EH performs vulnerability studies to identify environment, safety, and health vulnerabilities across the complex. Success will be measured by the reduction of the number of unaddressed serious vulnerabilities at DOE facilities from the current several dozen to zero by the end of FY 2000.

EH's multi-disciplinary, fully integrated oversight process for environment, safety, health, and safeguards and security evaluations has matured. Oversight activities serve as a catalyst for improvement and bring significant issues to senior management's attention. Success will be measured by downward trends in previously identified issues that lead to environmental releases, occupational injury and illness and recurrence of accidents.

EH is implementing nuclear safety standards for work in progress that will provide for the health and safety of workers, the public and the environment. Success will be measured by the effectiveness in implementing and complying with these nuclear safety standards on a DOE-wide basis.

The field, contractors, and outside organizations continue to adopt EH standards. Success is measured by a decrease in lost work days due to occupational illness or injury, a decrease in the number of personnel contaminations with radionuclides, and a decrease in the number of serious accidents where policy is a root cause of the problem.

David Michaels, PhD, MPH
Assistant Secretary
Environment, Safety and Health

Date

Environment, Safety and Health Energy Supply

Program Mission

The Office of Environment, Safety and Health (EH) is the major source of technical talent for the Department of Energy (DOE) in the areas of nuclear facility safety, worker safety and health, environmental management, and health studies. EH has set up a Corporate Safety function to facilitate transition of safety and health from internal regulation to that of licensing and regulation of safety and health to external regulation. As DOE's independent advocate for safety and health, EH assists line management in implementing major safety assurance and environmental compliance programs, and develops policies and standards related to environment, safety and health protection. EH staff is expert in the disciplines of nuclear safety, radiation protection, environmental protection, industrial hygiene, industrial safety, public health, construction safety, and risk management. EH activities funded within the Energy Supply appropriation are concentrated into three business lines within one operating decision unit: Technical Assistance; National Environmental Policy Act (NEPA); and Management and Administration. In addition, a program direction decision unit includes a portion of EH Federal staff and the EH Working Capital Fund.

EH activities include a wide range of functions that support key Departmental missions, address emerging safety vulnerabilities, nuclear and industrial hazards, and develop improved methods of managing or implementing programs. A substantial portion of these activities are also directed at performing crosscutting DOE-wide environment, safety and health functions analogous to those performed by any corporate safety office; e.g., supporting accreditation programs for radiation protection monitoring, administering DOE's Voluntary Protection Program for enhancing safety management, and collecting and analyzing DOE-wide environment, safety and health performance data to identify adverse trends or issues and assessing corporate vulnerabilities. EH maintains close contacts with private industry, regulatory agencies, and national environment, safety and health organizations, and facilitates information exchanges between DOE line management and counterparts in the private sector. EH staff also assist DOE managers in developing improved lessons-learned strategies; planning and conducting work (Enhanced Work Planning which is an integral part of the Integrated Safety Management System); applying regulations (guidance on NRC regulation); and providing radiation protection program management. EH activities support line program efforts to prevent injuries and illnesses; establish environment, safety, and health budget priorities; advocate cost-effective environmental management; and avoid risks attendant to the often unprecedented hazards that must be managed effectively across DOE.

The activities performed by the three business lines in support of the EH mission are as follows:

Technical Assistance activities involve DOE-wide safety functions that address emerging safety vulnerabilities, significant nuclear and industrial hazards, and improved methods for managing or implementing safety programs in support of Departmental missions. Additionally, this program provides a process for advocating the Department's position on emerging environmental regulations proposed by other Federal agencies, and assures that the Department's interests are considered in the formulation of cost-effective environmental standards affecting DOE. It also supports the Department's ability to represent the national position on environmental and radiation protection issues in the international standard-setting communities. Also, support is provided to: crosscutting Department-wide functions

which ensure the quality of environment, safety and health monitoring; safety and health protection of Federal and contractor employees; programs for strengthening safety performance; communication of environment, safety and health program guidance and practices; and lessons learned, including the maintenance and operation of an operating experience database.

National Environmental Policy Act (NEPA). EH provides technical assistance to DOE line management responsible for NEPA that enhances managers' decisionmaking, builds public trust, and minimizes the cost and time for document preparation and review while maintaining quality.

Management and Administration activities provide for the centralized management and direction of EH activities and include: budget and planning; systems support; information management; technical training and professional development; and DOE-wide assistance for the environment, safety, and health business and budget planning, execution and tracking processes.

Program Goals

- Provide technical operational assistance to provide quality, timely, efficient and effective environment, safety and health programs that meet priority needs and receive high customer satisfaction.
- Provide an effective system of policies, requirements, guidance and technical standards that protect the environment and enhance public and worker safety and health.
- Facilitate the effective implementation of the NEPA process enhancing efficiency and fostering public trust.
- Advocate the Department's position on emerging environmental regulations and standards to promote cost-effective, external regulatory programs protective of human health and the environment.
- Provide health physicists, industrial hygienist, and radiation scientist resources to improve the Department's ES&H activities.
- Maintain Department-wide business and budget planning and execution processes that identify environment, safety and health vulnerabilities and enable effective line program allocation and expenditure of environment, safety and health resources to the highest risk and significant safety issues.
- Provide an integrated information management program, including an operating experience database, that enhances environment, safety and health performance.
- Improve the performance and effectiveness of the Department's workforce and contractor employees in matters related to environment, safety and health through improved safety analyses and an effective lessons learned program.
- Provide corporate interface with external regulators to facilitate transition of jurisdiction for regulation of safety and health across the DOE complex.

Program Objectives

- Provide specialized technical assistance to line management to address environment, safety and health issues; identify processes that lead to improved performance.
- Provide an exchange of operating experience data and lessons learned strategies; promote safety management through analysis.
- Identify policy, requirements, guidance and standards in existing environment, safety and health directives, and integrate component parts into a new environment, safety and health directive system, and into a standards-based safety management system.
- Develop standards and implementation tools, as needed, that promote environmental and public protection goals in a more cost-effective and timely manner.
- Ensure appropriate review of Safety Analysis Reports (SARs), risk analyses and operational analyses.
- Develop environment, safety and health contract reforms that provide incentives for quality and timely performance and encourage innovative contracting approaches.
- Ensure the completion of timely and adequate NEPA reviews; ensure the consistency and quality of NEPA documents; and increase the efficiency of the NEPA process.
- Facilitate the transfer of DOE information and concerns to external regulatory authorities in support of formulating protective, cost-effective environmental regulations, directives and standards (both national and international) that reflect the Department's interests, including optimization of limited environmental protection and pollution prevention resources.
- Ensure the timely communication of DOE-specific guidance and instruction on the interpretation and implementation of newly-promulgated external environmental regulations, directives and standards to DOE line management where knowledge of, or expertise with, new environmental requirements is limited or does not exist.
- Streamline the environmental review process.
- Support the implementation of DOE-wide environment, safety and health budget planning and execution processes to improve accountability of contractors for environment, safety and health performance.
- Improve information management by enhancing EH's ability to provide quality environment, safety and health information to the public, DOE and other stakeholders; and promote safety management through analysis.
- Lead a transition from a prescriptive compliance-based approach to safety to a performance-oriented approach that provides a standards-based, graded approach to enhance facility safety.
- Foster robust academic programs for health physicists, industrial hygienists and radiation scientists that will provide an academic resource, including minority institutes, to assist the Department in technical studies.
- Act as the corporate point of contact for external regulation of DOE sites and facilities.

- Assure that workers are protected, to the maximum extent practicable, from hazardous and radioactive materials handling and operations.
- Maintain programs that promote and recognize excellence in safety and health.
- Support programs to enhance work planning, self-assessment and Integrated Safety Management Systems.
- Provide specialized programs for orientation, guidance and standards to prepare the Department for external regulation and facilitate its smooth transition.
- Develop and facilitate safety during closure of DOE's excess facilities across the DOE complex.
- Support and improve upon the safety and health programs across the DOE complex.

Performance Measures

The performance measures related to environment, safety and health activities are both qualitative and quantitative in nature. Some performance measures are:

- Improved understanding of the health effects associated with nuclear weapons production, testing, and use within past, current, and future DOE activities.
- Reduced worker health and safety impacts; no fatalities and fewer serious injuries; fewer instances of significant worker exposures; and lower overall total exposures to radiological and toxicological materials.
- Fewer radiological and toxicological contamination events; fewer abnormal operating events; fewer procedural violations; reduced non-compliance with external environmental requirements; and increased pollution prevention.
- Improved implementation tools to enhance environmental performance and reduce compliance/non-compliance costs.
- Decreased number of serious accidents where environment, safety and health policy is a root cause of the problem.
- Creation and implementation of a methodology to validate and authenticate information published by EH.
- Issuance of an annual report on ES&H expenditures/trends, accomplishments and emerging issues.

Significant Accomplishments and Program Shifts

Significant accomplishments and program shifts are defined within the respective business line descriptions that follow.

Funding Profile

Site Description

Albuquerque Operations Office

Albuquerque Operations Office is located on Kirtland Air Force Base in Albuquerque, New Mexico. The primary mission continues to be stewardship and maintenance of the nation's nuclear weapons stockpile. In addition to the national security mission, the Operations Office also devotes significant resources to restoring and improving the environmental quality of operations.

Sandia National Laboratories

Sandia National Laboratories' main laboratory is a national security laboratory located on Kirtland Air Force Base in Albuquerque, New Mexico. Sandia provides technical support in the evaluation of long term dry storage of K-Basin Spent Nuclear Fuel, taking into account the associated physical and chemical changes. Sandia also provides assistance in the development of software for radiological hazard analyses at DOE facilities.

Chicago Operations Office

Chicago Operations Office, Chicago, Illinois, is responsible for overseeing the operation of contractor-operated, multi-program laboratories such as Argonne National Laboratory and Brookhaven National Laboratory. In addition, Chicago Operations provides contractor support for EH's information management communications program including technical assistance for its local area network requirements and opportunities to develop, implement and evaluate stakeholder involvement, concepts, and processes. Chicago Operations Office also provides technical assistance in addressing methods to learn from worker error events, identify worker performance problems, and enhance worker safety behavior.

Argonne National Laboratory

Argonne National Laboratory is 25 miles southwest of Chicago's Loop. Argonne provides support in resolving the Nation's environmental, safety, and health problems and promotes environmental, safety and health stewardship. Argonne provides technical support on environmental and public protection issues, including analysis of emerging rulemakings; develops environmental guidance materials and implementation tools; develops DOE performance summaries on air resource protection; and implements Clean Air Act requirements. Argonne also provides technical expertise for water resources, and human and ecological risk assessments related to DOE releases. Argonne provides technical support on information issues and assists in managing information systems.

Brookhaven National Laboratory

Brookhaven National Laboratory (BNL) is located in Upton, New York on Long Island. As a non-defense research institution, BNL is dedicated to basic and applied investigation in a multitude of scientific disciplines. BNL provides technical support in the development of tools, case studies, and analyses related to radiation protection issues with particular emphasis on the ALARA (as low as

reasonably achievable) process. BNL also provides technical support in conducting reviews of safety analysis and risk assessment documents such as Environmental Assessments (EA), Environmental Impact Statements (EIS), Safety Analysis Reports (SAR), and Basis for Interim Operations (BIO). BNL provides technical support in the development of rules, orders, safety guides, and standards. These documents may include Safety Analysis Reports, technical safety requirements, waste disposal standards, and fire protection standards. BNL provides technical assistance for the Enhanced Work Planning program by implementing its Onsite Technical Assistance Program in the area of enhanced work planning and control.

Idaho Operations Office

Idaho Operations Office, Idaho Falls, Idaho, uses applied engineering to clean up the cold war legacy, execute multi-program missions, and leverage the Idaho National Engineering and Environmental Laboratory's expertise with emerging technology to meet the Nation's needs. In addition, Idaho Operations Office supports EH's technical information system by providing data collection and systems development support.

Idaho National Engineering and Environmental Laboratory

Idaho National Engineering and Environmental Laboratory (INEEL) is located 44 miles outside of Idaho Falls, Idaho. Lockheed Martin Idaho Technologies Company, as the prime contractor, provides technical support for information systems which includes maintaining the Occurrence Reporting and Processing System (ORPS) for use by DOE complex-wide. INEEL reviews policy and/or guidance documents that foster improvements in both performance and cost effectiveness of DOE's construction safety and hoisting and rigging programs.

Radiological and Environmental Science Laboratory

Radiological and Environmental Science Laboratory (RESL), Idaho Falls, Idaho, focuses primarily on analytical chemistry, radiation protection, and environment, safety and health activities. RESL supports the DOE Laboratory Accreditation Program (DOELAP) by administering the performance evaluation program for personnel dosimetry systems and acts as the performance testing laboratory. RESL receives applications, conducts test sessions, coordinates on-site assessments, and recommends accreditation as appropriate.

Oakland Operations Office

Oakland Operations Office, Oakland, California, is distinguished by its multi-program expertise in the following areas: national security; environment, safety and health; and biomedical/environmental sciences. The Oakland core competencies to support the success of these programs include: program/project execution; laboratory contract management; environment, safety, health and safeguards and security oversight; and business operations support. Oakland provides grant assistance for Fellowship Programs in areas such as radiation science, health physics.

Lawrence Berkeley Laboratory

Lawrence Berkeley Laboratory, Berkeley, California, pursues basic and applied research that advances the frontiers of science and solves a broad spectrum of national problems. It is a multi-program laboratory that serves the Nation's needs in technologies and environment, safety and health activities.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory (LLNL) is located in California's Tri-Valley region east of San Francisco. Lawrence Livermore conducts research in the national interest in the areas of advanced defense technologies, energy, environment, biosciences and basic sciences. LLNL also provides assistance in the development of rules, orders, guides and standards relating to safety at DOE nuclear facilities.

Oak Ridge Operations Office

Oak Ridge Operations Office, Oak Ridge, Tennessee, is responsible for research and development, defense programs, environmental management, and environment, safety and health activities. There are three major plant complexes on the Oak Ridge Reservation: Oak Ridge National Laboratory; Y-12 Plant; and the East Tennessee Technology Park, as well as the Oak Ridge Institute for Science and Education and the American Museum of Science and Energy. Together, these facilities represent a technological and educational resource and a major component of the East Tennessee Technology Corridor.

Office of Scientific and Technical Information

Office of Scientific and Technical Information (OSTI), Oak Ridge, Tennessee, is responsible for leading the Department's Technical Information Management Program and for providing direction and coordination for the dissemination of scientific and technical information. OSTI maintains technical information and DOE reports that EH staff access through OSTI.

Oak Ridge Institute for Science and Education

Oak Ridge Institute for Science and Education (ORISE), Oak Ridge, Tennessee, is a Department of Energy facility managed and operated by Oak Ridge Associated Universities. With a diverse array of complementary, and often unique programs, they are a resource for science education programs, emergency preparedness and response, radiological site characterization and other integrated scientific and technical expertise. ORISE provides grant assistance for Industrial Hygiene, Health Physics, and minority fellowships program awards.

Lockheed Martin Energy Systems

Lockheed Martin Energy Systems (LMES), Oak Ridge, Tennessee, carries out environmental management and restoration, environment, safety and health activities, manufacturing technologies, and other activities of national importance. LMES provides technical support and analysis on environmental protection issues associated with cultural resource management, water resource protection, and ecological resource protection including: analysis of emerging rulemakings, hazardous waste management, environmental restoration emerging rulemakings, and the development of environmental

guidance materials. LMES provides technical support in radiological characterization, interagency radiological site assessment, radiological dosimetry and risk analyses for public and environmental protection, and development of radiological guidance materials to convey regulatory requirements. LMES performs technical reviews of documents prepared in compliance with the National Environmental Policy Act (NEPA). They also provide analysis and assistance in preparing NEPA guidance documents. LMES provides technical support in the operations of the DOE Technical Standards Program. In addition, they also provide safety management, computer capabilities, technical editing, and related expertise to assist with the management of DOE Safety Programs in the areas of electrical safety and fire protection.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL), Roane County, Tennessee, is a multi-program science and technology laboratory. Scientists and engineers at the laboratory participate and support environment, safety, and health activities; increase the availability of clean, abundant energy; restore and protect the environment; and contribute to national security. ORNL provides technical expertise required to maintain safety methods capability available to all DOE criticality safety activities. ORNL provides assistance in the development and maintenance of criticality requirements and standards. ORNL also provides technical support in collecting, analyzing, and reporting environment, safety, and health requirements and budget requests to ensure that high priority projects are addressed during the budget process. The laboratory provides technical support in the development of risk-based, integrated worker safety programs through the development of various technical standards and guides, workshops, and training material. ORNL also assists in the DOE Voluntary Protection Program which is designed to provide a vehicle for DOE to recognize excellence in safety and health programs at its contractor facilities. The laboratory provides technical support to the Federal Employee Occupational Safety and Health (FEOSH) program in the development and implementation of the FEOSH program. ORNL also provides technical assistance in implementing the EH Onsite Technical Assistance Program.

Richland Operations Office

Richland Operations Office, Richland, Washington, manages waste products; develops, applies, and commercializes technologies; manages environment, safety and health activities; and supports cleanup and environmental restoration.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory (PNNL), Richland, Washington, develops and delivers new and effective environment, safety and health technologies. PNNL provides technical support on environmental and public protection issues, including analysis of emerging rulemakings, development of environmental guidance materials and implementation tools. This technical support includes development of DOE performance summaries on air resource protection and implementation of Clean Air Act requirements, water resources, and human and ecological risk assessment related to DOE releases. PNNL provides technical expertise in all aspects of radiological operations at DOE sites with Radiological Control Programs. This expertise involves radiological evaluations that monitor radiological practices, processes, and systems across the DOE complex.

PNNL provides technical support for the DOE Chemical Safety Program. Technical support is provided for health physics in the development of implementation guides, technical standards and technical solutions of specific radiological control problems. PNNL supports the development and implementation of the DOE Laboratory Accreditation Program, as well as the Voluntary Protection Program, Enhanced Work Planning, Federal Employee Occupational Safety and Health Program and other overall safety programs.

All Other Sites - Headquarters (Includes Commercial Contracts, Other Federal Agencies, and Universities)

Contractors provide:

- Technical and analytical support services relative to the implementation of and compliance with environmental statutes and regulations. Contractors provide technical support in the preparation of environmental guidance materials for DOE Headquarters program offices and DOE field organizations, and for document preparation in response to requirements of the National Environmental Policy Act (NEPA), DOE Orders and regulations pertinent to the Department. This includes reviewing environmental regulations and legislation to determine impact on DOE's NEPA compliance process and evaluating the effectiveness of DOE initiated reforms to improve its implementation of NEPA.
- Technical support for the Performance Indicator Program. They gather, analyze, trend, and report data to enhance the utility of the environment, safety and health reports presented to DOE senior management. They provide technical support in analyzing safety issues and concerns across the DOE complex. This includes support for various vulnerability studies such as the Spent Nuclear Fuel Study. They provide technical assistance in developing practical, cost-effective approaches and strategies for integrating environment, safety and health aspects into the decontamination and decommissioning projects at DOE sites.
- Technical support in the development and publication of an Operating Experience Weekly Summary to improve safety throughout DOE by applying lessons learned from previous occurrences. In addition, technical and analytical services are provided relative to EH information systems, computer support and video-teleconferencing. Technical support is also provided for the fellowship and faculty awards.
- Technical support and assistance in: analyzing results from technical support and assistance projects, and sharing lessons learned throughout the DOE complex to accelerate effective implementation of Integrated Safety Management; providing qualified safety and health professionals to perform research on questions delivered by DOE Response Line personnel; and providing technical assistance and support on matters relating to rulemaking activities.

The U.S. Department of Transportation/Volpe Systems provides technical support to the Aviation Safety program. Contractual support is provided as needed on a variety of tasks such as Information Outreach and Communication Outreach. The National Institute of Standards and Technology provides technical support for the DOE Laboratory Accreditation Program for Radiobioassay.

Technical Assistance

Mission Supporting Goals and Objectives

Technical Assistance has two fundamental goals: improving worker and nuclear facilities safety and protecting the environment. These activities often require the development of novel analysis tools and approaches, because the nature and mix of radioactive, hazardous, and toxic materials at DOE facilities are frequently one of a kind and unique. Efforts span: the design, construction, operation, maintenance, decontamination and decommissioning (D&D) and cleanup of nuclear weapons production and research-related facilities; construction safety; work planning activities, including techniques to identify, evaluate, and eliminate hazards; and identification of technologies and innovative adaptations of existing practices. Policy support and technical assistance is provided to support transactions with affected external regulatory agencies and with impacted Headquarters programs and field organizations. To enhance safety, support includes assistance to line management in developing Integrated Safety Management Systems; maintaining a corporate operating experience database; promoting effective operating experience analyses; applying WorkSmart Standards, and continuing Departmental Standards Committee initiatives. To help ensure safe operation of nuclear facilities and attendant hazardous activities, EH also develops and implements nuclear and worker safety policy requirements and standards including DOE Orders, rules, guidance documents, and technical standards. In the development of nuclear and worker safety requirements and standards, the Department interacts with other industrial, governmental, and international groups. In cases where DOE has unique nuclear conditions or hazards, particularly those involved in weapons production, DOE develops and applies its own DOE Technical Standards. These activities involve operation of the technical standards program in compliance with the National Technology Transfer and Advancement Act of 1995. EH develops and issues environmental policy to implement new legislation, regulations, or Executive Orders, or to otherwise protect the public and the environment when a deficiency in programs or operations is identified.

EH also serves as the central Departmental coordinating point for advocating the Department's position on external environmental regulations, directives and standards proposed by other Federal agencies. The primary purpose of this corporate activity is to assure the Department's interests are reflected in the formulation of protective, cost-effective environmental requirements applicable to DOE facilities and operations. This corporate activity is accomplished by tracking emerging rulemakings proposed under the authority of several key environmental laws, such as the Clean Air Act, Clean Water and Safe Drinking Water Acts, Comprehensive Environmental Response, Compensation and Liability Act, Emergency Planning and Community Right-to-Know Act, Atomic Energy Act and Resource Conservation and Recovery Act. The views of all of the Department's Program Offices and Field Organizations are solicited and considered with regard to a proposed rule and to the development of a consolidated Departmental response based on an internal analysis of the proposal and all comments received. Direct coordination with affected DOE elements is also conducted to ensure the formulation of an independent corporate position that best reflects the needs and interests of the entire complex. This DOE corporate position frequently considers, or is common to, energy sector and industry needs. In addition, this program supports the development of guidance and instruction for DOE line management to follow on the compliant interpretation and cost-effective implementation of new environmental requirements being promulgated by external regulatory agencies under the authority of the

aforementioned laws. This guidance and instruction provides the Department with tools for implementing public and environmental protection goals in a manner that helps optimize time, cost and compliance considerations. The program also consists of mandatory corporate environmental reporting, and participation on numerous intra-and inter-agency and international working groups, committees and organizations as the Departmental representative on environmental and radiation protection issues. EH acts as the corporate interface with the Occupational Safety and Health Administration (OSHA) where DOE has privatized facilities, and acts as their corporate interface with the Nuclear Regulatory Commission (NRC) where radiation protection or nuclear facility safety questions arise with respect to external regulation activities.

Significant Accomplishments

- Specialized technical assistance is provided to help line managers: develop site or facility-specific disposition plans; resolve nuclear safety issues evolving from decontamination and decommissioning (D&D) activities; work to ensure the safety of D&D workers from radiation and toxic exposure; and apply lessons-learned and good practices used by industry, the NRC and the International Atomic Energy Agency. During FY 1998, the program participated in the development of DOE Standard 1120-980, "Integration of Environment, Safety and Health into Facility Disposition Activities," and developed training sessions to implement this standard. During FY 1999, assistance is provided to implement this standard and to develop criteria for transitioning facilities at the end of a mission. (FY98: $200; FY99: $80; FY00: $80)

- Specialized technical support is provided to program and field offices as they implement Integrated Safety Management (ISM). ISM implementation is accomplished by using appropriate standards to ensure adequate protection for workers, the public and the environment against the hazards associated with facility operations. The ISM process implementation programs are underway at all DOE sites. Specifically, specialized assistance is being provided to the Tank Waste Remediation System (TWRS) Privatization and K-Basin Spent Nuclear Fuel stabilization projects at Hanford, and the Advanced Mixed Wastes Treatment Project at Idaho site during FY 1998 and FY 1999. (FY98: $200; FY99: $140; FY00: $140)

- Three DOE-wide assessments have helped DOE management better understand the condition and safety of spent nuclear fuel, plutonium, and highly enriched uranium stored at DOE sites across the nation. Although line management developed action plans to correct vulnerabilities found by the assessments, significant numbers of vulnerabilities remain uncorrected, and line management has had difficulty in tracking the status of corrective actions. EH is providing an independent compilation and evaluation of the status of the 560 vulnerabilities and their corrective actions. During FY 1998, an approach and a database for tracking and evaluating the vulnerabilities was established. During FY 1999, independent status reports on vulnerability resolution is being performed. (FY98: $300; FY99: $191; FY00: $191)

- EH evaluates and recommends new nuclear material technologies to improve the safety of tritium gas handling, plutonium nuclear materials packaging and storage, waste vitrification and stabilization and spent nuclear fuel processing. During FY 1998, significant expert technical support was provided in the preparation of a highly enriched uranium storage standard, and in the evaluation of a mixed oxide (MOX) fuel fabrication technology, Hanford's high level waste

vitrification technology, and Idaho's Advanced Mixed Waste Treatment technology. (FY98: $150; FY99: $0; FY00: $0)

- DOE's policy is to authorize conduct of high hazard nuclear operations only after the hazards have been carefully analyzed to determine the potential for accidents and their consequences, and necessary controls are provided to prevent or mitigate them. This is documented in a Safety Analysis Report (SAR) and other reports. The quality of these reports directly affects the safe operation of a facility through implementation of the prescribed controls. This program serves as DOE's corporate center of expertise for reviewing safety and authorization documentation. During FY 1998 and FY 1999, the review of selected SARs and Basis for Interim Operations and the evaluation of authorization bases will be performed at the request of line and field offices. (FY98: $500; FY99: $300; FY00: $300)

- EH provides specialized nuclear safety engineering support to program, field, and Secretarial offices in dealing with the challenges of changing former weapons production facilities to storage and waste management activities, and in consolidating the current weapons complex at Defense program sites. This includes stabilizing nuclear materials not recycled due to production cessation; revising the authorization basis for existing facilities to convert to a standards based approach consistent with modern safety standards; implementing a new regulatory framework (external regulation initiative) for DOE nuclear facilities; dismantling nuclear weapons; and disposing/storing fissionable materials. During FY 1998 and FY 1999, technical evaluation of the Hanford Tank Waste Remediation System (TWRS) Phase I design and the K-Basin Spent Nuclear Fuel (SNF) project is being performed and technical assistance is being provided to the Fort St. Vrain SNF project for the NRC licensing process and Advanced Mixed Wastes Treatment Project. In addition, technical assistance is being provided in the nuclear criticality safety assessments at Hanford, Rocky Flats, LLNL, ANL-W and in developing the Hydroxylamine Nitrate Technical report following the chemical explosion at Hanford. (FY98: $1,400; FY99: $1,000; FY00: $1,000)

- The National Environmental Policy Act (NEPA) requires that DOE evaluate potential environmental consequences of its actions. This activity assists in the overall review of Environmental Impact Statements (EIS) and Environmental Assessments (EA) by evaluating the accident and consequence analysis parts of these NEPA documents. During FY 1998 and FY 1999, accident analysis reviews of approximately 12 selected EISs and EAs will be performed annually. (FY98: $50; FY99: $50; FY00: $50)

- DOE owns many dams and water impoundments, seven of which are classified as high or significant hazard dams according to Federal guidelines. This activity sponsors the required safety inspection of these dams by the Federal Energy Regulatory Commission using Federal Emergency Management Agency guidelines. This activity also manages DOE's Dam Safety Program in accordance with Public Law 104-303 and participates with other dam-owning Federal agencies in the Interagency Committee on Dam Safety. In addition, this activity discharges the Department's responsibility of ensuring that the nuclear aspects of NASA's space missions are performed within acceptable safety margins. During FY 1998, this activity performed inspections of DOE's dams and water impoundments to assure their safety and conducted a nuclear review of the Cassini and Mars 2001 missions. During FY 1999, this activity will perform additional

inspections of DOE's dams and water impoundments to assure their safety, and a nuclear review of the Mars 2001 and Europa missions. (FY98: $325; FY99: $275; FY00: $275)

- The Department's ability to understand and learn from events occurring at its facilities is based upon the complex-wide Occurrence Reporting and Processing System (ORPS) managed within EH's Technical Assistance program. ORPS serves the corporate need to collect ES&H data and information as the basis for notification of events, performance measurements, analyses of operations, and lessons learned. Using information obtained primarily from ORPS, EH publishes the Operating Experience Weekly Summary, a document that presents analyses of accidents or unusual events. The similarity of many activities at the various DOE sites presents opportunities to enhance performance, meet environmental, safety, and health objectives, and reduce cost through the application of lessons learned throughout the DOE complex. This activity also publishes Safety Notices which provide more in-depth information on generic or recurring significant safety problems. In addition, special analysis reports are produced periodically, aimed at improving safety in single disciplines, such as decontamination and decommissioning and electrical safety. The DOE ES&H Performance Indicator Report, published quarterly, provides senior DOE management with a concise picture of Departmental performance in relation to performance indicators. Performance measures call attention to events that have directly affected workers and the environment, focus management attention on precursors to events, and provide a means of measuring the progress of risk reduction activities. During FY 1998 and FY 1999, the ORPS (which typically processes over 3000 reports annually) will be maintained and data and information from this system will be utilized in both the lessons learned and performance measurement programs. Fifty-two issues of the Operating Experience Weekly Summary will be published and disseminated to over 4,000 subscribers, and approximately 12 Safety Notices and Special Analysis Reports will be developed and disseminated. In addition, this program will collect and analyze corporate ES&H performance data and publish the Quarterly ES&H Performance Indicator Report, and maintain a new Internet system that allows customers to perform their own analysis. (FY98: $2,311; FY99: $1,789; FY00: $1,789)
- All nuclear facilities in DOE are required by law (10 CFR 835) to establish a radiation protection program that protects workers against radiological exposures. This activity provides assistance to line managers such as guidance, communication, coordination, and technical support in the field implementation of radiation protection programs. These services are provided across DOE sites and among same-site contractor organizations, and deliver valuable information about other sites where similar issues have been addressed, paths forward have been prepared, and solutions have been found. Outside perspectives conveyed to on-site managers and workers enable them to see their programs and activities in a different light. These activities are on-going each year. (FY98: $300; FY99: $200; FY00: $200)
- This activity provides technical support to the Department's Standards Committee (DSC). The DSC, chaired by the Assistant Secretary for the Office of Environment, Safety and Health, establishes processes and criteria for standards-based planning and work at DOE facilities. Best commercial practices are evaluated and effective standards-based work practices are developed and shared across the DOE complex. The standards developed by the DSC are instrumental in providing DOE and contractor line management with the tools necessary to plan and do work faster, better, and cheaper. (FY98: $350; FY99: $325; FY00: $325)

- The Atomic Energy Act requires the Department to self-regulate in the area of nuclear safety. This activity fulfills that requirement and establishes nuclear safety policy and the technical standards necessary to ensure that contractor activities adequately protect people, property and the environment from radiation hazards. These policies and standards are developed and maintained in collaboration with other nongovernmental and governmental groups and are independently reviewed by the Defense Nuclear Facilities Safety Board. While the Department adopts nongovernment safety standards when appropriate, DOE has unique nuclear hazards and operations, such as weapons production and cleanup, that require separate DOE requirements and standards. This activity also works with the NRC in the development of its nuclear safety requirements to ensure consistency with DOE nuclear safety policy and requirements. The Technical Standards Program, managed by this program, develops and maintains consensus standards for DOE use and coordinates DOE-wide participation in national and international standards-setting organizations. This program also evaluates contractor nuclear facility and operator training programs for effectiveness in implementing and complying with applicable nuclear safety requirements. (FY98: $1,625; FY99: $1,625; FY00: $1,625)

- This activity affords protection to DOE workers, the public and the environment from a criticality accident. KENO is the software code used to perform criticality safety evaluations. In FY 1998, KENO user training and applications assistance was provided to the DOE criticality safety community. Also, technical assistance was provided in the development and maintenance of criticality requirements and standards. (FY98: $220; FY99: $220; FY00: $220)

- EH assists DOE line management in preventing exposures to hazardous and toxic materials by developing cost-effective technical and analytical solutions for use in potentially threatening conditions. FY 1999 funding will develop and implement technical applications guidance for use by the field. In FY 2000 this activity will be incorporated into the hazards analyses and communications. In FY 2000 new activities will include safety and health data collection and analysis, interpretation of significant safety and health data, and creation of newly designed analytical tools and approaches to better identify and disseminate significant worker safety and health impact information. The DOE Worker Safety and Health Response Line now included in this new activity is replacing the "Corporate Services," and is a specific service provided to help resolve uncertainties regarding interpretations of all types of pertinent regulations and DOE Orders. (FY98: $900; FY99: $492; FY00: $492)

- The Decontamination and Decommissioning Project will be folded into an EH Facility Closure Program (FCP) in FY 1999, and will become a corporate-level crosscutting effort to provide Department of Energy (DOE) line managers with expert technical regulatory analyses and technical assistance as part of our support to line programs to better ensure the safe and cost-effective closure of surplus facilities. The technical bases for facility closure requirements were previously developed through the preceding EH Decontamination and Decommissioning (D&D) project during FY 1998 and FY 1999. The FCP initiative will provide technical analysis and clarification of DOE self regulatory expectations. Additionally, the FCP will support the transition to regulatory requirements and interpretations should the DOE proceed with external regulation. Technical assistance will be in the form of workshops/meetings with DOE line and field representatives to ensure both efficiency and consistency with the process of assisting on

54-291 99 - 33

specific closure requirements and regulatory interpretations. (FY98: $650; FY99: $300; FY00: $300)

- The Department uses aircraft for several missions including: transport of Defense special nuclear materials; critical site security; nuclear emergency response; aerial radiation measurement; and oil pipeline and powerline patrol. Both contracted private sector services and DOE-owned fleet aircraft are used in these services. Most of the services operate, or are on alert, 24 hours per day. Prior to developing a central office for standardization, aviation policy and technical safety assistance, DOE suffered a very high aircraft accident/incident rate. In 1991 and 1992 alone, DOE lost 12 aircraft and had 17 fatalities. Since the establishment of the Headquarters Aviation Operations Team in 1993, there has been only one accident and no fatality nor injury. The Aviation Operations team has developed and maintains a state-of-the-art accident-prevention information system which provides real-time safety information to operating field elements. In FY 1999, the Team is completing the development of a similar system which will assist with managing maintenance and fiscal information, and will produce mandated periodic reports. The development efforts end in FY 1999, and thereafter only system maintenance is necessary. The Team sends field inspectors to vendor sites to verify safety systems and standardization. These are continuing needs for FY 2000 and thereafter. Support funds for these efforts are leveraged through an interagency agreement with the Department of Transportation, Volpe National Transportation Systems Center. Volpe provides the development and maintenance support for the mission critical systems and shares the technology with other Federal agencies. Additionally, DOE shares its successes through the General Services Administration (GSA) sponsored Interagency Committee for Aviation Policy. (FY98: $350; FY99: $350; FY00: $350)
- In FY 1999, the guidance and interpretation function for the areas of construction safety will be consolidated with other specialized disciplines such as electrical and mechanical safety, fire arms safety, and fire protection that provide technical support for DOE Line Management. In FY 1998, construction safety required only nominal support in the areas of information collection and analyses, maintenance of information data bases, maintenance of documents on-line, and technical communications for these specialized disciplines. The personnel in these safety disciplines provide representation and support to national consensus bodies and advisory committees that are responsible for the development of standards, best management practices and other federal and industry-guidelines and regulations. (FY98: $300; FY99: $0; FY00: $0)
- For FY 2000, the technical assistance program will support a range of line activities, including: broad technical support, such as the guidance and interpretations function for construction safety; and other specialized technical safety disciplines, such as radiation protection, fire protection, industrial safety, industrial hygiene, and electrical safety. Personnel in these technical safety disciplines also provide representation and support to national consensus bodies and advisory committees that are responsible for the development of standards, best management practices and other Federal and industry-guidelines and regulations. Radiation protection activities provide: interpretations, amendments, and exemptions to 10 CFR 835; updated implementation guidance and technical standards; technical assistance to DOE line management on radiation protection to facilitate efficient program implementation and to support specific initiatives such as emergency response; and analysis of radiation exposures to DOE workers. (FY98: $1,200; FY99: $1,200; FY00: $1,200)

- DOE has 26 sites with significant chemical activities. Typically each site has more than 100,000 chemical containers, many of which are not fully characterized. The Department experienced a serious chemical explosion and other chemically related incidents in FY 1997, which led to the initiation of extensive review and upgrades in chemical safety practices. The upgrade initiative was initiated in FY 1998, however, activity will continue into FY 1999. A new 10-step chemical-safety improvement process has resulted in a significant overall reduction of chemical related injuries, but there remains much to be done. DOE is characterizing its legacy of chemical hazards and must address new hazards as they are identified. DOE is importing and incorporating the value-added aspects of programs of the Chemical Manufactures Association (CMA). These CMA programs include Responsible Care and best management practices of the chemical industry. This program will ensure that best practices are adapted to the special needs of each DOE site and implemented. It provides numerous opportunities for partnering among sites and between DOE and industry chemical and safety experts. The program will be extended to ensure that recent lessons learned in chemical safety are permanently captured and implemented in chemical work planning for our significant chemical operations. (FY98: $400; FY99: $500; FY00: $500)

- The Department of Energy Laboratory Accreditation Program (DOELAP) is mandated by regulation 10 CFR 835, and is similar to the Nuclear Regulatory Commission (NRC) private sector National Voluntary Laboratory Accreditation Program (NAVLAP). The DOELAP certifies each DOE facilities' ability to accurately determine a worker's exposure to radiation as measured by individual dosimeters (radiation detection badges) and radiobioassy, the analysis of urine and fecal samples to quantify the presence of any radiatioactive material inhaled or ingested by the worker. The daily operation of the DOELAP includes irradiating dosimeters and mailing them to facilities, calibration phantoms maintenance, preparation and processing of artificial urine and fecal samples, plus all the many support activities such as record maintenance and data collection. DOELAP accreditation is essential to demonstrate that worker radiation exposure is being measured accurately. A comprehensive, quality tested, internal dosimetry package will be provided to all DOE facilities for the calculation of internal radiation exposures to workers. Finally, extremity dosimetry will be incorporated into the existing whole body personnel dosimetry accreditation program, and accreditation technical standards, based upon national consensus standards, will be developed. (FY98: $2,400; FY99: $2,200; FY00: $2,200)

- The Voluntary Protection Program (VPP) is a nationally recognized program designed to encourage DOE sites to achieve excellence in their safety and health programs. VPP personnel assist sites in preparing for program participation by benchmarking DOE sites through partnering Occupational Safety and Health Administration (OSHA) VPP Star Sites from all sectors of the commercial arena with DOE sites so that DOE sites can learn and benefit from the commercial site efforts. By meeting established criteria, DOE sites can participate in the DOE/VPP program. Program participants are re-evaluated on set schedules to ensure continued adherence to program elements. The DOE-VPP Team provides direct support to field elements that are sponsoring VPP. Efforts include: utilization of specialized technical contact applications for onsite review teams; evaluation of quality control; technical assistance through its customer representative and outreach programs; coordination/networking; development of activities and materials; and interagency partner liaison. The DOE/VPP program is designed to also consider the applicant's achievements in integrated safety management. Onsite evaluations for four sites were performed

in FY 1998. In FY 1999, onsite evaluations-program assistance visits for four additional sites are expected. (FY98: $500; FY99: $500; FY00: $500)

- EH established a DOE-wide Federal Employee Occupational Safety and Health (FEOSH) program mandated by the OSH Act, DOE Order 440.1, and 29 CFR 1960. The continuing FEOSH program is prevention-oriented and provides expertise and tools to DOE line managers and field elements for developing and implementing site-specific safety and health programs for their Federal employees. The FEOSH program focus is to provide hazard intervention strategies that target particularly problematic safety and health issues. The FEOSH program also supports field elements providing specialized technical expertise not available locally; model programs that can be used for several Federal sites; and assistance in the resolution of employee safety and health concerns. (FY98: $200; FY99: $200; FY00: $200)

- Enhanced Work Planning (EWP) is a conduct of work process designed to improve worker safety and health practices which also results in improved work efficiency. The EWP principles are being applied to all work performed at DOE sites. This activity communicates EWP lessons learned among sites, and assists the field in developing a standardized approach to EWP, including work planning procedures, tools for better hazard analysis, hazard control strategies, and improved processes to target employee monitoring and identify health trends. At several DOE sites, EWP is now being implemented on a sitewide basis, and at other DOE sites, new pilots are beginning. In FY 1998, the majority of DOE sites will be implementing EWP programs, and in FY 1999, EWP will be embedded in work activities at virtually all DOE sites. In addition, the professional Federal staff have facilitated the downward trend of this program by sharing lessons learned, and sharing work planning procedures and software tools developed at EWP sites. Therefore, in FY 2000, the Department's sites should be relatively self-sufficient. (FY98: $1,700; FY99: $300; FY00: $0)

- EH provides the Defense Nuclear Facilities Safety Board (DNFSB) liaison, the primary focus of which is to serve as the transactional interface with the DNFSB. Activities to date have included development, coordination and preparation of responses to specific DNFSB recommendations, technical papers, reports, and requests for information on specific technical disciplines under the cognizance of this office which has the Departmental expertise in radiation protection and worker protection issues. In response to DNFSB Recommendation 95-2 and specific concerns by the DNFSB on safety management systems, the office conducted the Worker Protection Criteria initiative in FY 1998 to provide focus and definition for the basis of worker protection programs across the Department.The office will develop in FY 1999 model contract language and performance measures in support of DNFSB Recommendation 95-2, Integrated Safety Management Systems (ISM). The office will also develop tailored approaches to ISM implementation, collect and communicate lessons learned in ISM implementation and establish worker involvement as the eighth principle of ISM. During FY 2000, the projects will focus on moving the test protocols to site wide demonstration at selected sites. This activity will support the Department's ongoing implementation of its Integrated Safety Management Systems (ISMS) with emphasis on worker protection. (FY98: $400; FY99: $300; FY00: $1,100)

- Several preparatory activities are required to ensure the efficient transfer of regulatory jurisdiction from DOE to either OSHA, authorized states, or the Nuclear Regulatory Commission (NRC). This ongoing transitional activity requires identification, review and resolution of

significant implementation issues. Increased interactions with all potential federal external regulatory agencies was begun in FY 1997 to define the initial scope of transfer of jurisdiction from self-regulation to external regulation. Efforts are focused on four areas. The first is development of a scope and policy, which is designed to identify those fundamental organizational and structural changes that are needed to facilitate and expedite transition of jurisdiction to external regulators. The second is the matching of external regulator's existing set of regulations and policies through pilot projects, reviews and evaluations, and discussions among the various staffs. The third involves the provisions of real-time assistance and support to those field elements that are designed for intensive regulatory reviews. This will require the utilization of specialized contractor services to enhance staff capabilities which are limited in external regulatory experience. The fourth area is the development of a guidance and orientation mechanism for DOE field office/element and contractor personnel to ensure support to field and line program elements. Until DOE is regulated by external entities, DOE field offices are responsible for privatizations requiring the divestiture of properties or the investment of private capital on DOE-owned lands. Privatization support includes: resolution of safety and health jurisdictional issues; examination of safety and health issues related to "downsizing;" contract reform; privatization activities; evaluation of safety and health issues resulting from co-located privatized operations; evaluation of DOE's "landlord" responsibilities with respect to worker safety and health; maintenance of a database of DOE sites and facilities whose jurisdiction has been transferred to OSHA; independent assessment of regulatory and resource impacts; and working with the DOE legal staff to assess areas where lapses in safety oversight coverage may exist. (FY98: $1,400; FY99: $800; FY00: $1,200)

- Self-Assessment is an integral part of the Integrated Safety Management policy and program at DOE. The self-assessment module was developed in FY 1998 by EH staff, folded into the overall ISM process and pilot projects developed in the field. Improving self-assessment programs and integrating them into daily work processes and practices translates directly into cost savings as a result of improved productivity, efficiency, and safety. During FY 1999, it is anticipated that initial results from the demonstration efforts will show substantial value from testing a wide range of tools at various DOE sites. This effort will sustain the Department's ongoing implementation of Integrated Safety Management Systems at these demonstration sites. Further progression of this effort in FY 2000 will take place in conjunction with the Department's ongoing efforts to maintain a sustainable ISM system at all DOE sites and will include workshops and lessons learned conferences conducted by EH staff. (FY98; $0; FY99: $100; FY00: $0)

- Chronic beryllium disease (CBD) has been shown to be a very serious health problem at DOE defense and laboratory sites where beryllium was used. Numbers of former DOE beryllium workers have become immunologically sensitized, and others have progressed to a diagnosed disease. This activity supports a Secretarially-mandated policy for development and execution of a program for disease prevention and exposure control. The objectives are to define safety operating parameters, to establish medical surveillance programs, and to facilitate information exchange for prevention of chronic beryllium disease. This program, the Chronic Beryllium Disease Prevention Program, was initiated in FY 1997 with the efforts of a small Federal staff. In FY 1998, it focused on interim DOE Policy for exposure prevention strategies and initiated rule development on comprehensive program implementation. In FY 1999, specific activities include

resolving public comments received on the Notice of Proposed Rulemaking, published in the Federal Register in FY 1998, and publication of the Final Chronic Beryllium Disease Prevention Program rule. FY 1999 activities will also focus on interim DOE Policy to implement lessons learned that will enhance the rulemaking process and final rule. As the Policy rule will be completed in FY 1999, FY 2000 specific activities will include program implementation guidance and support, field program collaborative assistance, and expanded health surveillance. This activity will be supported by Federal staff who have developed the policy. This activity will be supported by the Federal staff who have developed the policy with the final rulemaking efforts funded in the EH Defense appropriation. (FY98: $0; FY99: $800; FY00: $0)

- Technical Assistance includes the review of environmental documents prepared by line management to verify the adequacy and validity of environmental technical information. This includes technical support on authorization of disposal sites and authorization limits for control and release of property containing residual radioactive material. (FY98: $305; FY99: $50; FY00: $50)
- The Technical Assistance also provides environmental policy advice and interpretation of DOE's rule on radiation standards and associated directives to protect the public and the environment. This includes significant increased assistance in the implementation of guidance to streamlining the approval and implementation process for controlling and releasing residual radioactive material. (FY98: $143; FY99: $50; FY00: $50)
- The program maintains up-to-date DOE-wide policy, directives, and regulations for radiation protection of the public and the environment and general environmental protection that increases the flexibility for implementing requirements in a more effective and streamlined manner, and incorporating within DOE an integrated management systems approach for environmental protection. The program also: reviews and updates environmental policies to reflect "reinventing government" concepts using an integrated management systems approach; and prepares proposed revisions to the Department's Environmental Protection Order. (FY98: $125; FY99: $100; FY00: $100)
- The Technical Assistance program provides environmental guidance, instruction and tools (e.g., regulatory bulletins, information briefs, models/codes, technical standards, management guides) to assist programs in understanding and implementing newly promulgated environmental requirements in the following areas: Clean Air Act, Clean Water and Safe Drinking Water Acts, Atomic Energy Act, Emergency Planning and Community Right-to-Know Act, cultural resource management acts, and hazardous substance release response, waste management and pollution prevention acts; and coordinates with various national and international standard-setting bodies in the development of technical standards pertinent to DOE. (FY98: $1,660; FY99: $1,200; FY00:$1,200)
- The Technical Assistance program also monitors over 200 emerging environmental rulemakings annually, and develops and represents DOE's position on proposed regulations, directives and standards to ensure that DOE's concerns are considered so as to promote efficient and cost-effective implementation of external regulatory programs complex-wide. The program completes reviews and evaluations of over 20 international and national standards and coordinate with

numerous national and international organizations on their development. (FY98: $880; FY99: $808; FY00: $808)

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Technical Assistance	21,444	16,445	16,445	0	0.0%
Total, Technical Assistance	21,444	16,445	16,445	0	0.0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Technical Assistance			
■ Many of the Department's facilities are near or past their intended operational lifetime. Hazards must be evaluated and controls established before each mission change from operation to final disposition (e.g. through shutdown, deactivation, decontamination, and decommissioning). Technical assistance will be provided that is essential to implementing DOE Standard 1120-98, "Integration of Environment, Safety and Health into Facility Disposition Activities", and to implementing facility transition criteria.	200	80	80
■ Hazard and safety analysis and technical safety requirement are important and integral elements of the Department's Integrated Safety Management (ISM) process for all phases of facility operations. As the Department's corporate center of expertise in these areas, assistance will be provided to sites and facilities in implementing ISM, as needed, for facility operations and disposition activities.	200	140	140
■ Follow-up will continue, at a reduced level of funding, on line management progress to correct safety deficiencies and hazards identified by the several complex-wide vulnerability studies (e.g., Plutonium Vulnerability Study, Spent Nuclear Fuel Study, and the Highly Enriched Uranium Vulnerability Study). Although line management has developed action plans to correct the 560 vulnerabilities found in the studies, a significant number remain uncorrected and line management is having difficulty in tracking the status of corrective actions. This activity will develop an independent status report of the vulnerability corrective actions and provide assistance to corrective action projects at Idaho, Savannah River, and Hanford.	300	191	191
■ The selection and application of new nuclear material technologies significantly contributed to DOE's strategic program for nuclear materials storage and waste management activities. Support was completed in the evaluation of applicable projects at the Idaho, Savannah River, and Hanford sites.	150	0	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The analysis of potential accidents, their consequences, and the controls to prevent or mitigate them are documented in Safety Analysis Reports (SARs) and other documents. The quality and accuracy of these documents directly affect the safe operation of a facility through the implementation of the controls they prescribe. As the corporate center of expertise in reviewing these documents, assistance will be provided at a limited level in evaluating selected SARs and Basis for Interim Operations (BIOs) at the request of line and field offices	500	300	300
■ EH provides specialized engineering support to program, field and Secretarial offices in a wide spectrum of technical disciplines including nuclear criticality safety, nuclear materials technology, chemical processes, fire protection, regulatory compliance and safety assessments. This specialized engineering assistance will significantly contribute to improving the safety of facility operations throughout the DOE nuclear complex and to developing the essential elements necessary for transitioning DOE's major sites with significant quantities of nuclear waste to external regulation. In addition, a level of assistance will be provided to enhance the safety of nuclear materials and facilities stabilization and consolidation, and waste processing activities	1,400	1,000	1,000
■ EH provides expert technical review of the accident and consequence analysis of Environmental Impact Statements and Environmental Assessments evaluations with regard to the potential consequence of the activity on the public and the environment	50	50	50

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ This activity assures the safety of DOE's seven hazardous dams and impoundments by sponsoring their inspection by the Federal Energy Regulatory Commission in accordance with Public Law 104-303. The activity supports participation on the Interagency Committee on Dam Safety. In addition to this committee, this activity supports participation on the Presidentially directed Interagency Nuclear Safety Review Panel (INSRP) to ensure that NASA's space missions will not disperse plutonium on earth. Safety reviews will be performed on the upcoming Mars 2001 mission and the Europa mission to Jupiter.	325	275	275
■ This activity manages an Occurrence Reporting and Processing System (ORPS) for notifying DOE management of nuclear events occurring at DOE facilities similar to the Nuclear Regulatory Commission's system. These data are compiled and analyzed for the purpose of deriving lesson(s) to be learned to prevent recurrence of a similar event. The lessons learned are disseminated throughout the DOE nuclear community through the publication of an Operating Experience Weekly Summary. When warranted, Safety Notices are also published to provide more in-depth information on significant safety problems and on generic or recurring events. Data will also be collected and analyzed on several dozen performance indicators that highlight activities directly affecting worker safety and protection of the environment. These data will be assimilated into a quarterly Performance Indicator Report which will provide DOE management with the progress made towards improving worker safety and protection of the environment at DOE sites. System improvements are being made to ORPS, which will result in decreased funding requirements in the outyears	2,311	1,789	1,789

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ EH continues to provide specialized nuclear radiation safety expertise to line management in resolving site/facility specific radiological health and safety problems and improving the safety of workers involved with nuclear operations. Activities include providing assistance on implementing 10 CFR 835, developing appropriate radiological engineering capabilities, instituting workshops to train personnel, and integrating essential safety controls into the site's planning, scheduling, and conduct of radiological activities	300	200	200
■ EH provides technical and liaison support to the Department's Standards Committee (DSC). This support includes information systems, materials and facilities for DSC meetings, and preparing DSC reports and documents. Support is also provided in defining criteria for establishing an acceptable standards program for operating facilities and assisting line organizations in incorporating these criteria in the development of standards-based planning and work	350	325	325
■ DOE is self-regulating as required by the Atomic Energy Act and, as such, is responsible for establishing the standards to which its contractors must adhere in performing nuclear related and non-nuclear operations. This program is charged with this responsibility and creates and revises the policies and standards necessary to ensure the safety and protection of workers, the public, and the environment in the performance of facility operations. These standards are issued in the form of rules, orders, and various guidance documents, each of which is designed to improve or enhance safe and environmentally benign operations. In addition, interface is maintained with the Defense Nuclear Facilities Safety Board, the Nuclear Regulatory Commission, and other governmental and industry groups on matters concerning nuclear safety and regulation	1,625	1,625	1,625

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continued support is required to maintain a quality safety methods capability available to DOE Criticality Safety activities. KENO (software code used to perform criticality safety evaluations) user training and applications assistance must be maintained. Development and maintenance of criticality requirements and standards must be continued. Improvements of the software code (KENO) must be made in order to establish a more user-friendly nuclear criticality safety software package	220	220	220
■ Hazards analyses includes safety and health data collection and analysis, interpretation of significant safety and health data and creation of newly designed analytical tools and approaches to better identify, analyze, and disseminate significant safety and health hazard impacts to the complex. The DOE Worker Safety and Health Response Line is a specific service provided to help resolve uncertainties regarding interpretations of all types of pertinent regulations and DOE Orders. The FY 2000 funding level is a best estimate based on past experience. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities.	900	492	492

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ In FY 1999, the Decontamination and Decommissioning (D&D) project will transition into the Facility Closure Program and will include the information and technical standard developed under the D&D phase of the project. The EH Facility Closure Program (FCP) is an EH corporate-level crosscutting effort to provide DOE line managers with expert technical regulatory analyses and support. This level-of-effort activity is part of our assistance to line programs to ensure the safe and cost-effective closure of surplus facilities. The basis for facility closure requirements was previously developed through the preceding EH D&D project during FY 1998 and ending in FY 1999, with that activity being transferred to the FCP initiative. The FCP initiative will provide technical analysis and clarification of DOE expectations. Additionally, the FCP is intended to support the transition to differing regulatory requirements and interpretations should DOE proceed with external regulation of these activities. Technical assistance is expected to be in the form of coordination between external regulators, regulatory analysis of site-specific requirements, workshops/meetings with DOE line and field representatives to ensure both efficiency and consistency with the process of assisting on specific closure requirements and regulatory interpretations. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities	650	300	300

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The Aviation Operations Team has developed and maintains a state-of-the-art accident-prevention information system which provides real time safety information to operating field elements. In FY 1998 and FY 1999, the Team will complete the development of a system to manage operation, maintenance and fiscal information, and to produce mandated periodic reports. The development efforts and system implementation will end in FY 2000, and thereafter only system maintenance is necessary. The Team sends field inspectors to vendor sites to verify safety systems and standardization. These are continuing level-of-effort needs for FY 2000 and thereafter. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities	350	350	350
■ FY 1998 was the last year in which specific funding was provided for guidance interpretation in the areas of construction safety. Beginning in FY 1999, this function has been consolidated with other specialized disciplines	300	0	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Activities include two broad based areas of support: technical services and radiation protection. Ongoing technical services include the guidance and interpretations function for the areas of construction safety, electrical safety, explosive safety, industrial hygiene, fire protection, and emergency response, which have been consolidated with other specialized technical disciplines to provide overall corporate technical support to DOE line programs. These corporate services include maintenance of technical standards, participation and representation in, and support to, national consensus bodies and advisory committees that are responsible for the development of standards providing best management practices and other Federal and industry-guidelines and regulations. Radiation protection activities focus mainly on the worker radiation protection in the DOE. These activities provide: interpretations, processing of amendments, and exemptions to 10 CFR 835, updated implementation guidance and technical standards; technical assistance to DOE line management on radiation protection to facilitate efficient program implementation and to support specific initiatives such as emergency response and analysis of radiation exposures to DOE workers. Overall reductions are minimal due to transfer of some work on the privatization initiative under external regulation. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities	1,200	1,200	1,200

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Activities will focus on implementing site chemical safety management programs that are consistent and in alignment with the Department's Integrated Safety Management Systems (ISMS), in order to promote safe management of chemical hazards consistent with other hazards management programs supported by ISMS. For FY 1999, the chemical safety program will conclude the chemical safety practice upgrade initiative. This program is now at level-of-effort status and supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities	400	500	500

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ This ongoing level of effort program consists of two parts: one is the DOE Laboratory Accreditation Program (DOELAP) and the Radiobioassay and Bioassay Accreditation Programs. The daily operation of the DOELAP includes irradiating dosimeters and mailing them to facilities, production of calibration phantoms, preparation and processing of artificial urine and fecal samples, record maintenance, data collection and report generation. DOELAP accreditation is essential to demonstrate to workers that their radiation exposures are being measured accurately. The DOELAP implements accreditation programs for whole body dosimetry programs, external dosimetry programs (wrist badges and finger rings) and radiobioassay laboratories. The Radiobioassay Accreditation Program and Extremity Dosimetry Accreditation Program implements recent national consensus standards and addresses quality assurance issues raised at sites across the DOE complex. A comprehensive and validated internal dosimetry package will be provided to all DOE facilities for the calculation of internal radiation exposures to workers. Finally, for radiation environments outside the scope of DOELAP (high energy neutrons at accelerator facilities and dose measurements associated with criticality accidents), intercomparison programs will be routinely modeled to identify quality issues and ensure consistency. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities	2,400	2,200	2,200

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ The Voluntary Protection Program (VPP) is modelled after private industry's program and is designed to encourage DOE sites to achieve excellence in their safety and health programs. DOE staff arrange a "benchmarking" partnership between a DOE site and a commercial site that already has OSHA VPP Star status. The DOE site can then benchmark its relative standing to the Star site and learn the proven programs and processes developed and tested by the commercial partner, thus transferring what can be utilized to the DOE site. DOE has an established set of criteria which aspiring VPP participants must meet. Once DOE-Star status is achieved, participating sites are re-evaluated on pre-determined schedules to assure continued adherence to program criteria. In addition to the brokering of partnerships for learning, DOE-VPP staff evaluate and process the VPP applications, select and lead onsite review teams, evaluate applicants with onsite review teams, and maintains customer representative and outreach programs for networking. Outreach program assistance is expected to increase with additional sites entering the program. Four additional sites are anticipated for FY 2000. Funding is based on history of costs on receiving, processing, review, and approval of a VPP application. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities	500	500	500

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The Federal Employee Occupational Safety and Health (FEOSH) program covers approximately 14,000 Federal employees in DOE. The FEOSH program is an ongoing, prevention-oriented program. It provides expertise and tools to DOE line managers and field elements for developing and implementing site-specific safety and health programs for their Federal employees. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities.	200	200	200
■ Specific budgeting for Enhanced Work Planning is concluded in FY 1999 because it has been adopted at virtually all DOE sites	1,700	300	0
■ This transactional interface activity with the Defense Nuclear Facilities Safety Board (DNFSB) covers the work associated with response to DNFSB recommendations and Technical Positions, both of which require DOE responses and actions. With DNFSB Recommendation 95-2, "Integrated Safety Management Systems," a complex process was developed to respond to the Recommendation. This activity supports and sustains the Secretary's commitment and challenge for accelerated ongoing implementation of the Departmental ISMS. The liaison effort to provide the DNFSB interface with ISMS program management began in FY 1999 and will carry on into FY 2000. At this time innovative approaches also will be deployed across the DOE complex to "jump start" and accelerate tailored approaches to ISM. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities.	400	300	1,100

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ External regulation transition support involves interactions with all Federal external regulatory agencies. It was begun in late FY 1997 and proceeded through FY 1998 to define the scope of issues involved in transfer of jurisdiction from self-regulation to external regulation. Efforts were focused on four areas: the first included broad scope policy, broad fundamental organizational and structural changes needed to facilitate and expedite transition of jurisdiction to external regulators; the second was the matching of external regulator's existing set of regulations and policies through pilots, reviews, evaluations, and discussions among the various staff; the third area was the development of guidance and orientation vehicles for use by field office/element and contractor personnel, and line program elements; and the fourth area is the development of a guidance and orientation mechanism for DOE field office/element and contractor personnel to ensure support to field and line program elements. EH has taken the initiative to set up a Corporate Safety function to facilitate transition of safety and health from internal regulation to that of licensing and regulation of safety and health to external regulating. Possibly a few single-purpose Science laboratories will be transitioned to external regulation in FY 2000. This effort supports the following commitment made in the Performance Agreement between the Secretary of Energy and the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities	1,400	800	1,200
■ Specific funding for Self-Assessment projects is concluded in FY 1999 and the project will be conducted by EH staff in FY 2000	0	100	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Chronic beryllium disease (CBD) is one of the very serious health problems resulting from working at DOE defense production and National Laboratory sites where beryllium was used. Numbers of former DOE beryllium workers have become immunologically sensitized, and others have progressed to a diagnosed disease. This activity supports a Secretarially-mandated policy development and execution of a disease prevention and exposure control program whose objective is to define operational safety parameters, establish improved medical surveillance programs, and facilitate information exchange for prevention of chronic beryllium disease. Activities will include program collaborative assistance, reviews and evaluations, and expanded health surveillance. This activity reflects the development of the Final Chronic Beryllium Disease Prevention Program rule. The final efforts for this rule development are funded in the EH Defense (Other Defense Activities) appropriation where the chronic beryllium disease program efforts are funded. This effort supports the following commitment made in the Performance Agreement between the Assistant Secretary for ES&H: Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities.	0	800	0

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Review environmental documents to verify the adequacy and validity of environmental technical information and to support implementation of streamlined and improved authorizations. Key reviews include several disposal site authorizations for DOE's low-level waste sites, and authorized limit documents for ten DOE activities. The disposal site authorizations are required for radioactive waste management, and the authorized limits result in more cost-effective and protective management of radioactive materials. Participation in these reviews is critical to the goals of improved cost-effective implementation procedure and ensuring environmental compliance. These reviews also identify needed updates to policy, guidance and program implementation tools that are needed by the field to effect program goals. Although these funds may not allow for the accomplishment of all requested reviews, they are estimated to address critical needs such as authorization reviews and analysis of annual environmental data to achieve the goals and basic performance metrics. This activity supports Strategy 1 of EH's Performance Agreement currently in effect: "Integrate and embed sound environment, safety and health management practices into the performance of DOE's day-to-day work" of the following performance objective: "Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment..."	305	50	50

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Provide environmental policy advice and interpretations on DOE's rule on radiation standards and associated directives to protect the public and the environment. This activity is essential to effective and consistent implementation of requirements, and appropriate use of radiation protection tools. It increases DOE-wide awareness of lessons learned, and avoids repeated and costly failures while capitalizing on success. Funding allocations are based on prior experience. Performance will be measured by the correctness and usefulness of advice given. In addition to the critical health and safety issues related to this activity (increases in radionuclide releases and doses), poor performance in this area could result in weakened DOE credibility with the public. This activity supports Strategy 1 of EH's Performance Agreement currently in effect: "Integrate and embed sound environment, safety and health management practices into the performance of DOE's day-to-day work" of the following performance objective: "Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities"	143	50	50

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Maintain up-to-date DOE-wide policy, directives and regulations for radiation protection of the public and general environmental protection. Activities include issuing rule radiation protection guidance and standards and associated directives, and updating of general DOE environmental protection policies and requirements including the Environmental Protection Order. Implementing 10 CFR Part 834, "Radiation Protection of the Public and Environment," is essential to DOE's public and environmental protection goals. It is necessary to ensure continued and improved safe operations at DOE facilities in a manner that is flexible and cost-effective. The environmental protection directives and policies included in this activity are intended to maintain within DOE an integrated systems approach for environmental protection that improves performance and reduces cost. Funding levels are based on experience from previous years and are prioritized based on an assumed funding level. Performance will be measured by the effectiveness of the improvements in policies and directives, and by the specific metric of resolving issues relating to EPA comments on Propose 10 CFR Part 834.	125	100	100

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Provide environmental guidance, instruction and tools (e.g., regulatory bulletins, information briefs, models/codes, technical standards, management guides) to assist programs in understanding and implementing newly promulgated environmental requirements in the following areas: Clean Air Act, Clean Water and Safe Drinking Water Acts, Emergency Planning and Community Right-to-Know Act, Atomic Energy Act, cultural and natural resources management acts and hazardous substance release response, waste management and pollution prevention acts. Through its work with emerging environmental regulations and Federal regulators, the Office of Environment has developed a firm understanding of regulatory requirements and an extensive working knowledge of how they affect the DOE complex and, to a certain degree, the energy section, as well as other government entities. This expertise is utilized to develop Departmental policies and guidance to assure DOE-wide understanding of newly promulgated environmental requirements, and respond to requests from DOE line management for assistance in developing cost-effective compliance strategies for new environmental regulations. These products and services help the Department meet its core value of protecting human health and the environment through the development of result oriented, cost-effective solutions. Performance will be measured by the level of success in fulfilling the commitments to improve the efficiency and effectiveness of DOE's ES&H activities articulated in the annual Performance Agreements between the Secretary of Energy and EH. This activity supports the "environment policy" component of Strategy 1 contained in the Performance Agreement currently in effect	1,660	1,200	1,200

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Monitor over 200 emerging environmental rulemakings annually, and develop and represent DOE's position on proposed regulations, directives and standards to ensure DOE's concerns are considered. Although EH's efforts focus on DOE research, development and production activity and facility needs, energy sector, as well as other Federal agency needs are frequently considered. The feedback provided to other agencies and institutions resulting from this effort promotes cost-effective, implementable regulations and standards while still ensuring protection of the public, environment and workers. It also provides feedback from field organizations to ensure that the practical aspects of proposed regulations are considered in their development. Funding levels are based on past experience, projected Federal and international regulations, directives and standards development schedules giving due consideration to anticipated legislative actions and administrative reforms. Performance will be measured by the level of success in fulfilling the commitments to improve the efficiency and effectiveness of DOE ES&H activities articulated in the annual Performance Agreements between the Secretary of Energy and EH. This activity supports the "environmental policy" component of the Strategy under the corporate management objective of the Performance Agreement currently in effect	880	808	808

National Environmental Policy Act

Mission Supporting Goals and Objectives

The National Environmental Policy Act (NEPA) program supports the implementation of the Department's proposed activities by providing the technical leadership and support needed to assure compliance with the National Environmental Policy Act and related environmental review requirements. The goal of the NEPA program is to foster sound departmental planning and decision-making and to build public trust through effective process implementation. NEPA program objectives include: (1) ensuring the timely and adequate completion of NEPA reviews through technical assistance, independent policy review, and approval recommendations for major programmatic environmental impact statements (EISs) site-wide and other EISs, and related NEPA documents; (2) ensuring the consistency and quality of NEPA documents and increasing the efficiency of NEPA personnel by determining and responding to customer needs; (3) issuing guidance on selected technical and policy topics; (4) conducting workshops for Headquarters and field NEPA personnel; and (5) participating in NEPA process improvement teams and other initiatives that foster continuing improvement of the NEPA process. Another objective is to streamline the environmental review process by issuing revised regulations and DOE Orders to reduce costs and regulatory burdens so that the process works better, costs less, and is more useful to decision makers and the public.

Significant Accomplishments

- Provide technical assistance and policy reviews and exercise quality control in the preparation of approximately 15 major environmental impact statements. (FY98: $2,000; FY99: $2,000 FY00: $2,000)
- Continue to implement NEPA streamlining efforts, including NEPA Contract Reforms, that will save more than $26 million over five years, and issue high priority guidance documents. (FY98: $1,000; FY99: $552: FY00: $500)

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
NEPA	3,000	2,552	2,500	-52	-2.0%
Total, NEPA	3,000	2,552	2,500	-52	-2.0%

Detailed Program Justification

NEPA	(dollars in thousands) FY 1998	FY 1999	FY 2000
■ Provide technical assistance, policy reviews and quality control in the preparation of major programmatic environmental impact statements, site-wide and other environmental impact statements, and related documents. This activity supports the environment policy strategy: "Integrate and embed sound environment, safety and health management practices into the performance of DOE's day-to-day work," of the corporate management objective of the current Performance Agreement: "Ensure the safety and health of the DOE workforce and members of the pubic, and the protection of the environment in all Department activities." Funding levels were derived from historical information and assuming a continued level of effort for approximately 15 major environmental impact statement reviews. Performance will be measured by the number, quality and timeliness of technical assistance and policy reviews.	2,000	2,000	2,000
■ Develop guidance and policy needed to increase the efficiency of Program and Field Office NEPA personnel and continue the regulatory development process to reduce costs and regulatory burdens so that the NEPA process works better, costs less, and is more useful to decision makers and the public. This activity supports the environment policy strategy of the corporate management objective of the current Performance Agreement. Funding levels were derived based on historical information assuming a continued level of effort for the regulatory development process and for issuance of high priority guidance or policy documents. Performance will be measured by the number and quality of guidance products issued.	1,000	552	500
Total, NEPA	3,000	2,552	2,500

Management and Administration

Mission Supporting Goals and Objectives

Management and Administration within the Office of Environment, Safety and Health (EH) consists of the following activities:

Information Management provides for the overall management of environment, safety, and health data and information for the DOE complex and other stakeholders. The office seeks to identify and facilitate access to data and information required for the successful conduct of the Department's environment, safety and health programs and activities by maintaining and integrating resources to provide for the reporting, tracking, trending, analysis, and dissemination of environment, safety, and health information and data.

EH Information Management provides life-cycle management of environment, safety, and health data and information. Through the ES&H Technical Information Services, the office provides for the reporting, analysis, tracking and dissemination of data throughout the DOE complex and to its stakeholders. Technical Information Services include the operation and maintenance of the Department's reporting systems for occurrence, radiation exposure, accident, safety performance and management, and medical and epidemiology information. Through the Worldwide Web, the Technical Information Services provides access to information in the areas of Oversight, Worker.Health and Safety, Environmental Policy and Assistance, Occupational Medicine, Medical Surveillance, Epidemiology, International Health, Lessons Learned, Integrated Safety Management, and Enforcement. Through its Technical Information Services, Information Management supports the Department's Strategic Goal of demonstrating organizational excellence in its environment, safety and health practices, in its communication and trust efforts, and its corporate management systems and approaches, as well as the Department's commitments to: (1) ensure the safety and health of the DOE workforce and the public, and the protection of the environment in all Departmental activities; (2) as a good neighbor and public partner, continually work with customers and stakeholders in an open, frank, and constructive manner; and (3) use efficient and effective corporate management systems and approaches to guide decisionmaking, streamline and improve operations, align resources and reduce costs, improve the delivery of products and services, and evaluate performance. The Office also maintains an information infrastructure necessary for implementing the EH mission.

In accomplishing its mission, the Office of Information Management relies on outsourcing of information management technologies including network operations, developing applications, maintaining and supporting systems, and technology transfer. Outsourcing provides access to hard-to-find skills and new rapidly evolving technologies and helps ensure that critical skills are available for short-term projects. It provides a mechanism to ensure that budgets and schedules can be met in a highly technological environment, and that resources are applied consistent with best industry practices for level-of-effort requirements. Outsourcing also allows management to focus on its primary objectives—customer service and cost management—in an environment of declining budgets and reductions in Federal staffs. Through outsourcing, successful implementation of the Department's Strategic Alignment Initiatives, and applying the General Accounting Office's guidance for improving mission performance through strategic information management and technology, the Office has reduced

its budget by more than 55 percent since FY 1994. At the same time, the level of customer service, as measured by metrics such as customer access and services provided, has increased every year.

Based on the efficiencies and reductions achieved between FY 1994 and FY 1997, and operational experience during FY 1998, the FY 2000 Budget estimate supports the level-of-effort required to follow best practices in the operation and maintenance of quality Technical Information Services in support of the Department's environment, safety and health missions.

Management Planning efforts are focused on enhancing the Department's business systems for planning and execution of environment, safety and health activities and functions, as well as ensuring the contracts provide an effective mechanism for managing environment, safety and health activities at all Departmental sites. The focus of Management Planning directly supports the Department's goal of clearly identifying and funding environment, safety and health priorities and ensuring that resources are appropriately spent on those priorities. Specific objectives include: (1) ensure all Departmental sites conduct sufficient work-scope planning and identify and fund environment, safety and health priorities in the FY 1999 budget and annually thereafter; and (2) monitor annually and report on environment, safety and health expenditures (commitments) and improve related internal controls.

Technical Training and Professional Development provides fellowships and grants to further industrial hygiene and health physics disciplines to provide a future employment pool for all of DOE.

Significant Accomplishments

Information Management

- Manages environment, safety and health data and information by integrating information technologies to support environment, safety and health reporting, tracking, and trending systems, and operating and maintaining information management systems and infrastructure to support the Department's Occurrence Reporting and Processing System, Radiation Exposure Monitoring System, Computerized Accident/Incident Reporting System, Performance Indicator Data System, Non-Compliance Tracking System, Safety Issue Management System, the ES&H Management Plan System, and other databases required for the environment, safety and health programs throughout the complex.
  - This activity supports the Department's Strategic Goal: The Department of Energy will strive to demonstrate organizational excellence in its environment, safety and health practices, in its communication and trust efforts, and in its corporate management systems and approaches: (1) "Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities;" (2) "As a good neighbor and public partner, continually work with customers and stakeholders in an open, frank, and constructive manner;" (3) "Use efficient and effective corporate management systems and approaches to guide decision making, streamline and improve operations, align resources and reduce costs, improve the delivery of products and services, and evaluate performance." (FY98: $4,807; FY99: $4,757; FY00: $4,757)
- Applies Web-based technologies and communications services available through EH's Technical Information Services to make information more rapidly and reliably available to the

environment, safety and health community and other stakeholders by providing awareness of and access to information and services that support the Department's National Environmental Policy Act program, Oversight, Lessons-Learned, Fire Protection, Radiation and Chemical Safety, Worker Health and Safety, International Health, Enforcement, Voluntary Protection, Medical, Vulnerability Assessment, and Integrated Safety Management programs.

- This activity supports the Department's Strategic Goal: The Department of Energy will strive to demonstrate organizational excellence in its environment, safety and health practices, in its communication and trust efforts, and in its corporate management systems and approaches: (1) "Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities;" (2) "As a good neighbor and public partner, continually work with customers and stakeholders in an open, frank, and constructive manner;" (3) "Use efficient and effective corporate management systems and approaches to guide decision making, streamline and improve operations, align resources and reduce costs, improve the delivery of products and services, and evaluate performance." (FY98: $4,493; FY99: $3,843; FY00: $3,843)

Management Planning

- On an annual basis, utilizes a risk-based prioritization approach to the review of line program environment, safety and health budgets and continue to ensure that all risk-significant environment, safety and health issues are adequately addressed in the Department's budget. This is possible due to the earlier successful institutionalization and integration of environment, safety and health risk-management activities within Headquarters line program and site processes. Management Planning efforts include providing guidance to Secretarial and field offices regarding the identification and budgeting for environment, safety and health activities. In addition, as part of the Departmental corporate budget discussions, Management Planning identifies and advises the Program Secretarial Officers and the Chief Financial Officer of any major environment, safety and health vulnerabilities present in the budget request. (FY98: $1,400; FY99: $800; FY00: $800)
- Develops the Department-wide environment, safety and health planning process from planning and budgeting to program execution and tracking for improved contractor accountability and performance. All Departmental sites were required to modify their contracts by December 31, 1997, to include the new DOE Acquisition Regulation (DEAR) Clause 970.5204-2, Integration of Environment, Safety and Health into Work Planning and Execution. Information on environment, safety and health commitments for execution year and progress made in meeting them is submitted by all Departmental sites during the annual budget submission. It is anticipated that the new Conditional Payment of Fee clause, which will strengthen the ability of the Department to promote appropriate ES&H performance, will be submitted for rulemaking in late 1998. (FY98: $2,600; FY99: $700; FY00: $700)

54-291 99 - 34

Technical Training and Professional Development

- Support ongoing grants, fellowships already awarded, and existing training programs at colleges and universities to ensure the education and development of the future DOE technical workforce. (FY98: $3,400; FY99: $2,503; FY00: $2,307)
- Continue to manage the planning, development, and administration of mandatory, technical, and professional development training for all EH staff. (FY98: $1,356; FY99: $400; FY00: $400)

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Information Management			
■ FY 2000 performance success will be measured by increased usage of ES&H Technical Information Services through the Worldwide Web, a greater availability, scope and content of ES&H Technical Information Services, and a greater volume of ES&H data routinely reported electronically through Internet technology. ES&H community and other stakeholders have more reliable access to relevant data through Internet technology. Continue the management of environment, safety and health data and information by:			
▸ Operating and maintaining information management systems and infrastructure to support the Department's Occurrence Reporting and Processing System, Radiation Exposure Monitoring System, Computerized Accident/Incident Reporting System, Performance Indicator Data System, Non-Compliance Tracking System, Safety Issue Management System, the ES&H Management Plan System, and other databases required for the ES&H programs throughout the complex.			
▸ Integrating information technologies to support ES&H reporting, tracking, and trending systems	4,807	4,757	4,757

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue to apply Web-based technologies and communications services available through the ES&H Technical Information Services to make information more rapidly and reliably available to the ES&H community and other stakeholders. Promote awareness of, and provide access to, information and services that support the Department's National Environmental Policy Act, Oversight, Lessons-Learned, Fire, and Radiation and Chemical Safety, Worker Health & Safety, International Health Studies, Enforcement, Voluntary Protection, Medical, Vulnerability Assessment and Integrated Safety Management programs. Since the development of the overall EH technical information system, the data collection efforts are streamlined in FY 1999 and FY 2000	4,493	3,843	3,843
Total, Information Management	9,300	8,600	8,600

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Management Planning			
■ Continue efforts to interface with key DOE sites in formulating sites' proposed ES&H programs and plans, conduct executive-level analysis of program cluster ES&H resource review (e.g., EM, DP, NE, ER) and program requests. The key focus is to improve the linkage between work and budget planning decisions to actual work execution, commitments and performance expectations. Specific activities that require contractor assistance include interfacing with key DOE sites (e.g., OR, RL, RF, ID) line programs efforts to ensure that proposed ES&H plans effectively address the inherent risks associated with the sites operations; assisting with the preparation of a corporate analysis of proposed line program ES&H plans and resources; and assisting in coordinating a response to external reporting requirements (e.g., Defense Nuclear Facilities Safety Board, Environmental Protection Agency) related to such Departmental issues as ES&H plans, resources, and compliance liabilities. Continue Departmental performance against its commitments under the Government Performance Results Act. Funding estimates are based on a labor hour estimate of the proposed work. This work directly supports the environment, safety and health strategy: "Ensuring DOE programs appropriately address ES&H priorities," of the corporate management objective of the current Performance Agreement. EH has collected the budget information for several years. Each year the data collection and review becomes more efficient. The sites' data is more readily accessible and useable, therefore the data collection and review expenses will decrease	1,400	800	800

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The key focus of the ES&H management plan effort is to ensure ES&H is an integral and visible element of work planning and work execution, ensure ES&H performance expectations and commitments are built into the programmatic (mission) and site-wide project milestones and priorities, and ensure commitment tracking and accountability mechanisms exist that clearly link work planning and commitments to actual work execution, performance monitoring (feedback), and financial incentives/rewards. The objective of this task is to provide corporate interface to improve the coupling between work and budget planning decisions to actual work execution commitments and performance expectations. Specific activities include working with key DOE operations offices with effective ES&H work and budget planning processes to enable the development of a mature commitment tracking system that enables line management monitoring and measuring of progress toward important ES&H commitments. Funding estimates are based on a labor hour estimate of the proposed work. This work directly supports the environment, safety and health strategy: "Ensuring DOE programs appropriately address ES&H priorities," of the corporate management objective of the current Performance Agreement	2,600	700	700
Total, Management Planning	4,000	1,500	1,500

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Technical Training and Professional Development			
■ Support ongoing grants, fellowships already awarded, and existing training programs at colleges and universities to ensure the education and availability of a future DOE technical workforce and to provide technical information which is beneficial to DOE and EH programs. FY 2000 performance will be measured by the quality and number of students that complete the Industrial Hygiene and Applied Health Physics fellowship programs.	3,400	2,503	2,307
■ Retain instructional support for the development of training activities. Conduct self assessments, as required by DOE training policy, to ensure that the EH training program is being implemented effectively and efficiently; and technical support needed for administering and upgrading the ES&H automated training management systems and databases is being maintained. Automated systems support the registration of training activities and process and store EH training data. These systems assure the accurate documentation and certification of the technical competence of the EH workforce and support grants, fellowships, and training programs at colleges and universities that enhance the recruitment of qualified graduates of critical disciplines and the development of the future DOE workforce. Also, support to Departmental training efforts is provided. The implementation of automated training systems in FY 1999 are expected to reduce support expenditures in FY 2000.	1,356	400	400
Total, Technical Training and Professional Development	4,756	2,903	2,707

Environment, Safety and Health - Energy Supply

Program Direction

Mission Supporting Goals and Objectives

Program Direction in this account provides overall direction and support for Environment, Safety and Health (EH) Energy Supply programs to ensure that all operations are conducted in the most efficient and effective manner.

Program Direction in this account has been grouped into four categories:

Salaries and Benefits provide funding for a Federal staff (FY98: 175 FTE; FY99: 129 FTE; FY00: 124 FTE) who have the technical expertise to carry out the essential EH mission. The EH mission requires experts to develop overall environment, safety and health policy for DOE sites and facility operations; to provide a central and coordinated source of scarce technical expertise to all field elements; to provide a central clearing house for information, analysis and feedback regarding new efforts, present activities, and unforeseen occurrences taking place at the multitude of diverse facilities within the DOE complex; to provide the Department with independent oversight capability to perform activities relative to environment, safety and health programs across the DOE complex, and oversee the Department's health studies endeavors.

Travel includes all costs of transportation, subsistence, and incidental expenses for EH's Federal employees in accordance with Federal Travel Regulations. This also includes travel costs associated with the permanent change of duty station.

Support Services are not provided for in this decision unit, consistent with Congressional direction.

Other Related Expenses provide for the EH Working Capital Fund and training for Federal staff. The Working Capital Fund provides for non-discretionary prorated costs for items such as space utilization, computer and telephone usage, mail service, and supplies. Training includes tuition for EH Federal employees.

Significant Accomplishments

Salaries and Benefits

- Salaries and Benefits reflect the revised full-time-equivalent (FTE) split between Energy Supply and Other Defense Activities. Overall, salaries and benefits are in line with the FTEs requested and include the 4.1% Economic Assumptions provided by the Office of Management and Budget (OMB). (FY98: $16,586; FY99: $11,313; FY00: $12,910)

Travel

- Overall, EH travel requirements are consistent with the overall EH Federal staff and include the 2.1% Economic Assumptions as provided by OMB. (FY98: $1,500; FY99: $1,500; FY00: $416)

Support Services

- Given the unique nature of the Environmental Safety and Health Program, support services are not provided for in this decision unit.

Other Related Expenses

- This provides for the EH Working Capital Fund (administered by the Office of Management and Administration) which covers non-discretionary prorated costs such as space utilization, computer and telephone usage, mail service, supplies and electronic services and training for Federal Staff which includes tuition costs for EH Federal employees. 2.1% is included for the Economic Assumptions as provided by OMB. (FY98: $5,464; FY99: $5,585; FY00: $5,672)

Technical Information Management

Program Mission

The mission of the Technical Information Management program (TIM) is to provide timely, accurate technical information to DOE's researchers and the public by collecting, preserving, and disseminating scientific and technical information, the principal product resulting from the multi-billion dollar Department of Energy research and development (R&D) program. The TIM program also provides worldwide energy scientific and technical information to the Department of Energy (DOE), the United States (U.S.) industry, academia, and the public through interagency and international scientific and technical information exchange agreements and coordinates technical information-related activities across DOE and its laboratories.

The Department of Energy makes a multi-billion dollar annual investment in energy- and environment-related R&D activities. The primary and immediate product of this investment is information that will lead to advances in basic science and technology; more efficient uses and conservation of our nation's energy resources; more advanced technologies for environmental protection and remediation; cleaner-burning fuels and better transportation sources.

As part of the Office of Science, the TIM program serves the U.S. research community by collecting and disseminating R&D information, increasingly in electronic, full-text form through the Internet. The program is continuing the radical transition to a new reality of reduced budget and staffing by using state-of-the-art information technology and skills. Working in partnership with other agencies, the TIM program provides the free, publicly-available Information Bridge (http://www.doe.gov/bridge) – one of the world's largest digital compilations of energy-related R&D information, containing nearly 30,000 (and growing) full-text technical reports. In addition, energy-related science journals are abstracted and indexed, resulting annually in 40,000 to 60,000 records of DOE and other domestic research being searchable with a single inquiry.

Other industrialized nations are also investing in energy R&D, and the resulting technical information is globally recognized as a valuable commodity that can be exchanged in order to save taxpayer dollars and avoid duplicative research. Representing DOE and the United States in international exchange agreements, the TIM program acquires an additional 80,000 foreign research records annually for use by the domestic science community. A large part of this foreign information acquisition comes through TIM's representation in the International Atomic Energy Agency's (IAEA) International Nuclear Information System (INIS). Under this agreement, TIM acquires foreign non-defense nuclear-related research information and fulfills the U.S. obligation to exchange its information as a member of the United Nations, to which IAEA reports.

Requirements for technical information management and dissemination are delineated in the American Technology Preeminence Act; the Paperwork Reduction Act (and implementing guidelines); Department of Energy enabling legislation; and international treaties/agreements with the International Atomic Energy Agency and the International Energy Agency.

Program Goal

To increase the payback and productivity of energy R&D by making the resulting information more easily accessible and widely available than ever before — at a lower cost per person served.

Specific GOALS include:

- Lead the Department in the collection, organization, preservation, and dissemination of scientific and technical information resulting from the Department's R&D programs; and
- Provide worldwide scientific and technical energy information to the Department, U.S. industry, academia, and the public.

Program Objectives

- Increase the number of researchers and citizens served with scientific and technical information at a lower cost per person served;
- Lead/advance the institutionalization of an electronic, decentralized technical information collection that contributes to the future development of a National Library of Energy Science and Technology;
- Negotiate and implement agreements for DOE's widespread, electronic access to U.S. science journals; and
- Provide more effective mechanisms for public access to global energy-related information.

Performance Measures

- Number of persons served with scientific and technical information and reduction in cost per person served;
- Percent of Departmental technical information exchanged electronically;
- Age and timeliness of information acquired and disseminated;
- Percent and amount of foreign energy-related information acquired to augment the U.S. collection and promote national competitiveness;
- Number of leading science journals available electronically to the DOE research community;
- Percent of DOE sites' distributed information collections linked and searchable with a single inquiry; and
- Customer satisfaction with Departmental scientific and technical information products and services.
- Continue to make available electronic journals at the desktop, and implement tools to facilitate electronic access to DOE's scientific and technical information.

Significant Accomplishments and Program Shifts

Program Support

The Technical Information Management program continues to make progress toward strategic priorities, known collectively as "Bringing Science Information to the Desktop."

- **Electronic Information Exchange and the Information Bridge**

  As technology and common standards advance, it becomes more timely and economical to exchange information in electronic media. While it will be necessary for the Department to maintain a centralized point of coordination for this electronic infrastructure (for policy, standards, archiving, etc.), Departmental elements will realize efficiencies in information technology, management, printing, and publishing as a result of Department-wide electronic exchange. EnergyFiles, a new web-based virtual library (http://www.doe.gov/EnergyFiles), puts energy science and technology information at the user's fingertips. It is a suite of Internet tools, which is now accessed over 70,000 times a month and provides one-stop access to approximately 350 different information repositories from across the DOE laboratories and other sites. The Information Bridge, which is the major component of Energy files and provides access to 30,000 full-text, electronic DOE R&D reports, will continue to enable the user to bypass expensive and time-consuming bibliographic searches and requests for paper reports. In FY 2000, the Information Bridge will be kept current with the latest in R&D results and will have at least a 50 percent increase in its user base.

- **Taking the Labor Out of Learning - Desktop Literature Searching**

  Scientific research is a cumulative and synergistic process where continued advances are dependent on previous research findings. The pace of these advances is largely dependent on researchers' and librarians' ability to locate and retrieve information pertinent to their research areas. While scientific journal articles and technical reports always cite references, locating and retrieving the full text of these references has historically been an additional, time-consuming step in the information search and possible only on the premises of major science libraries. The technology is now available to build electronic hyperlinks to the full-text referenced sources, taking a small fraction of the time of traditional searches and taking the labor out of learning. This capability, which is already being capitalized on in the life sciences at the National Library of Medicine, makes hyperlinks between electronic bibliographic systems (which are already maintained by the TIM program) and journal publishers' web sites containing full-text articles. The time is right for DOE to bring the same capability to the physical sciences research community. At the requested funding level, the requirements analysis for this capability will be completed.

- **Enhanced Access to Electronic Science Journals**

  The Technical Information Management program is aggressively pursuing agreements for the availability of electronic science journals for the Departmental research community, thereby saving the Department the cost of multiple paper-based subscriptions. Electronic journal agreements are estimated to save the Department $8,000,000 annually. In FY 2000, core science journals will be provided electronically to DOE research facilities.

- **Searching Distributed Collections**

  To complete the foundation for a future digital library for energy science and technology, technical information collections residing at DOE sites (20 plus labs and other research entities) must be linked and searchable with a single inquiry. This will be achieved through technology and standards capable of searching across multiple platforms and formats. In FY 2000, at least 5 major sites will be linked and searchable.

- **Archive of Science and Technology**

  The TIM program is the one place in the world where the Department's entire collection of scientific and technical information can be found. With the transition to the electronic information age, the repository function for the nation's energy-related science base must adapt to the new media. Interagency standards and agreements must be developed, adopted, and implemented while conserving resources and promoting information access and retrievability. The TIM program also houses a comprehensive repository of energy- and weapons-related classified and sensitive information—over 100,000 reports. Within national security requirements, the program is laying the groundwork for this collection to be protected and exchanged using new Information Age electronic technology.

- **Implementing the Transition from Paper to Electronic Information Management**

  The Department issued the Scientific and Technical Information Order, DOE O 241.1, and Implementation Guide which define the Department's new system for collecting scientific and technical information to make it searchable and retrievable. The new way of doing business described by the Order and Guide is the single most revolutionary change in the Technical Information Management program since it began in the 1940s. The Department's scientific and technical information program is being converted from a centralized paper-based one to a decentralized electronic environment. As technical information is the principal deliverable stemming from R&D, the web-based electronic TIM program is positioned to help improve the visibility of, and appreciation for, the Department's R&D. The Order and Guide were developed by a collaborative process between Laboratories, Operations Offices, and Headquarters; their development purposefully departed from command and control approaches and will ensure more timely and broadened access to results from taxpayer-supported R&D.

Site Description

The Office of Scientific and Technical Information is located on a 5 acre site in Oak Ridge, Tennessee. The mission of the TIM program is to provide timely, accurate technical information to DOE researchers and the public by collecting, preserving, and disseminating scientific and technical information. The TIM program is carried out at this one site.

[a] Share of Energy Supply, Research and Development general reduction for use of prior year balances assigned to this program. The total general reduction is applied at the appropriation level.

Program Support

Mission Supporting Goals and Objectives

Scientific and technical information is the principal deliverable from research and development (R&D). Department of Energy researchers, whether with laboratories, universities or contractors, document their research results in two main ways: report literature and journal literature. The TIM program plays a central role in making both types of literature searchable and retrievable.

For report literature, TIM coordinates a Department-wide program involving researchers, librarians, and program managers, which results in reports being collected, preserved, and disseminated. The Information Bridge, TIM's web product for reports, includes 2 million pages in 30,000 reports, all searchable. The Government Printing Office has found this product sufficiently valuable that it has sponsored making this web site available to the public.

For DOE-sponsored R&D that is recorded in journal literature, TIM creates bibliographic records and abstracts that allow the information to be located, searched, and retrieved. TIM makes these bibliographic systems available to the National Technical Information Service which, in turn, markets the database to vendors such as Dialog. Researchers access Dialog in order to do a literature search. Without such a bibliographic database, searches would be impossible.

All of this information is exchanged with foreign partners as part of international exchange agreements, in which the U.S. research community is given access to an additional 80,000 foreign research summaries per year, which would otherwise not be available from any other source.

Two primary laws specify and mandate DOE's technical information responsibilities: (1) Public Law 93-577, "National Energy R&D Policy Act," directs DOE to effectively manage and disseminate information resulting from R&D activities and (2) Public Law 102-245, "American Technology Preeminence Act," requires federal agencies to send technical information to the National Technical Information Service (NTIS) in the Department of Commerce. To most effectively meet these statutory responsibilities; to fulfill international information exchange obligations; and to ensure accountability for its R&D expenditures, DOE has assigned these responsibilities to the TIM program, operated by the Office of Scientific and Technical Information (OSTI) within the Office of Science. NTIS, as it has with a single entity in all federal R&D agencies, signed a Memorandum of Understanding with DOE designating OSTI as an NTIS "affiliate," whose responsibilities are to ". . . transfer to NTIS, within 15 days of the date it is first made available for public dissemination: one copy of each final scientific, technical, and engineering information product resulting from DOE's research and development activities. . ."

The TIM program receives information from over 7,000 research entities in the DOE complex; organizes the information into a searchable and retrievable collection; and, in addition to other dissemination mechanisms, submits the information to NTIS as required by the American Technology Preeminence Act. NTIS databases depend on the TIM program to collect DOE's technical information because (1) the 7,000 submitting entities (from which TIM gathers the information and maintains a coordinated collection infrastructure) would not uniformly send reports to NTIS and (2) NTIS is not equipped with the resources or capabilities to collect and organize this raw information from over 7,000

different sources. The TIM program also manages an active classified information repository of 10,000 reports, which are not exchanged with NTIS. The TIM program works with both the Government Printing Office and NTIS in disseminating the Department's R&D information to the public. These relationships are required by law. Technology is allowing for more streamlined and less redundant exchange of information.

While DOE and NTIS databases contain some of the same information, there is no redundancy between the mission of TIM and NTIS as TIM serves DOE's research community of 30,000 scientists and engineers; manages a 50-year archive of 1.1 million unclassified and 100,000 classified documents; and fulfills U.S. obligations under two international information exchange agreements, resulting in 80,000 foreign R&D summaries being available to the U.S. research community each year, a collection that would not otherwise be available from any other source. One of these exchange agreements involves the International Nuclear Information System (INIS), under the aegis of the International Atomic Energy Agency and the United Nations. Under this agreement, TIM fulfills the U.S. obligation to provide its non-defense nuclear-related R&D information and, in exchange, receives worldwide nuclear research results, which American scientists access, search, and retrieve.

Program Direction

Mission Supporting Goals and Objectives

Program Direction funding provides staffing and resources to both direct and execute the Technical Information Management (TIM) mission. Federally-staffed functions include policy development and integration; U.S. and DOE representation in interagency and international information exchange agreements; and collecting, preserving, and disseminating information resulting from DOE's R&D investment. Federal employees are used when it is more economical than outsourcing or the functions are inherently governmental in nature.

Program direction is divided into the following categories:

Salaries and Benefits provides for Federal staff involved in the functions described above.

Travel provides for program-related travel to coordinate and implement partnerships within DOE and with other federal agencies to exchange electronic information and provide free access, via the Internet, to taxpayer-sponsored R&D results.

Support Services provides on-site services in such areas as mail operations, local area network support, and analysis of electronic information exchange.

Other Related Expenses represent maintenance and utilities costs for the Office of Scientific and Technical Information facility and equipment for office automation and work requirements.

Funding Schedule

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
■ In the Technical Information Management (TIM) program, OSTI employees are responsible for both program direction and program execution/implementation. As such, OSTI has a percentage of its federal staff serving in an administrative or oversight capacity and the remainder serving as hands-on "implementers" of the program. Federally-staffed functions include policy development and integration; U.S. and DOE representation in interagency and international information exchange agreements; and collecting, preserving, and disseminating information resulting from DOE's R&D investment. Federal employees are used when it is more economical than outsourcing or the functions are inherently governmental in nature. In FY 2000, with 97 employees, the TIM program will continue the transition to bringing electronic science information to the desktop. The functions provided include enhancements to electronic information exchange and the DOE Information Bridge; enhanced access to electronic science journals; representing the U.S. and DOE in foreign information exchange agreements (resulting in 80,000 foreign records available to domestic researchers); electronic archiving of 50 years of DOE's legacy document collections; developing information technology applications for taking the labor out of learning and providing desktop literature searching; and searching distributed collections at DOE sites across the Complex. Achieving these functions will complete the foundation for a future digital library of energy science and technology thereby avoiding costly duplication of information collection, archiving, and dissemination by multiple DOE sites.	6,880	6,600	6,880

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Travel			
■ Travel funding is required for the partnering and coordination inherent in a nationwide, distributed research and information environment.	120	100	120
Support Services			
■ FY 2000 is at the base level of support services needed primarily for internal and external automatic data processing functions.	200	100	200
Other Related Expenses			
■ Expenses reflect facility maintenance costs, including scheduled replacement of parts, equipment, and supplies. Expenses also reflect a transition to enhanced telecommunications for handling increased information dissemination.	300	200	300
Total, Program Direction	7,500	7,000	7,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ FY 1999 salary costs reflect a lower staffing level following a major reduction in force in FY 1998. FY 2000 reflects a workforce of 1 less FTE but also includes cost of living increase of 4.2 percent, or $280,000	+280
Travel	
■ Travel increase of $20,000 is needed to coordinate with R&D sites in developing and implementing information exchange standards and priorities.	+20

	FY 2000 vs. FY 1999 ($000)
Support Services	
■ Support Services increase of $100,000 reflects a restoration of basic support to infrastructure services such as PC maintenance and training, scanning of DOE technical reports, and other information services as required of the TIM mission.	+100
Other Related Expenses	
■ Other Related Expenses increase of $100,000 includes remediation of an underground storage tank and upgrading of telecommunications capacity to manage increased volume of Internet customers.	+100

Field Operations

Program Mission

The Field Operations account pays for the administrative staff, technical experts, and operational resources that support the direct program activities at the four multi-purpose Operations Offices - Chicago, Idaho, Oak Ridge, and Oakland, and the eighteen laboratories and facilities under their purview. Through the administration of more than 3,500 science and technology contracts and grants at universities, and other public and private entities, these resources support the Department's Strategic Plan by sustaining the managerial, business, fiduciary, contractual, and technical foundation necessary to execute the four business lines - science and technology, national security, energy research, and environmental missions.

Program Goal

Provide management and administrative services, at reduced costs through consolidation and re-engineered processes, that enable the Field to continue environmental cleanups; reduce surplus weapons' inventory, support the national laboratories and research facilities; institute environmental, safety and health initiatives; maintain communications with stakeholders; create public and private partnerships, and take advantage of reindustrialization opportunities

Program Objectives

- To maintain the field infrastructure in an environment that is safe and hazard-free.
- To streamline the procurement processes to effect a reduced award cycle time and improve contractor performance and accountability.
- To enhance information systems and technology performance and reliability
- To improve the efficiency of financial operations and effectiveness of financial reporting
- To provide the basic day-to-day operational requirements associated with a viable office environment.
- To improve communications with customers, stakeholders, and the public

Performance Measures

- Award the competitive contracts for Y-12 Plant and Oak Ridge National Laboratory
- Transfer ownership of the Water Plant to the City of Oak Ridge.
- Complete the preliminary design of the Mixed Oxide (MOX) Fuel Fabrication Facility
- Realize cost avoidance of at least 10 percent by consolidating the acquisition of information systems and network architecture.

- Automate budget transmissions between the contractor/laboratories, the Field, and Headquarters.
- Increase the percentage of commercial payments made on time to 93 or better.
- Reduce contract closeout backlogs by 10 percent.
- Certify more than 50 percent of the technical staff to handle environmental, safety and health issues.
- Reduce the Freedom of Information backlog by 10 percent.
- Increase the percentage of procurement awards made within the established lead times.

Significant Accomplishments and Program Shifts

- The Source Evaluation Board conducted the request for proposal review for the MOX Fuel Fabrication and Reactor Irradiation Services. The proposed use of MOX fuel is part of the hybrid strategy to dispose of surplus weapons-usable plutonium. This effort supports President Clinton's commitment to eliminate the accumulation of plutonium surplus.
- The solicitation for architectural and engineering services to design the PIT Disassembly and Conversion Facility was conducted. The design effort is estimated to be last approximately 30 months.
- The shipment of Spent Fuel Rods from Asia has been completed. This was a major undertaking that involved several federal agencies and four states - California, Nevada, Utah, and Idaho. To date, more than 2,000 state and local personnel have been involved.
- The contract with the University of California was renewed. The incumbent of this contract is responsible for managing three of the Department's major management and operating contractors: Lawrence Livermore National Laboratory, Los Alamos National Laboratory, and Lawrence Berkeley National Laboratory. This new performance-based contract is valued at $12.5 billion through FY 2002.
- The Brookhaven National Laboratory contract was awarded in record time, considering the complexity of the solicitation requirements.
- Through the use of a telephonic hotline, seven solicitations were issued electronically. This practice eliminated the costs for printing and mail and provided immediate access to interested parties
- Integrated Safety Management clauses are being incorporated in contractor contracts to ensure worker safety and minimize environmental releases. These metrics are periodically evaluated and modified to challenge contractor performance.
- The lease for the Human Genome Facility in Walnut Creek, California was approved. This facility will house a team of scientists from Lawrence Berkeley National Laboratory, Lawrence Livermore National Laboratory, and Los Alamos National Laboratory that are working on the Human Genome Sequencing Project.
- Technical personnel are being certified to manage environmental, safety, and health issues. Self

assessments are being developed to help prioritize and project additional training needs

- The heating, ventilation, and air-conditioning systems were replaced to comply with air quality standards at Oak Ridge Additionally, the elevators were upgraded to minimize potential safety risks.
- A portion of Building 1916-T, located in Oak Ridge, Tennessee, was renovated in order to increase the number of occupants, leading to the relocation of approximately 110 employees from a smaller building The relocation eliminated the need for the smaller building altogether and reduces overall operating costs by approximately $500,000 per year.
- The financial systems database consolidation Phase II for all Oak Ridge Financial Service Center Clients was completed in FY 1999 making this Center of Excellence fully operational
- This account has managed a 24 percent reduction in federal staff since FY 1995, in accordance with the Department's strategic alignment initiative.

Site Description

Overall, these offices provide major services that support the programmatic missions of Defense Programs, Energy Efficiency and Renewable Energy, Energy Research, Environmental Management, Fossil Energy, Nuclear Energy, Nonproliferation and National Security, Uranium Enrichment, and Work for Others. The service responsibilities are indicated in "Missions Supporting Goals and Objectives." Additionally, each individual office has oversight and unique responsibilities as indicated below

Chicago Operations Office

Chicago is responsible for the integrated management of its four performance-based contractor laboratories sites -- Argonne National Laboratory, Fermi National Accelerator Laboratory, Princeton Plasma Physics Laboratory, and Ames Laboratory; and two government owned and government operated federal laboratories -- Environmental Measurements Laboratory and New Brunswick Laboratory Chicago also provides some technical support to the Brookhaven National Laboratory, another performance-based management contractor laboratory site. Chicago has cognizance of about 10,000 contractor employees located at various site offices across the nation. This responsibility includes ensuring the security and environmental safety of the taxpayer's investment -- approximately 16,000 acres of land with a physical plant worth of about $5 8 billion Chicago is often noted as a leader in both intellectual property matters and managing more than 2000 active procurement instruments Several departmental elements rely on these patent services and the expertise within this Center of Excellence for Acquisitions and Assistance

[a] Mainly due to a one percent increase in full time equivalents as authorized in the current staffing allocation.

[b] Oak Ridge received $2.9 million for modernization activities, in FY 1999 only, to net $500,000 cost avoidance annually thereafter.

Idaho Operations Office

Idaho has oversight responsibility for the Idaho National Environmental and Engineering Laboratory with its seven major operating facilities and one government owned and government operated federal laboratory, the Radiological and Environmental Science Laboratory The site covers 890 square miles (569,600 acres), includes 510 buildings entailing nearly 5 3 million square feet valued at $1.8 billion, and employees over 6,000 employees. Idaho is involved with multi-programs ranging from the DOE's Electric and Hybrid Vehicle program, Fusion Safety, Fossil Fuel activities, Advance Nuclear Test Reactor (which allows experiments under unique nuclear environments), and Environmental Restoration and Waste Management activities.

Oak Ridge Operations Office

Oak Ridge has oversight responsibility for the Oak Ridge National Laboratory (ORNL), the East Tennessee Technology Park (ETTP), Paducah Gaseous Diffusion Plant, Portsmouth Gaseous Diffusion Plant, Y-12 Plant, and the government owned and operated Oak Ridge Institute of Science and Education Laboratory (ORISE). Oak Ridge has cognizance over 15,000 contractor employees located at these sites, as well as responsibility for over 43,000 acres of land and approximately 46,000,000 square feet of facility space, valued at over $12 billion. ORNL has responsibility for the Energy Research Program's number one priority - the Spallation Neutron Source, which is scheduled to begin construction in FY 1999 The Y-12 Plant has recently resumed weapons production operations, and the ETTP is responsible for utilizing DOE assets by recycling metals, the sale of precious metals, and the disposition of uranium Other major initiatives at Oak Ridge include reducing environmental risk, reducing Y-12 weapons footprint, re-industrializing the ETTP and the Y-12 plants for commercial use; the revitalization of the scientific infrastructure; and creating public and private partnerships for regional economic development. Oak Ridge is also recognized as one of the Department's three Financial Centers of Excellence

Oakland Operations Office

Oakland is responsible for supporting the national securities and science, physics and biomedical research, and high energy physics activities which contribute to the California economy. These activities are conducted mostly at the following major laboratories of which Oakland has oversight responsibility: Lawrence Livermore National Laboratory, Lawrence Berkeley National Laboratory, and Stanford Linear Accelerator Center Oakland administers more than 1,600 contracts, grants and assistance awards valued at about $28 billion. OAK manages $1.2 billion in major industrial contracts with Westinghouse, General Electric, General Atomics and Combustion Engineering. As such, Oakland administers all grants west of the Mississippi and consequently, operates a Grants Center of Excellence.

Field Operations

Mission Supporting Goals and Objectives

Seventy percent of this program direction account pays salary and benefits of roughly fifty percent of the federal personnel located at each operations office. The staffing levels are consistent with the most current strategic alignment allocation for FY 2000. This level represents a 24 percent staffing decline from the FY 1995 baseline. The staffing supports the administrative and technical personnel that are responsible for managing the office, financial stewardship, personnel management, contract and procurement execution, human resources, labor relations, legal counsel, public and congressional liaison, patent and legal services, environmental compliance, safety and health management, infrastructure operations maintenance, information systems development and support, and reindustrialization.

The remaining thirty percent pays for a broad mix of costs that the operations offices' encounter during the execution of a fiscal year. The major costs are the fixed costs associated with rent, utilities, and telecommunications Other requirements such as information systems support, administrative support, mail services, printing and reproduction, travel, certification training, vehicle acquisition and maintenance, equipment, classified/unclassified data handling, records management, health care services, guard services, and facility and ground maintenance are also included. These costs are relatively fixed in that the level of effort may be reduced but not to the extent that the total cost can be eliminated without crippling office performance and productivity. The offices are also responsible for suppling office space and work material for the Office of Inspector General located at each site. With the budget reductions over the immediate past years, these areas are already funded at the minimum level necessary to support the Department's critical missions in the Field.

Other operational requirements funded include occasional contractor support to perform ecological surveys, costs validations, and environmental assessments, ensure compliance with Defense Nuclear Safety Board safety initiatives, abide by site preservation laws and regulations, and perform procurement contract closeouts activities. These costs requirements, influenced by Departmental and programmatic initiatives as well as regional and congressional constituents, are very unpredictable, so much so that, major refurbishment and desperately needed investments in office automation and computing upgrades were sacrificed to balance the increases in past years.

Beginning with the FY 1999 budget cycle, the Department initiated a specific plan for funding major refurbishment, projected to net annual savings, and modernization investments needed to enhance efficiency in the downsizing environment, sustain consolidated service centers, minimize safety hazards, update systems technology infrastructure, and support community outreach initiatives. To this avail, annual requirements of $5 million was supported by the Department beginning in FY 1999, to continue through FY 2004 In FY 1999, office space is being refurbished to increase occupancy and eliminate a smaller building at Oak Ridge -- all to net a $500,000 cost avoidance annually. Computer servers will be acquired to support corporate architecture at both Oak Ridge and Oakland. And lastly, obsolete computer desktop hardware has been replaced with 94 enhanced desktop workstations at Chicago. The initiatives included in the plan for FY 2000 have been terminated.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Detail Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
This account pays for the institutional management and matrix support federal staff at the operations offices This funding level will support 879 full time equivalents and the 868 positions authorized by the end of FY 2000 This is a 6 percent reduction in full time equivalents from FY 1999 which equates to a $3 9 million cost avoidance The losses in full time equivalents occurred within lower graded administrative and staff positions yielding protection for maintaining critical expertise and skill mix in other areas The number of remaining positions is 58 less than originally authorized for FY 2000	66,850	69,719	70,418
Travel			
These funds provide the field offices the opportunity to participate on task teams, work various issues, facilitate policy formulation at headquarters, conduct compliance reviews, and perform contractor oversight to ensure implementation of DOE orders and regulatory requirements at the facilities under their purview It also provides for attendance at conferences and training classes, and permanent change of station relocation, etc	1,445	1,395	1,443
Support Services			
These funds provide information management systems and administrative support necessary to supplement the fundamental requirements at each office Seventy-one percent of this support services request is dedicated to ensuring that the information systems are maintained by technical experts Such services include, computer programming, local area network connectivity and backup, computer desktop maintenance, staffed communications centers, and audio/TeleVideo operations The remainder covers a smorgasbord of services including mail distribution, contract closeout assistance, remote site office assistance, staffed copy and distribution centers, staffed supply stores, trash removal, logistics services, facility and grounds maintenance, and janitorial services, etc	10,655	12,252	12,846

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Other Related Expenses			
Other expenses provide for the essential day-to-day requirements associated with operating a viable office Seventy percent of the request pays for the rent, utilities, and telecommunication at each office This account has been able to reduce some rental costs by eliminating the amount of space occupied. However, the rental cost for Oakland alone is almost $3 million as a result of an increase imposed by General Services Administration for FY 2000 The remaining thirty percent enables the offices to pay for postage, printing and reproduction, computer hardware and software acquisitions, copier leases, and in most cases the site-wide health care service and vehicle fleet maintenance Employee training and development and the supplies and furnishings used by the federal staff are also included, etc	16,050	20,761	17,293
Total, Program Direction	95,000	104,127	102,000

Explanation of Funding Changes From FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Salaries and Benefits	
■ Salaries and Benefits increases due to the general pay and locality raises, promotions, and within grades This increase is the net effect of the following authorized adjustments in full time equivalents, totaling 59 less than FY 1999. Chicago up by 3, Idaho down by 5, Oak Ridge down by 25, and Oakland down by 32	+699
Travel	
■ Travel increases to support the staffing and transportation requirements for each office The cost range for air transportation is varied depending on the points of origin and destination Hence the travel allocations are based on historical activities and the increased costs for air fare and transportation	+48
Support Services	
■ Support Services increases with the fixed inflationary rate changes as established within existing contractual terms	+594
Other Related Expenses	
■ Other Related Expenses decreased overall This is the result of a $600,000 adjustment in Oakland's rent imposed by General Services Administration and $449,000 associated with utilities and telecommunications services in general for the remaining offices Furthermore, modernization initiatives planned for FY 2000 have been terminated (-$4,517,000)	-3,468
Total Funding Change, Program Direction	-2,127

Oak Ridge Landlord

Mission Supporting Goals and Objectives

Provide general infrastructure support for Oak Ridge Operations site and general operating costs for other activities adjacent to the Oak Ridge National Laboratory, the Y-12 Plant and the East Tennessee Technology Park.

Program Goals

Maintain the infrastructure of the Oak Ridge facilities in order to serve all users, including Energy Research, Defense Programs, Environmental Management and Nuclear Energy. The program provides physical security, emergency management, roads and grounds, and activities associated with the Oak Ridge Financial Service Center (ORFSC).

- *To continue to support physical security* - Provide 3-shift, 24 hour protective service for the four customers located at the site.
- *To continue to provide world class Financial Services Center* - The ORFSC will be focusing on implementation of Department-wide initiatives such as EC-web, consolidation of Travel Manager databases and other Departmental Integrated Standardized Core Accounting System (DISCAS) enhancements to improve efficiencies.
- *To continue to provide roads and grounds Maintenance* - Supports repairs of roads or portions of roads outside fenced areas of the Oak Ridge Reservation especially the Bethel Valley Road to the best of the programs ability.
- *To continue to solicit support from the broad community which uses the American Museum of Science and Energy* - Continue to serve as a public affairs and communications tool for transferring information to a broad community of users, thus supporting the DOE public information program by disseminating information regarding energy technologies and the policies and programs that affect them.
- *To upgrade water plant system with backflow preventer and booster pump* - Supports transfer of ownership of the Water Plant to the City of Oak Ridge as soon as possible.

Performance Measures

Performance measures related to productivity savings by improving the day to day landlord operations.

- Reduce use of overtime by the physical security personnel by 10% in FY 2000, through better resource planning, without compromising physical security.
- Ensure that personnel continue to maintain core competency in their ES&H and security roles through review and evaluation of training records and certifications.
- ORFSC will achieve timely payments of 96% of commercial subject to the Prompt Payment Act.

Modernize and consolidate facilities for efficient operations. Success will be measured in FY 2000 by:

- Completing the transition activities at the Water Plant by title and functions to the City of Oak Ridge.

Funding Detail

(dollars in thousands)

	FY 1998 Comparable Appropriation	FY 1999 Budget Request	FY 2000 Request

Significant Accomplishments and Program Shifts

- The Water Plant Modernization Project will be replaced by other transition activities related to the transfer of the Water Plant to the City of Oak Ridge.
- The ORFSC continues to support its satellite offices' financial operations. Offices served are Richland Operations Office, Rocky Flats Field Office, Savannah River Operations Office, Strategic Petroleum Reserve Office, Office of Scientific and Technical Information, Federal Energy Techynology Center (Morgantown and Pittsburgh sites), and Oak Ridge Operations Office. ORFSC performs the payment function for all of these satellite offices in accordance with established Memorandum of Understanding. DISCAS will be operated in one consoldidated data base with overall systems support being provided by ORFSC. Work processes will continue to be monitored and needed enhancements incorporated.

	FY 1998	FY 1999	FY 2000
■ Federal Building Infrastructure	0	580	150
■ Continuation of ongoing activities associated with the Emergency Management Program Office, roads and grounds and physical security	3,682	4,500	5,312
■ Continuation of the American Museum of Science and Energy. While urging funding by private or industrial partners, and an admissions fee for adults	1,400	1,100	1,100
■ Payment in lieu of taxes to the City of Oak Ridge, and Anderson and Roane Counties	1,700	1,700	1,700
■ ES&H compliance activities at Water Plant and other DOE-owned facilities	370	800	800
■ Water Plant transition activities	0	0	300
■ Identification, packaging, and shipment of documents relating to Human Radiation Experimentation (HRE) to the National Archives for permanent storage. Mapping activities and support for small businesses.	146	170	170
■ Respond to Defense Nuclear Facility Safety Board (DNFSB)recommendations involving directives management, training and development, emergency management, and ES&H.	565	800	800
■ Activities associated with the Oak Ridge Financial Service Center implementation of other department-wide initiatives.	1,637	1,350	1,480
■ ES&H activities associated with correcting the instability of a steep slope supporting the water reservoir	1,500	0	0
Total, Oak Ridge Landlord	11,000	11,000	11,812

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ Increase in physical security	+284
■ Increase in Roads and Grounds	+528
■ Increase in Oak Ridge Financial Services Center for Hardware & PC Upgrades	+130
■ Decrease in Federal Building Infrastructure	-430
■ Increase in Water Plant activities	+300
Total Funding, Oak Ridge Landlord	+812

Proposed Appropriation Language

For expenses of the Department of Energy activities including the purchase, construction and acquisition of plant and capital equipment and other expenses necessary for science activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101 et seq.), including the acquisition or condemnation of any real property or facility or for plant or facility acquisition, construction, or expansion, and purchase of not to exceed [5] *6* passenger motor vehicles for replacement only, [$2,682,860,000] *$2,835,393,000,* to remain available until expended[: *Provided,* That $7,600,000 of the unobligated balances originally available for Superconducting Super Collider termination activities shall be made available for other activities under this heading]. *(Energy and Water Development Appropriations Act, 1999.)*

[An additional amount of $15,000,000, to remain available until expended, for Department of Energy—Energy Programs, "Science", is hereby appropriated.] *(Omnibus Consolidated and Emergency Supplemental Appropriations Act, 1999, Public Law 105-277, Division A, Section 109.)*

Office of Science

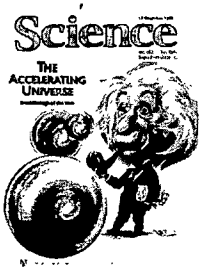
Executive Budget Summary

The Office of Science (SC) requests $2,844 Million for Fiscal Year 2000, an increase of $138M over FY 1999, to invest in thousands of individual research projects at hundreds of research facilities across the U.S., primarily in our national laboratories and research universities. The FY 2000 request will allow for continued construction of the Spallation Neutron Source, the first world class neutron source built by the U.S. in over 30 years; a new Scientific Simulation Initiative that will revolutionize our ability to solve scientific problems of extraordinary complexity and enable us to apply these new resources toward advancing DOE missions; participation in the Next Generation Internet effort with a focus on R&D and implementation of the technologies and tools that help meet mission requirements and contribute to the Scientific Simulation Initiative.

A History of Success:

Past successes from the SC research program and scientific user facilities have produced a rich history of contributions to science and society.

- Supported the work of 66 Nobel Laureates, from Enrico Fermi and E.O. Lawrence to Richard Smalley and Paul Boyer.
- SC's High Energy Physics program Supported *Science Magazine's* "1998 Breakthrough of the Year - *The Accelerating Universe*"



reprinted with permission from the American Association for the Advancement of Science, copyright 1998

- Developed the original prototype for positron emission tomography (PET) and the most widely used radio-pharmaceuticals used in nuclear medicine, provided the knowledge base for the nation's, and world's, radiation exposure standards, established the first Human Genome Program and the first global climate change research program.
- Advanced our understanding of the subatomic world and the fundamental forces and particles of nature through forefront research and research facilities, including the world's first super-conducting accelerator. These facilities offer a window into the most elusive particles and interactions at the very heart of matter illuminating the origin of the universe.
- Building on the advances of accelerator physics, synchrotron light sources were first conceived, constructed and utilized by SC scientists for research that enabled the discovery of new materials, advanced chip technologies, and breakthroughs in structural biology.
- Provided the first scientific investigation of multi-megawatts of fusion power produced in laboratory plasmas.

A Notable Change:

During FY 1999 budget deliberations, in recognition of more than 50 years of contributions to science and basic research, Congress changed the name of the Office of Energy Research to the Office of Science. With the FY 2000 budget request, we begin a new era as the Office of Science and, looking ahead to the challenges and opportunities of the twenty-first

century, we are building a new SC strategic plan for the future research needs of the Department.

Our Mission Hasn't Changed:

Our mission remains to: produce the scientific and technical knowledge needed to develop energy technology options; understand the health and environmental implications of energy production and use; maintain U.S. leadership in understanding the fundamental nature of energy and matter; provide and operate the large-scale facilities required in the natural sciences; ensure U.S. leadership in the search for scientific knowledge; and support the availability of scientific talent for the next generation.

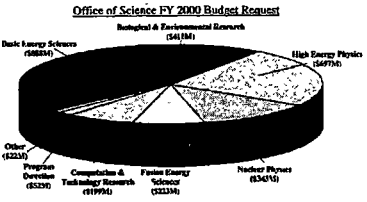


Figure 1

The FY 2000 budget request, depicted in Figure 1 and Table 1, has a program structure, that meets our mission consistent with Department goals and strategies. The major programs of the Office of Science are: High Energy and Nuclear Physics, Basic Energy Sciences, Biological and Environmental Research, Computational and Technology Research, and Fusion Energy Sciences.

The Department of Energy is a science agency because its mission and goals require technologies and scientific knowledge far beyond that which is currently available. From safeguarding the nuclear stockpile to ensuring our nation's energy supply for the next century, DOE continues to challenge the frontiers of science and technology.

The DOE Strategic Plan outlines the vision, goals and strategic objectives that will, through leadership in science and technology, help the DOE to meet those challenges. In keeping with the Government Performance and Results Act (GPRA), the Office of Science FY 2000 budget request includes program specific goals, strategies, and measures that focus our research activities and ensure continuity with Departmental plans and national goals.

Rethinking Our Goals and Strategies:

In the past year, the Department has begun to characterize the whole of our R&D efforts across business lines. The purpose and scope of this effort are to extend the work of the new SC strategic plan in terms of the R&D investments that enable us to meet our objectives and goals, and to assemble key information for improving our analysis and management of these investments.

The Office of Science's basic research supports and enables the R&D of the other business lines. A Science Portfolio has been developed with this fact in mind so as to clarify and improve integration of our program results throughout the Department. This Portfolio accompanies the release of the FY 2000 budget request.

As the Department builds R&D portfolios for its other business lines, the Office of Science will continue to integrate basic research with the applied R&D in the other business lines' portfolios so that there are strong linkages between technology needs and science.

The revised Strategic Plan of the Office of Science, to be published in Spring 1999, will articulate the long-range vision, goals, strategies, and objectives for our programs. The Science Portfolio complements and supports the strategic plan by providing a near-term "snapshot" of our investments against the new strategic framework.

The motivations behind this planning effort are to develop a shared long-term focus for SC programs, their scientific communities and performers; to position our future scientific program content to better serve the other DOE business lines and provide a framework for cooperation and risk taking; to project future possibilities and directions for our programs based on the latest technologies and scientific advances; to better illustrate the unique and coordinated role of SC programs within the DOE mission and the federal science investment; to inspire our researchers and to better communicate our program content and successes to our sponsors and the general public.

The new SC strategic plan, and supporting Science Portfolio, is structured around five high-level goals with twelve strategic objectives, listed in Figure 2. These goals were developed through a series of planning activities and workshops that drew on the experience and knowledge of our research scientists and stakeholders to capture both what is necessary and what is possible for our science as we look to the next century.

The first goal, **Fueling the Future**, is centered on science for affordable and clean energy options for the future. Some of the questions that motivate this goal are: *How can we tap and harness affordable, clean fuels? What clean new electric power systems will fuel the future?* and *How can energy systems be made more efficient and environmentally sound?* Development of this goal has been closely connected with the development of the Energy R&D portfolio and the objectives directly map onto the energy portfolio.

The second goal, **Protecting our Living Planet**, is centered on understanding energy impacts on people and the biosphere. Some of the questions that motivate this theme are: *What are the sources and fate of energy-related by-products? What factors affect global climate and how can they be controlled?* and *How do complex biological and environmental systems respond to our energy use?* This goal also contributes to both the Energy R&D portfolio and the Environmental R&D portfolio.

- **Fueling the Future**
  - New Fuels
  - Clean and Affordable Power
  - Efficient Energy Use
- **Protecting Our Living Planet**
  - Sources and Fate of Energy By-Products
  - Impacts on People and the Environment
  - Prevention and Protection
- **Exploring Energy and Matter**
  - Components of Matter
  - Origin and Fate of the Universe
  - Complex Systems
- **Extraordinary Tools for Extraordinary Science**
  - Instrumentation for the Frontiers of Science
  - Scientific Simulation
  - Institutional Capacity
- **Enabling World Class Science**

Figure 2

The third goal, **Exploring Energy and Matter**, is centered on discovering the building blocks of atoms and life. Some of the questions that motivate this theme are: *What are the fundamental components of matter? How can the origin and fate of the Universe reveal the secrets of energy, matter and life?* and *How do atoms and molecules combine to form complex dynamic systems?* This goal captures the most fundamental research in the Office of Science. The complex systems question links to R&D efforts in all of the DOE business lines.

The fourth goal, **Extraordinary Tools for Extraordinary Science**, is centered on the national assets that DOE provides for forefront, multidisciplinary research. This goal builds on the unique role of the Office of Science in providing the nation with forefront research facilities such as the National Laboratories, and an array of research accelerators, reactors and other unique facilities. The Office of Science will continue to ensure that these critical research

tools remain accessible to peer reviewed researchers from all across the nation and meet the technical challenges of forefront scientific investigation. This goal looks to the future and to training and educating the next generation of scientists and engineers.

Some of the questions that motivate this goal are: *How can we explore the frontiers of the natural sciences? How can we predict the behavior of complex systems?* and *How can we strengthen the nation's capacity for multidisciplinary science?* This goal enables research in all of the DOE business lines. By organizing future facilities needs, as identified by the scientific community, this theme ensures that America's research capability will remain both accessible and state of the art.

The fifth goal, **Enabling World Class Science**, conveys the commitment of DOE and National Laboratory staff to continuously improve their operational processes. Of paramount importance is the selection and conduct of excellent, productive science that is carried out safely and with care for the environment and involvement of local communities.

Implementing the New Strategies - Initiatives for FY 2000:

These five goals provide a framework for current programs and a platform for future efforts. FY 2000 initiatives and priorities are detailed below. Figure 3 lists these initiatives and identifies linkages to the SC goals.

Scientific Simulation Initiative - It is now possible to obtain computational capabilities 100 times faster than currently in common use through the application of technologies developed for the Accelerated Strategic Computing Initiative (ASCI). Therefore the Department of Energy, in coordination with the National Science Foundation and other federal science programs, has developed a Scientific

Figure 3

Simulation Initiative (SSI) in support of the President's Information Technology Initiative. The mission of the SSI is to further develop and employ the emerging generation of very high performance computers as major tools for scientific inquiry. These resources will revolutionize our approach to solving complex problems in *energy, environment, and fundamental research* and will stimulate our national system of innovation.

Portions of the program will be directed by a joint SC/Defense Programs ASCI research management committee. Within the Office of Science, the SSI will be an integrated effort with the Computational and Technology Research (CTR) program coordinating and overseeing competitive, peer reviewed selections of sites and applications. CTR, with Basic Energy Sciences (BES) and Biological and Environmental Research (BER), will manage the basic research applications.

Combustion - Currently, eighty-five percent of U.S. energy use is derived from the combustion of fossil fuels and this dependence on combustion is not likely to change in the coming decades. Combustion remains one of the primary causes of lowered air quality in urban environments. At present, engineers have neither sufficient knowledge nor the computational tools to understand and predict the chemical outcome of combustion processes with any degree of

practical reliability. Existing models that guide the design process are of very limited usefulness because of the extraordinary complexity of the combustion process. With very high end computing resources and a concerted research program in combustion modeling, we can develop the next generation of combustion modeling tools for accelerated design of combustion devices meeting national goals of emission reduction and energy conservation.

Global Systems -Unlike many disciplinary areas of research, the complex workings of the global environmental system cannot be studied in a laboratory setting. The integration of knowledge from the many disciplines that together describe the global system can only be performed in computer simulation models. It is only through such general circulation models that it is possible to understand current climate and climate variability and to predict future climate and climate variability, including prediction of the possible effects of human activities on the global system. Advances in scientific understanding are therefore predicated upon the successful development of modeling tools to keep pace with the rapid advances in the quality and quantity of data available. These tools will lead to the development of detailed fully coupled global system models that accurately reproduce, and ultimately predict, the behavior of the interacting components of the system, i.e. the global atmosphere, the world ocean, the terrestrial land surface and both glacial and sea ice.

Fundamental Research - Whereas the scientific accomplishments of this century have resulted in seeking and understanding the fundamental laws that govern our physical universe, the science of the coming century will be characterized by synthesis of this knowledge into predictive capabilities for understanding and solving a wide range of scientific problems, many with practical consequences. In this endeavor, the computer will be a primary instrument of scientific discovery. Many areas of scientific inquiry, critical to the department's mission, will be advanced dramatically with access to high-end computation - including, but not limited to, materials sciences, structural genomics, high energy and nuclear physics, subsurface flow, and fusion energy research.

The **Spallation Neutron Source** (SNS) - The importance of neutron science for fundamental discoveries and technological development has been enumerated in all of the major materials science studies over the past two decades, including a major study by the National Research Council entitled "Major Facilities for Materials Research and Related Disciplines" (Seitz-Eastman Report)

As the needs of our high-technology society have changed, so has the way in which we conduct the R&D that helps us to meet those needs. It has become increasingly important to develop new materials that perform under severe conditions and yet are stronger, lighter, and cheaper. Major research facilities are used to understand and "engineer" materials at the atomic level so that they have improved macroscopic properties and perform better in new, demanding applications.

The SNS is a next-generation facility for these types of applications. Neutron scattering will play a major role in all forms of materials design and understanding. This research will lead to the development of advances such as: smaller and faster electronic devices; lightweight alloys, plastics and polymers for transportation and other applications; magnetic materials for more efficient motors and for improved magnetic storage capacity; improved understanding of form and function in biological structures and the development of new drugs for medical care.

Upon completion, the SNS will be the world's most powerful neutron source, accommodating more than 1,000 researchers and 30 to 40 special purpose instruments.

The SNS Total Project Cost (TPC) is estimated to be $1,360 million over a 7.25-year schedule. The

original TPC of $1,333 million (7-year schedule) was independently validated to within 1%. Throughout the life of the project, semi-annual reviews will track cost and management. FY 1999 funding provided for the start of Title I design activities, initiation of subcontracts and long-lead procurement, and continued R&D to reduce technical and schedule risks. FY 2000 funding of $214M will support Title II (detailed) design for the technical components and control systems. Construction will begin in FY 2000 on some of the conventional facilities as will the procurement of key technical equipment.

The SNS project is an example of DOE's commitment to use the DOE laboratories as a system. Under DOE leadership, Oak Ridge National Laboratory is responsible for the project with participation from Lawrence Berkeley National Laboratory, Los Alamos National Laboratory, Brookhaven National Laboratory, and Argonne National Laboratory. The laboratories have been working together most effectively and R&D is proceeding smoothly.

Scientific Facilities Utilization - This FY 2000 budget request continues to strongly support Scientific Facilities Utilization in the following programs: Basic Energy Sciences, High Energy Physics, Nuclear Physics, Fusion Energy Sciences, Biological and Environmental Research, and Computational and Technology Research. Each year, over 15,000 university, industry, and government sponsored scientists conduct cutting edge experiments at these particle accelerators, high-flux neutron sources, synchrotron radiation light sources, and other specialized facilities, such as the Combustion Research Facility (CRF) at Sandia National Laboratories, Livermore, California. The CRF is an internationally recognized facility for the study of combustion science and technology, which will begin its first year of operation after its Phase II development project.

The user community continues to be pleased with the results of the Science Facilities Initiative as evidenced by their many letters of support and by the positive results of surveys conducted at the facilities

The **Large Hadron Collider** - The foremost high energy physics research facility of the next decade will be the Large Hadron Collider (LHC) at CERN, the European Center for Particle Physics. The primary physics goals of the LHC will impact our understanding of the relation of mass, fundamental forces, and the structure and origin of the universe. U.S. participation in the LHC is required to provide U.S. access to the high energy frontier in order to maintain the U.S. as a world leader in this fundamental area of science.

The LHC is an outstanding example of international cooperation in large scientific projects, as well as interagency and inter-laboratory cooperation. An International Cooperation Agreement has been negotiated between CERN, DOE and NSF. The Agreement provides for U.S. participation in the construction of the accelerator, and of the two very large detectors, ATLAS and CMS. Carefully defined lists of deliverables and costs have been agreed upon for each of these areas of participation. U.S. costs are capped at $531M ($450M DOE and $81M NSF), consistent with Congressional guidance. In return, participating U.S. universities and laboratories will join, as full partners, in LHC experiments. In addition, a Memorandum of Understanding (MOU) has been executed between DOE and NSF that defines the relationship between the agencies relative to programmatic coordination of U.S. LHC activities include joint oversight and execution of the U.S. LHC Construction Program.

Under the terms of this MOU, Fermilab is the Lead Laboratory for the accelerator portion of the program, which it will execute in cooperation with Brookhaven (BNL) and Lawrence Berkeley (LBNL) National Laboratories. BNL is the host laboratory for the ATLAS portion of the program, which also involves Argonne National

Laboratory (ANL) and LBNL along with 28 university groups. Similarly, Fermilab is the host laboratory for the CMS detector portion of the program, including BNL and Los Alamos National Laboratory (LANL) along with 33 university groups. Cost and schedule baselines have been reviewed and validated for each of the three programs and management systems are in place to monitor progress against baselines.

The **Next Generation Internet** (NGI) - The program is creating the foundation for more powerful and versatile networks of the 21st century, just as previous federal investments in information technology R&D created the foundation for today's Internet. This program is critical to DOE's science and technology missions because enhancements to today's Internet from commercial R&D will not be sufficient to enable effective use of: petabyte/year High Energy and Nuclear Physics facilities such as the Relativistic Heavy Ion Collider (RHIC); to provide remote visualization of terabyte to petabye data sets from computational simulation; to develop advanced collaboratories; and to enable effective remote access to tomorrow's advanced scientific computers.

For example, typical RHIC experimental collaborations involve thousands of scientists at hundreds of institutions across the country and the world. Using the current Internet, it would take about 2,500 hours to transmit one day's data from RHIC to one remote site for analysis. Using NGI it would take 25 hours.

Thus, DOE's NGI research program is focused on discovering, understanding, developing, testing and validating the networking technologies needed to enable wide area, data intensive and collaborative computing. The DOE applications share two important characteristics. They all involve extremely large data sets and they all require that scientists be able to interact with the data in (nearly) real time. Current network technology limitations significantly limit our ability to address these characteristics.

The DOE program includes research in advanced protocols, special operating system services for very high speed, and very advanced network control, the components needed to enable wide area, data intensive and collaborative computing. In addition the DOE program addresses issues that result from the many different kinds of network devices, network-attached devices, and services that need to be integrated together. Examples of the components and services that need to be integrated include: network resources, data archives on tape, high performance disk caches, visualization and data analysis servers, authentication and security services, and the computer on a scientist's desk. This type of integration, as well as the issues of improving the performance of the individual components, all require significant research because the issues are currently not well understood. Indeed, the first identification of many of these issues is the result of previous work in collaboratories and visualization supported by DOE.

Thus, DOE's participation in the NGI builds on previous DOE research and its over two decades of success in using advanced networks as tools for science. Furthermore, the differences between the requirements of commercial networks and networks for scientific research require DOE to conduct this research because these tools and technologies will not be developed by commercial R&D. However, the results and "spinoffs" of this research, after testing and prototyping by the scientific community, will impact broad commercial use of networks. DOE's FY 2000 NGI program will build on the results of the competitive research solicitations conducted in FY 1999.

Climate Change Technology Initiative (CCTI)- Eighty-five percent of our Nation's energy results from the burning of fossil fuels, a process that adds carbon to the atmosphere. Because of the potential environmental impacts of increases in atmospheric carbon dioxide, carbon management

has become an international concern and is a focus of the CCTI.

The Office of Science is well positioned to make significant contributions to the many solutions needed to address this problem. SC can build on the fundamental discoveries of core research programs in carbon and non-carbon energy sources, carbon sequestration, and carbon recycling, extending them to the new discoveries needed to make carbon management practical and efficient.

Activities in both Basic Energy Sciences and Biological and Environmental Research support the DOE and Administration CCTI efforts in: *science for efficient technologies, fundamental science underpinning advances in all low/no carbon energy sources, and sequestration science.*

The SC portion of the CCTI leverages the foundation of excellent research already underway. The additional SC effort will also have a major impact on many scientific disciplines by advancing the state of knowledge in such fields as genome science, molecular, cellular and structural biology, biochemistry, chemical dynamics, solid state chemistry, photochemistry, ecology, nano- and meso-phase materials science, condensed matter physics, engineering, theoretical chemistry and physics.

For example, the BER microbial genome program has made significant investments in the technology that enables genome sequencing at rates previously unattainable. Capitalizing on these investments, the genomes of microbes that produce methane and hydrogen from carbonaceous sources will be sequenced as part of the first awards under CCTI. This will enable identification of key genetic components of the organisms that regulate the production of these gases. The carbon sequestration research program will focus on understanding the natural terrestrial sequestration cycle and the natural oceanic sequestration cycle as part of the first awards under the CCTI. The ultimate goal is to enhance the natural carbon cycle in both the terrestrial and oceanic systems. The search for new fuel sources and carbon sequestration research are key elements of the carbon management program.

CCTI research and related activities within the Office of Science will continue to be coordinated with the Office of Fossil Energy. FY 1999 integration efforts include the coordination of new CCTI proposal solicitations and preparation of a detailed carbon dioxide sequestration roadmap.

Genome - In only its first full year of operation, the DOE Joint Genome Institute (JGI) became the second leading public producer of high quality human DNA among U.S. sequencing centers. The JGI is boldly scaling up its sequencing capacity from 21 million finished bases in FY 1998 to 30 million finished bases and 40 million high quality draft bases in FY 1999. In total, SC will complete sequencing of 50 million finished and 70 million high quality draft subunits of human DNA to submit to publicly accessible databases in FY 2000. In addition, SC will complete the full genetic sequencing of more than 10 microbes that have significant potential for waste cleanup and energy production.

Improvements in high throughput human DNA sequencing technology and sequence data management are needed to complete the first human genome by 2003 and to efficiently and cost effectively use that sequence information for future medical diagnoses and scientific discovery. The Joint Genome Institute, in which the National Laboratories work as a system, are primarily focused on high throughput sequencing. FY 2000 is the third year of a major 3-5 year scale-up in DNA sequencing capability for this virtual institute. DOE will continue to work with the private sector, where appropriate, to accelerate progress and reduce cost in the Human Genome project.

The SC program is actively involved with other federal agencies funding, human, plant and microbial research to encourage effective and efficient management of the total federal genome research portfolio.

Recent Successes of the Office of Science:

Fueling the Future:

- Identified a major error in current models of combustion process
- Provided a realistic picture of corrosion resistance to advance protection coatings
- Created electrically conducting nano-scale ropes, 50-100 times more conductive than copper

Protecting our Living Planet:

- Research on "Conan the Bacterium" (D. Radiodurans) helps in clean-up
- Two of the 1997 "11 hottest papers in biology" were for microbial genomic sequences funded by SC
- Discovered gene for kidney disease

Exploring Energy and Matter:

- Launched the Alpha Magnetic Spectrometer experiment on the Space Shuttle to explore the mysteries of missing anti-matter and dark matter
- Established the 3-D, atom-by-atom structure of the enzyme system responsible for DNA replication
- Demonstrated that the supposedly massless neutrino must, in fact, have a non-zero rest mass.

Extraordinary Tools:

- Signed the Large Hadron Collider agreement opening the frontier of high energy physics to American researchers
- New scientific research facilities on-line: the William R. Wiley Environmental Molecular Sciences Laboratory; the Jefferson Lab's Large Acceptance Spectrometer; SLAC's B-Factory, the Oak Ridge Free-Air CO_2 Enrichment Facility and the JGI Production (DNA) Sequencing Facility.
- Projects on time and budget: Fermilab's Main Injector, the Relativistic Heavy Ion Collider, the Combustion Research Facility Phase II, and the SNS.

SC Program Direction:

- Hammer award for Environmental Management Science Program
- Jointly developed the third DOE-NIH Human Genome Five Year Plan with accelerated sequencing goals
- Acknowledged as model for facilities management by the National Academy of Public Administrators (NAPA).

In addition, hundreds of principal investigators, funded by SC, win dozens of major prizes and awards sponsored by the President, the Department, the National Academy of Sciences, the National Academy of Engineering, and the major professional societies. These include the 1997 Nobel Prize for Chemistry, the 1997 Fermi and Lawrence awards, the National Science Foundation Career Award, eight of the 1998 R&D 100 awards, 1997 Discover Awards, the 1998 Federal Laboratory Consortium Award, and the 1997 and 1998 "Top Ten Contributions to Science," reported by *Science* Magazine.

Major Program Activities for FY 2000:

The **Basic Energy Sciences** (BES) program is a principal sponsor of fundamental research for the United States in the areas of materials sciences, chemical sciences, geosciences, biosciences, and engineering sciences. This research underpins the DOE missions in energy, the environment and national security; advances energy related basic science on a broad front; and provides unique national user facilities for the scientific community. Performance measurement, dominated by peer review, helps to determine the distribution of activities supported within BES and the individual projects supported within each activity. The program funds more than 2,400 researchers at 200 institutions nationwide. Program results continue to be recognized through the receipt of major prizes and awards from the scientific community.

BES also plays a major part in the FY 2000 Office of Science initiatives described above. BES is the sole supporter of the Spallation Neutron Source construction and a major contributor to the Scientific Simulation Initiative (Combustion and Fundamental Research portions), Scientific Facilities Utilization, and the Climate Change Technology Initiative.

BES plans, constructs, and operates 18 major scientific user facilities to serve over 6,000 researchers at universities, national laboratories, and industry. These facilities enable the acquisition of new knowledge that often cannot be obtained by any other means. These facilities have an enormous impact on science and technology, ranging from determinations of the structure of superconductors and biological molecules to the development of wear-resistant prostheses; from atomic-scale characterization of environmental samples to elucidation of geological processes; and from the production of unique isotopes for cancer therapy to the development of new medical imaging technologies. As part of its commitment to excellence, BES user facilities maintain a record of less than 10 percent unscheduled downtime, on average.

Facility enhancements and maintenance activities for BES in FY 2000 will be focused on the existing high-flux neutron sources, the Los Alamos Neutron Science Center at Los Alamos National Laboratory and the High Flux Isotope Reactor at Oak Ridge National Laboratory. These improvements, recommended by the Basic Energy Sciences Advisory Committee, will substantially increase the neutron flux and instrument capabilities available to the scientific community. BES is committed to keeping the development and upgrade of scientific user facilities, including the construction of the Spallation Neutron Source, on schedule and within cost, not to exceed 110 percent of estimates.

Within the base research effort, the program in Complex and Collective Phenomena, started in FY 1999, will continue to support work at the frontiers of basic research that hold the promise of delivering revolutionary breakthroughs. This effort is designed to obtain fundamental knowledge of increasingly complex systems in order to help bridge the gap in our understanding between the atomic and molecular properties and the bulk structural and mechanical properties of materials, for example. In addition, BES will continue its Partnership for Academic-Industrial Research (PAIR) program to facilitate research partnerships between academic researchers, their students, and industrial researchers.

The **Biological and Environmental Research** (BER) program in FY 2000 will focus on sequencing the human genome, microbial genome research, low dose exposure research, environmental processes research with an emphasis on global environmental change, environmental remediation research, and radiopharmaceutical research, structural biology, and molecular nuclear medicine.

Last year, *Science* magazine identified genomic sequencing as one of the top ten breakthroughs in science. BER's Microbial Genome Program supported the complete genomic sequencing of 6 of the 18 bacteria sequenced with at least 12 more in progress. Microbial genome research continues to sequence microbes relevant to DOE mission needs including work in three main areas: (1) microbial diversity, to identify potentially useful microbes, (2) new DNA sequencing strategies to rapidly and cost effectively determine the sequence of closely related microbes, and (3) novel strategies and tools for characterizing, manipulating, and modeling entire reaction pathways or gene regulatory networks. Microbes are used as models to understand more complex biology and to advance sequencing tools.

In FY 2000, human DNA sequencing continues to ramp up. The DOE Joint Genome Institute will sequence 50 million finished bases and 70 million high quality draft bases of human DNA.

Radiopharmaceutical research and molecular nuclear medicine will continue to develop more specific and sensitive radiopharmaceutical tracers and develop sensitive imaging technology that will impact clinical medicine. Positron Emission Tomography (PET) technology, developed previously in this program, will be used to elucidate complex biomedical problems such as the neurochemical basis of addictive and neurodegenerative diseases. Recent work has shown damage to the brain function in persons addicted to drugs, such as cocaine, that reinforces the craving for these drugs. The Boron Neutron Capture Therapy Program will complete Phase I trials to determine an effective and safe treatment dose and initiate a Phase II efficacy trial. BER will continue to exploit the unique capabilities of the National Laboratories in a national biomedical engineering program to develop novel medical technologies.

In FY 2000, The Atmospheric Radiation Measurement facility will begin operations of the third climate observatory in the Tropical Western Pacific on Christmas Island, thus completing the span of observatories across the Pacific warm pool. Valuable data will result for climate model development and improvement.

The Free Air Carbon Dioxide Enrichment (FACE) experiment will continue tree growth and physiological observations, including studies of ecosystem processes. FACE technologies have achieved international recognition, with FACE facilities developing in Europe and Panama. FACE has observed the effect of increased atmospheric concentrations of carbon dioxide on tree growth and physiology.

BER facilities in support of fundamental science to underpin environmental cleanup continue to have an impact. After its first full year of operation in 1998, the William R. Wiley Environmental Molecular Sciences Laboratory (EMSL) had already attracted nearly 600 outside users and collaborators from government laboratories, private industry, and academia. Interactions between EMSL and the Natural and Accelerated Bioremediation Research (NABIR) program will be strengthened, to provide unifying research facilities for academic and laboratory investigators in the fields contributing to bioremediation research.

BER also plays a major part in the FY 2000 Office of Science initiatives described above. BER is the primary supporter of SC Genome research, and a major contributor to SSI (Global Systems and Fundamental Research portions), Scientific Facilities Utilization, and the CCTI.

The **High Energy Physics** (HEP) program will continue to address new and exciting research at the forefront of particle physics.

At Fermilab, the newly upgraded D-Zero and CDF detectors will be moved into position at the Tevatron; and they, along with the newly commissioned Main Injector, will be used for the first time for antiproton-proton collisions. The Main Injector will increase the luminosity of the

Tevatron by a factor of 5. Also at Fermilab, the NuMI/ MINOS neutrino oscillation project will be well underway with construction of conventional facilities and technical components; and the Wilson Hall Safety Improvements Project will be progressing well in its second year of physical construction with completion scheduled for 2002.

SLAC's newly commissioned B-factory, a collaboration among SLAC, Lawrence Berkeley National Laboratory, and Lawrence Livermore National Laboratory, will be in its first full year of operation with its primary goal to obtain high luminosity to begin the study of CP-violation (matter-antimatter asymmetry). Also at SLAC, physical construction on a new office building for B-factory users will begin.

As planned, the Alternating Gradient Synchrotron (AGS) at Brookhaven was transferred to the Nuclear Physics program for use as an injector for RHIC. Therefore, use of the AGS for high energy physics in FY 2000 will be on an incremental cost basis. AGS runs, necessary to achieve the precision measurement of the muon g-2 anomalous magnetic moment, will continue in FY 2000.

The fabrication of components for the LHC project continues in FY 2000. Fermilab is the host and lead laboratory for the U.S. efforts on the CMS detector as well as host and lead laboratory, with the assistance of Brookhaven and Lawrence Berkeley, on the U.S. accelerator efforts. Similarly, Brookhaven is the host and lead laboratory for the U.S. efforts on the ATLAS detector.

In addition, R&D on accelerator concepts for future large accelerator facilities will continue in FY 2000. Consistent with recent HEP Advisory Panel recommendations, modest increases are planned for high energy physics university groups in FY 2000 to allow them to exploit new facilities mentioned above.

The **Nuclear Physics** (NP) program provides primary support in the U.S. for fundamental research on the structure and fundamental forces in atomic nuclei. The Program operates large and small particle accelerator facilities located at National Laboratories and Universities which provide the microscopic probes of these structures and forces. The scope of the FY 2000 Nuclear Physics Program is broadly enhanced by operation of several new facilities. The new Relativistic Heavy Ion Collider (RHIC) at Brookhaven National Laboratory will operate for its first full year to search for the predicted quark-gluon plasma, a heretofore unseen form of nuclear matter. The new Thomas Jefferson National Accelerator Facility in Newport News, Virginia, is fully operational, and will continue an already impressive program of research into the quark basis of the structure of nuclei. The Sudbury Neutrino Observatory (SNO) in Canada will be fully operational in FY 2000 and will be accumulating important information on the apparent low rate of neutrino flux from the sun. R&D and conceptual design development for a proposed world-class radioactive ion beam facility (ISOL) for nuclear structure and astrophysics studies, will be supported in FY 2000. A smaller radioactive ion beam facility (RIB) has recently begun to operate at Oak Ridge National Laboratory, and is prototyping new radioactive beam techniques as well as doing research.

Unique low energy heavy ion facilities at ANL and LBNL, will continue to pursue important investigations of highly deformed and exotic nuclei which require examination using very high resolution spectroscopy. The new and highly successful Gammasphere detector is being utilized at both ANL and LBNL to pursue such experiments. The MIT/Bates Linear Accelerator Center, which has been a major world center for nuclear research using electron scattering for over 25 years, will end operations in FY 2000.

54-291 99 - 36

The **Fusion Energy Sciences** (FES) program is completing its transition from a focus on the development of fusion as a new energy supply technology to emphasizing the science that underpins fusion energy. In FY 2000, the program will continue to make progress in understanding plasma physics, identifying and exploring innovative approaches to fusion power, and exploring the science and technology of energy producing plasmas, as a partner in the international fusion research effort.

FY 2000 will begin a three year effort, supported by FES, at the Princeton Plasma Physics Laboratory (PPPL) for the decontamination and decommissioning of the Tokamak Fusion Test Reactor (TFTR).

The program continues the move toward innovation and increased understanding of a wide range of confinement concepts. The National Spherical Torus Experiment (NSTX) facility provides strong support of the goal to explore innovative and more affordable development paths. Work on concept improvement at the exploratory level in both physics and enabling technology R&D will receive more emphasis. The inertial fusion energy element will be broadened to include research efforts on systems and related elements. This change in domestic program emphasis reflects a move away from the costly, large scale devices aimed at providing integrated plasma technology experiments operating with power plant-scale plasma parameters.

The International effort to explore the science and technology of energy producing plasmas was dramatically reduced in FY 1999 by termination of U.S. participation in the International Thermonuclear Experimental Reactor (ITER) project. The U.S. will, however, continue to pursue modest scale international collaborative activities on major international scientific facilities.

Research on high temperature toroidal plasmas will be carried out using the DIII-D facility at General Atomics, C-MOD at MIT and NSTX spherical torus at PPPL which will have its first full year of operations in FY 2000. The experimental program will be supported by broadly based theoretical, modeling and computational efforts. Technology activities supporting energy-producing plasmas will be drastically reduced as part of the shift in priorities noted above, but the long range program on low activation materials will continue. The physical and intellectual infrastructure associated with the experimental portion of energy producing plasmas will need to be re-established at an appropriate time depending upon technical advances toward lower-cost systems and/or increased urgency.

As recommended by Congress, a review of the several approaches to fusion (to be conducted by the Secretary of Energy Advisory Board) was initiated in December, 1998 and will be completed in May 1999. The National Academy of Sciences is also expected to complete a review of the fusion science program in FY 1999. Recommendations from these reviews will help to set the course for future fusion research activities.

The **Computational and Technology Research** (CTR) program supports advanced computing research — applied mathematics, high performance computing, networking, and operates supercomputer and associated facilities that are available to researchers 24 hours a day, 365 days a year. The combination of support for fundamental research, computational and networking tools development, and high-performance computing facilities provides scientists with the capabilities to analyze, model, simulate, and — most importantly — predict complex phenomena of importance to the Office of Science and the Department of Energy.

The long history of CTR accomplishments continued in FY 1999 including: the 1998 Gordon Bell Prize for Best Performance of a

Supercomputing Application, the 1998 IEEE Fernbach Award for outstanding contribution in the application of high performance computers using innovative approaches and four R&D 100 Awards to CTR researchers in areas ranging from parallel numerical libraries to near frictionless coatings.

Experiments at Office of Science facilities may generate millions of gigabytes (petabytes) of data per year (which would fill the disk drives of millions of today's personal computers) presenting significant computational and communications challenges in analyzing and extracting information from the data.

Some of the pioneering accomplishments of this program are: development of the technologies to enable remote, interactive access to supercomputers; research and development leading to the High Performance Parallel Interface (HiPPI) standard; and research leading to the development of the slow start algorithm for the Transmission Control Protocol (TCP), which enabled the Internet to scale to today's worldwide communications infrastructure.

CTR is responsible for DOE participation in the Next Generation Internet (NGI) program to create the foundation for more powerful and versatile networks of the 21st century.

CTR also heads the Department's Scientific Simulation Initiative (SSI) as a joint program with the other program offices in SC. CTR's role in the SSI includes management of the selection process for a small number of basic science application efforts initiated in FY 2000, management of the SSI Advanced Computing and Communications Facilities, and management of the Computer Science and Enabling Technology component.

In addition to these computing related activities CTR also manages the Laboratory Technology Research (LTR) program for the Office of Science. The mission of this program is to support high risk, energy related research that advances science and technology to enable applications that could significantly impact the Nation's energy economy. LTR fosters the production of research results motivated by a practical energy payoff through cost-shared collaborations between Office of Science laboratories and industry.

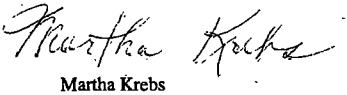
The Science **Program Direction** budget funds staff and related expenses which are necessary to provide overall management direction of the Office of Science research programs. The Office of Science will strive to meet staffing levels as outlined in its Workforce Management Plan. Work will continue on piloting the transfer of management responsibility of newly generated wastes at SC sites from Environmental Management to the Office of Science. The scientific and technological challenges of the Department's missions demand an adequate supply of scientists, engineers and technicians. For over 50 years, DOE and its predecessor agencies have supported science and engineering education programs involving university faculty as well as pre-college teachers and students. Tapping the significant human and physical resources of the DOE National Laboratories is perhaps the most distinguishing feature of the agency's contribution to science education. Within the FY 2000 request for Program Direction is SC's core program for science education, supporting such activities as: the Undergraduate Research Fellowship Program, the National Science Bowl, and Albert Einstein Distinguished Educator Fellowship. In addition, two new initiatives, developed in partnership with NSF, will be supported through the five SC scientific programs. The first initiative will be focused on providing pre-college science and math teachers with research opportunities that will improve their knowledge and skills of scientific discovery and enhance their ability to apply them in their classrooms. The second initiative will allow university faculty and undergraduate student teams to participate in long-term research projects at DOE Laboratories. Historically, over two-thirds of undergraduates who have participated in DOE programs have gone on to graduate school in disciplines directly related to DOE missions.

These activities will help to fulfill SC's responsibilities in developing the next generation of scientists and engineers in a responsible and focused manner.

Effective human resource management will ensure that critical staffing needs are met in support of the strategic goals of the Department. This includes, but is not limited to, the integration of diversity considerations into all human resource management activities, and effective long-term succession planning for executives and scientific/ technical positions. Enhanced business processes that are built from our Activity Based Management activities and Strategic Information Planning will enable the staff to carry out the mission and functions of the organization effectively and efficiently.

Closing:

The significant increase in the FY 2000 budget for the Office of Science recognizes the critical role that fundamental knowledge plays in achieving the DOE missions and for the general advance of the Nation's economy and the welfare of its citizens. The Scientific Simulation Initiative represents a major investment in producing the necessary scientific computation and information infrastructure for DOE science applications as part of a multi-agency initiative. This request will also provide the U.S. scientific community with increased research capability and new opportunities at the DOE scientific user facilities, including progress on SNS, a new forefront neutron source, and upgrades of existing facilities. On behalf of the Administration and the Department, I am pleased to present this budget for the Office of Science and welcome the challenge to deliver results.



Martha Krebs
Director
Office of Science

High Energy Physics

Program Mission

The High Energy Physics (HEP) program of the Department of Energy (DOE) has the lead responsibility for Federal support of high energy physics research and supports fundamental research activities under the mandate provided in Public Law 95-91 which established the Department. The High Energy Physics program is a key element in the Science and Technology component of the DOE Strategic Plan, supporting several of the strategies which make up that component. This program is also one of the identified elements in the Secretary's Performance Agreement with the President, and is an integral part of the Department's fundamental research mission. The program is directed at understanding the nature of matter and energy at the most fundamental level, and the basic forces which govern all processes in nature. Fundamental research provides the necessary foundation that ultimately enables the Nation to progress in its science and technology capabilities, to advance its industrial competitiveness, and to discover new and innovative approaches to our energy future.

The high quality of the research in this program is continuously evaluated through the use of merit based peer review and scientific advisory committees.

Program Goal

Provide new insights into the nature of energy and matter to better understand the natural world.

Program Objectives

- *To continue to support high quality research* — Support high quality university and laboratory based high energy physics research, both theoretical and experimental. Experimental research is primarily performed by university scientists using particle accelerators located at major laboratories in the U.S. and abroad.
- *To effectively operate the department's high energy physics accelerator facilities* — Provide optimal and cost effective operation for research of the Fermi National Accelerator Laboratory, and the Stanford Linear Accelerator Center. The Alternating Gradient Synchrotron complex at the Brookhaven National Laboratory will be transferred to the Nuclear Physics (NP) program during FY 1999.
- *To continue to provide world class research facilities* — Plan for and build new, state-of-the-art research facilities that allow researchers to advance the forefront of the science of high energy physics. Support essential improvements and upgrades at the major accelerator laboratories. Manage the commissioning of the Fermilab Main Injector project, the initial operation of the B-factory at SLAC and the continuation of the new experimental facility at Fermilab called Neutrinos at the Main Injector (NuMI).

- *To continue to provide the program's technological base* — Support long-range accelerator and detector R&D required to provide the advanced concepts and technologies which are critical to the long-range viability of high energy physics research.
- *To continue to pursue international collaboration on large high energy physics projects* — Work to put into place the management and control systems needed to successfully carry out the planned and agreed to collaboration with CERN on the Large Hadron Collider (LHC) project. Work to explore and pursue other opportunities for effective and beneficial international collaborative activities.

Scientific Facilities Utilization

The High Energy Physics request includes $439,814,000 to maintain support of the Department's scientific user facilities. This investment will provide significant research time for thousands of scientists in universities, and other Federal laboratories. It will also leverage both Federally and privately sponsored research, consistent with the Administration's strategy for enhancing the U.S. National science investment. The proposed funding will support operations at the Department's two major high energy physics facilities: the Tevatron at Fermilab, and the B-factory at the Stanford Linear Accelerator Center (SLAC), and on an incremental basis will provide support for limited operation of the Alternate Gradient Synchrotron (AGS) at the Brookhaven National Laboratory (BNL), which is primarily being operated as part of the Nuclear Physics (NP) funded Relativistic Heavy Ion Collider (RHIC) complex.

Performance Measures

Performance measures related to basic science activities are primarily qualitative rather than quantitative. The scientific excellence of the High Energy Physics program is continually reevaluated through the peer review process. Some specific performance measures are:

- Quality of scientific results and plans as indicated by expert advisory committees, recognition by the scientific community, and awards received by DOE-supported High Energy Physics researchers. The results of these reviews and other quality measures will be used to determine programmatic directions aimed at maintaining the world leadership position of the U.S. high energy physics program.
- Sustained achievement in advancing knowledge, as measured by the quality of the research based on results published in refereed scientific journals, and by the degree of invited participation at national and international conferences and workshops.
- Operation of research facilities in a manner that meets user requirements, as indicated by achieving performance specifications while protecting the safety of the workers and the environment, and by the level of endorsement by user organizations; operating facilities that are used for research at the forefront of science; and operating facilities reliably and according to planned schedules.
- Progress on the Neutrinos at the Main Injector project as measured by accomplishment of scheduled milestones; progress on achieving luminosity and operational efficiency for the B-factory at SLAC as measured by comparison with stated project goals.
- Progress on achieving luminosity and operational efficiency for the Tevatron at Fermilab in its new mode of operation with the recently completed Main Injector.

- The upgrade of scientific facilities will be managed to keep them on schedule and within cost.
- High Energy Physics will begin operating the B-factory at SLAC, the Main Injector for the Tevatron at Fermilab, and will deliver on the FY 2000 U.S./DOE commitments to the international Large Hadron Collider project.
- Review at least 80 percent of the research projects by appropriate peers and selected through a merit-based competitive process.
- Continue collaborative efforts with NASA on space science.

Significant Accomplishments and Program Shifts

- Completion of a long range planning study of the High Energy Physics program was accomplished by a Subpanel of the High Energy Physics Advisory Panel (HEPAP), (Gilman report). Their report is entitled "Planning for the Future of U.S. High-Energy Physics." The Subpanel's recommendations were considered carefully in preparing this budget.

Research and Technology

- Measurement, by teams of university and laboratory scientists working at Fermilab, of the mass and production properties of the top quark was accomplished. This is the last, and by far the heaviest, of the fundamental building blocks of matter (quarks) whose existence was predicted by the Standard Model of elementary particles. The mass of the top quark is now measured more accurately than any of the other quarks.
- The world's most precise measurement was made, by a team of university and laboratory scientists working at Fermilab, of the mass of the W boson. This result is considerably more precise than the best measurement from LEP.
- The world's highest precision single measurement was made by a group of university and laboratory scientists working at SLAC, of the weak mixing angle, a fundamental parameter of the Standard Model.
- The observation was made, by the CDF collaboration working at Fermilab, of the B meson containing a charmed quark. This discovery completes the theoretically predicted family of B mesons.
- The observation was made for the first time ever by the kTeV collaboration of the predicted decay of the kaon into a pair of pions and an electron-positron pair.
- A major advance in theoretical physics was achieved when it was shown and verified that all of the known "string" theories are equivalent. This greatly reduces the number of possible theories which describe all of the known forces including gravity.
- A test of a superconducting accelerator-style magnet fabricated at Lawrence Berkeley National Laboratory (LBNL) achieved a new world record field strength of 13.5 teslas (previous record 11 teslas.) This is a significant accomplishment in the effort to advance technology for future accelerators.
- At the g-2 experiment at BNL, designed to study the magnetic properties of the muon and to develop a more precise measurement of the anomalous magnetic moment, initial data collection has been

completed. Once data collection has been completed, the analysis of these data should become available over the next three years. The experimenters are confident that they will achieve the world's best measurement of the anomalous magnetic moment of the muon. If the final result agrees with the standard model, it will place significant new limits on physics beyond the standard model.

Facility Operations

- The final data collection with the Fermilab 800 GeV fixed-target program will be completed in FY 2000, and the prime focus of the Fermilab program will turn to research using the Tevatron collider with the higher luminosity of the new Main Injector.
- The Alternating Gradient Synchrotron at BNL will be transferred to the Nuclear Physics program for operation as the injector for the RHIC facility during the 3rd quarter of FY 1999. Beginning in FY 2000, use of the AGS for High Energy Physics experiments will be on an incremental cost basis.
- The European Center for Nuclear Research (CERN) in Geneva, Switzerland has initiated the Large Hadron Collider (LHC) project. This will consist of a 7 on 7 TeV proton-proton colliding beams facility to be constructed in the existing Large Electron-Positron Collider (LEP) machine tunnel (LEP will be removed). The LHC will have an energy 7 times that of the Tevatron at Fermilab. Thus the LHC will open up substantial new frontiers for scientific discovery.

  The Project is proceeding well. All the civil engineering contracts have been awarded and work is underway and proceeding on schedule. Work is underway for the ATLAS detector hall, for the CMS detector hall, for a beam transfer line tunnel on the Swiss side, and for a second beam transfer line tunnel together with enlargements of the main tunnel on the French side. In addition, CERN has completed approximately 700 million Swiss francs worth of contracting for the collider, which is a significant portion of the total project budget. This includes orders placed with three companies, German, Italian and French, for two full-length collider dipole magnets from each, with an option for a third.

  Participation by the U.S. in the LHC program is extremely important to U.S. High Energy Physics program goals. The LHC will become the foremost high energy physics research facility in the world around the middle of the next decade. With the LHC at the next energy frontier, American scientific research on that frontier depends on participation in LHC. The High Energy Physics Advisory Panel (HEPAP) Subpanel on Vision for the Future of High-Energy Physics (Drell) strongly endorsed participation in the LHC, and this endorsement has been restated by HEPAP on several occasions.

  The physics goals of the LHC include a search for the origin of mass as represented by the "Higgs" particle, exploration in detail of the structure and interactions of the top quark, and the search for totally unanticipated new phenomena. Although LHC will have a lower energy than the Superconducting Super Collider (canceled in 1993), it has strong potential for answering the question of the origin of mass. The LHC energies are sufficient to test theoretical arguments for a totally new type of matter. In addition, history shows that major increases in the particle energy nearly always yield unexpected discoveries.

  DOE and NSF have entered into an agreement with CERN about contributions to the LHC accelerator and detectors as part of the U.S. participation in the LHC program to provide access for U.S. scientists to the next decade's premier high energy physics facility. The resulting agreements were approved by CERN, the DOE and the NSF and were signed in December of 1997.

Participation in the LHC project (accelerator and detectors) at CERN will primarily take the form of the U.S. accepting responsibility for designing and fabricating particular subsystems of the accelerator and of the two large detectors. Thus, much of the funding will go to U.S. laboratories, university groups, and industry for fabrication of subsystems and components which will become part of the LHC accelerator or detectors. A portion of the funds will be used to pay for purchases by CERN of material needed for construction of the accelerator. As a result of the negotiations, CERN has agreed to make these purchases from U.S. vendors.

The agreement provides for a U.S. DOE contribution of $450,000,000 to the LHC accelerator and detectors over the period FY 1996 through FY 2004 (with approximately $81,000,000 being provided by the NSF). The DOE contribution is broken down as follows: detectors $250,000,000; accelerator $200,000,000 (including $90,000,000 for direct purchases by CERN from U.S. vendors and $110,000,000 for fabrication of components by U.S. laboratories).

The total cost of the LHC on a basis comparable to that used for U.S. projects is estimated at about $6,000,000,000. Thus the U.S. contribution represents less than 10 percent of the total. (The LHC cost estimates prepared by CERN, in general, do not include the cost of permanent laboratory staff and other laboratory resources used to construct the project.) Neither the proposed U.S. DOE $450,000,000 contribution nor the estimated total cost of $6,000,000,000 include support for the European and U.S. research physicists working on the LHC program.

The agreement negotiated with CERN provides for U.S. involvement in the management of the project through participation in key management committees (CERN Council, CERN Committee of Council, LHC Board, etc.). This will provide an effective base from which to monitor the progress of the project, and will help ensure that U.S. scientists have full access to the physics opportunities available at the LHC. The Office of Science has conducted a cost and schedule review of the entire LHC project and similar reviews of the several proposed U.S. funded components of the LHC. All of these reviews concluded the costs are properly estimated and that the schedule is feasible.

In addition to the proposed U.S. DOE $450,000,000 contribution and $81,000,000 NSF contribution to the LHC accelerator and detector hardware fabrication, U.S. participation in the LHC will involve a significant portion of the U.S. High Energy Physics community in the research program at the LHC. This physicist involvement has already begun. Over 500 U.S. scientists have joined the U.S.-ATLAS detector collaboration, the U.S.-CMS detector collaboration, or the U.S.-LHC accelerator consortium, and are hard at work helping to design the initial physics research program to be carried out at the LHC helping to specify the planned physics capabilities of the LHC accelerator and detectors, and helping to design and fabricate accelerator and detector components and subsystems.

Fabrication of LHC subsystems and components by U.S. participants began in FY 1998. Funding was provided in FY 1996 ($6,000,000) and FY 1997 ($15,000,000) for preliminary R&D, design and engineering work on the subsystems and components being proposed for inclusion in the agreement with CERN. This funding was essential in order to provide the cost and technical bases for the proposed U.S. responsibilities in LHC, and to be ready for rapid start to satisfy the anticipated timetable for the project. Funding in the amount of $35,000,000 was provided in FY 1998, $65,000,000 will be provided in FY 1999, and $70,000,000 in FY 2000 to support continuation of these R&D and design efforts, and the continuation of fabrication of those subsystems and components specified in the agreements with CERN.

The planned U.S. funding for the LHC project is summarized below.

U.S. LHC Accelerator and Detector Funding

(dollars in thousands)

Fiscal Year	Department of Energy			National Science Foundation[a]
	Accelerator	Detector	Total	
1996 [b]	2,000	4,000	6,000	0
1997 [b]	6,670	8,330	15,000	0
1998 [b]	14,000	21,000	35,000	0
1999	29,740	35,260	65,000	22,150
2000	31,200	38,800	70,000	15,900
2001	32,060	37,940	70,000	16,370
2002	31,200	38,800	70,000	16,860
2003	29,000	36,000	65,000	9,720
2004	24,130	29,870	54,000	0
Total	200,000 [c]	250,000	450,000	81,000

This estimated annual funding profile is based on the needs of the LHC project and is consistent with flat out year funding for the High Energy Physics program. The profile is subject to change as additional planning detail is derived. The total of $450,000,000 from DOE for the project is firm.

Construction

- The Fermilab Main Injector Project is proceeding well and is within the planned cost and schedule profiles. All relevant milestones have been met. At the end of FY 1998, the construction phase of the project was nearly complete and commissioning was underway.
- The C-Zero Experimental Hall project at Fermilab will provide a new underground experimental area at the C-Zero location on the Tevatron ring. When completed in FY 1999, this will provide space for a new program of fixed target and modest sized collider experiments now being planned at Fermilab.
- The B-factory Project at SLAC will be completed within the planned cost and schedule profiles. At the end of FY 1998, the project was essentially complete and commissioning was underway. The physics research program, using the BaBar detector will begin during FY 1999.
- The Wilson Hall Safety Improvements Project is proceeding well. An economical, safe and effective method for repairing the structural beams has been developed and detailed planning and contracting is underway.

---

[a] The NSF funding has been approved by the National Science Board.

[b] The FY 1996 and FY 1997 funding was for R&D, design and engineering work in support of the proposed U.S. participation in LHC. Beginning in FY 1998 funding was used for: fabrication of machine and detector hardware, supporting R&D, prototype development, and purchases by CERN from U.S. vendors.

[c] Includes $110,000,000 for LHC supporting R&D and accelerator components to be fabricated by U.S. laboratories and $90,000,000 for purchases by CERN from U.S. vendors.

Funding of Contractor Security Clearances

In FY 1999, the Department divided the responsibility for obtaining and maintaining security clearances. The Office of Security Affairs, which was responsible for funding all Federal and contractor employee clearances, now pays only for clearances of Federal employees, both at headquarters and the field. Program organizations are now responsible for contractor clearances, using program funds. This change in policy enables program managers to make the decisions as to how many and what level clearances are necessary for effective program execution. In this way, it is hoped that any backlog of essential clearances which are impeding program success can be cleared up by those managers most directly involved. The Office of Science is budgeting $373,000 and $270,000 for estimated contractor security clearances in FY 1999 and FY 2000, respectively, within this decision unit.

Funding Profile

Site Description

Ames Laboratory

Ames Laboratory is a Mulitiprogram Laboratory located on 10 acres in Ames, Iowa. Educational activities supported at the laboratory are directed towards providing opportunities for pre-college teachers that will participate directly in cutting-edge research at DOE science laboratories, and will renew their understanding of scientific investigation.

Argonne National Laboratory

Argonne National Laboratory in Argonne, Illinois, is a Multiprogram Laboratory located on a 1,700 acre site in suburban Chicago. ANL has a satellite site located in Idaho Falls, Idaho. High Energy Physics supports a program of physics research and technology R&D at ANL, using unique capabilities of the laboratory in the areas of accelerator R&D techniques and participation in the CDF and MINOS detector collaborations.

Brookhaven National Laboratory

Brookhaven National Laboratory is a Multiprogram Laboratory located on a 5,200 acre site in Upton, New York. High Energy Physics supports a program of physics research and technology R&D at BNL, using unique capabilities of the laboratory, including the Accelerator Test Facility and the capability for precision experimental measurement. High Energy Physics also makes limited use of the Alternating Gradient Synchrotron which is principally supported by the Nuclear Physics program.

Fermi National Accelerator Laboratory

Fermi National Accelerator Laboratory is a program-dedicated laboratory (High Energy Physics) located on a 6,800 acre site in Batavia, Illinois. Fermilab operates the Tevatron accelerator and colliding beam facility which consists of a four mile ring of superconducting magnets and is capable of accelerating protons and antiprotons to one TeV. Thus the Tevatron is the highest energy particle accelerator in the world, and has a unique capability for research at the energy frontier. Fermilab, together with SLAC, constitute the principal experimental facilities of the DOE High Energy Physics program.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory is a Multiprogram Laboratory located in Berkeley, California. The Lab is on a 200 acre site adjacent to the Berkeley campus of the University of California. High Energy Physics supports a program of physics research and technology R&D at LBNL, using unique capabilities of the laboratory primarily in the areas of participation in the BaBar collaboration, expertise in superconducting magnet R&D, and expertise in design of forefront electronic devices.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory is a Multiprogram Laboratory located on a 821 acre site in Livermore, California. High Energy Physics supports a program of physics research and technology R&D at LLNL, using unique capabilities of the laboratory primarily in the area of advanced accelerator R&D and participation in the B-factory project.

Los Alamos National Laboratory

Los Alamos National Laboratory is a Multiprogram Laboratory located on a 27,000 acre site in Los Alamos, New Mexico. High Energy Physics supports a program of physics research and technology R&D at LANL, using unique capabilities of the laboratory primarily in the area of theoretical studies, and computational techniques for accelerator design.

Oak Ridge Institute for Science and Education

Oak Ridge Institute for Science and Education is located on a 150 acre site in Oak Ridge, Tennessee. The High Energy Physics program supports a small effort at ORISE in the area of program planning and review.

Oak Ridge National Laboratory

Oak Ridge National Laboratory is a Multiprogram Laboratory located on a 24,000 acre site in Oak Ridge, Tennessee. The High Energy Physics program supports a small research effort using unique capabilities of ORNL primarily in the area of particle beam shielding calculations.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory is a Multiprogram Laboratory located on 640 acres at the Department's Hanford site in Richland, Washington. The High Energy Physics program supports a small research effort using unique capabilities of PNNL in the area of low background experiments.

Princeton Plasma Physics Laboratory

Princeton Plasma Physics Laboratory is a program-dedicated laboratory (Fusion Energy Sciences) located on 72 acres in Princeton, New Jersey. The High Energy Physics program supports a small research effort using unique capabilities of PPPL in the area of advanced accelerator R&D.

Stanford Linear Accelerator Center

Stanford Linear Accelerator Center is a program-dedicated laboratory (High Energy Physics) located on 426 acres in Menlo Park, California. SLAC operates for High Energy Physics the newly completed B-factory, the SLAC Linear Collider with the Stanford Large Detector, and a program of fixed target experiments. All of these facilities make use of the two mile long linear collider, or linac. SLAC, together with Fermilab, constitute the principal experimental facilities of the DOE High Energy Physics program.

All Other Sites

The High Energy Physics program funds research at 106 colleges/universities located in 38 states. This line also includes funding of research awaiting distribution pending completion of peer review results or program office detailed planning.

Research and Technology

Mission Supporting Goals and Objectives

The High Energy Physics program has two major subprograms. The Research and Technology subprogram provides support for the scientists who perform the research which is the core of the program, and the technology R&D, which is essential to maintain the accelerator and detector facilities at the cutting edge required for a successful research program. The Facility Operations subprogram, described later, provides the large facilities — accelerators, detectors, colliding beams devices — needed for the research program.

The Physics Research category in the Research and Technology subprogram provides support for university and laboratory based research groups conducting experimental and theoretical research in high energy physics. This research probes the nature of matter and energy at the most fundamental level, and the characteristics of the basic forces in nature. Experimental research activities include: planning, design, fabrication and installation of experiments; conduct of experiments; analysis and interpretation of data; and publication of results. Theoretical physics research provides the framework for interpreting and understanding observed phenomena and, through predictions and extrapolations based on current understanding, identifies key questions for future experimental explorations. This subprogram supports research groups at more than 100 major universities and at 9 DOE laboratories.

The High Energy Technology category in the Research and Technology subprogram provides the specialized advanced technology R&D required to sustain and extend the technology base and provide operational support for the highly specialized accelerators, colliding beams facilities, and detector facilities which are essential to the overall high energy physics program goal of carrying out forefront research. The objectives of this category include: 1) carry out R&D in support of existing accelerator and detector facilities aimed at maintaining and improving their performance parameters and cost effectiveness; 2) carry out R&D in support of planned and proposed projects to maximize their performance goals and cost effectiveness; 3) carry out R&D to transfer new concepts and technologies into practical application in the High Energy Physics context; and 4) carry out R&D to search for and develop new concepts and ideas which could lead to significant enhancements of research capabilities or to significant cost savings in the construction and operation of new facilities. This category supports work primarily at the DOE labs, but also at universities, other federal labs, and in industry.

The High Energy Physics program will provide opportunities for pre-college teachers that will participate directly in cutting-edge research at DOE science laboratories, and will renew their understanding of scientific investigation. Where teachers do not possess sufficient background to participate directly in research, DOE will provide mediated research experiences where teachers can work with teams of scientists and science educators to understand the nature of DOE's scientific research. The goal is to provide educators with the tools to sharpen their science and math foundations and apply these tools to their classroom practice. Funds will be provided to pay for teachers' stipends, travel, housing and subsidize laboratory scientists' time for this activity ($2,921,000).

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Physics Research	143,592	145,835	159,650	+13,815	+9.5%
High Energy Technology	65,536	69,056	67,540	-1,516	-2.2%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Physics Research			
■ **Fermilab:** In FY 2000 the experimental physics research groups at Fermilab will be working on completing and bringing into operation the upgraded CDF and D-Zero facilities, completing a fixed target run, analyzing data from recent experimental data taking runs, and preparing for future experiments including participation in the CMS detector for LHC. The theoretical research group and the theoretical astrophysics group will be working on a variety of theoretical topics.	10,415	8,826	9,240
■ **SLAC:** The experimental physics research groups at SLAC will concentrate their efforts in FY 2000 on the physics analysis and interpretation of the large amounts of data taken with the SLC Large Detector (SLD) detector in prior years, and on early data-taking with the recently commissioned BaBar detector facility and B-factory. Some physics research will also be done in a fixed target experiment studying parity violation, and with the CLEO detector at the Cornell Electron Storage Ring (CESR) facility at Cornell. The theoretical physics group will continue to emphasize topics related to the SLD, BaBar, and Next Linear Collider (NLC) research programs as well as tests of the Standard Model and Quantum ChromoDynamics (QCD).	11,411	12,027	12,441
■ **BNL:** In FY 2000, the BNL experimental physics research groups will be working on experiments at the BNL-AGS involving precision measurements of the muon magnet moment, and rare decays of the K meson; on the Fermilab collider experiment D-Zero probing the high energy frontier; and on the U.S. effort on the Large Hadron Collider ATLAS detector. The Theoretical physics research groups will be working on a number of topics.	7,662	7,690	8,226

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **LBNL:** In FY 2000, LBNL researchers will be analyzing data recently taken at the collider detectors and at fixed target experiments at Fermilab, and will be preparing for studies of B-Bbar decays using the BaBar detector on the B-factory at SLAC. The researchers will also be working on supernova measurements to establish values for cosmological parameters. Recent results indicate the universe may be expanding at an increasing rate. The Particle Data Group at LBNL continues as an international clearinghouse for particle physics information.	10,375	10,498	11,033
■ **ANL:** The experimental high energy physics group will continue collaborating in research on the CDF at Fermilab, and ZEUS at the DESY/HERA facility in Hamburg, Germany. They also will be working on the fabrication of two major new detector facilities: the ATLAS detector for future use at CERN's LHC facility, and the MINOS detector at the Soudan site in Minnesota. The MINOS detector is part of the NuMI project and will use a neutrino beam from Fermilab. The theoretical physics group will continue their research in formal theory, collider phenomenology, and lattice gauge calculations.	5,489	5,465	5,465
■ **Universities and Other Laboratories:** The University Program consists of groups at 100 universities doing experiments (77 universities) and theory (75 universities). These university groups plan, build, execute, analyze and publish results of experiments, train graduate students and post-docs; and provide theoretical concepts, simulations and calculations of physical processes involved in high energy physics. Provides support for research scientists at LANL, LLNL, ORNL, and PNNL. This University and small laboratory (LANL, LLNL, ORNL, PNNL) based research activity is described in more detail below. The recent HEPAP Subpanel (Gilman), recommended that the level of funding for the university based portion of the program be substantially increased over inflation over the next two year period. The funding detailed below includes funding for 3.5 percent over inflation providing more than half of the recommended first year increase. These increases are aimed at improving the research capabilities and operational effectiveness of these (primarily) university based research groups.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ **University and other laboratory based Research using Fermilab:** Some 55 DOE-funded universities participate in large international collaborations doing experiments at Fermilab. LLNL is also involved in the MINOS project. These experiments involve the CDF and D-Zero collider detectors, and the KTEV, FOCUS, MINOS, DONUT, and HYPER-CP experiments using external beams of kaons, photons, neutrinos and hyperons. Other experiments are performed in the antiproton accumulator. These universities help to fabricate the detectors, plan and execute the experiments, analyze data and publish the results. The participation has been and is expected to remain about constant, as fixed target 800 GeV experiments diminish and CMS, MINOS, and BTeV related activities increase.	24,905	25,170	26,940
▸ **University and other laboratory based Research using SLAC:** Some 27 DOE–funded universities participate in large international collaborations doing experiments at SLAC. LLNL is also involved in the BaBar detector project. The experiments involve the SLD and BaBar detectors, and other smaller detectors for fixed target experiments. These universities help to build the detectors, plan and carry out experiments, analyze the data and publish the results. The participation has been and is expected to remain about constant, as SLD diminishes, BaBar flourishes, and work on a future large linear collider continues.	9,960	10,360	11,400
▸ **University based Research using BNL:** Some 10 DOE-funded universities participate in collaborative experiments at BNL. These experiments involve fixed targets and kaon or pion beams, colliding beams of protons (RHIC-SPIN) or nuclei (PHOBOS) at RHIC, and external storage rings measuring the muon anomalous magnetic moment to high precision. This participation has decreased significantly due to the phasing out of most of the AGS High Energy Physics program.	3,980	2,960	2,070

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ **University based Research using the Cornell Electron Storage Rings:** Some 11 university High Energy Physics groups with DOE funding participate in the electron-positron colliding beam experiments at Cornell's CESR facility utilizing the collaboratively built CLEO detector. They help to plan, build, execute, analyze and publish the experiments. This participation has been decreasing, as some groups move to BaBar at SLAC.	4,980	4,440	4,145
▸ **University and other laboratory based Research not using accelerators:** Some 28 DOE-funded universities are involved in High Energy Physics experiments not utilizing accelerators. LANL, LLNL and PNNL are also involved in non-accelerator experiments. These experiments, which are primarily in the areas of astrophysics and cosmology, include MACRO (Italy), Super-Kamiokande (Japan), SNO (Canada), CHOOZ (France), SOUDAN (Minnesota), CDMS (Stanford), GRANITE (Mt. Hopkins, Arizona), Palo Verde (Arizona) and AMS (Space Station). They help build the detectors, plan, execute, analyze and publish the results. This participation has increased and is expected to increase further due to the newly emerging interest and opportunities in astrophysics and cosmology, such as GLAST, AUGER and CDMS (Soudan). The funding includes an increase of $1,800,000 for the fabrication of underground detectors such as those listed above. The allocation of these funds will be decided on the basis of a peer review process which is presently underway.	12,950	15,300	18,115
▸ **University and other laboratory Theoretical Studies:** Some 75 universities with DOE funding participate in research in theoretical high energy physics. Theoretical studies at LANL are also included here. This effort is expected to remain about constant. They provide theoretical ideas, concepts, calculations and simulations of physical processes in high energy physics.	18,920	19,250	20,720

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ **University based Research using Foreign Labs:** Universities funded by the DOE are doing experiments with international collaborations using facilities at foreign accelerator labs. Some 45 universities are conducting experiments at CERN (Switzerland), 11 at DESY (Germany), 10 at KEK (Japan), 1 at IHEP (Russia), 1 at BINP (Russia), and 2 at Beijing (China). They help to fabricate the detectors and experimental apparatus, plan and execute the experiments, analyze the data and publish the results. The participation has increased and is expected to increase further with the participation in the ATLAS and CMS detectors at CERN's LHC. The funding includes an increase of $1,000,000 to address technical infrastructure needs, such as technical staff and computers, related to research operations at foreign laboratories.	20,925	22,700	26,930
▸ **Other University and other laboratory based Research activities:** A new focussed program in Detector R&D, recommended by the HEPAP Subpanel, was started modestly in FY 1999, will be continued and expanded slightly ($1,000,000). The Outstanding Junior Investigator program, which is intended to identify and provide support for highly promising investigators at an early stage in their careers, will continue at a level of about $400,000 in new awards per year. A new educational program, Quark-Net, aimed at involving high school students and teachers in high energy physics research, will be started in FY 1999 and will continue at $250,000. The accelerator and beamline shielding studies carried out at ORNL are included here. Funding of conferences, studies, and workshops is also included here. The funding includes an increase of $500,000 to increase the capability of the computer network link to CERN and an increase of $750,000 for anticipated but unknown needs or opportunities which is not yet allocated.	1,620	1,149	2,925
Total, Universities and Other Laboratories	98,240	101,329	113,245
Total, Physics Research	143,592	145,835	159,650

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
High Energy Technology			
■ **Fermilab:**			
▸ **Accelerator R&D:** Activities in FY 2000 include design of an improved proton source; design of an electron cooling system to improve antiproton beam quality: construction of a large-scale experiment to test the concept of ionization cooling, which is critical for any future muon collider; R&D on superconducting magnets and other components for future 100 TeV proton colliders; and tests of accelerating electrons with plasma wake-fields driven by intense electron beams. Muon collider R&D, with a high priority in the National High Energy Physics program, will increase in FY 2000. The proposed funding provides an approximately constant level of effort, except for the increase to permit the critical muon collider experiment to proceed.	9,221	7,670	8,670
▸ **Experimental Facilities R&D:** Activities in FY 2000 include: R&D on the feasibility of reducing the cell size in the CDF detector wire chamber to accommodate the higher track density that will result from increasing the Tevatron collider event rate; developing scintillating fibers for the D–Zero detector that are capable of withstanding the increased radiation level resulting from the increased collision rates; R&D on radiation-hard materials such as diamond and silicon carbide to replace silicon micro strip detectors at high collision rates; R&D on specialized electronics for high event rates in numerous, high-density data channels; and developing parallel computing configurations, high speed networks, and high-capacity data storage systems for high data rates. The proposed funding provides a slightly decreasing level of effort.	8,700	6,670	6,670
Total, Fermilab	17,921	14,340	15,340

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **SLAC:**			
▸ **Accelerator R&D:** Activities in FY 2000 include R&D to explore new concepts in accelerator physics in support of design of future linear colliders. The R&D on the design for a linear collider to operate with TeV scale center of mass energy will be reduced to $12,000,000 in FY 2000. Relevant areas are high powered radio frequency systems, accelerator structures, controls and instrumentation, and advanced beam optics. This R&D and design activity is being done in the context of an international collaboration. R&D in support of the B-factory, commissioned in FY 1999, will continue at a significant level to ensure a strong luminosity performance in the initial data run for physics research. The R&D programs in generic collider R&D will continue, and the program in advanced accelerator physics looking at the use of lasers, plasmas, and ultra high frequency radio frequency systems, will be given slightly increased priority.	14,651	16,500	11,900
▸ **Experimental Facilities R&D:** In FY 2000, the focus will be on instrumentation for physics studies in the center of mass collision energy range of 50 GeV to 5,000 GeV. This will include work to support and improve performance of BaBar, the newly operating B-factory detector, and an expanded program of R&D, consistent with the recommendations of the HEPAP Subpanel, on developing preliminary designs for a detector to operate with a new electron-positron linear collider operating at the TeV center of mass energy scale.	1,545	2,500	2,900
Total, SLAC	16,196	19,000	14,800

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **BNL:**			
▸ **Accelerator R&D:** Activities in FY 2000 will include, R&D on new methods of particle acceleration such as laser acceleration and Free Electron Laser (FEL) accelerators, primarily using the excellent capabilities of the BNL Accelerator Test Facility. R&D on the muon collider concept will be expanded and will include design work on key system components including the high field solenoid and the dipole magnets. In the BNL superconductor test facility the characterization of new high critical temperature superconductors as well as their special requirements for magnet fabrication should be better understood. With the transfer of the AGS to the Nuclear Physics program during FY 1999, Accelerator R&D in support of the AGS is being brought to an orderly close.	5,570	5,045	5,155
▸ **Experimental Facilities R&D:** In FY 2000, semiconductor drift photo diodes for detection of photons of energies as low as 50 eV will be designed and produced. Development of radiation hardened monolithic electronics for a number of experiments will continue. Development of lead-wolfrate crystals with improved light output will continue. Testing of the modules that constitute the ATLAS barrel calorimeters will begin.	3,065	1,075	1,075
Total, BNL	8,635	6,120	6,230
■ **LBNL:**			
▸ **Accelerator R&D:** LBNL is a major contributor to accelerator and superconducting magnet R&D for advanced accelerator concepts, including the muon collider and the next linear collider. Development of these concepts is needed to advance the energy and luminosity frontiers to better understand the structure of matter. LBNL has a major role in designing, building, and testing the Low Energy Ring at the B-factory. In FY 1999, the B-factory will be fully commissioned. In FY 2000, preparations for muon cooling experiments, needed to confirm the practicality of a muon collider, will begin at Fermilab, using components developed at LBNL. The high-gradient, all-optical, laser-plasma wakefield accelerator at LBNL will begin accelerating electron bunches.	6,935	6,905	7,565

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ **Experimental Facilities R&D:** LBNL leads in providing custom state-of-the-art electronics, such as silicon vertex detectors, integrated circuit (IC) systems, and other components for high-energy particle detectors such as BaBar at the B-factory and the upgrades to CDF and D–Zero for the next, higher luminosity, runs at Fermilab. LBNL is also involved in developing computer programs for experimental data taking and analysis. In FY 2000, work will continue on large format CCDs and high-resolution imaging systems, plus the production and testing of IC systems.	2,620	2,670	2,670
Total, LBNL	9,555	9,575	10,235

■ ANL:

▸ **ANL Accelerator R&D:** R&D will continue on the acceleration of electrons using structures with plasmas or structures made of dielectric materials called wakefield accelerators. Using this new technique, accelerating gradients at one-third of conventional levels have been reached. Thus there is optimism that the much higher gradient predicted by theory can be achieved. Planning will be underway for an upgraded experimental facility which could generate much higher gradients. In addition, work will be undertaken on muon collider R&D as recommended by the HEPAP Subpanel.	1,135	1,130	1,305
▸ **Experimental Facilities R&D:** In FY 2000 work will be underway on the MINOS detector, the ATLAS detector for the LHC, and a possible upgrade of the ZEUS detector at DESY.	900	920	920
Total, ANL	2,035	2,050	2,225

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Universities, Other Laboratories, and Other Contractors:**			
▸ **University Program:** The funding will provide for a program of high priority technology R&D relevant to the development of particle accelerators. The R&D is aimed at breakthrough technologies; superconductors for high-field magnets; laser and collective-effect accelerator techniques; novel, high-power radio frequency generators; theoretical studies in particle beam physics, including the non-linear dynamics of particle beams; and at lowering the cost and improving the performance of future experiments and facilities. This element also includes the portion of the increased funding for R&D on future facility concepts as summarized in the table below which has not yet been allocated. Discussions and peer reviews are underway to design an optimum overall program and to identify and fund key activities. In FY 1998 $770,000 was transferred to the STTR program. Additional funding for the SBIR program is contained in the Facility Operations subprogram.	11,194	17,971	18,710
Total, High Energy Technology	65,536	69,056	67,540
Total, Research and Technology, ...	209,128	214,891	227,190

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ **Physics Research**	
▸ An increase in the base funding for the university program as recommended by the HEPAP.	+6,475
▸ An increase in the funding for the fabrication of non accelerator experiments as recommended by the HEPAP.	+1,800
▸ An increase to initiate an expanded program of detector R&D as recommended by the HEPAP.	+600
▸ An increase to provide for additional R&D to address the computing and networking needs of the new generation of detectors.	+1,500
▸ Initiation of an education program at National Laboratories.	+2,921

	FY 2000 vs. FY 1999 ($000)
▸ An increase in the funds held for allocation pending completion of planning and peer review activities.	+519
Total, Physics Research	+13,815
■ **High Energy Technology**	
▸ An increase in the funding for muon collider R&D at Fermilab	+1,000
▸ A decrease in the funding for NLC R&D at SLAC.	-5,000
▸ An increase in other Technology R&D at SLAC.	+800
▸ An increase in the funding for muon collider R&D at BNL.	+980
▸ Termination of the program of accelerator R&D at the AGS.	-870
▸ An increase in the funding of muon collider R&D at LBNL.	+660
▸ An increase in the funding for muon collider R&D at ANL.	+175
▸ An increase in the base funding for the advanced accelerator R&D program.	+620
▸ An increase in the funding held for allocation pending completion of planning and peer review activities.	+119
Total, High Energy Technology	-1,516
Total Funding Change, Research and Technology	+12,299

The following table summarizes the above changes for possible future HEP facilities:

	(dollars in millions)		
	FY 1998	FY 1999	FY 2000
Next Linear Collider	10.0	17.0	12.0
Muon-Muon Collider	4.5	5.5	8.2
Very Large Hadron Collider	2.5	3.0	3.0

Facility Operations

Mission Supporting Goals and Objectives

The Facility Operations subprogram includes the provision and operation of the large accelerator and detector facilities which are the essential tools that enable scientists in university and laboratory based research groups to perform experimental research in high energy physics. This subprogram includes funding for the operation and maintenance of the national laboratory research facilities including accelerators, colliders, secondary beam lines, detector facilities for experiments, experimental areas, computing, and computing networking facilities. It includes the costs of detector and accelerator components, personnel, electric power, expendable supplies, replacement parts and subsystems, inventories and, at Fermilab and SLAC, waste management activities. General Plant Projects (GPP) funding is provided for minor new construction, other capital alterations and additions, and for buildings and utility systems. Landlord General Purpose Equipment (GPE), and GPP funding for Lawrence Berkeley National Laboratory, Fermi National Accelerator Laboratory and Stanford Linear Accelerator Center are also included. Accelerator Improvement Projects (AIP) funding support for additions and modifications to accelerator facilities which are supported by the High Energy Physics research program is also included.

The principal objective of the Facility Operations subprogram is to maximize the quantity and quality of data collected for approved experiments being conducted at the High Energy Physics facilities. The ultimate measure for success in the Facility Operations subprogram is whether the research scientists have data of sufficient quantity and quality to do their planned measurements or to discover new phenomena. The quality of the data is dependent on the accelerator and detector capabilities, and on the degree to which those capabilities are achieved during a particular operating period. The quantity of the data relates primarily to the beam intensity, the length of the operating periods, and the operational availability of the accelerator and detector facilities.

Performance Measures

- Progress on achieving luminosity and operational efficiency for the B-factory at SLAC as measured by comparison with stated project goals.
- Progress on achieving luminosity and operational efficiency for the Tevatron at Fermilab in its new mode of operation with the recently completed Main Injector.
- High Energy Physics will begin operating the B-factory at SLAC, the Main Injector for the Tevatron at Fermilab.

Planned Accelerator Operations

	(in weeks)		
	FY 1998	FY 1999	FY 2000
Fermilab	13	38	29
SLAC	33	42	39
BNL	12	14	8

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Fermi National Accelerator Laboratory	191,195	210,145	212,743	+2,598	+1.2%
Stanford Linear Accelerator Center	107,745	111,290	118,290	+7,000	+6.3%
Brookhaven National Laboratory	59,367	42,882	5,347	-37,535	-87.5%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Fermilab			
Provides support for operation, maintenance, improvement, and enhancement of the Tevatron accelerator and detector complex. This complex includes the Tevatron, which can operate in a collider mode with protons and anti-protons, or in a fixed target mode with protons only; the new Main Injector which will be completed and commissioned in FY 1999; the Booster; the Linac; and the Anti-proton Source and Accumulator. The Tevatron collider and the 800 GeV fixed target modes are mutually exclusive; however, a fixed target program at 120 GeV using the new Main Injector is possible in parallel with Tevatron collider operation. This complex also includes the two large colliding beams detectors – CDF and D-Zero – and a number of fixed target experiments in the external beams areas.			
■ **Accelerator Operation:** In FY 2000, the upgraded Tevatron complex will be operated for about 6 weeks ending a fixed target run begun in FY 1999. This will be followed by 8 weeks of commissioning of the Main Injector and 15 weeks of operation of the Tevatron in collider mode with the higher luminosity available from the newly completed Main Injector. The funds requested will provide for the operation of the Tevatron, the Main Injector, the Booster, the Linac and the antiproton source as needed. The reduction in capital expenditures resulting from the completion of the CDF and D-Zero detector upgrade projects is partially offset by the planned increase for the MINOS Detector.	116,910	126,535	126,333

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Experimental Facility Operations:** In FY 2000, the upgrades of the CDF and the D-Zero detectors will be completed and the upgraded detectors will be brought into operation. In addition, the funding will support the active experiments in the completion of the fixed target run. The funding will also be used to provide the computing resources needed for the analysis of existing data and the planning and design of future experiments.	74,285	83,610	86,410
Total, Fermilab	191,195	210,145	212,743

Tevatron Operation

	(in weeks)		
	FY 1998	FY 1999	FY 2000
Fixed Target	0 [a]	22	6
Collider	0 [a]	0	15
Commissioning	13	16	8
Total, Tevatron Operation	13	38	29

SLAC

Provides for the operation, maintenance, improvement and enhancement of the accelerator and detector complex on the SLAC site. The accelerators include the electron linac and the SLC, and to these is being added the B-factory completed in FY 1999. The detector facilities include the SLD, the End Station A experimental set-ups, and BaBar, the detector which is being constructed for use with the B-factory. Also provides for maintenance of the laboratory physical plant.

[a] Operation of the Tevatron in collider or fixed target mode in FY 1998 is precluded by the long shutdown needed for completion of the Fermilab Main Injector project.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Accelerator Operation:** Accelerator operations at SLAC in FY 2000 will concentrate heavily on about 9 months of strong utilization of the newly completed asymmetric B-factory colliding beam storage rings in order to maximize the data collected by the BaBar detector facility. The linac will serve primarily as the injector of positrons and electrons to the B-factory storage rings during this time, although a 5 month parasitic run of a fixed target experiment at the full linac energy is also planned. Includes initial Major Item of Equipment (MIE) funding ($3,000,000) for the fabrication of a portion of the Gamma-ray Large Area Space Telescope (GLAST) project. GLAST, a high sensitivity space based instrument for the study of high energy gamma rays, is planned as a joint DOE-NASA project and has the potential for significant contributions from a number of foreign collaborators. SLAC is the lead laboratory for the DOE portion of the project. Total estimated cost is subject to further negotiations with NASA and potential foreign collaborators.	82,228	79,300	84,500
■ **Experimental Facility Operations:** Experimental facility operations will emphasize running the newly completed BaBar detector facility, which will be the priority research program at SLAC in FY 2000. The End Station A complex will also be operated during the fixed target run.	25,517	31,990	33,790
Total, SLAC	107,745	111,290	118,290

SLAC Operation

	(in weeks)		
	FY 1998	FY 1999	FY 2000

Total, SLAC Operation	33	42	39

[a] Fixed Target operation in parallel with B-factory operation.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
BNL			
Provides support for the operation, maintenance, improvement, and enhancement of the accelerator and detector complex on the BNL site. The principal facility is the AGS and its complement of experimental set ups. The AGS was transferred to the Nuclear Physics program during the 3rd quarter of FY 1999 to be operated as part of the RHIC facility. In FY 2000, the AGS operation for the HEP program will be on an incremental cost basis.			
■ **Accelerator Operation:** Operation activities covered under this budget category include the incremental cost of running the AGS complex for HEP. Operation for High Energy Physics in FY 2000 will be a eight week run for the muon magnetic moment experiment. Includes, in FY 1998 and FY 1999, but not FY 2000 landlord GPP and GPE funding..	38,332	29,672	3,047
■ **Experimental Facility Operations:** Provides for eight weeks of operation of the muon magnetic moment experiment and general support activities in the experimental areas.	21,035	13,210	2,300
Total, BNL	59,367	42,882	5,347

AGS Operation

(in weeks)

	FY 1998	FY 1999	FY 2000
AGS Operation for HEP	12	14	8

Universities and Other Labs			
Provides for capital equipment funding at ANL, LBNL, some smaller DOE labs, and for university based researchers. Provides landlord GPP and GPE for LBNL beginning in FY 2000. Includes $14,735,000 in FY 1999 and $15,015,000 in FY 2000 for the SBIR and STTR programs. Provides for certain computer networking expenses.	10,345	25,408	29,910
Large Hadron Collider			
■ In FY 1998 and FY 1999, funding was used for: R&D and measurement/testing on superconducting materials, cable, and wire; calculations and R&D on accelerator physics issues regarding the design, instrumentation, and prototypes of the magnets and RF accelerating cavities for the colliding beam intersection regions. Activities on the detectors will include R&D and prototype development of subsystems such as			

(dollars in thousands)

FY 1998	FY 1999	FY 2000

tracking chambers, calorimeters, and data acquisition electronics. The LHC work is being performed at various locations including 4 major DOE labs and more than 55 U.S. universities.

LHC Accelerator and Detector Funding Summary

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Facility Operations			
LHC			
Accelerator Systems			
Operating Expenses	4,315	7,070	600
Capital Equipment	9,685	8,330	19,500
Total, Accelerator Systems	14,000	15,400	20,100
Procurement from Industry	0	14,340	11,100
ATLAS Detector			
Operating Expenses	4,416	8,440	4,900
Capital Equipment	5,634	2,760	10,600
Total, ATLAS Detector	10,050	11,200	15,500
CMS Detector			
Operating Expenses	5,650	14,550	14,110
Capital Equipment	5,300	9,510	9,190
Total, CMS Detector	10,950	24,060	23,300
Total, LHC	35,000	65,000	70,000

- **Accelerator Systems:** In FY 2000, funding will support continuation of the production of interaction region quadrupole magnets, feedboxes, and absorbers; production of RF region dipoles; superconducting cable testing and support; and accelerator physics design studies. 14,000 15,400 20,100
- **Procurement from Industry:** Funding will support reimbursement to CERN for purchases from U.S. industry including superconducting wire, cable, and cable insulation materials. 0 14,340 11,100

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ **ATLAS Detector:** In FY 2000, funding will support the production of silicon strips, transition radiation tracker (TRT) modules, barrel cryostat and feedthroughs, front end electronics for the liquid argon calorimeter, the extended barrel tile calorimeter and electronics, the monitored drift tube muon chambers and electronics, and the alignment system for the muon spectrometer. The funding will also provide for advanced prototypes: the readout drivers (RODs) for the silicon and liquid argon systems, the TRT electronics, the electronic system for the liquid argon calorimeter. The R&D will be concluding for the pixel detectors while continuing for the trigger and data acquisition system.	10,050	11,200	15,500
▸ **CMS Detector:** In FY 2000, funding will support work on three of the subsystems in CMS. The endcap muon system will have set up the cathode strip chamber factory in FY 1999, and will be in full production. The hadron calorimeter system will have completed the two preproduction prototypes in FY 1999 and be in full production of copper absorber and the optics. The magnet system will complete the procurement of the majority of the items for the barrel and endcap steel flux return and the coil vacuum tank. The electromagnetic calorimeter subsystem will include procurement of front end transducers and electronics. The trigger/data acquisition and forward pixel subsystems will still be in an engineering phase.	10,950	24,060	23,300
Total, LHC	35,000	65,000	70,000
Waste Management			
■ Continues the pilot program concerning packaging, shipment and disposition of hazardous, radioactive or mixed waste generated in the course of normal operations at Fermilab and SLAC. This pilot program is intended to evaluate opportunities to reduce the volume of newly generated waste and its associated management and disposal costs..	4,960	4,910	4,910
Total, Facility Operations	408,612	459,635	441,200

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ **Fermilab**	
▸ An increase to support full operation of the facility.	+5,600
▸ An increase in GPP.	+999
▸ A decrease in equipment funding reflecting the completion of the CDF and D-Zero detectors offset by increase in the funding for the NuMI/Minos detector.	-4,001
Total, Fermilab	+2,598
■ **Stanford Linear Accelerator Center**	
▸ An increase to support full utilization of the B-factory.	+5,300
▸ An increase in AIP and GPP.	+1,700
Total, Stanford Linear Accelerator Center	+7,000
■ **Brookhaven National Laboratory**	
▸ A decrease reflecting the transfer of the AGS to the NP program.	-28,175
▸ A decrease reflecting the transfer of landlord responsibilities (GPP, GPE) to NP.	-9,360
Total, Brookhaven National Laboratory	-37,535
■ **Universities/Other**	
▸ An increase reflecting primarily the addition of the landlord responsibilities (GPP, GPE) at LBNL to HEP.	+4,502
■ **Large Hadron Collider**	
▸ An increase to follow the agreed profile.	+5,000
Total Funding Change, Facility Operations	-18,435

Construction

Mission Supporting Goals and Objectives

This provides for the construction of major new facilities needed to meet the overall objectives of the High Energy Physics Program.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Construction	50,850	21,000	28,700	+7,700	+36.7%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Fermilab Main Injector Project:** This project provides for a new accelerator to replace the injector accelerator for the Tevatron complex. The present injector for the Tevatron is the original Fermilab main ring which is less than fully adequate and nearing the end of its useful lifetime. The accelerator will be commissioned and the project completed during FY 1999.	30,950	0	0
■ **SLAC Master Substation Upgrade:** This project provides for an upgrade and reconfiguration of the main electric power substation on the SLAC site. Obsolete (and hazardous) switch gear will be replaced and load balancing will be implemented thus extending the useful life of the existing main 230 kv transformers. Procurement of long lead switch gear items was initiated in FY 1997, and the project will be completed by the end of FY 1998.	9,400	0	0
■ **Neutrinos at the Main Injector (NuMI):** This project provides for the construction of new facilities at Fermilab and at the Soudan Underground Laboratory in Soudan, Minnesota which are especially designed for the study of the properties of the neutrino and in particular to search for the neutrino oscillations. The FY 2000 funding is for continued detailed design and initiation of construction of conventional facilities and technical components.	5,500	14,300	22,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **C-Zero Area Experimental Hall:** This project provides for the construction of a new experimental hall at the C-Zero location on the Fermilab Tevatron ring. This will be used to house modest sized collider and fixed target experiments in a new experimental program being planned at Fermilab. This project will be completed in FY 1999.	5,000	0	0
■ **Wilson Hall Safety Improvement Project (Fermilab):** This project provides for urgently needed rehabilitation of the main structural elements of Wilson Hall, and for urgently needed rehabilitation of windows, plumbing, the roof and the exterior of the building.	0	6,700	4,700
■ **SLAC Research Office Building:** This project provides urgently needed office space for the substantial expansion of visiting scientists, or "users", which will occur when the B-factory becomes operational. The visiting user population is projected to increase from 200 visitors per year to 1,100 visitors per year. The new building will provide about 30,000 square feet and will be completed in FY 2001.	0	0	2,000
Total, Construction	50,850	21,000	28,700

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ Continuation of the Wilson Hall Safety Improvement Project at Fermilab.	-2,000
■ Continuation of the Fermilab NuMI project.	+7,700
■ Initiation of the Research Office Building.	+2,000
Total Funding Change, Construction	+7,700

Capital Operating Expenses & Construction Summary

Capital Operating Expenses

Total, Major Items of Equipment		105,469	72,900	45,010	54,801	

[a] The funding for the B-factory detector reflects cost savings of about $20,000,000 resulting from contributions of components and subsystems by non-U.S. collaborating institutions.

[b] Total estimated cost is subject to further negotiations with NASA and potential foreign collaborators.

98-G-304, Neutrinos at the Main Injector (NuMI), Fermi National Accelerator Laboratory, Batavia, Illinois

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

Total Estimated Cost and Total Project Cost have been adjusted due to changes in the construction profile.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1998 Budget Request *(A-E and technical design only)*	1Q '98	4Q '98	NA	NA	5,500	6,300
FY 1999 Budget Request *(Preliminary Estimate)*	—"—	3Q '99	1Q '99	4Q '02	75,800	135,300
FY 2000 Budget Request	3Q '98	2Q '00	3Q '99	2Q '03	76,200	136,100

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
1998	5,500	5,500	1,140
Construction			
1999	14,300	14,300	8,360
2000	22,000	22,000	26,300
2001	23,000	23,000	27,000
2002	11,400	11,400	11,900
2003	0	0	1,500

3. Project Description, Justification and Scope

The project provides for the design, engineering and construction of new experimental facilities at Fermi National Accelerator Laboratory in Batavia, Illinois and at the Soudan Underground Laboratory at Soudan, Minnesota. The project is called NuMI which stands for Neutrinos at the Main Injector. The purpose of the project is to provide facilities which will be used by particle physicists to study the properties of neutrinos, which are fundamental elementary particles. In the Standard Model of elementary

particle physics there are three types of neutrinos which are postulated to be massless and to date, no direct experimental observation of neutrino mass has been made. However, there are compelling hints from experiments which study neutrinos produced in the sun and in the earth's atmosphere that indicate that if neutrinos were capable of changing their type it could provide a credible explanation for observed neutrino deficits in these experiments.

The primary element of the project is a high flux beam of neutrinos in the energy range of 1 to 40 GeV. The technical components required to produce such a beam will be located on the southwest side of the Fermilab site, tangent to the new Main Injector accelerator at the MI-60 extraction region. The beam components will be installed in a tunnel of approximately 1 km in length and 6.5 m diameter. The beam is aimed at two detectors (MINOS) which will be constructed in experimental halls located along the trajectory of the neutrino beam. One such detector will be located on the Fermilab site, while a second will be located in the Soudan Underground Laboratory. Two similar detectors in the same neutrino beam and separated by a large distance are an essential feature of the experimental plan.

The experiments which are being designed to use these facilities will be able to search for neutrino oscillations occurring in an accelerator produced neutrino beam and hence determine if neutrinos do have mass. Fermilab is the only operational high energy physics facility in the U.S. with sufficiently high energy to produce neutrinos which have enough energy to produce tau leptons. This gives Fermilab the unique opportunity to search for neutrino oscillations occurring between the muon and the tau neutrino. Additionally, the NuMI facility is designed to accommodate future enhancements to the physics program that could push the search for neutrino mass well beyond the initial goals established for this project.

4. Details of Cost Estimate [a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs	7,150	7,720
Design Management costs (0.0% of TEC)	10	8
Project Management costs (0.0% of TEC)	20	22
Total, Engineering design inspection and administration of construction costs (9.4% of TEC)	7,180	7,750
Construction Phase		
Buildings	8,320	2,880
Special Equipment	10,120	10,270
Other Structures	30,960	38,690
Construction Management (6.0% of TEC)	4,590	540
Project Management (2.8% of TEC)	2,170	1,620
Total, Construction Costs	56,160	54,000
Contingencies		
Design Phase (2.8% of TEC)	2,172	not available
Construction Phase (14.0% of TEC)	10,688	not available
Total, Contingencies (16.8% of TEC)	12,860	14,050
Total, Line Item Cost (TEC)	76,200	75,800

5. Method of Performance

Design of the facilities will be by the operating contractor and subcontractor as appropriate. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts awarded on the basis of competitive bids.

[a] The annual escalation rates assumed for FY 1996 through FY 2002 are 2.5, 2.8, 3.0, 3.1, 3.3, 3.4, and 3.4 percent respectively.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project Cost						
Facility Cost						
Total, Line item TEC	0	1,140	8,360	26,300	40,400	76,200
Other Project Costs						
Capital equipment [a]	0	0	2,000	5,868	36,357	44,225
R&D necessary to complete construction [b]	450	810	40	0	0	1,300
Conceptual design cost [c]	630	200	0	0	0	830
Other project-related costs [d]	0	1,520	960	7,632	3,433	13,545
Total, Other Project Costs	1,080	2,530	3,000	13,500	39,790	59,900
Total Project Cost (TPC)	1,080	3,670	11,360	39,800	80,190	136,100

[a] Costs to fabricate the near detector at Fermilab and the far detector at Soudan. Includes systems and structures for both near detector and far detector, active detector elements, electronics, data acquisition, and passive detector material.

[b] This provides for project conceptual design activities, for design and development of new components, and for the fabrication and testing of prototypes. R&D on all elements of the project to optimize performance and minimize costs will continue through early stages of the project. Specifically included are development of active detectors and engineering design of the passive detector material. Both small and large scale prototypes will be fabricated and tested using R&D operating funds.

[c] Includes operating costs for development of conceptual design and scope definition for the NuMI facility. Also includes costs for NEPA documentation, to develop an Environmental Assessment, including field tests and measurements at the proposed construction location.

[d] Include funding required to complete the construction and outfitting of the Soudan Laboratory for the new far detector by the University of Minnesota.

7. Related Annual Funding Requirements

(FY 2003 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs [a]	500	NA
Utility costs (estimate based on FY 1997 rate structure) [b]	500	NA
Total related annual funding	1,000	NA
Total operating costs *(operating from FY 2003 through FY 2007)*	5,000	NA

[a] Including personnel and M&S costs (exclusive of utility costs), for operation, maintenance, and repair of the NuMI facility.

[b] Including incremental power costs for delivering 120 GeV protons to the NuMI facility during Tevatron collider operations, and utility costs for operation of the NuMI facilities, which will begin beyond FY 2002.

99-G-306, Wilson Hall Safety Improvements Project, Fermi National Accelerator Laboratory, Batavia, Illinois

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)

FY 2000 Budget Request	1Q '99	2Q '00	3Q '99	3Q '02	15,600	18,800

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Construction			
1999	6,700	6,700	1,690
2000	4,700	4,700	6,340
2001	4,200	4,200	6,990
2002	0	0	580

3. Project Description, Justification and Scope

Wilson Hall, constructed in 1972, is the central laboratory facility for the Fermilab site. It is a 17 story reinforced concrete building with a 16 story atrium. The great majority of its area is devoted to office space. In addition, the building contains the cafeteria, the communications center, medical office, some light industrial and shop areas, and an 800 seat auditorium.

The Wilson Hall Safety Improvements Project is a comprehensive project to remediate the deficiencies in this facility. Among the causes for the deficiencies are the age of the building and its systems, safety issues and updating to current code standards, and building components and systems that have reached their useful life expectancy.

The structural deficiencies are currently resulting in the ongoing safety issue of falling concrete debris in occupied areas of the building, and will eventually threaten the integrity of the entire facility. Additional spalling of the concrete could occur on the exterior faces of the building. The current glazing in the sloped window walls is not the code required safety glass. Breakage could result in the falling of sharp edged shards of glass into the atrium area. The quality of the existing drinking water is poor (taste & color) resulting in low usage which allows levels of lead and copper to exceed regulatory requirements.

The building structure portion of this project provides for the rehabilitation of the existing concrete structure at the crossover bays, which connect the two towers that comprise Wilson Hall. The joints between the crossover bays and tower are experiencing significant structural degradation, resulting in the ongoing safety issue of falling debris and the probability of continued deterioration of the joints. Recent computer analysis of the movement of the building structure has indicated that the joints need to be reworked to allow for the seasonal movement caused by temperature changes. This project will implement the solution to the joint erosion problem. It will consist of reconstructing the joints (assuring effective independent movement of each tower). Since a number of areas in the building will have restricted occupancy while the repairs are being made, this project will include the staff relocation required to accommodate the construction as part of Other Project Costs. At the completion of the structural joint repairs, a thorough exterior inspection will be conducted and any necessary repairs completed.

The building envelope portion of this project provides for the weatherproofing of components of the building shell that are currently allowing water penetration, the refurbishment of the existing skylight system, refinishing and partially reglazing the north and south curtain walls, and replacing the exterior entrances, including the entrance plaza:

Entry Plaza: The plaza that covers the "catacomb" area will have clear sealer applied to the sloped portions of the concrete walls enclosing the catacombs. The raised plaza portions will have waterproofing and pavers installed over the existing concrete. The existing paving at the entrance plaza will be removed and a new waterproof membrane and new paving will be installed.

North and South Curtain Wall: The north and south curtain walls of Wilson Hall are comprised of an anodized aluminum framing system that extends the full height of the building. The lower six floors of the system are sloped but do not have the current code required safety glazing. The finish of the aluminum framing is deteriorating and the system is allowing water penetration into the building. Safety glazing will be installed and the system will be repaired to resolve the water penetration.

4. Details of Cost Estimate [a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs	920	920
Project Management costs (0.0% of TEC)	100	100
Total, Engineering design inspection and administration of construction costs (6.5% of TEC)	1,020	1,020
Construction Phase		
Buildings	8,850	8,850
Inspection, design and project liaison, testing, checkout and acceptance	870	870
Construction Management (11.7% of TEC)	1,820	1,820
Project Management (2.8% of TEC)	430	430
Total, Construction Costs	11,970	11,970
Contingencies		
Design Phase (1.1% of TEC)	170	170
Construction Phase (15.6% of TEC)	2,440	2,440
Total, Contingencies (16.7% of TEC)	2,610	2,610
Total, Line Item Cost (TEC)	15,600	15,600

5. Method of Performance

Overall project management, quality assurance, supervision of design and construction efforts and coordination with the U.S. Department of Energy for this project will be the responsibility of the Fermi National Accelerator Laboratory, through the Facilities Engineering Services Section (FESS). Design will be accomplished by a combination of FESS staff and consultant A/E fixed price contracts under the direction of the Facilities Engineering Services Section. Construction for project completion will be accomplished by means of one or more competitively bid, fixed price construction subcontracts. Construction Management and overall project management during the construction phase of this project will remain the responsibility of the Facilities Engineering Services Section of the Fermi National Accelerator Laboratory.

[a] The economic escalation rates from FY 1997 dollars for FY 1999 through FY 2001 are 5.3%, 2.9%, and 2.9% respectively from the Department Price Change Index FY 1999 Guidance, General Construction.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project Cost						
Facility Cost						
Total, Line item TEC	0	0	1,690	6,340	7,570	15,600
Other Project Costs						
Conceptual design cost	530	270	0	0	0	800
Other project-related costs[a]	0	0	560	380	1,460	2,400
Total, Other Project Costs	530	270	560	380	1,460	3,200
Total Project Cost (TPC)	530	270	2,250	6,720	9,030	18,800

7. Related Annual Funding Requirements

	Current Estimate	Previous Estimate
Wilson Hall related annual costs	NA	NA
Incremental utility costs (estimate based on FY 1997 rate structure)	NA	NA
Total related annual funding *(operating from FY 2003 through FY 2007)*[b]	NA	NA

[a] Includes funding for relocation of tenants before and after the construction and rebuilding of their workspaces; refurbishment of existing elevators which will be used for construction purposes, and then restored to public use.

[b] No incremental annual operating costs will result from the completion of this project.

00-G-307, Research Office Building, Stanford Linear Accelerator Center, Stanford, California

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

1. Construction Schedule History

2001	5,200	5,200	6,250

3. Project Description, Justification and Scope

The new Central Office Building project will construct a two-story building with approximately 30,000 gross square feet that will provide permanent, energy efficient office and conference space to meet the needs of the Laboratory. The office building will be located immediately adjacent to and north of the existing SLAC Administrative and Engineering building in the central campus area of the Laboratory. The new government-owned facility described herein will be located on leased land. Features include fixed and flexible office areas, meeting rooms and conference facilities equipped with interior office furnishings. Conventional utilities, such as domestic water, sanitary sewer, HVAC, and electrical power, will be provided by short connections from existing services. Specialized utilities include HVAC control and equipment, telecommunication for video and computers, and the main electrical feed. Construction of this building will allow the demolition of thirteen very old, temporary structures, totaling approximately 20,000 square feet.

This building will provide adequate facilities for the BaBar experimental program. This experimental program is critical to delivering the scientific understanding necessary to the success of the DOE's and the Nation's long-term science objective of maintaining the U.S. high energy physics program at the forefront of basics research.

With the increasing level of activity associated with the BaBar collaboration and SLAC's on-going high energy physics (HEP) experimental program, SLAC's space requirements are projected to exceed the capacity of currently existing office and meeting facilities. The BaBar experiment, which is scheduled to begin operation in FY 1999, expects a large influx of Users who will require adequate office and support

space. SLAC expects to host approximately 1,100 HEP Users per year when the BaBar experiment begins full scale operations. The BaBar collaboration itself, consists of over six hundred users from around the world representing over seventy institutions. Office and meeting space is urgently needed to meet the demand created by this mega-collaboration. In the past, SLAC has only had about 200 collaborators/users in residence at any one time. Even at this level, most are housed in less than adequate facilities (the User community has become even more vocal about this in the past year or two). In the BaBar era, SLAC expects substantially more Users to be in residence and, as a national user facility, SLAC needs to be in a position to provide adequate space for them.

SLAC has investigated leasing and conversion alternatives to meet the projected need for office space but none has been judged to be as cost effective or satisfactory as the addition of the new office building. It was determined that there was insufficient off-site office space available nearby for leasing (12,000 square feet with a rental cost of $1,000,000 per year was available). Conversion of existing temporary and permanent facilities is not cost effective because the cost of renovation, necessary seismic and ADA work is roughly equal to the cost of new construction and the resulting space is inferior to new space specifically designed for office use. Additionally, valuable industrial space would be lost.

The use of substandard facilities could meet approximately two-thirds of this projected need but at substantial cost for necessary remedial work. With improved operating and energy efficiencies, it is estimated that the annual operating costs for this 30,000 square foot building will be equal to the current operating costs of the 20,000 square feet of temporary space to be removed.

If the new Central Office Building is not constructed, operating efficiencies and cost savings cannot be achieved, existing temporary structures, which are maintenance intensive and energy inefficient cannot be eliminated, the cost of seismic and ADA retrofitting will not be avoided, and parking will continue to be an operational deficiency in the main Computer Center area. Vehicular and pedestrian safety will not be improved. Commitments made to Stanford University and the SLAC HEP User population will not be met. An estimated $2,000,000 of avoidable costs will be incurred.

Funding is requested to initiate Preliminary and Final Design (Title I and II) of the project, procuring an Architect/Engineering firm to develop and oversee design, procure equipment, and begin construction.

4. Details of Cost Estimate [a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (5.8% of total estimated cost (TEC))	419	NA
Design Management costs at 23% of Preliminary and Final Design	98	NA
Project Management costs at 23% of Preliminary and Final Design	98	NA
Total, Design Phase	615	NA
Construction Phase		
Building	4,727	NA
Specialized Utilities	519	NA
Standard Equipment	496	NA
Construction Management at 2% of above	113	NA
Project Management at 1.5% of above	85	NA
Total, Construction Costs	5,940	NA
Contingencies at approximately 10 percent of above costs		
Design Phase (0.8% of TEC)	61	NA
Construction Phase (8.1% of TEC)	584	NA
Total, Contingencies	645	NA
Total, line item costs	7,200	NA

5. Method of Performance

Construction and procurement shall be accomplished by fixed price subcontracts on the basis of competitive bidding. Design and inspection shall be performed by the laboratory and contracted Architect-Engineers.

[a] Escalated to mid-point of construction with a factor of 1.0611. Allocated Indirects included in costs.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project Cost						
Facility Cost						
Design	0	0	0	615	0	615
Construction	0	0	0	335	6,250	6,585
Total Facility Costs (TEC)	0	0	0	950	6,250	7,200
Other Project Costs						
Conceptual design cost	0	0	30	0	0	30
Other project related costs[a]	0	0	0	0	200	200
Total, Other Project Costs	0	0	30	0	200	230
Total Project Cost (TPC)	0	0	30	950	6,450	7,430

7. Related Annual Funding Requirements

(FY 1998 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility maintenance/repair costs[b]	34	NA
Incremental utility costs[c]	36	NA
Total related annual funding	70	NA
Total Operating costs (operating from FY 2003 through FY 2007)	350	NA

[a] Includes funding for demolition of temporary structures; paving.

[b] Includes costs for janitorial services.

[c] Includes incremental utility costs for electric power and water.

Nuclear Physics

Program Mission

The Nuclear Physics program of the Department of Energy (DOE) has the lead responsibility for Federal support of nuclear physics research and supports fundamental research activities under the mandate provided in Public Law 95-91 which established the Department. The primary mission of the program is to develop and support the basic research scientists and facilities, and to foster the technical and scientific activities needed to understand the structure and interactions of atomic nuclei, and to understand the fundamental forces and particles of nature as manifested in nuclear matter. Atomic nuclei can be described as a collection of nucleons (protons and neutrons), bound together by the mechanism of exchange of mesons, mainly pi mesons (pions). The research forefront in nuclear physics now includes incorporation of the quark substructure of the nucleon into the understanding of nuclear structure and of quark-antiquark pairs to form the mesons. Quarks, which are the most elementary building blocks of matter, are bound together in groups of three by the exchange of gluons to form the nucleons.

Attendant upon this core mission are responsibilities to enlarge and diversify the Nation's pool of technically trained talent and to facilitate transfer of technology and knowledge acquired to support the Nation's economic base. The program works in close coordination with the Nuclear Physics program at the National Science Foundation (NSF), and jointly with the NSF charters the Nuclear Science Advisory Committee to advise on setting scientific priorities.

The high quality of the research in this program is continuously evaluated through the use of merit based peer review and scientific advisory committees.

Program Goal

Understand the structure of atomic nuclei and the fundamental forces required to hold their constituents in place, based on a series of systematic experimental and theoretical scientific investigations.

Program Objectives

- Conduct a program of maximum effectiveness to provide new insights into the nature of energy and subatomic matter, based on evaluation by rigorous peer review.
- Conceive, develop, construct, and operate world class scientific accelerator facilities in a timely, and effective manner. In the execution of this responsibility, together with other Science organizations, act as the Nation's leader in developing standards and management techniques to optimize construction and operations of facilities in a cost effective, safe, and environmentally benign way.
- Leverage United States objectives by means of international cooperation through exchanges of scientists and participation in internationally cooperative projects.
- Continue the advanced education and training activities of young scientists to maintain the skills and conceptual underpinning of the Nation's broad array of nuclear related sciences and technologies.

Performance Measures

- Evaluate the scientific quality and appropriateness of the total DOE Nuclear Physics program to maintain the United States position as world leader in nuclear physics research. Evaluations will be based on rigorous peer reviews conducted by internationally recognized scientific experts. Maintain the highest quality research by taking appropriate corrective management actions based on results of the reviews.
- Determine the production trends of diverse, highly trained young scientists - an essential ingredient for the vitality of the nation's technological base-using the Nuclear Physics annual census of scientific personnel. Funding patterns of university grants will include consideration of the optimum production rate of scientists.
- Use the assistance of technical experts to monitor the performance in scope, costs and schedule of construction projects for world class nuclear physics facilities such as the Relativistic Heavy Ion Collider. Measure project performance against cost and schedule milestones contained in project plans. Working with the relevant DOE project manager and laboratory project management, identify and establish programmatic modifications needed to enable projects to meet schedules and costs.
- Review at least 80 percent of the research projects by appropriate peers and selected through a merit-based competitive process.
- Use peer reviews and user feedback to monitor the effectiveness of facility operations. Evaluate facility performance against objectives set in program guidance based on funding availability, and measure achieved beam hour availability against guidelines developed for the Scientific User Facility Initiative. Identify participation and contributions by foreign scientists at facilities, and obtain input from user's groups at facilities. Develop appropriate facility funding profiles so as to best provide overall beam availability for the Nuclear Physics program.
- Measure overall program against the scientific priorities recommended in the long range plans that are regularly provided by the DOE/NSF Nuclear Science Advisory Committee (NSAC). Obtain assessments from NSAC and other community forums on the overall direction of the DOE Nuclear Physics program and its coordination with the NSF Nuclear Physics program. Based on this feedback, programmatic changes will be made, where necessary, to assure the Nuclear Physics program is appropriately directed towards highest priority topics in the long range plan.
- Upgrades of scientific facilities will be managed to keep them on schedule and within cost.
- Nuclear Physics will begin the research program at the Relativistic Heavy Ion Collider (RHIC) at Brookhaven National Laboratory (BNL) in FY 2000.

Significant Accomplishments and Program Shifts

Medium Energy Nuclear Physics

- In FY 2000, operations of the MIT/Bates Linear Accelerator Center facility will be terminated and Decommissioning and Decontamination (D&D) activities will begin.

- All three experimental halls at the Thomas Jefferson National Accelerator Facility are now operational for research. Beams of widely differing energies and currents can be delivered simultaneously to each of the halls to meet the specific requirements of the experiments. The laboratory is now also able to deliver polarized beam to any of the experimental halls.

Heavy Ion Nuclear Physics

- The Relativistic Heavy Ion Collider (RHIC) construction project at Brookhaven National Laboratory (BNL) continues on scope and budget with a completion date of the third Quarter of FY 1999. Fabrication of RHIC detectors, including the additional experimental equipment recommended by NSAC for purposes of particle detection and data analysis, also proceeds on schedule.

  In FY 2000 RHIC initiates its first full year of Operations and its research program will begin with four experiments (STAR, PHENIX, BRAHMS and PHOBOS) involving over 900 researchers and students from 80 institutions and 15 countries. The BNL Tandem/AGS/Booster accelerator complex, which acts as the injector for RHIC, will terminate routine operations of its fixed-target heavy-ion research program.

Low Energy Nuclear Physics

- Construction of the US/Canadian Sudbury Neutrino Observatory (SNO) detector, which sits in a nickel mine 6,800 feet below the surface of the earth, was completed in FY 1998. A dedication of the laboratory was held in Sudbury, Ontario, on May 28, 1998, with Stephen Hawking as one of the speakers. The filling of the region around the detector with water, and the central part of the detector with "heavy water" (D_2O), is now underway and initial measurements using the detector have commenced early in calendar year 1999.
- Gammasphere was moved from the 88-Inch Cyclotron at Lawrence Berkeley National Laboratory (LBNL) to the ATLAS facility at Argonne National Laboratory (ANL) in FY 1998. A research program at ATLAS was initiated which is focused on the study of the structure of nuclei far from stability utilizing Gammasphere coupled with the existing Fragment Mass Analyzer (FMA). It is now planned that Gammasphere will operate at ATLAS in FY 1999 and move back to the 88-inch Cyclotron in FY 2000.
- The Radioactive Ion Beam (RIB) facility at Oak Ridge National Laboratory (ORNL) successfully developed new beams in FY 1998 and has initiated a series of experiments directed at measuring cross sections important to astrophysics.

Nuclear Theory

- In FY 2000 the Nuclear Theory Institute at the University of Washington continues its activities as a premier international center for new initiatives and collaborations in nuclear theory research.

Scientific Facilities Utilization

The Nuclear Physics request includes $234,000,000 to maintain support of the Department's scientific user facilities. This funding will provide research time for thousands of scientists in universities, Federal agencies, and U.S. companies. It will also leverage both Federally and privately sponsored research consistent with the Administration's strategy for enhancing the U.S. National science investment.

Funding of Contractor Security Clearances

In FY 1999, the Department divided the responsibility for obtaining and maintaining security clearances. The Office of Security Affairs, which was responsible for funding all Federal and contractor employee clearances, now pays only for clearances of Federal employees, both at headquarters and the field. Program organizations are now responsible for contractor clearances, using program funds. This change in policy enables program managers to make the decisions as to how many and what level clearances are necessary for effective program execution. In this way, it is hoped that any backlog of essential clearances which are impeding program success can be cleared up by those managers most directly involved. The Office of Science is budgeting $106,000 and $88,000 for estimated contractor security clearances in FY 1999 and FY 2000, respectively, within the decision unit.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request
Nuclear Physics					
Medium Energy Nuclear Physics	113,400	118,698	-155	118,543	111,130

Site Description

Argonne National Laboratory (ANL)

Argonne National Laboratory (ANL) in Argonne, Illinois, is a Multiprogram Laboratory located on a 1,700 acre site in suburban Chicago. ANL has a satellite site located in Idaho Falls, Idaho. At Argonne, the Nuclear Physics program supports: (1) the Heavy Ion group, which operates the ATLAS Heavy Ion accelerator as a national user facility, and carries out related research; (2) the Medium Energy group, which carries out a program of research at TJNAF, Fermilab, and DESY in Germany; also supported are activities leading to a "spin" physics program at RHIC; (3) R&D directed at a proposed Isotope Separator On-Line accelerator facility (ISOL); (4) the Nuclear Theory group which carries out theoretical calculations and investigations in subjects supporting the experimental research programs in Medium Energy and Heavy Ion physics; and (5) data compilation and evaluation activities as part of the national data program.

Brookhaven National Laboratory (BNL)

Brookhaven National Laboratory is a Multiprogram Laboratory located on a 5,200 acre site in Upton, New York. The major effort at BNL, supported by the Heavy Ion Program, is the new Relativistic Heavy Ion Collider (RHIC) which uses the entire Tandem/Booster and Alternating Gradient Synchrotron (AGS) as an injector. RHIC is a major new and unique international user facility. RHIC will search for the predicted "quark-gluon plasma," a form of nuclear matter not previously observed. The Medium Energy group has been supported to carry out a program of hypernuclear physics and baryon resonance research using proton beams from the AGS. The Laser Electron Gamma Source (LEGS) group uses a unique polarized photon beam to carry out a program of photonuclear spin physics at the National Synchrotron Light Source (NSLS). The BNL Nuclear Theory group provides theoretical support and investigations primarily in the area of relativistic heavy ion physics. Low Energy support is provided for detector and chemical analysis development for the Sudbury Neutrino Observatory (SNO) and involvement in the SNO research program. BNL is also the central U.S. site for the American and international nuclear data and compilation effort. The National Nuclear Data Center is housed at BNL.

Idaho National Engineering & Environmental Laboratory (INEEL)

Idaho National Engineering and Environmental Laboratory is a Multiprogram Laboratory located on 572,000 acres in Idaho Falls, Idaho. At INEEL, a program of nuclear data and compilation is supported.

Lawrence Berkeley National Laboratory (LBNL)

Lawrence Berkeley National Laboratory is a Multiprogram Laboratory located in Berkeley, California. The Lab is on a 200 acre site adjacent to the Berkeley campus of the University of California. At LBNL, the Nuclear Physics program supports: (1) operations and research at the 88-inch Cyclotron, a heavy ion accelerator which is run as a national user facility; (2) the Relativistic Nuclear Collisions group, with activities at CERN/SPS, BNL/AGS, and RHIC, where they have been major players in the development of the large STAR detector for the new RHIC facility; (3) the Low Energy group, which plays a major role in the construction and implementation of the Sudbury Neutrino Observatory (SNO) detector; (4) the Nuclear Theory group, which carries out a program with emphasis on theory of relativistic heavy ion physics; and (5) the Nuclear Data group whose activities support the National Nuclear Data Center at BNL.

Lawrence Livermore National Laboratory (LLNL)

Lawrence Livermore National Laboratory is a Multiprogram Laboratory located on a 821 acre site in Livermore, California. Low Energy Research support is provided for the setup and use of the GENIE detector for a program of neutron research using LANSCE beams at Los Alamos National Laboratory. A nuclear data and compilation effort is supported at LLNL.

Los Alamos National Laboratory (LANL)

Los Alamos National Laboratory is a Multiprogram Laboratory located on a 27,000 acre site in Los Alamos, New Mexico. Nuclear Physics supports a broad program of research including: (1) the Liquid Scintillation Neutrino Detector (LSND) experiment which is searching for evidence of neutrino oscillations, and a program of neutron beam research investigating parity violation in nuclei; these activities utilize beams from the LANSCE proton accelerator; (2) a major effort to build components of the PHENIX detector for the new Relativistic Heavy Ion Collider (RHIC) at Brookhaven, as well as to carry out a program of heavy ion research; (3) research is supported to study the quark substructure of the nucleon in experiments at Fermilab, and to plan for the detectors and research for a "spin" physics program at RHIC which will utilize polarized proton beams; (4) the development of the Sudbury Neutrino Observatory (SNO) detector as well as involvement in the planned research program; (5) a broad program of theoretical research into a number of topics in nuclear physics; (6) Nuclear data and compilation activities as part of the national nuclear data program.

Oak Ridge Institute for Science and Education (ORISE)

Oak Ridge Institute for Science and Education is located on a 150 acre site in Oak Ridge, Tennessee. Nuclear Physics support is provided through ORISE for activities in support of the new Radioactive Ion Beam Facility (RIB) and its research program.

Oak Ridge National Laboratory (ORNL)

Oak Ridge National Laboratory is a Multiprogram Laboratory located on a 24,000 acre site in Oak Ridge, Tennessee. The major effort at ORNL is the Low Energy program support for research and operations of the new Radioactive Ion Beam Facility (RIB), which is run as a national user facility. RIB allows a program of experimental research investigating a number of issues in astrophysics. Also supported is a heavy ion group which is involved in PHENIX detector development activities for RHIC and the development of the RHIC research program. The theoretical nuclear physics effort at ORNL emphasizes investigations of low energy nuclear structure. Nuclear data and compilation activities are also supported as part of the national nuclear data effort.

Stanford Linear Accelerator Center

Stanford Linear Accelerator Center (SLAC) is a program-dedicated laboratory (High Energy Physics) located on 426 acres in Menlo Park, California. SLAC uses computational tools (i.e. simulations, interactive techniques, remote access to instrumentation for data collection and manipulation), in partnership with educational institutions, for teaching and learning science as it relates to the Office of Science's Nuclear Physics mission.

Thomas Jefferson National Accelerator Facility (TJNAF)

Thomas Jefferson National Accelerator Facility is a program-dedicated laboratory (Nuclear Physics) located on 273 acres in Newport News, Virginia. Major Medium Energy program support is provided for the operation and research program of TJNAF, a new and unique international user facility for the investigation of nuclear and nucleon structure based on the underlying quark substructure. Also supported is a nuclear theory group whose program of investigations support the experimental program of the laboratory. The Nuclear Physics program provides most of the support for this new single purpose laboratory.

All Other Sites

The Nuclear Physics program funds research at 83 colleges/universities located in 35 states. This line also includes funding of research awaiting distribution pending completion of peer review results.

Medium Energy Nuclear Physics

Mission Supporting Goals and Objectives

The Nuclear Physics Program supports the basic research necessary to identify and understand the fundamental features of atomic nuclei and their interactions. The Medium Energy Nuclear Physics subprogram supports academic fundamental research, and facility operations and research at electron and proton accelerator facilities at the higher energies of interest to nuclear physics. In addition, the subprogram supports research at accelerators operated by other Department of Energy programs (e.g., High Energy Physics and Basic Energy Sciences) and at other unique domestic or foreign facilities. The research programs are ultimately aimed at achieving an understanding of the structure of the atomic nucleus in terms of the quarks and gluons, the objects which are believed to combine in different ways to make all the other sub-atomic particles. Just as important is the achievement of an understanding of the "strong force", one of only four forces in nature, and the one which holds the nucleus of the atom together. Research efforts include studies of the role of excited states of protons and neutrons in nuclear structure, investigations of the role of specific quarks in the structure of protons and neutrons, studies of the symmetries in the behavior of the laws of physics, investigations of how the properties of protons and neutrons change when imbedded in the nuclear medium, measurements with beams of electrons or protons whose "spins" have all been lined up in the same direction (polarizing the beams) to determine unique "structure functions", and studies of how particles interact with each other inside the nucleus. Two national accelerator facilities are operated entirely under the Medium Energy subprogram - the Thomas Jefferson National Accelerator Facility (TJNAF) in Newport News, Virginia, operated by the Southeastern Universities Research Association and the Bates Linear Accelerator Center in Middleton, Massachusetts, operated by the Massachusetts Institute of Technology. These accelerator facilities serve a nationwide community of Department of Energy and National Science Foundation supported scientists from over 100 American institutions, of which over 90% are universities. Both facilities provide major contributions to American education at all levels. At both TJNAF and Bates, the National Science Foundation (NSF) has made a major contribution to new experimental apparatus in support of the large number of NSF users. A significant number of foreign scientists collaborate in the research programs of both facilities. The planned research program at the new TJNAF, for example, involves 600 scientists from 17 foreign countries; 81 of these scientists are from Conseil Europeen pour la Recherche Nucleaire (CERN) member states. At TJNAF, foreign collaborators have also made major investments in experimental equipment. Nuclear Physics will provide opportunities for college faculty and students to spend time at DOE laboratories, to participate in world-class research projects. Faculty/Student Science Teams will visit our DOE Laboratories during the academic summer/semesters, be involved in conducting research, writing proposals, utilizing technology and pursuing technical or scientific careers. Primary goals of the Science Teams are to build long-term partnerships among DOE laboratories and provide faculty/students with a deeper understanding of DOE science associated needs for research and development. Funds will be provided to pay for faculty/student stipends, travel, housing and subsidize laboratory scientists' time for this activity ($973,000).

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Research

University Research

These activities comprise a broad program of research, and includes 40 grants at 32 universities in 17 states and the District of Columbia. These research efforts utilize not only each of the accelerator facilities supported under the Medium Energy program, but also use other U.S. and international accelerator laboratories. Included in "Bates Research" is the effort performed at the MIT/Bates Linear Accelerator Center by MIT scientists. "Other University Research" includes all other university-based efforts using many research facilities, including MIT activities which are not carried out at Bates.

- **Bates Research:** At the MIT/Bates accelerator, university researchers have been carrying out "symmetry violation" studies on the proton in the North Experimental Hall. Out-of-plane measurements are being carried out using new spectrometers in the South Experimental Hall on the proton, deuteron, and complex nuclei including measurements of the transition of the proton to its excited state.
  - In FY 1999, important measurements will be completed in a limited experimental program.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ In FY 2000, the Bates accelerator will terminate operations. Supported MIT scientists will transition to other research facilities.	2,900	4,600	1,500
■ **Other University Research:**			
▸ University scientists are collaborating on important ongoing and future experiments at TJNAF. In FY 2000 activities include studies of the charge structure of the neutron in Hall C, planned measurements of the electric form factor of the proton, and a series of planned studies of the excited states of the proton in Hall B. First parity-violation measurements to look for the "strange quark" content of the proton in Hall A are already underway.			
▸ A number of university groups are collaborating in experiments using the new out-of-plane spectrometers in the South Experimental Hall at the Bates Laboratory. In FY 2000 Bates will cease operations; MIT and other university scientists will transition to other research facilities. Part of the Bates research funds are being added to other university research to support this transition.			
▸ University scientists and National Laboratory collaborators will continue to carry out the HERMES experiment at the DESY laboratory in Hamburg, Germany. This experiment will measure what components of the proton or neutron determine the "spin" of these particles, an important and timely scientific issue. In FY 2000, HERMES will utilize a new Ring Imaging Cerenkov counter for particle identification.			
▸ A new underground neutrino detector in Arizona is beginning a search for neutrino oscillations using the Palo Verde nuclear power reactors as the source of neutrinos. If neutrino oscillations are observed, implying neutrinos have mass, there would be a major impact on our understanding of the laws of physics. In FY 2000, the program will be completing its data-taking phase, and analysis will be underway.	13,180	12,485	14,162
Total, University Research	16,080	17,085	15,662

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
National Laboratory Research			
Included is: (1) the research supported at the Thomas Jefferson National Accelerator Facility, which houses the Nation's new and unique high intensity continuous wave electron accelerator and (2) research efforts at Argonne, Brookhaven, and Los Alamos National Laboratories. The National Laboratory groups carry out research at various world facilities as well as at their home institutions			
■ **TJNAF Research:**			
▸ Scientists at TJNAF, with support of the user community, have completed assembly of new experimental apparatus for Halls A, B, and C. All three experimental Halls are now operational. TJNAF scientists provide experimental support and operate the apparatus for safe and effective utilization by the user community. TJNAF scientists participate in the laboratory's research program, and collaborate in research at other facilities.			
▸ Eight experiments have been completed in Hall C. Experimental equipment in Hall A is complete and the experimental program is underway. Four experiments have completed data accumulation in Hall A. The complex large-acceptance spectrometer in Hall B has been completed and the research program is now underway. One experiment has been completed. In FY 2000, the experimental program will run routinely in all three Halls.			
▸ Capital equipment funding will be provided for assembling and installing polarized electron injector improvements for the accelerator. Capital equipment funds will be used to install ancillary equipment items such as polarized targets for experimental Halls A, B, and C spectrometer systems, complete a major upgrade of the data reduction system to handle massive amounts of raw data, and to continue fabrication of second generation experiments such as a spectrometer that is designed to investigate the strange quark content of the proton.	5,600	5,600	5,700

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Other National Laboratory Research:**			
▸ Argonne National Laboratory scientists are pursuing research programs at TJNAF, at the DESY Laboratory in Germany, and have proposed measurements of the quark structure of the nucleon at the new Main Injector at Fermilab. The theme running through this entire effort is the search for a detailed understanding of the internal structure of the nucleon.			
▸ At Brookhaven National Laboratory, scientists at the Alternating Gradient Synchrotron have been working with university researchers on experiments to look at the behavior of strange quarks in nuclei, and other work has been investigating the spectroscopy of strongly interacting particles. These efforts involve large detectors which were recently moved from Los Alamos and the Stanford Linear Accelerator Center. In FY 2000, efforts involving analysis of data obtained in prior years will be supported. The AGS will be primarily utilized as an injector for the new Relativistic Heavy Ion Collider (RHIC).			
▸ Also at Brookhaven, Laser Electron Gamma Source (LEGS) scientists are developing a new spectrometer and polarized target for a new program of spin physics. This unique facility produces its high energy polarized "gammas" by back scattering laser light from the circulating electron beam at the National Synchrotron Light Source (NSLS). In FY 2000, the research program utilizing the new equipment, will be fully underway.			
▸ At Los Alamos National Laboratory, scientists and collaborators may continue to carry out highly interesting but controversial measurements in search of neutrino oscillations. If oscillations are found, then neutrinos would have mass, in disagreement with our present understanding of the laws of physics.			
▸ Los Alamos National Laboratory scientists and collaborators are also developing detectors for the Relativistic Heavy Ion Collider which will enable use of polarized protons and which builds upon an experiment to measure the quark structure of the proton at Fermilab. . .	14,113	14,524	14,285
Total, National Laboratory Research	19,713	20,124	19,985

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Other Research			
■ **SBIR/STTR:** Amounts shown are the estimated requirement for the continuation of the SBIR and STTR programs and other established obligations which the Medium Energy Nuclear Physics subprogram must meet.			
▸ In FY 1998 $4,165,000 and $340,000 were transferred to the SBIR and STTR programs, respectively. The FY 1999 and FY 2000 amounts are the estimated requirement for the continuation of the SBIR and STTR programs.	987	6,064	5,748
Total, Research	36,780	43,273	41,395

Operations

TJNAF Operations

Included is the funding which supports: (1) operation of the Continuous Electron Beam Accelerator at the Thomas Jefferson National Accelerator Facility, and (2) major manpower, equipment, and staging support for the assembly and dismantling of complex experiments.

■ **TJNAF Accelerator Operations:**

▸ The accelerator is now capable of delivering beams of differing energies and currents simultaneously to the three experimental halls. Polarized beam capability is now also available and is being used for experiments.

	(hours of beam for research)		
	FY 1998	FY 1999	FY 2000
TJNAF	4,500	4,500	4,500

▸ AIP funding will provide for polarized injector and beam handling components which enable simultaneous polarized beam capability with varied operating parameters in the three experimental halls. AIP funding also supports other additions and modifications to the accelerator facilities. GPP funding is provided for minor new construction and utility systems.	39,755	41,200	43,360

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **TJNAF Experimental Support:**			
▸ Support is provided for the scientific and technical manpower, materials, and services needed to integrate rapid assembly, modification, and disassembly of large and complex experiments for optimization of schedules. This includes the delivery or dismantling of cryogenic systems, electricity, water for cooling, radiation shielding, and special equipment for specific experiments.	22,965	22,970	23,875
Total, TJNAF Operations	62,720	64,170	67,235
Bates Operations			
■ Funding is provided to support accelerator operations at the MIT/Bates Linear Accelerator Center.			
▸ Bates operations will terminate in FY 2000. Funding is provided for Decommissioning and Decontamination activities.			
	(hours of beam for research)		
	FY 1998	FY 1999	FY 2000
Bates	2,000	1,000	0
▸ Accelerator operations in FY 1998 provided beams for the research programs in the North and South Halls, for testing of internal continuous beams in the South Hall Ring, and for development of extracted continuous beams for delivery to the existing South Hall spectrometers.			
▸ AIP funding has supported additions and modifications to the accelerator facilities; GPP funding has provided for minor new construction and utility systems. No AIP/GPP will be provided in FY 2000.	13,550	10,800	2,500
Other Operations			
■ This category includes facility operations funding at other facilities when the importance of the science justifies the partial support of another research facility.			
▸ No operations support of other facilities is planned in FY 2000.	350	300	0
Total, Operations	76,620	75,270	69,735
Total, Medium Energy Nuclear Physics	113,400	118,543	111,130

Total Funding Change, Medium Energy Nuclear Physics	-7,413

Heavy Ion Nuclear Physics

Mission Supporting Goals and Objectives

The Heavy Ion Nuclear Physics subprogram supports research directed at understanding the properties of atomic nuclei and nuclear matter over the wide range of conditions created in nucleus-nucleus collisions. Using beams of accelerated heavy ions at low bombarding energies, research is focused on the study of the structure of nuclei which are only gently excited (cool nuclear matter), but taken to their limits of deformation and isotopic stability. With higher energy heavy-ion beams it is possible to study highly excited nuclei (warm nuclear matter) which, when sufficiently heated, are expected to vaporize in a process analogous to the liquid-gas phase transition of heated water. At relativistic bombarding energies the properties of hot, dense nuclear matter are studied with a goal of observing the deconfinement of normal matter into a form of matter, a quark-gluon plasma, which is believed to have existed in the early phase of the universe, a millionth of a second after the Big Bang.

Scientists and students at universities and national laboratories are funded to carry out this research on Department of Energy (DOE) supported facilities, as well as on National Science Foundation (NSF) and foreign supported accelerator facilities. The Heavy Ion Nuclear Physics subprogram supports and maintains accelerator facilities located at two universities (Texas A&M and Yale) and three National Laboratories (Argonne, Brookhaven and Berkeley) for these studies. The Relativistic Heavy Ion Collider (RHIC), under construction at Brookhaven National Laboratory since FY 1991, is scheduled to begin operations in the 4th Quarter of FY 1999, initiating a high-priority research program addressing fundamental questions about the nature of nuclear matter. In FY 2000 resources will be directed towards initiating RHIC's research program in its first full year of operation. All the National Laboratory facilities are utilized by DOE, NSF and foreign supported researchers whose experiments undergo peer review prior to approval for beam time. Capital Equipment funds are provided for detector systems, for data acquisition and analysis systems and for accelerator instrumentation for effective utilization of all the national accelerator facilities operated by this subprogram. Accelerator Improvement Project (AIP) funds are provided for additions, modifications, and improvements to the research accelerators and ancillary experimental facilities to maintain and improve the reliability and efficiency of operations, and to provide new experimental capabilities. The Heavy Ion Nuclear Physics subprogram also provides General Purpose Equipment (GPE) and General Plant Project (GPP) funds, for minor new construction, for other capital alterations and additions, and for improvements to land, buildings, and utility systems, for the Brookhaven National Laboratory (BNL) as part of Nuclear Physics' landlord responsibilities for this laboratory.

Performance Measures

- Nuclear Physics will begin the research program at the Relativistic Heavy Ion Collider (RHIC) at Brookhaven National Laboratory (BNL) in FY 2000.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Research					
University Research	17,197	16,685	16,965	+280	+1.7%

Detailed Program Justifications

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Research

University Research

Support is provided for the research of scientists and students from over 30 universities.

- Research using relativistic heavy ion beams, involving about two-thirds of the university scientists supported by the Heavy Ion program, is focused on the study of the production and properties of hot, dense nuclear matter with priorities on the initial experiments at RHIC where an entirely new regime of nuclear matter will become available for study for the first time. University researchers are involved in all aspects (construction, installation and operation) of the four detector systems (STAR, PHENIX, BRAHMS, and PHOBOS) at RHIC.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Research using low energy heavy ion beams, involving about a third of the university scientists, is focused on the study of the structure of nuclei with priorities on studies of highly excited nuclear systems, properties of unstable nuclear systems near the limits where protons and neutrons become unbound and reactions involving unstable nuclei that are of particular importance in nuclear astrophysics. These studies utilize the Gammasphere and Fragment Mass Analyzer Detectors with beams from the ATLAS and 88-inch Cyclotron facilities and complementary studies using the smaller university facilities (Yale and Texas A&M) whose in-house research programs also include an emphasis on student training.	17,197	16,685	16,965
National Laboratory Research			
Support is provided for the research programs of scientists at five National Laboratories (ANL, BNL, LBNL, LANL and ORNL).			
■ **BNL RHIC Research:** Laboratory researchers at BNL play a major role in planning and carrying out the research on the four experiments (STAR, PHENIX, BRAHMS and PHOBOS) at RHIC and have major responsibilities for maintaining, improving and developing this instrumentation for use by the user community. Activities will be focused on initiating a research program in the first full year of RHIC operations. FY 2000 will be a critical year involving continued integration of many different subsystems in the four RHIC detectors to facilitate the beginning of studies of the expected new forms of nuclear matter that will be created in heavy ion collisions at RHIC. The priority for the capital equipment included in this funding is on additional experimental equipment for RHIC, (see Major Items of Equipment) which includes a start in FY 2000 of the Electromagnetic Calorimeter enhancement for STAR whose preliminary TEC is about $5 million. This has been recommended in a NSAC review as important to enhance the physics objectives of the RHIC program. Included are funds for computing for off-line analysis, and enhancements to the baseline STAR and PHENIX detectors that address new physics.	15,247	17,870	12,400

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Other National Laboratory Research:** Laboratory researchers associated with accelerator facilities at ANL (ATLAS) and LBNL (88-inch Cyclotron) have major responsibilities for maintaining, improving and developing instrumentation for use by the user community at their facilities, as well as playing important roles in carrying out research that address the Program's priorities. Activities will be focused on studies of the properties of short-lived nuclei using specialized instrumentation, studies of nuclear structure with Gammasphere and R&D efforts for the proposed next generation Isotopic Separation On-Line (ISOL) facility for radioactive beams. Researchers at LANL, LBNL, and ORNL will utilize their laboratory competencies in undertaking R&D, management and construction responsibilities for major initiatives such as RHIC detectors (e.g., STAR and PHENIX) and play leadership roles in carrying out research utilizing them. Activities will be focused on initiating a research program in the first full year of RHIC operations. The priorities for capital equipment in this funding are for support for the ongoing research activities at the supported accelerator facilities.	19,931	20,555	21,050
Total, National Laboratory Research	35,178	38,425	33,450
Other Research			
■ Amounts shown are the estimated requirements for the continuation of the SBIR and STTR programs and other established obligations. In FY 1998 $695,000 was transferred to the SBIR program. The FY 1999 and FY 2000 amounts are the estimated requirement for the continuation of the SBIR and STTR programs.	86	2,505	2,808
Total, Heavy Ion Nuclear Physics Research	52,461	57,615	53,223
Operations			
RHIC Operations			
■ The RHIC Project is scheduled to be completed in the 3rd Quarter with commissioning operations beginning in the 4th Quarter of FY 1999. RHIC will be a unique facility whose colliding relativistic heavy ion beams will permit exploration of hot, dense nuclear matter and recreate the transition from			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
quarks to nucleons which characterized the early evolution of the universe. Studies with colliding heavy ion beams will provide researchers with their first laboratory opportunity to explore this new regime of nuclear matter and nuclear interactions which up to now has only been studied theoretically.			
▸ **RHIC/AGS Accelerator Operations:** Support is provided for the operation, maintenance, improvement and enhancement of the RHIC accelerator complex. The RHIC complex includes the Tandem/AGS facility whose fixed-target heavy-ion research program will be terminated in FY 2000 and which will serve as the injector for RHIC. RHIC will begin its first full year of operations with a 33 week running schedule and the goal of 22 weeks (3,300 hours) for research and 11 weeks for accelerator studies.	25,520	66,800	76,675

(hours of beam for research)

	FY 1998	FY 1999	FY 2000
AGS	672	0	0
RHIC	0	500	3,300

▸ **RHIC Experimental Support:** Support is provided for the operation, maintenance, improvement and enhancement of the RHIC experimental complex, including detectors, experimental halls, computing center and support for users. RHIC will initiate its research program in FY 2000 with four experimental detectors (STAR, PHENIX, BRAHMS and PHOBOS). Approximately 1,000 scientists and students from 81 institutions and 15 countries will participate in the research programs of these four experiments.	0	8,000	29,425
Total, RHIC Operations	25,520	74,800	106,100

National Laboratory Facility Operations

Support is provided for two National User Facilities: the ATLAS facility at ANL and the 88-inch Cyclotron facility at LBNL for studies of nuclear reactions, structure and fundamental interactions.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
▸ Support is provided for the operation, maintenance, improvement and enhancement of the ATLAS and 88-inch Cyclotron accelerator facilities. FY 2000 ATLAS and 88-inch operations funding (and beam hours shown below) reflect the move of the Gammasphere program back to the 88-inch Cyclotron and the continued development of radioactive beam capabilities at ATLAS. These facilities are planned to provide yearly hours of beam for research as indicated below. In FY 2000 each facility will carry out about 40 experiments conducted by about 270 researchers.			

(hours of beam for research)

	FY 1998	FY 1999	FY 2000
ATLAS	5,700	5,700	5,300
88-inch Cyclotron	4,500	4,500	5,500
▸ Accelerator Improvement Project (AIP) funds and capital equipment are provided for the maintenance and upgrade of these facilities.	10,805	12,542	13,127
Other Operations			
■ **GPP/GPE:** GPP funding will be provided for minor new construction, other capital alterations and additions, and for buildings and utility systems at Brookhaven National Laboratory (BNL). Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $5,000,000. In addition, the program has landlord responsibility for providing general purpose equipment (GPE) at BNL.	5,950	5,450	9,360
Total, Operations	42,275	92,792	128,587
Total, Heavy Ion Nuclear Physics	94,736	150,407	181,810

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Research	
■ **University Research**	
▸ FY 2000 funding for University Research provides for almost constant effort compared to FY 1999 for research and educational activities.	+280
■ **National Laboratory Research**	
▸ The $3,000,000 of FY 1999 funding provided for experimental support for RHIC detector and computer efforts is shifted in FY 2000 to RHIC Experimental Support Operations. The plans made early in the project to procure computing equipment just prior to operations to secure the most powerful and up-to-date system at the lowest cost, are on schedule. In FY 2000 about $2,500,000 of the capital equipment funding provided in FY 1999 for RHIC computing and experimental equipment projects which expand RHIC scientific capabilities are shifted to RHIC Experimental Support Operations. The buildup of scientific and technical support and infrastructure needed for the RHIC detectors when they become operational in FY 2000, was supported in research in the years preceding the start of RHIC operations. This manpower and infrastructure belongs in RHIC Experimental Support and Operations in FY 2000. FY 2000 operating funding for research at National Laboratories other than BNL is up about $500,000 when compared with FY 1999 and distributed with emphasis on enhanced support for R&D efforts directed towards issues relevant to the proposed ISOL facility for radioactive beams.	-4,975
■ **Other Research**	
▸ Estimated funding for SBIR and other obligations increases from FY 1999.	+303
Total, Research	-4,392
Operations	
■ **RHIC Operations**	
▸ First full year of RHIC operations commences. FY 1999 RHIC Construction funds of $16,620,000 are redirected to Operations. Approximately $5,500,000 of funds provided in FY 1999 to BNL RHIC Research for experimental support activities in preparation of start of RHIC Operations are transferred in FY 2000 to RHIC Operations. The FY 2000 funding provides for an estimated 33 week running schedule	+31,300

	FY 2000 vs. FY 1999 ($000)
■ **National Laboratory Facility Operations**	
▸ In FY 2000 funding for operations of the 88-Inch Cyclotron facility is increased to provide more beam hours for Gammasphere after its arrival from ATLAS. ATLAS operation will be slightly less than the FY 1999 level of effort.	+585
■ **Other Operations**	
▸ With the beginning of RHIC operations the program assumes landlord responsibility for providing general plant projects (GPP) and general purpose equipment (GPE) at BNL and ceases these responsibilities at LBNL.	+3,910
Total, Operations	+35,795
Total Funding Change, Heavy Ion Nuclear Physics	+31,403

Low Energy Nuclear Physics

Mission Supporting Goals and Objectives

The Low Energy Nuclear Physics subprogram supports research directed at addressing issues in nuclear astrophysics, the understanding of the behavior of nucleons at the surface of the nucleus as well as the collective behavior of the entire ensemble of nucleons acting in concert; nuclear reaction mechanisms; and experimental tests of fundamental symmetries. Part of this work can often be accomplished without the use of accelerators. The study of neutrinos from the sun, whose rate of production is not understood, is an example. University-based research is an important feature of the Low Energy subprogram. Since most of the required facilities are relatively small, they are appropriate for siting on university campuses, where they provide unique opportunities for hands-on training of nuclear experimentalists who are so important to the future of this field. Many of these scientists, after obtaining their Ph.D.s, contribute to a wide variety of nuclear technology programs of interest to the DOE. Included in this subprogram are the activities of the National Nuclear Data Center and its support sites that are aimed at providing information services on critical nuclear data and have as a goal the compilation and dissemination of an accurate and complete nuclear data information base that is readily accessible and user oriented.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
University Research	9,447	9,810	10,050	+240	+2.4%
National Laboratory Research	8,468	8,770	8,725	-45	-0.5%
Nuclear Data	5,096	4,900	5,000	+100	+2.0%
RIB Operations	8,840	8,630	9,250	+620	+7.2%
Other	21	1,115	1,145	+30	+2.7%
Total, Low Energy Nuclear Physics	31,872	33,225	34,170	+945	+2.8%

Detailed Program Justifications

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
University Research			
■ The three main components of research at universities in this subprogram are nuclear astrophysics, fundamental interactions in nuclei, and the structure of nuclei. The support level for this activity is determined by juxtaposing the peer review assessment of the worth and priority of the project with the researchers request for the number of graduate students, postdoctoral fellows, other staff and necessary items to complete the proposed work.			
■ Two university accelerators are supported in Low Energy: the University of Washington, Nuclear Physics Laboratory (NPL), and the Triangle Universities Nuclear Laboratory (TUNL) facility at Duke University. These small university facilities fit within the low energy program by providing a source of light ion and neutron physics beams. Long term measurements of a detailed nature are possible at these dedicated facilities and they are used to make measurements that address questions of a fundamental physics nature.			
■ University scientists perform research at on-site facilities, as user groups at National Laboratory facilities, and at the Sudbury Neutrino Observatory (SNO). These activities address fundamental issues essential to the long term goal of understanding the production and constituents of stars.	9,447	9,810	10,050
National Laboratory Research			
■ **Radioactive Ion Beam Facility Research:**			
▸ The RIB facility will focus mainly on nuclear astrophysics problems bearing on the creation of the elements and nuclear properties with extreme proton/neutron ratios.			
▸ Installation of the Daresbury Recoil Separator, a $2,000,000 device contributed by the United Kingdom, allows separation of the products of nuclear reactions from particles a trillion times more intense, enabling the measurement of nuclear reactions that fuel the explosion of stars.			
▸ Capital equipment funds are provided to expand the list of available beam species.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ There will be an increased level of effort dedicated to research and development leading to an advanced RIB facility.	5,313	4,615	5,400
■ **Other National Laboratory Research:**			
▸ In a major effort to study the processes that control our sun, the Sudbury Neutrino Observatory (SNO) was created. This observatory consists of a 40 foot diameter plastic (acrylic) vessel that holds 1,000 tons of heavy water that is the solar neutrino detector. The SNO laboratory is located 6,800 feet underground. The detector water fill will be completed in FY 1999 and data taking will start. The level of SNO support at the national laboratories is at a continuing level of effort that allows the systematic and efficient collection and analysis of data.			
▸ The research that follows after the completion of filling the tank will determine whether the observed dearth of solar neutrinos results from unexpected properties of the sun, or whether it results from a fundamental new property of neutrinos—namely that neutrinos produced in radioactive decay change their nature during the time it takes them to reach the earth from the sun.			
▸ Capital equipment funds were used to construct and transport special rare gas Helium-3 neutron counters (800m total length) to their underground storage in the ultra low cosmic ray background environment of the SNO mine. They are being stored for a period of time which is sufficient to allow decay to low levels of the radioactivity induced in the detectors by the above ground cosmic ray background.	3,155	4,155	3,325
Total, National Laboratory Research	8,468	8,770	8,725

Nuclear Data

- This is a service function of the Nuclear Physics program which collects, evaluates, stores, and disseminates nuclear information. Its single national and international center point is the United States National Nuclear Data Center (US-NNDC) at Brookhaven National Laboratory. The level of effort is at an ongoing level and was peer reviewed by a panel of experts that addressed the activity level.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The NNDC uses a network of individual nuclear data professionals located in universities and at other national laboratories who assist in assessing data as well as developing new novel, user friendly electronic network capabilities.			
■ The U.S. Nuclear Data Network (USNDN), a collaboration of DOE supported nuclear data scientists, reports to and supports the NNDC in data evaluation and development of on-line access capabilities.			
■ After completion of a review, a new activity, jointly supported with the Nuclear Physics research community, was established in order to serve the nuclear astrophysics community. This will be a joint activity between the US-NNDC and a consortium of researchers and data scientists. This new project, whose level of activity was established by user demand and input, will be an ongoing activity of the Data program.	5,096	4,900	5,000
RIB Operations			
■ The RIB facility is planned to provide beam hours for research as indicated below:			

	(hours of beam for research)		
	FY 1998	FY 1999	FY 2000
RIB	2,200	2,400	2,400

■ Research at the Oak Ridge Electron Linear Accelerator (ORELA), which is also operated by RIB staff, is aimed at resolving discrepancies in the rate of production of primordial elements compared with theoretical predictions, such as models that predict the formation of heavy elements like carbon, nitrogen, and oxygen in the Big Bang.			
■ This technically difficult project, which couples the existing cyclotron and tandem accelerators, was fully operational in FY 1998, and now is operating with radioactive ion beams of arsenic and fluorine as well as beams of Nickel-56.	8,840	8,630	9,250
Other			
■ Amounts shown are the estimated requirement for the continuation of the SBIR and STTR programs. The Lawrence and Fermi Awards which are funded under this line, provide annual monetary awards to honorees selected by the Department of Energy for their outstanding contributions to nuclear science.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **SBIR/STTR:** In FY 1998 $800,000 was transferred to the SBIR program. The FY 1999 and FY 2000 amounts are the estimated requirement for the continuation of the SBIR and STTR programs.	21	1,115	1,145
Total, Low Energy Nuclear Physics	31,872	33,225	34,170

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ **University Research**	
▸ Research associated with RIB experiments and nuclear astrophysics research activities will increase while SNO construction activities will be completed. . . .	+240
■ **National Laboratory Research**	
▸ Increased research in high priority nuclear astrophysics measurements will replace a diminished activity in solar neutrino research.	-45
■ **Nuclear Data**	
▸ Support will increase for activities to provide data and services on-line to replace data and services previously supplied in hard copy.	+100
■ **RIB Operations**	
▸ RIB operations will be maintained with a cost-of-living increase thereby providing a constant amount of beam time.	+620
■ **Other**	
▸ Estimated FY 2000 funds for SBIR increase compared to FY 1999.	+30
Total Funding Change, Low Energy Nuclear Physics	+945

Nuclear Theory

Mission Supporting Goals and Objectives

Theoretical Nuclear Physics is a program of fundamental scientific research that provides new insight into the observed behavior of atomic nuclei. From continuing interaction with experimentalists and experimental data, solvable mathematical models are developed which describe observed nuclear properties, and the predictions of the models are tested with further experiments. From this process evolves a deeper understanding of the nucleus. Traditionally, there are two generic types of nuclear models: (1) microscopic models where the nucleus is viewed as a system of interacting discrete protons and neutrons, and (2) collective models where the nucleus is treated as a drop of fluid. With the establishment of the Quantum Chromodynamics and the standard model, the ultimate goal of nuclear theory now is to understand nuclear models, and hence nuclei, in terms of quarks and gluons. An area of increasing interest recently is in nuclear astrophysics-topics such as supernova explosions, nucleosynthesis of the elements, and the properties of neutrinos from the sun.

The Nuclear Theory program supports all areas of nuclear physics, and is carried out at universities and National Laboratories. Some of the investigations depend crucially on access to forefront computing, and to the development of efficient algorithms to use these forefront devices. Components of the program are selected primarily on the basis of peer review by internationally recognized experts. A very significant component of the program is the Institute for Nuclear Theory (INT), where there is an ongoing series of special topic programs and workshops. The Institute is a seedbed for new collaborations, ideas, and directions in nuclear physics.

Significant progress has been made in the past year. Three examples of particular accomplishments in that period are: (1) University theorists made a significant step forward in our understanding of how and where the heavier elements observed in nature were originally produced, producing strong evidence that they were produced in neutron rich gas at the core of supernova explosions. (2) Theorists at universities and the national laboratories, in several collaborative efforts, have developed increasingly sophisticated models of the reactions between ultra relativistic heavy ions, such as will be produced in the soon to be operating Relativistic Heavy Ion Collider facility at the Brookhaven National Laboratory. In the past year, several new and potentially clear signals of the creation of the quark-gluon plasma in such collisions were suggested by these models. (3) Recently, national laboratory theorists have found, quite unexpectedly, that effects due to special relativity can explain a symmetry in the low lying states of nuclei that is observed in a large number of nuclei, but for which there was previously no satisfactory explanation.

The program is greatly enhanced through interactions with complementary programs overseas and those supported by the National Science Foundation. Many foreign theorists participate on advisory groups and as peer reviewers. There is large participation in the INT by researchers from Europe and Japan.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
University Research	9,974	10,464	10,510	+46	+0.4%
National Laboratory Research	5,356	5,296	5,320	+24	+0.5%
Total, Nuclear Theory	15,330	15,760	15,830	+70	+0.4%

Detailed Program Justifications

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
University Research			
■ Research is conducted through individual grants to faculty at roughly 50 universities.			
■ The range of topics studied through these grants is broad, and each of the active areas of experimental nuclear physics is supported by at least some of the nuclear theory grants.			
■ The overall character of the research program evolves with time to reflect changes in the overall nuclear physics program through redirecting some individual programs, phasing out other programs and starting new programs.			
■ Almost 100 Ph.D. students are supported by the Theory program, the major source of new Ph.D.s in nuclear physics in this country.			
■ The level of effort in this activity has been essentially constant in recent years. The bulk of the funds provided are used for salary support for faculty, postdocs, and students doing thesis research. Thus, a constant level of effort depends on a cost-of-living increase.			
■ The number of nuclear theorists supported in this activity is consistent with the recommendations for manpower levels in the report of the DOE/NSF Nuclear Science Advisory Committee Subcommittee on Nuclear Theory-1988.	9,974	10,464	10,510
National Laboratory Research			
■ Through this activity, small groups of theoretical nuclear physicists are supported at 6 National Laboratories.			
■ The range of topics in these programs is broad, and each of the active areas of experimental nuclear physics is supported by at least some of these nuclear theory activities.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ In all cases, the nuclear theory research at a given laboratory provides support to the experimental programs at the laboratory, or takes advantage of some unique facilities/programs at that laboratory.			
■ The larger size and diversity of the National Laboratory groups make them particularly good sites for the training of nuclear theory postdocs.			
■ The level of effort in this activity has been essentially constant in recent years. The bulk of the funds provided are used for salary support for staff. Thus, a constant level of effort depends on a cost-of-living increase.			
■ The number of nuclear theorists supported in this activity is consistent with the recommendations for manpower levels in the report of the DOE/NSF Nuclear Science Advisory Committee Subcommittee on Nuclear Theory-1988.	5,356	5,296	5,320
Total, Nuclear Theory	15,330	15,760	15,830

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ **University Research**	
▸ Continue program at slightly reduced level of effort, consistent with less than cost-of-living increase in funding.	+46
■ **National Laboratory Research**	
▸ Continue program at slightly reduced level of effort, consistent with less than cost-of-living increase in funding.	+24
Total Funding Change, Nuclear Theory	+70

Capital Operating Expense and Construction Summary

Capital Operating Expenses

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
General Plant Projects	4,610	4,000	5,655	+1,655	+41.4%
Accelerator Improvement Projects	4,200	4,900	3,900	-1,000	-20.4%
Capital Equipment	26,110	29,586	30,355	+769	+2.6%
Total, Capital Operating Expense	34,920	38,486	39,910	+1,424	+3.7%

Major Items of Equipment *(TEC $2 million or greater)*

(dollars in thousands)

	Total Estimated Cost (TEC)	Prior Year Appropriations	FY 1998	FY 1999	FY 2000	Acceptance Date
STAR Silicon Vertex Tracker	7,000	3,450	1,500	1,300	750	FY 2000
PHENIX Muon Arm Instrumentation	11,400	3,375	2,800	2,400	2,525	FY 2001
Analysis System for RHIC Detectors	7,900	775	2,000	3,600	1,525	FY 1999
BLAST Large Acceptance Detector	4,900	400	900	900	0	TBD

Total, Major Items of Equipment		8,000	7,200	8,200	6,600	

[a] Preliminary TEC is estimated to be about $5 million.

Biological and Environmental Research

Program Mission

The Biological and Environmental Research (BER) program mission – For over 50 years BER has been investing to advance environmental and biomedical knowledge connected to energy. The BER program provides fundamental science to underpin the business thrusts of the Department's strategic plan. Through its support of peer-reviewed research at national laboratories, universities, and private institutions, the program develops the knowledge needed to identify, understand, and anticipate the long-term health and environmental consequences of energy production, development, and use. The research is also designed to provide science in support of the Energy Policy Act of 1992.

The high quality of the research in this program is continuously evaluated through the use of merit based peer review and scientific advisory committees.

Program Goal

To develop the information, scientific "know-how," and technology for identification, characterization, prediction, and mitigation of adverse health and environmental consequences of energy production, development, and use.

Program Objectives

- *To Contribute to a Healthy Citizenry* — Map the fine structure of the human genome by 2003 providing resources to the international research community needed to identify disease genes and develop broad diagnostic and therapeutic strategies, including the development of individual risk assessments; conduct fundamental research necessary for the development of advanced medical technologies and radiopharmaceuticals; and use the unique National Laboratory facilities to determine biological structure and function at the molecular and cellular level in support of this nation's biomedical sciences, pharmaceutical interests, and environmental activities.
- *To Contribute to Cleanup of the Environment* — Conduct fundamental research necessary for the development of advanced remediation tools for containing wastes and cleaning up DOE's contaminated sites, particularly in support of the mission of DOE's Environmental Management (EM) office.
- *To Understand Global Environmental Change* — Acquire the data and develop the understanding necessary to predict how energy production and use can affect the global and regional environment.

Performance Measures

The quality and appropriateness of the Biological and Environmental Research (BER) program and individual research projects are judged by rigorous peer reviews conducted by internationally recognized scientific experts using criteria such as scientific merit, appropriateness of the proposed approach and qualifications of the principal investigator. Highest quality research is maintained by taking appropriate and, if needed, corrective management actions based on results of the reviews. A measure of the quality of the research is the sustained achievement in advancing knowledge as indicated by the publication of research results in refereed scientific journals, by invited participation at national and international conferences and workshops, and by awards received by BER-supported researchers. Progress in the field is also routinely compared to the scientific priorities recommended by the Biological and Environmental Research Advisory Committee and the National Science and Technology Council's (NSTC) committees on Environment and Natural Resources and on Fundamental Science.

An overarching and unique performance measure of the BER program is the diversity of program reviews conducted. This is particularly the case for BER program elements that are components of international research endeavors, e.g., the Human Genome Program and the Global Change Research Program. In addition to panel reviews that evaluate and select individual projects and programmatic reviews by the chartered Biological and Environmental Research Advisory Committee, these program elements are evaluated by interagency (and international) review bodies and by Boards and Committees of the National Academy of Sciences.

The BER program goes one step further in soliciting program reviews. Blue ribbon panels are charged with evaluating the quality of individual programs and with exploring ways of entraining new ideas and research performers from different scientific fields. This strategy is based on the conviction that the most important scientific advances of the new century will occur at the interfaces between scientific disciplines such as biology and information science. Groups like JASON and The Washington Advisory Group (TWAG), involving physicists, mathematicians, engineers, etc., are among the panels that have studied BER program elements such as the Atmospheric Radiation Measurement (ARM) program, climate change prediction activities, the William R. Wiley Environmental Molecular Sciences Laboratory (EMSL), and the Human Genome Program.

Facility operations are also monitored by peer reviews and user feedback. These facilities are provided in a manner that meets user requirements (as indicated by achieving performance specifications while protecting the safety of the workers and the environment); facilities are operated reliably and according to planned schedules; and facilities are maintained and improved at reasonable costs.

Specific BER program performance measures are:

- Excellence in basic research: At least 80 percent of the research projects will be reviewed by appropriate peers and selected through a merit-based competitive process.
- Access to Human Genome research results: BER will complete sequencing of 50 million finished and 70 million high quality draft subunits of human DNA to submit to publicly accessible databases in FY 2000.
- Microbial Genomics: BER will complete the genetic sequencing of over 10 additional microbes with significant potential for waste cleanup and energy production.

- Discovering new biological structures with more than 60 percent of them published in the peer reviewed literature resulting from data generated at synchrotron user stations served by the BER structural biology support facilities program.
- Progress in Boron Neutron Capture Therapy (BNCT) Research: Phase I clinical trials of BNCT at reactor sources of neutrons will be completed for at least 100 patients, and research on a facility for accelerator-based BNCT will be underway. These activities will provide the basis for evaluating the efficacy of BNCT and for designing phase II clinical trials that include reactor and accelerator-based sources of neutrons.
- Atmospheric Radiation Measurement (ARM) accomplishments: BER will conduct five intensive operations periods at the ARM Southern Great Plains site. Data will be obtained from the second station on the North Slope of Alaska. The third station in the Tropical Western Pacific, on Christmas Island, will become operational.
- Work will proceed on the development of the next generation coupled ocean-atmosphere climate model, leading to better information for assessing climate change and variability at regional, rather than global scales. This next generation model will change grid size from the current 300-500 kilometers on a side to less than 200 kilometers on a side.
- Twenty-five AmeriFlux sites representing major types of ecosystem types and land uses in North and Central America, including forests, croplands, grasslands, rangelands and tundra ecosystems, will be operating and collecting data that will allow inter-site comparisons of (1) the atmosphere-terrestrial biosphere exchange of energy and water, (2) the net sequestration of carbon dioxide, (3) the effects of environmental factors such as climate variation on the net exchange of carbon, and (4) the role of biophysical process controlling this exchange. AmeriFlux is a network of instrumented research tower sites designed to provide consistent, quality assured, documented long-term measurements of carbon exchange between the atmosphere and terrestrial biosphere. These measurements are necessary to define the current global carbon dioxide budget, enable improved predictions of future carbon dioxide concentrations, and enhance understanding of how carbon sequestration by the terrestrial biosphere is affected by climate, pollution, land use, and other factors.
- Develop and implement, in cooperation with Basic Energy Sciences, a comprehensive program within the Climate Change Technology Initiative, where the focus areas are those that promise the maximum impact in the area of carbon management in addition to supporting fundamental research that addresses other diverse aspects of the problem.
- Coordinate with other federal agencies, Canada, and Brazil to maximize national and international capabilites to enhance understanding of the current global carbon dioxide distribution and the role of the terrestrial biosphere in that distribution.
- Develop collaborative partnerships between strong marine sciences research institutions and those with developing capabilities to advance innovative techniques in modern molecular biology to understand the coupling between carbon and nitrogen cycles in coastal waters and sediments.
- In cooperation with NASA, NSF, USDA/Forest Service, and the Smithsonian Institution, provide quantitative data on the annual exchange of carbon dioxide between the atmosphere and terrestrial ecosystem from 25 AmeriFlux sites representing major types of ecosystem and land uses in North

Central America. Provide data on both the effects of environmental factors, such as climate variation, on the net sequestration or release of carbon dioxide and the role of biophysical processes controlling the net exchange.

- Environmental remediation developments: The Natural and Accelerated Bioremediation Research (NABIR) program will continue to support fundamental research in environmental and molecular sciences that will underpin the development of bioremediation for containing hazardous waste and cleaning DOE sites. Site characterization of the first NABIR Field Research Center will proceed, and activities necessary to enable research sample distribution to investigators will commence.
- The William R. Wiley Environmental Molecular Sciences Laboratory (EMSL) will be identified and cited as an important resource in research publications and research proposals written by investigators in academia and at National Laboratories.
- The development and upgrade of scientific facilities (including experimental stations) will be kept on schedule and within cost.
- The operating time lost at scientific user facilities due to unscheduled downtime will be less than 10 percent of the total scheduled possible operating time, on average.
- Independent assessments will judge BER research programs to have high scientific quality.
- Education accomplishments: The educational activities in the Global Change Research Program will continue to focus on bringing knowledge about the scientific questions and research needs surrounding global environmental change to students at the undergraduate and graduate levels, with an emphasis on DOE mission areas in global change research. Included in these activities are the Summer Undergraduate Research Experience, Graduate Research Environmental Fellowships, and participation in the multi-agency "Significant Opportunities in Atmospheric Research and Science" Program.
- Education accomplishments: Continuing to make 4 to 10 appointments each in the BER Alexander Hollaender Distinguished Post Doctoral Fellowship Program; and the Historical Black Colleges and Universities Faculty and Student Research Programs.

Significant Accomplishments and Program Shifts

Life Sciences

- **TIGR Takes the World of Biology by the Tail** - Three of the hottest eleven papers in biology in 1997 were published by DOE-funded scientist Craig Venter, the president of The Institute for Genomic Research (TIGR). The papers described the complete genomic sequencing of microbes, two of which were funded by the BER Microbial Genome Program. The impact these papers are having emphasizes one of the central principles of both the human and microbial genome programs, that complete genome sequences yield answers to fundamental questions in biology.
- **DOE Joint Genome Institute Second Leading U.S. Producer of DNA Sequence** - In only its first full year of operation, the DOE Joint Genome Institute (JGI) has set ambitious DNA sequencing goals based on international standards for DNA sequence quality. In FY 1998, the JGI became the second leading producer of high quality human DNA sequence among U.S. sequencing

centers. The JGI's monthly sequencing goals and progress are available to the entire scientific community at the JGI Web site, http://www.jgi.doe.gov/Docs/JGI_Seq_Summary.html.

DOE's Bold Human DNA Sequencing Scale Up:

Sequences Submitted to Public Database

FY 1998 Actual	FY 1999 Estimate	FY 2000 Estimate
21,000,000 finished	30,000,000 finished	50,000,000 finished
	40,000,000 draft	70,000,000 draft

The Human Genome Program (HGP) was initiated by the Department of Energy (DOE) in 1986 to map and determine the complete DNA sequence of the human genome. The principal goal of this international program is to determine a representative human DNA sequence of all 3 billion base pairs in the human genome. A Memorandum of Understanding was established with the National Institutes of Health (NIH) in 1988 to coordinate the U.S. Genome Project with the international efforts. The new 5 year plan, developed in 1998, calls for determining a draft sequence by FY 2001 and the complete finished sequence of the human genome by the year 2003. The U.S. is responsible for producing approximately 65 percent of the sequence information. The Department of Energy is sequencing 10-14 percent of the genome, a quantity that is proportional to its budget, with NIH responsible for the balance of the U.S. effort.

- **DNA Replication Uncovered** - A team of BER-funded Harvard Medical School researchers have established the 3 dimensional, atom-by-atom structure of an enzyme system responsible for DNA replication. The core enzyme, T7 DNA polymerase, has long been used as a key reagent for determining the sequence of DNA. This work contributes to the development of improved resources and technologies for microbial, human, and other genome sequencing projects and will aid in the rational design of antiviral regimens, whose DNA replication systems are promising targets for drug intervention.

- **Game of 20 Questions (Actually 30) May Speed Hunt for Disease-Causing Genes** - A new research tool, developed at the University of Southern California (USC) by molecular biologist Dr. Norman Arnheim and mathematician Dr. Pavel Pevzner, promises to speed the hunt for disease-causing genes. By using a new technique that resembles a game of "20 Questions," genes can be found buried in human chromosomes in large volumes of so-called "junk DNA" that does not carry information for specific protein products. This new tool has direct applications for research into genetically based human disease.

- **DOE Human Subjects Research Database for FY 1997 on the Web** - The DOE's Human Subjects Research Database (HSRD) has been updated for FY 1997 and is publicly accessible on the World Wide Web at http://www.er.doe.gov/production/ober/humsubj/database.html. The database was begun in response to Congressional interest following the Secretary of Energy Openness Initiative in 1994. The database consists of a detailed description of 252 research projects at 31 facilities, involving the use of human subjects that are supported by DOE or conducted at DOE facilities, ranging from actual experimentation to simple questionnaires.

- **Kidney Disease Gene Discovered with Help of Livermore Scientists** - DOE's investment in building a highly detailed human genetic roadmap for Chromosome 19 is paying off. Lawrence Livermore National Laboratory scientists have teamed with international collaborators in Sweden and Finland to pinpoint the location of a gene on Chromosome 19 that causes congenital nephrotic syndrome, a deadly kidney disease. The disease usually leads to death by age 2 striking about one in 10,000 Finnish children. The discovery has led to a diagnostic tool to test for the gene in parents who may be carriers of the disease and may be a key to understanding how the human kidney filtration process works.
- **Next Generation of Genome Instrumentation** - The genome instrumentation research subprogram that supported basic research leading to widely used gene sequencing methods in capillary electrophoresis and mass spectrometry has been redirected to target needs of genomic science after the completion of the first human genome sequence.
- **New Light on Molecules** - Development of an experimental station for soft x-ray spectroscopy of biologically important molecules is completed at the Advanced Light Source and initial experiments are carried out to evaluate the power of this technology in elucidating biological structures.
- **Genomic Contributions to CCTI** - The BER microbial genome program has made significant investments in the technology that enables genome sequencing at rates previously unattainable. Capitalizing on these investments, the genomes of microbes that produce methane and hydrogen will be sequenced as part of the first awards under the Climate Change Technology Initiative (CCTI). This will enable the identification of the key genetic components of the organisms that regulate the production of these gases. The search for new fuel sources is a key element of a more comprehensive carbon management program. Planning for joint CCTI-related activities with the Office of Fossil Energy was initiated.

Environmental Processes

- **Data on Arctic Ocean Provided** - The Atmospheric Radiation Measurement (ARM) program provided the atmospheric research component of the multi-agency Surface Heat Budget of the Arctic Ocean (SHEBA) experiment. The SHEBA experiment addressed the interactions among sea ice, atmospheric radiation, and clouds in the Arctic and the corresponding effects on polar and global climate. The ARM equipment used during the SHEBA campaign will be modified and redeployed on the North Slope of Alaska in 1999.
- **Looking at Clouds from Both Sides** - The joint ARM-UAV and NASA study of tropical cirrus clouds will have been completed, providing new information on key cloud formations that moderate the radiation budget of the Earth in 1999.
- **Island Effects on Clouds** - The ARM-led, multi-agency and Japanese experimental campaign on Nauru (Tropical Western Pacific) will have obtained new data on the effects of islands in measuring solar radiation and cloud interactions with the oceans in 1999.
- **Lead Role for ARM** - In response to a request from the World Climate Research Program's Global Energy and Water Cycle Experiment (GEWEX) Water Vapor Project, ARM assumed the lead role in developing guidelines for GEWEX observation and data management of this international program.

- **Variance Among Models Decreases** - The Program for Climate Model Diagnosis and Intercomparison continued to be the world's most authoritative effort in analyzing improvements in global climate models with virtually all climate modelers in the world participating. Analysis of the output from 11 different coupled ocean/atmosphere climate models, using a common scenario for increasing atmospheric carbon dioxide, has found that nearly all of the models calculate similar magnitudes for global average warming--about 2 degrees Celsius at the time that carbon dioxide doubles. This is in contrast to earlier studies that found considerable variance among model predictions.
- **More FACTS** - The first phase of the Forest Atmosphere Carbon Transfer and Storage (FACTS-1) experiment was completed. Located in the Duke Forest and developed as a joint effort between Brookhaven National Laboratory and Duke University, FACTS-1 is the first fully operational forest Free Air Carbon Dioxide Enrichment experiment. Data obtained during this phase will be analyzed to provide systematic data necessary to predict the quantity of carbon sequestered by forest vegetation and to understand the response of forest systems when exposed to elevated atmospheric carbon dioxide concentrations.
- **Changing Interannual Variation in Precipitation Impacts Forest Growth** - Experiments at the Throughput Displacement Experiment at the Walker Branch Watershed, Oak Ridge, Tennessee, suggested that if climate change resulted in a 30 percent decline in precipitation, it would alter the regeneration and species composition of deciduous forests in the southeastern U.S. Data also suggest that changes in interannual variation in precipitation, such as increases in drought intensity or frequency, will affect the growth and productivity of forest ecosystems more than would a 30 percent reduction in mean annual precipitation.
- **Data Center Serves the World** - In addition to serving as the international World Data Center for Atmospheric Trace Gases, the Carbon Dioxide Information Analysis Center (CDIAC) serves as the primary global-change data and information analysis center of the U.S. Department of Energy. More than just an archive of data sets and publications, CDIAC enhances the value of its holdings through intensive quality assurance, documentation, and integration. In recognition of this, CDIAC continued to serve as the Quality Systems Science Center for the tri-national North American Research Strategy for Tropospheric Ozone (NARSTO).
- **New Environmental Meteorology Program Initiated** - Capitalizing on the experience and data obtained in prior meteorological studies, the Atmospheric Sciences Program established a new Environmental Meteorology Program, initiating research in vertical transport and mixing and the coupling of these effects to atmospheric chemistry processes involving ozone and small particulate matter. Such research continues to support both the national and international aims of the NARSTO program.
- **Subsurface Science Program Completed** - Phaseout of the Subsurface Science Program activities will be completed in 1999, including the transition of basic research performed under BER sponsorship to the NABIR program and to applied activities supported by the Office of Environmental Management at the Test Area North, Idaho National Engineering and Environmental Laboratory. It was possible to capitalize on these earlier Subsurface Science Program field research activities to provide chemical and microbiological samples for fundamental research in bioremediation to investigators supported under the BER NABIR program.

- **Research on Long-Term Survival of Bacteria Completed** - In partnership with the Seboyetta Spanish Land Grant in rural New Mexico, research on environmental factors that control the long term survival of bacteria that are hundreds of meters deep was completed. The fact that surviving bacteria are also the most starvation-resistant bacteria has important implications for maintaining *in situ* microbial populations for bioremediation at Departmental sites. In completing the research, DOE, Land Grant authorities and residents have jointly reclaimed the drilling site, ensuring full compliance with State and Federal laws.
- **Carbon Sequestration Research Begins Under CCTI** - The carbon sequestration research program will focus on understanding the natural terrestrial sequestration cycle and the natural oceanic sequestration cycle as part of the first awards under the Climate Change Technology Initiative. The ultimate goal is to enhance the natural carbon cycle in both the terrestrial and the oceanic systems. Carbon sequestration is a key element of a more comprehensive carbon management program. Planning for joint CCTI-related activities with the Office of Fossil Energy was initiated.

Environmental Remediation

- **EMSL Attracts Wide Range of Users** - The William R. Wiley Environmental Molecular Sciences Laboratory (EMSL) will have completed its second full year of operation as a research laboratory and user facility. In its first three months of operation, the EMSL attracted over 300 users from PNNL, other government laboratories, private industry, and academia, with over half the users coming from academia.
- **First NABIR Field Research Site** - Located at a Departmental site, the first Field Research Center for the Natural and Accelerated Bioremediation Research (NABIR) program will have been selected and field site characterization will have commenced in 1999. In addition to funding the second round of three year awards under the NABIR program, funded investigators are developing research teams that build on the strengths of the individual projects and that begin the process of integrating individual research efforts across the program elements.

Medical Applications and Measurement Science

- **New Tool for Treatment of Stroke** - A Technology Transfer Success: A multi-disciplinary team of scientists and engineers from Lawrence Livermore National Laboratory were honored after receiving the 1998 Federal Laboratory Consortium (FLC) Award for their efforts to develop a new laser technique for the treatment of stroke. The project is an excellent example of how the technology developed for national security missions can be applied successfully in the field of medical devices. The corporate partner involved in this project was EndoVasix, Inc. in Belmont, CA.
- **This is Your Brain on...** - Greater understanding of brain function is being achieved through the application of modern nuclear medicine imaging techniques such as positron emission tomography. Recent work has shown damage to brain function in persons addicted to drugs such as cocaine, this damage reinforces the craving for these drugs.

Scientific Facilities Utilization

The Biological and Environmental Research request includes $40,390,000 to maintain support of the Department's scientific user facilities. Facilities used for structural biology research, such as beam lines at the synchrotron light sources and research reactors are included. The request also includes operation of the William R. Wiley Environmental Molecular Sciences Laboratory where the research activities will underpin environmental remediation. This funding will provide for the operation of the facilities, assuring access for scientists in universities, federal laboratories, and U.S. companies. It will also leverage both federally and privately sponsored research consistent with the Administration's strategy for enhancing the U.S. National science investment.

Climate Change Technology Initiative

Overview

The FY 2000 budget contains two carbon related programs, each of which cut across several agencies. The first is the Climate Change Technology Initiative (CCTI). That part of the CCTI that is within the Office of Science is a joint activity between the Biological and Environmental Research (BER) and Basic Energy Sciences (BES) programs. The second program is the U.S. Global Change Research Program (US/GCRP) that spans eleven agencies and is coordinated through the National Science and Technology Council's Committee on Environment and Natural Resources. Within DOE, the BER program plays the lead role in US/GCRP activities. Although the two programs, CCTI and US/GCRP, are synergistic, they are quite different. US/GCRP research focuses on developing the fundamental understanding of the comprehensive climate system and the global and regional adaptations to it. CCTI focuses on the underpinning fundamental science that will enable mitigation of climate change while maintaining a robust National economy. All research in the CCTI will be peer-reviewed fundamental scientific research; no funds will be devoted to policy studies.

Eighty-five percent of our Nation's energy results from the burning of fossil fuels, a process that adds carbon to the atmosphere — principally in the form of carbon dioxide -- from the sequestered fossil reservoir. Because of the potential environmental impacts of increases in atmospheric carbon dioxide, carbon management has become an international concern and has become the focus of CCTI. A comprehensive carbon management research and development program that meets the needs of the CCTI addresses the diverse aspects of this problem. The Office of Science is well positioned to make significant contributions to the many solutions needed for this problem, as it is set to build on the fundamental discoveries of its core programs and extend them to the new discoveries needed to make carbon management practical and efficient. The Office of Science core programs include research on both carbon and non-carbon energy sources and on both carbon sequestration and carbon recycling. These core activities can now be exploited in the generation of the science that will underpin the technologies of the future. The theme of efficiency in energy production and use must span the entire range of research activities. Research on carbon energy sources, and their impacts, is a focal point of interagency activity through the US/GCRP. Research on non-carbon energy sources is also a focal point of intra-agency activities and is led by the DOE Office of Energy Efficiency and Renewable Energy. The DOE Office of Science, through activities in both the BES program and the BER program, supports research that underpins both efforts.

A research program in carbon management would include research directed at the following themes:

(1) science for efficient technologies,

(2) fundamental science underpinning advances in all low/no carbon energy sources, and

(3) sequestration science.

The Office of Science has long standing programs in fundamental research that already impact these three categories. In FY 2000, resources of $12,656,000 are being requested by BER specifically for the CCTI. The research will be a natural extension of the complementary, ongoing work in several programs in the Office of Science. It will build on the foundation of excellent and relevant research already underway and focus on those areas that build on strengths of the current Office of Science programs and promise maximum impact in the area of carbon management. Within the BER program, the Life Sciences subprogram activities in genomics underpin studies on microorganisms that may form the core of new fuel sources. Core activities within the Environmental Processes subprogram, particularly in terrestrial carbon cycle and in ocean sciences research, open up the possibility of exploiting Nature's own carbon sequestration processes to enhance sequestration.

Immediate Impacts of Expanded Effort in the Science for Climate Change Technology

Additional Office of Science efforts will not only address an immediate societal problem, but will also have a major effect on many scientific disciplines by advancing the state of knowledge and by training students in areas of research that are important to carbon management. For example, biochemistry, molecular and cellular biology, structural biology, and genome science will be impacted, because the production of fuels and chemicals by plants and microorganisms and the interconversion of greenhouse gases requires a better understanding of metabolism, of the structure and function of sub-cellular components, and of enzymes. Similarly, the state-of-the-art in biochemistry, molecular biology, and ecology will be impacted. All of these biological processes are important in understanding the role of marine microorganisms in sequestering carbon. Improvements in combustion to reduce carbon emissions require a fundamental understanding in chemical dynamics and theoretical chemistry and physics. Conversion of sunlight to energy requires an understanding in many areas of science, including photochemistry, photosynthesis, metabolism, and solid state physics. The search for increased efficiency in energy production and use requires fundamental knowledge in ceramics, metals, polymers, solid state chemistry, and condensed matter physics for materials that can withstand higher temperatures, have lower coefficients of friction, and are stronger and lighter. Enhanced recovery of fuel resources and of disposal of carbon dioxide requires a fundamental understanding of geometric, structural, and hydrologic properties of reservoirs and of multiphase, nonlinear transport of fluids in porous and fractured structures. Crosscutting programs in nano- and meso-phase materials involve research at the forefront of materials science, chemistry, engineering, surface science, and semiconductor physics.

The new research efforts supporting advances in low/no carbon energy technologies as well as existing activities, will be closely coordinated with DOE's technology programs and will provide the knowledge base for the development of advanced technologies to reduce carbon dioxide emissions. Many of the activities will impact the Office of Energy Efficiency and Renewable Energy (EE) by providing options for increasing efficiency in automobiles by reducing weight; for increasing efficiency in the use of electricity by increasing the efficiency of electric motors and generators with better magnets; for increasing efficiency in the transmission of electricity by using superconductors; and for reducing energy consumption in manufacturing with improved sensors, controls, and processes. Much of this research

program will provide the knowledge base needed to increase the use of renewable resources with research aimed at understanding the metabolism of carbon dioxide and the metabolic pathways to the production of methane and other biofuels. Other aspects of the research program impact the Office of Fossil Energy (FE) by providing a foundation for effective and safe underground sequestration, new materials, a better understanding of combustion, and improved catalysts.

Funding will be provided for areas of research in carbon cycle management including appropriate areas that will be jointly identified and implemented by the BER and BES programs. Solicitations will be issued for individual research projects. Additionally, proposal notifications may be developed jointly with the DOE energy technology programs with the intention of establishing multi-disciplinary centers at universities and national laboratories that will use the full capabilities of the institutions for a research program in carbon cycle management encompassing, for example, topics in the following areas: integration and assessment; separations; efficiency; clean fuels; bioenergy; storage and conversion; sequestration; enhanced natural terrestrial cycles; and enhanced use of major scientific user facilities to support carbon management research.

Interagency Environment

The SC program in fundamental science supporting energy technologies will be closely coordinated with, and synergistic to, the activities in its sister agencies (e.g., NASA, NSF, NOAA, USDA, DOI, and EPA) within the US/GCRP. Through its leadership role in decade to century climate prediction, BER has developed the research capability for comprehensive and large scale modeling of carbon dioxide impacts on climate, ecology, and ocean sciences, and this expertise is augmented by complementary activities in the other agencies. Similarly, the network of carbon flux measurements and ecological experiments that BER has developed serve as a backdrop to those of many other agencies, and the state-of-the-art can thus be pushed ahead more rapidly by capitalizing on the more rapidly growing base of knowledge. BER also has a leadership role within the US/GCRP on consequence evaluation of increased greenhouse gases in global climate change, including integrated assessments that address both scientific and societal (including economic) impacts of carbon management. Finally, through its pre-eminent role in the Human Genome Program and its development of the complementary Microbial Genome Program, the BER program is ideally placed to support research that will focus on the application of genetic information of microorganisms to increase metabolic efficiency related to carbon dioxide and methane production or consumption.

BER Activities

Climate Change Technology Initiative

(dollars in thousands)

	FY 1999	FY 2000
Life Sciences	2,434	5,841
Environmental Processes	2,921	6,815
Total	5,355	12,656

The BER program has the opportunity to take advantage of the unique research capabilities within the Environmental Processes subprogram and to determine which natural systems of forest, other plant, and marine microorganisms can be induced to increase their natural carbon sequestration capabilities. This will help to position the Department and the Nation to build new energy efficient technologies that capitalize on Nature's own processes. Additionally, through its pre-eminent role in the Human Genome Program and its development of the complementary Microbial Genome Program within the Life Sciences subprogram, the BER program is ideally placed to support research that will focus on the production of genetic information on methane-producing and hydrogen-producing microorganisms that can be exploited in the development of useful and efficient non-fossil fuel sources. Where appropriate, these efforts will be coordinated with activities within the US/GCRP. When combined with complementary activities within the BES program, this initiative will lead to the comprehensive carbon management research program described, above.

Funding of Contractor Security Clearances

In FY 1999, the Department divided the responsibility for obtaining and maintaining security clearances. The Office of Security Affairs, which was responsible for funding all Federal and contractor employee clearances, now pays only for clearances of Federal employees, both at headquarters and the field. Program organizations are now responsible for contractor clearances, using program funds. This change in policy enables program managers to make the decisions as to how many and what level clearances are necessary for effective program execution. In this way, it is hoped that any backlog of essential clearances that are impeding program success can be cleared up by those managers most directly involved. The Office of Science is budgeting $101,000 and $90,000 for estimated contractor security clearances in FY 1999 and FY 2000, respectively, within this decision unit.

Scientific Simulation Initiative

This budget also includes the BER program's contribution to DOE's Scientific Simulation Initiative (SSI), an integrated effort bringing together computational and communication resources, focused research in scientific disciplines, and research in computer science and other enabling technologies to solve the complex problems that characterize DOE's scientific research needs. The SSI couples research in advanced scientific applications in the programs of the Office of Science with research in computer science and enabling technologies and advanced computing and communications facilities. It is a joint program between the Computational and Technology Research (CTR) program and the other programs in SC. The overview of the integrated program is given in the overview of the CTR budget; however, the specific contributions of the BER program are described below.

BER, which has been for many years the primary supporter of research in global systems in the DOE, will manage the global systems applications research effort. These efforts are the result of a successful interagency program to study global systems as a part of the U.S. Global Change Research Program (USGCRP), in which the Department plays a major role. These efforts will also contribute to the broader Presidential initiative in information technology. The goal of this effort is to dramatically advance the development, testing and use of fully coupled global system models with sufficient resolution to encompass the complete range of interactions from global to regional spatial scales over time periods of

tens to hundreds of years. Currently, too coarse spatial resolution, inadequate representation of key processes, such as cloud effects, and an inadequate number of short-duration model runs limit simulations and predictions of the global system. The computational and informational technology developed in the global systems research effort will be used to create a bridge that enables fully collaborative research between multi-institutional teams of computational scientists, global modelers and experts in the acquisition and interpretation of observational measurements. High fidelity component models, such as general circulation simulation codes of the atmosphere and ocean will be developed and tested first, then coupled for full system simulation. The data from these simulations as well as the individual component models themselves will be employed for more disciplinary-focused research related to environmental variability and change.

In addition, the simulation products of these models will provide a valuable and unique database for the study and understanding of long-term environmental variability and change. In order to make the best possible use of this data, the global systems component will develop and employ advanced collaborative and data management technology to enable the broad and diverse base of researchers and users from the many areas of environmental and earth science to advance the knowledge in their fields with the unprecedented volume and quality of the new information about the workings of the global environment.

To accomplish its goals the Global Systems applications research effort must: (1) accelerate progress in coupled general circulation model development and application; (2) reduce substantially the uncertainties in decade-to-century model-based projections of global environmental change; and (3) increase the availability and usability of global change projections to the broader environmental research and environmental assessment communities.

Funding Profile

Site Description

Ames Laboratory

Ames Laboratory is a Multiprogram Laboratory located on 10 acres in Ames, Iowa. At Ames, BER supports research into new biological imaging techniques such as fluorescence spectroscopy to study environmental carcinogens.

Argonne National Laboratory

Argonne National Laboratory (ANL) in Argonne, Illinois, is a Multiprogram Laboratory located on a 1,700 acre site in suburban Chicago. ANL has a satellite site located in Idaho Falls, Idaho. At ANL, BER supports the operation of the Structural Biology Center, a high-throughput national user facility for protein crystallography at the Advanced Photon Source, and research in protein structure relating to the process of photosynthesis. In support of Global Change research, ANL coordinates the operation and development of the Southern Great Plains ARM site. The principal scientist for the Atmospheric Chemistry program is at ANL, providing broad scientific integration to the program.

Research is conducted to understand the molecular control of genes and gene pathways in both microbes and mammalian cells and molecular factors that control cell responses to low doses of radiation.

Brookhaven National Laboratory

Brookhaven National Laboratory (BNL) is a Multiprogram Laboratory located on a 5,200 acre site in Upton, New York. BER supports the operation of beam lines for protein crystallography at the National Synchrotron Light Source and High Flux Beam Reactor for use by the national biological research community, research in biological structural determination, research and operation of the protein structure database, and research into new instrumentation for detecting x-rays and neutrons. Technology development research is conducted to improve current methods for high throughput DNA sequencing. Research is also conducted on the molecular mechanisms of cell responses to low doses of radiation and chemicals.

The Boron Neutron Capture Therapy (BNCT) program supports early clinical trials of this concept for treatment of brain cancers that do not respond to conventional treatment. The nuclear medicine program supports research into novel techniques for imaging brain function in normal and diseased states and funds the operation of the Brookhaven Imaging Center as a user facility for research in many branches of medicine.

Global change activities at BNL include the operation of the ARM External Data Center, a resource that provides ARM investigators with data from non-ARM sources, including satellite and ground-based systems. BNL scientists form an important part of the science team in the Atmospheric Sciences program, providing special expertise in atmospheric field campaigns and aerosol research. BNL scientists play a

leadership role in the development of, and experimentation at, the Free Air Carbon Dioxide Enhancement (FACE) at the Duke Forest.

Idaho National Engineering and Environmental Laboratory

Idaho National Engineering and Environmental Laboratory is a Multiprogram Laboratory located on 572,000 acres in Idaho Falls, Idaho. BER supports research into boron chemistry, radiation dosimetry, analytical chemistry of boron in tissues, and engineering of new systems for application of this treatment technique for brain and other tumors. Research into the analytical chemistry of complex environmental and biological systems using the technique of mass spectrometry is also supported.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory (LBNL) is a Multiprogram Laboratory located in Berkeley, California. The Laboratory is on a 200 acre site adjacent to the Berkeley campus of the University of California. LBNL is one of the major national laboratory partners that comprise the Joint Genome Institute (JGI) whose principal goals are high throughput human DNA sequencing and studies on the biological functions associated with newly sequenced human DNA. A significant component of the JGI's sequencing goal is the development and integration of instrumentation, automation, biological resources, and data management and analysis tools into a state-of-the-art DNA sequencing assembly line that is highly efficient and cost effective. The laboratory also conducts research on the molecular mechanisms of cell responses to low doses of radiation and chemicals and on the use of model organisms to understand and characterize the human genome.

LBNL operates beam lines for determination of protein structure at the Advanced Light Source for use by the national biological research community, research into new detectors for x-rays, and research into the structure of membrane and other proteins.

Research is conducted into the use of accelerators to produce neutrons for boron neutron capture therapy, an alternative treatment for highly malignant brain tumors. The nuclear medicine program supports research into novel radiopharmaceuticals for medical research and studies of novel instrumentation for imaging of living systems for medical diagnosis.

LBNL supports the Natural and Accelerated Bioremediation Research (NABIR) program and the field geophysical - biophysical research capabilities for NABIR field sites. BER supports research into new technologies for characterization of complex environmental contamination. LBNL also develops scalable implementation technologies that will allow widely used climate models to run effectively and efficiently on massively parallel processing supercomputers.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory (LLNL) is a Multiprogram Laboratory located on a 821 acre site in Livermore, California. LLNL is one of the major national laboratory partners that comprise the Joint Genome Institute (JGI) whose principal goals are high throughput human DNA sequencing and studies on the biological functions associated with newly sequenced human DNA. A significant component of the JGI's sequencing goal, is the development and integration of instrumentation, automation, biological resources, and data management and analysis tools into a state-of-the-art DNA sequencing assembly line that is highly efficient and cost effective. LLNL also conducts research on the molecular mechanisms of cell responses to low doses of radiation and chemicals, on the use of model organisms to understand and characterize the human genome, and on the development of new technologies for determining the structures of many more proteins than is currently possible.

Through the Program for Climate Model Diagnostics and Intercomparison, LLNL provides the international leadership to understand and improve climate models.

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL) is a Multiprogram Laboratory located on a 27,000 acre site in Los Alamos, New Mexico. LANL is one of the major national laboratory partners that comprise the Joint Genome Institute (JGI) whose principal goals are high throughput human DNA sequencing and studies on the biological functions associated with newly sequenced human DNA. A significant component of the JGI's sequencing goal is the development and integration of instrumentation, automation, biological resources, and data management and analysis tools into a state-of-the-art DNA sequencing assembly line that is highly efficient and cost effective. LANL also conducts research on the molecular mechanisms of cell responses to low doses of radiation and to understand the molecular control of genes and gene pathways in microbes.

Activities in structural biology include the operation of an experimental station for protein crystallography at the Los Alamos Neutron Science Center for use by the national biological research community and research into new techniques for determination of the structure of proteins.

LANL coordinates the operation and development of the Tropical Western Pacific ARM site. LANL also has a crucial role in the development, optimization, and validation of coupled atmospheric and oceanic general circulation models on massively parallel computers.

LANL also conducts research into advanced medical imaging technologies for studying brain function and research into new techniques for rapid characterization and sorting of mixtures of cells and cell fragments.

Oak Ridge Institute for Science and Education

Oak Ridge Institute for Science and Education (ORISE) is located on a 150 acre site in Oak Ridge, Tennessee. ORISE coordinates several research fellowship programs for BER including minority faculty and student research fellowships, Hollaendar postdoctoral fellowships, and humanitarian research awards

to scientists in the Former Soviet Union. ORISE also coordinates activities associated with the peer review of all BER-funded science.

ORISE conducts research into modeling radiation dosages for novel clinical diagnostic and therapeutic procedures.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL) is a Multiprogram Laboratory located on a 24,000 acre site in Oak Ridge, Tennessee. ORNL has a leadership role in research focused on the ecological aspects of global environmental change. The Throughput Displacement Experiment at the Walker Branch Watershed is a unique resource for long term ecological experiments. ORNL is the home of the newest FACE experiment supported by BER. ORNL is the home to the ARM archive, providing data to ARM scientists and to the general scientific community. ORNL scientists provide improvement in formulations and numerical methods necessary to improve climate models. ORNL is also home to the Carbon Dioxide Information and Analysis Center, an international resource for providing quality assured environmental data. ORNL scientists make important contributions to the NABIR program, providing special leadership in microbiology applied in the field.

ORNL conducts research on widely used data analysis tools and information resources that can be automated to provide information on the biological function of newly discovered genes identified in high throughput DNA sequencing projects. The laboratory also conducts research on the use of model organisms to understand and characterize the human genome and on the molecular mechanisms of cell responses to low doses of radiation and chemicals.

ORNL conducts research into the application of radioactively labeled monoclonal antibodies in medical diagnosis and therapy, particularly of cancer, as well as research into new instrumentation for the analytical chemistry of complex environmental contamination using new types of biosensors.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory (PNNL) is a Multiprogram Laboratory located on 640 acres at the Department's Hanford site in Richland, Washington. PNNL is home to the William R. Wiley Environmental Molecular Sciences Laboratory (EMSL). PNNL and EMSL scientists play important roles in both supporting the NABIR program and in performing NABIR research.

PNNL operates the unique ultrahigh field mass spectrometry and nuclear magnetic resonance spectrometry instruments at the Environmental Molecular Sciences Laboratory for use by the national biological research community.

PNNL provides the lead scientist for the Environmental Meteorology Program, the G-1 research aircraft, and expertise in field campaigns. PNNL provides the planning and interface for the Climate Change Prediction Program with other climate modeling programs. The ARM program office is located at PNNL, as is the ARM chief scientist and the project manager for the ARM data system; this provides invaluable logistical, technical, and scientific expertise for the program. PNNL is developing the Second Generation Model for predicting the benefits and costs of policy actions with respect to global climate change.

PNNL conducts research into new instrumentation for microscopic imaging of biological systems and for characterization of complex radioactive contaminants by highly automated instruments.

Sandia National Laboratories

Sandia National Laboratories (SNL) is a Multiprogram Laboratory, with a total of 3,700 acres, located in Albuquerque, New Mexico, with sites in Livermore, California, and Tonapah, Nevada. SNL coordinates the operation and development of the North Slope of Alaska ARM site. The chief scientist for the ARM-UAV program is at SNL, and SNL takes the lead role in coordinating and executing ARM-UAV missions.

To support environmental cleanup, SNL conducts research into novel sensors for analytical chemistry of contaminated environments.

Stanford Linear Accelerator Center

Stanford Linear Accelerator Center (SLAC) is a program-dedicated laboratory (High Energy Physics) located on 426 acres in Menlo Park, California. It is the home of the Stanford Synchroton Radiation Laboratory (SSRL) and peer-reviewed research projects associated with SSRL. The Stanford Synchrotron Radiation Laboratory was built in 1974 to take the intense x-ray beams from the SPEAR storage ring that was built for particle physics by the SLAC laboratory. Over the years, the SSRL grew to be one of the main innovators in the production and use of synchrotron radiation with the development of wigglers and undulators that form the basis of all third generation synchrotron sources. The facility is now comprised of 25 experimental stations and is used each year by over 700 researchers from industry, government laboratories and universities. Through Stanford Linear Accelerator Center, BER (in coordination with the National Institutes of Health) is funding the operation of Stanford Synchrotron Radiation Laboratory beam lines for structural biology. This program involves synchrotron radiation-based research and technology developments in structural molecular biology that focus on protein crystallography, x-ray small angle scattering diffraction, and x-ray absorption spectroscopy for determining the structures of complex proteins of many biological consequences.

All Other Sites

The BER program funds research at 70 colleges/universities located in 35 states. This line also includes funding of research awaiting distribution pending completion of peer review results.

BER supports a broad range of peer-reviewed research at America's universities, including institutions that traditionally serve minority communities. Research opportunities are announced through public solicitations in the Federal Register for research applications from universities and the private sector.

Life Sciences research is conducted at a large number of universities in all aspects of the program. Research is conducted in support of high throughput human DNA sequencing at the JGI, on the sequencing of entire microbial genomes with value to the DOE mission, to understand the molecular control of genes and gene pathways in microbes, on the use of model organisms to understand and

characterize the human genome, and on the molecular mechanisms of cell responses to low doses of radiation and chemicals.

In structural biology, universities provide new imaging detectors for x-rays, research in computational structural biology directed at the understanding of protein folding, and research into new techniques such as x-ray microscopy.

Peer reviewed projects are supported in each element of the Environmental Processes subprogram, with very active science teams, in particular, in the Atmospheric Chemistry Program and the ARM programs. Academic investigators are essential to the Integrated Assessment portfolio. Through the National Institute for Global Environmental Change, academic scientists play essential roles in the establishment and maintenance of, and research at, the AmeriFlux sites.

NABIR research grants are awarded following the peer review of applications received in response to solicitations published in the federal register. Academic and private sector investigators are performing research in areas that include mechanistic studies of bioremediation of actinide and transition metal contamination, the structure of microbial communities in the presence of uranium and other such contaminants, gene function in microorganisms with degradative properties, geochemical and enzymatic processes in microbial reduction of metals, and the use of tracers to monitor and predict metabolic degradative activity.

In nuclear medicine, universities conduct research into new types of radiopharmaceuticals, particularly those based on application of concepts from genomics and structural biology. Emphasis is placed on radiopharmaceuticals that will be of use in advanced imaging techniques such as positron emission tomography. Research is supported into new instrumentation for medical imaging. Five centers of excellence for application of lasers in medicine are funded at medical schools by this program. The Boron Neutron Capture Therapy program supports studies of novel boron compounds for use in treating brain cancer, early clinical trials of the technique, and new instrumentation based on accelerators that could be used in hospitals and clinics. The Measurement Science program supports research into novel types of biosensors for application in analytical chemistry of contaminated environments.

Life Sciences

Mission Supporting Goals and Objectives

Research is focused on utilizing unique DOE resources and facilities to develop fundamental biological information and advanced technologies for understanding and mitigating the potential health effects of energy development, energy use, and waste cleanup. Research is conducted in five areas: structural biology, cellular biology, molecular biology, human genome, and health effects. The research:

- Integrates information and technologies from genome, structural biology, and molecular biology research with human health research to understand the complex relationships between genes, the proteins they encode, and the biological functions of these proteins in the context of the whole organism.
- Develops new biotechnologies, including those derived from microbial genome research, for bioremediation applications, and for the mitigation of potential health effects resulting from energy development, energy use, and waste cleanup.
- Supports DOE research at national user facilities for scientists to determine the molecular structure of enzymes, antibodies, and other important biological molecules. Computational structural biology research combines computer science, structural biology, and genome research to predict the functions of biological molecules. This information will enable the design or more efficient use of biological molecules for drugs, environmental cleanup, or energy-production and use.
- Develops and applies new technologies and resources to map and determine the sequence of the subunits of DNA found in a typical human cell, for analyzing and interpreting DNA sequence data, and for studying the ethical, legal, and social implications (ELSI) of information and data resulting from the genome program, especially issues of privacy, intellectual property, and education. Program emphasis is on high throughput, production sequencing of human DNA, rapid entry of data into public databases, and identifying the functions for a portion of the 100,000 genes that make up the human genome.
- Develops new molecular-based tools for health surveillance, biological dosimetry, and individual susceptibility determination to understand and characterize the risks to human health from exposures to low levels of radiation and chemicals both at home and at work. An emphasis is placed on research that utilizes the unique resources and tools developed in the Department's human genome, structural biology, and cellular and molecular biology programs.

Climate Change Technology Initiative

The Life Sciences subprogram's support of microbial genome research also underpins the climate change technology initiative. Knowing the genomic sequence of microbes that produce methane and hydrogen, will enable the identification of the key genetic and protein components of the organisms that regulate these gases. Understanding more fully how the enzymes and organisms operate, we will be able to evaluate their potential use to produce methane or hydrogen from either fossil fuels or other carbonaceous sources, including biomass or even some waste products. Recently discovered "extremophile" organisms could be used to engineer biological entities that could ingest a feedstock like methane, sequester the carbon dioxide, and give off hydrogen.

Performance Measures

- Determine the molecular structures of proteins with more than 60 percent of the new structures that are published in the peer reviewed literature resulting from data generated at synchrotron user stations by BER structural biology program.
- Complete the sequencing of 50 million finished and 70 million draft subunits of human DNA to submit to publicly accessible databases in FY 2000.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Structural Biology	29,962	27,086	28,145	+1,059	+3.9%
Molecular and Cellular Biology	30,402	36,140	23,380	-12,760	-35.3%
Human Genome	85,226	88,786	90,270	+1,484	+1.7%
Health Effects	18,202	19,975	17,854	-2,121	-10.6%
SBIR/STTR	0	4,328	4,015	-313	-7.2%
Total, Life Sciences	163,792	176,315	163,664	-12,651	-7.2%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Structural Biology			
■ Infrastructure support and development for the Nation's structural biologists. Development and operation of experimental stations at DOE national user facilities such as the synchrotrons and neutron beam sources. Completion of development and initial operation of the protein crystallography station at the Los Alamos Neutron Science Center. Support for the major three-dimensional structural database for proteins.	17,003	16,000	16,000
■ Basic research in structural biology including instrumentation research and research that cuts across basic biology, molecular biology, and computational biology. Completion of initial studies of inverse protein folding to understand the rules proteins follow to acquire the three dimensional structure that gives them their biological function. First prototypes of pixel array detectors for x-rays will be ready for field testing that will greatly increase the sensitivity and speed data collection needed for determining the structure and, ultimately, the function of proteins. Implementation of proteome research program to understand the structure, function, and interactions of all proteins encoded by an organism's genome.	12,959	11,086	12,145
Total, Structural Biology	29,962	27,086	28,145
Molecular and Cellular Biology			
■ The field of microbial genomics is one of the most exciting and high profile fields in biology today. Initiated by DOE in 1994, microbial genomics and microbial genomic sequencing were identified by *Science* magazine as one of the top 10 fields of discovery in both 1997 and 1998. The BER Microbial Genome Program has supported the complete genomic sequencing of 6 of the 18 bacteria whose DNA has			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
been sequenced and published. At least 12 more are in progress. The broad impacts of this research emphasize a central principle of the BER genome programs - complete genomic sequences yield answers to fundamental questions in biology. Microbes are being sequenced and characterized in several parts of the BER program because of potential impacts across several DOE missions. These include the Climate Change Technology Initiative (sequencing methane or hydrogen producing microbes or microbes involved in carbon dioxide sequestration), environmental cleanup (microbes for bioremediation), alternative fuel sources (methane production or energy from biomass), industrial processes (industrial useful enzymes), and biological nonproliferation (understanding and detecting biowarfare agents). The microbial genome program continues to capitalize on DNA sequencing technology from the human genome program to determine the complete DNA sequence of microbes with potential environmental, energy, or commercial applications. While the program continues its emphasis on DNA sequencing it has expanded to include research in three additional areas: (1) microbial diversity, to identify a broader array of potentially useful microbes; (2) new strategies for determining the DNA sequence of microbes for which the complete sequence of a very closely related microbe is already known, to avoid the need for costly and time consuming sequencing of many important microbes from scratch; and (3) novel strategies and tools for characterizing, manipulating, and modeling entire reaction pathways or regulatory networks of microbes or groups of microbes to maximize the usefulness of these newly characterized microbes.	5,200	7,000	8,860

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The Climate Change Technology Initiative (CCTI) continues to determine the DNA sequence of microbes that produce methane or hydrogen from carbonaeous sources or that could be used to sequester carbon dioxide. New research is being initiated to characterize key reaction pathways or regulatory networks in these microbes following the determination of their DNA sequence. These new studies focus on the development of practical uses for microbes within the CCTI.	0	2,434	5,841
■ Funding was provided for the Northeast Regional Cancer Institute in Scranton, Pennsylvania per Congressional direction for FY 1998 and for the Institute for Molecular Biology and Medicine, University of Scranton, Scranton, Pennsylvania, per Congressional direction for FY 1999.	9,735	10,189	0
■ Molecular biology research, as a general research area, comes to an end with the exception of continued funding for the Human Science Frontiers Program, an international program of collaborative research to understand brain function and biological function at the molecular level supported by U.S. government through the DOE, the National Institutes of Health, the National Science Foundation, and the National Aeronautics and Space Administration.	6,735	4,684	1,000
■ The low dose exposure program uses molecular level knowledge gained from the Department's human genome and structural biology research to ascertain the effects on humans, ranging from cells to the whole organism, that arise from low-dose-rate exposures to energy and defense-related insults such as radiation and chemicals. This information will provide a better scientific basis for remediating contaminated DOE sites and achieving acceptable levels of human health protection, both for cleanup workers and the public, in a more cost-effective manner that could save billions of dollars.	3,000	8,000	7,679
■ Cellular biology research, as a general research area, comes to an end and is replaced by the low dose exposure program.	5,732	3,833	0

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Human Genome			
■ The Joint Genome Institute (JGI) and its Production Sequencing Facility (PSF) are primarily focused on high throughput sequencing of human DNA. The JGI is a virtual institute formed from the combined strengths and expertise of the DOE Human Genome Centers at the Los Alamos, Lawrence Livermore, and Lawrence Berkeley National Laboratories. FY 2000 is the third year of a major 3-5 year scale-up in DNA sequencing capacity for the PSF. In FY 2000 the PSF will complete the sequencing and submission to public databases of 50 million finished and 70 million high quality draft base pairs of human DNA.	46,300	50,000	53,894
■ Improvements in high throughput human DNA sequencing technology and sequence data management are needed to complete the first human genome by 2003 and to most efficiently and cost effectively use that new sequence information for future medical diagnoses and new scientific discovery. Research is conducted to continue the incremental improvements in current DNA sequencing technology by increasing throughput, increasing accuracy, and decreasing cost. New sequencing technologies, that have been investigated on a pilot scale, are tested and "hardened" in a DNA sequencing production environment. Research is conducted on the next generation of sequencing technology that will be needed to take advantage of the DNA sequence to be determined after 2003. Research on automated and robust approaches to analyze and manage the large amounts of DNA sequence being determined continues. These approaches will replace the hands-on, gene-by-gene analyses traditionally used by scientists to make their initial analyses of newly discovered or identified genes. A table follows displaying both DOE and NIH genome funding.	36,411	36,226	33,816

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ The Ethical Legal and Societal Issues (ELSI) program increases its emphasis on research related to the uses, impacts, and implications of genetic information in the workplace and the use of the workplace as a research environment.	2,515	2,560	2,560
Total, Human Genome	85,226	88,786	90,270

U.S. Human Genome Project Funding

Environmental Processes

Mission Supporting Goals and Objectives

Research is focused on understanding the basic chemical, physical, and biological processes of the Earth's atmosphere, land, and oceans and how these processes may be affected by energy production and use, primarily the emission of carbon dioxide from fossil fuel combustion. A major part of the research is designed to provide the data that will enable an objective assessment of the potential for, and consequences of, global warming. The program is comprehensive with an emphasis on understanding the radiation balance from the surface of the Earth to the top of the atmosphere (including the role of clouds) and on enhancing the quantitative models necessary to predict possible climate change at the global and regional scales. The components of the Atmospheric Radiation Measurement (ARM) program continue to work in an integrated fashion to produce the experimental and modeling results that will be necessary to resolve the greatest uncertainty in climate prediction - the role of clouds and solar radiation. Climate modeling using massively-parallel supercomputers will simulate climate change, predict climate, and evaluate model uncertainties due to changes in atmospheric concentrations of greenhouses gases on decade to century time scales. The Carbon Cycle program is designed to study the natural carbon cycle and to assess the potential impacts of climate change on terrestrial systems. There are four contributing areas to this research program: Climate and Hydrology, Atmospheric Chemistry and Carbon Cycle, Ecological Processes, and Human Interactions. The National Institute for Global and Environmental Change (NIGEC) is included within these four areas. The Environmental Processes subprogram includes funding for DOE's contribution to the U.S. Global Change Research Program that was codified by Congress in the Global Change Research Act of 1990 and for part of the Energy Research activities under the Climate Change Technology Initiative.

Climate Change Technology Initiative

The Atmospheric Chemistry and Carbon Cycle category supports basic research that promotes an understanding of the role that the terrestrial biosphere and human activities play on the state and quality of the global climate. Complementing the activities in support of the U.S. Global Change Research Program, science for the Climate Change Technology Initiative seeks the understanding necessary to exploit the biosphere's natural processes for use in sequestration of atmospheric carbon dioxide including the roles of marine microorganisms in ocean carbon sequestration and the mechanisms by which forest ecosystems sequester carbon.

Scientific Simulation Initiative

Building on the long-standing BER expertise in climate modeling, the Scientific Simulation Initiative will create a bridge between computational scientists, global modelers, and experts in the acquisition and interpretation of observational measurements to develop, test, and use highly advance fully coupled global system models. The focus will be on models that are of much higher spacial resolution than currently available, and model runs will simulate climate over time periods of tens to hundreds of years, at fidelities that cannot be achieved with current hardware or software. In doing so, the SSI will bring

together expertise from academia and the federal laboratories, and couple activities in a synergistic way to bring global system modeling to a broader spectrum of environmental research than is currently possible.

Performance Measures

- Proceed on the development of the next generation coupled ocean-atmosphere climate model, leading to better information for assessing climate change and variability at regional, rather than global scales. This next generation model will change grid size from the current 300-500 kilometers on a side to less than 200 kilometers on a side.
- Coordinate with other federal agencies, Canada, and Brazil to maximize national and international capabilities to enhance understanding of the current global carbon dioxide distribution and the role of the terrestrial biosphere in that distribution.
- Develop collaborative partnerships between strong marine sciences research institutions and those with developing capabilities to advance innovative techniques in modern molecular biology to understand the coupling between carbon and nitrogen cycles in coastal waters and sediments.
- In cooperation with NASA, NSF, USDA/Forest Service, and the Smithsonian Institution, provide quantitative data on the annual exchange of carbon dioxide between the atmosphere and terrestrial ecosystem from 25 AmeriFlux sites representing major types of ecosystem and land uses in North Central America. Provide data on both the effects of environmental factors, such as climate variation, on the net sequestration or release of carbon dioxide and the role of biophysical processes controlling the net exchange.
- Commence full operation at three Atmospheric Radiation Measurement (ARM) sites, providing unique climatological data necessary to improve climate prediction for use in energy policy development. Continue ARM accomplishments by conducting five intensive operations periods at the ARM Southern Great Plains site. Data will be obtained from the second station on the North Slop of Alaska. The third station in the Tropical Western Pacific, on Christmas Island, will become operational.
- Continue The Global Change Research Education Program which will continue to support graduate and undergraduate students conducting DOE-related global change research. It will continue to participate in the multi-agency "Significant Opportunities in Atmospheric Research and Science" Program (SOARS).

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Climate and Hydrology	63,150	64,093	74,383	+10,290	+16.1%
Atmospheric Chemistry and Carbon Cycle	20,675	29,972	32,924	+2,952	+9.8%
Ecological Processes	13,084	12,348	12,010	-338	-2.7%
Human Interaction	8,871	7,483	11,105	+3,622	+48.4%
SBIR/STTR	0	2,969	3,416	+447	+15.1%
Total, Environmental Processes	105,780	116,865	133,838	+16,973	+14.5%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Climate and Hydrology			
■ **Climate Modeling:** Improved simulations provide the scientific basis for predicting climate and its implications for future decades. Develop next generation coupled atmosphere-ocean general circulation models with improved resolution to approximately 200 km grid size. Additionally, develop improved climate observational databases for testing and verifying the models. Support will continue for needed computational resources on the supercomputers at the LANL Advanced Computing Laboratory.	20,469	21,336	20,274
■ **Scientific Simulation Initiative (SSI):** Regional Variability Associated with Global Changes: There is a need to analyze and downscale global climate model simulations to smaller scales for regional studies of environmental changes. Methodologies to do so will be developed and implemented using a hierarch of applied and engineering models. Technologies will be developed and employed that can quickly and efficiently work with large and distributed and archived sets of both observational and modeling data to produce data sets suitable for study of regional changes and their impacts. Two centers connected to the core SSP infrastructure will be established to access the primary data archive and computational facilities.	0	0	3,902

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Scientific Simulation Initiative (SSI):** Coupled Model Development, Testing and Application: With its partners in the multi-agency U.S. Global Change Research Program, DOE will establish two multi-institutional model development teams for research on fully coupled comprehensive models for simulating multi-decade and multi-century changes of the global environment at regional resolution. Included in these activities is implementation of collaboratory technology to facilitate interaction and speed progress.	0	0	2,930
■ **Scientific Simulation Initiative (SSI):** Component Model Research and Development: Initiate research to pursue improvements in predictability, numerical methods, and parameterizations needed for improving the fidelity and computational performance of the component models, such as atmospheric and ocean general circulation models, that integrate to form comprehensive, coupled climate models.	0	0	2,930
■ **Atmospheric Radiation Measurement (ARM):** The Atmospheric Radiation Measurement (ARM) infrastructure program develops, supports, and maintains the three ARM sites and associated instrumentation. Continue operation of over two hundred instruments at the Southern Great Plains site. Begin limited operations of the third Tropical Western Pacific station on Christmas Island. Redeploy ARM instruments used in the Surface Heat Budget of the Arctic Ocean (SHEBA) as the second North Slope of Alaska station. Provide data to scientific community through the ARM Archive.	28,017	28,224	27,371

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Atmospheric Radiation Measurement (ARM):** ARM research will support about 50 principal investigators working on cloud physics and on solar radiation interactions with water vapor and aerosols. Conduct the ARM-led, multi-agency and Japanese experimental campaign on Nauru (Tropical Western Pacific) to study the effects of islands in measuring solar radiation and cloud interactions with the oceans. Enhance interactions with prominent climate modeling centers, including those supported by the NSF and by NOAA. Additional field studies will focus on connection of ARM data with carbon cycle research	11,659	11,659	14,093
■ **Atmospheric Radiation Measurement (ARM)/Unmanned Aerial Vehicles (UAV):** The joint ARM-UAV and NASA field study of tropical cirrus clouds will provide new information on key cloud formations that moderate the radiation budget of the Earth.	3,005	2,874	2,883
Total, Climate and Hydrology	63,150	64,093	74,383
Atmospheric Chemistry and Carbon Cycle			
■ Atmospheric Science programs provide data that address the new air quality standards on tropospheric ozone and particulate matter. Conduct laboratory and field studies of the chemistry and reactivity of atmospheric species and transport. Support tropospheric ozone and aerosols studies, in conjunction with the North American Research Strategy for Tropospheric Ozone (NARSTO). Support air quality modeling and initiate pollution transport studies (and related aspects of weather forecasting). Complete the data analysis for the prototype megacity air quality study in Mexico City, Mexico. Partial support for the National Institute for Global Environmental Change (NIGEC) is included in this budget activity.	12,856	12,967	11,278

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Field studies of major ecosystem types and land uses provide data to better understand the effects of environmental factors such as climate variation on the net exchange of carbon and the role of biophysical processes controlling this exchange. Operate the AmeriFlux network of twenty-five instrumented research towers for measurements of long-term carbon dioxide and water vapor fluxes and energy exchange from a large variety of ecosystems. Using tools of microbiology explore linkages between carbon and nitrogen cycles in marine microbes by partnering institutions with traditional research in oceans and those with emerging capabilities.	7,819	13,113	14,831
■ Funding was provided for the Marine Mammal Research and Education Center at the National Energy Laboratory at Keahole Point, Hawaii, per Congressional direction in FY 1999.	0	971	0
■ Under the Climate Change Technology Initiative, improve understanding of biochemical mechanisms of natural carbon sequestration in both terrestrial and ocean systems in order to, ultimately, enhance or augment these natural processes. Conduct studies on the cellular processes that lead to sequestration in forest ecosystems and the identification of the pathways by which marine microorganisms enhance carbon flow from the atmosphere to ocean surface and, ultimately, to the deep ocean.	0	2,921	6,815
Total, Atmospheric Chemistry and Carbon Cycle	20,675	29,972	32,924
Ecological Processes			
■ Improve understanding and modeling of the effects of elevated carbon dioxide on whole ecosystem structure and function that effect the nation's resources. Investigate the relationship between precipitation and the regeneration and species composition of deciduous forests in Tennessee's Walker Branch Watershed. Analyze the effects of precipitation changes on nutrient cycling, carbon			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
sequestration, forest growth, and decomposition in a southeastern deciduous forest. Free Air Carbon Dioxide Enrichment (FACE) experiments at Duke Forest; the Nevada desert; Oak Ridge, TN; Cedar Creek, MN; and Rhinelander, WI, will provide data on the effects of elevated carbon dioxide and other environmental changes on forest, desert, and grassland ecosystems. Partial support for the NIGEC is included in this budget activity.	13,084	12,348	12,010

Human Interactions

- The Integrated Assessment program investigates the diffusion of technology innovation into societal use and develops expanded economic models to include consideration of five additional greenhouse gases (nitrous oxide, methane, CFC 11, HCFC 22, and CF4) other than carbon dioxide. The Information and Integration program stores, evaluates, and quality-assures a broad range of global environmental change data and disseminates these to the broad research community. Included is the Quality Systems Science Center for the tri-lateral (Mexico, United States, and Canada) NARSTO. The educational activities support DOE mission-related research into global environmental change by students at the undergraduate and graduate levels. Included in these activities are the Summer Undergraduate Research Experience, Graduate Research agency "Significant Opportunities in Atmospheric Research and Science" Program. Partial support for the National Institute for Global Environmental Change is included in this budget activity. BER will provide opportunities for pre-college teachers that will participate directly in cutting-edge research at DOE science laboratories and will renew their understanding of scientific investigation. Where teachers do not possess sufficient background to participate directly in research, DOE will provide mediated research experiences where teachers can work with teams of scientists and science educators to understand the nature of DOE's scientific research. The goal is to provide educators with the tools to sharpen their science and math foundations and apply these tools to their classroom practice. Funds

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
will be provided to pay for teacher's stipends, travel, housing, and subsidize laboratory scientists' time for this activity ($1,947,000).	8,871	7,483	11,105
SBIR/STTR			
■ In FY 1998, $2,625,000 and $154,000 were transferred to the SBIR and STTR programs, respectively. In FY 1999 and FY 2000 amounts shown are the estimated requirement for the continuation of these programs.	0	2,969	3,416
Total, Environmental Processes	105,780	116,865	133,838

Environmental Remediation

Mission Supporting Goals and Objectives

The research is primarily focused on gaining a better understanding of the fundamental biological, chemical, geological, and physical processes that must be marshaled for the development and advancement of new, effective, and efficient processes for the remediation and restoration of the Nation's nuclear weapons production sites. Priorities of this research are bioremediation and operation of the William R. Wiley Environmental Molecular Sciences Laboratory (EMSL). Bioremediation activities are centered on the Natural and Accelerated Bioremediation Research (NABIR) program, a basic research program focused on determining the conditions under which bioremediation will be a reliable, efficient, and cost-effective technique. This subprogram also includes basic research in support of pollution prevention, sustainable technology development and other fundamental research to address problems of environmental contamination. Facility operations supports the operation of the EMSL national user facility for basic research that will underpin safe and cost-effective environmental remediation methods and technologies and other environmental priorities.

Unique EMSL facilities such as the Molecular Science Computing Facility, the High-Field Mass Spectrometry Facility, and the High-Field Magnetic Resonance Facility will be used by the external scientific community and EMSL scientists to conduct a wide variety of molecular-level environmental science research, including improved understanding of chemical reactions in DOE's underground storage tanks, movement of contaminants in subsurface groundwater and vadose zone sediments, and atmospheric chemical reactions that contribute to global warming.

In the NABIR program, research advances will continue to be made from pore to field scales in the Biogeochemical Dynamics element; on genes and proteins used in bioremediation through the Biomolecular Science and Engineering element; in non-destructive, real-time measurement techniques in the Assessment element; in overcoming physico-chemical impediments to bacterial mobility in the Acceleration element; on species interaction and response of microbial ecology to contamination in the Community Dynamics and Microbial Ecology element; and in understanding microbial processes for altering the chemical state of metallic and radionuclide contaminants through the Biotransformation and Biodegradation element. In analogy with the Ethical, Legal, and Social Implications component of the Human Genome Program, the Bioremediation and Its Societal Implications and Concerns component of NABIR will explore societal issues surrounding bioremediation research and promote open and two-way communication with affected stakeholders, avoiding dictating solutions. Research in the Systems Integration, Prediction and Optimization element is being initiated to help define and develop an integrative model to aid collaboration and direction across research teams within the NABIR program.

Performance Measures

- Continue the Natural and Accelerated Bioremediation Research (NABIR) program to support fundamental research in environmental and molecular sciences that will underpin the development of bioremediation for containing hazardous waste and cleaning DOE sites. Site characterization of the first NABIR Field Research Center will proceed, and activities necessary to enable research sample distribution to investigators will commence.
- The William R. Wiley Environmental Molecular Sciences Laboratory (EMSL) will be identified and cited as an important resource in research publications and research proposals written by investigators in academia and at National Laboratories.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Bioremediation Research	28,781	28,895	28,039	-856	-3.0%
Clean Up Research	5,527	6,817	6,773	-44	-0.6%
Facility Operations	30,189	30,072	29,415	-657	-2.2%
SBIR/STTR	0	1,558	1,530	-28	-1.8%
Total, Environmental Remediation	64,497	67,342	65,757	-1,585	-2.4%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Bioremediation Research

- In NABIR, progress will be made in understanding both intrinsic bioremediation as well as manipulated, accelerated bioremediation using chemical/microbial amendments. Laboratory and field experiments will be in progress to understand the fundamental mechanisms underlying chemical processes, complexation/degradation, and microbial transport. Field site characterization of the first NABIR Field Research Center will proceed, in preparation for distribution of research samples to investigators. Three megabases of genomic DNA from microbes with potential utility in bioremediation will be sequenced. The interagency (DOE, National Science Foundation, Office of Naval Research,

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Environmental Protection Agency) program on environmental biotechnology will continue to be supported, completing the current awards, to advance understanding of the fundamental processes that control the bioavailability of complex chemical mixtures in field situations.	22,437	22,915	22,059
■ General Plant Projects (GPP) funding is for minor new construction, other capital alterations and additions, and for buildings and utility systems such as replacing piping in 30 to 40-year old buildings, modifying and replacing roofs, and HVAC upgrades and replacements. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. This subprogram includes landlord GPP funding for Pacific Northwest National Laboratory (PNNL) and for Oak Ridge Institute for Science and Education (ORISE). The total estimated cost of each GPP project will not exceed $5,000,000.	5,194	4,811	4,811
■ General Purpose Equipment (GPE) funding for general purpose equipment for PNNL and ORISE such as updated radiation detection monitors, information system computers and networks, and instrumentation that supports multi-purpose research.	1,150	1,169	1,169
Total, Bioremediation Research	28,781	28,895	28,039
Clean Up Research			
■ A program will be maintained to develop cost effective and efficient biotechnology and bioremediation methods and approaches for pollution prevention in key energy and pollution intensive industries. This includes additional research to characterize the geological, chemical, and physical properties that affect the rate and effectiveness of environmental remediation and waste-stream cleanup methods, including bioremediation.	5,527	6,817	6,773

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Facility Operations: William R. Wiley Environmental Molecular Sciences Laboratory (EMSL)			
■ EMSL became fully operational as a national user facility focusing on collaborative research, in FY 1998. Operating funds provide essential maintenance of instruments and associated support facilities, and the technical and Environmental, Safety and Health support needed by the wide-ranging user community to apply the EMSL scientific capabilities. EMSL will support about 600 users on an annual basis, with approximately half coming from academia to use such unique instrumentation as the 512- processor IBM SP computer system, the 750-MHZ and ultra high-field nuclear magnetic resonance spectrometers, the ultra-high vacuum scanning tunneling and atomic force microscopes, and the controlled atmosphere environmental chambers. . . .	27,057	28,083	27,426
■ Capital equipment support for the EMSL enables instrument modifications needed by collaborators and external users of the facility and helps to maintain the spectroscopic and computer equipment at state-of-the-art.	3,132	1,989	1,989
Total, Facility Operations	30,189	30,072	29,415
SBIR/STTR			
■ In FY 1998, $1,461,000 and $88,000 were transferred to the SBIR and STTR programs, respectively. In FY 1999 and FY 2000 amounts shown are the estimated requirement for the continuation of these programs.	0	1,558	1,530

Medical Applications and Measurement Science

Mission Supporting Goals and Objectives

The medical applications subprogram supports research to develop beneficial applications of nuclear and other energy-related technologies for medical diagnosis and treatment. The research is directed at discovering new applications of radiotracer agents for medical research as well as for clinical diagnosis and therapy. A major emphasis is placed on application of the latest concepts and developments in genomics, structural biology, computational biology, and instrumentation. Much of the research seeks breakthroughs in noninvasive imaging technologies such as positron emission tomography. The research in this activity is conducted in five specific areas: Radiopharmaceuticals, Instrumentation, Clinical Feasibility, Boron Neutron Capture Therapy (BNCT) and Molecular Nuclear Medicine.

The measurement science subprogram focuses on research in analytical chemistry to develop new instrumentation to meet the needs of the environmental and life sciences research programs of the Office of Biological and Environmental Research. Research is also supported that will meet needs for new instrumentation to characterize contaminated environments in support of the Department's environmental cleanup program.

Performance Measures

- Complete Phase I clinical trials of BNCT at reactor sources of neutrons for at least 100 patients.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Medical Applications	56,841	69,084	40,817	-28,267	-40.9%
Measurement Science	4,766	5,087	5,849	+762	+15.0%
SBIR/STTR	0	1,995	1,245	-750	-37.6%
Total, Medical Applications and Measurement Science	61,607	76,166	47,911	-28,255	-37.1%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Medical Applications			
■ Complete Phase I human clinical trials of boron neutron capture therapy (BNCT), for at least 100 patients, at Brookhaven National Laboratory, Massachusetts Institute of Technology and the Ohio State University, including trials to assess the maximum safe dosages of boron compound and neutron radiation. Capital equipment funds will be used to support research on an accelerator-based facility for BNCT as an alternative to the use of nuclear reactors.	11,648	11,441	10,892
■ Develop new approaches to radiopharmaceutical design and synthesis using concepts from genomics as well as computational biology and structural biology. Complete research into radiolabeling of monoclonal antibodies for cancer diagnosis and therapy, including research at the Garden State Cancer Center in the diagnosis of cancer and infectious diseases. Evaluate clinical potential of imaging of gene expression using radiotracers. Redirect program elements to emphasize development of techniques for the simultaneous use of multiple radiotracers to study physiological processes.	18,360	20,233	24,700
■ Develop new concepts in multimodal imaging systems for study of human brain function and complete evaluation of combination of nuclear medicine imaging systems with magnetic resonance imaging. Research into new applications of lasers in medicine emphasizes transfer of technology from the DOE laboratories to clinical research facilities. Capital equipment funds are provided in support of development of new instrumentation such as a PET camera for small animal imaging.	4,946	5,877	5,225
■ Complete phase-out of research into new radioisotopes for nuclear medicine applications.	36	0	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Funding for the Medical University of South Carolina, Loma Linda Medical Center, the University of California-Davis, the University of Rochester Medical Center, Englewood Hospital in New Jersey, the University of Nevada, Las Vegas, and New Mexico Highlands University as included in Congressional direction for FY 1998. Funding for these projects is completed in FY 1998.	21,851	0	0
■ Funding for Gallo Prostate Cancer Research and Treatment Center, City of Hope National Medical Center, National Foundation for Functional Brain Imaging, State University of New York - Stony Brook, University of California - Davis, University of Alabama, New Mexico Highlands University, West Virginia National Education and Technology Center and the University of South Carolina Medical Center, as included in Congressional direction for FY 1999. Funding for these projects is completed in FY 1999.	0	31,533	0
Total, Medical Applications	56,841	69,084	40,817
Measurement Science			
■ Complete research into new sensor instrumentation for characterization of chemical composition of contaminated subsurface environments in support of the Department's environmental cleanup efforts of highly radioactive chemical wastes. Continue research into new imaging instrumentation for environmental and life sciences applications. Capital equipment funds are provided for components needed for research into new instrumentation.	4,766	5,087	5,849
SBIR/STTR			
■ In FY 1998, $1,656,000 and $102,000 were transferred to the SBIR and STTR programs, respectively. In FY 1999 and FY 2000, amounts shown are the estimated requirement for the continuation of these programs.	0	1,995	1,245
Total, Medical Applications and Measurement Science	61,607	76,166	47,911

Explanation of Funding Changes From FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Medical Applications	
■ BNCT—maintains program at FY 1999 level of effort.	-549
■ Increased funding for Radiopharmaceuticals allows for research efforts at the Garden State Cancer Center	+4,467
■ Decrease in instrumentation is attributable to complete development of imaging instrumentation	-652
■ Decrease due to completion of Congressionally directed projects.	-31,533
Total, Medical Applications.	-28,267
Measurement Science	
■ Increased funding for research in new sensor instrumentation for characterization of chemical composition of contaminated environments.	+762
SBIR/STTR	
■ SBIR/STTR decrease due to reduction in research funding.	-750
Total Funding Change, Medical Applications and Measurement Science	-28,255

Capital Operating Expenses & Construction Summary

Capital Operating Expenses

Basic Energy Sciences

Program Mission

The MISSION of the Basic Energy Sciences (BES) program is to foster and support fundamental research in the natural sciences and engineering to provide a basis for new and improved energy technologies and for understanding and mitigating the environmental impacts of energy use. As part of its mission, BES plans, constructs, and operates major scientific user facilities to serve researchers at universities, national laboratories, and industrial laboratories.

The high quality of the research in this program is continuously evaluated through the use of merit based peer review and scientific advisory committees.

Program Goals

- Maintain U.S. world leadership in areas of the natural sciences and engineering that are relevant to energy resources, production, conversion, and efficiency and to the mitigation of the adverse impacts of energy production and use;
- Foster and support the discovery, dissemination, and integration of the results of fundamental, innovative research in these areas;
- Provide world-class scientific user facilities for the Nation; and
- Act as a steward of human resources, essential scientific disciplines, institutions, and premier scientific user facilities.

Program Objectives

- *Obtain major new fundamental knowledge.* — Foster and support fundamental, innovative, peer-reviewed research to create new scientific and engineering knowledge in areas important to the BES mission, i.e., in materials sciences, chemical sciences, geosciences, plant and microbial biosciences, and engineering sciences.
- *Support the missions of the Department of Energy (DOE).* — Promote the transfer of the results of basic research to contribute to DOE missions in areas of energy efficiency, renewable energy resources, improved use of fossil fuels, reduced environmental impacts of energy production and use, science-based stockpile stewardship, and future energy sources.
- *Plan, construct, and operate premier national scientific user facilities* — for materials research and related disciplines to serve researchers at universities, national laboratories, and industrial laboratories, thus enabling the acquisition of new scientific knowledge. These scientific facilities include synchrotron radiation light sources, high-flux neutron sources,

electron-beam microcharacterization centers, and specialized facilities such as the Combustion Research Facility. In addition, to encourage and facilitate the use of these facilities in areas important to BES activities and also in areas that extend beyond the scope of BES activities, such as structural biology, environmental science, medical imaging, rational drug design, micromachining, and industrial technologies.

- *Establish and maintain stable, essential research communities, institutions, and scientific user facilities.* — Steward important research communities and institutions in order to respond quickly and appropriately to mission need and scientific opportunity. For example, BES serves as the Nation's primary or sole supporter of such important subdisciplines as heavy element chemistry, natural and artificial solar energy conversion, catalysis, organometallic chemistry, combustion related science, separations science, neutron science, radiation chemistry, and radiation effects in materials.

Performance Measures

BES is prototypical of a large, diverse, and robust basic research program that exists within a mission agency. BES measures performance in four areas that together characterize this special role. The first three areas relate to the fundamental tenets or principles of BES, which correspond directly to the goals described above. These tenets are: (1) excellence in basic research; (2) relevance to the comprehensive energy mission of the agency; and (3) stewardship of research performers, essential scientific disciplines, institutions, and scientific user facilities. Combining and sustaining these tenets are the management challenge of BES. The fourth area that BES measures performance in, therefore, is program management.

Activities in these four areas are measured in a number of ways, which separate naturally into four categories: (1) peer review; (2) indicators or metrics (i.e., things that can be counted); (3) customer evaluation and stakeholder input; and (4) qualitative assessments, which might include historical retrospectives and annual program highlights. A number of activities that might be considered essential or "foundation" performance measurement activities are already in place in BES; indeed, some have been ongoing for many years. Paramount among these is peer review of all research activities.

During FY 1998, BES instituted several changes in the way performance measurement is accomplished in order to better quantify performance. First, BES formalized the peer review process for activities at the DOE laboratories. Although research at the laboratories had long been peer reviewed, BES codified that process using a process analogous to that described in 10 CFR 605 for the university grant program. Second, BES established baselines for all performance indicators for each scientific user facility using a new survey tool. This survey tool, developed in FY 1997 in collaboration with the facility directors and the facility user coordinators, now is completed annually by all BES facilities. An integral part of the survey tool is an assessment of user satisfaction. The tool has generated considerable interest outside of BES and has been distributed to other organizations and non-BES facilities at their request. Third, BES began formal peer reviews of its major scientific user facilities. These reviews, the first of which was

documented in the 1997 Basic Energy Sciences Advisory Committee (BESAC) report on synchrotron radiation light sources ("Synchrotron Radiation Sources and Science" chaired by Professor Robert Birgeneau, MIT), assess in the aggregate, the scientific output and, to the extent possible, the outcomes of facilities. The High-Flux Isotope Reactor at Oak Ridge National Laboratory was reviewed in this manner in FY 1998. The four electron beam microcharacterization centers will be reviewed in FY 1999.

In FY 2000, (1) the development and upgrade of scientific user facilities, including the construction of the Spallation Neutron Source, will be kept on schedule and within cost, not to exceed 110 percent of estimates; (2) the operating time lost at scientific user facilities due to unscheduled downtime will be less than 10 percent of the total scheduled possible operating time, on average; (3) all research projects will undergo regular peer review and merit evaluation based on procedures set down in 10 CFR 605 for the extramural grant program and under a similar modified process for the laboratory programs and scientific user facilities; (4) new projects will be selected by peer review and merit evaluation; (5) work performed by investigators in universities and DOE laboratories will continue to be recognized as outstanding through the receipt of major prizes and awards; (6) continue Partnerships for Academic-Industrial Research where peer reviewed grants are awarded to university researchers for fundamental, high-risk work jointly defined by the academic and industrial research partners; and (7) continue fabrication of instrumentation for the short-pulse spallation source on the Manuel Lujan Jr. Neutron Scattering Center at the Los Alamos Neutron Science Center.

Performance measurement helps determine the distribution of activities supported within BES and the individual projects supported within each activity. The funding level for each activity is derived by weighing a number of additional factors including mission need as defined by the BES and SC mission statements; scientific opportunity as determined, in part, by proposal pressure and by scientific workshops; connections with other BES and SC supported work; connections with needs expressed by the DOE technology offices and by energy-intensive industries; program balance; and budgetary constraints.

Prizes, Awards, and Honors

Annually, principal investigators funded by BES win dozens of major prizes and awards sponsored by professional societies and by others; in addition, many are elected to fellowship in organizations such as the National Academy of Sciences, the National Academy of Engineering, and the major scientific professional societies. Paramount among the honors in FY 1998 was the Nobel Prize in Chemistry. The Nobel Prize in Chemistry for 1997 was awarded to three biochemists, Paul D. Boyer (University of California at Los Angeles), John E. Walker (Medical Research Council Laboratory of Molecular Biology of Cambridge, England) and Jens C. Skou (Aarhus University in Denmark). Drs. Boyer and Walker were cited for their elucidation of the enzymatic mechanism underlying the synthesis of adenosine triphosphate (ATP). Dr. Boyer's

work was supported in part by the BES Energy Biosciences subprogram and its predecessor organizations from 1963 until his retirement in 1993. This is the fourth Nobel Prize awarded to BES principal investigators in the past four years.

Other selected major prizes and awards for FY 1998 include:

From the American Ceramic Society — the Robert L. Coble Award; the Long-Term Service Award; the Sosman Memorial Lecture

From the American Chemical Society — the Analytical Chemistry Award in Electrochemistry; the Arthur C. Cope Scholar Award in Organic Chemistry; the Arthur W. Adamson Award for Distinguished Service in the Advancement of Surface Chemistry; the E. V. Murphree Award in Industrial and Engineering Chemistry; the Award in Chromatography; the Irving Langmuir Award in Chemical Physics; the Award in Spectrochemical Analysis; the Arthur K. Doolittle Award for Best Paper at the Polymeric Materials Science and Engineering Division meeting

From the American Institute of Aeronautics and Astronautics — the Award for Distinguished Service

From the American Institute of Chemical Engineers — the Professional Progress Award; the Research Achievement Award; the Thomas Chilton Award; the Warren K. Lewis Award

From the American Institute of Chemists — the Chemical Pioneer Award

From the American Physical Society — the David Adler Lectureship Award in the Field of Materials Physics; the Davisson-Germer Prize in Atomic or Surface Physics; the Earle K. Plyler Prize in Molecular Spectroscopy; the Frank Isakson Prize for Optical Effects in Solids; the Joseph F. Keithley Award for Advances in Measurement Science; the Julius Edgar Lilienfield Prize; the Centenial Speaker Award

From the American Society for Mass Spectroscopy — the Biemann Medal; the Distinguished Contribution Award

From the American Society of Plant Physiologists — the Stephen Hales Prize

From the American Welding Society — the Burton Medal; the Masubuchi Award; the Warren F. Savage Memorial Award

From the Electrochemical Society — the Olin Palladium Award Lecture

From the Eli Lilly Corporation — the Eli Lilly Award

From the Federal Planning Division of the American Planning Association — the Best 1998 Area Development Plan (Spallation Neutron Source, ORNL)

From the Geological Society of America — the Day Medal

From the IBM Corporation — the Supercomputer Award

From the Institute of Electrical and Electronic Engineers — the Prize Paper Award

From the Inter-American Photochemical Society — the Inter-American Society Award

From the International Association for Structural Safety and Reliability — the IASSAR Research Award

From the International Electron Paramagnetic Resonance/Electron Spin Resonance Society (IES) — the Silver Metal for Chemistry

From the International Organization on Multiphase Flow — the Multiphase Flow International Prize

From the International Society of Electrochemistry — the Prix Jacques Tacussel Award

From the Japan Society for the Promotion of Science — the International Prize for Biology

From the Japan Society of Multiphase Flow — the Lifetime Achievement Award

From the Materials Research Society — the von Hippel Award; the Graduate Student Award

From the Microbeam Analysis Society — the Heinrich Award

From the Microscopy Society of America — the Outstanding Technologist Award

From the Mineralogical Society of America — the Mineralogical Society of America Award

From the North American Catalysis Society — the Robert Burwell Lectureship Award; the International Catalysis Award

From R&D Magazine — R&D 100 Awards for TRUST- Terminal Repeller Unconstrained Subenergy Tunneling; SAMMS - Self-Assembled Monolayers or Mesoporous Supports; and MICLEAN/MICARE Solvent Cleaning Systems

From the Science Museum of Virginia and the State of Virginia General Assembly — the Virginia Outstanding Scientist

From the Semiconductor Research Corporation — the Aristotle Award

From the Serbian Chemical Society — the Centenary Medal

From the Society for Technical Communication — the Technical Communcation Award

From the Society of Applied Spectroscopy, New England Section — the Lester W. Strock Award

From the Wolf Foundation — the Wolf Foundation Prize in Chemistry

From Vice President Gore — the Hammer Award

Two principal investigators received the Presidential Young Investigator Award; five were inducted into the National Academy of Sciences; one was inducted into the National Academy of Engineering. Seven principal investigators were advanced to fellowship in the American Academy of Arts and Sciences; three in the American Association for the Advancement of Science; four in the American Ceramic Society; nine in the American Physical Society; two in the American Society for Metals; and one each into the following organizations: Geological Society

of America, Institute of Electrical and Electronic Engineers, the American Welding Society, National Science Foundation/Japanese Science Technology Agency, Optical Society of America, and the Royal Society of New Zealand.

Finally, principal investigators served in numerous elected offices including: President, American Chemical Society; President, International Society of Electrochemistry; President, Mineralogical Society of America; President-elect, American Ceramic Society; President-elect, American Society of Plant Physiologists; Vice President, American Physical Society; Chair, Division of Materials Physics, American Physical Society; and First Vice Chair, American Society for Testing and Materials.

Significant Accomplishments and Program Shifts

The BES program is one of the Nation's major sponsors of fundamental research in broad areas of materials sciences, chemical sciences, geosciences, biosciences, and engineering sciences. The program encompasses more than 2,400 researchers in 200 institutions and 17 of the Nation's premier user facilities. Presented below are program accomplishments from FY 1998. The selected program highlights are representative of the broad range of studies supported in the BES program. These highlights demonstrate the discovery of new knowledge, the rapidity with which such new knowledge can often be incorporated into other scientific desciplines and into the commercial sector, and the great potential of new knowledge for future impacts in energy production and use. Following that are discussions of scientific facilities and program initiatives.

Selected FY 1998 Scientific Highlights/Accomplishments

Materials Sciences

- *Helping to Solve the Mystery of High-Temperature Superconductivity.* Understanding high-temperature superconductivity, discovered in 1987, remains *the* outstanding problem in modern condensed matter physics. Recent neutron scattering experiments suggest that the electric current in high temperature superconductors may be like "stripes" of flowing current separated by stripes where current does not flow. These stripes can be static or dynamic (like the stripes on our flags, waving in the wind). These and other experiments point to a very different electron pairing mechanism than that seen in low-temperature superconductors. Once the pairing mechanism is understood, it will be easier to find materials with higher critical superconducting temperatures and better mechanical properties.
- *Magnetic Resonance Imaging (MRI) Without Magnets.* Striking, high resolution MRI images have been obtained without the need for high field magnets or high frequency detectors normally required for MRI. The breakthrough involves MRI enhancement by noble gases magnetically polarized (100,000 fold) through laser treatment. A new ultra-low-field MRI instrument now makes it possible to obtain extremely bright MRI pictures of polarized samples in the earth's natural magnetic field, which is thousands of times weaker than fields obtained from traditional MRI magnets (which are bulky, expensive, and often hazardous). The new instrument has been used with localized injection of polarized xenon solutions into

human blood to provide the first observations of the real-time process of xenon penetrating red blood cells. (Xenon is an inert gas and an FDA-approved anaesthetic.) This combination of techniques opens the way to provide high resolution MRI images of localized areas in animal and human subjects.

- *Discovery of New Materials Using LEGO.* Of the enormous number of combinations of elements in the periodic table, only a very small fraction are used in real materials. It is quite certain that materials with optimum properties for various applications have not yet been discovered. For example, high-temperature superconductivity occurs in ceramic compounds with a most unlikely combination of elements. A new strategy using fast computers and concepts from quantum mechanics has been developed to search for "winning combinations" of atoms to produce materials with improved physical properties. This approach -- Linear Expansion in Geometric Objects (LEGO) -- recognizes that even complex crystal structures can be viewed as a collection of simple geometric objects such as dumbbells, triangles, etc. By assigning each geometric object an energy value, computers can rapidly scan hundreds of thousands of candidates looking for the lowest overall energy and, therefore, the most stable structures. LEGO has already predicted several new intermetallic compounds missed through conventional approaches.
- *Electrically Conducting Nanoscale Ropes.* Incredibly light synthetic metals with a potential electrical conductivity 50-100 times better than copper per weight are being made from carbon nanotubes doped with metals. First discovered in 1991, nanotubes are a new class of materials formed from graphite-like sheets of carbon rolled into exquisitely small cylinders. They self organize in the vapor phase during growth to form well ordered crystalline bundles of individual nanotubes. The introduction of dopant atoms, such as potassium or lithium, into the open spaces between adjacent tubes within a rope can increase electrical conductivity significantly at room temperature. Doped nanotube ropes are also attracting increased interest as constituents of novel nanoscale device structures and as replacements for pure lithium metal in Li ion batteries.
- *Molecular Bricks for Nanotechnology.* Lightweight materials are commonly composed of polymers, which are long chains of atoms. The chains are difficult to order completely, which limits their functionality and durability. Researchers have recently demonstrated new possibilities for the design of polymers using nano-objects, which can be regarded as molecular bricks. These bricks, which might have shapes as diverse as those of nature's proteins, create a toolbox for the design of lightweight materials that could self assemble into structures with surprising functionality. Using the first elements of this toolbox, a spherical nanostructure has been created that has internally continuous channels; some channels transport water and ions, while others block water but accept organic substances. These nano-sponges could trap toxic metals from water streams.
- *What Makes Stainless Steel Stainless?* Corrosion damage is estimated to cost the U.S. 4.2 percent of the Gross National Product each year. Metals can be used in industrial and technological applications only when appropriately protected. In the case of stainless steel and many other metals, protection is provided by a thin oxide film that prevents further

corrosion. However, the structure of these oxide films has remained a mystery despite decades of study. Recent research using surface-sensitive synchrotron x-ray diffraction with a combination of electrochemical experiments has now unambiguously determined that the oxide film on pure iron has a very fine-grained, nanocrystalline structure. Results for iron-chromium alloys (e.g., stainless steel) have shown that the oxide films are also nanocrystalline. This overturns the long accepted belief that stainless steel is corrosion resistant because its oxide film is non-crystalline. These surprising results provide a more realistic basis for understanding corrosion resistance and for the development of better corrosion protection coatings.

- *Do Cracks "Melt" Their Way through Solids?* Predicting and explaining why, how, and when solids fracture is a significant scientific challenge. The driving force for fracture is intensification of the local stress at a crack tip, yet the mechanism by which local strain is dissipated during crack propagation is not well understood. Can strain energy be dissipated via "local melting" around the crack tip? Recent computer simulations of crack formation predict this intriguing possibility. Simulations indicated that the melting in front of a crack tip can lead to catastrophic fracture. Using high-voltage electron microscopy, observations of moving crack tips in an intermetallic compound confirmed the prediction of the computer simulations and showed the development of melted and rapidly re-solidified regions adjacent to the crack tip. This new picture of fracture as a stress-induced melting process may lead to new approaches to stress-corrosion cracking in the automotive, aerospace, power generation, and ship building industries.
- *Smart Filters.* New materials with tailored pore sizes and pore chemistry can selectively remove deadly heavy metals -- such as mercury, lead, and silver -- from water. Researchers discovered that precise control over the amount of water in the pores of porous silica enabled the insertion of useful organic molecules on the walls of the pores. Using this knowledge, monolayers of organic sulfur compounds were bound to the internal surfaces of porous silica to prepare selective filter materials. The high surface area of the porous silica (a few grams have as much surface area as a football field) coupled with the bonding characteristics of the organic compounds results in high filtering capacity and high selectivity for specific contaminants. In addition, pore openings in the silica are designed to be too small for microbes to enter and digest the contaminants, later causing human illness from, for example, mercury contamination. The filter materials can purify highly contaminated water in a single treatment to a level that exceeds drinking water standards. The filters can also be recovered and reused after removing the contaminants.
- *A Line in the Sand.* Granular materials like gravel, salt, or dry chemicals are ubiquitous in our daily lives and central to many industrial processes, yet controlling their motion is both surprisingly difficult and not well understood. For example, granular material subjected to a driving force remains at rest until a minimum "critical force" is applied; then it moves in uncontrollable events like avalanches. Inefficiency in handling granular materials may result in the loss of up to 40 percent of the design capacity of industrial plants. In its retrospective of the last 50 years, *Physics Today* highlighted the emerging science of granular materials as a

notable event of the last decade. Scientists have recently developed a theoretical approach to describe the motion of granular materials in a vibrating environment. This theory correctly describes the unexpected formation of stripe, square, and hexagon patterns on the surface of vibrated granular media and the formation of localized excitations called "oscillons." The theory also predicted how to control aspects of granular motion -- a prediction that was confirmed by experiment. The new theory brings the description and control of granular motion to a higher level of understanding and shows promise of substantial advances in basic granular science, which can lead to industrial applications that exploit the controlled motion of granular materials.

- *Vortex Matter -- A New Understanding of Magnetism in Superconductors.* Magnetic fields in superconductors are carried by "vortices." Each vortex consists of a tube of magnetic field surrounded by a circulating flow of electrons that move without resistance. It is this free flow of electrons that gives superconducting materials their special property. Recently, it has been shown that the system of magnetic vortices can take many forms analogous to the solid, liquid, and gaseous forms of ordinary matter. The analogy between the behavior of vortices and ordinary matter is so strong that a new term has entered the scientific vocabulary -- vortex matter. Vortex matter melts from a crystalline to a liquid state in much the same way that ice melts to water. The properties of vortex matter can be controlled over a wide range. For example, the density of vortices can be varied by a factor of 10,000 simply by changing the applied magnetic field. This remarkable control enables the study of many types of phenomena in vortex matter whose analogies in ordinary matter are difficult or impossible to observe. Thus, the identification and characterization of the melting transition in vortex matter has significant implications for phase transitions in ordinary matter, for understanding the electromagnetic properties of superconductors, and for developing applications of superconductivity.

Chemical Sciences

- *Landmark Experiment Challenges Combustion Models.* Combustion is perhaps the oldest technology in human experience, yet its complexity limits predictions of combustion processes in devices ranging from simple laboratory burners to automobile engines. The challenge is characterizing the influence of chemistry and fluid dynamics on one another. A simple experiment recently has demonstrated a major error in current models for combustion processes. The experiment allows the interaction of chemistry and turbulence to be examined in quantitative detail for the first time. A planar flame sheet is deformed by a puff of air generated by a small loudspeaker. Spectroscopic techniques are used to determine the concentrations of reaction intermediates as the flame sheet deforms. Comparisons of these experiments with computational simulations showed that the widely accepted chemical reaction mechanism for simple methane combustion is in error, thus, requiring a fundamental change in our models for combustion.
- *Fishing for Radioactive Actinides with Molecular Hooks.* The selection, separation, and removal of radioactive actinide ions from complex aqueous waste stream mixtures remain vexing technical issues. The development of new, improved separation approaches will result

in significant cost savings for nuclear waste treatments as well as improve environmental safety and materials safeguard security. A new family of chelate agents or "chemical fish hooks" suitable for the reversible "catch and release" of trivalent actinide ions in highly acidic solutions has been designed, prepared, and characterized. The latest chelate derivatives show separation characteristics that are especially suited to practical, batch type waste treatments.

- *First Isolation of a Catalytic Oxidation Intermediate.* Despite worldwide efforts over the last 15 years on catalytic olefin oxidation, little progress has been made in extrapolating from ethylene (the smallest olefin) to larger olefins such as propylene. The key question -- the molecular mechanism of ethylene epoxidation (which gives us anti-freeze and polyester fibers) -- remains unresolved. Now, a combined experimental and theoretical tour de force has yielded the first definitive isolation and spectroscopic characterization of a stable intermediate in the catalytic process -- an oxametallacycle. Calculations were employed to determine the structure for the oxametallacycle on silver and to predict the infrared spectrum and molecular motions for that structure. Conclusive identification was provided by the excellent agreement between the predicted infrared spectrum and the experimental electron energy loss spectrum.
- *Liquid Crystalline Organic Semiconductors Discovered.* Liquid crystals change their optical properties as they transition between distinctive geometric states. Digital watch displays, for example, cycle between transparent and opaque forms. They, like other technologically important liquid crystals, are electrically insulating. Semiconducting crystals could have much broader application than insulating crystals, but large single crystals of these materials are difficult and expensive to produce. In a recent breakthrough, a family of liquid crystalline derivatives of perylene diimide was discovered that has semiconductor properties. The films of one compound self organize from a red, polycrystalline phase with randomly oriented crystallites into a black phase with highly ordered ribbon-like structure. The fluorescence intensity increases seven-fold during the transformation. This spontaneous change in photophysical properties makes this class of organic liquid crystals look very promising for future photoconversion applications.
- *Diode Lasers Detect Radiotoxic Isotopes.* Solid-state diode lasers, similar to those used in compact disc players, have been used in a new approach to detect the toxic radioisotope strontium-90, which received attention because of high levels found in milk after atomic weapons tests and the Chernobyl reactor accident. Diode lasers excite and efficiently ionize the strontium atoms; the resulting ions are detected using a mass spectrometer. The high efficiency allows the detection of less than one femtogram (femto = 10^{-15}, e.g., a single postage stamp compared to the area of Texas) of strontium 90. Furthermore, it is possible to selectively ionize the strontium 90 even in the presence of large excesses of the stable, naturally-occurring isotopes of strontium. Measurements can be performed in a few minutes as compared to the several weeks required previously for conventional radiochemical decay counting methods. Thus, this new approach should significantly improve the capabilities for near real-time monitoring of environmental restoration activities, nuclear weapons tests, reactor accidents, and the processing of nuclear fuels.

- *Photochemical Studies on the Light-Activated Drug Hypericin.* The popular herbal remedy St. John's wort contains the compound hypericin which, upon exposure to light, is toxic to tumors and HIV, the human AIDS virus. Now, the fundamental photochemistry of hypericin has been elucidated. A novel laser spectroscopic technique, fluorescence upconversion, was used to show definitively that the primary photochemical process is excited-state intramolecular proton or hydrogen transfer. Any incomplete proton or hydrogen atom transfers would acidfy the aqueous solution immediately surrounding hypericin, which may be of importance in its toxicity to viruses. The study is yet another example of the role that the physical sciences play in providing fundamental information relevant to a wide variety of subject areas.

Engineering and Geosciences

- *Remote Sensing of Fractures and Prediction of Failure in Rocks.* Long before catastrophic fracturing and failure of a material, sound waves transmitted through the material show a dramatic frequency shift. This shift has been documented before in fractured materials, but the observation of the shift *before* the formation of a continuous crack is a new discovery. Monitoring for the frequency shift can therefore be used to provide a warning of failure. The sound shifts to a lower frequency because the high-frequency sound (with shorter wavelengths) is preferentially absorbed or scattered. Because the frequency shift occurs prior to creation of a single fracture, there should be a network of oriented, disconnected features appearing prior to a crack that absorb or scatter the high-frequency sound in the same way as do observable cracks. Connected cracks in rocks provide pathways for water, oil, or pollutant flow. The growth of cracks can improve fluid flow or cause failure of well-bores, reservoirs, and tunnels or engineered structures; therefore, it is very important to understand how and when cracks form.

Energy Biosciences

- *The 1997 Nobel Prize in Chemistry.* Dr. Paul D. Boyer shared in the 1997 Nobel Prize in Chemistry for "elucidation of the enzymatic mechanism underlying the synthesis of adenosine triphosphate (ATP)." The energy captured from photosynthesis or released from respiration is converted into ATP, which is used for maintenance of cells, synthesis of cellular components, and other energy-requiring processes such as movement. ATP is frequently referred to as the "energy currency" of the cell. Dr. Boyer's work at the University of California at Los Angeles was supported in part by the Division of Energy Biosciences and its predecessor organizations from 1963 until 1993 under a project entitled "Energy Capture and Use in Plants and Bacteria."
- *Building Doors into Cells.* Before any molecule can enter a cell, it must first pass through the cell membrane—the thin, fat-containing film that covers all cells. The passage of most molecules through biological membranes is controlled by pores, defined openings made with specific proteins. The composition and structure of pore proteins can now be altered through genetic engineering. Changes in the size of the pore, the selectivity of the pore for letting different molecules pass through, and the pore's ability to open and close are three properties

currently being studied by bioengineering new pore proteins. Successful attempts to engineer modified pore opening and closing properties have provided insight on how these processes can occur mechanistically as well as for developing new biotechnological applications. Among the potential products of this research are chemical triggers or molecular switches that can be used to create new sensors to detect harmful chemicals or viruses. Other potential applications are the development of small light switches and new drug delivery systems.

Scientific Facilities Utilization

The BES program request includes $311,035,000 to maintain support of the scientific user facilities. Within this overall level of support is a partial cost-of-living increase for facility operations and an increase in funding for the High-Flux Isotope Reactor at Oak Ridge National to continue activities related to the replacement of the beryllium reflector and associated beamline upgrades. The reduction in support for the scientific user facilities from that of FY 1999 is primarily a result of the decrease in R&D for the Spallation Neutron Source. Support for facility operations is maintained at as high a level as possible consistent with budgetary constraints. Research communities that have benefited from the BES supported Scientific Facilities Initiative include materials sciences, chemical sciences, earth and geosciences, environmental sciences, structural biology, superconductor technology, medical research, and industrial technology development. More detailed descriptions of the specific facilities and their funding are given in the subprogram narratives and in the sections entitled "Site Description" and "Major User Facilities."

Spallation Neutron Source (SNS) Project

The purpose of the SNS Project is to provide a next-generation short-pulse spallation neutron source for neutron scattering and related research in broad areas of the physical, chemical, materials, biological, and medical sciences. The SNS will be the world's most powerful accelerator-based, pulsed neutron source producing 6-10 times more neutrons than any other such source. It will be used by researchers from academia, national labs, and industry for basic and applied research and for technology development in the fields of condensed matter physics, materials sciences, magnetic materials, polymers and complex fluids, chemistry, biology, and engineering. It is anticipated that the facility will be used by 1,000-2,000 scientists and engineers annually and that it will meet the Nation's need for neutron science capabilities well into the next century.

The SNS will consist of a linear accelerator (linac)-ring system that will deliver short pulses of protons to a mercury target where neutrons will be produced by a nuclear reaction process called spallation. The high-energy neutrons so produced will be moderated (i.e., slowed down) to reduce their energies. The "moderated" neutron beams will then be used for neutron scattering experiments. Specially designed scientific instruments will use these pulsed neutron beams for a wide variety of investigations on all types of materials.

As the needs of our high-technology society have changed, so has the way we do R&D on new materials to meet these needs. It has become increasingly important to develop new materials that perform under severe conditions and yet are stronger, lighter, and cheaper. Major research facilities, such as the BES synchrotron and neutron sources, are used to understand and "engineer" materials at the atomic level so that they have improved macroscopic properties and perform better in new applications. The SNS is a next-generation facility for just such applications. Neutron scattering will play a role in all forms of materials understanding and design, including the development of smaller and faster electronic devices; lightweight alloys, plastics, and polymers for transportation and other applications; magnetic materials for more efficient motors and for improved magnetic storage capacity; and new drugs for medical care.

The importance of neutron science for fundamental discoveries and technological development is now universally acknowledged. The scientific justification and need for a new pulsed neutron source and instrumentation in the U.S. have been thoroughly established by numerous studies by the scientific community since the 1970s. These include the 1984 National Research Council study "Major Facilities for Materials Research and Related Disciplines" (the Seitz-Eastman Report), which recommended the immediate start of the design of both a steady-state source and an accelerator-based pulsed spallation source. More recently, the 1993 DOE Basic Energy Sciences Advisory Committee (BESAC) report "Neutron Sources for America's Future" (the Kohn Panel Report) again included construction of a new pulsed spallation source with SNS capabilities among its highest priorities. This conclusion was even more strongly reaffirmed by the 1996 BESAC Report (the Russell Panel Report), which recommended the construction of a 1 MW spallation source that could be upgraded to significantly higher powers in the future.

The conceptual design of the SNS -- which was an interlaboratory effort involving Lawrence Berkeley National Laboratory in the ion source, Los Alamos National Laboratory in the linear accelerator, Brookhaven National Laboratory in the accumulator ring, and Argonne National Laboratory in targets and moderators -- was completed in June of 1997. The design conforms to the recommendations of the Russell Panel Report. The power will be in the 1 megawatt range or about six times that of the highest currently available worldwide, and the design will allow for significantly higher powers at a later stage. The design will further include moderators for neutrons with appropriate spectral and temporal characteristics in the epithermal, thermal, and cold energy ranges. There will be the potential for at least three target areas and for 30 to 40 instruments.

Agreements are in place with Rutherford Appleton Laboratory (England), the European Spallation Source project, and the Japanese Atomic Energy Research Institute to allow joint research and development. Furthermore, a Working Group on Neutron Sources has been established under the Megascience Forum of the Organization for Economic Cooperation and Development. A User Committee has been formed, consisting of distinguished members of the neutron science community, to provide input on instrumentation and on user needs.

FY 1999 funding provided for the start of Title I design activities, initiation of subcontracts and long-lead procurements, and continued critical research and development work necessary to reduce technical and schedule risks. FY 2000 funding of $214,000,000 is requested for the SNS

Project for detailed design (Title II) for the ion source, low-energy beam transport, LINAC structure and magnet systems, target assemblies, experimental instruments, and global control systems. Detailed design will be completed for several conventional facilities in preparation for the installation of major equipment in the following fiscal year; design will be completed on the front-end building, LINAC tunnel, high-energy beam transport tunnel, ring-service building, ring-to-beam transport tunnel, and the klystron hall. Construction will start for some conventional facilities including roads into the site, site preparation/grading, waste systems, and retention basins. Procurement for several significant equipment items such as dipole magnets, material for the target transport systems, and klystrons will begin. Project Management and Project Integration activities, which are exceptionally important during this phase of the project, will also be conducted. The Preliminary Safety Analysis Report (PSAR) will be completed during the fiscal year and work will begin on the final report. Additional information on the SNS project is provided in the SNS construction project data sheet, project number 99-E-334.

Facility Enhancements

BES will continue to support ongoing enhancements and maintenance activities of existing reactor and spallation neutron sources. (1) Fabrication of instrumentation will continue for the short-pulse spallation source at the Manuel Lujan Jr. Neutron Scattering Center at the Los Alamos Neutron Science Center (LANSCE). This instrumentation enhancement project was undertaken concurrently with an accelerator enhancement project funded by the Department's Office of Defense Programs. Together, these enhancements will result in a short-pulse spallation source facility equivalent to ISIS in Great Britain, currently the world's best for neutron scattering. This facility meets the requirements set by BESAC for an interim facility to the SNS at least as good as the ISIS facility. (2) The beryllium reflector at the High Flux Isotope Reactor at Oak Ridge National Laboratory is being changed. This is a scheduled maintenance operation that addresses the normal lifetime limitations of the beryllium reflector. Work was initiated in FY 1998 and will be completed in FY 2000. At the same time that the beryllium reflector, beam tubes and shutters, and monochrometer shields are replaced, several improvements will be made to instrumentation, beam tubes, and monochrometers. The improvements will provide increases in flux to the sample by factors of 2 to 3 times that of the Institute Laue Langevin, the world's best reactor neutron source. These improvements to HFIR were recommended by BESAC.

Partnerships for Academic-Industrial Research (PAIR) Program

The Partnerships for Academic-Industrial Research (PAIR) Program. Pending the results of an evaluation of ongoing awards, an additional $1,500,000 may be allocated to the PAIR program for a total budget of $3,000,000. This program is designed to encourage and facilitate research partnerships between academic researchers, their students, and industrial researchers. The PAIR program encompasses the entire range of research supported by the BES program. Grants are awarded on the basis of competitive peer review to university researchers for support of

fundamental, long-term, high-risk work that is jointly defined by the academic and industrial research partners and that supports a student or postdoctoral fellow from the university, who will spend at least four weeks per year in the industrial setting.

Complex and Collective Phenomena Program

The program in Complex and Collective Phenomena. In FY 2000, an additional $4,500,000 will be allocated to the program in Complex and Collective Phenomena for a total budget of $7,500,000. Much of the research supported by the BES program and its predecessor organizations during the past 50 years has been devoted to solving very difficult problems in idealized, simple systems. The challenge now is to use that knowledge to understand complex systems. This initiative supports work at the frontiers of basic research. Work is intended to be revolutionary rather than evolutionary, and it is expected that it may involve multidisciplinary and/or interdisciplinary efforts. Further it is expected to bridge the gap between an atomic level understanding (reductionist view) and a continuum mechanics understanding (classical view) of complex and collective phenomena. Awards are made on the basis of competitive peer review to university and DOE laboratory researchers. The initiative is open to the entire range of disciplines supported by the BES program. Some important categories of studies that might be included within the initiative in Complex and Collective Phenomena are:

Materials that are beyond binary; that lack stochiometry; that are far from equilibrium; that have little or no symmetry or low dimensionality. Often properties and behaviors that we desire exist only in "non ideal compounds," i.e., those that are made from more than a few elements, made in non stoichiometric combinations, made far from equilibrium; or made in one or two dimensions. These classes of materials, which will dominate the next generation of energy technologies, pose new challenges and opportunities because of their complexity.

Functional synthesis. The ability to *predict* structure/function relationships remains elusive. Because function can be exquisitely sensitive to even minor changes in both composition and structure and because the number of combinations is virtually boundless, we are unable to predict what combinations of elements and arrangements of atoms give rise to desired properties such as superconductivity, magnetism, ductility, toughness, strength, resistance, catalytic function, or enzymatic function.

The control of entropy. To a scientist, entropy has a precise mathematical definition; however, to a nonscientist, entropy can be viewed as synonymous with disorder. A standard maxim in physics is that "the entropy of the universe tends to increase," i.e., things become increasingly disordered with time. Interestingly, most of our energy now comes from fossil fuels that were derived from photosynthesis — the ability of plants to reduce entropy locally by absorbing sunlight and converting carbon dioxide to lower-entropy hydrocarbons, polysaccharides, and other compounds. However, even though photosynthesis has been studied for decades, we still do not completely understand it nor have we been able to duplicate or improve on it. This one example of the control of entropy — the ability to mimic the functions of plants — remains one of the outstanding challenges in the natural sciences.

Phenomena beyond the independent particle approximation. Phenomena beyond the independent particle model — that by their nature are collective — challenge our understanding of the natural world and require major advances in theory, modeling, computing, and experiment. Collective phenomena include widely diverse phenomena in the gas and condensed phases, including Bose-Einstein condensation, high-temperature superconductivity, and electron correlation.

Scaling in space and time. Research in chemistry, materials, geosciences, and biosciences covers lengths from the atomic scale to the cellular scale to the meter scale and times from femtoseconds to millennia. We understand single atoms, molecules, and pure crystals fairly well; but, when we go beyond these simple systems to larger more complex systems, our understanding is limited. Understanding phenomena over wide time scales is also important — from femtoseconds in spectroscopy to decades in the regulatory system of plants to thousands of years in radioactive waste disposal.

Climate Change Technology Initiative

Overview

The FY 2000 budget contains two carbon related programs, each of which cut across several agencies. The first is the Climate Change Technology Initiative (CCTI). That part of the CCTI that is within the Office of Science is a joint activity between the Biological and Environmental Research (BER) and Basic Energy Sciences (BES) programs. The second program is the U.S. Global Change Research Program (USGCRP) that spans eleven agencies and is coordinated through the National Science and Technology Council's Committee on Environment and Natural Resources. Within DOE, the BER program plays the lead role in USGCRP activities. Although the two programs, CCTI and USGCRP, are synergistic, they are different. USGCRP research focuses on developing the fundamental understanding of the comprehensive climate system and the global and regional adaptations to it. The CCTI focuses on the underpinning fundamental science that will enable mitigation of climate change while maintaining a robust National economy. All research in the CCTI will be peer-reviewed fundamental scientific research; no funds will be devoted to policy studies.

Eighty-five percent of our Nation's energy results from the burning of fossil fuels, a process that adds carbon to the atmosphere — principally in the form of carbon dioxide — from the sequestered fossil reservoir. Because of the potential environmental impacts of increases in atmospheric carbon dioxide, carbon management has become an international concern and has become a focus of the Climate Change Technology Initiative. A comprehensive research and development program that meets the needs of the Climate Change Technology Initiative addresses the diverse aspects of this problem. The Office of Science is well positioned to make significant contributions to the many solutions needed for this problem, as it is set to build on the fundamental discoveries of its core programs and extend them to the new discoveries needed to make carbon management practical and efficient. Science core programs include research on both carbon and non-carbon energy sources and on both carbon sequestration and carbon recycling. These core activities can now be exploited in the generation of the carbon management science

that will underpin the technologies of the future. The theme of efficiency in energy production and use must span the entire range of research activities. Research on carbon energy sources, and their impacts, is a focal point of interagency activity through the U.S. Global Change Research Program (USGCRP). Research on non-carbon energy sources is also a focal point of intra-agency activities and is led by the DOE Office of Energy Efficiency and Renewable Energy. The DOE Office of Science, through activities in both the Basic Energy Sciences (BES) program and the Biological and Environmental Research (BER) program, supports research that underpins both efforts.

A research program in carbon management would include:

- science for efficient technologies,
- fundamental science underpinning advances in all low/no carbon energy sources, and
- sequestration science.

Science has long-standing programs in fundamental research that already impact the three categories. In the BES program, funds in the amount of $19,504,000, are provided specifically for carbon management science in the Climate Change Technology Initiative. This work will be a natural extension of the complementary, ongoing work in several programs in Science, and it will build on the foundation of excellent and relevant research already underway. Focus areas will be those that build on strengths of the current Science programs and that promise maximum impact in the area of carbon management.

Immediate Impacts of Expanded Effort in Climate Change Technology

Additional science efforts will not only address an immediate societal problem, but they will also have a major effect on many scientific disciplines by advancing the state of knowledge and by training students in areas of research that are important to carbon management. For example, biochemistry, molecular and cellular biology, structural biology, and genome science will be impacted, because the production of fuels and chemicals by plants and microorganisms and the interconversion of greenhouse gases requires a better understanding of metabolism, of the structure and function of sub-cellular components, and of enzymes. Similarly, the state-of-the-art in biochemistry, molecular biology, and ecology will be impacted. All of these biological processes are important in understanding the role of marine microorganisms in sequestering carbon. Improvements in combustion to reduce carbon emissions require a fundamental understanding in chemical dynamics and theoretical chemistry and physics. Conversion of sunlight to energy requires an understanding in many areas of science, including photochemistry, photosynthesis, metabolism, and solid state physics. The search for increased efficiency in energy production and use requires fundamental knowledge in ceramics, metals, polymers, solid state chemistry, and condensed matter physics for materials that can withstand higher temperatures, have lower coefficients of friction, and are stronger and lighter. Enhanced recovery of fuel resources and of disposal of carbon dioxide requires a fundamental understanding of geometric, structural, and hydrologic properties of reservoirs and of multiphase, nonlinear transport of fluids in porous and fractured structures. Crosscutting programs in nano- and meso-phase materials

involve research at the forefront of materials science, chemistry, engineering, surface science, and semiconductor physics.

The new research efforts supporting advances in low/no carbon energy technologies, as well as existing activities, will be closely coordinated with DOE's technology programs and will provide the knowledge base for the development of advanced technologies to reduce carbon dioxide emissions. Many of the activities will impact the Office of Energy Efficiency and Renewable Energy (EE) and the energy and transportation industry by providing options for increasing efficiency in automobiles by reducing weight; for increasing efficiency in the use of electricity by increasing the efficiency of electric motors and generators with better magnets; for increasing efficiency in the transmission of electricity by using superconductors; and for reducing energy consumption in manufacturing with improved sensors, controls, and processes. Much of this research program will provide the knowledge base needed to increase the use of renewable resources with research aimed at understanding the metabolism of carbon dioxide and the metabolic pathways to the production of methane and other biofuels. Other aspects of the research program impact the Office of Fossil Energy (FE) by providing a foundation for effective and safe underground sequestration, new materials, a better understanding of combustion, and improved catalysts.

Funding will be provided for areas of research in carbon cycle management including appropriate areas that will be jointly identified and implemented by the Biological and Environmental Research and Basic Energy Sciences programs. Solicitations will be used for individual research projects. Additionally, proposal notifications may be developed jointly with the DOE energy technology programs with the intention of establishing multi-disciplinary centers at universities and national laboratories that will use the full capabilities of the institutions for a research program in carbon cycle management encompassing, for example, topics in the following areas: integration and assessment; separations; efficiency; clean fuels; bioenergy; storage and conversion; enhanced natural terrestrial cycles; and enhanced use of major scientific user facilities to support carbon management research.

Interagency Environment

The Office of Science program in fundamental science supporting energy technologies will be closely coordinated with, and synergistic to, the activities in its sister agencies (e.g., NASA, NSF, NOAA, USDA, DOI, and EPA) within the USGCRP. Through its leadership role in decade to century climate prediction, the Office of Science has developed the research capability for comprehensive and large scale modeling of carbon dioxide impacts on climate, on ecology, and on ocean sciences, and this expertise is augmented by complementary activities in the other agencies. Similarly, the network of carbon flux measurements and ecological experiments that the Office of Science has developed serve as a backdrop to those of many other agencies, and the state-of-the-art can thus be pushed ahead more rapidly by capitalizing on the more rapidly growing base of knowledge. The Office of Science also has a leadership role within the USGCRP on consequence evaluation of increased greenhouse gases in global climate change, including integrated assessments that address both scientific and societal (including economic) impacts of carbon management. Finally, through its pre-eminent role in the Human Genome Program and its

development of the complementary Microbial Genome Program, the Office of Science program is ideally placed to support research that will focus on the application of genetic information of microorganisms to increase metabolic efficiency related to both carbon dioxide and conversion to fuels through photosynthesis.

BES Activities

Climate Change Technology Initiative

(dollars in thousands)

	FY 1999	FY 2000
Materials Sciences	1,708	3,415
Chemical Sciences	2,197	4,394
Engineering and Geosciences	1,464	6,822
Energy Biosciences	2,436	4,873
Total	7,805	19,504

As noted above, an inclusive climate change technology research and development program must address diverse aspects of the problem including: (1) carbon recycling; (2) improved efficiency in the use of fossil carbon energy sources; (3) new and improved non-carbon energy sources; and (4) carbon dioxide sequestration. The BES program has long supported fundamental research that impacts these categories and has particularly strong programs related to the first three. A comprehensive program in issues relating specifically to carbon management, therefore, finds a natural home with the scientific communities supported by BES.

Focus areas are those that promise the maximum impact in the area of carbon management and that build on strengths of current BES programs. In the Materials Sciences subprogram, research focuses on three areas: high-temperature materials for more efficient combustion, magnetic materials that reduce energy loss during use, and semiconductor materials for solar-energy conversion. In the Chemical Sciences subprogram, research emphasizes atomic and molecular level understanding of chemical processes to enable predictive capability. A major component of the research will aim at reducing emissions of carbon dioxide through fundamental understanding of the chemistries associated with combustion, catalysis, photochemical energy conversion, electrical energy storage, electrochemical interfaces, and molecular specific separation from complex mixtures. In the Engineering and Geosciences subprogram, research emphasizes areas that will impact carbon dioxide sequestration in subsurface geologic formations. The program will include research to: (1) understand the mechanical stability of porous and fractured reservoirs/aquifers; (2) understand multiphase fluid flow within the aquifers; and (3) understand the geochemical reactivity in relevant conditions. Finally, in the Energy Biosciences subprogram, research emphasizes the biological process of photosynthesis, which is central to global carbon cycling.

All of the BES activities in CCTI are closely related to DOE's technology programs and will provide the knowledge base for the development of advanced technologies to reduce CO_2 emissions. When combined with the complimentary activities within the Biological and Environmental Research program, this initiative will lead to the comprehensive carbon management research program described above.

Fundamental Research Relating to Solar and Renewable Energy Resources

Included in this request are funds in the amount of $47,100,000 that potentially impact solar and renewable energy resource production and use in the categories of "biomass," "wind energy," "photovoltaics," "hydrogen," and "other (solar photoconversion)." These funds support multidisciplinary, basic research in the BES Materials Sciences, Chemical Sciences, and Energy Biosciences subprograms.

These multidisciplinary research activities are also relevant to a number of other areas that impact energy. Funding totalling $6,300,000 in this category also addresses the Climate Change Technology Initiative. Indeed, the nature of most of the BES programs is to provide the results of basic research that impact a wide variety of applications. For example, research in the area of biomass focuses on understanding, at the mechanistic level, the biology of plants, algae, and non-medical microbes. While the majority of fundamental research on plants and non-medical microbes is directly related to biomass or renewables, the research also directly impacts many other disciplines and technologies including agricultural food production, plant-derived pharmaceuticals, textile fibers, wood and wood byproducts, environmental restoration, and fermentation technologies. Similarly, research in solar photoconversion focuses on the detailed nature of how molecules in the photo-excited state transfer electrons (and thus energy); this work impacts numerous technologies in addition to solar and renewable energy programs including sensors, molecular photonics, photodegradation of hazardous wastes, photoassisted synthesis of chemicals, new analytical techniques (or methodologies), soil science, biological electron transfer, and carbon dioxide photoreduction. As a final example, research in photovoltaics focuses primarily on semiconductor physics and the synthesis of semiconductor materials. These materials are also used in microprocessors, batteries, displays, sensors, electrochromic windows, and semiconductor alloys.

BES engages in appropriate partnerships to make the results of the BES research widely known and used. Examples include partnerships with the DOE technology offices and with other federal agencies. As a result, BES engages in many joint activities. For example, in photovoltaics, the Office of Energy Efficiency and Renewable Energy (EE) and BES together sponsored a workshop in 1993. Based on this workshop, a jointly funded project was started at NREL that resulted in record-breaking photovoltaic efficiencies. In general, research activities in biomass, wind energy, photovoltaics, hydrogen, and solar photoconversion are coordinated with EE through Coordinating Committees in the Department, through ad hoc meetings, through workshops, and through joint funding at universities and at the Department's laboratories.

In November, 1997, more than 30 program staff from the Office of Science (SC) — primarily from BES — and from EE Offices of Utility Technologies and Transportation Technologies met to discuss programs in the areas noted above. The EE programs involved include those of photovoltaic energy systems, solar thermal, hydrogen technologies, wind technologies, biomass power, and biofuels (transportation). Follow on one-on-one meetings between program managers of both offices are now being held for identification of research needs, gaps and areas of opportunity of possible joint program development. For example, in May 1998, BES program staff participated in a Workshop on Biohydrogen Production sponsored by EE's Hydrogen program and by the Engineering Directorate at NSF; BES staff further provided reviews of EE projects in the area of biological hydrogen production and recommendations for the overall direction of that program. Another outcome of the November 1997 meeting has been the re-establishment of a Department-wide technical committee in the area of bioenergy which includes program representatives from BES and EE and also from the Office of Environmental Management (EM) and the Office of Fossil Energy (FE). The purposes of the revitalized DOE Bio-Energy Coordinating Committee (BECC) are to: (a) achieve effective coordination of all DOE bio-energy research and development; (b) assure optimum use of DOE's existing expertise in the field of bio-energy research and development; and (c) achieve the most rapid communication among DOE program representatives of new developments, opportunities, and issues in the areas of bio-energy research, development, demonstration and commercialization. In a related effort, BES and EE's Office of Fuels Development are drafting a joint research topic on biofuels for the FY1999 SBIR Program Solicitation.

Funding of Contractor Security Clearances

In FY 1999, the Department divided the responsibility for obtaining and maintaining security clearances. The Office of Security Affairs, which was responsible for funding all Federal and contractor employee clearances, now pays only for clearances of Federal employees, both at headquarters and the field. Program organizations are now responsible for contractor clearances, using program funds. This change in policy enables program managers to make the decisions as to how many and what level clearances are necessary for effective program execution. In this way, it is hoped that any backlog of essential clearances which are impeding program success can be cleared up by those managers most directly involved. The Office of Science is budgeting $346,000 and $313,000 for estimated contractor clearances in FY 1999 and FY 2000, respectively, within this decision unit.

Scientific Simulation Initiative

This budget also includes the BES program's contribution to DOE's Scientific Simulation Initiative (SSI), an integrated effort bringing together computational and communication resources, focused research in scientific disciplines, and research in computer science and other enabling technologies to solve the complex problems that characterize DOE's scientific research

needs. The SSI couples research in advanced scientific applications in the programs of the Office of Science (SC) with research in computer science and enabling technologies and advanced computing and communications facilities. It is a joint program between the Computational and Technology Research (CTR) program and the other programs in SC. The overview of the integrated program is given in the overview of the CTR budget; however, the specific contributions of the BES program are described below.

BES, through its Chemical Sciences subprogram manages the SSI Combustion Systems integrated applications effort. BES's participation in the SSI also represents an important contribution to the broader Presidential initiative in information technology. The Chemical Sciences subprogram has been involved in combustion research for over two decades. The goal of this research effort is to develop, through simulation and modeling, a sufficiently deep and detailed understanding of combustion processes to accelerate the development, characterization, and validation of design tools for advanced combustion devices. Eighty-five percent of current U.S. energy use is derived from the combustion of fossil fuels. This dependence on fossil fuels is not likely to change in the coming decades. For transportation technologies alone, preliminary calculations suggest that improvement in direct-injection diesel thermal efficiency of 35% is possible, which could result in energy savings of 3.7 quads or $26 billion and reductions of carbon dioxide ($CO_{2)}$ emissions of 250 million tons per year. Combustion has been and remains one of the primary causes of lowered air quality in urban environments. Providing the knowledge that can lead to improved efficiency of the fossil fuel combustion process while reducing unwanted emissions remains one of among the highest priorities in the Nation's research portfolio. High fidelity combustion simulation and modeling may well be the path to significant breakthroughs in the ability of engineers to characterize, and therefore optimize and control, all aspects of combustion devices.

At present, engineers have neither sufficient knowledge nor the computational tools to understand and predict the chemical outcome of combustion processes. The design of combustion devices remains an Edisonian process dependent on intuition, experience, and time consuming trial and error. Computational models to guide the design process currently are of limited use because of the extraordinary complexity of the combustion process. This complexity derives from:

- the hundreds of chemical reactions that comprise combustion chemistry;
- fluid dynamics with turbulence scales covering 6 orders of magnitude; and
- interactions between chemistry and fluid dynamics involving time and spatial scales that cover 12 orders of magnitude.

The anticipated accomplishments of this research effort will allow the complete characterization of the chemistry and fluid dynamics of combustion processes and systems. The computational tools developed under this program, along with the new level of understanding of complex combustion phenomena, will allow engineers to design a new generation of combustion devices optimized for energy efficiency and pollution reduction.

The combustion modeling and simulation component of the SSI will be managed in a manner consistent with the way BES manages other projects and facilities. A program manager in the Office of Basic Energy Sciences will be appointed to be responsible for the effort. This manager will be assisted by a technical management and coordination office located at one of the DOE laboratories whose role is to ensure that the subelements remain tightly integrated. Research teams at laboratories and universities, as well as the technical management and coordination office, will be competitively selected in response to a published announcement and following peer review.

Funding Profile

Site Description

Ames Laboratory

Ames Laboratory is a Multiprogram Laboratory located on 10 acres in Ames, Iowa. The laboratory was built on the campus of Iowa State University during World War II to emphasize the purification and science of rare earth materials. This emphasis continues today. The BES Materials Sciences subprogram supports experimental and theoretical research on rare earth elements in novel mechanical, magnetic, and superconducting materials. Ames scientists are leading experts on magnets, superconductors, and quasicrystals that incorporate rare earth elements. Recent innovations include the use of a rare earth alloy and the magnetocaloric effect to achieve efficient refrigeration without gases that are harmful to the atmosphere. The BES Chemical Sciences subprogram supports studies of heterogeneous electron transfer in self-assembled monolayers, ultrafast spectroscopic techniques to examine energy transfer phenomena, and studies of molecular beams to obtain highly accurate and precise thermochemical information for small molecules and radicals. Ames Laboratory continues to provide leadership in analytical chemistry with strength in organometallic based catalysis and heavy metal extraction chemistry important to high level wastes.

The laboratory is also home to the **Materials Preparation Center** (MPC), a user facility dedicated to the preparation, purification, and characterization of rare-earth, alkaline-earth, and refractory metal materials. Established in 1981, the MPC consolidates and makes available to scientists at university, industry, and government facilities the capabilities related to synthesis, processing, and characterization of advanced materials developed at Ames Laboratory during the course of its 40 years of basic research. Although the MPC is designated a national user facility, its operation differs from that of other such facilities in that the users do not conduct experimental or research activities within the Center; rather, they receive high purity materials or unique characterization services that are not available from commercial suppliers, on a full cost recovery basis. The MPC operates the Materials Referral System and Hotline and provides immeasurable value to the superconductivity community by publishing the bi-monthly High Tc Update.

Argonne National Laboratory

Argonne National Laboratory (ANL) in Argonne, Illinois, is a Multiprogram Laboratory located on 1,700 acres in suburban Chicago. ANL has a satellite site located in Idaho Falls, Idaho. ANL is home to one of the largest BES research efforts in broad areas of materials, chemical, and geosciences, and it is the site of three BES supported user facilities -- the Advanced Photon Source (APS), the Intense Pulsed Neutron Source (IPNS), and the Electron Microscopy Center for Materials Research (EMC).

The Materials Sciences subprogram supports research in high-temperature superconductivity; polymeric superconductors; thin-film magnetism; surface science; the synthesis, characterization, and atomistic computer simulation of interfaces in advanced ceramic thin-films; the investigation of the effects of neutron, gamma, and ion-irradiation of solids; tribological investigation of the boundary films on aluminum and aluminum alloys; and synthesis and electronic and structural characterization of oxide ceramic materials, including high-temperature superconductors. The Chemical Sciences subprogram

supports research in actinide separations; fundamental physical and chemical properties of actinide compounds; structural aspects fundamental to advanced batteries and coal chemistry; experimental and theoretical studies of metal clusters of catalytically active transition metals; molecular dynamics of gas-phase chemical reactions of small molecules and radicals; photosynthesis mechanisms; and atomic, molecular, and optical physics. ANL has one of three pulsed radiolysis centers that together form a national research program in this area. The other two are at Brookhaven National Laboratory and Notre Dame University. The Engineering and Geosciences subprogram supports research on processes controlling the mobility of fluids and metals in the Earth's crust.

The **Advanced Photon Source** is one of only three third-generation, hard x-ray, synchrotron radiation light sources worldwide. Dedicated on May 1, 1996 by the Secretary of Energy, the project was completed five months ahead of schedule and for $13,000,000 less than the baseline construction budget of $811,000,000. The APS has met or exceeded all technical specifications. The design of the 7 GeV synchrotron is optimized for insertion devices. This high-brilliance light source will be used by as many as 2,000 users annually to study the structure and properties of materials in a variety of disciplines including condensed matter physics, materials sciences, chemistry, geosciences, structural biology, medical imaging, and environmental sciences. In addition, the light source will be used for a variety of technological applications, including micromachining and lithography.

The **Intense Pulsed Neutron Source** is a 30 Hz short-pulsed spallation neutron source using protons from a linac/rapid cycling synchrotron to produce neutrons in a depleted uranium target. Twelve beam lines serve 14 instruments, one of which is a test station for instrument development. IPNS was the first neutron or synchrotron source in the U.S. to operate all instruments in the user mode, with time allocated by an external committee. Distinguishing characteristics of IPNS include its innovative instrumentation and source technology and its dedication to serving the users. The first generation of virtually every pulsed source neutron scattering instrument was developed at IPNS. Scientists at IPNS have conceived techniques such as geometric and electronic time focusing, multi-chopper phasing, multiple converging aperture collimation, and neutron reflectometry. In addition, the source and moderator technologies developed at IPNS, including uranium targets, liquid hydrogen and methane moderators, solid methane moderators, and decoupled reflectors, have impacted spallation sources worldwide. Research at IPNS is conducted in the structure of high-temperature superconductors, alloys, composites, polymers, catalysts, liquids and non-crystalline materials, materials for advanced energy technologies, and biological materials. Staff at IPNS are taking a leadership role in the design and construction of instrumentation for the Spallation Neutron Source.

The **Electron Microscopy Center for Materials Research** provides in-situ, high-voltage and intermediate voltage, high-spatial resolution electron microscope capabilities for direct observation of ion-solid interactions during irradiation of samples with high-energy ion beams. The EMC employs a tandem accelerator for simultaneous ion irradiation and electron beam microcharacterization. It is the only instrumentation of its type in the Western Hemisphere. The unique combination of two ion accelerators and two microscopes permits direct, real-time, in-situ observation of the effects of ion and/or electron bombardment of materials and consequently attracts users from around the world.

Brookhaven National Laboratory

Brookhaven National Laboratory (BNL) is a Multiprogram Laboratory located on 5,200 acres in Upton, New York. BNL is home to BES major research efforts in materials and chemical sciences as well as to efforts in geosciences and biosciences. BNL is also the site of two BES supported user facilities -- the National Synchrotron Light Source (NSLS) and the High Flux Beam Reactor (HFBR).

The Materials Sciences subprogram emphasizes experiments that make use of the NSLS and the HFBR. BNL scientists are among the world leaders in neutron and X-ray scattering applied to a wide variety of research problems such as high-temperature superconductivity, magnetism, structural and phase transformations in solids, and polymeric conductors. BNL has strong research programs in the structure and composition of grain boundaries and interfaces in high temperature superconductors, in aqueous and galvanic corrosion studies, and in the theory of alloy phases.

The Chemical Sciences subprogram supports one of three centers for pulsed radiolysis research at BNL. With the recent completion of a new innovative short-pulse radiation chemistry facility, BNL is well poised to contribute significantly to radiation sciences research for the next decade. There is also a forefront research project on the spectroscopy of reactive combustion intermediates and an active research effort on studies of the mechanisms of electron transfer related to artificial photosynthesis. Other Chemical Sciences research at BNL is focused around the unique capabilities of the NSLS in obtaining time dependant structural data of reacting systems, the structural changes accompanying catalytic and electrochemical reactions, and the formation of atmospheric aerosols and their reactivity.

The Energy Biosciences subprogram supports activities in the plant sciences, which include mechanistic and molecular-based studies on photosynthesis and lipid metabolism genetic systems. The studies on lipid biosynthesis may lead to exciting prospects for engineering new pathways for the synthesis of alternative fuels and petroleum-replacing chemicals. The Engineering and Geosciences subprogram supports synchrotron-based studies of rock-fluid interactions, particularly for investigations of diagenetic processes and synchrotron computed microtomography of porosity of reservoir rocks.

The **National Synchrotron Light Source** provides intense focused light from the infrared through the x-ray region of the spectrum by operating two electron storage rings: an X-ray ring and a vacuum ultraviolet (VUV) ring. X-Ray, ultraviolet, visible, and infra-red light from the storage rings is guided into 30 x-ray and 17 VUV beam ports, most of which are split into two to four experimental stations. The NSLS was commissioned in 1982. Annually, 2,300 scientists representing more than 350 institutions, over 50 of them corporations, conduct research at the NSLS in the fields of biology, chemistry, geology, materials science, medicine, metallurgy, and physics. In the basic sciences, researchers investigate the absorption and scattering of light to determine the properties of matter such as crystal structure, bonding energies of molecules, details of chemical and physical phase transformations, electronic structure and magnetic properties. The NSLS also serves as a training ground for future scientists. Between 1988 and 1998, over 600 students who earned doctorate degrees used the NSLS in their thesis research.

The **High Flux Beam Reactor**, commissioned in 1965, is a heavy-water cooled and moderated reactor designed to produce neutrons for scattering. In contrast to most reactors, which are designed to minimize the escape of neutrons from the core, the HFBR was expressly designed to maximize the number of neutrons available in external beams. The HFBR supports a range of neutron-based research in solid-state

and nuclear physics, chemistry, and structural biology. The reactor's 9 beam tubes deliver neutrons to 15 experimental facilities. Before the HFBR was put in standby mode in December, 1996, about 250 researchers conducted experiments at the facility annually. The HFBR will continue to be maintained in this standby mode while the Department evaluates options for its future.

Idaho National Environmental and Engineering Laboratory

Idaho National Engineering and Environmental Laboratory (INEEL) is a Multiprogram Laboratory located on 572,000 acres in Idaho Falls, Idaho. The Materials Sciences subprogram supports research in the modeling, growth, and properties of functionally gradient materials as an effective means of joining ceramic and metallic materials, on the microstructural evolution of rapidly solidified materials, and on high strength magnetic materials. The Chemical Sciences subprogram focuses on fundamental understanding of negative ion mass spectrometry, studies of secondary ion mass spectrometry, and computer simulation of ion motion and configuration of electromagnetic fields crucial to the design of ion optics. The Engineering and Geosciences subprogram supports studies to establish controls of biologically based engineering systems, to understand and improve the life expectancy of material systems used in engineering such as welded systems, to improve controls of nonlinear systems, and to develop new diagnostics techniques for engineering systems.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory (LBNL) is a Multiprogram Laboratory located in Berkeley, California, on a 200 acre site adjacent to the Berkeley campus of the University of California. LBNL is home to BES major research efforts in materials and chemical sciences as well as to efforts in geosciences, engineering, and biosciences. LBNL is also the site of two BES supported user facilities -- the Advanced Light Source (ALS) and the National Center for Electron Microscopy (NCEM).

The Materials Sciences subprogram supports research in laser spectroscopy, superconductivity, thin films, femtosecond processes, biopolymers, polymers and composites, surface science, and theory. Research is carried out on the fundamental features of evolving microstructures in solids; alloy-phase stability; structure and properties of transforming interfaces; and the structures of magnetic, optical, and electrical thin films and coatings. In the Center for Advanced Materials, research is conducted in the processing, mechanical fatigue, and high-temperature corrosion of structure ceramics and ceramic coatings; the synthesis, structure and properties of advanced semiconductor and semiconductor-metal systems; polymers; surface science and catalysis; and structure, development and magnetic properties of high performance metals and alloys. The Chemical Sciences subprogram has long excelled in fundamental, chemical dynamics research using molecular-beam techniques. Femtosecond spectroscopy studies of energy transfer on surfaces has also been developed. LBNL is recognized for its excellence in radiochemistry, the chemistry of the actinides, inorganic chemistry, and both homogeneous and heterogeneous chemical catalysis. The Engineering and Geosciences subprogram supports experimental and computational research on rock physics of porous and fractured rock, subsurface imaging through both seismologic and electromagnetic methods, and hydrologic research on fluid flow through both pores and fractures. Geochemical studies focus on advanced interpretations of low-temperature flow processes, innovations in analytical geochemistry, isotope and trace-element chemistry with mass spectrometric and

synchrotron-based analyses. Engineering research is concerned with the development of modern nonlinear dynamics with applications to problems in engineering sciences. The Energy Biosciences subprogram focuses on the physics of the photosynthetic apparatus and on the genesis of subcellular organelles.

The **Advanced Light Source**, which began operations in October 1993, is one of the world's brightest sources of ultraviolet light and soft X-rays. Soft X-rays of the ALS are an ideal tool for probing a wide range of electronic structural studies and are particularly useful for x-ray microscopy, surface science, and solid state physics of carbides, actinides and oxides. Such regions of the spectrum also offer special opportunities for research in chemical physics, electron spectroscopy, microscopy, and holography.

The **National Center for Electron Microscopy** provides instrumentation for high-resolution, electron-optical microcharacterization of atomic structure and composition of metals, ceramics, semiconductors, superconductors, and magnetic materials. The facility is home to the Nation's highest voltage microscope, one which specializes in high resolution studies.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory (LLNL) is a Multiprogram Laboratory located on 821 acres in Livermore, California. This laboratory was built in Livermore as a weapons laboratory some distance from the campus of the University of California at Berkeley to take advantage of the expertise of the university in the physical sciences. The Materials Sciences subprogram supports research in metals and alloys, ceramics, materials for lasers, superplasticity in alloys, and intermetallic metals. The Engineering and Geosciences subprogram supports research in the mechanisms and kinetics of low-temperature geochemical processes, laboratory research on the source of electromagnetic response in crustal rocks, modeling and laboratory experiments on rock fracturing, and reactive fluid flow and transport within fractures. The Chemical Sciences subprogram supports a new concept in catalysis, that of plasma assisted catalysis for environmental control of pollutants.

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL) is a Multiprogram Laboratory located on 27,000 acres in Los Alamos, New Mexico. LANL is home to BES major research efforts in materials sciences with other efforts in chemical sciences, geosciences, and engineering. LANL is also the site of an 800 MeV proton linac that is the basis for the Manuel Lujan Jr. Neutron Scattering Center at the Los Alamos Neutron Science Center (LANSCE).

The Materials Sciences subprogram supports research on strongly correlated electronic materials; the theory of evolving microstructures; and plasma immersion processes for ion-beam processing of surfaces for improved hardness, corrosion resistance, and wear resistance. The Chemical Sciences subprogram supports research to understand the electronic structure and reactivity of actinides through the study of organometallic compounds. Also supported is work to understand the chemistry of plutonium and other light actinides in both near-neutral pH conditions and under strongly alkaline conditions relevant to radioactive wastes. The BES Engineering and Geosciences subprogram supports experimental and theoretical research on rock physics, seismic imaging, and the physics of the Earth's electromagnetic field. Engineering research supports work to study the viscosity of mixtures of particles in liquids.

The **Los Alamos Neutron Science Center** provides an intense pulse source of neutrons for both national security research and civilian research. LANSCE comprises a high-power 800-million-electron-volt proton linear accelerator (linac), a Proton Storage Ring (PSR), production targets to the Manuel Lujan Jr. Neutron Scattering Center (Lujan Center) and the Weapons Neutron Research (WNR) facility, and a variety of associated experiment areas and spectrometers. Researchers at LANSCE use neutrons to study materials such as polymers, catalysts, and structural composites that are essential for many modern industrial products. The Lujan Center features instruments for measurement of high-pressure and high-temperature samples, strain measurement, liquid studies, and texture measurement. The facility has a long history and extensive experience in handling actinide samples. A 30 Tesla magnet is being developed for use with neutron scattering.

National Renewable Energy Laboratory

National Renewable Energy Laboratory (NREL) is a program-dedicated laboratory (Solar) located on 300 acres in Golden, Colorado. NREL was built to emphasize renewable energy technologies such as photovoltaics and other means of exploiting solar energy. The Materials Sciences subprogram supports basic research efforts that underpin this technological emphasis at this laboratory. For example, theoretical and experimental research on processing and properties of advanced semiconductor alloys and structures provided the basis for the computer-aided design and fabrication of a prototype solar cell; this cell has achieved 30% efficiency in conversion of the solar spectrum into electric energy. The Chemical Sciences subprogram supports research addressing the fundamental understanding of solid-state, artificial photosynthetic systems. This research includes the preparation and study of novel dye-sensitized semiconductor electrodes, characterization of the photophysical and chemical properties of quantum dots, and study of charge carrier dynamics in semiconductors. There is also basic research in synthesis related to catalysis and to advanced battery research addressing high-efficiency, thin-film cathodes based on doped vanadium and manganese oxides. The BES Energy Biosciences subprogram funds programs to examine the mechanisms of photosynthetic oxygen evolution.

Oak Ridge Institute for Science and Education

Oak Ridge Institute for Science and Education (ORISE) is located on 150 acres in Oak Ridge, Tennessee. The BES program provides funding to ORISE for support of a consortium of university and industry scientists to share the ORNL research station at NSLS to study the atomic and molecular structure of matter (known as ORSOAR, the Oak Ridge Synchrotron Organization for Advanced Research). The BES program also funds ORISE to provide support for expert panel reviews of major new proposal competitions, external peer review of DOE laboratory programs, technical review of proposals for DOE's EPSCoR program, and EPSCoR site reviews and the evaluation of program needs and impacts. ORISE also assists in the writing of annual BES subprogram summary books, the administration of topical scientific workshops, and provides support for other activities such as for the review of the Spallation Neutron Source Conceptual Design Report.

ORISE manages the **Shared Research Equipment Program** (SHaRE) at ORNL. The SHaRE Program has made available state-of-the-art electron beam microcharacterization facilities for collaboration with researchers from universities, industry and other government laboratories.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL) is a Multiprogram Laboratory located on 24,000 acres in Oak Ridge, Tennessee. ORNL is home to major research efforts in materials and chemical sciences with additional programs in engineering and geosciences. It is the site of the High Flux Isotope Reactor (HFIR) and the Radiochemical and Engineering Development Center (REDC). ORNL also leads the five-laboratory collaboration that will design and construct the Spallation Neutron Source (SNS).

ORNL has perhaps the most comprehensive materials research program in the country. The Materials Sciences subprogram supports basic research which underpins technological programs such as the energy efficiency program in superconductivity. Research is supported in superconductivity, magnetic materials, neutron scattering and x-ray scattering, electron microscopy, pulsed laser ablation, thin films, lithium battery materials, thermoelectric materials, surfaces, polymers, structural ceramics, alloys; and intermetallics. Research is carried out on the fundamentals of welding and joining and on welding strategies for a new generation of automobiles. The subprogram emphasizes experiments at HFIR and other specialized research facilities that include the High Temperature Materials Laboratory, the Shared Research Equipment (SHaRE) Program, and the Surface Modification and Characterization Facility.

The Chemical Sciences subprogram supports research in analytical chemistry, particularly in the area of mass spectrometry, separations chemistry, and thermo-physical properties. Examples of the science include solvation in supercritical fluids, electric field-assisted separations, speciation of actinide elements, ion-imprinted sol-gels for actinide separations, ligand design, stability of macromolecules and ion fragmentation, imaging of organic and biological materials with secondary ion mass spectrometry, and the physics of highly charged species.

The Engineering and Geosciences subprogram investigates experimental and analytical geochemistry with innovative technical approaches for low-temperature geochemical processes in reservoirs and crustal rocks. Engineering research supports the Center for Engineering Systems Advanced Research with emphasis in computational nonlinear sciences such as advanced use of neural nets and sensor fusion, stochastic approximations, and global optimization of cooperating autonomous systems such as cooperating, autolearning robots.

The **High Flux Isotope Reactor** is a light-water cooled and moderated reactor with a design power level of 100 megawatts currently operating at 85 megawatts. HFIR provides state-of-the-art facilities for neutron scattering and materials irradiation and is the world's leading source of elements heavier than plutonium for research, medicine, and industrial applications. HFIR has four horizontal beam tubes, which terminate in the neutron scattering beam room. There are a total of 11 instruments in the beam room and one additional instrument on the upper level. The installation of the new liquid hydrogen cold source will provide beams of cold neutrons for scattering research that are as bright as any in the world.

The **Radiochemical Engineering Development Center**, located adjacent to HFIR, provides unique capabilities for the processing, separation, and purification of transplutonium elements.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory (PNNL) is a Multiprogram Laboratory located on 640 acres at the Department's Hanford site in Richland, Washington. The BES Chemical Sciences subprogram supports research in theory and experiment related to the significant environmental clean-up concerns of the Department. Experimental research includes interfacial chemistry of water-oxide systems, near-field optical microscopy of single molecules on surfaces, inorganic molecular clusters, and direct photon and/or electron excitation of surfaces and surface species. Programs in analytical chemistry and in applications of theoretical chemistry to understanding surface catalysis are also supported by the Chemical Sciences subprogram; included are high-resolution laser spectroscopy for analysis of trace metals on ultra small samples, understanding the fundamental inter- and intra-molecular effects unique to solvation in supercritical fluids, and interfacing theoretical chemistry with experimental methods to address complex questions in catalysis. Theoretical, ab-initio quantum molecular calculations are integrated with modeling and experiment. The Materials Sciences subprogram supports research on stress-corrosion cracking of metals and alloys, high-temperature corrosion fatigue of ceramic materials, and irradiation effects in ceramic materials relevant to radioactive waste containment. The Engineering and Geosciences program supports research on basic theoretical and experimental geochemical research that underpins technologies important for the Department's environmental missions and research to improve our understanding of the phase change phenomena in microchannels.

Princeton Plasma Physics Laboratory

Princeton Plasma Physics Laboratory (PPPL) is a program-dedicated laboratory (Fusion Energy Sciences) located on 72 acres in Princeton, New Jersey. The Basic Energy Sciences (BES) program funds a research program that is part of the Department's participation in the AMTEX Partnership™ to enhance the competitiveness of the U.S. Textile Industry. The program, entitled On-Line Process Control (OPCon), seeks to identify and develop technologies to provide faster transition between products, efficient production of small lots, and improved economics via elimination of off-quality production and off-line testing. The BES supported work is focussed on development of instrumentation to measure fiber morphology in real time during synthetic fiber production by analysis of passive and active light scattering to measure birefringence of fibers.

Sandia National Laboratories

Sandia National Laboratories (SNL) is a Multiprogram Laboratory located on 3,700 acres in Albuquerque, New Mexico (SNL/A), with sites in Livermore, California (SNL/L), and Tonapah, Nevada. SNL is home to significant research efforts in materials and chemical sciences with additional programs in engineering and geosciences. SNL is also the site of the Combustion Research Facility (CRF).

SNL has a historic emphasis on electronic components needed for Defense Programs. The laboratory has very modern facilities in which unusual microcircuits and structures can be fabricated out of various semiconductors. Many of the research projects supported by the Materials Sciences subprogram at SNL/A are relevant to the overall mission of the laboratory. Included among these are projects on the processing and properties sol-gel chemistry of ceramic coatings; the development of nanocrystalline

materials through the use of inverse micelles; adhesion and wetting of surfaces of metals, glass, and ceramic materials; theoretical and experimental research of defects; and interfaces in metals and alloys. The leading program on the theory, structure, and dynamics of two-dimensional surface alloys is at SNL/L.

The BES geophysics research effort at SNL/A supports fundamental laboratory and imaging studies on rock mechanics, seismologic, and electromagnetic inversion studies, and experimental and theoretical studies on fluid and particulate flow in porous and fractured rock. Geosciences research focuses on theoretical and experimental geochemical investigations of stability and transport within minerals stable in the Earth's crust. Engineering research addresses the viscosity of mixtures of particles in liquids.

The **Combustion Research Facility** at SNL/L is an internationally recognized facility for the study of combustion science and technology. In-house efforts combine theory, modeling, and experiment including diagnostic development, kinetics, and dynamics. Basic research supported by the Chemical Sciences subprogram is often done in close collaboration with applied problems. Several innovative non-intrusive optical diagnostics such as degenerate four-wave mixing, cavity ring-down spectroscopies, high resolution optical spectroscopy, and ion-imaging techniques have been developed to characterize combustion intermediates. A principal effort in turbulent combustion is coordinated among the BES chemical physics program, the Office of Fossil Energy, and the Office of Energy Efficiency and Renewable Energy.

Stanford Linear Accelerator Center

Stanford Linear Accelerator Center (SLAC) is a program-dedicated laboratory (High Energy Physics) located on 426 acres in Menlo Park, California. It is the home of the Stanford Synchrotron Radiation Laboratory (SSRL) and peer-reviewed research projects associated with SSRL. The **Stanford Synchrotron Radiation Laboratory** was built in 1974 to take the intense x-ray beams from the SPEAR storage ring that was built for particle physics by the SLAC laboratory. Over the years, the SSRL grew to be one of the main innovators in the production and use of synchrotron radiation with the development of wigglers and undulators that form the basis of all third generation synchrotron sources. The facility is now comprised of 25 experimental stations and is used each year by over 700 researchers from industry, government laboratories and universities. These include astronomers, biologists, chemical engineers, chemists, electrical engineers, environmental scientists, geologists, materials scientists, and physicists. The Materials Sciences subprogram supports a research program at SSRL with emphasis in both the x-ray and ultraviolet regions of the spectrum. SSRL scientists are world leaders in photoemission studies of high-temperature superconductors and in x-ray scattering.

Thomas Jefferson National Accelerator Facility

Thomas Jefferson National Accelerator Facility (TJNAF) is a program-dedicated laboratory (Nuclear Physics) located on 273 acres in Newport News, Virginia. The Basic Energy Sciences program funds a research project at TJNAF related to fourth generation light sources based on linac-driven free electron lasers.

All Other Sites

The BES program funds research at 135 colleges/universities located in 43 states. This line also includes funding of research awaiting distribution pending completion of peer review results.

Materials Sciences

Mission Supporting Goals and Objectives

The Materials Sciences subprogram supports basic research in condensed matter physics, metals and ceramics sciences, and materials chemistry. This basic research seeks to understand the atomistic basis of materials properties and behavior and how to make materials perform better at acceptable cost through new methods of synthesis and processing. Basic research is supported in corrosion, metals, ceramics, alloys, semiconductors, superconductors, polymers, metallic glasses, ceramic matrix composites, catalytic materials, non-destructive evaluation, magnetic materials, surface science, neutron and x-ray scattering, chemical and physical properties, and new instrumentation. Ultimately the research leads to the development of materials that improve the efficiency, economy, environmental acceptability, and safety in energy generation, conversion, transmission, and use. These material studies affect developments in numerous areas, such as the efficiency of electric motors and generators; solar energy conversion; batteries and fuel cells; stronger, lighter materials for vehicles; welding and joining of materials; plastics; and petroleum refining.

Climate Change Technology Initiative. Research routes to improved carbon management in support of the Climate Change Technology Initiative include improved heat and corrosion resistant alloys to increase the efficiency of power generation, reducing energy losses in motors via improved magnetic materials, and displacing fossil fuels with higher-efficiency photovoltaic cells.

Performance Measures

- Continue Partnerships for Academic-Industrial Research where peer reviewed grants are awarded to university researchers for fundamental, high-risk work jointly defined by the academic and industrial research partners.
- Continue fabrication of instrumentation for the short-pulse spallation source at the Manuel Lujan Jr. Neutron Scattering Center at the Los Alamos Neutron Science Center.

	FY 1998	FY 1999	FY 2000
Materials Sciences Research			
■ **Structure of Materials:** This activity supports basic research in the characterization and structure of materials; the relationship of structure to the behavior and performance of materials; predictive theory and modeling; and new materials such as bulk metallic glasses and dimensionally restricted forms (films, dots) of materials. This activity provides world-class scientific user facilities to the Nation through the operation of four complementary and network interfaced electron beam microcharacterization user centers. These centers contain a variety of highly specialized instruments that complement each other in terms of their ability to characterize localized atomic positions and configurations, chemical gradients, interatomic bonding forces, etc. Major activities in FY 2000 will be responsive to the increasing demand for advanced facilities and models with capabilities to characterize and interpret the atomic structure, composition, bonding, and physical properties of materials with improved resolution and accuracy. Capital equipment needs for FY 2000 are expected to relate to facility refurbishment and upgrade.	24,455	25,655	25,390
■ **Mechanical Behavior and Radiation Effects:** These activities support basic research in the mechanical behavior of materials including load-bearing capability, failure and fatigue resistance, fracture toughness and impact resistance, high-temperature strength and dimensional stability, ductility or deformability of materials that is critical to their ease of fabrication, and radiation effects including understanding and modeling of radiation damage and surface modification using ion implantation. These activities relate to energy production and conversion through the need for failure resistant materials that perform reliably in the hostile and demanding			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
environments of energy production and use. The scientific results of this program also contribute to DOE missions in the areas of fossil energy, fusion energy, and radioactive waste storage. Major activities in FY 2000 will include continued development of experimental techniques and methods for the characterization of properties, the advancement of models and theories for interpretation, and the design and investigation of new materials and material structures. Capital equipment is needed for mechanical testing machines, especially with high-temperature capabilities, furnaces, and characterization equipment.	15,223	15,965	15,800
■ **Physical Behavior:** These activities support basic research in the physical behavior of materials, including aqueous, galvanic, and high-temperature gaseous corrosion and their prevention; photovoltaics and photovoltaic junctions and interfaces for solar energy conversion; the relationship to crystal defects and processing parameters to the superconducting current parameters for high-temperature superconductors; phase equilibria and kinetics of reactions in materials in hostile environments such as in the very high temperatures encountered in energy conversion processes; diffusion and the transport of ions in ceramic electrolytes for improved performance batteries and fuel cells. Major efforts in FY 2000 will continue fundamental studies of the mechanisms governing material response to aqueous, galvanic, and high-temperature gaseous corrosion; the processing and investigation of semiconductor materials and structures leading to enhanced solar energy conversion efficiencies; crystal defects, grain boundaries and interfaces for high-temperature superconductors; mechanisms controlling material response to hostile environments; and the structure and behavior of ceramic electrolytes for advanced fuel cells. Capital equipment is needed for corrosion studies and for electronic and spectroscopy instruments for the characterization of electronic, optoelectronic properties, and electrical properties of semiconductors, superconductors, and fuel cell electrolytes.	13,562	14,225	14,078

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Engineering Behavior:** These activities support basic research in the engineering behavior of materials. The research includes the synthesis and processing of materials with new or improved behavior, for minimization of waste, and with hard and wear resistant surfaces to reduce friction and wear; high-rate, superplastic forming of light-weight, metallic alloys for fuel efficient vehicles; high-temperature, structural ceramics and ceramic matrix composites for high-speed cutting tools and fuel efficient and low-pollutant engines; non-destructive analysis for early warning of impending failure and flaw detection during production; response of magnetic materials to applied static and cyclical stress; plasma, laser, charged particle beam surface modification to increase corrosion resistance; processing of high-temperature, intermetallic alloys. These activities underpin many of the DOE technology programs, and appropriate linkages have been established in the areas of light-weight, metallic alloys; structural ceramics; high-temperature superconductors; and industrial materials, such as intermetallic alloys. The activity includes the operation of the Materials Preparation Center that makes available small quantities of specialized research quality materials for research purposes that are not commercially or otherwise available. Major activities for FY 2000 will include continued work on design of new material compositions and structures, synthesis and processing new and enhanced materials, and characterization and interpretation of material behavior. Capital equipment includes furnaces, lasers, processing equipment, plasma and ion sources, and deposition equipment.	20,211	21,205	20,985
■ **Neutron and X-ray Scattering:** This activity supports basic research in condensed matter physics that makes use of neutron and x-ray scattering at major BES-supported user facilities. This research is aimed at a fundamental understanding of the atomic, electronic, and magnetic structure of materials and the effect of structure on the physical properties of materials. In FY 2000, measurements			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
of particular interest will include neutron and x-ray scattering from materials which exhibit complex phenomena resulting from competing interactions among the charge and spin of electrons and the crystalline lattice. New instruments and techniques to use neutron and x-ray beams will be developed. The level of support for this activity is determined by balance among all activities in condensed matter physics and by the availability of the neutron and x-ray beams to the scientific community and peer review of proposals. The enhancements of the High Flux Isotope Reactor and the Los Alamos Neutron Science Center, described later, will increase significantly the capacity for neutron scattering. In the long term, the Spallation Neutron Source will make a qualitative difference in the kinds of experiments that can be done. This activity will support increased research in neutron scattering to take advantage of the improved sources and to prepare for the Spallation Neutron Source. Capital equipment is provided for such items as detectors, monochromators, mirrors, and beamline instrumentation.	18,739	19,700	19,495
■ **Experimental Condensed Matter Physics:** This activity supports fundamental experimental research in condensed matter physics. This research includes measurements of the properties of solids, liquids, glasses, surfaces, thin films, artificially structured materials, self-organized structures, and nanoscale structures. This research is aimed at a fundamental understanding of the behavior of materials which underpins all DOE technologies. The materials examined include magnetic materials, superconductors, semiconductors and photovoltaics, liquid metals and alloys, and complex fluids. The measurements include optical and laser spectroscopy, electrical and thermal transport, thermodynamic and phase transition measurements, nuclear magnetic resonance, and scanning-tunneling and atomic-force microscopies. The development of new techniques and instruments including magnetic force microscopy, electron microscopic techniques, and innovative applications of laser spectroscopy are major			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
components of this activity. Measurements will be made under extreme conditions of temperature, pressure and magnetic field - especially with the availability of the 100 Tesla pulsed field magnet at LANL. The major efforts in FY 2000 will include continued support for investigations of materials with increasingly complex behavior, composition and structures with strongly competing interactions among the electronic charge and spin, and the crystalline lattice. A major new activity will be the synthesis and fabrication of unusual materials systems with pulsed laser ablation epitaxy, self-organized structures, and engineered materials and structures to provide insight into unusual behavior. Capital equipment is provided for items such as lasers, scanning tunneling microscopes, electron detectors for photoemission experiments, sample chambers, superconducting magnets and computers.	26,147	27,450	27,165
■ **Condensed Matter Theory, Particle-Solid Interactions, and Engineering Physics:** This activity supports basic research in theory and simulations, the use of ion beams to modify the properties of materials, and engineering applications. The theory activity complements much of the experimental work by guiding and stimulating experiments. The centers are group thrust areas in which individual scientists from widely different backgrounds work together to work on common research areas or making use of a common research facility. Included among these are the Center for X-ray Optics and the Center for Advanced Materials at LBNL and the Surface Modification and Characterization Facility at ORNL. Additionally, the design and construction of new, unique research instruments, such as the 100 Tesla Pulsed Field Magnet and the actinide photoelectron spectrometer at LANL, are supported in this activity. The emphasis in engineering physics is on the use of fundamental science to advance technology. Engineering physics includes activities			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
such as the application of sound waves for refrigeration; the fabrication of small, machined structures using x-rays; and the development of new, electron microscopy techniques such as the Z-contrast electron microscope at ORNL. This activity is science driven. Capital equipment is provided for items such as computer work stations, sample chambers, and high resolution electron microscopes. BES will provide opportunities for college faculty and students to spend time at DOE laboratories, to participate in world-class research projects. Faculty/Student Science Teams will visit our labs during the academic/summer semesters, be involved in conducting research, writing proposals, utilizing technology and pursuing technical or scientific careers. Primary goals of the Science Teams are to build long-term partnerships among DOE laboratories and provide faculty/students with a deeper understanding of DOE science associated needs for research and development. Funds will be provided to pay for faculty/student stipends, travel, housing, and subsidize laboratory scientists' time for this activity ($1,947,000).	19,553	20,555	22,341
■ **Materials Chemistry:** This activity supports basic research on the chemical properties of materials to understand the effect of chemical reactivity on the behavior of materials and to synthesize new chemical compounds and structures from which better materials can be made. The research is aimed at a fundamental understanding of the behavior of novel materials and structures. This activity includes research in solid state chemistry, surface chemistry, polymer chemistry, crystallography, synthetic chemistry, and colloid chemistry, which underpin technologies such as fuel cells, batteries, membranes, catalysis, electrochemistry, and solar energy conversion. This activity includes investigations of novel materials including low-dimensional, self-assembled monolayers; polymeric conductors; organic superconductors and magnets; complex fluids; and biomolecular materials. The research employs a wide variety of experimental techniques to characterize these materials including x-ray photoemission			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
and other spectroscopies, scanning tunneling and atomic force microscopies, nuclear magnetic resonance (NMR), and x-ray and neutron reflectometry. The activity also supports the development of new experimental techniques such as double rotation NMR, neutron reflectometry, and atomic force microscopy of liquids. Workshops on self-organized materials, electrode-electrolyte interfaces, catalysis, surface science and synchrotron x-ray micro-characterization have stimulated increased emphasis for these areas. Capital equipment is provided for such items as chambers to synthesize and grow new materials, nuclear magnetic resonance and electron spin resonance spectrometers, lasers, neutron reflectometers, x-ray beamlines, and atomic force microscopes.	23,547	24,715	24,458
■ **Experimental Program to Stimulate Competitive Research:** This activity supports basic research spanning the entire range of research supported by the Department in states that have historically received relatively less Federal research funding. The EPSCoR program supports research cluster activities at nine EPSCoR states through block grants and to individual investigator projects in all EPSCoR states and Puerto Rico. The EPSCoR states include Alabama, Arkansas, Idaho, Kansas, Kentucky, Louisiana, Maine, Mississippi, Montana, Nebraska, Nevada, North Dakota, Oklahoma, South Carolina, South Dakota, Vermont, West Virginia, and Wyoming, and the Commonwealth of Puerto Rico. The work supported by the EPSCoR program includes research in organic semiconductors, membranes, photochemistry, synchrotron radiation and ion beams, tribology, thin film optoelectronics, catalysis, high energy particle physics, experimental nuclear physics, human genome research, desert vegetation, characterization of petroleum reservoirs, and wind and electrochemical power sources. In FY 2000, this program will include new work that will make use of the DOE National Laboratories and the world-class facilities at these labs. This program will be science-driven and will support the most meritorious proposals based on peer review. Workshops and discussions have been held with representative scientists from EPSCoR states to acquaint them with the facilities and personnel at the DOE Laboratories.	6,815	6,815	6,815

EPSCoR Distribution of Funds by State

(dollars in thousands)

	FY 1998 Actual	FY 1999 Estimate	FY 2000 Estimate
Alabama	800	825 [a]	75
Arkansas	50	100	100
Idaho	50	100	100
Kansas	50	91	95
Kentucky	800	650 [a]	200

Totals	6,815	6,815	6,815

[a] In FY 1998 the funding commitments for awards to the States of Louisiana and Montana expire. In FY 1999, the funding commitments to the States of Alabama, Kentucky, Maine, Nevada, and Puerto Rico will expire.

[b] Includes technical support for the Experimental Program to Stimulate Competitive Research (EPSCoR). Uncommitted funds in FY 2000 will be competed among all EPSCoR states that do not have active Research Implementation Awards to begin new Research Implementation Awards.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Los Alamos Neutron Science Center (LANSCE) instrumentation enhancement:** This project is a major item of equipment with a total estimated cost of $20,500,000 that will provide enhanced instrumentation at the LANSCE and will be implemented concurrently with an accelerator upgrade funded by the Office of Defense Programs.	4,500	4,500	6,000
■ **Extension of HB-2 beam tube at the High Flux Isotope Reactor:** This project, a major item of equipment with a total estimated cost of $5,900,000 will provide beam access for six thermal neutron scattering instruments. Beam guides and optimized geometry will provide a neutron flux at the instrument positions 2-3 times higher than currently available.	0	3,500	2,400
■ **Replacement of High Flux Isotope Reactor Monochrometer Drums.**	0	1,800	0
■ **Spallation Neutron Source (SNS):** Conceptual design of the Spallation Neutron Source (SNS) was completed in FY 1997. FY 1998 funding will support continued Pre-Title I research and development on the SNS. Beginning in FY 1999, SNS research funding in support of construction is reflected in the facility operations section of this budget.	23,000	0	0
■ **Climate Change Technology Initiative:** Basic research in carbon management for the Climate Change Technology Initiative will focus on three areas: high temperature materials, magnetic materials, and semiconductor materials. A major goal in a carbon management program is the derivation of materials that can withstand higher temperatures for more efficient combustion and for improved properties in applications. Research will focus on attaining an atomic-level understanding and a predictive capability for bulk metallic glasses, which have the potential to make significant contributions in corrosion and wear resistance in fossil fueled power plants, and on structural ceramics, which will be used in high temperature applications such as engine components. Additional work will focus on a fundamental understanding of the			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
surface physics and chemistry of oxide layers, which is expected to produce alloys and coatings that have improved corrosion resistance at high temperatures. A second goal is the derivation of magnetic materials to reduce energy loss during use. Research on the microstructure of permanent magnetic materials to understand the optimum grain structure is expected to result in stronger magnets, and research in the processing of magnetic materials is expected to optimize magnetic properties. Taken together, research in magnetic materials is critical to energy efficiency, since electric motors consume about two-thirds of U.S. electric power. A final goal in the areas of materials sciences is the development of new semiconductor materials for solar energy conversion stressing very innovative studies in nanoscale and mesoscale physics that might lead to breakthrough advances. The research will focus on improving the efficiency of the conversion of light to electricity. For example, research in the physics of quantum confinement might lead to new nanoscale structures that can be tuned to absorb the full spectrum of sunlight, which, when coupled to electron transport structures, would provide new ways to convert sunlight to electricity.	0	1,708	3,415
Total, Materials Sciences Research	195,752	187,793	188,342

Facilities Operations

- **Operation of National User Facilities:** The facilities included in Materials Sciences are: National Synchrotron Light Source, High Flux Beam Reactor (currently not operating), Intense Pulsed Neutron Source, Stanford Synchrotron Radiation Laboratory, Manuel Lujan, Jr. Neutron Scattering Center, High Flux Isotope Reactor, Advanced Light Source, and the Advanced Photon Source. Research and development in support of construction of the Spallation Neutron Source is also included. The facility operations budget request, which includes operating funds, capital equipment, and Accelerator and Reactor Improvements (AIP) funding under $5,000,000, is

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
provided in a consolidated manner later in this budget. AIP funding will support additions and modifications to accelerator and reactor facilities which are supported in the Materials Sciences subprogram. Included in the AIP funding are funds for the HFIR upgrade. Capital equipment is needed at the facilities for items such as beam monitors, interlock systems, vacuum systems, beamline front end components, monochromators, and power supplies. A summary of the funding for the facilities included in the Materials Sciences subprogram is provided below. Additional funds for facility operations for some of these facilities are included in the Chemical Sciences subprogram of this budget.	186,076	217,104	209,599

(dollars in thousands)

Facilities	FY 1998	FY 1999	FY 2000

Explanation of Funding Changes From FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Materials Sciences Research	
■ Decrease in research for structure of materials.	-265
■ Decrease in research for mechanical behavior and radiation effects.	-165
■ Decrease in research for physical behavior.	-147
■ Decrease in research for engineering behavior	-220
■ Decrease in research for neutron and x-ray scattering.	-205
■ Decrease in research for experimental condensed matter physics.	-285
■ Decrease in materials research for condensed matter theory, particle-solid interactions, and engineering physics.	-161
■ Increase in funding will provide opportunities for college faculty and students to spend time at DOE laboratories to participate in world class research projects.	+1,947
■ Decrease in research for materials chemistry.	-257
■ Increase in capital equipment for LANSCE instruments	+1,500
■ Decrease in capital equipment funds for extension of HB-2 beam tube at HFIR for thermal neutron scattering because of completion of scheduled activities	-1,100
■ Decrease in capital equipment funds for monochromator drums on HB-1 and HB-3 because of completion of scheduled activities	-1,800
■ Increase support for Climate Change Technology Initiative.	+1,707
Total, Materials Sciences Research	+549

	FY 2000 vs. FY 1999 ($000)
Facilities Operations	
■ Decrease in SNS research and development funds because scheduled activities supporting construction are nearing completion	-10,700
■ Slight increase in support for the operation of major scientific user facilities.	+1,595
■ Increase in AIP funds for HB-4 beamline enclosure at HFIR.	+ 1,600
Total, Facilities Operations	-7,505
SBIR/STTR	
■ Decrease SBIR/STTR funding due to decrease in operating expenses.	-94
Total Funding Change, Materials Sciences	-7,050

Chemical Sciences

Mission Supporting Goals and Objectives

The Chemical Sciences subprogram has two major components. The disciplinary areas within each component are connected to and address needs of the principal DOE and BES mission goals and objectives. One major component is comprised of atomic, molecular and optical (AMO) physics; chemical physics; photochemistry; and radiation chemistry. This research provides a foundation for understanding fundamental interactions of atoms, molecules, and ions with photons and electrons. This work also underpins our fundamental understanding of chemical reactivity. This, in turn, enables the production of more efficient combustion systems with reduced emissions of pollutants. It also increases knowledge of solar photoconversion processes resulting in new, improved systems and production methods. Completely unanticipated benefits from this research often result. For example, research supported by the Chemical Sciences subprogram on small atomic clusters led to the discovery of the new forms of carbon named the fullerenes, typified by C_{60} (buckminsterfullerene). The 1996 Nobel Prize in chemistry was awarded to the scientists who made this discovery. The other major component of the research program is comprised of inorganic chemistry, organic chemistry, analytical chemistry, separations science, heavy element chemistry, and aspects of chemical engineering sciences. The research supported provides a better molecular level understanding of homogeneous and heterogeneous reactions occurring at surfaces, interfaces, and in bulk media. This has resulted in improvements to known heterogeneous and homogeneous catalytic systems and to new catalysts for the production of fuels and chemicals, better analytical methods in a wide variety of applications in energy processes and environmental sciences, new knowledge of actinide elements and separations important for environmental remediation and waste management, and better methods for describing turbulent combustion and predicting thermophysical properties of multicomponent systems.

Climate Change Technology Initiative. The chemical physics and photochemistry components of the research program provide the underlying chemical science needed to address carbon management. These areas enable more efficient combustion and new understanding of the photochemical conversion of CO_2 and the direct conversion of solar radiation to electricity. The component of the research program, comprised of separations science, physical chemistry and inorganic chemistry, provides the basis for new and improved catalysts for conversion of fuels to carbon dioxide and hydrogen, potentially for carbon dioxide conversion to chemicals, separation of the conversion components, and new electrochemical energy production and storage systems.

Scientific Simulation Initiative. This subprogram includes the Combusion Systems Integrated Applications component of DOE's Scientific Simulation Initiative (SSI), an integrated effort bringing together computational and communication resources, focused research in scientific disciplines, and research in computer science and other enabling technologies to solve the complex problems that characterize DOE's scientific research needs.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Chemical Sciences Research	128,452	132,750	139,230	+6,480	+4.9%
Facilities Operations	67,675	68,928	71,430	+2,502	+3.6%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Chemical Sciences Research

- **Photochemistry and Radiation Research:**
  - The photochemistry research program investigates, at the molecular level, fundamental processes that capture and convert solar energy. Fundamental concepts of light-induced charge separation at the molecular level are developed for application to photodriven endothermic reactions for the conversion of light energy to chemical energy. In addition, photochemistry presents opportunities for altering chemical reaction pathways so that high volume industrial intermediates and specialty chemicals can be produced by less polluting processes. The program encompasses organic and inorganic photochemistry, electron and energy transfer in homogeneous and heterogeneous media, photocatalysis, and photoelectrochemistry. Naturally occurring photosynthetic reaction centers and antenna systems are studied as models of biomimetic/ photocatalytic assemblies that can carry out efficient photoinduced charge separation.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
▸ Related to the photochemistry program but using different techniques is the radiation chemistry research program. This program supports research on the chemical effects produced by the absorption of energy from ionizing radiation. A major goal is to obtain molecular level information on chemical reactivity in solution, reactive transient intermediates, the kinetics and mechanisms of chemical reactions and processes at the solid/liquid interface. Frequently the studies are on systems that are not amenable to investigation by other techniques. Results from this research provide information on transients in solution and intermediates at liquid/solid interfaces for resolving important issues in solar photochemical energy conversion, environmental waste management and remediation; and intermediates relevant to nuclear energy production.			
▸ Recent workshops entitled "Research Opportunities in Photochemical Sciences" and "Research Needs and Opportunities in Radiation Chemistry" have helped identify issues for FY 2000 emphasis. These include: the fundamental mechanisms of inorganic and organic semiconductor electrode corrosion and passivation; improved theoretical models of heterogeneous electron and hole transfer across semiconductor interfaces; studies of the photophysics and chemistry of molecular excited states; control of the energetics of water splitting redox chemistry; and better understanding of the fundamental principles of photoinduced energy and charge transfer in natural and artificial photosystems as functions of structure, energetics, and medium.			
▸ Capital equipment is provided for such items as lasers, microscope scanners, liquid chromatographs, and temperature controllers.	24,907	23,927	22,982

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Chemical Physics Research:** This program investigates, at the molecular level, chemical reactions in the gas phase, at surfaces, and at interfaces and the relationship between molecular scale phenomena and bulk phenomena. Research activities involve closely-coupled experimental and theoretical efforts. Experimental projects include studies of molecular dynamics, chemical kinetics, spectroscopy, clusters, and surface science. The surface science and clusters research is aimed at providing predictive capability for surface mediated catalysis through provision of explanatory theories relating surface structure to surface mediated chemistry. One of the goals of the chemical physics program is to provide data and techniques for producing or predicting the values of chemical reaction rates to be included in combustion models for predicting the efficiency and emission characteristics of combustion devices and for optimization and control of combustion devices.	26,713	27,836	27,401
■ **Atomic, Molecular, and Optical (AMO) Science:**			
▸ This program supports theory and experiment to understand the interactions among atoms, molecules, ions, electrons, photons, and electromagnetic fields. This work provides the most basic underpinning of a broad spectrum of BES research activities including chemical reactivity, chemical physics, analytical techniques, materials sciences, and new instrumentation. It is this program that contributes knowledge at the most fundamental level necessary for science-based optimization of current energy sources and development of new ones. Furthermore, this program has produced our most detailed understanding of the interactions of particles with matter which enables us to understand the phenomena observed at the BES-supported synchrotron radiation light sources, the electron beam microcharacterization centers, and the neutron scattering facilities.			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Furthermore, work in AMO science has produced measurement techniques and instrumentation that is widely used by other scientific disciplines and by industry and medical sciences.			
▸ A recent workshop entitled "Atomic, Molecular, and Optical Physics Workshop" has helped define areas of priority for BES for FY 2000 and beyond. That workshop was the first in a series of annual workshops that will link the BES-supported AMO science community with other scientific and technical communities. Program priorities include a detailed understanding of the interactions of photons, electrons, ions, and heavy particles with matter including a fundamental understanding of the interaction of optical electromagnetic fields with matter in the high field regime; novel states of matter induced by such interactions; and the control of matter by these light fields. Priority research also incudes studies of novel materials such as nanostructured materials, quantum dots, and artificial atoms; and heavy-ion and highly-charged ion collisions.			
▸ Capital equipment is provided for such items as pulse processing electronics, laser upgrades, position sensitive and solid state (SiLi) detectors.	9,926	10,200	10,213
■ **Catalysis and Chemical Transformations:**			
▸ This activity supports basic research related to chemical transformations and conversions that are fundamental to new or existing concepts of energy production and storage. The emphasis is on understanding the fundamental chemical principles underlying the new and developing technologies. Of particular interest are research activities with the objectives of understanding the chemical aspects of catalysis, both heterogeneous and homogeneous; the chemistry of fossil resources; the conversion of biomass and related cellulosic wastes; and the			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
chemistry of precursors to advanced materials. The disciplines of organic, organometallic, inorganic, physical, and thermochemistry are central to these programs.			
▸ Catalysts are crucial to energy conservation in creating new, less-energy-demanding routes for the production of basic chemical feedstocks and value-added products. The creation of new organometallic precursors has the potential of providing materials that are synthesized by less-energy-intensive processes than older materials that they replace or which function as energy-saving media themselves. These activities are linked with other catalyst related activities in BES in the materials chemistry and chemical physics programs; to other activities in the Department (Office of Heavy Vehicle Technology and the Office of Industrial Technology within EE, the Office of Fossil Energy, and the Office of International Development), and to programs at NSF.			
▸ For FY 2000, new opportunities identified through workshops and changing directions within this field of science are in aqueous catalytic chemistry, understanding the interface between water and catalytic oxides, and in catalytic activation and conversion of chlorofluorocarbons. Another area associated with the Climate Change Technology Initiative is the development of catalysts and catalytic processes for the transformation of carbon dioxide, i.e., the development of chemistry for new or improved CO_2 sequestration concepts.			
▸ Capital equipment is provided for such items as ultrahigh vacuum equipment, Fourier-transform infrared instrumentation, and high-field, solid-state NMR spectrometers.	21,883	23,401	22,854

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Separations and Analysis:**			
▸ The separations science activity supports basic research to improve our understanding of methods for separating mixtures of gases, liquids, solids, and their component molecules, cations, and anions. The program covers a broad spectrum of separations concepts, including membrane processes, extraction under both standard and supercritical conditions, adsorption, chromatography, photodissociation, and complexation. The research addresses the fundamental molecular level questions underlying the single most energy consuming of all industrial processes -- separations. The science has wide applicability and the potential for significant savings. There are strong links between this effort and the separations and analysis efforts in the Environmental Management Science Program.			
▸ The analysis activity supports research on phenomena basic to analytical methods with the goal of improving the sensitivity, reliability, and/or productivity of analytical determinations. Chemical and physical principles that can lead to entirely new methods of analysis are investigated; however, this program does not support instrument development. Rather, the program is aimed at obtaining a thorough understanding of the basic chemistry of analytical techniques so that their utility can be realized.			
▸ Several opportunities have been identified for FY 2000 that would provide the foundations needed to advance new technologies. These include advances in ceramic membranes, improved understanding of supercritical fluids for separations, applications of combinatorial chemistry to ligand design, reliable calibration methods for laser ablation sources, and improved understanding of surface-enhanced Raman spectroscopy.			
▸ Capital equipment is provided for such items as computational workstations and inductively-coupled plasma atomic emission spectrometers.	14,248	13,528	13,406

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Heavy Element Chemistry:**			
▸ This program focuses on the chemical and certain physical properties of the actinide elements, principally the transuranium elements. A variety of investigations are pursued, including organometallic chemistry, chemistry of excited spectroscopic states, thermochemistry of actinide elements and compounds, chemistry of actinides in near-neutral aqueous solutions, the reactions of aqueous actinide ions with various complexing agents, development of preparative methods for actinide metals, and compounds and characterization of actinides in the solid state under pressure. This research is performed principally at the national laboratories because of the special facilities required for handling radioactivity.			
▸ This program is the principal source of support in fundamental chemistry of the actinide elements for the Nation. The Department has assumed stewardship responsibilities for providing the Nation with basic knowledge of the chemistry of these elements because of their importance to nuclear technology and to the Department's efforts to remediate its former weapons production sites. There are strong links between this activity and the actinide chemistry efforts in the Environmental Management Science Program.			
▸ For FY 2000, new opportunities have been identified in the emerging areas of aqueous coordination chemistry, solid-state speciation and reactivity, and advanced theoretical methods for the prediction of electronic and molecular structure and reactivity.			
▸ Capital equipment is provided for such items as an x-ray diffractometer and equipment for a synchrotron light source end station.	6,239	6,862	6,774

(dollars in thousands)

FY 1998	FY 1999	FY 2000

- **Chemical Energy and Chemical Engineering:**
  - This activity addresses energy aspects of chemically related engineering sciences, including thermodynamics, turbulence related to combustion, and physical and chemical rate processes. Particular attention is given to experimental and theoretical aspects of phase equilibria, especially of mixtures, including supercritical phenomena, and to the physics of gas phase turbulence. Also included are fundamental studies of thermophysical and thermochemical properties. Emphasis is given to improving and/or developing the scientific base for engineering generalizations and their unifying theories. Also included is fundamental research in areas critical to understanding the underlying limitations in the performance of non-automotive electrochemical energy storage systems. Areas of research include anode, cathode, and electrolyte systems and their interactions with emphasis on improvements in battery size, weight, life, and recharge cycles. The program covers a broad spectrum of research including fundamental studies of composite electrode structures, failure and degradation of active electrode materials, and thin film electrodes, electrolytes, and interfaces.
  - This activity provides support for those fundamental chemical engineering sciences that underpin nearly all energy intensive industrial chemical processes; particular emphasis is placed on electrochemical storage and turbulence both in combustion and in fluid flow where significant energy savings are possible. There are strong links with the combustion efforts in chemical physics and with other combustion efforts within the Department coordinated through the Combustion Coordinating Committee. The battery research efforts are coordinated with those in the Office of Transportation Technologies and the federal interagency battery consortium.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ For FY 2000 a new opportunity has been identified associated with the need to couple the current emphasis of the program in molecular simulations with molecular level theory.	8,044	8,869	8,448
■ **Climate Change Technology Initiative:** Basic research in carbon management will emphasize atomic and molecular level understanding of chemical processes to enable predictive capability. A major component of the research will aim at reducing emissions of carbon dioxide through fundamental understanding of the chemistries associated with combustion, catalysis, photochemical energy conversion, electrical energy storage, electrochemical interfaces, and molecular specific separation from complex mixtures. In particular, multidisciplinary efforts are required that focus on improved understanding of new and existing chemical and physical separation processes, transport mechanisms, and membrane systems with selective chemical functionality; this work will address issues that are critical to clean and efficient fuels in a reduced green-house-gas economy, such as separation of CO_2 from complex mixtures or new concepts for economical oxygen separation from air for partial oxidation schemes. In addition, work will be initiated using supercritical carbon dioxide as a reagent for the catalytic and photochemical reduction of carbon dioxide to specialty chemicals or hydrocarbons, thus preventing their release into the atmosphere. Examples of these activities are: understanding charge separation and electron transfer processes critical to photochemical reduction of carbon dioxide with water or hydrogen to hydrocarbons; understanding the interactions and dynamics between molecules and catalysts that result in new catalysts for carbon dioxide insertion into chemicals and understanding the complex relationship between chemical reaction dynamics and turbulence that are critical to improving the efficiency of fossil fuel combustion processes.	0	2,197	4,394

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Scientific Simulation Initiative, Combustion Simulation and Modeling:** This research effort, part of the overall DOE Scientific Simulation Initiative, will develop, through simulation and modeling, a deep and detailed understanding of combustion processes to accelerate the development, characterization, and validation of design tools for advanced combustion devices. Combustion processes are extraordinarily complex, consisting of hundreds of chemical reactions that comprise combustion chemistry, fluid dynamics with turbulence scales covering 6 orders of magnitude, and interactions between chemistry and fluid dynamics involving time and spatial scales that cover 12 orders of magnitude. To address this complexity, the problem will be broken into computational regimes: device scale, subgrid, and chemistry models. The chemistry models, using modern quantum mechanical computational methods, will calculate the rates of component, combustion reactions that cannot be measured. The subgrid models incorporate the detailed interaction of chemistry with fluid dynamics at a scale that is independent of the combustion device and provide data on material and energy balance required by the device scale models. The device scale model completes the simulation, incorporating the results and parameters supplied by the other two regimes into a description of the overall device performance. Models for each of the three regimes can and will be developed concurrently and interactively. The fundamental physical laws that govern combustion behavior are known. Computational codes that can take advantage of parallel computer architectures are already under development for each of the three regimes. Provision of sufficient fidelity in the prediction of combustion device performance, particularly the emission characteristics of combustion devices, will require computational resources of the scale being planned for the overall Scientific Simulation Initiative. The knowledge gained will be used by the combustion engineering community to develop design and optimization codes for new combustion devices.	0	0	6,828

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **General Plant Project (GPP):** GPP funding is for minor new construction, for other capital alterations and additions, and for improvements to land, buildings, and utility systems principally at the Ames Laboratory, Argonne National Laboratory, and Oak Ridge National Laboratory as part of the Basic Energy Sciences landlord responsibilities for these laboratories. Funding of this type is essential for maintaining the productivity and usefulness of the Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Additional GPP funding is included in the Facilities Operations justification. The total estimated cost of each GPP project will not exceed $5,000,000.	9,992	10,275	10,275
■ **General Purpose Equipment (GPE):** GPE funding is provided for Ames Laboratory, Argonne National Laboratory, and Oak Ridge National Laboratory as part of the Basic Energy Sciences responsibilities for these laboratories for general purpose equipment that supports multipurpose research.	6,500	5,655	5,655
Subtotal, Chemical Sciences Research	128,452	132,750	139,230

Facilities Operations

■ **Facilities Operations:** The facilities included in Chemical Sciences are: National Synchrotron Light Source, High Flux Isotope Reactor, Radiochemical Engineering Development Center, Stanford Synchrotron Radiation Laboratory, and Combustion Research Facility. The facility operations budget request, which includes operating funds, capital equipment, general plant projects, and AIP funding under $5,000,000, is described in a consolidated manner later in this budget. A summary table of the facilities included in this Chemical Sciences subprogram is provided below. Additional funds for facility operations for some of these facilities are included in the Materials Sciences subprogram of this budget.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Included in FY 2000 is the third and final major increment to the HFIR operating budget of $5,979,000 for the replacement of the beryllium reflector. The reflector replacement includes fabrication of the new reflector, disassembly and reassembly of the reactor and beam room, and associated safety and engineering activities. Reflector replacement, which began in FY 1998 and will be completed in FY 2000, is a recurring activity that must be performed every 10-12 years. AIP funding will support additions and modifications to accelerator and reactor facilities, which are supported in the Chemical Sciences subprogram. General Plant Project (GPP) funding is also required for minor new construction, for other capital alterations and additions, and for improvements to land, buildings, and utility systems. The total estimated cost of each GPP project will not exceed $5,000,000. Capital equipment is needed for the facilities for items such as beam monitors, interlock systems, vacuum systems, beamline front end components, monochromators, and power supplies.	67,675	68,928	71,430

Engineering and Geosciences

Mission Supporting Goals and Objectives

The Engineering and Geosciences subprogram conducts research in two disciplinary areas, engineering and geosciences. In Engineering Research, the goals are to extend the body of knowledge underlying current engineering practice to create new options for improving energy efficiency and to broaden the technical and conceptual knowledge base for solving the engineering problems of energy technologies. In Geosciences Research, the goal is on fundamental knowledge of the processes that transport, concentrate, emplace, and modify the energy and mineral resources and the byproducts of energy production. The research supports existing energy technologies and strengthens the foundation for the development of future energy technologies. Ultimately the research impacts control of industrial processes to improve efficiency and reduce pollution, to increase energy supplies, and to lower cost and increase the effectiveness environmental remediation of polluted sites.

Climate Change Technology Initiative. The Geosciences Research Program will enhance the scientific underpinning necessary for improving the characterization of subsurface formations and their host potential for carbon dioxide sequestration. Geomechanical studies and research on rock-fluid interactions will support evaluations of carbon dioxide injection technologies, reservoir storage capacities, and long-term storage stability. Research concerning the physics of flow for multiple reactive fluid phases in fractured rock systems will provide the basis for predicting the viability of terrestrial carbon dioxide sequestration and for improved efficiency of fossil energy and geothermal energy production. Additional research in geochemistry will complement the research activities in geophysics with investigations to enhance understanding of the geochemical reactivity within the reservoirs/aquifers under static and dynamic flow conditions for fluids enriched in constituents important for CO_2 sequestration.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Engineering Research	17,296	17,471	14,500	-2,971	-17.0%
Geosciences Research	22,855	24,189	22,097	-2,092	-8.6%
SBIR/STTR	0	1,079	948	-131	-12.1%
Total, Engineering and Geosciences	40,151	42,739	37,545	-5,194	-12.2%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Engineering Research			
■ **Engineering Research:** The Engineering Research activity supports work in three technical areas: (1) mechanical systems including fluid mechanics, heat transfer, and solid mechanics; (2) systems sciences including process control, instrumentation, and intelligent machines and systems; and (3) engineering analysis including nonlinear dynamics, data bases for thermophysical properties, models of combustion processes for engineering applications and foundation of bioprocessing of fuels, and energy related waste and materials. In FY 2000, funding will be terminated for research in turbulence, control systems, integrated manufacturing, and combustion. Research will be decreased in fluid dynamics and flow through porous research in bodies.	17,296	17,471	14,500
Geosciences Research			
■ **Geosciences Research:** The Geosciences Research activity supports basic research in geophysics and geochemistry to improve the level of understanding necessary for advances in and choices among current and emerging energy and environmental technologies. Geochemical research focuses on fundamental understanding of mineral-fluid interactions to provide a better foundation for oil, gas, and geothermal resource recovery and control of contaminants in groundwater flow; new fundamental thermodynamic and physical property information on rocks, minerals, and geologic fluids for resource recovery and contaminant assessment and monitoring; and extending the applicability of isotopic tracer methods for evaluation of natural and human-perturbed processes in the geologic environment. This information, in concert with other geosciences research, is providing the basis for efforts leading to quantitative predictive capabilities for processes that take place in the			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Earth's crust. In FY 2000, funding will be terminated on mechanical stability of porous reservoirs and multi-phase flow through porous bodies. Funding will be reduced in geochemistry and geophysics.	22,855	22,725	15,275
■ **Climate Change Technology Initiative:** Basic research in carbon management for the Climate Change Technology Initiative will emphasize those aspects of geosciences and engineering that will provide the understanding needed for sequestration of carbon dioxide in subsurface reservoirs. The research program will focus on three areas where improved understanding is needed to evaluate the potential for deep underground sequestration: (1) understanding the mechanical stability of porous and fractured reservoirs/aquifers during injection and over the long times required for sequestration; (2) understanding flow of fluids with multiple phases within the aquifers; and (3) understanding the geochemical reactivity within and among fluids, and between fluids and rock material within the reservoirs/aquifers. In order to understand the mechanical stability of formations, a better understanding of the stress-strain-poroelasticity- viscoelasticity-thermoelasticity constitutive relationships are necessary, as are fracture mechanics models, improved seismic models, and inversion codes to track mechanical stability of rocks at reservoir depths and scales. Fluid flow studies are need to understand mixing, fingering and phase retardation, fluid-fluid transport at ambient and injection conditions, fluid-fluid-mineral interactions including wetting behavior, and surface tension effects. In order to understand the mechanical stability of potential storage formations, a better understanding of the geochemical reactivity of reservoirs/aquifers -- under conditions involving fluids rich in constituents important for CO_2 sequestration and in the presence of interacting mineral-fluid system -- will be needed to fully evaluate these systems in terms of sequestration potential and safety.	0	1,464	6,822

Energy Biosciences

Mission Supporting Goals and Objectives

The Energy Biosciences subprogram supports mechanistic research on fundamental biological processes related to capture, transformation, storage and utilization of energy. The research focuses on plants and non-medical microorganisms to form a broad scientific foundation for support of Department of Energy's goals and objectives in energy production, environmental management, and energy conservation. Basic research on plants includes photosynthetic mechanisms and bioenergetics in algae, higher plants, and photosynthetic bacteria; control mechanisms that regulate plant growth and development; fundamental aspects of gene structure, function, and expression; plant cell wall structure, function and synthesis; and mechanisms of transport across membranes. Research supported in these areas seeks to define and understand the biological mechanisms that effectively transduce light energy into chemical energy, to identify the biochemical pathways and genetic regulatory mechanisms that can lead the efficient biosynthesis of potential fuels and petroleum-replacing compounds, and to elucidate the capacity of plants to remediate contaminated environments by transporting and detoxifying toxic substances. The research focus in the microbiological sciences includes the degradation of biopolymers such as lignin and cellulose, anaerobic fermentations, genetic regulation of microbial growth and development, thermophily, e.g., bacterial growth under high temperature, and other phenomena with the potential to impact biological energy production, conversion and conservation. Organisms and processes that offer unique possibilities for research at the interface of biology and the physical, earth and engineering sciences are also studied.

Climate Change Technology Initiative. Biological systems, particularly plants, algae, and microbes, play a major role in the capture and release of atmospheric carbon dioxide. Photosynthetic organisms use sunlight to convert carbon dioxide into more complex organic compounds, while many non-photosynthetic organisms use the energy in various inorganic and organic compounds to fix carbon dioxide. The biological processes of carbon dioxide fixation offer numerous possibilities leading to the reduction of atmospheric carbon dioxide levels by replacing fossil-derived fuels with renewable resources or providing fixed carbon for long-term sequestration.

Funding Schedule

FY 1998	FY 1999	FY 2000

Energy Biosciences

- **Energy Biosciences**: This activity supports basic research in the energy-related biosciences forming the mechanistic foundation for the development of future biotechnologies related to energy. This work provides the knowledge necessary to use biological systems associated with the capture, transformation, storage and utilization of energy, and other significant missions of the Department of Energy. Those programs within the Department that are active in creating or exploiting technologies are supported through numerous interactions at both the manager and the researcher level. The Basic Energy Sciences program is scientifically heterogeneous and many efforts are made to encourage the development of truly interdisciplinary research activities. The Energy Biosciences subprogram is actively involved with other federal agencies funding basic plant and microbial research to encourage effective and efficient management of the total federal research portfolio.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The successes of this subprogram, along with other federal research efforts, are developing an expanding science knowledge base leading to the rapid expansion of biotechnological applications using both plants and microbes. The formation of numerous large "life science" corporations is indicative of this trend. Ongoing basic research is leading to numerous new and unexploited research opportunities, including functional plant genomics, organellar and chromosome-level bioengineering, elucidation of new biochemistries, and determiantion of cellular and morphological development. Each of these areas have the potential to be commercially applied, resulting in major economic and societal impacts ranging from the revitalization of the rural economy through dispersal of the nation's manufacturing base to the formation of a new generation of bio-based industries; in addition to having a major impact on the nation's production and use of energy expensive chemicals and fuels. Recently, private and charitable research foundations have responded to both the opportunities and impacts of fundamental research in these areas and are building large basic research institutes in St. Louis and San Diego. They have the resources to build the needed facilities, but are relying on the federal government to provide the long-term support of the research activities and to provide the required scientific personnel. Capital Equipment is provided for items used for structure determination and for special analysis of biomaterials.	26,710	26,652	25,537

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Climate Change Technology Initiative:** Basic research in carbon management for the Climate Change Technology Initiative begun in FY 1999 emphasized the biological process of photosynthesis, which is central to global carbon cycling. The primary current focus of these photosynthesis activities is the biophysics and biochemistry of energy capture and structural studies on the photosynthetic apparatus. There are a number of unexplored opportunities that complement this work with studies on the mechanism of photosynthetic carbon fixation and the subsequent metabolism of the fixed carbon. An example of the research supported are studies to provide a fundamental understanding of chloroplasts, which are small membrane bound entities in the cytoplasm of plant cells where photosynthesis occurs. Chloroplasts contain DNA and are able to control their development and replication. The new research will investigate the principals underlying the biochemical and molecular genetic mechanisms of chloroplast development and reproduction along with critical interactions of chloroplasts with the cytoplasm and nucleus. The understanding obtained from these and related studies will permit the production of radical changes in photosynthetic carbon capture by manipulating both the efficacy of the photosynthetic apparatus and its function in whole plants.	0	2,436	4,873

Construction

Mission Supporting Goals and Objectives

Construction is needed to support the research in each of the subprograms in the Basic Energy Sciences program. Experiments necessary in support of basic research require that state-of-the-art facilities be built or existing facilities modified to meet unique research requirements. Reactors, radiation sources, and neutron sources are among the expensive, but necessary, facilities required. The budget for the BES program includes funding for the construction and modification of these facilities.

Major User Facilities

Mission Supporting Goals and Objectives

The BES scientific user facilities provide experimental capabilities that are beyond the scope of those found in laboratories of individual investigators. Synchrotron radiation light sources, high-flux neutron sources, electron beam microcharacterization centers, and other specialized facilities enable scientists to carry out experiments that could not be done elsewhere. These facilities are part of the Department's system of scientific user facilities, the largest of its kind in the world. A description of each facility is provided in the "Site Descriptions" section. Any unusual or nonrecurring aspects of funding are described in the following section "Detailed Program Justification."

The facilities are planned in collaboration with the scientific community and are constructed and operated by BES for support of forefront research in areas important to BES activities and also in areas that extend beyond the scope of BES activities such as structural biology, medical imaging, and micro machining. These facilities are used by researchers in materials sciences, chemical sciences, earth and geosciences, environmental sciences, structural biology, superconductor technology, and medical research and technology development. The facilities are open to all qualified scientists from academia, industry, and the federal laboratory system whose intention is to publish in the open literature. The funding schedule includes only those facilities that have operating budgets for personnel, utilities, and maintenance.

Funding Schedule

Funding for operation of these facilities is provided in the Materials Sciences and Chemical Sciences subprograms.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Facilities Operations			
■ National Synchrotron Light Source at Brookhaven National Laboratory	30,996	32,176	32,756

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ High Flux Beam Reactor at Brookhaven National Laboratory. On December 21, 1996, the High Flux Beam Reactor (HFBR) was shut down for normal refueling. However, before the reactor was restarted, the announcement was made that a plume of tritium, believed to emanate from the reactor spent fuel pool, was contaminating the ground water south of the reactor. The reactor has remained in standby mode since that time. Because the reactor contains radioactive fluids in the primary cooling system, nearly a full staff is necessary to maintain the reactor and associated equipment in safe operating condition. The funding requested in FY 2000 represents that required to maintain the reactor and to proceed with safety modifications that are required regardless of whether the reactor is restarted or is decommissioned.	22,986	22,568	22,580

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line in the left margin.)

Significant Changes

The Total Estimated Cost and Total Project Cost have been increased and the construction schedule has been extended. The schedule delay and increased costs are a result of the planned FY 1999 funding being reduced by $27,000,000 in the FY 1999 appropriation.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1999 Budget Request *(Preliminary Estimate)*	1Q 1999	4Q 2003	3Q 2000	4Q 2005	1,138,800	1,332,800
FY 2000 Budget Request (*Current Estimate*)	1Q 1999	4Q 2003	3Q 2000	1Q 2006	1,159,500	1,360,000

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Construction			
1999	101,400	101,400	53,700
2000	196,100	196,100	166,200
2001	267,900	267,900	263,800
2002	262,500	262,500	274,100
2003	193,600	193,600	207,300
2004	78,300	78,300	131,700
2005	49,200	49,200	47,200
2006	10,500	10,500	15,500

3. Project Description, Justification and Scope

The purpose of the Spallation Neutron Source (SNS) Project is to provide a next-generation short-pulse spallation neutron source for neutron scattering and related research in broad areas of the physical, chemical, materials, biological, and medical sciences. The SNS will be a national facility with an open user policy attractive to scientists from universities, industries, and federal laboratories. It is anticipated that the facility will be used by 1,000—2,000 scientists and engineers each year and that it will meet the national need for neutron science capabilities well into the next century.

The importance of neutron science for fundamental discoveries and technological development is universally acknowledged. The scientific justification and need for a new neutron source and instrumentation in the U.S. have been thoroughly established by numerous studies by the scientific community since the 1970s. These include the 1984 National Research Council study *Major Facilities for Materials Research and Related Disciplines* (the Seitz-Eastman Report), which recommended the immediate start of the design of both a steady-state source and an accelerator-based pulsed spallation source. More recently, the 1993 DOE Basic Energy Sciences Advisory Committee (BESAC) report *Neutron Sources for America's Future* (the Kohn Panel Report) again included construction of a new pulsed spallation source with SNS capabilities among its highest priorities. This conclusion was even more strongly reaffirmed by the 1996 BESAC Report (the Russell Panel Report), which recommended the construction of a 1 megawatt (MW) spallation source that could be upgraded to significantly higher powers in the future.

Neutron probes are a unique and increasingly indispensable scientific tool. Over the past decade, they have made invaluable contributions to the understanding and development of many classes of new materials, from high temperature superconductors to fullerenes, a new form of carbon. In addition to creating the new scientific knowledge upon which unforeseen breakthroughs will be based, neutron science is at the core of many technologies that currently improve the health of our citizenry and the safety and effectiveness of our industrial materials.

The information that neutrons provide has wide impacts. For example, chemical companies use neutrons to make better fibers, plastics, and catalysts; drug companies use neutrons to design drugs with higher potency and fewer side effects; and automobile manufacturers use the penetrating power of neutrons to understand how to cast and forge gears and brake discs in order to make cars run better and more safely. Furthermore, research on magnetism using neutrons has led to higher strength magnets for more efficient electric generators and motors and to better magnetic materials for magnetic recording tapes and computer hard drives.

Based on the recommendations of the scientific community obtained via the 1996 Russell Panel Report, the SNS has been designed to operate at an average power on target of about 1 MW. At this power level, the SNS will be the most powerful spallation source in the world--six times that of ISIS at the Rutherford Appleton Laboratory in the United Kingdom. However, the SNS has been deliberately designed to allow for economical upgrading to substantially higher powers once the technology is developed to make this possible. Thus, the SNS will be the nation's premiere neutron facility for many decades.

The importance of high power, and consequently high neutron flux (i.e., high neutron intensity), cannot be overstated. The properties of neutrons that make them an ideal probe of matter also require that they

be generated with high flux. (Neutrons are particles with the mass of the proton, with spin 1/2, and with no electrical charge.) Neutrons interact with nuclei and magnetic fields; both interactions are extremely weak, but they are known with great accuracy. Because they weakly interact with materials, neutrons are highly penetrating and can be used to study bulk phase samples, highly complex samples, and samples confined in thick-walled metal containers. Because they have spin, neutrons have a magnetic moment and can be used to study magnetic structure and magnetic properties of materials. Because their interactions are known with great accuracy, neutron scattering is far more easily interpreted than either photon scattering or electron scattering.

However, the same properties that make neutrons an ideal probe of matter also result in their most significant disadvantage. Because neutrons interact only weakly with matter, most neutrons pass through a sample without producing a detectable interaction. Therefore, neutron scattering experiments are said to be extremely "flux limited." This situation is further exacerbated because, unlike photons and charged particles, neutrons cannot be focused. Therefore, high brilliance (i.e., highly focused) neutron beams are very difficult to make. The combination of weak interaction and inherent low brilliance has driven the quest for high-flux neutron sources. The pursuit of high-flux neutron sources is more than just a desire to perform experiments faster, although that, of course, is an obvious benefit. High flux enables broad classes of experiments that cannot be done with low-flux sources. For example, high flux enables studies of small samples, complex molecules and structures, time-dependent phenomena, and very weak interactions. Put most simply, high flux enables studies of complex materials in real time and in all disciplines--physics, chemistry, materials science, geosciences, and biological and medical sciences.

The SNS will consist of a linac-ring accelerator system that delivers short (microsecond) pulses to a target/moderator system where neutrons are produced by a nuclear reaction process called spallation. The process of neutron production in the SNS consists of the following: negatively charged hydrogen ions are produced in an ion source and are accelerated to 1 giga electron volt (GeV) energy in a linear accelerator (linac); the hydrogen ion beam is injected into an accumulator ring through a stripper foil, which strips the electrons off of the hydrogen ions to produce a proton beam; the proton beam is collected and bunched into short pulses in the accumulator ring; and, finally, the proton beam is injected into a heavy metal target at a frequency of up to 60 Hz. The intense proton bursts striking the target produce pulsed neutron beams by the spallation process. The high-energy neutrons so produced are moderated (i.e., slowed down) to reduce their energies, typically by using thermal or cold moderators. The "moderated" neutron beams are then used for neutron scattering experiments. Specially designed scientific instruments use these pulsed neutron beams for a wide variety of investigations.

The primary objectives in the design of the site and buildings for the SNS are to provide optimal facilities for the DOE and the scientific community for neutron scattering well into the next century and to address the mix of needs associated with the user community, the operations staff, security, contamination control, noise, etc.

A research and development program is required to ensure technical feasibility and to determine physics design of accelerator and target systems that will meet performance requirements.

The objectives stated above will be met by the technical components described earlier (ion source; linac accelerator; accumulator ring; target station with moderators; beam transport systems; and experimental facilities capable of supporting up to 18 neutron scattering beam lines for research instruments) and attendant conventional facilities. Also included on the site will be facilities to support the needs of

operations staff, technical support staff, users and capabilities for remote servicing of activated components. An initial suite of approximately 10 neutron scattering instruments is included in the TEC.

The FY 1999 budget authority allowed the start of Title I design activities, initiation of subcontracts and long-lead procurements, and continuation of critical research and development work necessary to reduce technical and schedule risks in this project. Initiation of most long-lead procurements is delayed until FY 2000 due to the reduction in the FY 1999 appropriation.

FY 2000 funding of $214,000,000 is requested for the SNS Project for detailed design (Title II) for the ion source, low-energy beam transport, linac structure and magnet systems, target assemblies, experimental instruments, and global control systems. Detailed design will be completed for several conventional facilities in preparation for the installation of major equipment in the following fiscal year; design will be completed on the front-end building, linac tunnel, high-energy beam transport tunnel, ring-service building, ring-to-beam transport tunnel, and the klystron hall. Construction will start for some conventional facilities including roads into the site, site preparation/grading, waste systems, and retention basins. Procurement for several significant equipment items such as dipole magnets, material for the target transport systems, and klystrons will begin. Project Management and Project Integration activities, which are exceptionally important during this phase of the project, will also be conducted. The Preliminary Safety Analysis Report (PSAR) will be completed during the fiscal year and work will begin on the final report.

4. Details of Cost Estimate [a]

	(dollars in thousands) Current Estimate	Previous Estimate
Design and Management Costs		
Engineering, design and inspection at approximately 26% of construction costs	166,900	166,900
Construction management at approximately 4% of construction costs	26,300	26,300
Project management at approximately 15% of construction costs	102,900	96,800
Land and land rights	0	0
Construction Costs		
Improvements to land (grading, paving, landscaping, and sidewalks)	28,600	28,600
Buildings	176,700	176,700
Other structures	600	600
Utilities (electrical, water, steam, and sewer lines)	30,500	30,500
Technical Components	417,900	406,300
Standard Equipment	1,100	1,100
Major computer items	12,000	12,000
Removal cost less salvage	0	0
Design and project liason, testing, checkout and acceptance	9,700	6,700
Subtotal	973,200	952,500
Contingencies at approximately 19 percent of above costs	186,300	186,300
Total Line Item Cost	1,159,500	1,138,800
Less: Non-Agency Contribution	0	0
Total, Line Item Costs (TEC)	1,159,500	1,138,800

5. Method of Performance

The ORNL Management and Operating Contractor will provide overall project management and integration, design and ultimate procurement of the target station, beam transport, and experiment systems, and will subcontract for the services of an Industry Team for design and construction management services. The Industry Team will consist of an Architect-Engineer for the conventional facilities design and a Construction Manager for construction, installation, equipment procurement, testing and preoperational support. Other DOE laboratories will, through intra laboratory agreements, become members of the overall project's management, design and R&D team, particularly in the areas encompassed by the linac, the accumulator ring, instrumentation, and the target. Procurement and

a The cost estimate is based on a conceptual design completed in FY 1997. The DOE Headquarters Economic Escalation indices were used as appropriate over the project cycle.

construction will be accomplished, to the extent feasible, by fixed-priced subcontracts awarded to industry on the basis of competitive bidding.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Year Costs	FY 1998	FY 1999	FY 2000	Outyears	Total
Project Cost						
Facility Cost[a]						
Line Item TEC	0	0	53,700	166,200	939,600	1,159,500
Plant Engineering & Design	0	0	0	0	0	0
Expense-funded equipment	0	0	0	0	0	0
Inventories	0	0	0	0	0	0
Total direct cost	0	0	53,700	166,200	939,600	1,159,500
Other project costs						
R&D necessary to complete project[b]	200	21,400	25,300	16,300	26,200	89,400
Conceptual design cost[c]	15,303	0	0	0	0	15,303
Decontamination & Decommissioning (D&D)	0	0	0	0	0	0
NEPA Documentation costs[d]	0	1,500	400	0	0	1,900
Other project-related costs[e]	0	0	800	900	89,097	90,797
Capital equipment not related construction[f]	0	100	2,100	700	200	3,100
Total, Other project costs	15,503	23,000	28,600	17,900	115,497	200,500
Total project cost (TPC)	15,503	23,000	82,300	184,100	1,055,097	1,360,000

a Construction line item costs included in this budget request are for providing Title I and II design, inspection, procurement, and construction of the SNS facility for an estimated cost of $1,159,500,000.

b A research and development program at an estimated cost of $89,400,000 is needed to confirm several design bases related primarily to the accelerator systems, the target systems, safety analyses, cold moderator designs, and neutron guides, beam tubes, and instruments. Several of these development tasks require long time durations and the timely coupling of development results into the design is a major factor in detailed task planning.

c Costs of $15,303,000 are included for conceptual design and for preparation of the conceptual design documentation prior to the start of Title I design in FY 1999.

d Estimated costs of $1,900,000 are included to complete the Environmental Impact Statement.

e Estimated costs of $90,797,000 are included to cover pre-operations costs.

f Estimated costs of $3,100,000 to provide test facilities and other capital equipment to support the R&D program.

7. Related Annual Funding Requirements [a]

	(FY 2000 dollars in thousands)	
	Current Estimate	Previous Estimate
Facility operating costs	21,300	N/A
Facility maintenance and repair costs	25,300	N/A
Programmatic operating expenses directly related to the f ility	22,500	N/A
Capital equipment not related to construction but related the programmatic effort in the facility	2,100	N/A
GPP or other construction related to the programmatic fort in the facility	1,000	N/A
Utility costs	30,400	N/A
Accelerator Improvement Modifications (AIMs)	4,100	N/A
Total related annual funding	106,700	N/A

[a] Expressed in FY 2006 dollars, the first full year of operation.

Computational and Technology Research

Program Mission

The mission of the Computational and Technology Research (CTR) program, which consists of two distinct activities, is

- to foster and support fundamental research in advanced computing research — applied mathematics, computer science, and networking — and to operate supercomputer, networking, and related facilities to enable the analysis, modeling, simulation, and prediction of complex phenomena important to the Department of Energy, and
- to foster and support high-risk research in the natural sciences and engineering in partnership with the private sector leading to innovative applications relevant to the Nation's energy sector.

The high quality of the research in this program is continuously evaluated through the use of merit based peer review and scientific advisory committees.

Program Goals

- Maintain world leadership in areas of advanced computing research relevant to the complex problems of the Department of Energy.
- Integrate the results of advanced computing research into the natural sciences and engineering.
- Provide world-class supercomputer and networking facilities for scientists working on problems that are important for the Department.
- Integrate and disseminate the results of high-risk research in the natural sciences and engineering to the private sector through the Laboratory Technology Research subprogram.

Program Objectives

- *Foster and support fundamental, peer-reviewed research.* — Foster research to create new fundamental knowledge in areas of advanced computing research important to the Department.
- *Apply advanced computing knowledge to complex problems of importance to DOE.* — Promote the transfer of the results of advanced computing research to contribute to DOE missions in areas such as the improved use of fossil fuels including understanding the combustion process; the atmospheric and environmental impacts of energy production and use including global climate modeling and subsurface transport; and future energy sources including fusion energy.
- *Plan, fabricate, assemble, and operate premier supercomputer and networking facilities.* — Serve researchers at national laboratories, universities, and industry, thus enabling both new understanding

through analysis, modeling, and simulation of complex problems and effective integration of geographically distributed teams through national collaboratories.

- *Transfer results of fundamental research to the private sector.* — Provide tangible results of research and development activities through cost-shared partnerships with industry.

Performance Measures

The Computational and Technology Research program measures performance in various ways, depending on the objective. However, performance measures fall into four broad categories: (1) peer review; (2) indicators or metrics (i.e., things that can be counted); (3) customer evaluation and stakeholder input; and (4) qualitative assessments, which might include historical retrospectives and annual program highlights. The key process is peer review of all research activities. Facility performance measures include achievement of performance specifications, operating time, throughput, user satisfaction, and effective utilization of resources as determined by reports from external review panels, user steering committees, and internal Office of Science (SC) program manager committees. In addition, CTR supercomputer and network facilities have periodic external performance reviews. The Energy Science Network (ESnet) operations and management were reviewed in this manner in FY 1998.

In FY 2000, (1) facilities, including the National Energy Research Scientific Computing Center (NERSC) and ESnet, will be operated within budget to meet user and overall SC program requirements; (2) the operating time lost at scientific facilities due to unscheduled NERSC/ESnet downtime will be less than 10 percent of the total scheduled possible operating time, on average; (3) all new and continuing research projects will undergo regular peer review and merit evaluation based on the principles set down in 10 CFR 605 for grants or in cooperative agreements supported by the Office of Science; (4) work performed by investigators supported by CTR will continue to be recognized as outstanding through the receipt of major prizes and awards; and (5) initiate 7 Laboratory Technology Research projects that address the Department's top priorities for science and technology, through cost-shared research partnerships with industry.

Significant Accomplishments and Program Shifts

The CTR program builds on decades of leadership in advanced computing. Some of the pioneering accomplishments of this program are:

Mathematical, Information, and Computational Sciences

- **Remote, interactive access to supercomputers.** At the National Magnetic Fusion Energy Computing Center [the predecessor to the National Energy Research Scientific Computing Center (NERSC)], DOE pioneered the concept of remote, interactive access to supercomputers. Before this time, scientists using supercomputers had to travel to the location of the computer to make use of it. In addition, users were only able to use these computers by submitting jobs and waiting for hours or days to see the output. The Mathematical, Information, and Computational Sciences (MICS) subprogram developed the first interactive operating system for supercomputers, Cray Time Sharing System (CTSS), as well as a nationwide network to allow remote users to have effective access to the computers. This operating system revolutionized

access to supercomputers by enabling users to see their jobs as they executed. When the National Science Foundation (NSF) initiated its Supercomputer Centers program in the 1970's, the CTSS operating system was adopted by the San Diego Supercomputing Center and the National Center for Supercomputing Applications to enable users to access NSF's first CRAY machines.

- **Numerical Linear Algebra Libraries**. Today's high performance computations rely on high performance, efficient libraries of numerical linear algebra software. These libraries, which are the core of numerical efforts in the solution of differential and integral equations — LINPACK, EISPAC, LAPACK, SCALAPACK — are the direct result of decades of DOE funding and basic research in this area. These libraries are used by thousands of researchers worldwide and are a critical part of the world's scientific computing infrastructure.

- **High Performance Parallel Interface (HiPPI)**. In order to develop a standard interface between supercomputers and other devices, such as disk arrays and archival tape systems, and visualization computers, DOE laboratories developed the high performance network interface (HiPPI) and led a consortium of vendors to make it the industry standard for the highest bandwidth interconnects between computers and peripheral devices. Many research issues in high speed signaling, data parallelism and high speed protocol design needed to be understood to enable this advance.

- **Parallel Virtual Machine (PVM) and Message Passing Interface (MPI).** DOE researchers developed PVM and MPI to enable scientists to make effective use of networks of workstations and massively parallel computers. Both of these software packages have become standards in the industry and are implemented by virtually all of the high performance computer manufacturers in the world. Both of these developments were enabled by over a decade of basic research in message passing and distributed computing supported by DOE along with many experiments to apply these techniques to real scientific problems.

- **Slow Start Algorithm for the Transmission Control Protocol (TCP).** Transmission Control Protocol (TCP) part of TCP/IP (Internet Protocol) is responsible for ensuring that packets arrive at their destination. In 1987, as DOE and the other Federal agencies were interconnecting their networks to form the core of the Internet, critical parts of the infrastructure began to fail. There was concern that this represented a fundamental flaw in the TCP/IP architecture; however, a researcher at LBNL applied ideas from fluid flow research to understand the problem and develop a solution. This new TCP algorithm was incorporated in virtually every commercial version of Internet software within 6 months and enabled the Internet to scale from a small research network to today's worldwide infrastructure.

Building on this long history of accomplishments, principal investigators of the Computational and Technology Research program this year received recognition through numerous prizes, awards, and honors. A sample of the significant accomplishments produced by the program this year is given below.

- **1998 Gordon Bell Prize for Best Performance of a Supercomputing Application.** An international team of scientists including those from the Department's Oak Ridge and Lawrence Berkeley National Laboratories won the 1998 Gordon Bell prize for best performance of a supercomputing application for simulation of magnetism metal alloys. The team won the award for their modeling of 1,024 atoms of a metallic magnet. The calculation submitted by the team to the Gordon Bell Prize judges performed at 657 Gigaflops performance level (657 billion

calculations per second); however, the team subsequently was able to raise the performance of their application to more than one teraflop (one trillion calculations per second.) In addition to supporting the winning entry, the CTR program partially supported the two other finalists.

- **1998 Fernbach Award.** Dr. Phillip Colella, a mathematician at DOE's Lawrence Berkeley National Laboratory, received the 1998 Sidney Fernbach Award at the SC98 conference in Orlando. Colella received the award for his "outstanding contribution in the application of high performance computers using innovative approaches." The Fernbach Award, created in memory of a computer scientist at DOE's Lawrence Livermore National Laboratory, is presented by the IEEE (Institute of Electrical and Electronics Engineers) Computer Society. Dr. Colella's research has focused on problems in Computational Fluid Dynamics and advanced techniques for the generation of the grids that form the basis for many scientific computations. His research has been applied to problems in the simulation of combustion devices as well as national security applications.

- **Simulation of Instabilities in Fluid Layers.** Many important physical systems can be described as layered fluids. For example, layers of oil float on salt water in geological structures. Even structures with layers of metal behave like layered fluids under high pressure and temperature. These types of systems develop very complex, unstable structures at the boundary between fluids. Computation of the characteristics of these boundaries is especially difficult, because their locations must be tracked accurately as part of the calculation. In addition, the most common formulations of the problem require many more grid points than are practical on even the largest computers. Applied mathematicians at the State University of New York, Stony Brook, in collaboration with physicists at Los Alamos National Laboratory (LANL) have discovered and implemented clever numerical schemes capable of following surfaces that can evolve into complicated shapes over time. They have used these new techniques to simulate this type of fluid instability under conditions where experiments are not possible, thus allowing design of devices for Defense Program's Advanced Strategic Computing Initiative and fusion energy applications. Modeling and simulation are absolutely vital since experimental data will never be available for conditions of importance to the designers.

- **Research in Optimization Impacts U.S. Industry.** Applied mathematicians at Rice University, working with engineers at Boeing, developed a software package for improving the manufacture of airplane components. The software combines new approaches to the optimization of systems having hundreds of thousands of parameters with research in the theory of control systems to enable engineers to optimize manufacturing processes. Previous design schemes for Boeing's production processes were based on simple "rules of thumb" that failed often in practice, and standard optimization packages were easily overwhelmed by the sheer size of the problems. This necessitated a complete rethinking of design and optimization strategies in order to accommodate industrial-size problems. The Rice researchers developed novel techniques in nonlinear optimization theory to correctly identify the underlying problems and provide feasible solutions. Boeing is using the software on its production line to lower costs and improve quality.

- **Law for Turbulent Stress Proved to be Invalid.** To design systems such as gas turbines, airplanes, or combustion devices where flow of gasses over physical structures is important, it is critical to be able to accurately describe the turbulent stress generated by the flow of the gas over the structure. Since the turn of the century, the standard methodology for calculating this was a

simple mathematical model called the "law of the wall." This model, which is found in every engineering textbook, is based on relatively crude approximations that have been accepted without serious thought since the turn of the century. Mathematicians at Lawrence Berkeley National Laboratory (LBNL) have recently developed a rigorous mathematical basis for calculating turbulent wall effects and demonstrated that the "law of the wall" is not valid in general. They showed by careful mathematical analysis that the correct description of turbulent effects on solid objects requires a family of "scaling laws" rather than a single "law of the wall." This is difficult research since it must blend hard mathematical analysis with the proper physical insights from the fluid dynamics of turbulent flows. The discovery will have profound consequences in the engineering and design of airplanes, gas turbines, and other systems where controlling turbulence is critical to performance. The mathematical predictions of the Berkeley group have been verified recently by experiments at Princeton.

- **R&D 100 Award to Sandia Researchers.** Researchers at Sandia National Laboratories were awarded an R&D 100 award in FY 1998 for the Aztec software package. Aztec is a collection of very high performance software routines that run on the highest performance computers in the nation to solve important linear algebra problems such as solving systems of millions of linear equations. This type of linear algebra is at the core solving ordinary and partial differential equations on computers as well as many other types of scientific computations. Aztec grew out of the successful research programs at Sandia in numerical linear algebra and parallel programming techniques.

- **Advanced Computing Software Tools Enable Rapid Application Development.** One of the major challenges in modern high performance computing is to develop tools that enable scientists to quickly create computer software to solve scientific problems. Otherwise, chemists, materials scientists, and others would spend their entire effort creating software for computers that would be obsolete just as the applications were ready. The speed of change in the underlying computer architectures and the complexity of these computers and their operating systems makes this a major area of research. The Parallel Object-Oriented Methods and Applications (POOMA) Framework effort at LANL is one promising research approach to developing effective tools to help scientists in the disciplines develop software. In an early test with POOMA, a post-doc with no parallel programming experience developed computer software to solve a three dimensional fluid turbulence problem (including the tools to visualize the results while the program was running) in only six weeks rather than the 6-9 months required in similar efforts. POOMA is used extensively by two of the scientific applications pilots — the computational accelerator physics and numerical tokamak turbulence projects.

- **New Scientific Application Enabled By Interfacing Two Software Packages.** One research challenge facing advanced computing is to enable software developed by different teams to work together on massively parallel computers. Recently researchers at Argonne National Laboratory (ANL) and Lawrence Livermore National Laboratory (LLNL) have demonstrated that it is possible for well-designed components developed at different laboratories to be easily used together by providing each with a common interface. The latest generation of ordinary differential equation solvers for systems, whose behavior combines fine scale and large scale features, developed at LLNL has been interfaced with a large family of parallel algebraic solvers developed at ANL. This coupled software system has enabled several new applications. One of these is a collaboration of researchers at Louisiana Tech University and Oak Ridge National

Laboratory (ORNL) to develop a code for fully three-dimensional simulations of the dynamics of micro-structural interactions in materials. This code would not have been possible before the researchers had access to the coupled ANL-LLNL system.

- **Significant Speedups Achieved For Laue Crystallographic Analysis.** Advances in numerics coupled with work to enable software to run in parallel on many processors has enabled researchers in the "Supercomputer Solution of Massive Crystallographic and Microtomographic Structural Problems" scientific application pilot project to dramatically reduce the time required to analyze the data from Laue diffraction experiments. A typical illustration comes from progress made on a scientific applications project—diffraction patterns and intensities produced by x-rays passing through a crystal lattice are used to deduce information about molecular structures. The Laue diffraction technique is the most important tool in time-resolved crystallography, where structure data are captured rapidly to image the structure of a molecule at various stages of a reaction. Improved optimization and numerical techniques have been applied to the code that performs the complicated task of analyzing Laue diffraction data to obtain the structure of the molecules. The dramatic improvements in time-to-solution that have been made will significantly enhance experimental capabilities because runtimes are reduced from hours to minutes. These results are expected to be especially important for the 30 percent of users of DOE light sources who are involved in discovering protein structures.

- **ESnet Demonstrates Priority Service For Internet Traffic.** Scientists at two national laboratories successfully selected marked Internet traffic for priority service over unmarked traffic in a cross-country demonstration. This demonstration is a key milestone in the development of a broad set of capabilities called "differentiated services," which are required for the Internet to be able to give different levels of service on demand to network customers. The demonstration of such capabilities for production-mode scientific research between Lawrence Berkeley National Laboratory and Argonne National Laboratory across the ESnet paves the way for more reliable and constant connectivity via priority bandwidth on the Internet. Achieving this improved level of service is essential to the work of the Department, which is pioneering the use of various technologies to allow scientists at more than 30 DOE national labs to share access to some of the Nation's most advanced research facilities. The complex interactions between software on computers, network hardware such as routers, and telecommunications equipment operated by commercial carriers make this a difficult research problem. In addition, all of these components must be capable of efficiently scaling up to operate across the worldwide Internet which processes tens of billions of packets a month.

- **Collaboratory Tool Attracts Users.** The electronic notebook collaboratory tool project has been so well received that over eighty groups across the country have adopted the prototype electronic notebook. Some are DOE projects, but many are from outside the Department including pharmaceuticals, chemical processing and medicine. The electronic notebook is valuable to researchers because: it can be shared by a group of researchers; it can be accessed remotely; it cannot be misplaced, lost, or accidentally destroyed (if backed up); it is easy to incorporate computer files, plots, etc.; notarization and authentication are possible; it can easily be searched for information; it can include multimedia; and it can include hyperlinks to other information. In order to enable these capabilities, the electronic notebook project has had to overcome a number of challenges including the development of new technologies for describing types of data such as

experimental protocols and experimental devices, which are not well treated by traditional techniques.

Laboratory Technology Research

- In FY 1999, the SC single-purpose laboratories (Fermi National Accelerator Laboratory, Thomas Jefferson National Accelerator Facility, Princeton Plasma Physics Laboratory, and Stanford Linear Accelerator Center) and Ames Laboratory were reinstated into the Laboratory Technology Research (LTR) subprogram, thus restoring the subprogram to its original participants. LTR now provides coverage to more regions of the country where small businesses, in particular, can take advantage of the resources at SC laboratories. LTR capabilities have been enhanced for cost-shared partnerships in fusion energy sciences, high energy physics, nuclear physics, materials sciences, chemical sciences, structural biology, and other disciplines.
- The LTR subprogram received two R&D-100 awards in 1997 and three R&D-100 awards in 1998. The 1998 awards were given to:
  - Oak Ridge National Laboratory, in collaboration with the Society of Exploration Geophysicists, for "Advanced Computational Tools for 3-D Seismic Analysis." This research was cosponsored by DOE's Office of Fossil Energy.
  - Argonne National Laboratory in collaboration with Front Edge Technology of Baldwin Park, CA, Stirling Motors of Ann Arbor, MI, and Diesel Technology of Wyoming, MI, for "Near-Frictionless Carbon Coatings."
  - Argonne National Laboratory, in collaboration with Commonwealth Edison of Chicago, IL, for "Combined Expert System/Neural Network for Process Fault Diagnostics."

Advanced Energy Projects

- The Advanced Energy Projects subprogram will be terminated in FY 2000.

Scientific Facilities Utilization

The CTR program request includes $27,500,000 in FY 2000 to support the NERSC Center. This investment will provide research time for about 3,500 scientists in universities, federal agencies, and U.S. companies. It will also leverage both federally and privately sponsored research, consistent with the Administration's strategy for enhancing the U.S. National science investment. The proposed funding will enable NERSC to maintain its role as the Nation's largest, premier unclassified computing center, which is a critical element in the success of many SC research programs. Research communities that benefit from NERSC include structural biology; superconductor technology; medical research and technology development; materials, chemical, and plasma sciences; high energy and nuclear physics; and environmental and atmospheric research.

Funding of Contractor Security Clearances

In FY 1999, the Department divided the responsibility for obtaining and maintaining security clearances. The Office of Security Affairs, which was responsible for funding all Federal and contractor employee clearances, now pays only for clearances of Federal employees, both at headquarters and the field. Program organizations are now responsible for contractor clearances, using program funds. This change in policy enables program managers to make the decisions as to how many and what level clearances are necessary for effective program execution. In this way, it is hoped that any backlog of essential clearances which are impeding program success can be cleared up by those managers most directly involved. The Office of Science is budgeting $46,000 and $47,000 for estimated contractor security clearances in FY 1999 and FY 2000, respectively, within this decision unit.

Scientific Simulation Initiative

The CTR program also leads DOE's Scientific Simulation Initiative (SSI), an integrated effort bringing together computational and communication resources, focused research in scientific disciplines, and research in computer science and other enabling technologies to solve the complex problems that characterize DOE's scientific research needs. The SSI is a significant component of the broader President's Information Technology Research Initiative (ITRI) which responds to the recommendations of the President's Information Technology Advisory Committee (PITAC). The SSI couples research in advanced scientific applications in the programs of the Office of Science (SC) with research in computer science and enabling technologies and advanced computing and communications facilities. It is a joint program between CTR and the other program offices in SC. The overview of the integrated program is given here; however, the specific contributions of the other programs (Basic Energy Sciences and Biological and Environmental Research) are included in their budgets. This initiative will build on and benefit from the demonstrated capabilities brought about by the Department's Accelerated Strategic Computing Initiative (ASCI) that have made it possible to obtain computational capabilities 100 times faster than currently in common use. The mission of this proposed effort is to develop further and to employ the emerging generation of very high performance computers as major tools for scientific enquiry. These resources will revolutionize our approach to solving complex problems in energy, environment, fundamental research, and technology development as well as stimulate our national system of innovation. The goal of the SSI is to:

> *"Revolutionize our ability to solve scientific problems of extraordinary complexity and to apply these resources to scientific problems relevant to the Department's mission through the exploitation of the emerging power of exceptional computational capabilities."*

As has been discussed earlier in this budget, scientific research has long been characterized as the interplay of theory and experimentation. Over the last half century the emergence of computers for solving complex mathematical problems and for analyzing large sets of data has introduced a third activity to complement both theory and experimentation. Defined as simulation and modeling, but also encompassing a broad range of data analyses, the application of computational resources to complex scientific problems has made increasingly important contributions to scientific discovery and understanding as those resources have grown more powerful. The SSI builds on DOE's 50 year history

of transforming advances in information technology into tools for scientific discovery to accelerate this process through a partnership with DOE laboratories, the academic community and industry.

This program began with workshops focused on the scientific opportunities that could result from access to multi-teraflop computing. All of the programs in the Office of Science made convincing cases that access to computing at this level would open new areas of research and enable solutions to new classes of problems. These workshops culminated in a workshop on advanced scientific and engineering computing jointly sponsored by DOE and the National Science Foundation at the National Academy of Sciences in July, 1998. This workshop validated the opportunity for scientific discovery and advanced engineering afforded by terascale computing. Throughout this document, the term teraflop is used in discussing the computational resources under consideration. One teraflop is one trillion (10^{12}) floating point operations per second. For comparison, desktop personal computers are generally capable of one hundred thousand (10^{5}) floating point operations per second. Current commercially available supercomputers are capable of nearly half teraflop performance.

Based on the input from these workshops, a plan for the SSI was developed to realize the goals of the SSI. It is a balanced plan of research which includes advanced computing and communications facilities, such as terascale computers and very high performance networks, computer science and enabling technology research to make these facilities useful, and investments in scientific disciplines to enable development of the advanced applications that will be required. The strategy for SSI applications has two components. The first was a selection of two mission critical application areas: global systems and combustion systems. In both of these cases, the initial SSI planning workshops identified significant opportunities for advanced computation to dramatically advance the state of the art with important impact on the nation's ability to respond effectively to issues such as the effect of greenhouse gasses on global climate and development of internal combustion engines able to meet societal goals for efficiency and pollution control. These two initial applications play a significant role in defining the requirements for computer and communications facilities as well as the computer science and enabling technology which will be required. These two applications will also play an important role in testing, integrating, and debugging both hardware and software components. The second component of the SSI applications strategy is an open, peer reviewed competition among basic science disciplines to select a small number for initial inclusion in the initiative and access to SSI computer and communications facilities.

The Scientific Simulation Initiative Builds on ASCI

One reason the Department is prepared to undertake this initiative at this time is that the proposed effort builds upon the DOE Defense Program (DP) Accelerated Strategic Computing Initiative (ASCI) which was launched in 1996 with a focus on multi-teraflop scale computing to meet the imposing challenges posed by Science Based Stockpile Stewardship.

Meeting the goals set for ASCI requires computers with capabilities exceeding those available today by a factor of one thousand and the ASCI program is following an aggressive hardware and software technology plan that will achieve the development and use of 100 teraflop computers by 2004. As a result of the ASCI effort, much more powerful computer systems, designed for full simulation of all scientific aspects of nuclear stockpile stewardship, have been developed. ASCI continues to develop the computational infrastructure needed to make effective use of these systems, including large-scale scientific data storage capabilities, computational grids for high-speed communication, software development systems for massively parallel computer systems, high-performance visualization systems,

etc. These advances, although focused on DOE's stockpile stewardship responsibility, presage the development of a comprehensive simulation capability for a whole range of scientific problems.

A Critical Element in the President's Initiative in Information Technology

Although the SSI is focused on revolutionary uses of computing as a tool for science, many of the investments in computer science and enabling technology will contribute to and benefit from the broader ITRI initiative. PITAC recommended significant increases in support for basic research in: Software, Scalable Information Infrastructure, High End Computing, and Socio-Economic and Workforce Impacts, as well as support of research projects of broader scope and visionary "Expeditions to the 21st century" to explore new ways that computing could benefit our world.

The SSI Computer Science and Enabling Technology (CSET) program has four components: Algorithms, Models, Methods and Libraries; Problem Solving Environments and Tools; Distributed Computing and Collaboration Technology; and Visualization and Data Management. The underlying strategy in all of these areas is based on taking advantage of the most recent work in software components and extending it to enable it to function at very high performance. In addition, the realities of the hardware platforms that will be available at SSI performance levels requires that the components be fault tolerant and that techniques be developed to enable the assembly of components into reliable fault tolerant assemblies. Thus, with respect to the PITAC recommendation on Software development, we expect SSI to be a significant program for fundamental research in software development methods and component technologies and to begin the development of a national repository of software components.

In addition, challenges facing SSI in the area of data management and visualization will require significant new research in the areas of human computer interfaces and interaction to enable researchers to navigate and extract scientific knowledge from petabyte-scale data archives resulting from SSI scale simulations and the coming generation of large experimental facilities. Both the SSI planning workshops as well as the ASCI Visualization Corridors workshops identified this as a critical area that would perhaps be an "Expedition to the 21st Century."

However, there are areas of software research included in the PITAC report that SSI will not cover, particularly software for systems such as air traffic control.

With regard to the PITAC recommendation on a Scalable Information Infrastructure, SSI will have a more modest impact because the problem for The SSI is primarily providing very high performance access for a modest number of people rather than providing access to billions of users worldwide.

With regard to the PITAC recommendation on High End Computing, SSI will have a major impact on R&D to improve the performance of high end computers, acquiring high end systems to support scientific research and moving towards petaop (1000 teraflop) systems by 2010. However, while SSI is a part of the solution to the problem of access to high end computing for science and engineering research and will develop many of the technologies needed to make this possible, the computing systems proposed are scaled to support a modest number of focused scientific projects, which will be collaborative efforts of large teams of disciplinary scientists, computer and computational scientists and mathematicians.

With regard to the PITAC recommendation on Socio-Economic and Workforce Impacts, The SSI will increase research funding in relevant areas of IT and will develop strategies to retrain existing scientists and IT workers as well as train new undergraduate and graduate students in these disciplines.

In addition to the research contributions that SSI will make to the broader ITRI, SSI facilities will provide crucial testbeds for testing many of the ideas that emerge from basic research in information technology.

As stated at the outset the SSI is an integrated initiative from the Office of Science. The descriptions of the various components, corresponding to the goals are included in the budgets of the responsible offices. The SSI has five principal objectives:

- **Revolutionize scientific research by the application of teraflop computational resources.** Whereas the scientific accomplishments of this century have resulted in seeking and understanding the fundamental laws that govern our physical universe, the science of the coming century will be characterized by synthesis of this knowledge into predictive capabilities for understanding and solving a wide range of scientific problems, many with practical consequences. In this endeavor, the computer will be a primary instrument of scientific discovery. Many areas of scientific inquiry critical to the Department's mission will be advanced dramatically with access to teraflop scale computing including but not limited to materials sciences, structural genomics, high energy and nuclear physics, subsurface flow, and fusion energy research.
- **Discover, develop and deploy crosscutting computer science and applied mathematics technology.** The practical and intellectual challenges to making effective use of terascale computers require the development of a terascale technology base in software, networking, data management and visualization, communications, and operating environments to enable scientists to make effective use of the simulation infrastructure.
- **Establish a national terascale distributed scientific simulation infrastructure.** This network of terascale computers, ultra-high speed communications, science centers, and support centers in academia, the national laboratories, and industry will provide the advanced computing testbeds which enable the accomplishment of the first three objectives.
- **Understand, model, and predict the effects on the earth's global environment of atmospheric greenhouse gas emissions, with an emphasis on carbon dioxide.** Through the use of teraflop scale computers, accelerate progress in general circulation model development and application to reduce substantially the uncertainties in decade-to-century model-based projections of global environmental change and to increase the utility of such projections to the broad research community. Current models of global systems cannot presently achieve regional specification in global environmental change projections with the requisite accuracy and reliability needed to support national and international energy and environmental policies. Work towards this objective will also play a significant role in defining, testing, and integrating the SSI facilities and SSI crosscutting computer science and applied mathematics technologies into tools for scientific dsicovery.
- **Understand, model, and predict the behavior and properties of combustion processes and devices.** With teraflop scale computing resources and a concerted research program in combustion modeling, develop a new generation of combustion modeling tools for accelerated

design of combustion devices meeting national goals of emission reduction and energy conservation. Through provision of a comprehensive understanding of the details of combustion, design engineers will have the computational tools to predict the chemical outcome of combustion processes with practical reliability, thus avoiding a time consuming, trial and error approach to the design of combustion devices (gas turbines, internal combustion engines, etc.) Work towards this objective will also play a significant role in defining, testing, and integrating the SSI facilities and SSI crosscutting computer science and applied mathematics technologies into tools for scientific discovery.

This initiative is a part of the broader President's ITRI. The Department's primary focus is advancing science through terascale computing. To accomplish these goals, DOE will partner with other agencies, particularly the National Science Foundation, to leverage the strengths of both agencies. In the case of research in global systems the research is already part of a broad interagency effort coordinated under the U.S. Global Change Research Program (USGCRP). Computer science and enabling technologies activities have been coordinated between agencies through the Computing, Information, and Communications R&D Subcommittee of the NSTC for a number of years. As a part of this initiative, closer ties will be established between DOE-funded activities and activities funded by other agencies. The development of enabling technologies for SSI will also be coordinated with the development of related technologies for ASCI through a joint CTR - ASCI research management committee. Where appropriate, joint interagency programs in other scientific disciplines may be established.

The CTR budget includes descriptions of the SSI computational science and enabling technology, as well as advanced computing and communications facilities elements of the SSI. In addition, the CTR budget includes funding for the competitive, peer reviewed selection of a small number of basic science applications to complement the two larger integrated applications efforts. The description of the Global Systems element of the SSI is included in the Biological and Environmental Research (BER) budget and the description of the Combustion Systems element is included in the Basic Energy Sciences (BES) budget. For reference, a high level summary of the proposed budget for the entire SSI initiative is given in the table below. These amounts will be reduced for the required SBIR/STTR assessments of 2.65%.

Objective	Program	FY 2000 Request
Earth's Global Environment	Biological and Environmental Research	$10 million
Combustion Systems	Basic Energy Sciences	$7 million
Basic Science Applications	Computational and Technology Research	$6 million
Computer Science and Enabling Technology	Computational and Technology Research	$16 million
SSI Facility Operations	Computational and Technology Research	$30 million
Staffing Resources	Science Program Direction	$1 million
Total SSI		$70 million

Site Description

Ames Laboratory

Ames Laboratory is a Multiprogram Laboratory located on 10 acres in Ames, Iowa. The MICS subprogram at Ames Laboratory conducts research in the materials scientific application pilot project, which focuses on applying advanced computing to problems in microstructural defects, alloys, and magnetic materials, and in computer science. The LTR subprogram at Ames also conducts research in the physical, chemical, materials, mathematical, engineering, and environmental sciences through cost-shared collaborations with industry.

Argonne National Laboratory

Argonne National Laboratory (ANL) in Argonne, Illinois, is a Multiprogram Laboratory located on a 1,700 acre site in suburban Chicago. ANL has a satellite site located in Idaho Falls, Idaho. The MICS subprogram at ANL conducts basic research in mathematics and computer science, as well as research in advanced computing software tools and collaboratory tools. ANL also participates in several scientific application and collaboratory pilot projects as well as supporting an advanced computing research facility. The advanced computing research facility (ACRF) at ANL focuses on advanced computers in the IBM-SP family of technologies as well as the interaction of those architectures with advanced visualization hardware. The LTR subprogram at ANL also conducts research motivated by practical energy payoffs through cost-shared collaborations with industry. The areas emphasized in the research portfolio are chemistry of ceramic membranes, separations technology, near-frictionless carbon coatings, and advanced methods for magnesium production.

Brookhaven National Laboratory

Brookhaven National Laboratory (BNL) is a Multiprogram Laboratory located on a 5,200 acre site in Upton, New York. The LTR subprogram at BNL conducts research motivated by practical energy payoffs through cost-shared collaborations with industry. The areas emphasized in the research portfolio are materials for rechargeable lithium batteries, sensors for portable data collection, catalytic production of organic chemicals, and DNA damage responses in human cells.

Fermi National Accelerator Laboratory (Fermilab)

Fermilab is located on a 6,800-acre site about 35 miles west of Chicago, Illinois. The LTR subprogram at Fermilab conducts research in areas such as: superconducting magnet research, design and development, detector development and high-performance computing through cost-shared collaborations with industry.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory (LBNL) is a Multiprogram Laboratory located in Berkeley, California. The Laboratory is on a 200 acre site adjacent to the Berkeley campus of the University of California. The MICS subprogram at LBNL conducts basic research in the mathematics and computer science, as well as research in advanced computing software tools and collaboratory tools. LBNL participates in several scientific application and collaboratory pilot projects as well as supporting an advanced computing research facility. The advanced computing research facility (ACRF) at LBNL currently focuses on very large scale computing on hardware in the T3E architecture from SGI-Cray including issues of distributing jobs over all the processors efficiently and the associated system management issues. LBNL manages the Energy Sciences Network (ESnet). ESnet is one of the world's most effective and progressive science-related computer networks that provides worldwide access and communications to Office of Science (SC) facilities. In 1996, the National Energy Research Scientific Computing Center (NERSC) was moved from the Lawrence Livermore National Laboratory to LBNL. NERSC provides a range of high-performance, state-of-the-art computing resources that are a critical element in the success of many SC research programs. The LTR subprogram at LBNL also conducts research motivated by practical energy payoffs through cost-shared collaborations with industry. The areas emphasized in the research portfolio are molecular lubricants for computers, advanced material deposition systems, screening novel anti-cancer compounds, and innovative membranes for oxygen separation.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory (LLNL) is a Multiprogram Laboratory located on a 821 acre site in Livermore, California. The MICS subprogram at LLNL involves significant participation in the advanced computing software tools program as well as basic research in applied mathematics.

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL) is a Multiprogram Laboratory located on a 27,000 acre site in Los Alamos, New Mexico. The Mathematical Information and Computational Sciences (MICS) subprogram at LANL conducts basic research in the mathematics and computer science and in advanced computing software tools. LANL also participates in several scientific application and collaboratory pilot projects as well as supporting an advanced computing research facility. The Advanced Computing Research Facility (ACRF) at LANL focuses on a progression of technologies from SGI - Cray involving Origin 2000 Symmetric Multiprocessor Computers linked with HiPPI crossbar switches. This series of research computers has been given the name "Nirvana Blue."

Oak Ridge Institute for Science and Education

Oak Ridge Institute for Science and Education (ORISE) is located on 150 acres in Oak Ridge, Tennessee. ORISE provides support for education activities funded within the CTR program.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL) is a Multiprogram Laboratory located on a 24,000 acre site in Oak Ridge, Tennessee. The MICS subprogram at ORNL conducts basic research in the mathematics and computer science, as well as research in advanced computing software tools and collaboratory tools. ORNL also participates in several scientific application and collaboratory pilot projects. The LTR subprogram at ORNL also conducts research motivated by practical energy payoffs through cost-shared collaborations with industry. The areas emphasized in the research portfolio are high temperature superconducting wire, microfabricated instrumentation for chemical sensing, and radioactive stents to prevent reformation of arterial blockage.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory (PNNL) is a Multiprogram Laboratory located on 640 acres at the Department's Hanford site in Richland, Washington. The MICS subprogram at PNNL conducts basic research in the mathematics and computer science, as well as research in advanced computing software tools and collaboratory tools. PNNL also participates in several scientific application pilot projects. The LTR subprogram at PNNL also conducts research motivated by practical energy payoffs through cost-shared collaborations with industry. The areas emphasized in the research portfolio are mathematical simulation of glass production, interactions of biological polymers with model surfaces, and characterization of micro-organisms in environmental samples.

Princeton Plasma Physics Laboratory

The Princeton Plasma Physics Laboratory (PPPL), a laboratory located in Plainsboro, New Jersey, is dedicated to the development of magnetic fusion energy. The LTR subprogram at PPPL conducts research in areas that include the plasma processing of semiconductor devices and the study of beam-surface interactions through cost-shared collaborations with industry.

Sandia National Laboratories

Sandia National Laboratories (SNL) is a Multiprogram Laboratory, with a total of 3,700 acres, located in Albuquerque, New Mexico, with sites in Livermore, California, and Tonapah, Nevada. The MICS subprogram at SNL conducts basic research in mathematics and computer science, as well as research in advanced computing software tools and collaboratory tools. SNL also participates in several scientific application and collaboratory pilot projects.

Stanford Linear Accelerator Center

The Stanford Linear Accelerator Center (SLAC) is located at the edge of Silicon Valley in California about halfway between San Francisco and San Jose on 426 acres of Stanford University land. The LTR subprogram at SLAC conducts research in areas such as advanced electronics, large-scale ultra-high vacuum systems, radiation physics and monitoring, polarized and high-brightness electron sources, magnet design and measurement, and controls systems through cost-shared collaborations with industry.

Thomas Jefferson National Accelerator Facility

The Thomas Jefferson National Accelerator Facility (TJNAF) is a basic research laboratory located on a 200 acre site in Newport News, Virginia. The LTR subprogram at the TJNAF conducts research in such areas as accelerator and detector engineering, superconducting radiofrequency technology, speed data acquisition, and liquid helium cryogenics through cost-shared collaborations with industry.

All Other Sites

The CTR program funds research at 71 colleges/universities located in 24 states. This line also includes funding of research awaiting distribution pending completion of peer review results.

Mathematical, Information, and Computational Sciences

Mission Supporting Goals and Objectives

The Mathematical, Information, and Computational Sciences (MICS) subprogram supports advanced computing research — applied mathematics, high performance computing, and networking — and operates supercomputer and associated facilities that are available to researchers 24 hours a day, 365 days a year. The combination of support for fundamental research, computational and networking tools development, and high-performance computing facilities provides scientists with the capabilities to analyze, model, simulate, and — most importantly — predict complex phenomena of importance to the Office of Science and to the Department of Energy.

Examples of the complex problems addressed by the Office of Science and the Department of Energy are: climate modeling, including the effects of greenhouse gases on global climate change; the combustion process, including the simulation of combustion in devices such as diesel engines; the subsurface transport of pollutants; the rational design of new materials to produce, for example, new alloys, superconductors, polymers, and catalysts; the effects of aging on the nuclear stockpile; and the analysis of vast amounts of real data from experiments at the Office of Science facilities for high energy physics, nuclear physics, materials sciences, chemical sciences, structural biology, and other disciplines.

For many such problems, traditional theoretical and experimental approaches may not be suitable; theory may be inadequate to handle the complexity, and experiments may not be feasible, because they are too dangerous, too expensive, or simply impossible owing to the length and time scales involved. Furthermore, experiments at the Office of Science facilities may generate millions of gigabytes (petabytes) of data per year (which would fill the disk drives of millions of today's personal computers) presenting significant computational and communications challenges in analyzing and extracting understanding from the data.

The increases in computational and communications capabilities achieved over the past two decades have made simulation a third branch of science that now complements theory and experiment and allows a new approach to previously intractable problems. However, as computational and communications capabilities have increased, so too have the challenges associated with effectively using these capabilities. The rate of increase in these capabilities itself poses formidable challenges. Significant hardware changes can occur as often as every 18 months; these, in turn, may require completely new approaches to computing software. This has already changed the way in which computation is performed in scientific disciplines such as materials science, biology, and fusion energy. Teams involving scientists from the disciplines as well as mathematicians; computer scientists; and experts in computer graphics, data management, and advanced computer networks are now required to address scientific problems that make use of the most modern computer and communications capabilities. This situation is quite different from that of even ten years ago when individual scientists could code and perform calculations with little or no support from others.

These same increases in computational and communications capabilities are having a second important impact on the way science is conducted. It is now possible for large geographically distributed teams to easily and effectively collaborate using major experimental facilities, computational resources, and data

resources. The name given to such optimized linkages among geographically distributed resources is "collaboratories." In the coming years, they are expected to play an increasingly important role in the Nation's scientific enterprise.

In order to enable scientists in the Office of Science to make effective use of these capabilities, the MICS subprogram supports research in three areas:

- Applied Mathematics. Research on the underlying mathematical understanding and numerical algorithms to enable effective description and prediction of physical systems such as fluids, magnetized plasmas, or protein molecules. This includes, for example, methods for solving large systems of partial differential equations on parallel computers, techniques for choosing optimal values for parameters in large systems with hundreds to hundreds of thousands of parameters, improving our understanding of fluid turbulence, and developing techniques for reliably estimating the errors in simulations of complex physical phenomena.
- Computer Science. Research in computer science to enable large scientific applications through advances in massively parallel computing such as very lightweight operating systems for parallel computers, distributed computing such as development of the Parallel Virtual Machine (PVM) software package which has become an industry standard, and large scale data management and visualization. The development of new computer and computational science techniques will allow scientists to use the most advanced computers without being overwhelmed by the complexity of rewriting their codes every 18 months.
- Networking. Research in high performance networks and information surety required to support high performance applications — protocols for high performance networks, methods for measuring the performance of high performance networks, and software to enable high speed connections between high performance computers and networks. The development of high speed communications and collaboration technologies will allow scientists to view, compare, and integrate data from multiple sources remotely.

In all of these areas — applied mathematics, computer science, and networking — the requirements far exceed the current state-of-the-art; furthermore, the requirements far exceed the tools that the commercial marketplace will deliver. In addition to these fundamental research efforts, the MICS subprogram takes the results of these efforts and forms partnerships with users in scientific disciplines to validate the usefulness of the ideas and to develop them into tools. MICS also provides the advanced computing and communications facilities that enable scientists to use these tools.

MICS provides two types of advanced computing and communications facilities. The first type of facility enables scientists to use the tools developed. Examples are NERSC and ESnet. The second type of facility is itself a research project. The principal current examples of this type of facility are the Advanced Computing Research Facilities (ACRFs) at Argonne National Laboratory, Lawrence Berkeley National Laboratory, and Los Alamos National Laboratory that represent the evolution of the High Performance Computing Research Centers and were established as part of the High Performance Computing and Communications initiative. The ACRFs combine research in computer software and hardware with targeted applications. One of the major issues that these facilities attempt to address is how different choices in computer architecture affect the ability of a system to scale to very large numbers of processors and very high performance. In order to address these issues, computers at a scale that push the state-of-the-art must be sited at the ACRFs. These computers enable research in computers

and computing, but they are not sufficiently mature or robust for production computing by large numbers of users.

Partnerships with the scientific disciplines are an important management philosophy in the MICS subprogram. Partnerships with the scientific disciplines are critical, because they test the usefulness of current advanced computing research, enable MICS to transfer the results of this research to scientists in the disciplines, and help define promising areas for future research. Finally, to develop future generations of scientists with the breadth of skills required to be effective both in advanced computing research and in interacting with disciplinary sciences, MICS supports the Computational Science Graduate Fellowship program.

The MICS subprogram includes the Department's participation in the President's Next Generation Internet (NGI) Initiative. This initiative will create the foundation for more powerful and versatile networks of the 21st century, just as previous federal investments in information technology R&D created the foundation for today's Internet. DOE's participation in this initiative is focused on network requirements that will enable data-intensive scientific research not now possible because of network limitations. It is anticipated that the results and "spinoffs" of this research, after testing and prototyping by the scientific community, will impact broad commercial use of networks.

DOE's NGI research program is focused on discovering, understanding, developing, testing and validating the networking technologies needed to enable wide area, data intensive and collaborative computing that is not currently possible. This program will integrate scientists working on fundamental research in applied mathematics, computer science, and networking with scientists working on DOE applications to develop new ways to link scientists with DOE's major scientific user facilities and computational centers. Such research is needed to enable effective use of petabyte/year High Energy and Nuclear Physics facilities such as the Relativistic Heavy Ion Collider (RHIC); to provide remote visualization of terabyte to petabyte data sets from computational simulation; to develop advanced collaboratories; and to enable effective remote access to tomorrow's advanced scientific computers. These applications share two important characteristics. They all involve extremely large data sets, and they all require that scientists be able to interact with the data in (nearly) real time. Current network technology limitations significantly limit our ability to address either of these characteristics.

The NGI activities are critical for DOE's fundamental science research. For example, using the current Internet, it would take about 2,500 hours to transmit one day's data from RHIC to one remote site for analysis. Typical RHIC experimental collaborations involve thousands of scientists and hundreds of institutions spread across the country and the world. Management of scientific data is further complicated because the data must be managed in large units. This is very different than data management in the commercial sector. For example, a standard telecommunications billing record is only 180 bytes long; a large web page is 500 kilobytes; but the data from a global climate model at any given time during the simulation (a single time step) may be greater than a gigabyte or 2,000 times as large as that of a large web page!

The technologies developed for commercial network traffic are simply inadequate for scientific network traffic. Significant *research* is needed to enable today's commercial networks to be used for scientific data. This research must include advanced protocols, special operating system services for very high speed, and very advanced network control. For example, a coast to coast gigabit/second network may have as much as a gigabit of data in transit at any one time. If this is scientific data this might be one

packet. Current protocols would require that all of the switches along the way be able to buffer a gigabit of data at very high rate, which is not possible with today's switches. Therefore research is required. The issues related to managing a single gigabit packet versus 2,000 500 kilobit packets are very different.

In addition to the complications posed by the transmission of large data sets, there are additional complications that result from the many different kinds of network devices, network-attached devices, and services that need to be integrated together. Examples of the components and services that need to be integrated include: network resources, data archives on tape, high performance disk caches, visualization and data analysis servers, authentication and security services, and the computer on a scientist's desk. This type of integration, as well as the issues of improving the performance of the individual components, all require significant research because the issues are currently not well understood. Indeed, the first identification of many of these issues is the result of previous work in collaboratories and visualization supported by this subprogram. Thus DOE's participation in the NGI builds on previous results of the MICS subprogram to address critical issues in the network. Furthermore, the differences between the requirements of commercial networks and networks for scientific research require DOE to conduct this research because these tools and technologies will not be developed by commercial R&D. However, there will be tremendous "spinoff" benefits to the Internet in general after the research is completed and the results enhance commercial networks.

Scientific Simulation Initiative

This budget also includes the MICS subprogram's contribution to DOE's Scientific Simulation Initiative (SSI), an integrated effort bringing together computational and communication resources, focused research in scientific disciplines, and research in computer science and other enabling technologies to solve the complex problems that characterize DOE's scientific research needs. The SSI couples research in advanced scientific applications in the programs of the Office of Science with research in computer science and enabling technologies and advanced computing and communications facilities. It is a joint program between CTR and the other program offices in SC.

It is a requirement for the success of this program to use the expertise that exists in national laboratories, universities, and industry and, where appropriate, formation of multidisciplinary teams of researchers. Participants from various institutions will be encouraged through open peer reviewed competitions. Also, strong partnerships with the DOE ASCI program and complementary programs in other agencies will be essential. The overview of the integrated program is given in the Program Mission statement of the CTR budget; however, the specific contributions of the MICS subprogram are described below.

MICS contributes to the SSI in three ways:

Management of the Computer Science and Enabling Technology (CSET) component of the SSI;

Management of the SSI Advanced Computing and Communications Facilities; and

Management of the peer reviewed selection process for the basic science application efforts to be initiated in FY 2000.

The goal of the CSET component of the SSI is to develop needed software systems, to deploy these systems into the DOE computing infrastructure, to support users, and to conduct the needed research to address future problems, all with close involvement of the applications scientists and the computer systems providers. CSET teams will also work closely with the vendor community to ensure that needed

capabilities are incorporated into products, systems, and services. Working with the university research community, CSET teams will ensure a steady flow of young researchers into the field and will form long-term collaborations in the areas needed by scientific simulation. CSET teams will also establish natural partnerships with the DOE ASCI program and with the NSF Partnerships for Advanced Computational Infrastructure (PACI) program, which are addressing complementary goals. These partnerships could result in the joint funding of research and development activities and joint deployment of infrastructure capabilities. CSET is a critical crosscutting activity for the Scientific Simulation Initiative — one that will enable the program to accomplish far more than if applications teams were required to develop all the necessary software and infrastructure themselves. Through the sharing of common tools and technologies, the CSET activities will dramatically improve the cost-effectiveness of the SSI. In order to accomplish these goals, CSET must support a vigorous research program as well as significant development and software deployment activities to address the following critical issues.

First, despite considerable progress during the past ten years in making massively parallel computer systems usable for applications, much remains to be done. Computer systems targeted for SSI will scale from approximately 1,000 nodes today to 5,000 or 10,000 nodes for systems in 2004. This scaling will require substantial improvements in parallel computing tools, parallel I/O (input/output) systems, data management, algorithms, and program libraries. Not only will the number of compute nodes increase, but the nodes themselves will become more complex, as systems designers are forced to introduce more layers of memory hierarchy to maintain performance and develop new hardware features to support rapid communication and synchronization. The end result five years from now will be hardware systems that, while showing their roots in today's systems, will be substantially different and substantially more complex and therefore more challenging to exploit for high performance.

Second, because applications software systems typically outlive hardware by an order of magnitude (i.e., computer hardware typically has a useful lifetime of three years, whereas large-scale scientific codes last one to two decades), new software must be designed for machines not only for the near future but for the next decade. This effort will require close working relationships between code developers from the applications areas and computer scientists who are involved in next-generation systems and architecture design.

Third, the applications themselves are getting more complex. They are incorporating more sophisticated physical models, are using advanced numerical techniques (e.g., adaptive mesh refinement, unstructured and implicit solvers, and hierarchical methods), and are beginning to be combined into large-scale "simulation systems" that include the linkage of two or more previously stand alone models (e.g., ocean-atmosphere-biosphere or fluid-structures-chemistry). Furthermore, in some cases these models are being driven by an optimization environment to enable them to address policy questions.

Finally, in addition to rapidly changing hardware and applications targets, the user and development community is also evolving. No longer can groups afford to work only with local collaborators or to use only locally available hardware and software resources. The development and user environments of the near future will need to enable ubiquitous collaboration and distributed computing capabilities to address these complexities. As the applications codes themselves become more interdisciplinary, so too will the teams that write them. As the need to incorporate deep knowledge of computer science techniques into future codes increases, so will the need to form long-term collaborations among applications scientists and computer scientists and mathematicians. These unavoidable trends mean that the problem-solving

environments of the future will need to support human-to-human interactions as easily as we support computer to computer interactions today.

The management of SSI Computing and Communications facilities also poses challenges. Specifying, developing procurement specifications for, and finally delivering installed SSI facilities require great skill and experience. All of the facilities must work together because the performance of the system is determined by the slowest component. The SSI facilities must provide the linkage between the computing environment developed for the user and the systems management and systems integration required to support these environments. The SSI requires three distinct types of computing facilities: computing, networking and associated supporting hardware.

DOE will establish an open solicitation process that seeks the widest participation in establishing its terascale computing infrastructure, including competition among national laboratories, universities, and industry, based on their qualifications. The sites for the major teraflop computers will be selected through peer-reviewed competition. A number of considerations are important in selecting organizations to manage and locations at which to site SSI facilities. One of the most important is an expertise to perform the necessary computing systems integration into the existing nationwide DOE Office of Science computing infrastructure. These large-scale systems have requirements for scalable systems management that will enable relatively small systems administration teams to manage systems with 1000's of nodes and 10,000's of processors. These systems also need to be tightly integrated with data storage environments, mass stores, visualization environments, and distributed computing frameworks. Other considerations include incremental site preparation costs, the cost of connecting at very high speed to the networking infrastructure, and site financial leverage in providing operational support to the facility.

Finally, MICS will manage the open peer reviewed competition among basic science disciplines to select a small number for initial inclusion in the initiative. These applications will be chosen from throughout the portfolio of the Office of Science based on the scientific and technical merit of the proposals; the importance to DOE missions; and the readiness of the area and the associated scientific communities to move quickly to terascale computers.

Funding Schedule

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Mathematical, Computational, and Computer Sciences Research

- **Applied Mathematics:** Research on the underlying mathematical understanding and numerical algorithms to enable effective description and prediction of physical systems. This activity supports research at DOE laboratories, universities, and private companies to provide the DOE laboratory community and the wider national scientific and engineering communities with the most powerful and effective mathematical and computational tools for modeling, analyzing, and simulating complex phenomena in the core disciplinary and technology areas of DOE. Laboratory, academic, and industry researchers supported by the program work at laboratory sites with DOE mentors. To accomplish its goals, the program supports research in a number of areas including: **Mathematical Physics** including string theory, superstring theory, geometry of space-time, and quantum effects; **Ordinary and Partial Differential Equations** including numerical methods, high performance algorithms, massively parallel algorithms, distributed computing, novel gridding schemes, numerical linear algebra, iterative methods, sparse solvers, and dense solvers; **Control Theory** including differential-algebraic systems, order reduction, queuing theory; **Shock Wave Theory** including hyperbolic systems, multipole expansions, mixed elliptic-hyperbolic problems, and wavelet transforms; **Fluid Dynamics** including compressible, incompressible, and reacting flows, turbulence modeling, and multiphase flows; **Dynamical Systems** including chaos-theory and control, and bifurcation theory; **Programming and Optimization** including linear and nonlinear programming, interior-point methods, and discrete and integer programming; and **Geometric and Symbolic Computing** including minimal surfaces and automated theorem proving. The FY 2000 budget includes the continuation of work initiated in FY 1999

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
to develop the mathematical basis for modeling and simulating complex stochastic phenomena of the type that arise in vital DOE areas such as global climate modeling, environmental remediation, and stockpile stewardship. CTR will provide opportunities for college faculty and students to spend time at DOE laboratories, to participate in world-class research projects. Faculty/Student Science Teams will visit DOE labs during the academic/summer semesters, be involved in conducting research, writing proposals, utilizing technology and pursuing technical or scientific careers. Primary goals of the Science Teams are to build long-term partnerships among DOE laboratories and provide faculty/students with a deeper understanding of DOE science associated needs for research and development. Funds will be provided to pay for faculty/student stipends, travel, housing, and subsidizing laboratory scientists' time for this activity ($1,947,000).	23,576	25,232	27,179
■ **Computer Science:** Research in computer science to enable large scientific applications. This activity supports research in two general areas: the underlying software to enable applications to make effective use of computers with hundreds or thousands of processors as well as computers that are located at different sites; and large scale data management and visualization. The first area includes research in protocols for message passing and parallel input/output (IO) as well as tools to monitor the performance of scientific applications. The second area includes research in effective techniques for retrieving data with complex internal structure from massive data archives that may be geographically distributed as well as advanced techniques for visualizing very large scale scientific data.	14,000	14,000	14,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Advanced Computing Software Tools:** R&D to develop the results of fundamental research in applied mathematics and computer science into an integrated set of tools that can be used by scientists in various disciplines to develop high performance scientific applications (e.g., to simulate the behavior of materials) that will have a useful life spanning many generations of computer hardware. These tools will include capabilities for representing complex geometries, solving diverse numerical equations, simplifying multi-language parallel execution, evaluating and enhancing code performance, and dynamically steering calculations during execution. This effort began as a part of the DOE2000 initiative.	5,000	5,000	5,000
■ **Scientific Applications Pilot Projects:** R&D to apply computational techniques and tools developed in the Advanced Computing Software Tools effort to basic research problems in order to test the usefulness of current advanced computing research, transfer the results of this research to the scientific disciplines, and help define promising areas for future research. Examples of pilot projects include: research in simulations of the earth's climate; research in the fundamental structure and properties of magnetic materials; creation of advanced tools to understand the chemistry of actinides; and partnerships with experimental disciplines such as high energy and nuclear physics, human genomics, and crystallography to improve the ability of these disciplines to manage and analyze the petabytes of data (that would fill the hard disks of millions of today's PC's) produced by their experiments and simulations. These efforts represent the evolution of the Grand Challenge projects that were initiated as part of DOE's component of the Federal High Performance Computing and Communications program, which started in FY 1991. These projects will now be phased out in an orderly manner	5,281	7,328	3,785

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Scientific Simulation Initiative (SSI) Algorithms, Models, Methods and Libraries:** New classes of algorithms will need to be developed to effectively utilize SSI systems. SSI computers will be characterized by large-scale distributed shared memory, with deep memory hierarchies. To achieve maximum performance, new hierarchical algorithms and methods need to be developed that can take advantage of these architecture features. In addition, mathematical techniques that are already under development may yield fundamentally new ways to conduct individual simulations and ensemble calculations, improving predictability and our understanding of errors in computations. New strategies for building mathematical software based on components are also likely to make a large contribution to programmer effectiveness for the SSI applications.	0	0	2,947
■ **SSI Problem Solving Environments and Tools (PSET):** A major challenge for CSET will be the development of an integrated problem solving environment that supports the rapid construction and testing of applications codes. These environments need to support the most advanced parallel tools and libraries and enable users to collaborate on the development of codes, planning runs, debugging and performance analysis. PSET systems will also allow the user to monitor jobs visually and to steer computations from their desktop and to share these results with others.	0	0	2,920
■ **SSI Distributed Computing and Collaboration Technology (DCCT):** Many SSI applications teams will be distributed around the country. They need the capability to work together not only to develop codes, but also to share data, design experiments, plan work and jointly conduct long running jobs. DCCT will support the creation of a software technology base to support SSI simulations that will enable users to run jobs at remote sites and migrate data from one site to another. Distributed computing technology will enable users to begin to see a single logical view of the DOE computing infrastructure and request, coordinate, and manage resources from multiple sites to attack a problem.	0	0	2,920

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **SSI Visualization and Data Management Systems:** Simulations run on 10 teraflop or 40 teraflop class computers will generate 10's or 100's of Terabytes of output per job. Advanced scientific visualization and analysis systems will be needed to translate this mass of output to human understanding. Some data will best be analyzed visually while other data will need to be post-processed to extract features and statistics. Both forms of analysis will need sophisticated data management systems to enable the rapid and facile manipulation of datasets. Large-scale databases will be used to manage data from simulations and advanced data organization techniques will support rapid and hierarchical traversals of data providing the user the possibility of flying through data in real-time. Associated capital requirements for large scale data management and visualization testbeds are also supported	0	0	6,815
■ **SSI Basic Science Applications:** Support two basic science SSI application efforts. These efforts will be selected through a competitive process that evaluates the scientific and technical merit of the proposed project, the potential of the proposed work to make significant new science possible, and the readiness of the scientific discipline and associated scientific community to make early use of terascale computers.	0	0	5,841
Total Mathematical, Computational, and Computer Sciences Research	47,857	51,560	71,407
Advanced Computation, Communications Research, and Associated Activities			
■ **Networking:** Research in high performance computer networks and information surety required to support high performance computer applications — protocols for high performance networks, methods for measuring the performance of high performance networks, and software to enable high speed connections between high performance computers and both local area and wide area networks. In addition, this activity supports research in network protocols to enable applications to request, and be guaranteed, certain levels of network capability.	5,987	4,500	4,500

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ **Collaboratory Tools:** R&D to develop the results of fundamental research in computer science and networking into an integrated set of tools to enable scientists to remotely access and control facilities and share data in real time. In order to accomplish this goal a number of issues are under investigation including: definition and demonstration of a general and modular security architecture that can protect open network applications such as control of experimental devices; development of a modular electronic notebook prototype that can be used in a number of desktop computer environments to enable the sharing of scientific results, data from scientific instruments, and design of scientific procedures; development of tools to manage distributed collaborations such as tools for managing multipoint videoconferences ranging from the current "whoever is speaking has the floor" to more formal meetings where a meeting leader controls who has the "floor"; development of advanced techniques for managing and returning to the electronic record of the collaboration; and exploration of techniques such as virtual reality to enable large groups to work together effectively at a distance. This effort began as a part of the DOE2000 initiative.	3,000	3,000	3,000
■ **National Collaboratory Pilot Projects:** R&D to test, validate, and apply collaboratory tools in partnership with other DOE programs. The two pilot projects are: (1) the Materials MicroCharacterization Collaboratory, a partnership with Basic Energy Sciences and Energy Efficiency and Renewable Energy to provide remote access to facilities located at Oak Ridge National Laboratory, Lawrence Berkeley National Laboratory, Argonne National Laboratory, and the National Institute of Standards and Technology, and the University of Illinois for electron beam microcharacterization of materials; and (2) the Diesel Combustion Collaboratory, a partnership with Basic Energy Sciences, Energy Efficiency and Renewable Energy, and three U.S. manufacturers of diesel engines, to link the research and researchers at Sandia National Laboratory, Lawrence Berkeley National Laboratory, Lawrence Livermore National Laboratory, and the University of Wisconsin with efforts and researchers at industrial			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
laboratories in Indiana and Michigan to develop the next generation of clean diesel engines. This effort began as a part of the DOE2000 initiative. These partnerships with the scientific disciplines and the technology programs enable MICS to be particularly successful in bringing advances in advanced computing research to bear on important problems faced by scientists in other disciplines. In addition, they provide important feedback to the researchers on what problems are most important.	3,000	3,000	3,000
■ **National Energy Research Scientific Computing Center (NERSC):** NERSC, located at LBNL, provides high performance computing for investigators supported by the Office of Science. The Center serves 3,500 users working on about 700 projects; 35 percent of users are university based, 60 percent are in National Laboratories, and 5 percent are in industry. NERSC provides a spectrum of supercomputers offering a range of high performance computing resources and associated software support. These computational resources will be integrated by a common high performance file storage system that facilitates interdisciplinary collaborations. This file storage system, the Archival Systems Upgrade, is a major item of equipment in FY 2000 with a total estimated cost of $2,000,000.	26,500	26,500	27,500
■ **Advanced Computing Research Facilities (ACRFs):** ACRFs support advanced computational hardware testbeds for scientific application pilot projects and fundamental research in applied mathematics and computer science. Because many of the issues to be investigated only appear in the computer systems at significantly larger scale than the computer manufacturers' commercial design point, these facilities must procure and develop software to manage and make useful the largest scale systems that can be afforded. In addition, the ACRFs, taken together, must have a full range of different computer architectures to enable comparison and reduce overall program risk. These all involve significant research efforts, often in partnership with the vendors to resolve issues including operating system stability and performance, system manageability and scheduling, fault tolerance and recovery, and details of the interprocessor communications network.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Therefore, all of these systems are managed as research programs and not as information technology investments. ACRFs are located at Los Alamos National Laboratory (Nirvana Blue partnership with the DOE Biological and Environmental Research (BER) program and Defense Programs (DP), based on SGI/Cray Technology); Argonne National Laboratory (IBM-SP); and Lawrence Berkeley National Laboratory (SGI/Cray T3E and Next Generation procurement). Related capital equipment needs such as high speed disk storage systems, archival data storage systems and high performance visualization hardware are also supported. The ACRFs represent the evolution of the High Performance Computing Research Centers that DOE initiated as a part of the Federal High Performance Computing and Communications initiative.	22,895	17,411	11,876
▪ **Energy Sciences Network (ESnet):** ESnet provides worldwide access to the Office of Science facilities, including: advanced light sources; neutron sources; particle accelerators; fusion reactors; spectrometers; ACRFs; and other leading-edge science instruments and facilities. ESnet provides the communications fabric that links DOE researchers to one another and forms the basis for fundamental research in networking, enabling R&D in collaboratory tools, and applications testbeds such as the national collaboratory pilot projects. To provide these facilities, ESnet management at LBNL contracts with commercial vendors for advanced communications services including Asynchronous Transfer Mode (ATM) and Wave Division Multiplexing (WDM). ESnet management provides system integration to provide a uniform interface to these services for DOE laboratories. In addition, ESnet management is responsible for the interfaces between the network fabric it provides and the worldwide Internet including the National Science Foundations's very high performance backbone network service that provides high performance connections to many research universities. One reason that ESnet, in the words of the 1998 external review committee, is able to provide the capabilities and services to its users "at significantly lower budgets than other			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
agencies" is its management structure with strong user and site coordination committees. This management structure is built on DOE's experience in operating large user facilities. Related capital equipment needs are also supported such as high speed network routers, ATM switches, and network management and testing equipment.	14,787	14,787	14,787
■ **Next Generation Internet (NGI):** DOE's program will focus on developing, testing and validating the networking technologies needed to enable wide area, data intensive and collaborative computing. The program, which began in FY 1999, has three subcomponents. First, research in basic underlying technologies such as: protocols and techniques for coordinating multiple, heterogeneous network-attached devices; congestion and flow control techniques; multi-gigabit end system interfaces, analyzers, and switches along with mechanisms to reduce operating system overhead for data transfers; mechanisms to provide application controlled Class of Service and Quality of Service; and middleware to provide Internet Protocol (IP), ATM, and WDM resource and admission control, scheduling, management, prioritization, accounting, and debugging. Second, Application-Network Technology-Network Testbed Partnerships to: integrate and test advanced network R&D and testbeds with DOE mission applications such as HENP Data, remote visualization of simulation results, advanced collaboratories; define what network & middleware services are required to permit these applications to effectively run over wide area networks; define the features and the API's necessary to allow the application and middleware to communicate; integrate local and wide-area network technologies to create distributed collaboratories; and integrate Differentiated Services, or other Quality of Service functions, into wide area networks and production network testbeds without compromising the existing production network services. Third, DOE-University Technology Testbeds focused on: R&D to implement advanced network services across multiple, interconnected networks; deployment of advanced differentiated services technology			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
across autonomous networks when priority flow represents a significant fraction of the available capability; development and testing of advanced tools to manage "peering" of networks with advanced services; cross-domain implementations of security and authentication technologies; development and testing of network performance monitoring and characterization software which applications can use in this environment to optimize their performance; and development of policy frameworks and specification languages to facilitate the negotiation of capabilities across autonomous system boundaries.	0	14,602	14,602
■ **SSI Research Computing Facilities and Network Infrastructure:** Initiation of a procurement for one 5 Teraflop-class computer system and associated data archive facilities in the third quarter of FY 2000. This activity includes not only procurement of the computing and storage systems but also the associated operational costs and facility improvements which will be required. This process will have two distinct stages. DOE will establish an open solicitation process that seeks the widest participation in establishing its terascale computing infrastructure, including competition among national laboratories, universities, and industry, based on their qualifications. The sites for the major teraflop computers will be selected through peer-reviewed competition. A number of considerations are important in selecting organizations to manage and locations at which to site SSI facilities. One of the most important is an expertise to perform the necessary computing systems integration into the existing nationwide DOE Office of Science computing infrastructure. These large-scale systems have requirements for scalable systems management that will enable relatively small systems administration teams to manage systems with 1000's of nodes and 10,000's of processors. These systems also need to be tightly integrated with data storage environments, mass stores, visualization environments, and distributed computing frameworks. Other considerations include incremental site preparation costs, the cost of connecting at very high speed to the networking infrastructure, and site			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
financial leverage in providing operational support to the facility. After the site is selected, the site must conduct an open competition to procure the 5 teraflop-class computer system as well as the other supporting computing and data storage systems. This activity also includes significant enhancements to the ESnet infrastructure to support access to the SSI computer facility by SSI scientists. SSI computing facilities and remote sites require very high performance network facilities to be effective. Planning estimates indicate that aggregate network data flow into and out of SSI facilities must be near 100 gigabits/second, almost 200 times faster than the fastest links on today's ESnet. In addition, remote sites with major participation in SSI science areas and CSET require significantly greater network capabilities than ESnet can provide within its current funding profile. Enhanced network services will be provided to remote sites on the basis of need and the resources available. The balance of funding between the computer facility and enhanced networking will be determined by detailed review after the selection of the computer facility site. However, preliminary estimates indicate that the computer facility will require between 80 percent and 85 percent of the funding in this activity. Associated requirements for capital equipment and GPP funding are included here..	0	0	29,417

Laboratory Technology Research

Mission Supporting Goals and Objectives

The mission of the Laboratory Technology Research (LTR) subprogram is to support high risk, energy related research that advances science and technology to enable applications that could significantly impact the Nation's energy economy. LTR fosters the production of research results motivated by a practical energy payoff through cost-shared collaborations between the Office of Science (SC) laboratories and industry.

An important component of the Department's strategic goals is to ensure that the United States maintains its leadership in science and technology. LTR is the lead program in the Office of Science for leveraging science and technology to advance understanding and to promote our country's economic competitiveness through cost-shared partnerships with the private sector.

The National Laboratories under the stewardship of the Office of Science conduct research in a variety of scientific and technical fields and operate unique scientific facilities. Viewed as a system, these ten laboratories — Ames Laboratory, Argonne National Laboratory, Brookhaven National Laboratory, Fermi National Accelerator Laboratory, Lawrence Berkeley National Laboratory, Oak Ridge National Laboratory, Pacific Northwest National Laboratory, Princeton Plasma Physics Laboratory, Stanford Linear Accelerator Center, and Thomas Jefferson National Accelerator Facility — offer a comprehensive resource for research collaborations. The major component of the LTR research portfolio consists of investments at these laboratories to conduct research that benefits all major stakeholders — the DOE, the industrial collaborators, and the Nation. These investments are further leveraged by the participation of an industry partner, using Cooperative Research and Development Agreements (CRADAs). Another LTR program component provides rapid access by small business to the research capabilities at the SC laboratories through agile partnership mechanisms including personnel exchanges and technical consultations with small business. The LTR subprogram currently emphasizes three critical areas of DOE mission-related research: advanced materials processing and utilization, intelligent processes and controls, and energy-related applications of biotechnology.

Performance Measures

- Initiate about 7 Laboratory Technology Research projects that address the Department's top priorities for science and technology, through cost-shared research partnerships with industry.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Laboratory Technology Research	14,983	12,751	13,921	+1,170	+9.2%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Laboratory Technology Research

- This activity supports research to advance the fundamental science and technology at the Office of Science laboratories toward innovative energy applications. Through CRADAs, the SC laboratories enter into cost-shared research partnerships with industry, typically for a period of three years, to explore energy applications of research advances in areas of mission relevance to both parties. In FY 2000, about 7 new Laboratory Technology Research projects will be initiated. The research portfolio consists of approximately 100 projects and emphasizes the following topics: advanced materials processing and utilization, intelligent processes and controls, and energy-related applications of biotechnology. Efforts underway include the exploration of (1) a process to produce ultra-smooth diamond coatings on rotating and sliding mechanical parts in order to reduce energy consumption, improve product reliability, and reduce toxic emissions to the environment; (2) a new family of wireless, single-chip luminescent-sensing devices for use in monitoring of environmental pollutants and in high throughput screening of new therapeutic drugs; and (3) an x-ray imaging module, consisting of a cadmium zinc telluride detector and an application-specific integrated circuit, to determine bone density in the diagnosis of osteoporosis by performing whole

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
body scans with lower dose rate and higher resolution. A small but important component of this activity provides industry, particularly small businesses, with rapid access to the unique research capabilities and resources at the SC laboratories. These research efforts are usually supported for a few months to quantify the energy benefit of a specific problem posed by an industry. Recent projects supported the development of (1) a low-temperature oxygen plasma technology for remediation of soils contaminated by pesticides and other chemicals; (2) a new class of fluids that can transfer heat more efficiently than conventional fluids and offer several energy-related benefits, including decreased pumping power needs and reduction in required heat exchanger size, for use in the transportation, electronics, and textile industries; and (3) improved catalytic materials, which can lead to substantial energy savings in petroleum refining and chemical manufacturing.	14,983	12,751	13,921
SBIR/STTR			
■ In FY 1998, $391,000 and $24,000 were transferred to the SBIR and STTR programs, respectively. The FY 1999 and FY 2000 amounts are the estimated requirement for the continuation of the SBIR and STTR programs.	0	423	379

Advanced Energy Projects

Mission Supporting Goals and Objectives:

The Advanced Energy Projects (AEP) subprogram funded research that established the feasibility of novel, energy-related concepts that span the Department's energy mission and goals. Funded projects were based on innovative ideas that spanned multiple scientific and technical disciplines and did not fit into any other DOE program area. A common theme for each project was the initial linkage of new research results to an energy application with a potentially significant payoff. Typically, AEP supported projects up to a level of about $250,000 per year for a period of about 3 years. Projects were selected from proposals submitted by universities and national laboratories. Funding criteria emphasized scientific merit as judged by external peer review.

Energy Research Analyses

Program Mission

The mission of the Energy Research Analyses (ERA) program is to evaluate the quality and impact of Department of Energy research programs and projects.

Program Goal

Provide Department of Energy program managers and senior managers with objective assessments of research projects and programs in order to evaluate the quality and impact of these efforts, to identify undesirable duplications and gaps, and to provide analysis of key technical issues in support of long range energy research planning, science and technology planning, and technical and performance evaluation of departmental programs and objectives.

Program Objectives

- *To Provide The Basis For Judgments on The Quality of Research And Its Impact.* Using merit review with peer evaluation, provide departmental program managers and their superiors with detailed information about the technical strengths and weaknesses of projects that comprise the research and development (R&D) program as a basis for judgment of the quality of the research and its impact.

- *To Provide Independent Views of Future R&D Needs in Areas of Interest to The Department.* Evaluate the status of science and technology areas of potential importance to the Department's mission, and to lay out appropriate fundamental and applied research and development to hasten the advance towards potential energy applications.

- *To Develop Strategic And Performance Plans.* Use advice from outside experts, advisory committees, departmental managers, national laboratory managers, industrial scientists and managers, and officials of other government agencies to formulate strategic and performance plans for the Office of Science and for the Science and Technology business line of the Department.

- *To Contribute to DOE And Interagency Program Analysis And Planning For Government Science And Technology.* Participate in committees, task forces, working groups, and workshops of the Department of Energy and organizations such as the National Science and Technology Council, the National Science Foundation, the National Academy of Sciences, and private sector organizations such as the Industrial Research Institute, and the Electric Power Research Institute.

Performance Measures

- Quality and value of peer review evaluations, as indicated by satisfaction of investigators and program managers and actions taken to improve or replace projects that have significant shortcomings, and to capitalize on the strengths of stronger projects.
- Satisfaction by customer program managers with assessments of science and technology needs, as indicated by changes or additions to make DOE programs and projects more productive and relevant to DOE missions.
- Quality and acceptance of strategic and performance plans, as indicated by their use by the Director of the Office of Science and by program offices in multi-year program planning, program management, and in effectively justifying programs.
- Influence on government science and technology planning and analysis, as indicated by contributions to DOE, interagency, and outside recommendations on science policies and plans.

Significant Accomplishments and Program Shifts

Energy Research Analyses

- Independent peer reviews verified the quality and relevance of over 100 DOE projects and tasks in FY 1997. These levels of effort will be scaled down through FY 2000 to accommodate the reduced funding.
- A new Office of Science Strategic Plan will be completed in FY 1999 that will guide the Office of Science into the first quarter of the next century.
- A Department of Energy Science Facilities Roadmap will be completed in FY 1999 that will optimize the Nation's investments in the Department's scientific facilities into the first quarter of the next century.

[1] Share of Science general reduction for use of prior year balances assigned to this program. The total general reduction is applied at the appropriation level.

[2] Excludes $36,000 which has been transferred to the SBIR program and $2,000 which has been transferred to the STTR program.

[3] Funding provided to laboratories, universities, industry, other Federal agencies and other miscellaneous contractors.

Site Description

Oak Ridge National Laboratory

Oak Ridge National Laboratory is a Multiprogram Laboratory located on a 24,000 acre site in Oak Ridge, Tennessee. Oak Ridge National Laboratory supports the Energy Research Analyses program in technical reviews of Department research programs. This activity includes technical support for peer review assessments and other studies and workshops as requested.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory is a Multiprogram Laboratory located on a 640 acre site at the Department's Hanford site in Richland, Washington. Pacific Northwest National Laboratory carries out research in the areas of technical planning and economic analysis to contribute to the Energy Research Analyses program's formulation of long term plans and science policy. This activity includes assessments of international basic energy science programs and private sector investments in energy R&D.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory is a Multiprogram Laboratory located in Berkeley, California. The Laboratory is on a 200 acre site adjacent to the Berkeley campus of the University of California. This activity contributes to the Energy Research Analyses program's formulation of long-term plans and science policy.

All Other Sites

This line includes funding of research awaiting distribution pending finalization of program office detailed planning.

Energy Research Analyses

Mission Supporting Goals and Objectives

The Energy Research Analyses (ERA) program assesses research projects and programs in order to judge the significance of these efforts and to identify undesirable duplications and gaps. Peer reviews of individual research projects using outside experts are performed. Technical assessments to determine the direction of future research and state-of-the-science reviews are also performed. The program also provides analyses in support of long range energy research planning, science and technology planning, and technical evaluation of DOE programs and objectives.

Multiprogram Energy Laboratories - Facilities Support

Program Mission

The Multiprogram Energy Laboratories - Facilities Support (MEL-FS) program provides line item construction funding (i.e., projects with a total estimated cost of $5,000,000 or above) for general purpose facilities to support the infrastructure of the five Office of Science multiprogram national laboratories. These are: Argonne National Laboratory - East (ANL-E), Brookhaven National Laboratory (BNL), Lawrence Berkeley National Laboratory (LBNL), Oak Ridge National Laboratory (ORNL), and Pacific Northwest National Laboratory (PNNL). These laboratories are government-owned, contractor-operated (GOCO) and have over 1,100 buildings with 14.3 million gross square feet of space and an estimated replacement value of over $9,000,000,000. Total operating funding for these laboratories is over $3,000,000,000 a year. The Office of Science manages this program to provide a comprehensive, prioritized and equitable approach to its stewardship responsibility for the general purpose support infrastructure of these laboratories.

The program also provides funding for Payments in Lieu of Taxes (PILT) as authorized by the Atomic Energy Act of 1954, as amended. These discretionary payments are made to state or local governments where the Department or its predecessor agencies have acquired property previously subject to state or local taxation.

Program Goal

To ensure that the support facilities at the multiprogram laboratories can meet the Department's research needs in a safe, environmentally sound, and cost-effective manner primarily by refurbishing or replacing deteriorated, outmoded, unsafe, and inefficient general purpose infrastructure.

Program Objectives

- To correct Environment, Safety and Health (ES&H) inadequacies.
- To reduce risk of operational interruptions due to failed support systems.
- To provide cost effective operations and reduce maintenance costs.
- To provide quality space for multiprogram research and support activities.
- To preserve the government investment in the physical plant of the laboratories.
- To promote performance-based infrastructure management.

Performance Measures

Performance measures related to the MEL-FS program are continuously being refined to ensure that they: 1) incorporate external/internal customer inputs; 2) drive performance; 3) address the strategic plan; and 4) focus on the effectiveness of the laboratory system. Current performance measures include:

- Support of line item construction funding to reduce risk, ensure continuity of operations, avoid or reduce costs and increase productivity.

  Expectation: Fund highest priority needs based on scoring from Life Cycle Asset Management (LCAM) Cost-Risk-Impact Matrix.

- Overall condition of laboratory buildings.

  Expectation: Increase the percentage of facilities rated adequate.

- Excellence in project management.

  Expectation: Increase the percentage of projects completed within baseline cost and schedule.

Significant Accomplishments and Program Shifts

- Progress in Line Item Projects - Two projects are scheduled for physical completion in FY 2000: the Building Electrical Services Upgrade- Phase I at ANL-E and the Electrical Services Rehabilitation-Phase IV at LBNL.
- Continue the Payments in Lieu of Taxes (PILT) for ANL-E and BNL.

[a] Share of Science general reduction for use of prior year balances assigned to this program. The total general reduction is applied at the appropriation level.

Site Description

Argonne National Laboratory - East

Argonne National Laboratory - East (ANL-E) in Argonne, Illinois, is a Multiprogram Laboratory located on a 1,700 acre site in suburban Chicago. The laboratory consists of 122 facilities, 4.6 million gross square feet of space, with the average age of the facilities being 30 years. Approximately 29 percent of the space is considered adequate, while the remainder needs rehabilitation or replacement/demolition. The MEL-FS program is currently funding or proposes funding the following projects:

- MEL-001-03 - Electrical Systems Upgrade, Phase III (TEC $7,620,000) Project includes upgrading transmission lines, transformers, switchgear, etc. to insure system reliability.

- MEL-001-06 - Central Supply Facility (TEC $5,900,000) - This project will consolidate operations currently dispersed throughout the site into one central location.

- MEL-001-09 Fire Safety Improvements, Phase IV (TEC $8,430,000) This proposed new start for FY 2000 will bring 30 major facilities into compliance with the Life Safety Code and the National Fire Alarm Code.

The program also provides funding for Payments in Lieu of Taxes (PILT) as authorized by the Atomic Energy Act of 1954, as amended. These discretionary payments are made to state or local governments where the Department or its predecessor agencies have acquired property previously subject to state or local taxation.

Brookhaven National Laboratory

Brookhaven National Laboratory is a Multiprogram Laboratory located on a 5,200 acre site in Upton, New York. The laboratory consists of 349 facilities, 4.1 million gross square feet of space, with the average age of the facilities being 38 years. Approximately 27 percent of the space is considered adequate, while the remainder needs rehabilitation or replacement/demolition. The MEL-FS program is currently funding:

- MEL-001-04 - Electrical Systems Modifications, Phase I (TEC $5,730,000) This project will include: the replacement of and installation of new cables and underground ductbanks; the installation of a new 13.8 kV - 2.4 kV substation and replacement of other obsolete components.

- MEL-001-07 - Sanitary System Modifications, Phase III (TEC $6,500,000) This project will: replace or rehabilitate approximately 9,900 feet of existing deteriorated (8 to 20 inch) sewer piping; replace the sewage digester; connect five facilities to the sanitary system; and make other modifications to reduce discharges to the environment.

The program also provides funding for Payments in Lieu of Taxes (PILT) as authorized by the Atomic Energy Act of 1954, as amended. These discretionary payments are made to state or local governments where the Department or its predecessor agencies have acquired property previously subject to state or local taxation.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory is a Multiprogram Laboratory located in Berkeley, California. The laboratory is on a 200 acre site adjacent to the Berkeley campus branch of the University of California. The laboratory consists of 118 facilities, 1.6 million gross square feet of space, with the average age of the facilities being 34 years. Approximately 19 percent of the space is considered adequate, while the remainder needs rehabilitation or replacement/demolition. The MEL-FS program is currently funding or proposes to fund the following projects:

- MEL-001-05 - Building 77-Rehabilitation of Building Structure and Systems (TEC $8,000,000) This project will correct seismic deficiencies and refurbish and upgrade the electrical and mechanical systems to facilitate the high precision processes currently being performed in the facility.

Oak Ridge National Laboratory

Oak Ridge National Laboratory is a Multiprogram Laboratory located on a 24,000 acre site in Oak Ridge, Tennessee. The laboratory consists of 466 facilities, 3.4 million gross square feet of space, with the average age of the facilities being 36 years. Approximately 18 percent of the space is considered adequate, while the remainder needs rehabilitation or replacement/demolition. The MEL-FS program is currently funding or proposes to fund the following projects:

- 94-E-363- Roofing Improvements (TEC $16,000,000) This project is replacing the roofs on numerous facilities, thereby extending their lives significantly.

- MEL-001-08 Electrical Systems Upgrade (TEC $5,900,000) This proposed new start for FY 2000 will include: replacing overhead feeders; installing advanced protective relaying capabilities at major substations; and replacing major switchgear and transformers.

Multiprogram Energy Laboratories - Facilities Support

Mission Supporting Goals and Objectives

This subprogram supports the program's goal to ensure that the multiprogram laboratories' support facilities can meet the Department's research needs primarily by refurbishing or replacing deteriorated, outmoded, unsafe, and inefficient general purpose infrastructure. General purpose facilities are general use, service and support facilities such as administrative space, cafeterias, general office/laboratory space, utility systems, sanitary sewers, roads, etc. Less than half of the space is considered fully adequate, while the remainder needs rehabilitation or replacement/demolition. The large percentage of inadequate space reflects the age of the facilities (average age of 33 years), changing research needs that require more office space and light laboratory space, ES&H requirements and obsolete systems.

Capital investment requirements are identified in laboratory Institutional Plans which address needs through the year 2003 based on expected programmatic support. The projected needs through the period total over $320,000,000. Of this amount, 53 percent is to rehabilitate or replace buildings; 33 percent is for utility projects; and 14 percent for ES&H projects. All projects are first ranked using a prioritization model that takes into account risk, impacts, and mission need. The projects that have ES&H as the principal driver are further prioritized using the Risk Prioritization Model from the DOE ES&H and Infrastructure Management Plan process.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
General Purpose Facilities	10,829	10,271	15,500	+5,229	+50.9%
ES&H	10,418	9,829	4,600	-5,229	-53.2%
Infrastructure Support	0	1,160	1,160	0	0.0%
Total, Multiprogram Energy Laboratories-Facilities Support	21,247	21,260	21,260	0	0.0%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
General Purpose Facilities			
■ Supports the initiation of one new General Purpose Facility subproject in FY 2000, as well as the continuation of three FY 1999 subprojects under the Multiprogram Energy Laboratories Infrastructure Project (MEL-001). The FY 2000 new start is for design activities on the Electrical Systems Upgrade at ORNL ($357,000). The FY 1999 subprojects are the Central Supply Facility at ANL-E ($3,380,000); the Electrical Systems Modifications, Phase I at BNL ($3,881,000), and the Rehabilitation of Building 77 at LBNL ($6,133,000). Also supports the ongoing Roofing Improvements Project at ORNL ($1,749,000) (94-E-363) .	10,829	10,271	15,500
ES&H			
■ Supports the initiation of one new ES&H subproject in FY 2000, as well as the continuation of one FY 1998 and one FY 1999 subproject under the Multiprogram Energy Laboratories Infrastructure Project (MEL-001). The FY 2000 new start is for design activities on the Fire Safety Improvements, Phase IV at ANL-E ($400,000). The FY 1999 subproject is the Sanitary System Modifications, Phase III at BNL ($3,000,000). Also supports the completion of the Electrical Systems Upgrade, Phase III at ANL-E ($1,200,000).	10,418	9,829	4,600
Infrastructure Support			
■ Continue meeting payments in lieu of taxes assistance requirements for communities surrounding Brookhaven National Laboratory and Argonne National Laboratory-East.	0	1,160	1,160
Total, Multiprogram Energy Laboratories - Facilities Support	21,247	21,260	21,260

54701 00-45

Explanation of Changes

	FY 2000 vs. FY 1999 ($000)
■ There are no changes from FY 1999 to FY 2000 for the MEL-FS program.	0

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design and Construction			
FY 1998	7,259	7,259	2,358
FY 1999	14,924	14,924	8,955
FY 2000	18,351	18,351	18,782
FY 2001	17,316	17,316	21,210
FY 2002	2,030	2,030	8,205
FY 2003	0	0	370

3. Project Description, Justification and Scope

This project funds two types of subprojects:

- Projects to correct ES&H deficiencies including fire safety improvements, sanitary system upgrades and electrical system replacements; and
- Projects that renovate or replace inefficient and unreliable general purpose facilities (GPF) including general use, service and support facilities such as administrative space, cafeterias, utility systems, and roads.

General Purpose Facility Projects:

a. Subproject 01 - Upgrade Steam Plant, ORNL

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
5,300	0	3,400	1,900	0	0	1Q 1998 - 4Q 1999

This project will upgrade the ORNL steam plant by adding a new steam boiler of approximately 100,000 pounds per hour capacity and capable of burning both natural gas and fuel oil. The boiler will be procured with all necessary ancillary equipment, such as blowers, feedwater pumps, and controls. Suitable weather protection will be provided.

This project is needed because of the age of the five existing boilers. Three are 46 years old, one is 44 years old, and the fifth is 32 years old. The new boiler capacity will allow decreased firing time on the oldest boilers and will extend their useful life. In addition, the new boiler will improve the efficiency of the steam plant.

b. Subproject 04 - Electrical Systems Modifications, Phase I (BNL)

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
5,730	0	0	849	3,881	1,000	2Q 1999 - 4Q 2001

This project is the first phase of a planned modernization and refurbishment of the Laboratory's electrical infrastructure. The project provides for the replacement of 30 to 50 year old deteriorating underground electrical cables, the addition of underground ductbanks to replace damaged portions and support new cabling, the installation of a new 13.8 kV - 2.4 kV substation to address capacity and operational problems, and the retrofitting/reconditioning of switchgear power circuit breakers.

c. Subproject 05 - Bldg. 77 - Rehabilitation of Building Structure and Systems (LBNL)

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
8,000	0	0	754	6,133	1,113	2Q 1999 - 4Q 2001

This project will rehabilitate Building 77's structural system to restore lateral force resistance and arrest differential foundation settlement, and will modernize architectural, mechanical, and electrical systems. These upgrades will restore this 33 year-old, 68,000 sq.ft. building to acceptable seismic performance; provide environmental controls appropriate to precision fabrication processes; increase the reliability and maintainability of building systems; provide flexibility to meet future challenges; and extend building life by 40 years and building systems by 20 to 25 years.

d. Subproject 06 - Central Supply Facility (ANL-E)

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
5,900	0	0	1,860	3,380	660	2Q 1999 - 2Q 2001

This project is a change in scope from the stand-alone facility of 39,100 sq.ft. described in the FY 1999 President's Request. The proposed facility is a 22,000 sq.ft. addition to the Transportation and Grounds Facility (Bldg. 46) along with remodeling of 3,500 sq.ft. of space in the existing Transportation and Grounds Facility. This project will result in economies and efficiencies by providing a highly efficient and cost-effective consolidated facility to meet the missions of the Materials Group and the Property Group of ANL-East and will eliminate the need for 89,630 square feet of substandard (50 year-old) space in six buildings which will be demolished (Bldgs. 4, 5, 6, 26, 27, and 28). The Materials Group receives, sorts, stores, retrieves, and distributes the majority of all materials and supplies for the Laboratory. The Property Group tags, controls, stores, and distributes excess property and precious metals for the Laboratory. This facility will contain truck docks; receiving and distribution areas; inventory control; general material storage; support and office areas; property storage; and exterior hazardous storage. This project will also eliminate 7,000 linear feet of steam supply and return lines. This proposed scope change is a result of: process improvements that have led to a reduction in on-hand inventory, relocation of DOE records storage to off-site archives; relocation of mail services; and a reduction to the labs vehicular fleet that reduced the utilization of Bldg. 46.

e. Subproject 08 - Electrical Systems Upgrade (ORNL)

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
5,900	0	0	0	357	5,543	3Q 2000 - 2Q 2002

This project will replace electrical distribution feeders and upgrade transformers and switchgear feeding research facilities and primary utility support facilities throughout the Oak Ridge National Laboratory (ORNL) complex. It will also provide advanced protective relaying and metering capabilities at major substations. The project is part of a phased infrastructure upgrade to restore the electrical distribution systems serving the ORNL. The purpose of the upgrade is to maintain a reliable source of electrical power appropriate for servicing scientific research facilities. Without the proposed upgrade, the potential for electrical faults and outages will increase as the distribution system ages, with attendant increased risk of equipment damage and the potential inability to meet laboratory programmatic goals due to downtime of critical facilities. These facilities include the central research facilities, supercomputing facility, Robotics and Process Systems facility, the central chilled water plant, and the steam plant. Also, maintenance costs involved in continued operation of the existing deteriorated system will increase as the system ages.

ES&H Projects:

a. Subproject 02 - Electrical Systems Rehab. Phase IV, (LBNL)

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
6,500	0	2,400	4,100	0	0	2Q 1998 - 4Q 2000

The Blackberry Switching Station Replacement Project is the last major planned rehabilitation to the LBNL electrical power system, in order to maintain its reliability and improve its safety. The project will upgrade the existing 12 kV power system and utilize circuit breakers installed in the FY 1987 MEL-FS project improvement to the main Grizzly Substation.

The project will correct existing deficiencies in the power distribution system that serves the Blackberry Canyon Service Area. The improvements will replace the existing electrical system, which consists of aged and underrated electrical equipment, 20 to 30 years old in many instances, that is difficult to maintain and unsafe to operate. It will provide the Laboratory with increased operational flexibility as well as improvements in reliability, maintainability and safety.

b. Subproject 03 - Electrical Systems Upgrade, Phase III, (ANL-E)

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
7,620	0	1,459	4,961	1,200	0	2Q 1998 - 1Q 2001

The project provides for the upgrade of the main electrical substation at Facility 543 and Facility 549A.

The work consists of the following items: install a new 138 kV overhead steel pole transmission line and upgrade the existing transmission line, relocate an existing transformer, upgrade existing transformers, replace existing 13.2 kV outdoor switchgear, and replace existing oil circuit breaker.

The intended project will accomplish several objectives related to system reliability, personnel safety, environmental hazards, risk reduction and system expansion.

c. Subproject 07 - Sanitary System Modifications, Phase III, (BNL)

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
6,500	0	0	500	3,000	3,000	2Q 1999 - 2Q 2002

The BNL Sanitary System consists of over 20 miles of collection piping which collects sanitary waste from nearly all the BNL facilities. The collection piping transports the waste via gravity piping and lift stations to a sewage treatment plant (STP). This project is the third phase of the upgrade of the Laboratory sanitary waste system. In the first two phases, major operations of the STP were upgraded and approximately 14,000 feet of trunk sewer lines were replaced, repaired, or lined. Phase III will continue this upgrade and will replace or rehabilitate approximately 9,900 feet of existing deteriorated (8 to 20 inch) sewer piping, connect five facilities to the sanitary system by installing 7,500 feet of new sewer pipe, and two new lift stations. This will eliminate non-compliant leaching

fields and cess pools, reduce non-contact cooling water flow into the sewage system by 72 million gallons per year by: diverting flow to the storm system; converting water heat exchangers to air cooled condensers; and replacing water cooled equipment in 15 buildings. The STP anaerobic sludge digester will be replaced with an aerobic sludge digester to eliminate high maintenance activity and improve performance, and install liners and modify the under drain piping in the STP sand filter beds.

d. Subproject 09 - Fire Safety Improvements, Phase IV, (ANL-E)

TEC	Prev.	FY 1998	FY 1999	FY 2000	Outyear	Construction Start/ Completion Dates
8,430	0	0	0	400	8,030	3Q 2000 - 2Q 2003

This project will complete the effort of correcting known deficiencies with respect to fire detection and alarm systems; life safety and OSHA related sprinkler systems; and critical means of egress in twenty-eight (28) buildings at the Argonne National Laboratory-East (ANL-E) site. Correction of these deficiencies is required to comply with DOE Order 420.1, OSHA 1910,164, and OSHA Subpart C. These deficiencies, if uncorrected, could result in unmitigated risks of injury to personnel and/or damage to DOE property in case of fire.

4. Details of Cost Estimate

N/A

5. Method of Performance

Design will be negotiated by architect-engineer contracts or laboratory personnel. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts awarded on the basis of competitive bids.

FY 2000	1,749	1,749	3,820
FY 2001	0	0	769

a This project was proposed as an FY 1993 new start (93-E-329). Application of a portion (-$4,024,000) of the FY 1993 programmatic general reduction of $40,000,000 necessitated a delay in the start of this project to FY 1994.

b Reflects reductions as follows: $-68,000 Contractor Salary Freeze; $-96,000 rescission.

c Reflects application of a portion ($-2,803,000) of Energy Supply Research and Development reductions.

d Reflects application of a portion ($66,000) of Science general reduction.

3. Project Description, Justification and Scope

This project will replace deteriorated roofing on buildings and facilities throughout the Oak Ridge National Laboratory complex. ORNL has over 2.4 million square feet of roof area on approximately 160 buildings. Based on a recent study by the laboratory's Plant and Equipment Division, approximately seventy percent of the total area needs to be replaced due to age and deterioration. This project is the first of several planned projects to replace the deteriorated roofing. It will replace the roofs that are in the worst condition (top priority) on buildings housing the most important facilities. Most of the existing roofing materials contain asbestos and much of it has traces of radioactive contaminants. This project will provide for the installation of new roofing and includes the necessary engineered controls to assure compliance with applicable health and safety regulations.

Approximately 70 percent of the roofs have been in service for over 20 years. Because of age and deterioration, many of these roofs have already developed leaks and require an increasing amount of maintenance. The results of the Plant and Equipment Division study of these roofs, giving the type and condition of each roof by building, including conditions of asbestos and/or radioactive contamination, were used as the basis of the conceptual design. In some cases the problems have reached the point that they could affect equipment, records, and research activities, as well as the health and safety of personnel working in the buildings or facilities.

During the past few years budget constraints and the increased cost of satisfying environment, safety and health regulations have resulted in a reduction in funds available for roof replacement. The effects of this shortfall have been compounded by the increased cost associated with restrictions placed on work with or around asbestos materials. Most of the roofs needing replacement involve asbestos materials. This combination of factors has resulted in a growing backlog of roofs that need replacement due to a lack of adequate funding. The current average annual cost of roof repairs is $800,000. This does not include damage from leaks before repairs are made. There is currently a backlog of over $5,000,000 of repairs needed. The roof replacement program is normally funded from expense funds; however, line item funding is requested because of the magnitude of the backlog and the need to provide an acceptable margin of response to meeting future replacement needs in a timely manner.

Failure to fund this project will result in a continuation of the expensive piece-meal repair program. As the roofs age, the number of leaks will increase, repairs will become more expensive and the potential for serious structural and equipment damage will grow, along with the threat to employee health and safety. Further deterioration of facilities could result in decreased program funding for DOE and ORNL.

Use of the metric system of measurement for design, procurement and construction of this project was considered; but because of the nature of the work and the prevailing practices in the region, it was determined to be uneconomical.

4. Details of Cost Estimate [a]

	(dollars in thousands) Current Estimate	Previous Estimate
Engineering design inspection and administration of construction costs		
Engineering, design and inspection at approximately 7% of construction costs	800	800
Construction management at approximately 12% of construction costs	1,300	1,300
Project management costs at approximately 2% of engineering, design and inspection costs and construction management costs	200	200
Total, Engineering design inspection and administration of construction costs	2,300	2,300
Construction Costs (install new roofing) [b]	2,860	2,860
Removal and packaging of existing roofing	8,040	8,040
Design and project liason, testing, checkout and acceptance	200	200
Total, Construction Costs	13,400	13,400
Contingencies at approximately 19 percent of above costs	2,600	2,600
Total line item cost (TEC)	16,000	16,000

5. Method of Performance

Design shall be performed under a negotiated architect-engineer contract and inspection shall be performed by the operating contractor. To the extent feasible, construction and procurement shall be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding.

a The cost estimate is based on conceptual design completed April 1991 at a cost of $70,000 and updated March 1993. The DOE Headquarters Economic Escalation Indices for Construction Projects were used as appropriate over the project cycle.

b Construction costs include $60,000 for readiness reviews.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project cost						
Facility Cost						
Line Item TEC	4,887	2,324	4,200	3,820	769	16,000

Total Project Cost (TPC)	5,019	2,324	4,200	3,820	769	16,132

7. Related Annual Funding Requirements

(dollars in thousands)

	Current Estimate	Previous Estimate
Facility maintenance and repair costs [a]	515	515
Total related annual funding	515	515
Total operating costs (from FY 2001 through FY 2021)	515	515

[a] Includes dollars to repair roofing installed by this project over the estimated 20 years of life.

Fusion Energy Sciences

Program Mission

The Fusion Energy Sciences program is a broad-based, fundamental research effort, producing valuable scientific knowledge and technological benefits in the near term with the aim of providing the science base for a fusion energy option in the long term.

This is a time of important progress and discovery in fusion research. By virtue of previous investments in facilities, and more recently, sophisticated diagnostics and modeling capabilities, the Fusion Energy Sciences program is making great progress in understanding the fundamental processes of confining fusion fuels, such as the mechanisms responsible for turbulent losses of particles and energy across the magnetic field lines. In addition, the program is identifying and exploring innovative approaches to fusion power in search of an optimized confinement system with an affordable development path.

The high quality of the research in this program is continuously evaluated through the use of merit based peer review and scientific advisory committees.

Program Goal

The goal of the Fusion Energy Sciences program is to:

> *"Acquire the knowledge base for an economically and environmentally attractive fusion energy source."*

Although there is not a schedule for developing and deploying fusion energy systems the availability of fusion, as an option for large central station power plants, would be valuable insurance against possible environmental concerns about fossil and nuclear energy. In addition, there may be nearer term non-electric applications of fusion in transmutation of wastes and isotope production.

Program Objectives

Crosscutting and interrelated objectives of the Fusion Energy Sciences program, as developed through stakeholder meetings and endorsed by the Fusion Energy Sciences Advisory Committee, are summarized below.

- *Understand the physics of plasmas, the fourth state of matter.* Plasmas comprise most of the visible universe, both stellar and interstellar, and have many practical applications. Progress in plasma physics has been the prime engine driving progress in fusion research, and conversely, fusion energy has been the dominant motivation for plasma physics research.
- *Identify and explore innovative and cost-effective development paths to fusion energy.* There are several approaches to fusion, from the tokamak, which is the most advanced power plant candidate, to alternative magnetic configurations, or to inertial confinement using particle beams or lasers. The

current fusion program includes research on tokamak improvements and, increasingly, research on other innovative concepts, including drivers for inertial fusion energy.

- *Explore the science and technology of energy producing plasmas, the next frontier in fusion research, as a partner in an international effort.* Understanding the physics of energy-producing (i.e. burning), plasmas and developing the technologies essential for fusion energy are linked goals that can best be achieved through the cooperative efforts of the world community. The long-term benefits to the United States in such a cooperative effort include enhanced progress toward our mission through scientific and technological integration in the much larger world fusion effort as an energy source for a growing world population.

The Fusion Energy Sciences budget is divided into three subprograms; Science, Facility Operations, and Enabling R&D. The Science subprogram includes research funds for plasma science and the development of improved confinement concepts. Funds for building and operating major experimental facilities are in the Facility Operations subprogram. The Enabling R&D subprogram includes funds for establishing the scientific foundation which underlies current advances in fusion technology and provides technological capabilities and innovations needed to advance plasma science and develop the knowledge base for an attractive fusion energy source.

Scientific Facilities Utilization

The Fusion Energy Sciences request includes $96,600,000 to maintain support of the Department's scientific user facilities. This investment will provide significant research time for thousands of scientists in universities, and other Federal laboratories. It will also leverage both Federally and privately sponsored research, consistent with the Administration's strategy for enhancing the U.S. National science investment. The proposed funding will support operations at the Department's three major fusion energy physics facilities: the Doublet III-D at General Atomics, the Alcator C-Mod at the Massachusetts Institute of Technology and the National Spherical Torus Experiment at Princeton Plasma Physics Laboratory.

Performance Measures

The Fusion Energy Sciences program supports the Department's strategic goal of delivering the scientific and technological innovations critical to meeting the Nation's energy challenges. The performance measures of the Fusion Energy Sciences program fall into four areas: (1) excellence of the science, (2) relevance to the DOE mission and national needs, (3) stewardship of research capabilities, and (4) human resource management. The ways in which the Fusion Energy Sciences program measures performance include components such as peer review, specific charges to the Fusion Energy Sciences Advisory Committee (FESAC), and professional recognition of research performers. These have been an integral part of the program for many years. Each major research facility has a Program Advisory Committee (PAC) that provides broadly based community input directly to the facility team. Proposals for new facilities or upgrades to existing facilities at laboratories have both scientific and cost and schedule reviews.

For FY 2000, specific performance measures are:

- The National Spherical Torus Experiment (NSTX) will operate with a National Research Team demonstrating long pulse (greater than 1 second) operation at plasma currents approaching 1 megampere, a factor of 40 increase over the current exploratory level spherical torus experiments.
- Three new innovative concept exploration experiments--the LSX field-reversed configuration, the flow-stabilized Z pinch (both at the University of Washington) and the Pegasus spherical torus at the University of Wisconsin--will be fully operational providing basic scientific understanding of relevant concept phenomena.
- The DIII-D tokamak will test the feasibility of using increased electron cyclotron heating power and improved power exhaust techniques to extend the pulse length of advanced toroidal operating modes, a necessary requirement for future fusion energy sources.
- A decontamination and decommissioning contract at the Princeton Plasma Physics Laboratory (PPPL) will be awarded for the removal of the Tokamak Fusion Test Reactor (TFTR) tokamak and activated components from the experimental test cell.
- The materials research program will be coordinated with design studies through an overall systems approach, and broadened to allow increased modeling and innovative exploratory research on novel materials" as recommended by the FY 1998 FESAC materials review.
- New funding opportunities in basic plasma science and junior plasma physics faculty development programs will be provided through competitive announcements.
- The theory of strong turbulence will be used as a foundation to develop models for using shear in the plasma flow to stabilize the transport of energy and particles in toroidal devices such as tokamaks and stellarators. In addition, a new energy transport code framework, based on modern computing techniques, will be completed and made available for use via the web.

Significant Accomplishments and Program Shifts

Science

- To accommodate continuing governmental financial constraints, the fusion sciences program continues to move toward more innovation and increased understanding of a wider range of confinement concepts, and away from the more costly, large scale devices aimed at providing integrated plasma and technology experiments operating with power plant-scale plasma parameters.
  - Support of the goal to understand the physics of plasmas continues at the increased level of funding for general plasma science to improve the basis for fusion science and research on high-temperature toroidal plasmas in the DIII-D, C-MOD, and NSTX experiments.
  - Support of the goal to explore innovative and more affordable development paths includes increased operation of the new NSTX science facility. Work on concept improvement at the exploratory level in both physics and enabling R&D will continue to receive strong emphasis.
- A major review of magnetic and inertial fusion energy options by the Secretary of Energy Advisory Board has begun in FY 1999 in response to congressional requests.

- The National Academy Review of the Quality of Science in the Fusion Energy Sciences Program will be carried out in FY 1999 as part of a follow-up to the 1996 restructuring of the fusion program.
- A review of leading candidates for the next proof-of-principle steps within the innovative confinement concepts program was carried out, and program recommendations will be made by FESAC in FY 1999.
- In FY 1999 scientists at the University of Wisconsin will begin testing new stellarator symmetry principles which promise to improve understanding of how to optimize this toroidal fusion concept. At the Lawrence Livermore National Laboratory the first experiments on high temperature sustainment of spheromak plasmas will begin. Both of these elements represent initial results from the FY 1996 restructuring of the fusion program to work more on innovative confinement concepts.
- Within the NSF/DOE Partnership in Basic Plasma Science and Engineering begun in FY 1997, an additional set of applications were reviewed in FY 1998, and 13 were selected for funding including two NSF Career awards. Of the successful applicants, 7 were funded directly by OFES and funding was shared for one of the NSF Career awards. The fusion-sponsored development program for junior faculty in plasma physics in FY 1998 resulted in 2 additional awards. Both programs will continue in FY 1999 and planning with other agencies, including NSF, will be carried out for FY 2000 initiatives.
- A peer-reviewed competition for new ideas in measurement techniques for toroidal and burning plasma devices was carried out in early FY 1999 and awards were announced in February 1999.
- The Electron-Impact Ionization Theory, which was developed at the National Institute of Standards and Technology for fusion applications, is beginning to find application in modeling for air pollution control devices and ionization and radiation monitors. Its application to modeling for plasma processing of semiconducting devices by INTEL and other companies, which was reported last year, continues to grow.
- Current drive using new microwave hardware was shown for high magnetic field operation of the Alcator C-Mod facility. These results, along with demonstrated microwave heating at high magnetic field, indicate that advanced toroidal operating modes can be produced and studied in Alcator C-Mod.

Facility Operations

- The National Spherical Torus Experimental (NSTX) project at the Princeton Plasma Physics Laboratory (PPPL) will be completed in FY 1999 and a national research team will be organized. The facility will begin experimental operations by the 3rd quarter of FY 1999 and the NSTX Program Advisory Committee (PAC) will provide guidance to PPPL for initial operations.
- Significant modifications to the divertor and heating systems of the DIII-D facility were completed, providing capabilities required for FY 2000 experiments that will extend the pulse duration of advanced toroidal operating modes. Important experimental results were obtained that show plasma stability control with feedback coils and demonstration of radio frequency current drive that is necessary for long pulse operations.

Enabling R&D

- Support of the goal to explore the science and technology of energy producing plasmas is dramatically reduced by termination in FY 1999 of U.S. participation in the international pursuit of leading edge science in an integrated, large-scale experimental facility (ITER).
- In early FY 1999, the U.S. will close out its participation in ITER design activities.
- In FY 1999, we will work with other ITER Parties to attempt to complete the testing of the ITER superconducting model coil in Japan. This testing program will confirm the design and establish operating margins and will allow us to benefit from the $45,000,000 we have invested in building a major portion of the coil.
- The fusion program will continue its bilateral and multilateral activities on major scientific facilities abroad and maintain observer contact with the ITER project to keep informed of progress by the remaining three ITER parties.
- The program will retain low activation materials research. However, remaining enabling R&D activities supporting energy-producing plasmas will be drastically reduced.
- A series of critical enabling R&D tasks involving radio-frequency heating and current drive components were successfully completed over the past year. Tasks include fabrication of the NSTX antenna and tuning system, and installation of a DIII-D high power microwave system. The results of these auxiliary heating development efforts will have broad applicability to future U.S. fusion experiments.
- AWARDS

  Marshall Rosenbluth, University of California at San Diego, was awarded the **National Medal of Science** in December 1997

  Darin Ernst, Princeton Plasma Physics Laboratory, won the **1998 APS-DPP Award for Outstanding Doctoral Dissertation in Plasma Physics**

  Nine fusion researchers were elected **Fellows of the American Physical Society in 1998**

  Paul Woskov, MIT Plasma Science and Fusion Center, in collaboration with PNNL, won a **1998 R&D 100 Award** for a device that measures smokestack emissions. The award winning work has its roots in fusion diagnostics and plasma physics.

Funding of Contractor Security Clearances

- In FY 1999, the Department divided the responsibility for obtaining and maintaining security clearances. The Office of Security Affairs, which was responsible for funding all Federal and contractor employee clearances, now pays only for clearances of Federal employees, both at headquarters and the field. Program organizations are now responsible for contractor clearances, using program funds. This change in policy enables program managers to make the decisions as to how many and what level clearances are necessary for effective program execution. In this way, it is hoped that any backlog of essential clearances which are impeding program success can be cleared up by those managers most directly involved. The Office of Science is budgeting $115,000 and $96,000 for estimated contractor security clearances in FY 1999 and FY 2000, respectively, within this decision unit.

Site Description

Argonne National Laboratory

Argonne National Laboratory (ANL) in Argonne, Illinois, is a Multiprogram Laboratory located on a 1,700 acre site in suburban Chicago. ANL has a satellite site located in Idaho Falls, Idaho. Argonne's Fusion Energy Sciences program contributes to a variety of fusion enabling R&D program activities in areas of modeling, analysis, and experimental research. Argonne has a lead role internationally in analytical models and experiments for liquid metal cooling in fusion devices, including the ALEX facility, that studies the interaction of flowing liquid metals with magnetic fields, and liquid lithium flow loop that studies corrosion in candidate structural alloy materials. Argonne's capabilities in the engineering design of fusion energy systems has contributed to the design of ITER components, including blankets, tritium systems, and plasma-facing components, as well as to analysis supporting ARIES studies of fusion power plant concepts. Argonne also contributes to low-activation materials research with its unique capabilities in vanadium alloy testing in fission reactors and post-irradiation examinations.

Idaho National Engineering and Environmental Laboratory

Idaho National Engineering and Environmental Laboratory (INEEL) is a Multiprogram Laboratory located on 572,000 acres in Idaho Falls, Idaho. Since 1978, INEEL has been the lead laboratory for fusion safety for the Fusion Energy Sciences program. As the lead laboratory, they have helped to develop the fusion safety data base which will demonstrate the environmental and safety characteristics of both nearer term fusion devices and future fusion power plants. They have focused their research on: (1) understanding the behavior of the sources of radioactive and hazardous materials in a fusion machine, (2) understanding the energy sources in a fusion machine that could mobilize these materials, and (3) developing the analytical tools that demonstrate the environmental and safety characteristics of a fusion machine. In FY 2000, fusion efforts at INEEL will be focused solely on safety research associated with existing or planned domestic experimental facilities.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory (LBNL) is a Multiprogram Laboratory located in Berkeley, California. The Laboratory is on a 200 acre site adjacent to the Berkeley campus of the University of California. One of LBNL's missions is to study and apply the physics of heavy ion beams and to advance related technologies. The U.S. Heavy-Ion Fusion (HIF), centered at LBNL, program has the long-range goal of developing inertial fusion energy (IFE) as an economically and environmentally attractive source of electric power.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory (LLNL) is a Multiprogram Laboratory located on an 821 acre site in Livermore, California. LLNL is host for Defense Programs' National Ignition Facility, which will give the United States the first opportunity in the world to demonstrate inertial fusion ignition and energy gain in the laboratory. This goal will provide the IFE program with crucial results concerning target physics. This fusion energy mission is consistent with the NIF mission statement. Livermore partners with other Laboratories (LBNL, for example, in Heavy Ion Fusion) in fusion energy research. This program also includes collaborations on the DIII-D tokamak at General Atomics, construction of an innovative concept experiment, The Sustained Spheromak Physics Experiment (SSPX) at LLNL, and benchmarking of fusion physics computer models with experiments such as DIII-D. The SSPX will start experimental operations in FY 1999. Definitive results on the feasibility of sustaining high temperature spheromak plasmas utilizing external electrode current drive are expected by the end of FY 2000.

Los Alamos National Laboratory

Los Alamos National Laboratory is a Multiprogram Laboratory located on a 27,000 acre site in Los Alamos, New Mexico. The FY 2000 budget will support the creation of computer codes for modeling the stability of plasmas, as well as work in diagnostics, innovative fusion plasma confinement concepts such as Magnetic Target Fusion, and maintenance of the Tritium Systems Test Assembly (TSTA) facility in a standby mode.

Oak Ridge Institute for Science and Education

Oak Ridge Institute for Science and Education (ORISE) is located on a 150 acre site in Oak Ridge, Tennessee. ORISE was established by DOE to undertake national and international programs in education, training, health, and the environment. ORISE and its programs are operated by Oak Ridge Associated Universities (ORAU) through a management and operating contract with DOE. Established in 1946, ORAU is a consortium of 88 colleges and universities. For the Office of Fusion Energy Sciences (OFES), ORISE acts as an independent and unbiased agent to administer the Fusion Energy Sciences Graduate and Postgraduate Fellowship Programs, in conjunction with OFES, the Oak Ridge Operations Office (ORO), participating universities, DOE laboratories, and industries. ORISE also assists in the organization and administrative support for the Fusion Energy Sciences Advisory Committee meetings.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL) is a Multiprogram Laboratory located on a 24,000 acre site in Oak Ridge, Tennessee. ORNL develops a broad range of components that are critical for improving the research capability of fusion plasma experiments located at other institutions and that are essential for developing fusion as an environmentally acceptable energy source. ORNL will provide leadership of the Virtual Laboratory for Technology, which integrates all U.S. fusion program enabling R&D activities into a coordinated multi-institutional framework. The laboratory is a leader in the theory of heating of plasmas by electromagnetic waves, antenna design, and design and modeling of pellet injectors to fuel the plasma

and control the density of particles. Research is also done in the area of turbulence and its effect on transport of heat through plasma. Codes developed at the laboratory are also used to model plasma processing in industry. While some ORNL scientists are located full-time at off-site locations, others carry out their collaborations with short visits to the host institutions, followed by extensive computer communications from ORNL for data analysis and interpretation, and theoretical studies.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory (PNNL) is a Multiprogram Laboratory located on 640 acres at the Department's Hanford site in Richland, Washington. The Fusion Energy Sciences program at PNNL is focused on research on materials that can survive in a fusion neutron environment. The available facilities used for this research include mechanical testing and analytical equipment, including state-of-the-art electron microscopes, that are either located in radiation shielded hot cells or have been adapted for use in evaluation of radioactive materials after exposure in fission test reactors. Experienced scientists and engineers at PNNL provide leadership in the evaluation of ceramic matrix composites for fusion applications and support work on vanadium, copper and ferritic steels as part of the U.S. fusion materials team. PNNL also plays a leadership role in a fusion materials collaboration with Japan, with Japanese owned test and analytical equipment located in PNNL facilities and used by both PNNL staff and up to ten Japanese visiting scientists per year.

Princeton Plasma Physics Laboratory

Princeton Plasma Physics Laboratory (PPPL) is a program-dedicated laboratory (Fusion Energy Sciences) located on 72 acres in Princeton, New Jersey. PPPL is the only U.S. Department of Energy (DOE) laboratory devoted primarily to plasma and fusion science. It hosts experimental facilities used by multi-institutional teams and also sends researchers and specialized equipment to other fusion facilities in the United States and abroad. PPPL is the host for the National Spherical Torus Experiment (NSTX), which is an innovative toroidal confinement device closely related to the tokamak, and is currently working on the conceptual design of another innovative toroidal concept, the compact stellarator. PPPL scientists and engineers have significant involvement in the DIII-D and Alcator C-Mod tokamaks in the U.S. and the large JET (Europe) and JT-60U (Japan) tokamaks abroad. This work is focused on developing the scientific understanding and innovations required for an attractive fusion energy source. PPPL scientists are also involved in several basic plasma science experiments, ranging from magnetic reconnection to plasma processing. PPPL, through its association with Princeton University, provides high quality education in fusion-related sciences, having produced 175 Ph.D. graduates since its founding in 1951.

Sandia National Laboratory

Sandia National Laboratory is a Multiprogram Laboratory, with a total of 3,700 acres, located in Albuquerque, New Mexico, with other sites in Livermore, California, and Tonapah, Nevada. Sandia's Fusion Energy Sciences program plays a lead role in developing plasma-facing components for fusion devices through the study of plasma interactions with materials, the behavior of materials exposed to high

heat fluxes, and the interfaces of plasmas and fusion device first wall. Sandia selects, specifies, and develops materials for components exposed to high heat and particles fluxes and conducts extensive analysis of prototypes to qualify components before their in use in fusion devices. Materials samples and prototypes are tested in Sandia's Plasma Materials Test Facility, which use high-power electron beams to stimulate high heat fluxes expected in fusion environments. Materials and components are exposed to tritium-containing plasmas in the Tritium Plasma Experiment. Tested materials are characterized using Sandia's accelerator facilities for ion beam analysis. Sandia supports a wide variety of domestic and international fusion experiments in areas of tritium inventory removal, materials postmortem analysis, diagnostics development, and component design and testing.

Stanford Linear Accelerator Center

Stanford Linear Accelerator Center (SLAC) is a program-dedicated laboratory (High Energy Physics) located on 426 acres in Menlo Park, California. SLAC is operated for the United States Department of Energy by Stanford University. The main interest in fusion at SLAC is the possibility of adapting the accelerator science and technology from elementary particle physics to the production of fusion power from the implosion of inertial fusion targets driven by beams of high energy, heavy ions. A member of the accelerator research department at SLAC has been involved with the heavy ion fusion program since its inception.

All Other Sites

The Fusion Energy Sciences program funds research at 51 colleges/universities located in 25 states. This line also includes funding for DIII-D and related programs at General Atomics and funding of research awaiting distribution pending completion of review results or program office detailed planning.

Science

Mission Supporting Goals and Objectives

The goals of this subprogram are to advance our understanding of plasma science, and to develop innovative approaches for confining a fusion plasma. These goals are accomplished through a modest program in basic plasma science; active research programs in both toroidal innovations and in non-toroidal concepts; focused efforts to resolve outstanding physics issues related to energy producing plasmas; strong theory and modeling programs; and the creation of improved diagnostics that make possible rigorous testing of the scientific principles of fusion.

Plasma science is the study of ionized matter—ranging from neon lights to stars—that make up 99 percent of the visible universe. It contributes not only to fusion research, but also to many national science and technology goals, ranging from astrophysics to industrial processing to national security. One objective of the Science subprogram is to broaden the intellectual and institutional base in fundamental plasma physics. Ongoing programs including a development program for junior faculty in plasma physics and a joint NSF/DOE partnership in plasma physics and engineering contribute to this objective.

Fusion energy research advances through a balanced combination of large-, medium-, and small-scale experiments, theory, and modeling. The largest component of the Science subprogram is the tokamak research activity, which focuses on gaining a predictive understanding of the behavior of plasmas in near reactor-level conditions where the fusion fuel begins to "burn". Tokamak research will be carried out primarily on the DIII-D facility at General Atomics. DIII-D has been a major contributor to the world fusion program over the past decade by developing advanced modes of toroidal operations through the flexibility of its plasma shaping and computer control systems, and by increasing the knowledge base of fusion physics through extensive diagnostics and theoretical and modeling support of experiments. The other major U.S. tokamak experiment, the Alcator C-Mod at the Massachusetts Institute of Technology (MIT), uses high magnetic fields to explore high temperature and density plasmas in a unique, compact, and cost-effective facility. Additional high-leverage tokamak research will be carried out through international collaborations on large, state-of-the-art facilities abroad. Increased collaboration on facilities such as JET (Europe) and JT-60 (Japan) was recommended by the Fusion Energy Science Advisory Committee.

Research on alternative confinement concepts, both magnetic and inertial, is aimed at identifying approaches that may improve the economical and environmental attractiveness of fusion energy sources. This research is carried out at various levels ranging from the concept explorations stage to the proof-of-principle stage. The first proof-of-principle experiment, the new National Spherical Torus Experiment (NSTX) facility at the Princeton Plasma Physics Laboratory (PPPL), will begin its first full year of operation in FY 2000, with a goal of demonstrating improved stability and confinement in a very compact structure over the next several years. Additional proof-of-principle level experiments at PPPL, University of Wisconsin, and Los Alamos National Laboratory have been positively reviewed and are awaiting further consideration by the Fusion Energy Sciences Advisory Committee. Small-scale exploratory experiments are carried out primarily at universities, while proof-of-principle experiments, such as the NSTX will be primarily hosted at national laboratories.

The Inertial Fusion Energy (IFE) activity is exploring an alternate path for fusion energy that would capitalize on the major R&D effort in inertial confinement fusion (ICF) carried out for stockpile stewardship purposes within the Office of Defense Programs. The IFE program depends on the ICF program for experimental research into the physics of target ignition that will be tested in the National Ignition Facility at LLNL. Efforts in IFE focus on developing the components needed to apply the ICF results to energy systems. These include the most efficient methods for heating and compressing a target pellet to fusion conditions, methods for clearing the target chamber between pulses, and target design.

Theory and modeling are essential to progress in fusion and plasma science because they provide the capability to analyze existing experiments, produce new ideas to improve performance, and provide a scientific assessment of new ideas. An important component of the theory program is the development and use of computational tools to help understand the physical phenomena that govern confinement of high temperature plasmas. Similarly, the development and improvement of diagnostic tools for analyzing plasma behavior continues to provide new insights regarding fusion plasmas.

Performance Measures

- Three new innovative concept exploration experiments--the LSX field-reversed configuration, the flow-stabilized Z pinch (both at the University of Washington) and the Pegasus spherical torus at the University of Wisconsin--will be fully operational providing basic scientific understanding of relevant concept phenomena.
- A new energy transport code framework, based on modern computing techniques, will be completed and made available for use via the web.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Tokamak Experimental Research	46,198	46,831	45,918	-913	-1.9%
Alternative Concept Experimental Research	23,996	38,600	45,150	+6,550	+17.0%
Theory	19,773	22,500	23,000	+500	+2.2%
General Plasma Science	5,149	6,109	6,500	+391	+6.4%
SBIR/STTR	0	4,278	4,866	+588	+13.7%
Total, Science	95,116	118,318	125,434	+7,116	+6.0%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Tokamak Experimental Research			
■ TFTR physics research was completed in 1998.	5,500	0	0
■ DIII-D at General Atomics (GA) is the major operating tokamak in the United States. DIII-D is a national facility, with about half of its scientific staff coming from U.S. fusion laboratories other than GA, as well as some from several foreign laboratories. In FY 2000 the research activity will focus on use of two new hardware improvements in auxiliary heating and power exhaust systems. This will allow progress in the development of advanced toroidal operations for long pulses which is essential for incorporation of these operating modes into the design of future machines.	21,430	21,905	22,520
■ Alcator C-Mod will also operate as a national facility with an improved set of diagnostics. Research activity will focus on support of the compact, high field approach to ignition and on the physics of the plasma edge and power exhaust.....	6,211	7,600	7,800
■ Several unique, innovative tokamak experiments are supported at leading universities. These focus on various topics, including advanced toroidal operating modes and plasma stability and control. This program also develops unique diagnostic probes that provide an understanding of the plasma behavior in fusion research devices, supplying the necessary information for analysis codes and theoretical interpretation. The requested funding level in FY 2000 supports the core diagnostic development research, as well as the work begun as a result of an FY 1999 competitive initiative to develop new diagnostic techniques.	6,557	7,400	7,250

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ International collaboration at the level of $4,200,000 provides the opportunity for joint and coordinated experiments between the U.S. and foreign experiments, thereby increasing the database and the understanding of fusion physics. With the limited operation of major tokamaks in the U.S., international collaboration provides increased opportunity for the U.S. scientists to continue their participation in the advancement of fusion science, especially in the area of burning plasma physics. The scientists from PPPL and ORNL will continue collaborations with JET, Tore Supra, TEXTOR, and ASDEX-UG in Europe and with JT-60U in Japan. The remaining $4,148,000 is required for graduate and postgraduate fellowships in fusion science and technology, general science literacy programs with teachers and students, support for historically black colleges and universities, and similar broad outreach efforts related to fusion science and technology.	6,500	9,926	8,348
Total, Tokamak Experimental Research	46,198	46,831	45,918

Alternative Concept Experimental Research

■ **Experimental Plasma Research (Alternates):** Research on novel magnetic confinement configurations is important both for its intrinsic scientific value and for its potential to discover concepts that would make more attractive fusion power sources. This category has two components. The first component contains twelve diversified exploratory level experiments located primarily in universities. Four of these experiments (Sustained Spheromak Physics Experiment at LLNL; Columbia University/MIT Dipole; Ion Rings at Cornell University; and Ion Trap at LANL) resulted from a FY 1998 innovative concept competition. A second category includes design and experimental work on three novel concepts that have been proposed for full proof-of-principle funding..	14,550	19,000	23,750

■ **NSTX:** The NSTX at PPPL will begin the first full year of research in FY 2000. The research program will be organized as a national collaboration with representatives of other institutions participating in the research activity on an equal basis with researchers from PPPL. Initial objectives will be plasma formation, two methods of controlled startup, plasma heating by radio-frequency waves and diagnostic surveys to define acceptable operational regimes that can be used

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
for more powerful experiments. Advanced diagnostic development specifically for NSTX is also funded by this element.	2,446	9,800	11,300
■ **Inertial Fusion Energy:** Inertial fusion energy research continues with efforts to improve heavy ion accelerator efficiency, chamber wall protection, and design of fusion energy target pellets. Scoping studies for major next step device options will be undertaken, with a goal of providing the inertial fusion energy program the capacity to benefit from physics results on Defense Programs' National Ignition Facility in the latter part of the next decade.	7,000	9,800	10,100
Total, Alternative Concept Experimental Research	23,996	38,600	45,150

Theory

- The theory and modeling program is a broad-based program with researchers located at national laboratories, universities, and industry. A new program emphasis is advanced computing, including the development of new modeling codes and a code library for use by all fusion researchers. Work in tokamak theory ($15,105,000) includes efforts to support existing toroidal experiments and also includes the development of many new theories and modeling tools, since these are usually applied to tokamaks before being applied to alternates. An example of this is work on self organized criticality, which may provide a new approach to understanding confinement. The majority of the work in toroidal theory is aimed at developing a complete physical picture of advanced toroidal operating modes. With the restructuring of the fusion program, there is an increased focus on alternate concepts. In alternate concept theory ($2,707,000), the emphasis will be on understanding the fundamental processes determining equilibrium, stability, and confinement in each alternate. Generic theory ($2,188,000) covers development of basic plasma theory that is applicable not only to fusion research, but also to basic plasma science. It also includes work on atomic theory, which is applicable to all confinement devices.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The objective of the advanced computing activity is to improve simulation and modeling capabilities in order to obtain a quantitative understanding of plasma behavior in fusion experiments. This will ensure optimum use of a set of innovative national experiments and fruitful collaboration on major international facilities. In FY 2000, funds ($3,000,000) will be used to develop a modern transport code to simulate energy transport in toroidal magnetic confinement systems. . .	19,773	22,500	23,000
General Plasma Science			
■ The plasma science program focuses on basic plasma science and engineering research, primarily in the university community. Advances in basic plasma physics will support the Fusion Energy Sciences program as well as other important areas of science and technology. Both the Plasma Science Junior Faculty Development Program and collaborative efforts such as the NSF/DOE plasma science and engineering program will continue at FY 1999 levels. The program will also continue to collect and distribute atomic physics data for fusion.	5,149	6,109	6,500
SBIR/STTR			
■ In FY 1998 $3,476,000 and $208,000 were transferred to the SBIR and STTR programs, respectively. The FY 1999 and FY 2000 amounts are the estimated requirement for the continuation of the SBIR and STTR programs.	0	4,278	4,866
Total, Science	95,116	118,318	125,434

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Tokamak Experimental Research	
■ Additional funding is provided for increased diagnostics on DIII-D.	+615
■ Additional funding is provided for increased research expenses on Alcator C-Mod.	+200

	FY 2000 vs. FY 1999 ($000)
■ This decrease is primarily associated with the FY 1999 prior year general reduction account going to zero in FY 2000.	-1,578
■ Reduction will decrease support for research at UCLA	-150
Total, Tokamak Experimental Research	-913
Alternative Concept Experimental Research	
■ Support for NSTX research is increased to provide funding for personnel and minor equipment for the first full year of operations that includes research collaborations and preparations of advanced diagnostics.	+1,500
■ Funding for alternate concept experiments is increased to maintain breadth and permit establishment of one or more proof-of-principle experiments..	+4,750
■ This increase will permit continued efforts to improve accelerator efficiency for inertial fusion energy..	+300
Total, Alternative Concept Experimental Research	+6,550
Theory	
■ The advanced computational effort will expand efforts to develop new codes to predict plasma performance.	+500
General Plasma Science	
■ These funds will enhance the NSF/DOE Partnership in Basic Plasma Science and Engineering.	+391
SBIR/STTR	
■ Support for SBIR/STTR is mandated at 2.65 percent. These grants will support plasma science, fusion science, and fusion enabling R&D.	+588
Total Funding Change, Science	+7,116

Facility Operations

Mission Supporting Goals and Objectives

This activity provides for the operation of major experimental facilities that are the essential tools that enable scientists in university, industry, and laboratory based research groups to perform experimental research in fusion research facilities: DIII-D at GA, Alcator C-Mod at MIT, and NSTX at PPPL. These facilities consist of magnetic plasma confinement devices, plasma heating and current drive systems, diagnostics and instrumentation, experimental areas, computing and computer networking facilities, and other auxiliary systems. It includes the cost of operating personnel, electric power, expendable supplies, replacement parts and subsystems, and inventories. In the case of PPPL, this funding also supports beginning the final three-year phase of decontamination and decommissioning of the Tokamak Fusion Test Reactor which was shut down in FY 1997; ongoing caretaking for the tritium systems and activated elements is required during this process. General plant projects (GPP) funding for PPPL supports minor facility renovations, other capital alterations and additions, and buildings and utility systems. Capital equipment funding for upgrading the research capability of DIII-D is also included, as are funds for design, modification, and installation of the NSTX neutral beam heating system, and for further enhancements to the facility.

The principal objective of the Facility Operations subprogram is to maximize the quantity and quality of data collected for experiments being conducted at fusion energy science facilities.

The following table summarizes the scheduled weeks of operations for DIII-D and NSTX.

Facility Utilization

	(Weeks of Operation)		
	FY 1998	FY 1999	FY 2000
DIII-D	15	14	14
Alcator C-Mod	9	12	18
TFTR	8	0[a]	0[a]
NSTX	0	6	14

[a] Facility Shutdown.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
TFTR	5,140	3,600	13,600	+10,000	+277.8%
DIII-D	26,370	29,195	29,880	+685	+2.3%
Alcator C-Mod	9,689	9,923	10,100	+177	+1.8%
NSTX	13,850	16,800	15,000	-1,800	-10.7%
General Plant Projects /Other	1,100	1,677	800	-877	-52.3%
Total, Facility Operations	56,149	61,195	69,380	+8,185	+13.4%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
TFTR			
■ Begin a three-year program ($10,000,000 in FY 2000 out of a planned total of $48,000,000) to complete the decontamination and decommissioning of TFTR. This activity will provide for the removal and disposal of the tokamak and remaining activated components from the test cell and the basement. In addition during the D&D funding ($3,600,000) is necessary to maintain and keep the facility safe during the project.	5,140	3,600	13,600
DIII-D			
■ Provides support for operation, maintenance, and improvement of the DIII-D Electron Cyclotron Heating (ECH) systems and support for other equipment at the GA site. In FY 2000, these funds support plasma operation using hydrogen and deuterium fuel for approximately 14 weeks; plus downtime for significant upgrades to the ECH, divertor systems, and maintenance.	26,370	29,195	29,880
Alcator C-Mod			
■ Provides support for operation, maintenance and minor machine improvements. In FY 2000, these funds support plasma operation using hydrogen and deuterium fuel for approximately 18 weeks; plus down time for machine and diagnostic improvements.	9,689	9,923	10,100

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
NSTX			
■ Provides for continuation of research activity on the NSTX experiment and installation of the first set of planned diagnostic upgrades. This will allow extension of the pulse duration to 1 second and operation at plasma currents approaching 1 megampere, a factor of 40 increases over current exploratory level spherical torus experiments; first investigations of non-inductive current drive, a principal program objective; and measurement of advanced plasma confinement scenarios.	1,770	7,900	12,500
■ **NSTX Project:** Project completed in FY 1999 and facility begins operations.	12,080	5,450	0
■ **NSTX Neutral Beam:** Project for preparation and installation of a previous TFTR neutral beam heating system on NSTX.	0	3,450	2,500
Total, NSTX	13,850	16,800	15,000
General Plant Projects/Other			
■ These funds provide primarily for general infrastructure repairs and upgrades. The major project included in the FY 2000 plan is an upgrade of the fire alarm system throughout the site where NSTX is located.	1,100	1,677	800
Total, Facility Operations	56,149	61,195	69,380

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
TFTR	
■ Funding is provided to initiate TFTR decontamination and decommissioning.	+10,000
DIII-D	
■ Additional funding is for operation of increased number of DIII-D systems (ECH, divertor, etc.).	+685
Alcator C-Mod	
■ Additional funding is provided for increased operation of the Alcator C-Mod.	+177
NSTX	
■ A decrease for the NSTX project at PPPL is due to the completion of fabrication, and a shift to facility operations.	-5,450
■ An increase in NSTX facility operations to support the first full year of operations.	+4,600
■ A decrease in NSTX neutral beam heating system to complete this fabrication effort.	-950
Total, NSTX	-1,800
General Plant Projects/Other	
■ General Plant Projects support at PPPL is increased $100,000 to reflect maintenance requirements; support for other facility operations is terminated.	-877
Total Funding Change, Facility Operations	+8,185

Enabling R&D

Mission Supporting Goals and Objectives

For sustained scientific progress toward ultimate research goals, science-oriented programs that push the frontiers of human knowledge, such as fusion, require intellectual resources, experimental facilities with state-of-the-art technological capabilities, and technology innovations. The Enabling R&D subprogram includes funds for: (1) establishing the scientific foundation that underlies current technological advances in fusion, and (2) providing the technological capabilities and innovations needed to advance fusion science; developing the knowledge base for an attractive fusion energy source. These contribute to two strategic goals for the fusion program. This subprogram is divided into two elements: Engineering Research and Materials Research.

For the Engineering Research element, activities through FY 1998 were heavily oriented toward the ITER Engineering Design Activities (EDA), a four party (European Union, Japan, Russian, U.S.) international effort to demonstrate the scientific and technological feasibility of fusion as an energy source. In July 1998 the other three ITER parties prepared to enter into a 3-year post-EDA extension period that would develop a reduced cost design and provide the basis for an assessment of the technical, financial, and hosting readiness to proceed with ITER construction as an international project. However the DOE was unable to obtain congressional agreement for U.S. participation in the extension. Accordingly, the U.S. effort toward ITER will be closed out in early FY 1999, and the Engineering Research element restructured by being downsized and redirected away from energy-oriented goals.

In restructuring this element in FY 1999, the scope of activities will be broadened to address more fully the diversity of domestic interests in enabling R&D. These interests include a focus on critical needs for enabling technologies for U.S. plasma experiments and for international collaborations that allow the U.S. to access plasma experimental conditions not available domestically. These interests also include the scientific foundations of innovative technology concepts for future plasma experiments. These innovations are needed to exploit the performance gains being sought from physics concept improvement research. Major FY 1998 accomplishments include: completion, as an ITER participant, of the ITER Final Design Report, which is the first comprehensive, fully integrated design of a major fusion power experiment; completion of winding the ITER superconducting magnet model coil, which will be shipped to Japan in early FY 1999 for testing in a Japanese facility during FY 1999; and completion of critical tasks involving radio-frequency heating and plasma current drive components that have broad applicability to the U.S. fusion program.

The Materials Research element continues to focus its scientific research on low-activation materials which have high performance capability and can withstand long-term exposure to the energetic particles and electromagnetic radiation expected from energy-producing plasmas. During FY 1998, this element made major inroads toward mapping of irradiation effects on candidate low-activation alloys, which is needed to set priorities for future research, and underwent a review by FESAC that will continue to influence planning for FY 1999 and beyond.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Engineering Research	58,281	34,991	20,074	-14,917	-42.6%
Materials Research	7,744	7,000	7,000	0	0.0%
SBIR/STTR	0	1,132	726	-406	-35.9%
Total, Enabling R&D	66,025	43,123	27,800	-15,323	-35.5%

Detailed Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Engineering Research			
■ Funding reductions will require a substantial downsizing and redirection of effort on the energy-oriented technology segment of the fusion program. Efforts will be focused on critical needs of domestic plasma experiments and on the scientific foundations of innovative technology concepts for future plasma experiments. Nearer-term experiment support efforts will be oriented toward plasma facing components ($5,600,000) and plasma heating and fueling technologies ($3,700,000). Longer-term efforts will be oriented toward: superconducting magnet research ($1,500,000) and plasma facing and energy extraction component innovations ($1,500,000) needed to fully exploit investments in concept improvement experiments; and toward tritium research ($1,000,000) and safety research ($1,000,000) issues critical to the safety and environmental attractiveness of fusion as an energy source. Advanced design studies will be directed toward identifying attractive pathways toward fusion energy ($2,950,000). In addition, design studies of next-step options ($2,224,000), taking fullest advantage of recent scientific advances, will continue. Management of this diverse collection of fusion technologies will be accomplished through a Virtual Laboratory for Technology ($600,000) whereby improved coordination and communication of plans, progress, and results will be accomplished through the use of modern information technology.	58,281	34,991	20,074

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Materials Research			
■ Materials research remains a key element in developing a safe, reliable, and environmentally attractive fusion energy system. Scientific understanding and the development research and testing of vanadium alloys, silicon carbide composite materials, and advanced ferritic steels for structural service in the high power zones for fusion energy sources will continue. Priorities for this work, including innovative approaches to evaluating materials and improved modeling of materials behavior are guided by the results of a Fusion Energy Sciences Advisory Committee review conducted during 1998.	7,744	7,000	7,000
SBIR/STTR			
■ In FY 1998 $1,681,000 and $101,000 were transferred to the SBIR and STTR programs, respectively. The FY 1999 and FY 2000 amounts are the estimated requirement for the continuation of the SBIR and STTR programs.	0	1,132	726
Total, Enabling R&D	66,025	43,123	27,800

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Engineering Research	
■ Reduction in research on superconducting magnets plasma facing components and plasma fueling (following completion of ITER Superconducting Model Coil)..	-7,322
■ Reduction in research on energy extraction, diagnostics, tritium processing, vacuum vessel welding, remote handling, and safety.	-2,731
■ Reduction in design of next step option experiments being considered within U.S. domestic fusion program.	-1,276
■ Increase in Advanced Design Studies	+500
■ Reduction in information technology research	-948
■ Reduction in ITER closeout costs to zero in FY 2000	-3,140
Total, Engineering Research	-14,917

	FY 2000 vs. FY 1999 ($000)
SBIR/STTR	
■ Reduction due to overall reduction in Engineering Research.	-406
Total Funding Change, Enabling R&D	-15,323

Program Direction

Mission Supporting Goals and Objectives

This subprogram was transferred to the Science Program Direction decision unit in FY 1999 at the direction of Congress. This subprogram provided the Federal staffing resources and associated funding needed to plan, direct, manage, and administer the highly complex scientific and technical research and development program in fusion energy.

Science Program Direction

Program Mission

This program provides the Federal staffing and associated funding required to provide overall direction of activities carried out under the following programs in the Office of Science (SC): High Energy Physics, Nuclear Physics, Biological and Environmental Research, Basic Energy Sciences, Fusion Energy Sciences, Computational and Technology Research, Multiprogram Energy Laboratories-Facilities Support, and Energy Research Analyses. This funding also provides the necessary support to the Director of SC to carry out SC's responsibilities under the Department of Energy (DOE) Organization Act (P.L. 95-91) and as mandated by the Secretary. These responsibilities include providing advice on the status and priorities of the Department's overall research and development programs and on the management of the Department's multipurpose laboratories; developing research and development plans and strategies; and supporting university and science education. This program also provides program-specific staffing resources at the Chicago, Oakland, and Oak Ridge Operations Offices directly involved in executing SC programs.

Program direction has been divided into four categories: salaries and benefits, travel, support services, and other related expenses, the latter including the Working Capital Fund. "Support Services" refers to support services contracts that provide necessary support functions to the Federal staff, such as technical support, computer systems development, travel processing, and mailroom activities. "Other related expenses" refers to other administrative costs of maintaining Federal staff, such as building and facility costs and utilities in the field, information technology expenses, and training. The Working Capital Fund includes centrally provided goods and services at Headquarters, such as supplies, rent and utilities.

Also included in Program Direction are several specific education related activities. For over 50 years, the Department of Energy and its predecessor agencies (Atomic Energy Commission and the Energy Research and Development Administration) has supported science and engineering education programs involving university faculty as well as pre-college teachers and students. The Department has provided support for university students, pre-college teachers and college faculty through hands-on research experiences at the Department's National Laboratories and research facilities.

The involvement of the Energy Department's National Laboratories in faculty/student research is perhaps the most distinguishing feature of the agency's participation over the years in science and engineering education. No other Federal agency has the extensive network of research laboratories and facilities as DOE with its unique physical and human resources. These laboratories and facilities have been key to the Department's contribution over time to the Nation's science and engineering education goals.

The funds appropriated for science education will support activities that utilize the Department's scientific and technical resources to enhance the development of a diverse, well-educated and scientifically literate workforce.

In addition to the science education program in this science program direction budget, other mission oriented education activities are funded within science research programs. Below is a table identifying the programs and the allocation of funds. The funds will allow university faculty and student teams at the

undergraduate level to participate on long-term research projects at DOE laboratories. Pre-college science and math teachers will be provided with research appointments to improve their knowledge and skills of scientific discovery and enhance their ability to apply them in a classroom environment. Through these investments, the Department will make major contributions towards fulfilling several national priorities: enhancing the diversity of the technical workforce; supporting systemic reform of undergraduate education; and attracting, retaining, and graduating students in fields of interest to DOE and others in the public and private sectors. The funds will also allow the Department to encourage educators to participate directly in the ongoing science research of its laboratories. By joining teams of researchers, educators will experience directly the cutting-edge development of the Science Laboratories, and will better understand the process of scientific investigation. Funds provided will pay for faculty/student and pre-college teachers' stipends, travel, and housing and will subsidize laboratory scientists' time for this activity.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Basic Energy Sciences	0	0	1,947
Computational Technology Research	0	0	1,947
Biological and Environmental Research	0	0	1,947
High Energy Physics	0	0	2,921
Nuclear Physics	0	0	973
Total	0	0	9,735

Program Goal

To fund the staff and related expenses that are necessary to provide overall management direction of SC's basic and fundamental scientific research programs funded in the Science appropriation; and to enable the Director of SC to serve as the Department's science advisor for formulation and implementation of basic and fundamental research policy.

For science education the goal is to ensure that the Department effectively utilizes and leverages the resources of its laboratory-based system to support its energy, science and math education mission.

Program Objectives

- To develop, direct and administer a complex and broadly diversified program of mission-oriented basic and applied research and development designed to support the development of new and improved energy, environmental and health technologies.
- To manage the design, construction and operation of forefront scientific research facilities for use by the Nation's scientific community, including the Spallation Neutron Source Project.
- To conduct independent technical assessments, peer reviews and evaluations of research proposals, programs and projects.

- To enhance international collaboration to leverage the U.S. investment in research and development.
- To review, analyze and, where appropriate, champion the recommendations of the Office of Science's Federally chartered advisory committees including the Fusion Energy Sciences Advisory Committee, High Energy Physics Advisory Panel, Nuclear Science Advisory Committee, Basic Energy Sciences Advisory Committee, and Biological and Environmental Research Advisory Committee.
- To provide opportunities and effective mechanisms for students and faculty to participate at the Department's laboratories in hands-on research experiences, with a focus on undergraduates.
- To enhance departmental outreach activities in science, technology, engineering and mathematics education at our R&D facilities in order to increase the awareness and understanding of the general public of the Department's science programs.

Performance Measures

- Responsiveness to national science policy and major science initiatives.
- Improvement in environment, safety and health compliance.
- Provision for new and enhanced research facilities and equipment within scope and budget and on schedule.
- Continued improvement in the utilization of staffing, travel and support contractor funds.
- Continuance of improved levels of facility operating time.
- Expansion of international collaborative efforts.
- Cost sharing and leveraging of program resources with other agencies on a one-to-one basis to multiply the program's impact.
- Increase the flow of underrepresented students up to 50 percent into science and math programs/careers achieved.

Significant Accomplishments and Program Shifts

Program Direction

- The Office of Science continues to achieve technical excellence in its programs despite managing one of the largest, most diversified and most complex basic research portfolios in the Federal Government with a relatively small Federal and support contractor staff compared to other programs both within and outside the Department.
- Increased productivity at U.S. scientific research facilities as part of the Scientific Facilities Utilization initiative.

- Concluded the international agreement for U.S. participation in the Large Hadron Collider project. Signatories included the Secretary of Energy and the Director of the National Science Foundation. Execution of the program has begun.
- Initiated operation of the William R. Wiley Environmental Molecular Sciences Laboratory at Pacific Northwest National Laboratory.
- At Fermilab, complete construction of the C-Zero Experimental Hall within scope and budget, and on schedule (FY 1999 completion); and complete the Main Injector within scope and budget, and on schedule (FY 1999 initial operation).
- Complete the B-factory and its detector at the Stanford Linear Accelerator Center within scope and budget, and on schedule (FY 1999 initial operation).
- Continue construction of the Relativistic Heavy Ion Collider and its detectors at Brookhaven National Laboratory within scope and budget, and on schedule (FY 2000 initial operation).
- Enhance the scientific capabilities for experiments at the Thomas Jefferson National Accelerator Facility (TJNAF) to provide new opportunities for researchers. Three TJNAF experimental halls will be fully operational.
- Carrying out experiments at the Radioactive Ion Beam facility at Oak Ridge National Laboratory.
- Continue pilots in FY 1999 for transfer of management responsibility from Environmental Management to Science for newly generated wastes at the Stanford Linear Accelerator Center (SLAC) and Fermilab.
- Manage the Joint Genome Institute and the Atmospheric Radiation Measurement sites using the National Laboratories as an integrated system.
- Strengthen integrated safety management and infrastructure management at the National Laboratories.
- Operate the state-of-the-art National Energy Research Scientific Computing and Energy Science Network for the benefit of SC and DOE.
- Plan and manage a complex, scientific R&D program to establish the knowledge base needed for an attractive fusion energy science.
- Continue and refine framework of appropriate international arrangements needed to carry out SC programs in a most cost-effective manner.
- Continue to improve environmental, safety and health performance at the Brookhaven National Laboratory through aggressive implementation of the DOE Action Plan for Improved Management of the Laboratory.
- Continue enhancement of neutron science capability at the Los Alamos Neutron Science Center and the High Flux Isotope Reactor at Oak Ridge.
- Continue design and construction of the Neutrinos at the Main Injector (NuMI) project.

- Establishment of the Spallation Neutron Source Project Office at the Oak Ridge Operations Office in FY 2000.
- Implement the Scientific Simulation Initiative to rapidly develop and deploy a national terascale computing infrastructure and apply it to complex civilian science and engineering problems of national importance.

Science Education

- The Science Undergraduate Laboratory Fellowship Program has implemented an innovative, interactive Internet system to receive and process hundreds of student applications for summer and semester research appointments at 11 participating DOE Laboratories. The automated system is virtually paperless and provides an excellent example of how the Internet can be used to streamline the operation of the Department's research participation programs.
- Through special recruitment efforts, the Science Undergraduate Laboratory Research Fellowship Program has attracted a diverse group of students using the electronic application. Nearly 20 percent of those submitting applications represented under represented ethnic groups. About 40 percent of the applications were female, and more than 25 percent were from low-income families. More than 400 summer 1998 appointments were made through the new application process with additional appointments expected in the fall.

Site Description

Ames Laboratory

Ames Laboratory is a Multiprogram Laboratory located on 10 acres in Ames, Iowa. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Argonne National Laboratory

Argonne National Laboratory (ANL) in Argonne, Illinois, is a Multiprogram Laboratory located on a 1,700 acre site in suburban Chicago. ANL has a satellite site located in Idaho Falls, Idaho. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Brookhaven National Laboratory

Brookhaven National Laboratory is a Multiprogram Laboratory located on a 5,200 acre site in Upton, New York. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Fermi National Accelerator Laboratory

Fermi National Accelerator Laboratory is a program-dedicated laboratory (High Energy Physics) located on a 6,000 acre site in Batavia, Illinois. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory is a Multiprogram Laboratory located in Berkeley, California. The Laboratory is on a 200 acre site adjacent to the Berkeley campus of the University of California. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate

on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

National Renewable Energy Laboratory

National Renewable Energy Laboratory is a program-dedicated laboratory (Solar) located on 300 acres in Golden, Colorado. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Oak Ridge National Laboratory

Oak Ridge National Laboratory is a Multiprogram Laboratory located on a 24,000 acre site in Oak Ridge, Tennessee. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Oak Ridge Institute for Science and Education

Oak Ridge Institute for Science and Education is located on a 150 acre site in Oak Ridge, Tennessee. Educational activities are in support of the national laboratory participation program which provides hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory is a Multiprogram Laboratory located on 640 acres at the Department's Hanford site in Richland, Washington. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate

their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Princeton Plasma Physics Laboratory

Princeton Plasma Physics Laboratory is a program-dedicated laboratory (Fusion Energy Sciences) located on 72 acres in Princeton, New Jersey. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Stanford Linear Accelerator Center

Stanford Linear Accelerator Center is a program-dedicated laboratory (High Energy Physics) located on 426 acres in Menlo Park, California. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Thomas Jefferson National Accelerator Facility

Thomas Jefferson National Accelerator Facility is a program-dedicated laboratory (Nuclear Physics) located on 273 acres in Newport News, Virginia. Educational activities supported at the laboratory are directed towards providing hands-on research experiences for undergraduate student and science teacher participants on state-of-the-art equipment while engaging them on important issues at the forefront of scientific inquiry. Teachers, utilizing the Department's extensive computational and communications technology expertise, will also concentrate on developing tools and materials to translate their research experiences into computerized learning tools that can be used to take advantage of the universal availability of the Internet as a teaching medium.

Program Direction

Mission Supporting Goals and Objectives

Program Direction provides the Federal staffing resources and associated costs required to provide overall direction and execution of Office of Science program and advisory responsibilities. Science Program Direction supports staff in the High Energy Physics, Nuclear Physics, Basic Energy Sciences, Biological and Environmental Research, Fusion Energy Sciences, Computational and Technology Research, Multiprogram Energy Laboratories-Facilities Support, and Energy Research Analyses programs, including management and technical support staff. This program also supports staff at the Chicago, Oakland, and Oak Ridge Operations Offices directly involved in program execution. The staff includes scientific and technical personnel as well as program support personnel in the areas of budget and finance, general administration, grants and contracts, information resource management, policy review and coordination, infrastructure management, construction management, and environment, safety and health.

The FY 2000 request includes Working Capital Fund resources of $3,285,000 to cover the costs of centrally provided goods and services at Headquarters, such as supplies, rent, and utilities.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Staff funded in this decision unit monitor and evaluate over 3,500 grants and contracts at more than 225 institutions, including universities, industry and other government agencies, in addition to monitoring and evaluating the programs at 13 National and single-purpose Laboratories. SC also manages the Department-wide Small Business Innovation Research and Small Business Technology Transfer programs. Our reengineering efforts have eliminated unnecessary and non-value added work from the system where possible. In FY 2000, SC will also support the Spallation Neutron Source Project Office in Oak Ridge and the Scientific Simulation Initiative.	26,620	32,964	35,247
Travel			
The FY 2000 estimate reflects escalation of costs for airfare, lodging, etc. This increase only reflects a two percent increase over FY 1999. Alternatives to travel such as teleconferencing will be utilized when possible.	1,163	1,518	1,731
Support Services			
Provide necessary mailroom, travel services, environment, health and safety support, computer systems development, SBIR program support, security and hardware and software installation, configuration, and maintenance activities. Emphasis in FY 1999 and FY 2000 will be placed on continued implementation of an information architecture for Science to establish integrated business management systems, consistent with the provisions of the Clinger-Cohen Act (Information Technology Management Reform Act) of 1996. This is essential to take work out of the system and to meet workload demands. SC is widely acknowledged as being the most efficient and conservative user of support services contracts in the Department.	4,695	5,344	5,332

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Other Related Expenses			
Acquire computer hardware and software in FY 1999 and FY 2000 necessary to accomplish corporate systems development and networking upgrades. The FY 1999 and FY 2000 estimates include $3,243,000 and $3,285,000, respectively, to cover Headquarters Working Capital Fund charges.	5,122	5,474	5,550
Total, Program Direction	37,600	45,300	47,860

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ Increase of $2,283,000 in salaries and benefits is due to two additional FTE's for the Spallation Neutron Source Project Office in Oak Ridge, five additional FTEs for the Scientific Simulation Initiative, and the impact of cost of living, locality pay, within grades, promotions, lump sum payments, and awards.	+2,283
Travel	
■ Increase of $213,000 in travel provides a partial offset for escalation of travel costs, airfare, lodging, and miscellaneous expenses due to inflation	+213
Support Services	
■ Decrease of $12,000 in support services provides the minimum level of support services needed to provide for SC's needs.	-12
Other Related Expenses	
■ Increase of $76,000 in Other Related Expenses provides the minimum amount of funds to cover hardware/software acquisitions, infrastructure technology upgrades, field training, and the Working Capital Fund.	+76
Total Funding Change, Science Program Direction	+2,560

Science Education

Mission Supporting Goals and Objectives

For over 50 years, the Department of Energy and its predecessor agencies (the Atomic Energy Commission and the Energy Research and Development Administration) has supported science and engineering education programs involving university faculty as well as pre-college teachers and students. The Department has provided support for university students, pre-college teachers and college faculty through hands-on research experiences at the Department's National Laboratories and research facilities.

The involvement of the Energy Department's national laboratories in faculty/student research is perhaps the most distinguishing feature of the agency's participation over the years in science and engineering education. No other Federal agency has the extensive network of research laboratories and facilities as DOE with its unique physical and human resources. These laboratories and facilities have been the key to the Department's contribution over time to the Nation's science and engineering education goals.

As we approach the new century, the Nation continues to face important challenges related to the recruitment and retention into science and engineering of students who have historically been under represented (e.g., women, disabled persons, African Americans, Hispanic Americans and Native Americans) in these fields. Guided by recent reports such as the National Research Council on Undergraduate Education Achievement Trends in Science and Engineering, the Department will continue to design, through the Office of Science, an undergraduate research fellowship program that couples academic study with extensive hands-on research experiences in a variety of DOE national laboratory settings. This program is intended to enhance the likelihood that underrepresented students will successfully complete their undergraduate studies and move on to graduate school. Historically, over two-thirds of undergraduates who have participated in DOE programs such as this have gone on to graduate school in disciplines directly relevant to the DOE science and technology missions.

In addition to the science education program in this science program direction budget, $9,734,000 of other mission oriented education activities are funded within science research programs. Below is a table identifying these programs and the allocation of funds. The funds will allow university faculty and student teams at the undergraduate level to participate on long-term research projects at DOE laboratories. Pre-college science and math teachers will be provided with research appointments to improve their knowledge and skills of scientific discovery and enhance their ability to apply them in a classroom environment. Through these investments, the Department will make major contributions towards fulfilling several national priorities: enhancing the diversity of the technical workforce; supporting systemic reform of undergraduate education; and attracting, retaining, and graduating students in fields of interest to DOE and others in the public and private sectors. The funds will also allow the Department to encourage educators to participate directly in the ongoing science research of its laboratories. By joining teams of researchers, educators will experience directly the cutting-edge development of the Science Laboratories, and will better understand the process of scientific investigation. Funds provided will pay for

faculty/student and pre-college teachers' stipends, travel, and housing and will subsidize laboratory scientists' time for this activity.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Undergraduate SC Laboratory Fellowship Program			
The Science Undergraduate Laboratory Research Fellowship Program is a key component of the SC Science Education Program to enable students to focus their research interests on solving current scientific problems and prepare for meeting the challenge of DOE's future energy science mission requirements. The program will also ensure a steady flow of students with technical expertise into the Nation's pipeline of workers in both academia and industry.	0	3,900	3,900

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
National Science Bowl Program			
In addition, the Office of Science will manage and support the "National Science Bowl" for high school students from across the country. Since its inception, more than 50,000 high school students have participated in this event. The National Science Bowl is a highly publicized academic competition among teams of high school students who answer questions on scientific topics in astronomy, biology, chemistry, mathematics, physics, earth, computer, and general science. In 1991, DOE developed the National Science Bowl to encourage high school students from across the nation to excel in math and science and to pursue careers in those fields. It provides the students and teachers who have prepared them a forum to receive national recognition for their talent and hard work. We are planning to invest $400,000 into the National Science Bowl to manage both regional and national competitions.	0	400	400
Albert Einstein Distinguished Educator Fellowship Program			
The Albert Einstein Fellowship Awards for High School Teachers continues to be a strong pillar of the program for bringing real classroom experiences to our education programs and outreach activities. This congressional initiative, established by the Albert Einstein Distinguished Educator Fellowship Act of 1994, has enabled the Department to maintain an enriching relationship with the National Triangle Coalition that serves the Federal Government as the clearinghouse for selecting the teachers. We plan to invest $200,000 in the Einstein Fellowship Awards which will allow us to place teachers at the Department and in the U.S. Congress.	0	200	200

Nuclear Waste Disposal

Nuclear Waste Disposal
Proposed Appropriation Language

For nuclear waste disposal activities to carry out the purposes of Public Law 97-425, as amended, including the acquisition of real property or facility construction or expansion, [$169,000,000] *$258,000,000* to remain available until expended, [of which $165,000,000 is] to be derived from the Nuclear Waste Fund; and *in addition $39,000,000 shall be derived by transfer from funds appropriated to the Defense Nuclear Waste Disposal account in Public Law 104-46 to become available without regard to the limitations of Public Law 104-46 and to remain available until expended; Provided, That* [of which] not to exceed [$250,000] *$4,727,000* may be provided to the [Department of Energy to reimburse the] State of Nevada [solely for expenditures, other than salaries and expenses of State employees,] to conduct scientific oversight responsibilities pursuant to the Nuclear Waste Policy Act of 1982, [and] *(Public Law 97-425) as amended: Provided further, That* not to exceed [$5,540,000] $5,432,000 may be provided to affected *units of* local governments, as defined in Public Law 97-425, to conduct appropriate activities pursuant to the Act: *Provided further*, That the distribution of the funds [to] *as determined by* the units of local government shall be [determined] *approved* by the Department of Energy: *Provided further*, That the funds shall be made available to the *State and* units of local government by direct payment: *Provided further*, That within 90 days of the completion of each Federal fiscal year, the *State and* each local entity shall provide certification to the Department of Energy, that all funds expended from such payments have been expended for activities as defined in Public Law 97-425. Failure to provide such certification shall cause such entity to be prohibited from any further funding provided for similar activities: *Provided further*, That none of the funds herein appropriated may be: (1) used directly or indirectly to influence legislative action on any matter pending before Congress or a State legislature or for lobbying activity as provided in 18 U.S.C. 1913; (2) used for litigation expenses; or (3) used to support multi-state efforts or other coalition building activities inconsistent with the restrictions contained in this Act.

Explanation of Change

The Budget requests a total of $409 million in budgetary resources for the Civilian Radioactive Waste Management Program in FY 2000. This sum includes a request for new budget authority totaling $370 million, as well as a request that an additional $39 million be provided from $85 million in unobligated balances remaining from the FY 1996 Defense Nuclear Waste Disposal Appropriation (Public Law 104-46) and transferred to the Nuclear Waste Disposal account in FY 2000. This funding will be used to carry out required scientific and technical studies identified in the Viability Assessment of the proposed repository at the Yucca Mountain Site. The FY 2000 Request is identical to the funding profile depicted in the Viability Assessment. Without the identified level of funding, the Program would have to be recast to attempt to hold the critical milestone for a decision whether to recommend the Site to the President in 2001.

The prohibition regarding the use of Nuclear Waste Disposal funds for salaries and expenses of State employees is proposed for elimination in the FY 2000 appropriations request. In earlier versions of the President's budget, this clause was inadvertently not proposed for deletion.

Office of Civilian Radioactive Waste Management
Executive Budget Summary

Program Mission

The Office of Civilian Radioactive Waste Management is responsible for the management and disposal of the Nation's spent nuclear fuel and high-level radioactive waste. The office provides leadership in developing and implementing strategies to accomplish this mission that assure public and worker health and safety, protect the environment, merit public confidence, and are economically viable.

Program Goal

The Nuclear Waste Policy Act of 1982 established the Federal government's responsibility and statutory framework to provide for the permanent disposal of commercially generated spent nuclear fuel and the high-level radioactive waste generated by the Nation's nuclear defense activities. As originally enacted, the Act also directed the Department to study the need for and feasibility of the development and operation of a monitored retrievable storage for spent nuclear fuel. The Department submitted a site-specific proposal for such a facility, but the siting action was nullified by Congress in the Nuclear Waste Policy Amendments Act of 1987.

The Department, as directed by the Act, initially undertook a national screening exercise to evaluate candidate repository sites. In 1986, at the conclusion of this scientific screening activity, the Department recommended three sites to the President for further study as potential geologic repositories. Congress, however, in the Nuclear Waste Policy Amendments Act of 1987, directed the Department to investigate only one site, Yucca Mountain, Nevada, for possible development as a geologic repository.

Disposition in a geologic repository provides a final, permanent solution for the commercially generated spent nuclear fuel that is currently in temporary storage at reactor sites around the country. A geologic repository is also key to the disposition of the high-level radioactive wastes that resulted from operation of the Department's facilities that were key elements of the Nation's nuclear weapons complex (e.g., Hanford, Idaho National Laboratory, Rocky Flats, Savannah River). Continued progress by the Civilian Radioactive Waste Management Program is critical to the completion of the clean-up of those sites now under the jurisdiction of the Department's Office of Environmental Management. A permanent repository site will also enable the Nation to continue to demonstrate leadership and advance nonproliferation goals by moving forward with its plans for the disposition of weapons-grade materials (Highly Enriched Uranium and Plutonium). Additionally, a permanent geologic repository site will enable the Department to dispose of spent fuel used in the Naval Nuclear Propulsion Program.

54-291 99 - 47

Significant Accomplishments and Program Shifts

The Conference Report to the FY 1997 Energy and Water Appropriations Act directed the Program to complete a Viability Assessment for the Yucca Mountain site. This report was completed and submitted to Congress in December 1998.

The Viability Assessment is the compilation of almost 16 years of intensive, scientific and technical work at the Yucca Mountain site. It is an unparalleled synthesis of information and data regarding the Yucca Mountain site's ability to contain spent nuclear fuel and high-level radioactive waste. The Viability Assessment describes the Yucca Mountain site, the repository and waste package's design and costs, and details the results of a quantitative Total System Performance Assessment that describes how the site's engineered and natural barriers work together as a system. The Viability Assessment also contains a plan for and costs associated with the submission of a License Application to the Nuclear Regulatory Commission and the costs to construct and operate a repository at the Yucca Mountain site.

The FY 2000 Budget Request is identical to the funding requirements in the Viability Assessment. Without the identified level of funding, the Program would have to be recast to attempt to hold the critical milestone for Site Recommendation to the President in 2001. In addition, the scheduled submission of the License Application to the Nuclear Regulatory Commission in 2002 would slip. This slippage would also affect the 2010 date for emplacement of spent fuel and initiation of operations of the repository.

The Viability Assessment now provides the foundation for the Program's current and planned set of activities.

Program Objectives

The Program continues to aggressively build on the momentum achieved in the last four years. In FY 1999, the Program is planning to complete the Draft Environmental Impact Statement for Yucca Mountain and, in FY 2000, issue the Final Environmental Impact Statement. The completion of these major Program objectives will be followed by: 1) a decision by the Secretary whether to recommend the Yucca Mountain site to the President in 2001, if the site is found to be suitable; and 2) if recommended, submission of a License Application for the construction of a repository to the Nuclear Regulatory Commission in 2002

We are continuing the transition begun in FY 1999; that is, to shift emphasis from the construction/operations arena and the collection of basic data to activities that support the remaining key near-term objectives articulated in the Nuclear Waste Policy Act - the preparation of materials to support a Site Recommendation to the President and the submission of a License Application to the Nuclear Regulatory Commission. Those activities were described, in large part, in the *License Application Plan and Costs* (Volume 4) of the Viability Assessment. The work generally includes further refinement of repository and waste package designs, continued evaluation of repository behavior through total system performance assessment, refinement of the conceptual and numerical models used in evaluating repository performance, and continued scientific investigations to reduce

key uncertainty about the Yucca Mountain site. In addition, the Program will focus on assisting the Russian Federation in developing geologic repository alternatives to current radioactive waste management practices and use of Russian scientists and engineers for furthering nonproliferation objectives.

Key FY 2000 Activities

The Office of Civilian Radioactive Waste Management's FY 2000 budget request of $409 million supports the activities necessary to determine the suitability of the Yucca Mountain site as a repository, develop the documentation needed for a Secretarial decision on the Site Recommendation to the President in FY 2001, and conduct other activities associated with the Federal government's waste acceptance obligations.

Following the issuance of the Viability Assessment and the Draft Environmental Impact Statement for the Yucca Mountain site in FY 1999, the Program, through its Yucca Mountain Site Characterization Office, will focus principally on completing the Final Environmental Impact Statement and on technical and scientific investigation activities and repository and waste package design activities. These activities will serve to support a decision whether to recommend the Site to the President in 2001 and prepare a License Application for submission to the Nuclear Regulatory Commission in 2002. Activities proposed to be undertaken at the Yucca Mountain site are fully consistent with the description of the remaining work contained in the Viability Assessment.

Submission of the License Application in 2002 will complete the Site Characterization Phase of the repository program. Scientific and technical work will, however, continue subsequent to the submission of the License Application for performance confirmation purposes.

The Office of Waste Acceptance, Storage and Transportation will continue to focus on development of implementation plans for achieving the legal and physical transfer of spent nuclear fuel from reactor sites and Department-operated sites (e.g. Hanford, Idaho National Laboratory, Rocky Flats, Savannah River) once a Federal radioactive waste management facility becomes available. The Department will also continue to develop acquisition plans for waste acceptance and transportation services utilizing private sector entities. This approach offers a market stimulus for commercial development of the equipment and management capabilities required for transportation and storage of the spent nuclear fuel and high-level waste.

Program Organization

The Program continues to utilize two business centers (Yucca Mountain Site Characterization Project and the Waste Acceptance, Storage and Transportation Office) and a management center. The management center's responsibilities focus on providing overarching regulatory compliance, program control and management functions to both business centers.

Sources of Funding

To provide funding for the Program's activities, our FY 2000 appropriations request is principally from two sources: the Nuclear Waste Disposal Appropriation and the Defense Nuclear Waste Disposal Appropriation. The Budget requests a total of $409 million in budgetary resources for the Civilian Radioactive Waste Management Program in FY 2000. This sum includes a request for new budget authority totaling $370 million, as well as a request that an additional $39 million be provided from $85 million in unobligated balances remaining from the FY 1996 Defense Nuclear Waste Disposal Appropriation (Public Law 104-46) and transferred to the Nuclear Waste Disposal account in FY 2000.

Major Issues

Prior Year Reductions in Funding

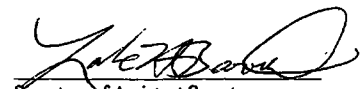
As a result of a comprehensive reassessment of the Program undertaken in 1994, a new program approach was prepared. This program approach was described in detail in the *Civilian Radioactive Waste Management Program Plan* (December 1994). To support the Program's activities, a funding profile was also developed. However, beginning in FY 1996, the Program received substantially less funding than was required to implement the program approach. As a consequence, the approach outlined in the Program Plan was no longer sustainable. The Program revised its approach to preserve the most critical activities and milestones. That approach was described in the *draft Civilian Radioactive Waste Management Program Plan, Revision 1 (May 1996).* Furthermore, despite streamlining its approach to meeting the objectives of the Nuclear Waste Policy Act and achieving considerable efficiencies and undertaking additional, unplanned work, such as the cross-drift, the Program has received less funding than the funding profile contained in the 1996 Program Plan. A new funding profile was developed and was included in the Civilian Radioactive Waste Management Program Plan, Revision 2, dated July 1998. This had the effect of increasing programmatic, scientific and technical risk.

The recently issued Viability Assessment contains a revised funding profile that supports the critical programmatic milestones. We have developed and costed a scope of work that is required to meet the established milestones. The Program now finds itself at the point of not being able to absorb any additional funding reductions without having impacts on the critical near-term milestones for the Yucca Mountain Site Characterization Project. Obviously, any near-term milestone slippage would also affect the planned 2010 date for emplacement of waste at that site.

Performance Measures

FY 2000 efforts will focus on development of the technical bases and draft documents that will support a Site Recommendation Statement in FY 2001. The following product-oriented performance measures are planned for FY 2000 in support of the Site Recommendation Statement and License

Application: complete and issue the final Environmental Impact Statement; select the reference design for a decision whether to recommend the Site and the License Application; and, select the natural system reference models for Site Recommendation and License Application.



Signature of Assistant Secretary

Public Law Authorization:
P L 97-425, "Nuclear Waste Policy Act" (1982)
P.L 100-203, "Nuclear Waste Policy Amendments Act" (1987)

[a] The Budget requests a total of $409 million in budgetary resources for the Civilian Radioactive Waste Management Program in FY 2000. This sum includes a request for new budget authority totaling $370 million, as well as a request that an additional $39 million be provided from $85 million in unobligated balances remaining from the FY 1996 Defense Nuclear Waste Disposal Appropriation (Public Law 104-46) and transferred to the Nuclear Waste Disposal account in FY 2000

[b] Of the $370 million in new budget authority requested, $112 million is requested for the Defense Nuclear Waste Disposal account in FY 2000. Under the scorekeeping guidelines adopted under the Budget Enforcement Act, the $39 million transfer of unobligated balances to the Nuclear Waste Disposal account will be scored as a reduction in current budget authority in the Defense Nuclear Waste Disposal account , resulting in net budget authority of $73 million.

In addition, $258 million in new budget authority is requested from the Nuclear Waste Disposal Fund for the Nuclear Waste Disposal account. Under the scorekeeping guidelines adopted under the Budget Enforcement Act, the $39 million transfer will be scored as an increase in current budget authority in the Nuclear Waste Disposal account, resulting in net budget authority of $297 million

[a] Includes Financial Assistance to the State of Nevada, and Affected Units of Local Government and includes funding for contracts administered in Nevada (i.e. Management and Operating Contractor, USGS, National Academy of Science, Universities, etc.)

[b] The Budget requests a total of $409 million in budgetary resources for the Civilian Radioactive Waste Management Program in FY 2000. This sum includes a request for new budget authority totaling $370 million, as well as a request that an additional $39 million be provided from $85 million in unobligated balances remaining from the FY 1996 Defense Nuclear Waste Disposal Appropriation (Public Law 104-46) and transferred to the Nuclear Waste Disposal account in FY 2000.

Site Description

Argonne National Laboratory

In support of Design and Engineering, Argonne National Laboratory conducts waste form testing. The laboratory is also the custodian for new spent fuel approved test material.

Lawrence Berkeley Laboratory

In support of Core Science, Lawrence Berkeley National Laboratory conducts Unsaturated Zone flow and transport modeling, thermal hydrologic modeling activities, geophysics testing, and supports Drift Scale testing. LBNL also performs the seepage tests in the exploratory studies facility alcoves and niches. LBNL supports the abstraction activities needed to conduct the Total System Performance Assessment in support of Site Recommendation and Licensing Application.

Lawrence Livermore National Laboratory

In support of Core Science, Lawrence Livermore National Laboratory conducts experiments and modeling activities needed for the repository design and to predict responses of the engineered and natural barrier systems to the heat generated by radioactive waste. The experiments include the Single Heater and Drift Scale tests in the ESF, the proposed heater tests in the Cross drift, and the Large Block test on the Fran Ridge at the site. In support of Design and Engineering, LLNL conducts testing and modeling of the waste package environment, waste package materials and waste forms. LLNL also supports the abstraction activities needed to conduct Total System Performance Assessment in support of Site Recommendation and Licensing Application.

Sandia National Laboratory

In support of Core Science, Sandia National Laboratories conducts in-situ monitoring in the Exploratory Studies Facility and in the East-West drift, and performance confirmation testing. The laboratory conducts geoengineering and rock mechanics studies, and backfill analyses in support of Design and Engineering. The laboratory also supports Suitability/Licensing and Performance Assessment with performance assessment modeling.

Los Alamos National Laboratory

In support of Core Science, Los Alamos National Laboratory conducts geochemistry, mineralogy, and colloid transport studies. LANL conducts laboratory – and field-scale transport tests, including the Busted Butte Transport Test, and develops radionuclide transport models for the unsaturated and saturated zone groundwaters at the site. LANL corroborates with USGS on isotopic and groundwater chemistry investigations needed for transport models. In support of Operations/Construction, the laboratory coordinates testing at the Yucca Mountain site, including testing in the ESF. LANL also supports the abstraction activities needed to conduct Total System Performance Assessment in support of Site Recommendation and Licensing Application.

Nevada Operations Office

In support of the Yucca Mountain Project and the OCRWM Program Direction, the Nevada Operations Office administers disbursement of External Oversight and PETT funds to affected units of government, and also administers contracts/agreements with: TRW Environmental Safety Systems as the OCRWM Management & Operating (M&O) contractor, the United States Geological Survey, the National Academy of Sciences, the University and Community College System of Nevada, Atomic Energy Canada Limited, Jason Technologies Corporation, Alpha Services , Science Applications International Corporation, Bechtel Nevada , and Wackenhut Services, Inc.

Nevada Test Site

In support of Core Science and Operations/ Construction at the Yucca Mountain Site, the Nevada Test Site, through Bechtel Nevada, provides NTS common site support such as: logistics, fire protection, security, emergency medical services, roads/grounds maintenance, environmental operations, vehicle/construction equipment maintenance, facility maintenance, bus transportation, janitorial and refuse services, and power usage.

Yucca Mountain Project Office in Nevada

The Yucca Mountain Project Office in Nevada has the primary responsibility for the characterization of the Yucca Mountain site, and if the site is suitable, for preparing and submitting a license application to the Nuclear Regulatory Commission for construction of the repository. As the future owner and licensee of the repository, DOE develops and implements policies and strategies for the work to be completed and oversees the management and operating contractor and the United States Geological Society in performing this work. YMSCO manages the contracts for the management and operating contractor and the support services contractors for work at Yucca Mountain.

Site characterization and license preparation activities include developing and conducting surface-based and underground data collection and testing; design of the repository and waste package subsystems; developing and implementing environmental, safety and health policies; preparing the environmental impact statement; interacting with oversight and regulatory groups; and providing the necessary management and site infrastructure to support these activities.

Oak Ridge Institute for Science and Education

In support of Program Management, the Oak Ridge Institute for Science and Education administers undergraduate and graduate educational programs.

Oak Ridge National Laboratory

In support of Design and Engineering, the Oak Ridge National laboratory provides support in analyzing commercial reactor criticality data, radiochemical assays and uncanistered fuel design. The laboratory also provides technical support for the disposal criticality topical report, thermal/neutronics model and criticality analysis process report.

Pacific Northwest Laboratory

In support of Design and Engineering, the Pacific Northwest Laboratory provides waste form testing support.

Yucca Mountain Site Characterization

Mission-Supporting Goals and Objectives

Our Nation's commitment to geologic disposal as the basic goal of its waste management policy is essential not only for addressing the problem of disposition of commercial spent fuel, but also for cleaning up the nuclear weapons complex, complying with the international nonproliferation policy, supporting the international consensus on permanent disposal of nuclear waste, and fulfilling the national defense mission. Permanent disposal of civilian- and defense-related high-level radioactive waste will enable the Nation to continue to demonstrate leadership and advance nonproliferation goals by moving forward with its plans for the disposition of fissile materials, as well.

Substantial and demonstrable progress has been made toward reaching a decision on the suitability of the Yucca Mountain site. In FY 1996, the *draft Civilian Radioactive Waste Management Program Plan, Revision 1, issued May 1996*, placed the focus of the Program on completing the necessary technical and scientific work at the Yucca Mountain site to maintain the long-term objective of initiating repository operations in 2010. Over the past four years, the Yucca Mountain Site Characterization Project has focused its activities on site characterization, principally to develop subsurface laboratories. If the site proves suitable and the Secretary of Energy decides to recommend the site for repository development, a Site Recommendation Statement will be prepared and submitted to the President in 2001. If the President, and then Congress, approve the Site Recommendation, a License Application will be prepared and submitted to the Nuclear Regulatory Commission in mid-2002.

The *revised Program Plan* outlined the steps necessary to streamline and focus the repository program at Yucca Mountain. The refocused set of activities enabled the Program to retain the schedule for completing a License Application while increasing funding needs in the post-FY 1996 time frame only moderately. The Program is implementing the scientific and technical activities at the Yucca Mountain Site Characterization Project in accordance with the recently issued Viability Assessment.

In addition, the Program will focus on assisting the Russian Federation in developing geologic repository alternatives to current radioactive waste management practices and use of Russian scientists and engineers for furthering nonproliferation objectives.

The focus in FY 2000 is on completing the technical work necessary to determine whether the Yucca Mountain site is suitable for development as a geologic repository and on developing the documentation needed to support a Secretarial decision on Site Recommendation. The Program has made significant progress and is well poised to complete the technical work necessary to support a decision by the Secretary of Energy on whether to recommend approval of the site in FY 2001. This work includes an evaluation of compliance with 10 CFR 960, the Department of Energy's siting guidelines. Additionally, the FY 2000 activities include a major international component.

In FY 1999, the Program continues to gain momentum toward a Secretarial decision on a Site Recommendation and License Application by:

- Publishing the Viability Assessment of a Repository at Yucca Mountain to support policy decisions on proceeding toward Site Recommendation and License Application.
- Completing a draft Environmental Impact Statement.

- Completing the formal, independent peer review of the Total System Performance Assessment documentation for the Viability Assessment to support development of the Total System Performance Assessment for a Site Recommendation Statement and License Application.
- Completing repository and waste package designs for use in developing the Total System Performance Assessment and other documentation for a Site Recommendation Statement and License Application.

In FY 2000, the Yucca Mountain Site Characterization Project will continue to build on these achievements. The Nuclear Waste Policy Act of 1982, as amended, prescribes the steps and contents for the statement that must accompany a Site Recommendation. Efforts will focus on development of the technical bases and draft documents that the Department of Energy will incorporate into a Site Recommendation Statement in FY 2001.

The following product-oriented performance measures are planned for FY 2000 in support of a Site Recommendation Statement and License Application:

- Select the natural system reference models to support a decision to recommend the Site and the License Application.
- Select the reference design to support a decision to recommend the Site and the License Application.
- Complete and issue the final Environmental Impact Statement.

In addition to these performance measures, the following key accomplishments also are planned for FY 2000 in support of a Site Recommendation Statement and License Application:

- Evaluate the Yucca Mountain site for compliance with 10 CFR Part 960, the Department of Energy's repository siting guidelines.
- Initiate development of the documentation that will support a Secretarial decision on Site Recommendation.
- Complete an internal review of the Working Draft License Application.
- Initiate development of the Acceptance Draft License Application to incorporate new design information and feedback from review of the Working Draft License Application.

Other key activities will continue beyond FY 2000, as follows:

- In FY 2001, hold public hearings on the Secretary of Energy's consideration of the possible recommendation of the site for development as a repository.
- Complete the final 10 CFR Part 960 compliance evaluation to document whether the site meets the specified siting guidelines, as input to a Site Recommendation Statement.
- In FY 2001, complete a departmental review of the Site Recommendation Report that will provide the technical bases for a Site Recommendation Statement.
- In FY 2001, finalize a Site Recommendation Statement for the Secretary of Energy to submit to the President and then Congress (if the Secretary decides to recommend the site). The Site Recommendation Statement will include the Site Recommendation Report, final Environmental Impact Statement, and other information required by the Nuclear Waste Policy Act of 1982, as amended.

- In FY 2002, submit a License Application to the Nuclear Regulatory Commission (if the President and Congress approve the Site Recommendation). This activity will initiate the Licensing Phase of the repository program. Formal licensing activities will continue for the remainder of FY 2002 through FY 2005.

Funding Schedule[a]

(dollars in thousands)

	FY 1998	FY 1999	FY 2000[a]	$ Change	% Change
Core Science	73,669	74,832	73,959	-873	-1.2%
Design and Engineering	62,888	78,394	91,539	13,145	16.8%
Suitability/Licensing and Performance Assessment	31,143	53,130	61,192	8,062	15.2%
National Environmental Policy Act	4,254	1,962	2,343	381	19.4%
Operations/Construction	47,814	34,203	42,705	8,502	24.9%
Project Management	36,042	28,234	37,600	9,366	33.2%
External Oversight and Payments Equal to Taxes	11,900	11,659	22,329	10,670	91.5%
Total, Yucca Mountain Site	267,710	282,414	331,667	49,253	17.4%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Core Science

The Core Science activities focus on investigating the geologic conditions of the Yucca Mountain site and determining the ability of Yucca Mountain to act as a natural barrier to radionuclide release into the environment. Core Science activities include collecting and testing geologic, hydrologic, geochemical, and geomechanical site characterization and performance confirmation data from the subsurface and surface. The ongoing collection of data through FY 2001 will include data from short- and long-term testing programs (both on the surface and underground) that produce quality field and laboratory measurements for use in conceptual and

[a] The Budget requests a total of $409 million in budgetary resources for the Civilian Radioactive Waste Management Program in FY 2000. This sum includes a request for new budget authority totaling $370 million, as well as a request that an additional $39 million be provided from $85 million in unobligated balances remaining from the FY 1996 Defense Nuclear Waste Disposal Appropriation (Public Law 104-46) and transferred to the Nuclear Waste Disposal account in FY 2000.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

numerical process models and engineering design calculations. These data will provide an increased understanding of the hydrology, geology, and geochemistry of the site and supply information on how thermal, hydrologic, chemical, and mechanical processes behave in the immediate natural environment. Other Core Science activities include collecting and monitoring environmental data to ensure compliance with regulatory requirements; testing material performance; planning, formulating, modeling, and testing scientific hypotheses; completing models and reports and collaborating with Russian scientists and engineers on characterization issues of mutual interest. The data collected will be used in the documentation that supports the major program products (e.g. Environmental Impact Statement, Site Recommendation Statement, License Application). The nonproliferation objective is to promote the concept of geologic disposition alternatives in Russia for Russian-generated spent nuclear fuel, high-level radioactive wastes, and post-cold war surplus materials.

Additionally, under a cooperative agreement, the University and Community College System of Nevada will continue to provide the public and the Yucca Mountain Site Characterization Office with an independent, unbiased body of scientific and engineering data concerning the study of Yucca Mountain as a potential high-level waste repository.

The key activity for Core Science in FY 2000 involves selecting natural system reference models used to support development of the Site Recommendation Report and License Application. To successfully complete this activity, we will:

- Select the near field environment (NFE) model
- Select the unsaturated zone (UZ) flow and transport model
- Select the saturated zone (SZ) flow and transport model

The Core Science subelement is divided into five key areas: Data Interpretation and Modeling, Testing to support a Site Recommendation, Testing for License Application, Testing for Licensing Phase and Performance Confirmation, and Environmental Monitoring and

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Compliance.

- **Data Interpretation and Modeling**—Data interpretation and modeling are essential end products of the site characterization activities. Nuclear Regulatory Commission regulations require numerical predictions of the effectiveness of the multiple barrier concept to mitigate a potential release to the natural environment and minimize radionuclides transport to potential human receptors. Both conceptual and numerical models of the natural barriers surrounding the waste packages have been developed for three increasingly larger areas—drift-scale, site-scale, and regional-scale. The drift-scale covers the size of a waste emplacement drift, which is five meters in diameter by approximately 40 meters in length. The site-scale is approximately 30 by 40 kilometers and is correlated to the repository operations area; and the regional-scale is approximately 245 by 230 kilometers. These models will be updated and refined as new information is collected through Site Recommendation, License Application, and performance confirmation testing.

  Specific performance measurement goals include data interpretation and modeling of the unsaturated zone, saturated zone, and near field (including approximately 10 process models, 8 abstraction models, and input data sets) for selection of the natural system reference models for the near-field environment and flow and radionuclide transport in the unsaturated and saturated zones. The input data sets for equivalent continuum models of lumped fracture parameters in the host rock are obtained from inverse modeling of the calibrated mountain-scale (i.e., hundreds to thousands of meters) simulation. The input data sets are adjusted for model scales and model codes.

  We will continue with the cooperative agreement ($10M) between the Department of Energy and the University and Community College System of Nevada to collect scientific and engineering data on Yucca Mountain. These scientific research activities will investigate areas of seismic activity, regional water resources, regional groundwater modeling, and moisture migration in the mountain.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
We will continue to work with Russian scientists and engineers at the closed city of Krasnoyarsk-26 to study the thermal effects analogue for Yucca Mountain. In addition, we will conduct exchanges of world-class expertise in system analyses, performance assessment, and risk assessment modeling for geologic disposal with former Russian weapons scientists and engineers from closed nuclear cities ($1.9M).			
Some work ($2.4M) originally planned for FY 1999 has been deferred to FY 2000, including collecting data to verify and supplement the data used in the UZ, SZ, NFE transport models; and precipitation and infiltration into the mountain	9,000	22,100	24,400
▪ **Testing to Support the Site Recommendation Report**— This testing provides the technical foundation for data and analyses of the natural system relating to the safety and the relationship between the geologic environment and the waste packages. Data available by the first quarter of FY 2000 will be used for analyses in the Site Recommendation Report. For the remainder of FY 2000, several of the same information networks will continue to acquire new data for use in the next phase of the Project (License Application) under Testing for License Application. Therefore, no funding will be necessary for testing to support a site recommendation in FY 2000 due to the transfer of activities to License Application testing.			
FY 2000 also includes $1.5 million in work originally planned for FY 1999 but deferred to FY 2000.....	15,000	35,102	7,000
▪ **Testing for License Application**—License Application testing, including enhanced characterization of the repository block, builds on the data acquired for the Site Recommendation Report. Data available by the end of FY 2000 will be used in the License Application. However, data-gathering activities will continue for performance confirmation testing. Results of subsurface investigations will support the hydrologic process models, Total System Performance Assessment for the decision whether to recommend the Site and the License Application, and repository design. Subsurface activities will complete the analyses of secondary minerals sampled in the			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
tunnel walls and estimate past percolation flux. Surface-based activities will include tracer-complex testing to acquire additional data on groundwater flow and radionuclide transport in the saturated zone. FY 2000 also includes $2.6 million in work originally planned for FY 1999, but deferred to FY 2000. This work includes testing in the Enhanced Characterization of the Repository Block (ECRB) Crossover and Infiltration alcoves and niches. This testing will provide data on hydrology in the unsaturated zone, infiltration and interaction of the geologic fracture and matrix.....	22,753	3,000	27,600
▪ **Testing for Licensing Phase and Performance Confirmation**—Licensing Phase testing activities include gathering data from an existing monitoring network that will gradually expand as testing for a decision regarding the Site and License Application come to a close. Measurement devices installed during these test periods will become part of the Testing for Licensing Phase network. Currently, Licensing Phase monitoring includes the extensive measurement network used to monitor seismic activity at approximately 24 locations on and around the Yucca Mountain site, as well as some of the underground instrumentation in the alcoves and niches associated with the Exploratory Studies Facility. Testing for Licensing Phase testing does not include the additional environmental monitoring covered under Environmental Monitoring and Compliance.			
▪ Performance Confirmation is required by 10 CFR 960 to confirm that subsurface conditions and changes in those conditions are within the limits stated in the License Application and that natural and engineered systems and components are as anticipated. Performance confirmation activities will assist in defining the performance confirmation baseline, predicting values and variations of critical performance parameters, establishing limits on deviations from predicted performance, conducting tests, and collecting data. Performance confirmation activities include long-term testing and monitoring, drift-scale thermal testing,			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
confirmation testing, subsurface testing, and surface-based testing. These activities will continue through repository analyses, which may be necessary for an updated License Application prior to repository operations.			
The budget request for Licensing Phase testing and performance confirmation may increase as monitoring points are added at the end of the testing periods and other testing requirements are identified by the Nuclear Regulatory Commission.	13,416	2,000	2,000
▪ **Environmental Monitoring and Compliance**—Environmental monitoring and compliance activities, as regulated by various statutes and regulations (e.g., Clean Water Act; Endangered Species Act; Federal Land Policy Management Act; Comprehensive Environmental Response, Compensation, and Liability Act), provide environmental and socioeconomic baselines through ongoing monitoring activities and ensure that site characterization continues by acquiring and maintaining the required permits. These activities also ensure regulatory compliance by conducting surveillances, audits, and assessments of site activities.			
Environmental monitoring and compliance activities provide scientific support for preparation of the Environmental Impact Statement. Data gathering and reporting of meteorological conditions provide direct support to design and engineering, Total System Performance Assessments, and analyses of potential radiological doses. These same meteorology data also are necessary to demonstrate that the requirements of preclosure radiological safety, regional airflow patterns, and extreme weather conditions relative to population centers can be met. It is anticipated that environmental monitoring and compliance activities will remain level through FY 2001 and then decline somewhat with decreased overall project activities prior to submitting the License Application.			
Additional environmental monitoring and compliance activities planned for FY 2000 through FY 2002 include scientific and engineering reviews of hazardous and solid waste handling and repository designs to ensure regulatory compliance; comment resolution support for environmental and			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
socioeconomic issues on the draft Environmental Impact Statement from the State of Nevada, affected units of local government, affected Indian tribes, and the public; and support for preparation of the final Environmental Impact Statement and technical documentation for the proposed Site Recommendation Statement and License Application.			
FY 2000 also includes $600 thousand in work for biosphere modeling originally planned for FY 1999, but deferred to FY 2000	13,500	12,630	12,959
Total, Core Science	73,669	74,832	73,959

Design and Engineering

In FY 1999 and FY 2000, refinement of the preliminary repository and waste package designs will continue to provide more detail. In addition, a quality assurance verification of the design to be used in the Total System Performance Assessment for License Application will be completed. Three key design options that would enhance repository performance will be evaluated for the Working Draft License Application. These options include: backfilling the emplacement drifts; installing drip shields over the waste packages to keep water from contacting the waste packages; and coating the waste packages with a ceramic material. In addition, several key design alternatives will be evaluated for the Working Draft License Application as proposed in the Viability Assessment, Volume II. These alternatives include continuous ventilation of the wastes, both pre- and post-closure; different waste package designs and materials (depending on the waste type); lower thermal loads in the underground emplacement drifts; self-shielded waste package designs that eliminate most underground remote handling operations; and different waste package emplacement configurations (in-drift, in-floor emplacement).

In FY 2000, the reference design to support the Site Recommendation Report and License Application will be selected and documented. These design documents will include safety and accident analyses and will describe the design in sufficient detail to show whether the repository can be operated safely during waste emplacement in

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Yucca Mountain and after all waste packages have been emplaced (i.e., preclosure period).

The design will progress and culminate in a License Application design submittal. The design will continue to be developed after the responses to the Nuclear Regulatory Commission's comments on the License Application have been incorporated. The design effort will support procurement of construction contractors and materials, as well as actual construction of the repository facilities and fabrication of the waste packages. These activities currently are scheduled to begin in FY 2005.

Important areas of ongoing design emphasis include waste package materials; waste form testing and analyses; waste handling system and emplacement operations; a description of how the Monitored Geologic Repository would operate (i.e., repository concept of operations); a demonstration of design compliance with codes, standards, and regulatory requirements (i.e., design verification); assurance that the technical work being performed within the individual engineering specialties is integrated (i.e., interface control); and detailed engineering for these elements of the repository system that show no similarities to systems licensed previously in commercial nuclear power plants.

The ongoing Monitored Geologic Repository design alternatives evaluation (planned for completion in 1999) will result in the selection of a repository/waste package design concept for the License Application. The design concept will, most likely, result in additional features that will require detailed design analyses, as necessary, for licensing. The key activity for FY 2000 in design and engineering involves decisions on the design and options that will be presented in the License Application. In addition, the materials selected for potential new waste packages or engineered barrier system components may require additional testing and fabrication or weld development.

Waste forms that we plan on placing in the repository include spent nuclear fuel from commercial nuclear power plants, spent nuclear fuel and high-level waste from the Department of Energy, fuel and mixed oxide spent nuclear fuel from the Navy, and immobilized plutonium. The repository design must accommodate the varied

(dollars in thousands)

FY 1998	FY 1999	FY 2000

characteristics (e.g., size, weight, radioactivity, heat) of these fuels in the repository design. Development of repository acceptance criteria (e.g., disposal interface specifications) for noncommercial spent fuel will continue.

The design and engineering subelement consists of three major areas—Waste package development, Repository Design, and Systems Engineering. Waste Package development includes two very distinct areas of technical activity—waste package design and waste forms and waste package materials testing. Repository design also includes two distinct areas of technical activity—subsurface facilities design and surface facilities design. Systems engineering integrates all aspects of design and demonstrates that the Monitored Geologic Repository (as designed) will perform safely and efficiently.

- **Waste Package Design**—Spent nuclear fuel and high-level waste—the primary waste forms planned for disposal in a deep geologic repository—contain highly radioactive materials (i.e., radionuclides). To safely and consistently handle these materials and other types of waste forms, the high-level waste will be sealed in containers (i.e., waste packages) prior to disposal in a Monitored Geologic Repository. Waste packages are being designed primarily to provide a way to safely handle waste during repository operations, contain and isolate the waste from the environment while in the repository, and prevent criticalities (e.g. nuclear chain reactions) from occurring during repository operations and after permanent closure of the repository.

  The waste packages are especially complex because they are first-of-a-kind designs that must safely contain the waste in the repository environment for thousands of years. The Nuclear Regulatory Commission has never licensed such a container.

  This activity provides structural, thermal, radiation shielding, criticality, and operational analyses to demonstrate viable waste package designs and new concepts for all waste forms; provides support for resolution of waste package viability issues and evaluation of waste package design licensing issues; develops engineering/design requirements; conducts short-term corrosion experiments and initiation of long-term corrosion tests to support development of

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
materials process models for new or modified waste package and engineered barrier system components; develops fabrication and welding verification methods; prepares cost estimates; evaluates alternative design concepts and selects the preferred design; provides waste package design information to the Total System Performance Assessments; and initiates designs to support waste package procurement. Hundreds of distinct activities (e.g. structural, thermal, radiation shielding analyses) to demonstrate viable waste package designs will be conducted. The increase from FY 1999 to FY 2000 reflects increased design activities to complete the Site Recommendation Statement and begin final design activities for License Application.			
FY 2000 also includes $1.5 million in work originally planned for FY 1999 but deferred to FY 2000. This work includes design of the waste package prototype, testing and fabrication	11,200	14,855	17,800
▪ **Waste Forms and Waste Package Materials Testing**—The materials selected for fabricating the waste packages must be capable of isolating waste forms for thousands of years from water that may seep into the underground openings where the waste packages are located (i.e., emplacement drifts). Long-term containment of the waste will allow most of the radionuclides to decay into stable elements before potential release to the surrounding rock. Waste forms and waste package materials testing activities are conducted primarily to provide input to models that will predict how waste package materials and waste forms will eventually degrade and allow the release of radionuclides into the natural barriers of the repository rock. These process models provide important tools to help select waste package materials and conduct performance assessment radionuclide release evaluations.			
This activity provides support for and development of process models; performs long-term degradation experiments and analytical studies; conducts performance confirmation testing of waste package materials and waste forms; performs long-term corrosion tests (24 test vessels); conducts design-specific tests (e.g., effects of machining, behavior of			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
the weld/material interface); determines the adhesion and protection characteristics of ceramic coatings; conducts stress-corrosion cracking tests; and develops models that describe and predict actual corrosion phenomena at the material/environment interface under various conditions. A significant number of test vessels will be used to perform hundreds of long-term tests and experiments.	11,200	16,355	16,400

- **Subsurface Facilities Design**—A subsurface repository would be exposed to environmental conditions significantly different from those encountered in standard mining practices (e.g., expected temperatures due to thermal radiation from the spent nuclear fuel would exceed the boiling temperature of water). Since there are no operating geologic repositories for high-level nuclear waste anywhere in the world, in this type of geologic medium, the subsurface design is a first-of-a-kind. The subsurface design consists of drawings and specifications for structures, systems, and components supported by analyses and trade-off studies. Subsurface structures include the ventilation shafts, access ramps, access tunnels, and emplacement drifts. Subsurface systems include ground support, ventilation, fire protection, data gathering and monitoring, communications, enunciated alarm systems, and performance confirmation. Major subsurface components include the waste transporter and emplacement gantry crane.

  Because of the nature of radioactivity, design efforts also focus on structures, systems, or components that serve to protect worker or public health and safety. Aspects of the repository design that contribute to the prevention or limitation of the potential release of radioactivity to the environment are identified as "safety-related." Subsurface design work is prioritized first on unique-to-a-repository, safety-related items that have no regulatory precedent; second on safety-related items that the Nuclear Regulatory Commission is familiar with because they have licensed similar items at nuclear power plants; and third on nonsafety-related structures, systems, and components that are necessary for operation.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
This activity provides subsurface facilities design support, including developing several thousand designs, drawings, and analyses for safety-related systems with and without previous Nuclear Regulatory Commission licensing precedence; evaluates waste package transport system and engineered barrier system enhancements and modifications; evaluates and selects multiple design alternatives to be presented in the License Application; resolves subsurface design viability issues; evaluates subsurface facility design licensing issues; and prepares input to the Total System Performance Assessments. The budget request increases in FY 2000 as design activities increase to complete the design products for Site Recommendation Statement and begin final design for License Application.			
FY 2000 also includes $1.0 million in near field design work originally planned for FY 1999 but deferred to FY 2000	13,000	19,302	21,489

- **Surface Facilities Design**—Surface facilities are being designed to receive spent nuclear fuel and high-level waste transported to the Yucca Mountain site in shipping casks, remove these wastes from the shipping casks and place them into disposal containers (i.e., waste packages), seal the disposal containers by welding, and deliver the filled waste packages to a holding area in preparation for underground emplacement for a potential Monitored Geologic Repository.

  Major surface facilities include the carrier preparation building, waste handling building, waste treatment building, transporter maintenance building, site utilities, and other support facilities (e.g., warehouses, maintenance shops, administrative facilities). The shipping casks will be received from the rail or truck carriers at the carrier preparation building where they will be prepared for removal. Nuclear waste will be removed from the shipping casks and loaded into waste packages in the waste handling building. The low-level waste generated during waste handling operations will be prepared for disposal at the Nevada Test Site. Vehicles used to transport and emplace waste packages will be serviced at the transporter

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
maintenance building.			
The waste handling facility and operations have some unique design considerations. Although some of the waste handling operations are similar to those of a nuclear facility, such as handling spent nuclear fuel, the number of fuel assemblies to be handled is approximately 400 times greater than in a nuclear facility. The production rates for the repository waste handling facility hot cell activities are significantly greater, with 60-ton casks being remotely handled in hot cells. Package closure operations include welding a large number of disposal containers to remain competent for thousands of years.			
This activity provides surface facilities design enhancements or modifications, including developing thousands of design drawings and analyses for safety-related systems with and without previous Nuclear Regulatory Commission licensing precedence; resolves multiple surface facility design viability and licensing issues; and prepares input to the Total System Performance Assessments. The budget request increases in FY 2000 as design activities increase to complete the design products for the Site Recommendation Statement and begin final design for License Application.			
FY 2000 also includes $1.0 million in work originally planned for FY 1999 but deferred to FY 2000. This work includes waste handling building design and operation	8,488	8,871	11,550
▪ **Systems Engineering**—The potential Monitored Geologic Repository is a large, technically complex combination of scientific, engineering, and construction activities. Systems Engineering is used to coordinate and integrate these diverse activities to ensure that the License Application design meets the regulatory requirements to safely contain and isolate waste from the public and the environment.			
Systems engineering has four major roles in the development of a geologic repository. The first role is to translate the regulatory requirements into design criteria so the repository and waste packages can be designed to meet these requirements. This results in a hierarchy of requirements that must be complied with			

(dollars in thousands)

FY 1998	FY 1999	FY 2000

when developing detailed designs and specifications, as well as during construction. The second role is to review the repository and waste package designs as they progress from the conceptual through the preliminary and on to the final stages to ensure that the designs included in the License Application meet the regulatory requirements and are properly integrated throughout the design process. This activity is referred to as requirements and design verification. The third role is to assure the Department of Energy and Nuclear Regulatory Commission that the designs, as built, will operate in a cost-effective and efficient manner and that changes to the designs and specifications are documented and controlled in accordance with the approved quality assurance program. The fourth role is to develop an operations test program to demonstrate that the designs will operate as intended. This program, intended to test the operations of the actual facility, is developed during the design process and continues through the start-up phase.

Successful application of the systems engineering principles ensures that the performance of a Monitored Geologic Repository, as included in the License Application, is balanced against the construction and operation costs of the repository. This is accomplished through the use of benefit/cost analyses, design alternative evaluations, engineering trade-off studies, and operations analyses that support the development of the design and Total System Life Cycle Cost estimates. These activities are performed throughout the life of the Project to provide the proper balance between repository performance and cost, and they are documented to provide the technical bases that support the Nuclear Regulatory Commission licensing process. Professional estimators are also used to support engineering and construction planning activities.

This activity provides systems engineering and training support, includes preparing descriptions of how a Monitored Geologic Repository should operate; develops system description documents; conducts hundreds of design reviews to ensure that the designs are integrated and consistent with regulatory requirements; develops thousands of the technical bases (i.e., records) for the designs; determines the

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
completeness and cost-effectiveness of the designs through cost/benefit analyses and Total System Life Cycle Cost estimates; conducts hundreds of design analyses; and prepares plan descriptions to start and test the facilities' operations. Systems Engineering processes support the development of the technical basis for the License Application Design.			
FY 2000 also includes $1.5 million in work originally planned for FY 1999 but deferred to FY 2000. This work includes Site Recommendation/License Application design criteria and the Exploratory Studies Facility nuclear safety analysis	19,000	19,011	24,300
Total, Design and Engineering	62,888	78,394	91,539

Suitability/Licensing and Performance Assessment

The objective of the suitability/licensing and performance assessment activity is to first compile the technical documentation that will support a Site Recommendation Statement, and second, if the Secretary of Energy decides to recommend the site and the President and Congress approve the recommendation, to complete the License Application for repository construction, which will be submitted to the Nuclear Regulatory Commission by the Secretary of Energy. A draft Site Recommendation Report will be developed during FY 2000 to provide the technical bases required under the Nuclear Waste Policy Act of 1982, as amended, as part of the Site Recommendation Statement. This report, the final Environmental Impact Statement, and other information required by the Nuclear Waste Policy Act of 1982, as amended, will be considered by the Secretary of Energy in deciding whether to recommend the site to the President in FY 2001.

Before the License Application is submitted, the Department of Energy will work with the Nuclear Regulatory commission to resolve procedural and technical issues. The licensing process can be facilitated further by coordinating and participating in prelicensing interactions with the Nuclear Regulatory Commission to determine and agree on the content and level of detail required for the License Application. These interactions will enable the Nuclear Regulatory Commission to accept

(dollars in thousands)

FY 1998	FY 1999	FY 2000

the License Application for review upon submittal in FY 2002 and, if warranted, approve a construction authorization by FY 2005.

This budget subelement includes interactions with the Nuclear Regulatory Commission, Nuclear Waste Technical Review Board, and other external organizations that are intended to facilitate an understanding of the bases for the Site Recommendation Statement and License Application.

Complete program records are critical to the preparation of the Environmental Impact Statement, reports supporting a Site Recommendation Statement and License Application and for the Nuclear Regulatory Commission's license review process. All technical data used for the repository design, Total System Performance Assessment, and models for site processes and conditions must be traceable and electronically retrievable in accordance with 10 CFR 960 Part 2, Subpart J. The latest web-based technologies will be utilized to ensure that program data and records are quickly and easily retrievable at the time that the Secretary of Energy decides to recommend the site to the President.

Performance assessments are important in evaluating site suitability to support a Site Recommendation Statement and License Application. Performance assessments are needed to quantitatively evaluate the ability of the natural system and engineered barriers to meet postclosure performance objectives. Performance assessments are conducted to provide information on the performance of the total repository system in the postclosure period by making calculations to evaluate physical processes that affect potential migration of radionuclides and the potential doses to individuals living in the vicinity of Yucca Mountain in the distant future.

The key activity for suitability/licensing and performance assessment in FY 2000 is documentation of the base case for the Total System Performance Assessment that will support the Site Recommendation Statement and License Application.

The suitability/licensing and performance assessment subelement consists of four major areas: to support a decision on the Site; Licensing; Technical Information Management; and Performance Assessment. The performance assessments for closing out issues in the

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

Viability Assessment and Site Recommendation/License Application are discussed separately.

- **Site Recommendation**—The Office of Civilian Radioactive Waste Management will develop a Site Recommendation Report to support a Statement and submit it to the Secretary of Energy in FY 2001. The Report and a proposed Site Recommendation Statement will be based on an integrated description of the site characterization and design information developed by core science and design and engineering through mid-FY 2000 and the Total System Performance Assessment Site Recommendation/License Application that will be completed in early FY 2001. The Site Recommendation Statement will be supported by the results of an evaluation of the Yucca Mountain site's suitability for development as a repository under 10 CFR 960, the Department of Energy's siting guidelines. This suitability evaluation will begin in FY 2000 and be completed in FY 2001 to support the Site Recommendation Statement. The final Environmental Impact Statement, as well as other inputs required by the Nuclear Waste Policy Act of 1982, as amended, will be included as part of the Site Recommendation Statement. The Program will coordinate preparation and issuance of two Site Characterization Progress Reports.

  The estimate for FY 2000 reflects the staff hours that are expected to accomplish the planned work scope. This estimate is based on experience gained from developing and reviewing the Viability Assessment in FY 1998 and coordinating the development of the Working Draft License Application in FY 1999 for review in FY 2000, as well as previous experience in developing Site Characterization Progress Reports.. ..... 1,500 1,004 1,500

- **Licensing**—Licensing activities focus on compliance with statutory and regulatory requirements, interacting with the Nuclear Regulatory Commission and oversight groups, and developing the License Application. The License Application will be developed iteratively between FY 1999 and FY 2002.

  In FY 2000, the Program will coordinate the review of

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
the Working Draft License Application and development of the Acceptance Draft License Application to provide the required information to support the licensing review by the Nuclear Regulatory Commission beginning in FY 2002 (the License Application is expected to comprise several tens of thousands of pages). Ongoing activities include publishing Semiannual Site Characterization Progress Reports, which are required by the Nuclear Waste Policy Act of 1982, as amended, and Nuclear Regulatory Commission regulations; tracking agreements and commitments made with the Nuclear Regulatory Commission; and observing and commenting on proposed regulatory revisions being considered by the Environmental Protection Agency and Nuclear Regulatory Commission. The estimate for FY 2000 reflects the staff hours that are expected to accomplish the planned work scope. This estimate is based on experience gained from developing and reviewing the Viability Assessment in FY 1998 and coordinating the development of the Working Draft License Application in FY 1999 for review in FY 2000, as well as several years of interactions with the Nuclear Regulatory Commission, its staff, the Advisory Committee on Nuclear Waste, with the Nuclear Waste Technical Review Board and other external groups. The budget request for Licensing increases in FY 2000 to accommodate the review of the Working Draft License Application that will be developed during FY 1999 and to coordinate development in FY 2000 of the Acceptance Draft License Application, which must fully address the information required under Nuclear Regulatory Commission regulations and the comments resulting from the review of the Working Draft License Application.	4,680	17,705	19,492
▪ **Technical Information Management**—Technical information management activities consist of developing, maintaining, and enhancing an Integrated Electronic Information System, including hardware, software, and administrative controls. This system will support the development, documentation, and archiving of licensing information. The Integrated Electronic Information System will be a controlled			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
system for storing, disseminating, and archiving scientific and design data and controlling model development and design analyses by ensuring the accuracy and consistency of the technical information used.			
The Integrated Electronic Information System includes the Web-based information system, project electronic licensing document development and management system, records management system, and technical data management system. The records management system equates to the Licensing Support Network required by 10 CFR 960, Part 2, Subpart J. Each of these component systems will be fully linked so that licensing and supporting documentation is traceable and transparent to the references and data.			
The Web-based information system will be deployed to support development of the Working Draft License Application, and the technical data management system will be fully functional in FY 1999. The Licensing Support Network will be certified by the Department of Energy and ready for use in licensing proceedings prior to submittal of the License Application in FY 2002.			
This estimate is based on experience gained during FY 1998 and FY 1999 in processing existing and new records for electronic access. It also is based on the FY 1999 development and deployment for internal use of the Web-based information system to support development of the Working Draft License Application and the technical data management system. The budget for technical information management increases in FY 2000 because the Nuclear Regulatory Commission requires the delivery of an electronic docket at the time the site is recommended (planned for FY 2001).			
FY 2000 also includes $2.2 million in work originally planned for FY 1999 but deferred to FY 2000. This work includes processing data into the Technical Data Management System, increasing the efficiency in document development and control by developing an Electronic Data Management System and records reprocessing.	10,900	13,022	17,100

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▪ **Total System Performance Assessment—Site Recommendation/License Application**—Total System Performance Assessment—Site Recommendation/License Application will be developed based on the results of the Total System Performance Assessment—Viability Assessment and the final component of the peer review completed in FY 1999. The Total System Performance Assessment process will continue to serve as an integration tool for models and analyses produced by core science and design and engineering. This process, and the Total System Performance Assessment resulting from it, will be a key source of information critical to the FY 2001 decision whether to recommend the Site and FY 2002 License Application. In the Total System Performance Assessment-Site Recommendation/License Application, relevant abstracted model results, simplified process models, and design information will be combined with a reference case set of parameters to determine expected repository performance. The analyses will present the base case results showing the estimated dose to a human receptor at 20 kilometers downgradient from a hypothetical repository release. The release scenario is an occurrence of moisture in the unsaturated zone contacting the waste package for a sufficiently long time to corrode the metal container and carry the radionuclides to the water table (about 800 feet below the proposed repository horizon). This type of scenario is needed to evaluate potential impacts to human health and safety and to the environment to support the evaluation of site suitability, development of the remaining bases for the Site Recommendation Statement, and preparation of the License Application. This activity is labor-intensive with several computer simulations and interpretation of results. The budget request is estimated at $750,000 per month based on experience in developing the Total System Performance Assessment—Viability Assessment. FY2000 also includes $1.0 million in work originally planned for FY 1999 but deferred to FY 2000.	7,063	20,639	23,100
▪ **Total System Performance Assessment—Viability Assessment**—Total System Performance Assessment was a key component of the Viability Assessment in FY 1998. It served as an integration tool for models			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
and analyses produced by core science and design and engineering. Performance measures included simulated doses to affected populations and/or releases at specified boundaries. Total System Performance Assessment—Viability Assessment also presented sensitivity and uncertainty analyses to define key parameters that impact total system performance and to evaluate the significance of alternative assumptions in the overall prediction. Impacts of the Total System Performance Assessment—Viability Assessment on the scientific process models and design products were described, and recommendations were made for modifications that could significantly reduce uncertainty in the final dose calculations in the next performance assessment iteration. Results of the Total System Performance Assessment—Viability Assessment peer review, which will be completed in FY 1999, will be considered in the Total System Performance Assessment—Site Recommendation/ License Application.			
This activity was completed in the first quarter of FY 1999. The budget requirements in FY 2000, because all work related directly to this phase of performance assessment, will be finished with completion of and responses to the final report of the peer review panel in FY 1999.	7,000	760	0
Total, Suitability/Licensing and Performance Assessment..	31,143	53,130	61,192

National Environmental Policy Act

This subelement addresses the environmental data that will form the basis of the Environmental Impact Statement for a *Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada.* The Nuclear Waste Policy Act of 1982, as amended, requires that an Environmental Impact Statement be included in a Site Recommendation Statement and that the Nuclear Regulatory Commission, in granting repository construction authorization, adopt the Department of Energy's Environmental Impact Statement to the extent practicable. The National Environmental Policy Act process began in FY 1995 with the publication of a Notice

(dollars in thousands)

FY 1998	FY 1999	FY 2000

of Intent in the Federal Register, which initiated the public comment period on the proposed scope of the Environmental Impact Statement. As part of the scoping effort, 15 public meetings were conducted across the nation. Comments made at the scoping hearings were documented formally in a Comment Summary Document, which was issued in FY 1997. In FY 1999, the draft Environmental Impact Statement will be completed and issued for public review and comment. The public comment period will end in FY 2000. The final Environmental Impact will be published in late FY 2000. The final Environmental Impact Statement will evaluate potential environmental impacts associated with building, operating, and eventually closing a repository at Yucca Mountain. Data to support the Environmental Impact Statement will be generated by Core Science, Design and Engineering, and Suitability/Licensing and Performance activities.

This subelement includes three major activities to support development of the Environmental Impact Statement. The first activity involves performing environmental impacts and consequence analyses for each technical discipline in the Environmental Impact Statement (e.g., ecology, archeology, biology, meteorology, economics, and sociology). These impact analyses consider the results of the Total System Performance Assessment of the repository, estimate environmental consequences, and identify mitigation measures. The second activity involves conducting analyses in the technical areas that form the basis for and justification of the Environmental Impact Statement's conclusions. This process focuses on matters involving socioeconomic impacts, sensitive ecosystems, analysis of transportation impacts, issues of environmental justice, and analysis of repository performance and resulting environmental impacts during the preclosure and postclosure periods. The third activity involves further refining the technical analyses that support the Environmental Impact Statement after receiving public, agency, and tribal comments, as appropriate; supporting interdepartmental reviews; managing efforts to publish and distribute the document to all interested parties on a national basis in FY 2000; and continuing to maintain the administrative record.

The key activity for the National Environmental Policy

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Act in FY 2000 is publishing the final Environmental Impact Statement.			
▪ **National Environmental Policy Act**—To support the development of the Environmental Impact Statement, we will perform a environmental impact and consequence analyses; support Total System Performance Assessment analyses; identify mitigation measures; review draft and final text developed by the Environmental Impact Statement contractor; and interface with Department of Energy sites, headquarters organizations, regulatory and oversight organizations, and Department of Energy management on issues related to data collection and analyses for the Environmental Impact Statement. *Note that the cost of actually writing the Environmental Impact Statement is not included in this subelement. Those costs are included in Program Direction under support contractor scope.*	4,254	1,962	2,343
Total, National Environmental Policy Act	4,254	1,962	2,343

Operations/Construction

Operations/Construction activities include providing, maintaining, and managing the operating systems, structures, and construction necessary to support the Yucca Mountain site characterization effort. Operations activities include maintaining facilities and systems constructed to gather site characterization data; maintaining facilities in the central support area at the site; providing and maintaining site utilities and communications; and providing transportation for site workers. Construction activities include constructing and modifying test areas; changing the configuration of the ESF to provide a fully functional underground scientific research facility; and providing direct support for test setup and execution. Scientific and technical support facilities constructed to support testing include the Exploratory Studies Facility, Busted Butte Facility, Fran Ridge Facility, and various surface test drilling sites (boreholes). The Exploratory Studies Facility, which is the cornerstone of the underground characterization effort, includes the 5-mile Main-Loop, 1.7 mile Cross Drift, and 11 large test areas. These underground facilities are used

(dollars in thousands)

FY 1998	FY 1999	FY 2000

for scientific testing to enhance our understanding of the repository block; reduce characterization uncertainties ; confirm data; and support the Environmental Impact Statement, Site Recommendation Statement, and License Application. In FY 1998, the Cross Drift was excavated above the repository block to provide access to the western portion of the repository block. Construction of all major test areas to provide locations for scientific testing and data collection will be completed in FY 2000. This includes $3.5 million for cross-drift niches and alcove construction and Exploratory Studies Facility configuration modification originally planned for FY 1999. These test areas provide access for collection of observational and confirmatory data to support the data in the Viability Assessment and for the Site Recommendation Statement. The Central Support Area, originally constructed in the late 60s and early 70s, consists of existing buildings, roads, utilities, and communication systems that have been rehabilitated and are maintained to provide the necessary base of operations.

Out-year operations, including general test support and upgrading of the major Exploratory Studies Facility systems to provide and maintain a fully functional underground scientific research facility, will continue. In addition, minor construction will continue, as necessary, to upgrade existing testing areas. Safety and health programs also will continue to protect employees and the public, as will field support services provided by the Nevada Test Site.

The Operations/Construction subelement is composed of four key areas—Exploratory Studies Facility Operations, Exploratory Studies Facility Test Support and Construction, Site Operations and Test Support, and Safety and Health.

- **Exploratory Studies Facility Operations**—Exploratory Studies Facility operations ensure that this underground and other subsurface test locations, including the Busted Butte Unsaturated Zone Test Facility, are available for scientific study and ensure that the testing environment is consistent with programmatic and institutional requirements and continued site characterization. The Exploratory Studies Facility includes 25 major support systems that provide the necessary utilities to sustain life ,conduct

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
complex in situ laboratory experiments, and protect complex scientific equipment. The major support systems include ventilation, power, water, communications, ground support, underground transportation, and material and supplies handling.			
Continue provisions of the Exploratory Studies Facility support services (e.g., trash and refuse management, janitorial, drinking water, sanitation, vehicle fueling, access control, and underground transportation.			
Based on past experience, the average monthly cost to provide these services is $1.5 million. Costs associated with operations of the major support systems is expected to remain somewhat constant through License Application submittal.	18,314	16,380	17,500

- **Exploratory Studies Facility Test Support and Construction**—Construction activities include constructing and modifying test areas; modifying the configuration of Exploratory Studies Facility systems to provide a fully functional underground scientific research facility; resolution of Exploratory Studies Facility Title III engineering reports, and providing direct support for test setup and execution. All major site characterization construction was completed at the beginning of FY 1999 with completion of the Cross Drift. FY 1999 construction activities include resolution of Exploratory Studies Facility as-built issues, archival of Exploratory Studies Facility configuration files, and upgrading of Exploratory Studies Facility systems to provide a full functional underground scientific research facility. Planned Exploratory Studies Facility system work includes alignment of the Exploratory Studies Facility rail system and upgrade of critical electrical systems. Other activities will include technical support to construction tasks and construction support to the surface-based drilling program.

  FY 2000 also includes $3.5 million in work originally planned for FY 1999. This work includes cross-drift niches and alcove construction and replacement and upgrading of some of the Exploratory Studies Facility (which includes the electrical switch gear building, drainage channel, fencing, lighting, fire protection,

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
power distribution, and communications.			
As the level of construction and testing activities decreases, the support requirements also will decrease	15,200	5,247	10,500
▪ **Site Operations and Test Support**—Site operations and test support activities provide the laboratories, buildings, and services to support the 500 scientists and engineers working on site at Yucca Mountain, as well as approximately 3,500 visitors who tour the site each year. On-site facilities consist of buildings and associated utilities, motor pool, site roads, power, fuel, water distribution, and sewage collection. Support services include janitorial, refuse management, bus transportation, emergency medical services, field surveying, site security, tour coordination, material and property control, communications, and fleet operations. Site operations and test support also includes common field support services provided by the Nevada Test Site. Other surface and subsurface testing sites that are maintained on an ongoing basis include the C-Well Complex, Fran Ridge, and approximately 350 boreholes and 200 trenches and test pits. Site operations and test support is a long-duration task that spans the site characterization, licensing, construction, and operations phases.			
Site Operations and test support is expected to remain fairly constant through License Application submittal. The cost to provide surface operations and test support will be approximately $823 thousand dollars per month	11,600	9,876	11,250
▪ **Safety and Health**—Safety and health programs prevent or mitigate potential hazards during core science data collection, construction, and testing activities that form the scientific bases for the Site Recommendation Statement and License Application. These activities also are conducted to comply with the statutory and regulatory requirements of the Occupational Safety and Health Act and will continue through all phases of the repository program.			
Ongoing activities focus on protecting employees, members of the public, environment, and site workers from hazards that may result from the site			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
characterization activities. All aspects of the activities at the Yucca Mountain site recently completed the transition to the Office of Civilian Radioactive Waste Management Integrated Safety Management System. The Exploratory Studies Facility continues to be monitored for occupational health compliance with ventilation and air quality requirements for dust abatement and silica exposure mitigation. Medical emergency services, emergency management programs, fire prevention programs to support field activities, and safety and health programs complying with applicable requirements also are ongoing.			
As the level of operations/construction activities decrease, the cost of safety and health activities will decrease. However, specific safety and health activities planned for FY 2000 through FY 2002 will be expanded or reduced based on the hazard potentials and potential environmental risks in each phase of the project.	2,700	2,700	3,455
Total, Operations/Construction	47,814	34,203	42,705

Project Management Support

Project management provides support to technical and scientific programs allowing for the planning, funding, managing, measuring, and processing of data. Most importantly, project management activities support the program goals to complete the Site Recommendation Report to support a decision whether to recommend the Site and submit a License Application (if the site is determined to be suitable) by providing the systems and processes necessary to conduct institutional, scientific and technical activities. Specific project management activities include planning, scheduling, and measuring performance for all of the Yucca Mountain Site Characterization Project elements, as well as information technology and telecommunications management; lease scoring; office services, training, security, and procurement; facilities management and motor pool operations; records management; and technical document control. Project management also includes conducting public information and outreach programs to ensure that open and informative interactions with the public and program stakeholders are

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
continued.			
▪ **Management Support Activities**—Project Management activities that were completed in FY 1998 and are planned for FY 1999 through FY 2002 support the development of the Environmental Impact Statement, Site Recommendation Report, and License Application. Project management will include monitoring program activities to ensure compliance with applicable statutes, regulations, and Department of Energy orders and directives; planning, scheduling, budgeting, and measuring the performance of program activities to ensure that the Office of Civilian Radioactive Waste Management program objectives are met; monitoring program activities to ensure that they are accomplished in accordance with approved work scopes, authorized budgets, and scheduled milestones; providing program participants with facilities, equipment, systems, training, security, and support services needed to perform their approved activities; maintaining the information technology and telecommunications systems; maintaining records and technical references; managing the outreach program; and supporting public hearings on the Environmental Impact Statement and a decision to recommend the site, if determined suitable. Management support activities average 10 percent or less of the program budget. FY 2000 also includes $2.2 million in work originally planned for FY 1999 but deferred to FY 2000. This work includes information technology and telecommunications support	36,042	28,234	29,900
▪ **Lease Scoring**—Maintain current leases on office space, the current leases for office space in Las Vegas, Nevada begin to expire in FY 2000. Funding supports the minimum extensions (one-year to three-year, identified in the current contract) until new leases are negotiated and awarded.	0	0	7,700
Total, Project Management	36,042	28,234	37,600

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
External Oversight and Payments-Equal-to-Taxes			
Financial assistance activities within the external oversight and payments-equal-to-taxes subelement provide the eligible units of government funds for conducting oversight and monitoring activities for the Yucca Mountain site characterization and offsetting lost tax revenues. Financial assistance for external oversight and payments-equal-to-taxes is required by the Nuclear Waste Policy Act of 1982, as amended. External oversight activities consist of financial and technical assistance to the State of Nevada and affected units of local government (i.e., Churchill, Clark, Esmeralda, Eureka, Lander, Lincoln, Mineral, Nye, and White Pine Counties in Nevada and Inyo County in California).			
Payments-equal-to-taxes are made to the State of Nevada and Nye, Clark, and Inyo Counties.			
▪ **External Oversight**—Financial assistance will be provided to the State of Nevada, Nye County, and nine counties adjacent to Nye County to allow participation in activities required under the Nuclear Waste Policy Act of 1982, as amended, [Section 116(C)(1)(A)].	5,000	5,930	12,329
▪ **Payments-Equal-to-Taxes**—Payments-equal-to-taxes will be provided to the State of Nevada, Nye, Clark, and Inyo Counties. The increase in FY 2000 is due to an expected increase in payments-equal-to-taxes to Nye County.	6,900	5,729	10,000
Total, External Oversight and Payments-Equal-to-Taxes...	11,900	11,659	22,329
Total Yucca Mountain Site Characterization.....	267,710	282,414	331,667

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. F Y 1999 ($000)
Core Science	
▪ The budget projected for Core Science stays relatively level in FY 2000 as the testing activities to support a decision whether to recommend the site draw to a close and testing for License Application increases. The funding for site characterization decreases but is affected by increases in external research under the cooperative agreement with the University and Community College System of Nevada and support for Russian Scientists and engineers on site characterization activities.	-873
Design and Engineering	
▪ The upward trend from FY 1999 to FY 2000 reflects increased design activity to complete to support a site recommendation report input and start final design activities for License Application. These activities include surface and subsurface design development, waste package design, waste forms, and waste package materials testing. Systems engineering functions support the development of the technical basis for the License Application design.	+13,145
Suitability/Licensing and Performance Assessment	
▪ The budget to support a decision on the site increases in FY 2000 to accommodate the effort required to coordinate preparation of the Site Recommendation Report and to initiate the review of this major statutory product. The budget for licensing increases in FY 2000 to accommodate the significant effort associated with the review of the Working Draft License Application that will be developed during FY 1999. The increase also covers additional staff resources necessary to coordinate development in FY 2000 of the Acceptance Draft License Application, which must fully address the information required under Nuclear Regulatory Commission regulations and the comments resulting from the review of the Working Draft License Application. The budget increases for Technical Information Management for FY 2000 to address the significant effort and staff resources necessary to satisfy the Nuclear Regulatory Commission's	

	FY 2000 vs. FY 1999 ($000)
requirement for electronic docketing for License Application. The budget increases for Performance Assessment in FY 2000 for two reasons. FY 2000 includes $1 million in Performance Assessment work originally planned for FY 1999 by deferred to FY 2000. The increase is also due to increased resource requirements needed to support Site Recommendation. Development and deployment of the Web-based information system for internal use will be completed in FY 1999. In FY 2000, this system will be available for use in developing the Acceptance Draft License Application and for eventual use in the Licensing Support Network being developed to provide the Integrated Electronic Information Management System, which is required under Nuclear Regulatory Commission regulations to provide electronic access to the records needed to support the licensing process	+8,062
National Environmental Policy Act	
▪ The budget for this subelement increases in FY 2000 to provide additional support for the public hearing during coordination of the final Environmental Impact Statement	+381
Operations/Construction	
▪ Cross-Drift construction (the last major construction project required for site characterization), north portal upgrade, and the unsaturated zone testing facility as part of the Exploratory Studies Facility underground laboratory will be completed in FY 1999. Emphasis in FY 2000 shifts to completing the testing activities.	+8,502
Project Management	
▪ Current lease agreements on facilities for Yucca Mountain begin to expire in FY 2000. The Project Management increase of $9.4 million is due a $7.7 million lease scoring requirement for one to three year extension of the current leases of approximately 206,000 square feet of office space and a $1.7 million increase in information technology in support of licensing activities.	+9,366
External Oversight and Payments-Equal-to-Taxes	
▪ External oversight is budgeted for the State of Nevada, Nye County, and nine counties adjacent to Nye County. Payments-equal-to-taxes	

	FY 2000 vs. F Y 1999 ($000)
are provided to the eligible government units. The increase in FY 2000 is due to a planned increase in payments-equal to taxes to Nye County as a result of site improvements and funding for the state which was not appropriated fully in FY 1999	+10,670
Total Funding Change, Yucca Mountain Site Characterization	+49,253

Waste Acceptance, Storage and Transportation

Mission-Supporting Goals and Objectives

The Waste Acceptance, Storage and Transportation (WAST) activities include: the development of processes for the legal and physical transfer of commercial spent nuclear fuel to the Federal Government; creation of a national transportation capability for waste acceptance and transportation; burn-up credit studies to take credit for the reductions in spent nuclear fuel reactivity resulting from fuel usage in a reactor; and resolution of institutional issues with Program stakeholders and the phasing out of discussions with the Nuclear Regulatory Commission for a storage facility design. The national transportation capability necessary to accept and transport spent nuclear fuel will utilize a market-driven initiative. This initiative involves a procurement process for contracts with the private sector to acquire needed waste acceptance and transportation services; it begins with the development of business plans, and includes a phase for mobilization and fabrication of canister, transport cask and storage modules, and a transportation operations phase. This approach offers a market stimulus for the commercial development of the equipment and management capabilities required for the transportation and storage of spent nuclear fuel.

The FY 2000 funding will provide for continuation of the core activities that will precede removal and transportation of spent nuclear fuel from reactor sites to a Federal facility. These activities include: collection and maintenance of spent nuclear fuel discharge information; development of procedures for verification of spent nuclear fuel parameters; maintenance and implementation of the Standard Contract; interactions with the International Atomic Energy Agency, the Nuclear Regulatory Commission, contract holders, and others concerning nuclear materials safeguards; interactions with stakeholders; and the development activities associated with the procurement initiative for waste acceptance and transportation equipment and services.

Spent Fuel Storage

This activity will be suspended in FY 1999, following receipt from the Nuclear Regulatory Commission of a safety assessment report for the Phase I Centralized Interim Storage Facility Topical Safety Analysis Report.

Transportation

This activity, which includes planning for the acquisition of a safe and cost-effective transportation capability, is being developed to utilize private sector entities to accomplish the Department's commercial spent nuclear fuel waste acceptance and transportation requirements. The proposed procurement has been structured in a phased process to facilitate competition and minimize contract risk to DOE. Development of the detailed plans for waste acceptance and transport, the fabrication of the transportation casks and related equipment, and the actual transportation services will proceed within the planned contract phases. The Department plans to complete development of the request for proposals for waste acceptance and transportation services in FY 2000, and issue it in FY 2001. This activity also includes the consideration and resolution of institutional issues and interactions with stakeholders, and technical assistance (Nuclear Waste Policy Act Section 180(c)) to states and tribes.

Waste Acceptance

The Waste Acceptance activity includes developing plans for achieving the legal and physical transfer of waste to the Federal Government from the owners and generators of spent nuclear fuel and high-level waste, once a Federal facility is ready to begin operations; supporting the transportation, storage and disposal of waste, once accepted; and developing recommendations for the Department's waste acceptance policy. Activities required to facilitate waste acceptance include: 1) development of a process for the orderly transfer of spent nuclear fuel and high level waste into the Federal system consistent with the needs of both the Federal Government and the owners and generators; 2) development of a plan to carry out the Program's waste acceptance responsibilities; 3) continuation of a collaborative dialogue with the Nation's nuclear utility companies as well as other owners and interested stakeholders; 4) verification of the fees collected for commercial spent nuclear fuel; 5) maintenance and implementation of the provisions in the Standard Disposal Contract; and 6) provision of contingency planning support, studies and analyses directed toward the market-driven initiative.

Project Management

Project Management and Administration consists of activities and tasks that support each of the product areas for the Waste Acceptance, Storage and Transportation Project. Specifically, the Project Management and Administration area includes the traditional areas of project management, project control, and technical and programmatic integration of tasks and activities across the Project.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Spent Fuel Storage	1,549	310	0	-310	-100.0%
Transportation	3,180	10	4,100	4,090	40900.0%

Detailed Program Justifications

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Spent Fuel Storage			
▪ Respond to the Nuclear Regulatory Commission questions and interact with the Commission during their review of the Centralized Interim Storage Facility Topical Safety Analysis Report Rev 0. The receipt of the Nuclear Regulatory Commission's safety assessment report for the non-site-specific Centralized Interim Storage Facility Topical Safety Analysis Report is expected in FY 1999. No activity is planned for FY 2000	1,349	310	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▪ Perform non-site-specific contingency planning for a Centralized Interim Storage Facility; maintain and update the database on industry developments for storage and transportation technology.....	200	0	0
Total, Spent Fuel Storage	1,549	310	0
Transportation			
▪ Prepare acquisition documents and technical specifications and issue for public comment the revised draft Request for Proposal (FY 1998), and support development during FY 2000 of the RFP for waste acceptance and transportation services including transport cask systems and auxiliaries (for issuance in FY 2001); develop procurement for market-driven waste acceptance and transportation services.....	1,855	0	3,700
▪ Review and revise Section 180(c) Notice of Policy and Procedures for implementing the Nuclear Waste Policy Act Section 180(c) and support preparation and evaluation of grant applications.....	200	0	200
▪ Continue stakeholder interactions.....	200	0	200
▪ Support ten cooperative agreements.....	625	0	0
▪ Submit an updated Actinide-only Burn-up Credit Topical Report to the Nuclear Regulatory Commission to take credit for the reductions in spent nuclear fuel reactivity as a result of fuel usage in a reactor.....	300	10	0
Total, Transportation.....	3,180	10	4,100
Waste Acceptance			
▪ Address Civilian Radioactive Waste Management System safeguards and security issues, implementing associated policies and procedures, and maintaining interface/liaison with other affected elements of the Civilian Radioactive Waste Management System.....	80	30	175

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▪ Process and verify utility fee payment data and develop quarterly revenue projections.....	270	270	270
▪ Develop Standard Disposal Contract modifications and/or deviations, as required, to support the waste acceptance process and Regional Servicing Contractor services acquisition processes. Maintain spent nuclear fuel storage data and assumptions; update Utility Storage Assessment model to include utility cost calculations, and industry forecasts to support Civilian Radioactive Waste Management System planning; and support development of waste acceptance criteria in FY 2000.....	73	423	379
▪ Implement the Standard Disposal Contract and other agreements; validate and disseminate utility supplied spent nuclear fuel discharge/storage data; update and publish the Acceptance Priority Ranking and Annual Capacity Report; and, prepare and distribute the updated Utility Spent Nuclear Fuel Discharge Projections and Analysis. Update verification requirements as required, including commercial and DOE owned spent nuclear fuel and high level waste; and support the litigation process.....	100	193	206
Total, Waste Acceptance	523	916	1,030
Project Management			
▪ Provide cost, schedule, planning, and integration related tools and services: cost and schedule baseline management; Strategic and Program Plan development/update; and project management documentation; Provide project control functions by monitoring cost, schedule and technical performance, performing variance analyses, and developing and implementing corrective actions.....	130	160	160
▪ Develop the Waste Acceptance, Storage and Transportation Annual Plan, and support the project validation review process; update the Project Cost & Schedule Baseline Project Summary Schedule work breakdown structure and dictionary and Long-Range Plan, as required.....	370	259	340

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▪ Maintain Waste Acceptance, Storage and Transportation life cycle cost estimate, support Total System Life Cycle Cost, and update Waste Acceptance, Storage and Transportation Project Life Cycle Cost Report; maintain and manage the technical baseline; conduct/coordinate system studies and analyses including the Waste Acceptance, Storage and Transportation Operations Plan; and perform/support verification and design control The Total System Life Cycle Cost Report will be issued in FY 1999 and updated in FY 2000	195	195	100

Accelerator Transmutation of Waste

Mission Supporting Goals and Objectives

In FY 1999, funding was provided to assess the application of advanced accelerator technology to the transmutation of high-level defense waste. This work was coordinated with the activities being done in other offices on the development of high power accelerator technology.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Accelerator Transmutation of Waste	0	4,000	0	-4,000	-100.0%
Total, Waste Acceptance, Storage and Transportation	0	4,000	0	-4,000	-100.0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
▪ In FY 1999, the Department conducted a road mapping activity to identify the critical technical issues which must be resolved in order to establish the technical feasibility of the accelerator transmutation of waste (ATW). The study involved the design of an R&D program to address those issues, including schedule and cost. Opportunities for collaborative programs with foreign ATW efforts, as well as possible cooperative activities with other DOE accelerator programs, were identified. Institutional challenges were evaluated, and the impact on civilian radioactive waste management and other related programs was determined. Finally, the total life cycle cost to treat civilian spent nuclear fuel by ATW was estimated

Program Integration

Mission Supporting Goals and Objectives

Program Integration provides management support and program integration to the Program Director, the Yucca Mountain Site Characterization Project, and the Waste Acceptance, Storage and Transportation Project. Program Integration is comprised of the Office of Quality Assurance, Program Management and Human Resources and Administration. These offices are responsible for Program planning and management, Program integration, regulatory coordination, quality assurance, institutional activities, resources and information management, and international waste management activities.

Quality Assurance

This Program element identifies and ensures implementation of federally mandated requirements for Nuclear Quality Assurance (QA) applicable to the Civilian Radioactive Waste Management System (CRWMS) program activities related to radiological health and safety and waste isolation. It establishes and maintains a Quality Assurance Program formulated to ensure quality in activity planning and performance, thereby ensuring quality of the end-products. Documented compliance with these quality requirements establishes confidence in the effective implementation of the CRWMS program to support the execution and eventual licensing and/or certification of high-level nuclear waste operation activities.

Activities associated with the QA function, while performed by personnel not associated with the performer organization (NRC independence requirements), are directly related to the acceptability of the technical products and services provided by the performer organization. Before technical products and services can be deemed acceptable, reviews, audits, and surveillance (as appropriate) by the QA organization must be performed. QA is not an administrative function, but rather a necessary step (per NRC regulation) to assure technical acceptability such that we are confident in fulfilling our mission to protect the public, workers, and the environment. To maintain the high level of objectivity necessary to satisfy NRC requirements, the contractor support relied upon by the QA function must be independent of the Program's principal site investigators. The QA element achieves this independence by utilizing support service contract personnel who are independent of the Program's Management and Operations contractor. For this reason, all QA funding is displayed in the Program Direction element, and not in the budget elements where the substantive QA work is performed.

System Integration

The Systems Integration unit ensures development of an integrated waste management system, i.e., that the acceptance and transportation services component is compatible with the repository and waste package design activities and performs as a coordinated single system that meets mission requirements, and is safe, efficient, reliable, and cost-effective. This element coordinates policy, interprets technical requirements, and manages Program requirements documents. It maintains current descriptions of the overall waste management system, its components, and interfaces to enhance communication among parties responsible for individual system components assuring smooth flow at

interfaces. The unit operates and maintains the program-wide Configuration Information System (CIS) to track changes to baselined and controlled documents.

This element leads and coordinates interface activities with other Departmental organizations, including: Environmental Management (EM), Fissile Materials Disposition (MD), Nuclear Energy (NE), and Naval Reactors (NR). It also evaluates and defines criteria for acceptance of other waste forms for disposal; facilitates and implements Memoranda of Agreement (MOA) with Departmental waste generators; and identifies and assigns technical interfaces to appropriate Program elements.

The Systems Integration unit provides support and strategic planning assistance to the project offices and to the Director. This unit annually determines the adequacy of the fee charged to generators of commercial Spent Nuclear Fuel (SNF), in accordance with the Nuclear Waste Policy Act of 1982. Periodically, the Department's recommendation requires the conduct of Total System Life-Cycle Cost (TSLCC) analyses to support the determination of whether program revenues are sufficient to cover the cost of the program. Additionally, this unit conducts systems studies, tradeoff studies, sensitivity studies, and contingency analyses to ensure that the system-wide impacts of proposed changes are considered and alternative or contingency system configurations and concepts are evaluated.

Regulatory Integration

The mission of the Regulatory Integration unit is to ensure that the activities leading to the final waste management system, including commercial and Department-owned nuclear materials, are consistent with the regulatory guidance provided by the governing authorities. Regulatory activities include helping to ensure that project activities are consistent with Departmental policy and environmental impact statements for other Department programs. The focus is on plans and strategies for compliance with applicable statutes and regulations. The approach to accomplishing this mission is to conduct regulatory reviews, and continue interactions with several external oversight agencies, including the Nuclear Regulatory Commission (NRC), Environmental Protection Agency (EPA), and Nuclear Waste Technical Review Board (NWTRB). Interactions include addressing management and technical issues related to the repository project, interim storage, and transportation of spent fuel and high-level waste. Interactions with the NRC on licensing issues are critical to the success of the overall program schedule because they directly impact the NRC licensing process for program activities and facilities.

Strategic Planning

This element supports the Director's program planning requirements by integrating policy direction received from the Administration, Congress, and the Office of the Secretary into an overall program strategy. It provides resources for Program compliance with Departmental obligations resulting from the Government Performance and Results Act of 1993 and the Government Management Reform Act of 1994, including the DOE Strategic Plan, Annual Performance Plan, and Annual Performance Report, and supports the development and maintenance of multi-year and annual planning documents. This element also provides funding for responses to program inquiries, interface requirements with external program oversight parties and liaison activities with other related offices and programs with the Department.

International Waste Management

This activity keeps the Program abreast of international developments and new ideas, and affords the opportunity to influence international opinion and direction on strategies for disposition of nuclear materials. This unit assists in preparing for bilateral meetings and provides the Program's inputs to various international fact and information books.

Program Management

The key components of this element are business and management center planning, formulating and executing budgets and annual work plans, and establishing Program- and project-level cost, schedule, and technical baselines. Program Management provides the basis for: determining, prioritizing, and allocating Program resources; defining, costing, and executing work scope and schedules; and monitoring, analyzing, and improving Program performance.

Human Resources and Development

This activity supports the quality assurance training program at Headquarters and the review of quality assurance procedures impacting training and personnel verification activities.

Audits, Education and Information

This element encompasses diverse activities that support the Program's mission, including compliance with legislative requirements to develop and submit an Annual Report to Congress, develop and submit financial statements to the Department's Chief Financial Officer, develop and submit the Annual Assurance Memorandum to the Secretary, and develop and submit to Congress, OMB and GAO, Departmental responses to recommendations in GAO and DOE IG audit reports. Implementation of an appropriate investment strategy and the prudent management of the Nuclear Waste Fund investment portfolio are essential to fulfilling the Program's fiduciary responsibility under the Nuclear Waste Policy Act. Public information and education activities conducted by the National Information Center support the Nuclear Waste Policy Act objective of keeping the public informed of Program activities, and assist in building customer, stakeholder, and public confidence in and support for the Program. The Program's Historically Black Colleges and Universities Undergraduate Scholarship Program and Radioactive Waste Management Graduate Fellowship Program support the Department's compliance with Executive Order 12677 and the Secretary's science education initiative, as well as ensuring that the Program's future need for a diversified workforce of highly specialized scientists and engineers will be met.

Information Management

This activity encompasses the strategic application of information technology to: support the accomplishment of the Program's mission by providing integrated information systems, solutions and services that enhance the productivity of human resources, drive business process improvement efforts, reduce overall Program costs, and support "reinventing government" and Departmental strategic alignment initiatives. Information management activities include designing and developing information systems; providing a reliable infrastructure for effective and timely access to, and

communication of, information; ensuring integration and integrity of technical, regulatory, management, and financial information; streamlining of Program work processes through automation to reduce the paperwork burden and increase the productivity and job satisfaction of human resources; and promoting an organizational culture based on proactive planning, compliance with Federal and Departmental regulations, and responsiveness to Program dynamics; and supporting the collection and storage of records required for licensing.

Funding Schedule

FY 1998	FY 1999	FY2000

Program Management and Integration

Systems Integration

- Revise the CRWMS Program baseline to incorporate updated policies, Administration/Congressional direction, and requirements, such as incorporation of plutonium waste forms.

(dollars in thousands)

	FY 1998	FY 1999	FY2000
▪ Support the development of Project technical baseline and interface control documentation. Establish initial technical, cost, and schedule baseline for CRWMS through repository closure. Update Total System Description for the Program. Coordinate Program-level System Integration Design Reviews.			
Systems Analysis			
▪ Update CRWMS Total System Life Cycle Cost estimate and Report on Fee Adequacy to be consistent with repository License Application design and acceptance and transportation strategies. Conduct, review, and issue systems engineering logistics and waste stream analyses to support Program and project planning and project development. Develop and review cost assumption packages in support of the Total System Life Cycle Cost (TSLCC) analyses; maintain and enhance, as necessary, detailed cost and logistics computer models; and update cost databases.			
DOE Nuclear Materials			
▪ Implement required responsibilities established in the Memoranda of Agreement for acceptance of DOE SNF, DOE HLW, and Navy Spent Fuel. This includes support to the MOA Administrator, issuance of SNF and HLW data needs; development of acceptance capacities for DOE and Navy materials requiring acceptance, transportation, and disposal; establishment of fee payment schedules to ensure appropriate allocation of Congressional Defense Nuclear Waste Disposal Appropriations; and evaluation of credits for tax-payer expenditures which benefited. Develop, review, and publish technical baseline documentation and acceptance criteria for DOE Nuclear Materials, including system engineering requirements documents and interface control documents. Support control and distribution of Program level controlled documents.			
Configuration/Baseline Management			
▪ Monitor project level Baseline Change Control Boards' activities. Provide operations and maintenance support including training for the Program-wide CIS. Provide operations and maintenance support including training for the Program-wide CIS.			
Systems Integration.....	2,719	3,143	3,265

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Regulatory Integration

- Coordinate and participate in interactions with external agencies, such as: the Nuclear Regulatory Commission; the Environmental Protection Agency; and the Nuclear Waste Technical Review Board. These interactions include addressing management and technical issues related to the repository project, interim storage, and transportation of spent fuel and high-level waste

- Coordinate and integrate Program environmental, safety, and health activities to ensure compliance with Departmental directives and policies, EPA standards, NRC licensing requirements, and Occupational Safety and Health Act (OSHA) standards. Major activities include coordination of environmental impact statements from other Departmental Offices involving disposal of spent nuclear fuel, high-level waste and other Department-owned radioactive materials.

- Provide regulatory assessments and integration of storage, transportation, and disposal considerations for waste forms managed by other Departmental offices, such as Environmental Management, Fissile Materials Disposition, and Nuclear Energy (Naval Reactors), to ensure consistency with applicable interim storage, transportation, and repository requirements.

- Analyze proposed regulatory changes to determine impact on the Program and ensure compliance with newly promulgated rules. Provide continued support on emerging regulatory issues that will arise as the projects continue to move forward.

- Support activities leading to issuance of the final rule revising the Department's guidelines for determining site suitability for a repository.

- Support project activities associated with development of the license application plan, including coordination of relevant interactions with the Nuclear Regulatory Commission, Advisory Committee on Nuclear Waste, Nuclear Waste Technical Review Board and Congress.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▪ Provide oversight of and guidance on Program Safeguards and Security activities, including interface with Nuclear Regulatory Commission, Advisory Committee on Nuclear Waste and International Atomic Energy Agency.			
▪ Coordinate Headquarters review and formal approval of the draft and final environmental impact statement and Records of Decision, for a repository at Yucca Mountain. Provide coordination with Nuclear Regulatory Commission on issues related to the environmental impact statement.			
Regulatory Integration	364	763	763
Strategic Planning			
▪ Provide liaison with the Nuclear Waste Technical Review Board to address and resolve technical issues associated with site suitability activities. Provide technical, graphics, layout and editorial support in updating Program planning documents. Manage the Memorandum of Agreement with the U.S. Geological Survey for provision of analytical and technical support.			
Strategic Planning	1,026	1,127	1,208
International Waste			
▪ Assist in preparing for cooperative bilateral meetings and Nuclear Energy Agency Radioactive Waste Management Committee Meetings. Provide input to International Nuclear Waste Management Fact Book and update the Foreign Waste Management Programs Information Book.			
International Waste	277	313	313

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Program Management			
▪ Improve program and project management systems. Finalize the integrated management policy document, and implement new policies accordingly. Support implementation of improved Departmental management policies			
Program Management	663	663	711
Subtotal, Program Integration	5,049	6,009	6,260
Human Resources and Administration			
Human Resources Development			
▪ Update course outlines, instruction guides and lesson plans for quality assurance training; develop training courses for new Administrative Procedures or Headquarters Local Procedures approved by the Office of Quality Assurance; and assist in the review of quality assurance procedures and documents that impact the training and personnel qualifications program. Assist in responding to Corrective Active Reports, Deficiency Reports, and the Quality Assurance Management Assessment. Purchase needed supplies, non-computer equipment, publications, and services.			
Human Resources Development	90	89	93
Audits, Education and Information			
▪ Produce reports and other documents required by Congress or the Department, such as the Program's Annual Report to Congress, audited financial statements, annual Federal Manger's Financial Integrity Act (FMFIA) reports, responses to General Accounting Office (GAO) and DOE IG audit recommendations, and Freedom of Information Act (FOIA) requests. Manage the Nuclear Waste Fund investment portfolio by providing monthly investment instructions to the CFO for implementation. Comply with executive orders and support the Department's education initiatives by conducting a Historically Black Colleges and Universities (HBCU) Undergraduate Scholarship Program and the Radioactive Waste Management Graduate Fellowship Program. Provide Program information to customers/stakeholders/public through the			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Program's Home Page, direct responses to public inquiries and *The OCRWM Enterprise*, a semiannual newsletter.			
Audits, Education and Information	1,162	1,149	1,195
Information Management			
▪ Maintain existing information systems and networks. Validate Information Management (IM) Strategic Plan; revise/update IM Multi-Year Program Plan; develop integrated IM Annual Planning Guidance; conduct IM short-range planning and integrated IM budget planning.			
▪ Provide essential user support, training, Help Desk support, and records processing services.			
Information Management	3,562	4,003	4,244
Subtotal, Human Resources and Administration	4,814	5,241	5,532

Total Program Integration	+542

Program Direction

Mission Supporting Goals and Objectives

Program direction provides overall direction and administrative support for the Office of Civilian Radioactive Waste Program to manage and dispose of the Nation's spent nuclear fuel and high-level radioactive waste.

Program Direction has been grouped into four categories: 1) Salaries and Benefits; 2) Travel; 3) Other Related Expenses; and 4) Support Services.

Salaries and Benefits

This element includes compensation for regular salaries and wages paid directly to federal civilian full-time permanent and other than full-time permanent employees, other payments that become a part of the employee's basic pay rate and other personnel compensation such as overtime, holiday pay and cash incentive awards. Benefits includes payments such as the employer's share of employee retirement, health and life insurance, accident compensation, Federal Insurance Contribution Act taxes, and Federal Retirement Thrift Savings Plan. Benefits also include payments for former employees such as severance pay to employees involuntarily separated, and voluntary separation incentives. This includes payments to the unemployment fund, payments of nine percent of final basic pay to the civil service retirement fund for employees who took the early-out or buy-out authority, and payments to the Employees health benefits fund for annuitants.

Travel

This category provides funding for the transportation of Government employees, their per diem allowances while in authorized travel status, and other expenses incidental to travel that are to be paid by the Government either directly or by reimbursing the traveler.

Other Related Expenses

Other related expenses includes funding for building maintenance, rents, communications, utilities, computer/video support, printing and graphics, photocopying, postage, and supplies. The Working Capital Fund was established in FY 1997 by the Office of Human Resources to allocate the cost of common administrative services to the recipient organizations. Activities included in the Working Capital Fund include automated office support, telephone services, postage, printing and graphics, supplies, photocopying, building occupancy, contract closeouts and contract audits.

Support Services

Support Services include the following:

Environmental Impact Statement Technical Support – Specific technical scope for the Environmental Impact Statement contractor includes preparing the draft and final Environmental Impact Statements

using technical data developed by OCRWM and the Management and Operating contractor; and supporting public hearings.

The Nuclear Waste Policy Act, 1982, as amended, required that an Environmental Impact Statement be developed in accordance with the National Environmental Policy Act for inclusion in the Site Recommendation Statement.

The Environmental Impact Statement will evaluate three alternatives to help estimate the potential impacts of the proposed repository. These alternatives are based on how much heat the waste packages will generate once inside the repository and how this heat will be distributed (i.e., thermal load). Each assumption will reflect differences in the size of the subsurface repository, as well as the layout or configuration of the drifts and the spacing between them. These alternative conditions, in turn, will affect the prediction of the repository's long-term performance.

Quality Assurance Technical Support – Provide support in: complying with NRC requirements, developing and maintaining the OCRWM Quality Assurance Requirements and Description (QARD), developing Quality Assurance procedures, maintaining QA databases, developing and conducting OCRWM QA training and maintaining QA training records. Conduct audits, surveillance, on-site inspections, tests, and reviews of participant and vendor activities.

Support continued revisions to the Technical Baseline and continue the overview of DOE/Environmental Management production runs for acceptance of defense vitrified waste and DOE/Environmental Management qualification of Spent Fuel Site quality assurance programs.

Support the Waste Acceptance Storage and Transportation (WAST) Program element non-site specific design and engineering for an Interim Storage Facility (ISF) and issuance of draft RFP for Transportation, Storage Module, and Waste Acceptance services.

Support system integration, engineering activities, and continue to support EM vitrification and DOE and Navy owned spent fuel activities.

Management & Technical Support Services Provides an independent technical review capability of the work accomplished by the DOE National Laboratories and the management and operations contractor conducting the characterization of Yucca Mountain and the design and licensing of the potential geologic repository. Technical support services include the review and analysis of technical studies and papers and regulatory documents and reports, such as contractor deliverables, the Viability Assessment, Site Recommendation, and License Application. Facilitates independent peer reviews of plans, processes, and predictive models. Provides construction support services to review and analyze the designs and documents supporting licensing and construction. Provides Management services including independent analysis of the managing and operating contractor work plans, schedules and cost estimates.

Specific technical expertise required by OCRWM include environmental, safety and health; NEPA statutory requirements; licensing and NRC statutory framework; design, engineering, design analyses, design basis documents, and process models; scientific programs relating to geology, hydrology, rock mechanics, tectonics, and performance assessments; operations and construction; and project control; procurement analysis, and information management.

Automated Data Processing Support - Provide services to assist in the operation and management of the Office of Civilian Radioactive Waste Management communications network and computer facilities, including Web page development, computer hot line and help desk support, software and hardware installation and maintenance, and early evaluations of enhanced software.

Quality Assurance Management Assessment - Assists OCRWM in the annual quality assurance management assessment to comply with NRC licensing regulations.

Department of Energy Support Services - Provide automated data processing support services for Headquarters.

Technical Analysis Support Services- Provide analysis of spent fuel projections.

Administrative Support Services - Provide administrative services to the Yucca Mountain Site Characterization Office, including coordination of mail, correspondence, records submittal, office supplies, and facilities management services.

Defense Nuclear Waste Disposal

Defense Nuclear Waste Disposal

Proposed Appropriation Language

For nuclear waste disposal activities to carry out the purposes of Public Law 97-425, as amended, including the acquisition of real property or facility construction or expansion, [$189,000,000] *$112,000,000* to remain available until expended. *Further, for the foregoing purposes, $190,000,000, to become available October 1, 2000 to remain available until expended.*

Explanation of Change

The Budget requests that an additional $39 million be provided from $85 million in unobligated balances remaining from the FY 1996 Defense Nuclear Waste Disposal Appropriation (Public Law 104-46) and transferred to the Nuclear Waste Disposal account in FY 2000.

Defense Nuclear Waste Disposal

Program Mission

The goal of the Defense Nuclear Waste Disposal Program is to dispose of high-level waste generated from atomic energy defense activities. The primary focus of this program is to find a long term geological repository for Defense Nuclear Waste. This effort supports the Yucca Mountain Site Characterization Project and the Waste Acceptance Storage and Transportation (WAST) Project, which are described in detail in the Nuclear Waste Fund Budget Request.

Funding Profile

a Includes Financial Assistance to the State of Nevada, and Affected Units of Local Government and includes funding for contracts administered in Nevada (i.e. Management and Operating Contractor, USGS, National Academy of Science, Universities, etc.)

Site Description

Argonne National Laboratory

In support of Design and Engineering, Argonne National Laboratory conducts waste form testing. The laboratory is also the custodian for new spent fuel approved test material.

Lawrence Berkeley Laboratory

In support of Core Science, Lawrence Berkeley National Laboratory conducts Unsaturated Zone flow and transport modeling, thermal hydrologic modeling activities, geophysics testing, and supports Drift Scale testing. LBNL also performs the seepage tests in the exploratory studies facility alcoves and niches. LBNL supports the abstraction activities needed to conduct the Total System Performance Assessment in support of Site Recommendation and Licensing Application.

Lawrence Livermore National Laboratory

In support of Core Science, Lawrence Livermore National Laboratory conducts experiments and modeling activities needed for the repository design and to predict responses of the engineered and natural barrier systems to the heat generated by radioactive waste. The experiments include the Single Heater and Drift Scale tests in the ESF, the proposed heater tests in the Cross drift, and the Large Block test on the Fran Ridge at the site. In support of Design and Engineering, LLNL conducts testing and modeling of the waste package environment, waste package materials and waste forms. LLNL also supports the abstraction activities needed to conduct Total System Performance Assessment in support of Site Recommendation and Licensing Application.

Sandia National Laboratory

In support of Core Science, Sandia National Laboratories conducts in-situ monitoring in the Exploratory Studies Facility and in the East-West drift, and performance confirmation testing. The laboratory conducts geoengineering and rock mechanics studies, and backfill analyses in support of Design and Engineering. The laboratory also supports Suitability/Licensing and Performance Assessment with performance assessment modeling.

Los Alamos National Laboratory

In support of Core Science, Los Alamos National Laboratory conducts geochemistry, mineralogy, and colloid transport studies. LANL conducts laboratory – and field-scale transport tests, including the Busted Butte Transport Test, and develops radionuclide transport models for the unsaturated and saturated zone groundwaters at the site. LANL corroborates with USGS on isotopic and groundwater chemistry investigations needed for transport models. In support of Operations/Construction, the laboratory coordinates testing at the Yucca Mountain site, including testing in the ESF. LANL also supports the abstraction activities needed to conduct Total System Performance Assessment in support of Site Recommendation and Licensing Application.

Nevada Test Site

In support of Core Science and Operations/ Construction at the Yucca Mountain Site, the Nevada Test Site, through Bechtel Nevada, provides NTS common site support such as: logistics, fire protection, security, emergency medical services, roads/grounds maintenance, environmental operations, vehicle/construction equipment maintenance, facility maintenance, bus transportation, janitorial and refuse services, and power usage.

Nevada Operations Office

In support of the Yucca Mountain Project and the OCRWM Program Direction, the Nevada Operations Office administers disbursement of External Oversight and PETT funds to affected units of government, and also administers contracts/agreements with: TRW Environmental Safety Systems as the OCRWM Management & Operating (M&O) contractor, the United States Geological Survey, the National Academy of Sciences, the University and Community College System of Nevada, Atomic Energy Canada Limited, Jason Technologies Corporation, Alpha Services , Science Applications International Corporation, Bechtel Nevada , and Wackenhut Services, Inc.

Yucca Mountain Project Office in Nevada

The Yucca Mountain Project Office in Nevada has the primary responsibility for the characterization of the Yucca Mountain site, and if the site is suitable, for preparing and submitting a license application to the Nuclear Regulatory Commission for construction of the repository. As the future owner and licensee of the repository, DOE develops and implements policies and strategies for the work to be completed and oversees the management and operating contractor and the United States Geological Society in performing this work. YMSCO manages the contracts for the management and operating contractor and the support services contractors for work at Yucca Mountain.

Site characterization and license preparation activities include developing and conducting surface-based and underground data collection and testing; design of the repository and waste package subsystems; developing and implementing environmental, safety and health policies; preparing the environmental impact statement; interacting with oversight and regulatory groups; and providing the necessary management and site infrastructure to support these activities.

Oak Ridge National Laboratory

In support of Design and Engineering, the Oak Ridge National laboratory provides support in analyzing commercial reactor criticality data, radiochemical assays and uncanistered fuel design. The laboratory also provides technical support for the disposal criticality topical report, thermal/neutronics model and criticality analysis process report.

Pacific Northwest Laboratory

In support of Design and Engineering, the Pacific Northwest Laboratory provides waste form testing support.

Departmental Administration

Proposed Appropriation Language

For salaries and expenses of the Department of Energy necessary for departmental administration in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101 et seq.), including the hire of passenger motor vehicles and official reception and representation expenses (not to exceed $35,000), [$200,475,000] *$240,377,000*, to remain available until expended, plus such additional amounts as necessary to cover increases in the estimated amount of cost of work for others notwithstanding the provisions of the Anti-Deficiency Act (31 U.S.C. 1511 et seq.): *Provided*, That such increases in cost of work are offset by revenue increases of the same or greater amount, to remain available until expended: *Provided further*, That moneys received by the Department for miscellaneous revenues estimated to total [$136,530,000] $116,887,000 in fiscal year [1999] 2000 may be retained and used for operating expenses within this account, and may remain available until expended, as authorized by section 201 of Public Law 95-238, notwithstanding the provisions of 31 U.S.C. 3302: *Provided further*, That the sum herein appropriated shall be reduced by the amount of miscellaneous revenues received during fiscal year [1999] 2000 so as to result in a final fiscal year [1999] 2000 appropriation from the General Fund estimated at not more than [$63,945,000] $123,490,000. *(Energy and Water Development Appropriation Act, 1999.)*

Departmental Administration

Executive Summary

Support the Departmental Mission

The Departmental Administration Appropriation (DA) funds eleven Department of Energy headquarters offices which provide guidance and support benefitting all operating elements of the Department in such areas as human resources, administration, accounting, budget, legal services, information management systems, life cycle asset management, workforce diversity, policy, congressional liaison, public affairs and contract reform. Their mission is to provide internal and external customers with timely, quality service which facilitates achievement of the Department's goals

Reinventing Government

This account has undergone radical changes during the last five fiscal years; realizing a 32% decline in federal employment from 1,920 (including the Office of the Secretary) in FY 1995 to 1,297 proposed in the FY 2000 budget. At the same time, the Department has implemented initiatives designed to streamline and provide essential products and services in a more efficient manner One example of such an initiative is the effort to consolidate the Department's accounting operations; reducing from nineteen centers scattered across the United States, to three centers of excellence, the largest of which is at DOE headquarters Another example is our effort to consolidate our office space and reduce the number of separate buildings housing DOE headquarters personnel.

Vital Functions Performed

Despite these reductions the Department stands ready to provide essential services to its mission programs, as well as serve the Secretary of Energy and protect taxpayer interests. The following highlights are provided to outline the remaining critical functions and essential services provided by this account. These vital services include:

- Performing strategic planning and implementing management reforms like the Government Performance and Results Act.
- Planning to maximize the value of Departmental assets and revenue from the sale of assets.
- Cooperating with International Energy Consortiums and Interagency review of policies that affect Department of Energy concerns.

- Facilitating communication between the Department and Congress, the Executive Office, State and Local Governments and the public.
- Performing financial and accounting functions including producing audited financial statements.
- Fulfilling the Department's budget mission in terms of timely formulation and oversight of program execution (overhead and uncosted balances)
- Providing effective and timely legal services, counsel, and support to Departmental elements.
- Representing the Department before Federal, State, and other Governmental Agencies and Courts.
- Protect our Intellectual Property associated with patents, invention disclosures, and waiver requests.
- Acting as an honest broker for the Secretary among competing programmatic elements.
- Processing procurement and personnel actions.
- Developing and maintaining Corporate Information Systems and Communication Technology.
- Ensuring the success of the Working Capital Fund by supplying products and services throughout the Department.
- Promoting diversity within the entire Department and throughout the program areas affected by our decisions (including economic impact).

A strong corporate vision helps set the proper priorities to ensure that a program which succeeds in its goals will not fail in its mission. These offices provide a strong internal mechanism to focus program efforts on corporate goals. This is the optimal method of fulfilling our obligations to those who rely on the mission of the Department of Energy.

Program Overview

DOE programs funded in this appropriation are: Office of the Secretary, Policy and International Affairs, Chief Financial Officer, Management and Administration, Congressional and Intergovernmental Affairs, Public Affairs, Field Management, General Counsel, Economic Impact and Diversity, Board of Contract Appeals and Contract Reform and Privitization. Federal support

functions include planning and national and international energy policy analysis, environmental policy, budget, accounting, legal, personnel, labor relations, staffing, organizational management, logistical services, printing, information management, contract management and reform, quality management, personal property management, scientific and technical training, congressional liaison, public and consumer outreach, economic impact and diversity, and contract dispute adjudication Funding includes Departmental Administration employee travel and training, budget and accounting systems, logistical services, automated data processing development and acquisition (non-program specific), equipment maintenance, civil rights, each Departmental Administration sub-program's share of the working capital fund, and capital equipment. Also funds energy and environmental policy studies, public service announcements, newswire services, minority education/business/community support and assistance, and Department-wide technical training development.

Cost of Work for Others

The budget provides for the cost of products and services provided by the field offices and national laboratories for non-DOE users. Work results from revenue programs related to the budgeted mission of DOE or is reimbursable work for state and local entities which are precluded by law from making advance payments Costs are offset with revenues received from the sale of products or services

Revenues

The revenues associated with the Cost of Work for Others program support the products and services described above. Miscellaneous revenues come from the sale of by-products that have no cost associated with the Departmental Administration appropriation, but offset the appropriation.

Budget Overview

The FY 2000 request provides $4.9 million for 40 full time equivalents within the Office of the Secretary, and $3.2 million for seven full time equivalents within the Contract Reform and Privitization Office. This request also provides $112.1 million for related salary and benefit expenses for 1,257 full-time equivalent employees for the other organizations within the Departmental Administration Account. The request includes $3.5 million for travel funding, $71.2 million for contractual support, and $18.6 million for program support. Cost of Work for Others and Revenues are budgeted at $34.0 million and $116.9 million, respectively. There is a FY 2000 Base Request of $13.0 million for the Corporate Information Management Program within program support. In addition, a total of $7.1 million of prior year balances are being utilized in FY 2000 to offset program level for salaries and benefits ($.5 million) and cost of work ($6.6 million). The net appropriation request is $123.5 million

Office of the Secretary

Mission Supporting Goals and Objectives

The budget submission for the Office of the Secretary provides the Federal staffing resources and associated costs required to provide overall policy direction for the Department of Energy in fulfilling its mission to foster a secure and reliable energy system that is environmentally and economically sustainable, to be a responsible steward of the Nation's nuclear weapons, to clean up our own facilities, and to support continued United States leadership in science and technology.

Program Goal

Provide leadership to ensure the coordination of the Department of Energy's efforts through:

- *Energy Resources* to promote secure, competitive, and environmentally responsible energy systems that serve the needs of the public.
- *National Security* to maintain the Nation's security, promote international nuclear safety, and reduce the global danger from weapons of mass destruction.
- *Environmental Quality* to aggressively clean up the environmental legacy of nuclear weapons and civilian nuclear research and development programs, minimize future waste generation, safely manage nuclear materials and permanently dispose of the Nation's radioactive wastes.
- *Science and Technology* to deliver the scientific understanding and technological innovations that are critical to the success of DOE's mission and the Nation's science base.
- *Corporate Management* to demonstrate organizational excellence in the Department's environment, safety and health practices, communication and trust efforts, and corporate management systems and approaches.

Program Objectives

- Assure adequate and diversified supplies of energy, reduce U.S. vulnerability to disruptions in energy supplies, expand the efficiency and productivity of energy use while limiting environmental impact, and support U.S. energy, environmental and economic interests in global markets.
- Effectively support and maintain a safe, secure, and reliable enduring nuclear weapons stockpile without nuclear testing, replace nuclear testing with a Stockpile Stewardship Program, ensure the vitality of the Department's national security enterprise, reduce nuclear weapons stockpiles and the proliferation threat caused by the potential diversion of nuclear materials, continue leadership in policy support and technology development for international arms control and nonproliferation efforts, and improve international nuclear safety.

- Protect public health and the environment by reducing the environmental, safety, and health risks and threats from DOE facilities and materials, safely and expeditiously dispose of waste generated by nuclear weapons and civilian nuclear research and development program, and develop the technologies and institutions required for solving domestic and global environmental problems.

- Utilize the unique scientific and technological resources of our laboratories and universities to maintain leadership in basic research, increasingly focus applied research and technology development in support of the Department's other business lines, and maintain world technical leadership through long-term systemic reform of science and mathematics education.

- Demonstrate organizational excellence in our environment, safety and health practices, and build communication and trust by delivering on our commitments to Congress, the Administration, stakeholders and customers.

- Provide a safe and rewarding workplace that is recognized for business excellence, and managerial and scientific creativity.

Performance Measures

The Office of the Secretary, through its leadership of the Department, will continue to advance U.S. energy, environmental, economic, and national security. This office will oversee the Department's strategies, commitments, and performance goals outlined in the Department's Strategic Plan, the Performance Agreement between the Secretary and the President, and the Department's Annual Performance Plan.

Significant Accomplishments

Significant accomplishments for the Department are provided in each DOE Program budget submittal.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change
Salaries and Benefits	3,717	4,194	4,400	206

FTEs	28	37	40	3

[a]The Office of the Secretary plans to use $825,000 of carryover balances to support FY 1999 Operations.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Salary and Benefits provide funding for staff in the Office of the Secretary, Deputy Secretary and the Under Secretary to cover salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, performance awards, and benefit payments. The Office of the Secretary provides leadership and guidance to the Department's programs which contribute to the Nation by providing technical information and a scientific and educational foundation to achieve: efficiency in energy use, diversity in energy sources, a more productive and competitive economy, improved environmental quality, and a secure national defense. . .	3,717	4,194	4,400
Travel			
The FY 2000 travel request provides funding for the Secretary, Deputy Secretary, Under Secretary, and special assistants to travel both internationally and domestically in support of the Department's missions. Beginning FY 2000, travel costs for the Secretary's security detail will be financed by the Office of Nonproliferation and National Security.	400	800	534
Other Related Expenses			
Other Related Expense provides funding for employee training and development.	6	6	6
Total, Program Direction.	4,123	5,000	4,940

Explanation of Funding Changes FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Salaries and Benefits	
■ Increase in salaries and benefits associated with the full effect of the FY 1999 pay raise and the partial effect of the FY 2000 pay raise and general pay increases for promotions, within grade increases, and performance awards.	+206
Travel	
■ The travel budget increases slightly to reflect additional travel associated with the Deputy Secretary and the Under Secretary, offset by moving the costs of security related to the Secretary to the Office of Nonproliferation and National Security.	-266
Total Funding Change, Program Direction	-60

Management and Administration

Mission Supporting Goals and Objectives

This budget submission covers the Office of Management and Administration and the Secretary of Energy Advisory Board. The Office of Human Resources and Administration was renamed the office of Management and Administration to reflect more accurately the broad management responsibilities of the office.

The Office of Management and Administration works in partnership with our customers to support the Department of Energy by providing effective corporate management systems and business practices while enhancing the effectiveness and well-being of our employees. We will provide best value, high quality, and timely products and services in the areas of administrative services, human resources and training, information management, corporate performance excellence, procurement assistance, and executive secretariat support.

The Office of the Secretary of Energy Advisory Board administers and coordinates the activities of the Secretary of Energy Advisory Board (SEAB), an external advisory board chartered under the Federal Advisory Committee Act of 1972 (Public Law 92-436). The Board and its subcommittees are the most effective means for the Secretary of Energy to obtain timely, balanced, and independent external advice on issues of national importance related to the missions of the Department of Energy. In FY 1998, five subcommittees conducted open public meeting and reported recommendations to the Board and, in turn, the Secretary of Energy. These subcommittees were: (1) Openness Advisory Panel (ongoing); (2) Laboratory Operations Board (ongoing); (3) Electric System Reliability Task Force (completed in FY 1998); (4) Tennessee Valley Electric System Advisory Committee (completed in FY 1998); and (5) Education Task Force (completed in FY 1999). In addition, the Board plans to establish one or more additional subcommittees in FY 1999.

Program Goal

To continue as a proactive and flexible service team dedicated to helping the Department perform its varied missions more effectively. Working in partnership with our customers, we will strive to continually improve our products and services in ways that support their needs.

Program Objectives

- We will create and maintain efficient corporate management systems that assist the Department of Energy in the accomplishment of its mission.
- We will provide best-value products and services to our customers.
- We will be recognized by our customers as being a Quality organization by emphasizing customer and employee satisfaction, and improved partnerships.

- We will enhance the effectiveness, well being, and satisfaction of MA employees.

Significant Accomplishments and Program Shifts

Taken together, the Offices of Management and Administration and the Secretary of Energy Advisory Board have supported the Department's efforts to reform and modernize corporate management practices in such diverse and high profile areas as the following:

- Downsizing, strategic alignment, and related human resources initiatives;
- Reengineering Headquarters administrative functions through the Working Capital Fund;
- Contract reform and privatization,
- Information technology advances and resolution of the "Year 2000" issues;
- Openness initiative and reduction of the Freedom of Information Act backlog,
- Modernizing DOE systems for document control, personnel functions, and payroll; and
- Productivity advances through rigorous self-assessment practices.

These advances have been sustained, notwithstanding a major downsizing within these offices. From FY 1993 to the present, Federal staffing has been reduced by over 40% -- double the rate of the overall DOE staffing decrease and 50% faster than DOE headquarters. Concurrently, there has been both a major reduction and reconfiguration of budget resources. Overall, including program "customer" funding (now provided primarily through the Working Capital Fund) MA spending in nominal dollars decreased by almost $50 million from FY 1993 through FY 1997, and real dollar purchasing power decreased by nearly 30% in the same period. Due to creation of the Working Capital Fund for FY 1997 and future periods, the proportion of MA contract dollars that derives from customer decisions quadrupled from 14% in FY 1993 to 56% in FY 1997.

Looking ahead, this budget request is consistent with the following drivers:

- The Department's Strategic Plan (and the MA counterpart thereto);
- The Secretary's Performance Agreement with the President;
- The Secretary's "Workforce 21" initiatives;
- The Department's contract reform objectives
- The milestones for Year 2000 changes in mission critical information systems;
- The Department's FY 1999 appropriation and the FY 1999 Performance Plan associated therewith;
- The November 1998 report to the Congress on the Corporate Management Information Program;
- The Secretary's Openness Initiative; and
- Our December 13, 1998 guidance to customers on Working Capital Fund costs.

Performance Measures

Performance measures for Management and Administration and for the Secretary of Energy Advisory Board are linked to the Department of Energy Strategic Plan, to the performance plan called for by the Government Performance Results Act, and to the Secretary's annual performance agreement with the President. Specific performance measures and their links to the FY 1999 Performance Agreement with the President follow.

External Performance Measures/Accomplishments			
	FY 1998	FY 1999	FY 2000
Use efficient and effective corporate management systems and approaches.	Provided best value, high quality and timely Management and Administration products and services and increased customer satisfaction levels by 5% over the pervious year survey results.	Provide best value, high quality and timely Management and Administration products and services so as to sustain a customer satisfaction level of 90%.	Provide best value, high quality and timely Management and Administration products and services so as to sustain a customer satisfaction level of 90%.
Continue to streamline and improve operations, further reduce overhead expenditures, and facilitate additional workforce reductions while aiding affected employees and communities.	Consolidated Headquarters personnel into six locations by the end of FY 1998 and achieved $3 83 million in savings in rent as forecasted.		
	Achieved staffing level of 10,355 in FY 1998 which was 519 below the end-of-year target of 10,874.	Achieve staffing reduction to meet Departmental target of 10,613 by the end of FY 1999.	Achieve staffing reduction to meet Departmental target of 10,269 by the end of FY 2000.
Improving Human Resource Practices	Established two training centers of excellence and realized $3.1 million in savings.	Improve workforce skills and reduce training costs by implementing the FY 1999 milestones in the DOE Corporate Education, Training, and Development Business Plan.	Improve workforce skills and reduce training costs by implementing the FY 2000 milestones in the DOE Corporate Education, Training, and Development Business Plan.
Improving Human Resource Practices.	Hired 40 welfare to work recipients through the end of FY1998.	Continue hiring welfare to work recipients to achieve the Presidential goal of 55, 40 of whom will be hired by the end of FY 1999.	Continue hiring welfare to work recipients to achieve the Presidential goal of 55 by FY 2000
Ensure that DOE employees are appropriately trained and technically competent commensurate with their ES&H responsibilities	Met the Technical Qualifications Standards requirements and issued a revised Implementation plan for DNFSB Recommendation 93-3.	Improve Federal technical workforce capabilities at defense sites by implementing the FY 1999 milestones of the Revised Implementation Plan for DNFSB Recommendation 93-3.	Improve Federal technical workforce capabilities at defense sites by implementing the FY 2000 milestones of the Revised Implementation Plan for DNFSB Recommendation 93-3.

External Performance Measures/Accomplishments			
	FY 1998	FY 1999	FY 2000
Improving Human Resource Practices	Implement a DOE-wide employee-accessible automated personnel system by December 1998.	Implement a DOE-wide employee-accessible automated personnel system by December 1998.	Increase the electronic transfer of personnel documents through implementation of paperless workflow in CHRIS, reducing personnel paper transactions by 15%.
		Reengineer the DOE awards process for Headquarters On-the-Spot and Special Act awards, and reengineer the Training Administration function.	
Ensuring DOE information systems are based on cost-effective technology solutions	Implemented a five-year information management strategic plan and annual operational plans linked to the budget process.	Develop annual operational Information Management plan linked to the budget process.	Develop annual operational Information Management plan linked to the budget process
	Initiated a Configuration Control Board pilot in Defense Programs.	Continue to improve infrastructure to allow accessing and sharing information easily and seamlessly across the DOE complex.	Continue to improve infrastructure to allow accessing and sharing information easily and seamlessly across the DOE complex.
	Exceeded the Departmental goal by increasing the number of DOE organizations that rely on the Paperless Directives System to 89%.		
	Completed an acceleration plan for all mission-critical systems to achieve Year 2000 compliance by March, 1999.	Implement all FY 1999 milestones for year 2000 changes for mission-essential systems	
Ensuring DOE information systems are based on cost-effective technology solutions.	Completed Corporate Management Information Program (CMIP) report to Congress March 1998.	Develop the Corporate Management Information Program (CMIP) reports to Congress.	Develop the Corporate Management Information Program (CMIP) reports to Congress.

External Performance Measures/Accomplishments			
	FY 1998	FY 1999	FY 2000
Continue to streamline and improve operations, further reduce overhead expenditures, and facilitate additional workforce reductions while aiding affected employees and communities	Achieved $61 million in information technology cost avoidances over five years through improved technology	Achieve $65 million in further cost avoidances in information architecture and large scale procurements Continuously evolve the Department-wide information architecture with supporting standards to foster $100 million in cost avoidances by FY 2003.	Achieve $58 million in further cost avoidance through improved information technology
Improving communications with customers and public.	Significantly improved the World Wide Web Home Pages and totally revamped the DOE Home Page. Visits increased by nearly 40%.	Improve the quality and volume of information on DOE's World Wide Web site and demonstrate user-interest through higher numbers of home page visits each year	Annually improve the quality and volume of information on DOE's World Wide Web site and demonstrate user-interest through higher numbers of home page visits each year. Continue to enhance information security throughout the Department to minimize vulnerabilities and protect the nation's infrastructure.
Use prudent contracting and business management practices.	Major management contracts were converted to performance-based management contracts as extended or competed consistent with objectives. Service contracts converted to performance based contracts consistent with schedule. Automated system to track and measure contractor performance completed and deployed.	Develop fully integrated program of performance objectives and measures for major management contracts consistent with DOE performance based management concepts. 100% of the Department's M&O/M&I contracts will conform to the DOE Contract Reform objectives	
		Converting all management and operating contracts awarded in FY 1999 to performance-based management contracts.	Converting all management and operating contracts awarded in FY 2000 to performance-based management contracts.

External Performance Measures/Accomplishments			
	FY 1998	FY 1999	FY 2000
Use prudent contracting and business management practices.	Comprehensive review of Department of Energy Acquisition Regulations for management and operating contracts completed. Agenda for FY 1999 modifications completed.	Modify Department of Energy Acquisition Regulations to comport with the results of the review Award 50 percent of all management and operating contracts including 3 M&O contracts that will change to Federal Acquisition Regulation contracts during FY 1999 using competitive procedures.	
	Contracting workforce development program completed.	Expand professional development and certification programs to acquisition-associated professional fields.	95% of contract professionals will be certified under DOE professional development standards.
	Cycle times for priority procurement process reduced by 30 - 60%. Target met or exceeded	Develop and install electronic procurement systems for paperless procurement action processing, web-enabled past performance database, and electronic commerce system for purchases under $25,000	Maintain and operate electronic procurement systems installed through FY 1999 to accomplish the following: ■ industry interactive procurement processes; ■ electronic procurement system for purchases under $25,000; and ■ paperless procurement action processing system.
		Award 50% of all service contracts in FY 1999 as performance-based contracts.	Award approximately 50% of service contracts as performance-based contracts.
Continue to streamline and improve operations, further reduce overhead expenditures, and facilitate additional workforce reductions while aiding affected employees and communities.	Technical and support service contract obligations reduction target of $610 million exceeded by 20%	Reduce support service contracting obligations below $610 million in FY 1999.	Reduce support service contracting obligations below $610 million in FY 2000.

External Performance Measures/Accomplishments			
	FY 1998	FY 1999	FY 2000
Use efficient and effective corporate management systems and approaches	Implemented DOCS in the Executive Secretariat and one-stop in all program offices. Baselined executive document management cycle-time and responded to customer feedback. Improved customer satisfaction rate for executive document management by 5%.	Implement DOCS to two or more levels in several program offices Monitor executive document management cycle-time, reduce cycle-time by 5% and sustain or improve customer satisfaction rate for executive document management	Continue implementing DOCS to two or more levels in several program offices. Continue monitoring executive document management cycle-time and customer satisfaction to sustain or improve customer satisfaction with executive document management.
	Continued use of DOECAST for Secretary of Energy communication to employees and improved customer satisfaction by 5% based on MA customer survey	Continue high-speed, low cost DOE-wide communication using DOECAST system, measured by estimated cost avoidance and a sustained level of customer satisfaction.	Continue high-speed, low cost DOE-wide communication using DOECAST system, measured by estimated cost avoidance and a sustained level of customer satisfaction.
Improving communications with customers and public	Established electronic FOIA (EFOIA) requirements and implemented EFOIA homepage site that includes on-line access to reading room material, and other DOE records. Published Privacy Act system notice to delete obsolete systems of records. Added two program offices to the centralized requests processing project Reduced backlog of pending requests by 15% and average case age by 15%	Fully implement EFOIA. Reduce backlog of pending requests by 10% and average case age by 15%.	Fully automate FOIA program using corporate solution approach. Continue to reduce backlog by 10% and average case age by 10%.
Improving Managerial Performance and Accountability	Using the Malcolm Baldrige, President's, or Energy Quality Award Criteria, demonstrated continuous organizational improvement by improved self-assessment scores.	Use the Malcolm Baldrige, President's, or Energy Performance Excellence Award Criteria to measure customer satisfaction, employee satisfaction, and the achievement of business results.	Use the Malcolm Baldrige, President's, or Energy Performance Excellence Award Criteria to measure customer satisfaction, employee satisfaction, and the achievement of business results

External Performance Measures/Accomplishments			
	FY 1998	FY 1999	FY 2000
Secretary of Energy Advisory Board			
Improving the management of the laboratories to enhance the delivery of leading-edge science and technology at reduced costs	Continued to assess ways of improving R&D management, reducing R&D management costs, and reducing R&D overhead costs by Completed a study of the missions and effectiveness of the Department's small laboratories and reporting to SEAB; Completed a study of peer review as a means of ensuring excellence in R&D and reporting to SEAB; Updated and analyzed information on laboratory productivity metrics and reporting to SEAB; and Supported the Department's "road map" planning efforts involving program offices and laboratories.	Conduct a review and assessment of the linkage between the Department's missions and programs. Conduct a review and analysis of the Department's planning and management processes and their links to the R&D portfolio. Conduct a review of laboratory performance measures and their appropriateness to laboratory R&D Conduct a review and analyze the effectiveness of contractual and field oversight	Track implementation of recommendations resulting from FY 1999 activities. Identify further refinements to improve cost effectiveness and enhance the contributions of the laboratory system to the Department's missions.
As a good neighbor and public partner, continually work with customers and stakeholders in an open, frank, and constructive manner	Continued to address classification/declassification policy and openness issues by reporting to SEAB on: Assessing document imaging technology to expedite document declassifications; Assessing the use of technology to address key records management issues impacting openness; and Assessing the Department's implementation of the Fundamental Classification Policy Review. Reviewed site-accessibility issues.	Engage representatives from communities in which the Department has facilities in a series of discussions of the Department's role as a neighbor. Report to the Secretary on the status of relations with these communities. Continue to oversee the implementation of openness and classification and declassification policies and procedures by Review and analysis of ways to utilize technology to improve the outputs of declassification and the accessibility of records; and Review and assessment of the Department's implementation of the Fundamental Classification Policy Review and Final Rule (10 CFR 1045 § 1046.6)	Engage representatives from communities in which the Department has facilities in a series of discussions of the Department's role as a neighbor. Report to the Secretary on the status of relations with these communities. Continue to oversee the implementation of openness and classification and declassification policies and procedures.

External Performance Measures/Accomplishments			
	FY 1998	FY 1999	FY 2000
Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact.	Continued to address institutional, technical, and policy issues and contribute to electric system restructuring legislation by developing letter reports on: Technical issues in transmission system reliability; Interrelationships between industry, state, and Federal reliability organizations; Reliability enforcement authorities; Adequacy of generation and support services; Financial incentives for reliability. To be completed in FY 1998.		
Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact.	The Tennessee Valley Electric System Advisory Committee will address the following major topics regarding the Tennessee Valley Authority in their final report: Regulation and Jurisdiction; Mission; Competition. To be completed in FY 1998.		
Ensure the vitality of DOE's national security enterprise by ensuring sufficient scientific and technical personnel.	The Task Force on Education was formed in FY 1998 to advise SEAB on ways to make the Department's scientific, technical and supercomputing capabilities more available to our Nation's schools, colleges and universities, and to provide recommendations on how the Department can best enhance science, technology, engineering and mathematics education in the United States.	Complete the task force final report and submit final recommendations to the SEAB. To be completed in FY 1999.	

External Performance Measures/Accomplishments			
	FY 1998	FY 1999	FY 2000
Deliver leading-edge technologies that are critical to the DOE mission and the nation.		Initiate one of two new Task Forces to assess the key policy and institutional issues critical to the Department's missions, to include: A task Force to review fusion energy technologies, both inertial and magnetic, to assess the appropriate balance among these concepts to provide the scientific basis for an informed selection of the best option for development To be completed in FY 1999	Initiate one of two new Task Forces to assess key policy and institutional issues critical to the Department's missions

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salaries and Benefits	47,017	47,340	49,100	1,760	3.7%
Travel	1,652	1,700	1,665	-35	-2.1%
Support Services	19,000	27,000*	18,000	-9,000	5.9%
Other Related Services	30,488	30,960	32,508	1,548	5.0%
Total, Program Direction	98,157	107,000	101,273	-5,727	-5.4%
Full Time Equivalents	607	598	592	-6	-1.0%

* Includes $10,000,000 in accordance with P.L. 105-277 for emergency expenses related to Year 2000 conversion of federal information technology systems.

Detailed Program Justification

	(dollars in thousands)		
	FY1998	FY1999	FY2000
Salaries and Benefits			
Provides funding in FY 2000 for 592 full time equivalent employees to include salaries, overtime, incentive awards, lump sum leave, SES and other performance awards, payments on behalf of employees for payments to funds such as workman's compensation..	47,017	47,340	49,100
Travel			
Travel funds finance staff travel, Secretary of Energy Advisory Board and subcommittee travel, travel associated with scheduling and logistics for Secretarial trips, and travel associated with permanent change of station. Also included are DOE shuttle bus service, rental of vehicles from the GSA motor pool, lease of DOE fleet, and charter of aircraft or buses.	1,652	1,700	1,665
Support Services			
Support Services finance technical support services and management support services. The areas of support include information resources management, automated data processing, delivery of training, operation of the Headquarters technical and law libraries, database maintenance, and administrative support. Includes $10,000,000 only in FY 1999 for Y-2K efforts.	19,000	27,000	18,000
Other Related Expenses			
Other Related Expenses finance the acquisition of goods and services that support this office's mission that are not considered support services, in addition to items purchased from the working capital fund such as rent, supplies, telephone service, etc.	30,488	30,960	32,508
Total, Program Direction	98,157	107,000	101,273

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ The increase of $1,760,000 primarily reflects the full effect of the FY 1999 pay raise and the partial effect of the FY 2000 pay raise ($1,425,000), plus the full effect in FY 2000 of promotions from FY 1999 plus anticipated promotions in FY 2000 ($335,000)..	+1,760
Travel	
■ Decrease in travel is due to increased in use of alternatives like teleconferencing.	-35
Support Services	
■ Decrease in Support Services is due to a decrease of $10,000,000 appropriated in Public Law 105-277 for Y-2K activities offset by a $1,000,000 increase in activities to improve the Department's infrastructure to accommodate new and upgraded management systems.	-9,000
Other Related Expenses	
■ Increase in Other Related Expenses is for interagency agreements, and computer software and hardware upgrades and replacements.	+1,548
Total Funding Change, Program Direction	-5,727

Support Services

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Management and Administration Program Support

Program Mission

Program Support includes funding for the Scientific and Technical Training Program and the Corporate Management Information Program (CMIP).

The Scientific and Technical Training Program provides DOE-wide training standards and guidelines, and advanced learning technologies, such as automated course catalogues, video and computer training methods, and distance learning Includes funding for coordination and assessment of the implementation of Defense Nuclear Facilities Safety Board training, education, and development recommendations

CMIP, a seven-year, $102 million investment initiative to replace major outdated DOE corporate systems provides a disciplined and cost-effective way to modernize a wide range of DOE business systems in a coordinated manner that reflects use of emerging technologies.

Program Goal

We will create and maintain efficient corporate management systems that assist the Department of Energy in the accomplishment of its mission.

Program Objectives

This program was first funded in FY 1998 and includes the following major corporate initiatives which will continue over the next six years at a planning level of $102 million:

- Corporate Human Resources Information System (CHRIS);
- Corporate Business Management Information System-Financial Management (BMIS);
- Corporate Technology Supported Learning;
- Procurement Systems Modernization,
- Information Architecture, Capital Planning and Investment, and Strategic Information Management; and
- Infrastructure and Telecommunications Improvements.

Funding Schedule

(dollars in thousands)

Program Support	FY 1998	FY 1999	FY 2000	$ Change	% Change
Scientific and Technical Training	500	450	450	0	0.0%
Corporate Management Information	6,000	8,000	13,000	5,000	62.5%
Total, Management and Administration	6,500	8,450	13,450	5,000	59.2%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Scientific and Technical Training			
Implement the FY 2000 milestones of the Revised Implementation Plan for DNFSB Recommendation 93-3; provide DOE-wide training standards and guidelines, advanced learning technologies and continued support for the Federal Technical Capability Program.	500	450	450
Total, Scientific and Technical Training	500	450	450

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Corporate Management Information Program

- **Corporate Human Resources Information System (CHRIS)**
  - Maintain CHRIS in a full production environment for personnel action processing as official personnel system of record.
  - Support the re-engineering of additional human resource services at Headquarters and in the field.
  - Implement additional human resource functions to meet identified needs of stakeholders and customers to assist them in the efficient conduct of their business.
  - Successfully upgrade PeopleSoft HRMS from release 7.0 to release 8.0 (two release upgrade) to ready the system for integrated testing of HRMS and Payroll/Time and Labor.
  - Expand DOE Employee Self-Service to provide additional information and services to employees and managers at the desktop.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

- **Corporate Business Management Information System-Financial Management (BMIS)**
  - Purchase of commercial off-the-shelf core financial system software, minimal implementation and integration services, and training sufficient to support two pilot sites.
  - Acquisition and installation of the hardware and utility software required to support the pilot project.
  - Expansion of the Financial Data Warehouse and the Corporate Executive Information System which will serve as the principal reporting tools for the new system.
- **Corporate Technology Supported Learning (TSL)**
  - A comprehensive assessment of TSL training needs.
  - Infrastructure analysis and design.
  - Purchase and installation of hardware, equipment and net server software.
  - Purchase of network services.
  - conducting system tests.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

- **Procurement Systems Modernization**
  - Industry Interactive Procurement Process involves the electronic issuance of requests for proposals to offerors, offeror submission of proposals, electronic distribution and evaluation of those proposals, and interactive communication with offerors during the negotiation process
    - Complete testing at Headquarters, including testing with volunteer companies.
    - Registration of companies within the system.
    - Training of Federal personnel Department-wide
    - Development of DOE wide requirements.
    - Programming changes to meet DOE wide requirements.
    - Installation and testing a selected field offices.
    - Roll out to major procurement offices.
  - Electronic Procurement System for purchases under $25,000 - this integrated, Web-based operational electronic simplified acquisition system allows users to request to purchase goods, secure supervisory approvals, commit funds, issue solicitations and /or orders to vendors, and approve invoices for payment.
    - Continue to roll out system to DOE procurement offices and Headquarters staff offices, which involves system set up and training of Federal personnel.
    - Operate the system Department wide, involving maintenance of the DOE gateway and hub through which all communications travel, and continual vendor registration in system.
    - Modify the system as users identify enhancements needed.
    - Complete the programming, testing and implementation of the invoice approval process.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ Paperless procurement action processing system involves the electronic creation of a procurement request, for actions over $25,000, by a program office, routing for approvals, securing funding commitments, and transmitting the procurement request to the procurement office.			
– Complete development, testing and implementation at Headquarters with EE.			
– Identify and train other Headquarters offices and install and test system with those offices.			
– Maintain and operate the system.			
– Develop DOE wide requirements.			
– Programming changes to meet DOE wide requirements.			
– Installation and testing at selected field offices.			
– Roll out to field offices.			
■ **Information Architecture, Capital Planning and Investment and Strategic Information Management**			
▸ Conduct cross program/site architectural analysis and updates to the Departmental Information Architecture.			
▸ Continue implementation of the Departmental Capital Planning and Information Technology Investment process at a slow pace.			
▸ Conduct one Strategic Information Management process.			
■ **Infrastructure and Telecommunications Improvements**			
▸ Continue network upgrades and work on priority projects to bring our telecommunications infrastructure up to required level complex-wide and strengthen the security of this critical component of the infrastructure.			
Total, Corporate Management Information Program	6,000	8,000	13,000
Total, Management and Administration	6,500	8,450	13,450

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Corporate Management Information Program	
■ Increase in Corporate Management Information Program is due to contractual requirements for the on-going development of the Business Management Information System	+5,000
Total Funding Change, Management and Administration	+5,000

Chief Financial Officer

Mission Supporting Goals and Objectives

Mission Statement: ***The mission of the Department of Energy's financial management community is to administer the Department's financial operations and to ensure their integrity.***

Functional Responsibilities

The Office of Chief Financial Officer (CFO) provides centralized direction and oversight of the full range of financial activities including: responsibility for the Department's budget formulation, presentation and execution; Department-wide oversight of the requirements of the Federal Managers' Financial Integrity Act (FMFIA); Departmental accounting and financial policies, procedures and directives; operation and maintenance of the Department's payroll system and financial information system/Standard General Ledger; and, performance of financial management functions (accounting, cash management, and reporting). In addition to these Department-wide responsibilities for Headquarters offices, the CFO performs selected financial management functions for field locations; provides oversight of financial operations for the Naval Petroleum Reserves in California and Wyoming; and acts as an Accounting Service Center for six DOE offices. The CFO is also responsible for financial performance based oversight activities within the Department. In all, this office supports the financial needs of a $17 billion enterprise with 16,800 federal employees and 105,000 contractor employees.

Strategic Plan

The CFO Strategic Plan presents a vision of the Department of Energy as a leader in the field of financial management, ranked among the best in government and industry and committed to enhancing its quality. The financial management community needs to be an integral part of the Department's decision making process. Our Strategic Plan is an attempt to develop a long-term perspective that aligns the financial management program with the Department's program missions as partners in a constantly changing environment. To make this vision a reality, the CFO is focusing on five major thrust areas: **Financial Stewardship, Full Partnership, Customer Orientation, Human Resource Management, and Technology/Information Architecture.** CFO Strategic Plan supports the Department's strategic goals as promulgated in the Department's Mission Statement and Strategic Plan. The Core Values of the Department are reflected in our goals and objectives. Sound financial management is essential to accomplishing the Department's goals.

Critical Items/ Success Factors

CFO efforts to improve financial management at the Department support the Secretary's business line goal for Corporate Management: organizational excellence in corporate management systems and approaches. CFO activities ensure the Congress, the Administration, and by extension the American Taxpayer, that the Department is pursuing program goals while maintaining financial stewardship of their funds.

Financial management at the Department operates in an environment of Government-wide efforts to improve financial management and implements legislative and administrative provisions which stress the need for change. CFO performance in producing Audited Financial Statements, performance based budgets (GPRA), and the Corporate Executive Information System maintains our record of sound financial management. Equally important are efforts to implement a paperless travel process and expand electronic funds transfers, efforts to consolidate accounting centers, par.icipation in Business Management Oversight Process (BMOP) headquarters oversight of field operations, and the Department's efforts to control and manage uncosted balances, construction project balances, and functional support costs. The CFO is making meaningful progress in upgrading and modernizing our financial systems with a view toward outsourcing services and purchasing commercial off the shelf (COTS) software where practical.

As a Result of CFO Efforts

Efforts during FY 2000 will result in the continued production of credible financial reports, performance based budgets, improved budget presentations, heightened responsiveness to the OMB and Congress, and better communication with stakeholders. Accounting initiatives will increase efficiency while sustaining timely payments. Information Management efforts will result in modernizing our business management systems, timely reporting, data integrity and improved decision-making tools. Human Resource initiatives will ensure equal opportunity, improve human relations, develop financial management professionals, and expand opportunities for CFO staff. We expect to expand our awareness of customer needs through customer service training, a revised customer service plan, and customer satisfaction surveys.

In addition to these important initiatives, the CFO provides financial services and products essential to sound financial management at the Department. Budget review, funds control, and budget execution are examples of financial services. Other financial services include: program liaison, financial policy and budget consultations, travel and payroll services, and financial systems operations and maintenance. Financial products include: budget requests, reprogramming requests, financial reporting, and analyses. A majority of CFO resources are committed to producing these ongoing financial products and services.

Corporate Financial Systems

Funding for the next generation Business Management Information System (BMIS), which includes the Corporate Executive Information System (EIS) and Financial Data Warehouse (FDW), is sought as part of the Corporate Management Information Program (CMIP) in the Office of Management and Administration, Chief Information Officer, program support request within the Departmental Administration budget request. This activity will be performed under the direction of CFO systems managers. The EIS and FDW will provide an effective means of capturing and integrating data and making business information available to executives, managers, and staff to support the decision making process and achieve the goals put forward in GPRA. The FY 2000 accomplishments will include: acquisition of COTS accounting software, hardware, programming to meet statutory and regulatory requirements, minimum interfaces to other systems, training, and other costs necessary for the pilot implementation. While these funds are not part of this justification, they will be managed by the CFO and are critical to financial management at the Department.

Performance Measures

- Submit an Accountability Report by March 1, 2000 which combines the FMFIA Report, and the CFOs Act Annual Report (including audited financial statements for FY 1999 performance) with other reports required by the Inspector General Act and the GPRA which will result in a more streamlined and consistent Departmental Report.
- Expand the use of Intranet and Internet websites to reduce the requirements for paper reports, approval signatures, leave and earnings statements and facilitate paperless financial processes and increasing customer access by 25%.
- Expand the development and use of web-based applications by 20% to facilitate standardized access for data entry and reporting capabilities.
- Analyze the costs and benefits to the Department of outsourcing payroll operations including payroll systems operations and maintenance completed by September 2000.
- Obtain Treasury's approval through the Department's General Counsel to close out petroleum price violation receivables pursuant to Section 2B of Emergency Petroleum Allocation Act of 1973, where possible, by September 2000.
- Submit a performance based budget to Congress on time and with adequate support.
- When providing the Congressional budget and supporting documents to stakeholders and the public, increase the use and timeliness of materials available as electronic media, computer compact disk, or on the Internet.
- Improve linkage between the goals of the Department's strategic plan, annual performance plan, and resources requested in the budget. This will reduce the time necessary to analyze the impact of changes to funding or, alternately, changes in strategic policy.
- Maintain a 95% prompt payment percentage and make 95% of commercial payments by way of Electronic Funds Transfer for FY 2000, meeting the targeted goal for the Department.
- Conduct two business management oversight reviews of Field Office financial activities.
- Maintain and reduce uncosted balances as a percent of total available to cost.
- Maintain and reduce unobligated balances as a percent of total obligational authority.
- Maintain and reduce functional support costs as a percent of total costs.
- Ensure that no IG or GAO audit recommendations remain open more than one year without a management decision.
- Continue efforts to identify information requirements for the Executive Information System and implement a minimum of two new business areas in FY 2000.
- Continue efforts to expand the data captured and stored in the Financial Data Warehouse and increase the user base by 20%.
- Implement the Business Management Information System (BMIS) to replace our core accounting system on a pilot basis at one accounting service center and two satellite sites to test software functionality and interfaces with other Departmental systems.

- Standardize accounting among the three finance service centers by September 2000, facilitating any future decision to further consolidate functions or service centers for the Department. This effort is performed in concert with process improvement efforts related to the BMIS project.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Headquarters					
Salaries and Benefits	14,344	15,830	16,502	+672	+4.2%

[a]The Chief Financial Officer plans to use $770,000 of carryover balances to fully fund a staffing level of 208 FTEs.

[b]The Chief Financial Officer plans to use $466,000 of carryover balances to offset FY 2000 program requirements.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Provides funding in FY 2000 for 208 full-time-equivalent employees to include salaries, overtime, incentive awards, lump sum leave, SES and other performance awards, payments on behalf of employees, payments to funds such as unemployment compensation and buyouts. CFO staff serves many customers in a wide range of products and services. Within the Department we provide customers with financial services ranging from travel and payroll services for employees to financial reporting for program evaluation. We prepare and execute the Department's budget and interpret and enforce the Department's financial policies. Outside of the Department we serve other federal agencies including the General Accounting Office, Treasury, and Office of Management and Budget. The CFO represents the Department's financial interests with Congress and responds to significant financial legislation beginning with the CFO Act of 1990. Overall the CFO contributes a financial perspective to Departmental decision making	14,344	15,830	16,502
Travel			
Funds staff travel for Department-wide and CFO activities including travel associated with the Department's initiatives related to a new core accounting system, a new payroll system, oversight activities, and budget validation studies.	176	190	196

Explanation of Funding Changes FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Salaries and Benefits	
■ The increase of $672 k in personnel compensation and benefits primarily reflects an increase due to a cost of living adjustment and base pay adjustment due to the partial effects of the FY 1999 and FY 2000 pay raises..	+ 672
General Management	
■ General Management: Travel requirements increase $6 k due to CFO initiative to challenge budget estimates and implementation of new corporate systems for accounting and payroll. Training increases by $13 k due to implementation of new corporate financial and payroll systems. The WCF increases $112 k offset by a decrease in Other (eliminate HHS agreement with a new Treasury ASAP system) of -$131 k. Inflation is offset by other contractual efficiencies.	0
Total Funding Change, Program Direction	+ 672

Field Management

Mission Supporting Goals and Objectives

The Office of Field Management is responsible for the managerial oversight of the Department's eight Operations Offices and two Field Offices and provides specialized technical support to enhance the stewardship of the Department's facilities, major projects, and infrastructure. As a corporate integrator, Field Management's role is to foster communications that strengthen the Headquarters/Field relationship, establish consistent approaches that cut across programmatic lines, create practical business management solutions for operational issues within the Department, and advocate continuous improvement techniques. The Federal Staff and related costs associated with fulfilling Field Management's responsibilities are funded by program direction resources.

Significant Accomplishments

- In January 1998, DOE executed the first Contract for Sale covering an entire site - Mound. This action sets the pace for similar innovative sale and lease transactions which respond to the marketplace, encourage economic development, and ultimately reduce the Department's landlord costs. Innovation and inventiveness are now key to a successful real estate program in FY 1998 and beyond.
- Starting in FY 1998, deferred maintenance and maintenance data will be captured in the Facility Information Management System, the Department's corporate real property and facility database. An excess facility designator feature will also be added This will enable the Department, for the first time, to analyze its facility maintenance expenditures on a building-by-building basis and thus help identify areas to reduce landlord costs.
- Deferred maintenance costs will be reflected in the Department's FY 1998 audited Financial Statements. In support of this effort, maintenance management systems are being evaluated.
- Field Management's technical expertise in utility management continues to contribute to significant cost reductions for field and program elements averaging about $19 million a year. For example, a consolidation program for natural gas reduced costs by about $9 million annually, contract negotiations reduced Savannah River electric costs by $18 million a year and saved $3.5 million at the Oakland Operations Office.
- Estimated savings and costs avoidance were identified based on value management studies of project acquisitions. Once implemented, the savings realized over the next ten years would be approximately $97.2 million.
- Integrating systems engineering methods to improve baseline qualities at 13 DOE sites helped Environmental Management identify estimated savings of $2 billion over ten years.
- Field Management established the Departmental policy that will ensure retention of Facility Representative technical competence during staffing realignments. The Facility Representative Retention Guidance was also issued. This fulfills a DOE Commitment as part of the Defense

Nuclear Facility Safety Board (DNFSB) Recommendation 93-3 Implementation Plan and will maintain day-to-day operational safety at contractor-operated DOE facilities is insured.

- The Lessons Learned INTERNET Homepage was revitalized and an INTERNET Homepage providing information about the Department's Society for Effective Lessons Learned Sharing (SELLS) was established. In addition, the SELLS executive committee was reorganized to improve the operational effectiveness of the organization.
- Under the Business Management Oversight process, an expanded pilot study of headquarters oversight over the federal activities at ten field offices was completed in FY 1998. The next step is to proceed with Department-wide implementation. The estimated annual cost savings is $280,000.
- Field Management established the Departmental policy that will ensure retention of Facility Representative technical competence during staffing realignments. The Facility Representative Retention Guidance was also issued. This fulfills a DOE Commitment as part of the Defense Nuclear Facility Safety Board (DNFSB) Recommendation 93-3 Implementation Plan and will maintain day-to-day operational safety at contractor-operated DOE facilities is insured.
- The project management training course, designed to enhance the knowledge, skills and abilities of the Department's field employees was conducted in FY 1998. The course development was completed in FY 1997 and is designed for those field managers that are responsible for assessing and controlling project risks that impact scope, schedule, and cost baselines.
- A plan to implement the congressionally mandated independent reviews of the Department's project management process was established. This effort was coordinated with the Department's business line programs, the Field, OMB, and Congress.

Performance Measures

- Complete the independent project management reviews and forward the applicable reports and Departmental position papers to Congress.
- Verify progress against establish project scope, schedule, and cost baseline objectives on projects valued at $5 million or more.
- Define and pursue innovation strategies for promoting mortgage reduction through dispositioning excess property, including real estate, facilities, and material.
- Complete a disposition schedule for all non contaminated real property (including facilities), identified in the Facility Information Management System as "excess" by October 1, 1999.
- Improve Field Element authorized staffing of Facility Representative to 95 percent.
- Establish a clearing house of training courses required for Core Qualification of Facility Representatives by the end of fiscal year 2000.
- Ensure that maximum efficiency, economy, and reliability are achieved and the savings demonstrated as a result of contract negotiations and regulatory interventions, especially with respect to deregulation within the utility industry. Success will be measured by cost avoidance

greater than at least twice the cost of running the program.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salaries and Benefits	4,297	4,743	5,182	+439	9.3%
Travel	255	255	255	0	0.0%
Support Services	1,120	584	725	+141	24.1%
Other Related Expenses	2,282	1,918	1,918	0	0.0%
Total, Program Direction	7,954	7,500	8,080	+580	7.7%
Full-Time Equivalents	46	48	48	0	0.0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Staffing authorized for FY 2000 is 48. The majority (33 of the 48) provides direct services to the field and the Department by enhancing the stewardship of the Department's facilities, infrastructure, and major projects with respect to real estate matters (including disposition), utilities negotiation, facilities inventory and reporting, contract reform, engineering support, and independent assessment of projects. The remaining 15 positions support operations of the Office itself and oversee the management of the ten field offices under FM's purview. This includes policy development, implementation of corporate initiatives, field liaison support, management of the Senior Executive Service cadre in the field, and resource management (both funding and staffing).	4,297	4,743	5,182

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Travel			
Funds staff transportation to the field sites, enables physical participation on task teams, facilitates conducting training for the field, and hosting conferences that support Departmental initiatives and other areas relative to project management, utility rate negotiations, real estate planning, corporate lessons learned, resource validations, facility representative management, independent costs estimates, and quality assurance. Alternative travel methods, such as TeleVideo conference, have been incorporated into normal business operation. As a result, the request for travel funds remains flatlined to the fiscal year 1997 level.	255	255	255

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Support Services			
Finances the technical expertise, corporate systems, and related expenses associated with life cycle asset management implementation. This "cradle to grave" comprehensive planning approach, will result in assets that are efficiently utilized and maintained in a safe and environmentally responsible manner. In FY 2000, there will be more of an emphasis on training development and refining policy guidance in these core areas: project management, facility maintenance, systems engineering, and value management. The two corporate systems, recognized as the Facility Information System (FIMS) - a real estate inventory system, and the Condition Assessment System (CAS) - a facility maintenance database, collectively have the capability to identify all excess buildings and other structures and the related deferred maintenance costs. Efforts are underway to update the data in each. Such data will enable the Department to target high cost areas for footprint reduction and focus on dispositions that generate the highest mortgage reduction savings.			
Beginning in FY 1999 and continuing in FY 2000, the Department is trying to properly align technical support cost with the programmatic missions that receive direct benefit from these efforts. As a result, the primary technical support service costs for real property management and disposal and utility service planning and acquisitions have been extracted from Field Management's support service line. These costs are embodied within the Department's programmatic budgets. The workload in both of these areas is expected to increase significantly, especially with the emphasis on the identification and disposal of excess property and the impacts of deregulation within the utility industry.	1,120	584	725
Other Related Expenses			
Provides funding for employee development and training, computer hardware and software in support of the local area network and federal staff desktops, cosponsorships in lessons learned and process improvement initiatives, and items purchased through the Working Capital Fund, e.g. rent, supplies, mail handling, telecommunications, postage, network systems maintenance, contract audits, and payroll outsourcing, etc.	2,282	1,918	1,918
Total, Program Direction	7,954	7,500	8,080

Explanation of Funding Changes From FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Salaries and Benefits	
■ Increase in salaries and benefits is due to general pay increases, promotions, and within grades.	+439
Support Services	
■ Increase results from the reduction in technical support services for real estate management and utility management within Field Management's budget and the dedication to develop training courses and refine Departmental guidance for the following:	
▸ With the increased emphasis on enhancing the project management implementation within the Department, resources are being dedicated to develop policy, detailed guidance, and training/certification programs, as well as create an automated management database system to tract independent assessment milestones and deliverables.	
▸ Each agency is required by Public Law 104-106, Section 4306 to have a value management process in place such that savings and/or cost avoidances are identifiable based on the consistent application of these principles. The initial training course will be developed in FY 1999. In FY 2000, a more advanced class is planned. With the fundamental ground work established, the cost to implement is expected to be less in FY 2000.	
▸ Course development and technical support in the deferred maintenance area are planned for FY 2000 to ensure consist data is captured and reported by the Field. This will help ensure that the data reported in the Department's Financial Statements meets commonly accepted accounting practices with respect to facility maintenance activity	+141

	FY 2000 vs FY 1999 ($000)
■ **Other Related Expenses**	
The net change is zero as a result of the following:	
▸ The Working Capital Fund decrease is associated with savings resulting from work space consolidations and a re-engineered approach for computer desktop support and maintenance.	
▸ Field Management is a co-sponsor of the Federal Construction Council. Participation enables the Department to obtain technical expertise regarding industry project management practices and established baselines. A modest $5,000 increase is anticipated for FY 2000.	
▸ The increase in information systems supports the acquisition of hardware and software to upgrade Field Management's local area network.	+0

Board Of Contract Appeals

Mission Supporting Goals and Objectives

The Board of Contract Appeals is an administrative tribunal, responsible to the Secretary and under law for the fair and impartial trial and adjudication of a variety of disputes. With few exceptions, these disputes are related to the Department's acquisition and financial assistance programs. The Board exercises an array of statutory and delegated authorities. Board decisions constitute final agency decisions and are not subject to administrative review or modification. The Board also serves as the principal source of neutrals for acquisition and financial assistance related mediation and other alternative dispute resolution procedures.

The goal of the Board of Contract Appeals is to provide to the fullest extent practicable, informal, expeditious and inexpensive resolution of contract and financial assistance related disputes pursuant to the Contract Disputes Act of 1978, the Alternative Disputes Resolution Act, and other authority The objectives of the office include: contribute to mutually beneficial relationships between the Department and its contractors and financial recipients; hear and decide disputes or resolve them through alternative means, vindicating the Department's and the contractor's or recipient's contractual expectations in an expeditious, economical, fair and impartial manner; and advance the implementation of alternative disputes resolution procedures; contract disputes resolution without trials and decisions saves substantial public and private resources in appropriate cases.

Performance Measures

- Under delegated authority from the Secretary, provide alternative dispute resolution services to cost-reimbursement contracts.
- Implemented fact-finding authority for debarments
- Executed a Memorandum of Understanding with the U.S. Securities and Exchange Commission to act as their agency Board of Contract Appeals.
- Continue to assess benefits of expanded mediation of disputes at the subcontract level in cost-reimbursement contracts
- Continue Board-provided alternative dispute resolution through standardized provisions in cost-reimbursement contract solicitations

Congressional & Intergovernmental Affairs

Mission Supporting Goals and Objectives

The mission of the Office of Congressional and Intergovernmental Affairs (CI) is to promote Departmental policies, programs and initiatives through liaison, communication, coordination and interaction with Congress, State, local, and Tribal governments, other Federal agencies, stakeholders, and the general public.

The office is charged with serving the needs of a wide range of customers, including Members of Congress and Committees; State, local and Tribal governments; DOE stakeholders; consumer and public interest groups, and Federal and contractor employees. The mission and its incumbent responsibilities are well served by the office's functioning as a "one stop shop" for information about the Department's energy, national security, science and environmental business lines. The release of timely, factual information and a commitment to creating opportunities for early customer involvement in the Department's decision-making process have contributed to the office's success in fulfilling its mission and achieving its goals and objectives.

The office strives for continuous improvement in its partnerships with constituent groups and stakeholders. These efforts are supported through close collaboration with DOE officials and program staff on the development and implementation of legislative strategies; by communicating DOE's missions and benefits to our primary customers; and through rapid response to our customer's requests for information.

Program Goals

- Embrace the importance of keeping the nation's citizens informed, and provide information to Members of Congress, Committees and staff, State, local, and Tribal officials, American taxpayers; contribute to a broad national understanding of the Department's mission in areas ranging from energy security to economic development and national security; and support the statutory requirements of the DOE Organization Act, Public Law 95-91, to provide liaison between the Department, Congress, and the general public.
- Build trust and ensure public understanding of the importance of Department of Energy (DOE) policies, programs, and initiatives.
- Comply with DOE's Acquisition Regulation which directs this office to advise Members of Congress regarding pending awards that have an impact upon the Members' State/District.
- Communicate to all of our customers through its work advising and coordinating with program offices on matters relating to congressional, intergovernmental, and tribal, and other outreach activities. In doing so, we deliver on our commitment to a policy of openness and accessibility.

- Provide timely, responsive information in anticipation of customer needs and targeted to the full range of DOE customers -- from Members of Congress, Committees and staff, governors, tribal leaders, local elected/appointed officials, and community groups around DOE sites, to professionals in the business, environmental, and national security communities.
- Support early and effective customer involvement in DOE decision making by improving coordination of stakeholder activities that cross-cut other DOE programs.
- Prepare briefing materials for the Secretary, Deputy Secretary and Under Secretary in preparation for meetings with Members of Congress and stakeholders.

Performance Measures

- Measure overall performance through customer feedback, leadership's ability to meet commitments and program objectives and feedback from our employees.
- Assist program offices in their preparation of official Departmental testimony and accompany senior Departmental officials to approximately 70 hearings. Assisted program offices in preparation for those hearings.
- Attend over 3,000 briefings and meetings and over 60 committee markups in performance of CI's liaison functions.
- Research, prepare, and/or review:
  - 100 briefing books/papers regarding Congressional hearings and meetings;
  - 3,200 pieces of Congressional correspondence, developed with program offices on program/policy issues;
  - 90 reports on Congressional hearings, coordination of 86 hearing statements, 1,655 pre- and post-hearing Questions and Answers; 97 inserts for the record; and 1,000 congressional letters relating to hearings;
  - 250 Daily Reports and 52 Weekly Reports for senior Departmental officials providing detailed congressional and intergovernmental information on meetings, hearings, mark-ups, site visits and other major events;
  - Numerous Congressional notifications on Departmental program issues and major announcements;
  - 3,000 contract and grant notifications for Members of Congress requiring over 9,000 congressional notifications, and to affected Governors;
  - Several thousand notifications to Governors/Tribal leaders/American Indian Organizations/ consumer groups and industry of major actions;

- 200 invitations for meetings or appearances by the Secretary and other principal Departmental officers with intergovernmental or public liaison groups;
- 535 biographies for Members of Congress (including energy-related information, Committee assignments, energy and environment-related legislation sponsored and co-sponsored by Member(s), background information on Departmental facilities in Member's District/State, and major energy interests and concerns); and
- 100 State Briefing Papers prepared for Administration officials covering energy issues and concerns for the relevant State.

Funding Schedule

Public Affairs

Mission Supporting Goals and Objectives

The mission of the Office of Public Affairs is to communicate information about DOE's work in a timely, accurate and accessible way.

The office is responsible for overall public affairs for the Department, including communicating Departmental policies, initiatives and information to the news media and the general public; managing and coordinating public affairs activities for Headquarters, field offices and sites, and DOE laboratories; serving as primary spokesperson for the Department; responding to requests for information from the public and the news media; arranging interviews with the news media; providing speechwriting services to the Secretary, Deputy Secretary and Under Secretary; preparing written information about Departmental activities; reviewing publications, audiovisuals, and exhibits; compiling news clips; and managing the Department of Energy's Home Page.

Program Goals

- Communicate information about the Department in a timely, accurate and accessible way to the news media and the public.
- Deliver on the Department's commitment to openness and public participation in decisionmaking through wide dissemination to the press of documents relating to NEPA process, Superfund and other regulatory processes.
- Provide public affairs guidance and services to program and field offices including writing news releases, planning news conferences, arranging interviews, preparing and editing written and visual materials.
- Manage and operate the public inquiries room and respond to walk-up visitors inquiring about the Department's programs and activities and research and respond to telephone and written inquiries.
- Improve internal communications by writing and publishing a monthly newsletter about current events around the Department, and compiling and distributing news clips about Departmental activities.
- Provide coordinated review of non-technical Departmental publications, audiovisual materials, and exhibits to ensure consistency, cost-effectiveness and clarity.
- Prepare speeches, briefing materials, and analysis to the Secretary, Deputy Secretary, Under Secretary and principal secretarial officers in support of their work to explain Administration and Departmental policies, initiatives and actions.

Performance Measures

- Measure performance through customer feedback, ability to meet commitments and program objectives.
- In support of serving as an intermediary with the news media, DOE stakeholders, and the general public, staff resources:
  - Plan and coordinate 120 press conferences, over 300 press releases and responded to over 20,000 inquiries for information or interviews from the news media;
  - Operate the Departmental public inquiries office that handles requests concerning all DOE program and activities, responding to over 14,000 public inquiries from students, schools, colleges, libraries, industry, businesses, Federal agencies, State and local governments, and private citizens;
  - Produce and distribute 12 editions of the Departmental news magazine to DOE employees and contractors with external copies sent to Congressional offices, Federal agencies, State and local governments, news media, libraries, colleges, schools, energy-related trade associations and public interest organizations, embassies and others on request;
  - Redesign and assumed editorial control of the Department of Energy's Home Page to make it more accessible and informative providing information to the public;
  - Compile news clips articles from 50 major newspapers, five regional papers, eight weekly magazines/journals and produce/distribute over 500 copies of news, magazine, and regional clips; and
  - Reviewed/approved over 175 publications, exhibits and audiovisuals of Departmental activities.
- In support of the Department's mission:
  - Assist, advise, and/or prepare speeches, talking points, and presentations for the Secretary;
  - Communicate guidance and coordinate activities with Field and Laboratory public affairs offices; and
  - Coordinate and provide strategic information of schedules for major announcements.

Total, Program Direction	3,413	3,500	3,963

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ In FY 1999, Public Affairs will utilize approximately $200,000 in carryover balances to cover a funding shortfall for employees currently on board. The increase in FY 2000 represents new budget authority of $200,000 to continue employment at 31 FTEs, and a $100,000 increase due to cost of living adjustments, promotions and performance awards.	+300
Travel	
■ Travel reflects a slight increase to allow staff to accompany Secretary, Deputy Secretary, and Under Secretary at public appearances.	+14
Support Services	
■ Support services reflects an increase for computer support for advancing communications technologies and development and other technical computer support.	+125
Other Related Expenses	
■ Other related expenses reflects an increase in training ($+5,000) and other program support for services associated with the preparation of daily news clips and radio/TV transcription services ($+11,000). There is an increase in the working capital fund ($+8,000).	+24

General Counsel

Mission Supporting Goals and Objectives

The Office of General Counsel is responsible for providing comprehensive legal services to the Secretary and the Department. These services include legal counsel with respect to every program and function of the Department, except those relating to the Federal Energy Regulatory Commission and Environment, Safety, and Health's administrative enforcement activities related to Nuclear Safety. General Counsel assures that the Department operates in compliance with applicable laws and regulations. The position of General Counsel is established by Public Law 95-91, Section 202(b).

Performance Measures

- General Counsel utilizes feedback from customers and General Counsel personnel, and reviews such as those conducted by the DOE Inspector General and the General Accounting Office as bases for measures of performance.
- The Office of Alternate Dispute Resolution is committed to increasing by 20% the number of workplace disputes mediated, increasing by 20% the number of litigation cases mediated and demonstrating estimated savings of 50% in litigation costs.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999[a]	FY 2000	$ Change	% Change
Salaries and Benefits	15,802	15,746	16,788	+1,042	+6.6%
Travel	128	100	83	-17	-17.0%
Support Services	236	496	720	+224	+45.2%
Other Related Expenses	3,490	3,550	3,843	+293	-8.3%
Subtotal, General Counsel	19,656	19,892	21,434	+1,542	+7.8%
Use of Prior-year Balances	0	-642	0	+642	-100%
Total, General Counsel	19,656	19,250	21,434	+2,184	+11.3%
Full Time Equivalents	167	162/168[a]	164		

[a]Although the internally approved manpower level for General Counsel is 168 FTEs, enacted funding for FY 1999 does not fully fund the projected staffing level of 162 FTEs. Therefore, in order to maintain its commitment to provide adequate legal services to the Department, GC will utilize carryover of about $642,000 in FY 1999 to cover the shortfall.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Provides funding in FY 2000 for 164 full-time equivalent employees to include salaries, overtime, incentive awards, lump sum leave, SES and other performance awards, payments on behalf of employees for payments to funds such as workman's compensation, unemployment compensation and buyouts. In FY 2000 there is a slight increase in funding provided for additional FTEs to address critical hires in such key areas as additional legal services for the Waste Fund and Environmental Management programs	15,802	15,746	16,788
Travel			
Provides funding for employees to attend hearings, court trials, proceedings, and to take depositions wherever necessary. Also provides funding for conference attendance and travel to attend training	128	100	83
Support Services			
Provides funds for technical support services, including: computer/LAN operations, staffing of the DOE law library, outside attorneys to process intellectual property actions, and consulting and software programming services to receive, process, and track transactions for a nationwide intellectual property database	236	496	720
Other Related Expenses			
Provides funding for Dept. Of Commerce fees for intellectual property prosecution, law library books and materials, employee training, and items included in the Working Capital Fund (rent, utilities, building operation and maintenance, supplies, telephone, DOE wide computer/LAN operations, etc.)	3,490	3,550	3,843
Use of Prior Year Balances	0	-642	0
Total, General Counsel	19,656	19,250	21,434

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 1999 vs FY 2000 ($000)
Salaries and Benefits	
■ The increase of $1,042,000 reflects the hiring of two additional critical Deputy General Counsels ($300,000), the effect of replacing outgoing attritions with critical senior grade employees ($142,000), the full effect of the FY 1999 pay raise and the partial effect of the FY 2000 pay raise ($400,000), and increased SES and PMS bonus awards to an allowable level of 3% of base pay ($200,000).	+1,042
Travel	
■ The decrease of $17,000 reflects an expected decrease in the level of GC travel requirements.	-17
Support Services	
■ The increase of $224,000 consists of a $114,000 increase in intellectual property costs, a $160,000 increase in computer/LAN support (which represents costs for the maintenance of a DOE nationwide database used for recording and reporting all DOE funded costs for outside legal services relative to DOE contractor litigation), and a decrease of $50,000 in law library contractor personnel services.	+224
Other Related Expenses	
■ The increase for Other Related Expenses primarily consists of a $13,000 inflationary increase in law library books and materials, a $28,000 inflationary increase in intellectual property costs, and a $250,000 increase to cover patent costs which were previously funded by uncosted balances with the Dept. of Commerce.	+293
Total Funding Change, General Counsel	+1,542

Policy and International Affairs

Mission Supporting Goals and Objectives

In this era of radically shifting priorities and sharply reduced budgets, the Secretary and the Department increasingly rely on the Office of Policy and International Affairs (PO) to establish clear goals, develop policies, analyze policy impacts, mobilize resources, and launch new initiatives to reduce the cost and enhance the effectiveness of DOE programs. The objectives of the Office of Policy and International Affairs are to identify and develop policies based on sound analysis that support the Department's vision and fulfill the Department's mission, provide accurate and unbiased analysis of existing and prospective policies in the areas of energy, environment, science and technology, and national, economic, energy and environmental security; ensure attention to energy needs and perspectives as decisions with significant energy implications are considered by other departments and agencies; ensure effective communication of Administration and Departmental policies, priorities, objectives, and measurements; to advance energy, environmental, and non-proliferation policies in international agreements; and to promote positive relationships with foreign nations that support U S. policy goals.

Performance Measures

- Effective analysis and advocacy to assure that Federal regulatory activities of other agencies affecting the energy sector are consistent with National energy policies and do not impose unnecessary energy costs on consumers and producers, as measured by the number of analyses completed and comments provided and by the cost savings achieved by changes in regulatory proposals resulting from our interventions.

- Effective analytical and policy development activities in support of the Administration, Federal Energy Regulatory Commission (FERC), Congress and states to increase reliance on competition in energy markets to benefit consumers while maintaining a sufficient level of environmental protection and high energy reliability, as measured by number and influence of analyses provided and by customer satisfaction

- Leadership in the analysis, policy development, and negotiation processes surrounding global climate change, as measured by number and influence of analyses supporting cost-effective, flexible approaches to mitigation that reflect a realistic appraisal of energy needs and priorities.

- Maintenance and effective utilization of energy modeling capabilities, as measured by success in meeting requests from the Administration and Congress for timely analysis of emerging energy issues.

- Effective support of U.S. economic, environmental and national security policy goals, as measured by the magnitude of foreign actions or international energy policy, regulatory and legislative actions that are attributable, in part, to Departmental efforts, and by adoption of DOE positions by multilateral organizations.

- Improved efficiency in the Department's international R&D-related activities as measured by cost savings from collaboration among DOE programs on international activities. Further, effective development and implementation of international research and development agreements, as measured by the number of R&D agreements and/or related modifications concluded and the value of information or experience acquired in support of, and complementary to, domestic R&D programs

- Effective analytical and policy development activities in support of the Administration's national security objectives on nuclear materials stewardship, non-proliferation, stockpile stewardship, national security, environmental management, and health and safety of the general public and DOE employees as measured by the number and influence of analyses provided and by customer satisfaction.

- Effective development of science and technology policies in support of Departmental missions in fundamental science, mission-driven research and development, laboratory missions and management, and international science and technology cooperation, as measured by the number and influence of analyses, papers, meetings, teaming arrangements, task forces, workshops, reports, publications, and other means of communicating and effecting policy formulation and change in the Department's science and technology policies and programs.

- Effective implementation of the DOE Strategic Management System, as measured by the degree to which the Department's program strategic plans and individual performance evaluation standards reflect the priority goals from the Department's Strategic Plan and the degree to which the Department's Strategic Plan, budget, Annual Performance Plan, and Annual Performance Report are aligned. Further success will be ensured by the satisfaction of Congressional and OMB stakeholders that the Department is in full compliance with the Government Performance and Results Act of 1993.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salaries and Benefits	11,423	11,479	13,000	+1,521	13.3%

Other [b]	182	0	0	+0	0.0%
Total, Other Related Expenses	3,471	2,021	3,430	+1,409	69.7%

[a] Includes non-WCF expenditures for subscriptions, telephones, credit cards, pagers, portable phones, interpreters, ADP hardware/software acquisitions, LAN administration, international phone charges, and budget and accounting system maintenance.

[b] Included funds for PO's overseas offices in Moscow, Paris, and Tokyo; since FY 1998 offices were transferred to the Office of Nonproliferation and National Security and Office of Nuclear Energy, Science and Technology.

Policy and International Affairs Program Support

Program Mission

The Office of Policy and International Affairs (PO) is the primary policy advisor to the Secretary and the Department on national and international energy policy matters. Our role is to render advice to the leadership of the Department and represent the Department in interagency discussions, based on a broader range of policy objectives than would be found within the Department's separate program offices.

Program Goals

- Advocate the Department's policies on energy, environmental and national security issues in decision- making processes with other Departments and agencies.
- Ensure effective and consistent implementation and communication of Administration and Departmental policies and priorities.
- Effectively engage the international community in discussions and actions to advance energy, environmental, and non-proliferation policies through multilateral international agreements and bilaterally with key foreign nations to support U.S. policy goals.

Program Objectives

- **Policy Development**: PO identifies, develops and analyzes policy issues, helps define long-term goals, objectives, and priorities, and mobilizes appropriate program offices to participate in these activities.
- **Policy Analysis**: PO provides the Secretary, Deputy Secretary and the Under Secretary independent analysis and program assessment. In this context, PO is deemed independent because they have no vested or parochial interests in specific DOE programs. During the decision-making process, the Secretary is assured of impartial and unbiased policy advice from PO.
- **Policy Coordination**: PO is the central DOE organization that develops and coordinates domestic and international policy initiatives and strategies on issues that cut across more than one program area. PO prevents "stove piping" by facilitating the development of integrated and coordinated policy approaches across all of the Department's functions. PO also ensures that DOE is aligned with core national goals and objectives. Ongoing Policy responsibilities include coordination of the Department's international activities.
- **Policy Communication**: PO provides a policy communication link between DOE and its stakeholders including other agencies, Congress, State and local governments. PO ensures that the views of the White House, Congress, public and private sector organizations, and foreign countries are addressed in the policy making process. PO is the Department's representative on

many domestic and international policy initiatives and provides information on Departmental, national and international policies, strategies, and trends

- **Policy Oversight**: PO ensures that Secretarial policies and priorities are implemented throughout the Department's planning and budgeting processes These activities include development of the Department's strategic plans, annual performance plans, budgets and the Performance Agreement with the President PO also ensures Secretarial priorities are upheld during the evaluation of program performance against Secretarial commitments and annual performance reporting

Significant Accomplishments and Program Shifts

- Served as the Department's pathfinder for U.S energy industry trade and investments throughout the world, including oil and gas production and pipeline transportation infrastructure. PO continued to develop and implement Department-wide regional energy trade and investment strategies aimed at promoting energy policy and market reform, U.S. industry investment and sustainable energy programs and nuclear non-proliferation policies Recently, PO served as the central Departmental office in advancing the Administration's policy in the Caspian region to promote U.S. company involvement in oil and gas production and building pipeline infrastructure.

- Provided the primary expertise in the restructuring of the electric utility industry. PO led the Department's analytical assessment of the electric industry restructuring effort PO analysts conducted modeling assessments to estimate the effects of industry changes on future energy security, reliability of supply, and financial and environmental implications. This resulted in the March 25, 1998 Administration announced Comprehensive Electricity Competition Plan. PO continues the analytical studies of electric industry restructuring in order to estimate effects of industry changes on future energy security, reliability of supply, and financial and environmental implications.

- Assured balanced consideration of energy issues in the development of Administration environmental policies. PO led the Department's effort to determine, during the formulation stage, the impact of environmental and energy policies on such factors as employment, gross output, and the competitiveness of energy intensive industries. Such analyses resulted in the Department having the opportunity to affect the Administration's development of policies that properly weigh energy economic impacts in achieving environmental objectives

- Provided the corporate capability for the development of the Comprehensive National Energy Strategy. PO led the Department's effort to develop the Comprehensive National Energy Strategy which reflects the vital role energy plays in our economy and the importance that the Administration attaches to having a well defined energy policy.

- Provided the overall management and coordination of the Department's Strategic Planning under the Government Performance and Results Act (GPRA). PO continued to provide, through the DOE Strategic Plan, central guidance to Departmental program offices to focus DOE's broad and diverse programs on achieving national energy goals and objectives. PO also continued

overseeing the Department's effort to ensure improving public accountability as part of the Government Performance and Results Act (GPRA).

- Developed corporate approaches to solve problems. PO established the first corporate asset management program which generated $35 million in revenues.

- Coordinated DOE's international science and technology agreements. PO continued to coordinate foreign policy/national security and international energy policy direction for DOE's international science and technology agreements and negotiated agreements with foreign governments for DOE program offices

▸ Manage and improve the Department's Strategic Management System linking strategic planning, performance planning, budgeting, performance management, and performance reporting from the Departmental level down to the employee and contract level	5	50	5

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ Manage the Department's 5-Year integrated planning and budgeting process and coordinate department-wide cross-program analysis to identify opportunities for improved integration	30	10	30
▸ Manage a managerial accountability and responsibility framework through formal Performance Agreements between the Secretary and his direct reports	20	5	20
▸ Manage the development of crosscutting Strategic Plans (e.g., International Programs, Environmental Security, etc.)	20	5	20
■ **Oil Security**			
▸ Provide analytic support and implementing strategies for Departmental initiatives to increase or ensure domestic supplies of oil and natural gas	35	30	65
■ **Science and Technology Policy**			
▸ Evaluate overall effectiveness of DOE international R&D agreements database and necessary enhancements	25	25	50
▸ Implement the Department-wide policy on R&D evaluation, in compliance with and support of the Government Performance and Results Act	25	25	50
■ **National Security**			
▸ Establish annual reporting on the status, issues and opportunities for nuclear materials management in the U.S.	50	25	50
■ **International Energy Policy**			
▸ Encourage regional cooperation and policy and regulatory reform in support of energy resource development in Russia, the former Soviet Union, Latin America and Asia.	129	105	530

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Electricity and Natural Gas**			
▸ Support Office of the Secretary in preparing next National Energy Policy Plan, i.e. Comprehensive National Energy Strategy	30	30	50
Total, Policy Analysis and System Studies	500	350	1000
Environmental Policy Studies			
■ **Pollution and Climate Change**			
▸ Continue Departmental participation in international negotiations to develop a regional protocol controlling nitrogen oxides and a global treaty controlling persistent organic pollutants under the United Nations Economic Commission for Europe, and Environment Program respectively	100	100	150
▸ Refine policy cost models to address evolving strategies on climate change issues	20	30	50
▸ Advocate the Department's views on key domestic regulatory issues with substantial energy implications, including particulate matter standards, implementation of ozone standards, the setting of air toxic emissions levels for utilities and trucks, review and possible revision of fine particulate ambient air standard, and integration of measures to attain particulate matter ambient standard and regional haze goals.	100	150	150
▸ Update the energy section of the U.S. Climate Action Report which provides a status of U.S. government climate change activities that have resulted from the 1993 Climate Change Action Plan	50	75	75
■ **Oil Security**			
▸ Develop and assess modifications to alternative fuels policies to improve their overall effectiveness in providing clean and cost-competitive energy supplies	25	30	50

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ Continue the assessment of refinery capabilities to produce fuels required by a variety of technologies under consideration by the Partnership for a New Generation of Vehicles programs and other transportation technology developers.	50	50	50
▸ Apply refinery analysis capabilities to contemporary environmental issues, likely including implementation by 2004 of Tier II automobile and light truck standards as well as heavy duty truck standards.	50	50	100
■ **Electricity and Natural Gas**			
▸ Work with federal and state agencies, the electric power industry, consumer, and special interest groups to implement legislative and regulatory reform in the electric industry.	50	75	100
▸ Continue joint DOE/NARUC Electricity forums to promote federal and state cooperation and dialogue on restructuring issues	125	150	200
▸ Conduct analyses of electric industry restructuring to guide implementation of legislation and regulatory reforms.	350	350	380
▸ Participate in federal regulatory proceedings regarding the implementation of new electricity restructuring legislation.	100	100	150
■ **Integration of Energy, Economic and Environmental Policies**			
▸ Develop analytic frameworks to address the potential for market power in the electric power transmission network.	50	50	50
▸ Integrate national technology-specific industrial production models into a consistent international framework.	95	100	100
▸ Provide policy support to program office participation in the development of a new model energy code that will be the basis for future residential energy efficiency in the U.S. and elsewhere, as required under EPACT.	50	75	75

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **International Energy Policy**			
▸ Critique gains to date of US domestic and international energy policy objectives in multilateral and bilateral energy policy fora.	75	95	100
▸ Identify near and long term United States government energy policy objectives to determine levels of continued involvement in bilateral and multilateral fora.	100	125	145
▸ Strengthen international oil emergency preparedness policies and response mechanisms.	35	50	75
▸ Evaluate appropriate steps to rehabilitate energy development and advance regulatory reform in Asia markets.	50	75	100
▸ Continue to promote regional cooperation and selection of a Main Export Pipeline route from Central Asia to hard currency markets.	25	50	50
■ **Science and Technology Policy**			
▸ Assess feasibility, implement case studies and evaluate the Department's International Grants Program for Scientific and Technological Cooperation.	50	50	50
▸ Implement decisions on environmental restoration and waste remediation at the Hanford Reservation in cooperation with the DOE national laboratories.	50	50	50
▸ Close discussions with the Russians on the idea of a nuclear waste repository in the former Soviet Union.	0	20	25
■ **National Security, Materials Management, and Energy and Environmental Security**			
▸ Implement Energy and Environment Security Initiative to enable the Department to influence the United States on foreign policy by merging energy and security concerns to achieve common objectives.	50	50	75

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ In conjunction with the Office of Nuclear Energy, monitor the status of life extension at the nation's commercial nuclear power plants and the status of early nuclear plant retirements associated with changes in the utility industry.	50	25	40
▸ In conjunction with the Offices of Nuclear Energy and Civilian Radioactive Waste Management, monitor the status of funding for decontamination and decommissioning by the nation's commercial nuclear power plants.	50	25	42
Total, Environmental Policy Studies	1,750	2,000	2,432
Total, Program Support	2,250	2,350	3,432

Explanation of Funding Changes From FY 1999 To FY 2000

	FY 1999 vs. FY 2000 ($000)
Policy Analysis and System Studies/Environmental Policy Studies	
■ Increase in funds will support the Administration's proposal to increase the competitiveness of the electric sector by enhancing the modeling capabilities by improving the representation of physical power flows to more accurately represent the likely impact of competition on prices to specific areas of the country and to more accurately assess the potential electric reliability implications of environmental policies, to support electric sector restructuring and climate policy objectives, resources will be used to support studies that assess the impact of changing power markets on nuclear plant retirement decisions, the efficiency of fuel use at coal-fired plants and consumer decisions regarding the voluntary purchase of "green power"; develop the analytical basis for evaluating and crediting emission reductions to reduce greenhouse gas emissions; provide increased technical and analytical assistance to enable developing countries to identify the technological opportunities for reducing emissions and the benefits of active participation in global emissions trading; promote regional cooperation in electricity and gas markets and sustainable energy development in Sub-Saharan Africa; advance policy and regulatory reform and open markets in the Asian Pacific Area as a result of the Asian Financial Crisis; address policy, regulatory and institutional issues in specific countries (Caspian region, Central America, Southern Africa, South Asia) to foster progress in promoting regional integration of gas and electricity distribution systems and markets; assist developing countries to promote the deployment of sustainable energy technologies	+1,082
Total Funding Change, Program Support	+1,082

Economic Impact and Diversity

Mission Supporting Goals and Objectives

The goals of the Office of Economic Impact and Diversity are to: become a recognized leader among Federal agencies in managing diversity as a strategic imperative, ensure equitable opportunities for small, minority, and women-owned businesses to compete for contracts and subcontracts; promote collaborative efforts with educational institutions, Federal agencies, and energy industry organizations to establish state-of-the-art research and development centers of excellence at the universities; conduct ongoing research programs to determine the effects (including the SocioEconomic and environmental effects) of national energy programs, policies, and regulations of the Department on minorities; facilitate small business growth in contracting opportunities with DOE, ensure that the Department is addressing the provisions of Executive Order 12898 and that the environmental justice strategies are being implemented in an effective manner; partnership with minority educational institutions, small and women owned businesses, and financial communities in order to enhance their upward occupational, economic and social mobility; implement the Civil Rights Act; enforce affirmative employment programs; and implement the Department's nationwide whistle blower reform initiatives. This office will work to (1) develop and maintain the framework and mechanisms for an aggressive Department-wide 10-Point Civil Rights, Affirmative Employment, and Equal Opportunity Plan; (2) establish and implement uniform employee concerns policies for resolution of environmental, health and safety, and human resources disputes, (3) foster and enhance diversity in the DOE workforce; (4) develop minority educational assistance programs, and (5) devise small business contracting plans. This program office will also implement African-American, Hispanic, Asian, and other minority educational assistance programs; evaluate contractor plans and performance to assure full implementation of the Department's Diversity Contract Clause; monitor the results of the 10-Point Civil Rights Plan with regard to hiring, promotions, training, and equitable treatment, ensure DOE Federal and contractor employees have effective means of voicing health, safety, environment, fraud, waste, abuse, whistle blower retaliation concerns; avoid prolonged and costly litigation through the use of alternative dispute resolution, including mediation; utilize greater management tools to assess effectiveness of employee concerns program to ensure employee concerns are considered fully, fairly and timely, and set forth a vision statement which fosters and embraces diversity throughout the Department.

Office of Small and Disadvantaged Business Utilization

The Office of Small and Disadvantaged Business Utilization is legislated by P.L. 95-507, for the oversight Departmental programs regarding the development and execution of policies and programs, to ensure that an equitable portion of the total contracts and subcontracts for the Department's services and supplies are procured with small business enterprises. This program effort is to achieve the Department's small business percentage goals to maintain current level of funding. The program activity level is appropriate based on OSDBU's responsibility within the Department for policy, plans, and oversight of execution of functions under the Small Business Act and Executive Orders 12073 and 12138.

- **Significant Accomplishments and Program Shifts**
  - Codified the comprehensive DOE/SBA Delegation of 8(a) Contracting Authority Memorandum

of Understanding and the Department's Diversity Plan.

- Coordinated and co-chaired various business expositions and partnering fairs such as the "Minority Enterprise Development Week."

- Collaborated, prepared and co-chaired the development of new training regulations with regard to Historically Under-utilized Business (HUB) Zone small and disadvantaged business contracting and wrote DOE policy recommendations for inclusion in "Building Communities for the 21st Century".

- Represented the Department at, and coordinated various Hispanic business activities such as the U.S. Hispanic Chamber of Commerce's Annual Awards Conference in Kansas City, the annual California Hispanic Chamber of Commerce Conference, and the Hispanic Association of Colleges and Universities Workshops in San Diego.

- Established an additional 10 mentor-protégé agreements between DOE and small disadvantaged businesses located in Richland, Washington, Oak Ridge, Tennessee, Beavercreek, Ohio, and Newington, Connecticut. 3 DOE Mentor-Protégé Program firms completed program and will now continue independently of ED. Coordinated Mentor-Protégé signing ceremonies between Oak Ridge National Laboratory and AIMSI, a 8(a) small disadvantaged business firm. Completed proposed DOE Mentor-Protégé regulations to replace Mentor-Protégé Initiative Final Guidelines published in the Federal Register.

- Developed a "Forecast of Contracting and Subcontracting Opportunities" for fiscal year 1999, containing 200 contracting and subcontracting opportunities totaling more than $250 million. Distributed copies to the National Network of Small Business Program Managers. The Forecast is available to the public on the Economic Impact and Diversity's web site.

- Reviewed Departmental procurement requests valued in excess of $3 million to ensure equitable contracting opportunities for small businesses to compete for the Department's acquisitions.

- Co-sponsored, coordinated and participated in 10 outreach efforts with women-owned and small, disadvantaged businesses at Federal, State, and local government seminars and private-sector expositions, workshops and technology fairs.

- Completed and submitted the "Report to Congress on Small Business Programs" for fiscal years 1994, 1995, 1996, and 1997

- Solicited participation of management and operating contractors into the DOE 8(a) Pilot Program, resulting in 2 new recruitments (Mason & Hangar Corporation, Albuquerque and TRW Environmental Safety Systems, Nevada.)

- Clarified rules of 8(a) Pilot Program to managers Department-wide. Increased award obligations from $119 million in FY 1997 to $142 million in FY 1998.

- Developed and launched a Department-wide women-owned small business campaign to provide outreach, marketing and training assistance.

- Initiated a DOE Headquarters Speakers Service for women-owned small business associations and organizations.

- Planned and co-hosted a DOE Headquarters women-owned small business marketing fair.

- Developed and coordinated the Secretary's Small and Disadvantaged Business Awards Program. Fifty-eight awards were presented in FY 1998.

- Created a "Useful Internet Addresses" list for use by the public sector.

- Provided telephone counseling to approximately 200 woman-owned small businesses

Office of Civil Rights

The Office of Civil Rights, mandated by P.L. 88-353, Title VII of the Civil Rights Act of 1964, as amended, enforces the Department's affirmative employment programs by assuring equal opportunity for all employees and applicants identifying and eliminating barriers to employment both physical and non-physical; and develops, monitors and implements an equal employment opportunity counseling, complaints, and investigations programs and leading diversity strategies for the Department. This program activity is a continuing level of effort and is based on implementing an aggressive Department-wide 10 Point Civil Rights Plan and statutory responsibilities to develop and administer Departmental policies, practices, and procedures to assure equal opportunity and to devise and integrate diversity in all workplace and business decisions.

- **Significant Accomplishments and Program Shifts**

  - Delivered timely service for formal EEO complaints by reducing the average EEO compliant processing time to 25 percent less than the allowed 180 days.

  - Delivered effective, tailored diversity training to Departmental organizations that are based upon program specific workforce data.

  - Delivered commemorative and special emphasis programs that educate and reach a greater number of the Departmental workforce.

  - Closed out 151 formal discrimination complaint cases: of which ED found no discrimination in 61 cases; found discrimination in 3 cases; completed 60 "final agency decisions"; dismissed 46, withdrew 7, and settled 34. In addition, ED completed 81 informal complaints. Currently there are 254 cases on hand.

  - Completed various Departmental Affirmative Employment Program activities and promoted shared vision of diversity throughout the Department by assuring work force diversity strategies.

Office of Employee Concerns

The Office of Employee Concerns (OEC) provides a focal point for employees to address the issues that concern them in a full, fair, and timely manner. OEC which typically handles approximately 500 environmental, health, safety and site security cases complex-wide, has adopted alternative dispute resolution (ADR) processes to facilitate the resolution of issues at the earliest possible stage. The expanded use of ADR is part of the DOE Strategic Plan. The Department's policy is that employees have the right and responsibility to report concerns relating to the environment, safety, health, security or

management of DOE operations. The OEC program activity level is based on environmental safety and health issues and possible ramp-up changes due to an increase in additional case work and functions previously handled by the Ombudsperson

- **Significant Accomplishments and Program Shifts**

  - Reduced long-standing employee concerns. Used calendar year 1996 figures as a baseline and reduced by 50% the number of open concerns in the 3-6 month category.

  - Produced the second annual "Employee Concerns Activity Report", widely used by DOE Principals and other senior management to review the number, type, and location of safety, health, environment, and site security concerns through the DOE complex.

  - Fully implemented a standard concerns tracking system Established a uniform system to retrieve necessary information regarding employee concerns from anywhere in the DOE complex within 24 hours.

  - Completed the proposed DOE Order 442.3 (to replace Order 5480.29 regarding the Department's safety and health program), and Policy Guidelines to formalize the employee concerns program. These documents will ensure common procedures and goals in the employee concerns program complex-wide

  - Mediated numerous whistleblower and equal employment opportunity (EEO) cases, reducing caseload as well as promoting the use of alternative dispute resolution processes. Specifically, out of 26 cases, 16 were successfully mediated, a 60% success rate

  - Completed and disseminated the first complex-wide employee concerns newsletter to inform employee concerns to managers, senior management, and stakeholders of significant developments in the subject area

  - Implemented a communication strategy to promote the employee concerns program by briefing the Secretary, Deputy Secretary, Field Managers, the Defense Nuclear Facilities Safety Board, DOE/Contractor counsels and participants at a whistleblower conference sponsored by American University and the Government Accountability Project.

  - Completed proposed changes to the Department's Contractor Employee Protection program, including drafting responses to the public comments received as a result of the Notice of Proposed Rulemaking.

  - Closed out a major DOE effort to identify and seek final resolution of "old whistleblower cases," i.e , cases involving employees alleging whistleblower reprisal between 1977 and 1992 for whom prior remedies were not available

Program Goal

- Ensure equitable opportunities for small, minority, and women-owned businesses to compete for contracts and subcontracts.
- Stimulate a diverse work environment that ensures full participation of all employees, and create

alliances with small and underutilized businesses and minority educational institutions.

- Uphold the Department's responsibilities to provide equal employment opportunity within the workplace.
- Implement the Department's whistleblower reform initiative - Continue support for the Employee Concerns Program to streamline the Department's resolution process and investigate reports of reprisals.

Program Objectives

- *Promote the Growth of Business Enterprises* — Support economic incentives for small and disadvantaged, women-owned and minority businesses through focused linkages with government-funded programs, such as the Small Business Administration and the Small Business Innovative Research Programs, and facilitate long-term investments.
- *Confirm the Department's Commitment for Excellence, Fairness and Results* — Integrate diversity in all workplace and business decisions, specifically as it relates to small business development, economic development, community outreach and involvement, educational programs and workforce opportunities.
- *Contribute to the Department's Commitment to a Policy of "Zero Tolerance"* — Implement guidance and policy, and investigate cases of reprisal against employees who raise environmental, health and safety, security and human resources issues. Implement the Department's Equal Employment Opportunity and Diversity Program Guidelines Guidelines elaborate on policies, procedures and responsibilities for the various civil rights and diversity programs.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Full Time Equivalents	40	43	42	-1	-2.30%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Salary and Benefits provide funding for full-time permanent and other than full-time permanent employees in the following classes: salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, Senior Executive Service and other performance awards, payments to funds for the benefit of employees, workman's compensation, and buyout compensation. A funding level of $3,991,000 will be needed to maintain 42 full-time equivalent staff positions (13 FTEs will implement the Minority Economic Impact Programs; 8 FTEs will provide Small and Disadvantaged Business Utilization support activities; 3 FTEs will fulfill whistle blower reform initiatives; and 18 will support Civil Rights functions).	3,554	3,676	3,991
Travel			
Travel provides funding in the amount of $116,000 to perform site visits regarding Research Program activities, minority educational institution assistance program activities; conduct employee discrimination complaint investigations; meet with minority business enterprise communities and financial institutions; provide support on diversity-related trips; sponsor the small and disadvantaged business management and technical assistance outreach activities; and to investigate unsafe and unhealthy whistleblower reports from field office employees.	86	116	116

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Other Related Expenses			
Other Related Expenses total funding of $939,000 of which $198,000 which will be used for investigating and reviewing employee discrimination complaint cases; sponsoring small and disadvantaged business exhibits, conference materials and other outreach activities; and implementing training and preparing fact-finding reports for whistle blower reform initiatives. $741,000 provides funding for the Working Capital Fund which supports utilities, telephone, rent, supplies, equipment, printing, graphics, copying, postage, etc.	713	908	936
Total, Program Direction	4,353	4,700	5,046

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 1999 vs. FY 2000 ($000)
Salaries and Benefits	
■ The increase is the result of a decrease of one FTE offset by an increase for health insurance premiums, the full effect of the FY 1999 pay raise, and the partial effect of the FY 2000 pay raise.	+315
Other Related Expenses	
■ Working Capital Fund: The increase is the result of small increases expected in the following business lines: rent, supplies, equipment and printing and graphics.	+31
Total, Funding Change, Economic Impact and Diversity	+346

Other Related Expenses

Total, Other Related Expenses	713	908	939	+31	3.4%

Minority Economic Impact Program Support

Program Mission

The Office of Economic Impact and Diversity (ED) is mandated by various legislation and Executive Orders to advise the Secretary of Energy on the impacts of energy policies, programs, regulations, and other Departmental actions on under-represented communities, minority educational institutions, and small and women-owned business enterprises. ED's Program Support dollars are used for the functions of the Minority Economic Impact (MI) Programs The mandate requires that MI. a) conducts a SocioEconomic Research and Analysis Program to develop and assess energy consumption data and integrate the data with the National Energy Modeling System to provide equity determinations and other policy-related analyses and economic assessments as specified in P.L. 95-619 Section 211; b) provides Management and Technical Assistance Programs to support minority educational activities focused at various levels of the educational pipeline and provide technical and scientific educational capabilities; and c) provides technical training, financial assistance, and small business assistance programs to enhance economic development capabilities among under represented population segments. To augment program assistance efforts, the Minority Energy Information Clearinghouse serves as a centralized repository and dissemination point and is responsible for the design and maintenance of web sites for the ED organization. In addition, coordination and implementation of the Department's environmental justice activities, as required by Executive Order 12898, continue to be implemented within ED.

Program Goal

The Office devises and leads multi-faceted programs and activities as it recognizes the fact that our Nation's ability to compete in a global economy depends on the development of our national resources among all segments of the population. The goals and objectives of ED are focused to contribute to our Nation's energy security objectives, economic prosperity, and equity determinations in energy policy decision-making. Accordingly, program elements include:

- Implement a comprehensive agency-wide scientific research and education program for the participation of minority educational institutions in Department of Energy missions and functions
- Conduct ongoing research programs to determine the effects (including the socioeconomic and environmental effects) of national energy programs, policies, and regulations of the Department on minorities.
- Bolster and develop effective financial business incentives and initiatives to encourage minority financial institutions to link with business enterprises in facilitating long-term economic development.
- Sustain focused management and technical assistance programs with educators, to encourage youths to study in the diverse area of energy related curriculums and technologies.

- Ensure that the Department is effectively addressing the provisions of Executive Order 12898 and that environmental justice strategies are being implemented in an effective manner.
- Provide management and technical assistance to minority business enterprises to assist their communities with economic development efforts.

Program Objectives

- *Contribute to Our Nation's Energy Security and Industrial Competitiveness* — Design initiatives for scientific training and research programs in the mathematics and science disciplines; support the development of research and educational infrastructure at Historically Black Colleges and Universities (HBCUs) and minority educational institutions; establish synergistic linkages with industry and the national energy laboratories which will increase the technical capabilities of the labor force in the energy industry and improve the current critical deficient levels
- *Enhance our Nation's Minority Educational Resources* — Support the research and educational infrastructure at secondary and post secondary educational institutions; invest in human resources at all levels of the educational curriculum through improved scientific training and research experiences in mathematics, science, and engineering for both teachers and students, and utilize the resources of Federal and private sector laboratories and energy technology industries.
- *Enhance our Nation's Energy Resources and Environmental Quality* — Continue to support the Department's National Energy Strategy by developing and implementing effective methods of determining the distribution and employment effects associated with related energy policies and programs of the Department among various population segments. Improve the analytical capability to identify cost-effective efficiency increases in various energy use sectors and also to incorporate equity issues into energy and environmental policy decisionmaking. Identify, develop, and implement programs and policy options to soften adverse impacts of energy and environmental policies, programs, and regulations on various population segments. Ensure that the Department is effectively implementing environmental justice strategies to address Executive Order 12898 on environmental justice and addressing the issues of our stakeholders.

Performance Measures

- Increase funding to Minority Institutions by 5 percent over FY 1999
- Provide two technical assistance seminars for disadvantaged businesses to improve their performance in the energy sector of the economy on a regional basis.
- Publish, in the Code of Federal Regulations, the DOE Mentor-Protègè Program.
- Enhance America's science workforce by partnering with the Department to ensure that minority serving institutions are afforded and take advantage of the Federal research, development, education and equipment opportunities for which they are eligible and increase their awards by 5 percent over FY 1998.
- Commit to specific procurement strategies that will increase the participation of women-owned small businesses in the Federal marketplace through a Memorandum of Understanding with the Small Business Administration.
- Provide expanded access to information on health related risks from operating our facilities to ensure that minority low-income populations, which may be disproportionately adversely impacted by DOE facilities, understand the Department's environmental justice goals and strategies.
- Implement the environmental justice philosophy into DOE's operational activities by a) achieving at least 15 percent increased level of community interaction at DOE's public meetings; b) developing specific criteria for evaluating effective implementation of environmental justice principles of DOE's M&O Contractors, and c) achieving at least 10 percent increased clean-up of hazardous wastes in communities impacted by DOE's operations.

Significant Accomplishments and Program Shifts

Office of Minority Economic Impact

- **Socioeconomic Research and Analysis Program (SERAP)**

  - Analytical work at the disaggregate level will be developed to facilitate effective energy policy decision-making regarding the impact of the recent restructuring of the electric utility industry and also to focus on economic development issues regarding specific regions and different population groups.

  - Analytical tools, such as the socioeconomic data bank, will be updated and augmented to reconstitute energy consumption and expenditure details at the household level and by Census regions. This will facilitate more comprehensive forecasts of the distributive impact of energy policies, programs, and activities on different segments of the population and also address the equity issue in energy policy determinations.

  - Department of Energy's (DOE) Environmental Justice Program – Publication and dissemination of the Department of Energy's *"Subsistence and Environmental Health Newsletter"* will be

continued to address the risk communication prototype program included in DOE's Environmental Justice Strategy, dated April 1995. Specific focus will be on a) the severity of health problems associated with the consumption of contaminated fish and wildlife by some ethnic populations, b) the development of a "Web-based Resource" to address issues relating to Executive Order 12898, which focuses on environmental justice, and c) addressing DOE's strategic goal of environmental quality

Management and Technical Assistance Program: Minority Education

- Convene two meetings per year with educational institution presidents and interested community leaders to provide opportunities for collaboration in economic development activities.

- Implement at least one new interagency agreement between diverse educational institutions, other Federal agencies, and the energy industry for the purpose of establishing one new high technology research and development center at one of these institutions.

- Conduct at least two opportunity workshops with representatives from minority educational institutions to encourage submission of proposals within specific DOE program areas

- Facilitate collaborative research and development efforts between educational institutions and the Department's national laboratories by sharing facilities and human resources.

- Continue the Minority Technical Education Program, emphasizing community colleges' needs to develop curricula with infrastructure support and promote partnerships with industry and national laboratories as a means of promoting economic growth in surrounding communities. In addition, increased opportunities will be provided for successful bridge programs from two-year and four-year institutions leading to careers with energy-related industries

- Expand the Southeastern Consortium for Minorities in Engineering (SECME) program to include partnerships with other pre-college programs aimed at improving teacher training and science curricula materials.

- Facilitate efforts to expand participation of high schools in the Department's Regional and National Science Bowl competitions.

- Convene an annual meeting of minority educational institution presidents with the Secretary of Energy to discuss areas of interest for participation of their institutions

Management and Technical Assistance Program: Business and Community Development

- Demonstrate DOE as a model organization that fosters and embraces diversity by committing to equity, inclusion, opportunity, accommodation, and non-discrimination

- Improve the work environment to increase productivity, enhance employee development and establish DOE as a place where women and minorities want to work

- Promote diversity on a continuous basis in ways which are visible to the entire work force.

- Promote focused, multi-stakeholder, and self-sustaining institutional structures for minority communities

- Assess the status quo of minority communities to analyze and evaluate the lessons learned over the past few decades and speculate about future direction

- Facilitate the creation of partnerships at local, regional, and national levels among government, business, industry, and academia for the implementation and execution of activities, programs, initiatives and projects.

- Foster more successful business opportunities, economic development, community development and enhance energy efficiency and innovative technology deployment with minority businesses.

- Promote international business partnerships through the Africa Growth and Opportunity Act and the North American Free Trade Agreement to build minority economic development while exporting US technology.

- Facilitate participation and support of Native American-owned and tribal controlled businesses in contract opportunities with the Department, and Historically Under-represented Business (HUB) Zones.

- Provide outreach, training, and customer service initiatives designed to encourage minority owned firms to actively participate in electronic commerce

Management and Technical Assistance Program: Bank Deposit Financial Assistance

- Develop strategies which will be utilized in encouraging joint ventures with minority financial institutions and business communities.

- Recommend to minority financial institutions that they increase their debt capital by providing loans to minority owned businesses in order to increase services to secondary business markets.

- Identify eligible minority financial institutions to increase diversity of Trustee Banks

Site Description

Sandia National Laboratories

Sandia National Laboratories has a long history of successful partnerships with the private sector and academia, whether through relatively simply technical assistance arrangements with small business or collaborative technology development with large companies or a consortium. To make its resources more easily available to small businesses, Sandia has established a Small Business Initiative with user facility agreements to allow small business technical personnel to gain access to many of Sandia's facilities and equipment. Sandia's Energy and Environment organization supports DOE customers, other government agencies, and U.S. industry with effective science and engineering solutions that improve our national security and the quality of our environment. Sandia National Laboratories was one of the first to implement a Strategic Plan for Diversity and outreach to the neighboring community.

Argonne National Laboratory

Argonne National Laboratory, located in southwest Chicago, Illinois, is the Nation's first national laboratory, chartered in 1946. Its multi-disciplinary workforce is optimized for productivity and its management is based on objective management of performance. During the past 15 years, DOE's SocioEconomic Research and Analysis Program (SERAP) has utilized a multi-disciplinary team at Argonne to establish a unique SocioEconomic data bank, by population categories, and to generate numerous unparalleled energy policy assessment models which have provided input into Departmental decision making regarding energy policies and use patterns, energy policy impacts, and the overall issue of equity and energy policy. This information for the SERAP has been generated into PC software, in the majority of cases, to enable DOE to share the models and other information with other energy regulators, such as public utilities commissions and other energy industry organizations and congressional staff members. The information has also been disseminated to our stakeholders through DOE's National Information Clearinghouse. The data bank incorporates information from the Energy Information Administration's periodic surveys and numerous other major energy-related relevant data bases. The unique level of detail which this data bank continues to provide for the SERAP has enabled DOE to base its energy policy decisions on a disaggregate level of detail rather than at the national level. The program is mandated by P.L. 95-619, Section 211(a)(b)(c) to advise the Secretary on the effects of energy policies and regulations on various population groups.

Oakland Operations Office

The Oakland Operations Office (OAK), located in Oakland, California, is one of several operations offices nationwide dedicated to achieving U.S. Department of Energy goals through quality programs and cost-effective business management OAK began as a small Atomic Energy Commission area office to coordinate the "Big Science" programs at Lawrence Berkeley Laboratory. As industry and new laboratories with diverse interests became established, OAK grew, becoming responsible for more contracts, nationwide programs, grants and management serving key Headquarters (HQ) customers. OAK serves the public by executing programs, performing contract management, and conducting operational oversight of National Laboratories, research and development contractors and grantees in support of Department of Energy requirements and priorities. OAK operates a cost-effective matrix support organization while servicing HQ customers OAK's functions include integrating and coordinating HQ funding, program direction, functional policy direction, and guidance through the Financial Assistance Center.

The Office of Economic Impact and Diversity (ED) is one of OAK's key HQ customers Oakland's financial Assistance Center is one of the Department's Center of Excellence, with the awarding and administration of numerous grants annually In addition, OAK has significant experience in managing nationwide programs and in providing technical assistance to various educational institutions. OAK has provided program management and grant administration services to ED for over 17 years. In 1987, the Minority Honors Training and Industrial Assistance Program (Honors) was established by ED. OAK assisted in developing and competing the program nationwide, and continues to award and administer the program The program was restructured by ED in 1993, with OAK's assistance, was competed nationwide, and renamed the Minority Technical Education Program (MTEP). As a result of nationwide competition, OAK assisted with the awarding of eight grants for this ED Program and is currently

managing the administration of the grants. The goal of MTEP is to enhance minority post-secondary two-year educational institutions capacity to increase the number of minorities in mathematics, computer sciences, life sciences or engineering careers, and to strengthen the quantity and quality of energy-related technical and academic curricula.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL), based in Oak Ridge, Tennessee, is responsible for major DOE programs in energy research and development, in environmental management, biomedical and environmental sciences and technology, and numerous other areas. The staff at ORNL reflects a multi-discipline team of experts with an unceasing focus on understanding and assisting stakeholders. ORNL also collaborates with staff at the University of Tennessee. In addition, the staff also collaborates with the National Center for Environmental Decision-Making Research, which is funded by the National Science Foundation. ORNL staff assist this Office with the development of a tri-annual DOE subsistence and Environmental Health Newsletter and a related web site; a major component of a risk communication prototype program to address the severity of the problems associated with consuming contaminated fish and wildlife by some ethnic populations. This program was included in DOE's Environmental Justice Strategy for addressing Executive Order 12898 on Environmental Justice. The collaborative efforts in place at ORNL has heightened the quality and validity of the Newsletter articles which provide very focused information and a special "Readers' forum" for our readers and stakeholders to have their perspectives and information on relevant issues included in the Newsletter. Also included are activities of some States that are related to links between subsistence patterns and environmental health. Project-specific stories, participatory research involving community members and work initiated on pueblos, and urban subsistence and environmental health issues are also addressed.

The Oak Ridge National Laboratory (ORNL) is a multi-program science and technology laboratory that conducts basic and applied research and development to create scientific knowledge and technological solutions that strengthen the Nation's leadership in key areas of science, increase the availability of clean, abundant energy; restore and protect the environment and contribute to national security. ORNL collaborates with industry, universities and other Federal laboratories to pursue the Department's missions, and strives to increase awareness of cooperative research and technical assistance opportunities available for small and minority businesses. As the only national laboratory in the Southeastern U.S., ED places a strong emphasis on building collaborative relationships for businesses and minority educational institutions in this region.

Minority Economic Impact Program Support

Mission Supporting Goals and Objectives

SocioEconomic Research and Analysis Program (SERAP)

The SocioEconomic Research and Analysis Program is mandated by P.L. 95-619. In carrying out this mandate, the Department recognizes the fact that our Nation's ability to compete in a global economy depends on the development of our national resources among all segments of the population. This program will continue a minimum level of effort to develop and enhance the analytical tools and software to a) provide a credible quantitative framework for long-term analysis of energy environmental issues; b) assist the Department in building a consensus on energy issues; c) assess the impacts of energy programs, policies, legislative and regulatory proposals; d) establish innovative methods by which massive energy and SocioEconomic database systems can be integrated for long-term analyses and forecasting of energy and environmental data and other information; and e) develop a distributional analysis module for the National Energy Modeling System for impact decisions by geographic regions, low-income groups, and Native American Tribal governments. The Research and Environmental Justice Program efforts relate to the strategic goals of energy resources and addresses a continuing level of effort, as required by its legislative mandate and overall energy policy needs.

Management and Technical Assistance (M&TA)

The Management and Technical Assistance (M&TA) provides technical assistance to minority educational institutions and minority business enterprises to enable them to participate in market research, planning, economic and business analysis, and program and contract opportunities within the Department. To augment these efforts, the Minority Information Clearinghouse serves as a centralized repository and dissemination point. Enhance minority participation in the energy technology industry by supporting the research and education infrastructure at minority educational institutions. Invest in human resources at all levels of the educational curriculum through improved scientific training and research experiences in mathematics and sciences, for both students and teachers. Incorporate the technical resources of Federal and private sector laboratories and energy technology industries to assist under-represented students to pursue careers in mathematics and sciences. Encourage innovation and business entrepreneurship which will improve the level of competition in the energy arena. This program is used to develop effective mechanisms to. a) encourage and promote under represented population groups to pursue scientific and technical energy-related training at all levels of the education pipeline; and b) assert the support for small businesses by assisting them through developing a climate that is conducive to integrating their capabilities with the Department's needs.

Financial Assistance Program

The Financial Assistance Program is mandated by P.L. 95-619, to provide short-term deposits of Federal funds in minority-owned financial institutions. Under this program, non-appropriated funds obtained through consent decrees in the Economic Regulatory Administration's Petroleum Violation Escrow

Account are deposited in short-term certificates of deposit in minority financial institutions to be used as the additional capital for loans and investments in their respective minority communities. The continued level of funding is essential in order to provide eligible participants with available working capital to stimulate economic development and growth for minority business development in inner-cities.

FY 1998 and FY 1999 Significant Accomplishments

- **SocioEconomic Research and Analysis Program (SERAP)**

  - Under the sponsorship of the Baltimore Urban League, two presentations were made by members of the SocioEconomic Research and Analysis (SERAP) team. Attendees at each of the presentations included elected officials, public service commissioners, public utilities executives, educators, and members of community based organizations. The presentations were made at: a) the Minority Energy Technical Assistance Program in Tucson, Arizona. Discussions focused on "SocioEconomic considerations for electric Industry Restructuring," and other issues such as: market power, uncertainty and reliability, stranded costs, stranded benefits (low income assistance and environmental protection), aggregation, and relevant consumer information. b) The presentation at the Minority Energy Technical Assistance Program in Denver, at the Colorado Urban League focused on the overall mission of the SERAP, the legislative mandate and other rationale for the program, the objective of developing disaggregated analysis of the impact of energy policy, characterizing energy use patterns of energy use by minority households in different regions of the U.S. and the impact on the equity issue and the energy expenditure share of income by population group and Census regions and the impact of situational factors on energy consumption outcomes.

  - Gave presentation at the National Center for Environmental Decision-making Research (sponsored by the National Academy of Sciences). Conducted workshop on "Challenges of Environmental Justice Issues" at the national, regional, and local levels. Interacted with Federal, Tribal and State governments, creating an organizational structure for effective interactions; and developed core performance measures.

  - Developed and co-authored with DOE's Office of Environment, Safety and Health a guidance document for DOE employees involved with environmental safety health activities on "Incorporating Environmental Justice Principles into the Comprehensive Environmental Response Compensation Liabilities Act Process."

  - Initiated the planning and development and editing of the 3rd Volume of "*Subsistence and Environmental Health*", a U.S. Department of Energy Environmental Justice Newsletter, Fall 1998 issue. Articles focused on issues such as tradition, culture, and food safety, mercury dose reconstruction, food preservation and health, health effects of consuming fish from contaminated urban waters, in addition to more detail on fish consumption and health, such as the dangers of bioaccumulation. Approximately 3500 copies were printed, with some DOE offices requesting bulks of 100 copies for use at relevant conferences.

Management and Technical Assistance Program

- Continued the Minority Technical Education Program with 8 community colleges to provide bridge programs and technical training for science and technology students

- Continued the SECME (formerly Science and Engineering Consortium for Minorities in Engineering) program with 26 elementary, middle, and high schools in the District of Columbia and 13 middle and high schools in Prince George's County public schools, resulting in 12 high school seniors entering college to pursue science, engineering, mathematics, or technology degrees.

- Coordinated the Department's National Historically Black Colleges and Universities Program, which included a showcase of 15 HBCU exhibits of Departmental partnerships and presentation of a grant to the National Association for Equal Opportunity in Higher Education (NAFEO) to develop a science resume for HBCU students. Awarded a grant of $140,000 to NAFEO to develop a science resume system to give graduate schools access to HBCU science and technology graduate students' resumes for greater opportunities for choice graduate school admissions and financial assistance.

- Coordinated the first District of Columbia Science Bowl with 13 District of Columbia public high schools and 1 private school.

- Sponsored a technical assistance workshop of 150 participants from 56 HBCUs during the annual conference of the National Alliance of HBCU Sponsored Program Administrators at Norfolk State University, Norfolk, Virginia.

- Partnered with the 100 Black Men of Los Angeles Education Committee to provide 23 scholarships/fellowships to high achieving minority students pursuing degrees in science, mathematics, engineering and technology degrees.

- Facilitated continued funding of the Historically Black Colleges and Universities/Minority Institutions consortium and Spelman College from the Office of Environmental Management.

- Facilitated education and building projects under the auspices of the Gore-Mbeki Bi-National Commission including expansion of a township development pilot project where U.S. government funding has complemented U.S. private sector innovation in the areas of energy efficient housing, energy small business entrepreneurship, and renewable energy training.

- Facilitated collaborative relationships with the private industry, through the International Power Institute, to study the economic, political and cultural environments in targeted developing countries in order to make appropriate technology based recommendations to provide for increased markets for U.S. technologies.

- Implemented a pilot project, CREATE 21, – Consortium for Revitalization through Advanced Technology-Based Economic Development, to assist businesses, industries and communities to adopt near-term energy efficient technologies in local communities.

- Began Phase I of a strategy that can be implemented to create more effective partnerships between minority businesses and minority educational institutions to increase and enhance entrepreneurial development for both institutions.

- Sponsored a two-month study tour for five senior members of South Africa's Department of Minerals and Energy to support South Africa in the process of rebuilding its energy sector into a key modern, market-oriented, and environmentally sensitive component of its infrastructure.

- Partnered with the Department of Justice on an interagency project in support of Native American owned businesses and interests

Financial Assistance Program

- Increased the level of funding for participating Minority Financial Institutions from $201.4 million to $213.4 million which represents a $12 0 million increase over the previous fiscal year.

- The Department of Energy placed 2,246 certificate of deposits in Minority Financial Institutions which provided an infusion of capital in the communities served by participating Minority Financial Institution in 22 deposits of $2,090

- Expanded the Bank Deposit Financial Assistance Program by increasing by six the number of minority financial institutions participating in the Department's program.

- Provided deposits to new participating Minority Financial Institutions that will increase opportunities for small and minority businesses to obtain entrepreneurial capital as well as alternative financial services.

Funding Schedule

(dollars in thousands)

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
SocioEconomic Research and Analysis Program			
Provides funding for a quantitative framework for determining the effects of national energy policies, programs, and regulations on minorities; to provide regional socioeconomic and other information and related analysis of DOE's policies and programs, on a comparative basis; and to develop focused technical assistance relating to new energy technologies for minority businesses and minority communities	150	150	150
Management and Technical Assistance Program			
Provides funding for Minority Educational Institutions Support programs designed to broaden the participation of minorities in the Department's research, development, and demonstration and training programs through the development of improved scientific research and related capabilities at minority educational institutions.	750	808	808
Provides funding for Business and Community Development program activities which offer management and technical assistance to minority business enterprises to enhance their opportunities to participate fully in the energy programs of DOE.	570	542	542
Financial Assistance Program			
Provides funding for the Bank Deposit Financial Assistance Program which provides short-term deposits of Federal funds in minority-owned financial institutions.	180	200	200
Total, Minority Economic Impact	1,650	1,700	1,700

Contract Reform and Privatization Project Office

Mission Supporting Goals and Objectives

The Contract Reform and Privatization Office's (PC) mission is to act as the principle advisor to the Secretary in the formulation, guidance, and implementation of the Department's privatization and contract reform initiatives. The office represents the Department on privatization and contract reform matters in dealings with Congress, other Federal agencies, and various stakeholders. It participates in reviews at various stages of privatization projects including acquisition planning, budgeting, and the development of Requests for Proposal (RFP) and contracts, and has concurrence authority on all major procurement actions.

The PC will ensure that privatization and contract reform initiatives are conducted with the most effective and cost-efficient contracting systems, techniques and practices available for mission accomplishment, and will stimulate innovation in order to better manage change in departmental programs and to help ensure a proper allocation of risk in business and management strategies.

This office will work to strengthen and coordinate the policy, planning and guidance capabilities of the Department to provide an integrated management approach in privatization and contract reform projects to ensure the success of the Department's mission It will also assist in addressing and meeting the critical human resources needs across the Department to successfully implement privatization and contract reform projects In addition, the PC will provide systematic analyses of key areas of privatization and contract reform to determine whether on-going approaches should be continued, improved, or discarded.

Performance Measures

- Hire a privatization director, develop a Department-wide privatization strategy, and identify and pursue privatization opportunities.
- Establish a clearinghouse for Department-wide "lessons learned" and "best practices" that embody the work of Headquarters and Field elements, and that recognize the diversity of the Department's mission and its facilities and contractors
- Develop and conduct relevant training sessions, workshops and conferences on diverse topics, such as proper risk allocations, financial engineering, and consistent implementation of performance measures.
- Collect, categorize, analyze, and validate "best practices" of the government and private sector, and determine the most effective manner in which they can be integrated into Department operations.
- Partner in the development of protocols for the recruitment, allocation, and deployment of jobs to meet the changing needs of the Department and in successfully implementing changing contractual practices

Funding Schedule[a]

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salaries and Benefits		643	943	+300	+46.7%
Travel		175	175	0	0%
Support Services		2,130	1,830	-300	-14.1%
Other Related Expenses		252	252	0	0%
Total, Contract Reform and Privatization		3,200	3,200	0	0%
Full Time Equivalents		5	7	0	0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
The salaries and benefits reflect that this newly created office will require a small core group of full-time permanent employees. The resources listed here are based on the concept of a small office that would coordinate and facilitate privatization and contract reform activities throughout the Department. This category includes: salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, Senior Executive Service and other performance awards, payments to funds for the benefit of employees, and workman's compensation.		643	943
Travel			
Travel funds finance staff travel for Department-wide activities in contract reform and privatization areas, such as advance acquisition planning, development of site management strategies, project reviews, workshops, and training.		175	175

[a]In FY 1998, funding for this program was provided within the Environmental Management program office budget. In FY 1999, the Energy and Water Development Appropriations Act, P.L. 105-245, identified separate funds for PC.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Support Services			
Support services will finance skills in key areas, such as finance engineering, risk allocation, complex legal and tax matters, and private sector project management expertise. These skills are limited within the Department. The plan recognizes the need to supplement the skills of the new Director and current staff with contract support on an as needed basis.		2,130	1,830
Other Related Expenses			
Other related expenses will finance the acquisition of goods and services that support the office mission and are not considered support services. They include working capital fund, rent, supplies, telephone service, ADP support, etc.		252	252
Total, Program Direction		3,200	3,200

Explanation of Funding Changes FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ The $300,000 increase consists of hiring 2 additional senior level employees, the partial effect of the FY 1999 pay raise, and the full effect of the FY 2000 pay raise.	+300
Support Services	
■ With an increase in federal staffing resources and skills mix, the reliance upon contractor Support Services will decrease accordingly in FY 2000.	-300
Total Funding Change, Contract Reform and Privatization	0

Support Services[a]

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Technical Support[b]		1,100	1,000	-100	-9.1%
Management Support[c]		700	600	-100	-14.3%
Special Studies[d]		330	230	-100	-30.3%
Total, Support Services		2,130	1,830	-300	-14.1%

Other Related Expenses[a]

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Working Capital Fund		77	77	0	0%
Training of Federal Staff		75	75	0	0%
Outreach Activities		50	50	0	0%
Acquisitions		50	50	0	0%
Total, Support Services		252	252	0	0%

[a]In FY 1998, funding for this program was provided within the Environmental Management program office budget. In FY 1999, the Energy and Water Development Appropriations Act, P.L. 105-245, identified separate funds for PC.

[b]Technical Support includes support to privatization planning projects in the areas of financial engineering analysis, risk allocation, and complex legal and tax matters as they relate to negotiations of contract reform and privatization contracts in the complex.

[c]Management Support includes training and educational development in the areas of project financing, value management, risk allocation training. It also includes putting on workshops.

[d]Special Studies include tax analysis, alternative contracting methods, economic and environmental analysis, safety risk analysis, international privatization projects, and lessons learned with applicability to DOE.

Cost of Work for Others

Mission Supporting Goals and Objectives

The Cost of Work for Others (CWO) program provides funding to the Department of Energy's (DOE) multi-purpose field offices and national laboratories to finance the cost of products and services requested by non-DOE users, both foreign and domestic. The products and services provided by the Department under this program generally are not available from alternate sources and 1) are a revenue program which results from a budgeted mission of the Department; or, 2) are reimbursable work for non-federal entities where the sponsor is precluded by law from providing advance funding. The costs of the Cost of Work for Others program are offset by revenues received from the sale of products and services to our customers.

The goals for this program are continued access to the department's laboratory complex and availability of by-products for sale to these non-federal customers. The CWO program satisfies the needs of our non-federal customers. For this reason, performance evaluation for this work is the responsibility of our customers. The success of this program is indicated by the steady stream of business from the targeted groups.

A new activity added to the Cost of Work Program in FY 1997 was a portion of the Department's Foreign Research Reactor Spent Fuel Program. This program which involves the receipt and storage of foreign research reactor spent fuel is provided for in the Cost of Work Program only to the extent of revenues provided. In addition to the funding provided here, the Defense Environmental Management Appropriation includes $9,200,000 in FY 1998; $9,500,000 in FY 1999 and $9,800,000 in FY 2000 at the Savannah River site and $10,100,000 in FY 1998; $8,716,000 in FY 1999 and $7,800,000 in FY 2000 at the Idaho site, to support those activities associated with the Foreign Research Reactor Spent Fuel program which are not offset by revenues, including all costs associated with spent fuel returned from other than high income nations.

Funding Schedule

(dollars in thousands)

Use of Prior Year Balances	0	0	-6,672	-6,672	>999
Total, Cost of Work for Others	37,470	44,312	27,355	-16,957	-38.3%

[a]FY 1998 reflects reduction of $3,000,000 in budget authority to fund spent fuel receipt, storage and management activities at Savannah River.

[b]FY 1998 reflects reduction of $1,500,000 in budget authority to fund spent fuel, receipt, storage and handling activities at Savannah River.

[c]FY 1998 reflects supplemental of $5,408,000, $4,500,000 in budget authority identified above in footnotes a and b and the use of $1,570,000 in prior year balances.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Products Sold:			
Savannah River Operations Office			
■ Support forest management and the sale of timber by the U.S. Forest Service. The funding level was derived based on the personnel costs for the 32 FTEs of the U.S. Forest Service who support the Savannah River timber management program, and the historical costs, adjusted for inflation, associated with contractual support for services, radio maintenance, reforestation activities surveying and monitoring of protected, endangered and threatened species, archeology surveys and various research studies.	4,080	4,561	5,149
Services Performed:			
Albuquerque Operations Office			
■ Provide miscellaneous services for state and local governments, such as highly specialized computer and automation support at the Sandia and Los Alamos National Laboratories and sale of utilities to the County of Los Alamos at Los Alamos National Laboratory.	3,600	2,500	2,500
Argonne National Laboratory			
■ Support research activities for state and local governments such as the support of the Chemical Stockpile Emergency Preparedness Program operated by the Alabama Emergency Management Agency. The funding level was derived based on an analysis and of the expenses for providing the specific research activities requested by the State of Alabama..	725	75	1,200
Brookhaven National Laboratory			
■ Provide for the sale of isotopes and the sale of foreign and domestic data bank sales. Continue to miscellaneous activities for state and local governments. The funding amount was estimated based on extensive historical data of the costs of producing these isotopes, data banks and miscellaneous services.	759	1,570	968

54-291 99 - 53

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Chicago Operations Office			
■ Provide certified reference materials used by the Nuclear community at the New Brunswick Laboratory. The level of funding was derived based on historical sales of certified reference materials and the costs associated with projected new sales.	100	150	150
Idaho Operations Office			
■ Receive, manage and provide interim storage of Foreign Research Reactor Spent Fuel.	0	3,100	1,800
Lawrence Berkeley Laboratory			
■ Conduct work for state and local governments and non-profit organizations including tritiation of compounds; R&D on environmental remediation; vacuum evaporation of elements on various detectors; provide high resolution scanning electron microscopy for chemical analysis of detenin for an NIH project; support NIH research on the relationship of materials used in medicine; and construction of a model to be used in sickle cell anemia research. The requested level of funding was derived using a variety of methods including: zero based budgeting, specific cost reviews with adjustments for inflation, trend analysis, and use of expert opinions in cases where an activity was not previously performed.	4,296	9,157	1,768
Lawrence Livermore Laboratory			
■ Conduct work for for state and local governments and non-profit organizations including structural inspection of dams and water contaminants for the California Dept. of Water Resources; projects supporting the California State Dept. of Transportation; research for the California State Tobacco Related Disease Program; studies on genetic defects for UC Berkeley; and measurement of samples at the Accelerator Mass Spectrometry Center at LLNL for the UC-San Francisco. The level of funding was derived based on a projection of the specific costs associated with performing the above work. These costs include: salary and benefits for lab employees, associates post doc/ graduate students, summer students, consultants, and supplemental labor; lab admin charges, subcontractors, and equipment.	6,577	3,410	3,184

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Oak Ridge Operations Office			
■ Provide miscellaneous services for state and local governments including providing treated water to the City of Oak Ridge and universities. The estimate is based on the historical operational costs adjusted for inflation of the water plant used to provide treated water to the City of Oak Ridge and analysis of the historical costs adjusted for inflation associated with providing each of the requested services as stated in the statements of work to the requesting state or local government. These costs include staff resources, supplies, materials and contractual expenses.	1,781	1,386	1,515
Oak Ridge National Laboratory			
■ Provide miscellaneous services for state and local governments including research of high temperature materials; analysis of transportation systems; magnetic fusion transportation of nuclear waste; preparation of materials for transmission electron microscopy characterization; irradiation services; and various environmental modeling, analysis and assessments. The estimate is based on an analysis of the historical costs adjusted for inflation associated with providing each of the requested services as stated in corresponding statement of work. These costs include staff resources, supplies, materials and contractual expenses required to perform the service.	774	2,903	3,093
Oakland Operations Office			
■ Support particle physics collaboration with Japan and other development efforts at the Stanford Linear Accelerator Center (SLAC). The funding level is based on the historical costs of labor, materials and services required to provide these activities.	3,300	3,000	3,000
Savannah River Operations Office			
■ Receive, manage and provide interim storage of Foreign Research Reactor Spent Fuel. The funding level was derived based on the historical transportation costs of a shipment from a country, unloading costs for a shipment, satellite tracking costs, and overland shipment support activities such as emergency preparedness training and other needs of the country or sate involved with a shipment.	11,478	12,500	9,700

Miscellaneous Revenues

Mission Supporting Goals and Objectives

Miscellaneous Revenues are received from the sale of by-products that have no cost associated with the Departmental Administration appropriation. These items are by-products of activities funded by other on-going departmental programs and are collected as miscellaneous revenues. Included in this estimate are revenues collected from the Reimbursable Work program for added factor and depreciation.

Inspector General

Office of Inspector General

Proposed Appropriation Language

For necessary expenses of the Office of Inspector General in carrying out the provisions of the Inspector General Act of 1978, as amended, [$29,000,000] *$30,000,000*, to remain available until expended.

Inspector General Program Direction

Mission Supporting Goals and Objectives

Program Mission

Major statutory responsibilities of the Office of Inspector General (OIG) are to detect and prevent fraud, abuse, and violations of law and to promote economy, efficiency, and effectiveness in the operations of the Department of Energy (DOE). In addition, the President and Congress have directed the OIG to assume other responsibilities, such as performing financial statement audits, intelligence oversight, and audit of the operation of the value engineering program in DOE

The OIG's goals, objectives, and performance measures follow.

Program Goals

- Conduct statutorily required audits of the Department of Energy to enhance the public's ability to rely on the Department's financial and management systems
- Conduct performance reviews, which promote the efficient and effective operation of the Department of Energy's business lines.
- Conduct investigations to promote efficient and effective Department operations and maintain the integrity of the Department of Energy's business lines by aggressively pursuing fraud, waste, and abuse.
- Conduct inquiries, which assist in fostering public confidence in the Department of Energy.

Program Objectives

- Complete Chief Financial Officers Act (CFO), Government Management Reform Act (GMRA), and other audits by established due dates.
- Identify and report significant systems' deficiencies, thereby enabling the Department to take corrective action and demonstrate improved stewardship of public resources.
- Focus performance reviews on those issues and programs having the greatest potential for the protection or recovery of public resources
- Conduct oversight, consistent with Executive Order requirements, of the Department's intelligence programs.
- Conduct investigations of allegations of violations of criminal and civil Federal law, as well as serious administrative misconduct, in order to facilitate successful prosecutions and administrative actions that maximize recovery of public resources and deter future wrongdoing.
- Maintain investigative inter-agency cooperative efforts to combat fraud, waste, and abuse.
- Make recommendations for positive change in Department program operations through the issuance of administrative reports to management resulting from investigations

- Conduct proactive investigative efforts focusing on areas most vulnerable to fraud, waste, and abuse within the Department.
- Conduct inquiries which enable the Department to hold employees and contractors accountable to the highest standards of honesty, objectivity, and integrity

Performance Measures

- Complete required financial statement audits by designated due dates in the law.
- Render an opinion annually on the Department's consolidated financial statements, system of internal controls, and compliance with laws and regulations.
- Coordinate, at least annually, with Department management and other interested parties to identify and prioritize audit opportunities each fiscal year.
- Complete at least 60 percent of audits planned for the year and replace those audits not started with more significant audits, which identify time-sensitive issues needing review
- In 90 percent of open audits, consider past audit work to determine if the Department has taken corrective action on audit recommendations.
- Complete 90 percent of all audits within 12 months to provide timely information to Department management
- Develop a strategic and annual plan for a Technology Audits unit comprised of auditors with specialized skills and training in the audit and analysis of information systems.
- Plan and conduct reviews based on assessment of risk of, or benefit to, key Department programs.
- Improve internal Offices of Audit Services and Inspections processes in order to more effectively and efficiently manage high profile, sensitive, and priority reviews
- Reduce by 5 percent the time required to complete programmatic inspections that promote more efficient and effective Department operations.
- Provide quarterly OIG intelligence oversight reports to the Intelligence Oversight Board within required time frames.
- Obtain 75 percent acceptance rate on criminal and civil cases formally presented for prosecutorial consideration.
- Obtain judicial and/or administrative action on 35 percent of all cases in open status during the fiscal year.
- Improve internal Office of Investigations processes in order to more effectively and efficiently manage high-profile, sensitive, and priority investigations.
- Ensure 25 percent of all cases open during the fiscal year are task force/joint agency investigations.
- Obtain a 90 percent management compliance rate for recommendations made in administrative reports issued to the Department during the fiscal year.
- Establish a baseline for measuring the success of previously established mechanisms for tracking and reporting on notable and major positive change to Department programs and operations that resulted from Office of Investigations administrative reports to management.

- Develop and implement comprehensive computer crimes awareness briefings throughout the Department, and represent the OIG in existing multi-agency computer crime task force initiatives aimed at the prevention and detection of computer crimes.
- Initiate a proactive investigative effort of the Department's grant program, utilizing the profile of known grant fraud "indicators."
- Decrease the average number of days to process mismanagement, integrity and abuse allegations by 5 percent, thereby assisting management through more timely resolution of complaints.
- Refer 80 percent of allegations to management within 14 days of the case being initiated after a referral decision has been made.

Significant Accomplishments and Program Shifts

FY 1998 Accomplishments

- Issued 91 audit reports with a potential dollar impact of $596,232,072, compared to 80 reports and $270,327,259 for FY 1997. These reports provided a series of recommendations designed to improve and enhance the operation of DOE.
- Met the requirements of the Chief Financial Officers (CFO) Act of 1990 and the Government Management Reform Act of 1994, which included issuing the report on the "Audit of the U.S. Department of Energy's Consolidated Financial Statements For Fiscal Year 1997," February 26, 1998. The consolidated financial statements audit is a yearly requirement which is unprecedented in its scope and resource demands on the OIG.
- Found that the Department did not effectively implement existing procedures or establish other monitoring procedures to ensure that grantees fulfill their grant obligations. As a result, many grantees did not provide final technical and/or financial reports. At the five procurement offices audited, the OIG projected that the Department had not received final deliverables on 718 inactive grants valued at about $232 million. In other cases, officials inappropriately extended performance periods so that the grant instrument would continue to be classified as active.
- Found that the Department had not resolved previously reported OIG concerns when the OIG determined that over 850 contractor employees were currently working at Headquarters at an estimated cost of $76 million. The Department did not effectively manage the use of field contractor employees assigned to Headquarters and other Federal agencies.
- Disclosed in an audit of 12 major contractors that the Department did not adjust the fee bases of the major contractors to reflect actual managerial and technical effort associated with the oversight of subcontractors As a result, major contractors were paid fees for the administration of subcontracts as well as $34 million in fees for the subcontractors' effort.
- Found that the Department generally did not dispose of low-level and low-level mixed waste as cost-effectively as possible. Most Department facilities stored large quantities of waste on-site, and disposals of low-level waste were often not cost-effective. In addition, the Department built low-level waste disposal facilities at Savannah River and Oak Ridge, at a cost of $27.1 million, even though off-site disposal would have been more cost-effective.
- Contributed audit resources to the Chief Information Officer's (CIO) review of Year 2000 (Y2K) issues. The OIG participated in scheduled compliance reviews and commented on the resulting

reports for the Savannah River Operations Office, the Nevada Operations Office, the Office of Nonproliferation and National Security, and the Office of the Chief Financial Officer. In addition, the OIG reviewed site reports for the Albuquerque and Richland Operations Offices and discussed these reports with CIO staff.

- Opened 99 new investigations and referred 48 investigations to the Department of Justice for prosecutive action and 37 investigations to DOE management for positive change. Investigative results include: 10 indictments; 10 convictions; 25 debarments/suspensions; over $3 million in fines, settlements, and recoveries; 101 positive recommendations to management; and 16 administrative disciplinary actions.
- Opened 22 task force/joint agency investigations involving major program areas, including environmental, procurement, grant, and other sensitive case activities.
- Discovered that two supervisory employees of a Department subcontractor performing a demolition project had stolen copper and sold it to a metals dealer for over $25,000 in cash. OIG agents recovered stolen copper valued at over $44,000 along with the $25,000 in cash. Both employees pleaded guilty, were sentenced and fined, and were debarred for three years. The investigation also identified deficiencies in the Department's contractor safeguards and property accountability system The Department took several corrective actions.
- Conducted an investigation as a result of a company voluntarily notifying the OIG that it had mischarged time on an Energy Information Administration contract and other Government contracts with several agencies. The company disclosed approximately $25,000 in questionable charges. The mischarging involved at least one company employee who was terminated and who then filed a Qui Tam suit under the False Claims Act asserting that a company supervisor had directed the mischarging An OIG investigation confirmed the time mischarging and revealed additional time mischarging by the company supervisor with other employees. The company entered into a $425,000 civil settlement agreement on the Qui Tam.
- Conducted an investigation that determined that a contractor employee (buyer) made unauthorized modifications to a vendor's purchase orders in return for kickbacks. The vendor received an overpayment of $153,115 The buyer and a vendor official pled guilty, were both ordered to pay over $111,000 in restitution, and were sentenced. The vendor company also agreed to pay $29,000 to settle a Civil False Claims Act action The vendor company and two owners of the vendor company were debarred from Government contracting for 3 years.
- Issued 20 inspection reports, and management implemented 58 inspections recommendations to improve operations of the Department. Resolved 42 percent of the existing caseload of alleged reprisal against contractor employees
- Reported quarterly to the Intelligence Oversight Board, as required by Executive Order 12863, "President's Foreign Intelligence Advisory Board," and continued oversight of the Department's intelligence activities in accordance with Executive Order 12333, "United States Intelligence Activities."
- Reviewed and analyzed complaints received by the OIG regarding possible fraud, waste, abuse, and mismanagement to determine the appropriate course of action. In addition to initiating audits, investigations, and inspections regarding certain of these complaints, the OIG referred 207 allegations to DOE management and other governmental agencies for appropriate action. Improvements

resulting from these referrals included enhanced controls over the use of government credit cards and property disposal. In addition, management took four personnel actions on referred matters.

- Participated in an interagency assessment of the Internal Revenue Service (IRS) Inspection Service. The report identified opportunities to enhance the effectiveness of the Inspection Service, particularly in the areas of independence, public reporting of both audit results and accounting for investigative results, and the process of managing complaints in the IRS.

FY 1999/2000 Planned Objectives

- Meet the requirements of the Chief Financial Officers (CFO) Act of 1990 and the Government Management Reform Act (GMRA) of 1994 for audited Department financial statements. Include audit results in performance audits of the Department's primary functions and facilities.
- Focus performance reviews on those issues and programs having the greatest potential for the protection or recovery of public resources.
- Perform at least one performance review per year at major Department facilities, specifically Los Alamos, Livermore, and Berkeley Laboratories, with annual obligations of approximately $2.4 billion, in FY 1999, and at Sandia, Brookhaven, and Argonne Laboratories in FY 2000.
- Audit for economy and efficiency the Department's efforts in work force restructuring and economic development, environmental programs, the implementation of performance based contracting, and realignment initiatives (including streamlining organizational structure and flow).
- In FY 1999 develop a strategic and annual plan for, and begin development of, a Technology Audits unit comprised of auditors with specialized skills and training in the audit and analysis of information systems. In FY 2000 continue to develop and equip the unit and achieve full implementation.
- Conduct investigations of allegations of violations of criminal and civil Federal law, as well as serious administrative misconduct, in order to facilitate successful prosecutions and administrative actions that maximize recovery of public resources and deter future wrongdoing.
- Maintain investigative inter-agency cooperative efforts to combat fraud, waste, and abuse.
- Make recommendations for positive change in Department program operations through the issuance of administrative reports to management resulting from investigations.
- Conduct proactive investigative efforts focusing on areas most vulnerable to fraud, waste, and abuse within the Department.
- In FY 1999 begin development of a computer crimes unit comprised of Federal agents who possess the specialized skills necessary to proactively and reactively investigate the highly complex computer crimes within the Department. In FY 2000 continue to develop and equip the unit, develop and implement comprehensive computer crimes awareness briefings throughout the Department, and represent the OIG in existing multi-agency computer crime task force initiatives aimed at the prevention and detection of computer crimes.
- In FY 1999 establish a methodological profile of known grant fraud "indicators" for use in identifying areas of vulnerability within the Department's grant program, utilizing data from previously successful cases In FY 2000 use the profile to initiate proactive investigations of the grant program.

- Inspect allegations of waste or mismanagement that have high visibility with Department senior managers, Congress and the public, and continue to review management systems issues that are identified during administrative allegation reviews.
- Establish a multidisciplinary unit capable of quickly responding to sensitive issues or allegations involving high visibility/critical programs or the integrity of senior Departmental officials.
- Manage the system by which Hotline allegations are referred to Department management or other agencies for appropriate action.
- Report quarterly to the Intelligence Oversight Board, as required by Executive Order 12863, "President's Foreign Intelligence Advisory Board," and continue oversight of the Department's intelligence activities in accordance with Executive Order 12333, "United States Intelligence Activities"
- Conduct reviews of the Department's security activities.

Program Shifts

- The OIG is a revenue-positive, "level of effort" organization which, during FY 1998, identified attainable economies and efficiencies which have provided a positive dollar impact of approximately $4.4 million per audit employee per year. Thus, funding at the FY 2000 requested level should result in significant returns to the taxpayers.
- Numerous supplemental requirements have been imposed on the OIG in recent years, reducing the OIG's discretion to pursue some missions under the Inspector General Act of 1978, as amended. For example:
  - The Chief Financial Officers Act of 1990 and Government Management Reform Act of 1994 require audit of the Department's financial statements;
  - Executive Order 12863, "President's Foreign Intelligence Advisory Board," requires at least quarterly and "as necessary or appropriate" reporting to the Intelligence Oversight Board;
  - Appropriations report language creating the Department's Working Capital Fund requires an annual OIG audit of the Fund;
  - OMB Circular 131 requires the OIG to audit the Department's value engineering program;
  - The Intelligence Community Whistleblower Protection Act of 1998 requires the OIG to review complaints filed by intelligence community complainants, and to communicate with Congress, the Secretary, and the complainants regarding such concerns.
- This trend of placing additional mandates on the OIG appears to be continuing. For example, Congress has been considering proposed amendments to the Government Performance and Results Act, which will require extensive OIG review of Department performance plans and reports.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Required for net increase in salaries and benefits due to pay raise and base salary increases. Per IG Act, the OIG employs auditors, investigators, and inspectors to detect and prevent fraud, abuse, and violations of law and to promote economy, efficiency, and effectiveness in the operations of the Department	21,528	22,873	23,239
Travel			
Travel is a critical requirement due to the nature of the OIG's work. Required to make first-hand observations of conditions and review original records at DOE sites, conduct interviews; follow up on leads, meet with subjects, witnesses, and U.S. Attorneys; appear in court; etc	1,139	1,278	1,278
Support Services			
Required primarily for ADP services, and for contractor expertise, which is needed for financial statement audits required by the CFO Act and GMRA, and for technical expertise (e g., actuaries, computer system specialists, petroleum engineers) which could not cost-effectively be maintained in-house. FY 2000 reflects a 15 percent escalation in the contract's negotiated labor rates consistent with industry practices	1,907	2,457	2,609
Other Related Expenses			
Required primarily for OIG contributions to the DOE Working Capital Fund, and for such basic support needs as ADP equipment and software, contract close-out costs, employee relocation expenses, and training, which is critical for OIG staff to maintain required levels of proficiency and comply with the IG Act by meeting GAO training requirements published in the Government Auditing Standards, 1994 Revision	2,926	2,392	2,874
Total, Program Direction	27,500	29,000	30,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Salaries and Benefits	
Salaries/Benefits increases due to pay raise and base salary increases, partially offset by decrease of 9 FTEs	+366
Travel	
Travel remains the same due to staffing decrease of 9 FTEs being offset by inflation and increased travel requirements for specialized work units described below	0
Support Services	
Support Services increases due primarily to 15 percent escalation in contract negotiated labor rates consistent with industry practices, partially offset by ADP savings as a result of discontinuing off-site database management systems and enhancing in-house capabilities	+152
Other Related Expenses	
Other Related Expenses increases due to the need to continue to develop and equip specialized work units to audit ADP systems and data, and to investigate computer-related crimes. These units will require Pentium II class systems with compatible hardware and peripherals, which will be utilized nationally by agents and auditors to address targeted encryption capability, data retrieval, duplication analysis, and applications that will assist in interpreting computer crime efforts targeting UNIX, LINUX, and NOVELL operating systems, vulnerability testing, application control reviews, and financial statement auditing	+482

Working Capital Fund

Management and Administration

Working Capital Fund

Program Mission

This budget submission covers the activities of the Office of Management and Administration that are included in the Working Capital Fund (Fund). The Fund is a financial management tool for improving the financing and delivery of a range of common administrative services. The Fund began operation in FY 1997 with nine business lines having budgets totaling $93 million.

Program Objectives

The objectives of the Fund include:

- Ensure that program mission budgets include a fair allocation of the costs of common administrative services;
- Improve the efficiency of administrative services by providing managers with the opportunity and responsibility to make choices on the amount, priority, and, where possible, the sources of administrative services used by their programs; and
- Expand the flexibility of the Department's budget structure to permit service providers to respond to customer needs.

Significant Accomplishments and Program Shifts

The operations and policies of the Fund are overseen by a Working Capital Fund Board composed of 11 members and chaired by the Director, Management and Administration. Since it was first convened in February 1996, the Board has adopted specific pricing policies for the various business lines. Such pricing policies form the basis for the FY 2000 submission, including the revision of FY 1998 and FY 1999 estimates. For FY 2000, Electronic Services have been separately identified, whereas they had previously been included within the Building Occupancy business line. Only contractual services costs are included in the Fund; no Federal salaries or costs to administer the Fund are included.

Recent WCF accomplishments:

- the Fund staff worked with the Chief Financial Officer to codify existing WCF financial policies and procedures and to add new policies in areas recommended for attention by the Inspector General. These policies and procedures were adopted by the Board during the December 10, 1998 meeting.
- The metrics for the WCF business lines show program customers continue to respond to incentives, though with a smaller fall-off in consumption levels than in FY 1997 when the Fund was first in operation.

- Mail: Headquarters use of USPS for outgoing mail and use of internal distribution within DOE have both dropped off, and there has also been a decline in the number of mail stops and a large decrease in incoming USPS mail requiring sorting and distribution.
- Copying: While the number of separate machines has grown gradually, the number of copies generated continued to decline.
- Information Management infrastructure: WCF customers continued to reduce telephone connections, and LAN connections also decreased for the first time. However, actual usage indicators increased.
- Contract Closeout: The inventory of Headquarters contracts awaiting closeout continued to decline.

- Prices have generally remained stable except for decreases announced for mail distribution, electronic services, and local telephone calls.

Table 1 summarizes projected costs by business line and Table 2 summarizes costs by customer organization. These cost estimates represent the best projections currently available, but are subject to change based on customer decision regarding the mix, level, and source of services employed to support mission programs. In some cases, customers may choose to acquire services outside the Fund, and in other cases, customers may make tradeoffs to expand their use of Fund services in order to reduce other costs, including travel or contractual services. Furthermore, customers already appear to have made tradeoffs within the services provided through the Fund, including reduced use of paper and copying through increased reliance on electronic communication.

For each business line, three cost estimates are provided for each customer organization in Tables 3 through 14. These estimates are all based on current pricing policies and business structure decisions made by the Board.

Telephones

Description

The telephone business line is the telephone company for DOE Headquarters. It comprises an infrastructure connecting two main headquarters buildings and satellite buildings for internal dialing and commercial basic line service. The infrastructure includes communication networks, installed telephone processing switching equipment, and trained technical personnel. Infrastructure levels are expected to adjust over time to the planned reduction in the numbers of Headquarters facilities. Services included are adding new users, moving existing users, and changing features or functionality, and repair service for dial tone trouble calls. Commercial line service includes local, long distance, FTS, and international dialing provided and controlled through the Headquarters Information Exchange System. Specialized services include operator-assisted calls, voice mail, 3-way calling, call forwarding, and automatic ring back, among others.

Board Pricing Policy

Telephone system costs are allocated to Headquarters offices based upon three categories:

- Headquarters telephone system infrastructure costs, which are composed of: (a) the cost of the leased telecommunications circuits connecting the Headquarters buildings to the internal telephone system, including the CENTREX telephone line charges for staff located in leased facilities; (b) the cost of leased telecommunications circuits that support local, long distance and international calling; and © the cost of the technical staff who operate the Headquarters telephone switches, and install and repair the telephone wiring plant, are allocated among program organizations based on the number of active telephone lines as a per line monthly charge. Since the Fund's inception, program customers have been validating, and reducing, the number of active phone lines.
- The costs of dedicated communication circuits are be allocated to those organizations requesting installation of such lines.
- All long distance, local, and international calls are allocated to the originating telephones and thus to programs based on the actual billing information received by the Department.

Table 3 provides the estimated telephone charges for each organization in Headquarters.

Networking

Description

Networking provides:

- Connectivity for DOE Headquarters through Local and Wide Area Networks. This connectivity provides interoperability for 86 organizational Local Area Network (LAN) segments in two main headquarters and 12 satellite buildings, and connectivity to the Headquarters mainframe systems. There are approximately 7,000 LAN connections in Headquarters.
- Access to the Internet and World Wide Web, Electronic mail, and DOECast for information sharing through the LAN backbone infrastructure.
- Interface services and communications links to field sites, other government agencies, and public/private business partners.

Board Pricing Policy

Networking charges represent infrastructure costs which are composed of: (1) the cost of the leased telecommunications circuits connecting the Headquarters metropolitan area locations (including the Germantown campus) into the network backbone system; (2) the cost of maintaining the common network infrastructure components (routers, switches, bridges, hub-mail routing servers, etc.); and (3) the cost of providing the technical staff who install and repair network connections and monitor/operate the various common network components. These charges will be allocated among program organizations based on the number of active local area network (LAN) connections as a per connection monthly charge. Since the Fund's inception, program customers have been validating the number of active LAN connections.

Table 4 provides the estimated networking charges for each organization in Headquarters.

Desktop Support

Description

Desktop Support contains three components: Workstation Infrastructure, Technology Training, and. Maintenance of Desktop Workstations:

- Workstation Infrastructure
  - Provides media decontamination service, live test demonstrations of emerging technology, virus investigation and control, tactical hardware and software analysis and evaluations, and disk media recovery services.
  - Provides a centralized "Help Desk" service for ordering hardware repairs, technical support of software products used throughout Headquarters, and reporting of telephone system and Local Area Network (LAN) problems.
- Technology Training
  - Develops and delivers technical training courses, including new courses, enhanced courses, and revision of course materials, in the office automation environment to reflect software upgrades and enhancements.
  - Offers technical training and publishes a Departmental Training Information System course catalog and Information Management Technology Training Bulletins of class descriptions and schedules.
  - Offers Local Area Network-Based Computer Based Training .
  - Coordinates and schedules specialized training including individualized instruction and training that may be requested from or for employees with special needs.
- Maintenance of Desktop Work Stations
  - Installation, repair, upgrades, disconnections and reconnections to Desktop systems.
  - Loaner equipment when compatible equipment is available from the maintenance shops and customer equipment cannot be repaired within 24 hours.
  - Time & Material services per fee schedule including relocations, repairs to peripherals, repairs to facsimile equipment.
  - Maintenance contracts with third party vendors to service specialized equipment per customer request.
  - Warranty coordination service for repairs covered under vendor warranty. This includes returning equipment for such repair and assuring that the work has been done when the equipments returns from the vendor, and reinstallation of the product for the user after repairs have been completed.

Board Pricing Policy

- Certain expenses, such as virus protection, adaptive workstation support, and half of the Help Desk (Software HOTLINE) costs, are infrastructure and allocated among programs by the number of workstations.
- Training services are charged on a user fee basis.
- Customers have the choice of three options for maintenance of desktop workstations:
  - Annual Subscription: Maintenance fee per workstation for microcomputer workstation repair or portable notebook computer, with or without docking station, to include (a) onsite repair; (b) loaner equipment, when available, for equipment that will be out of service for more than 24 hours; and (c) installation of compatible upgrade components.
  - Warranty Service: Warranty maintenance administration is offered and covers performance of all vendor required diagnostics, picking up, packaging, shipping, tracking and ensuring return of hardware shipped off-site for warranty maintenance, as well as installation upon return.
  - Time and Materials: Devices as well as desktop units not elected to be covered under Desktop Services subscription, may be covered under a pay as you use Time and Material contract, based on an hourly labor rate.
- Finally, the remaining half of Help Desk (Hardware HOTLINE) costs referenced in the first bullet completes this second component.

Table 5 provides the estimated desktop charges for each organization in Headquarters.

Electronic Services

Description

Pending a change in policy, the Electronic Services includes repair and maintenance of Headquarters radio communications and electronic equipment.

Board Pricing Policy

In FY 1997 and FY 1998, electronic services costs were included in the Building Occupancy business line as indirect cost allocated in proportion to direct costs. We have broken out Electronic Services in FY 1999 and FY 2000 as a separate business, but have used the prior methodology, proration by direct Building Occupancy costs, as the allocation method.

Table 6 provides the estimated electronic services charges for each organization in Headquarters.

Building Occupancy

Description

The core services in the Building Occupancy Business Line include space, utilities such as heat and electricity, cleaning services, snow removal, maintenance, pest control, trash removal, and waste recycling. Engineering and facilities services provided are drafting, construction, engineering, lock repair and key management, safety and occupational health, and conference support.

Board Pricing Policy

There are three components to the Board policy:

- On a building-by-building basis, direct rental value of the space assigned to each organization is calculated, based on the actual rent charged to the Department by the General Services Administration. Customer rent costs are based on areas expected to be assigned to each organization on October 1 of the Fiscal Year.
- Then the common use space costs in each building are divided among the tenants of that building based on their proportional shares of direct rent costs.
- Certain additional costs, such as common area alterations and health and life safety programs and the like, are allocated as a prorata addition to the building-by-building charges described above.

The changes from FY 1999 to FY 2000 primarily reflect new General Services Administration rental policies.

Table 7 provides the estimated building occupancy charges for each organization in Headquarters.

Supplies

Description

This business operates self service stores which carry a wide variety of consumable office products. At customers' request, we also acquire speciality items that are not stocked in the stores. Products carried are based on review of equipment in the agency inventory and customer requests.

Board Pricing Policy

Each organization pays for supplies purchased by its employees. The price charged includes the cost of the items and the distributed cost of operating the stores; that is the cost of the contractor staff, and warehouse storage and distribution of supplies.

Table 8 provides the estimated supplies charges for each organization in Headquarters.

Photocopy

Description

Provision of

- staffed copy centers at Forrestal, Germantown and L'Enfant Plaza capable of reproducing 25,000 impressions per document. Products available at these centers are: Black and white copies up to 11x17, multiple color copies up to 11x17, colored and white recycled stock, tape binding, velobinding (self service), comb (spiral) binding, 3 ring binding, 3-hole punching, tab creation and insertion, optical scanning of paper copy documents, document storage on tape and CD-rom, digital printing system, transparencies for vu-graphs.
- Centralized (Walkup) Copy Rooms.
- Dedicated (Customer-Assigned) Copiers including needs assessment analysis to determine workload and most appropriate equipment.

Board Pricing Policy

Each office pays the full cost to maintain and supply its assigned dedicated copiers. For walkup and staffed copiers, a cost per copy is calculated and programs are charged based on the number of copies made by program staff.

Table 9 provides the estimated photocopy charges for each organization in Headquarters.

Mail Services

Description

The DOE Mail Center provides a variety of mail services for all official and other authorized mail for the Department of Energy and its employees. The services provided include the processing of all incoming postal mail, outgoing official mail, internal mail processing, accountable mail processing, pouch mail, a variety of overnight express mail services, directory services, and pick-up and delivery services.

Board Pricing Policy

Mail service pricing has three components: Offices pay the actual dollar meter value for outgoing United States Postal Service mail; the actual cost for Federal Express or other special mail; and pay for internal mail distribution based on the number of mail stops.

Table 10 provides the estimated mail services charges for each organization in Headquarters. These estimates reflect the United States Postal Service's proposed increase for first class mail.

Printing and Graphics

Description

The printing and graphics business line provides procurement and liaison with commercial printers through the Government Printing Office. It also provides design and development of pre-press graphics, electronic forms and exhibits, and court reporting services. Contractor staff distribute in-house-produced materials as well as materials produced by other government agencies. This business line also provides professional photography, lab technicians, portrait studio operations, and graphics visual aids and presentation materials. Centralized visual archives are provided by through a staffed repository of general interest photos.

Board Pricing Policy

Organizations pay for direct printing costs and Federal Register costs. Additionally for graphics services, programs pay maintenance and depreciation costs on graphics equipment as a percentage allocation of costs incurred in the previous fiscal year.

Table 11 provides the estimated printing and graphics charges for each organization in Headquarters.

Contract Closeout

Description

The contract closeout business line is the final stage in contract administration support for DOE Headquarters elements. Services include ensuring that all contracted products and services have been delivered and that costs incurred by the contractor are allowable and justified. Then, any remaining unexpended funds obligated under the contract are released.

Board Pricing Policy

Each Headquarters element pays for actual closeout cost, determined by the unit price of each contract instrument type and negotiated level of service.

Table 12 provides the estimated contract closeout charges for each organization in Headquarters.

Payroll Processing and Personnel Costs

Description

This business line integrates three areas of service.

- Payroll Services: Prepares civilian payrolls based on authenticated documentation. Computes, deposits, and reports Federal, State, and local income taxes. Maintains employee records related to Civil Service and Federal Employees Retirement Systems, reports retirement information to the Office of Personnel Management, and performs reconciliation of account balances with Office of Personnel Management and Treasury. Accounts and reports employee's health benefit coverage, thrift savings plans, and unemployment compensation, among other non salary employee payments. Maintains donated leave subsystem. Maintains and operates the Department's system of allocating payroll costs to the proper appropriation.
- Personnel Services: All personnel services will continue to be carried out by Federal employees and therefore do not fall under the Working Capital Fund payroll and personnel business line. Detailed employee information and Office of Personnel Management regulations are critical inputs to payroll and personnel services. Information systems which support this effort are outdated and unable to support Year 2000 compliance. The Department has embarked on an integrated, long-term solution to these problems since FY 1997.
- Personnel and Payroll Information: Implements state-of-the-art Corporate Human Resource Information System utilizing PeopleSoft commercial-off-the-shelf software and a data repository, DOEInfo. The systems development will implement personnel, payroll, and time and labor processes in conformance with the Department's business practices. The software provides the full range of personnel office services to include personnel action processing, staffing, classification, recruitment, performance management, training administration; employee relations support; health and safety/workers' compensation; career succession and planning; and skills inventory; payroll; and, time and attendance. Once complete the integrated system will provide accurate and timely pay to employees, meet regulatory reporting requirements in a timely and accurate manner, improve the integrity of human resource information; streamline business processes, eliminate non-value added work, transition to a paperless desktop work environment, eliminate redundant systems across the Department, and provide real-time reporting and information access to support management decision-making.

Board Pricing Policy

Costs for this business are allocated by distributing total costs to each program on the basis of their employment levels at the end of the previous fiscal year. For estimating purposes, the business is using employment targets developed during the budget cycle.

Table 13 provides the estimated distribution of costs by program customer.

Corporate Executive Information System

Description

The Corporate Executive Information System (EIS) provides Departmental executives and senior managers immediate access to business information at their desktops. The Corporate EIS supports summary level analyses for management business decisions and provides information for external summary level reporting and inquiries. Currently, the Corporate EIS provides information on eight functional business areas by integrating data from six Departmental source systems. Plans provide for the functional business areas to be expanded to incorporate additional business information (both financial and programmatic) as Departmental manager identify their business information requirements. Business information and source systems providing information to the EIS will be expanded to provide for the new information requirements.

Board Pricing Policy

There are three components to the policy:

- On a per user basis, each organization will be charged for annual operational costs of the system. These costs will include software maintenance, operations and maintenance, and hardware upgrades. The operating costs will be distributed to the budgeted user base to derive annual per user costs.
- Each organization will be responsible for payment of user costs and such costs will be paid to the WCF account.
- An agreement between the WCF Business line Fund Manager, the WCF Business Line Service Manager, and Departmental organizations will be prepared and approved by all parties participating as managers and customers of the WCF account.

Table 14 provides the estimated distribution of costs by program customer.

Environmental Management

Executive Budget Summary

The Department of Energy's (DOE) Environmental Management (EM) program is requesting $5.700 billion of traditional budget authority and $228 million of privatization funding, for a total Fiscal Year (FY) 2000 budget request of $5.928 billion. The traditional budget authority request consists of $4 494 billion under the Defense Environmental Restoration and Waste Management appropriation, $1.055 billion under the Defense Facilities Closure Projects appropriation, $331 million under the Non-Defense Environmental Management appropriation, and $240 million under the Uranium Enrichment Decontamination and Decommissioning Fund appropriation. This request is offset by $420 million for the Federal Contribution to the Uranium Enrichment Decontamination and Decommissioning Fund. With this level of funding, EM will be substantially in compliance with applicable environmental and other requirements. The structure of the EM budget continues to be based on the grouping of activities into projects at the various Departmental sites, a crucial step in accelerating work and lowering the cost of carrying out the EM mission.

I. EM FY 2000 Budget Request

The Environmental Management program has developed a budget request of $5.700 billion for FY 2000 for traditional budget authority. This request represents an increase of approximately $100 million over the current appropriation of $5.604 billion for FY 1999. This provides sufficient funding to be substantially in compliance with agreements and requirements, address most planned Defense Nuclear Facilities Safety Board recommendations, address known significant safety risk issues, develop cost- and schedule-reducing alternative cleanup technologies, and accelerate the closure of EM sites.

The FY 2000 budget request will enable the EM program to continue towards the fulfillment of the vision of closing as many sites as possible by 2006. This request fully reflects the project-oriented structure that EM has developed as a key component of its strategy to accelerate cleanup and reduce costs. It includes a brief description of each project, the budget authority requested for the project, and the performance metrics that will be used to measure the progress of the project. In accordance with the Government Performance and Results Act, these performance measures also reflect the linkage between the EM budget and the program's goals and objectives as stated in the Department of Energy's Strategic Plan, the commitments for FY 2000 in the DOE Annual Performance Plan, and the commitments in the Secretary's Performance Agreement with the President. The requested funds for Science and Technology activities are consistent with the EM Research and Development Program Plan which 'maps' investments in solutions to site-identified needs. EM's Science and Technology program represents approximately two-thirds of DOE's Environmental Quality Business Line Research and Development Portfolio.

In addition to the request for traditional budget authority, EM is requesting $228 million in the Defense Environmental Management Privatization account for FY 2000. This funding will enable EM to continue on schedule with the following privatization activities:

- Tank Waste Remediation System, Phase I, at Richland
- Advanced Mixed Waste Treatment Project at Idaho
- Spent Nuclear Fuel Dry Storage Project at Idaho
- Transuranic Waste Treatment Project at Oak Ridge
- Environmental Management/Waste Management Disposal Facility at Oak Ridge

The following table is a summary of EM's FY 2000 budget request compared to the FY 1998 and FY 1999 appropriated levels.

EM FY 2000 Budget Request

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Current Appropriation	FY 2000 Request
Albuquerque	316,734	202,541	202,600
Carlsbad	173,700	185,404	186,404
Chicago	49,776	54,063	54,100
Idaho [a]	415,556	435,642	409,422
Nevada	68,918	80,081	85,307

Total, Traditional Budget Authority	5,662,841	5,603,619	5,700,000
Privatization	200,000	228,357	228,000
Total, EM [b]	5,862,841	5,831,976	5,928,000

II. Background: Cleanup Challenges and Vision for the Future

Over the past five decades, DOE and its predecessor agencies developed the largest government-owned industry in the United States, responsible for the research, development, testing, and production of

[a] The Idaho program for FY 2000 also includes the use of $43 million in prior year balances for Pit 9 activities, for a total program level of $452.422 million.

[b] Excludes funding appropriated or requested under EM, but managed by EH for health studies activities ($12.0 million in FY 1999 and $20.0 million in FY 2000).

nuclear weapons, as well as a variety of nuclear-related research projects. When most nuclear weapons production operations ceased in the late 1980's, DOE created the EM program to manage the thousands of contaminated areas and buildings, huge waste volumes, and nuclear materials left over from the nuclear weapons production process. EM's responsibilities include facilities and areas at 113 geographic sites (excluding the 21 sites in the Formerly Utilized Sites Remedial Action Project transferred to the U.S. Army Corps of Engineers). These sites are located in 30 States and one territory, which occupy an area equal to that of Rhode Island and Delaware combined -- about 2 million acres.

In addition to EM's responsibilities for environmental remediation, decommissioning of facilities, and the storage, treatment, and disposal of nuclear and hazardous wastes, EM is responsible for the safe management of approximately 18 metric tons of plutonium metal and oxides and residues. Plutonium can spontaneously ignite in contact with air in certain circumstances, so careful handling and storage safety is required. Because of its potential use in nuclear weapons, plutonium must also be stored in a manner to prevent theft or diversion. Thousands of metric tons of highly radioactive spent nuclear fuel, a by-product of the Department's weapons production process, are also under EM's care. Some of this spent fuel is corroding in its current storage. Further, EM is managing the return of foreign research reactor spent nuclear fuel from a number of different nations to meet key non-proliferation goals of the United States. EM's goals in meeting these responsibilities are to reduce urgent risks to human health and the environment, meet crucial national non-proliferation goals, manage the long-term contamination and safety threats, and reduce program costs.

In June 1996, to reconcile the pressing need to stabilize spending levels in the short term, while reducing both economic and environmental liabilities over the long term, EM established a vision for the program:

> *By 2006, the Environmental Management program intends to complete cleanup at most of its 53 remaining sites. At the 10 remaining sites, including our five largest sites, treatment will continue for the remaining "legacy" waste streams. This vision will drive budget decisions, the sequencing of projects, and the actions needed to meet program objectives. This vision will be implemented in collaboration with stakeholders, regulators, and Tribal Nations.*

Accelerating cleanup and project completion is a central goal of the EM program. Accelerating cleanup can reduce both short-term and life-cycle program costs and is necessary to demonstrate progress towards the completion of the EM mission. As of the end of FY 1998, cleanup had been completed at 65 of the 113 geographic sites in the EM program, leaving 48 to be completed.

Even after completing cleanup, EM will maintain a presence at most sites to monitor, maintain and provide information on the contained residual contamination. These activities are designed to maintain long-term protection of human health and the environment. Such long-term stewardship will include passive or active institutional controls and, often, treatment of groundwater over a long period of time. The extent of long-term stewardship required at a site will depend on the end state reached at that particular site. Each site's end state will be determined after consultation among DOE and other representatives of the Administration, Congress, Tribal Nations, representatives of regulatory agencies, and state and local authorities, representatives of non-governmental organizations, and interested members of the general public.

III. FY 2000 Budget Strategy/Priority

For the past several years, Congress has appropriated relatively stable traditional budget authority for the EM program at a level of approximately $5.6 billion. Over this same period, due to the decline in EM program uncosted carryover balances, actual expenditures for the program have declined from a high of $6.8 billion in FY 1996 to a projected $5 6 billion in FY 1999. Program requirements, however, have not been declining or stabilizing in a commensurate manner. For example, the sites' *Accelerating Cleanup: Paths to Closure* submissions indicate over 500 environmental problems for which new technology is needed in order to accomplish cleanup. The most recent life-cycle cost analysis of the EM program, as well as several programmatic issues that have arisen during the execution of the budget in FY 1998 and FY 1999, indicate that additional traditional budget authority, substantially above current levels, may be needed to address emerging issues and requirements.

The budget of the EM program is constrained by the Balanced Budget Agreement between the President and the Congress. The EM program is committed to living within these constraints. Accordingly, the EM program is committed to accommodating these emerging issues and requirements within the requested level of $5.7 billion for traditional budget authority. In a number of instances, this will require improved program efficiency, a reprioritization of current work, and/or adjusting funding profiles. EM intends to work with the Congress, regulators, the Defense Nuclear Facilities Safety Board, stakeholders, and Tribal Nations to address issues that may arise.

In developing the FY 2000 budget request, the Department's Chief Financial Officer established a "peer review" team, which consisted of representatives from five EM sites, EM Headquarters, and the Office of the Chief Financial Officer, to review the field EM budget submissions. The purpose of this review was to categorize the EM activities within the sites' budget requests in a consistent manner across the DOE complex in terms of the reason , or "driver," that funding was being sought for each project. The peer review proved useful in ensuring that all EM activities were characterized in a similar manner during the budget-building process. Accordingly, EM intends to use a similar process for building the budget request for FY 2001. EM will use the same matrix of drivers that the peer review team developed to categorize activities for the FY 2001 budget, and will share the categorization of each activity with regulators, stakeholders, and Tribal Nations.

The following are major principles and strategies that are the foundation for the EM program in FY 2000:

- Address serious risks
- Maintain compliance
- Accelerate cleanup and reduce costs
- Ship transuranic waste to the Waste Isolation Pilot Plant in Carlsbad, New Mexico
- Utilize privatization initiatives where appropriate
- Integrate waste and materials management
- Continue to make the EM program more efficient
- Accelerate deployment of technologies and invest in science
- Stabilize the Federal workforce
- Implement an Integrated Planning, Accountability and Budgeting System for EM
- Work with regulators, stakeholders, and Tribal Nations

A. Address Serious Risks

The Department is committed to ensuring its facilities and activities pose no undue risks to the public and worker health and safety. The FY 2000 budget request provides sufficient funding to accomplish this goal, as well as to reduce the most serious environmental risks across the DOE complex. These include maintaining the safe containment of high-level waste stored in tanks at Hanford, Washington; stabilizing plutonium at Hanford, Washington, Rocky Flats, Colorado, and Savannah River, South Carolina; and ensuring the safe storage of spent nuclear fuel at Hanford, Idaho, and Savannah River.

B. Maintain Compliance

At the FY 2000 total budget request of $5.928 billion (including privatization), EM will have sufficient funding to be substantially in compliance with applicable environmental and other requirements At some sites, there may be a gap between compliance requirements and the work that is expected to be accomplished. EM is striving for additional efficiencies and other measures to close this gap. EM will continue to work with regulators to address this issue. More specifically, EM will attempt to comply with all applicable requirements of Federal, State, and local statutes and regulations; permits, administrative orders, or judicial decrees; and enforceable milestones or schedules established in agreements negotiated between EM and regulators. If necessary, EM will close the gap by using funding available for other EM activities at each site, in accordance with the Department's reprogramming procedures. In addition, the EM program intends to meet commitments to the Defense Nuclear Facilities Safety Board. As the program resources continue to be fiscally constrained, innovation and close collaboration with Congress, regulators and stakeholders has been, and will continue to be, necessary to meet our compliance requirements in a practical and efficient manner. EM will work closely with regulators, the Defense Board, and others to achieve this objective. Additionally, the strategies identified in the following sections--accelerating cleanup, reducing costs, privatization, increasing efficiency, and accelerating deployment of new technologies--will help EM meet its compliance requirements in a more efficient and cost-effective manner.

C. Accelerate Cleanup and Reduce Costs

The Department's strategy for accelerating cleanup is presented in the *Accelerating Cleanup: Paths to Closure* report that was released in June 1998. This report provides a project-by-project depiction of the technical scope, cost, and schedule required to complete work at the remaining DOE sites. DOE officials, stakeholders, regulators, Tribal Nations, and the Congress now have a comprehensive management tool that can aid the analysis of the challenges that we face. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, EM sites are working aggressively to reduce outyear costs by completing projects in the quickest, most efficient manner possible, thereby reducing life-cycle costs and schedules

In order to more closely align the annual budget formulation process and the long-term strategies set forth in the *Accelerating Cleanup: Paths to Closure* process, all EM activities have been organized into "projects", which have a defined scope and end state. Project Baseline Summary documents describe these projects and include the following: scope, schedule, cost, compliance, safety and health, risk, performance metrics, and other data The EM program budget accounts are

structured to reflect the 2006 vision, and the Project Baseline Summaries have been grouped into the appropriate budget accounts to be consistent with these goals.

The strategy in the *Accelerating Cleanup: Paths to Closure* document allows EM to formulate budgetary and policy strategies and goals in the context of impacts to life-cycle costs and schedules. The Department recognizes that there may be differences in any given year between the actual budget requests and the funding used for analytical purposes in the report. This difference is inevitable due to the dynamic nature of the budget formulation process.

The funding levels presented in *Accelerating Cleanup: Paths to Closure* and the EM budget differ due to the constraints on EM funding imposed by the Balanced Budget Agreement. Absent any budgetary constraints, these baseline requirements would total well over $6 billion in traditional budget authority for FY 2000 and beyond. Part of the significant challenge in managing the EM program is to fit the baseline requirements within the current and expected funding levels. The strategies identified in the *Accelerating Cleanup: Paths to Closure* report to improve the program's efficiency and to reduce costs are critical to meeting this challenge.

Accelerating Cleanup: Paths to Closure will be updated annually. Annual updates of this report will reflect cleanup progress, advances in technologies, projected savings due to demonstrated enhanced performance, the effects of annual budget allocations, and changes in site end states. The next update to *Accelerating Cleanup: Paths to Closure* is planned to be completed in the summer of 1999.

In August 1997, the Secretary of Energy designated three sites -- Rocky Flats, Fernald and Miamisburg -- as pilot sites for accelerated closure. In support of the vision of accelerated cleanup and site closure, Congress in FY 1998 designated a new Defense Facilities Closure Projects appropriation to accelerate the closure of the Rocky Flats and Fernald sites In FY 1999, this appropriation account was expanded to include all of the Ohio sites. The Department's FY 2000 budget request for Environmental Management continues to support these initiatives, and includes sufficient funding to accelerate the Rocky Flats and Ohio sites.

EM achieved a major milestone in FY 1998 which significantly contributes to the overall EM cleanup mission. In FY 1998, all Uranium Mill Tailings Remedial Action Surface Project remediation activities were completed. This brings to a close one of the Department's longest running and major environmental cleanup programs, which was authorized by Congress in 1978 and cost approximately $1.5 billion, including $100 million provided by the states involved. Under the Uranium Mill Tailings Remedial Action Surface Project, the Department completed remedial actions at 22 of the 24 originally designated sites, with two sites being delisted and their responsibility transferred to the state of North Dakota. The Project involved efforts with 11 States, 2 Indian tribes, and 23 communities. Cleanup was performed at over 5,300 vicinity properties located near the 22 designated Uranium Mill Tailings Remedial Action sites, and over 40 million cubic yards of material were remediated and nineteen long-term disposal cells were constructed. At most of these sites, groundwater contamination remains (and is being addressed by the Uranium Mill Tailings Remedial Action Groundwater Project) and the disposal cells must be permanently monitored and maintained. The completion of the Uranium Mill Tailings Remedial Action Surface Project marks a significant milestone in the Department's efforts to remediate the environmental legacy from the production of nuclear weapons. Just as mining and milling of uranium was the first step towards the production of nuclear weapons, the completion of the Uranium Mill Tailings

Remedial Action Surface Project represents the first step towards "closing the circle" of the environmental legacy from nuclear weapons production.

D. Ship Transuranic Waste to the Waste Isolation Pilot Plant

The Secretary of Energy notified Congress on May 13, 1998, that after two decades of development, the Waste Isolation Pilot Plant was ready for operations for transuranic waste disposal since all the Land Withdrawal Act disposal prerequisites had been completed. The start of disposal operations has been delayed pending resolution of the 1992 Permanent Injunction for shipping waste to the Waste Isolation Pilot Plant for the now canceled test phase. Also, on July 17, 1998, three lawsuits were filed against the Environmental Protection Agency over its decision to certify the Waste Isolation Pilot Plant for radioactive waste disposal operations. Within these constraints, the Department remains committed to doing all it can to meet its obligations for the cleanup of its sites. Disposal operations are expected to begin in FY 1999, provided the legal constraints have been resolved. The FY 2000 request assumes the initiation of disposal operations in FY 1999. The FY 2000 request will allow the Waste Isolation Pilot Plant to ramp-up to 14 shipments per week of waste from the waste generator sites and be on track to achieve 17 shipments per week by the end of December 2000. Once waste treatment, transportation, and disposal have been completed, the transuranic waste will be isolated, and the risks from storing transuranic waste at multiple sites across the country will have been eliminated.

E. Utilize Privatization Initiatives Where Appropriate

Privatization remains a key component of EM's contracting strategy to meet cleanup challenges with declining resources. Essentially a form of fixed-price contracting, the objective of EM privatization is to reduce the cost of products and services by having the Government pay for products delivered in accordance with desired specifications (e.g., treated waste, waste disposed of, or soil remediated). Through open competition, market forces should establish the most efficient contractual price for a specified service or product while shifting some of the performance risk and incentives to the contractor. The selected contractor(s) will be responsible for and own development of technologies, equipment, and facilities necessary to deliver the end product or service. Whether privatization is the most appropriate contracting strategy for a particular site or activity is determined on a case-by-case basis.

In FY 2000, the EM program is requesting $228 million for privatization projects, including continuation of the Tank Waste Remediation System for high-level waste treatment at the Hanford Site in Washington, the Advanced Mixed Waste Treatment and the Spent Nuclear Fuel Dry Storage projects at Idaho, and the Environmental Management/Waste Management Disposal Facility and the Transuranic Waste Treatment projects at Oak Ridge, Tennessee.

As provided in the National Defense Authorization Act for Fiscal Year 1998, contracts for EM privatization projects must meet the following criteria: be awarded on a competitive basis; require the contractor to construct or acquire any equipment or facilities required to carry out the contract; require the contractor to bear any of the costs of the construction, acquisition, and operation of such equipment or facilities that arise before the commencement of the provision of goods or services under the contract; and provide for payment to the contractor under the contract only upon meeting the performance specifications in the contract. The EM goal in utilizing this methodology is to gain an edge through best-in-class management capability, business strategies, technological

approaches, schedule enhancements, regulatory experience, and cost efficiencies. This type of project funding is widely used in the private sector to finance power plants and other major investments. The Department believes the privatization program is the most cost-effective approach for the selected projects.

EM plans to provide increased training for the Federal staff responsible for oversight of the privatization projects. EM will establish criteria for the approval of the contractor's selection of managers for privatization projects, and the managers selected will be reviewed against these criteria. Quarterly reviews of the major privatization projects, including the Hanford Tank Waste Remediation System project and the Idaho Advanced Mixed Waste Treatment project, will continue to be conducted.

EM developed the Tank Waste Remediation System to manage the radioactive waste in the large underground storage tanks at the Hanford Site in Washington. The tanks at Hanford are one of the most urgent environmental and public health risks under the Department's purview. Approximately 56 million gallons of waste containing approximately 240,000 metric tons of processed chemicals and 250 million curies of waste are currently being stored in 177 tanks Treatment of this waste, to convert it into a more stable form, is the largest privatization initiative planned by EM.

The Advanced Mixed Waste Treatment project at the Idaho National Engineering and Environmental Laboratory will incinerate and solidify 65,000 cubic meters of transuranic waste located in retrievable storage. The contract has an option for treatment of up to 120,000 cubic meters of additional mixed wastes from around the United States.

The Spent Nuclear Fuel Dry Storage Project at the Idaho National Engineering and Environmental Laboratory will provide the capabilities to initiate interim dry modular storage of Spent Nuclear Fuel. The fuel currently resides in facilities at Idaho, various universities, and foreign research reactors This project will place approximately 50 cubic meters of spent nuclear fuel (11% of the Idaho total) into dry interim storage prior to shipment out of the State of Idaho.

The Transuranic Waste Treatment project at the Oak Ridge National Laboratory in Tennessee will transfer remote-handled transuranic waste sludge from 13 different tanks into the eight storage tanks which are co-located in the Melton Valley area and which contain the majority of the waste sludge. In addition to sludge, the transuranic waste project includes approximately 500 cubic meters of remote-handled solids and approximately 1,100 cubic meters of contact-handled solids. All transuranic solids will be delivered to the private vendor for treatment, followed by disposal at the Waste Isolation Pilot Plant in New Mexico.

At the Oak Ridge Reservation in Tennessee, the Environmental Management/Waste Management Disposal Facility will consist of a disposal cell with ancillary facilities to support initial operations and an area for the potential development of future treatment, storage, and disposal facilities. The disposal cell will have a 1.1 million cubic meter capacity, be above-grade, and be a Resource Conservation and Recovery Act-compliant earthen structure with a robust, multi-component cap. Based on projected waste volumes and cell design assumptions, the disposal cell is estimated to require 60-70 acres, with a total facility footprint of 100-120 acres, including initial support facilities and an area reserved for future expansion.

F. Integrate Waste and Materials Management

The EM FY 2000 budget request includes several key initiatives to substantially reduce mortgage and outyear costs by moving materials to other sites for interim storage pending final disposal. The EM program continues to formalize the baselines for each site, as well as integrate the baselines across sites for nuclear waste and materials. The Department has included funding in the FY 2000 budget request for the option of accelerating the movement of the non-pit plutonium from Rocky Flats to Savannah River two years earlier than previously planned, thus supporting Rocky Flats closure by 2006 rather than 2010. In this capacity, the Savannah River request, in conjunction with other Rocky Flats projects, could result in significant life-cycle cost savings. In FY 1999, the Department anticipates making decisions resulting from the Waste Management Programmatic Environmental Impact Statement, clarifying the number of low-level and mixed low-level waste treatment and disposal facilities that will operate around the complex. EM has developed initial disposition maps to show the pathways to move waste or materials from inventory/generation, through treatment or stabilization, to final disposition. EM has already opened discussions with representatives of affected States, through the National Governors' Association, on feasible and lower-cost options for disposal of mixed low-level and low-level waste.

G. Continue to Make the EM Program More Efficient

The EM program is striving for ways to become more efficient and to do more with less. Drawing upon past experience, knowledge of practices in the private sector, experience of other government agencies, and analysis of the performance of its program, EM is seeking to improve its productivity in order to bridge the gap between planned available funding and resources needed to meet program goals. Many of these strategies are set forth in more detail in the June 1998 *Accelerating Cleanup: Paths to Closure* document.

In order to reduce support costs, EM has adopted a common methodology for tracking such costs. Using cost category definitions developed by the Financial Management Systems Improvement Council, the Department's Chief Financial Officer is tracking this information, broken out by cost category, fiscal year, and direct and indirect funding sources. By examining cost trends in each of these categories and benchmarking these costs at EM sites against similar costs in the private sector, EM can focus on measures to reduce specific support costs. Savings are being achieved and hopefully more areas can be reduced, so more funding is available for actual cleanup.

H. Accelerate Deployment of Technologies and Invest in Science

The EM Science and Technology program has matured to the point where significant performance gains and cost savings, in the form of cost avoidance, can be achieved through aggressive deployment of the large number of currently and soon-to-be available technologies. In the *Accelerating Cleanup: Paths to Closure*, EM sites identified over 500 technology problems for which technological solutions can achieve schedule improvements prior to 2006 and produce significant cost savings. EM believes that technology development offers some of the program's best opportunities for substantial cost reductions. EM has implemented a Research and Development Program Plan that maps investments in solutions to site-identified needs to ensure work is being performed on the highest priority needs. This plan ensures our science and technology activities are planned and managed in an interactive, coordinated and participatory relationship with EM cleanup project managers and stakeholders.

EM has also identified those areas where innovative technologies will be needed to solve problems that are currently intractable or for which solutions will ultimately extend beyond a ten-year horizon. The EM Science Program, established in FY 1996, conducts a long-term basic research effort, in cooperation with the Department's Office of Science, that focuses on these long-term problems, such as subsurface contamination in the vadose zone and groundwater at the Hanford Site.

For FY 2000, the EM program is requesting $230.5 million for the Science and Technology program. The Science and Technology program has expanded its role to encompass basic research through deployment

I. Stabilize the Federal Work Force at Reduced Levels

The EM program needs to have an adequate number of appropriately-skilled Federal employees in the field and at Headquarters. These employees are necessary to integrate and coordinate among sites to improve efficiency, oversee contractors to ensure cost-effective use of tax dollars, and respond to concerns and issues raised by the regulators, stakeholders, and tribes. In May 1995, as part of the Department's Strategic Alignment Initiative, targets were established for Headquarters staffing levels consistent with the National Performance Review objectives of decentralizing government agencies, putting more work in the field locations, and generally reducing the size of the Federal government. In May 1998, the Department issued revised staffing targets to address changing priorities across the complex and the continued emphasis on reducing the Federal workforce. As a result of this second round of allocations, EM's Strategic Alignment Initiative end-of-year on-board target was further reduced in both FY 1999 and FY 2000. The revised targets will result in a total EM workforce reduction of 490 full-time equivalents since FY 1996. Headquarters staff has been reduced 281 full-time equivalents (a 40 percent reduction since FY 1996) and the field staff has been reduced 209 full-time equivalents.

On November 20, 1998, Secretary Richardson announced the successful completion of the Strategic Alignment Initiative and the implementation of the next phase, Workforce for the 21st Century Initiative (Workforce 21). This will enable the Department to hire and retain personnel in key areas with skills and technical expertise that are critical to the success of the EM program, as well as other Department missions in national security, energy resources, and science and technology.

To manage and oversee a multi-billion dollar program, EM must be able to attract and retain personnel with the necessary environmental, financial, managerial, and technical capabilities. The reductions in personnel and funding over the last several years have resulted in the loss of a significant number of highly qualified people. Further reductions, as well as a continued inability to replace people with critical skills who depart, will adversely affect the Department's ability to effectively manage this program.

The FY 2000 budget request assumes a level of 2,724 full-time equivalents in support of the EM program. This level, consistent with Workforce 21, is sufficient to support stable staff levels necessary for effective and efficient management of the EM program The following chart depicts the EM full-time equivalent staffing levels for Headquarters and the Field offices, by fiscal year.

Full-Time Equivalent Allocations

(whole FTEs)

	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000
Headquarters	706	579	438	435	425
Field Offices	2,508	2,475	2,344	2,329	2,299
Total, EM	3,214	3,054	2,782	2,764	2,724

Headquarters staff has been reduced through attrition, a buyout program, and the transfer of several programmatic functions and associated personnel to the field. The following chart depicts the field office staffing trends from FY 1998 through FY 2000.

Federal Staffing Trends by Operations/Field Office

(whole FTEs)

	AL	CB	CH	FE	ID	NV	OK	OR	OH	RL	RF	SR
FY 1998	145	56	107	66	240	56	70	140	223	494	257	490
FY 1999	134	61	110	65	239	55	72	139	223	508	247	476
FY 2000	129	61	106	51	236	53	69	133	224	535	242	460

J. Implement an Integrated Planning, Accountability and Budgeting System for EM

EM is developing an Integrated Planning, Accountability and Budgeting System to document quantitative goals and performance metrics, track progress, and eliminate duplicative management and tracking systems, reviews, and reports Under this system, the EM program has reorganized all activities (formerly tracked in about 1,000 activity data sheets) into more than 390 projects comprised of a group of similar or associated activities that will be tracked from the planning stage through budget formulation and execution. DOE believes that this management focus on projects will support the EM goal of completing cleanup as soon as possible, increase efficiency, reduce costs, and provide a more stable and understandable reporting structure, which is discussed in more detail in Section IV.

K. Work with Regulators, Stakeholders and Tribal Nations

Public participation is a cornerstone of the EM program. By working cooperatively with regulators, stakeholders, and Tribal Nations, the EM program has improved its efficiency and been able to meet its regulatory requirements in a more efficient and cost-effective manner. EM has formally established a number of mechanisms for regular intersite dialogue and input into EM decision making on local and national issues. Among these mechanisms are the Environmental Management Advisory Board, Site-Specific Advisory Boards, and the State and Tribal Governmental Working Group; the National Governors' Association Task Force; the National Association of Attorneys General; and the Transportation External Coordinating Working Group.

For several years, EM has been a leader among federal agencies in involving the public in budget formulation. In addition, EM and the EM sites conduct regular public meetings on issues of public interest.

IV. FY 2000 Budget Structure

In FY 1999, EM established a new budget structure that more closely aligns with EM's goals of accelerating cleanup and moving to project-based management. This structure is intended to continue to improve EM's ability to track progress and costs and provide a more understandable reporting structure. There are three fundamental elements to this structure:

- Organizing work into 'projects' (which are described in Project Baseline Summaries);
- Using program accounts which focus on site closure, site/project completion, and post 2006 completion; and
- Aligning performance measures (metrics) by project to meet the intent and requirements of the Government Performance and Results Act.

The budget structure continues to categorize projects according to their specific appropriations -- Defense Facilities Closure Projects, Defense Environmental Restoration and Waste Management, Defense Environmental Management Privatization, Non-Defense Environmental Management, and the Uranium Enrichment Decontamination and Decommissioning Fund.

Beginning with the FY 2000 Congressional Budget Request, the budget narrative is written to the project baseline summary level, within each program and appropriation account. This is a departure from the organization of the FY 1999 request, which was presented by performance measure/major activity and which provided crosscut information regarding the projects. Although the narrative discussion now focuses on the projects, crosscut information is provided in the 'Ancillary Tables' section of this Executive Budget Summary, which includes information such as funding estimates by performance metric, funding by installation, etc

A. Project Baseline Summaries

As mentioned previously, for the FY 2000 budget request, EM has identified more than 390 projects (as described in Project Baseline Summaries) that include (1) defined scopes, schedules, and costs; (2) budget data; (3) performance data; and, (4) compliance and safety and health data. The EM program has also aggregated the budget and performance data for each site to demonstrate the results that will be accomplished for the resources requested.

B. Program Accounts: Focus on Accelerating and Completing Cleanup

EM's three budget program accounts reflect near-term goals and emphasis on completion.

- **Site Closure.** This account provides funding for completing cleanup and closing down facilities with no enduring Federal presence on-site, except for stewardship activities. The Site Closure account under the Defense Appropriation includes the Rocky Flats site in Colorado, and the Fernald, Miamisburg, Columbus, and Ashtabula sites in Ohio. In the Non-Defense Appropriation, the Site Closure account includes the Grand Junction, CO, Weldon Spring, MO; West Valley, NY; Columbus, OH; and Miamisburg, OH sites,

as well as the UMTRA-Groundwater sites in various states. The Department has established a goal of completing cleanup at the sites in this account by the end of 2006

- **Site/Project Completion.** This account provides funding for environmental management projects that are expected to be completed by 2006 at (1) EM sites where overall site cleanup will not be fully accomplished by 2006; and (2) DOE sites where all EM projects will be completed by 2006 (except for long-term stewardship activities), but where there will be a continuing federal workforce at the site to carry out enduring non-EM missions, such as support of nuclear weapons activities or scientific research, and the necessary waste management activities to handle newly-generated wastes from these missions. This account includes projects and sites under the following Operations Offices: Albuquerque, Chicago, Idaho, Oakland, Richland, and Savannah River.

  In a limited number of cases, sites have been placed in the Site/Project Completion account even though there is no expectation of a continuing mission after cleanup is completed. In these instances, use of the Site Closure account would have created an additional appropriation control for an Operations/Field office with a limited amount of associated funding, thereby hindering managerial flexibility in the execution of projects at these sites.

- **Post 2006 Completion.** This account provides funding for projects that are expected to require work beyond FY 2006. This includes projects at the Albuquerque, Idaho, Nevada, Oak Ridge, Richland, and Savannah River Operations Offices, as well as the Waste Isolation Pilot Plant in Carlsbad, New Mexico, and multi-site and Headquarters activities.

  This account includes efforts at the largest Department sites, where operations have been carried out over a long period of time and associated cleanup will also take longer to complete.

C. Government Performance and Results Act Implementation

The EM program has been actively involved in incorporating the requirements of the Government Performance and Results Act into its planning, budgeting, and management systems. The Act requires: (1) Strategic Plans that articulate each program's fundamental missions and provide long-term, general goals for implementing the missions; (2) Annual Performance Plans that provide the direct link between the longer-term goals outlined in the Strategic Plan and what managers do on a day-to-day basis; and (3) Annual Performance Reports that describe the program results for the resources expended and how well the previous year's Annual Performance Plan goals were met.

The EM program is making progress in implementing the intent and requirements of the Government Performance and Results Act. Specific areas of emphasis include the following:

- EM will establish FY 1999 Management Commitments for each Operations/Field Office that are based on a roll-up of the Project Baseline Summary performance goals and selected key milestones reported in the FY 2000 budget request. These commitments will be used as a management tool for assessing program performance and results during Headquarters/Field periodic status reviews.

- The EM program will focus on improving the accuracy and completeness of its performance measures data. In particular, the life-cycle quantity estimates for the

measures (i.e., cubic meters of waste disposed) will be further refined and improved to set the near-term performance goals within the appropriate context of the total environmental work scope to be accomplished. EM will continue to manage using the Corporate Performance Measures (i.e., release site completions, facilities decommissioned, waste disposed, etc.) to demonstrate quantifiable progress towards completion of EM's geographic sites.

- The EM program will continue to improve its effectiveness and efficiency. To reduce the costs of EM's massive cleanup effort, the program continues to seek opportunities to accelerate cleanup without jeopardizing the safety of workers, communities, or the environment. By implementing enhanced performance, EM will be able to accelerate cleanup and closure schedules, and thereby lower life-cycle cleanup costs. EM has established accelerated site closure targets for the Rocky Flats Environmental Technology Site (from 2010 to 2006), the Fernald Environmental Management Project (from 2008 to 2005), and Miamisburg Environmental Management Project (from 2005 to 2004).

  EM has identified several enhanced performance mechanisms that are expected to result in improvements to productivity and/or accelerated site closure

  - Acceleration of Technology Deployment -- Introducing less expensive and/or more effective cleanup technologies,
  - Integration -- Identifying better ways to transfer and manage wastes among sites;
  - Project Sequencing -- Completing projects with high "up-keep" costs;
  - Contract Reform -- Creating incentives for contractors to improve performance (quality results and accelerated completion), and
  - Lessons Learned -- Increasing productivity based on lessons learned.

V. Transfer of Responsibilities

There are no new transfers of responsibility between EM and other Departmental programs reflected in the FY 2000 budget request. However, the Office of Environment, Safety and Health will manage the health studies program using funding appropriated or requested under the Defense Environmental Restoration and Waste Management appropriation (consistent with FY 1999). In addition, the DOE Office of Science manages the solicitation of proposals and the scientific review process, in partnership with the EM Science Program.

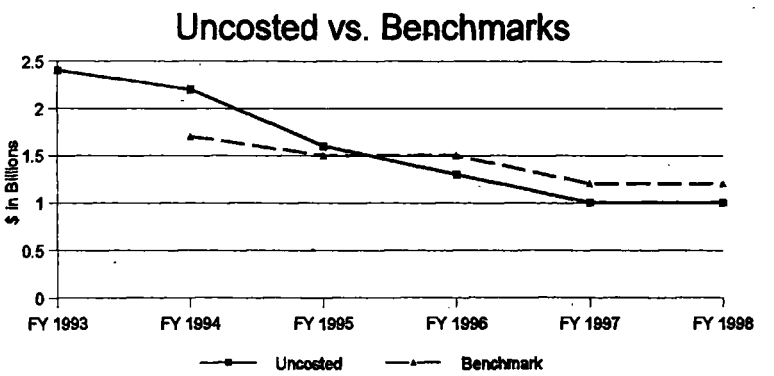
VI. Prior Year Balances

Prior year uncosted obligations exist when funds are legally obligated on a contract, subcontract, or purchase order, but the work has not yet been performed and the funds have not been costed or liquidated. These funds are commonly referred to as uncosted balances. Over the past several years, the Department has made significant progress in reducing the level of uncosted balances. In fact, as reflected in the Department's "Report on Uncosted Balances for Fiscal Year Ended September 30, 1997", issued to

Congress on March 16, 1998, "the Department's total uncosted balance is the lowest it has been in over 16 years."

The EM program has made a significant contribution towards reducing uncosted balances. Although some uncosted balances are a necessary business practice, the challenge is to define how much is enough. In FY 1996, EM established benchmarks (reasonable levels to carry over from one fiscal year to the next) as a tool to define the point at which greater scrutiny must be applied to ensure that uncosted balances are not excessive. In FY 1997, the Department adopted percentage thresholds which are applied consistently across all Departmental programs

EM's uncosted balances were well below the Department's thresholds in FY 1997. For example, the EM actual uncosted carryover for FY 1997 was $1.01 billion, over $200 million below the Department's guidelines. This trend continued through FY 1998 with an ending uncosted balance of $1.006 billion, well below the Department's threshold of $1.2 billion. EM is continuing to monitor its uncosted balances to improve funds management to ensure that uncosted balances carried forward to the next fiscal year are as low as practical and obligated on essential work scope/activities. The following chart depicts the historical trend of EM's uncosted balances versus the established benchmarks.



(dollars in billions)

	FY 1993	FY 1994	FY 1995	FY 1996	FY 1997	FY 1998
Uncosted	2.4	2.2	1.6	1.3	1.0	1.0
Benchmark	n/a	1.7	1.5	1.5	1.2	1.1

VII. Environmental Management Corporate Performance Measures

EM has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected for the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts.

EM managers have developed specific corporate measures to link planning goals with the budget, program execution, and evaluation of program performance and results. The EM corporate performance measures demonstrate tangible environmental results towards completing cleanup (or achieving the intended end state) at the remaining geographic sites. These corporate performance measures include:

- Volume of waste treated and disposed by waste type
- Number of release sites cleaned up
- Number of facilities deactivated
- Number of facilities decommissioned
- Quantity of nuclear material and spent nuclear fuel stabilized and prepared for disposition
- Number and type of alternative technology deployments

The summary-level performance measures reflected in the FY 2000 budget request are based upon the project-level performance measures contained in the Project Baseline Summaries. The corporate performance measures also include crosscutting measures related to health and safety, contracting, and stakeholder trust and confidence. The linkage between the projects' performance measures and EM's budget request will enable EM, the Congress, and others to track, on an annual basis, EM's progress towards its commitments, as well as progress towards project and geographic site completion.

The FY 2000 budget request presents performance measures data at the Project Baseline Summary level and at various roll-up levels to demonstrate key program accomplishments and results at EM's projects and sites. Each project includes a list of the corporate performance measures applicable to the project for FY 1998, FY 1999, and FY 2000. While a significant number of EM's projects have quantifiable corporate performance measures, not all projects have work scope associated with these measures. Some of the reasons why a project does not contain any corporate measures for the budget profile years include: work on the project has not yet begun; work is in progress and has not yet been completed; and the project is for landlord, infrastructure, or construction activities that do not have measures. The project baseline summary narrative provides a description of the project's activities, measures, and work scope to fully address planned and actual accomplishments and results.

A. Geographic Site Completions

The Department is implementing strategies to accomplish DOE's Environmental Quality strategic objective to "*clean up as many as possible of the Department's 53 remaining contaminated geographic sites by 2006.*" At the ten remaining sites after 2006, including our five largest sites, treatment will continue for the remaining 'legacy' waste streams. Fifty-three geographic sites remained to be cleaned up as of the beginning of FY 1998 (this number included the addition of the Waste Isolation Pilot Plant, which is a disposal site). Five geographic sites were completed during FY 1998, leaving a total of 48 geographic sites to be cleaned up as of the beginning of FY 1999.

A geographic site is considered 'complete' (or at its end state) when.

- Deactivation or decommissioning of all facilities currently in the EM program has been completed, excluding any long-term surveillance and monitoring;
- All releases to the environment have been cleaned up in accordance with agreed-upon cleanup standards;
- Groundwater contamination has been contained, or long-term treatment or monitoring is in place;
- Nuclear material and spent fuel have been stabilized and/or placed in safe long-term storage; and
- 'Legacy' waste (i.e., waste produced by past nuclear weapons production activities, with the exception of high-level waste) has been disposed of in an approved manner.

FY 2000 Geographic Site Completions

In FY 2000, EM plans to complete three geographic sites, increasing the total completed to 71 of the 113 geographic sites in the EM program. These completions reflect 24 of the 24 Uranium Mill Tailings Remedial Action surface project sites (two of these sites were delisted at the request of the State of North Dakota); all of the 25 Formerly Utilized Sites Remedial Action Project sites (per Congressional direction, the remaining Formerly Utilized Sites Remedial Action Project sites were transferred to the Army Corps of Engineers for remediation at the beginning of FY 1998); and 22 other sites, leaving 42 sites to be cleaned up. The three planned geographic site completions in FY 2000 are:

- Argonne National Laboratory-West in Idaho;
- General Atomics Site in California; and,
- Battelle Columbus Laboratory King Avenue Site in Ohio.

Geographic Site Completion Progress

- In FY 1999, EM plans to complete the following three geographic sites, bringing the number of completed geographic sites to 68:
  - Ames Laboratory in Iowa;
  - Sandia National Laboratory in California; and,
  - Princeton Plasma Physics Laboratory in New Jersey.
- In FY 1998, EM completed the following five geographic sites, bringing the number of completed geographic sites to 65:
  - Center for Energy and Environmental Research in Puerto Rico; and,
  - Completed remedial action at the final two Uranium Mill Tailings Remedial Action surface project sites (Naturita and Maybell in Colorado) and revoked the designation of the two North Dakota sites (Belfield and Bowman) from the project.

B. Cleanup

EM has also demonstrated and will continue to demonstrate significant cleanup progress through the completion of remediation at numerous "release sites" and "facilities" at the various geographic sites, ultimately leading to the completion of an entire geographic site. Release sites represent discrete areas of contamination at a particular site, and facilities are contaminated structures.

Remedial actions/release site cleanup, facility deactivation, and facility decommissioning are further defined as follows:

- *Remedial Action/Release Site Cleanup* -- Remedial actions are taken to identify and contain or remove soil and ground water contamination to prevent it from spreading. Remedial action/release site cleanups are conducted at inactive waste sites or facilities where releases or spills have occurred and contamination has been released into the environment. Completion of release site assessments are also tracked to show interim cleanup results.
- *Facility Deactivation* -- Deactivation activities minimize the risks, hazards, and associated costs at facilities and make those facilities available for potential re-use or eventual decontamination and decommissioning. These activities can include material handling and movement activities. The intent, however, is not to achieve an end point for the material, but to remove the material with the goal of readying the facility/system for the preferred end state.
- *Facility Decommissioning* -- Decommissioning involves the decontamination and/or dismantlement and removal of nuclear facilities that are no longer active and pose a risk to public health or the environment. Decommissioning operations range from small cleanup activities involving portions of buildings to complete structural dismantlement Completion of facility assessments are also tracked to show interim decommissioning results.

FY 2000 Performance Goals for Cleanup

- Release Site Assessments and Cleanups
  - Complete approximately 760 release site assessments.
  - Complete approximately 200 release site cleanups, increasing the total number of release sites completed to more than 4,400 out of a total inventory of approximately 9,700 release sites.
- Facility Deactivation and Decommissioning
  - Deactivate approximately 60 facilities.
  - Complete approximately 345 facility decommissioning assessments.
  - Decommission 110 facilities, increasing the total number of facilities decommissioned to more than 600 out of a total inventory of approximately 3,300 facilities.

Cleanup Progress

- Release Site Assessments and Cleanups
  - Complete approximately 310 release site assessments in FY 1999; and completed 583 release site assessments in FY 1998.
  - Complete approximately 165 release site cleanups in FY 1999; and completed 290 release site cleanups in FY 1998
- Facility Deactivation and Decommissioning
  - Deactivate approximately 65 facilities in FY 1999; and deactivated 70 facilities in FY 1998.

- Complete approximately 120 facility decommissioning assessments in FY 1999; and completed 89 facility decommissioning assessments in FY 1998.
- Decommission approximately 80 facilities in FY 1999; and decommissioned 108 facilities in FY 1998.

Geographic Site Completions

	Pre-FY 1998	FY 1998[2]	FY 1999	FY 2000	Total[3]
End of Year Remaining[1]	53	48	45	42	113
Cumulative Completions[2]	60	65	68	71	

1. 53 geographic sites remained to be cleaned up at the beginning of FY1998 (this includes the addition of WIPP which is a disposal site).
2. Completions include two UMTRA sites Belfield and Bowman, ND The desgnation of these sites as UMTRA sites was revoked in FY1998.
3. Excludes 21 FUSRAP sites transferred to the U.S. Army Corps of Engineers in FY 1998.

C. Waste Treatment, Storage, and Disposal

The Department is implementing strategies to accomplish DOE's Environmental Quality strategic objective to, *"safely and expeditiously dispose of waste generated by nuclear weapons and civilian nuclear research and development programs and make defense high level radioactive wastes disposal-ready."* Listed below are long-term and near-term goals for managing the radioactive waste types: high-level waste, transuranic waste, low-level waste, and mixed low-level waste. EM issued the Waste Management Programmatic Environmental Impact Statement Records of Decision for Hazardous Waste Treatment and Transuranic Waste Storage and Treatment in FY 1998 and continued to resolve issues related to the issuance of Records of Decision for High-Level Waste Storage and Low-Level and Mixed Low-Level Waste Treatment and Disposal These Records of Decision will help define the storage, treatment, and disposal facilities for waste management activities. EM developed initial disposition maps to show the planned pathways to move waste or materials from inventory or generation through required processing to treatment or stabilization and on to final disposition. In addition, DOE will examine areas where consolidation of facilities can occur to reduce overall programmatic costs.

- *High-Level Waste* -- High-level waste is highly-radioactive waste material resulting from the reprocessing of spent nuclear fuel, including the liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations, and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation. The waste is stored largely as a liquid or sludge, with some waste in the form of calcine. The long-term objective for high-level waste management is disposal in a licensed geologic repository. High-level waste is made disposal-ready through treatment to produce canisters of vitrified waste. The Department is currently vitrifying liquid high-level waste at the Defense Waste Processing Facility at the Savannah River Site in South Carolina, and the West Valley Demonstration Project in New York. Work will also continue for the privatization of high-level waste treatment at the Hanford Site in Washington and solidification of liquid to a calcine form at the Idaho National Engineering and Environmental Laboratory.

- *Transuranic Waste* -- Transuranic waste is radioactive waste containing more than 100 nanocuries of alpha-emitting transuranic isotopes per gram of waste, with half-lives greater than 20 years, except for a) high-level radioactive waste; b) waste that the Secretary of Energy has determined, with the concurrence of the Administrator of the Environmental Protection Agency, does not need the degree of isolation required by the 40 CFR Part 191 disposal regulations; or c) waste that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR Part 61. Approximately 98% of DOE's transuranic waste is stored at six major sites: the Los Alamos National Laboratory, the Rocky Flats Environmental Technology Site, the Oak Ridge National Laboratory, the Hanford Site, the Idaho National Engineering and Environmental Laboratory, and the Savannah River Site. The long-term goal is to dispose of all defense-related transuranic waste in the Waste Isolation Pilot Plant in New Mexico.

- *Mixed Low-Level Waste* -- Mixed low-level waste consists of both hazardous (as defined by the Resource Conservation and Recovery Act) and radioactive (as defined by the Atomic Energy Act) components and is not high-level or transuranic waste. The long-term goal for mixed low-level waste is to develop the necessary treatment and disposal capacity needed to dispose of the existing inventory as well as any newly generated waste. The near-term goal for mixed waste is to complete site selection for disposal facilities and optimize the treatment configuration outlined in the site treatment plans.
- *Low-Level Waste* -- Low-level waste is radioactive waste, including accelerator-produced waste that is not high-level waste, radioactive waste, transuranic waste, spent nuclear fuel, byproduct material (as defined under the Atomic Energy Act of 1954), or naturally occurring radioactive material. Low-level waste is currently disposed at Los Alamos National Laboratory, the Idaho National Engineering and Environmental Laboratory, and the Savannah River, Oak Ridge, Nevada, and Hanford sites. The Nevada and Hanford sites also accept low-level waste from other sites in the DOE Complex. The Savannah River Site accepts a small volume of low-level waste from the Naval Reactors Program. The near-term and long-term goals of the low-level waste management program are to continue to dispose of low-level waste at a pace to eliminate currently stored low-level waste and match generation of new waste.

In addition to the waste type measures listed above, EM also reports the quantity of hazardous waste disposed and the volume of remediation waste generated. While not EM Corporate Performance Measures, hazardous waste and remediation waste activities are reported in the budget by Project Baseline Summary, where applicable.

The safe storage, treatment and disposal of waste ensures that these materials do not pose unacceptable risk to the public, workers, or the environment. Waste management activities support completion of EM's geographic sites and will ultimately enable many of EM's sites to be made available for other beneficial uses.

FY 2000 Performance Goals for Waste Management

Specific performance goals for managing the treatment, storage (i.e., FY 2000 year-end inventory), and disposal of the Department's waste in FY 2000 include:

- High-Level Waste
  - Treat approximately 1,400 cubic meters of high-level waste.
  - Store approximately 355,000 cubic meters of high-level waste.
  - Produce approximately 105 canisters of high-level waste:
    - At the Defense Waste Processing Facility at the Savannah River Site, vitrify approximately 100 canisters of high-level waste This completes about 15% of the total canisters that will be produced at Savannah River from FY 1996 to life-cycle completion.
    - Continue processing high-level waste tank heels at the West Valley Demonstration Project to produce up to 5 canisters of high-level waste in FY 2000. This

completes more than 90% of the total canisters that will be produced at West Valley from FY 1996 to life-cycle completion.

- Transuranic Waste
  - Treat approximately 600 cubic meters of transuranic waste.
  - Store approximately 109,000 cubic meters of transuranic waste.
  - Make disposal-ready and ship to the Waste Isolation Pilot Plant in Carlsbad, New Mexico, approximately 3,400 cubic meters of transuranic waste. Shipment of transuranic waste to the Waste Isolation Pilot Plant is contingent upon resolution of pending litigation, and for mixed-waste, timely receipt of the Resource Conservation and Recovery Act Part B Permit. This is about 2% of the total transuranic waste that requires disposal between FY 1998 and FY 2070.
- Mixed Low-Level Waste
  - Treat approximately 10,000 cubic meters of mixed low-level waste.
  - Store approximately 34,000 cubic meters of mixed low-level waste.
  - Dispose of approximately 15,000 cubic meters of mixed low-level waste.
- Low-Level Waste
  - Treat approximately 9,000 cubic meters of low-level waste.
  - Store approximately 213,000 cubic meters of low-level waste.
  - Dispose of approximately 79,000 cubic meters of low-level waste.

Waste Management Progress

Examples of progress in managing our waste include:

- High-Level Waste Treatment and Disposal-Ready
  - Treat approximately 1,500 cubic meters of high-level waste in FY 1999; and treated 2,411 cubic meters of high-level waste in FY 1998.
  - Produce approximately 215 canisters of high-level waste in FY 1999; and produced 331 canisters of high-level waste in FY 1998. Specifically:
    - EM expects to produce up to 200 canisters of vitrified high-level waste at the Defense Waste Processing Facility at Savannah River in FY 1999; and produced 250 vitrified high-level waste canisters in FY 1998.
    - EM expects to produce up to 15 canisters of vitrified high-level waste at the West Valley Demonstration Project in FY 1999; and produced 81 canisters of vitrified high-level waste in FY 1998.
- Transuranic Waste Treatment and Disposal
  - Treat approximately 350 cubic meters of transuranic waste in FY 1999; and treated 90 cubic meters of transuranic waste in FY 1998.

- Make disposal-ready and ship to the Waste Isolation Pilot Plant approximately 700 cubic meters of transuranic waste in FY 1999; and made disposal-ready 229 cubic meters of transuranic waste in FY 1998. Shipment of transuranic waste to the Waste Isolation Pilot Plant is contingent upon resolution of pending litigation, and for mixed waste, timely receipt of the Resource Conservation and Recovery Act Part B permit.

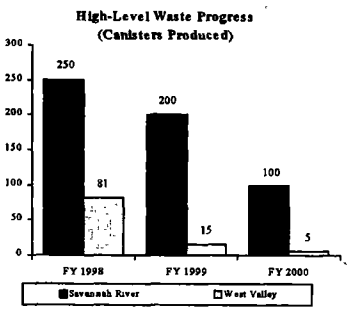
- Mixed Low-Level Waste Treatment and Disposal
  - Treat approximately 11,000 cubic meters of mixed low-level waste in FY 1999; treated 11,048 cubic meters of mixed low-level waste in FY 1998.
  - Dispose of approximately 15,000 cubic meters in FY 1999; disposed of 10,727 cubic meters of mixed low-level waste in FY 1998.
- Low-Level Waste Treatment and Disposal
  - Treat approximately 21,000 cubic meters of low-level waste in FY 1999; treated 15,375 cubic meters of low-level waste in FY 1998.
  - Dispose of approximately 73,000 cubic meters in FY 1999; disposed of 29,762 cubic meters of low-level waste in FY 1998.

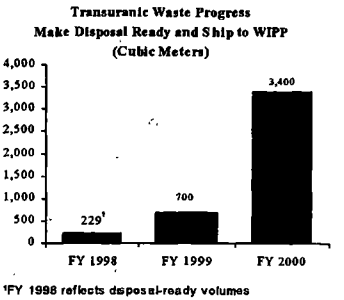
Other significant examples of progress in managing our waste include:

- Declared the Waste Isolation Pilot Plant geologic repository ready for operations for transuranic waste disposal in FY 1998; disposal operations of non-mixed transuranic waste are expected to begin in FY 1999; a permit for receipt and disposal of mixed transuranic waste is also expected to be received in FY 1999
- The Los Alamos National Laboratory received certification from the Carlsbad Area Office and the Environmental Protection Agency to dispose of transuranic waste at the Waste Isolation Pilot Plant. Both the Idaho National Engineering and Environmental Laboratory and Rocky Flats Environmental Technology Site received certification from the Carlsbad Area Office, and are in the process of receiving approval from the Environmental Protection Agency, to dispose of transuranic waste at the Waste Isolation Pilot Plant.
- Authorized commencement of the Tank Waste Remediation System contract Phase 1B at Hanford in August 1998, for treatment of between 6% and 13% of the high-level waste.
- Began site development and construction of support facilities and began Immobilized Low Activity Waste and Immobilized High Activity Waste storage facility projects at Hanford to support privatization
- Completed 16 Tank Characterization Reports at Hanford, meeting all required Defense Nuclear Facilities Safety Board Recommendation 93-5, Tank Waste Characterization Studies, commitments for FY 1998.
- Started operations of the Waste Receiving and Processing facility transuranic waste processing line at Hanford in FY 1998.

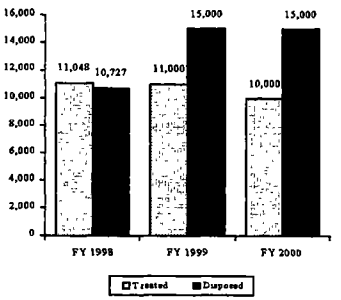
- Closed the Unreviewed Safety Question for organic complexants at Hanford, resolved safety issues, and took 18 organic complexant tanks off the watch list in FY 1998; also closed the flammable gas Unreviewed Safety Question for double-shell and single-shell tanks at Hanford.
- Completed the tank farm cross-site transfer line at Hanford in FY 1998.
- Started or resumed interim stabilization of three tanks at Hanford in FY 1998, expect to start interim stabilization of four additional Hanford tanks in FY 1999.
- Began operation of the Replacement High-Level Waste Evaporator at Savannah River to assist in achieving space gain of 2.9 million gallons (FY 1999) in the tank farm through evaporation of waste.
- Closed a second high-level radioactive waste tank at Savannah River in FY 1998.
- Completed calcining the remaining non-sodium bearing waste at Idaho, four months ahead of the Idaho Settlement Agreement milestone.
- Awarded contract and began Phase I of the Advanced Mixed Waste Treatment Project at the Idaho National Engineering and Environmental Laboratory to treat DOE mixed transuranic and low-level waste.
- Awarded the Oak Ridge transuranic waste treatment privatization contract and broad spectrum contracts for mixed low-level waste treatment in FY 1998.
- Completed Phase I vitrification at the West Valley Demonstration Project in FY 1998, ahead of schedule and under budget; 500,000 curies are expected to be transferred from the tank farms to the vitrification facility in FY 1999.
- Negotiated a Joint Federal/State Oversight Agreement of the Low-Level Waste Disposal Program with the State of Nevada in FY 1998.
- Completed design and construction of the Waste Management Facility upgrade at the Argonne National Laboratory-East in FY 1998.
- Issued Records of Decision for the treatment and storage of transuranic waste and for treatment of hazardous waste based on the Waste Management Programmatic Environmental Impact Statement in FY 1998; Records of Decision for low-level and mixed low-level waste treatment and disposal are expected to be issued in FY 1999.

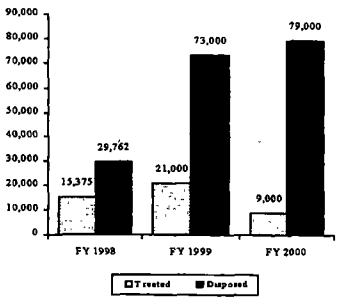
Waste Management Progress





¹FY 1998 reflects disposal-ready volumes





D. Pollution Prevention

The Department is implementing initiatives to accomplish DOE's Environmental Quality strategic objective to *"prevent future pollution"* in accordance with the Department-wide pollution prevention goals issued by the Secretary on May 3, 1996. The goals require the Department to reduce routine waste generation by 50 percent (for hazardous, mixed, and radioactive wastes) by December 31, 1999, based upon 1993 baseline rates.

For FY 2000 and beyond, EM will shift its emphasis from routine waste prevention to reducing waste that results from cleanup, stabilization, and decommissioning activities. The annual goal for this waste reduction is 10 percent, from annual planned baseline volumes. The Department plans to change its way of managing the Pollution Prevention Program in FY 2000 by shifting more responsibility from Headquarters to the field. Funds for the Headquarters-controlled National Pollution Prevention Program project baseline summary will be reduced. The field will provide resources to implement many of the activities funded by the National Pollution Prevention Program in prior years. Examples include activities required to comply with Executive Orders and DOE Orders, technical support to waste generators to identify opportunities, implementing high return-on-investment projects, tracking pollution prevention progress and reporting results to Headquarters The purpose of this program shift is to integrate Pollution Prevention into the Department's operating culture.

E. Nuclear Material and Spent Nuclear Fuel Stabilization

Stabilizing, monitoring, and maintaining the large quantity of nuclear material and spent nuclear fuel is one of the most urgent tasks in the EM program. Nuclear material stabilization activities support the DOE Environmental Quality strategic objective to *"reduce the most serious risks from the environmental legacy of the U.S. nuclear weapons complex first."* The Department must stabilize these materials and fuel (i.e., produce a safer chemical and/or physical form of the material) to reduce the level of potential risks such as exposure to radiation, contamination of people and the environment, and critical events. Stabilization converts nuclear material to a stable form suitable for storage, either safe interim or long-term depending upon the programmatic plans for the material. Stabilization means that something (processing from a liquid to a solid form, processing to remove activated waste streams, repackaging, etc.) must be done to the nuclear material so that they pose significantly less risk to workers, the public, and/or the environment. Nuclear material will be stabilized in the F-Canyon, FB-Line, H-Canyon, and HB-Line at Savannah River, the Plutonium Finishing Plant at Richland, and in several facilities at the Rocky Flats Environmental Technology Site. These activities have been prioritized so that the most serious risks are addressed first. Milestones have also been developed for the management of spent nuclear fuel including both DOE-owned fuels, as well as foreign research reactor fuels being returned to the United States for non-proliferation purposes. These fuels will be treated, where necessary, packaged suitably for final disposal where practicable, and placed in interim dry storage. Further, as nuclear material and spent fuel are placed in a more stable (i.e., lower risk) form, the physical plant (i.e., buildings, production systems, machinery, and utilities) can be deactivated.

The performance measures for nuclear material and spent nuclear fuel focus on the amount of nuclear material *stabilized* and subsequently *made disposition-ready* while awaiting final disposition.

Nuclear Material

- *Stabilization* encompasses activities where the intent is to convert nuclear material to a stable form suitable for storage, either safe interim or long-term, depending upon the programmatic plans for the material. This includes staging, preparation, and operations actions. These actions are taken to both manage and reduce risks. The following types of nuclear material will be reported under "stabilization": Plutonium Solution (liters); Plutonium Residue (kilograms bulk); Plutonium Metal/Oxides (containers); Uranium Solution (liters); Uranium in Other Forms (kilograms bulk); Other Nuclear Material in Solution Form (liters); and Other Nuclear Material in Other Forms (handling units).
- *Material Made Disposition-Ready.* "Disposition-ready" materials are prepared for transportation, long-term storage, or final disposition. The amount of material provided represents the material's post-stabilization (treatment) weight, mass, volume, or number of containers The following types of nuclear material will be reported under "disposition-ready": Plutonium Metal/Oxides or in Other Forms (containers); Uranium Solution (liters); Uranium in Other Forms (kg bulk); Other Nuclear Material in Solution Form (liters); and Other Nuclear Material in Other Forms (containers).

Spent Nuclear Fuel. Spent nuclear fuel includes fuel, targets, and slugs.

- *Stabilization.* Spent nuclear fuel stabilization encompasses activities where the intent is to treat, where necessary, spent nuclear fuel to a safe, stable state to a point where it can be made disposition ready, including all staging and preparation actions. These actions are taken to both manage and reduce risks.
- *Disposition Ready.* Spent nuclear fuel is prepared as best as known practices will allow for transportation, long-term storage, or final disposal. Activities under "disposition ready" may include repackaging/movement of stabilized spent fuel from wet to dry storage; technology development for disposal; and repackaging of fuel to meet storage standards and criteria.

FY 2000 Performance Goals for Nuclear Material and Spent Nuclear Fuel Stabilization

The existing performance measures for nuclear material and spent nuclear fuel were revised during FY 1998 to resolve classified data reporting issues and to more completely quantify progress in nuclear material and spent nuclear fuel stabilization These updated performance measures are reported below.

- Nuclear Material Stabilized
  - Stabilize approximately 160 liters of plutonium solution
  - Stabilize approximately 38,000 kilograms bulk of plutonium residue.
  - Stabilize approximately 238 containers of plutonium metal/oxides.
  - Stabilize approximately 9 kilograms bulk of uranium in other forms.
  - Stabilize approximately 430 handling units of other nuclear material in other forms.
- Nuclear Material Made Disposition-Ready
  - Make disposition-ready approximately 910 containers of plutonium metal/oxides/other
  - Make disposition-ready approximately 85,600 liters of uranium solution

- Make disposition-ready approximately 2 containers of other nuclear material in other forms

- Spent Nuclear Fuel Stabilized and Made Disposition-Ready
  - Stabilize approximately 53.1 metric tons of heavy metal of spent nuclear fuel
  - Make disposition-ready approximately 0 005 metric tons of heavy metal of spent nuclear fuel
  - Make disposition-ready approximately 0 016 cubic meters of spent nuclear fuel

Nuclear Material Stabilization Progress

Examples of progress in managing nuclear material for FY 1998 and FY 1999 include:

- Nuclear Material Stabilized
  - Stabilize approximately 40 liters of plutonium solution in FY 1999; stabilized 3,035 liters of plutonium solution in FY 1998
  - Stabilize approximately 33,000 kilograms bulk of plutonium residue in FY 1999; stabilized 5,004 kilograms bulk of plutonium residue in FY 1998.
  - Stabilize approximately 332 containers of plutonium metal/oxides/other in FY 1999; stabilized 80 containers of plutonium metal/oxides/other in FY 1998.
  - Stabilize approximately 78 kilograms bulk of uranium in other forms in FY 1999.
  - Stabilize approximately 460 handling units of other nuclear material in other forms in FY 1999; stabilized 147 handling units of other nuclear material in other forms in FY 1998.
- Nuclear Material Made Disposition-Ready
  - Make disposition-ready approximately 2 containers of plutonium metal/oxides in FY 1999, made disposition-ready 2 containers of plutonium metal/oxides in FY 1998.
  - Make disposition-ready approximately 7 kilograms bulk of uranium in other forms in FY 1999
  - Make disposition-ready approximately 23 containers of other nuclear material in other forms in FY 1999; made disposition-ready 3 containers in FY 1998.

Spent Nuclear Fuel Stabilization Progress

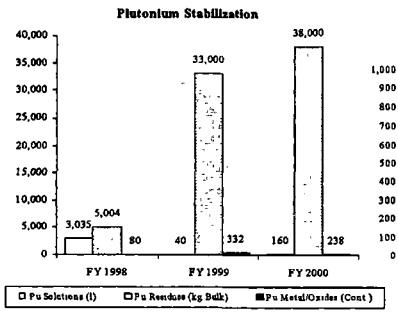
Examples of progress in managing spent nuclear fuel for FY 1998 and FY 1999 include:

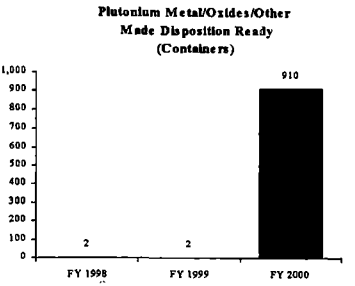
- Spent Nuclear Fuel Stabilized and Made Disposition Ready
  - Stabilize approximately 6.015 metric tons of heavy metal of spent nuclear fuel in FY 1999; stabilized 0.753 metric tons of heavy metal of spent nuclear fuel in FY 1998.
  - Stabilize approximately 0.132 cubic meters of spent nuclear fuel in FY 1999; stabilized 0.332 cubic meters of spent nuclear fuel in FY 1998.
  - Make disposition-ready 0.091 metric tons of heavy metal of spent nuclear fuel in FY 1998.
  - Make disposition-ready approximately 16.282 cubic meters of spent nuclear fuel in FY 1999; made disposition-ready 12 028 cubic meters of spent nuclear fuel in FY 1998.

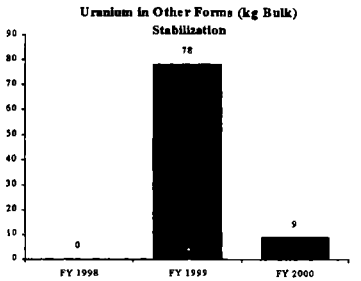
Other significant examples of progress in nuclear material and spent nuclear fuel stabilization include:

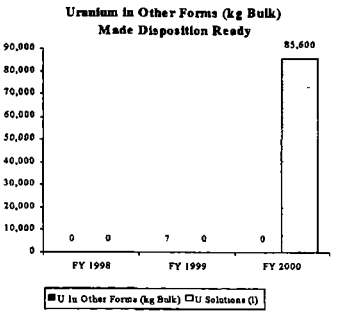
- Drained two areas in Building 371; drained and removed 2 liquid piping systems in Building 771; and stabilized or repackaged 5,004 kg plutonium-bearing residues at the Rocky Flats Environmental Technology Site in Colorado in FY 1998.
- Completed DOE's first shipment of spent fuel from Asia via the Concord Naval Weapons Station in California to the Idaho National Engineering and Environmental Laboratory in FY 1998.
- In support of the U.S. non-proliferation policy, completed the transport and receipt of four shipments of foreign research reactor spent nuclear fuel from approximately ten countries to the Savannah River Site in South Carolina in FY 1998.
- Drain and remove 12 liquid systems in Building 771 at the Rocky Flats Environmental Technology Site in FY 1999.
- Drain 10 areas in Building 371 at the Rocky Flats Environmental Technology Site in FY 1999.
- Begin transferring spent nuclear fuel from wet storage in the Test Area North-607 pool at Idaho to the interim dry storage facility in FY 1999.
- Complete the first cross-country shipment of foreign research reactor Training, Research Irradiation Reactors from General Atomics spent nuclear fuel from Europe to the Idaho National Engineering and Environmental Laboratory via the Charleston Naval Weapons Station in FY 1999.
- Begin stabilization of plutonium oxide at the Plutonium Finishing Plan at the Hanford Site in Washington in FY 1999.
- Complete removal of spent nuclear fuel from Facility 7823 on the Oak Ridge Reservation in Tennessee in FY 1999.

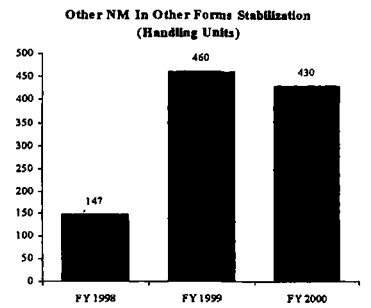
Progress in Nuclear Material Stabilization

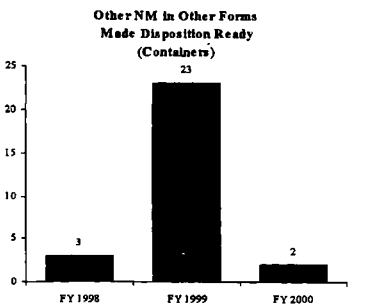




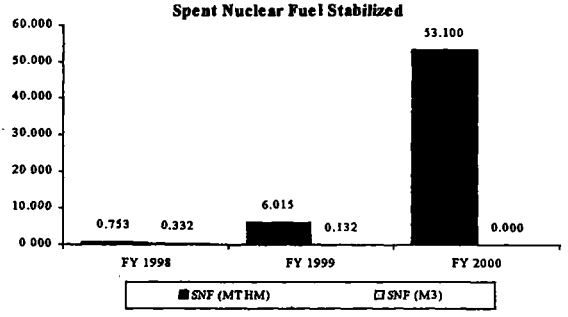


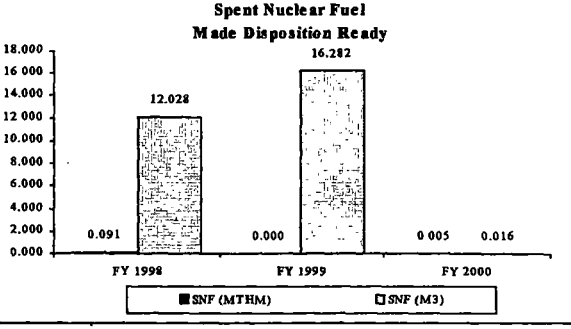






Progress in Spent Nuclear Fuel Stabilization





F. Technology Development and Deployment

EM is implementing initiatives for developing and deploying alternative environmental cleanup, nuclear waste, and spent fuel treatment technologies that reduce cost, resolve currently intractable problems, and/or are more protective of workers and the environment. Developing and deploying alternative technologies supports the DOE Environmental Quality strategic objective to *"reduce the life-cycle costs of environmental cleanup."* EM's technology development efforts in FY 2000 concentrate on five major focus areas: (1) Mixed Waste; (2) Tank Waste Remediation; (3) Subsurface Contaminants; (4) Deactivation and Decommissioning; and (5) Plutonium. EM's measures for assessing technology development and deployment progress are:

- Number of alternative technologies demonstrated -- Technologies or systems that meet the performance-specification-based needs as identified by the Site Technology Coordinating Groups
- Number of alternative technologies ready for implementation -- Technologies or systems with cost and engineering performance data.
- Number of alternative technology deployments -- Deployment is the use of a technology or technology system toward accomplishment of one or more site-specific DOE EM program cleanup objectives as applied to the actual waste requiring management at the site.

FY 2000 Performance Goals for Technology

Specific performance goals for technology development and deployment for FY 2000 include.

- Technology Development and Deployment
  - Demonstrate 30 alternative technology systems that meet the performance-specification-based needs as identified by the Site Technology Coordinating Groups.
  - Make 30 environmental technology systems ready for implementation with cost and engineering performance data.
  - Accomplish 60 alternative technology deployments A goal of 60 deployments is established based on the current rate of technology deployments. Historically, it has proven difficult to quantify longer-term performance goals for deployments due to the nature of the technology work scope and variations in timing and magnitude of the deploying EM program's work scope.

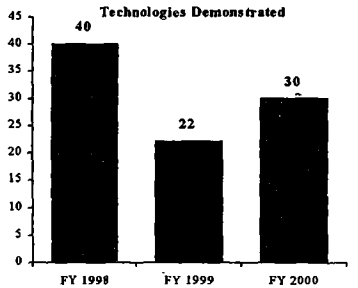
Technology Progress

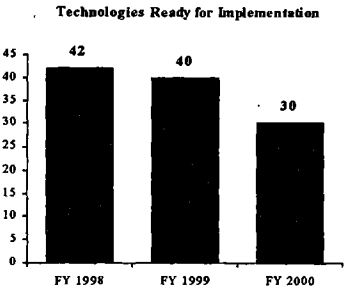
Examples of progress in Technology Development and Deployment during FY 1998 and FY 1999 include:

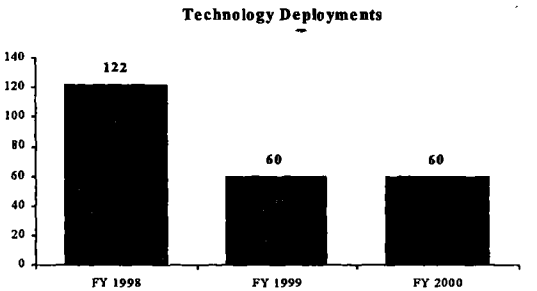
- Initiated a deployment support effort designed to incentivize widespread use of available cost- and schedule-reducing alternative technologies, thereby accelerating cleanup and maximizing cost avoidance. More than 30 accelerated site technology deployment projects have been competitively selected in FY 1999 Fourteen high-potential deployment projects were competitively selected and initiated in FY 1998.

- Demonstrate 22 alternative technology systems that meet Site Technology Coordination Group-identified needs in FY 1999. Demonstrated 40 alternative technology systems in FY 1998, including technologies for use in retrieving solid waste from the Hanford Tanks that remains after the liquid waste has been removed.
- Make 40 alternative technology systems ready for implementation in FY 1999. Made 42 alternative technology systems ready for implementation with cost and engineering performance information in FY 1998, including a sensor that measures the direction and force of groundwater flow, providing valuable information on groundwater movement which is critical in locating and designing, and monitoring waste disposal sites.
- Accomplish 60 innovative technology deployments in FY 1999. Deployed alternative technologies in 122 instances during cleanup projects in FY 1998.
- Solicited, peer reviewed and awarded new EM Science Program grants in the areas of Deactivation and Decommissioning and High-Level Waste in FY 1998. This basic longer-term research is aimed at DOE's most intractable problems.

Progress in Technology Development and Deployment







NOTES
1. FY 1999 is based on the FY 1999 Appropriation
2. FY 2000 is based on the FY 2000 Request. The goal of 60 deployments is established based on the current rate of technology deployments.

G. Corporate Performance Measures - EM Program Totals

This section provides corporate performance measures aggregated to a total EM program level. These roll-ups are supported by detailed information included within the FY 2000 Budget that depict performance measures and goals for FY 1998, FY 1999, and FY 2000. The budget details are provided by appropriation, program account (e g., Site Closure, Site/Project Completion, and Post 2006 Completion), Operations/Field Office (and/or site), and Project Baseline Summary performance measures. EM will continue to improve its performance-based budgeting process and the quality of its performance data over the coming year.

Please note the following when reviewing the tables which follow:

- **Release Sites/Facilities:** The sequence and priority in which release sites and facilities at each geographic site are cleaned up vary. The level of effort and resources required to complete EM's release sites and facilities depend upon the urgency, complexity, risk, size of the particular release site and/or facility, and a variety of other factors. Some areas require more characterization and some facilities are much more difficult to cleanup than others. Typically, the simpler release site/facilities are cleaned up first, leaving the more complicated (and generally more costly) activities for later. These more complex areas/facilities may take several years to complete and may also require more time due to resource constraints. Therefore, comparisons between release sites and facility completions both within a particular site, across sites, and from year-to-year, will not provide a good indicator of program progress.
- **Waste:** These tables focus on high-level, transuranic, mixed low-level, and low-level waste progress. Hazardous waste and/or other waste accomplishment data are not reflected in these summary tables. However, in most cases, they are included in the supporting budget narratives. Volume of waste "stored" values represent the inventory status as of the last day of the fiscal year for the "FY 1998 Actual", the "FY 1999 Planned", and "FY 2000 Planned".

Corporate Performance Measures - EM Program Totals [a]

	FY 1998 Actual	FY 1999 Planned	FY 2000 Planned	Life-cycle
Release Sites and Facilities				
Number of Completed Release Site Assessments	583	313	761	n/a

[a] This table presents the total estimated budget authority by performance measure category (e.g., Transuranic Waste, Release Sites, Nuclear Material Stabilization, etc.) and "other" activities (e.g., operational activities, etc.) *below* the Project Baseline Summary level. The table reflects only an estimate of the budget authority associated with key program activities related to waste management, remediation, facility deactivation, and nuclear material and spent nuclear fuel stabilization. The budget authority provided for these performance measures and "other" activities are estimates only and are therefore not of auditable quality. The total budget authority reported for each Project Baseline Summary in the main line budget is of audit quality consistent with EM's project-based management approach.

[b] Includes waste that is not classified as high-level waste, transuranic waste, hazardous waste, low-level waste, or mixed low-level waste.

[a] Life-cycle estimates for release sites, facilities, nuclear material, and spent nuclear fuel are from FY 1997 through FY 2070. Waste type estimates are from FY 1998 through FY 2070, with the exception of high-level waste canisters produced which are from FY 1996 through FY 2070. Life-cycle estimates will be updated in the Spring 1999 update of EM's corporate database.

[b] FY 1999 and FY 2000 reflect disposal-ready volumes and shipments to the Waste Isolation Pilot Plant. FY 1998 reflects disposal-ready volumes only.

[c] Reflects the available disposal capacity at the Waste Isolation Pilot Plant in Carlsbad, New Mexico

[a] See the following pages for explanation of variances on this chart which exceed +/-15 percent.

FY 1998 EM Corporate Performance Measure Variance Explanations

Listed below are explanations for variances between the FY 1998 planned and actual results for EM's Corporate Performance Measures that meet or exceed a +/- 15 percent threshold. The FY 1998 "planned" data are consistent with performance measures data reported in the FY 1999 Congressional Budget Request.

Facilities

- **Number of Facilities Decommissioned**

  The +37 in the number of facilities decommissioned is primarily a result of the addition of facilities that were not accounted for in the original facility inventory at the beginning of FY 1998.

Waste Treatment, Storage, and Disposal

- **Volume of High-Level Waste Treated**

  The -1,783 m^3 high-level waste treatment variance is primarily the result of an overstatement of the original target at one operations/field office due to the multiple counting of high-level waste treatment volumes as they transfer between projects. The year-end actual high-level waste treatment volumes reflect the appropriate counting methodology.

- **Number of High-Level Waste Canisters Produced**

  A total of 43 additional high-level waste canisters were produced in FY 1998. Savannah River produced fifty more canisters than the 200 planned due to process improvements and operational efficiencies. West Valley produced 81 canisters of high-level waste. While West Valley's canister count goal of 88 was not reached, the canisters were filled to a higher level thus producing only 81 canisters. (The increase in fill percentage was a significant waste minimization achievement).

- **Volume of Transuranic Waste Treated**

  The -165 m^3 transuranic waste treatment variance is primarily the result of activities that were put on hold pending the opening of the Waste Isolation Pilot Plant.

- **Volume of Transuranic Waste Disposed**

  The -388 to -592 m^3 transuranic waste disposal variance is the result of delays in disposal activities pending resolution of legal challenges to the opening of the Waste Isolation Pilot Plant.

- **Volume of Mixed Low-Level Waste Treated**

  The 4,437 m^3 increase in mixed low-level waste treatment is primarily due to: (1) a change in Savannah River Operations Office's use of the Consolidated Incinerator Facility campaign during FY 1998 from low-level waste to mixed low-level waste; (2) the addition of mixed low-level waste

volumes from Paducah and Portsmouth that had not previously been counted (as a result of changes to the definition); and (3) the use of funds redirected from projects with cost underruns.

- **Volume of Mixed Low-Level Waste Stored**

  The 11,793 increase in mixed low-level waste inventory is primarily due to the addition of waste volumes from Paducah and Portsmouth that had not previously been counted in the original target (as a result of changes to the definition to include all EM waste except remediation waste).

- **Volume of Mixed Low-Level Waste Disposed**

  The 2,533 m^3 increase in mixed low-level waste disposed is primarily the result of : (1) accelerated shipments of pondcrete at Rocky Flats; (2) the addition of mixed low-level waste volumes from Paducah and Portsmouth that had not previously been counted (as a result of changes to the definition); and (3) the use of funds redirected from projects with cost underruns.

- **Volume of Low-Level Waste Treated**

  The -6,742 m^3 low-level waste treatment variance is primarily the result of delays in the start of the Waste Sort Facility at Savannah River and the fact that no low-level waste was burned in the Consolidated Incinerator Facility.

- **Volume of Low-Level Waste Stored**

  The 125,413 m^3 increase in the volume of low-level waste inventory is largely the result of the addition of low-level waste volumes from Paducah and Portsmouth that had not been previously counted (as a result of changes to the definition for low-level waste to include all EM waste except remediation waste). Also contributing to the increase were: lawsuits that temporarily restricted low-level waste disposal; delays in the Waste Management Programmatic Environmental Impact Statement Records of Decision; and the temporary suspension of low-level waste shipments from Fernald to Nevada.

- **Volume of Low-Level Waste Disposed**

  The -22,706 m^3 low-level waste disposal variance is primarily due to: (1) delays in the startup of Savannah River's Waste Sort Facility and the Super Compactor which limited the ability to treat and dispose of waste; (2) less low-level waste was generated than originally anticipated at Albuquerque; and (3) the temporary suspension of low-level waste shipments from Fernald to Nevada. In addition, the original target was overstated by approximately 10,000 cubic meters as a result of counting remediation waste in the volumes initially reported.

Nuclear Material and Spent Nuclear Fuel Stabilization

The nuclear material performance measure subcategories were revised during FY 1998 to resolve classified data reporting issues. These revised performance measures are included in the EM Corporate Performance Measures table.

- **Nuclear Material Stabilized at Richland -- Plutonium (Pu) (kg)**

  This measure was revised during FY 1998 to avoid classified data reporting issues at some of EM's other sites. The FY 1998 "actual" is therefore "N/A".

- **Nuclear Material Stabilized at Rocky Flats -- Pu Solution (liters)**

  The -4,700 liter Pu solution variance at Rocky Flats is primarily a result of the termination of draining operations in Building 771 earlier in the year due to unexpected safety issues. While the desired commitment for draining of the Pu liquid systems was not achieved, some additional work scope, involving the strip out of piping, was accelerated and accomplished in FY 1998. The safety problems in Building 771 have been resolved and draining is expected to be completed in December 2001 along with the acceleration of the pipe removal activities.

- **Special Nuclear Material Shipments at Rocky Flats -- (# of shipments).**

  Rocky Flats completed a total of 38 special nuclear material shipments, including 30 shipments of former war reserve pits to the Pantex Plant, 5 shipments of highly-enriched uranium to the Y-12 Plant, and 3 pit shipments to the Los Alamos National Laboratory. Due to delayed funding at both receiver sites and a technical issue associated with highly-enriched uranium shipping, Rocky Flats was not able to complete all 60 planned special nuclear material shipments. The shipping of former war reserve pits to Pantex has resumed and the remaining shipments will be completed in FY 1999 The shipping of highly-enriched uranium to Y-12 resumed in September 1998 However, the technical issue associated with the highly-enriched uranium shipping is not totally resolved Alternatives to resolve this technical issue are currently under development in conjunction with Defense Programs.

- **Nuclear Material Stabilized at Rocky Flats -- Pu Residue (kg bulk)**

  The -14,546 kg bulk plutonium residue variance is primarily due to safety issues and construction delays at Rocky Flats. Recovery plans have been implemented for the Solid Residue Project Six new processing lines have been operational within the last several months and the recovery plan is projected to recoup most of the FY 1998 shortfall in FY 1999.

- **Spent Nuclear Fuel Stabilized**

  The -2.927 metric tons of heavy metal of spent nuclear fuel stabilized variance is due to schedule delays at the Idaho National Engineering and Environmental Laboratory as a result of the: (1) bankruptcy of VECTRA, a sub-tier contractor under Newport News Shipbuilding, that caused a delay in the design and fabrication of the Heated Vacuum Drying System. The spent fuel drying campaign, which relies on this equipment, impacted 55% of the spent fuel scheduled to be stabilized in FY 1998. Nevertheless, the commitment to the State of Idaho to complete the spent nuclear fuel storage facility by December 1998, has been met as specified in the Idaho Settlement Agreement, and (2) safety analysis issues have been resolved, and fuel stabilization activities at the canning station and the repair of the equipment and cranes necessary to relocate vulnerable spent fuel into new generation dry storage wells have resumed.

Science and Technology

- **Technology Deployments**

  Significantly higher numbers of innovative technology deployments were achieved than originally planned due to implementation of the Congressionally-supported Technology Deployment Initiative, adoption of a deployment orientation as part of the Focus Area-centered program

approach for technology development, and improved coordination of Science and Technology activities with EM line program needs/opportunities as part of the EM Integration activity and the EM *Accelerating Cleanup: Paths to Closure* process. In addition, because "technology deployment" is a relatively new EM Corporate Performance Measure, the initial FY 1998 deployment targets were somewhat conservative.

[a] EM is refining the life-cycle cost estimate (as well as schedule baseline) for this project based on change in assumptions for transfer of newly-generated waste to the generator program.

[b] EM is refining the life-cycle cost estimate for this project based upon the current and historic levels of appropriations and the resulting unappropriated balance.

[c] This includes $260K of carryover from prior year appropriations that will be costed and is therefore included in the EM baseline cost but is not reflected in the budget authority amounts shown here.

[d] Includes $18K of carryover from prior year appropriations that will be costed and is therefore in the EM baseline cost but is not reflected in the budget authority amounts shown here.

[a] It is the intent of the Environmental Management Program to fund the Weldon Spring Site Remedial Action Project at a program level of $63.5 million. The program will work to identify funding sources for this important activity.

[b] EM is refining the life-cycle cost estimate (and planned completion date) for this project.

(dollars in thousands)

Defense Environmental Restoration and Waste Management

Proposed Appropriation Language

For Department of Energy expenses, including the purchase, construction and acquisition of plant and capital equipment and other expenses necessary for atomic energy defense environmental restoration and waste management activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101 et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion; and the purchase of [passenger motor vehicles (not to exceed 3 new sedans and 6 for replacement only, of which 3 are sedans, 2 are buses, and 1 is an ambulance, $4,310,227,000] *35 passenger motor vehicles for replacement only, $4,514,376,000,* to remain available until expended *of which $8,700,000 shall be derived from excess pension payment refunds. Further, for the foregoing purposes, $4,505,676,000, to become available October 1, 2000, and to remain available until expended. (Energy and Water Development Appropriations Act, 1999.)*

Explanation of Change

Change in appropriation language relates to the number of motor vehicles, and provides for two years of appropriation.

Defense Environmental Restoration and Waste Management

Program Mission

The Environmental Management (EM) program is responsible for managing and addressing the environmental legacy resulting from the production of nuclear weapons and nuclear research. The nuclear weapons complex generated waste, pollution, and contamination which pose unique problems, including unprecedented volumes of contaminated soil and water, radiological hazards from special nuclear material, and a vast number of contaminated structures. Factories, laboratories, and thousands of square miles of land were devoted to the enterprise of producing tens of thousands of nuclear weapons in the name of national security. Much of this massive infrastructure, waste, and contamination still exists and is largely maintained, decommissioned, managed, and remediated by the EM program, which is sometimes referred to as the "cleanup program." EM's responsibilities include facilities and areas at 113 geographic sites (excluding the 21 sites in the Formerly Utilized Sites Remedial Action Project transferred to the U.S. Army Corps of Engineers). These sites are located in 30 states and one territory and occupy an area equal to that of Rhode Island and Delaware combined -- or about 2 million acres.

The FY 2000 request for the Defense Environmental Restoration and Waste Management appropriation is $4,494,376,000, an increase of $185,809,000 from the FY 1999 current appropriation level of $4,308,567,000.

Program Goal

The EM program has established a goal of cleaning up as many of its contaminated sites as possible by 2006 in a safe and cost-effective manner. By working towards this goal, EM can reduce the hazards presently facing its workforce and the public, and reduce the financial burden on the taxpayer. The FY 2000 budget request continues to reflect the program's emphasis on site closure and project completion

Program Objectives

- Continue to address the most serious environmental risks across the DOE complex and ensure that facilities and activities pose no undue risks to the public and worker safety and health.
- Continue to be substantially in compliance with applicable environmental and other requirements and meet compliance milestones.
- Continue surveillance and maintenance of facilities.

Performance Measures

EM has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected for the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts These performance measures can be found in the site details that follow.

Significant Accomplishments and Program Shifts

The FY 2000 budget request fully reflects the project-oriented structure that EM has developed as a key component of the effort to accelerate cleanup and reduce costs. All EM activities have been organized into projects which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, EM sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow.

Site/Project Completion

Program Mission

The Defense Site/Project Completion account provides funding for projects that are expected to be completed by FY 2006 at sites or facilities where a Department of Energy (DOE) mission will continue (e.g., environmental management, nuclear weapons stockpile stewardship or scientific research) beyond FY 2006. Hence, this account focuses on the completion of specific Environmental Management (EM) projects at sites where the Department anticipates continuing missions.

This account includes projects and sites under the following operations offices: Albuquerque, Idaho, Oakland, Richland, and Savannah River. Although the largest amount of funding for Site/Project Completion activities is in the Defense Environmental Restoration and Waste Management appropriation, a greater number of sites in this account are funded in the Non-Defense Environmental Management appropriation.

In a limited number of cases, sites have been placed in the Site/Project Completion account even though there is no expectation of a continuing mission after cleanup is completed. In these instances, use of the Site Closure account would have created an additional appropriation control for an Operations/Field office with a limited amount of associated funding, thereby hindering managerial flexibility in the execution of projects at these sites.

Program Goal

The FY 2000 budget request will enable the EM program to continue its goal of completing its cleanup mission at as many sites as possible by 2006. This goal is part of the strategies identified in the *Accelerating Cleanup: Paths To Closure* document, whereby EM sites are working aggressively to reduce outyear costs by completing projects as soon and as efficiently as possible, thereby reducing life-cycle costs and schedules.

Program Objectives

- To continue environmental cleanup projects that are expected to be completed by 2006 at EM sites where overall site cleanup will not be fully accomplished by 2006.
- To continue environmental cleanup projects at DOE sites where all EM projects are expected to be completed by 2006 (except for long-term stewardship activities), but where there will be a continuing federal workforce at the site to carry out enduring non-EM missions, such as nuclear weapons activities or scientific research, and the necessary waste management activities to handle newly generated wastes from these missions.

Performance Measures

EM has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected for the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts. These performance measures can be found in the site details that follow.

Significant Accomplishments and Program Shifts

The FY 2000 budget request fully reflects the project-oriented structure that EM has developed as a key component of the effort to accelerate cleanup and reduce costs. All EM activities have been organized into projects which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, EM sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow.

Albuquerque

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Environmental Management, Site/Project Completion Program, carried out by the Albuquerque Operations Office, is to support cleanup activities at seven geographic sites in six states. These sites include the Kansas City Plant in Missouri; the Pantex Plant in Texas; the Sandia National Laboratory sites in California and New Mexico; the Maxey Flats site in Kentucky; the Pinellas Plant in Florida; and the South Valley Superfund Site in New Mexico.

The Albuquerque Operations Office also has responsibility for miscellaneous programs such as the Waste Management Education and Research Consortium, Historically Black Colleges and Universities, Innovative Treatment Remediation Demonstration Program, Norfolk State University Center, and Agreements in Principle with Texas and Missouri.

Program Goal

The Albuquerque Operations Office goal is to complete cleanup of all geographic sites under its cognizance in this account by FY 2006. The cleanup of the Kansas City Plant and the Sandia National Laboratories/California sites will be completed in FY 1999; the cleanup of the Pantex Plant will be completed in FY 2001; the Sandia National Laboratories/New Mexico site will be completed in FY 2003, and the cleanup and transition of the Kansas City Plant to the Office of Defense Programs is planned to be completed in FY 2004. These sites have continuing Defense Programs missions. The assumption is that any required surveillance and maintenance and ground water monitoring activities will be funded by Defense Programs, although this has not been discussed formally with Defense Programs yet. Groundwater remediation, the only remaining cleanup activity at the Pinellas Plant will continue to about FY 2014. The DOE's responsibility as a potentially responsible party for the Comprehensive Environmental Response, Compensation, and Liability Act-required remedial action activities at the Maxey Flats Disposal Site will be satisfied by FY 2002, when the last potentially responsible party payment is made.

Program Objectives

Historically, the Albuquerque Operations Office's primary mission has been to manage sites that were involved in the research, development, production and maintenance of nuclear weapons.

The objective of the program is to have all identified Environmental Restoration sites remediated and waste disposed of in an on-site disposal cell or at an off-site location. Nearly all of the land is expected

to be available for other programmatic uses by around FY 2003, with monitoring continuing at several sites.

Performance Measures

Performance Measures are provided at an aggregate level after each Funding by Site table, as well as at the project level in the Detail Justification.

Significant Accomplishments and Program Shifts

Kansas City Plant

- Transferred the Kansas City Waste Management activities to the Office of Defense Programs (FY 1998).
- Installed Iron Filing Wall for in-situ groundwater treatment and containment (FY 1998)
- Received Environmental Protection Agency acceptance to use industrial standards for ground water and soil cleanup in lieu of residential standards (FY 1998)
- Completed interim remediation (test cell tanks) at Motor Vehicle Repair Sump Site (FY 1998).
- Completed interim remediation at Trichlorethylene Still Area location (FY 1998).
- Completed and implemented a Transition Plan for long-term surveillance and maintenance responsibilities following completion of the restoration program to the landlord (Defense Programs) in FY 2004 (FY 1998).
- Complete all Environmental Protection Agency required investigative activities for the 95th Terrace Site and resubmit the Resource Conservation and Recovery Act Facility Investigation Report proposing no further action (FY 1999).
- Complete groundwater treatment analysis to determine effectiveness of Iron Filing Wall for in-situ treatment and containment of contaminated plume (FY 1999).
- Complete transition from Environmental Protection Agency Consent Order to State (Missouri) Post Closure Permit (FY 1999).

Pantex Plant

- Submitted a petition to delete the Pantex Plant from the National Priorities List pursuant to the Environmental Protection Agency's interim policy change. The deletion will eliminate dual reporting and response actions under the Comprehensive Environmental Response, Compensation, and Liability Act and the Resource Conservation and Recovery Act, allowing the Environmental Restoration Program regulation under the Resource Conservation and Recovery Act Part B Permit. (FY 1998)

- Completed Phase IV groundwater treatability study; installed six borings, five perched monitoring wells, and four extraction wells; and completed treatability report. (FY 1998)
- Cleaned up or recommended no further action for 246 of 249 release sites (FY 1998). Remediation or recommendation for no further action will be completed for the 3 remaining major sites in FY 2001.
- Treated, stored, and disposed of newly generated mixed low-level waste according to Site Treatment Plans for Sandia Laboratories and Pantex (FY 1998).
- Supported construction of new Hazardous Waste Treatment and Processing Facility at Pantex (FY 1998).
- Transition waste management responsibilities for newly generated waste at Pantex to Defense Programs (FY 1999).
- Completed Landfills Corrective Measures Study, six final Resource Conservation and Recovery Act Facility Investigation Reports, and Groundwater Corrective Measures Study (FY 1998) and start Corrective Measure Implementation for Groundwater, Landfills; start and complete Burning Grounds Interim Corrective Measures, High Explosives/Radiation Sites, and Biovent Treatability Study (FY 1999).
- Completed remediation of depleted uranium contamination at Firing Site #5 (FY 1998).
- Completed accelerated remediation for nine release sites (FY 1998).
- Conducted site-wide risk assessments to support closure of 15 release sites (FY 1998).
- Complete additional Resource Conservation and Recovery Act Facilty Investigation at Old Sewage Treatment Plant, and complete three final Resource Conservation and Recovery Act Facility Investigation Reports (FY 1999).

Sandia Environmental Restoration Project

- Constructed and operated Corrective Action Management Unit; continued remediation of Chemical Waste Landfill, Foothills Test Area, Tijeras Arroyo, and Central Coyote Test Area (FY 1998).
- Completed remediation of the Sandia/California Navy Landfill (FY 1998).
- Submitted to State Regulator 16 release sites for No Further Action (FY 1998).
- Conducted assessment of Technical Area 315 Groundwater; continued remediation of Technical Areas 1 and 2 (Classified Waste Landfill) and Canyons Test Area (FY 1998).
- Complete site-wide characterization (FY 1999).
- Submit to State regulators 26 release sites for No Further Action (FY 1999).
- Complete remediation of Sandia/California Fuel Oil Spill (FY 1999).
- Conduct assessment of Sandia North groundwater and remediation of Technical Area 2 and conduct assessment and remediation of Southwest Test Area and Canyons Test Area and Mixed Waste Landfill (FY 1999).

- Transfer waste management activities at Sandia National Laboratories to Defense Programs (FY 1999).

Pinellas Plant

- Completed closeout of administrative activities and vacated the Pinellas Site; continued long-term groundwater remediation activities. (FY 1998).

Program Shift

- The Office of Defense Programs has taken financial and programmatic responsibility for the waste management activities in FY 1999.
- The completion end dates for Sandia National Laboratories and Kansas City Plant are being extended beyond previous baseline schedules due to new scope being identified at both locations that will take longer to complete than previously believed.

Site Description

Kansas City Plant

The Kansas City Plant is part of a Federal complex located in south Kansas City, Missouri. In FY 1993, the Department shut down several facilities across the country and consolidated the production of non-nuclear components for nuclear weapons at the Kansas City Plant. The site is comprised of

43 release sites, all of which will be completed by the end of FY 2004. This will complete remediation actions required by State and Federal regulators. Advanced technologies are being employed to reduce soil contamination (microwave enhanced volatilization technology) and to reduce groundwater cleanup time and cost (Iron Filing Trench treatment wall). Activities necessary to transition to a steady state Environmental Restoration Program will also be accomplished in FY 2004. Institutional controls and groundwater treatment and monitoring will continue indefinitely beyond FY 2000. Beginning in FY 1998, the Office of Defense Programs took financial and programmatic responsibility for waste management activities.

Pantex Plant

The Pantex Plant is located near Amarillo, Texas, and has responsibility for dismantlement and maintenance of the Nation's nuclear weapons stockpile and storage of plutonium from dismantled weapons. At the Pantex Plant, the EM activities consist primarily of storage, treatment, and disposal of various waste types and cleanup of contaminated soils and ground water. In FY 1994, the site was placed on the National Priorities List, thereby requiring remediation under the Comprehensive Environmental Response, Compensation, and Liability Act authority. The Pantex Plant is comprised of 249 release sites, of which 246 have been either cleaned up or recommended for no further action; the remaining three need extensive cleanup activities and will be completed in FY 2001, which will complete the remediation of this site. Ground water pump and treat will likely need to continue well past this date; however, technology development activities are underway through the Innovative Technology Research and Development program to try to accelerate groundwater cleanup at the Pantex Plant. Beginning in FY 1999, the Office of Defense Programs has financial and programmatic responsibility for waste management activities.

Sandia National Laboratories-California

The Sandia National Laboratories-California facility is located adjacent to the Lawrence Livermore National Laboratory in California. Major restoration activities include the cleanup of a 59,000 gallon diesel fuel oil spill from an underground transfer pipe. The key to complete remediation of this facility in FY 1999 is using advanced technology (bioremediation). In FY 1999, waste management activities have been transferred to the Office of Defense Programs.

Sandia National Laboratories-New Mexico

The Sandia National Laboratories-New Mexico site located in Albuquerque, New Mexico, is a research and development facility with a primary mission of developing, engineering, and testing non-nuclear components of nuclear weapons. In FY 1999, disposal of more than 90 percent of its historical/legacy low-level waste and mixed low-level waste will be completed. Major restoration efforts involve the remediation of inactive waste disposal and release sites at Albuquerque and a number of other remote locations. These sites have known or suspected releases of hazardous, radioactive, or mixed waste.

Another major initiative will be to close out remediation activities at all of the release sites by FY 2003. The original baseline, which is reflected in this budget, will be adjusted because additional contamination has been found at the chemical and classified waste landfills requiring additional remediation. In FY 1999, waste management activities have been transferred to the Office of Defense Programs.

Pinellas Plant

In September 1997, remediation of the Pinellas Plant was completed and the site was transferred to Pinellas County. In December 1998, DOE completed all remaining administrative closeout activities at Pinellas and vacated the site, except for continuing groundwater remediation to be overseen by the Grand Junction Office. In FY 1999 and FY 2000, DOE will continue annual payments for Pinellas post-contract medical, pension, and other contractor worker retirement benefits. In FY 1998 and FY 1999, operation and maintenance of groundwater remediation systems at the Building 100 and Old Drum Storage Sites, the Northeast Site, 4.5 Acre Site, and the Wastewater Neutralization/Building 200 Area will continue. Bio-remediation will take place at the Northeast Site and Building 100, and will continue into FY 2000

South Valley

The Department is a potentially responsible party at the South Valley site in New Mexico. The one release site at South Valley was completed in FY 1996. Currently ground water monitoring and ground water remediation system operation and maintenance activities are ongoing at this site. The Government has reached a liability buy-out settlement under which DOE will no longer have any financial liability for the project until the end of year 2003.

Maxey Flats

The Maxey Flats site in Kentucky is another site where DOE is responsible for contributing a potentially responsible party payment for the cleanup of the site. Maxey Flats is considered one release site. Environmental Management's last potential responsible party payment is expected in FY 2002, ending the DOE's responsibility at the site.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The sites are managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost-effective services to the Government. The scope Planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. Most of the projects included in this section of the budget have had an independent cost review of the scope, and the funds requested for FY 2000 are appropriate to perform the activities.			
AL-002 / Albuquerque Miscellaneous Programs (Waste Management Education and Research Consortium, Historically Black Colleges and Universities, Innovative Treatment Remediation Demonstration Program, Norfolk State University Center for Materials Research, AIP-TX/MO)			
Provides financial assistance for grants, cooperative agreements, innovative remediation technologies, and other analytical research.			
■ Continuation of multi-year grants and cooperative agreements with the Norfolk State University Center for Materials Research, Waste Management Education and Research Consortium, and Historically Black Colleges and Universities consortium.			
■ Continuation of the Innovative Treatment Remediation Demonstration Program, which is a cooperative effort among DOE, the Environmental Protection Agency, and industry to generate full-scale and real-world treatment and performance data for selected innovative technologies to accelerate their acceptance and use nationwide.			
■ Continuation of agreements-in-principle with the States of Texas and Missouri.			
AL-002	16,245	7,100	4,600

Metrics
No quantifiable corporate performance measures are associated with this project.

Remedial Action			
Cleanups	5.0	0.0	0.0
AL-014 / Pantex Plant Site Remediation Project			
This project provides for cleanup of contaminated soils and groundwater resulting from production and testing of explosive components for nuclear weapons. Remediation methodologies incorporated in this effort include excavation and off-site disposal of soils contaminated with high explosives/radionuclides, recirculation and filtration of groundwater, and a Resource Conservation and Recovery Act landfill cap. These efforts are in accordance with and meet the Resource Conservation and Recovery Act requirements.			
■ Complete site-wide risk assessment.			
■ Complete groundwater, landfills and high explosive/radiation corrective measures.			
■ Complete additional Resource Conservation and Recovery Act Facility Investigation Characterization for Active Firing Sites.			
■ Complete Burning Grounds Interim Corrective Measures, and begin post-remediation long-term surveillance and maintenance.			
■ Complete four Final Resource Conservation and Recovery Act Facility Investigation Reports.			
■ Implement Field Scale Soil Composting System.			
■ Conduct groundwater remediation and monitoring.

AL-018 / Sandia ER Project

The mission of the Sandia Environmental Restoration Project is to complete all necessary corrective actions (assessment and remediation) at environmental restoration sites in the most expeditious and cost-effective manner, while minimizing worker, public health, and environmental risks, satisfying public concerns, and complying with all applicable federal, state and local laws. All of the designated solid waste management units and additional areas of concern will be remediated or placed under management controls adequate to ensure agreement of the federal and state regulatory authorities that, based on risk to humans or the environment, no further action is warranted.

- Complete Corrective Action Management Unit operations, continue remediation of Chemical Waste Landfill.
- Complete assessment of Tech Area 2 Groundwater, and complete remediation of canyons and southwest test areas.
- Complete compliance monitoring of Sandia/California.
- Continue assessment/remediation of Mixed Waste Landfill.
- Complete remediation of Foothills Test Area, Tijeras Arroyo, Central Coyote Test Area, and Tech Area 315 groundwater
- Continue remediation of Tech Area I, and complete septic system remediations.

	(dollars in thousands)

Chicago

Mission Supporting Goals and Objectives

Mission

The mission of the Defense funded Environmental Management (EM) Site/Project Completion program carried out by the Chicago Operations Office is to support projects that will be completed by FY 2006 at sites or facilities where a Department of Energy mission such as the Office of Science or Nuclear Energy research will continue. Chicago Operations Office managed activities have been conducted at three sites in two states. These include the Ames Laboratory in Iowa; and the Argonne National Laboratory-East site in Illinois. The Chicago Operations Office manages, coordinates, tracks, and assists in the implementation of programs among various sites. The majority of activities managed by the Chicago Operations Office have been funded in the Non-Defense account. The FY 1999 and the FY 2000 Defense account budget requests include no funding for Chicago activities. All defense-related efforts were completed by the end of FY 1998.

Program Goal

The Chicago Operations Office is committed to ensuring its facilities and activities pose no undue risk to the public, worker health and safety, maintaining compliance with applicable environmental and other requirements, and working aggressively to clean up as many sites as possible by 2006 to reduce outyear costs and, reducing life cycle costs and schedules.

Program Objectives

Beginning in FY 1999, there are no defense-funded activities remaining at the Chicago Operations Office. All activities will be supported under the non-defense EM Site/Project Completion account. All prior defense-funded activities; e.g., Site A, have been completed. The Chicago Operations Office proactively employs innovative and alternative technologies, wherever appropriate and applicable, to address remedial as well as decontamination and decommissioning problems in order to reduce cost and risk, and to improve the schedule.

Performance Measures

Performance Measures are provided at an aggregate level after each Funding by Site table, as well as at the project level in the Detail Justification.

Significant Accomplishments and Program Shifts

FY 1998 accomplishments under defense funding included quarterly monitoring well and surface water sampling related to the remediated Chemical Disposal Site at Ames Laboratory. Ongoing monitoring also continued at Site A/Plot M. At Argonne National Laboratory - East, decontamination and decommissioning activities consisted of: (1) assessment of 22 facilities including the Argonne Thermal Source Reactor, Building 579, the 60" Cyclotron and the Building 301 Hot Cells; (2) completion of four facility cleanups including two facilities at the Chicago Pile 5 Test Reactor, deploying innovative technologies, and two at the Argonne Thermal Source Reactor; (3) completion of further application recommendations for 22 Chicago Pile 5 Test Reactor technology demonstrations; and (4) continuation of surveillance and maintenance. Use of technology development initiatives include a large scale demonstration project and a public/private sector partnership. These demonstrations allow rapid comparison of a variety of commercially-available and innovative technologies and possible use of lower-cost technologies for the Chicago Pile 5 Test Reactor decommissioning. Cost sharing is provided by private industry and utilities, and results of the demonstrations are being considered for use at other Argonne National Laboratory-East facilities, and at other DOE facilities, such as Hanford, Oak Ridge, and Idaho National Engineering and Environmental Laboratory, as well as at private and utility sites.

Site Description

AMES Laboratory (Iowa State University)

Ames Laboratory is an Energy Research laboratory in Ames, Iowa that conducts basic and applied research in the preparation, characterization, and evaluation of properties of metals and their alloys, especially rare earth metals. Ames Laboratory also performs materials research, high-performance computing, and environmental research. It seeks solutions to energy-related problems through the exploration of physics, chemistry, engineering, applied mathematics, and materials sciences.

Argonne National Laboratory - East

Argonne National Laboratory - East is a research laboratory occupying a 700 acre tract of land located approximately 22 miles southwest of downtown Chicago in DuPage County, Illinois. It is an Office of Science multidisciplinary research and development laboratory that conducts basic and applied research to support the development of energy-related technologies. Energy-related research projects include safety studies for light-water reactors, developing components and materials for fission and fusion reactors, superconductivity research, improvements in coal power, synchrotron radiation sources, and waste heat utilization. Further research includes medical radioisotope technology, environmental research, genetics research, materials engineering, ceramics, carcinogenesis, and the biological effects of ionizing radiation. Argonne-East is the home for the Advanced Photon Source facility which provides experiment capability, with the use of photons, for industry, government, and academic scientists to create advances in pharmaceuticals, adhesives, food processing, and many other applications.

Site A/Plot M

Site A/Plot M is the former site of early activities by the Manhattan Engineering District between 1942 and 1956. The site is located within the Palos Forest Preserve in Cook County, Illinois and is owned by the Forest Preserve District of Cook County. Site A contained two experimental nuclear reactors and associated research laboratories. Plot M was used for the burial of radioactive waste from experimental research at Site A. Initial work involved research and the development of radioisotopes and fission products for uses in defense and non-defense activities. Removals of radiological hot spots and soils contaminated with heavy metals were completed in October 1996. Site A/Plot M is currently undergoing monitoring of groundwater, soil, and air to affirm that there is no significant spread of contamination. Responsibility for surveillance and monitoring was transferred to the Grand Junction Project Office in Spring 1998.

Idaho

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Site/Project Completion Environmental Management (EM) program at the Idaho National Engineering and Environmental Laboratory is to safely manage and dispose of transuranic waste, mixed low-level waste, low-level waste, hazardous, and other waste, while maintaining full compliance with applicable requirements and agreements, and particularly the Idaho Settlement Agreement, and perform environmental restoration according to the Federal Facility Agreement and Consent Order.

Program Goal

The goal of this portion of the Idaho program is to complete, by 2006, cleanup of several waste streams and release sites, dispose of all Idaho National Engineering and Environmental Laboratory low-level legacy waste in FY 1999, dispose of most of the Idaho National Engineering and Environmental Laboratory mixed low-level waste by FY 2006, satisfy the Settlement Agreement requirement to ship 3,100 m^3 of transuranic waste off-site for disposal (by December 31, 2002), and have a major portion of the Idaho National Engineering and Environmental Laboratory-managed spent nuclear fuel in stable, dry storage awaiting final disposition. Low-level waste, mixed low-level waste, and other waste will be treated, stored, and disposed in compliance with regulatory requirements and agreements. Environmental Restoration activities will be completed for Waste Area Groups 1, 4, and 5.

Program Objectives

One objective of this program is to complete remediation efforts where it can be done soon, improve the site infrastructure for the long-term continuing mission, and manage waste streams, including transuranic waste shipments off-site, in order to free resources to apply to the long-term continuing cleanup of the Idaho National Engineering and Environmental Laboratory and comply with the Idaho Settlement Agreement.

Another objective of the Environmental Management program at the Idaho National Engineering and Environmental Laboratory is to use technology development to accelerate cleanup schedules and reduce costs. These new technologies will ensure completion of the primary goals. Innovative technologies continue to be developed to meet the Idaho National Engineering and Environmental Laboratory needs and will be demonstrated and implemented as necessary to meet schedules and budgets. Use of technologies such as advanced transuranic waste characterization systems will improve throughput and increase efficiency.

Performance Measures

Performance Measures are provided at an aggregate level after each Funding by Site table, as well as at the project level in the Detail Justification.

Significant Accomplishments and Program Shifts

- Completed first and second In-Situ Vitrification Planar Melts at Test Area North V-Tanks (FY 1998) and initiate Operable Unit 1-07B Stage 2 treatability study field demonstrations (FY 1999, Waste Area Group 1).
- Completed Operable Unit 1-10 Comprehensive Remedial Investigation/Feasibility Study and Proposed Plan (FY 1998, Waste Area Group 1) and Initiate Operable Unit 1-10 Remedial Design/Remedial Action activities (FY 1999, Waste Area Group 1).
- Completed Operable Unit 4-13 Remedial Investigation Baseline Risk Assessment (FY 1998) and complete Operable Unit 4-13 Comprehensive Record of Decision and Proposed Plan (FY 1999, Waste Area Group 4).
- Complete assessment of all Waste Area Group 4 release sites and facilities (FY 1999).
- Completed Operable Unit 5-12 Comprehensive Remedial Investigation/Feasibility Study (FY 1998) and draft Record of Decision and submit for regulatory review (FY 1999, Waste Area Group 5).
- Completed Operable Unit 10-04 Comprehensive Remedial Investigation/Feasibility Study (FY 1998). Implement Operable Unit 10-04 Remedial Investigation/Feasibility Study Work Plan field activities (FY 1999) (Waste Area Group 10).
- Completed deactivation of the ROVER Facility (FY 1998) and Old Waste Calcining Facility (FY 1999, OIM-110).
- Reduce security requirement by completing installation of Security System Alarm System at the Idaho Nuclear Technology and Engineering Center (FY 1998) and complete construction of security facility remodeling, security system operating and project turnover (FY 1999, OIM-105).
- Complete the deactivation design for the Nuclear Technology and Engineering Center Fuel Processing Complex (CPP-601), Hot Chemistry Laboratory (CPP-627), and Headend Processing Plant (CPP-640) (FY 1999, OIM-112).
- Completed Sitewide Electrical Distribution Systems Upgrade (FY 1998, OIM-107).

- Complete segments of the Electrical Utilities System Upgrade Project e.g.., replacement of electrical panels, correct overloaded circuits, and test the reliability of the system (FY 1999, OIM-106).
- Continued Storage Waste Examination Pilot Plant production examination operations, selective intrusive waste sampling and analysis, and head space gas sampling to characterize and certify transuranic waste for disposal at the Waste Isolation Pilot Plant near Carlsbad, New Mexico (FY 1998/FY 1999, ID-WM-103).
- Disposed of 34 m^3 of mixed low-level waste and 3,264 m^3 of low-level waste, and safely stored 1,714 m^3 of mixed low-level waste and 6,035 m^3 of low-level waste in compliance with environmental regulations and DOE Orders (FY 1998). Dispose of 50 m^3 of mixed low-level waste and 6,500 m^3 of low-level waste, and safely store 1,123 m^3 of mixed low-level waste and 2,000 m^3 of low-level waste in compliance with environmental regulations and DOE Orders (FY 1999, ID-WM-101).
- Characterize and validate 68 m^3 of non-mixed transuranic waste designated for disposal at the Waste Isolation Pilot Plant. Approximately 64,990 m^3 of transuranic waste will be safely stored at the Idaho National Engineering and Environmental Laboratory in compliance with environmental regulations and DOE Orders (FY 1999, ID-WM-103).
- Meet Idaho Settlement Agreement, Federal Facility Compliance Agreement, Federal Facility Agreement/Consent Order, and other regulatory requirements in a safe and environmentally acceptable manner (FY 2000).
- Comply with Federal Facilities Agreement/Consent Order schedules and milestones for the assessment and cleanup of Test Area North, Test Reactor Area, Idaho Nuclear Technology Engineering Center, Central Facilities Area, Power Burst Facility, Radioactive Waste Management Complex, and Pit 9 Remediation and for site-wide monitoring (FY 2000).

Site Description

Idaho National Engineering and Environmental Laboratory

The Idaho National Engineering and Environmental Laboratory, established as the National Reactor Testing Station in 1949, occupies 890 square miles in the Snake River Plain of Southeastern Idaho. Over the years, 52 reactors have been constructed and operated at the Idaho National Engineering and Environmental Laboratory. There are nine primary facilities at the Idaho National Engineering and Environmental Laboratory as well as administrative, engineering, and research laboratories in Idaho Falls, approximately 50 miles east of the site. Other activities at the Idaho National Engineering and Environmental Laboratory over the last five decades include nuclear technology research, defense programs, engineering testing and operations, as well as ongoing projects to develop, demonstrate, and transfer advanced engineering technology and systems to private industry. These activities have resulted in an inventory of high-level waste and an inventory and the continued generation of spent nuclear fuel, transuranic waste, mixed low-level waste, and low-level waste. Idaho National Engineering and Environmental Laboratory activities have also resulted in contaminated areas and potential release sites requiring remediation under the Comprehensive Environmental Response, Compensation, and Liability Act, and other environmental regulations. Finally discontinued activities at the Idaho National Engineering and Environmental Laboratory have left a number of surplus facilities. The deactivation program provides for the deactivation of these surplus facilities placing them in a safe, stable, low-cost condition, requiring minimal surveillance and maintenance.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Idaho site is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost-effective services to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. Funding estimates are based on historic cost information and annual cost estimating guidance. For most projects, cost estimates were independently reviewed by the US Army Corps of Engineers, and a DOE and site management and operating contractor team.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
ID-ER-101 / Test Area North Remediation (Waste Area Group 1)			
Waste Area Group 1 has 10 Operable Units, containing 94 potential release sites, listed in the Federal Facilities Agreement/Consent Order. Activities associated with Waste Area Group 1 are legally mandated by the Federal Facilities Agreement/Consent Order and the Comprehensive Environmental Response, Compensation, and Liability Act. Funding supports the completion of all cleanup activities associated with Waste Area Group 1 by FY 2006 and ensures implementation of the operable unit 1-07B groundwater cleanup action providing containment of the contaminant plume and active aquifer remediation.			
■ Operate Groundwater Test Facility for Operable Unit 1-07B Phase B Hot Spot Containment and removal; construct and operate Phase C Dissolved Phase Plume Treatment Units..			
■ Begin active remediation of non-radionuclide contaminated surface soil sites.			
■ Perform Operable Unit 1-07B Stage 2 treatability study field demonstrations for in-situ, chemical oxidation and natural attenuation.			
■ Implementation of field cleanup activities at the Water Research Reactor Test Facility diesel oil spill sites, grade and restrict access to several burn pits, and implement mercury spill cleanup.			
■ Submit Operable Unit 1-10 Draft Remedial Action Work Plan to DOE for review and approval.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
ID-ER-104 / Central Facilities Area Remediation (Waste Area Group 4)			
Waste Area Group 4 consists of 52 potential release sites which require assessment as stipulated by the Federal Facilities Agreement/Consent Order and the Comprehensive Environmental Response, Compensation, and Liability Act. A Record of Decision for Operable Unit 4-13, to be submitted in June 1999, will detail the final remedial actions which must be performed at the various release sites. Funding supports all regulatory requirements and completion of all remedial activities by 2003.			
■ Continue long-term groundwater and landfill soil monitoring at Operable Unit 4-12.			
■ Implement the Remedial Design/Remedial Action Work Plan for Operable Unit 4-13 including cleanup or removal of soil contamination sites including cesium-contaminated drainfields, lead-contaminated transformer storage yards, and radium-contaminated dry wells.			
■ Initiate Remedial Design/Remedial Action activities at 10 remaining release sites.

ID-ER-105 / Power Burst Facility/Auxiliary Reactor Area (Waste Area Group 5)			
Waste Area Group 5 has 13 Operable Units listed in the Federal Facility Agreement/Consent Order. Activities associated with Waste Area Group 5 are legally required by the Federal Facilities Agreement/Consent Order and the Comprehensive Environmental Response, Compensation, and Liability Act. Operable Unit 5-12 consists of 4 sites and the comprehensive Remedial Investigation/Feasibility Study required to complete the Waste Area Group 5 cleanup. The Remedial Investigation/Feasibility Study recommendations support preparation of a Comprehensive Record of Decision for Operable Unit 5-12. The Operable Unit 5-12 Comprehensive Record of Decision is a Federal Facilities Agreement/Consent Order milestone due October 1999. Funding supports regulatory requirements and completion of all investigations and remedial actions by FY 2006.			
■ Prepare the Remedial Design Scope of Work for Operable Unit 5-12.			
■ Prepare and implement the Remedial Design/Remedial Action Work Plan for Operable Unit 5-12.

ID-OIM-106 / Electrical and Utility Systems Upgrade Project, Idaho Nuclear Technology and Engineering Center (96-D-464)			
This project is to upgrade the Idaho National Engineering and Environmental utility systems by correcting high risk life-safety, health, and environmental deficiencies. The work corrects safety deficiencies and will improve reliability and efficiency of electrical systems needed to support the site settlement agreement. This project was validated by DOE-Idaho and Power Engineers of Hailey, Idaho			
■ Complete construction of the Electrical Distribution System and Standby Power System.			
■ Continue replacement of electrical panels and service entrances in specific facilities to correct overloaded equipment, grounding problems, and code violations.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Complete testing on the Electrical Distribution System and Standby Power System.			
■ Continues funding for construction of the Electrical and Utility Systems Upgrade Project, 96-D-464. Included in the funding totals for this PBS are $14,985,000 for FY 1998; $11,544,000 for FY 1999; and $11,971,000 for FY 2000 for the line-item.

ID-OIM-109 / Health Physics Instrument Laboratory (99-D-404)

The Health Physics Instrumentation Laboratory project is a line item construction project which provides for the design, procurement, and construction of the new facility in order to provide reliable and safe radioactive detection equipment for all programs at the Idaho National Engineering and Environmental Laboratory. Laboratory operations will include repair, calibration, dosimeter irradiation, and research and development required to support radiation detection equipment needs for the site. This new facility will replace an existing facility which is beyond its original design life and is significantly deteriorated. Original cost estimate and scope were validated by a DOE and site management and operating contractor team, and the construction phase will be competitively subcontracted.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Complete title design activities and initiate construction with completion planned in FY 2002.			
■ Continues funding for construction of the Health Physics Instrumentation Laboratory, 99-D-404. Included in the funding totals for this PBS are $0 for FY 1998; $950,000 for FY 1999; and $7,200,000 for FY 2000 for the line item.

ID-OIM-110 / Pre-FY 2007 Surplus Facility Deactivation Project

This project provides for the deactivation of surplus facilities which reduces the cost and risk associated with surplus contaminated facilities. This includes removal of radioactive and hazardous materials, removal of uranium and other fissile materials, and isolation of the surplus facilities from ongoing operating and utility systems. The project supports compliance with Resource Conservation and Recovery Act and has been validated by the DOE.

- Increase deactivation activities at CPP-601, Security Training Facility.
- Completion of the title design for CPP-603 wet spent nuclear fuel deactivation project on schedule.

ID-WM-101 / Idaho National Engineering and Environmental Low-Level Waste/Mixed Low-Level Waste/Other Waste Program

The project provides for the daily management, treatment, storage and disposal of mixed low-level waste, low-level waste, hazardous waste, industrial waste cubing system, and special case waste for the Idaho National Engineering and Environmental Laboratory. This project enables DOE to comply with the Idaho National Engineering and Environmental Laboratory and other DOE Site Treatment Plans under the Federal Facility Compliance Act by providing incineration, stabilization, macroencapsulation, sizing/sorting/segregation, and lead cask dismantlement services for treatment of the Idaho National Engineering and Environmental Laboratory and other DOE Complex sites' mixed low-level waste at the Waste Reduction Operations Complex through FY 2003 and commercial treatment of the Idaho National Engineering and Environmental Laboratory mixed low-level waste between FY 2004 and FY 2006 using the Advanced Mixed Waste Treatment Project. This project also provides low-level waste volume reduction, where possible, through incineration, compaction, and size reduction at the Waste Reduction Operations Complex and disposal in the active pit of the Radioactive Waste Management Complex Subsurface Disposal Area. Other DOE Complex or commercial low-level waste disposal facilities will be utilized after FY 2006 for contact-handled low-level waste. This project also enables the Idaho National Engineering and Environmental Laboratory to comply with the Resource Conservation and Recovery Act treatment and disposal requirements for hazardous waste using commercial treatment, storage, and disposal facilities.

- Continue lead cask dismantlement at Test Area North.
- Continue mixed low-level waste incineration, stabilization, and sizing at the Waste Reduction Operations Complex.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue low-level waste volume reduction activities at the Waste Reduction Operations Complex.			
■ Continue contact handled and remote handled low-level waste disposal in the Radioactive Waste Management Complex Subsurface Disposal Area.			
■ Continue to operate and maintain one storage facility for hazardous waste.			
■ Continue off-site treatment and disposal of hazardous waste.			
■ Consolidated project control and reporting will be provided.

ID-WM-103 / Idaho National Engineering and Environmental Transuranic Waste

The mission of the Transuranic Waste program is to safely store, treat, and prepare for disposal approximately 65,000 m^3 of transuranic mixed waste located at the Idaho National Engineering and Environmental Laboratory Radioactive Waste Management Complex. Most of the waste was shipped from the Rocky Flats Plant for interim storage until disposal at a transuranic waste repository. The Radioactive Waste Management Complex operations include waste characterization and certification of transuranic waste to meet the Waste Isolation Pilot Plant waste acceptance criteria. This project is needed to meet the Idaho Settlement Agreement requirement to ship a minimum of 3,100 m^3 of transuranic waste out of the state by December 31, 2002. The remaining waste will be treated in the planned, privatized Advanced Mixed Waste Treatment Project to meet the Waste Isolation Pilot Plant Waste Acceptance Criteria or other appropriate disposal facility requirements before it is shipped for disposal. The Advanced Mixed Waste Treatment Project capital asset acquisition project (ID-WM-104) is discussed in the Defense EM Privatization account; and the Advanced Mixed Waste Treatment Project production operations project (ID-WM-105) is discussed in the Defense Post 2006 Completion account. All stored transuranic waste is planned to be removed from Idaho by December 31, 2015, but no later than December 31, 2018, as required by the Agreement.

- Ship 1,015.0 m^3 of transuranic waste to the Waste Isolation Pilot Plant for disposal.
- Safely store approximately 63,975 m^3 of transuranic mixed waste in compliance with environmental regulations and DOE orders.
- Provide transuranic waste characterization and certification-related support activities for disposal at Waste Isolation Pilot Plant by completing examination of at least 5,000 drums of transuranic waste at the Stored Waste Examination Pilot Plant.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Provide for compliance with the requirements in the Idaho Settlement Agreement for transuranic and transuranic mixed waste, such as safety analyses reports, transuranic database maintenance, and annual updates of the Resource Conservation and Recovery Act permits.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
ID-ER-101 / Test Area North Remediation	
■ Funding increase required to construct and operate Operable Unit 1-07B Phase C Dissolved Phase Plume Treatment Units. Also, implementation of field cleanup activities at the Water Research Reactor Test Facility diesel oil spill sites, grade and restrict access to several burn pits, and implement mercury spill cleanup	6,351
ID-ER-104 / Central Facilities Area Remediation	
■ Increase in funding due to initiation of cleanup activities in support of Operable Unit 4-13 contaminated soil sites per Record of Decision; initiation of Remedial Design/Remedial Action activities at 10 remaining release sties	1,167
ID-ER-105 / Power Burst Facility/Auxiliary Reactor Area	
■ Increase in funding required to begin implementation of cleanup activities at Operable Unit 5-12 per Record of Decision	1,342
ID-LRP-101-PC / Environmental Engineering and Science Center	
■ Funding for this activity is requested in the Defense Science and Technology budget in FY 2000 to consolidate complex-wide program	-8,939

	FY 2000 vs. FY 1999 ($000)
ID-OIM-105 / Security Facilities Consolidation Project	
■ Decrease in funding due to project completion	-840
ID-OIM-106 / Electrical and Utility Systems Upgrade Project	
■ Decrease in funding consistent with project baseline funding profile and scope of work	-705
ID-OIM-108 / Idaho National Engineering and Environmental Laboratory Road Rehabilitation	
■ Decrease represents winding down of the project toward 2001 completion date	-5,363
ID-OIM-109 / Health Physics Instrument Laboratory	
■ Increase represents the transition from design to construction	6,261
ID-OIM-110 / Pre-FY 2007 Surplus Facility Deactivation Project	
■ Increase reflects completion of title design for CPP-603 and increased deactivation activities at CPP-601	785
ID-OIM-112 / Pre-FY 2007 Idaho National Engineering and Environmental Laboratory Surveillance and Maintenance	
■ Decrease reflects surveillance and maintenance requirements relative to progression of deactivation work	-141
ID-OIM-114 / Sitewide Idaho National Engineering and Environmental Laboratory Information Network	
■ Initiation of project support activities for new initiative in FY 2000	50
ID-OIM-115 / Site Operations Center	
■ Develop path forward in anticipation of FY 2001 line-item construction project (multi-purpose support facility) to replace aging and deteriorating facilities.	1,306
ID-WM-101 / Idaho National Engineering and Environmental Low-Level Waste/Mixed Low-Level Waste/Other Waste Program	
■ Decrease reflects one year deferral of funding for commercial macroencapsulation for mixed low-level waste; cessation of operation of the industrial waste cubing system; and a reduction of low-level waste Performance Assessment/Composite Analysis maintenance-related activities	-3,441

	FY 2000 vs. FY 1999 ($000)
ID-WM-103 / Idaho National Engineering and Environmental Transuranic Waste	
■ Increased funding will enable the Idaho National Engineering and Environmental Laboratory to successfully meet the Idaho Settlement Agreement milestone to ship 3,100 cubic meters of transuranic waste out of Idaho by December 31, 2002. Includes upgrading Real-Time Radiography System to maintain examination throughput rates; utility and drainage upgrades to Resource Conservation and Recovery Act storage modules; and building a second Transuranic Package Transporter loading facility to support current shipping schedules of transuranic waste to the Waste Isolation Pilot Plant	2,559
Total Funding Change, Idaho	392

Oakland

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Environmental Management (EM) Site/Project Completion program managed through the Oakland Operations Office, is to plan and implement remediation and waste treatment, storage, and disposal activities at three sites, two in California and one in New York. The sites are the Lawrence Livermore National Laboratory, consisting of the Livermore Site and Site 300, and the Separations Process Research Unit at the Knolls Atomic Power Laboratory in Schenectady, New York. Other DOE programs such as Defense Programs, Science, and Nuclear Energy Naval Reactor Program continue to have operating facilities at these sites. Also, the Oakland Operations Office is responsible for the administration of State and educational grants funded by this appropriation.

Program Goal

EM programmatic goals are to have cleanup completed at the Lawrence Livermore National Laboratory site by 2006, and at the recently identified Separations Process Research Unit site by 2014, and to ensure operating facilities and contaminated sites pose no undue risk to the public, worker health and safety, maintain compliance with applicable environmental laws, and manage risks associated with current and prior DOE operations.

Program Objectives

The program objective is to assess, remediate, decontaminate and decommission contaminated sites and facilities; characterize, treat, minimize, store, and dispose of hazardous and radioactive waste; develop demonstrate, test and evaluate new cleanup technologies. These program activities are conducted taking an integrated approach to assessing work and meeting schedules, while balancing risk, mortgage reduction, compliance, cost efficiencies, stakeholder input and implementation of enhanced performance mechanisms. Financial responsibility for newly generated waste will be returned to the generating DOE program by FY 2003. The Lawrence Livermore National Laboratory will be cleaned up and all legacy waste will be characterized and shipped off-site by FY 2006. Long-term surveillance and maintenance of implemented remedial actions (e.g., pump and treat facilities) will be assumed by the landlord programs post FY 2006. The Separations Process Research Unit will be cleaned up and all legacy wastes will be characterized and shipped off-site by FY 2014.

The Oakland Operations Office has identified several innovative technologies to be evaluated and used at the Lawrence Livermore National Laboratory. For example, field demonstrations using innovative technologies, in situ hydrous pyrolysis, Electrical Resistance Tomography, and biofiltration began in

FY 1998 at the Lawrence Livermore National Laboratory main site. Another innovative approach being considered is the Engineered Plume Collapse strategy which will demonstrate a system of these and other technologies to remove organic contaminants from ground water more rapidly than baseline conventional pump and treat approach. The current Interim Record of Decision for Building 834 at Lawrence Livermore National Laboratory Site 300 specifies an evaluation of various technologies for remediation of trichloroethylene plume and dense non-aqueous phase liquid sources. To date, surfactant testing has been completed and analyses are ongoing. At the Lawrence Livermore National Laboratory main site the Expedited Technology Demonstration Project was implemented in FY 1998 using a molten salt treatment methodology.

Performance Measures

Performance Measures are provided at an aggregate level after each Funding by Site table, as well as at the project level in the detail justification.

Significant Accomplishments and Program Shifts

- At the Livermore Main Site, continued operation of 4 permanent treatment facilities and 8 portable treatment units; began operation of portable treatment units at three new locations Treatment Facility D-East, Treatment Facility D-Southeast, and treatment facility-Building 518; and started Phase I in-site groundwater treatment facility at Trailer 5475 (FY 1998).
- Continue maintenance and operation of treatment facility and portable treatment units; install a soil vapor extraction treatment facility at TR 5475; start Phase II of groundwater in situ system at TR 5475; and complete one release site at the Livermore Main Site (FY 1999).
- Continue environmental restoration activities, i.e. groundwater monitoring and treatment system operation for containment and contaminant source removal and implementation of other cleanup actions, to ensure compliance with Federal Facility Agreements at both of the Lawrence Livermore National Laboratory sites (FY 2000).
- Completed and submitted Remedial Design Report #4 for Trailer 5475 and East Taxi Strip at Livermore Site and completed 6 release sites at the Livermore Main Site (FY 1998).
- Prepare closure documentation for Buildings 514 and 612 at the Livermore Main Site (FY 1999).
- Completed closure and cap construction of Pit 6 Operable Unit at the Lawrence Livermore National Laboratory Site 300 (FY 1998).
- Complete a Site-Wide Feasibility Study for the Lawrence Livermore National Laboratory Site 300 and complete 4 release sites (FY 1999).
- Completed Site 300 Building 815/Operable Unit 4 Final Action Memorandum and completed 7 release sites at Site 300 (FY 1998).

- Begin interim action groundwater treatment system at Building 815/Operable Unit 4 and treatability study for contaminant removal at Building 854/Operable Unit 6 at Site 300 (FY 1999).
- At the Livermore Main Site, completed construction of Decontamination and Waste Treatment Facility Phases 4 and 3A and started construction on Phase 3B (FY 1998) and continue construction of Phase 3B and start construction of Phase 5 (FY 1999).
- Activate and begin operational testing of the Decontamination and Waste Treatment Facility at the Lawrence Livermore National Laboratory Main Site (FY 2000).
- Completed construction on the Explosive Waste Treatment Facility at Site 300 (FY 1998) and begin operations (FY 1999).
- Initiated the testing of the effectiveness of Molten Salt Oxidation on mixed waste at the Livermore Site (FY 1998).
- Complete testing activities of Molten Salt Oxidation at Livermore site (FY 1999).
- Treated approximately 50,000 gallons of aqueous mixed low-level waste and 27,000 gallons of low-level waste, disposal of 778 cubic meters of low-level waste, 209 cubic meters of mixed low-level waste, and 4,666 cubic meters of hazardous waste (FY 1998).
- Manage over 1,800 cubic meters of newly generated solid waste; treat about 32,000 gallons of aqueous mixed low-level waste/low-level waste and dispose of approximately 573 cubic meters of low-level waste at the Nevada Test Site and over 149 cubic meters mixed low-level waste at a commercial treatment, storage, and disposal facility (FY 1999).
- Build an overhead crane in the high activity waste storage area at the Livermore Site (FY 1999).
- Issue an Environmental Assessment or Categorical Exclusion for the Large Container Processing Unit to meet National Environmental Protection Act requirements at the Livermore Site (FY 1999).
- Initiate surveillance and maintenance responsibility for the Separations Process Research Unit facilities (FY 2000).
- Continue storage, treatment, and some offsite disposal of waste(low-level, mixed low-level, and transuranic waste) at Lawrence Livermore National Laboratory (FY 2000).

Site Description

Lawrence Livermore National Laboratory

The Lawrence Livermore National Laboratory is a multi-disciplinary research laboratory specializing in weapons research and development which has two geographic locations in northern California. The Livermore Site is approximately one square mile and is located 40 miles east of San Francisco, near the City of Livermore. Site 300 is comprised of about 11 square miles and is located 15 miles southeast of the Livermore Site. Both the Livermore Site and Site 300 are on the Environmental Protection Agency's National Priorities List. Environmental Restoration activities at the Lawrence Livermore National Laboratory are focused on identifying contaminated ground water and soil from past operations and implementing appropriate cleanup actions. The environmental restoration activities at the Lawrence Livermore National Laboratory are divided into nine Operable Units, 1 at the Livermore Site, 8 at Site 300, and a total of 193 release sites. As of FY 2000, 139 release sites for the Livermore Site and Site 300 will be completed. Waste management activities are directed at compliant storage, treatment and off-site shipment for disposal of both legacy and currently generated hazardous and radioactive waste. In addition, characterization of a large portion of the legacy transuranic waste inventory is dependent on the completion of the Large Container Packaging Unit in FY 2001. Completion of the Decontamination and Waste Treatment Facility in FY 2000 will provide new, centralized, and integrated facilities for the treatment of all Lawrence Livermore National Laboratory waste.

Separations Process Research Unit

The Separations Process Research Unit located in Schenectady, New York has inactive facilities that require decontamination and decommissioning. To date no decontamination and decommissioning has been performed and the facilities have been placed in safe shutdown with the Nuclear Energy Naval Reactor Program maintaining landlord responsibilities. Beginning in FY 2000 the surveillance and maintenance of these facilities will be the responsibility of the EM program. In addition to the surveillance and maintenance, basic health and safety effort (radiation safety, industrial hygiene, industrial and nuclear safety) will be developed and implemented. Completion of the decontamination and decommissioning is planned for FY 2014.

Oakland Operations Office

Based on an Oakland Operations Office and State development statement of work, Oakland Operations Office awards and manages grants provided to the State for oversight activities which include, participation in scoping meetings, review of documents, and involvement with the public. Also, the Oakland Operations Office provides funds and grants to support various activities, such as tribal colleges and universities, center for environmental excellence, independent reviews and Hispanic scholarships.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Lawrence Livermore National Laboratory Livermore Site and Site 300 are managed through a performance based contract with the University of California to assure the most cost-effective services to the Government. The scope planned for cleanup activities in FY 2000 have been reviewed and are appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. These activities have had an independent cost review of the scope by the Corps of Engineers and the funds requested for FY 2000 are appropriate to perform the activities based on a historical level of effort costs.

Metrics			
Remedial Action/Release Site Cleanups	7.0	4.0	5.0

OK-021 / Lawrence Livermore National Laboratory Base Program

The mission of this project is to formulate a centralized waste management program at Lawrence Livermore National Laboratory to ensure waste handling practices from the generating source through final disposition are consistent to ensure safe and compliant operations at the treatment, storage and disposal facilities. Waste types managed under this project include low-level waste, mixed low-level waste, transuranic waste, mixed transuranic waste and hazardous waste which includes treatment and disposal at commercial facilities.

- Review new procedures and processes associated with the activation and operation of the Decontamination and Waste Treatment Facility.
- Prepare safety and closure documentation for the obsolete Treatment, Storage, and Disposal Facilities.
- Plan, coordinate, and execute movement of materials, equipment, systems, and staff to the Decontamination and Waste Treatment Facility.
- Activate and operate (start up testing) the Decontamination and Waste Treatment Facility.

OK-021	19,778	21,434	21,891

OK-026 / Lawrence Livermore National Laboratory General Plant Projects

The mission of the General Plant Projects is to support waste management operations by providing small capital improvements to property, purchase new/improved technology equipment, perform coded compliance updates, and/or upgrade existing buildings and utilities to meet current or new regulations and requirements.

- Procure long-lead equipment items such as air handling units.

OK-026	375	395	1,700

Metrics
No quantifiable corporate performance measures are associated with this project.

OK-027 / Lawrence Livermore National Laboratory Decontamination and Waste Treatment Facility (86-D-103)

The construction of the Decontamination and Waste Treatment Facility at the Lawrence Livermore National Laboratory is to provide new, centralized and integrated facilities for the hazardous waste management operations that will meet the requirement for a Low Hazard (chemical) Category 3 (nuclear) Facility.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Complete the activation of the Decontamination and Waste Treatment Facility ■ Continues funding and construction of the Decontamination and Waste Treatment Facility construction line item 86-D-103. Included in the funding totals for this program baseline summary are $11,250 for FY 1998, $4,752 (prior year funds used as an offset for FY 1999 uncosted reduction) for FY 1999, and $2,000 for FY 2000 for the line item.			
OK-027	11,250	4,752	2,000

Metrics
No quantifiable corporate performance measures are associated with this project.

OK-040-D / State Grants

The purpose of the project is to provide funding to support grants for State regulatory agencies who have oversight of the Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation, and Liability Act programs for DOE. A Memorandum of Agreement between the Department and Indian Nations allows for grants to support tribal universities and colleges.

- State agencies participate in meetings, review and comment on documents, and concur on environmental restoration actions.
- Provide funds to support activities related to tribal colleges and universities, center for environmental excellence, independent review and Hispanic scholarships.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
OAK-001 / Lawrence Livermore National Laboratory Main Site Remediation	
■ Decrease in funding request is due to reduced costs of treatment facility installation and build-outs and near-term completion of ROD commitments to control contaminant plume migration	-975
OK-002 / Lawrence Livermore National Laboratory Site 300 Remedial Action	
■ Increase in costs are for the finalization of the site-wide ROD, implementation of interim actions, development and implementation of a remedial design and construction schedule that will install source control remedies at all the Operable Units, application of destructive removal technologies such as hydrous pyrolysis, electro-kinetics and in situ chemical injection of oxidation reactants, and completion of source investigations	1,957
OK-021 / Lawrence Livermore National Laboratory Base Program	
■ Slight increase in funding to ensure safe and compliant operations for treatment, storage and disposal of wastes at the Lawrence Livermore National Laboratory	457
OK-026 / Lawrence Livermore National Laboratory General Plant Projects	
■ Increase in cost to procure long-lead equipment items with varied costs such as air handling units	1,305
OK-027 / Lawrence Livermore National Laboratory Decontamination and Waste Treatment Facility	
■ Decrease in costs consistent with Decontamination and Waste Treatment Facility (construction project for processing transuranic waste, mixed low-level waste, low-level waste, hazardous waste, and other waste) nearing completion at the Lawrence Livermore National Laboratory	-2,752
OK-040-D / State Grants	
■ Activities will continue but will be funded at a reduced level. However, similar activities are being funded in the Non-Defense Environmental Management appropriation	-1,900

	FY 2000 vs. FY 1999 ($000)
OAK 041 / Accelerated Waste Treatment	
■ Increase in cost for preparation and obtaining an Environmental Assessment and Resource Conservation and Recovery Act permits preparing the preliminary Safety Analysis Report and to issue a Request for Procurement for a contractor to design and build the large container processing units	685
OAK-SPRU / Separations Process Research Unit	
■ First year of funding requested for EM to assume surveillance and maintenance responsibility of Separation Process Research Unit facilities to be decontamination and decommissioning	500
Total, Oakland	-723

Richland

Mission Supporting Goals and Objectives

Mission

The Richland Operations Office manages the Department of Energy's Hanford Site in Southeast Washington State. The site mission under the Defense Environmental Management, Site/Project Completion account is to safely store and stabilize inventories of spent nuclear fuel and special nuclear materials. Included in this mission is deactivation of the nuclear facilities associated with these materials in order to reduce the risks posed by aging facilities and reduce the high annual costs for maintaining such facilities.

Program Goal

The Hanford Site will address the urgent risks associated with stored Spent Nuclear Fuel in close proximity to the Columbia River, plutonium and other nuclear material inventories requiring stabilization, and the deactivation of the associated nuclear facilities that exist to maintain these inventories.

Under the Spent Nuclear Fuel Project, by 2006 the entire inventory of 2,100 metric tons of degrading spent nuclear fuel will be removed from the K-Reactor storage basins, and stored in a dry storage configuration in the Canister Storage Building. Schedules and milestones related to stabilizing the spent nuclear fuel are commitments in the Hanford Federal Facility Agreement and Consent Order, commonly referred to as the "Tri-Party Agreement" and the Defense Nuclear Facilities Safety Board Recommendation 94-1 Implementation Plan. Deactivation of the K-East and K-West fuel storage basins would occur after fuel removal. The spent nuclear fuel would remain in dry storage awaiting final disposition, which is currently thought to be the geologic repository.

Also, by 2006 the entire inventory of about 4 metric tons of plutonium at the Plutonium Finishing Plant will be stabilized and placed in a safe interim storage configuration. Schedules and milestones related to stabilizing plutonium bearing materials at the Plutonium Finishing Plant are commitments in the Defense Nuclear Facilities Safety Board Recommendation 94-1 Implementation Plan. After stabilization, the goal of removing the safe stored material to an off-site location as soon as possible will be pursued. In conjunction with the stabilization activities at the Plutonium Finishing Plant, deactivation of the facility will occur as sections of the plant are no longer needed for stabilization.

Deactivation of other former defense nuclear facilities that fall under the Facility Transition Program will be accomplished. Deactivation of these facilities provides risk reduction benefits as well as outyear cost avoidances. Significant deactivation completions already accomplished are the Plutonium-Uranium Extraction facility that reduced the annual surveillance and maintenance costs from about $34 million to

less than $1 million a year, the B-Plant which reduced the annual surveillance and maintenance costs from about $19 million to less than $1 million per year, and the N-Reactor. The deactivation of facilities in the 300 Area, such as Buildings 324 and 327, which contain upwards of 1.5 million curies of dispersable radioactive material, will provide significant outyear savings in surveillance and maintenance costs. In addition to deactivation of these surplus facilities, some will be considered for economic transition to the private sector. With significant experience in nuclear facility deactivation, Richland provides lessons-learned and support to other facilities on-site as well as complex wide.

Program Objectives

In FY 2000, the Spent Nuclear Fuel project will make significant progress in preparations for the commencement of spent fuel removal from the K-East and K-West basins. Specifically the K-West system for removing fuel from the basin will be installed and tested in support of commencing fuel removal in early FY 2001. For K-East basin, the fuel retrieval system installation will begin to support a fuel retrieval start date in FY 2002. While awaiting fuel removal, the safe and contained storage of the spent nuclear fuel in the K-Basins is a primary objective achieved through the surveillance and maintenance of the facilities necessary to comply with the facility safety requirements.

At the Plutonium Finishing Plant, significant progress toward stabilization of plutonium bearing materials will be made in FY 2000. Specifically, stabilization of up to 600 kilograms of plutonium residues are expected, 160 liters of plutonium bearing solutions will be stabilized, and about 238 containers of plutonium metals and oxides will be stabilized. While stabilization activities proceed, the safe and secure storage of the special nuclear material in the Plutonium Finishing Plant is a primary objective. It will be achieved through surveillance and maintenance of the Plutonium Finishing Plant necessary to comply with the facility safety requirements and safeguards requirements. Safeguards requirements include obligations to comply with International Atomic Energy Agency non-proliferation inspections.

Planning for the deactivation and transition of facilities that fall under the Facility Transition Program will be accomplished. Specifically, this will include buildings mostly in the 300 area - such as Buildings 324 and 327. While these facilities await deactivation and transition, the safe and secure maintenance of the facilities will be achieved through surveillance and maintenance of the facilities necessary to comply with the facility safety requirements and safeguards requirements.

Performance Measures

Performance Measures are provided at an aggregate level after each Funding by Site table, as well as at the project level in the Detail Justification.

Significant Accomplishments and Program Shifts

- Completed N-Reactor deactivation (FY 1998).

- Completed negotiation of spent nuclear fuel Tri-Party Agreement milestones and resolved dispute resolution (FY 1998).
- Completed construction of the Spent Nuclear Fuel canister storage building superstructure (FY 1998).
- Completed manufacture of the Spent Nuclear Fuel stabilization equipment prototype (FY 1998)
- Completed Spent Nuclear Fuel Project baseline validation (FY 1998).
- Completed B-Plant deactivation (FY 1998)
- Restarted limited plutonium operations at the Plutonium Finishing Plant (FY 1998).
- Completed size reduction and shipment of Building 324 B-Cell rack 1B and low-level waste to the Hanford burial grounds per Tri-Party Agreement requirements (FY 1998).
- Completed resolution of Building 324 fire hazard concerns (FY 1998).
- Completed final Building 324/327 Stabilization/Deactivation Project Plan per Tri-Party Agreement Milestone (FY 1998).
- Transferred 236 legacy waste buckets stored in Building 327 hot-cells to the Hanford burial grounds (FY 1998).
- Completed transfer of all Building 324 cesium inventory to the Waste Encapsulation and Storage Facility in the Central Hanford 200 Area for interim storage (FY 1998).
- Complete Spent Nuclear Fuel stabilization facility pre-operational acceptance test (FY 1999).
- Complete Spent Nuclear Fuel project safety designs (FY 1999).
- Restart plutonium stabilization activities at the Plutonium Finishing Plant (FY 1999).
- Complete cold installation for the vertical denitration calciner and commence prototype vertical denitration calciner stabilization operations at the Plutonium Finishing Plant (FY 1999).
- Complete installation of three additional plutonium stabilization furnaces at the Plutonium Finishing Plant (FY 1999).
- Complete design and initiate procurement of automated Plutonium stabilization and packaging system (FY 1999).
- Complete size reduction and shipment of Building 324 B-Cell racks 1A and 2A and low-level waste to the Hanford burial grounds per Tri-Party Agreement requirements (FY 1999).
- Complete fuel retrieval, drying, transport and storage system testing to support commencement of fuel removal from the K-West basin in early FY 2001 (FY 2000).
- Complete K-East modification and begin K-East Fuel Retrieval System installation in preparation for K-East basin fuel removal in FY 2002 (FY 2000).
- Continue stabilization of 160 liters of plutonium bearing solutions, and about 238 containers of plutonium metals and oxides (FY 2000)

- Commence stabilization of about 600 kilograms of plutonium bearing residues and plutonium bearing polycube materials (FY 2000).
- Continue surveillance and maintenance of spent nuclear fuel facilities and all facilities and material that fall under the Facility Transition Program (FY 2000).

Site Description

Hanford

The United States Department of Energy's Richland Operations Office manages the Department's Hanford Site, in Southeastern Washington State. The 1,465 square kilometer (560 square mile) site is bounded on the north by over 50 miles of the Columbia River, and to the south by Rattlesnake Ridge. The flat plateau containing the Hanford site is the only section of the mid-Columbia River that is not confined by gorges, and is known as the Hanford Reach. The Department leases some of Hanford's land to the State of Washington which in turn leases it to the US Ecology and the Washington Public Power Supply System.

Hanford was established in secrecy during World War II to produce plutonium for the nation's nuclear weapons. Peak production years were reached in the 1960s when 9 production reactors were in operation along the river. The last to be decommissioned was N-Reactor and its fuel in the K-Basins is now being relocated to higher ground in the central plateau, known as the 200-Area. The 200-Area had been the site of major nuclear chemical processing plants which were all shut down by the early 1990s. The 200-Area is now the core of major waste management operations; and includes 177 underground storage tanks containing the high-level waste from past processing operations. A major effort to immobilize these wastes by vitrification is underway by a privatization contractor. The Plutonium Finishing Plant is one of the last production facilities that will remain operational -- to process remaining plutonium materials. Other areas of the site include the Fast Flux Test Facility (400-Area) which does not currently have a mission (currently budgeted and managed by the Office of Nuclear Energy); research and development activities by Pacific Northwest National Laboratories in the

300-Area, and support facilities in the 1100-Area, most of which have been turned over to the local communities

The Hanford mission is now site cleanup and environmental restoration, including the groundwater/vadose zone integration project to protect the Columbia River. The cleanup is covered by a 1989 consent agreement between the Department of Energy, the Environmental Protection Agency, and the Washington State Department of Ecology. This Tri-Party Agreement contains enforceable milestones for bringing Hanford into compliance with the Comprehensive Environmental Response, Compensation, and Liability Act and the Resource Conservation and Recovery Act. Most of the Hanford budget is directed at compliance with these milestones. Additionally, the Defense Nuclear Facilities Safety Board takes great interest in safety at Hanford and has issued recommendations which are the basis for the Defense Nuclear Facilities Safety Board commitments that are also high priority budget items.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The site is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost-effective services to the Government. The scope Planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. Nearly 100 percent of the projects' funding included in this section of the budget had an independent cost review of the scope, and the funds requested for FY 2000 are appropriate to perform the activities based on estimated project progress and accumulated cost management success.			
RL-ER09 / N Reactor Deactivation			
This project involved the deactivation of 88 facilities; cleanout and stabilization of the N Basin; cleanout and stabilization of the Emergency Dump Basin; removal of fuel spacers from silos; operation of the N Reactor waste pool; and surveillance and maintenance.			
■ Project completed in FY 1998. No further activity.			
RL-ER09	15,772	0	0

Metrics
No quantifiable corporate performance measures are associated with this project.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

RL-TP01 / B-Plant Sub-Project

This project deactivated and maintained B Plant and its ancillary facilities in a safe and cost-effective surveillance and maintenance status through FY 1998. It will be turned over to the Environmental Restoration project during FY 1999.

- B-Plant deactivation completed in FY 1998. B-Plant closeout activities and punch-list items are completed in FY 1999. No further activity in FY 2000.
- This project included $2,400,000 in FY 1998 for line-item 97-D-451, B-Plant Safety Class Ventilation Upgrade.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
RL-TP04 / 300 Area/Special Nuclear Materials Sub-Project			
This project's main objective is to complete deactivation and closure of the 300 Area Fuel Supply Shutdown complex. It includes regulatory compliant surveillance and maintenance of 1200 metric tons of special nuclear material until it is dispositioned; isolating Building 313; closure of two remaining Resource Conservation and Recovery Act permitted treatment, storage, disposal systems; complete deactivation and stabilization activities of the systems/buildings in the Fuel Supply Shutdown complex; and disposition of the remaining low enriched spent nuclear fuel.			
■ Continue surveillance and maintenance activities for maintaining facility safety bases.			
RL-TP04	3,677	4,444	3,658
Metrics			
Facility Deactivation			
Buildings Deactivated During Period	0.0	0.0	16.0
Buildings in Post Deactivation Monitoring	0.0	2.0	18.0
Buildings Not Yet Deactivated/Monitored	0.0	16.0	0.0

RL-TP05 / Plutonium Finishing Plant Deactivation

Provides for safe and secure storage of special nuclear materials at the Plutonium Finishing Plant complex, and provides the basic infrastructure on which nuclear material stabilization and facility deactivation are dependent. Implements the Defense Nuclear Facility Safety Board Recommendation 94-01 by stabilizing, repackaging, and removing all remaining plutonium-bearing materials from the Plutonium Finishing Plant. In addition, implements deactivation of the Plutonium Finishing Plant complex.

- Begin processing plutonium solutions through the vertical denitration calciner.
- Initiate plutonium residue cementation and stabilization of polycube material.
- Complete design, procurement, installation, test, and personnel training for the new Plutonium Stabilization and Handling System.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continues funding and construction of the Plutonium Stabilization and Handling System for Plutonium Finishing Plant construction line-item (98-D-453). Included in the totals for this project are $3,136,000 for FY 1998; $10,699,000 for FY 1999; and $16,860,000 for FY 2000 for the line-item.			
■ Continue thermal stabilization of plutonium oxides.			
■ Continue surveillance and maintenance activities related to facility and related systems, as well as surveillance and monitoring of stored nuclear material.			
■ Support International Atomic Energy Agency non-proliferation activities at the Plutonium Finishing Plant. Approximately one metric ton of excess plutonium oxide is stored in the Plutonium Finishing Plant vaults, under international safeguards. This material is routinely inspected by the International Atomic Energy Agency to ensure it has not been diverted toward any nuclear weapons application.

RL-TP10 / Accelerated Deactivation			
This project provides for deactivation of all Hanford contaminated facilities outside the 300 Area that are not covered in any other Hanford Environmental Management project. There are 48 non-mobile contaminated facilities that will eventually be included under this project, but most are not slated for transition to a safe, inexpensive state until after 2001. Initially, 8 non-mobile facilities will be assessed and characterized, have inventories (including spent nuclear fuel) removed, and develop regulatory, deactivation and post-deactivation plans to achieve shutdown endpoints.			
■ Continue surveillance and maintenance activities.			
■ Develop Building 231 End Point Criteria, necessary regulatory documentation and deactivation plans.			
■ Provides planning necessary for deactivation of three radioactively contaminated facilities; 222T, 222U, and 2704C.

RL-TP12 / Transition Project Management

This project provides centralized program, project, and business management to plan, execute and control the Facility Stabilization Project. Tasks include common safeguards and security, environmental, safety and health and radiation control, quality assurance, systems engineering, support for technology development implementation, procurement, planning, integration of operations and project management of the Fluor Daniel Hanford contractor.

- Support technical development of the 200 Area Canyon Entombment Project.
- Provide Fluor Daniel Hanford, Inc. project management direction.

RL-TP12	10,776	15,148	15,191

Metrics
No quantifiable corporate performance measures are associated with this project.

RL-TP14 / Hanford Surplus Facility Program 300 Area Revitalization Project

This project reduces the risk to the public, workers and environment of up to 156 excess facilities in the 300 Area by removing, isolating, or stabilizing contaminants, providing surveillance and maintenance to assure releases do not occur, and keeping facilities from further deterioration until final disposition of the facilities is determined.

- Continue minimum safe facility surveillance and maintenance.
- Initiate 300 Area facility assessments and develop a 300 Area project plan.

RL-WM01 / Spent Nuclear Fuels Project

This project will move spent nuclear fuel from wet storage in the K-East and K-West basins near the Columbia River to safe, dry interim storage in the 200 Area Central Plateau. Continued use of these facilities far past their design lives threatens Hanford with a loss of radioactive storage basin water into the surrounding soil and from there potentially into the Columbia River. This project includes: removal and repackaging spent nuclear fuel into multi-canister overpacks, fuel drying, transport and staging, removal of sludge and debris from the K-Basins for appropriate disposition, treating and conditioning the water in the basins, and consolidating spent nuclear fuel in the Central Hanford 200 Area pending final disposition.

- Complete fuel retrieval, drying, transport and storage system testing to support commencement of fuel removal from the K-West basin in early FY 2001.
- Complete K-East modification and begin K-East basin Fuel Retrieval System installation in preparation for K-East basin fuel removal in early FY 2002.
- Continues funding and construction of the Spent Nuclear Fuel Canister and Storage and Stabilization Facility line-item (96-D-406). Included in the funding totals are $21,744,000 in FY 1998; $38,680,000 in FY 1999; and $24,441,000 for FY 2000 for the line-item.

Savannah River

Mission Supporting Goals and Objectives

Mission

The Savannah River Site is a key U.S. Department of Energy facility in accomplishing the mission of the Defense Environmental Management, Site/Project Completion account.

The Savannah River Cleanup Program has as its mission the elimination of the legacy that resulted from the production of nuclear materials during the Cold War. This legacy includes contaminated facilities and land areas, many of which still contain nuclear materials and wastes. The Savannah River Site, located near Aiken, South Carolina, covers over 300 square miles and includes five nuclear reactors, two chemical separations facilities, fuel and target fabrication facilities, tritium processing facilities, a heavy water facility, two high-level waste tank farms, low-level waste storage and disposal facilities, a high-level waste treatment facility, the Savannah River Technology Center, and numerous administrative and technical support facilities. These facilities have varying degrees of environmental contamination (soil and groundwater); the majority of which will require some remedial action to address environmental and health risks.

The Savannah River Cleanup program is composed of the following major elements: spent nuclear fuel management, nuclear materials stabilization, waste management (high-level, transuranic, hazardous, mixed low-level, and other), deactivation, remediation, and supporting landlord requirements. This account funds all activities whose life-cycle will be completed by FY 2006.

Program Goal

The Savannah River Site is committed to managing the spent nuclear fuel, stabilizing nuclear materials, and managing all types of wastes using currently available (or near-term) technology and facilities. Eventually, the nuclear materials would be dispositioned, and the remaining spent nuclear fuel and wastes would be sent to geologic repositories. To the extent possible (to be determined through technical analyses, National Environmental Policy Act review, and the regulatory process), Savannah River may be able to assist other sites in eliminating their Cold War "legacies". Savannah River Site personnel will complete stabilization of all spent nuclear fuel and all other nuclear materials (currently scheduled to be received or already received at Savannah River) requiring stabilization in FY 2006. Achievement of this effort depends on attainment of productivity enhancements through 2006.

Program Objectives

Although DOE has ceased production of nuclear materials for defense purposes, and all Savannah River Site reactors are shut down, there remains a significant amount of legacy nuclear materials in the "pipeline", both at Savannah River and across the DOE complex. The program objective is to stabilize these legacy nuclear materials, in various enrichments, concentrations, compounds, forms, and storage configurations that require further treatment/handling in order to place them in a form which can be safely stored until disposition or disposal. Stabilization means that changes must be made (conversion from a liquid to a solid, removal of reactive and other constituents, repackaging, etc.) in the form and/or storage conditions for nuclear materials such that they can be stored with minimal risk to workers, the public, and/or the environment until disposition. As long as significant quantities of nuclear materials in liquid or unstable forms continue to reside in the production facilities, all the attributes of an operating facility must be maintained including security, radiation protection, material control and accountability, trained and certified operator and maintenance personnel, essential safety system operation, emergency response capability, sampling and monitoring, configuration management, fire protection, maintenance of the safety authorization basis, etc. Thus, the cost of continuing to store these materials in their current condition (surveillance and maintenance part of the budget) is very high and approaches the cost of operating the facilities for the "cleanup" mission.

In July 1997, the Secretary of Energy approved the operation of both the F-Canyon and H-Canyon for the stabilization of "at risk" nuclear materials. This dual canyon strategy uses existing processes and facilities specifically designed for these materials, thus optimizing the site's capability for the completion of materials stabilization. Accordingly, the strategy would result in the expeditious stabilization of Savannah River Site nuclear materials in accordance with Defense Nuclear Facilities Safety Board Recommendation 94-1.

The Savannah River Site's F-Canyon and FB-Line will complete stabilization of the Savannah River Site plutonium bearing materials covered by the Defense Nuclear Facilities Safety Board Recommendation 94-1 for processing in these facilities by 2004, and the stabilization of certain Rocky Flats Environmental Technology Site plutonium residues and scrub alloy will be complete by 2002. Receipt and stabilization of a limited amount of these plutonium residues from Rocky Flats supports DOE's goal for the accelerated closure of the Rocky Flats Environmental Technology Site. Development and installation of equipment for vitrifying the americium/curium into borosilicate glass form will be ongoing with stabilization of the americium/curium solution projected to be complete in 2002. H-Canyon will continue to dissolve Mark 16/22 spent fuel. Activities for startup of HB-Line Phase II will also continue.

The two chemical processing canyons at the Savannah River Site, and the related support facilities, provide the capability to stabilize the Savannah River Site legacy materials (as well as some of the legacy materials from other sites in the DOE complex) for interim storage and eventual disposition. As of the end of FY 1998, these facilities had stabilized 3,500 gallons of Pu-242 solutions, 80,000 gallons of Pu-239 solutions, 16,000 corroding targets from the L-Reactor basin, and 144 canisters of failed or de-clad spent fuel. Remaining materials to be stabilized in the canyons include 34,000 liters of Pu-239 bearing solutions, 230,000 liters of enriched uranium bearing solutions, 14,000 liters of americium/curium solution, 6,000 liters of neptunium solutions, 1,900 assemblies of Savannah River

fuels, 900 items of other aluminum-clad fuel and targets, and 2,200 containers of plutonium and uranium vault materials, and over 3,000 containers of plutonium residues from Rocky Flats. Proposed missions include stabilizing about 19 metric tons of heavy metal of additional spent nuclear fuel to address potential health and safety vulnerabilities. Nuclear materials stabilized in the canyons will be stored in the Savannah River Nuclear Material Storage Facility when this facility becomes available, until dispositioned.

Spent nuclear fuel that does not require stabilization for health and safety reasons will require additional treatment or packaging to prepare it for disposal in a geologic repository. The Alternative Technology Project is evaluating a melt and dilute option (preferred) and a co-dispose option (backup) that will provide a suitable form for disposal without separating the fissile element.

Deactivation will begin once the bulk nuclear materials are stabilized/removed from a facility and consists of activities such as removal of hazardous chemicals, flushing and cleanout of systems and equipment, etc., to the point that little contamination or safety risk to workers, the public, and the environment exists. As this is achieved, the attributes of an operating nuclear facility described above (security, radiation protection, material control and accountability, etc.) can be eliminated or substantially curtailed resulting in major reductions in surveillance and maintenance costs. Although additional deactivation would result in significant savings, extensive deactivation of the reactors (C, P and R-Areas), heavy water production (D-Area) ,and fuel fabrication facilities (M-Area) has resulted in major reductions in the annual surveillance and maintenance costs for these facilities. Deactivation is yet to be substantially undertaken in K- and L-Areas, Separations (F and H Areas), and the waste management facilities in S-Area since these facilities are operating and/or still contain substantial quantities of nuclear materials or wastes.

The High-Level Waste program includes funding for construction line-item projects, such as Waste Management Upgrades (96-D-408); H-Tank Farm Storm Water Systems Upgrades (98-D-401); and Tank Farm Support Services F and H Area (99-D-402). The Landlord program includes support for construction line-item projects, such as Plantwide Fire Protection, (90-D-149); Chlorofluorocarbon Heating, Ventilation and Air Conditioning Chiller Retrofit (96-D-471) and Regulatory Monitoring and Bioassay Laboratory (97-D-470).

Performance Measures

Performance Measures are provided at an aggregate level after each Funding by Site table, as well as at the project level in the Detail Justification.

Significant Accomplishments and Program Shifts

- Restarted HB-Line Phase 1 (FY 1998).
- Restarted H-Canyon, first cycle (FY 1998) and restart H-Canyon second cycle (FY 1999).

- Initiated stabilization of Savannah River Site plutonium sweepings (FY 1998) and dissolution of Savannah River Site plutonium sweepings and turnings (FY 1999).
- Completed dissolution of Savannah River Site sand, slag and crucible (FY 1998), and initiate stabilization of Rocky Flats sand, slag and crucible (FY 1999).
- Completed stabilization of remaining Savannah River Site Taiwan Research Reactor spent fuel (FY 1998).
- Continued dissolution of Savannah River Site Mark 16-22 spent fuel (FY 1998).
- Sign contract for sale of excess heavy water (FY 1999).
- Defer construction of the Actinide Packaging and Storage Facility subproject and conduct optimization analysis for surplus plutonium disposition missions that may come to Savannah River (FY 1999).
- Complete detailed design and begin construction activities of the K-Area Nuclear Material Storage Modifications subproject (FY 1999).
- Completed service piping and gang valve systems for three high-level waste tanks (FY 1998).
- Issue draft Savannah River Site spent nuclear fuel management Environmental Impact Statement with preferred alternative treatment for disposal of aluminum-based spent fuel and issue the final Environmental Impact Statement and Record of Decision (FY 1999).
- Begin characterization cabinet operation for characterization/repackaging Savannah River Site plutonium residues for dissolution in HB-line (FY 1999).
- Begin the K-Area Nuclear Materials Storage Modifications subproject construction activities (FY 1999).
- Complete F-Tank Farm electrical upgrades (FY 1999).
- Complete stabilization of Rocky Flats scrub alloy; continue stabilization of Rocky Flats sand, slag, and crucible; complete stabilization of remaining Experimental Breeder Reactor-II spent fuel (subject to the ongoing National Environmental Policy Act); continue declassification of Rocky Flats plutonium metal (subject to the ongoing National Environmental Policy Act); continue characterization and repackaging of plutonium residues; continue dissolution and blending down to low enriched uranium MK-16/22 spent fuel; begin dissolution of additional spent fuel (subject to the ongoing National Environmental Policy Act); begin stabilization of plutonium scrap and mixed scrap; and continue packaging plutonium metal into 3013 inner containers (FY 2000).

Site Description

Savannah River

The complex covers 198,344 acres, or 310 square miles encompassing parts of Aiken, Barnwell, and Allendale counties in South Carolina, bordering the Savannah River.

The site is owned by the U.S. Department of Energy and operated by an integrated team led by Westinghouse Savannah River Company. Under the contract that went into effect October 1, 1996, the Westinghouse Savannah River Company is responsible for the site's nuclear facility operations; Savannah River Technology Center; environment, safety, health, and quality assurance; and all of the site's administrative functions. The team also includes Bechtel Savannah River Incorporated (parent company: Bechtel National Incorporated), which is responsible for environmental restoration, project management, engineering and construction activities; Babcock and Wilcox Savannah River Company (parent company Babcock and Wilcox Government Group), which is responsible for facility decontamination and decommissioning; and British Nuclear Fuels Limited Savannah River Corporation (parent company British Nuclear Fuels Limited Incorporated), which is responsible for the Site's solid waste program. Wackenhut, Incorporated is responsible for the Site's physical security program.

While the changing world has caused a downsizing of the site's original defense mission, the future of the Savannah River Site lies in several areas: reducing the nuclear danger; transferring applied environmental technology to government and non-government entities; cleaning up the site and managing the waste the Savannah River Site has produced; and forming economic and industrial alliances.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Savannah River Site is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost-effective services to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure* report. The funds requested for FY 2000 are appropriate to perform the activities based on the use of the "Activity-Based Costing Methodology" and on an independent review of the programmatic assumptions and projected scope. All construction line-item projects were validated and many projects received an independent cost estimate review.

SR-HL09 / Tank Farm Service Upgrades (96-D-408)

The Tank Farm Services Upgrade project has four parts. Parts 1 and 2: H-Area West Hill service piping and gang valve house upgrades will replace buried service piping with easy access, above-ground trenches and pipe racks, thereby eliminating costly repairs to leaking, buried pipes. These upgrades will also replace the existing gang valve house (which services Tanks 35-37) with 3 new gang valve houses. Part 3: H-Area East Hill cooling water upgrades will replace worn out cooling water pumps and install additional cooling water pumps and heat exchangers to increase cooling water capacity and reliability to support the additional demands of In-Tank Precipitation and Extended Sludge Processing (SR-HL04). Part 4: F-Area electrical upgrades will alleviate overload conditions on a transformer and automatic transfer switch which cause power interruptions and associated unplanned work outages.

- H-Area East Hill Cooling Upgrades: Award a fixed-price construction subcontract to complete construction.
  - Complete construction, including installation of heat exchangers and the internal heat exchanger for Tank 50, replacement of three cooling tower water pumps, and the addition or replacement of three chromate cooling water pumps.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ Prior year funds utilized.			
▸ These funding levels include line-item construction funding of $3,100,000 in FY 1998.			
SR-HL09	3,660	1,099	0

Metrics
No quantifiable corporate performance measures are associated with this project.

SR-HL10 / H-Tank Farm Storm Water System Upgrades (98-D-401)

The scope of this project includes evaluation of the entire stormwater collection, retention, and outfall system related to flooding condition surrounding Tanks 9-12H; awarding the design fixed-price contract, completing the detailed design work; awarding a construction fixed-price contract for diversion line replacements and the storm water pumping and monitoring system; and completing construction including installation of new manholes, storm water piping and diversion boxes, and modification to Diversion Box 907-1H and Retention Basin 281-8H.

- Complete construction including new manholes, storm water piping, and modifications to Diversion Box 907-1H and Retention Basin 281-8H for project 98-D-401, H-Tank Farm Storm Water System Upgrades.
- These funding levels include line-item construction funding of $1,000,000 in FY 1998; $3,120,000 in FY 1999, and $2,977,000 in FY 2000.

SR-HL10	1,110	3,633	4,430

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

SR-HL11 / Tank Farm Support Services F-Area (99-D-402)

The scope of this project includes replacement in F-Area Tank Farm of all service lines to Tanks 25-28, 33-34, and 44-47, as well as to the 242-16F evaporator. The existing underground service piping systems will be abandoned in place and not removed, in order to minimize cost, radiological waste generation, and personal radiation exposure

- Award construction subcontract.
- Start construction on the replacement service piping to Tanks 25-28, 33-34, and 44-47, as well as the 242-16F evaporator for project 99-D-402, Tank Farm Support Services F-Area.
- These funding levels include line-item construction funding of $2,745,000 in FY 1999 and $3,100,000 in FY 2000.

SR-HL11	0	3,243	4,314

Metrics

SR-IN01 / Plantwide Fire Protection Line Item (90-D-149)

The project is to design, install, test, start-up and turnover to operation a cost-effective set of fire protection upgrades to numerous existing facilities across the Savannah River Site. The upgrades will be designed to reduce the probability or consequences of a fire that could threaten public health or welfare, pose an undue hazard to site personnel, prevent unacceptable DOE program delays, or cause excessive property damage. The scope of the project has been redefined to limit additional project work to primarily address only life safety issues as defined by national codes and standards relative to fire protection.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The project will provide upgrades to existing facilities in various areas across the entire plant site. Upgrades include new or additional provisions to water supply and distribution systems, sprinkler suppression systems, standpipe and hose stations, manual and automatic fire alarm and detection systems, passive protection features, emergency lighting systems, and elevator recall functions. Upgrades will, or have been accomplished in 100-C, K, and L Areas; Defense Waste Processing Facility (S-Area); and miscellaneous A-Area, N-Area, G-Area and other areas of the Site.			
■ Complete project and close-out of all fire protection systems for the small tasks subproject.			
■ Complete project and financial closure for the Plantwide Fire Protection construction line item and all subprojects within the line item.			
■ No line-item construction funds are requested for this project.			
SR-IN01	1,257	1,490	637

Metrics
No quantifiable corporate performance measures are associated with this project.

SR-IN02 / Operations Support Facility Line Item (92-D-150)

This project constructed office buildings to house operations support personnel at the Savannah River Site.			
■ No activity. Project was completed in FY 1996. Funds were inadvertently recast into this project baseline summary at yearend. Funds should have been recast into SR-SF02, L-Reactor Spent Nuclear Fuel, for operational support of L-Reactor.

No quantifiable corporate performance measures are associated with this project.

SR-IN10 / Regulatory Monitoring and Bioassay Laboratory (97-D-470)

This project will design, build and equip a new Regulatory Monitoring and Bioassay Laboratory for the Environmental Monitoring and Health Physics Technology departments of the Environmental, Safety, Health and Quality Assurance Division at the Savannah River Site. The new facility will continue to provide full compliance with Occupational Safety and Health Administration, radiation protection requirements, industrial hygiene and environmental protection requirements as detailed in Federal and state regulations and DOE Orders. The Regulatory Monitoring and Bioassay Laboratory will house the equipment and personnel to support site requirements to sample, prepare and analyze environmental media (air, water, soil) for radiological, chemical and biological parameters, develop technologies to clean and monitor the environment, and for the determination, evaluation and documentation of personnel exposure to radioactive materials. The new laboratory and support facilities will include laboratory modules, sample preparation areas, analytical instrument rooms, mechanical and electrical support services, storage space, and offices for technical and administrative personnel. The structural, mechanical, electrical and architectural design provisions will consider expansion capability for additional laboratory modules and associated support features.

- Construction of the laboratory is projected to be 95 percent complete.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Utilities will be installed, including the sanitary sewer; all will be fully operational			
■ Major components, such as heating, ventilation and air conditioning, fume hoods, fire protection systems and laboratory modules will be installed and contractor testing will be initiated.			
■ The parking lot will be completed.			
■ These funding levels include line-item construction funding of $5,600,000 in FY 1998; $7,000,000 in FY 1999, and $12,200,000 in FY 2000.			
SR-IN10	6,103	7,542	12,994

Metrics
No quantifiable corporate performance measures are associated with this project.

SR-IN13 / Decontamination of Laboratory Facility 772-F and 773-A (00-EXP)

The project will decontaminate areas of the service floor of 772-F and decontaminate and replace the roof of 773-A. Approximately 15,000 square feet of the area in Building 772-F will be decontaminated. The project will also replace parts of the 773-A roof equipment to preclude any additional contamination from occurring due to leaking exhaust components. At 773-A, approximately 40,000 square feet of contaminated roofing area will be replaced, as well as approximately 110,000 square feet of non-contaminated leaking roof area will be replaced. Leaks through the contaminated roofing are currently contaminating interior laboratory modules, requiring significant expense to decontaminate work areas.

- This project is a new start operating expense funded line-item project.
- The initial task will be to obtain a fixed-price architect/engineer to complete the "state-of-the-art" decontamination study and to create two specifications for obtaining two subcontractors for installation work scheduled to begin in early FY 2001.
- Award of the contract is expected in late FY 2000.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Perform design and begin urgent roof repairs to Building 773-A.			
SR-IN13	0	0	2,774

SR-NM01 / F-Area Stabilization Project

This project involves converting the Savannah River Site "at-risk" nuclear materials into stable forms suitable for interim to long-term storage using the F-Canyon, FB-Line, 235-F, and supporting facilities. Additionally, a limited quantity of certain off-site nuclear materials from the Rocky Flats Environmental Technology Site are to be stabilized using these facilities. The majority of the Savannah River Site materials stabilization activities are in accordance with the Department's commitments in response to the Defense Nuclear Facilities Safety Board Recommendation 94-1 (Improved Schedule for Remediation in the Defense Nuclear Facilities Complex). Additional nuclear materials proposed to be processed in the F-Canyon facilities include a limited volume of spent nuclear fuel that represents a potential health and safety vulnerability. Stabilization of this spent nuclear fuel is not a DOE Defense Nuclear Facilities Safety Board 94-1 commitment. A decision for the management of these fuels is projected for 1999 following the completion of the Savannah River Site Spent Nuclear Fuel Management Environmental Impact Statement.

- Continue modifications to the F-Canyon Multi-purpose Processing Facility in preparation for vitrification of americium/curium.
- Continue to transfer depleted uranium material to H-Area.
- Continue characterization activities on material in inventory for stabilization and/or repackaging.
- Continue the stabilization of the Rocky Flats Environmental Technology Site plutonium residues and scrub alloy.

Stabilized - Other Nuclear Material Forms (Handling Units)	147.0	459.0	432.0

SR-NM02 / H-Area Stabilization Project

The purpose of the H-Area Stabilization project is to stabilize "at risk" nuclear materials and spent fuel followed by the deinventory of HB-Line and H-Canyon and transition them to minimum surveillance and maintenance status until they can be turned over for final decontamination and decommissioning. To accomplish this, nuclear materials that remained in the processing pipeline at the end of the Cold War must be converted to stable forms. These activities will take place in accordance with the Department's implementation plan for Defense Nuclear Facilities Safety Board Recommendation 94-1 and the Savannah River Site Interim Management of Nuclear Materials Environmental Impact Statement. Other drivers for these activities are the Plutonium and Highly Enriched Uranium Vulnerability Assessments and Materials Disposition Environmental Impact Statements.

The following stabilization activities remain for H-Area:

- Reprocess Mark-16 and 22 spent nuclear fuel and separate the highly enriched uranium for blending to low enriched uranium.
- Reprocess miscellaneous spent nuclear fuels.
- Dissolve Pu-239 residues in HB-Line.
- Convert Pu-239 solution to oxide in HB-Line.
- Deinventory HB-Line vault.
- Blend existing highly enriched uranium solutions and those created from processing of Mark-16 and 22 spent fuels with depleted uranium solutions to create low enriched uranium for potential use in commercial reactor fuel.
- Convert Neptunium-237 solutions to oxide in HB-Line.
- Dissolve low assay Pu-238 residues.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Continue to reprocess Mark-16 and 22 spent nuclear fuel and separate the highly enriched uranium for blending to low enriched uranium.			
■ Continue dissolving plutonium scrap and residues in HB-Line.			
■ Continue preparations for startup of HB-Line Phase II.			
Note: The Department is planning to submit an FY 1999 reprogramming that will increase the funding by $17,748,000. This will permit hiring of personnel to start up HB-Line (Phase II) to stabilize nuclear materials. If the reprogramming is not endorsed, Savannah River will postpone the start-up of Phase II up to 6 months.

Stabilized - Other Nuclear Material Forms (Handling Units)	

SR-NM03 / Nuclear Material Storage Line Item (97-D-450)

This project will provide interim and long-term storage and handling capability for stabilized Savannah River Site , Rocky Flats and Hanford nuclear materials awaiting disposition (should a decision be made pursuant to National Environmental Policy Act reviews). This project consists of two subprojects: the Actinide Packaging and Storage Facility which will store (and repackage, as necessary) the stabilized plutonium, and the K-Area Nuclear Materials Storage Modifications subproject will store stabilized plutonium from Rocky Flats which is needed to sufficiently accelerate Rocky Flats shipments to the Savannah River Site for closure by 2006.

- Finish subcontract construction work on the K-Area Nuclear Materials Storage Modifications subproject.
- Startup and operate the K-Area Nuclear Materials Storage Modifications subproject.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ These funding levels include line-item construction funding of $18,000,000 in FY 1998; $79,184,000 in FY 1999, and $4,000,000 in FY 2000.			
Note: The Department is planning to submit an FY 1999 reprogramming that decreases the funding for the Actinide Packaging and Storage Facility subproject by $44,000,000. This will permit the mission of this subproject to be re-evaluated in light of DOE's preferred alternatives for the Department's plutonium disposition mission. If the reprogramming is not endorsed, Savannah River shall defer all construction until the mission re-evaluation is complete.			
SR-NM03	21,292	90,060	7,505

Metrics
No quantifiable corporate performance measures are associated with this project.

SR-NM04 / Canyon Exhaust Line Item (92-D-140)

This project replaces the aging critical electrical and mechanical exhaust equipment in both F- and H-Canyons that will provide for reliable contamination control consistent with the Savannah River Site safety criteria and Federal and State air exhaust and underground tank regulations. The project scope is divided into three design packages: design package-1 covers the rerouting of the canyon recycle vessel vent systems, design package-2 removes and replaces the six underground diesel fuel storage tanks, and design-package-3 replaces the existing canyon exhaust fan and diesel houses. FY 1999 funding is required to continue the project and cover procurements which substantially exceeded the original cost estimates. (This funding level reflects plant and operating expense funds).

- 292-F and H fan replacement work will be completed and financial closure will occur.
- These funding levels include line-item construction funding of $3,667,000 in FY 1999. (See note below.)

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Note: The Department is planning to submit an FY 1999 reprogramming that will increase funding for this critical project by $26,252,000. This will permit accelerated replacement of vital safety equipment. If the reprogramming is not endorsed, Savannah River may have to shut down one or both of the canyons due to failure of the fans and motors.			
SR-NM04	1,826	5,819	0

Metrics
No quantifiable corporate performance measures are associated with this project.

SR-SF01 / K-Reactor Spent Nuclear Fuel Project

The K-Reactor spent nuclear fuel project provides basin storage of the Savannah River Site spent nuclear fuel awaiting stabilization, as well as storage for heavy water and nuclear materials awaiting disposition. K-Area also serves as an administrative and operational support location for all spent nuclear fuel storage activities.

- Safely manage the spent nuclear fuel stored in the basin.
- A mission for interim storage of special nuclear material from DOE Rocky Flats has been added to the scope of this (K-Reactor spent nuclear fuel) project. With addition of this mission, the K-Reactor area will not be available for deactivation in FY 2002 as previously planned. Storage of Rocky Flats plutonium is scheduled to continue until FY 2012. This change in mission requires this Project Baseline Summary to be moved to the Post 2006 Completion account in FY 2000.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
SR-SF04 / Heavy Water - D Area			
The heavy water processing project provides for the consolidated storage of heavy water into K-Reactor. The K-Reactor was previously modified to provide storage of 3,000 drums of heavy water.			
■ The Heavy Water Processing project has previously been included in the Site/Project Completion account with the cost of operations offset by heavy water sales revenue. Previously, heavy water rework (RW) and Dupont water (DW) operations in D-Area were scheduled to cease by December 2000. Recent events surrounding the sale of heavy water places the Heavy Water program into the Post 2006 Completion account in FY 2000 because the tritium removal and heavy water deliveries will continue through FY 2008.			
SR-SF04	16,133	11,140	0
Metrics			
No quantifiable corporate performance measures are associated with this project.			
SR-SF06 / Alternate Technology Project			
The purpose of the Alternative Technology project is to develop alternative treatment and packaging technologies for aluminum-based research reactor spent nuclear fuel, with specific focus on direct co-disposal with high-level waste and melt and dilute/poison technologies, that would put the spent nuclear fuel in a form suitable for geologic disposal without necessarily separating the fissile materials.			
■ The Alternate Technology project will support the Spent Nuclear Fuel Treatment and Storage initiative, resolve any remaining technical issues (e.g., reducing off-gas contamination), and support the repository licensing process requirements. Additional confirmatory development of the "melt and dilute" technology will be supported.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
SR-SF07 / Disassembly Basin Upgrade Line Item (95-D-158)			
This project provides for modifications to the L-Area basin to permit receipt and storage of research reactor fuels in a number of different type of transportation casks. The legal weight truck subproject provides the capability to handle the legal weight truck and National Lead, Incorporated, casks in L-Area without negating the current capability to process other type fuel transportation casks.			
The High Flux Isotope Reactor subproject provides modular storage racks and associated equipment to allow the storage of 60 high flux isotope reactor cores. These racks are being installed in the bucket storage area of the 105-L Reactor Area Disassembly Basin. Fuel handling tools will be supplied to unload the fuel casks and place the fuel element on a fuel carrier.			
■ No activity. Project will be completed in FY 1999.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
SR-HL09 / Tank Farm Service Upgrades	
■ The Tank Farm Service Upgrade project will be completed in FY 2000 using prior year funding	-1,099
SR-HL10 / H-Tank Farm Storm Water System Upgrades	
■ Increase in funding level based on construction schedule	797
SR-HL11 / Tank Farm Support Services F-Area	
■ Increase in funding level based on construction schedule	1,071
SR-IN01 / Plantwide Fire Protection Line Item	

	FY 2000 vs. FY 1999 ($000)
■ Project will be completed and closed out	-853
SR-IN05 / Chlorofluorocarbon Heating, Ventilation and Air Conditioning Chiller Retrofit Line Item	
■ Decrease in funding due to delays in project schedule	-7,659
SR-IN10 / Regulatory Monitoring and Bioassay Laboratory	
■ Increase in funding level based on construction schedule	5,452
SR-IN13 / Decontamination of Laboratory Facility 772-F and 773-A	
■ Funds support first year funding for design activities of an operating expense funded project including critical roof repairs to Building 773-A	2,774
SR-NM01 / F-Area Stabilization Project	
■ Additional funding required to continue construction of the F-Canyon Multi-Purpose Processing Facility stabilization project and continue development needed to support the vitrification of americium/curium solution	24,626
SR-NM02 / H-Area Stabilization Project	
■ Additional funds required for preparations for startup of HB-Line Phase II	16,347
SR-NM03 / Savannah Nuclear Material Storage Line Item	
■ Decrease in funding level based on deferring the Actinide Packaging and Storage Facility subproject until its mission is re-evaluated in light of the potential plutonium disposition missions	-82,555
SR-NM04 / Canyon Exhaust Line Item	
■ No FY 2000 funds are requested due to a planned FY 1999 reprogramming that will increase this project by $26,252,000. This will permit accelerated replacement of vital safety equipment which has been failing	-5,819
SR-SF01 / K-Reactor Spent Nuclear Fuel Project	
■ Project moved to the Post 2006 Completion account because of extended mission to store plutonium from the Rocky Flats Environmental Technology Site	-25,845
SR-SF04 / Heavy Water - D Area	
■ Decrease in activity due to deinventory the 400 Area. Project moved to the Post 2006 Completion account due to long-term delivery schedule of the heavy water	-11,140
SR-SF06 / Alternate Technology Project	
■ Decrease due to focus on development of a single, relatively mature, technology	-262
SR-SF07 / Disassembly Basin Upgrade Line Item	
■ Project closed out in FY 1999	-114
Total Funding Change, Savannah River	-84,279

Major Issues

Site budgets are being challenged by ongoing nuclear materials stabilization activities, new initiatives to support other Environmental Management site closures, and new emerging programs (e.g , alternative spent nuclear fuel treatment capabilities). Key to accomplishing the programmatic objectives in FY 2000 is the successful reprogramming of funds in FY 1999 from the Savannah River Nuclear Materials Storage Project (97-D-450) to support H Canyon nuclear materials stabilization programs and for the safety upgrades to canyon exhaust systems provided in the Upgraded Canyon Exhaust System upgrade project (92-D-140). Should this reprogramming be unsuccessful, nuclear materials stabilization activities in H Canyon would likely be extended by two years, failing to address commitments made in response to the Defense Nuclear Facilities Safety Board Recommendation 94-1. If the upgrades provided in the Upgraded Canyon Exhaust System project are deferred, one or both canyons may be shut down to provide assurance of safe conditions.

Given the Department's recent decisions to name the Savannah River Site as the preferred location for surplus plutonium immobilization, plutonium conversion to mixed-oxide fuels and for surplus plutonium pit disassembly and conversion, the storage requirements that were to be addressed by the Actinide Packaging and Storage Facility subproject need to be reexamined. Should all of these missions be located at Savannah River, optimization of the suite of plutonium storage, immobilization and conversion needs is necessary. The optimization analyses must be completed in a timely manner to allow for completion of plutonium stabilization and interim storage of the inventory of plutonium currently stored at the Savannah River Site.

99-D-402, Tank Farm Support Services, F Area, Savannah River Site, Aiken, South Carolina (SR-HL11)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin)

Significant Changes

- Tank Farm Support Services scopes of work have been adjusted to facilitate improved project management and work execution between this line item and the 93-D-187, "High-Level Waste Removal from Filled Waste Tanks" line item.
- All F Tank Farm Support Service work scope has been transferred into this line item.
- All H Tank Farm Support Service work scope has been consolidated into the 93-D-187 line item.
- The net effect of the adjusted work scope is a reduction in the total estimated cost and total project cost from $22,073,000 to $18,599,000 and $32,014,000 to $23,966,000, respectively. These reductions were due to a revised conceptual design and more detailed estimate that includes the above described work scope.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete

FY 2000 Budget Request *(Preliminary Estimate)*	"	"	"	"	18,599	23,966

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
1999	1,322	1,322	1,322
2000	404	404	404
2001	441	441	441
2002	252	252	252
Construction			
1999	1,423	1,423	0
2000	2,696	2,696	4,119
2001	7,311	7,311	7,311
2002	4,750	4,750	4,750

3. Project Description, Justification and Scope

The service systems for the Type III (horizontal cooling coil bunch) and IIIA (vertical cooling coils) Tanks in the F-Area Tank Farm provide such systems as steam, plant air, instrument air, breathing air, flush water, cooling water, inhibited water, bearing water, and domestic water to facility components. The tanks and associated process facilities served by the service systems are expected to support long-term operations for waste processing, waste removal, and tank closure at the Savannah River Site

The purpose of this plant modification is to replace existing direct buried service piping with new below grade trench contained pipelines or new above ground piping systems. The replacement piping for the F-Area Tank Farm shall include all service lines provided to Tanks 25-28, Tanks 33-34, Tanks 44-47, and the 242-16F evaporator. The existing underground service piping systems will be abandoned in place rather than be removed to minimize cost, radiological waste generation, and personal radiation exposure in support of As Low As Reasonably Achievable.

The service piping for F-Area Tank Farm has been in place since the late 1960s and early 1970s These lines have been developing leaks that are hard to locate and expensive to repair. Over the past 7 years, approximately 100 repairs of underground piping in F- and H-Area have been required at a cost of $8 million. These leaks also result in unscheduled facility outages which have significant operational costs and performance impacts. Relocation of service piping above grade will provide accessibility, minimize future maintenance costs, and provide service reliability necessary to support waste transfer

The FY 2000 funds will be used to complete definitive design, award the construction fixed-price contract, and begin construction.

The scope of this project was rebaselined in FY 1998. Scope of work proposed for H-Area has been deleted and appropriate adjustments to cost and schedule completed Consistent with long-term high-level waste program strategy, the H-Area scope of work can be more effectively managed as part of the proposed High-Level Waste System Upgrades line item (93-D-187).

4. Details of Cost Estimate [a]

	(dollars in thousands) Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (8.3% of total estimated cost (TEC))	1,550	1,875
Design management costs (2.4% of TEC)	452	200
Total, engineering, design, inspection, and administration of construction costs (10.8% of TEC)	2,002	2,075
Construction phase		
Other (major utilities/comp items, specialized facilities, etc.)	11,651	13,179
Inspection, design and project liaison, testing, checkout and acceptance	0	1,098
Construction management (9.9% of TEC)	1,846	900
Total, construction costs	13,497	15,177
Contingencies		
Design phase (2.2% of TEC)	417	600
Construction phase (14.4% of TEC)	2,683	4,221
Total, contingencies (16.7% of TEC)	3,100	4,821
Total, line item costs (TEC)	18,599	22,073

5. Method of Performance

Design will be performed by a fixed-price contractor for the Management and Operating contractor at the Savannah River Site. Construction and procurement will be accomplished utilizing fixed-price subcontracts awarded on the basis of competitive bidding, where possible.

[a] The DOE escalation rates (percent per year) are not segregated due to conceptual nature of estimate.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Project cost							
Facility cost							
Design	0	0	1,322	404	441	252	2,419
Construction	0	0	0	4,119	7,311	4,750	16,180
Total facility costs (Federal and Non-Federal)	0	0	1,322	4,523	7,752	5,002	18,599
Other project costs							
Conceptual design cost [a]	246	243	0	0	0	0	489
Other project-related costs [b]			904	1,314	1,366	1,294	4,878
Total other project costs	246	243	904	1,314	1,366	1,294	5,367
Total project costs (TPC)	246	243	2,226	5,837	9,118	6,296	23,966

7. Related Annual Funding Requirements

(FY 2003 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs	200	200
Annual facility maintenance and repair costs	100	100
Programmatic effort related to facility	0	0
Other annual costs	100	100
Total related annual funding *(operating from FY 2003 through FY 2028)*	400	400

[a] The conceptual design will be completed at an approximate cost of $489,000.

[b] In FY 2000, $1,314,000 will be used to support final design, construction efforts and permitting; $2,660,000 in outyears will be used to support construction and startup testing.

99-D-404, Health Physics Instrumentation Laboratory, Idaho Falls, Idaho (ID-OIM-109)

2002	681	681	2,300

3. Project Description, Justification and Scope

This project provides for the design, procurement, and construction activities to provide for a new Health Physics Instrument Laboratory at the Idaho National Engineering and Environmental Laboratory. Because of the nature of business at the Idaho National Engineering and Environmental Laboratory, radioactive detection services and personnel dosimeters are required to ensure a safe and healthful workplace for Idaho National Engineering and Environmental Laboratory workers. This project will provide a new facility for the servicing, calibrating, and testing of radiation detection instruments used in radioactive environments. The purpose of the Health Physics Instrument Laboratory is to provide, repair, and maintain radiation detection instruments; evaluate newly developed instruments; and research and develop new methods of radiation detection. The project will also support needs for the irradiation, calibration, quality control, and quality assurance of electronic dosimeters.

This facility provides laboratories for the neutron, gamma, alpha, and beta calibration and irradiation of instrumentation. A low energy x-ray system will provide for low energy photon characterization and irradiation. The primary sources that will be used for the isotopic calibrations are Cesium-137, Plutonium-239, Californium-252, and Cobalt-60. Several other low activity isotopes will be used for general characterization of the instruments.

The facility will respond to site users' requirements by providing quick response for calibration, irradiation, and turn around of dosimeters and radiological instrumentation. The assumptions used to develop project, scope, schedule, and cost are:

a. The new Health Physics Instrument Laboratory facility will be required to meet American National Standards Institute N232 guidelines as specified by DOE Order 5480.11. "Radiation Protection for Occupational Workers."

b. The new facility is based on code requirements for safe/handling of radioactive sources, operations associated with equipment testing and calibration, functional layout of the building and shielding requirements for each radioactive source and surrounding areas.

c. The cost estimate is based on preliminary building layouts and construction techniques associated with radioactive shielding as developed by the operating program.

d. The construction schedule is consistent with historical construction at the Idaho National Engineering and Environmental Laboratory.

e. Studies may be required during the execution of this project to ensure that all requirements associated with this facility are met and scope may need to be modified as studies recommend.

The continued use of the existing Health Physics Instrument Laboratory facility results in excessive maintenance and operational costs. The current deficiencies with American National Standards Institute, National Electrical Code, and Occupational Safety and Health Act standards, as well as DOE Orders, require significant resources of time and money to correct. Continued expenditure of the resources is not a viable solution due to the age of the facility, which is planned for future demolition. The inadequate space, design, structure, systems, and age of the current Health Physics Instrument Laboratory facility pose the following operational limitations and inherent safety and code deficiencies:

a. Inadequate number and design of shielded rooms for performance of x-ray, gamma, and neutron source calibrations. These calibrations are required to be performed under compliance with American National Standards Institute N323. N42.17A and N43.5 guidelines.

b. Absence of environmental testing capabilities to meet American National Standards Institute N323.

c. Inadequate environmental control, leading to wide fluctuations in temperature throughout the facility. American National Standards Institute N323 and MIL-SID-45662A require a properly controlled environment for the calibration of radiation detection instruments.

d. Significant safety concerns such as asbestos in walls, floor tiles, and ceiling materials throughout the building: inadequate coverage by fire sprinkler system, in violation of National Fire Protection Association Standards; numerous electrical safety problems, in violation of Occupational Safety and Health Act Standard 1910.303 and National Electrical Code; lead based paint on all painted surfaces;

and significant roof leakage. Numerous deficiencies were identified in the Occupancy Readiness Review conducted on CFA-633 in 1991.

e. Lack of proper shielding in rooms used for performing calibrations, significantly increasing personnel radiation exposure rates at several locations accessible to personnel during performance of calibrations, identified by Tiger Team Corrective Action Plan Number EGG1/RP.89.1.CP01 "Upgrade Health Physics Instrument Laboratory Capabilities for Space and Testing Standards." The shielding does not meet As Low As Reasonably Achievable requirements.

f. Insufficient work space to consolidate all Idaho National Engineering and Environmental Laboratory instrument calibrations in the existing Health Physics Instrumentation Laboratory to obtain site-wide standardization of calibrations. This issue was raised in Tiger Team Corrective Action Plan Number EGG1/RP.8.1.CP01 "Upgrade Health Physics Instrument Laboratory Capabilities for Space and Testing Standards."

The deficiencies noted above contribute to the inability of the existing Health Physics Instrumentation Laboratory to perform its function in a compliant manner. Due to the age and deteriorated condition of the building, future additions and modifications are cost prohibitive. The facility has been identified for closure and demolition; however, until a replacement facility can be provided for the Health Physics Instrumentation Laboratory operations, the CFA-633 phase out cannot occur. Construction of a new Health Physics Instrumentation Laboratory facility will eliminate the excessive maintenance and repair expense necessary to bring the existing facility into compliance and will avoid the additions to the deteriorated building that would be required to comply with American National Standards Institute N323. A Health Physics Instrumentation Laboratory type facility would still be required on-site regardless of obtaining off-site calibration services. The on-site facility would be required to provide a centralized service for performing as-found inspections, shipping, receiving, and verification of the instrumentation calibration. All off-site suppliers use a disclaimer that states the calibrations were performed to the required specification, but do not warranty that the instrument remains properly calibrated after shipping. In addition, differing atmospheric conditions can impact the accuracy of the instruments. These situations require that some calibration capability must be maintained at the Idaho National Engineering and Environmental Laboratory to verify instrument calibrations. During the design phase of this project, Idaho National Engineering and Environmental Laboratory mission needs will be reviewed and changes made to effectively address facility requirements.

The requested FY 2000 budget appropriation will authorize the subcontractors to start physical construction.

4. Details of Cost Estimate.[a]

	(dollars in thousands) Current Estimate	Previous Estimate
Design Phase		
Preliminary and final design costs (design drawings and specifications)	658	659
Design management costs (<1% of TEC)	40	236
Project management costs (1.6% of TEC)	189	0
Total, Engineering, design, inspection and administration of construction costs (7.5% of TEC)	887	895
Construction Phase		
Improvements to Land	378	378
Buildings	4,648	5,087
Utilities	212	0
Other (major utilities, specialized facilities, etc)	0	194
Specialized Equipment	0	2,237
Standard Equipment	2,465	0

Total, Line Item Costs (TEC)	11,900	11,900

5. Method of Performance

The Department of Energy Idaho Operations Office shall be responsible for implementation of the project, including selection of principal contractors and approval of specified procurement actions. DOE Idaho Operations Office project management shall be performed by the Office of Infrastructure Management. Safety, environmental, and other project support shall be furnished to the project on matrix basis by the DOE Idaho Operations Office organization.

Lockheed Martin Idaho Technologies Company, as operating contractor, shall provide project management services to coordinate all project activities. Lockheed Martin Idaho Technologies Company shall be responsible for the development of the project's technical requirements, completion of the architectural and engineering design, review and management of the engineering and construction activities, coordination of long-lead procurement of construction materials and equipment, construction

[a] The Conceptual Design is 100 % complete. Escalation rates applied to this cost estimate were FY 1999-2.4 percent; FY 2000-2.8 percent; FY 2001-2.7 percent; and FY 2002-2.8 percent.

subcontracting, coordination of the activities of construction subcontractors, checkout of systems, and turnover of the completed project.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1999	FY 2000	FY 2001	Outyears	Total
Project Cost						
Facility Cost						
Design	0	900	229	0	0	1,129
Construction	0	0	1,871	6,600	2,300	10,771
Total Facility Costs (Federal and Non-Federal)	0	900	2,100	6,600	2,300	11,900
Other Project Costs						
Conceptual design costs	200	0	0	0	0	200
NEPA documentation costs [a]	30	25	20	10	10	95
Other project-related costs [b]	50	75	90	110	150	475
Total Other Project Costs	280	100	110	120	160	770
Total Project Costs (TPC)	280	1,000	2,210	6,720	2,460	12,670

7. Related Annual Funding Requirements

(FY 2003 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs	988	0
Annual facility maintenance/repair costs	216	1,416
Annual utility costs	212	0
Total related annual funding (operating from FY 2003 through FY 2023)	1,416	1,416

[a] NEPA documentation cost - NEPA cost for this period includes environmental checklist verification that facility descoping did not change the approved Funding Of No Significant Impact/Environmental Assessment on Health Physics Instrument Laboratory. Environmental activities during this period includes state air permit preparation and preliminary storm water pollution plan development.

[b] Other project related costs - This category includes the costs associated with the preparation of the Project Execution Plan, project validation and revalidation, operational funded design reviews, safety, quality, program support of other facility alterations and existing Health Physics Instrument Laboratory facility tours. System Operational testing, operational readiness reviews, move-in costs and operationally funded configuration management activities for the completed facility are also included.

98-D-401, H-Tank Farm Storm Water System Upgrade, Aiken, South Carolina (SR-HL10)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

- The total project cost has been reduced from $13,321,000 to $12,155,000. The reduction is the result of completion of conceptual design resulting in better defined workscope and cost estimate.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete

FY 1999 Budget Request *(Preliminary Estimate)*	"	"	"	"	8,934	13,321
FY 2000 Budget Request *(Title I Baseline)*	"	"	3Q 1999	"	"	12,155
FY 2001 Budget Request *(Current Baseline Estimate)*	"	"	"	2Q 2001	"	"

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
1998	400	400	294
1999	150	150	204
2000	25	25	70
2001	24	24	31
Construction			
1998	600	600	0
1999	2,970	2,970	1,910
2000	2,952	2,952	4,588
2001	1,813	1,813	1,837

3. Project Description, Justification and Scope

This project alleviates existing flooding problems surrounding tanks 9-12H and the potential for unsafe tank top loading conditions, as well as the flooding of the ditch located at the base of West Hill on the south side of H-Tank Farm. The removal of storm water from tanks 9-12H top area will increase safety margins and minimize rain water infiltration to these waste tanks. This project considers the entire storm water system that affects or is affected by this flooding situation, including storm water runoff from the West Hill north slope, storm water runoff from all zones that exit the diversion box 907-1H, the capacity of the retention basin 281-8H and flow into Four Mile Creek.

The flooding conditions in the waste tank 9-12H area must be eliminated in order to prevent the spread of radioactive contamination violating South Carolina Hazardous Waste Management Regulations (SCHWMR) R 61-79.265.31. This flooding condition impacts the waste tanks' annulus pans and primary spaces; spreads radioactive contamination; creates unsafe conditions; violates As Low As Reasonably Achievable principles and creates additional waste volume. If the flooding condition surrounding tanks 9-12H is not corrected, the potential for injury to personnel and tank top overloading will continue to exist In addition, this project will increase the storage basin operating capacity by 100 percent (~4,000,000 gallons) allowing the storage of the design basis storm water volume precluding uncontrolled discharge to the local outfall. This project will also provide features that will reduce or eliminate overflow from existing manholes. The FY 1998 funds will be used to develop a design Task Order Proposal Request, award the design fixed-price contract, and complete the detailed design work. In addition, a construction fixed-price contract specification will be prepared for a FY 1999 Construction Start. FY 2000 funds will be used to complete construction of the H-Tank Farm Storm Water System Upgrades barring unforseen site conditions which require substantial application of contingency. FY 2001 funds will be used to complete construction.

The gross annual facility costs are estimated to be $400,000 upon completion of the facility in FY 2001.

4. Details of Cost Estimate.[a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (4.7% of total estimated cost (TEC))	419	437
Design management costs (0.5% of TEC)	46	47
Total, engineering, design, inspection, and administration of construction costs (5.2% of TEC)	465	484
Construction phase		
Other (major utilities/comp items, specialized facilities, etc.)	5,219	5,116
Inspection, design and project liaison, testing, checkout and acceptance	815	899
Construction management (4.2% of TEC)	373	373
Total, construction costs	6,407	6,388
Contingencies		
Design phase (1.5% of TEC)	134	212
Construction phase (21.6% of TEC)	1,928	1,850
Total, contingencies (23.1% of TEC)	2,062	2,062
Total, line item costs (TEC)	8,934	8,934

5. Method of Performance

Design will be performed by a fixed-price contractor for the Management and Operating contractor at the Savannah River Site. Construction and procurement will be accomplished utilizing fixed-price subcontracts awarded on the basis of competitive bidding, where possible.

[a] The DOE escalation rates used for this estimate are as follows: FY 1997-1.9 percent; FY 1998-2.6 percent; FY 1999-2.7 percent; and FY 2000-2.8 percent. The above estimate includes $462,000 for escalation.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Project cost							
Facility cost.[a]							
Design	0	294	204	70	31	0	599
Construction	0	0	1,910	4,588	1,837	0	8,335

Total project costs (TPC)	280	364	3,323	5,985	2,203	0	12,155

7. Related Annual Funding Requirements

(FY 2001 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs	200	200
Annual facility maintenance and repair costs	100	100
Programmatic effort related to facility	0	0
Other annual costs	100	100
Total related annual funding *(operating from FY 2001 through FY 2033)*	400	400

[a] Total cost of construction is $8,934,000, these funds will be used for design, construction, and project management.

[b] $2,941,000 will support final design, preliminary construction planning efforts, permitting, construction, and startup testing.

98-D-453, Plutonium Stabilization and Handling System for PFP, Richland, Washington (RL-TP06)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [ ] in the left margin)

Significant Changes

- The procurement of the Stabilization and Packaging System equipment is now planned as a phased procurement which expedites receipt and startup of packaging equipment, and then receipt and startup of stabilization equipment.
- The project total funding estimate was repriced due to introduction of Hanford site adders.

1. Construction Schedule History

2002	2,805	4,690	3,200
2003	0	0	2,490

3. Project Description, Justification and Scope

In May 1994, the Defense Nuclear Facilities Safety Board issued Recommendation 94-1 which urged the U.S. Department of Energy to remediate liquids and solids containing fissile material to a form more suitable for safe interim storage within a reasonable time period. The Department of Energy accepted DNFSB Recommendation 94-1, and outlined its corrective actions in a February 1995 Implementation Plan. In January 1995, Department of Energy Technical Standard DOE-STD-3013-96 was issued as the basis for 50-year storage of surplus plutonium with a plutonium content greater than 50 percent by weight. This standard requires that the plutonium-bearing material be thermally stabilized at 1000°C with a loss-on-ignition of less than 0.5 percent by weight. Following thermal stabilization, the material must be packaged in a standardized package configuration capable of keeping the material in a safe and stable state for the full time period. A national consensus team has designed the standardized packages with two welded stainless steel containers surrounding a stainless steel convenience can compatible with mechanized handling.

The Plutonium Finishing Plant currently does not have a system capable of stabilizing or packaging large quantities of plutonium-bearing solids to these specifications. Vault fixtures in the Plutonium Finishing Plant secure vaults and related laboratory equipment are not large enough to accommodate the standardized containers, and the cooling capacity of vault air conditioning units is at maximum.

This project provides an automated Stabilization and Packaging System that is capable of stabilizing and packaging the current inventory of >50 percent plutonium-bearing material stored in the plant's vaults. To accommodate the new standardized container configuration, this project will also modify selected

---

[a] Reflects FY 1998 Internal Reprogramming of $5,000,000 by the Richland Operations Office from the original appropriation of $8,136,000.

[b] Reflects FY 1999 reduction of $16,115,000 from new budget authority and $1,885,000 from prior year to meet uncosted reduction included in the FY 1999 Energy and Water Development Appropriation.

Plutonium Finishing Plant vault fixtures and upgrade nondestructive assay measurement systems, such as calorimetry and isotopic measurement systems, to measure package plutonium content. The stabilization and packaging capability, and corresponding vault and equipment modifications are critical to the Department of Energy's commitment to safely store plutonium in the standardized container.

The scope of this project is to procure and install the Stabilization and Packaging System equipment via a phased approach to an existing national procurement contract, to modify selected Plutonium Finishing Plant vault fixtures, and to upgrade nondestructive assay measurement systems. Facility infrastructure will be modified to support this new stabilization and packaging system and the standardized container configuration.

The Stabilization and Packaging System will be installed in the Plutonium Finishing Plant Plutonium Storage Vault complex, Building 2736-ZB. Deliverables associated with the Stabilization and Packaging System procurement include the following:

- Engineering, analysis, design, fabrication, delivery, and testing of the Stabilization and Packaging System equipment,
- Utility interface requirements;
- System safety basis;
- Operating, maintenance, and training procedures and manuals,
- Testing and startup procedures;
- Design, testing and procurement of a small initial quantity of standardized package components,
- Personnel training and technical assistance during startup.

The Stabilization and Packaging System will have the capability to receive and unload plutonium containers; stabilize plutonium oxides; package plutonium metals and oxides; meet material control and accountability requirements; and provide radiological containment and shielding. Detailed design, equipment procurement, and installation of the system will be complete by September 2000, and will be ready for beneficial use by May 2001. Stabilization equipment will be installed by March 2001 and available for beneficial use by July 2001.

This project also makes the necessary facility modifications to support installation and operation of the Stabilization and Packaging System and storage of the standardized containers. Modifications to 2736-ZB Building include:

- Capacity and control upgrade of the ventilation fan and exhaust filtration systems;
- Addition of support services for the Stabilization and Packaging System such as bottled gas supplies for package inerting and welding, dry air for glovebox inerting, off gas treatment, stack constant air monitoring capability, electrical supply upgrades and closed loop cooling for laser welder;
- Rearrangement of facility functions currently housed in the proposed location for the Stabilization and Packaging System;

- Upgrade of laboratory equipment for calorimetry, gamma spectroscopy, radiography;
- Architectural modifications of office areas and air locks to allow Stabilization and Packaging System operations.
- Modification of selected Plutonium Finishing Plant vault fixtures to store the new standardized package;
- Modification of vault security equipment related to storage fixtures;
- Upgrade of cooling capacity to accommodate the standardized containers in an efficient configuration.

The FY 1998 appropriation was used to begin definitive design required prior to Stabilization and Packaging System procurement, and to compile the technical specification for the procurement. Procurement will be initiated as early as possible in FY 1999. The FY 1999 appropriation will be used to complete definitive design, provide procurement of long-lead items for the packaging equipment, complete the infrastructure design, and initiate construction of infrastructure modifications. The FY 2000 appropriation will be used to install and test the Stabilization and Packaging System packaging equipment, initiate installation of the Stabilization and Packaging System stabilization equipment, and complete facility infrastructure modifications.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (7.3% of total estimated cost (TEC))	2,810	2,250
Design management costs (2.0% of TEC)	790	260
Total, engineering, design, inspection, and administration of construction costs (9.3% of TEC)	3,600	2,510
Construction phase		
Buildings and improvements to land	5,900	5,750
Specialized equipment	18,800	18,430
Inspection, design and project liaison, testing, checkout and acceptance	1,000	340
Construction management (5.2% of TEC)	2,000	2,670
Total, construction costs	27,700	27,190
Contingencies		
Design phase (1.8% of TEC)	700	1,000
Construction phase (17.1% of TEC)	6,600	5,900
Total, contingencies (18.9% of TEC)	7,300	6,900
Total, line item costs (TEC)	38,600	36,600

5. Method of Performance

Design and inspection will be performed by the onsite engineer-construction contractor. Construction work will be performed to the maximum extent possible by fixed-price contractors. The operating contractor will provide project management during design, procurement, and construction of the project.

6. Schedule of Project Funding

3. Project Description, Justification and Scope

This project provides for the design, procurement, and rehabilitation of approximately 45 miles of existing roadways and approximately 27,000 square yards of parking areas within the Idaho National Engineering and Environmental Laboratory. The rehabilitation actions include the redesign and construction of intersections to reduce safety concerns during waste transportation and other vehicle traffic, widening of roadways, modification of drainage patterns, resloping of shoulders, and renovation of roadways and parking lots. The following methods of construction will be utilized according to the degree of deterioration:

a. Excavation and reconstruction of the roadway from the base up through the paved surface.

b. Base removal and construction, on sections of roadways where base deterioration has occurred, and application of an asphalt overlay.

c. Application of an asphalt overlay to the roadway.

d. Application of an open graded plant mix seal coat.

e. Application of a seal coat, including crack repair.

The Idaho National Engineering and Environmental Laboratory has over 87 miles of paved roads within its 890 square mile boundary. In addition to this primary transportation network, over 100 miles of unpaved service roads allow access to remote areas for security, environmental experiments and sampling, maintenance activities, and emergency vehicles. Road construction projects are part of a continuing program to preserve/extend the useful life and upgrade the Idaho National Engineering and Environmental Laboratory transportation infrastructure. This project is necessary to provide for safe and effective programmatic support. During the 1980's, the Idaho National Engineering and Environmental Laboratory received sufficient funding to sustain the road program; however, no significant projects have been completed since 1990.

This project is necessary to continue to provide support for all present and future Idaho National Engineering and Environmental Laboratory activities. It supports DOE's mission to provide safe and environmentally compliant transportation routes for waste shipments in support of the October 17, 1995 court order and transportation of soil borrow to meet various Idaho National Engineering and Environmental Laboratory regulatory and compliance issues under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Resource Conservation and Recovery Act (RCRA), and other authorities. The project directly supports the Sitewide specific planning goal of providing roads which meet the State of Idaho Highway Construction Specifications, American Association of State Highway and Transportation Officials, and the Idaho National Engineering and Environmental Laboratory engineering standards.

The Idaho National Engineering and Environmental Laboratory uses the U.S. Army Corps of Engineers' computerized pavement management system, "PAVER," to assess the condition of the paved roadway network. This information will be used in conjunction with the transportation routes addressed above to determine priorities and rehabilitation efforts.

The Lockheed Martin Idaho Technologies Company Retirement Unit Catalog (CFO-FSD-CNM-98-002)

was used for making the correct funding determination and proper capitalization decision. The project is a Betterment and Improvement to property record units or retirement units that cost $25,000 or more and extends the useful life of the record/retirement unit.

The requested FY 2000 budget appropriation will be used to complete construction activities.

4. Details of Cost Estimate [a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and final design costs (design drawings and specifications)	364	364
Design management costs (< 1% of TEC)	7	93
Project management costs (< 1% of TEC)	86	0
Total, Engineering, design, inspection and administration of construction costs (4.3% of TEC)	457	457
Construction Phase		
Improvements to land	7,510	7,510
Inspection, design and project liaison, testing, checkout and acceptance	209	209
Other (major utilities/comp items, specialized facilities, etc.)	0	132
Construction management costs (5.0% of TEC)	542	542
Project management costs	132	0
Total, Construction Costs	8,393	8,393
Contingencies		
Design Phase (<1% of TEC)	86	86
Construction Phase (17.3% of TEC)	1,864	1,864
Total, Contingency (approximately 18.1% of TEC)	1,950	1,950
Total, Line Item costs (TEC)	10,800	10,800

5. Method of Performance

The Department of Energy Idaho Operations Office shall be responsible for implementation of the project, including selection of principal contractors and approval of specified procurement actions. DOE Idaho Operations Office project management shall be performed by the Construction Management Group in the Office of Program Execution. Safety, environmental, and other project support shall be furnished to the project on an as-needed basis by the DOE Idaho Operations Office matrix organization.

The design, project management, and construction management shall be performed by the operating contractor. Construction and procurement shall be accomplished by fixed price contracts awarded on the

[a] The Conceptual Design is 100% complete. Escalation rates applied to this cost estimate were FY 1998-2.5%; FY 1999-2.7%;FY 2000-2.9%;and FY 2001-3.0%.

basis of competitive bidding. Inspection may be performed by another agent. Check-out of systems, and maintenance of the completed project shall be performed by the operating contractor.

The Idaho National Engineering and Environmental Laboratory operating contractor Project Manager shall be responsible for the entire project: design, all construction activities at the Idaho National Engineering and Environmental Laboratory site, construction subcontracting, direction of the activities of construction subcontractors, and performance and management of construction activities as required to complete the project in a timely, safe, and cost-effective manner.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1999	FY 2000	FY 2001	Outyears	Total
Project Cost						
Facility Cost						
Design [a]	221	322	0	0	0	543
Construction [b]	0	5,811	4,151	295	0	10,257
Total Facility Costs (Federal and Non-Federal)	221	6,133	4,151	295	0	10,800
Other Project Costs [c]						
Conceptual design costs	0	0	0	0	0	0
NEPA documentation costs	0	0	0	0	0	0
Other project-related costs	44	256	200	100	0	600
Total Other Project Costs	44	256	200	100	0	600
Total Project Costs (TPC)	265	6,389	4,351	395	0	11,400

[a] Design - The cost is based upon the conceptual design that was completed in March 1996. The Conceptual Design cost estimate was prepared utilizing the Idaho National Engineering and Environmental Laboratory Cost Estimating Manual and DOE Order 5700.2D.

[b] Construction - The cost is based upon the conceptual design that was completed in March 1996. The Conceptual Design cost estimate was prepared utilizing the Idaho National Engineering and Environmental Laboratory Cost Estimating Manual and DOE Order 5700.2D.

[c] Other Project Related Costs - This category includes the costs associated with the hazardous waste determination, Operating Contractor Construction Support, Quality and Safety audits, document control, design and constructability reviews, Facility Acceptance Review, and project closeout.

7. Related Annual Funding Requirements

(FY 2001 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility maintenance/repair costs	153	153
Total related annual funding (operating from FY 2001 thru FY 2021)	153	153

97-D-450, Savannah River Nuclear Material Storage (formerlyActinide Packaging and Storage Facility), Savannah River Site, Aiken, South Carolina (SR-NM03)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin).

Significant Changes

- The DOE has concluded it prudent to halt further progress on the Actinide Packaging and Storage Facility subproject and conduct a systems engineering evaluation of plutonium material management functions and planned facilities at the Savannah River Site, considering benefits and efficiencies available through designing and constructing facilities with an eye toward shared systems, economies of scale, and improved safety margins. Such systems engineering evaluations have been supported by the Defense Nuclear Facilities Safety Board, and the Savannah River Site has recently initiated efforts to take a fresh look at current storage availability and the magnitude of the future plutonium mission at the Savannah River Site.

  Existing storage capacity at the Savannah River Site and storage capability proceeding in K-Area will support receipt of Rocky Flats non-pit material and materials currently at the Site. If the evaluation reveals that an alternative to the Actinide Packaging and Storage Facility can be accommodated, this could affect the Fissile Materials Disposition program in two ways: (1) an amended Record of Decision to move the Hanford material to the Savannah River Site would have to be developed, and (2) an alternative to the Actinide Packaging and Storage Facility subproject for the receipt and storage of materials for the Immobilization and Associated Processing Facility, project number 00-D-142, would have to be addressed.

- The DOE is planning to submit a reprogramming action to reapply the Actinide Packaging and Storage Facility subproject funds to other urgent requirements.

- If the reevaluation reveals that the Actinide Packaging and Storage Facility subproject is still required, the Department will proceed with project activities in FY 2001 based on a revised, integrated storage design. This will delay facility operations by approximately 3 years

- The narrative contained in the following pages generally reflects the previously proposed mission of the Actinide Packaging and Storage Facility subproject prior to the decision to demobilize.

The K-Area Nuclear Material Storage Modifications subproject (S-W226) total estimated cost has been reduced by $14,000,000 from $41,000,000 to $27,000,000. The procurement of the 9975 shipping containers will be the responsibility of Rocky Flats. This change results in a reduction in the total estimated cost and total project cost of this project from $198,000,000 to $184,000,000 and $245,900,000 to $231,900,000, respectively.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1997 Budget Request *(Preliminary Estimate)*	1Q 1997	1Q 1998	2Q 1998	3Q 2001	109,838	138,753

2000	4,000	4,000	17,112
Outyears	63,256	63,256	62,335

[a] As a result of the Record of Decision for the Storage and Disposition of Weapons-Usable Fissile Materials dated January 14, 1997, the Actinide Packaging and Storage Facility storage capacity for stabilized Special Nuclear Material will be increased from 2,000 to 5,000 positions to accommodate the receipt of additional surplus plutonium (pending completion of National Environmental Policy Act documentation). The cost, schedule, and technical impact of this change is reflected herein. Additional FY 1997 funding of $9,500,000 is contained within the Office of Fissile Materials Disposition appropriation, Project 97-D-140, Consolidated Spent Nuclear Materials Storage Facility. The balance of the Office of Fissile Materials Disposition funding for the expansion of the Actinide Packaging and Storage Facility vault ($8,500,000) is included in EM's budget for FY 1999. The original appropriation for FY 1997 was $7,900,000.

[b] $2,160,000 of the $8,500,000 will be recast to EM from FY 1997 Office of Fissile Materials Disposition unobligated funds, Project 97-D-140. The EM appropriation for FY 1999 is $79,184,000.

[c] The Department is planning to submit an FY 1999 reprogramming that decreases the funding for the Actinide Packaging and Storage Facility subproject by $44,000,000. The mission of this subproject will be reevaluated in light of DOE's preferred alternatives for the Department's plutonium disposition mission.

3. Project Description, Justification and Scope

Actinide Packaging and Storage Facility Subproject S-6061:

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
157,000	17,400	16,000	60,344 *	0	63,256	TBD

The Department of Energy committed, in the Implementation Plan for the Defense Nuclear Facilities Safety Board Recommendation 94-1, to meet the DOE Criteria for Safe Storage of Plutonium Metal and Oxides (DOE-STD-3013) by May 2002 The existing vaults in the Savannah River Site facilities are not sufficient or capable of meeting the commitments in the Defense Nuclear Facilities Safety Board Recommendation 94-1 Implementation Plan; therefore, the Actinide Packaging and Storage Facility must be constructed. The Savannah River Site has determined that a new Actinide Packaging and Storage Facility is the safest (to the worker and environment), and the most economical option compared to the major modification and refurbishing of existing Savannah River Site facilities and to a "no action" option A life cycle cost estimate demonstrated that a new Actinide Packaging and Storage Facility has the lowest total associated cost with a payback period of approximately 10 years

The Actinide Packaging and Storage Facility will provide for thermal stabilization, repackaging, and safe, secure, cost-effective storage of the special nuclear material to meet DOE-STD-3013-96, Criteria for Preparing and Packaging Plutonium Metals and Oxides for Long-Term Storage The facility will be constructed in F-Area with a hardened and buried structure of approximately 50,000 square feet containing the Material Access Area. Included in the Material Access Area are the contaminated waste water collection tanks, truck bay, safe havens, and elevator vestibule. The Material Access Areas will be supported above grade by several soft structures including an Entry Control Facility, and Auxiliary Mechanical Equipment Building, and various technical support structures. These structures total approximately 47,000 square feet and contain heating, ventilation, and air conditioning support equipment, diesel generators, maintenance areas, instrumentation, security equipment, and other administrative functions. All structures will be designed to meet applicable National standards and DOE Orders.

Specifically, the facility will consist of process areas and equipment for truck unloading/loading, material confirmation, shipping, packaging and unpackaging, accountability measurements, safety evaluation, International Atomic Energy Agency inspections, repackaging, waste management, a vault room with automated accessible storage bays, and full support and administration functions. For vault surveillance and container handling, automation will be used to minimize exposure. Additionally, a bagless transfer operation will be used to minimize exposure for the transfer of special nuclear material from the existing containers to containers designed for interim storage. Due to the importance and significance of the International Atomic Energy Agency Program, equipment and instrumentation costs will be estimated and tracked separately from all other control accounts on this subproject. Most of the special nuclear material in the Actinide Packaging and Storage Facility will be under international safeguards which will be

* The Department is planning to submit an FY 1999 reprogramming that decreases the funding for the Actinide Packaging and Storage Facility subproject by $44,000,000. The mission of this subproject will be reevaluated in light of DOE's preferred alternatives for the Department's plutonium disposition mission.

conducted by the International Atomic Energy Agency. Domestic safeguards instrumentation will be used, where possible, but additional instrumentation will be provided specifically for international safeguards. The estimated cost of these additional items is summarized in Section 4 of this data sheet.

Utilities and services required will include electricity, potable process water, chemical storage, steam, compressed air, standard and high-efficiency particulate air filtered ventilation, and communications.

The FY 1999 funding will be utilized to demobilize the project and evaluate the path forward. Outyear funding will be utilized to support integration with other plutonium disposition activities.

This subproject will:

(1) Provide safe and secure interim storage for special nuclear material until final dispositioning options are selected.

(2) Provide a cost-effective central storage facility to consolidate current special nuclear material inventory which meets the DOE standard for storage of plutonium metals and oxides and the time table recommended by the Defense Nuclear Facilities Safety Board.

(3) Enable the deinventory of the canyon facilities and thereby reduce staffing and security requirements.

(4) Reduce worker radiation exposure by providing automation (where feasible) for container storage retrieval and positioning.

(5) Provide a location for International Atomic Energy Agency inspection to meet non-proliferation objectives.

K-Area Nuclear Material Storage Modifications Subproject S-W226:

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
27,000	0	2,000	21,000	4,000	0	4th Qtr. FY 1998 - 4th Qtr. FY 2000

Existing K-Area facilities will be modified to provide cost-effective interim storage of non-pit plutonium metals and oxides from Rocky Flats. Modifications will include dismantling and removing unused process equipment in four building areas: Stack Area, Crane Maintenance Area, Crane Wash Area, and Process Room. These areas total approximately 30,000 square feet, are within the security areas that existed for reactor operations, and are adjacent to a currently active Material Access Area for Highly Enriched Uranium storage. Security systems in the four building areas will be reactivated and upgraded to support using these Material Access Areas for interim plutonium storage. Existing systems including the K-Area security perimeter, security control system, and building water/power ventilation support systems will be utilized by this project. Building modifications will provide for truck unloading/loading, material confirmation, shipping, accountability measurements, and storage in the Material Access Areas. The plutonium stored in K-Area will not be subject to International Atomic Energy Agency controls. (NOTE: The 9975 canister purchase will be the responsibility of Rocky Flats, and therefore has been removed from the cost baseline of subproject S-W226.

FY 1999 funding will be used to continue design, construction activities, ready the facility for the receipt and storage of the initial shipments. FY 2000 funding will be used to complete construction activities.

This subproject will:

(1) Provide secure interim storage for special nuclear material until dispositioned.

(2) Enable early shipments from Rocky Flats and facilitate an early closure of the Rocky Flats facilities (FY 2006)

(3) Provide the necessary confirmatory and accountability equipment to support safeguards requirements.

4. Details of Cost Estimate [a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (9.8% of total estimated cost (TEC))	18,010	19,210
Design management costs (1.2% of TEC)	2,275	1,790
Project management costs (0.2% of TEC)	426	0
Total, engineering, design, inspection, and administration of construction costs (11.3% of TEC)	20,711	21,000
Construction phase		
Buildings & improvements to land	75,362	85,149
Specialized equipment (safeguard equipment and IAEA equipment)	6,659	2,731

2000	12,220	12,220	12,681
2001	2,960	2,960	6,098

3. Project Description, Justification and Scope

This project combines Project 97-D-473, Health Physics Site Support Facility with Project 97-D-470, Environmental Monitoring Laboratory, into a single laboratory facility. The Environmental Monitoring Laboratory project is renamed Regulatory Monitoring and Bioassay Laboratory. This project will efficiently design, build, and equip a new laboratory providing essential environmental monitoring and personnel bioassay analyses capabilities for the Savannah River Site. This facility will provide continued full compliance with the Occupational Safety and Health Administration requirements, radiation protection requirements, industrial hygiene and environmental protection requirements as detailed in Federal and state regulations and DOE Orders. It will house sections for the equipment and personnel to support site requirements to sample, prepare, and analyze environmental media (air, water, soil, and biota) for radiological, chemical and biological parameters, develop technologies to clean and monitor the environment, and for the determination, evaluation, and documentation of personnel exposure to radioactive materials Also, it will include laboratory modules, sample preparation areas, analytical instrument rooms, mechanical and electrical support services, important personnel dosimetry records retention area, laboratory storage space, and offices for technical and administrative personnel. The structural, mechanical, electrical and architectural design provisions will consider the facilitation of potential structural and internal modifications in support of future growth or additional laboratory modules and support features. The facility size will be approximately 81,000 square feet, and will be finalized during definitive design. The facility will be divided into three major functional areas: 1) laboratory, 2) office and administration, and 3) service and general use basement. The laboratory section includes; sampling rooms, non-radiological laboratory modules, radiochemistry laboratory models, radio-analytical counting rooms, in-vitro bioassay laboratories and storage rooms. In addition, a partial basement (under the laboratory area) will be provided to include laboratory exhaust hood duct system, mechanical equipment, and some storage and general use area. The office and administration area includes space for management and staff, data management, publication rooms and vital records retention rooms. A Wastewater Treatment Facility is provided to neutralize and treat laboratory wastewater

The 735-A support laboratory operated by the Environmental Monitoring Section of the Environmental Protection Department and the Health Protection Department is 42-years old and is at the end of its life cycle. The 732-11A laboratory, while much newer, has also experienced significant overall deterioration. General deterioration is evident in both buildings due to high volumes of laboratory samples being processed via slow evaporation of concentrated nitric and hydrochloric acids; ventilation system failures have occurred and are documented. These are expected to become prevalent within the next 5 years creating occupational safety and health concerns. Current operations are being performed in facilities that have the following deficiencies: 1) facilities provide inconsistent and unreliable neutralization capabilities for acidic waste water; 2) facilities cannot accommodate large amounts of automated instrumentation and computers; 3) facilities do not allow adequate sample segregation; and 4) there is inadequate space to store and process bioassay samples for the current (and projected) workforce. Existing facility renovation or expansion is not practical nor cost-effective. Renovation would be ineffective since the existing facility does not have adequate space to continue performing the types, quantities, or quality of required analyses. No other suitable space is available on site meeting the requirements and criteria of a laboratory. Renovation would exceed the time and cost to build a new facility.

Sudden and unexpected loss of the site bioassay processing and environmental monitoring capability could occur due to a significant physical failure in building or heating, ventilation, and air conditioning integrity in the existing facility adversely impacting most site support operations. DOE Orders 5400.1, "General Environmental Protection Program"; 5400.5 and pending rule to 10 CFR 834, "Radiation Protection of the Public and the Environment" require the Savannah River Site to conduct programs that quantify the impact of Savannah River Site activities, in any, on the public, environment, and natural resources. Without the Regulatory Monitoring and Bioassay Laboratory, the activities needed to ensure compliance with environmental, Federal, and state requirements would be jeopardized. For example, 13 major facilities risk potential shutdown if air emissions are not analyzed to ensure compliance with the Clean Air Act or effluents to ensure compliance with the Clean Water Act. Failure to comply with Federal or state environmental requirements would leave the site subject to enforcement actions, both civil and criminal. This facility will house the environmental activities requiring fast turnaround quality control and contractor oversight and analysis of samples containing levels of radioactivity that present a potential contamination risk to off-site commercial laboratories. Off-site commercial laboratories are used to analyze samples, verify and validate data for both compliance and noncompliance environmental programs that do not require rapid turnaround. Privatization of environmental activities is not cost-effective and has been eliminated as an option. With regards to worker protection, personnel would be restricted from performing radiological work pending resolution of bioassay assessments. Site work covered by bioassay programs include high-level and low-level waste processing and storage, Defense Waste Processing Facility operations, reactor fuel storage, tritium production and handling, H-Area and F-Area canyons, environmental remediation projects, and other occasional process and incidental site functions. Administration and support of multiple services contracts would be difficult, costly, and error prone. Experience has shown that turnaround times from commercial services are too long to respond effectively to incidents with potential uptakes.

Outsourcing the entire Savannah River Site bioassay analysis to commercial services has been reviewed as an alternative to new construction. The Savannah River Site bioassay laboratory is the largest

processor of actinide bioassay samples in the United States, and it may not be possible to subcontract to a single, existing commercial laboratory. In addition, there is little demand for actinide bioassay sample processing outside the DOE complex; therefore, commercial laboratories have limited capacity and little experience in performing these analyses. If multiple laboratories were utilized, the analytical techniques and statistical treatment of the data could be inconsistent making final result comparisons and dose assignments more difficult to perform and defend. In addition, the Savannah River Site has experienced problems with three different subcontractor laboratories in the past 6 years that performed a small portion of our analyses. Although contracted turnaround times were specified for 3 weeks, results were often not reported for many months (and in some cases greater than 6 months). In addition, it was difficult to obtain the actual hard copy and electronic counting records for quality assurance and dose assessment purposes, and considerable manpower was expended resolving data discrepancies. Historically, many of the DOE sites have had similarly poor service from off-site bioassay laboratories which has resulted in the canceling of contracts and development of on-site capabilities. Problems at Hanford and Sandia within the past decade have resulted in Federal criminal investigations for fraud and mismanagement. Recently, DOE Headquarters issued a communique describing problems that resulted from the Mound Facility using an off-site contract laboratory to perform their bioassay analyses. In previous and current cost assessments of outside laboratories, it has been shown that there is no clear cost advantage to subcontract these services. This along with the increased risk in subcontracting, as mentioned above, has led to a management decision to consolidate all bioassay sample analyses on site.

The gross annual operating cost for this facility is estimated to be $1,800,000. This includes operations, building maintenance, equipment repair and utility costs.

FY 2000 funds will be used for the fixed-price construction and inspection services. Construction activities include: complete building structure, interior finishes, mechanical and electrical systems, and install fixed laboratory equipment.

4. Details of Cost Estimate [a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (7.4% of total estimated cost (TEC)) [b]	2,237	1,780
Design management costs (1.9% of TEC)	580	0
Total, engineering, design, inspection, and administration of construction costs (9.3% of TEC)	2,817	1,780
Construction phase		
Buildings & improvements to land	19,574	17,955
Specialized equipment	2,085	3,330
Other (major utilities/comp items, specialized facilities, etc.)	338	1,800
Inspection, design and project liaison, testing, checkout and acceptance	597	1,865
Construction management (4.1% of TEC)	1,238	550
Total, construction costs	23,832	25,500
Contingencies		
Design phase (0.4% of TEC)	114	196
Construction phase (11.6% of TEC)	3,517	2,804
Total, contingencies (12.0% of TEC)	3,631	3,000
Total, line item costs (TEC)	30,280	30,280

5. Method of Performance

This project will be managed by the Management and Operating contractor. The design and construction shall be accomplished by fixed-price subcontracts awarded on the basis of competitive bidding.

---

[a] The Department of Energy (DOE) February 1997 escalation rates (percent per year) used for this estimate are as follows: FY 1997 2.7%; FY 1998 2.8%; FY 1999 2.6%; FY 2000 2.7%; FY 2001 2.8%. The above estimate includes $844,520 for escalation.

[b] Includes abandoned design and project support cost for Project 97-D-470 (estimated at $1,131,000).

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Project cost							
Facility cost							
Design	1,455	1,400	76	0	0	0	2,931
Construction	0	0	8,570	12,681	6,098	0	27,349
Total facility costs (Federal and Non-Federal)	1,455	1,400	8,646	12,681	6,098	0	30,280
Other project costs [a]							
Conceptual design cost [b]	604	360	0	0	0	0	964
NEPA documentation costs [c]	100	0	0	0	0	0	100
Other project-related costs [d]	316	230	450	400	660	0	2,056
Total other project costs	1,020	590	450	400	660	0	3,120
Total project costs (TPC)	2,475	1,990	9,096	13,081	6,758	0	33,400

[a] Reflects adjustments to overhead costs.

[b] Includes $964,000 spent to prepare Functional Design Criteria, scope of work, preliminary drawings, conceptual estimate, conceptual design report, and a Task Order Proposal Request for architect/engineer services. An estimated $360,000 will be spent to rebaseline the combined projects (revise Functional Criteria and Task Order for architect/engineer services).

[c] Includes $40,000 for National Environmental Policy Act documentation, $50,000 for site characterization, $10,000 to revise existing documentation.

[d] Includes startup, equipment setup/checkout, training, and procedure safety documentation preparation, operational readiness/assessment.

7. Related Annual Funding Requirements

(FY 2001 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs (staff, utilities, etc.) [a]	1,000	230
Annual facility maintenance and repair costs [b]	565	250
Other annual costs [c]	235	540
Total related annual funding *(operating from FY 2001 through FY 2026)*	1,800	1,020

[a] Includes salaries, benefits, overhead staffing, janitorial services and supplies (6 FTE).

[b] Includes repair of equipment; heating, ventilation, and air conditioning; etc. (1.4 FTE).

[c] Includes electric power, fuel, oil and water.

96-D-406, Spent Nuclear Fuels Canister Storage and Stabilization Facility, Richland, Washington (RL-WM01)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

- Total project cost increases from $203,114,000 to $233,798,000 due to the following: 1) Canister Storage Building capital equipment not related to construction costs increased for the addition of a sample/weld station in the facility; 2) Canister Storage Building operating costs increased to operate the new sample/weld station; and 3) Cold Vacuum Drying Safety Analysis Report costs increased to modify safety/environmental permit documentation to incorporate modified multiple canister overpacks design, and to address consideration of aluminum hydroxide issues. Some of the increase was offset by cancellation of the Hot Conditioning System. Evolutions of the project safety basis and modification of the multiple canister overpacks design indicate that the Hot Conditioning System is no longer necessary prior to interim storage

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1996 Budget Request *(Preliminary Estimate)*	1Q 1996	1Q 1998	2Q 1996	2Q 1998	135,800	180,780

- Electrical Distribution

Existing electrical power supplies for the equipment supporting the double-shell tank primary/annulus ventilation systems and the 244-A/244-S Double Contained Receiver Tank ventilation systems will be upgraded and/or replaced to provide backup power capabilities In addition to providing improved reliability for ventilation systems, these upgrades will allow shutdown of the main switchgear to permit routine preventative maintenance to be performed In addition, the project will upgrade the single-shell tank electrical power systems to support clean/controlled/stable operations. No new safety class power systems are planned as part of this project.

The purpose of Phase II of this project is to improve reliability of safety-related systems, reduce on-site health and safety hazards, reduce the risk of unmonitored releases to the environment, support waste disposal privatization and support the double-shell tank "Manage Tank Waste" functions by restoring the selected Tank Farm facilities and systems. Assessments of the Tank Farms' instrumentation/control, ventilation, waste transfer, and electrical systems, which included physical inspections/condition assessments and engineering analyses to determine compliance with applicable requirements, have identified the need for extensive infrastructure restoration in order to meet the overall Tank Waste Remediation System mission goals and support safe operation and maintenance activities.

Because of their age, many infrastructure systems and components have either exceeded their useful service lives and can be expected to fail in the near-term; have deteriorated beyond repair and must be replaced to ensure continued reliable operation; or operate outside current environmental, health, and safety regulations. Due to the age and obsolescence of the existing equipment, it is often difficult to obtain replacement parts for failed or degraded components. These conditions, coupled with the problems associated with performing maintenance work in contaminated areas, have resulted in high operation and maintenance costs for the Tank Farm facilities.

The FY 2000 appropriation will be used to support continued Phase I construction activities associated with the project management activities.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
1996	23,500 [a]	23,500	20,893
1997	16,500	16,500	15,791
1998	10,500 [b]	10,500	12,187
1999	8,697	8,697	10,326
2000	3,845	3,845	3,845
Construction			
1996	19,500	19,500	11,149
1997	44,172	44,172	35,798
1998	11,244 [b]	11,244	26,731
1999	29,983	29,983	31,221
2000	20,596	20,596	20,596

3. Project Description, Justification and Scope

This Major System Acquisition project consists of all the activities necessary to safely stabilize and store approximately 2,100 metric tons of spent N-Reactor fuel currently stored at the 100 K East and West facilities. There are three specific subprojects within this Major System Acquisition as follows:

a. Subproject #01 - Canister Storage Building (W-379)

TEC	Previous	FY 1998	FY 1999	FY 2000	Construction Start - Completion Dates
123,739	84,951	6,118	17,131	15,539	2nd Qtr. FY 1996 - 2nd Qtr. FY 2000

The Canister Storage Building originated from Hanford's canceled waste vitrification plant project. It is being modified to provide long-term, dry storage for spent nuclear fuel removed from the 100 K East and West basins. The fuel will be stored in Multiple Canister Overpacks at the Canister Storage Building. The Canister Storage Building also includes an annex to facilitate final sealing of the Multiple Canister Overpacks.

This facility is envisioned to consist of 2,900 square meters (31,580 square feet), of which approximately 2,310 square meters (23,160 square feet) will be available for storage and 590 square

[a] Reflects appropriation of $42,000,000 with addition of $1,000,000 for FY 1996 internal reprogramming to provide for additional concrete pouring required to maintain higher heat control to store both Spent Nuclear and Tank Waste Remediation System Canisters.

[b] Reflects appropriation of $16,744,000 with addition of $5,000,000 from FY 1998 internal reprogramming to provide for design, procurement, and safety analysis of the Cold Vacuum Drying processing equipment.

meters (6,420 square feet) for loading, handling and service areas. The Nuclear Regulatory Commission Equivalency Requirement Implementation necessitates that the Canister Storage Building be designed and constructed to withstand tornado loadings which has resulted in the design and construction of hardened elements..

Following cold conditioning, fuel will be taken to the vault area where it will be placed, via a Multiple Canister Overpack handling machine, in storage tubes and cooled by natural outside air circulation. The fuel could remain in storage for up to 40 years or until a suitable repository becomes available.

Cost increases experienced in FY 1998 in areas of Title III design, Safeguards and Security System, the structural systems in response to the Nuclear Regulatory Commission equivalency and tornado hardening requirements have required the project to defer work scope from FY 1998 into FY 1999 for project to stay within the FY 1998 funding authorization. The work scope that is being deferred includes the remaining fabrication of the storage tubes, all shield plug fabrication planned for FY 1998 , vaults 2 and 3 insulation concrete, all as built work and all remaining equipment

Currently, spent Hanford N-Reactor fuel is stored in unlined, concrete water-filled basins that are not seismically qualified and are located approximately 93.3 meters (100 yards) from the Columbia River. Any significant seismic event could cause a very serious hazard to the environment and potentially place the health and well being of the surrounding community in jeopardy.

The FY 2000 appropriation will be used to complete Canister Storage Building construction, including the procurement and installation of tube shield plugs and impact absorbers.

Planned conditioning provides facilities and process equipment which increases N-Reactor spent nuclear fuel stability in preparation for dry stockpiling at Hanford's Canister Storage Building.

This conditioning activity now consists of only a cold vacuum drying and process.

b. Subproject #02 - Cold Vacuum Drying Facility (W-441)

TEC	Previous	FY 1998	FY 1999	FY 2000	Construction Start - Completion Dates
58,149	12,604	15,094	21,549	8,902	1st Qtr. FY 1997 - 3rd Qtr. FY 2000

Spent nuclear fuel presently stored in K-basins will be removed from existing storage canisters, washed to minimize loose particulate (sludge), and repacked into Multiple Canister Overpack's prior to removal from the Basins The Multiple Canister Overpack's then will be transferred to a cold vacuum drying facility located in the 100 K Area. Bulk water will be removed and the fuel vacuum dried. Next, the Multiple Canister Overpack's will be transported to the Canister Storage Building, located in the central 200 area, where containers can ~~will~~ be stored up to 40 years.

FY 2000 appropriation will be used for construction closeout.

c. Subproject #03 - Hot Conditioning Facility (W-484)

TEC	Previous	FY 1998	FY 1999	FY 2000	Construction Start - Completion Dates
6,649	6,117	532	0	0	

This subproject has been canceled. Evaluations of project safety basis and modification of the Multiple Canister Overpack design indicate that hot conditioning was no longer necessary prior to interim storage. Budget authorized is being reallocated to the Canister Storage Building and Cold Vacuum Drying.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (17.6% of total estimated cost (TEC)	33,189	28,789
Design management costs (15.4 % of TEC)	28,960	25,401
Total, engineering, design, inspection, and administration of construction costs (33.0% of TEC)	62,149	54,190
Construction phase		
Buildings and improvements to land	82,204	64,701
Specialized equipment	24,168	34,116
Other (major utilities/comp items, specialized facilities, etc.)	0	0
Removal cost less salvage	2,700	2,700

Total project costs	104,211	52,084	51,292	26,211	0	233,798

7. Related Annual Funding Requirements

(FY 2001 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs (staff, utilities, etc.)	2,230	2,743
Annual facility maintenance and repair costs	0	0
Other annual funding	2,230	2,743
Total related annual funding (operating from FY 2001 through FY 2041)	4,460	5,486

96-D-464 Electrical and Utility Systems Upgrade, Idaho National Engineering and Environmental Laboratory, Idaho Falls, Idaho (ID-OIM-106)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

The Idaho Chemical Process Plant has been renamed to better reflect the mission to the Idaho National Technology and Engineering Center.

Increase the number of new standby generators required from one to two. This was driven by a change in the operational requirements for the Coal Fired Steam Generating Facility standby generator to operate as a stand-alone unit. Originally this unit was to be relocated to the Standby Power Facility and paralleled with the other three Idaho Nuclear Technology and Engineering Center generators.

3. Project Description, Justification and Scope

The Electrical and Utility Systems Upgrade project will upgrade the Idaho National Technology & Engineering Center utility systems by correcting high risk life-safety, health, and environmental deficiencies. Correction of these deficiencies will reduce safety and health risks and provide safe and reliable utilities to support the Idaho Nuclear Technology and Engineering Center mission. The Idaho Nuclear Technology and Engineering Center electrical and utility supply and distribution system provides the infrastructure necessary to support plant operations. This system is outdated, overloaded, and not in compliance with Code of Federal Regulations (CFR) for Occupational Safety and Health Act requirements, DOE orders, or national codes and standards. These factors, combined with plant-wide growth, have over utilized the capacity of the distribution systems and increased the potential health and safety risks associated with long-term use and maintenance of the Idaho Nuclear Technology and Engineering Center utility systems.

The scope of this project includes upgrades to normal and standby power/electrical systems and other utility systems. The system upgrades, improvements, and corrections listed in order of priority, include:

---

[a]The amounts in this column have been updated to reflect actual costs through FY-1998 and the most current estimates to complete.

[b]Directed reduction of $440,000 in FY 1996 to meet the uncosted reduction imposed by Congress.

a. installation of a new 13.8 kilovolt-amperes (kVA) high voltage electrical ductbank and manhole system (approximately 15,000 linear feet) to separate high-voltage power circuits from low voltage power, instrumentation, alarm, and communication circuits to correct life-safety and code compliance problems that put maintenance and construction personnel at risk;

b. upgrading, relocating, or new installation of seven 13.8 kVA/13.9 kVA substations and seven 13.8 kVA/480V or 2.4 kVA load centers to eliminate overloaded conditions on existing electrical distribution equipment;

c. upgrading the existing standby power network and control system and installation of two new 2,000 kVA (nominal) diesel generators (a replacement for an old, unreliable unit and one additional new unit) to provide paralleling, synchronizing, load sharing; and load shedding capabilities to provide reliable standby power during normal (commercial) power outages to equipment which provides for containment and control of radioactive and fissile materials, environmental monitoring, security functions, and personnel and property protection;

d. replacement of approximately two hundred 20-40 year old panelboards and associated switchgear in existing buildings that are inadequately rated to safely interrupt and predict against potentially explosive levels of short circuit energy that presents a significant fire hazard;

e. Reconfiguration of electrical service equipment in existing buildings to eliminate multiple electric service entrances that violate code and constitute maintenance and fire-response safety hazards.

The conceptual design has identified major items of scope, and additional deficiencies were found during studies and design efforts. These will be prioritized and completed under this project as funding allows.

The Idaho Nuclear Technology and Engineering Center electrical and utility systems provide the infrastructure services required to support the safe operation and maintenance of the site facilities. Electrical and Utility Systems Upgrade Project feasibility studies and various operating contractor self assessment studies have shown that the electrical and utility systems at the Idaho Nuclear Technology and Engineering Center, because of its age, use, and the rapid growth in utility requirements, are unsafe, unreliable, or violate CFR Occupational Safety and Health Act requirements, DOE orders, DOE Idaho Operations Office A-E Standards, and industry codes and standards, with significant life-safety and health implications. These utility systems are also rapidly approaching severe overload conditions. These high risk deficiencies, along with the system overload, jeopardize the ability of the electrical and utility systems to support the DOE mission at the Idaho Nuclear Technology and Engineering Center to safely receive, inspect, store, and condition for disposal, spent nuclear fuel, and to manage radioactive wastes generated from fuel handling activities while protecting the safety of the workers, the public, and the environment.

Although the mission of the Idaho Nuclear Technology and Engineering Center was changed in 1992 by the DOE from fuel reprocessing to waste management, utility requirements are still projected to increase since the existing facilities, including the inactive fuel reprocessing facilities, will continue to use essentially the same operational quantities of electrical power and other utilities to maintain safe confinement conditions until they are decommissioned. Important equipment such as heating and ventilation fans are still required to operate to maintain pressure boundaries; radiation and environmental monitoring equipment is required to operate to protect the safety and health of the workers; and a

standby power system is required to operate to provide power to important equipment and instrumentation in case of loss of commercial normal power.

Upgrades to the electrical and utility systems thoughout the Idaho Nuclear Technology and Engineering Center complex have been delayed for many years. The last upgrade to the electrical utility infrastructure, the Utility Replacement and Expansion Project (UREP), was completed in FY 1984 at a cost of $10,500,000. The UREP was originally designed to provide the necessary electrical power requirements through 1989. This increased the electrical capacity from 4 MVA to 14 MVA. The Idaho National Engineering and Environmental Laboratory Electrical Upgrade (FY 1993) Project installed a new 26 MVA substation to replace the overloaded 14 MVA substation. The Idaho National Engineering and Environmental Laboratory Electrical Upgrade Project, however, did not provide any new electrical ductbanks or smaller unit substations for distribution of this power to the Idaho Nuclear Technology and Engineering Center facilities.

The Idaho Nuclear Technology and Engineering Center electrical power distribution system is approaching its design capacity. In April 1992, the Idaho Nuclear Technology and Engineering Center power usage reached its highest level (13 MVA, 93 percent of rated 14 MVA capacity) since the plant began operations, even though all fuel reprocessing has been discontinued. Eight existing 13.8 kV feeders in the electrical power distribution system are overloaded or at rated capacity. These feeders are expected to become overloaded as new facilities and equipment loads are added to support the new Idaho Nuclear Technology and Engineering Center missions. The majority of the Idaho Nuclear Technology and Engineering Center electrical manholes presently contain a mixture of high-voltage power, low-voltage power, and low-voltage non-power (communication, alarms, security) circuits without proper separation, which is prohibited by the National Electric Code (NEC) and other safety codes. Several of the existing distribution centers exceed their rated capacities during peak load periods. Several distribution centers have insufficient electrical current interrupting ratings which constitute a potential explosion and fire hazards. In many facilities, power is supplied to multiple service entrances at different locations within a building. This presents a hazard to maintenance and emergency (e.g. fire) response personnel when trying to electrically isolate systems or the facility itself. Many of the service entrance panels or switchgear and internal distribution panels are not adequately protected against short circuit conditions. Many panels, raceways, and conductors are not installed in accordance with safe NEC required practices. Two of the four primary standby power generators have connected loads that exceed their continuous ratings. Such deficiencies represent potential safety hazards to operations and maintenance personnel. Also, many of these 40 year old facilities have deteriorating and obsolete equipment with spare parts no longer available from suppliers.

Upgrades to the Idaho Nuclear Technology and Engineering Center electrical and utility distribution system are essential to: (1) provide for safe operation of site facilities that are key to the Idaho Nuclear Technology and Engineering Center mission, (2) provide a safe work place for employees, (3) minimize risk of property damage as well as damage to the environment, and (4) provide adequate capacity to support the DOE mission.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and final design costs (design drawings and specifications)	7,252	7,252
Design management costs (3.2% of TEC)	1,720	1,720
Project management costs (1.5% of TEC)	794	0
Total, Engineering, design, inspection, and administration of constuction costs (18.3% of TEC)	9,766	8,972
Construction Phase		
Buildings	2,246	0
Specialized equipment	0	2,446
Other (major utilities/comp items, specialized facilities, etc)	22,481	0
Removal cost less salvage	0	22,281
Inspection, design and project liaison, testing, checkout and acceptance	4,154	4,693
Construction management costs (7% of TEC)	3,737	6,776
Project management costs	2,784	0
Total, Construction Costs	35,402	36,196
Contingencies		
Design Phase (< 1.0% of TEC)	242	828
Construction Phase (15.0% of TEC)	8,042	7,456
Total, Contingency (approximately 15.5% of TEC)	8,284	8,284
Total, Line Item costs (TEC)	53,452	53,452

5. Method of Performance

Design will be performed by the operating contractors Facility Engineering (design) Organization. Construction and procurement will be accomplished by fixed price contracts and subcontracts awarded on the basis of competitive bidding to the maximum extent possible. Some time and material construction contracts or force account construction work under operating contractor, direct management, may be utilized for work in areas of radiological or hazardous waste contamination. Title III inspection will be accomplished by the operating contractor.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1999	FY 2000	FY 2001	Outyears	Total
Project Cost.[a]						
Facility Cost						
Design	7,906	353	508	723	518	10,008
Construction	12,392	11,424	8,565	5,851	5,212	43,444
Total Facility Costs (Federal and Non-Federal)	20,298	11,777	9,073	6,574	5,730	53,452
Other Project Costs						
Conceptual design costs	5,395	0	0	0	0	5,395
NEPA documentation costs	83	0	0	0	0	83
Other project-related costs	3,934	2,066	1,205	1,158	556	8,919
Total Other Project Costs	9,412	2,066	1,205	1,158	556	14,397
Total Project Costs (TPC)	29,710	13,843	10,278	7,732	6,286	67,849

7. Related Annual Funding Requirements

(FY 1999 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs	800	800
Annual facility maintenance/repair costs	750	750
Total related annual funding (operating from FY 1999 through FY 2038)	1,550	1,550

[a]Revision of costs based on detailed estimate to complete prepared January 24, 1997.

96-D-471, CFC HVAC/Chiller Retrofit, Savannah River Site, Aiken, South Carolina (SR-IN05)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

- The total project cost reduced from $58,500,000 to $54,000,000 due to clearer defined estimates as a result of experience gained from execution of subprojects.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete

2001	8,342	8,342	5,774
2002	9,186	9,186	13,011

3. Project Description, Justification and Scope

DRIVERS

Current legislation banned chlorofluorcarbon production in December 1995. Continued chlorofluorcarbon use is allowed under strict maintenance and operation regimens. However, the free market pricing mechanisms and DOE policy severely discourage procurement of replacement chlorofluorcarbons. In order to continue operations, the DOE must eventually end its reliance upon chlorofluorcarbons for all cooling applications.

CHLOROFLUORCARBON MISSION

Due to the regulatory requirements, as well as the related impending chlorofluorcarbon shortages, it is imperative that action be taken to preserve EM mission capability by instituting chlorofluorcarbon management for conserving this limited resource pending replacement by non-chlorofluorcarbons, to reduce the continued cost of operation through increased energy efficiency, and to protect the environment from further damage. Ultimately, this program will eliminate the use of ozone-depleting chlorofluorcarbons to ensure compliance with the Environmental Protection Agency Stratospheric Ozone Protection Amendment of the Clean Air Act.

This project provides for the elimination of the use of ozone-depleting chlorofluorcarbons to ensure compliance with the Environmental Protection Agency stratospheric ozone protection amendment of the Clean Air Act at the Savannah River Site. A project of this type cannot be fully detailed in advance due to changing mission requirements, unexpected catastrophic equipment failures, environmental compliance schedules, etc. The subprojects identified are examples of chillers under consideration. This approach is

based upon similar endeavors by other federal agencies, such as the General Services Administration. In general, the estimated funding for each location and listed subprojects is preliminary in nature and primarily indicative of the size of the subproject and the relative magnitude of the requirements. It should be noted also that the continuing study of requirements will result in changes in scope of some of the subprojects.

Refrigerant and cooling requirements are the principal use for ozone-depleting substances (chlorofluorcarbons) at the Savannah River Site (with Halon fire suppression and specialized solvent cleaning operations comprising the remaining usage). The program will eliminate the use of chlorofluorcarbons used in refrigeration and cooling in chillers, direct expansion air conditioners, process coolers, and other refrigeration equipment. (Halon and solvent cleaning usage is already being addressed by site waste minimization activities and the use of non-chlorofluorcarbon based fire protection methodologies.) Small window and wall slot air conditioners and other equipment with refrigerant charges of 10 pounds or less will be replaced when leaks are detected or at the end of their useful life with new equipment utilizing non-chlorofluorcarbon refrigerants, and are not addressed under this program. The ultimate disposal or destruction of chlorofluorcarbon refrigerants is not considered as part of this effort.

The principal chlorofluorcarbon refrigerants found on the Savannah River Site include R-11, R-12, R-113, R-114, R-502, and R-503. Replacement non-chlorofluorcarbon refrigerants/systems are already commercially available, and no development activity is required. However, since some non-chlorofluorcarbon refrigerant replacements are generally of a higher toxicity, additional ventilation and monitoring systems may be required for some of the modified systems to comply with industry standards.

Aging control systems may also require upgrade in order to interface with modern replacement systems. Asbestos and other potential contaminants found during equipment replacement/retrofit may require abatement, containment, or remediation. In modifying existing systems, required utilities and distribution connections and demolition and disposal may be necessary for non-salvageable components and systems.

The following legislative actions have been considered in the formulation of the Chlorofluorcarbon Heating, Ventilation, and Air Conditioning Chiller Retrofit Project:

- Title VI of the Clean Air Act, as amended, which mandates a curtailment of ozone-depleting substance production.
- Title III of the Clean Air Act, as amended, waives the Government's sovereign immunity under Section 302(e) and subjects "...any agency, department, or instrumentality of the United States and any officer, agent, or employee thereof" to the provisions of the Act. The Federal Enforcement provisions outlined in Section 113 include civil and criminal penalties for knowingly violating the provisions.
- The Refrigerant Recycling Rule as given in 58 FR 28660 allows a maximum leakage of 15 percent per annum of a refrigerant system's charge of Chlorofluorcarbon working fluid.
- Title 40 of the Federal Regulations addresses air pollution in general. The Environmental Protection Agency final rule (40 CFR 82, "Production and Consumption Controls," 12/10/93) accelerates the phase-out of Class I substances.

- Executive Order 12856 of 1993 addresses federal compliance with right-to-know laws and pollution prevention requirements, and stipulates 50 percent reduction in leakage/emission of Emergency Planning and Community Right-to-Know Act chemicals by December 31, 1991, including some Chlorofluorcarbons.
- The National Pollution Prevention Act of 1990.
- Executive Order 12843 addresses procurement policies for ozone-depleting substances.

The Chlorofluorocarbon Heating, Ventilation, and Air Conditioning-Chiller Retrofit Project has been planned to provide a consistent prioritized method for the application of scarce capital resources to address the replacement or conversion of equipment reliant upon chlorofluorcarbon refrigerants. The project will utilize a consistent strategy for assessment of requirements to maintain credibility, and a funding approach based on technical and budget priorities to systematically reduce risk and insult to the ozone and environment while protecting worker and public safety and maintaining critical program activities.

The subprojects identified in this section (new starts) represent the highest priority efforts given the current equipment conditions, site mission status, environmental and/or regulatory compliance information, etc. However, site requirements, unexpected regulatory or safety driven issues, or equipment failures may result in a re-prioritization of the activities proposed under this project. This reprioritization may result in subproject(s) being substituted for those identified as New Starts. Subproject additions/substitution/deletions will be controlled and tracked through the Baseline Change Control process. Subproject changes will be discretely identified once approved through the Baseline Change Control process.

The following is a brief description and justification for each of the chiller subprojects proposed for.

FY 2000 Proposed Projects: (New Starts)

Subproject 06: S Area

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
8,250	0	0	0	500	7,750	2nd Qtr. FY 2000 - 2nd Qtr. FY 2002

Replace six chillers with a total capacity of 2,540 tons.

FY 1999 Projects:

Subproject 13: New Special Recovery/HB Line Areas

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
3,300	0	0	463	431	2,406	2nd Qtr. FY 2000 - 4th Qtr. FY 2001

Replace two chillers in HB Line and one in New Special Recovery Facility.

FY 1998 Projects:

Subproject 07: 299-H

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
1,063	700	363	0	0	0	4th Qtr. FY 1998 - 1st Qtr. FY 1999

Replace one 400 ton chiller.

Subproject 08: 235-F

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
2,638	364	900	1,374	0	0	1st Qtr. FY 1999 - 4th Qtr. FY 1999

Replace two chillers with a total capacity of 350 tons.

Subproject 12: Tritium, Phase III

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
1,900	0	300	1,600	0	0	1st Qtr. FY 1999 - 3rd Qtr. FY 1999

Convert two 658-ton chillers to a non-chlorofluorcarbon refrigerant.

FY 1997 Projects:

Subproject 04: F-Canyon / Analytical Laboratories

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
9,172	3,500	1,543	4,129	0	0	1st Qtr. FY 1998 - 3rd Qtr. FY 1999

Replace ten chillers with a total capacity of 3,720 tons. Consolidation of chillers into a central chiller plant will be considered.

Subproject 05: H-Canyon

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
2,771	800	1,971	0	0	0	1st Qtr. FY 1998 - 4th Qtr. FY 1998

Replace two 350-ton chillers in 221-H. Replace one 10-ton chiller and convert one 160-ton chiller in 221-HBL to a non-chlorofluorcarbon refrigerant.

FY 1996 Projects:

Subproject 02: Tritium, Phase I

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
677	677	0	0	0	0	2nd Qtr. FY 1996 - 4th Qtr. FY 1996

Replacement of one 445-ton chiller in Building 234-H which is currently inoperable.

Subproject 03: Tritium, Phase II

TEC	Previous	FY 1998	FY 1999	FY 2000	Outyears	Construction Start - Completion Dates
7,857	4,000	3,423	434	0	0	2nd Qtr. FY 1997 - 2nd Qtr. FY 1999

Consolidate eight chillers into a central four chiller plant providing 1,350 tons of cooling.

Additional New Start projects beyond FY 2000 have a total estimated cost of $7,372,000.

EXECUTION CONSIDERATIONS

The two principal options for addressing existing Chlorofluorcarbon dependent chiller/heating, ventilation, and air conditioning systems are: 1) conversion (retrofits) and 2) replacement.

- *Conversion* (retrofit) of the equipment to use alternative non-ozone depleting refrigerants such as hydrochlorofluorocarbon or hydrofluorocarbon. Conversion needs to consider the impact on the materials utilized in chiller construction (e.g., corrosive effect of alternative refrigerants upon chiller seals) and the impact on equipment performance.
- *Replacement* of the equipment with new non-chlorofluorcarbon dependent equipment.

Consideration/evaluation of the conversion versus replacement decision include:

- Age of the chillers;
- Performance of the existing chillers; machine capability; relative efficiency, maintainability, and reliability,
- Life cycle cost analyses;
- Spare part availability;
- Current system capacity margin and future growth requirements; system impact on the site and facility mission and mission urgency;
- Accessibility issues and structural modifications that may be necessary to accommodate a replacement.

In summary, as equipment approaches the end of its useful life, replacement may appear to be an obvious choice However, the decision for replacement will not be made until installation costs have been adequately addressed (i.e., removal of existing equipment, accessibility for the placement of new equipment, equipment tie-in points, and new support equipment). The final decision to convert or replace can only be made following a case-by-case engineering evaluation which considers all of the above factors. Private industry involvement and practices will be employed to the greatest extent possible

4. Details of Cost Estimate [a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (5.5% of total estimated cost (TEC))	2,489	2,192
Design management costs (2.6% of TEC)	1,192	0
Total, engineering, design, inspection, and administration of construction costs (8.2% of TEC)	3,681	2,192
Construction phase		
Other (major utilities/comp items, specialized facilities, etc.)	27,407	32,263
Inspection, design and project liaison, testing, checkout and acceptance	898	1,428
Construction management (8.7% of TEC)	3,897	0
Total, construction costs	32,202	33,691
Contingencies		
Design phase (2.1% of TEC)	939	548
Construction phase (18.2% of TEC)	8,178	8,569
Total, contingencies (20.3% of TEC)	9,117	9,117
Total, line item costs (TEC)	45,000	45,000

5. Method of Performance

Installation of replacement equipment and system conversions (retrofits) will be performed to the greatest extent feasible through competitive solicitations or competitively selected service contracts. Procurement will be accomplished to the maximum extent practical through competitively bid solicitations and contracts.

[a] The DOE escalation rates (percent per year) used for this estimate are as follows: FY 1996-3.2%; FY 1997-2.7%; FY 1998-2.8%; FY 1999-3.0%; FY 2000-3.0%; FY 2001-3.0%. The above estimate includes $2,433,257 for escalation.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Project cost							
Facility cost							
Design	1,520	1,408	821	502	369	0	4,620
Construction	3,161	10,127	5,968	2,339	5,774	13,011	40,380
Total facility costs (Federal and Non-Federal) [a]	4,681	11,535	6,789	2,841	6,143	13,011	45,000
Other project costs							
Other project-related costs	3,128	1,710	1,185	1,264	910	803	9,000
Total other project costs	3,128	1,710	1,185	1,264	910	803	9,000
Total project costs (TPC)	7,809	13,245	7,974	4,105	7,053	13,814	54,000

7. Related Annual Funding Requirements

(FY 2000 dollars in thousands)

	Current Estimate [b]	Previous Estimate
Annual facility operating costs (staff, utilities, etc.)	0	0
Annual facility maintenance and repair costs	0	1,953
Programmatic effort related to facility	0	0
Other annual costs	0	1,421
Total related annual funding *(operating from FY 2000 through FY 2023)*	0	3,374

[a] The line item TEC is $45,000 which includes design, procurement, and construction.

[b] Replacement of the chillers will result in less maintenance and energy costs of approximately $3,400,000.

86-D-103, Decontamination and Waste Treatment Facility, Livermore, California (OK-027)

(Changes from FY 1999 Congressional Budget Request and denoted with a vertical line [|] in the left margin)

Significant Changes

Update project completion date to reflect latest approved baseline change.

3. Project Description, Justification and Scope

This project has experienced a number of scope changes since its inception. The original scope in FY 1986 consisted of a Liquid Waste Processing Facility, a Decontamination Facility, an operational Support Building, mechanical/electrical utility upgrades, and site preparation. The project was located in the southeast corner of the laboratory and the Total Project Cost was $11,700,000. Between 1987 and 1990, the location of the site was changed to the northeast corner of the laboratory, due to the potential for

[a] $25,000 approved FY 1990 reprogramming for the Waste Isolation Pilot Plant· FY 1992 General Reduction of $2,060,000, and prior year funds used for FY 1994/FY 1996 General Reduction

[b] Reduction of $500,000 of current year funds in FY 1997

[c] Prior year funds used as an offset for FY 1999 uncosted reduction, $1,040,000. Original appropriation was $4,752,000.

[d] Includes other project costs

seismic activity. The scope was increased to include a Solid Waste Processing Building, an incinerator and burn pan, a boiler and chiller plant, a Reactive Materials Building, and a Storage Building The Total Project Cost increased to $40,900,000. In 1990, the Lawrence Livermore National Laboratory Director adopted the recommendation of an internal laboratory panel to delete the incinerator and burn pan from the scope of the project due to public opposition. In 1993, a new baseline was approved which deleted the incinerator and the decontamination building, and added the Real Time Radiography Building, the Transuranic handling facility, and the upgrade of Building 494 for mixed waste process development and engineering, increasing the Total Project Cost to $74,769,000. In 1993, DOE Oakland did an Integrated Waste Management Study which evaluated the waste management needs of Lawrence Livermore National Laboratory and concluded that the scope of the Decontamination and Waste Treatment Facility did not meet these needs. This resulted in the Alternative Design Review, which further evaluated the laboratory's waste management needs and compared various options for meeting these needs. The Baseline Change Proposal approved in December 1996, is based on deleting the portion of scope associated with the Mixed Waste Management Facility. In addition, Resource Conservation and Recovery Act closure of the old processing areas will be required within 180 days of moving to the new facility. This revised baseline represents the final path forward for the design and construction of the facility.

The scope is described in the Construction Project Data Sheet which follows.

This project will enhance, improve, and expand hazardous waste and mixed waste management at the Laboratory through the construction of approximately 79,100 square feet of new, state-of-the-art facilities for decontamination and waste treatment processes and 5,090 square feet of modifications to an existing building. This project will provide new, centralized and integrated facilities for Hazardous Waste Management operations that will meet the requirements for Low Hazards Category 3 Facility. The project will include the design and construction of new buildings on a nine-acre site located in the northeast sector of the Laboratory; it will share the site with existing Hazardous Waste Management Building 693.

It is anticipated that design and construction will be accomplished in seven phases to meet project schedule and funding constraints. A brief description of project scope by phase follows.

Phase 1 - Site improvements. This phase includes debris removal, excavation, grading, trenching, electrical service, underground utilities, partial paving, curb and gutter, and sidewalks.

Phase 2 - Mixed Waste Management Facility. This phase has been deleted.

Phase 3A - Decontamination and Waste Treatment Facility. This phase consists of construction of the Truck Bay, Solid Waste Processing Building, Chemical Exchange Warehouse, High Curie Waste Storage, Radwaste Storage Building, and modifications to existing Building 280.

Phase 3B - Decontamination and Waste Treatment Facility. This phase consists of construction of the Liquid Waste Processing Building, Reactive Materials Building and Classified Waste Storage Building.

Phase 4 - Decontamination and Waste Treatment Facility. This phase consists of construction of the Operational Support Building.

Phase 5 - Final site improvements. This phase consists of all remaining site work for the project, such as final grading, paving, parking facility, fencing, landscaping, and exterior lighting.

Phase 6 - Resource Conservation and Recovery Act Closure of existing facilities.

The proposed Decontamination and Waste Treatment Facility at Lawrence Livermore National Laboratory will continue to meet the goals of Lawrence Livermore National Laboratory's waste management program while significantly enhancing Lawrence Livermore National Laboratory's waste management capabilities. Enhanced capabilities provided by the revised scope include the following: repackaging of radioactive, mixed and transuranic wastes, decontamination and size reduction, treatment of mixed, reactive, sewer diversion wastes and proper storage of radioactive, mixed, hazardous, and high-curie waste.

- Designing mitigative and preventive features to meet current requirements of DOE Orders and Lawrence Livermore National Laboratory Health and Safety standards in accordance with the hazardous classification.
- Consolidating the liquid waste operation into a centralized hazardous waste management facility which will optimize manpower and facility utilization.

In 1990, the Resource Conservation and Recovery Act land disposal restrictions became effective, prohibiting the land disposal of untreated hazardous and mixed radioactive wastes. DOE disposal facilities (such as the Nevada Test Site) that previously accepted untreated mixed waste will no longer be permitted to accept such wastes. The proposed Decontamination and Waste Treatment Facility will be capable of treating a portion of land disposal restricted mixed and hazardous wastes.

a. Liquid Waste Processing Building

The existing Liquid Waste Facility (514) is an old engine test building constructed in the 1940's for use by the U.S. Navy. The facility has been modified to process radioactive and hazardous liquid wastes through a single process line. Some of the present equipment and much of the present piping is deteriorated and requires expensive repair to maintain operations. The present location, which is separated from the other Hazardous Waste Management facilities, has insufficient space to allow for the additional expansion required to provide complying facilities. Due to the limited treatment technology employed, and excessive volume of end product that is produced it is difficult to solidify for disposal. The present radioactive and mixed wastes solidification building does not meet the ventilation, contamination, and confinement requirements of DOE Order 6430.1A. Continuing maintenance and improvement has not alleviated the situation. In addition to the liquid waste processing systems, the new building will house the analytical laboratory, maintenance shop, and a silver recovery facility. The advantages of the facility include:

- Siting the new facility in a location which meets the seismic requirement of Resource Conservation and Recovery Act and the State.
- Providing sufficient treatment to assure meeting the new restrictive discharge limits established by regulators.
- Providing more efficient technology to minimize disposal volume to comply with environmental regulations and DOE Orders.
- Providing close capture ventilation and spill containment systems to comply with the environmental regulations which limit air emissions and prohibit liquid discharges to the environment.

b. Waste Receiving, Classification, and Solid Waste Processing Building

Receiving and Classification Area

Receiving and classification is currently being performed in an open shed with limited space resulting in many containers being stored outdoors and the remainder receiving only minimal weather protection. There are no facilities to properly segregate incompatible wastes, and nothing to contain spills or container ruptures as required by Resource Conservation and Recovery Act, California hazardous wastes regulations, and DOE Orders. An open area is still used. Although spills are contained, they would mix with rainwater. The new facility will provide the space necessary to receive, segregate, and store chemical and radioactive containers of all types and sizes until the proper analysis and classification is completed and a determination made on the treatment, packaging, and shipping methods required to properly prepare them for ultimate safe disposal. A work station will be included in the facility for maintaining incoming and outgoing shipping documentation and inputting data to the central computer through a terminal.

Solid Waste Processing Area

Radioactive solid waste processing consists of packaging and compacting of low-level waste and transuranic waste and is presently done in the Building 612, Dry Waste Facility which is seismically deficient and cannot meet the As Low As Reasonably Achievable requirements of DOE Order 6430.1A. Specific advantages of the new facility are:

- Meeting the Uniform Building Code and Lawrence Livermore National Laboratory seismic requirements.
- Increases processing capability with safer handling and control.
- Provides transuranic size reduction, packaging, and container inspection capability.
- Designing mitigative and preventive features to meet current requirements of DOE Orders and Lawrence Livermore National Laboratory Health and Safety standards in accordance with the hazard classification.

c. Storage Building

Radioactive Waste Storage Area

Radioactive and mixed wastes stored at the present Hazardous Waste Management site are stored outside exposing them to the weather. The radioactive waste storage area is required at the new Decontamination and Waste Treatment Facility in order to provide safe and compliant storage of those materials.

Chemical Exchange Warehouse

The Chemical Exchange Warehouse will house the cost cutting program which allows for programmatic chemical users to share chemicals and not continue to purchase chemicals that are not needed, i.e., if an experiment only requires a small quantity of a chemical, they may find the chemical at the Chemical Exchange Warehouse and avoid purchasing a new container full. Excess chemicals from a program are turned into the Chemical Exchange Warehouse for reassignment as necessary.

Building 280 Modifications

Building 280 will house the transuranic, transuranic mixed, and high curie waste.

d. Operational Support Building

This facility will provide the following:

- Central support for the four major operational functions; waste receiving and shipping, mixed aqueous waste treatment, solid waste processing and storage.
- Bring together the supervisory, administrative, technical support, and operational personnel currently housed in dispersed locations.
- Provide a training room to meet the requirements of 40 CFR 264.16 for training of personnel in handling hazardous waste.

e. Standby Generator

The standby generator is necessary to supply standby electrical power to critical facilities and operations in the Decontamination and Waste Treatment Facility during and following an earthquake. It must be invulnerable to damage to assure sustained electric power to equipment in the moderate hazard facilities which must continue to operate, i.e., ventilation, fire protection, and alarm systems, and also allow the safe shut-down of critical hazardous waste processing systems.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and final design costs (5.4% of total estimated cost (TEC))	3,391	3,063
Design management costs (2.4% of TEC)	1,489	1,481
Total, Engineering, design, inspection, and administration of construction costs (7.8% of TEC	4,880	4,544
Construction Phase		
Buildings and improvements to land	35,021	33,751
Specialized equipment	4,775	4,775
Inspection, design and project liaison, testing, checkout and acceptance	2,539	1,740
Construction management (3.5% of TEC)	2,198	2,107
Total, Construction costs	44,533	42,373
Contingencies		
Design phase (1.0% of TEC)	605	918
Construction phase (5.5% of TEC)	3,428	5,611
Total, Contingencies	4,033	6,529
Unrecoverable Costs		
Design	5,356	5,356
Project Management	1,393	1,393
Permit	2,167	2,167
Total, Unrecoverable Costs	8,916	8,916
Total, line item costs (TEC)	62,362	62,362

5. Method of Performance

Current estimate based on re-baseline cost estimate. Escalation is applied according to Lawrence Livermore National Laboratory Cost Estimating Procedures and Lawrence Livermore National Laboratory approved escalation rates.

Contracting arrangements are as follows:

Design will be on the basis of a negotiated architect-engineer contract. Major equipment requiring long-lead time will be purchased by Lawrence Livermore National Laboratory early in the project on the basis of competitive bidding. To the extent feasible, construction will be accomplished by a fixed-price contract awarded on the basis of competitive bidding. Minor architect-engineering work and activation will be performed by Lawrence Livermore National Laboratory forces.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Project Cost							
Facility Cost							
Design	3,756	1,116	585	28	0	0	5,485
Construction	12,554	6,776	17,563	8,215	2,114	739	47,961
Inventories/Unrecoverable	8,916	0	0	0	0	0	8,916
Total, Facility Costs (Federal and Non-Federal)	25,226	7,892	18,148	8,243	2,114	739	62,362
Other project costs							
Conceptual design cost.[a]	315	0	0	0	0	0	315
Other project-related costs.[b]	454	0	0	0	0	0	454
Total, Other project cost	769	0	0	0	0	0	769
Total, Project Costs (TPC)	25,995	7,892	18,148	8,243	2,114	739	63,131

[a]FY 1992 General Reduction of $2,060,000

[b]Funding of $454,000 in the classification represents Research and Development costs required to develop project and seismic criteria.

7. Related Annual Funding Requirements

	(FY 2000 dollars in thousands)	
	Current Estimate	Previous Estimate
Annual facility operating costs.[a]	1,155	1,155
Annual facility maintenance/repair costs.[b]	1,026	1,026
Programmatic operating expenses directly related to the facility.[c]	4,820	4,820
Capital equipment not related to construction but related to the programmatic effort in the facility.[d]	400	400
GPP or other construction related to the programmatic effort in the facility	200	200
Total Related Annual Funding	7,601	7,601
Total Operating costs (Operating from FY 2000 through FY 2020)	152,020	152,020

[a]Based on projected space recharge of $10.00 per square foot - operating costs of the facility in 2000 are estimated to be $1,155,000 per year including escalation. The funds for these costs are a normal part of the past and current programs.

[b]Labor is estimated for 7.6 Full Time Equivalents to support the operations of approximately $135,000 per year for a total annual cost of $1,026,000. The funds for these personnel are a normal part of the past and current programs.

[c]This estimate is for 30 Hazardous Waste Management operating and support personnel at $4,050,000 in FY 2000, and for an estimated annual cost of $770,000 for chemicals, drums, pumps, spare parts, equipment replacement, etc. The operating funds for these personnel are a normal part of the past and current programs

[d]This is an average annual estimate which includes both the small items needed for continuous operation of the facility and the occasional large item (over $200,000) which cannot be described at this time, but can be predicted as needed to maintain technical excellence in efforts conducted in the facility ($400,000)

00-EXP, Laboratory Facilities Roof and Shielded Area Restoration, 773-A & 772-F, Savannah River Site, Aiken, South Carolina (SR-IN13)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

- None.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 2000 Budget Request *(Preliminary Estimate)*	2Q 2000	4Q 2000	3Q 2000	2Q 2002	14,660 [a]	15,700 [a]

2. Financial Schedule (Operating Expense Funded)

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
2000	734	734	360
2001	450	450	824
Construction			
2000	2,040	2,040	2,040
2001	8,516	8,516	8,516
2002	2,920	2,920	2,920

3. Project Description, Justification and Scope

The main objective of this operating expense funded project is the decontamination of the existing Central Laboratory, Building 772-F, and the Savannah River Technology Center's main laboratory, Building 773-A, at the Savannah River Site, in order that operational and maintenance requirements can be accomplished in a cost-effective manner.

This project has two primary objectives. The first objective is to decontaminate the 772-F Service Floor Shielded Areas, which are high radiation and contamination areas, to a level that would allow operational

[a]The estimate is based on a completed Conceptual Design Report estimate.

and maintenance personnel to access the area as a respirator class area for routine work. Also, it will decontaminate the fan and filter room areas to the contamination level of a Radiological Buffer Area so that frequent access required for maintenance and surveillance can be easily accomplished. The shielded areas of 772-F became contaminated due to corrosion of the high activity drain lines from laboratory modules. A completed project (S-4383) replaced the leaking drain lines with fully jacketed drain lines, with leak detection, to prevent additional contamination from entering the shielded areas. The Building 772-F fan and filter room areas on the service floor have become contaminated during equipment replacement and maintenance in the area. Procedural changes are now in place to prevent these areas from becoming recontaminated. Reducing the levels of radiation and contamination is necessary to provide radiological working conditions in areas such that they may be utilized for their intended purpose, and to decrease the overall radiation exposure to personnel performing tasks in these areas. Personnel performing tasks in respirators will be more productive than when using the presently employed breathing air system. This will result in reduced costs associated with maintaining appropriate radiological controls.

The second objective of the operating expense funded project is to decontaminate the 773-A roof and equipment on the roof and replace the roofing system on portions of Building 773-A such that it may be utilized for its intended purpose. The new roofing system may be similar/equivalent to the original roofing system on 773-A. The Savannah River Technology Center's laboratory 773-A building, which is the main Savannah River Technology Center laboratory building, has been in operation since the early 1950's. Over the years, portions of the roof have become radioactively contaminated due to stack releases and exhaust leaks from process systems. The roof has deteriorated from wear and weather which has resulted in rain water leaks into the building. This project will include decontamination of the roof and equipment on the roof, the removal of existing roofing system, the installation of a cleaned sealed replacement roof, and the replacement and/or repair of associated ventilation equipment. The project will include the necessary work to remove or fix in place transferable contamination that could become airborne or become assimilated into the roof water run off. Systems and procedures are now in place to mitigate the chances of future stack releases and other operational concerns that would recontaminate the roof areas. The area to be covered with the new roofing system per this project is about 60 percent of the roof area of 773-A. This is about 150,000 square feet and based on recent costs for replacement of a clean roof the cost alone would be about $2,400,000.

However, since the roof is deteriorated, contamination exists on portions of the roof, and decontamination of the roof is necessary for operational reasons; the roof will be replaced as part of this project. No roof structural members will need replacing with this project. There will also be incidental repairs to ventilation equipment in order to prevent future contamination of the roof. This will involve replacement of leaking flexible seals with new units of the same type and will add secondary shields on roof duct work to contain leaks in this area. This is a minor part of the project and is not considered a betterment to the ventilation system since repairs are needed for the ventilation system to serve its designated purpose.

Improved radiological working conditions and lower overall radiation exposure to personnel performing tasks on the roof will result from the reduction in levels of radiation and contamination. In addition, the leaking rainwater cleanups and subsequent impacts on laboratory operations will be eliminated as will the potential for the spread of contamination to clean laboratories and the environment.

f funding for this project is not received in FY 2000, the roof areas of 773-A will continue to deteriorate nd increase the potential for the spread of contamination, as well as continue to have a negative impact n laboratory missions, operations, and maintenance. The continuing exposure of personnel to high levels f radiation and contamination for normal maintenance and surveillance activities will also continue to ave a negative impact to personnel safety in both 772-F and 773-A.

he execution of this project will improve present physical working conditions in the Savannah River echnology Center's main laboratory building and in the Analytical Labs 772-F building. These improved workin conditions will put these facilities in a better position to support current and future short- and long-te lab missions.

FY 200 funding will be used to obtain a fixed-price architect/engineer and to initiate and award the subcom icts for the construction phase of the project.

4. Details of Cost Estimate [a]

[a] Other project costs include Radiological Control Operations support for area surveys. It also includes support for work package processing, waste characterization, facility design reviews, temporary modification design and control, and support facility activities related to the project. Startup costs and management of the other project costs is also included in this estimate.

96-EXP, Americium/Curium Vitrification, Savannah River Site, South Carolina (SR-NM01)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin)

Significant Changes

- Detailed design and construction activities on portions of the project have been deferred to allow additional time for the process and equipment development It is estimated that the project will undergo a rebaselining in the 3rd Quarter FY 1999 The rebaselining will provide definitive impacts to the baselines.
- The significant changes to the cost and schedule baselines are a result of the deferment of design and construction activities and additional research and development effort due to the difficulties in the adaptation of a commercial melter to produce stable glass with highly radioactive aqueous feed.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete

2001	10,004	10,004	10,004

3. Project Description, Justification and Scope

This project proposes the vitrification of the F-Canyon americium/curium solutions into borosilicate glass via a melter to be installed in the Multi-Purpose Processing Facility of the 221 F-Canyon. This project would provide for the development and design of the vitrification process, the design of the associated building infrastructure interfaces and the construction and installation of the equipment. This project would provide for the refurbishing of the existing Multi-Purpose Processing Facility to accommodate the new equipment.

Approximately 15,000 liters of solution containing the valuable isotopes 243 Am and 244 Cm have been accumulated in the 221 F-facility from recovery campaigns that began in the mid-1970s. These solutions have been identified in several documents as a vulnerability and, as such, require stabilization. These documents include the Defense Nuclear Facilities Safety Board Recommendation 94-1 and the Plutonium Environment, Safety and Health Vulnerability Assessment Report. There is no reasonable method to transport this material in solution from outside of F-Canyon. Due to intense radiation source of the material, a heavily shielded, remotely operated facility is required for handling and processing. There is no existing operable process to convert this solution to a solid form for safe storage or transport to the National Heavy Element and Advanced Neutron Sources Programs at the Oak Ridge National Laboratory. An analysis of several alternatives has resulted in this project to develop the process to stabilize the solutions by vitrification into a glass form. The facility most suitable for installing vitrification equipment to stabilize this solution is the Multi-Purpose Processing Facility.

An extensive research and development program was implemented at the Savannah River Site to stabilize the americium/curium solution as DOE had no existing stabilization capability. During the development process, the initial melter concept was determined unsuitable. Problems due to geometry (heat distribution) and operations characteristics (continuous feed/pour and offgas generation) were

encountered. Since January 1998, development work has focused on a new melter concept (cylindrical, batch feed/pour). This new concept has been successfully demonstrated on surrogate material resulting in project design recommencement. Based upon the new design a total project rebaseline (cost and schedule) will be complete in June 1999.

The FY 2000 funds will be used to continue design for this project, procure materials, and continue with construction.

4. Details of Cost Estimate.*

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (29.8% of total estimated cost (TEC))	12,024	9,186
Design management costs (4.4% of TEC)	1,775	1,174
Total, engineering, design, inspection, and administration of construction costs (34.2% of TEC)	13,799	10,360
Construction phase		
Other (major utilities/comp items, specialized facilities, etc.)	12,464	0
Removal costs less salvage	0	12,640
Inspection, design and project liaison, testing, checkout and acceptance	2,325	0
Construction management (1.8% of TEC)	746	0
Total, construction costs	15,535	12,640
Contingencies		
Design phase (9.5% of TEC)	3,841	7,400
Construction phase (17.8% of TEC)	7,174	3,644
Total, contingencies (27.3% of TEC)	11,015	11,044
Total, line item costs (TEC)	40,349	34,044

5. Method of Performance

Design and construction shall be performed by the Management and Operating contractor or subcontractor under the direction of the Management and Operating contractor.

* The DOE escalation rates (percent per year) are not segregated due to preconceptual nature of estimate.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Total
Project cost						
Facility cost						
Design	9,490	1,348	2,500	3,929	373	17,640
Construction	2,505	988	1,201	8,011	10,004	22,709
Total facility costs (Federal and Non-Federal)	11,995	2,336	3,701	11,940	10,377	40,349
Other project costs						
R&D necessary to complete project.[a]	8,830	4,909	4,700	1,600	0	20,039
Conceptual design cost.[b]	300	0	2,000	0	0	2,300
NEPA documentation costs.[c]	100	0	0	0	0	100
Other project-related costs.[d]	3,285	2,036	3,068	5,000	3,844	17,233
Total other project costs	12,515	6,945	9,768	6,600	3,844	39,672
Total project costs (TPC)	24,510	9,281	13,469	18,540	14,221	80,021

7. Related Annual Funding Requirements

(FY 2002 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs (staff, utilities, etc.).[e]	2,400	2,400
Annual facility maintenance and repair costs	100	100
Programmatic effort related to facility	0	0
Other annual costs	100	100
Total related annual funding *(operating from FY 2002 through FY 2002)*	2,600	2,600

[a] Includes cost associated with the development of the vitrification process.

[b] The conceptual design was originally completed in November 1995. A new conceptual design is being prepared for an alternate melter system.

[c] Includes cost associated in complying with National Evironmental Policy Act of 1969.

[d] Includes all costs associated with the process development, training, procedures and facility support during construction of the project including Radcon protection.

[e] The operating life of this facility will be approximately 6 months. The staffing costs associated with this are expected to be $2,400,000 (12 FTEs).

Post 2006 Completion

Program Mission

The Post 2006 Completion account includes Environmental Management projects currently planned to require funding beyond FY 2006. Within the Defense Environmental Restoration and Waste Management appropriation, this account includes a significant number of projects at the largest Department of Energy sites--the Hanford site in Washington; the Savannah River site in South Carolina; the Idaho National Engineering and Environmental Laboratory in Idaho; the Oak Ridge Reservation in Tennessee--as well as, the Los Alamos National Laboratory in New Mexico; the Nevada Test Site; and the Waste Isolation Pilot Plant in Carlsbad, New Mexico. A variety of multi-site activities are also funded in this account, including the deposit to the Uranium Enrichment Decontamination and Decommissioning Fund.

After completion of cleanup, it will be necessary for the Environmental Management program to maintain a presence at most sites to monitor, maintain, and provide information on the contained residual contamination. These activities will be necessary to maintain the reduction in risk to human health. Such long-term stewardship will include passive or active controls and, often, treatment of ground water over a long period of time. The extent of long-term stewardship required at a site will reflect the end-state developed in consultation among the Department of Energy and other representatives of the Administration, Congress, Tribal Nations, representatives of regulatory agencies and state and local authorities, representatives of nongovernmental organizations, and interested members of the general public.

Program Goal

Accelerating cleanup and project completion is a central goal of the Environmental Management program. This goal is part of the strategies identified in the *Accelerating Cleanup: Paths To Closure* document, whereby all Environmental Management sites are working aggressively to reduce outyear costs by completing projects as soon and as efficiently as possible, thereby reducing life-cycle costs and schedules. For those sites in the Post 2006 Completion account, treatment will continue for the remaining "legacy" waste streams.

Program Objectives

- Continue to address the most serious environmental risks across the Department of Energy complex and ensure that facilities and activities pose no undue risks to the public and worker safety and health. This includes safe containment of high-level waste tanks at Hanford, Washington and Savannah River, South Carolina; and ensuring the safe storage of spent nuclear fuel at Hanford, Idaho, and Savannah River.
- Continue to be substantially in compliance with applicable environmental and other requirements and meet compliance milestones.
- Begin shipments of transuranic waste from various sites around the complex to the Waste Isolation Pilot Plant in FY 1999 and continue shipping and disposal operations in FY 2000.

Performance Measures

Environmental Management has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected for the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts. These performance measures can be found in the site details that follow.

Significant Accomplishments and Program Shifts

The FY 2000 budget request fully reflects the project-oriented structure that Environmental Management has developed as a key component of the effort to accelerate cleanup and reduce costs. All Environmental Management activities have been organized into projects which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, the Environmental Management sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow.

Albuquerque

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Environmental Management, Post 2006 Completion program, carried out by the Albuquerque Operations Office is to support cleanup of some 2000 potential release sites at the Los Alamos National Laboratory in New Mexico and to provide for legacy waste management activities at the Los Alamos National Laboratory. In addition, the Los Alamos National Laboratory helps provide complex-wide solutions to issues associated with stabilization and storage of plutonium and other nuclear materials.

Program Goal

The Albuquerque Operations Office goal is to complete cleanup of all geographic sites under its cognizance in this account by FY 2006, except for the cleanup of the Los Alamos National Laboratory, which will be complete in FY 2015. Since the Los Alamos National Laboratory has a continuing Defense Programs mission, Environmental Management is planning for any required surveillance and maintenance and ground water monitoring activities to be budgeted for by the Department of Energy's Defense Programs, although this agreement has not been formally discussed with Defense Programs yet. The Los Alamos National Laboratory also manages programs which help reduce the potential for public exposure to nuclear materials through retrieval of excess plutonium-239 neutron sources and stabilization of at-risk excess nuclear materials. The Nuclear Materials Stewardship Project Office assists in the implementation of the Environmental Management Excess Materials Management Plan, which supports accelerated closure of Environmental Management sites and facilities.

Program Objectives

The program objective for the Los Alamos National Laboratory is to have all contaminated sites remediated and all legacy waste disposed of by FY 2015. The Los Alamos National Laboratory's goal is to complete the work-off of legacy mixed low-level waste (approximately 637 m^3) by the end of FY 2004 and transuranic waste by the end of FY 2015. Treatment and disposal of all newly-generated mixed low-level waste and low-level waste as it is generated at the Albuquerque sites is funded by Defense Programs starting in FY 1999. A key initiative at the Los Alamos National Laboratory in FY 1999 will be to retrieve approximately 4,600 m^3 of waste from earth-covered storage pads and place into inspectable storage configurations in accordance with a State of New Mexico compliance order. The FY 2000 budget also provides for continued transuranic waste retrieval and preparation activities at the Los Alamos National Laboratory in support of shipment and disposal at the Waste Isolation Pilot Plant In FY 2000, the environmental restoration program will close out 28 release sites, complete 14 assessments, and decommission two facilities. The development and design processes and

improvements made in the Nuclear Material Facility Stabilization Research and Development Program will manage excess nuclear materials to help accelerate closure of sites and facilities, and the Plutonium-Beryllium Neutron Source Recovery Program will attempt to accelerate recoveries and process the remaining backlog of plutonium-239 neutron sources. The Nuclear Material Stewardship Project Office will coordinate, consolidate, and integrate research and development and other activities to expedite the movement of nuclear materials regarding their packaging and shipping.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by site table, as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Historically, the Albuquerque Operations Office's primary mission has been to manage sites that were involved in the research, development, production, and maintenance of nuclear weapons. The Los Alamos National Laboratory has an ongoing research mission and will maintain most of its 43 square miles of property but is considering transfer of 4,646 acres to the County/Pueblos for industrial, residential, or cultural use. The Los Alamos National Laboratory Environmental Restoration project is scheduled to be completed in FY 2008.
- Received certification (Los Alamos National Laboratory) from the Carlsbad Area Office for transuranic characterization and transportation to the Waste Isolation Pilot Plant (FY 1998).
- Continued monitoring activities and oversight of the New Mexico Agreements-in-Principle (FY 1998/FY 1999).

Environmental Restoration

- Completed assessment activities for 71 potential release sites and closed out 24 potential release sites (FY 1998). Complete assessments for 34 potential release sites, and close out 18 potential release sites (FY 1999).
- Completed work on 200 No Further Action proposals submitted in prior years (FY 1998).
- Decontaminated and decommissioned four structures (FY 1998) Decontaminate and decommission one additional structure (FY 1999).
- Completed two deep wells (FY 1998), and will install four alluvial aquifer wells and drill two additional deep wells (FY 1999).
- Submitted to the regulators the Pajarito Canyon Work Plan, the Resource Conservation and Recovery Act Feasibility Investigation Report for the County Airport Landfill, and a Corrective Measures Study Plan for Technical Area 16, Outfall 260 (FY 1998). Complete and plan to submit in the summer of 1999 the Environmental Restoration Report to Congress in response to Public Law 105-119 (Land Transfer) (FY 1999).

Waste Management - Legacy Waste

- Completed the Site Treatment Plan Annual Update Report and completed compliance monitoring (FY 1998).
- Characterized and disposed of 135.5 m^3 of mixed low-level waste (FY 1998) and 79 m^3 more of legacy mixed low-level waste (FY 1999).
- Retrieved legacy transuranic waste from Pad 1 and placed it into compliant storage (FY 1998), and will retrieve legacy transuranic waste from Pad 4 under earth cover and place into compliant storage (FY 1999).
- Installed characterization gloveboxes in the RAMROD facility (FY 1998/FY 1999).
- Upgrade the Los Alamos radioactive liquid wastewater treatment facility (FY 1998/FY 1999).
- Prepared, certified, packaged, and made road-ready 17 shipments of the Los Alamos National Laboratory legacy transuranic waste for shipment to the Waste Isolation Pilot Plant (FY 1998). Continue to prepare and certify transuranic waste for shipment to the Waste Isolation Pilot Plant (FY 1999).
- Treated and disposed of legacy mixed low-level waste according to the Site Treatment Plan (FY 1998/FY 1999).
- Transfer the Los Alamos National Laboratory newly generated new waste program to the Defense Programs (FY 1999).

Nuclear Material Facility Stabilization

- Continued the Research and Development program core technology component. Specific activities:
  - Completed many of the core technology projects needed to characterize materials science of stored materials.
  - Completed salt distillation technology for use at the Rocky Flats Environmental Technology Site.
  - Transferred pyrolysis technology to Hanford.
  - Began additional research and development activities identified by the Research and Development Committee in support of the Defense Nuclear Facilities Safety Board Recommendation 94-1 implementation (FY 1998).
- Continued activities to stabilize at-risk excess nuclear materials and to accelerate site closures in support of the Defense Nuclear Facilities Safety Board Recommendation 94-1 (FY 1998).
- Continued to analyze samples in support of shelf-life studies. The data is used in support of the exercise to develop a new plutonium storage standard (FY 1998).
- Continued experiments on the thermal conditions inside shipping containers with materials in food pack/volrath cans (FY 1998).
- Completed stabilization demonstrations for ash and graphite fines (FY 1998).

- Transferred residue "washing" technology to the Rocky Flats Environmental Technology Site (FY 1998).
- Began additional research and development activities as identified by the Research and Development Committee in support of the Defense Nuclear Facilities Safety Board Recommendation 94-1 implementation (FY 1998).
- Deliver two polycube pyrolysis units to Hanford (FY 1999).
- Continue shelf-life studies and surveillance (FY 1999).

Nuclear Criticality Predictability Program

- Evaluated data generated by the Nuclear Criticality Predictability Program at the Los Alamos National Laboratory and processed data in support of the Defense Nuclear Facilities Safety Board Recommendation 97-2 (FY 1998).
- Continued maintenance of production analytical software; continued training in the use of software systems; remediated code and nuclear data to reduce analytical uncertainties; validated new methods and technology; and provided technical support to DOE to plan and conduct its Nuclear Criticality Program (FY 1998/FY 1999).

Nuclear Materials Stewardship Project

- Supported the EM Nuclear Materials Integration Project with expertise in materials forms, locations, and inventories (FY 1998). Contribute to Trade Studies of material disposition options under Nuclear Material Integration (FY 1999).
- Prepared a complex-wide transportation plan for nuclear materials undergoing stabilization (FY 1998). Coordinate material transportation issues complex-wide for nuclear material undergoing stabilization and disposition (FY 1999).
- Coordinated preparation of a new plutonium storage standard (FY 1998). Publish new plutonium storage standard to support stabilization and disposition activities (FY 1999).

Plutonium/Beryllium Sources

- Removed over 1,100 plutonium-239-bearing neutron sources from the private and public sector since 1979. Approximately 300 such sources remain to be recovered (FY 1999).

Site Description

Los Alamos National Laboratory

The Los Alamos National Laboratory encompasses over 43 square miles in northern New Mexico and conducts major programs in multiple areas, including applied research in nuclear and conventional weapons development, nuclear fission and fusion, nuclear safeguards and security, and environmental and energy research. The waste produced includes low-level, mixed, hazardous, transuranic, sanitary waste streams, and small amounts of other waste from research. The primary waste management activities include storage, treatment, and disposal of transuranic and mixed low-level waste. All newly generated waste activities are transferred to the Office of Defense Programs in FY 1999. The Laboratory is comprised of over 2,000 release sites and about 130 facilities. Through FY 1998, remediation of 1,395 release sites and decommissioning of 41 facilities was completed. Completion of additional release sites and facilities are planned as follows: 9 release sites and one facility in FY 1999, and 28 release sites and two facilities in FY 2000. Because of its expertise with nuclear materials, the Los Alamos National Laboratory has been designated the lead laboratory for research and development efforts to support the Department's response to Defense Nuclear Facilities Safety Board Recommendation 94-1. In this capacity, the Los Alamos National Laboratory provides solutions to complex-wide technical and operational issues associated with stabilization and storage of plutonium and other nuclear materials.

Albuquerque Operations Office

The Department of Energy-Albuquerque manages, coordinates, tracks, and assists in the implementation of programs at the Los Alamos National Laboratory. Legal drivers at Albuquerque include the Resource Conservation and Recovery Act; Comprehensive Environmental Response, Compensation, and Liability Act; National Environmental Policy Act; State laws and codes; and DOE Orders.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Los Alamos National Laboratory is managed through a performance-based management and operating contract to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. Approximately 30 percent of the projects included in this section of the budget will have an independent cost review of the scope. The funds requested for FY 2000 are appropriate to perform the activities based on a historical level of effort cost.

AL004 / New Mexico Agreement in Principle

The New Mexico Agreement-in-Principle provides funding through a grant for the support of New Mexico's oversight and monitoring of the Department of Energy compliance with applicable environmental laws and regulations for the Los Alamos National Laboratory; Sandia National Laboratory, New Mexico; Lovelace Biomedical and Environmental Research Institute; and the Waste Isolation Pilot Plant. The New Mexico Environmental Department employees supporting Agreement-in-Principle activities are located on-site at the Department of Energy facilities in Los Alamos and Albuquerque and at the New Mexico Environmental Department in Santa Fe.

- Funds provide for surface water, ground water, air and soil monitoring activities.
- Preliminary review of environmental documents to expedite regulatory review process, which impacts cleanup schedules at the National Laboratories.
- Technical support/advice to Los Alamos and Sandia Citizens Advisory Boards.
- Technical support/advice to four Los Alamos Accord Pueblos.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Support/review of the Paths to Closure Plan and additional environmental documents.			
■ Site-sponsored public outreach activities at all three facilities.			
■ Increase public willingness to accept additional mission/scope at both National Laboratories.			
AL004	1,650	980	950

Metrics
No quantifiable corporate performance measures are associated with this project.

AL008 / Nuclear Material Facility Stabilization Research and Development

The Los Alamos National Laboratory is performing research and development activities as part of the Department's efforts to stabilize at-risk excess nuclear materials and to accelerate site closures. This program is being carried out primarily for the Department's response to the Defense Nuclear Facilities Safety Board Recommendation 94-1, which is the responsibility of the Office of Nuclear Material and Facility Stabilization. This recommendation focuses on accelerating the Department's efforts to reduce health and safety risks to workers, the public, and the environment. The Office of Nuclear Material and Facility Stabilization continues to direct the stabilization technology development activities under this project in coordination with the Nuclear Materials Stewardship Project Office in Albuquerque.

- Supports process development implementation to expedite removal of plutonium inventory from Rocky Flats and to expedite consolidation of excess plutonium inventories to reduce mortgage costs.
- Develop processes and improvements to support integrated management programs for excess nuclear materials.
- Design research experiments to address long-term technology issues (e.g., corrosion, radiolysis, etc.) in order to reduce technology and safety and health risks.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue activities in support of the Defense Nuclear Facilities Safety Board Recommendation 94-1 Implementation Plan.			
■ Continue stabilization technology development, technology transfer, and implementation support activities.			
■ Install neutron scattering instrument for demonstrating neutron scattering.			
■ Continue shelf-life studies, surveillance, and core technology functions.			
AL008	14,100	12,920	12,900

Metrics
No quantifiable corporate performance measures are associated with this project.

AL009 / LANL Environmental Restoration

This project protects human health and the environment from hazards posed by inactive and surplus DOE facilities and contaminated lands. The primary drivers for this project are the Laboratory's permit for corrective actions under the Hazardous and Solid Waste Amendments to the Resource Conservation and Recovery Act and concerned stakeholders. There are 2,122 potential release sites, including sites on private, county, Federal, and DOE properties.

- Complete assessment of 14 potential release sites.
- Submit 28 potential release sites for No Further Action.
- Implement the Hydrogeologic Work Plan.
- Continue remedial action at Technical Area (TA)-21, TA-15, TA-16, and TA-10 sites. The Los Alamos Land Transfer activities will be partially funded, with one site assessment and one site completion.

AL013 / LANL Waste Management - Legacy Waste

This project provides for the treatment, storage, or disposal of all legacy transuranic waste, including mixed transuranic waste and mixed low-level waste generated at the Los Alamos National Laboratory. The waste was generated at 33 technical areas and is treated, stored, and disposed in compliance with applicable Federal and state requirements.

- Complete the Site Treatment Plan, update annual report, and perform compliance monitoring.
- Dispose of legacy mixed low-level waste
- Store, sort, segregate, and repackage transuranic waste to reduce amount of transuranic waste in inventory.
- The State of New Mexico certified 194 cubic meters in Lot 1 as non-mixed transuranic waste in FY 1998, which can be shipped when the Waste Isolation Pilot Plant begins operation. No additional legacy transuranic waste will be fully certified.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Retrieve legacy transuranic waste under earthen cover and place into storage awaiting characterization.

AL026 / Pu/Beryllium Sources

The Los Alamos National Laboratory conducts programs for the management of nuclear materials, including the Plutonium-Beryllium Neutron Source Recovery Project. The Neutron Source Recovery Project reduces the potential for public exposure to nuclear materials through the retrieval of excess plutonium neutron sources.

- Accelerate recoveries and process the remaining backlog of Pu-239 neutron sources.
- Develop implementation plan to integrate Plutonium/Beryllium capabilities with the Non-Defense funded Radioactive Source Recovery Program to address the Department's responsibilities for neutron sources.

AL027 / Nuclear Criticality

This project funded a portion of the Department's Nuclear Criticality Predictability Program to address implementation of the Defense Nuclear Facilities Safety Board Recommendation 97-2. The program was centralized under the Multi-Site Budget beginning in FY 1999.

- Program activities described in the Multi-Site Budget.

AL027	225	0	0

Metrics
No quantifiable corporate performance measures are associated with this project.

AL028 / Nuclear Material Stewardship Project Office

This project is designed to leverage field expertise in Nuclear Materials management in order to consolidate and expedite the movement of plutonium and other nuclear materials, thus allowing for accelerated shutdown of Environmental Management facilities.

- Integrate and coordinate research and development activities supporting Nuclear Materials Stewardship.
- Integrate research and development support to the Defense Nuclear Facilities Safety Board Recommendations 94-1 and 97-1, with needs identified by the Nuclear Material Integration Project.
- Produce and maintain the stewardship Integrated Research and Development Plan, providing multi-year identification of research and development needs, integration and planning activities, priorities, resource requirements, and issues.
- Integrate and coordinate nuclear material packaging and shipping activities.
- Chair the cross-site, cross-program Nuclear Materials Packaging and Shipping Committee.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Produce and maintain the Stewardship Integrated Transportation and Packaging Plan, providing multi-year identification of transportation and packaging needs, integration and planning activities, priorities, resource requirements, and issues.			
■ Lead and support the proposed trade study of the potential benefits/tradeoffs of disposing of excess strontium and cesium sources, standards and technical materials.			
■ Define and establish the National Isotope and Sealed Source Management Office. The scope will be to integrate, coordinate, and facilitate the planning for management (storage, recycle, and disposition) of the Department's excess nuclear sources, standards, and technical materials.			
■ Support accelerated site closure at locations such as Rocky Flats through optimization of material management solutions.			
■ Continue coordination of nuclear material transportation and storage issues.

Carlsbad

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Environmental Management, Post FY 2006 Completion program, carried out by the Carlsbad Area Office, is to protect human health and the environment by opening and operating the Waste Isolation Pilot Plant for safe disposal of transuranic waste and by establishing an effective system for management of transuranic waste from generation to disposal. The disposal facility is located in southeastern New Mexico near Carlsbad, 2,150 feet (655 meters) underground in bedded salt. Transuranic waste is a by-product of the nation's nuclear weapons research, development, production, and decommissioning activities. Originally, transuranic waste was buried as low-level waste in Department of Energy constructed landfills. Since 1970, however, transuranic waste has been placed in retrievable storage pending the completion and opening of a geologic disposal facility. The Congress authorized the Waste Isolation Pilot Plant in 1979 (Public Law 96-164) as a research project to prove the feasibility of deep geological disposal for transuranic waste to protect human health and the environment. In October 1992, Congress passed the Waste Isolation Pilot Plant Land Withdrawal Act (Public Law 102-579), which permanently transferred public lands to the Department of Energy and defined the total capacity of the Waste Isolation Pilot Plant to be 6,200,000 cubic feet (175,600 m^3) of transuranic waste. Since October 1992, the Department has focused on activities directly related to the completion of the legislative prerequisites and to the demonstration of compliance with long-term disposal regulations and Resource Conservation and Recovery Act regulations in order to reach a disposal decision. In September 1996, Congress amended the Waste Isolation Pilot Plant Land Withdrawal Act to delete duplication in regulatory compliance and to streamline provisions of the Act. The Act, as amended, also authorizes the Department to annually provide $20,000,000 plus an annual Consumer Price Index increase, for 14 years starting in FY 1998, to the State of New Mexico for economic impact assistance.

Program Goal

The primary goal of the program is to meet all regulatory and technical requirements to begin disposal operations in the Waste Isolation Pilot Plant at the earliest opportunity. The Waste Isolation Pilot Plant startup is a key element in the Environmental Management strategy for disposal of transuranic waste under the Department of Energy control. Many of the Federal Facility Compliance Act consent orders and agreements between the States, agencies, and the transuranic waste sites are based on the assumption that the facility will receive transuranic waste in the immediate future. The Department remains committed to meeting all the near-term transuranic waste compliance agreements included in the various States Agreements. The transportation and disposal system capacity is scheduled to be available to meet the requirements of the compliance agreements; however, characterization and waste loading process adjustments will be required by the transuranic waste sites to meet recent requirements imposed by the State of New Mexico. Site processes are starting to reflect these procedural changes. In particular, the Idaho National Engineering and Environmental Laboratory is working to ensure that the 3,100 m^3 of transuranic waste will be disposed at the Waste Isolation Pilot Plant by December 31, 2002. By FY 2006, the Waste Isolation Pilot Plant expects to have disposed of approximately 40,000 m^3 of contact-handled transuranic waste and approximately 1,700 m^3 of remote-handled transuranic waste. Current planning has all transuranic waste at the Nevada Test Site, the Mound Plant, and selected small quantity sites disposed by FY 2006. The total volumes disposed by FY 2006 represent 40 percent of the current inventory of 109,000 m^3 of transuranic waste now stored at the sites, and 24 percent of the total capacity of 175,600 m^3. During the planned 35-year disposal phase, waste will be received from 10 major sites and 13 small quantity sites. The disposal phase is followed by a five-year decommissioning and dismantlement phase.

The planned end state for the Waste Isolation Pilot Plant is to have all qualified Department of Energy transuranic waste disposed and to decommission and dismantle all surface facilities at the Waste Isolation Pilot Plant site. Life-cycle costs in FY 1998 dollars for the period FY 1997-2006 are $1,825,300,000 and post FY 2006 costs are expected to be $5,897,548,000. The key risk reduction factor that is addressed by the Waste Isolation Pilot Plant is the elimination of potential hazards to the public, workers, and environment by permanently disposing transuranic waste in a deep underground repository. The Privatization Appropriation for FY 1998 included $21,000,000 for capital equipment for shipping containers such as the Transuranic Waste Package Transporter II necessary to fully implement the contact-handled transuranic waste transportation system. The Privatization Appropriation for FY 1999 included $19,605,000 to develop and fabricate the 72B cask, which will be used to transport remote-handled transuranic waste by the selected privatized contractor. These two privatization projects are expected to save more than $290,000,000 in the Waste Isolation Pilot Plant funding requirements over the next 35 years.

Program Objectives

The Environmental Management Program expects the Waste Isolation Pilot Plant to meet transuranic waste disposal goals by ramping up to a receipt rate of 14 contact-handled transuranic waste shipments per week by the end of FY 2000 and 17 shipments per week by December 31, 2000. The expected transuranic waste shipment capacity will increase from about 165 in FY 1999 to about 422 in FY 2000. The expected transuranic waste disposal capability will increase from about 1,320 m^3 in FY 1999 to about 3,376 m^3 in FY 2000. The facility is also relying on privatization of contact-handled and remote-handled transuranic waste transportation services to reduce costs. There are no additional major projects planned for the Waste Isolation Pilot Plant Site. Future construction needs will be covered under the general plant project funding.

The Carlsbad Area Office vision is to serve as the model for public management of transuranic waste and to be perceived by stakeholders as setting new standards of excellence. The Carlsbad Area Office funds a wide variety of institutional programs that provide economic impact assistance and operational oversight. Institutional support provides additional funding for other activities such as the Environmental Evaluation Group, Carlsbad Environmental Monitoring and Research Center, Western Governors' Association, Southern States Energy Board, cooperative agreements with Indian Tribes, New Mexico Emergency Response, New Mexico Impact Assistance, and other activities. Funding for these activities totals $31,700,000 in FY 2000. Prior year funding was $35,200,000 in FY 1999, and $31,100,000 in FY 1998.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by site table; as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Issued the Waste Isolation Pilot Plant Supplemental Environmental Impact Statement Record of Decision for disposal operations on January 16, 1998 (FY 1998).
- Declared the Waste Isolation Pilot Plant Operational Readiness on March 26, 1998 (FY 1998).
- Received Environmental Protection Agency Certification of the Waste Isolation Pilot Plant compliance with disposal regulations on May 13, 1998 (FY 1998).
- Notified Congress on May 13, 1998, of intent to operate the Waste Isolation Pilot Plant as a disposal facility (FY 1998).
- Received the draft Waste Isolation Pilot Plant Resource Conservation and Recovery Act Part B permit from the New Mexico Environment Department on May 15, 1998 (FY 1998).
- Received notification from the Defense Nuclear Facilities Safety Board that the Waste Isolation Pilot Plant can be operated safely on June 3, 1998 (FY 1998).
- Provided $20,000,000 to the State of New Mexico for impact assistance (FY 1998).

- Received the State of New Mexico letter of determination that the Los Alamos National Laboratory waste proposed for initial shipment to the Waste Isolation Pilot Plant is not subject to the Resource Conservation and Recovery Act in December 1998 (FY 1999).
- Obtain the Environmental Protection Agency approval of the Rocky Flats Environmental Technology Site and the Idaho National Engineering and Environmental Laboratory Quality Assurance and Waste Characterization Programs (FY 1999).
- Award Contact-Handled Transuranic Waste Transportation Services privatization contract (FY 1999).
- Receive favorable litigation decisions and initiate transuranic waste shipments to the Waste Isolation Pilot Plant (FY 1999).
- Begin to receive waste from the transuranic waste generator sites at an initial rate of one shipment per week increasing to five shipments per week by the end of FY 1999 (FY 1999).
- Receive the Waste Isolation Pilot Plant Resource Conservation and Recovery Act Part B final permit from the State of New Mexico (FY 1999)
- Award Remote-Handled Transuranic Waste Transportation Services privatization contract (FY 1999 or early FY 2000).
- Provide $20,300,000 to the State of New Mexico for impact assistance (FY 1999).

Program Shifts

- The June 1998 "Accelerating Cleanup: Paths to Closure" included schedules and performance metrics based upon opening the Waste Isolation Pilot Plant in late May or June of FY 1998. These assumptions were based on the need to meet current transuranic waste sites' compliance agreements wherever possible.
- The Department of Energy anticipates that the State of New Mexico will issue to the Waste Isolation Pilot Plant a final Resource Conservation and Recovery Act Part B Permit for disposal of hazardous (mixed) transuranic waste during FY 1999 At the current time, the Department of Energy is only eligible to dispose of non-mixed transuranic waste at the Waste Isolation Pilot Plant until a Resource Conservation and Recovery Act permit is granted
- On May 13, 1998, the Environmental Protection Agency issued a final rulemaking that certified that the Waste Isolation Pilot Plant complies with the Agency's radioactive waste disposal regulations Following Environmental Protection Agency's certification of the Waste Isolation Pilot Plant, the Department of Energy informed Congress of the Department's intent to begin disposal operations at the facility since all the Waste Isolation Pilot Plant Land Withdrawal Act disposal prerequisites had been completed. The start of disposal operations at the Waste Isolation Pilot Plant has been delayed pending the resolution of a 1992 Permanent Injunction for shipping waste to the Waste Isolation Pilot Plant for the now canceled test phase. Also, on July 17, 1998, three lawsuits were filed against the Environmental Protection Agency over its decision to certify the Waste Isolation Pilot Plant for radioactive waste disposal operations.

- Within these constraints, the Department remains committed to doing all it can to meet its obligations to the various States for the cleanup of its sites. Disposal operations are expected to begin in FY 1999, provided that all legal constraints have been resolved.

Site Description

Waste Isolation Pilot Plant

The Waste Isolation Pilot Plant facility is comprised of surface support buildings, a waste-handling building, four shafts, and the mined underground operations area. The facility is designed for deep geological disposal of defense-generated transuranic waste resulting from nuclear weapons production, dismantlement, and site cleanup. The repository is located in southeastern New Mexico near Carlsbad, 2,150 feet (655 meters) underground in bedded salt. The bedded salt where transuranic waste will be disposed has been stable for over 225 million years, and, through extensive computer modeling and experiments, the Department of Energy has successfully demonstrated to the Environmental Protection Agency that the salt will remain stable for at least the next 10,000 years. On May 13, 1998, the Environmental Protection Agency certified that the Waste Isolation Pilot Plant complies with the radioactive waste disposal standards, and the Department of Energy notified Congress that the Waste Isolation Pilot Plant was ready to begin disposal operations. However, only non-mixed transuranic waste will be disposed until the State of New Mexico has issued a Resource Conservation and Recovery Act Part B Permit.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The managing and operating contractor, Westinghouse Waste Isolation Division, accounts for approximately 50 percent of the Carlsbad Area Office funding requirements. Westinghouse operates the Waste Isolation Pilot Plant through a contract that is nearly 90 percent Fixed Price. The remaining funding contracting vehicles are dependent upon existing contracting mechanisms, such as national laboratories, grants, and agreements in principle. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. All of the projects included in this section of the budget have had an independent review through the Carlsbad Area Office's program planning process. There are no projects covered by the Office of Management and Budget A-11, Part B, in this section of the budget.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
CAO-1 / WIPP Base Operations			
This project provides for all activities required to maintain waste receipt and disposal operations including: mining, waste handling, surface and underground facility operations, compliance with State and Federal laws related to safety and health and operational permits, and administrative infrastructure. Also included is the legislative commitment to pay Impact Assistance to the State of New Mexico ($20,900,000) in FY 2000.			
■ Continue receiving waste from the transuranic waste generator sites.			
■ Transuranic waste shipment capability will increase from about 165 in FY 1999 (1,320 m^3) to about 422 in FY 2000 (3,376 m^3.)			
CAO-1	101,979	106,621	111,698
Metrics			
Transuranic Waste			
TRU Inventory - Interim Storage (m^3)			
Disposal Capability - DOE On-Site (m^3)	0.0	1,320.0	3,376.0

CAO-2 / WIPP Disposal Phase Certification and Experimental Program

This project includes experimental and performance assessment work in support of the recertification and operational performance improvements for the Waste Isolation Pilot Plant site and the national transuranic waste system; and establishing a focused international nuclear waste disposal research and development program.

- Continue to develop and maintain an up-to-date performance assessment capability to support the Waste Isolation Pilot Plant recertification in FY 2003.
- Conduct monitoring, confirmatory testing, and experimental activities to support the Waste Isolation Pilot Plant recertification in FY 2003.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue Actinide Source Term tests at the Los Alamos National Laboratory and Gas Generation tests at Argonne National Laboratory-West/Idaho National Engineering and Environmental Laboratory in support of the Environmental Protection Agency Recertification.			
CAO-2	39,862	37,387	35,295

Metrics
No quantifiable corporate performance measures are associated with this project.

CAO-3 / WIPP Transportation

This project includes all activities related to transportation, such as Emergency Response training, establishing and opening transportation corridors; all contact-handled and remote-handled packaging initiatives; carrier services for transporting waste to the Waste Isolation Pilot Plant; and stakeholder interfaces with the Western Governors Association, the Southern States Energy Board and Native American Tribes.

■ Provide transportation services for the shipment to the Waste Isolation Pilot Plant for contact-handled transuranic waste from the waste generator sites.			
CAO-3	9,186	17,494	19,222

Metrics
No quantifiable corporate performance measures are associated with this project.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
CAO-4 / WIPP Transuranic Waste Sites Integration and Preparation			
This project includes program integration and infrastructure activities required to prepare the Department of Energy transuranic waste complex for waste shipments to the Waste Isolation Pilot Plant including all certification-like activities performed by the Carlsbad Area Office. This project also includes the Secretary of Energy commitments to outside stakeholders such as: the Carlsbad Environmental Monitoring and Research Center, the Technical Training Center, as well as oversight commitments to the National Academy of Sciences and the Environmental Evaluation Group. Also included are infrastructure support costs such as the Interagency Agreement with the Bureau of Land Management.			
■ Continue quality assurance and waste certification audit activities to certify transuranic waste shipments to the Waste Isolation Pilot Plant.			
■ Continue remote-handled integration activities to ensure receipt of remote-handled waste in FY 2002.			
CAO-4	22,673	23,902	20,189
Metrics No quantifiable corporate performance measures are associated with this project.			
Total, Carlsbad Area Office	173,700	185,404	186,404

Explanation of Funding Changes From FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
CAO-1 / WIPP Base Operations	
■ Increase contact-handled transuranic waste receiving capabilities at the Waste Isolation Pilot Plant from 1,320 m^3 in FY 1999 to 3,376 m^3 in FY 2000; and full panel mining operations, and inflationary increase of $600,000 over the FY 1999 payment to the State for Economic Impact Assistance.	5,077
CAO-2 / WIPP Disposal Phase Certification and Experimental Program	
■ Decrease occurs as the program decides not to accelerate the completion of simulation model upgrades in support of first recertification, and also reflects reduced experimental program activities.	-2,092
CAO-3 / WIPP Transportation	
■ Increase transportation rates from five shipments per week to 14 shipments per week by the end of FY 2000 and 17 shipments per week by December 31, 2000.	1,728
CAO-4 / WIPP Transuranic Waste Sites Integration and Preparation	
■ Decrease reflects completion of most of the reports mandated by the Waste Isolation Pilot Plant Land Withdrawal Act and efficiencies attained from a full year of operational status.	-3,713
Total Funding Change, Carlsbad	1,000

Idaho

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Post 2006 Completion, Environmental Management account, carried out by the Idaho National Engineering and Environmental Laboratory is to safely manage and dispose of high-level radioactive waste, transuranic waste, and spent nuclear fuel, while maintaining full compliance with applicable requirements and agreements, particularly the Idaho Settlement Agreement, and completion of the environmental restoration activities under the Federal Facility Agreement and Consent Order.

Program Goal

The Environmental Management work is projected to continue at the Idaho National Engineering and Environmental Laboratory through 2060. The primary goal of the Post 2006 completion account is to meet the Idaho Settlement Agreement, which includes treatment, storage, and disposal operations for transuranic waste, high-level waste, and mixed waste, dry storage and transfer of spent nuclear fuel, closure of remaining Comprehensive Environmental Response, Compensation, and Liability Act remediation sites and surveillance and maintenance of contaminated facilities until deactivation, decontamination and decommissioning, or facility disposal can be accomplished. Necessary infrastructure upgrades will be performed to support these ongoing activities. The Idaho Settlement Agreement requires spent nuclear fuel to be packaged for transfer and removed from Idaho by January 1, 2035. Idaho is the "lead laboratory" for integrating DOE-owned spent nuclear fuel activities and is the interface with the DOE Office of Civilian Radioactive Waste Management. A key goal of this program is to assure that all DOE owned fuel will be acceptable for disposal in a geologic repository. The budget request assumes both productivity improvements and projected efficiencies

Program Objectives

The objective of this program is to complete all remediation efforts for the site under the Federal Facility Agreement and Consent Order. The program also will provide for interim dry storage of spent nuclear fuel produced for the Idaho National Engineering and Environmental Laboratory reactors, foreign and domestic research reactors, and other DOE site reactors, and in addition, manage spent nuclear fuel at Ft. St. Vrain in Colorado. The objective is also to provide for safe storage, pretreatment, and disposal of high-level waste, low-level waste, mixed low-level waste, and mixed transuranic waste generated by waste treatment and decontamination activities at the Idaho Nuclear Technology and Engineering Center All of the legacy high-level waste has been pretreated and converted to a calcine, with only sodium-bearing liquid waste remaining in the tank farm from decontamination and waste treatment activities. The high-level waste project objective is to continue calcining liquid waste through the first half of FY 1999, and then place the calciner in standby, pending a decision on upgrading it to meet

regulatory requirements or the selection of an alternative technology. The high-level waste project objective provides for continued management through safe storage, liquid evaporation, and continued decontamination activities (debris treatment and filter leaching).

In addition the following objectives are governed by the Settlement Agreement (October 17, 1995) with the State of Idaho:

- The high-level waste activities will treat sodium-bearing waste by 2012.
- The Department of Energy will empty the 11 High-Level Waste Tanks by 2012. Under a Consent Order modification signed in FY 1998, the Department of Energy will empty the five pillar and panel tanks by FY 2003 and accelerate their closure several years earlier than 2012.
- Submit a closure plan for at least one tank by December 2000.
- By December 2035, all high-level waste at the Idaho National Engineering and Environmental Laboratory will be treated and road ready for shipment out of Idaho.
- The Department of Energy will begin negotiations with the State in December 1999 on final plan and schedule for treatment of high-level waste, following the development of the Idaho National Engineering and Environmental Laboratory High-Level Waste and Facility Disposition Environmental Impact Statement.
- Decision on future calciner operations by June 2000.
- The Department of Energy will begin operating a new privatized dry spent nuclear fuel storage facility by July 1, 2003, and complete the transfer of all spent fuel from wet storage facilities to dry interim storage by December 31, 2023.
- The Department of Energy will remove all spent fuel from Idaho by January 1, 2035.
- The Advanced Mixed Waste Treatment Project will meet the Idaho Settlement Agreement through awarding the Advanced Mixed Waste Treatment Project contract (actual award December 1996); completing construction of the Advanced Mixed Waste Treatment Project by December 31, 2002; commencing operations by March 31, 2003; begin shipping a running average of at least 2,000 m^3 of transuranic waste out of the State of Idaho each year after January 1, 2003; and completing the shipment of 65,000 m^3 of transuranic waste to the Waste Isolation Pilot Plant, or another such facility designated by DOE, by a target date of December 31, 2015, but no later than December 31, 2018.

By FY 2006 the Idaho National Engineering and Environmental Laboratory plans to accomplish the following objectives:

- Over 40 percent of the Department of Energy's spent nuclear fuel in fuel handling units as counted in FY 1998 will be transferred to dry interim storage.
- Approximately 19,500 m^3 of stored transuranic and alpha low-level mixed waste will be treated by the Advanced Mixed Waste Treatment Project and shipped to the Waste Isolation Pilot Plant or another appropriate facility for disposal.
- Newly generated mixed waste will be treated in the Advanced Mixed Waste Treatment Project facility, at other Department of Energy facilities, or at commercial treatment facilities.

- All Records of Decision for environmental restoration work at the Idaho National Engineering and Environmental Laboratory should be negotiated by FY 2003.
- 100 percent of environmental restoration assessments, and 90 percent of release sites will be completed.
- Two High-Level Liquid Waste Tanks will be closed.

A major objective of the Environmental Management Program at the Idaho National Engineering and Environmental Laboratory is to use technology development to ensure completion of the primary goals. These technologies will accelerate cleanup schedules and reduce costs. Innovative technologies continue to be developed to meet the Idaho National Engineering and Environmental Laboratory needs and will be demonstrated and implemented as necessary to meet schedules and budgets. Examples of these technologies include:

- Process studies to increase the sodium bearing radioactive waste throughput at the calciner facility.
- Demonstrations of solvent extraction processes to remove transuranic waste and strontium components from sodium bearing wastes.
- Development of pilot scale vitrification methods, including development work on cross flow filtration system to remove particulates from the waste stream.
- Demonstration of advanced transuranic waste characterization systems needed to improve throughput and increase efficiency.
- Use of the light duty utility arm to characterize tank heels.
- Deployment of the Rapid Geophysical Surveyor for ultra-high resolution geophysical mapping and adaptation of the dig face characterization instrumentation with the Global Positioning Radiometric Scanner System for broad area radiation mapping.
- Remote Excavator for removal of unexploded ordnance.
- Demonstration of in situ bioremediation of organic contaminants at an injection well.
- Stabilization of the Waste Experimental Reduction Facility fly ash and other low activity waste.
- Passive Vapor Vacuum Extraction for removal of below surface organic vapors.
- Robotics and advanced systems for waste handling and deactivation and decommissioning.
- Decommissioning of highly contaminated fuel pools and associated structures using innovative technologies.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table; as well as at a project level in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Initiated remedial activities associated with the comprehensive Record of Decision for the Test Reactor Area (FY 1998), and complete remedial actions and initiate operations and maintenance activities at Operable Unit 2-13 (FY 1999) Waste Area Group 2.
- Completed two Facility Assessments and four Facility/Structure Decontamination and Decommissionings completions (FY 1998); complete five Facility Assessment and eight Facility/Structure Decontamination and Decommissioning completions (FY 1999).
- Continued the Vacuum Vapor Extraction Remedial Action and ground water and Pad A monitoring (FY 1998, Waste Area Group 7).
- Developed plan for Stage 1 subsurface exploration of Pit 9 to obtain materials for bench-scale treatability studies for Transuranic Pits and Trenches Projects (FY 1998 Waste Area Group 7); conduct bench-scale treatability studies on waste materials from Pit 9 and characterization concerning waste form and contaminate migration for Transuranic Pits and Trenches (Operable unit - 7-13/14) (FY 1999).
- Developed Work Plan Addendum for Operable Units 7 13/14 (FY 1998 Waste Area Group 7).
- Continued Meteorologic Monitoring, Seismic Monitoring, Emergency Preparedness, Environmental Monitoring, Experimental Breeder Reactor-1, Architect/Engineer and Cost Estimating Standards, and Integrated Facility Planning Activities (FY 1998/FY 1999).
- Completed a limited portion of backlog of maintenance and repair safety and health correction items (FY 1998/FY 1999).
- Completed safety and health corrective action plan for July 1998, Idaho National Engineering and Environmental Laboratory Worker Fatility (FY 1999).
- Completed calcining of high-level waste in FY 1998, several months earlier than the Settlement Agreement milestone.
- Initiated calcining of the sodium bearing waste in FY 1998, several years earlier than the Settlement Agreement Milestone, and continued to process liquid waste during FY 1998 and first half of FY 1999.
- Received foreign research reactor fuel shipments safely and without incident (FY 1998).
- Carry out Idaho Nuclear Technology and Engineering Center (formerly Idaho Chemical Processing Plant) infrastructure operations (e.g., provide steam for 130 buildings, 147,000 kilowatt hours per bay of power, and 2,500,000 gallons of water) (FY 1998/FY 1999).

- Transferred 225 units of spent nuclear fuel out of wet storage at the Chemical Processing Plant-603 into more modern storage at the Chemical Processing Plant-666 (FY 1998).
- Completed peer review of plutonium research and development priorities to accomplish plutonium stabilization (FY 1998).
- Complete the Draft Comprehensive Record of Decision for Idaho Nuclear Engineering Technology Center (Waste Area Group 3) in March 1999; for Test Area North (Waste Area Group 1) in April 1999; for Central Facilities Area (Waste Area Group 4) in July 1999; and for the Power Burst Facility (Waste Area Group 5) in August 1999.
- Complete final Record of Decision for Waste Area Group 3, (July FY 1999).
- Develop plans for Stage 2 limited retrieval/excavation in selected areas of Pit 9 and pilot-scale treatability studies and tests (FY 1999).
- Complete construction on all approved FY 1998 and prior general plant project facility upgrades (FY 1999).
- Complete conceptual design for the proposed FY 2001 Sitewide Idaho National Engineering and Environmental Laboratory Information Network (FY 1999).
- Issue a Record of Decision for shipment and ultimate disposal of spent nuclear fuel outside of Idaho (FY 1999).
- Begin transferring fuel from wet storage in the Test Area North-607, Nuclear Hot Shop, pool to the interim dry storage facility (FY 1999).
