply to exports of Schedule 3 chemicals to countries not listed in Supplement No. 2 to part 745 of the EAR.)

AT applies to entire entry. The Commerce Country Chart is not designed to determine license requirements for items controlled for AT reasons in 1C350. A license is required, for AT reasons, to export or reexport items controlled by 1C350 to a country in Country Group E:1 of Supplement No. 1 to part 740 of the EAR. (See part 742 of the EAR for additional information on the AT controls that apply to Iran, North Korea, Sudan, and Syria. See part 746 of the EAR for additional information on sanctions that apply to Iran, North Korea, and Syria.)

License Requirement Notes 1. Sample Shipments: Subject to the following requirements and restrictions, a license is not required for sample shipments when the cumulative total of such shipments does not exceed a 55-gallon container or 200 kg of a single chemical to any one consignee during a calendar year. A consignee that receives a sample shipment under this exclusion may not resell, transfer, or reexport the sample shipment, but may use the sample shipment for any other legal purpose unrelated to chemical weapons.

a. Chemicals Not Eligible:
   a. [Reserved]

b. CWC Schedule 2 chemicals (States not Party to the CWC). No CWC Schedule 2 chemical or mixture identified in 1C350.b is eligible for sample shipment to States not Party to the CWC (destinations not listed in Supplement No. 2 to part 745 of the EAR) without a license.

c. Countries Not Eligible: Countries in Country Group E:1 of Supplement No. 1 to part 740 of the EAR are not eligible to receive sample shipments of any chemicals controlled by this ECCN without a license.

d. Sample shipments that require an End-Use Certificate for CW reasons: No CWC Schedule 3 chemical or mixture identified in 1C350.c is eligible for sample shipment to States not Party to the CWC (destinations not listed in Supplement No. 2 to part 745 of the EAR) without a license, unless an End-Use Certificate issued by the government of the importing country is obtained by the exporter prior to export (see §745.2 of the EAR for End-Use Certificate requirements).

e. Annual report requirement. The exporter is required to submit an annual written report for shipments of samples made under this Note 1. The report must be on company letterhead stationery (titled “Report of Sample Shipments of Chemical Precursors” at the top of the first page) and identify the chemical(s), Chemical Abstract Service Registry (C.A.S.) number(s), quantity(ies), the ultimate consignee’s name and address, and the date of export for all sample shipments that were made during the previous calendar year. The report must be submitted no later than February 28 of the year following the calendar year in which the sample shipments were made, to: U.S. Department of Commerce, Bureau of Industry and Security, 14th Street and Pennsylvania Ave. NW., Room 2099B, Washington, DC 20230, Attn: “Report of Sample Shipments of Chemical Precursors.”

2. Mixtures:
   a. Mixtures that contain precursor chemicals identified in ECCN 1C350, in concentrations that are below the levels indicated in 1C350.b through .d, are controlled by ECCN 1C395 or 1C995 and are subject to the licensing requirements specified in those ECCNs.

b. A license is not required under this ECCN for a mixture, when the controlled chemical in the mixture is a normal ingredient in consumer goods packaged for retail sale for personal use. Such consumer goods are designated EAR99. However, a license may be required for reasons set forth elsewhere in the EAR.

Note to Mixtures: Calculation of concentrations of AG-controlled chemicals:

a. Exclusion. No chemical may be added to the mixture (solution) for the sole purpose of circumventing the Export Administration Regulations.

b. Percent Weight Calculation. When calculating the percentage, by weight, of ingredients in a chemical mixture, include all ingredients of the mixture, including those that act as solvents.

3. Compounds. Compounds created with any chemicals identified in this ECCN 1C350 may be shipped NLR (No License Required), without obtaining an End-Use Certificate, unless those compounds are also identified in this entry or require a license for reasons set forth elsewhere in the EAR.

4. Testing Kits: Certain medical, analytical, diagnostic, and food testing kits containing small quantities of chemicals identified in this ECCN 1C350, are excluded from the scope of this ECCN and are controlled under ECCN 1C395 or 1C995. (Note that replacement reagents for such kits are controlled by this ECCN 1C350 if the reagents contain one or more of the precursor chemicals identified in 1C350 in concentrations equal to or greater than the control levels for mixtures indicated in 1C350.)
Technical Notes: 1. For purposes of this entry, a "mixture" is defined as a solid, liquid or gaseous product made up of two or more ingredients that do not react together under normal storage conditions.

2. The scope of this control applicable to Hydrogen Fluoride (see 1C350.d.7) in the List of Items Controlled includes its liquid, gaseous, and aqueous phases, and hydrates.

3. Precursor chemicals in ECCN 1C350 are listed by name. Chemical Abstract Service (CAS) number and CWC Schedule (where applicable). Precursor chemicals of the same structural formula (e.g., hydrates) are controlled by ECCN 1C350, regardless of name or CAS number. CAS numbers are shown to assist in identifying whether a particular precursor chemical or mixture is controlled under ECCN 1C350, irrespective of nomenclature. However, CAS numbers cannot be used as unique identifiers in all situations because some forms of the listed precursor chemical have different CAS numbers, and mixtures containing a precursor chemical listed in ECCN 1C350 may also have different CAS numbers.

Related Definitions: For the purpose of this entry, "medical, analytical, diagnostic, and food testing kits" are pre-packaged materials of defined composition that are specifically developed, packaged and marketed for medical, analytical, diagnostic, or public health purposes. Replacement agents for medical, analytical, diagnostic, and food testing kits described in 1C395.b are controlled by ECCN 1C350 if the replacement agents contain at least one of the precursor chemicals identified in that ECCN in concentrations equal to or greater than the control levels for mixtures indicated in 1C350.b, .c, or .d.

Items: a. Mixtures containing more than 10 percent, but less than 30 percent, by weight of any single CWC Schedule 2 chemical identified in ECCN 1C350.b. (For controls on other mixtures containing these chemicals, see Note 1 in the Related Controls paragraph of this ECCN.)

b. "Medical, analytical, diagnostic, and food testing kits" (as defined in the Related
Definitions for this ECCN) that contain CWC Schedule 2 or 3 chemicals controlled by ECCN 1C350.b or .c in an amount not exceeding 300 grams per chemical. (For controls on other chemicals containing these and other controlled chemicals, see Note 2 in the Related Controls paragraph of this ECCN.)

Technical Notes for 2B001 to 2B009, 2B201, 2B290 and 2B591 to 2B599: 1. Secondary parallel contouring axes, (e.g., the w-axis on horizontal boring mills or a secondary rotary axis the center line of which is parallel to the primary rotary axis) are not counted in the total number of contouring axes. Rotary axes need not rotate over 360°. A rotary axis can be driven by a linear device (e.g., a screw or a rack-and-pinion). 2. The number of axes which can be coordinated simultaneously for “contouring control” is the number of axes along or around which, during processing of the workpiece, simultaneous motions are performed. This does not include any additional axes along or around which other relative motions are performed, such as:
2a. Wheel-dressing systems in grinding machines; 
2b. Parallel rotary axes designed for mounting of separate workpieces; 
2c. Co-linear rotary axes designed for manipulating the same workpiece by holding it in a chuck from different ends.
4. A “tilting spindle” is counted as a rotary axis.
5. Stated “unidirectional positioning repeatability” may be used for each specific machine model as an alternative to individual machine tests, and is determined as follows:
5a. Select five machines of a model to be evaluated.
5b. Measure the linear axis repeatability (R_y, R_z) according to ISO 230-2:2014 and evaluate “unidirectional positioning repeatability” for each axis of each of the five machines.
5c. Determine the arithmetic mean value of the “unidirectional positioning repeatability” values for each axis of all five machines together. These arithmetic mean values “unidirectional positioning repeatability” (UPR) become the stated value of each axis for the “unidirectional positioning repeatability” of each machine tool model.
5d. Since the Category 2 list refers to each machine tool individually, there will be as many ‘stated ‘unidirectional positioning repeatability”’ values as there are linear axes.
5e. If any axis of a machine model not controlled by 2B001.a. to 2B001.c. has a ‘stated ‘unidirectional positioning repeatability”’ equal to or less than the specified ‘unidirectional positioning repeatability” of each machine tool model plus 0.7 µm, the builder should be required to reaffirm the accuracy level once every eighteen months.
6. For the purpose of 2B, measurement uncertainty for the “unidirectional positioning repeatability” of machine tools, as defined in the International Standard ISO 230-2:2014, shall not be considered.
7. For the purpose of 2B, the measurement of axes shall be made according to test procedures in 5.3.2. of ISO 230-2:2014. Tests for axes longer than 2 meters shall be made over 2 m segments. Axes longer than 4 m require multiple tests (e.g., two tests for axes longer than 4 m and up to 8 m, three tests for axes longer than 8 m and up to 12 m), each over 2 m segments and distributed in equal intervals over the axis length. Test segments are equally spaced along the full axis length, with any excess length equally divided at the beginning, in between, and at the end of the test segments. The smallest “unidirectional positioning repeatability”-value of all test segments is to be reported.
2B001 Machine tools and any combination thereof, for removing (or cutting) metals, ceramics or “composites”, which, according to the manufacturer’s technical specifications, can be equipped with electronic devices for “numerical control”; as follows (see List of Items Controlled).

**Items:** The list of items controlled is contained in the ECCN heading.

**Technical Notes:**
1. In a scroll compressor or vacuum pump, crescent-shaped pockets of gas are trapped between one or more pairs of intermeshed spiral vanes, or scrolls, one of which moves while the other remains stationary. The moving scroll orbits the stationary scroll; it does not rotate. As the moving scroll orbits the stationary scroll, the gas pockets diminish in size (i.e., they are compressed) as they move toward the outlet port of the machine.

2. In a bellows-sealed scroll compressor or vacuum pump, the process gas is totally isolated from the lubricated parts of the pump and from the external atmosphere by a metal bellows. One end of the bellows is attached to the moving scroll and the other end is attached to the stationary housing of the pump.

3. Fluoropolymers include, but are not limited to, the following materials:
   - a. Polytetrafluoroethylene (PTFE);
   - b. Fluorinated Ethylene Propylene (FEP);
   - c. Perfluoroalkoxy (PFA);

d. “Technology” for the “development” of generators of machine tool instructions (e.g., part programs) from design data residing inside “numerical control” units;

e. “Technology for the development” of integration “software” for incorporation of expert systems for advanced decision support of shop floor operations into “numerical control” units;

f. “Technology” for the application of inorganic overlay coatings or inorganic surface modification coatings (specified in column 3 of the following table) to non-electronic substrates (specified in column 2 of the following table), by processes specified in column 1 of the following table and defined in the Technical Note.

N.B. This table should be read to control the technology of a particular ‘Coating Process’ only when the resultant coating in column 3 is in a paragraph directly across from the relevant ‘Substrate’ under column 2. For example, Chemical Vapor Deposition (CVD) ‘coating process’ technical data are controlled for the application of ‘silicides’ to ‘Carbon-carbon, Ceramic and Metal “matrix” “composites”’ substrates, but are not controlled for the application of ‘silicides’ to ‘Cemented tungsten carbide (16), Silicon carbide (18)’ substrates. In the second case, the resultant coating is not listed in the paragraph under column 3 directly across from the paragraph under column 2 listing ‘Cemented tungsten carbide (16), Silicon carbide (18)’.

### Notes to Table on Deposition Techniques

1. The term ‘coating process’ includes coating repair and refurbishing as well as original coating.

2. The term ‘alloyed aluminide coating’ includes single or multiple-step coatings in which an element or elements are deposited prior to or during application of the aluminide coating, even if these elements are deposited by another coating process. It does not, however, include the multiple use of single-step pack cementation processes to achieve alloyed aluminides.

3. The term ‘noble metal modified aluminide’ coating includes multiple-step coatings in which the noble metal or noble metals are laid down by some other coating process prior to application of the aluminide coating.

4. The term ‘mixtures thereof’ includes infiltrated material, graded compositions, co-deposits and multilayer deposits and are obtained by one or more of the coating processes specified in the Table.

5. MCrAlX refers to a coating alloy where M equals cobalt, iron, nickel or combinations thereof and X equals hafnium, yttrium, silicon.
tantalum in any amount or other intentional additions over 0.01% by weight in various proportions and combinations, except:

a. CoCrAlY coatings which contain less than 22% by weight of chromium, less than 7% by weight of aluminum and less than 2% by weight of yttrium;
b. CoCrAlY coatings which contain 22 to 24% by weight of chromium, 10 to 12% by weight of aluminum and 0.5 to 0.7% by weight of yttrium; or
c. NiCrAlY coatings which contain 21 to 23% by weight of chromium, 10 to 12% by weight of aluminum and 0.9 to 1.1% by weight of yttrium.

6. The term ‘aluminum alloys’ refers to alloys having an ultimate tensile strength of 190 MPa or more measured at 293 K (20 °C).
7. The term ‘corrosion resistant steel’ refers to AISI (American Iron and Steel Institute) 300 series or equivalent national standard steels.
8. ‘Refractory metals and alloys’ include the following metals and their alloys: niobium (columbium), molybdenum, tungsten and tantalum.

10. “Technology” for single-step pack cementation of solid airfoils is not controlled by Category 2.
11. ‘Polymers’, as follows: polyimide, polyether, polysulfide, polycarbonates and polyurethanes.
12. ‘Modified zirconia’ refers to additions of niobium (columbium), hafnia, or other metal oxides, (e.g., calcia, magnesia, yttria, hafnia, rare earth oxides) to zirconia in order to stabilize certain crystallographic phases and phase compositions. Thermal barrier coatings made of zirconia, modified with calcia or magnesia by mixing or fusion, are not controlled.
13. ‘Titanium alloys’ refers only to aerospace alloys having an ultimate tensile strength of 900 MPa or more measured at 293 K (20 °C).
14. ‘Low-expansion glasses’ refers to glasses which have a coefficient of thermal expansion of \( 1 \times 10^{-6} \, \text{K}^{-1} \) or less measured at 293 K (20 °C).
15. ‘Dielectric layers’ are coatings constructed of multi-layers of insulator materials in which the interference properties of a design composed of materials of various refractive indices are used to reflect, transmit or absorb various wavelength bands. Dielectric layers refers to more than four dielectric layers or dielectric/metal “composite” layers.
16. ‘Cemented tungsten carbide’ does not include cutting and forming tool materials consisting of tungsten carbide/cobalt, nickel, titanium carbide/cobalt, nickel, or chromium carbide/nickel.
17. ‘Technology’ “specially designed” to deposit diamond-like carbon on any of the following is not controlled: magnetic disk drives and heads, equipment for the manufacture of disposables, valves for faucets, acoustic diaphragms for speakers, engine parts for automobiles, cutting tools, punching-pressing dies, office automation equipment, microphones, medical devices or molds, for casting or molding of plastics, manufactured from alloys containing less than 5% beryllium.
18. ‘Silicon carbide’ does not include cutting and forming tool materials.

19. Ceramic substrates, as used in this entry, does not include ceramic materials containing 5% by weight, or greater, clay or cement content, either as separate constituents or in combination.

Technical Note to Table on Deposition Techniques: Processes specified in Column 1 of the Table are defined as follows:

a. Chemical Vapor Deposition (CVD) is an overlay coating or surface modification coating process wherein a metal, alloy, “composite”, dielectric or ceramic is deposited upon a heated substrate. Gaseous reactants are decomposed or combined in the vicinity of a substrate resulting in the deposition of the desired elemental, alloy or compound material on the substrate. Energy for this decomposition or chemical reaction process may be provided by the heat of the substrate, a glow discharge plasma, or “laser” irradiation.

Note 1: CVD includes the following processes: directed gas flow out-of-pack deposition, pulsed CVD, controlled nucleation thermal decomposition (CNTD), plasma enhanced or plasma assisted CVD processes.

Note 2: Pack denotes a substrate immersed in a powder mixture.

b. Thermal Evaporation-Physical Vapor Deposition (TE-PVD) is an overlay coating process conducted in a vacuum with a pressure less than 0.1 Pa wherein a source of thermal energy is used to vaporize the coating material. This process results in the condensation, or deposition, of the evaporated species onto appropriately positioned substrates. The addition of gases to the vacuum chamber during the coating process to synthesize compound coatings is an ordinary modification of the process. The use of ion or electron beams, or plasma, to activate or assist the coating’s deposition is also a common modification in this technique. The use of monitors to provide in-process measurement of optical characteristics and thickness of coatings can be a feature of these processes. Specific TE-PVD processes are as follows:

1. Electron Beam PVD uses an electron beam to heat and evaporate the material which forms the coating.
2. Ion Assisted Resistive Heating PVD employs electrically resistive heating sources in combination with impinging ion beam(s) to produce a
controlled and uniform flux of evaporated coating species;
3. “Laser” Vaporization uses either pulsed or continuous wave “laser” beams to vaporize the material which forms the coating;
4. Cathodic Arc Deposition employs a consumable cathode of the material which forms the coating and has an arc discharge established on the surface by a momentary contact of a ground trigger. Controlled motion of arcing erodes the cathode surface creating a highly ionized plasma. The anode can be either a cone attached to the periphery of the cathode, through an insulator, or the chamber. Substrate biasing is used for non line-of-sight deposition.

Note: This definition does not include random cathodic arc deposition with non-biased substrates.
5. Ion Plating is a special modification of a general TE-PVD process in which a plasma or an ion source is used to ionize the species to be deposited, and a negative bias is applied to the substrate in order to facilitate the extraction of the species from the plasma. The introduction of reactive species, evaporation of solids within the process chamber, and the use of monitors to provide in-process measurement of optical characteristics and thicknesses of coatings are ordinary modifications of the process.

b. Pack Cementation is a surface modification coating or overlay coating process wherein a substrate is immersed in a powder mixture (a pack), that consists of:

1. The metallic powders that are to be deposited (usually aluminum, chromium, silicon or combinations thereof);
2. An activator (normally a halide salt); and
3. An inert powder, most frequently alumina.

Note: The substrate and powder mixture is contained within a retort which is heated to between 1,030 K (757 °C) to 1,375 K (1,102 °C) for sufficient time to deposit the coating.

d. Plasma Spraying is an overlay coating process wherein a gun (spray torch) which produces and controls a plasma accepts powder or wire coating materials, melts them and propels them towards a substrate, wherein an integrally bonded coating is formed. Plasma spraying constitutes either low pressure plasma spraying or high velocity plasma spraying.

Note 1: Low pressure means less than ambient atmospheric pressure.

Note 2: High velocity refers to nozzle-exit gas velocity exceeding 750 m/s calculated at 293 K (20 °C) at 0.1 MPa.

e. Slurry Deposition is a surface modification coating or overlay coating process wherein a metallic or ceramic powder with an organic binder is suspended in a liquid and is applied to a substrate by either spraying, dipping or painting, subsequent air or oven drying, and heat treatment to obtain the desired coating.

f. Sputter Deposition is an overlay coating process based on a momentum transfer phenomenon, wherein positive ions are accelerated by an electric field towards the surface of a target (coating material). The kinetic energy of the impacting ions is sufficient to cause target surface atoms to be released and deposited on an appropriately positioned substrate.

Note 1: The Table refers only to triode, magnetron or reactive sputter deposition which is used to increase adhesion of the coating and rate of deposition and to radio frequency (RF) augmented sputter deposition used to permit vaporization of non-metallic coating materials.

Note 2: Low-energy ion beams (less than 5 keV) can be used to activate the deposition.

g. Ion Implantation is a surface modification coating process in which the element to be alloyed is ionized, accelerated through a potential gradient and implanted into the surface region of the substrate. This includes processes in which ion implantation is performed simultaneously with electron beam physical vapor deposition or sputter deposition.

a.5. Analog-to-Digital Converter (ADC) and Digital-to-Analog Converter (DAC) integrated circuits, as follows:
   a.5.a. ADCs having any of the following:
      a.5.a.1. A resolution of 8 bit or more, but less than 10 bit, with an output rate greater than 1 billion words per second;
      a.5.a.2 A resolution of 10 bit or more, but less than 12 bit, with an output rate greater than 300 million words per second;
      a.5.a.3. A resolution of 12 bit with an output rate greater than 200 million words per second;

   a.5.a.5. A resolution of more than 14 bit with an output rate greater than 20 million words per second;

TECHNICAL NOTES: 1. A resolution of n bit corresponds to a quantization of 2^n levels.
   2. The number of bits in the output word is equal to the resolution of the ADC.
   3. The output rate is the maximum output rate of the converter, regardless of architecture or oversampling.
   4. For ‘multiple channel ADCs’, the outputs are not aggregated and the output rate is the maximum output rate of any single channel.
   5. For ‘interleaved ADCs’ or for ‘multiple channel ADCs’ that are specified to have an interleaved mode of operation, the outputs are aggregated and the output rate is the maximum combined total output rate of all of the outputs.
   6. Vendors may also refer to the output rate as sampling rate, conversion rate or throughput rate. It is often specified in megahertz (MHz) or mega samples per second (MSPS).
   7. For the purpose of measuring output rate, one output word per second is equivalent to one Hertz or one sample per second.

a.5.b. Digital-to-Analog Converters (DAC) having any of the following:
   a.5.b.1. A resolution of 10 bit or more with an ‘adjusted update rate’ of greater than 3,500 MSPS; or

TECHNICAL NOTES: 1. ‘Spurious Free Dynamic Range’ (SFDR) is defined as the ratio of the RMS value of the carrier frequency (maximum signal component) at the input of the DAC to the RMS value of the next largest noise or harmonic distortion component at its output.

2. SFDR is determined directly from the specification table or from the characterization plots of SFDR versus frequency.
857

3. A signal is defined to be full scale when its amplitude is greater than \(-3\) dBfs (full scale).

4. ‘Adjusted update rate’ for DACs is:

   a. For conventional (non-interpolating) DACs, the ‘adjusted update rate’ is the rate at which the digital signal is converted to an analog signal and the output analog values are changed by the DAC. For DACs where the interpolation mode may be bypassed (interpolation factor of one), the DAC should be considered as a conventional (non-interpolating) DAC.

**Items:** a. Pulse discharge capacitors having either of the following sets of characteristics:

- a.1. Voltage rating greater than 1.4 kV, energy storage greater than 10 J, capacitance greater than 0.5 μF, and series inductance less than 50 nH; or
- a.2. Voltage rating greater than 750 V, capacitance greater than 0.25 μF, and series inductance less than 10 nH;

b. Superconducting solenoidal electromagnets having all of the following characteristics:

- b.1. Capable of creating magnetic fields greater than 2 T;
- b.2. A ratio of length to inner diameter greater than 2;
- b.3. Inner diameter greater than 300 mm; and
- b.4. Magnetic field uniform to better than 1% over the central 50% of the inner volume;

**NOTE:** 3A201.c does not control accelerators "specially designed" for and exported "as part of" medical nuclear magnetic resonance (NMR) imaging systems. The phrase "as part of" does not necessarily mean physical part in the same shipment; separate shipments from different sources are allowed, provided the related export documents clearly specify that the shipments are dispatched "as part of" the imaging systems.

- c. Flash X-ray generators or pulsed electron accelerators having either of the following sets of characteristics:
  - c.1. An accelerator peak electron energy of 500 keV or greater, but less than 25 MeV, and a "figure of merit" (K) of 0.25 or greater; or
  - c.2. An accelerator peak electron energy of 25 MeV or greater, and a "peak power" greater than 50 MW;

**NOTE:** 3A201.d does not control accelerators that are "parts" or "components" of devices designed for purposes other than electron beam or X-ray radiation (electron microscopy, for example) nor those designed for medical purposes.

**Technical Notes:** (1) The "figure of merit": K is defined as: 
\[ K = \frac{1.7 \times 10^9 V^2}{Q} \]
where \( V \) is the peak electron energy in million electron volts, \( Q \) is the maximum accelerated charge in Coulombs. If the accelerator beam pulse duration is greater than 1 μs, then \( Q \) is the maximum accelerated charge in 1 μs. \( Q \) equals the integral of \( i \) with respect to \( t \), over the lesser of 1 μs or the time duration of the beam pulse \( Q = \int i \, dt \), where \( i \) is beam current in amperes and \( t \) is time in seconds.

(2) "Peak power" = (peak potential in volts) × (peak beam current in amperes).

(4) In machines based on microwave accelerating cavities, the peak beam current is the lesser of 1 μs or the duration of the pulsed beam packet resulting from one microwave modulator pulse.

Technical Note on “Adjusted Peak Performance” (“APP”)

“APP” is an adjusted peak rate at which “digital computers” perform 64-bit or larger floating point additions and multiplications.

ABBREVIATIONS USED IN THIS TECHNICAL NOTE
n number of processors in the “digital computer”
i processor number (1,..,n)
ti processor cycle time (ti = 1/Fi)
Fi processor frequency
Ri peak floating point calculating rate
W1 architecture adjustment factor
“APP” is expressed in Weighted TeraFLOPS (WT) in units of 10^12 adjusted floating point operations per second.

OUTLINE OF “APP” CALCULATION METHOD

1. For each processor i, determine the peak number of 64-bit or larger floating-point operations, FPOi, performed per cycle for each processor in the “digital computer”.

2. Calculate the floating point rate R for each processor.

\[ R_i = \frac{FPO_i}{t_i} \]

3. Calculate “APP” as

\[ \text{“APP”} = \sum W_i \times R_i + \sum W_i \times R_i \]

4. For ‘vector processors’, W_i = 0.9. For non-‘vector processors’, W_i = 0.3.

Note 1: For processors that perform compound operations in a cycle, such as an addition and multiplication, each operation is counted.
Note 2: For a pipelined processor the effective calculating rate \( R \) is the faster of the pipelined rate, once the pipeline is full, or the non-pipelined rate.

Note 3: The calculating rate \( R \) of each contributing processor is to be calculated at its maximum value theoretically possible before the "APP" of the combination is derived. Simultaneous operations are assumed to exist when the computer manufacturer claims concurrent, parallel, or simultaneous operation or execution in a manual or brochure for the computer.

Note 4: Do not include processors that are limited to input/output and peripheral functions (e.g., disk drive, communication and video display) when calculating "APP".

Note 5: "APP" values are not to be calculated for processor combinations (interconnected by "Local Area Networks", Wide Area Networks, I/O shared connections/devices, I/O controllers and any communication interconnection implemented by "software").

Note 6: "APP" values must be calculated for processor combinations containing processors "specially designed" to enhance performance by aggregation, operating simultaneously and sharing memory.

Technical Notes: 1. Aggregate all processors and accelerators operating simultaneously and located on the same die.

2. Processor combinations share memory when any processor is capable of accessing any memory location in the system through the hardware transmission of cache lines or memory words, without the involvement of any software mechanism, which may be achieved using "electronic assemblies" specified in 4A003.c.

Note 7: A 'vector processor' is defined as a processor with built-in instructions that perform multiple calculations on floating-point vectors (one-dimensional arrays of 64-bit or larger numbers) simultaneously, having at least 2 vector functional units and at least 8 vector registers of at least 64 elements each.

Category 5—Telecommunications and "Information Security"

Part I—Telecommunications

Notes: 1. The control status of "components", test and "production" equipment, and "software" therefor which are "specially designed" for telecommunications equipment or systems is determined in Category 5, Part 1.

N.B.2: See also Category 5, Part 2 for equipment, "components", and "software", performing or incorporating "information security" functions.

2. "Digital computers", related equipment or "software", when essential for the operation and support of telecommunications equipment described in this Category, are regarded as "specially designed" "components", provided they are the standard models customarily supplied by the manufacturer. This includes operation, administration, maintenance, engineering or billing computer systems.

**TECHNICAL NOTE:** 1. 'Piezoelectric polymer film' sensing elements consist of polarized polymer film that is stretched over and attached to a supporting frame or spool (mandrel).

2. 'Flexible piezoelectric composite' sensing elements consist of piezoelectric ceramic particles or fibers combined with an electrically insulating, acoustically transparent rubber, polymer or epoxy compound, where the compound is an integral part of the sensing elements.

3. 'Hydrophone sensitivity' is defined as twenty times the logarithm to the base 10 of the ratio of rms output voltage to a 1 V rms reference, when the hydrophone sensor, without a pre-amplifier, is placed in a plane wave acoustic field with an rms pressure of 1 \(\mu Pa\). For example, a hydrophone of \(-160\) dB (reference 1 V per \(\mu Pa\)) would yield an output voltage of \(-10^{-3}\) V in such a field, while one of \(-180\) dB sensitivity would yield only \(-10^{-6}\) V output. Thus, \(-160\) dB is better than \(-180\) dB.

LIST OF ITEMS CONTROLLED

Related Controls: This entry does not control accelerometers which are "specially designed" and developed as MWD (Measurement While Drilling) sensors for use in downhole well service operations.

Related Definitions: N/A

Items:

- a. Linear accelerometers designed for use in inertial navigation systems or in guidance systems of all types, usable in "missiles" having all of the following characteristics, and "specially designed" "parts" and "components" therefor:
  1. "Scale factor" "repeatability" less (better) than 1250 ppm; and
  2. "Bias" "repeatability" less (better) than 1250 micro g.

  NOTE TO PARAGRAPH b: This paragraph (b) does not include accelerometers that are designed to measure vibration or shock.
Stability is defined as standard deviation (1 sigma) of the variation of a particular parameter from its calibrated value measured under stable temperature conditions. This can be expressed as a function of time.

**Items:**

a. All types of gyroscopes, usable in rockets, missiles, or unmanned aerial vehicles capable of achieving a ‘‘range’’ equal to or greater than 300 km, with a rate ‘‘drift rate’’ ‘‘stability’’ of less than 0.5 degrees (1 sigma or rms) per hour in a 1 g environment.

c. Gyros of any type, designed for use in rockets, missiles, or unmanned aerial vehicles capable of achieving a ‘‘range’’ equal to or greater than 300 km, and ‘‘specially designed’’ ‘‘parts’’ and ‘‘components’’ therefor.

d. Integrated navigation systems, designed or modified for use in rockets, missiles, or unmanned aerial vehicles capable of achieving a ‘‘range’’ equal to or greater than 300 km and capable of providing a navigational accuracy of 200 m Circular Error Probable (CEP) or less.

**Related Definitions:**

- Stability is defined as a measure of the ability of a specific mechanism or performance coefficient to remain invariant when continuously exposed to a fixed operating condition. (This definition does not refer to dynamic or servo stability.) (IEEE 528–2001 2.247).

LIST OF ITEMS CONTROLLED

Related Controls: (1) See also 7B101, 7B102 and 7B994.
(2) This entry does not control test, calibration or alignment equipment for ‘Maintenance level I’ or ‘Maintenance Level II’.

Related Definitions: (1) “Maintenance Level I”: The failure of an inertial navigation unit is detected on the aircraft by indications from the Control and Display Unit (CDU) or by the status message from the corresponding sub-system. By following the manufacturer’s manual, the cause of the failure may be localized at the level of the malfunctioning Line Replaceable Unit (LRU). The operator then removes the LRU and replaces it with a spare.
(2) “Maintenance Level II” The defective LRU is sent to the maintenance workshop (the manufacturer’s or that of the operator responsible for level II maintenance). At the maintenance workshop, the malfunctioning LRU is tested by various appropriate means to verify and localize the defective Shop Replaceable Assembly (SRA) module responsible for the failure. This SRA is removed and replaced by an operative spare. The defective SRA (or possibly the complete LRU) is then shipped to the manufacturer. ‘Maintenance Level II’ does not include the disassembly or repair of controlled accelerometers or gyro sensors.

a.1.a. Altitude equal to or greater than 15,000 m; or

a.1.b. Temperature range of at least −50 °C to +125 °C; and

a.2. Incorporating, or designed or modified to incorporate, a shaker unit or other vibration test equipment to produce vibration environments equal to or greater than 10 g rms, measured ‘bare table’, between 20 Hz and 2 kHz while imparting forces equal to or greater than 5 kN.

E. “TECHNOLOGY”

Note 1: “Development” or “production” “technology” controlled by 9E001 to 9E003 for gas turbine engines remains controlled when used for repair or overhaul. Excluded from 9E001 to 9E003 control are: technical data,
drawings or documentation for maintenance activities directly associated with calibration, removal or replacement of damaged or unserviceable line replaceable units, including replacement of whole engines or engine modules.

Note 2: USML Category XV(f) and ECCNs 9E001, 9E002 and 9E515 do not control the data transmitted to or from a satellite or “spacecraft,” whether real or simulated, when limited to information about the health, operational status, or measurements or function of, or raw sensor output from, the “spacecraft,” “spacecraft” payload(s), or its associated subsystems or components. Such information is not within the scope of information captured within the definition of “technology” in the EAR for purposes of Category 9 Product Group E. Examples of such information, which are commonly referred to as “housekeeping data,” include (i) system, hardware, component configuration, and operation status information pertaining to temperatures, pressures, power, currents, voltages, and battery charges; (ii) “spacecraft” or payload orientation or position information, such as state vector or ephemeris information; (iii) payload raw mission or science output, such as images, spectra, particle measurements, or field measurements; (iv) command responses; (v) accurate timing information; and (vi) link budget data. The act of processing such telemetry data—i.e., converting raw data into engineering units or readable products—or encrypting it does not, in and of itself, cause the telemetry data to become subject to the ITAR or to ECCN 9E515 for purposes of 9A515, or to ECCNs 9E001 or 9E002 for purposes of 9A004. All classified technical data directly related to items controlled in USML Category XV or ECCNs 9A515, and defense services using the classified technical data remain subject to the ITAR. This note does not affect controls in USML XV(f), ECCN 9D515, or ECCN 9E515 on software source code or commands that control a “spacecraft,” “payload,” or associated subsystems for purposes of Category 9 Product Group E. Examples of such information captured within the definition of “technology” in the EAR for purposes of 9A004 do not affect controls in USML XV(f), ECCN 9D515, or ECCN 9E515 on software source code or commands that control a “spacecraft,” “payload,” or associated subsystems for purposes of Category 9 Product Group E.

9E001 “Technology” according to the General Technology Note for the “development” of equipment or “software,” controlled by 9A001, 9A002, 9A012, 9B (except for ECCNs 9B004, 9B010, 9B019, 9B900 and 9B901), or ECCN 9D001 to 9D004, 9D101, or 9D104.

LIST OF ITEMS CONTROLLED

Related Controls: (1) Hot section “technology” specifically designed, modified, or equipped for military uses or purposes, and developed principally with U.S. Department of Defense funding, is “subject to the ITAR” (see 22 CFR parts 120 through 130). (2) “Technology” is subject to the EAR when actually applied to a commercial aircraft engine program. Exporters may seek to establish commercial application either on a case-by-case basis through submission of documentation demonstrating application to a commercial program in requesting an export license from the Department Commerce in respect to a specific export, or in the case of use for broad categories of aircraft, engines, “parts” or “components,” a commodity jurisdiction determination from the Department of State.

Related Definitions: N/A

Items: a. “Technology” “required” for the “development” or “production” of any of the following gas turbine engine “parts,” “components” or systems:

- a.1. Gas turbine blades, vanes or “tip shrouds”, made from directionally solidified (DS) or single crystal (SC) alloys and having (in the 001 Miller Index Direction) a stress-rupture life exceeding 400 hours at 1,273 K (1,000 °C) at a stress of 200 MPa, based on the average property values:

        - a.3.c.3. Manufactured from material controlled by 1C016 with resins controlled by 1C008;

995
**Technical Note:** A 'splitter duct' performs the initial separation of the air-mass flow between the bypass and core sections of the engine.

1. Uncooled turbine blades, vanes or ‘tip shrouds’ designed to operate at a ‘gas path temperature’ of 1,373 K (1,100 °C) or more;

**Technical Notes:**

1. 'Gas path temperature' is the bulk average gas path total (stagnation) temperature at the leading edge plane of the turbine component when the engine is running in a 'steady state mode' of operation at the certificated or specified maximum continuous operating temperature.
2. The term ‘steady state mode’ defines engine operation conditions, where the engine parameters, such as thrust/power, rpm and others, have no appreciable fluctuations, when the ambient air temperature and pressure at the engine inlet are constant.

1. Gas turbine engine ‘parts’ or ‘components’ using ‘diffusion bonding’ ‘technology’ controlled by 2E0003.b;
2. ‘Damage tolerant’ gas turbine engine rotor ‘parts’ or ‘components’ using powder metallurgy materials controlled by 1C002.b;

**Technical Note:** 'Damage tolerant' ‘parts’ and ‘components’ are designed using methodology and substantiation to predict and limit crack growth.

Technical Notes:

1. For the purposes of 9E003.c, 'Incidence angle' is the acute angle measured between the plane tangential to the airfoil surface and the hole axis at the point where the hole axis enters the airfoil surface.
2. For the purposes of 9E003.c, 'Hole shape ratio' is the nominal length of the axis of the hole divided by the square root of its minimum ‘cross-sectional area’.
3. For the purposes of 9E003.c, 'Incidence angle' is the acute angle measured between the plane tangent to the airfoil surface and the hole axis at the point where the hole axis enters the airfoil surface.
4. Techniques for manufacturing holes in 9E003.c include “laser”, water jet, Electro-Chemical Machining (ECM) or Electrical Discharge Machining (EDM) methods.

5. For adjustable flow path geometry, see 9E003.h.

6. Power density of more than 700 kW/m³ of ‘box volume’;

**Technical Note:** 'Box volume' is the product of three perpendicular dimensions measured in the following way:

- **Length:** The length of the crankshaft from front flange to flywheel face;
- **Width:** The widest of any of the following:
  - a. The outside dimension from valve cover to valve cover;
  - b. The dimensions of the outside edges of the cylinder heads;
- **Height:** The largest of any of the following:
  - a. The diameter of the flywheel housing;
  - b. The diameter of the flywheel housing;
  - c. The diameter of the flywheel housing;
  - d. The diameter of the cylinder head;
  - e. The diameter of the cylinder head;

SUPPLEMENT NO. 2 TO PART 774—GENERAL TECHNOLOGY AND SOFTWARE NOTES

1. General Technology Note. The export of “technology” that is “required” for the “development”, “production”, or “use” of items on the Commerce Control List is controlled according to the provisions in each Category. “Technology” “required” for the “development”, “production”, or “use” of a controlled product remains controlled even when applicable to a product controlled at a lower level.

License Exception TSU is available for “technology” that is the minimum necessary for the installation, operation, maintenance (checking), or repair of those products that are eligible for License Exceptions or that are exported under a license.

N.B.: This does not allow release under a License Exception of the repair “technology” controlled by 1E002.e, 1D002.f, 8E002.a, or 8E002.b.

N.B.: The “minimum necessary” excludes “development” or “production” technology and permits “use” technology only to the extent “required” to ensure safe and efficient use of the product. Individual ECCNs may further restrict export of “minimum necessary” information.

2. General Software Note. License Exception TSU (mass market software) (see § 740.13 of
