Weapons Activities

Proposed Appropriation Language

For Department of Energy expenses, including the purchase, construction and acquisition of plant and capital equipment and other incidental expenses necessary for atomic energy defense weapons activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101 et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion; [the purchase of not to exceed 1 fixed wing aircraft;] and the purchase of passenger motor vehicles (not to exceed [32] *3* for replacement only [,and one bus], [$4,400,000,000] *$4,531,000,000* to remain available until expended: [Provided, That funding for any ballistic missile defense program undertaken by the Department of Energy for the Department of Defense shall be provided by the Department of Defense according to procedures established for Work for Others by the Department of Energy.] *Further, for the foregoing purposes; $4,531,000,000, to become available October 1, 2000 and remain available until expended.* (Energy and Water Development Appropriations Act, 1999.)

Explanation of Change

Changes in the appropriation language include the number of vehicles required; a request for appropriations covering two years; and deletion of language pertaining to the ballistic missile defense system which does not need to be repeated annually.

Weapons Activities

Executive Budget Summary

Vision

High confidence in the safety, security, reliability and performance of the Nation's enduring nuclear weapon stockpile under a comprehensive test ban, utilizing a science-based approach to stockpile stewardship within a smaller, more efficient and cost effective weapons complex infrastructure.

Mission

The mission of Defense Programs is:

- to maintain indefinitely the safety, reliability and performance of the current nuclear weapons stockpile without nuclear testing;
- to maintain the capability to return to the design and production of new weapons and to underground nuclear testing, if so directed by the President; and,
- to dismantle excess weapons safely, and dispose of or store excess components.

Strategy

Rely on scientific understanding and expert judgement, rather than on nuclear testing and the development of new weapons, to predict, identify and correct problems affecting the safety, reliability or performance of the enduring stockpile. Carry out assessment and certification activities, analyzing and evaluating the effects of changes on warhead safety and performance. Develop and enhance surveillance capabilities for predicting and detecting problems. Develop advanced design and manufacturing capabilities necessary to refurbish stockpile warheads and certify new parts, materials and processes for the future. Retire and dismantle weapons as needed to meet arms control objectives. As new tools are developed and validated, incorporate them into a smaller, environmentally-sound, more flexible and agile weapons complex infrastructure for the future.

Policy Framework

In the early 1990's, as part of its continuing world leadership role in the arms control arena, the U.S. halted production of new nuclear warheads and conducted its last nuclear explosive test. Thus ended an era in which the U.S. modernized its nuclear weapon stockpile by continually replacing aging systems with new systems and in which nuclear testing served as the ultimate arbiter of the safety, reliability and performance of the Nation's nuclear weapon stockpile. With the decision to cease production of new nuclear warheads and end nuclear testing, the Nation faced the challenge of maintaining its existing nuclear weapon stockpile with other tools and different kinds of tests for the foreseeable future. In 1993 and 1994, the President and the Congress directed the Secretary of Energy to establish a stockpile stewardship program to ensure the preservation of the core intellectual and technical competencies of the United States in nuclear weapons.

In September 1994, the President approved the Nuclear Posture Review, which established requirements for the Department of Energy related to maintaining nuclear weapons infrastructure and capabilities, and ensuring tritium availability. The requirements for DOE were stated in terms of "infrastructure to support U.S. nuclear forces," delineated specifically as follows: maintain nuclear weapon capability (without underground nuclear testing); develop a stockpile surveillance engineering base; demonstrate the capability to design, fabricate and certify weapon types in the enduring stockpile; maintain the capability to design, fabricate, and certify new warheads; and ensure tritium availability. No production of new-design nuclear warheads is required. To meet these requirements, the Department of Energy developed the Stockpile Stewardship and Management Program. The strategies and key components of this approach were articulated initially in the May 1995 DOE report, *The Stockpile Stewardship and Management Program: Maintaining Confidence in the Safety and Reliability of the Enduring U.S. Nuclear Weapon Stockpile.*

In August 1995, the President announced that the United States would pursue a zero yield Comprehensive Test Ban Treaty (CTBT) as a means of reducing the danger posed by nuclear weapons proliferation. In September 1996, the United Nations General Assembly voted nearly unanimously to endorse the CTBT negotiated at the Geneva-based Conference on Disarmament. President Clinton signed the treaty on September 24, 1996, and submitted it to the Senate for ratification on September 23, 1997. One of the six safeguards that defines the United States' participation in the CTBT is the conduct of a stockpile stewardship program to ensure the safety and reliability of the weapons remaining in the nation's nuclear stockpile. In addition, the President requested a new annual certification process to certify that the stockpile is safe and reliable in the absence of underground nuclear testing, and to produce a statement about future confidence in the safety and reliability of the stockpile.

In January 1996, the Senate gave overwhelming approval to the START II Treaty; however, the Russian Duma has not ratified START II. The U.S. Senate's treaty ratification text highlighted the Nation's commitment to proceed with a robust stockpile stewardship program, to reestablish and maintain sufficient production capabilities and capacities, to maintain the U.S. nuclear weapons laboratories and the core competencies therein, to ensure rapid access to a new production source for tritium within the next decade, and to maintain the Nevada Test Site at a level which would enable timely resumption of underground nuclear testing if directed by the President.

In April 1996, the Secretary of Energy submitted to the Congress the first Stockpile Stewardship and Management Plan. The Plan was a roadmap of program activities needed to accomplish stockpile stewardship and management program goals. The document's first update was completed and sent to the Congress on October 28, 1997, and Defense Programs also issued a summary progress report on the program, *Stockpile Stewardship Program; Overview and Progress,* in October 1997. The second update was issued in April 1998, and the third update of the *Stockpile Stewardship Plan* is targeted for publication in support of the FY 2000 Congressional Budget Request.

The Department completed work on the Stockpile Stewardship and Management Programmatic Environmental Impact Statement (SSM/PEIS) in late 1996. On December 19, 1996, the Secretary of Energy signed the Record of Decision, enabling the DOE to proceed to construction on several key new experimental facilities, reestablish a limited pit manufacturing capability, and begin facility downsizing in FY 1998 where needed in accordance with anticipated future workload levels.

On June 18, 1997, the President signed the implementing Presidential Decision Directive (PDD) for the Fiscal Year 1997-2002 Nuclear Weapons Stockpile Memorandum. The President has declared United

States nuclear forces will maintain flexibility to both "hedge" against foreign political reversals (START I) as well as to "lead" through further reductions (START II). This strategy has been recognized in developing the programs and associated budget to meet these goals. This strategy is also supported in the Department's plans to transition the nuclear weapons complex from capacity-based to capability-based, while providing flexibility to support changing stockpile sizes.

On December 22, 1998, Secretary of Energy Bill Richardson made two key national security decisions related to the stockpile. He chose the use of Tennessee Valley Authority (TVA) reactors for producing tritium over construction of a new linear accelerator at Savannah River, and designated TVA's Watts Bar and Sequoyah reactors as the preferred facilities rather than paying for the completion of TVA's unfinished Bellefonte reactor. Secretary Richardson decided that Hanford's Fast Flux Test Facility should not play any role in producing tritium for the nation's stockpile and he outlined a course for deciding whether it should be restarted to serve future civilian research missions.

Secretary Richardson's announcement fulfills the Department's 1995 commitment to select by the end of 1998 between a commercial light water reactor and a linear accelerator as the primary source of tritium. Consistent with the Department's dual track strategy for tritium production, the linear accelerator option has been designated as a backup technology. As directed by the FY 1999 National Security Authorization Act, the Department will continue the dual track through FY 1999, and plans to complete key engineering, development and demonstration milestones for the accelerator by the end of 2002.

On December 11, 1998, Secretary Richardson signed the annual certification letter to the President (below) and on December 23, 1998, he signed the FY 1998-2003 Nuclear Weapons Stockpile Memorandum (NWSM). The NWSM was forwarded to the President on January 7, 1999. There will be no FY 1999 NWSM; rather, the current NWSM requires the FY 2000-2005 NWSM by September 30, 1999.

MEMORANDUM FOR THE PRESIDENT DEC 11 1998

SUBJECT: Nuclear Stockpile Certification

In response to your direction to conduct an annual certification of the nuclear weapons stockpile, we have thoroughly reviewed the safety and reliability of the stockpile under the Comprehensive Test Ban Treaty. The nuclear stockpile has no safety or reliability concerns that require underground testing at this time. Problems that have arisen in the stockpile are being addressed and resolved without underground nuclear testing to ensure the stockpile remains safe and reliable. In reaching this conclusion, we have obtained the advice of the Directors of the National Weapons Laboratories, the Commander in Chief, United States Strategic Command, and the Nuclear Weapons Council. We will continue to inform you annually on the safety and reliability of the nuclear weapons stockpile in the absence of underground nuclear testing, and in the context of the DOE's Stockpile Stewardship Plan.

Bill Richardson
Secretary of Energy

William S. Cohen
Secretary of Defense

Executed: December 22, 1998

Program Overview

Defense Programs carries out a single, highly integrated technical program for maintaining the safety and reliability of the U. S. nuclear stockpile that has evolved in response to this policy framework. The Stockpile Stewardship Program's overall goal is encompassed in the *DOE Strategic Plan (September 1997)* National Security Strategic Goal:

Support national security, promote international nuclear safety, and reduce global nuclear danger from weapons of mass destruction.

It is Defense Programs' mission to carry out this goal by providing high confidence in the safety, security, reliability and performance of the enduring U.S. stockpile without nuclear testing, ensuring the effectiveness of the U.S. nuclear deterrent while simultaneously supporting U.S. arms control and nonproliferation objectives. Defense Programs also provides the capabilities to resume U.S. underground nuclear testing and to reconstitute nuclear weapons production capacities, consistent with Presidential directives, the Nuclear Posture Review, and the START I treaty, should national security so demand in the future.

There are four national security objectives from the *DOE Strategic Plan* upon which this program and budget are based:

- Maintain confidence in the safety, reliability and performance of the nuclear weapon stockpile without nuclear testing.
- Replace nuclear testing with a science-based stockpile stewardship and management program.
- Ensure the vitality of DOE's national security enterprise.
- Reduce nuclear weapon stockpiles and the proliferation threat caused by the possible diversion of nuclear materials.

Weapon designers and computational physicists partner to develop 3-dimensional simulation and modeling tools.

The **Stockpile Stewardship** activities address issues of assessing and maintaining confidence in stockpile safety and reliability without nuclear testing through a technically challenging science-based stockpile stewardship program utilizing upgraded or new experimental, computational and simulation capabilities. The programs are planned to meet the infrastructure requirements of the Nuclear Posture Review to maintain the vitality of the laboratories and the Nevada Test Site. Major initiatives continue in high energy density research with lasers, radiography, and pulsed power. Accelerated research and development in advanced computations to acquire and use data will improve predictive capabilities which will be the foundation of the science-based stewardship approach. Highly complex subcritical experiments are conducted using chemical high explosives to generate high pressure environments in which to study and obtain new data on nuclear weapon materials, such as plutonium. The Accelerated Strategic Computing Initiative (ASCI), a discrete element within the Stockpile Stewardship decision unit, provides the leading-edge, high end simulation capabilities needed to meet weapon assessment and certification requirements without nuclear testing. ASCI synergizes the resources of the national laboratories, computer industry, and academia to push the

development of hardware and advanced applications, and then introduces the new applications into the core programs.

To form the scientific basis of, and scientific validation for, the stewardship program, major new experimental facilities are also planned to expand and enhance the scientific base for stockpile stewardship. The National Ignition Facility, scheduled to be completed in 2003, will provide a means to study primary boosting, assess secondary performance and validate new physics models and codes while pursuing its goal to demonstrate thermonuclear ignition in the laboratory. The Dual-Axis Radiographic Hydrodynamic Test Facility, when completed in FY 2002, will provide an experimental capability to validate the implosion performance of nuclear weapons primaries. Technology development is underway for potential facilities to maintain the scientific capabilities needed in the future, and to assure that Defense Programs can continue to attract and retain the high quality personnel needed to make the scientific and technical judgements related to the safety and reliability of the stockpile in the absence of nuclear testing.

The **Stockpile Management** activities continue historical responsibilities to provide near-term and long-range support for the enduring stockpile, and to ensure an adequate supply of tritium. Along with stockpile surveillance, this includes normal maintenance, corrective maintenance and system refurbishment, as well as weapon dismantlement. The Stockpile Management decision unit funds initiatives in enhanced surveillance and advanced manufacturing, as well as the Stockpile Management Restructuring Initiative projects to downsize and modernize production capabilities needed for the future. The activities are supportive of the infrastructure requirements cited in the Nuclear Posture Review.

The DOE completed a PEIS for tritium production, and pursued a dual-track approach to research, development and engineering of potential future tritium supply technologies. After extensive review of the regulatory, cost, proliferation, environmental, technical and national security issues associated with each option, on December 22, 1998, Secretary Richardson chose to use commercial light water reactors owned by the TVA for producing tritium in the future. Engineering, development and demonstration and preliminary design of essential components of an accelerator for production of tritium will be supported as a backup technology.

Weapons **Program Direction** funds all federal personnel related costs, as well as support and contractual services for Federal employees. Other support costs are also included through FY 1999, such as a salary subsidy for the Los Alamos School District and payments for the Northern New Mexico Educational Enrichment Foundation. These activities more appropriately belong within a program decision unit, and beginning in FY 2000 are transferred to Stockpile Stewardship.

The major initiatives included in the Stockpile Stewardship Program are designed to assist in a rapid and effective transition from program activities optimized for the former underground nuclear testing era to a future program under the constraints of a CTBT. These initiatives are beginning to achieve their objectives, and as such, this budget reflects integration of some of these efforts into the ongoing base programs within this five year period.

In recognition of this progress, Defense Programs will consider proposing **budget structure** changes in the future. Although the current budget and accounting structure is meeting our needs today, and those of our contractors and customers in the Department, OMB and Congress, we are analyzing potential changes for the future ranging from changing the overall title of the appropriation to eliminating current decision units in favor of a single integrated account structure. We expect to study various options to

keep pace with the program's continuing evolution as discussed above, with organizational changes, and in response to ongoing implementation of the Government Performance and Results Act.

Maintaining the U.S. nuclear weapon stockpile in this new era will continue to challenge our best capabilities. The Stockpile Stewardship and Management programs must be implemented promptly and fully. In particular, new facilities and capabilities must be developed and validated while personnel with nuclear-test experience are still available. This program provides the framework and capabilities for success, although there are areas where challenges and risks are increasing at a rate that warrants continued vigilance.

The FY 1999 appropriation totals $4.4 billion. The appropriations act authorized $4.482 billion, but provided only $4.4 billion in new budget authority with the difference to be made up by use of prior year balances. The Department plans to obligate $4.418 billion to new commitments in FY 1999. That level is a result of new appropriations of $4.4 billion, and reapplication of $18 million in prior year balances which were available with no adverse program impact. Also included in this amount is a reprogramming of $3.683 million approved in November 1998. The process to determine use of prior year balances to offset the Congressional reduction is discussed more fully later in this section. In addition, $28.6 million in prior year work has been carried over to be conducted in FY 1999, for a total planned obligational level of $4.447 billion. End of year FY 1998 unobligated balances associated with this work will be obligated in FY 1999, and as such are not available to be applied to the appropriation as discussed above.

The request for the FY 2000 program is $4.531 billion. This is consistent with the Administration's commitment that about $4.5 billion will be needed annually to adequately support the Stockpile Stewardship program. FY 2000 funding for the Tritium source programs is included within this level, and reflects the December 1998 decision on technology and schedule for the new tritium source.

Table 2

Decision Unit Summary

Federal Staff (FTEs) [a]	1,837	1,876	0	1,876	1,799	-77	-2.2%

General

The FY 2000 budget request increases 3 percent over the FY 1999 appropriation. The increase is driven by an 8 percent increase in activities in the Stockpile Stewardship decision unit, principally related to simulation and modeling efforts in both ASCI and the core programs, and functional transfers of education-related activities into the decision unit from Program Direction. The Stockpile Management decision unit decreases 2.6 percent, due to reductions programmatic infrastructure. The budget request includes $170 million for tritium supply activities. The Program Direction decision unit decreases 1.4 percent, reflecting savings attributable to a smaller federal workforce.

The FY 2000 budget request supports initiatives begun during the past five years that are maturing and contributing the new tools and technologies needed for science based stewardship under the provisions of a CTBT. We are meeting our commitments to provide new and enhanced experimental facilities, and have accomplished significant downsizing and reorganizing of the Federal and contractor workforce to accomplish the mission in the future.

Stockpile Stewardship

Activities in the Stockpile Stewardship decision unit provide the physical and intellectual infrastructure required to meet the scientific and technical requirements of the Stockpile Stewardship Program, principally at the Lawrence Livermore, Los Alamos and Sandia National Laboratories and the Nevada Test Site. The programs provide the technical basis for confidence in the safety, reliability, and performance of the U.S. weapons stockpile in the absence of underground nuclear testing. The programs

[a] This FTE level represents a Departmental employment ceiling. Defense Programs anticipates a total employment level below the ceiling.

have been balanced to develop and maintain essential scientific and technical capabilities over the long term while meeting near term workload requirements and schedules. The Accelerated Strategic Computing Initiative (ASCI) and the Inertial Confinement Fusion (ICF), Technology Partnerships, Education, and Infrastructure Construction programs are included in the Stockpile Stewardship decision unit.

Stockpile Stewardship is requesting $2,286.2 million in FY 2000, an increase of $170.3 million or 8 percent over FY 1999. The funding increase is primarily due to increased requirements in the core programs to verify and validate new physics and materials models resulting from successful ASCI-sponsored efforts in advanced code development, and additional planned growth in ASCI and Stockpile Computing programs. Initiation of three new laboratory infrastructure projects will provide specialized space necessary for the advanced computers and associated capabilities. The increase also reflects the transfer of support for the Los Alamos Schools and the Northern New Mexico Educational Enrichment Foundation from the Weapons Program Direction account, and inclusion of funding for the new National Atomic Museum in Albuquerque, New Mexico.

The growth in the ASCI and Computations programs is about 12 percent from FY 1999 to FY 2000. This continues the momentum in both hardware development and acquisition to attain computers capable of sustained operations of 100 trillion operations per second (TeraOps) level by 2004, as well as in building 3-D computer codes which, in conjunction with the experimental programs in core stewardship and ICF, are aimed at providing the required levels of fidelity in weapons simulations. Two new computations initiatives begun in FY 1999 will continue in FY 2000. Distributed Computing at a Distance (DisCom^2) will enable the ASCI and Stockpile Computing program to deliver key computing and communications technologies that complement the ASCI vision, and the Numerical Environment for Weapons Simulations (NEWS) will create localized data exploration super corridors to support large-scale data analysis and assimilation tasks for researchers and weapons assessment teams.

A significant new item in the stewardship programs in FY 2000 is the advent of a laboratory infrastructure construction initiative. The goal is to provide for the infrastructure needs at the laboratories and the Nevada Test Site at about $100 million in annual investments over a 5-10 year period. Major programmatic facilities are not included in this effort; they will continue to be separately justified and funded within the R&D portions of the account. In the near term, the emphasis will be on construction of four facilities to provide the unique floor space needed at the laboratories to house the state of the art computers as well as provide visualization and other simulation capabilities to maximize the utility of the greatly enhanced computing capabilities by the weapon designers. A listing of candidate projects and associated cost estimates is included in the budget request.

Detailed discussion of the Stockpile Stewardship program activities is included in the following sections of the budget document.

Stockpile Management

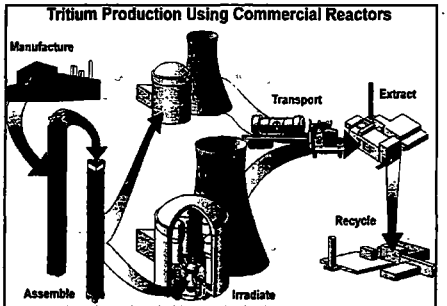
The Stockpile Management budget was formulated to maintain infrastructure essential for stockpile operations. Program activities support limited life component exchange; provide for stockpile surveillance/evaluation; support enhanced surveillance, directed weapon modifications and alterations supporting Stockpile Life Extension Program decision points; reestablish pit production capability and capacity; support commitments to entities external to Defense Programs, such as the DNFSB; support the Advanced Manufacturing Design and Production Technologies program and remaining ESP tasks consistent with Program Plans; and support the dismantlement of retired weapons. The Stockpile

Management request is $1,998.3 million, 2.6 percent below FY 1999. Small increases are included for Enhanced Surveillance, ADAPT, Radiological Nuclear Accident Response, Tritium and Materials. These increases are offset by decreases in the Core Management base program. Stockpile maintenance efforts will focus on limited life component exchange consistent with the START I stockpile, Life Extension for the W87, and alterations for the B61 and B83. Dismantlement work will focus on continuation of the W56 and W79, and start up activities for the B53 for projected dismantlement of approximately 375 weapons.

Pit Production efforts will continue to recapture required technologies at Los Alamos for the W88, B61-7 and W87. Fabrication of a limited number of W88 Trident II pits for certification and qualification continues on schedule with the goal of providing war-reserve pits for the stockpile in 2001.

Tritium Source

The $170 million funding request for the tritium source in FY 2000 is consistent with the December 22, 1998, secretarial decision which designated irradiation in a commercial light water reactor as the primary tritium production technology and production in a linear accelerator as backup.



Secretary Richardson selected tritium production in a commercial light water reactor as the primary approach for the new tritium source on December 22, 1998

Detailed discussion of the Stockpile Management program activities is included in the following sections of the budget document

Program Direction

The request for Program Direction funding decreases about 1.4% from the FY 1999 appropriated level, related to continued downsizing of the federal workforce. Federal support costs ($9.6 million) for the Amarillo, Kirtland and Kansas City Area Offices are relocated from the Stockpile Management decision unit into Program Direction to fully reflect the cost of Federal oversight performed by those offices. Funding for the Los Alamos School District and the Northern New Mexico Educational Foundation formerly included in this decision unit has been transferred to a more appropriate location in the Stockpile Stewardship Education programs in FY 2000.

Independent Assessments of Construction Projects

The conference report accompanying P.L. 105-245, Energy and Water Development Appropriations Act for FY 1999, stated that none of the funds provided for new FY 1999 construction project starts could be obligated until an independent assessment validating the cost and schedule for the specific project was completed and provided to the House and Senate Committees on Appropriations. This direction followed similar language in FY 1998 which directed external reviews of selected ongoing construction projects, but without the prohibition on release of funds.

The DOE assessment process is managed by the Office of Field Management (FM). The reviews are conducted by support service contractors, and FM coordinates DOE's response to review findings and recommendations as well as transmission of the reports to the congressional committees.

To date, six of eleven DP reports on ongoing projects resulting from the FY 1998 direction have been submitted to the Congress. Five assessments from this first group are still in process. There are nine reviews required as a result of the FY 1999 language. One review is near completion; the other eight are targeted to begin by February 1, 1999, with transmission to Congress targeted for early April, 1999. These delays have already affected FY 1999 budget execution and overall project schedules, and modifications are reflected in the FY 2000 budget.

In FY 1999, for projects in the Stockpile Stewardship decision unit, $15 million of the $25 million requested for new starts was provided in a single line, to be allocated to specific projects by the Department. The allocation of funding to the FY 1999 new starts and the project schedules reflected in the budget request is consistent with the schedule for completion of the assessments. To the extent that this schedule slips, or that projects are significantly changed by external review recommendations and corrective actions, we will keep the Congress fully and currently informed.

Use of Prior Year Balances

The appropriations conference report included language which directed that FY 1999 activities be funded using $4.4 billion in new budget authority and $82.5 million in prior year balances. To implement this guidance, Defense Programs undertook a rigorous process to examine prior year O&M balances reported at the end of FY 1998. This task was made even more difficult by the fact that **overall ending net FY 1998 uncosted balances for Defense Programs were $160 million below the Department's goal for operations and maintenance activities.** Using DP's Financial Information Variance Reporting (FIVR) system, the FY 1998 end of year accounting data at the lowest level and the Department's threshold goal for appropriate levels of uncosted balances, DP Headquarters, field and contractor organizations analyzed and rejustified any individual uncosted balances in excess of the Department of Energy's thresholds of 13% for operating expenses and 50% for capital equipment and general plant projects, and all unobligated balances (including construction) reported at the end of the year. As a result of this process which examined about $125 million in potentially available balances, only about $6.3 million in uncosted balances and $8.5 million in unobligated balances could be deobligated/reobligated without unacceptable impact on programs authorized and funded in prior years. This $14.8 million can be reobligated to fund the FY 1999 program in addition to the $4.4 billion in new budget authority, making a total of $4.414 billion available for the FY 1999 program, rather than $4.482 as outlined in the appropriation. (A congressional reprogramming request was also approved in November 1998 which revises the total FY 1999 appropriation to $4.418 million.)

This reduced FY 1999 funding level will have negative program impacts; details are still being assessed by Defense Programs program managers and by contractor personnel at the laboratories and plants. To arrive at the current program and site allocations, DP accommodated all congressional direction on FY 1999 programmatic and site funding first and then assessed the $82.5 million funding reduction proportionally to each DP organization. Available prior year balances were reobligated in the programs where they were identified. We will continue to examine our activities to determine whether additional prior year balances may become available later in the fiscal year to increase the $4.418 billion total currently available for FY 1999 activities.

Surplus Facilities and Nuclear Materials

The historical development of the nuclear weapons program and the end of the Cold War resulted in a weapons complex that was much larger and more diverse than needed for the future mission. Major portions of the complex have already been transferred to the Office of Environmental Management

(EM). Yet, as DP continues to consolidate and otherwise adjust the size of the complex to meet future needs, many more facilities and nuclear materials have and will become excess to national security needs.

Due to their hazardous nature, these facilities and materials require significant expenditures to assure safety, security and environmental protection. These expenditures will continue to be required until the hazards are removed through deactivation, decommissioning and decontamination activities. If DP is unable to transfer the excess facilities and materials without having to invest large sums, the financial burden will increase over time thereby resulting in decreased funding for DP's core mission.

For the FY 2000 budget and beyond, Defense Programs makes the following three assumptions regarding disposition of surplus facilities and nuclear materials:

(1) Beginning in FY 2002, DP will be able to transfer its contaminated excess facilities, including any excess nuclear materials remaining therein, to EM for deactivation, decommissioning and decontamination.

(2) DP further assumes that given two years notice of intent to transfer surplus facilities and nuclear materials, EM will accept such facilities and nuclear materials in "as is" condition. In doing so, EM will budget for and manage the cleanup and disposal of such facilities and nuclear materials.

(3) In FY 2001, DP will transfer responsibility for Building 3019 at the Oak Ridge National Laboratory to EM.

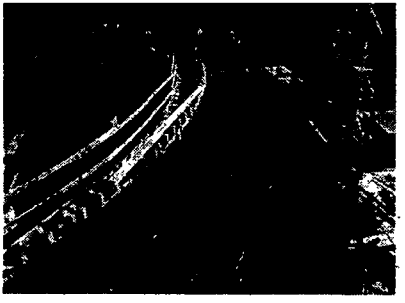
Following are brief site descriptions; more detailed information about Defense Programs' sites and facilities is located in each of the following decision units.

Los Alamos National Laboratory (LANL)

LANL is a multidisciplinary research facility located in northern New Mexico, engaged in a variety of programs for DOE and other government agencies. While the primary mission is defense programs, LANL supports other programs including: arms control, nonproliferation, nuclear material disposition, energy research, science and technology, and environmental management. Research and development at LANL in the basic sciences, mathematics, and computing have application to a broad range of activities including: national security, nonnuclear defense, nuclear and nonnuclear energy, atmospheric and space research, geoscience, bioscience, biotechnology, and the environment. Activities in both the Stockpile Stewardship and Stockpile Management decision units are carried out at LANL.

Lawrence Livermore National Laboratory (LLNL)

LLNL is a multidisciplinary research facility located in Livermore, California, engaged in a variety of programs for DOE and other government agencies. While the primary mission is defense programs, LLNL supports other programs including: arms control, nonproliferation, nuclear material disposition, energy research, science and technology, and environmental management. Research and development at LLNL in the basic sciences, mathematics, and computing have application to a broad range of activities including: national security, nonnuclear defense, nuclear and nonnuclear energy, atmospheric and space research, geoscience, bioscience, biotechnology, and the environment.



National Ignition Facility at LLNL - Reinforcing steel in place for the 12 foot thick target bay wall (October 1998).

Activities in both the Stockpile Stewardship and Stockpile Management decision units are carried out at LLNL.

Sandia National Laboratories (SNL)

SNL is a multidisciplinary research facility engaged in a variety of programs for DOE and other government agencies. Sandia has two principal locations: Albuquerque. New Mexico and Livermore, California. While the primary mission is defense and related programs, SNL conducts R&D activities in advanced manufacturing, electronics, information, pulsed power, energy, environment, transportation, and modeling and simulation-based life cycle engineering. Activities in both the Stockpile Stewardship and Stockpile Management decision units are carried out at SNL.

Kansas City Plant (KCP)

The Kansas City (Missouri) Plant is the main facility in the nuclear weapons complex for the manufacture and procurement of nonnuclear components for nuclear weapons, including electrical, electronic, electromechanical, mechanical, plastic, and nonfissionable metal. The broad range of components and devices procured from U.S. industry is supported by an extensive system to qualify suppliers and accept products. The Kansas City Plant primarily supports activities in the Stockpile Management decision unit.

Pantex Plant (PXP)

The Pantex Plant, located near Amarillo, Texas, is the only facility in the nuclear weapons complex for quantity assembly\disassembly of nuclear weapons. Also, plutonium pits from dismantled weapons are stored at Pantex. The site has been designated as the permanent location for strategic reserve pit storage and the interim storage location for surplus pits resulting from dismantlement activities and the planned closure of the Rocky Flats Site. Pantex fabricates high explosives used in nuclear weapons and performs modifications and surveillance of nuclear weapons scheduled to remain in the future stockpile. The Pantex Plant primarily supports activities in the Stockpile Management decision unit.

Y-12 Plant (Y-12)

The Y-12 Plant in Oak Ridge, Tennessee, maintains the only capability in the nuclear weapons complex to fabricate quantity uranium and lithium components and parts for nuclear weapons, including secondaries and radiation cases. In addition, Y-12 has historically stored highly enriched uranium (HEU) and lithium for the nuclear weapons complex and Y-12 is now designated the permanent location for the storage of strategic reserves of these materials. The Y-12 Plant primarily supports activities in the Stockpile Management decision unit.

Savannah River Site (SRS)

The primary DP mission at the SRS in Aiken, South Carolina, is the recycling of tritium from the weapons stockpile and the loading and surveillance of tritium reservoirs. Formerly, this location was the site for production of special nuclear materials, however these capabilities have been closed down and the site is undergoing environmental restoration. The tritium loading infrastructure at SRS primarily supports activities in the Stockpile Management decision unit.

Nevada Test Site (NTS)

The core DP mission at the NTS is to maintain the capability to conduct an underground nuclear test within 2-3 years as required by Presidential Directive and by Safeguard C accompanying the

Comprehensive Test Ban Treaty. DOE is involved in a number of other activities at NTS including hazardous liquids spill testing, solar technology demonstration, radioactive and mixed waste disposal, and the Yucca Mountain characterization programs. The Nevada Test Site supports activities in both the Stockpile Stewardship and Stockpile Management decision units.

Table 4

Federal Employment Estimates

(FTEs)

	FY 1998	FY 1999	FY 2000
Albuquerque Operations Office	1,109	1,151	1,122
Nevada Operations Office	253	259	238
Oakland Operations Office	80	82	84
Oak Ridge Operations Office	64	64	58
Savannah River Operations Office	32	33	33
Headquarters	299	287	264
Total Weapons Federal Employment (DOE Estimated FTEs)	1,837	1,876	1,799

This FTE level represents a Departmental employment ceiling. Defense Programs anticipates a total employment level below the ceiling.

Strategic Alignment Initiative

Onboard staffing for Defense Programs at the time of transmission of the 120-Day Study to the Congress in June 1997 was 1,992. Defense Programs reached its FY 1998 Strategic Alignment Initiative (SAI) end of year staffing level of 1,895 by the end of January 1998. Of the approximately 100 separations required to meet the FY 1998 SAI staffing level, Headquarters provided about 50, including 17 involuntary separations. The field provided its share of 50 separations through voluntary actions; no involuntary actions occurred in the field during FY 1998. Defense Programs ended FY 1998 with an actual staffing level of 1,787.

New SAI targets were received in May 1998 which reduced DP's allocation by an additional 86 in FY 1998 (1,895 to 1,809) and 65 in FY 1999 (1,876 to 1,811) and adjusted the FY 2000 target to 1,782 in recognition of DP's successful staff reduction efforts. Actual FY 2000 end of year on board staffing is currently estimated at 1,746, although that estimate and DP's SAI target may be adjusted based upon the results of the Secretary's ongoing Workforce 21 initiative to review critical skills and workforce imbalances throughout DOE.

Program Performance Measures

The Strategic Objectives, Strategies and Performance Measures from the September 1997, Department of Energy Strategic Plan are the basis for this budget request. The following four national security strategic objectives will be accomplished as a result of carrying out the supporting activities detailed in this budget justification.

- NS-1 Maintain confidence in the safety, reliability, and performance of the nuclear weapons stockpile without nuclear testing.
- NS-2 Replace nuclear testing with a science-based Stockpile Stewardship and Management Program.
- NS-3 Ensure the vitality of DOE's national security enterprise.
- NS-4 Reduce nuclear weapons stockpiles and the proliferation threat caused by the possible diversion of nuclear materials.

The FY 2000 Performance Plan and the FY 1999 Performance Agreement with the Secretary are highlighted later in this document.

Victor H. Reis
Assistant Secretary for Defense Programs

1/15/99
Date

Defense Programs Performance Measures for FY 2000

Following is a listing of each National Security Strategic Plan objective, and the accompanying strategies and performance measures for Defense programs focused on FY 2000. "Other" is indicated for funding associated with activities supporting a strategy, but not encompassed within the specific performance measures listed for that strategy.

Objective 1: Maintain confidence in the safety, reliability, and performance of the nuclear weapons stockpile without nuclear testing.

Strategy 1: Extend the life of U. S. nuclear weapons by continuing the Stockpile Life Extension Program and Stockpile Maintenance activities.

Performance Measures:

A. Meet all annual weapon alteration and modification schedules developed jointly by DOE and DoD.

B. Conduct studies and development work required to support weapon systems and components for the future stockpile.

Strategy 2: Improve detection and prediction capabilities for assessing nuclear weapon component performance and the effects of aging.

Performance Measure:

A. Adhere to schedules set forth in the Enhanced Surveillance Program Plan for activities that enhance knowledge of weapon-relevant physical processes affecting aging and operation of weapon components.

Strategy 3: Continually evaluate the safety, reliability, and performance of the nuclear weapons stockpile.

Performance Measures:

A. Annually report to the President on the need or lack of need to resume underground nuclear testing to certify the safety and reliability of the nuclear weapons stockpile.

B. Revalidate enduring stockpile systems to meet established military characteristics.

C. Undertake an independent assessment of the Stockpile Stewardship Program and its implementation throughout the DP national security enterprise.

Strategy 4: Provide a reliable source of tritium for the nuclear weapons stockpile.

Performance Measure:

A. Begin implementation of the selected technology and backup to provide a reliable source of tritium.

54-291 99 - 2

Objective 2: Replace nuclear testing with a science-based Stockpile Stewardship and Management Program

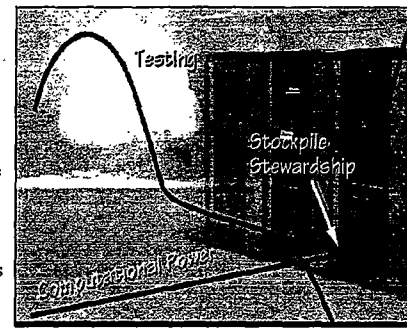
Strategy 1: Develop the advanced simulation and modeling technologies and computational tools necessary to confidently mitigate the loss of underground nuclear testing.

Performance Measures:

A. Provide computer platforms sized to support the stewardship objective of full physics, high fidelity simulations of nuclear weapons performance.

B. Deliver three-dimensional high fidelity weapons performance codes by 2004.

C. Demonstrate a computer code capable of performing a three-dimensional analysis of the dynamic behavior of a nuclear weapon primary, including a prediction of the total explosive yield, on an ASCI computer system.



Growth in computations needed for the change from a test-based to a science-based stockpile stewardship program

D. Develop and implement visualization, networking and data management systems to efficiently support utilization of ASCI codes and computers across the weapons complex.

Aerial view of the NIF construction site, October 1998

Strategy 2: Develop new nuclear weapons physics experimental test capabilities.

Performance Measures:

A. Continue construction of the National Ignition Facility according to its Project Execution Plan schedules.

B. Meet all cost and schedule goals for construction of the Dual-Axis Radiographic Hydrodynamic Test Facility (DARHT) consistent with an FY 2002 completion.

C. Meet all cost and schedule goals for construction of the Contained Firing Facility at LLNL consistent with a 4th quarter FY 2001 completion.

D. Meet all cost and schedule goals for construction of the Atlas facility at LANL consistent with a 1st quarter FY 2001 completion.

E. Obtain and assess information required to decide whether to construct 1) an advanced hydrotest facility and/or 2) an advanced pulsed power facility.

Strategy 3: Advance our understanding of the fundamental characteristics of weapons behavior through weapon systems engineering and advanced experiments to support future assessments of weapons safety, reliability, and performance.

Performance Measures:

A. Conduct two subcritical experiments at the Nevada Test Site to provide valuable scientific information about the behavior of nuclear materials during the implosion phase of a nuclear weapon.

B. Conduct experimental and theoretical research necessary to maintain or advance research, development and engineering capabilities in nuclear materials science and weapons design.

C. Conduct high energy density research on inertial confinement fusion facilities necessary to enhance understanding of areas of physics relevant to a better predictive assessment of nuclear weapons performance.

Objective 3: Ensure the vitality of DOE's national security enterprise

Strategy 1: Provide an appropriately-sized, cost-effective, safe, secure, and environmentally sound national security enterprise.

Performance Measures:

A. Ensure that all facilities required for successful achievement of the Stockpile Stewardship Plan are operational.

B. Meet the established schedules for downsizing and modernizing our production facilities.

C. Adhere to schedules set forth in the Advanced Manufacturing, Design and Production Technology Multi-Year Program Plan.

D. Meet schedules to rebuild, qualify and certify Trident II pits by FY 2001 and develop intermediate pit production capability of 20 pits per year at the Los Alamos National Laboratory by 2007.

Other transportation and logistics capabilities.

Strategy 2: Ensure that sufficient scientific and technical personnel are available to meet DOE's long-term national security requirements.

Performance Measures:

A. Establish strategic alliances and collaborations among the weapons laboratories, industries, and universities to enable effective use of scientific and technical personnel throughout the R&D community.

B. Implement the Strategic Alignment Initiative and recommendations of the 120-Day Study.

Strategy 3: Ensure and enhance protection of nuclear materials, sensitive information, and facilities.

Performance Measures:

A. Continue material protection, control, and accountability upgrades at three DOE facilities with weapons-usable material.

B. No loss of U.S. origin nuclear materials in the U.S. and abroad from theft, loss, or illicit trafficking.

Strategy 4: [Strategy 4 does not receive direct Defense Programs support]

Strategy 5: Maintain test readiness and maintain and enhance emergency response and management capabilities to address any nuclear weapons, radiological or other emergency in the U.S. or abroad.

Performance Measures:

A. Ensure that the capability to resume underground nuclear testing is maintained, in accordance with the Presidential Decision Directive and Safeguard C of the CTBT.

B. Maintain robust emergency response assets in accordance with Presidential Decision Directive 39, the Atomic Energy Act, Executive Order 12656 and Federal Emergency Plans.

C. Continue ongoing efforts of exercises, training and drills to improve response readiness to any possible weapons of mass destruction (WMD) and terrorist threat contingency using upgraded diagnostics and new equipment.

Objective 4: Reduce nuclear weapons stockpiles and the proliferation threat caused by the possible diversion of nuclear materials.

Strategy 1: Dismantle nuclear warheads that have been removed from the U.S. nuclear weapons stockpile in a safe and secure manner.

Performance Measure:

A. Adhere to schedules for the safe and secure dismantlement of approximately 375 nuclear warheads that have been removed from the U.S. nuclear weapons stockpile.

Defense Programs FY 1998 Performance Agreement

(dollars in millions)

FY 1998 Performance Measure	Final Status	Budget Reference [a]	FY 1998 Estimate
Meeting all DoD annual weapons alteration, modification and surveillance schedules.	Successful	1 1	718
Certifying nuclear weapon stockpile safety, reliability and performance according to DOE/DoD procedures	Fully Successful	1 3 a 1.3 b	336
Completing the analysis to support the selection, by December 1998, of a new source for tritium.	Successful	1.4.a/b	261
Meeting established schedules for the development and installation of a 3-trillion operations per second computer system	Fully Successful	2 1 b	71
Beginning the physical construction according to schedules in the Project Execution Plan for the National Ignition Facility	Fully Successful	2.2 a	282
Conducting 3 or 4 subcritical experiments to provide information about the behavior of nuclear materials during the implosion phase of a nuclear weapon	Partially Successful	2.3.a	86
Ensuring that the capability to resume underground testing is maintained in accordance with the Presidential Decision Directive and Safeguard C of the CTBT through a combined expenmental and test readiness program	Fully Successful	3.5 a	122
Maintaining robust emergency response assets in accordance with Presidential Decision Directive 39, the Atomic Energy Act and executive Order 12656 to ensure Departmental response to any nuclear weapons or radiological emergency in the United States or abroad.	Fully Successful	3.5.b/c	77
Adhering to schedules for the safe and secure dismantlement of approximately 1,000 nuclear warheads that have been removed from the U.S. nuclear weapon stockpile	Fully Successful	4.1.a	190
Assuring that all facilities required for successful achievement of the Stockpile Stewardship and Management Plan are operational, and that schedules for downsizing and modernizing facilities are met.	Partially Successful	3 1.a&b	432

U.S. Department of Energy

FY 1998 PERFORMANCE AGREEMENT STATUS

Agreement Status Details
Data as of 12-Jan-99

NATIONAL SECURITY

NS 1-1 MAINTAINING THE ENDURING STOCKPILE

Status: Successful

Description: Extend the life of U.S. nuclear weapons by continuing the Stockpile Life Extension Program and Stockpile Maintenance activities. Improve detection and prediction capabilities for assessing nuclear weapon component performance and the effects of aging, and continually evaluate the safety, reliability, and performance of the nuclear weapons stockpile.

Success will be measured by:

Certifying nuclear weapons stockpile safety, reliability, and performance according to DOE/DoD procedures.

Analysis: The establishment of an annual process for the review and certification of the safety and reliability of the nuclear weapons stockpile was directed by President Clinton and is crucial to this Nation's pursuit of the Comprehensive Test Ban Treaty. The Secretaries of Defense and Energy must advise the President each year whether the nuclear stockpile has any safety or reliability concerns that require underground testing. In reaching their conclusion they are advised by the Directors of DOE's national weapons laboratories, the Commander of the U.S. Strategic Command, and the joint Nuclear Weapons Council.

Two annual certifications have been successfully completed, the latest submitted to Congress by the President on February 12, 1998.

The DOE portion of the 3rd Annual Certification was completed on July 31, 1998. Final 1998 DOE laboratory reports reviewing the status of the nine types of warheads in the enduring stockpile were published during July 1998, and signed out by Defense Programs for distribution to the members of the Nuclear Weapons Council Standing and Safety Committee for their use in preparing the 3rd NWC Annual Stockpile Certification report. *(The third annual certification letter was signed by the Secretaries of Defense and Energy on December 11, 1998, and executed on December 22, 1998.)*

Status: Fully Successful

Meeting all DoD annual weapons alteration, modification and surveillance schedules.

Analysis: Surveillance activities are required to properly assess the safety and reliability of weapons in the Nation's stockpile. Surveillance includes both tests on weapon components at DOE's nuclear weapons laboratories and flight tests of unarmed weapons to examine delivery performance. During Fiscal Year 1998, the Department completed 40 of the 45 planned flight tests and 82 of the planned 100 laboratory tests. The flight test shortfall was due to logistics issues between the DoD and DOE. The laboratory test shortfall was due to a expiration of the W62 Nuclear Explosive Safety Study and other facility related issues.

Weapon alterations and modifications are crucial to upgrade the stockpile to meet higher safety standards, replace faulty components, meet changed military requirements, or extend the life of the weapon. During Fiscal Year 1998, the Department had eight weapon alterations and modification ongoing (either research and development activities or refurbishment). The alterations were for the B61 (three), W87 (two), B83 (two), and the W76. The modification was for the B83. All of these activities were performed on schedule. The one modification this year was completed on schedule. DOE plans to complete the remaining required tests next fiscal year. Even with this shortfall, the DOE was able to give the DoD a reliability assessment.

Status: Successful

NS 1-4 DEVELOPING A REPLACEMENT SOURCE OF TRITIUM

Status: Successful

Description: Provide a reliable source of tritium as required for the nuclear weapons stockpile by FY 2005 or FY 2007 depending on the production option selected.

Success will be measured by:

Success will be measured in FY 1998 by completing the analysis to support the selection by December 1998, of a new production source for tritium.

Analysis: Tritium, is a radioactive isotope of hydrogen essential to the proper function of all U.S. nuclear weapons. Tritium decays at about 5 percent per year and must therefore be replaced in weapons periodically. No new tritium has been produced by the U.S. since 1988. Tritium is recycled from dismantled weapons to meet stockpile requirements. A reliable source of tritium production for the stockpile should be available by fiscal year 2005 or fiscal year 2007 depending on the technology selected.

In late 1995 DOE announced it would pursue a dual track approach to examine and demonstrate the two most promising supply alternatives, the purchase of an existing or partially complete commercial light water reactor (CLWR) or purchase of irradiation services therefrom or the design and construction of an accelerator for the production of tritium (APT).

In January, 1998, the Tritium Supply Program completed the analysis of the primary tritium source options necessary to support a possible 2nd Qtr. FY 1998 technology decision by the Secretary. A

decision, however, was not made at that time. Both projects have continued development, demonstration, and design activities through FY 1998 and the analysis is expected to be updated for a decision expected by the end of December 1998.

CLWR activities so far this fiscal year include the following: In October 1997, thirty two tritium-producing rods were placed in the Tennessee Valley Authority's (TVA) Watts Bar reactor for an irradiation demonstration. Two draft environmental impact statements were completed and issued for public comment: Draft Environmental Impact Statement for the Production of Tritium in a Commercial Light Water Reactor and Draft Environmental Impact Statement for Construction and Operation of a Tritium Extraction Facility at the Savannah River Site. Preliminary design of the Tritium Extraction Facility, a FY 1998 milestone, has been completed and an independent, parametric cost estimate is being conducted. As required by Congress, an interagency review of nonproliferation policy issues has been completed. A technical report has been prepared and submitted to the Nuclear Regulatory Commission. DOE is in receipt of a proposal from the TVA for the Department to provide funds for completion of TVA's Bellefonte Unit 1 reactor in exchange for long-term irradiation services. An interagency agreement for irradiation services without completion of Bellefonte may also be a possibility. Concluding an agreement with TVA, a FY 1998 milestone, has not yet been completed, pending the Secretary's selection decision.

Accelerator Production of Tritium (APT) activities this fiscal year include the following: An engineering development and demonstration program has successfully demonstrated key elements of a tritium production accelerator. Performance testing of a laser beam through the Chalk River Injector Test Stand radio-frequency quadrupole (RFQ) was successfully completed and exceeded requirements. Fabrication and assembly of the copper RFQ for the Low Energy Demonstration Accelerator was completed. Installation of the RFQ and preparations for tests of beam through the RFQ were nearly completed. Preliminary engineering design of the APT plant was initiated in October 1997. An APT Modular Design Study, optimizing plan configurations for START-I and START II stockpile requirements, was completed in May 1998. Safety presentations to independent reviewers and the DNFSB were conducted throughout the year. Issues raised by these reviewers have resulted in features being incorporated into the APT design to increase its safety. A draft Environmental Impact Statement to construct and operate the APT at the Savannah River Site was completed and approved, public hearings were held, and the final EIS was completed for review.

Status: Successful

NS 2-1 REPLACING UNDERGROUND TESTING WITH SCIENCE

Status: Fully Successful

Description: Develop the advanced simulation and modeling technologies necessary to confidently mitigate the loss of underground testing by FY 2004.

Success will be measured by:

Success will be measured in FY 1998 by meeting established schedules for the development and installation of a 3- trillion operations per second computer system.

Analysis: The Accelerated Strategic Computing Initiative (ASCI) is a time-critical, essential element of the Department of Energy's Stockpile Stewardship Program. ASCI will enable DOE to develop the advanced simulation and modeling technologies necessary to shift from the past stockpile management approach based on new weapon development and nuclear testing to a science-based approach based on maintenance of the existing stockpile through advanced simulation and fundamental experiments. Specifically, ASCI will create and provide to all stewardship activities the leading-edge weapon simulation capabilities that are essential for maintaining the safety, reliability, and performance of the nation's nuclear stockpile under the current nuclear test moratorium and to meet the challenge set forth by the Comprehensive Test Ban Treaty.

Currently, ASCI is meeting all established schedules for the development and installation of a 3-trillion operations per second computer system. The initial delivery of a computer system was received in FY 1997, and the technology refresh was installed in the first half of FY 1998. Code development teams, including weapons designers, at the national weapons laboratories are using the system performing at a level of between 400-900 billion operations per second and running weapons simulations that are larger and more complex than was possible on previous machines. These simulations include higher resolution, improved physics models, and more robust computational math. At the end of September 1998, three months ahead of schedule, IBM benchmarked the 3-terops computer system at a sustained 1-teraops calculation.

Status: Fully Successful

NS 2-2 DEVELOPING NEW EXPERIMENTAL CAPABILITIES FOR UNDERSTANDING WEAPONS SCIENCE

Status: Fully Successful

Description: Develop new nuclear weapons physics experimental test capabilities.

Success will be measured by:

Success will be measured in FY 1998 by beginning the physical construction according to schedules in the Project Execution Plan for the National Ignition Facility (NIF).

Analysis: The NIF Project is essentially on schedule and on cost, and all aspects of the Project are making satisfactory progress. All of the Project's firm fixed price building contracts have been awarded. In June, major concrete pours for the Target Building and Switchyard floors were completed essentially on schedule. Construction of the Laser Building and Central Plant, which are on the critical path for Conventional Facilities, is currently delayed 2-4 weeks, but the Project completion date is being held. The critical task for the remainder of this year is to get the roofing and siding completed by the start of the next rainy season. Design and procurement of special equipment and materials are the most challenging aspects of the NIF Project. Design reviews continue to be successfully completed and production of engineering drawings continues, although at a slower rate than planned. The beam transport system procurement was awarded in June, and the target chamber contract is on schedule. Establishment of needed manufacturing

capacity at optics vendors is proceeding well as they prepare for pilot production beginning in early FY 1999. More information on the NIF project can be obtained at http://lasers.llnl.gov/lasers/nif.html

Status: Fully Successful

NS 2-3 CONDUCTING EXPERIMENTS TO ADVANCE OUR UNDERSTANDING OF WEAPONS BEHAVIOR

Status: Partially Successful

Description: Advance our understanding of the fundamental characteristics of weapons behavior through systems engineering and advanced experiments and modeling to support future assessments of weapons safety, reliability, and performance.

Success will be measured by:

Success will be measured in FY 1998 by conducting three to four subcritical experiments to provide information about the behavior of nuclear materials during the implosion phase of a nuclear weapon.

Analysis: Subcritical experiments are designed to provide an improved understanding of certain dynamic material properties of plutonium, the fissile material in most primaries, and are consider essential for assessing nuclear warhead performance, reliability, and safety in the absence of nuclear testing. These experiments also make a significant contribution to maintaining nuclear test readiness, required by Safeguard C of the Comprehensive Test Ban Treaty and Presidential Decision Directive.

On March 25, 1998, we conducted the first subcritical experiment of FY 1998, Stagecoach, a Los Alamos National Laboratory experiment. On September 26, 1998, Bagpipe, a Lawrence Livermore National Laboratory subcritical experiment, was successfully executed. Extensive preparatory work has been completed for Cimarron and Clarinet, the third and fourth subcritical experiments planned for FY 1998. Planned execution for Cimarron is November, 1998, and Clarinet is planned to follow one or two months thereafter. The Stagecoach subcritical experiment was used to obtain additional data on the equation of state of high explosively shocked plutonium materials at high pressures and to develop diagnostic instrumentation for future experiments. In addition to providing information that will be used on future subcritical experiments, Bagpipe was also used to further understanding of the effects on plutonium of aging, the use of different coating materials, and the effects of different manufacturing methods. Data from subcritical experiments will be used to develop the science-based stewardship computer models.

Status: Partially Successful

NS 3-1 DOWNSIZING AND MODERNIZING THE NATIONAL SECURITY ENTERPRISE

Status: Partially Successful

Description: Provide an appropriately-sized, cost-effective, safe, secure, and environmentally sound national security enterprise. Ensure that sufficient scientific and technical personnel are available to meet DOE's long-term national security requirements.

Success will be measured by:

Ensuring that all facilities required for successful achievement of the Stockpile Stewardship and Management Plan remain operational, and the established schedules for downsizing and modernization of the production facilities are met (DP)

Analysis: Two key activities are underway to provide operational production facilities for the successful implementation of the Stockpile Stewardship Plan. These two activities are the reestablishment of a Pit Production Program at the Los Alamos National Laboratory in New Mexico and resumption of Enriched Uranium Operations (EUO) at the Y-12 Plant near Oak Ridge, Tennessee.

During FY 1997 shipping/receiving, assembly/disassembly, depleted uranium operations, and evaluation of canned subassemblies operations were all restored. Phase A1 of the enriched uranium operations resumption process (resuming casting, rolling and forming, and machining operations) restarted in June 1998. Phase A2 (materials control and accountability functions) has been delayed and rescheduled to November 1998. The final phase (phase B) of resumption provides chemical processing capabilities, is scheduled for completion in calendar year 1999.

The Pit Production Program successfully demonstrated on schedule the first major step in its plan to reestablish a pit production capability. In February 1998 the first early development unit pit was successfully produced. While not meeting the full certification requirements to enter the stockpile this pit did successfully demonstrate the first series of capabilities needed to produce a fully certified pit.

The downsizing and modernization of production facilities are planned under the Stockpile Management Restructuring Initiative. This includes the tritium facilities at the Savannah River Site near Aiken, South Carolina; uranium machining, recycling and storage facilities at the Y-12 Plant at the Oak Ridge Reservation, Oak Ridge, Tennessee; assembly/disassembly and high explosive fabrication facilities at the Pantex Plant near Amarillo, Texas; and non-nuclear production facilities for electronic, electro-optical devices, plastic and machined parts at the Kansas City Plant in Kansas City, Missouri. Construction funds for the downsizing at Savannah River and Y-12 were received in FY 1998 and construction funds for Pantex and Kansas City have been requested in the FY 1999 Budget.

Title I design for the project at Savannah River, scheduled to commence the second quarter of this fiscal year was delayed to the third quarter. Physical construction started in the third quarter on schedule. Due to rescoping, the start of the Title I design of the Y-12 project was delayed from the first quarter of this fiscal year to the fourth quarter. For the projects at Pantex and Kansas City critical decision two (approval of baselines) was not approved in the fourth quarter as scheduled

Status: Partially Successful

NS 3-5 MAINTAINING READINESS FOR NUCLEAR EMERGENCIES

Status: Fully Successful

Description: Maintain nuclear test readiness and enhance emergency management capabilities to address any nuclear weapons, radiological, or other emergency in the United States or abroad.

Success will be measured by:

Ensuring that the capability to resume underground testing is maintained in accordance with the Presidential Decision Directive and Safeguard C of the CTBT through a combined experimental and test readiness program.

Analysis: Maintaining the capability to resume nuclear testing requires DOE to maintain (1) test facilities and equipment at the Nevada Test Site (NTS) and (2) nuclear testing skills of personnel at both the NTS and the nuclear weapons laboratories.

Experiments requiring large quantities of high explosives or special nuclear materials driven by small amounts of high explosives, the latter referred to as subcritical experiments, are conducted at the NTS. These experiments and specially designed test readiness exercises maintain NTS personnel test readiness skills including containment, security, assembly, storage and transportation, insertion and emplacement, timing and control, arming and firing, diagnostics, test control center activities, and postshot drilling.

Two subcritical experiments, Stagecoach and Bagpipe, and 29 high-explosive experiments have been conducted at the NTS in FY 1998. In September, 1998, we conducted VENTEX98, a table-top exercise that simulated a mass venting of an underground nuclear test at the Nevada Test Site for the purpose of exercising the emergency response systems that could be needed during a nuclear test.

The NTS also has an ongoing archiving program capturing on videotape the knowledge and testing experience of departing personnel as well as data, photos, drawings, procedures, nuclear explosive safety studies, containment evaluation plans, lesson learned, and other information.

In FY 1998, almost 84 hours of video taping of subject matter experts discussing 11 functional areas was completed; over 32,000 pages of documents were scanned and indexed into the archiving database; and encyclopedic-style CD-ROMs covering 5 functional areas were produced.

Hundreds of stockpile stewardship experiments have been conducted this fiscal year at nuclear weapons laboratory facilities such as the Flash X-Ray, Pulsed High-Energy Radiographic Machine Emitting X-Rays, Pegasus, Los Alamos Neutron Science Center, Nova Laser, High Explosive Applications Facility and PBFA Z which exercise many nuclear testing related skills and technologies, including nuclear design, experiment integration, nuclear chemistry, and weapons engineering.

Status: Fully Successful

Maintaining robust emergency response assets in accordance with Presidential Decision Directive 39, The Atomic Energy Act of 1954 and Executive Order 12656 to ensure Departmental response to any nuclear weapons or radiological emergency in the United States or abroad.

Analysis: The Department's Emergency Response program provides a national capability to respond to any radiological emergency or nuclear accident within the United States and abroad. The all volunteer force that makes up the cadre of deployment forces is mostly from the nuclear weapons laboratories. The seven major capabilities/assets maintained are the Aerial Measuring System (AMS), the Accident Response Group (ARG), the Atmosphere Release Advisory Capability (ARAC), the Federal Radiological Monitoring & Assessment Center (FRMAC), the Radiological Assistance Program (RAP), the Nuclear Emergency Search Team (NEST) and the Radiation Emergency Assistance Center & Training Site

(REAC/TS). These capabilities are maintained primarily through participation in national, state and local operations, exercises, and training.

The Department's emergency response program performed at a Fully Successful level for FY 1998. Highlights of these activities for the fiscal year are as follows: During FY 1998, DOE radiological emergency response assets participated in 32 U.S. and overseas exercises and 17 real-world events. Also, REAC/TS responded to 67(60 U.S.- 7 Foreign) calls for medical assistance for 224 individuals and provided radiation accident management training to 399 health professionals. During June 1998, emergency response assets participated in an interagency exercise ELLIPSE ALPHA in Virginia Beach, Virginia. The objective of the exercise was to evaluate the federal capabilities of responding to a domestic radiological Weapon of Mass Destruction. In September 1998, Departmental emergency assets also participated in a major overseas exercise ELLIPSE BRAVO. The objective of the exercise was to evaluate and validate the U.S. federal response to a biological Weapon of Mass Destruction in an international environment. On October 15, 1997, emergency response support was provided to the National Aeronautics and Space Administration for the launch of the Cassini Space Mission to Saturn. The Department participated with multiple agencies to identify support requirements and develop ground operations and emergency response plans and procedures in the event of a launch accident and the release of radioactive material. On board generators contained 32.8 kilograms of plutonium dioxide. Over 100 personnel and equipment from RAP, ARAC, REAC/TS, and FRMAC, capable of providing onsite and offsite radiological support, participated in the launch. A joint U.S./U.K. nuclear weapon accident command post exercise DIAGONAL GLANCE was conducted in the United Kingdom during the period September 15-18, 1998. The scenario involved a U.S. Air Force aircraft carrying nuclear weapons crashing on U.K. soil. The primary objective of DIAGONAL GLANCE was to evaluate international, national, and local government agreements, policies, procedures, and interfaces as they apply to a U.S. nuclear weapon accident occurring on U.K. soil. Between April 2-8, 1998, RAP teams were deployed to provide assistance to the State of Connecticut and the Environmental Protection Agency (EPA) in conducting surveys for radioactive contamination in buildings previously used in the clock manufacturing and the radium dial painting industry. Ten buildings in four different cities were surveyed. Contamination was found in four of the five occupied buildings. As lead Federal Agency, the EPA recommended follow-up resolutions and protective actions. With respect to Domestic Preparedness Training in support of the Nunn, Lugar, Domenici legislation, RAP and REAC/TS elements participated in 29 city visits and training activities. In April 1998, the Department of State requested DOE radiological advisory assistance to the United Arab Emirates to validate either the presence or absence of radiological contamination threat at the crash site of an airliner. The Departmental assets performed an assessment of the threat of "Red Mercury" being aboard the aircraft which had crashed in the desert on December 16, 1997, killing 77 individuals. No evidence of radiological contamination was detected.

Status: Fully Successful

NS 4-1 REDUCING THE WEAPONS STOCKPILE

Status: Fully Successful

Description: Dismantle nuclear warheads that have been removed from the U.S. nuclear weapons stockpile in a safe and secure manner.

Success will be measured by:

Success will be measured in FY 1998 by adhering to schedules for the safe and secure dismantlement of approximately 1,000 nuclear warheads that have been removed from the U.S. nuclear weapons stockpile.

Analysis: In fiscal year 1998, 1062 U.S. nuclear warheads were dismantled versus a fiscal year goal of 1004. The majority of dismantlements were W69 Short-Range Attack Missile warheads, in addition to some W79 Artillery-Fired Atomic Projectile warheads and surveillance units.

Status: Fully Successful

Defense Programs FY 1999 Performance Agreement

(Budget Authority Dollars in Millions)

Stockpile Stewardship

Program Mission

The Stockpile Stewardship Program is responsible for providing the capabilities to maintain high confidence in the nuclear stockpile. The maintenance of the research and development (R&D) infrastructure, which includes not only the physical complex of the three weapons laboratories and the Nevada Test Site, but also the scientists and engineers and the basic and applied research base on which the vitality and technical capabilities of the laboratories and the Nevada Test Site rest, is essential to success. The success of the Stockpile Stewardship Program is dependent upon Defense Programs' ability to maintain the level of scientific based capability needed to provide the ongoing technology and science resources required to insure that any Department question can be addressed by the best scientists and engineers using the most advanced sciences and technologies. This capability is of primary importance for the nuclear weapons stockpile responsibilities of the Department, but also supports the needs of other users of the laboratories and the Nevada Test Site by maintaining basic capabilities.

Weapons Stockpile Stewardship provides upgraded or new experimental, computational, and simulation tools needed to address issues of maintaining confidence in the safety, security, and reliability of the nuclear stockpile without underground nuclear testing. The cornerstone of the experimental capabilities provided by the Stockpile Stewardship Program is the National Ignition Facility (NIF) which is currently under construction at the Lawrence Livermore National Laboratory. NIF will provide the means to experimentally study primary boosting, assess secondary performance and weapons effects, and improve and validate new physics models and codes. The Dual Axis Radiographic Hydrodynamic Test (DARHT) facility, currently under construction at the Los Alamos National Laboratory will be the Nation's most advanced hydrodynamic experimental facility; DARHT experiments are essential for validating the implosion performance of primaries. Computational modeling and predictive simulation are integral to every activity in the Stockpile Stewardship and Management Program. Advanced computational and simulation capabilities being developed under the Accelerated Strategic Computing Initiative (ASCI) will be incorporated into ongoing stockpile computational activities. The program also includes research and development to provide the technology required for stockpile management. Key to the success of this science-based program is ensuring that highly qualified people are available for national security programs. At the most fundamental level, the Stockpile Stewardship Program relies on the judgment and skills of experienced scientists and engineers, supported by essential experimental and computational resources, and the preservation of their knowledge base.

Program Goals

- Provide high confidence in the safety, security, reliability and performance of the enduring U.S. nuclear stockpile, without underground nuclear testing, to ensure the effectiveness of the U.S. nuclear deterrent while simultaneously supporting U.S. arms control and nonproliferation objectives.
- Provide the ability to resume U.S. underground nuclear testing and reconstitute nuclear weapons production capacities, consistent with Presidential directives and the Nuclear Posture Review.

Program Objectives

There are four national security objectives in the DOE Strategic Plan upon which this program and budget are based:

- Maintain confidence in the safety, reliability, and performance of the nuclear weapons stockpile without underground nuclear testing.
- Replace nuclear testing with a science-based Stockpile Stewardship Program.
- Ensure the vitality of DOE's national security enterprise.
- Reduce nuclear weapons stockpiles and the proliferation threat caused by the possible diversion of nuclear materials.

Strategies

Weapons Stockpile Stewardship supports the following strategies:

- Extend the life of U. S. nuclear weapons by continuing the Stockpile Life Extension Program and Stockpile Maintenance activities.
- Improve detection and prediction capabilities for assessing nuclear weapon component performance and the effects of aging.
- Continually evaluate the safety, reliability, and performance of the nuclear weapons stockpile.
- Develop the advanced simulation and modeling technologies and computational tools necessary to confidently mitigate the loss of underground nuclear testing.
- Develop new nuclear weapons physics experimental test capabilities.
- Advance our understanding of the fundamental characteristics of weapons behavior through weapon systems engineering and advanced experiments to support future assessments of weapons safety, reliability, and performance.
- Provide an appropriately-sized, cost-effective, safe, secure, and environmentally sound national security enterprise.
- Ensure that sufficient scientific and technical personnel are available to meet DOE's long-term national security requirements.
- Ensure and enhance protection of nuclear materials, sensitive information, and facilities.
- Maintain test readiness and maintain and enhance emergency response and management capabilities to address any nuclear weapons, radiological or other emergency in the U.S. or abroad.
- Dismantle nuclear warheads that have been removed from the U.S. nuclear weapons stockpile in a safe and secure manner.

Performance Measures

For **FY 2000**, the Stockpile Stewardship Program will support the following performance measures:

- Meet all annual weapon alteration, modification, and surveillance schedules developed jointly by DOE and DoD.
- Conduct studies and development work required to support weapons systems and components for the future stockpile.

- Annually report to the President on the need or lack of need to resume underground nuclear testing to certify the safety and reliability of the nuclear weapons stockpile.
- Revalidate enduring stockpile systems to meet established military characteristics.
- Provide the computer platforms sized to support the stewardship objective of full physics, high fidelity simulations of nuclear weapons performance.
- Deliver three-dimensional high fidelity weapons performance codes by 2004.
- Demonstrate a computer code capable of performing a three-dimensional analysis of the dynamic behavior of a nuclear weapon primary, including a prediction of the total explosive yield, on an Accelerated Strategic Computing Initiative (ASCI) computer system.
- Develop and implement visualization, networking and data management systems to efficiently support utilization of ASCI codes and computers across the weapons complex.
- Continue construction of the National Ignition Facility (NIF) according to its Project Execution Plan schedules.
- Meet all cost and schedule goals for construction of the Dual-Axis Radiographic Hydrodynamic Test (DARHT) Facility consistent with an FY 2002 completion.
- Meet all cost and schedule goals for construction of the Contained Firing Facility at LLNL consistent with a fourth quarter FY 2001 completion.
- Meet all cost and schedule goals for construction of the Atlas facility at LANL consistent with a first quarter FY 2001 completion.
- Obtain and assess information required to decide whether to construct 1) an advanced hydrotest facility and/or 2) an advanced pulsed power facility.
- Conduct two subcritical experiments at the Nevada Test Site to provide valuable scientific information about the behavior of nuclear materials during the implosion phase of a nuclear weapon.
- Conduct experimental and theoretical research necessary to maintain or advance research, development, and engineering capabilities in nuclear materials science and weapons design.
- Conduct high energy density research on inertial confinement fusion facilities necessary to enhance understanding of areas of physics relevant to a better predictive assessment of nuclear weapons performance.
- Ensure that all facilities required for successful achievement of the Stockpile Stewardship Plan are operational.
- Ensure that the capability to resume underground nuclear testing is maintained, in accordance with Presidential Decision Directive and Safeguard C of the Comprehensive Test Ban Treaty (CTBT).
- Establish strategic alliances and collaborations among the weapons laboratories, industries, and universities to enable effective use of scientific and technical personnel throughout the R&D community.

For **FY 1999**, the Stockpile Stewardship Program, as funded by the FY 1999 appropriation, will support the following significant overall performance measures:

- Annually report to the President on the need or lack of need to resume underground nuclear testing to certify the safety and reliability of the nuclear weapons stockpile. (Secretary of Energy Bill Richardson certified to the President that the nuclear stockpile is safe, secure, and reliable on December 22, 1998.)
- Meet all DoD annual weapons alteration, modification, and surveillance schedules.
- Continue revalidation of the military characteristics of the W76 warhead, and begin revalidation of a second weapon type.
- Accelerate the ongoing development of critical, full-physics, three-dimensional weapons simulation codes; specifically, perform sustained weapons simulations at 1 trillion operations per second.
- Demonstrate operation of a 10 trillion operations per second computer system.
- Deliver a computer code capable of performing a three-dimensional analysis of the dynamic behavior of a nuclear weapon primary, including a prediction of the total explosive yield, on an ASCI computer system. Compare computed results with existing nuclear test data.
- Meet all cost and schedule goals for construction of NIF and related technology development, including completion of the Optics Assembly Building, initiation of Special Equipment installation, and completion of the Target Bay Area for Target Chamber installation.
- Begin operations of the first accelerator of DARHT and deliver accelerator cells for prototype testing with the beam for the second accelerator.
- Make the decision within the 5-year period whether to construct an advanced hydrotest facility and/or an advanced pulsed power facility.
- Conduct two to three subcritical experiments at the Nevada Test Site to provide valuable scientific information about the behavior of nuclear materials during the implosion phase of a nuclear weapon.
- Establish strategic alliances and collaborations among the weapons laboratories, industries, and universities to enable effective use of scientific and technical personnel throughout the R&D community.
- Maintain the capability to resume underground testing, in accordance with Presidential direction.

Significant Accomplishments and Program Shifts

During **FY 1998**, implementation of the Stockpile Stewardship Program, initiated in FY 1994, continued in accordance with the Stockpile Stewardship and Management Plan and resulted in the following accomplishments:

- Successfully completed certification of the safety and reliability of the U.S. nuclear weapons stockpile according to DOE/DoD procedures.
- President Clinton announced and endorsed ASCI's Pathforward initiative contract awards at a LANL press conference on February 3, 1998. Awardees of the $50 million 4-year contracts aspire to achieve a 30Tf supercomputer performance by the year 2001.

- DOE announced on February 12, 1998, selection of IBM for the ASCI Option White (10Tf) supercomputer to be located at LLNL.
- Vice President Gore and Energy Secretary Bill Richardson announced on October 28, 1998, the world's fastest computer at LLNL. The ASCI Blue Pacific - SST IBM machine, which contains 2.6 trillion bytes of memory, and will perform 3.9 trillion operations per second.
- Measured a fundamental property of hydrogen (equation of state) in the Nova laser at weapon-relevant pressures providing unexpected results that change our understanding of weapon performance and the state of hydrogen within the planet Jupiter. This work was awarded the American Physical Society's prize for the Outstanding Plasma Physics Accomplishment for 1998.
- Completed flight tests and laboratory tests which support stockpile surveillance activities, including flight tests to support the final certification of the B61-11.
- Completed modeling of applicable past nuclear tests and hydro tests for certification rationale to support the SLBM Warhead Protection Program.
- Continued development activities for, or refurbishment of, eight weapons alterations and/or modifications, including B61, W87, B83, and W76 alts, and the B83 mod.
- Successfully conducted the third and fourth subcritical experiments, "Stagecoach" and "Bagpipe," which provided data to improve the accuracy of computer simulations of nuclear weapons as part of the science-based Stockpile Stewardship Program, and were used to develop and refine diagnostics for the more complex subcritical experiments of the future.
- Maintained the capability to resume underground nuclear testing in accordance with the Presidential Decision Directive and Safeguard C of the CTBT through a combined experimental and test readiness program that included 29 high-explosive experiments at the Nevada Test Site and hundreds of stockpile stewardship experiments conducted at various facilities which exercise many nuclear testing related skills and technologies, including nuclear design, experiment integrations, nuclear chemistry, and weapons engineering. Conducted a table-top exercise that simulated a mass venting of an underground nuclear test at the NTS, exercising the emergency response systems that could be needed during a nuclear test. Continued an ongoing archiving program designed to preserve the knowledge and testing experience of departing personnel as well as data, photos, drawings, procedures, nuclear explosive safety studies, containment evaluation plans, lessons learned, and other information.
- Developed and used proton radiography to examine high explosive detonation issues related to typical weapons in the U.S. stockpile which allows designers to assess high explosive performance over a large temperature range and to develop computational models used for stockpile assessment and certification.
- Using neutron resonance spectroscopy, obtained the first simultaneous measurements of the internal temperature and average velocity of atoms in a shocked metal which will underpin detailed models of the hydrodynamics of weapon materials.
- Created a new encapsulant for nuclear weapon components with much higher resistance to high voltage breakdown which will improve the reliability of miniature high voltage firing sets.

- Developed ion-implantation process which has doubled the strength of electroformed nickel alloys for nuclear weapon miniature electromechanical devices such as strong-link switches and gyroscopes.
- Completed facility construction of the first arm of DARHT at the Los Alamos National Laboratory and began the preliminary design of the second axis accelerator for DARHT.
- Began the physical construction of NIF on schedule and maintained schedule throughout the year despite the impacts of El Niño rains.

Program Shifts

In FY 2000, the first steps will be taken to integrate the advanced computational and simulation models, methodologies, and materials models developed and matured within the Accelerated Strategic Computing Initiative with various relevant and complementary components of ongoing Core Stewardship activities. These integrated activities are key elements of the model and simulation-based capabilities needed to maintain the Nation's nuclear weapon stockpile. Advancements in systems modeling will be incorporated into the ongoing technical reviews of stockpile weapons conducted in support of the annual certification process. Materials models and databases will be utilized to address weapons aging and reliability issues and to support the reliability and surety of remanufactured components. Verified and validated primary and secondary codes will be used to support the surveillance, assessment and refurbishment of the weapons systems in the nuclear weapons stockpile. **Integration of achievements from Accelerated Strategic Computing Initiative (ASCI) with the ongoing Core Stewardship program** is essential to provide high confidence in the safety, security, reliability and performance of the enduring U.S. nuclear stockpile, without underground nuclear testing.

The Stockpile Stewardship Program plans to invest in an **infrastructure construction initiative** at the three laboratories and the Nevada Test Site. Over a 5 - 10 year period, the goal is to invest approximately $100 million per year to maintain and refurbish aging infrastructure systems and facilities. The funding planned for the initiative will support ongoing and new infrastructure construction projects, but does not include the funding for programmatic construction projects.

The funding responsibility for the **Los Alamos County School District** subsidy and the **Northern New Mexico Education Enrichment Foundation** have been transferred to the Education program from the Weapons Program Direction budget. Funding for the **National Atomic Museum**, to be located at the International Balloon Park Museum in northern Albuquerque, New Mexico is also included in the Education program.

Defense Programs is studying the replacement of the current Administration Building complex (SM-43) at Los Alamos National Laboratory. This complex serves both administrative and technical divisions, including weapon assessment and certification groups. The complex is 45 years old and increasingly difficult and costly to maintain. All building systems have exceeded their design life. The Department is facing expensive upgrades to the electrical and fire protection systems, as well as major seismic upgrades.

Site-Wide Environmental Documentation

Defense Programs oversees and coordinates site-wide environmental documentation activities at the three weapons laboratories and the Nevada Test Site, as the Department's landlord, although funding is provided by all affected activities at each site. The Record of Decision on the Nevada Test Site site-wide environmental impact statement (SWEIS) was completed in December 1996. The Los Alamos National Laboratory SWEIS is expected to be completed by the end of the second quarter of FY 1999. The Sandia National Laboratories (New Mexico) SWEIS has begun, with a Notice of Intent completed in May of 1997. The draft SWEIS is

scheduled for distribution for comment in the second quarter of FY 1999, with completion of the SWEIS anticipated by the end of FY 2000. Defense Programs is also conducting a 5-year review or supplement analysis of the Lawrence Livermore National Laboratory SWEIS, originally completed in 1992; a determination on this supplement analysis is expected in the second quarter of FY 1999. The Stockpile Stewardship and Management programmatic environmental impact statement (PEIS), the basis of the FY 1997 Record of Decision for Defense Programs, supports major projects including NIF. Defense Programs is preparing a supplemental EIS for the National Ignition Facility to review the environmental impacts of additional information discovered since the Stockpile Stewardship and Management PEIS was completed.

Management and funding responsibility for several production related facilities at LANL, including the Plutonium Facility (Technical Area 55), the Chemistry and Materials Research Laboratory, and the Los Alamos Criticality Experiments Facility, was transferred to the Weapons Stockpile Management decision unit in FY 1998.

Conceptual Design Reports and Post-Conceptual Design Engineering

During the budget request period, FY 1999-FY 2001, Defense Programs may choose to begin conceptual design activities for an advanced hydrotest facility and an advanced pulsed power facility. It is estimated that each of these conceptual design reports will likely cost in excess of $3 million.

Budget Structure

The Weapons Stockpile Stewardship budget request is organized in the following manner:

- **Core Stockpile Stewardship**: This program supports the specific activities required for science-based Stockpile Stewardship through the maintenance of the physical and intellectual infrastructure at Lawrence Livermore National Laboratory, Los Alamos National Laboratory, Sandia National Laboratories and the Nevada Test Site. Major program elements include Programs and Initiatives, Core Research and Advanced Technology, and Testing Capabilities and Readiness. The budget structure for Core Stockpile Stewardship is more "functional" than "programmatic." Because there is such a large research and development aspect to Stockpile Stewardship, in many cases, the basic capabilities that we must maintain across the laboratories and plants serve many programmatic objectives. While they are not "functional" in the same sense as the Department's Functional Cost Reporting structure which focuses on indirect activities, they are inputs, rather than outputs, for the laboratories.
- **Inertial Confinement Fusion**: The Inertial Confinement Fusion program is a research and advanced technology development effort directly supporting the Department's national security mission in Stockpile Stewardship. The National Ignition Facility (96-D-111), a 192-beam neodymium glass laser facility intended to achieve controlled thermonuclear fusion in the laboratory, is under construction at LLNL. When completed, the NIF will be a cornerstone of the Stockpile Stewardship program, and represents a major initiative for the Department.
- **Technology Partnerships and Education**: The Technology Partnerships and Education programs directly share the expertise and scientific development in the laboratories with the private sector and obtain skills and knowledge from the private sector for the enhancement of laboratory capabilities. The Technology Partnerships program strengthens the science and technology base through participation in cooperative, dual-benefit partnerships with private industry. Education initiatives support science education activities and enhance continuing technical capabilities in support of the program's mission, exercising the unique capabilities of the Department of Energy with emphasis on graduate and post-graduate activities.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request

Public Law Authorization:

Public Law 105-85, National Defense Authorization Act for FY 1998.

---

[a] Reflects Stockpile Stewardship allocation of appropriated use of prior year balances: Core Stewardship $ -359,000; ICF $ -52,000; and Technology Partnerships $ -43,000.

[b] Reflects Stockpile Stewardship allocation of appropriated use of prior year balances: $ -39,552,000.

[c] Reflects Stockpile Stewardship allocation of appropriated use of prior year balances, taken as reductions to new budget authority: Core Stewardship $ -33,006,000; ICF $ -4,618,000; and Technology Partnerships $-1,928,000, and reapplication of available prior year balances to cover FY 1999 program activities: Core Stewardship $ +3,676,000.

[d] Reflects reprogramming of $3,683,000 (98-R-4), approved November 1998.

Discussion of Activities

The Stockpile Stewardship activities provide the physical and intellectual infrastructure at the weapons laboratories and the Nevada Test Site, and provides the scientific, engineering, and computational tools needed to address issues of maintaining confidence in the safety, reliability and performance of the nuclear weapons stockpile without underground nuclear testing. The Stockpile Stewardship decision unit consists of the Core Stockpile Stewardship, Inertial Confinement Fusion, Technology Partnerships, and the Education programs.

The FY 2000 budget for the Stockpile Stewardship program has been formulated to balance the need to develop and maintain essential scientific and technical capabilities over the long term with near-term workload requirements and schedules. This has required difficult, but appropriate, choices that have resulted in some reduction of opportunities to improve our understanding of the hydrodynamic behavior of primaries, develop physics and materials models, and take full advantage of the National Ignition Facility for weapons physics experiments.

Core Stockpile Stewardship

The FY 2000 request of $1,768.5 million for Core Stockpile Stewardship maintains a capable physical and intellectual infrastructure to support the enduring stockpile, including surveillance, evaluation, and preventive maintenance for the stockpile; provides and enhances the research, engineering and development capabilities, including advanced computing and experimental simulation and modeling, required to refurbish and recertify the enduring stockpile; maintains the capability to resume underground nuclear testing, if directed; and retains the ability to develop and support the manufacturing of replacement designs.

Direct Stockpile Activities includes studies and research to apply basic science to surveillance, assessment, and refurbishment requirements associated with the **nuclear weapons stockpile**, as defined by Department of Energy commitments to the DoD and Stockpile Management requirements. Included are Enhanced Fidelity Instrumentation, ACORN Implementation, the Submarine Launched Ballistic Missile Warhead Protection Program, and Stockpile Readiness/Safety Assessments. The Stockpile Life Extension Programs (SLEP) will provide Full Scale Engineering Development (FSED) and other required phase 6.2A and 6.3 activities for the W76 and W80, including support for the refurbishment First Production Unit (FPU) date of FY 2005 for the W76 and FY 2006 for the W80. Verified and validated primary and secondary code simulations and models will be used to support the surveillance, assessment and refurbishment of the weapons systems in the nuclear weapons stockpile.

Transitioning from 2-D to 3-D simulation codes will help to better predict many aspects of the aging stockpile.

Experimental Activities provides the ability to certify the enduring stockpile in the absence of nuclear testing, and improves our understanding of stockpile aging and the effects of reliability through experiments using high explosives and/or small quantities of special nuclear material. In FY 2000, two **subcritical experiments** will be conducted at the Nevada Test Site. Subcritical experiments are scientific experiments using chemical high explosives to generate high pressures which are applied to

nuclear materials. High speed measurement instruments are used to obtain valuable scientific data on the behavior of those nuclear materials under conditions similar to those during the implosion phase of a nuclear weapon. The configuration and quantities of explosives and nuclear materials are designed so that no nuclear explosion will take place. The data obtained from subcritical experiments will help benchmark complex computer simulations of nuclear weapons performance and will be used to help certify the safety and reliability of the Nation's nuclear weapons stockpile. With the moratorium on underground nuclear testing, scientists and engineers compare experimental data with data from prior underground nuclear tests in order to validate or modify computational codes.

Cimarron subcritical experiment conducted in Nevada on December 11, 1998.

Experiments will also be conducted at the **Los Alamos Neutron Science Center (LANSCE)** in advanced materials science, nuclear science and particle-beam accelerator technology in addition to weapons surveillance. The **Z Pulse Power Program**, which is funded through both the ICF and Core Stewardship programs, is supported at a constrained level sufficient to pursue only highest priority activities.

Also within Core Stockpile Stewardship, the **Accelerated Strategic Computing Initiative (ASCI)** is on track to attain 100 trillion operations per second (TeraOps) level by 2004, building upon the successes achieved with the demonstrated 1 TeraOp on the Option Red computer and the recently demonstrated performance of the Option Blue computer platforms at LLNL and LANL. The Option White computer is planned to perform at a peak level of 10 TeraOps in year 2000 through a sequence of technology updates. Also during FY 2000, ASCI will continue building "more complete physics" 3-D computer codes which, in conjunction with the experimental programs in core stewardship and ICF, are aimed at providing the required levels of fidelity in weapons simulations.

Stockpile Computing provides the traditional core computing capabilities in the weapons complex as well as implementation of the **Numerical Environment for Weapons Simulations**, (NEWS). Launched in FY 1999, NEWS will create localized data exploration super corridors to support large-scale data analysis and assimilation tasks for researchers and weapons assessment teams.

Construction is continued on two new experimental facilities: the **Dual Axis Radiographic Hydrodynamic Test (DARHT) Facility** and the **Atlas pulsed power facility**, both at Los Alamos National Laboratory. DARHT's dual-axis, multi-time viewing capability will replace LANL's current diagnostic tool for hydrodynamic testing, the Pulsed High-Energy Radiographic Machine Emitting X-Rays, and provide crucial experimental data on many of the stockpile systems. Atlas will provide a pulsed power experimental capability to address secondary weapons physics questions in a high energy density environment.

Advanced hydrodynamic radiography development activities are supported, leading to a decision within the planning period whether to construct an advanced hydrodynamic radiography facility. Startup costs and a limited number of experiments on the Two Stage **Gas Gun** and the **Big Explosive Experimental Facility (BEEF)** at the Nevada Test Site are provided along with other experimentation and research radiation flow, cross sections, hydrodynamics, equation of state, etc, needed for advanced computer modeling and analyses, in lieu of underground nuclear testing.

Ongoing **Core Research and Advanced Technology** activities including physics; systems engineering; advanced manufacturing; chemistry and materials, high explosives, special nuclear materials, and tritium research will continue. Systems modeling and materials models and databases developed and matured in ASCI will be incorporated into these research areas.

Testing Capabilities and Readiness to resume underground nuclear testing within 2-3 years is maintained. Support is provided for the University of Nevada Cooperative Agreement which was initiated in FY 1998 to encourage and facilitate collaborative efforts between academic researchers at Nevada institutions of higher education and researchers at the national laboratories and other DOE contractors.

Funding is also included in Stockpile Stewardship's **infrastructure construction** account to initiate three new construction projects which will provide the unique floor space needed at the laboratories to house the state of the art computers as well as provide visualization and other capabilities to maximize the utility of the greatly enhanced computing capabilities by the weapon designers. The **Strategic Computing Complex** at LANL and the **Terascale Simulation Facility** at LLNL will provide clear unobstructed computer floor space with scalable power and cooling capabilities to house 100 TeraOps and beyond. The **Joint Computational Engineering Laboratory** at SNL will provide a state-of-the-art facility for research, development, and application of leading edge, high-end computational and communications technologies.

Inertial Confinement Fusion (ICF)

The request of $465.7 million for the ICF program supports a minimal indirect drive program and introduces some risk to the **National Ignition Facility (NIF)** research program. The request provides the required construction funding to maintain the project on schedule; however, the schedule for the ignition program on NIF will be at risk. Specifically, the funds will support NIF infrastructure buildup, operational training and initiation of laser area operations; NIF optics pilot production, NIF component validation; and,

The target bay floor slab with additional forms in place during the second week of November.

experiments and computational theory and modeling consistent with potentially delayed NIF ignition plan. The ICF program will provide the required capabilities for only the highest priority weapons program led experiments on Omega, and possibly, Nike. Funding for the NIF cryogenic handling system is not included in the request, deferring the initiation of this effort until FY 2001. The request supports the direct drive ignition program, based on the ignition plan, at Omega and the Nike facility at the Naval Research Laboratory. The Z program, which is funded through both the ICF and Core Stewardship programs, is supported at a level sufficient to pursue the highest priority activities. The request provides for the minimal level of target deliveries from General Atomics to the ICF laboratories, but does not include funding for any cryogenic research. Finally, support is provided for the grants program to independent investigators in high energy density physics directly related to stockpile stewardship.

Technology Partnerships

The FY 2000 request of $22.2 million supports, at a significantly reduced level, ongoing industrial partnerships focused on advanced manufacturing and the development of current and potential key suppliers of components, software, hardware, and equipment for the Weapons Stockpile Stewardship Program. In addition, funding is provided for the American Textile Partnership (AMTEX), the Advanced Computational Technology Initiative (ACTI), and the Small Business Program.

Education

The FY 2000 request of $29.8 million for the Education program provides funding for utilization of the unique resources of the Department of Energy national laboratories -- people, programs, and facilities -- to improve science and math education throughout the Nation. Enhancing the scientific education of our citizens will ensure a highly trained, diverse scientific workforce for the laboratories and will enhance our ability to conduct the Stockpile Stewardship mission. The projects, approved by Headquarters and conducted by the national laboratories, are grouped in six major categories: teacher/faculty enhancement, curriculum improvement, institutional improvement, student support, educational technology and public understanding of science. Each laboratory publishes an annual report on the projects and their accomplishments. Historically Black Colleges and Universities and other minority institutions receive approximately 15 percent of this funding.

Support for the Los Alamos County School District and the New Mexico Educational Enrichment Foundation, formerly funded under Weapons Program Direction, is included in the Stockpile Stewardship funding beginning this fiscal year. Funding is also requested for the National Atomic Museum to be built in Albuquerque, New Mexico.

Explanation of Funding Changes from FY 1999 to FY 2000

Stockpile Stewardship is requesting $2,286.2 million in FY 2000, an increase of $170.3 million, or 8 percent above the FY 1999 appropriation of $2,115.9 million. The funding increase, primarily in Core Stewardship, is needed to verify, validate, and integrate the simulation and modeling advances, developed and matured in ASCI, into the ongoing research and development program, which maintains the current nuclear weapon stockpile and supports the annual certification process. The integration of these simulation and modeling advances with the ongoing modeling efforts in materials science, hydrodynamics, and radiation flow is essential to achieving the weapons performance and safety code objectives required for stockpile assessment and certification without underground nuclear testing. The increase in funding also supports continued growth in the ASCI and Stockpile Computing programs; continuation of ongoing construction projects, initiation of three new infrastructure projects; the transfer

of funding to support the Los Alamos County School District and the Northern New Mexico Educational Enrichment Foundation from the Weapons Program Direction account; and the initiation of the National Atomic Museum at Albuquerque, New Mexico. These increases are partially offset by decreases to Technology Partnerships and NIF construction funding.

The budget request for the **Core Stockpile Stewardship** program is $1,768.5 million, an increase of $208.1 million, or 13 percent, over the FY 1999 adjusted appropriation. Additional information can be found in the Detailed Program Justification; however, significant funding changes include:

+ $ 37.6 million	Increase to **Direct Stockpile Activities** to support development activities to support refurbishment of the W76 Trident SLEP, and primary and secondary code verification and validation for stockpile weapon systems.
+ $ 4.5 million	Increase to **Experimental Activities** to support archiving and experimental activities, including complex subcritical experiments, in support of stockpile certification efforts.
+ $ 40.1 million	Continue planned growth in the **Accelerated Strategic Computing Initiative**, including support for accelerated 3-D code development, planned platform requirements, academic alliances, and accelerated distributive and distance computing.
- $ 8.7 million	Decrease to **Special Projects** reflecting the transfer of waste management activities to the waste generators.
+ $ 59.5 million	Increase to **Performance Assessment Science & Technology** to support additional hydrotest experiments, neutron science research at LANSCE, advanced hydrodynamics research, and verification and validation of systems modeling in support of annual stockpile certification.
+ $ 43.8 million	Increase to **Chemistry & Materials Science & Technology**, including verification and validation of materials modeling to address weapons aging and reliability issues and to support the reliability and surety of remanufactured components.
+ $ 18.7 million	Increase to **Stockpile Computing**, including continuation of the Numeric Environment for Weapons Simulation initiative which will create data exploration supercorridors to support large-scale data analysis by researchers and weapons assessment teams.
- $ 13.4 million	Reduction to **Testing Capabilities and Readiness** funding to support two subcritical experiments, a decrease from the FY 1999 funding level which supported three to four experiments.
+ $ 26.0 million	Initiate three new infrastructure projects: **Strategic Computing Complex** at LANL, **Terascale Simulation Facility** at LLNL, and **Joint Computational Engineering Laboratory** at SNL; continue funding for construction of **DARHT**; partially offset by decreases in funding requirements for ongoing Stewardship construction.

The budget request for the **Inertial Confinement Fusion** program is $465.7 million, a decrease of $37.7 million, or 7 percent, from the FY 1999 appropriation, reflecting the scheduled decrease in NIF construction funding and completion of the NIF optics pilot production. The NIF construction schedule is maintained within this request. Within the program, the National Ignition Plan is partially supported, with minimal development of NIF target diagnostics and experimental equipment, and the initiation of the NIF cryogenic handling system, originally planned for FY 2000, is delayed until FY 2001. Funding is included to utilize Omega for 18 weeks of weapons physics experiments by scientists from LANL and LLNL, the same as the FY 1999 level.

The budget request for **Technology Partnerships** is $22.2 million, a decrease of $20.9 million, or 48 percent, from the FY 1999 appropriation of $43.1 million. The FY 2000 request includes up to $5 million for AMTEX and up to $9 million for ACTI. The remaining $8.2 million will support ongoing R&D Cooperative Agreements. Some partnerships will begin transition to closeout in FY 1999 while others may be absorbed within other core stewardship efforts as appropriate.

The budget request for the **Education** program is 29.8 million, an increase of $20.8 million, associated with the transfer of funding responsibility from the Weapons Program Direction budget for the Los Alamos County School District (up to $8.0 million) and the Northern New Mexico Education Enrichment Foundation (a minimum of $6.0 million), support for the new National Atomic Museum ($5.5 million) to be built in northern Albuquerque, New Mexico, and an increase of $1.3 million to other Education activities.

[a] Reflects Stockpile Stewardship allocation of appropriated use of prior year balances: Core Stewardship $ -359,000; ICF $ -52,000; and Technology Partnerships $ -43,000.

[b] Reflects reapplication of available prior year balances to cover FY 1999 program activities: Core Stewardship $ +3,676,000; and a reprogramming of $3,683,000 (98-R-4), approved November 1998.

Site Description

Weapons Stockpile Stewardship activities are conducted predominantly at the three weapons laboratories, Lawrence Livermore, Los Alamos, and Sandia National Laboratories in California and New Mexico, and at the Nevada Test Site. Funding is also provided to the University of Rochester, the Naval Research Laboratory, and General Atomics through the Inertial Confinement Fusion program and to various production sites for research and development activities related to Stockpile Stewardship. Other miscellaneous locations are funded through the Stockpile Stewardship program as noted on the Funding by Site table above.

Los Alamos National Laboratory

The Los Alamos National Laboratory (LANL), established as a nuclear weapons design laboratory in 1943, is located on about 28,000 acres adjacent to the town of Los Alamos, New Mexico, which is approximately 25 miles northwest of Santa Fe.

The core competencies at LANL supporting the Stockpile Stewardship Program include theory, modeling and simulation, and high-performance computing to model a broad range of physical, chemical, and biological processes; complex experiments and measurements; nuclear and advanced materials; and nuclear weapons science and technology including the physics of nuclear weapons design and large-scale calculations of weapons phenomena. LANL also possesses unique capabilities in neutron scattering required for stockpile stewardship and enhanced surveillance and shares with LLNL the responsibility for the safety and reliability of the physics package in the Nation's nuclear weapons.

Among the major specialized facilities at LANL are the TA-55 Plutonium Facility for surveillance of plutonium "pits" and plutonium pit manufacturing, actinide research, and nuclear waste research and the Los Alamos Neutron Science Center user facility for supporting advanced materials science, nuclear science and particle-beam accelerator technology in addition to weapons surveillance. Two new facilities, the Dual Axis Radiographic Hydrodynamic Test (DARHT) Facility and the Atlas pulsed power facility, are now under construction. DARHT's dual-axis, multi-time viewing capability will replace LANL's current diagnostic tool for hydrodynamic testing, the Pulsed High-Energy Radiographic Machine Emitting X-Rays, and provide crucial experimental data on many of the stockpile systems. Atlas will provide a pulse power experimental capability to address secondary weapons physics questions in a high energy density environment.

Sandia National Laboratories

The Sandia National Laboratories (SNL) are responsible for the nonnuclear components and systems engineering for all nuclear weapons and is a crucial point of contact with DoD in the areas of weapon requirements, system design, logistics, surveillance, training, and dismantlement. SNL manufactures certain nonnuclear components including neutron generators and is capable of providing an assured source of radiation hardened electronics. SNL provides unique capabilities in advanced manufacturing technology, microelectronics, and photonics and maintains distinctive competencies in engineered materials and processes, computational and information sciences, engineering sciences, and pulsed-power technology. Distributed Computing at a Distance, a component of the ASCI program, will originate at SNL.

Among the major specialized facilities at SNL are a Microelectronics Development Laboratory, a Combustion Research Facility for combustion science and laser spectroscopy, an Advanced

Manufacturing Processes Laboratory for rapid prototyping and assessing quality and reliability, an Intelligent Systems and Robotics Center supporting intelligent and agile manufacturing, and Pulsed Power Accelerators for testing and development of defense components.

Nevada Test Site

The Nevada Test Site (NTS), established in 1950, encompasses approximately 867,000 acres in Nye County in southern Nevada, about 65 miles northwest of Las Vegas. Since the U.S. Nuclear Testing Moratorium Act went into effect in early October 1992, no nuclear tests have been conducted by the United States.

The core mission at the NTS is to maintain the capability to conduct an underground nuclear test within 2-3 years of any such request by the President. Maintenance of this capability is required by Presidential Directive and is consistent with the Administration's Safeguards accompanying the Comprehensive Test Ban Treaty. To fulfill this mission, the necessary NTS infrastructure, facilities, and technical personnel are supported through exercises and experiments. Subcritical experiments sponsored by the nuclear weapons design laboratories (LANL and LLNL) serve a dual purpose of providing experimental data and exercising nuclear testing personnel skills; these experiments are the primary basis of maintaining nuclear test readiness.

General Atomics

General Atomics, located in La Jolla, California, is the current contractor for supplying the national laboratories with inertial confinement fusion targets for experimental campaigns.

Lawrence Livermore National Laboratory

The Lawrence Livermore National Laboratory (LLNL), was established as a nuclear weapons design laboratory in 1952. It is located on 1.3 square miles in Livermore, California. It has an auxiliary testing range located on eight square miles situated about 18 miles east of the main site. LLNL's primary mission is to support DOE's Stockpile Stewardship Program to ensure that the nation's nuclear weapons remain safe, secure, and reliable and to prevent the spread and use of nuclear weapons worldwide. The laboratory brings to this mission extensive experience in supercomputing and laser technology as well as a broad range of world-class science and engineering capabilities, including nuclear science and technology and advanced sensors and instrumentation. LLNL has demonstrated successes in assembling multi-disciplinary approaches, applying expertise in advanced defense technologies, energy, environment, biosciences, and basic science, to complex national issues.

Among the major specialized facilities supporting LLNL's programmatic efforts are the ASCI Blue Pacific computer system for high-fidelity weapon simulation, the High Explosive Applications Facility for energetic materials research, the Flash X-Ray Facility for hydrodynamic tests, and the Nova laser which will be used for inertial fusion and weapon-physics research until its scheduled closure in FY 1999.

New projects are underway to prepare LLNL's capabilities for its critical responsibilities to maintain the nuclear deterrent without nuclear testing. The National Ignition Facility (NIF) has been under construction since June 1997 and will be the world's largest and most powerful laser facility when completed in FY 2003. NIF will perform fusion, weapon-physics, and weapon-effects experiments in support of the Stockpile Stewardship Program. An important step toward meeting the DOE's goal of establishing the advanced weapon simulation capability required by the Stockpile Stewardship Program

will be the construction of the Terascale Simulation Facility. The Contained Firing Facility is a hydrodynamic test facility that will be an environmental improvement to Livermore's existing Flash X-Ray Facility.

Naval Research Laboratory

The Naval Research Laboratory located in Washington, D.C. contributes to the national Inertial Confinement Fusion program through the use of its Krypton-fluoride Nike laser which was completed in FY 1995. Nike's capabilities are particularly useful for defining beam smoothness requirements for direct drive laser fusion ignition. In addition, the laboratory has strong capabilities in code development and atomic physics.

University of Rochester

The University of Rochester's Laboratory for Laser Energetics in Rochester, New York, operates its 60-beam glass laser, Omega, primarily for research on direct drive laser fusion. However, the Omega facility is increasingly being used to field weapons physics experiments by scientists from Lawrence Livermore National Laboratory and Los Alamos National Laboratory as operation of Nova ceases in FY 1999. The use of Omega for weapons physics will continue as the stockpile stewardship program transitions to the use of NIF beginning on the first bundle in FY 2002.

Core Stockpile Stewardship

Mission Supporting Goals and Objectives

The Core Stockpile Stewardship Program provides confidence in the safety and reliability of the U.S. nuclear weapons stockpile, and maintains a nuclear design capability for the indefinite future in the absence of new weapons requirements and underground nuclear testing. This program maintains the U.S. capability to resume underground nuclear testing within 2-3 years and provides the physical and intellectual infrastructure, including computational and simulation capabilities, required to meet the programmatic requirements of the science-based Stockpile Stewardship Program without underground nuclear testing. Primary locations of activity are the Lawrence Livermore, Los Alamos and Sandia National Laboratories and the Nevada Test Site. The Stockpile Stewardship Plan provides primary programmatic guidance.

Ongoing Activities

- Maintain and enhance an effective stockpile surveillance and evaluation program, including preventive maintenance for the stockpile;
- Continue to create and deploy leading-edge computational and simulation capabilities;
- Support advanced experimental facilities;
- Provide and enhance the research, development, and engineering capabilities required to refurbish and recertify the safety and reliability of the enduring stockpile; and
- Retain the ability to develop and support the manufacturing of replacement designs.

In FY 2000, the first steps will be taken to integrate the advanced computational and simulation models, methodologies, and materials models developed and matured within the Accelerated Strategic Computing Initiative (ASCI) with various relevant and complementary components of ongoing Core Stewardship activities. These integrated activities are key elements of the model and simulation-based capabilities needed to maintain the Nation's nuclear weapon stockpile. Advancements in systems modeling will be incorporated into the ongoing technical reviews of stockpile weapons conducted in support of the annual certification process. Materials models and databases will be utilized to address weapons aging and reliability issues and to support the reliability and surety of remanufactured components. Verified and validated primary and secondary codes will be used to support the surveillance, assessment and refurbishment of the weapons systems in the nuclear weapons stockpile. Integration of achievements from ASCI with the ongoing Core Stewardship program is essential to provide high confidence in the safety, security, reliability and performance of the enduring U.S. nuclear stockpile, without underground nuclear testing.

Budget Contents

Core Stockpile Stewardship is broken into the following major categories: **Direct Stockpile Activities, Experimental Activities, Accelerated Strategic Computing Initiative, Special Projects, Performance Assessment Science & Technology, Systems Components Science & Technology, Chemistry & Materials Science & Technology, Stockpile Computing, Testing Capabilities and Readiness, Institutional and Infrastructure Requirements, and Construction.**

Direct Stockpile Activities provide for initial design and development of all new weapon designs, if needed; preproduction design and engineering activities; design and development of weapon modifications; technical aspects of the laboratory surveillance and flight test program; and analysis behind safety studies and assessments. This program supports studies and research to apply basic science to weapon stockpile problems producing new technologies; products and processes in the vital surety areas (safety, security, and use control) technology development and implementation. The analysis needed to dismantle and safely store weapons being removed from the stockpile is provided. Verified and validated primary and secondary codes developed in the ASCI program will be integrated into the direct stockpile programs to support surveillance, assessment and refurbishment activities.

Experimental Activities support the ability to certify the enduring stockpile in the absence of underground nuclear testing, and improve our understanding of stockpile aging and the effects on reliability through experiments using high explosives and/or small quantities of special nuclear material. Experiments are conducted at the three nuclear weapons laboratories (Los Alamos, Lawrence Livermore, and Sandia National Laboratories) and at the Nevada Test Site (NTS). The experiments at the NTS also directly support Presidential direction to maintain the ability to safely conduct an underground nuclear test at the NTS within 2-3 years. Funding for the NTS contractors who support these experiments is included in the Testing Capabilities and Readiness budget category.

An important component of the experimental program is the subcritical experiments. Subcritical experiments are scientific experiments using chemical high explosives to generate high pressures which are applied to nuclear materials. High speed measurement instruments are used to obtain valuable scientific data about the behavior of those nuclear materials under conditions similar to those during the implosion phase of a nuclear weapon. The configuration and quantities of explosives and nuclear materials are designed so that no nuclear explosion will take place. The data obtained from subcritical experiments will help benchmark complex computer simulations of nuclear weapons performance and will be used to help certify the safety and reliability of the Nation's nuclear weapons stockpile. With the moratorium on underground nuclear testing, scientists and engineers compare experimental data with data from prior underground nuclear tests in order to validate or modify computational codes.

Accelerated Strategic Computing Initiative (ASCI) supports Defense Programs' response to the Presidential decision to pursue a zero-yield Comprehensive Test Ban Treaty. ASCI will build upon the successes achieved with the demonstrated 1 TeraOp performance on the Option Red and recent demonstrated performance of over 3 TeraOps on the Option Blue platforms ahead of schedule. ASCI continues its' balanced approach to implementing the program through highly integrated strategies, such as, Advanced Applications; Platforms; Problem Solving Environments; Strategic Alliances; One Program\Three Labs; and Distributed Computing and Distance Computing, ($DisCom^2$). The ASCI program has developed high-end simulation capabilities (Advanced Applications and Platforms) needed to meet weapons assessment and certification (Problem Solving Environments and Advanced Applications) requirements without nuclear testing. The supercomputers developed under the ASCI program, along with associated diagnostic, modeling, and validation technologies, $DisCom^2$, and the Numeric Environment for Weapons Simulation, are key to supporting the execution of the Stockpile Stewardship Program. These strategies, taken collectively, are being pursued to accelerate the development of simulation codes, computer platforms and computing environments needed to address the challenges of credibly simulating the performance, safety, and reliability of the enduring nuclear stockpile with unprecedented levels of data fidelity.

Special Projects provide miscellaneous research, development and support activities necessary to carry out the Stockpile Stewardship Program, but which do not programmatically fit into any other category. Waste Management is included in this program.

Performance Assessment Science and Technology supports theoretical and experimental weapons physics research with an emphasis on anticipated future national security missions and requirements. This includes technical reviews of stockpile weapons conducted in support of the annual certification process, hydrotest and pulsed power experiments, in addition to advanced hydrotest and advanced pulsed power research. Advanced systems modeling developed under ASCI is utilized to address ongoing stockpile weapon system performance issues.

Systems Components Science and Technology includes research emphasizing the integration of warhead systems with delivery systems, and advancement of subsystem enabling technologies. This research includes component modularity, standardization, and reuse; utilization of microelectronic systems to improve safety, security and reliability; and development of the tools, methods, and processes needed to support future design and manufacturing requirements.

Chemistry and Materials Science and Technology provides research in materials science to address the unique set of issues relating to the specialized materials developed for, and used in, nuclear weapons. These activities are required to address the resolution of weapons aging and reliability issues; to support the remanufacture of stockpile components in a timely, cost effective, and environmentally benign way; and to enhance the reliability and surety of remanufactured components. Materials models and databases developed within ASCI are employed to address ongoing weapons issues in materials science.

Stockpile Computing conducts computing operations, develops models and provides code maintenance to support execution of Stockpile Stewardship. Stockpile Computing supports the development, enhancement, and maintenance of simulation codes and databases for the weapons program and research in theoretical physics, mathematical modeling, software and algorithms. These activities are essential in weapons safety and reliability assessments, stockpile life extension endeavors, design of physics experiments, developing appropriate diagnostics, and analyzing past nuclear experimental results. Areas of current and planned efforts include: assessments of complex/unique accident scenarios; improvements of predictive capability for weapon safety and performance analysis; improvement in weapon materials dynamic response models; multi-dimensional simulation of physics; visualization tools; and robotics algorithms.

The Stockpile Computing initiative entitled the Numeric Environment for Weapons Simulation (NEWS), begun in FY 1999, increases substantially in FY 2000 as planned, to keep pace with, and provide commensurate computational and computer infrastructure with planned program performance curves. The NEWS combines simulation codes and platforms with problem solving tools and visualization tools to allow large numbers of designers to use high-end simulation capabilities to address time-urgent stockpile issues such as surveillance, aging and re-manufacturing.

Testing Capabilities and Readiness provides a continental U.S. site for underground nuclear weapons testing at the Nevada Test Site (NTS). Consistent with Presidential direction, Defense Programs is required to maintain a readiness capability to safely conduct an underground nuclear test at the NTS within 2-3 years, if needed. In addition to maintaining the appropriate infrastructure, personnel, knowledge, and skills to meet this requirement, measures are to be taken to assure continued

environmental, worker health, public safety, and physical protection. Presidential direction also requires that sufficient resources should be included to conduct experimental activities planned by the three nuclear weapons laboratories (Los Alamos, Lawrence Livermore, and Sandia National Laboratories).

In FY 1998, Defense Programs successfully conducted the third and fourth subcritical experiments, "Stagecoach" and "Bagpipe," which provided data to improve the accuracy of computer simulations of nuclear weapons as part of the science-based Stockpile Stewardship Program, and were used to develop and refine diagnostics for the more complex subcritical experiments of the future. Extensive preparatory work was conducted on two experiments planned for FY 1999; it should be noted that most of the work and expenditures for an experiment occur prior to the actual date that the experiment occurs. In FY 1999 the first of those subcritical experiments, "Cimarron," was conducted on December 11, 1998. The next planned experiment, "Clarinet," is scheduled for the second quarter of FY 1999. Two subcritical experiments are planned for FY 2000. We expect that this effort will be maintained at 2 or 3 experiments annually throughout the planning period. Activities supporting the experimental program conducted at NTS by the laboratories also exercise skills needed to maintain test capabilities and readiness.

Institutional and Infrastructure Requirements evolved from a programmatic laboratory capital equipment and general plant project (GPP) budget category to institutional infrastructure support for Core Stockpile Stewardship sites. Funding in this category supports multiple laboratory programs or is of a basic infrastructure nature and therefore are not allocated to other Core Stockpile Stewardship Operations & Maintenance budget categories. Capital equipment or general plant project funding directly associated with a programmatic activity is budgeted accordingly.

Construction projects for Core Stockpile Stewardship, both programmatic and infrastructure in nature, support the DP mission at the three nuclear weapons laboratories and the Nevada Test Site. Details for all of the construction projects are included in the construction project data sheets.

Performance Measures (Presidential Measures are underlined)

- Meet all annual weapons alteration and modification schedules developed jointly by DOE and DoD.
- Conduct studies and development work required to support weapon systems and components for the future stockpile.
- Annually report to the President on the need or lack of need to resume underground nuclear testing to certify the safety and reliability of the nuclear weapons stockpile.
- Revalidate enduring stockpile systems to meet established military characteristics.
- Provide computer platforms sized to support the stewardship objective of full physics, high-fidelity simulations of nuclear weapons performance.
- Deliver three-dimensional, high-fidelity weapons performance codes by 2004.
- Demonstrate a computer code capable of performing a three-dimensional analysis of the dynamic behavior of a nuclear weapon primary, including a prediction of the total explosive yield, on an ASCI computer system.

- Develop and implement visualization, networking and data management systems to efficiently support utilization of ASCI codes and computers across the weapons complex.
- Meet all cost and schedule goals for construction of the Dual-Axis Radiographic Hydrodynamic Test Facility (DARHT) consistent with an FY 2002 completion.
- Meet all cost and schedule goals for construction of the Contained Firing Facility at LLNL consistent with a 4th Quarter FY 2001 completion.
- Meet all cost and schedule goals for construction of the Atlas Facility at LANL consistent with a 1st Quarter FY 2001 completion.
- Obtain and assess information required to decide whether to construct 1) an advanced hydrotest facility and/or 2) an advanced pulsed power facility.
- Conduct two subcritical experiments at the Nevada Test Site to provide valuable scientific information about the behavior of nuclear materials during the implosion phase of a nuclear weapon.
- Conduct experimental and theoretical research necessary to maintain or advance research, development and engineering capabilities in nuclear materials science and weapons design.
- Conduct high energy density research on inertial confinement fusion facilities necessary to enhance understanding of areas of physics relevant to a better predictive assessment of nuclear weapons performance.
- Ensure that all facilities required for successful achievement of the Stockpile Stewardship Plan are operational.
- Adhere to schedules set forth in the Advanced Manufacturing, Design and Production Technology Multi-Year Program Plan.
- Implement the Strategic Alignment Initiative and recommendations of the 120-Day Study.
- Continue material protection, control, and accountability upgrades at three DOE facilities with weapons-usable material.
- Ensure that the capability to resume underground nuclear testing is maintained, in accordance with the Presidential Decision Directive and Safeguard C of the CTBT.
- Adhere to schedules for the safe and secure dismantlement of approximately *375* nuclear warheads that have been removed from the U.S. nuclear weapons stockpile.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Operations and Maintenance					
Direct Stockpile Activities	179,103	177,848	215,452	+37,604	+21.1%
Experimental Activities	57,120	54,526	59,011	+4,485	+8.2%
Accelerated Strategic Computing Initiative	223,529	300,926	341,000	+40,074	+13.3%
Special Projects	15,485	92,012	83,278	-8,734	-9.5%
Performance Assessment Science & Technology	248,593	237,559	297,100	+59,541	+25.1%
Systems Components Science & Technology	114,253	101,680	102,830	+1,150	+1.1%
Chemistry & Materials Science & Technology	57,258	59,250	103,084	+43,834	+74.0%
Stockpile Computing	150,560	182,800	201,500	+18,700	+10.2%
Testing Capabilities & Readiness	180,977	190,500	177,126	-13,374	-7.0%
Institutional & Infrastructure Requirements	54,226	56,201	54,974	-1,227	-2.2%
Total, Operations and Maintenance	1,281,104	1,453,302	1,635,355	+182,053	+12.5%
Construction	98,810	107,126 [a]	133,145	+26,019	+24.3%
Total, Core Stockpile Stewardship	1,379,914	1,560,428	1,768,500	+208,072	+13.3%

[a] Reflects reprogramming of $3,683,000 (98-R-4), approved November 1998.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Direct Stockpile Activities			
■ The Stockpile Readiness Program supports activities on stockpile weapons to maintain or expand the understanding on the original development work, assess current reliability and safety status, respond to design issues and questions, and support the multi-agency Project Officers Group for each weapon system	53,344	55,593	61,295
■ The Stockpile Reduction Program develops dismantlement procedures, provides liaison and technical support, and assists in the dismantlement of weapons and components designed by each weapons design laboratory	9,680	9,122	8,444
■ The Enduring Stockpile Program includes revalidation of enduring stockpile weapon systems to meet military characteristics and development work necessary for refurbishment efforts like the W87 Peacekeeper Stockpile Life Extension Program (SLEP)	75,963	76,318	62,297
■ The Future Stockpile Program includes activities directed toward possible future stockpile modifications such as the Submarine Launched Ballistic Missile (SLBM) Warhead Protection Program (WPP), a cooperative program between the Navy and DOE to exercise and maintain expertise for SLBM systems and to demonstrate replacement warhead options for possible future deployment, if needed. The Stockpile Life Extension Programs (SLEP) will provide Full Scale Engineering Development (FSED) and other required phase 6.2A and 6.3 activities for the W76 and W80; including support for the refurbishment First Production Unit (FPU) date of FY 2005 for the W76 and FY 2006 for the W80	40,116	36,815	60,016
■ Systems verification and validation simulation efforts, incorporating the advanced computation and simulation of primary and secondary codes, to support stockpile weapon systems	0	0	23,400
Total, Direct Stockpile Activities	179,103	177,848	215,452

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Experimental Activities			
■ Archiving activities to identify and preserve information on stockpile weapon design parameters, production and engineering data, and data from nuclear and nonnuclear tests that support the certification of current stockpile weapons ...	13,482	12,595	13,796
■ Hydrodynamic experiments to assess nuclear components including subcritical experiments. Two subcritical experiments will be conducted in FY 2000	36,638	33,521	37,246
■ Aboveground experiments to assess and certify nonnuclear stockpile weapons subsystems and component hardware to neutron, x-ray, and gamma-radiation	7,000	8,410	7,969
Total, Experimental Activities	57,120	54,526	59,011
Accelerated Strategic Computing Initiative (ASCI)			
■ Advanced Applications / Problem Solving Environments efforts greatly enhance physics in 3-D computer codes that provide unprecedented levels of fidelity in weapons simulations to maintain the path forward to the goal of 100 TeraOps performance through intermediate milestones of 10 and 30 TeraOps planned for 2000 and 2002, respectively. FY 2000 efforts in Advanced Applications will focus on 3-D codes capable of demonstrating the dynamic behavior of a nuclear weapons primary and demonstration of the dynamic response of a weapon system in the hostile radiation and blast of reentry	132,801	144,750	115,912
■ Problem Solving Environments involves crosscutting support to the other strategies in ASCI and involves working closely with U.S. industry to accelerate development and mitigate impediments to provide computer systems far exceeding current industry projections, but essential to Stockpile Stewardship	23,683	44,300	58,286

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Platforms activities provide the supercomputer systems needed to attain the planned path forward to the goal of 100 TeraOps performance level by 2004. Intermediate milestones of 10 and 30 TeraOps will be met in FY 2000 by completing and installing a basic development environment for the 10 TeraOps Option White system and completing acceptance of this system. Selection of a 30 TeraOps computer supplier is also planned for FY 2000	37,955	55,400	78,300
■ Strategic Alliances will allow the ASCI program to engage U.S. universities on critical simulation capability problems addressing physics, materials modeling, fire and explosives safety and computer science issues in Level I Alliance. In FY 2000 each Alliance Level I center is expected to complete an integrated application code and demonstrate it on an ASCI computer system	24,938	12,490	32,400
■ Distributed Computing and Distance Computing ($DisCom^2$) efforts will continue with this strategy which was begun in FY 1999, that will enable the ASCI and Stockpile Computing program to deliver key remote computing, visualization and communications technologies that complement the ASCI vision	0	25,950	47,192
■ Verification and validation efforts begun in FY 1999 have been integrated in the core program to utilize direct stockpile data	0	10,150	0
■ One Program / Three Labs continues with its integration strategy and provides the means to leverage other ASCI strategies and provides an appropriate level of coordination among the labs	4,152	7,886	8,910
Total, Accelerated Strategic Computing Initiative (ASCI)	223,529	300,926	341,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Special Projects			
■ Waste Management and other activities which do not fit into other budget categories, or for which special visibility is necessary. This category includes funding for Waste Management at Los Alamos and Sandia National Laboratories in FY 1999 and FY 2000; a portion of the funding in FY 2000 at Sandia for Waste Management is funded by Stockpile Management	599	77,540	70,363
■ Extraordinary ES&H Site Remediation activities address one-time corrective actions such as decontamination, decommission and demolition of surplus facilities at Sandia National Laboratories, and the "re-canning" of stored plutonium at Lawrence Livermore National Laboratory under the Defense Nuclear Facilities Safety Board Recommendation 94-1	2,523	2,419	1,394
■ The Joint DoD/DOE Munitions Technology Development Program leverages the resources of the Department of Defense and the DOE to improve the capabilities of nonnuclear munitions technology and advance the science base for nuclear stockpile stewardship in areas of mutual interest between the two agencies. Activities are coordinated through a 5-year plan that is updated and approved annually by both agencies	11,463	11,035	10,501
■ Nuclear Criticality activities at Los Alamos National Laboratory in response to the Department's Implementation Plan for the Defense Nuclear Facilities Safety Board Recommendation 97-2	900	1,018	1,020
Total, Special Projects	15,485	92,012	83,278
Performance Assessment Science & Technology			
■ Performance assessment activities to explore concepts and technologies that offer potential options for meeting future national security requirements. These activities do not involve formal hardware development; however, they may include a limited amount of prototyping or experimentation to assess or demonstrate conceptual feasibility and they often require intensive computational analysis	65,891	52,224	47,407

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Basic weapons physics research for both nuclear and nonnuclear components, radiation source development, and development of improved diagnostics for use in aboveground experimental facilities. Issues involving hydrodynamics, radiation, plasma, nuclear, solid state, optical, and chemical physics are being addressed to improve understanding of physics and code validation, and to sustain the skills of theoretical and experimental scientists. Weapons-related physics experiments on inertial fusion facilities are also supported. Pulsed power experiments are conducted on Pegasus, Z, Atlas, and Saturn; and hydrotest experiments are conducted at PXR and Phermex	136,819	134,871	143,757
■ The Los Alamos Neutron Scattering Center (LANSCE) is the primary facility for Stockpile Stewardship Program researchers to conduct research addressing issues in neutron science. Defense Programs maintenance of this facility allows it to support other users within DOE	33,721	34,893	38,423
■ Advanced Hydrodynamic Radiography conducts research in and develops linear induction accelerator technology, inductive voltage adder technology, and proton radiography as technology options for a future Advanced Hydrotest Facility	12,162	15,571	19,671
■ Advanced systems modeling developed in ASCI to address ongoing stockpile weapon system performance issues	0	0	47,842
Total, Performance Assessment Science and Technology	248,593	237,559	297,100
Systems Components Science and Technology			
■ Systems Engineering activities which facilitate the incorporation of new technologies into weapon systems and stockpile stewardship operations	64,165	56,482	56,268
■ Electronics, Photonics, Sensors and Mechanical Components support research in enabling technologies which control and operate nuclear weapons including intelligent systems which monitor and diagnose the condition of weapons with regard to aging, functional status, intrusion/tamper detection, and anticipated performance	33,188	34,470	36,361

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Advanced Manufacturing efforts develop the cost-effective, environmentally acceptable product realization tools, methods, and processes in direct support of the nuclear weapons stockpile	16,900	10,728	10,201
Total, Systems Components Science and Technology	114,253	101,680	102,830
Chemistry and Materials Science and Technology			
■ Chemistry and Materials supports research on materials synthesis and processing, determination of materials structure and composition, and development of functional properties in polymers, metals, ceramics, inorganic and organic materials, composites, and salts	13,098	12,935	11,949
■ High Explosives involves fundamental physics and chemistry of explosive materials, characterization and modeling of explosive properties, improvement of firing technology, investigation of demilitarization technologies, and engineering of explosive component prototypes and their evaluation for weapons use	14,768	17,283	17,830
■ Special Nuclear Materials activities support the development of advanced and automated processing, casting, dynamic testing and machining technologies for beryllium, plutonium, and uranium	24,114	22,931	24,644
■ Tritium activities support research on the production, disassembly, handling, and use of tritium and its compatibility with other materials and components and focuses on four main areas: gas transfer, solid storage systems, neutron generator tubes, and inertial fusion targets	5,278	6,101	6,161
■ Materials models and databases developed within ASCI are combined with ongoing materials modeling efforts to address ongoing weapons issues in materials science	0	0	42,500
Total, Chemistry and Materials Science and Technology	57,258	59,250	103,084

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Stockpile Computing			
■ Stockpile Computing base program activities will continue along with code development and maintenance efforts to improve 3-D "more complete physics" modeling codes in support of the enduring stockpile	150,560	155,200	134,230
■ Numeric Environment for Weapons Simulation will provide implementation of a local computational environment for a large number of weapons designers to use high end simulation capabilities, such as rapid visualization of stockpile surveillance activities in order to "see and understand" the effects of aging on the stockpile and its associated phenomena	0	27,600	67,270
Total, Stockpile Computing	150,560	182,800	201,500
Testing Capabilities and Readiness			
■ Supports Defense Programs' plans to conduct two subcritical experiments in the U1a complex at the NTS in FY 2000. Also includes funding for upgrades and expenses of the U1a complex in accordance with the upgrade plan	60,090	63,341	48,930
■ Support to the weapons laboratories for nonnuclear experiments conducted at the NTS, primarily at the Big Explosive Experimental Facility (BEEF)	4,733	3,255	4,700
■ Support to the weapons laboratories for experimental activities at locations other the NTS (mainly the weapons laboratories)	18,343	19,106	18,857
■ Experimental diagnostics activities which support experiments conducted both on and off the NTS, including some potentially used for the NIF, and in support of the nuclear test readiness mission	10,948	14,767	20,266
■ Support for activities vital to maintaining a capability to resume underground nuclear testing within 2-3 years that are not exercised as a byproduct of the experimental program	34,888	30,410	29,023

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Technical Facility Operations and Management supports experimental and nuclear test readiness functions, including operations of the Device Assembly Facility (DAF), and the two-stage gas gun (R&D, general plant project, operational testing, and startup)	19,704	24,446	24,902
■ Other activities supporting the direct program, including the Cooperative Agreement with the University of Nevada, and the radio upgrade project at the NTS	32,271	35,175	30,448
Total, Testing Capabilities and Readiness	180,977	190,500	177,126
Institutional & Infrastructure Requirements			
■ Institutional Capital Equipment that supports multiple laboratory programs or is of a basic infrastructure nature and therefore is not allocated to other Core Stockpile Stewardship Operations & Maintenance budget categories	39,122	37,001	36,774
■ Institutional General Plant Projects that supports multiple laboratory programs or is of a basic infrastructure nature and therefore is not allocated to other Core Stockpile Stewardship Operations & Maintenance budget categories. Examples include: decontamination & decommissioning refueling and service facility, removal of adjacent transportables, inadequate parking at technical area 3, etc.	15,104	19,200	18,200
Total, Institutional & Infrastructure Requirements	54,226	56,201	54,974
Construction			
■ See "Capital Operating Expenses and Construction Summary" for details	98,810	107,126	133,145
Total, Core Stockpile Stewardship	1,379,914	1,560,428	1,768,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Direct Stockpile Activities	
■ Decreased laboratory support for the dismantlement program and other minor program reallocations consistent with Nuclear Weapons Stockpile Memorandum (NWSM) defined workload	-4,314
■ Decreased development work to support for the W87 Peacekeeper Stockpile Life Extension Program (SLEP) to reflect first production and certification in FY 1999	-7,230
■ Conduct Full Scale Engineering Development activities and other required activities to support refurbishment First Production Unit date of 2005 for the W76 Trident SLEP	+21,000
■ Develop and validate potential refurbishment options within the Submarine Launched Ballistic Missile (SLBM) Warhead Protection Program (WPP)	+4,748
■ Systems verification and validation efforts have been integrated into this budget category to utilize direct stockpile data	+23,400
Total, Direct Stockpile Activities	+37,604
Experimental Activities	
■ FY 1999 activities in this area were reduced as a result of the unavailability of prior year balances to offset the final FY 1999 appropriation (impacts and allocations of these program reductions have not been finalized at the subprogram activity level); FY 2000 activities approximate the FY 1998 program level and support two subcritical experiments. Archiving and experimental activities by the weapons laboratories support both test readiness and certification of the nuclear stockpile	+4,485
Accelerated Strategic Computing Initiative	
■ ASCI increases in the 5th year of the program are planned to accomplish the program goal of attaining 100 TeraOps of computational performance by 2004 as well as intermediate milestones of 10 and 30 TeraOps planned for 2000 and 2002, respectively. In FY 2000, ASCI activities grow by 13 percent, attributable to the following planned growth in the program elements	
■ Advanced Applications \ Problem Solving Environments decreases 8 percent to reflect integration of models and systems developed in ASCI into ongoing core stewardship activities, and reflects efficiencies in code compilation efforts	-14,852

	FY 2000 vs. FY 1999 ($000)
■ Platforms increases $22.9 million, or 41 percent, to support the completion efforts of the 3 TeraOps Option "Blue" system and the planned technology refreshes associated with this system as well as costs associated with the 10 TeraOps Option White system.	+22,900
■ Strategic Alliances increases to continue funding of the existing Level I Alliance Agreements with academia as well as initiate some Level II and III Alliance proposals. Recipients of Alliance work to date include the California Institute of Technology, Stanford University, the University of Chicago, the University of Utah and the University of Illinois at Urbana/Champaign. Types of approved Alliance work include: simulation of dynamic responses of metals; turbulence simulations; astrophysics; and fire and explosives safety.	+19,910
■ One Program\Three Labs increases 13 percent and represents the continuation of the strategy to integrate and align the weapons laboratories with each other and the complex to fulfill ASCI mission goals. This strategy encompasses the planned program collaboration meetings, topical and Principal investigators meetings, program planning, outreach and crosscuts.	+1,024
■ Verification and Validation decreases as matured codes are integrated in the core program to utilize direct stockpile data.	-10,150
■ Distributed Computing and Distance Computing (DisCom^2) increases 82 percent to accelerate the development and deployment of a pre-eminent design, analysis, and (re)manufacturing capabilities that will serve as an enterprise-wide computational fabric which extends the required simulation environments to support high-end computing at remote sites	+21,242
Total, Accelerated Strategic Computing Initiative	+40,074
Special Projects	
■ Funding decrease reflects the allocation of the cost of waste management activities at SNL to waste generators	-6,107
■ Funding decrease for Extraordinary ES&H Site Remediation, DoD Munitions MOU, and other miscellaneous activities	-2,627
Total, Special Projects	-8,734

	FY 2000 vs. FY 1999 ($000)
Performance Assessment Science and Technology	
■ Minor program reallocations to support the certification of the stockpile and advanced experimental capabilities	-712
■ Increased support to conduct hydrotest experiments in support of certification and to establish a baseline from which future changes to stockpile weapons can be detected and measured	+4,781
■ Conduct neutron science research at the LANSCE facility, increase operating beam time by two months, and utilize two new "fast track" spectrometers	+3,530
■ Increase support to conduct research in and develop linear induction accelerator technology, inductive voltage adder technology, and proton radiography as technology options for a future Advanced Hydrotest Facility	+4,100
■ Advanced systems modeling being verified and validated and integrated into ongoing technical reviews	+47,842
Total, Performance Assessment Science and Technology	+59,541
Systems Components Science and Technology	
■ FY 1999 activities in this area were reduced as a result of the unavailability of prior year balances to offset the final FY 1999 appropriation (impacts and allocations of these program reductions have not been finalized at the subprogram activity level); FY 2000 activities approximate the revised FY 1999 program level	+1,150
Chemistry and Materials Science and Technology	
■ Materials models and databases developed in ASCI will be verified and validated and integrated into ongoing materials research to address weapon aging and remanufactured component reliability and surety issues	+42,500
■ FY 1999 activities in the balance of this area were reduced as a result of the unavailability of prior year balances to offset the final FY 1999 appropriation (impacts and spreads of these program reductions have not been finalized at the subprogram activity level); FY 2000 activities approximate the revised FY 1999 program level	+1,334
Total, Chemistry and Materials Science & Technology	+43,834

	FY 2000 vs. FY 1999 ($000)
Stockpile Computing	
■ The Stockpile Computing base program decreases 14 percent, based on planned workload requirements relating to hardware and software maintenance; computer operations; system administration, support and integration; configuration and resource management; computer security; and integration of systems. System networks upgrades to enhance data transfer speeds and data storage continue to expand as technology for high density storage advances	-20,970
■ Numeric Environment for Weapons Simulation (NEWS), begun in FY 1999, increases to provide data exploration corridors commensurate with ASCI program advances in the advanced applications; platforms; and problem solving environments strategies	+39,670
Total, Stockpile Computing	+18,700
Testing Capabilities and Readiness	
■ Defense Programs plans to conduct two subcritical experiments in the U1a complex at the Nevada Test Site (NTS) in FY 2000. The FY 1999 funding level supported 3 to 4 subcritical experiments	-10,711
■ Funding for upgrades and expenses of the U1a complex decrease in accordance with the upgrade plan	-3,700
■ Minor program reallocations to support the experimentation and nuclear test readiness objectives at the NTS	+1,037
Total, Testing Capabilities and Readiness	-13,374
Institutional & Infrastructure Requirements	
■ Funding for institutional capital equipment and general plant projects is decreased due to the need to maintain scientific and technical staff and experimental facilities	-1,227

	FY 2000 vs. FY 1999 ($000)
Construction	
■ Core Stockpile Stewardship Construction continues funding of all ongoing construction projects and initiates three new infrastructure projects in FY 2000. The three new projects will provide the unique floor space and scalable architecture for power and cooling capabilities needed at the laboratories to house state-of-the-art computers as well as provide visualization and other capabilities to maximize the utility of the significant advances in computing capabilities by the weapon designers. Construction of these facilities is supported through the 5-year period ...	+26,019
Total Funding Change, Core Stockpile Stewardship	+208,072

Capital Operating Expenses & Construction Summary

Capital Operating Expenses

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
General Plant Projects [a]	22,948	23,000	23,000	0	0.0%
Capital Equipment [b]	58,259	59,000	59,000	0	0.0%
Total, Capital Operating Expenses	81,207	82,000	82,000	0	0.0%

Construction Projects

(dollars in thousands)

	Total Estimated Cost (TEC)	Prior Year Approp-riations	FY 1998	FY 1999	FY 2000	Unappro-priated Balance

Inertial Confinement Fusion

Mission Supporting Goals and Objectives

The mission of the Inertial Confinement Fusion (ICF) program is twofold: (1) to address high energy density physics issues as a key component of the science-based Stockpile Stewardship program, and (2) to develop a laboratory microfusion capability for defense and energy applications. The near-term goals pursued by the ICF program in support of this mission are demonstrating ignition in the laboratory and expanding the program's capabilities in high energy density science. The National Ignition Facility (NIF) is the cornerstone of this effort.

The program contributes to the goals of the Weapons Stockpile Stewardship program by:

- providing facilities and capabilities needed to study many of the basic and applied science issues underlying stockpile stewardship;
- conducting experiments to validate and verify the advanced weapons simulation codes being developed by the core nuclear weapons program and the Accelerated Strategic Computing Initiative (ASCI) to assess the reliability and effects of aging on weapons in the stockpile;
- providing calculational techniques to model high energy density phenomena in new simulation codes; and
- helping to retain the high quality of scientific and technical expertise necessary for national security.

Technical Background

ICF focuses energy from a "driver," typically a laser or ion beam accelerator, to implode and compress a small, spherical capsule shell containing deuterium and tritium (DT) fuel. The "inertia" of the compressed fuel keeps the reactants together long enough, under the proper conditions, for the fusion ignition and burn to occur. The goal is to achieve "gain," that is, to get more energy out of the system than was put into the system. The ICF capsule can be imploded in one of two ways: direct or indirect drive. In the direct drive approach, the driver energy is focused directly onto the capsule to drive the implosion. In the indirect drive approach, the driver energy is directed into a radiation enclosure, or hohlraum, generating a uniform soft x-ray environment which then drives the capsule. In either case, the irradiation energy must be uniformly absorbed in the capsule's outer ablator layer. The heated ablator material rapidly blows off symmetrically. The rocket-like reaction force causes the "pusher" and the remaining portion of the fuel capsule to spherically implode, compressing and heating the DT fuel to ignition. The same technique that provides capsule implosion provides radiation environments for the study of high energy density physics that occur in weapons. Experiments on ICF facilities can also address radiation flow, hydrodynamics, equation of state and opacity issues specifically for weapon analyses.

The ICF program has developed unique capabilities in pursuit of its national mission. The laser and pulsed power facilities developed under the ICF program, along with associated diagnostic, modeling, and target fabrication components, are the most advanced array of high energy density physics research capabilities in the world. These facilities support science based stockpile stewardship while advancing inertial fusion technology toward a laboratory ignition demonstration with multi-megajoule fusion

yields. Over the next five years, most of the ICF resources are allocated to an integrated theoretical and experimental program (high energy density physics studies, target fabrication, laser science, computation) to advance the technology in support of achieving ignition and other weapon physics experiments. Demonstration of ignition and burn in the laboratory is the most challenging goal of the National Ignition Facility (NIF), which is using glass laser technology and is on schedule to be completed at the end of FY 2003.

Program Goals

- Demonstrate fusion ignition in the laboratory.
- Provide access to physics regimes of interest in nuclear weapon science and investigate physics issues.
- Expand the aboveground simulation capability for nuclear weapons effects.
- Develop diagnostic instruments applicable to weapons stockpile stewardship research.
- Develop and experimentally benchmark computational models, including testing of three-dimensional simulation capabilities.
- Attract and retain highly competent scientists and engineers within the nuclear weapons program.

Program Facilities

- Beamlet: a scientific prototype of one beam of the NIF located at LLNL . It began operating experiments in 1994. It was shut down during FY 1998 and was shipped to SNL for use as a "backlighter" diagnostic on the Z facility.
- National Ignition Facility (NIF): a 192-beam neodymium (Nd) glass laser being built at Lawrence Livermore National Laboratory (LLNL). It is scheduled to be completed at the end of FY 2003.
- Nike: a Krypton-fluoride (KrF) laser located at the Naval Research Laboratory (NRL). It was completed in FY 1995 and is being used primarily to define beam smoothness requirements for direct drive laser fusion.
- Nova: a ten-beam glass laser located at LLNL. It has been the program's major facility for research on indirect drive laser fusion, and has made important contributions to stockpile stewardship and basic experiments on high energy density physics since it began operating in 1985. Nova will be shut down in FY 1999.
- Omega: a 60-beam glass laser used primarily for research on direct drive laser fusion located at the University of Rochester's Laboratory for Laser Energetics (UR/LLE). This facility was upgraded beginning in FY 1991 and began operating in the upgraded configuration in May 1995. During FY 1998, the facility began fielding weapons physics experiments (including classified). Omega will serve as the "bridge" facility between the shutdown of Nova and the startup of NIF.
- Z: a pulsed power machine used for inertial fusion research, located at Sandia National Laboratories (SNL). It has made many significant technological breakthroughs since it began operating as a z-pinch device in October 1996 and now conducts weapons physics and ignition related experiments.

- Trident: a smaller glass laser facility at Los Alamos National Laboratory (LANL) used for diagnostic testing and development, as well as weapons and basic physics experiments.

Performance Measures

- Continue construction of the National Ignition Facility according to its Project Execution Plan schedules.
- Conduct high energy density research on inertial confinement fusion facilities necessary to enhance understanding of areas of physics relevant to a better predictive assessment of nuclear weapons performance.

Significant Accomplishments

- Awarded all of the major physical construction contracts on the NIF. Construction well underway on the Optics Assembly Building, Target Area Building and Laser Building.
- By the end of FY 1998, completed nearly all of the Title II designs on special equipment items, and awarded contracts for support structures, laser auxiliary systems and target auxiliary systems.
- Zygo in Connecticut completed construction of their 25,000 square foot NIF optics manufacturing facility in February 1998 to be used for finishing NIF amplifier slabs and mirrors.
- Schott Glass Technologies in Pennsylvania completed construction of its NIF laser glass building, and Hoya in California completed a subscale melter demonstration for NIF laser glass in March 1998.
- Tinsley completed its 30,000 square foot facility for polishing NIF lenses and windows in Richmond, California in November 1998.
- On January 29, 1998, LLNL unveiled the world's largest KDP crystal. Grown in a record 6 weeks, it was 20 inches across, slightly less than 3 feet tall, and weighed 500 pounds. These fast growth crystals will be sliced into 1-cm thick plates to be used to change the color and switch the direction of the laser beams on NIF. 100 to 150 of these crystals are needed over the next five years for the NIF.
- Improved z-pinch dynamics on Saturn and Z have significantly enhanced total x-ray powers for stewardship missions -- achieved 2 MJ of x-ray energy and 290 TW of x-ray power on Z.
- Awarded 14 grants under the Inertial Fusion Science in Support of Stockpile Stewardship Program for unclassified innovative research in high-energy-density science.
- Initiated classified weapons physics experiments on the Omega facility at the University of Rochester to compensate for the shutdown of Nova in FY 1999.

ICF Funding by Laboratory

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Base ICF Program (excludes NIF)			
Lawrence Livermore National Laboratory	89,846	102,242	107,500
Los Alamos National Laboratory	21,896	21,940	23,000
Sandia National Laboratories	24,500	31,000	30,000
University of Rochester/Laboratory for Laser Energetics	26,299	28,800	30,450
Naval Research Laboratory	9,000	16,758	9,500
General Atomics	10,937	8,870	7,000
Headquarters	27	102	1,550
Oakland Operations Office	1,849	2,670	2,700
Total, Base ICF Program	184,354	212,382	211,700
National Ignition Facility			
National Ignition Facility - Other Project Costs	31,300	6,800	5,900
Construction (96-D-111)	197,800	284,200	248,100
Total, National Ignition Facility	229,100	291,000	254,000
Total, Inertial Confinement Fusion	413,454	503,382	465,700

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Operations & Maintenance					
Base ICF Program	184,354	212,382	211,700	-682	-0.3%
National Ignition Facility - Other Project Costs	31,300	6,800	5,900	-900	-13.2%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Base ICF Program			
Target Physics, Theory and Modeling			
Target physics experimental activities are supported to resolve target physics issues on both indirect and direct drive, including laser imprinting and hydrodynamic instability growth. Included are activities related to ignition, as well as weapons physics experiments on radiation flow, opacity, hydrodynamics, and material equation of state. In FY 2000, a major emphasis in this area will be the recruitment and training of operators for NIF. Approximately 60 operators will be trained at LLNL during FY 2000 for first bundle and laser bay 2 operations. This activity will also support the operations of the Optics Assembly Building where all of the NIF modules will be prepared for facility installation. Development of prototype ignition targets and minimal fabrication of initial NIF diagnostics will begin in FY 2000. The backlighter diagnostic for the Z facility at Sandia will be completed during FY 2000 which will enhance the experimental value of this facility for weapons physics science. NRL will continue experiments in FY 2000 to evaluate the potential for direct drive ignition on NIF. UR/LLE will address critical issues of direct-drive ICF physics in FY 2000, including work on "warm" physics and improvements in laser imprinting and Raleigh-Taylor growth-rate mitigation. A small amount of funding is included at HQ to support critical National Ignition Plan activities at currently undetermined sites. Allocation of funding among sites for this effort will be determined during execution of the FY 2000 budget	101,463	133,618	160,733
Target Development, Fabrication and Handling			
Research, development, fabrication and delivery of non-cryogenic and cryogenic targets are supported at all of the sites; however, cryogenic research and development at General Atomics is not directly supported in FY 2000	26,245	24,157	20,322

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Laser and Optics Technology Development			
Glass laser and optics component validation for NIF and Omega are supported. NIF optics pilot production, the culmination of the NIF laser and optics technology development effort, will be completed early in FY 2000	48,561	41,037	26,742
Advanced Driver Development			
Experimental activities on advanced pulsed-power accelerators, advanced glass laser concepts such as diode pumped solid state lasers, and advanced KrF driver concepts needed for the future (beyond NIF) have been supported in the past; however, given resource constraints, funding is not requested for this activity in FY 2000	5,398	9,750	0
Other ICF Activities			
Independent technical review of the ICF program (e.g. National Academy of Sciences), the National Laser Users Facility, and other user activities, including an individual investigator grant program in high energy density science relevant to ICF are supported	2,687	3,820	3,903
Total, Base ICF	184,354	212,382	211,700
National Ignition Facility			
National Ignition Facility - Other Project Costs			
The operations and maintenance funded activities that are directly related to the NIF, including research and development necessary to complete construction, conceptual design, NEPA documentation, and other project related costs are supported. Optics vendor facilitization will be completed during FY 2000	31,300	6,800	5,900
Construction (96-D-111)			
Provides the line item funding for the Total Estimated Cost (TEC) of the National Ignition Facility. FY 2000 funding represents the funding required to meet the approved schedule for NIF. During FY 2000, Switchyard 2, Laser Bay 2, and the Target Bay will be commissioned for installation of special equipment and the Target Chamber will be installed	197,800	284,200	248,100
Total, National Ignition Facility	229,100	291,000	254,000
Total, Inertial Confinement Fusion	413,454	503,382	465,700

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Base ICF Program	
Target Physics, Theory and Modeling	
■ Increase primarily due to the start of the transition from Nova operations to the ramp-up to NIF operations. Increase includes operations procedures preparation, operator training, operations support equipment, optics processing, and operations of the Optics Assembly Building. Funding will partially support the National Ignition Plan, minimal development of NIF target diagnostics and experimental equipment, but delays the initiation of the NIF cryogenic handling system until FY 2001. Funding is included to utilize Omega for 18 weeks of weapons physics experiments by scientists from LANL and LLNL, the same as the FY 1999 level of effort	+27,115
Target Development, Fabrication and Handling	
■ Decrease due to completion of the Omega cryogenic handling system and the elimination of direct support for General Atomics cryogenic research and development	-3,835
Laser and Optics Technology Development	
■ Decrease due to the completion of NIF optics pilot production	-14,295
Advanced Driver Development	
■ Decrease reflecting the need to allocate funds to the higher priority areas in support of NIF ignition	-9,750
Other ICF Support	
■ Minimal increase to adequately fund HQ support activities and independent investigator grants	+83
Total, Base ICF Program	-682
National Ignition Facility	
■ Decrease for NIF construction (-$36.1 million) and NIF Other Project Costs (-$.9 million) based on the approved funding profile for the project	-37,000
Total Funding Change, Inertial Confinement Fusion	-37,682

Capital Operating Expenses & Construction Summary

Capital Operating Expenses

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
General Plant Projects	1,876	5,550	2,000	-3,550	-64.0%
Capital Equipment	9,856	9,900	10,000	100	1.0%
Total, Capital Operating Expenses	11,732	15,450	12,000	-3,450	-22.3%

Construction Projects

(dollars in thousands)

	Total Estimated Cost (TEC)	Prior Year Appropriations	FY 1998	FY 1999	FY 2000	Unappropriated Balance
96-D-111 National Ignition Facility, LLNL	1,045,700	169,300	197,800	284,200	248,100	146,300
Total, Construction		169,300	197,800	284,200	248,100	146,300

Technology Partnerships and Education

Mission Supporting Goals and Objectives

The DP Technology Partnerships program builds cost-shared collaborative R&D partnerships between DP sites and industry. These partnerships were designed to directly support Stockpile Stewardship program objectives by enlisting the expertise and resources of U.S. industry. Defense Programs also provides funding for the Amarillo Plutonium Research Center and the Advanced Computational Technology Initiative (ACTI).

The Education program provides funding to utilize the unique resources of the Department of Energy -- people, programs, and facilities -- to improve science and math education throughout the Nation, while supporting the Defense Programs mission. Enhancing the scientific education of our citizens will ensure a highly trained, diverse scientific workforce for the laboratories and will enhance our ability to maintain the scientific and technical expertise necessary to conduct the Stockpile Stewardship mission. The projects, approved by Headquarters and conducted mainly by the Lawrence Livermore National Laboratory, Los Alamos National Laboratory, and Sandia National Laboratories, ongoing in nature or for a defined period, are grouped in six major categories: student support, teacher/faculty enhancement, curriculum improvement, institutional improvement, educational technology and public understanding of science. Each laboratory publishes an annual report on the projects and their accomplishments. Historically Black Colleges and Universities and other minority institutions receive approximately 15 percent of this funding.

Beginning in FY 2000, the Education program will also include funding responsibility transferred from Weapons Program Direction for the Los Alamos County School District to support ongoing education enrichment activities, enhanced teacher salaries and the Northern New Mexico Educational Enrichment Foundation. In addition, funding is requested for the new National Atomic Museum to be located at the Balloon Park Museum in northern Albuquerque, New Mexico.

Performance Measures

- Establish strategic alliances and collaborations among the weapons laboratories, industries, and universities to enable effective use of scientific and technical personnel throughout the R&D community.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Technology Partnerships	55,901	43,072	22,200	-20,872	-48.5%
Education	8,944	9,000	29,800	+20,800	231.1%
Total, Technology Partnerships and Education	64,845	52,072	52,000	-72	-0.1%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Technology Partnerships			
■ In FY 2000, the Technology Partnerships program will continue to work closely with the Advanced Manufacturing, Design and Production Technologies (ADaPT) initiative, Enhanced Surveillance Program, and the Stockpile Stewardship R&D program, though at a reduced level, to ensure partnership activities contribute significantly to the program goals and objectives and the overall DP mission. FY 2000 partnership activities will be focused mainly in two areas: 1) advanced manufacturing, including process technologies, advanced coatings, precision machining and inspection, casting, microelectronics, opto-electronics, forming and joining technologies, computer modeling and simulation robotics, and 2) development of current and potential key suppliers of components and tools (software and hardware), and equipment. Cost shared collaborations have proven the most beneficial, contributing significantly to DP weapons program objectives as well as U.S. competitiveness	35,239	28,072	8,200
■ Support for AMTEX will be discontinued in FY 2000	9,931	7,500	0
■ Support for the Amarillo Plutonium Research Center will be continued in this category (transferred from Weapons Stockpile Management) in FY 2000 with funding up to $5 million	0	0	5,000
■ Support for ACTI will be continued with funding up to $9 million in FY 2000	10,731	7,500	9,000
Total, Technology Partnerships	55,901	43,072	22,200

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Education			
■ Provide science and math education programs mainly at the three weapons laboratories, with approximately 15 percent of the funding at Historically Black Colleges and Universities and other minority institutions	8,944	9,000	10,300
■ Provide funding for the National Atomic Museum at the new Anderson Abruzzo International Balloon Park Museum (northern end of Albuquerque).	0	0	5,500
Prior to FY 2000, funding for the Los Alamos County School District was requested within Weapons Program Direction. In FY 2000, funding responsibility for these activities has been transferred from Weapons Program Direction in order to combine these activities with other ongoing education programs under the Stockpile Stewardship Education program:			
■ In FY 1998, the Department provided $8 million to the School District to support ongoing education enrichment activities and to support enhanced teacher salaries. In FY 1999, Congress appropriated $7 million for the School District; this budget requests up to $8 million for FY 2000	0	0	8,000
■ In FY 1998, the Department made the first payment, $3 million, to endow the Northern New Mexico Educational Enrichment Foundation. Per Congressional direction, the Department will provide $25 million to fully endow the Foundation by FY 2002. $3 million was appropriated in FY 1999 and this budget provides a minimum of $6 million for the Northern New Mexico Educational Enrichment Foundation in FY 2000	0	0	6,000
Total, Education	8,944	9,000	29,800
Total, Technology Partnerships and Education	64,845	52,072	52,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Technology Partnerships	
■ Funding for partnership activities decreases over 48 percent from FY 1999 appropriation. Many of the ongoing cooperative agreements which began to transition to closeout in FY 1999 will continue to close or may be absorbed within core stockpile stewardship efforts as appropriate	-19,872
■ Support for the American Textile Partnership (AMTEX) will be discontinued in FY 2000	-7,500
■ Support for the Amarillo Plutonium Research Center is transferred to this category from Weapons Stockpile Management in FY 2000	+5,000
■ Up to $9 million will support the Advanced Computational Technology Initiative (ACTI) which will be formulated to provide maximum benefit to weapons programs	+1,500
Total, Technology Partnerships	-20,872
Education	
■ The science and math education programs increases by $1.3 million from the FY 1999 appropriation.	+1,300
■ The Education program reflects the transfer of funding responsibility from the Weapons Program Direction decision unit to Stockpile Stewardship Education Programs for continued support for the Los Alamos County School District (up to $8 million) and the Northern New Mexico Educational Enrichment Foundation (a minimum of $6 million). In comparable terms, funding for the School District increases by $1 million from the FY 1999 level, and funding for the Foundation increases by $3 million over the FY 1999 level.	+14,000
■ Funding is requested for the new National Atomic Museum to be located at the Balloon Park Museum in northern Albuquerque, New Mexico.	+5,500
Total, Education	+20,800
Total Funding Change, Technology Partnerships and Education	-72

2003	23,000	23,000	23,000
2004	9,500	9,500	11,400

3. Project Description, Justification and Scope

Description

The project provides for the design, engineering and construction of the Terascale Simulation Facility (TSF) which will enable the very large-scale weapons simulations essential to ensuring the safety and reliability of the nuclear weapons stockpile. The building will contain a multi-story office tower with an adjacent computer center designed to house the 100 TeraOPS-class computers needed to meet the requirements of the Stockpile Stewardship Program. The TSF will bring together weapons code development teams to integrate experiments, material, physical, computer, and experimental sciences in support of the Stockpile Stewardship Program. The TSF will also help manage the networks and the "Assessment Theaters" necessary to store and understand the data generated by the most powerful computing systems in the world. The computer and simulation equipment are not funded by this project.

Justification

The Accelerated Strategic Computing Initiative (ASCI) has as its mission the acceleration of terascale simulation to meet the demands of the nation's nuclear defense mission. The challenge is to maintain confidence in the nuclear stockpile without underground nuclear testing. Along with sub-critical experiments, one of the primary tools employed will be three-dimensional (3-D) scientific weapons

calculations of unprecedented computational scope. As has been emphasized in the ASCI Program Plan, it is the rapid aging of both the stockpile and the designers with test experience that is at the heart of the issue and the reason for acceleration. The most critical period is between 2003 and 2010. By 2003, the number of designers with test experience will be reduced by about 50 percent from their numbers in 1990. By 2010 the percentage will be further reduced to about 15 percent. By 2003, most of the weapons in the stockpile will be in transition from their designed field life to beyond-field-life design. By 2010, about half will be in the beyond-field-life design stage. Therefore, some validated mechanism or capability must be available soon to certify the safety and reliability of this aging stockpile. A major element of this capability will be the ASCI applications codes and the associated terascale simulation environment. The ASCI program intends over the next six years to reach a threshold state simulation capability in which the first functional "full system calculation" generation of codes requiring a 100-plus TeraOPS computer will be used to certify the stockpile. The remaining designers and analysts with test experience will be an indispensable part of this process, because they will validate the models and simulation results.

The ASCI applications codes and the weapons analysts who make use of these applications require a supporting simulation infrastructure of major proportions, which includes:

- Terascale computing platforms (ASCI Platforms)
- A supporting numerical environment consisting of data management, data visualization and data delivery systems (Stockpile Computing Numerical Environment for Weapons Simulation (NEWS))
- Sophisticated computer science and numerical methods research and development teams (ASCI Problem Solving Environments (PSE) and Alliances)
- A first rate operations, user services and systems team
- Data assessment theaters plus high performance desktop visualization systems

To house, organize and manage these simulation systems and services requires a new facility with sufficient electrical power, mechanical support, networking infrastructure and space for computers and staff. The proposed Terascale Simulation Facility (TSF) at LLNL will meet these requirements.

Scope

The TSF project will construct a building (Building 453) of approximately 270,000 square feet located adjacent to an existing (but far less capable) computer facility, Building 451, on the LLNL main site. The building will contain a multi-story office tower with an adjacent computer center. The computer center will house computer machine rooms totaling approximately 47,500 square feet. The computer machine rooms will be clear span (without impediments) and of an aspect ratio designed to minimize the maximum distance between computing nodes and switch racks. The ceiling height will be sufficiently high to assure proper forced air circulation. A raised access floor will be provided in order to allow adequate room for air circulation, cabling, electrical, plumbing, and leak detection equipment.

The first computer structure will be available for occupancy in 2002. The building will be built with enough power and cooling to support two terascale systems. The first system will likely be installed in 2002. The computer center and electrical rooms will be designed so that power and cooling capacity can be shifted to areas requiring greater or lesser load. As a risk reduction strategy, the building will be further designed so that power and mechanical resources can be easily added in the event that systems

sited in the future will require higher levels of power. However, it is expected that after 2004, the rate of growth of the peak capability of installed computers will relax. Therefore, the building should have enough power and cooling to accept any system procured after 2004.

The TSF will include meeting rooms, offices, and a Data Assessment Theater for scientific visualization. The theater will be used both for prototyping advanced visualization concepts and for production. In short, the theater represents that area where physical and computer scientists working together will visualize and make accessible to the human eye and mind the huge data sets generated by the computers. This will allow workers to understand and assess the status of the immensely complex weapons systems being simulated.

The office space will accommodate staff and scientists who require access both to classified and unclassified workstations. Vendors, operational and problem solving environment staff must have immediate access to the computer system, since the simulation environment will require very active support. A key principle underlying all TSF planning is tight coupling between Stockpile Stewardship Program elements and the platforms. Thus, the TSF will also house the nucleus of the classified and unclassified (LabNet) networks. Additionally, space will be available to support a weapons code development team to integrate experimental, physical, material and computer sciences for support of Stockpile Stewardship requirements. To assure the efficient operation of remote Assessment Theaters, high-speed networking hubs will connect the computers seamlessly to key weapons scientists and analysts at the highest performance available.

Project Milestones

FY 2000:	Start design	2Q
	Physical construction start	4Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications - $3,600)	4,715	0

Total, Line Item Costs (TEC) [a]	83,500	0

5. Method of Performance

Design shall be performed under a negotiated Best Value architect/engineer contract. Construction and procurement shall be accomplished by fixed-price contracts based on competitive bidding and best value.

[a] Escalation rates taken from the FY 2000 DOE escalation multiplier tables.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs							
Total facility costs							
Design	0	0	0	5,500	800	375	6,675
Construction	0	0	0	1,900	18,200	56,725	76,825
Total facility costs (Federal and Non-Federal)	0	0	0	7,400	19,000	57,100	83,500
Other project costs							
Conceptual design costs	0	500	800	0	0	0	1,300
NEPA documentation costs	0	0	150	0	0	0	150
Other project-related costs [b]	0	410	175	0	0	665	1,250
Total other project costs	0	910	1,125	0	0	665	2,700
Total Project Cost (TPC)	0	910	1,125	7,400	19,000	57,765	86,200

7. Related Annual Funding Requirements

(FY 2004 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project--20 years)		
Facility operating costs [c]	1,400	0
Programmatic operating expenses directly related to the facility [d]	53,100	0
Utility costs [e]	8,000	0
Total related annual costs (operating from FY 2004 through FY 2023)	62,500	0

[b] Including tasks such as Project Execution Plan, Pre-Title I Development, Design Criteria, Safeguards and Security Analysis, Architect/Engineer Selection, Value Engineering Study, Independent Cost Estimate, Energy Conservation Report, Fire Hazards Assessment, Site Surveys, Soil Reports, Permits, Administrative Support, Operations and Maintenance Support, ES&H Monitoring, Operations Testing, Energy Management Control System Support, Readiness Assessment.

[c] Facility operating costs are $1,400,000 per year (which also includes facility maintenance and repair costs), when facility is operational in 4th Qtr. FY 2004. Costs are based on the LLNL internal indirect rate Laboratory Facility Charge (LFC) for facility operating costs.

[d] The annual operating expenses for the Terascale Simulation Facility are estimated at $53,100,000 based on representative current operating expenses of 300 personnel. The majority of this funding is expected to come from DOE/DP for activities in support of the Nuclear Weapons Stockpile Stewardship Program.

[e] Costs are based on LLNL utility charges.

00-D-105, Strategic Computing Complex (SCC) Los Alamos National Laboratory, Los Alamos, New Mexico

2000	26,000	26,000	22,600
2001	56,000	56,000	59,374
2002	18,000	18,000	18,026

3. Project Description, Justification and Scope

Justification

Without nuclear testing, large-scale computations are the only means of predicting the safety, reliability, and yield of a nuclear weapon. The nuclear stockpile is aging. Generically, aging produces effects that introduce small three-dimensional defects which break the symmetries which designers have invoked in the past when designing nuclear weapons. We are also faced with the issue of the aging of the weapon scientists and engineers that were responsible for developing and testing the weapons in our stockpile. The new simulation models being developed for the stockpile can best be validated by these weapon scientists and engineers. Consequently, greatly enhanced computational requirements in both speed and memory are needed in the near future. It is estimated that assessing the safety and performance of the stockpile will require a factor of 100,000 increase in computational power over what has been required to design new weapons. The Accelerated Strategic Computing Initiative (ASCI), one of the highest priority programs within the Stockpile Stewardship Program, is designed to maintain the safety, reliability, and performance of the nuclear weapons in the stockpile, and is dedicated, and on track, to achieving this goal in less than a decade.

Numerical simulations are now the most important mechanism for the integration of the many complex processes which take place in a thermonuclear weapon. This means that the continued certification of the safety and reliability of the nation's nuclear stockpile relies to a greater extent on computer simulations. To respond to this challenge, the Strategic Computing Complex (SCC) at Los Alamos will

be capable of initially supporting a 50 TeraOPS computer platform and be capable of expanding to beyond 150 TeraOPS before 2010. To meet urgent national security requirements associated with nuclear weapons Stockpile Stewardship, this facility must be operational by the 2nd quarter of FY 2002. There is no other facility capable of housing and powering the ASCI supercomputer planned for the SCC.

The SCC and its associated information infrastructure—the high-speed networks, workstations, visualization centers, interactive data-analysis tools and collaborative laboratories—will support the Stockpile Stewardship Program and, potentially, other research efforts involving the simulation of complex phenomena of national importance. The SCC will enable the fulfillment of the prime stewardship mission to ensure the safety, reliability and performance of the Nation's nuclear weapons stockpile without underground nuclear testing. For example, it will be possible to simulate weapons safety scenarios at a multiscale level, beginning with the weapon in its transport container and going through detailed descriptions of components all the way down to the microstructure of the aged high-explosive material.

Description and Scope

The SCC will be a three-story structure with approximately 267,000 gross square feet which will house the world's largest and most capable computer (initially 30 TeraOPS, or 30 trillion floating point operations per second) in a specially designed 43,500-square-foot computer room. This room will be supported by electrical and mechanical rooms in excess of 60,000 square feet.

The facility will provide a dynamic environment for approximately 300 nuclear weapons designers, computer scientists, code developers, and university and industrial scientists and engineers to collaborate to extend the cutting edge of simulation and modeling development in support of nuclear weapons stockpile stewardship requirements. These scientists and engineers will work together, with support personnel, in simulation laboratories (approximately 200 in classified and 100 in unclassified areas). The facility will be located in Technical Area 3 (TA-3) at the Los Alamos National Laboratory.

The SCC features a visualization environment consisting of two immersive theaters, one in the classified area and one in the unclassified area. These theaters will have overhead projection and wrap-around features supporting the latest virtual-reality and visionarium environments. These theaters represent the highest-end capability available for data viewing analysis.

A powerwall theater in the secure environment will provide high-resolution interleaved displays that fill a wall with the latest projection technology. In addition to the powerwall display, this theater will contain conference capability, multiple display monitors, and electronic white-boards to promote effective teaming and collaborative discussions.

A third simulation environment promoting collaborations among teams is supplied by the areas designated as collaboratories. There are four of these areas, and they will contain conference space, a media-stack including laser-disc recorders for animation production and viewing, an immersadesk for compact virtual-reality (VR) analysis, multiple high-resolution graphics heads, electronic white-board, video teleconferencing tools, and electronic collaborative tools for effective interaction with researchers at open and secure sites. The collaboratory provides the users, code developers, and managers with an informal, information- and technology-rich environment with systems for simulation development,

collaboration, discussion, media-development, presentation, and problem analysis. The SCC will bring together weapons code development teams to integrate experiments, material, physical computer and experimental sciences in support of the Stockpile Stewardship Program.

An auditorium with seating for approximately 200 people will be provided to serve both classified and unclassified meetings. Conference rooms will be available in the classified and unclassified areas.

The proposed facility concept consists of a three-story structure that includes offices, simulation laboratories, collaboratories, a power wall, and a visualization theater. Site utilities directly related to this facility will be extended and upgraded as necessary.

The mechanical systems will be designed for maximum flexibility. The computer-room cooling system is planned to be adaptable for air-cooled computers, water-cooled computers, or a combination of both types. The simulation laboratory spaces are heated, cooled, and ventilated with modular, variable-volume air handling units, with separate air handling unit systems for classified and unclassified areas. Energy conservation is provided by the use of cooling-tower heat exchangers that are used to meet cooling requirements without running chillers during winter and cooler months.

The SCC facility will be fed by two different 13.8 kV underground power sources and is configured with double-ended switchgear and unit substations to allow switching for maintenance and isolation of faults. The proposed design consists of power conditioners, K-rated transformers, and distribution equipment rated for the high harmonics generated by the computer. The system is modular and expandable to allow growth and easy modification. A grounding ring surrounds the building in addition to a signal reference grid in the computer room to reduce electrical noise. A lightning protection system is incorporated into the facility. A fire detection system will be installed to monitor the entire building, as will a highly sensitive smoke detection system under the computer-raised floor. Communication lines will service the facility through an underground ductbank system utilizing fiber optic cable for both secure and open systems. Copper lines will be used for the voice communication system.

The facility infrastructure is designed to be scalable. At construction completion, the facility will have mechanical and electrical equipment installed to support up to 50 TeraOPS. As requirements go beyond the 50-TeraOPS capability, mechanical and electrical equipment can be added within the building in increments as required to support the computer technology at that time. This scalable feature of the SCC includes future installation of chillers, cooling towers, computer room air-conditioning units, substations, motor-generator power-conditioners, transformers, and panelboards. Scalability provides the Department of Energy (DOE) with a cost-effective option of not installing additional support equipment until it is needed and the ability to capitalize on technological advances in computing technology, as well as in the support equipment.

The computers and simulation equipment to be housed in the SCC are not funded as part of this project, they are funded as part of the ASCI Operations and Maintenance program.

Project Milestones:

FY 2000:	Start Design	1Q
	Start Construction	1Q [a]

4. Details of Cost Estimate

	(dollars in thousands) Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design, Drawings and Specifications - $3,458)	5,665	0

5. Method of Performance

Design, construction, and procurement will be accomplished by a competitive best value fixed-price design-build contract. Design-build is a project delivery system where a single entity performs both the design and construction. Some advantages of design-build include a single source for construction activities, cost control and accountability.

[a] To meet the proposed completion of the computer room by January 2002, this project will be executed through a design-build contract. Design for grading and onsite utilities will begin in October 1999, physical construction on this aspect of the project will proceed at the end of December 1999, while design on the building continues.

[b] Escalation rates taken from the FY 2000 DOE escalation multiplier tables.

7. Related Annual Funding Requirements

(FY 2002 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project--20 years)		
Facility operating costs [d]	650	0
Facility maintenance and repair costs [e]	1,270	0
Programmatic operating expenses directly related to the facility [f]	55,000	0
Utility costs	6,600	0
Total related annual costs (operating from FY 2002 through FY 2021)	63,520	0

[d] When the facility is operational in the 2nd Quarter of FY 2002, costs will average $650,000 for labor and material per year. An average of 3.0 staff years will be required to operate the facility.

[e] Based on projected annual costs for LANL site services subcontractor as derived from historical maintenance and repair costs for the LDCC facility.

[f] Annual programmatic operating expenses are estimated at $55,000,000 based on representative operating expenses of 300 people. The majority of this funding is expected to come from DOE/DP for activities in support of the Nuclear Weapons Stockpile Stewardship Program.

00-D-107, Joint Computational Engineering Laboratory, Sandia National Laboratories, Albuquerque, New Mexico

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 2000 Budget Request *(Preliminary Estimate)*	2Q 2000	2Q 2001	3Q 2001	4Q 2003	28,870	30,303

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
2000	1,800	1,800	1,500
2001	6,700	6,700	3,261
2002	20,370	20,370	17,748
2003	0	0	6,361

3. Project Description, Justification and Scope

The Joint Computational Engineering Laboratory (JCEL) will be a new, state-of-the-art facility at Sandia National Laboratories for research, development, and application of leading-edge, high-end computational and communications technologies. JCEL will provide office space and laboratories for 175 people in a building with a total of approximately 55,200 gross square feet. JCEL will be the center of Sandia's computational modeling, analysis, and design community, and will be constructed in close proximity to Sandia's existing computer and communications building, presently occupied by part of this community.

JCEL's primary mission is to ensure the rapid development and application of high-end computing, modeling, analysis, and design needed to achieve the objectives of DOE's Stockpile Stewardship Program.

JCEL will utilize key expertise to create strategic simulations and advanced collaborative environments, and it will provide space for strategic partners from universities, DOE Laboratories, and the private sector to work together to integrate the technological expertise of government, universities, and industry. Increased interaction, collaboration, and teamwork are essential for shifting more rapidly to science-based methods and for effective stewardship of the nuclear stockpile. JCEL will provide classified and unclassified space in close proximity to facilitate collaboration between the users of high-end simulation technology and the developers, including research and development partners from universities and

industry, while maintaining strict security of classified weapon information. JCEL will also include space designed to encourage interaction and collaboration among the scientists and engineers occupying the building and will provide work space tailored for multidisciplinary, high-performance teams who will develop computer codes and analyze nuclear weapons.

JCEL will provide labs for developing, prototyping and using Virtual Environment Technology, where designers, analysts, and experimenters can interact with each other as if they were in the same room. Moreover, JCEL will use, as well as develop, this leading-edge technology. It will prototype and demonstrate a science and engineering workplace of the 21st century.

The communications networks will enable JCEL's occupants to use the supercomputers in the DOE complex. To display the extensive results of complicated, three-dimensional simulations of nuclear weapons, the JCEL project will also provide computer equipment for virtual reality and advanced visualization techniques, graphics workstations and printers, and video equipment.

To achieve its goals, the JCEL project will provide:

- A facility of approximately 55,200 gross square feet located immediately south of Building 880 in Technical Area I of Sandia National Laboratories on Kirtland Air Force Base in Albuquerque, New Mexico.
- Office space, laboratory space, management and administrative space, and interaction and meeting space.
- Access zones that include controlled, limited-access, and restricted areas.
- Classified and unclassified communications within the facility and between the facility and the rest of Sandia and DOE complex.
- Computer equipment for displaying and printing the results from complex, three-dimensional computer simulations of nuclear weapons.
- Computer workstations for use by engineers and scientists from other DOE labs, universities, and the private sector assigned temporarily to JCEL.
- Video equipment for video conferencing, displaying, and editing video images produced by computer simulations.

Benefits

- Reduced program costs through use of high-fidelity computer simulations developed through JCEL programs to reduce the scope of costly test programs.
- Faster response on stockpile stewardship issues that will arise.
- Rapid interchange of appropriate technology with the external community.
- Accelerated Defense Programs technology development.
- Cost savings in the development of Sandia research foundation technology base through in-kind contributions from industrial partners.

Project Scope

Plan, design, and construct a new, three-story building to accommodate a total of about 175 people, which will provide classified and unclassified space in close proximity. The project will provide computer equipment to: display three-dimensional simulations; support engineers and scientists from other DOE labs, universities, and the private sector, and provide video conferencing capability. Computer equipment includes: Interactive Multimedia equipment ($3,577,500); Virtual Reality/Advanced Visualization equipment ($1,192,500); high-end 3D graphic workstations and printers ($429,300); and design and analysis workstations ($477,000). In addition, the project will move existing furniture and install some new furniture. Site landscaping, parking, pedestrian access improvements, signage, and fencing improvements will be provided.

Project Milestones:

FY 2000: Start Design 2Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate

Contingencies		
Design Phase (0.9% of TEC)	263	0
Construction Phase (10.5% of TEC)	3,041	0
Total Contingencies (11.5% of TEC)	3,304	0
Total, Line Item Costs (TEC) [a]	28,870	0

[a] Escalation rates taken from the FY 2000 DOE escalation multiplier tables.

5. Method of Performance

Architectural and engineering design and inspection will be performed by Sandia Facilities Departments and/or under a competitive-bid fixed-price contract based on capability and capacity to perform the work. Construction will be performed under a competitive-bid fixed-price contract or multiple competitive-bid fixed-price contracts.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs							
Total facility costs							
Design	0	0	0	1,500	758	0	2,258
Construction	0	0	0	0	2,503	24,109	26,612
Total facility costs (Federal and Non-Federal)	0	0	0	1,500	3,261	24,109	28,870
Other project costs							
Conceptual design cost [b]	989	0	0	0	0	0	989
Other project-related costs [c]	0	159	100	58	35	92	444
Total other project costs	989	159	100	58	35	92	1,433
Total Project Cost (TPC)	989	159	100	1,558	3,296	24,201	30,303

[b] Includes NEPA documentation costs.

[c] Including tasks such as Project Execution Plan, Pre-Title I Development, Design Criteria, Safeguards and Security Analysis, Architect/Engineer Selection, Value Engineering Study, Independent Cost Estimate, Energy Conservation Report, Fire Hazards Assessment, Site Surveys, Soils Reports, Permits, Administrative Support, Operations and Maintenance Support, ES&H Monitoring, Operations Testing, Energy Management Control System Support, Readiness Assessment.

7. Related Annual Funding Requirements

(FY 2003 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project–30 years)		
Facility operating costs [d]	259	0
Facility maintenance and repair costs [e]	118	0
Programmatic operating expenses directly related to the facility [f]	51,000	0
Utility costs	196	0
Total related annual costs (operating from FY 2003 through FY 2032)	51,573	0

[d] When all facilities are operational in the 4th Quarter of FY 2003, average $258,840 for labor and materials per year. An average of 3.4 staff years will be required to operate the facility.

[e] A total of 1.0 staff years per year are required to maintain the facility.

[f] Annual programmatic operating expenses are estimated at $51,000,000, based on representative current operating expenses of 175 people. The majority of this funding is expected to come from DOE/DP for activities in support of the Nuclear Weapons Stockpile Stewardship Program. Lesser amounts are expected from other sources for activities which are mutually beneficial to the funding source and DOE/DP. By bringing these activities together in one building, we expect the effectiveness of this work to be increased by at least 10% and probably much more. This would correspond to a savings of at least $5 million per year of DOE/DP operating funds.

99-D-102, Rehabilitation of the Maintenance Facility, Lawrence Livermore National Laboratory, Livermore, California

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- Public Law 105–245, the Energy and Water Development Appropriations Act for FY 1999, provided only $15,000,000 of the $25,300,000 requested for new Stockpile Stewardship construction projects, and required independent assessments to validate cost and schedule before initiation of the projects. The independent assessments are targeted to start in the beginning of February with transmission to Congress in early April. Project milestones and funding profiles for this project are consistent with the schedule for completion of the assessments and the Department's implementation of the $10,300,000 FY 1999 funding reduction.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)

FY 2000 Budget Request *(Current Baseline Estimate)*	4Q 1999	2Q 2000	3Q 2000	2Q 2001	7,900	8,100

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	4,000	4,000	458
2000	3,900	3,900	6,031
2001	0	0	1,411

3. Project Description, Justification and Scope

Building 511 is the mission-critical center of all facility maintenance activity at the Lawrence Livermore National Laboratory (LLNL). In addition to being the center for general facilities maintenance, repair activities, and minor facilities modifications for all facilities at LLNL, the activities conducted in Building 511 include custom manufacture of items essential to experiments conducted in support of the Stockpile Stewardship and Management program and other programs at the lab.

Building 511 is a shop facility that is nearly 60 years old. It will be upgraded and remodeled to make it functional and serviceable for at least the next 20 years, while assuring life safety and operational requirements within the facility. New exterior finish system and window casements will provide a weather-tight building skin. Fire protection and electrical systems will be upgraded as required by code. Rest room facilities will be modified to reflect workplace diversity and to comply with accessibility standards. Entries to the facility will be upgraded for people and for material handling access and egress.

Specifically, this project will accomplish the following:

- Remove and dispose of asbestos siding (28,000 square feet) and install new exterior insulation finishing systems on all exterior faces of the building.
- Replace existing window units and glass (approximately 9,000 square feet).
- Upgrade all existing rest rooms.
- Update fire protection systems including fire exiting requirements, and replace existing fire sprinkler system.
- Replace code deficient and obsolete electrical panels, upgrade electrical receptacles, switches, and grounding.
- Modify building entry to accommodate easy passage of people and material.
- Install an elevator to facilitate movement of people and material to the second floor.

[b] Current estimate based on Conceptual Design Report of March 1997.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs							
Total facility costs							
Design	0	0	458	777	0	0	1,235
Construction	0	0	0	5,254	1,411	0	6,665
Total facility costs (Federal and Non-Federal)	0	0	458	6,031	1,411	0	7,900
Other project costs							
Conceptual design cost	100	0	0	0	0	0	100
NEPA documentation costs	0	15	0	0	0	0	15
Other project-related costs	50	35	0	0	0	0	85
Total other project costs	150	50	0	0	0	0	200
Total Project Cost (TPC)	150	50	458	6,031	1,411	0	8,100

7. Related Annual Funding Requirements

(FY 2001 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project--20 years)		
Facility operating costs [c]	557	557
Total related annual costs (operating from FY 2001 through FY 2019)	557	557

[c] Facility operating costs are estimated to be $557,000 per year. Costs are based on utility charges and the LLNL internal indirect rate Laboratory Facility Charge for facility operating costs. An average of approximately 6 FTE staff years will be required to operate the facility per year.

99-D-103, Isotope Sciences Facilities, Lawrence Livermore National Laboratory, Livermore, California

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- Public Law 105–245, the Energy and Water Development Appropriations Act for FY 1999, provided only $15,000,000 of the $25,300,000 requested for new Stockpile Stewardship construction projects, and required independent assessments to validate cost and schedule before initiation of the projects. The independent assessments are targeted to start in the beginning of February with transmission to Congress in early April. Project milestones and funding profiles for this project are consistent with the schedule for completion of the assessments and the Department's implementation of the $10,300,000 FY 1999 funding reduction.
- The Total Estimated Cost decreased from $19,400,000 to $17,400,000 and the Total Project Costs decreased from $19,800,000 to $17,700,000 as a result of the following scope reductions:
  - The poor condition of 29 exhaust systems required their replacement using operating expense funds prior to the initiation of this project.
  - Three HVAC systems in B154 were upgraded by an FY 1998 General Plant Project to satisfy an immediate need for additional laboratory space.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1999 Budget Request *(Preliminary Estimate)*	1Q 1999	4Q 1999	2Q 2000	2Q 2002	19,400	19,800
FY 2000 Budget Request *(Current Baseline Estimate)*	4Q 1999	1Q 2003 [a]	2Q 2000	2Q 2004	17,400	17,700

[a] Project design and construction components are organized into separate phases with construction on individual phases proceeding upon completion of the design for that phase.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	2,000	2,000	100
2000	2,000	2,000	3,700
2001	5,000	5,000	4,500
2002	4,400	4,400	4,400
2003	4,000	4,000	4,000
2004	0	0	700

3. Project Description, Justification and Scope

This project provides for a major rehabilitation of the nuclear chemistry facilities at Lawrence Livermore National Laboratory to extend the life of these essential program facilities. The principle objective of the project is to enhance the radio chemistry research, analytical, and characterization services provided to Defense Programs activities at LLNL. These facilities also support critical analytical waste characterization and programmatic environmental monitoring activities as well.

This project provides for a seismic retrofit and construction of an office addition to the Isotope Science Facility (Building 151), retrofit of Building 151/Building 154 ventilation systems, decontamination of the Refractory Materials Facility (Building 241) and disposal of four existing trailers. The current nuclear chemistry building (B-151) is a 31-year old wet-chemistry research building in need of a major rehabilitation to extend its life in support of the Weapons Stockpile Stewardship Program. The seismic rating of Building 151 does not meet current code requirements. This project will provide the seismic modifications necessary to meet current code requirements for performing isotopic research and support the ongoing mission.

- The Building 151 Office Addition is approximately 22,000 square feet contiguous to B-151. It resolves long standing co-location and program operating efficiency issues in a cost effective package. Exterior treatment will be selected consistent with the existing building, with access provided directly from Building 151 at both floor levels. The addition will contain offices, conference and meeting rooms, elevator, rest rooms, programmatic storage, and various support facilities.
- The existing Building 151 HVAC system is inefficient, difficult to maintain, and does not meet current requirements for exhaust and control. The majority of mechanical work entails taking approximately 51 fume-hood exhaust systems and manifolding them into four new systems. Two air handling units will be converted from constant-volume to variable-air-volume systems with variable-frequency drives. Building 154 is underutilized due to the difficulties in balancing the three air-pressure zones as required by researchers. To fully utilize this building for wet-chemistry laboratory use, the existing HVAC system, retention tank system, utilities, and fire-protection system must be

upgraded. The HVAC work done under the FY 1998 General Plant Project corrected some of the HVAC system problems, but not all. In addition, approximately 11 new fume hoods with associated exhaust ductwork, fans, and controls will be provided. B-151 and B-154 HVAC modifications and fume hood replacements will rehabilitate these high downtime and high maintenance subsystems and extend life to meet the current mission. Some safety and operational benefits also result.

- After moves are completed from Building 241, it will be characterized and decontaminated for future use by Defense Programs at LLNL. Four office trailers will be demolished or excessed to complete the moves. Consolidation of operations from B-241 and personnel from four older trailers complete the efficiency and cost-driven elements, which though minor in cost, have substantial operational benefits.

Along with the seismic retrofit and HVAC system/fume hood replacement, the project encompasses program consolidation for increased efficiency of operations, indirect cost savings, and safety of operations benefits. These are reflected respectively in the B-151 Addition, the B-154 HVAC modifications, and program moves from B-241 and trailers (T-1326, T-1527, T-1927, and T-2425).

Project Milestones:

FY 1999:	Start Title I Design	4Q
FY 2000:	Complete Title I Design	3Q
	Start Title II Design	3Q
	Start Construction	2Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications -$1,080)	1,350	1,615
Design Management Costs (0.1% of TEC)	20	35
Project Management Costs (0.4% of TEC)	80	80
Total Design Costs (8.3% of TEC)	1,450	1,730
Construction Phase		
Improvements to Land	275	0
Buildings	6,875	10,720
Utilities	155	0
Standard Equipment	940	0
Removal Cost Less Salvage	2,160	170

[a] Design and construction was planned as three separate packages (Package 1: 4 buildings; Package 2: 3 buildings; Package 3: 4 buildings). Construction on Package 1 will begin while design of Package 2 is still ongoing.

[b] Design and construction will now be handled as five separate packages (Package 1: 2 buildings; Package 2: 2 buildings; Package 3: 1 building; Package 4: 2 buildings; Package 5: 4 buildings). Construction on each package will begin upon completion of the design for that package, while design continues on the remaining packages.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	2,500	2,500	1,608
2000	2,400	2,400	3,176
2001	2,800	2,800	2,689
2002	2,800	2,800	2,900
2003	9,400	9,400	7,836
2004	0	0	1,691

3. Project Description, Justification and Scope

This project is the second of three phases of the LLNL roof replacement program. The first Phase is funded under 96-D-102. Phase II addresses 11 Weapons Stockpile Stewardship and Management Program buildings which require complete roofing system replacement along with the replacement of associated roof mounted equipment and piping systems which have deteriorated beyond economical repair. This is required in order to maintain and protect the integrity of the facilities and to assure that programmatic work can proceed without the risk of serious damage to the buildings or the programmatic efforts contained within. Work includes buildings: B111, B113, B121, B141, B194, B231, B241, B251, B281, B321 and B332. In all cases, the roofing systems have exceeded their 20 year design life by 11 to 23 years. The same holds true for most of the roof mounted equipment and piping systems as they are original equipment, again with an average design life of 20 years. Both the roofing and mechanical systems have deteriorated to the point where normal repair is no longer a viable alternative.

The 11 roofs in this project are experiencing severe deterioration problems including membrane failure, and the associated roof mounted mechanical equipment is also showing high levels of unreliable operation which adversely effect the support to the programmatic effort. As stated, normal maintenance procedures no longer are effective to maintain weather integrity of the roofing systems, to the point that leaks in the roofing system are jeopardizing experiments, experimental data and equipment. The impact from not replacing the roofing and mechanical equipment systems will result in excessive maintenance and repairs costs. In addition, the adverse programmatic impact could cost the Lab and Defense Programs significant dollars in lost production.

Operating expense budgets fund maintenance at a level of required repair, but not at the level required to replace roofs and roof mounted mechanical equipment. Since these 11 buildings are required to support critical Weapons Stockpile Stewardship and Management Program missions, capital funding is requested for the replacement of the roofs and associated roof mounted mechanical equipment.

Project Milestones:

FY 1999: Package No. 1 (Buildings 111 and 194)	
Start Design	3Q
Complete Design	4Q
Start Construction	4Q
FY 2000: Complete Construction Package No. 1	1Q
Package No. 2 (Buildings 332, 251, and 121)	
Start Design	1Q
Complete Design	2Q
Start Construction	3Q
Complete Construction	4Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications - $640)	770	770
Design Management Costs (0.1% of TEC)	29	29
Project Management Costs (0.3% of TEC)	50	50
Total Design Costs (4.3% of TEC)	849	849

Design Phase (1.0% of TEC)	207	207
Construction Phase (12.9% of TEC)	2,563	2,563
Total Contingencies (13.9% of TEC)	2,770	2,770
Total, Line Item Costs (TEC) [c]	19,900	19,900

[c] Escalation rates taken from FY 1999 DOE escalation multiplier tables. Current estimate based on Conceptual Design Report of March 1997.

5. Method of Performance

The Laboratory proposes a new approach to the implementation of this project. The new approach includes obtaining the services of a roofing specialist to develop construction contractor specifications and perform construction management and inspection. The construction contract is planned to be a unit price based contract with standard construction details. Change order processing and negotiations will be greatly simplified. This new approach should greatly reduce the cost of engineering and design. Minor architect-engineer work and activation will be performed by LLNL forces.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total

2000	1,000	1,000	2,203
2001	0	0	500

3. Project Description, Justification and Scope

The purpose of this project is to consolidate all of the existing health physics calibration functions at LANL in one location. The location will be remote from the general public due to the radiation present when calibrating instruments. The facility will allow calibration of radiation protection instruments to the required levels for: x-rays, beta and alpha contamination, gamma-rays, tritium, and neutrons.

The equipment and sources currently used for the radiation detector calibrations are over 30 years old in almost all cases. Source drive mechanisms have exceeded their useful lives. If an equipment failure or a source rupture occurs (due to old age), the mission of the Laboratory could be severely compromised. Without appropriate health physics instruments in place, facilities could be shut down because of the possibility of compromised worker radiation protection.

The current facilities are scattered among three areas: the Calibration Building, TA-3-130; and the upper floor and two basement areas of the Physics Building, TA-3-40. A number of Physics Division personnel are located in the same building and close to the ESH-4 Calibration Laboratory at TA-3-40. Operations at the Calibration Laboratory can cause low level radiation exposures to these personnel. These exposures are not As-Low-As-Reasonably Achievable (ALARA). The operators of the existing calibration equipment are also subject to radiation fields due to the configuration of the radiation sources. These exposures would be eliminated with operations moved to a refurbished facility.

The LANL Radiation Instrument Calibration (RIC) function is a very important institutional program. Approximately 8,000 instruments are maintained, repaired, and calibrated each year. These include portable and fixed alpha/beta contamination monitors, exposure rate meters, tritium-in-air monitors, continuous air monitors, and stack effluent monitors. Effluent monitor results are reported to the Environmental Protection Agency (EPA). The calibrations performed have a significant link to the radiation worker health and safety.

This newly renovated facility will allow the calibration functions to meet the requirements of 10 CFR 835, Occupational Radiation Protection; DOE Order 5480.4 - Environmental protection, Safety and Health Protection, which requires compliance with ANSI N323 - Radiation Protection Instrument Test and Calibration, and ANSI N42.17 - Performance Specifications for Health Physics Instrumentation, and will enable the laboratory to close a Tiger Team Category II finding.

The site selected, TA-36 Building 1, is currently occupied by a group performing administrative functions and very low level radiation experiments. The current occupants would be moved to another location. The TA-36 site is remote from the densely populated areas of the Laboratory, is served by paved roads, and is located in a secure area. The building (approximately 100,000 square feet) will be renovated, additional shielding installed for the calibration function, and renovated for all functions associated with radiological calibration. One smaller structure will be constructed at TA-36 by the project. The structure, Building 214, will be approximately 2,380 square feet and will house two free in air calibration functions that require high bay facilities. This building will be a concrete structure due to shielding requirements. The remote, refurbished site would eliminate the problems outlined above. The calibrations would be performed using state-of-the-art equipment, minimizing the probability of failure and the consequent threat to the Laboratory mission. The operator exposure would be eliminated as well. The ALARA concerns would no longer be an issue.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	1,600	1,600	720
2000	6,500	6,500	6,064
2001	5,200	5,200	5,927
2002	4,930	4,930	5,519

3. Project Description, Justification and Scope

The Department of Energy (DOE) has the statutory and mission responsibility for the design, production, maintenance, retirement and dismantlement of the United States nuclear weapons. In support of this mission, Defense Programs is responsible for the engineering development of the nonnuclear components and the overall systems engineering and integration for all nuclear weapons, including the

integration of nuclear weapons with their delivery vehicles. Responsibilities also include assuring that weapons' military characteristics (MCs) and Stockpile-to-Target-Sequence (STS) requirements are met for hostile, normal, and abnormal environments.

Pertinent, reliable, and timely information is key to fulfilling these responsibilities, and in part, this information is obtained through laboratory testing and corresponding analysis. Testing is performed in five primary areas in support of nonnuclear components and systems:

- Development testing (testing to certify design intent)
- Experimentation to validate and certify analytical models
- Product certification (such as neutron generators and AT 400 containers)
- Surveillance testing, which sometimes includes investigative testing
- Testing to support dismantlement.

Confidence in certifying the stockpile has been and will continue to be contingent upon high-quality, reliable, and pertinent data and competent analysis of that data, although the approach to obtain and analyze data and the nature of the data will change in response to DOE stockpile stewardship challenges.

The Model Validation and Systems Certification Center (MVSCTC) Project will provide a modern communications infrastructure coupled with a common control/operations facility for Sandia's eleven full-scale environmental test capabilities located in Tech Area III. The concept design of the MVSCTC reflects an optimized operational system composed of three subsystems including: Communications Infrastructure, Command and Control, and facilities to accommodate related operational functions.

The MVSCTC Project will implement an operational system that allows for both remote and local control of each of the test capabilities. This system will allow for more effective and efficient management of test operations and provide flexibility in meeting programmatic and specific customer needs. The Command and Control Center (CCC) will provide the remote control; Mobile Interface Units (MIUs) will provide local data acquisition and command and control as well as connection to the communications infrastructure at the individual test capabilities.

The MVSCTC communications infrastructure will be comprised of a communications hub (the CCC) and supporting infrastructure (communications media from the CCC to each of the test sites) that will link Sandia's environmental test capabilities to other Sandia personnel involved in modeling, simulation, design and related activities. Additionally, the infrastructure will link the MVSCTC into the nuclear weapons complex (NWC) electronic information network. The communications infrastructure will consist of high-capacity cabling installed in an underground concrete-encased ductbank of conduits. The capacity and robust nature of this infrastructure protection assures not only the viability of the communications infrastructure over the long run but also allows advances in communications technology to be easily incorporated over the life of the system.

Two MIUs, which are self-contained mobile trailers that house the equipment necessary to control the test capabilities and collect data from them, will be used for local control of test capability and to interface the communications system to nine of the eleven test capabilities. (Two test capabilities have unique programmatic needs that require connection to the communications system at all times.) Shared use of these two MIUs to support nine test facilities standardizes and reduces the equipment that is

otherwise required at each of the test facilities. The MIUs are being built as part of Sandia's Modernization Program; only the purchase and installation of the pertinent communications infrastructure termination equipment to be placed in the MIU as part of the MVSCTC is included in this capital project request.

Facilities to Accommodate Related Operational Functions

The scope of the proposed project will include the rehabilitation of two existing buildings, Buildings 6584 and 6587. A small addition will be constructed on the southwest corner of Building 6584 to accommodate a new entry ramp and lobby for the Command and Control Center. Included in the scope is 15,200 square feet of Building 6584 (circa 1950) and 4,700 square feet in the west end of Building 6587 (circa 1950). Existing occupants will be relocated to accommodate the MVSCTC.

Special Facilities

Communications Infrastructure

The communications infrastructure is the overall system of fiber-optic and copper lines and related infrastructure elements. To provide needed communications capacities, an unspliced 72 fiber cable will be installed from the CCC to each test capability. Use of unspliced runs assures longevity of the infrastructure and maximum information transmission capacity.

In addition to the fiber-optic cable, copper lines consisting of 30 pairs of telephone cable and 15 pairs of individually-shielded instrumentation cable will be installed. The telephone cable provides 24-hour service to each test capability for telephone, fire, and intrusion systems.

All fiber-optic and copper lines will be installed in a PVC ductbank, placed in a trench and encased in concrete. The depth of the concrete encased ductbank will be 30-inches below grade. Associated manholes and/or junction boxes will be locked.

The proposed communications infrastructure is located primarily within Sandia's Tech Area III. However, the main fiber optic trunk, which is to be installed from the existing Tech Control Center (TCC) in the Technology Support Center (TSC, Building 6585) to the MVSCTC, extends beyond the Tech Area III borders. The TSC is located just outside Tech Areas III and V, approximately 400 linear feet from the MVSCTC common control facility in Building 6584. The Tech Control Center (TCC) in the TSC will provide the point of physical connection into existing telecommunications infrastructure.

Planned connection to the existing copper telephone infrastructure will occur at a location close to the TSC (specifically, Building 6585A containing an optical remote) or at an additional trunk breakout location near the Centrifuge Facility, Building 6526. The actual connection point will depend on modifications that Sandia is presently making to the telephone infrastructure.

Command/Control System

The command and control system includes all the electronic systems required to manage the communications systems, interface the information systems to the test capabilities and allow operators, engineers, and customers to control capability functions and observe and record operations. Electronic equipment required to perform these functions includes: digital network and

video switching and transmission hardware; computer systems; video display and recording systems; and hardcopy peripherals. The majority of this equipment will be located in the CCC. Hardware required for the communications network completion at the test site or in the MIUs is also included in the MVSCTC Project scope.

Total Construction Costs (77.6% of TEC)	14,150	14,150
Contingencies		
Design Phase (1.2% of TEC)	213	213
Construction Phase (14.1% of TEC)	2,569	2,558
Total Contingencies (15.3% of TEC)	2,782	2,771
Total, Line Item Costs (TEC) [a]	18,230	18,219

5. Method of Performance

This work will be accomplished using a Sandia administered fixed-price, incentive, design-build contract.

[a] Escalation rates taken from the FY 1999 DOE escalation multiplier tables. Current estimate based on Conceptual Design Report dated March 12, 1997.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Project costs							
Facility costs							
Design	0	0	720	564	227	0	1,511
Construction	0	0	0	5,500	5,700	5,519	16,719
Total facility costs (Federal and Non-Federal)	0	0	720	6,064	5,927	5,519	18,230
Other project costs							
Conceptual design costs	306	0	0	0	0	0	306
NEPA documentation costs	20	0	0	0	0	0	20
Other ES&H costs	0	0	6	14	14	14	48
Other project-related costs	10	72	106	98	110	122	518
Total other project costs	336	72	112	112	124	136	892
Total Project Cost (TPC)	336	72	832	6,176	6,051	5,655	19,122

7. Related Annual Funding Requirements

(FY 2002 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated useful life of each facility—40 years)		
Facility operating costs [b]	141	141
Facility maintenance and repair costs [c]	818	818
Programmatic operating expenses directly related to the facility [d]	5,733	5,733
Capital equipment not related to construction but related to the programmatic effort in the facility	235	235
Utility costs	77	77
Total related annual costs (operating from FY 2002 through FY 2041)	7,004	7,004

[b] Facility operating costs will average $127,000 for labor and $14,000 for materials per year. An average of 1.7 staff years will be required to operate all facilities. The facility does not replace any other facility.

[c] Maintenance and repair costs for all facilities average $348,000 for labor and $470,000 for materials. A total of 5 staff years per year is required to maintain all facilities.

[d] Estimate reflects annual programmatic operating expenses associated with the operations and maintenance of the eleven test capabilities that are to be connected through the communications infrastructure to the common command and control facility implemented by the MVSCTC. Estimate includes: all loaded labor associated with direct test activities as well as preventative maintenance; facility costs (space charges, direct purchases, service contracts, etc.) and associated overhead loads. Estimate also includes projected, annualized operating expenditures incurred to maintain, repair, or replace-in-kind the existing equipment in these test capabilities.

99-D-108, Renovate Existing Roadways, Nevada Test Site

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- Public Law 105–245, the Energy and Water Development Appropriations Act for FY 1999, provided only $15,000,000 of the $25,300,000 requested for new Stockpile Stewardship construction projects, and required independent assessments to validate cost and schedule before initiation of the projects. The independent assessments are targeted to start in the beginning of February with transmission to Congress in early April. Project milestones and funding profiles for this project are consistent with the schedule for completion of the assessments and the Department's implementation of the $10,300,000 FY 1999 funding reduction.

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	2,000	2,000	1,021
2000	7,005	7,005	6,002
2001	2,000	2,000	3,982

3. Project Description, Justification and Scope

This project will provide for the renovation of 37.0 miles of Mercury Highway from the southern boundary of the Nevada Test Site (NTS) to the intersection of Rainier Mesa Road to Area 3. These repairs will consist of removing existing debris from pavement cracks, filling cracks with asphalt sealant, installing a stress absorbing membrane, and applying a new asphaltic-concrete overlay. In addition, the 2.3 miles of the Rainier Mesa Road from the intersection of Mercury Highway to the

intersection of road 4-04 in Area 4 will be reconstructed. Repairs will consist of total reconstruction of the roadbed and the application of the asphalt pavement.

The renovated road will have two-inch-thick overlay; the reconstructed road will have three-inch-thick paving. Aggregate shoulders will parallel each side. All required traffic signs, striping, and markers will be included in this project. No buildings or utilities are included in this project.

Mercury Highway is the primary access highway for any activity at the NTS, including subcritical experiments and future missions. This all-weather, paved, asphaltic-concrete road has been in service for almost 40 years. All personnel, heavy equipment, and supplies entering and/or exiting the NTS depend upon this access route. The pavement surface has severely deteriorated because of age, ground motion from underground nuclear events, and heavy truck traffic. Trucks frequently carry loads that far exceed normal highway limits, i.e., H-20 highway wheel-loading. Standard remedial measures, such as crack-filling or chip-and-seal overlays, will do little to extend the road's service life. The proposed extensive renovation will both eliminate the pavement distress as well extend the road's service life.

The Rainier Mesa Road is the only access road to the ongoing Big Explosive Experiment Facility (BEEF) in Area 4. This road is now extensively damaged. Total reconstruction of this road is required to continue use as a viable access road in support of the BEEF program.

Project Milestones:

FY 1999:	Start Design	3Q
FY 2000:	Complete Design	1Q
	Start Construction	2Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	1,332	1,332

3. Project Description, Justification and Scope

The Dual-Axis Radiographic Hydrotest Facility (DARHT) project was previously a subproject of the Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase II project (88-D-106). With the virtual completion of the remaining ten subprojects in 88-D-106, the DARHT effort was established as a stand-alone project in FY 1997 so that it can be more readily managed, monitored and funded.

Justification

Since its inception in 1988, the DARHT project has been recognized as a key link in DOE efforts to maintain the quality and reliability of the nuclear weapons stockpile. Historically, radiographic hydrodynamic tests and dynamic experiments have been a requirement to support the DOE (and

---

[e] Funds appropriated in FY 1988-1996 are from the DARHT subproject 88-D-106 and were moved to 97-D-102 to support management and monitoring of the project.

[f] Reflects an appropriation of $15,760,000 and the subsequent sequestration of $4,855,000 for FY 1990 and the FY 1990 Omnibus reprogramming approved by appropriations subcommittees.

[g] Reflects an appropriation of $16,800,000 and the subsequent FY 1991 Omnibus reprogramming of $11,800,000 approved by Congressional subcommittee

[h] No funds were appropriated in FY 1993. Reflects reprogramming of $3,500,000 redirected from prior year appropriation from Dormitones subproject of Line Item 88-D-106 at the Nevada Test Site (NTS).

[i] FY 1998 funding represents $24,300,000 for completion of Phase 1 (first-axis) and $22,000,000 for engineering planning and long-lead procurement for Phase 2.

predecessor agencies) mission; they remain an important requirement for future efforts of the Stockpile Stewardship and Management (SS&M) Program as they assist in the understanding and evaluation of nuclear weapon performance. Dynamic experiments are used to gain information on the physical properties and dynamic behavior of materials used in nuclear weapons, including changes due to aging. Hydrodynamic tests are used to obtain diagnostic information on the behavior of a nuclear weapons primary (using simulated materials for the fissile materials in an actual weapon) and to evaluate the effects of aging on the nuclear weapons remaining in the greatly reduced stockpile. The information that comes from these types of tests and experiments cannot be obtained in any other way.

The DOE existing capability to obtain diagnostic information was designed and implemented at a time when the organization could rely on direct observations of the results of underground nuclear tests to provide definitive answers to questions regarding nuclear weapons performance. Without the ability to verify weapons performance through nuclear tests, the remaining diagnostic tools are inadequate by themselves to provide sufficient information. Accordingly, as the Nation moves away from nuclear testing, DOE must enhance its capability to use other tools to predict weapons safety, performance, and reliability. In particular, DOE must enhance its capability to perform hydrodynamic experiments to assess the condition and behavior of nuclear weapons primaries.

Although the current U.S. stockpile is considered to be safe and reliable, the existing weapons are aging beyond their initial design lifetimes and, by the turn of the century, the average age of the stockpile will be older than at any time in the past. To ensure continued confidence in the safety and reliability of the U.S. nuclear weapons stockpile, DOE needs to improve its radiographic hydrodynamic testing capability as soon as possible. Uncertainty in the behavior of the aging weapons in the enduring stockpile will continue to increase with the passage of time because existing testing techniques, by themselves, are not adequate to assess the safety, performance, and reliability of the weapons primaries. Should DOE need to repair or replace any age-affected components, retrofit existing weapons, or apply new technologies to existing weapons, existing techniques are not adequate to assure weapons safety and reliability. In an era without nuclear testing, DOE believes that it is probable that the existing weapons will require these types of repairs or retrofits in the foreseeable future. DOE has determined that no other currently available advanced techniques exist that could provide a level of information regarding nuclear weapons primaries comparable to that which could be obtained from enhanced radiographic hydrodynamic testing.

In addition to weapons work, DOE uses its radiographic testing facilities to support many other science missions, and needs to maintain or improve its radiographic testing capability for this purpose: Hydrodynamic tests and dynamic experiments are important tools for evaluating conventional munitions; for studying hydrodynamics, materials physics, and high-speed impact phenomena; and for assessing and developing techniques for disabling weapons produced by outside interests.

Project History Leading to Current Project Scope

Originally, the project scope included two 16-MeV electron-beam accelerators producing x-rays. In FY 1990, the Department decided to defer construction of the Hydrotest Firing Site (HFS) pending completion of technology development verified by the test results from an Integrated Test Stand (ITS), which consisted of about 30 percent of one x-ray machine. Following the successful ITS test results, development and construction of the hydrotest firing site was re-scoped based on the recommendations of two independent "Blue Ribbon" review committees assembled to assist the Department of Energy

(DOE) in enhancing the development of a vital hydrotest capability. The new scope provided for the development, procurement, and installation of the first of two 16-MeV flash x-ray machines (for dual-axis radiography) at the firing site; and construction of a weatherproof building to house the dual-axis radiographic systems and supporting calibration activities. Construction was resumed in FY 1994.

On January 26, 1995, an injunction was issued for this project by the United States District Court for the District of New Mexico, requiring a cessation of all actions associated with the DARHT construction project, including any construction, procurement, design, or any furtherance of the DARHT project pending completion and judicial review of an Environmental Impact Statement (EIS) and Record of Decision (ROD). In response, the Department ceased all project activities and completed an EIS for the project. A ROD was published in October 1995. The preferred option that was selected was to complete the project and operate the DARHT facility with the use of steel containment vessels to minimize the environmental impacts from operation of the facility. This containment option includes multiple phases to eventually obtain at least 75 percent reduction in the emissions from high-explosives testing when compared to the DARHT Baseline Alternative analyzed in the EIS. The January 1995 injunction was lifted in April 1996 and DARHT construction resumed in May 1996.

The DARHT project is now redefined to comply with the ROD preferred alternative and is divided into two phases. The first phase, most of which has been in progress since FY 1988, consists of the construction of a Radiographic Support Laboratory (RSL) and a Hydrotest Firing Site (HFS), which includes the first of two flash x-ray machines. In addition, this phase includes: the initial stage of containment of emissions from the high-explosives experiments to be conducted at the facility; an increase in accelerator energy from 16 to 20 MeV; changes in the accelerator to generate higher electron-beam currents; and improved diagnostics. Phase 1 will be completed during FY 1999 and the first axis will become operational by June 1999. Phase 2 will include the second flash x-ray machine, as well as the second stage of increased containment of testing emissions. The Department's decision in September 1997 of the Long-Pulse Induction Accelerator as the best technology for the second axis resulted in the current baseline for the project. A third phase of increased containment of testing emissions as defined in the ROD will be evaluated after several years of operating experience on DARHT. If a decision is made at the time to develop a vessel system capable of containing a 400 pounds of TNT equivalent high explosives, a new line item would be proposed.

Phase 1

Phase 1 provides for the construction of the Radiographic Support Laboratory, which is completed; development, procurement, and installation of the first of two flash x-ray machines (for dual-axis radiography) at the firing site; procurement and installation of state-of-the-art hydrodiagnostic instrumentation at the firing site; construction of a blastproof building to house the dual-axis radiographic systems and support calibration activities; and, the first containment vessel (an existing vessel design modified for DARHT testing).

Hydrotest Firing Site (HFS)

The entire HFS building is being constructed as part of this phase, as well as the first x-ray machine and all electronic and optical diagnostics. The second machine, necessary to complete the essential dual-axis configuration of the facility, will be built in a sequential manner (Phase 2), allowing it to take advantage of engineering and scientific advances that occur before its construction. The first machine is a state-of-the-art linear induction accelerator, producing an electron beam of approximately 20-MeV that will be

converted into an x-ray beam. A high speed electronic data acquisition system, a firing site control system, and optical imaging systems will also be included. Optical instrumentation includes high-speed framing and streak cameras and laser velocity interferometers. To improve the diagnostics capability of this facility, a gamma-ray camera is included.

The HFS building is a two-level, 39,650-square-foot building to house and operate both accelerators. The walls and roof are designed to shield personnel operating the facility from the radiation produced by the accelerators, as well as to resist blast forces resulting from the detonation of explosives. The accelerators will be located on a three foot thick concrete slab on grade. Both accelerator rooms contain a total of approximately 13,175 square feet and are equipped with a 10-ton capacity bridge crane. Completion of the entire building for both x-ray machines allows installation of the second machine (Phase 2) to take place without stopping hydrodynamic testing activities that would begin upon installation of the first machine.

The power supply rooms provide space adjacent to the accelerators for electrical equipment that serves the accelerators. These rooms are equipped with 3-ton capacity bridge cranes. The detection chamber is electromagnetically shielded. Adjacent to the detection chamber are the control room, a cable room, a capacitor discharge unit (CDU) room, and a computer room. The detection chamber, computer room and accelerator control room are also provided with an access flooring system. Other rooms include an optical room, an analyzer room, a Fabry Perot room, a laser illumination room, an assembly room, toilets, and mechanical/electrical equipment room. This area contains approximately 26,475 square feet.

Fire protection is provided throughout by a hydraulically designed foam/water automatic sprinkler system. Plumbing and process piping includes hot and chilled circulating water, potable hot and cold water, industrial cool water, sanitary sewer, compressed air, natural gas, transformer oil, and low-conductivity water systems. A boiler and two chillers are included to provide hot and cold water. This conditioned water is used for heating, ventilating, and air-conditioning the building, with the exception of the detection chamber and accelerator control room, which are serviced with "computer-type" units. Two above-ground, 12,000 gallon oil storage tanks, a cooling tower, and an electrical substation are provided. Power is supplied to the building from an existing 13.2 kV line. The building is equipped with communication systems that include telephone, intercom, and broad band communications.

Site work includes a new asphalt surfaced access road, an asphalt surfaced circulation road and parking area, surface drainage, and erosion control. Utilities extended to the site include natural gas, water, electrical power, and communication services. A septic tank and seepage pit are provided to handle the sanitary sewage.

For Phase 1, a prototype vessel system and a temporary cleanout unit are being fabricated to obtain the initial 5 percent reduction in testing emissions when compared to the DARHT Baseline Alternative analyzed in the EIS for the first five-year period of facility operation. The prototype vessel system will be a modification of an existing steel vessel design for experiments containing up to 27 kg of high-explosives.

Phase 2

Included in DARHT Phase 2 is the second electron beam accelerator which will be installed in the second accelerator hall provided in Phase 1. The second machine, necessary to complete the essential dual-axis configuration of the facility, is being built in a sequential manner, allowing it to take advantage of engineering and scientific advances that have occurred since construction of the first machine. In September 1997, the Department selected the Long-Pulse Linear Induction Accelerator because it presented the greatest technological advancement for the lowest cost and least risk. The second machine will be capable of providing four high-quality beam pulses over four microseconds with each pulse comparable in quality to the single pulse machine in the first axis.

The technology selected for Phase 2 requires a machine that is longer than the accelerator hall currently under construction. To accommodate the longer machine, it was necessary to increase the size of the west accelerator hall by 1,300 square feet. Other modifications that were required to the HFS included a larger roof hatch to install equipment, extension of the 3-foot thick accelerator foundation and glycol system modifications. While the HFS was constructed as part of Phase 1, the changes were driven by Phase 2 requirements and were, therefore, budgeted for in Phase 2.

A preparation facility includes high bay space for cleanout, process, and two staging areas. The high bay spaces will include bridge cranes. This facility includes a small analytical lab, change rooms, storage, waste storage, fabrication shop, a small multipurpose room, an area for office cubicles, and the mechanical/electrical support spaces.

Fire protection for the vessel preparation facility will be provided throughout by a hydraulically designed automatic sprinkler system. Areas with the potential for contamination will drain to a 25,000 gallon above-ground storage tank to provide secondary containment of the sprinkler water. The areas with the potential for contamination will also be connected to a mitigating debris recycling system. Other plumbing systems will be potable hot and cold water, hot and cold circulating water, a double wall drain line for potentially contaminated water, and sanitary waste drainage. A natural gas-fired boiler will provide the hot water and a chiller will provide the chilled water. The HVAC system will include a HEPA filtration system to vent the vessels. The areas with potential contamination will be designed for seven air changes per hour with a once-through air handling system. The analytical lab will be equipped with a fume hood. The building will be equipped with communication systems that will include telephone, intercom, and broad-bank communications.

Site work for the vessel preparation facility will include a new asphalt surfaced access road, a large asphalt paved circulation and parking area. The circulation area will be designed for the large vessel handling equipment and storage. There will also be approximately 2,000 square feet of covered storage. Utilities extended to the site will include natural gas, water, sanitary sewer, electrical power, and communication services. Power will be supplied to the building from an existing 13.2-kV line.

This phase includes a vessel capable of containing a detonation of 124 pounds of TNT equivalent high explosives and a vessel capable of confining a detonation of 44 pounds of TNT equivalent high explosives. This results in a reduction in testing emissions of at least 40 percent, when compared to the DARHT Baseline Alternative analyzed in the EIS, during the second 5-year period of facility operation. Containment goals will be met or exceeded through the use of a combination of techniques: containment, material replacement, post-shot recovery, and program management.

Experience gained during Phases 1 and 2 will allow the final containment techniques to be implemented that would result in at least 75 percent reduction in testing emissions when compared to the DARHT Baseline Alternative analyzed in the EIS for the remaining years of facility operation. The Department of Energy will meet the release reduction goals of this phase through the use of the combination of techniques discussed above.

Project Milestones:

FY 1999:	Phase 1:	HFS Construction Complete	3Q
		First Axis Machine Operational	3Q
		Complete First Axis Readiness Assessment	3Q
	Phase 2:	Deliver Accelerator Cells to LANL for Prototype Testing with the Beam	4Q
FY 2000:	Phase 1:	Complete	
	Phase 2:	Complete Second Axis Machine Accelerator Hardware Design	1Q
		Complete Confinement Vessel Design	2Q
		Complete Design for Vessel Preparation Facility	4Q

4. Details of Cost Estimate*

(dollars in thousands)

Phase 1	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	23,959	23,959
Total Design Costs (22.7% of TEC)	23,959	23,959
Construction Phase		
Buildings	23,814	23,814
Special Equipment	46,804	46,804
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	2,032	2,032
Project Management (6.1% of TEC)[j]	6,439	6,439
Total Construction Costs (74.8% of TEC)	79,089	79,089
Contingencies		
Construction Phase (2.5% of TEC)	2,652	2,652
Total Contingencies (2.5% of TEC)	2,652	2,652
Total, Line Item Costs (TEC)	105,700	105,700

*Note: The Details of Cost Estimate section has been split between Phase 1 and Phase 2 to more accurately reflect costs under the categories required for the FY 2000 budget. It is not possible to identify all costs in the new categories since this project was established and tracked using cost categories in effect at the time of initial funding in FY 1988.

[j] Since the project was initially funded in FY 1988, all of the Phase 1 management effort has been tracked only as project management; consequently, all design and construction management is included as project management under the construction phase.

4. Details of Cost Estimate

(continued)

	(dollars in thousands)	
	Current Estimate	Previous Estimate
Phase 2		
Design Phase		
Preliminary and Final Design Costs (Design Drawings and Specifications)	17,337	17,337
Design Management Costs (0.2% of TEC) [k]	273	273

Total, Line Item Costs (Phase 1 and Phase 2)	259,700	259,700

5. Method of Performance

Design and procurement of the conventional facilities were performed under negotiated architect-engineer contracts. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding.

---

[k] Design and construction management only includes conventional facility design and construction. Design phase project management includes only conventional facility design phase management. Construction Phase project management includes both the conventional facility construction phase management and all of the special equipment project management. Special equipment does not have a traditional construction component with design, procurement and installation taking place concurrently among the various special equipment work elements. Attempting to separately track and report special equipment design and construction management would require establishing an additional 26 WBS elements and associated cost control elements. This is deemed to have greater cost than benefit. The intent to establish conventional facility construction design and construction management costs is supported, however, in this approach..

[l] Escalation rates taken from FY 1999 DOE escalation multiplier tables.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years*	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs							
Total facility costs							
Design	20,239	10,004	6,568	3,999	2,039	2,004	44,853
Construction	49,939	27,677	41,241	55,342	30,067	10,581	214,847
Operating expense funded equipment	1,105	0	0	0	0	0	1,105
Total facility costs (Federal and Non-Federal)	71,283	37,681	47,809	59,341	32,106	12,585	260,805
Other project costs							
R&D necessary to complete construction	1,471	0	0	0	0	0	1,471
Conceptual design cost	260	0	0	0	0	0	260
NEPA documentation costs	2,960	0	0	0	0	0	2,960
Other project-related costs [m]	2,795	8	461	0	0	1,040	4,304
Total other project costs	7,486	8	461	0	0	1,040	8,995
Total Project Cost (TPC)	78,769	37,689	48,270	59,341	32,106	13,625	269,800

7. Related Annual Funding Requirements

(FY 2002 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project--30 years)		
Facility operating costs [n]	10,400	10,400
Programmatic operating expenses directly related to the facility [o]	8,000	8,000
Total related annual costs (operating from FY 2002 through FY 2031)	18,400	18,400

[m] These are the costs for (1) FY 1997 Technology Options Study to evaluate the alternative technologies for the second x-ray machine, (2) facility start-up including the Readiness Assessment, and (3) management of operating expense items.

[n] These are all direct and indirect costs associated with maintaining the facility readiness for programmatic purposes. It includes facility maintenance, utility costs, space tax, organizational support, janitorial services, and security with both axes operational and in the final containment phase. It includes the RSL, HFS, and Vessel Preparation Facility. On average, the related effort is 28.5 FTEs.

[o] The annual programmatic operating expense will fluctuate significantly from year to year depending on the programmatic effort. The $8,000,000 is an average based on the FY 1997 effort at PHERMEX.

96-D-102, Nuclear Weapons Stockpile Stewardship Facilities Revitalization, Phase VI, Various Locations

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical *line* [|] in the left mar gin.)

Significant Changes

- Reduced FY 1999 funding for new Stockpile Stewardship construction projects, and the resulting impacts to FY 2000 and outyear funding profiles, have required reprioritization of outyear Stockpile Stewardship funding requirements. As a result, the funding profile for the Storm Drain, Sanitary Sewer, and Domestic Water subproject at Sandia National Laboratories has been adjusted. By the end of FY 2000, the project will complete the Sanitary Sewers, Water System Meters and Controls, and the 9th Street Storm Drain System. No funding will be requested in FY 2001, and when funding resumes in FY 2002, the project will start and complete Water Systems Rehabilitation and complete the remainder of the Storm Drain portion of this subproject.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1996 Budget Request [a]	1Q 1996	1Q 1999	3Q 1997	4Q 1999	33,700	34,660 [a]
FY 1997 Budget Request	1Q 1996	4Q 1999	3Q 1997	1Q 2002	69,659	70,748
FY 1998 Budget Request	1Q 1996	4Q 1999	3Q 1997	1Q 2002	72,876	75,475
FY 1999 Budget Request	1Q 1996	4Q 1999	3Q 1997	4Q 2000	74,226	76,254
FY 2000 Budget Request *(Current Baseline Estimate)*	1Q 1996	3Q 2002	3Q 1997	4Q 2003	74,226	76,298

[a] The TEC/TPC for this project in FY 1996 includes only two subprojects. Additional subprojects were included in the FY 1997 (two) and FY 1998 (two) Construction Project Data Sheets bringing the total number of subprojects funded within this line item to six.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1996	2,520	2,520	340
1997	19,250	19,250	3,744
1998	19,810	19,810	21,470
1999	24,106 [b]	24,106	28,679
2000	2,640	2,640	12,802
2001	0 [b]	0	1,291
2002	2,900	2,900	1,900
2003	3,000	3,000	4,000

3. Project Description, Justification and Scope

This series of projects provides for the construction of new facilities, and modifications, relocations, and additions to existing facilities for the Nuclear Weapons Stockpile Stewardship facilities at Sandia National Laboratories (SNL), Los Alamos National Laboratory (LANL), Lawrence Livermore National Laboratory (LLNL) and the Nevada Test Site (NTS). These projects are a multiyear capital investment program to revitalize the Nuclear Weapons Stockpile Stewardship complex. These facilities will replace or add to existing facilities and infrastructure that are overaged, deteriorated, overcrowded, or are inadequate to preserve capabilities required for the current and future weapons stockpile stewardship program.

The Nuclear Weapons Stockpile Stewardship program is made up of a highly complex set of activities which are extremely dependent on current and advanced technology facilities and equipment to meet its varied needs. The successful performance of the Stockpile Stewardship program contributes directly to the quality and reliability of the nuclear weapons stockpile. In addition to unremitting requirements for reliability and performance, we are committed to pursue new safety and safeguards features for the enduring stockpile. These standards require innovative physics concepts and designs, the development of new materials and material applications, and extension of both engineering and manufacturing technologies beyond the current "state-of-the-art." All of this requires support of a reliable infrastructure.

The revitalization effort was initiated in FY 1984 with Project 84-D-107, Nuclear Testing Facilities Revitalization, and was followed in FY 1985, FY 1988, FY 1990, FY 1992 and FY 1994 by follow-on phases. These projects were defined based on needs identified by representatives from the Albuquerque and Nevada Operations Offices, and the three weapons laboratories. Since the initiation of these

[b] A reprogramming action that received final Congressional approval on November 5, 1998, increased FY 1999 funding for the 138 kV Substation Modernization subproject by $3,683,000 and eliminated the corresponding FY 2001 funding requirement.

projects, all aspects of the laboratory complex capital asset base continued to be critically reviewed and have resulted in the initiation of this line item project which contains six subprojects.

The consolidation of the Nuclear Weapons Stockpile Stewardship revitalization needs into one project data sheet focuses the issue of the total needs of the Stockpile Stewardship program. With the decreased demand for new weapon systems, this project is oriented toward preserving the critically needed infrastructure at LANL, NTS, SNL, and LLNL. These subprojects all cover general purpose facilities at various DOE locations that are an integral part of the installation support infrastructure. Included are basic utility systems, such as electrical power distribution, sewage, roads, parking lots, gas distribution, water supply, and the like. Many of these systems were constructed during the 1940s to World War II specifications with a 10-year maximum life expectancy. Despite extensive preventative maintenance over the intervening years, many of them are now deteriorated beyond economic repair and do not meet present-day standards for safety and environmental protection.

Full funding for subprojects 01, Water Well Replacements; 02, Fire Protection Improvements; 04, Roof Replacement; and 06, Site 300 Fire Station/Medical Facility has been provided through prior year appropriations.

Details for subprojects 03, 138 kV Substation Modernization; and 05, Storm Drain, Sanitary Sewer, and Domestic Water Systems, Modernization, which require funding in FY 2000 are provided.

Subproject 01 - Water Well Replacements, LANL, Los Alamos, New Mexico

TEC	Previous	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start - Completion Dates
$16,800	$11,200	$ 4,500	$ 1,100	$ 0	$ 0	$ 0	3Q 1997 - 4Q 1999

This project received its final funding in FY 1999. No additional funding is required.

Project Milestones:

FY 1999:	Complete Construction for Phase B	3Q
	Complete Construction for Phase C	4Q
FY 2000:	Start of Operations	2Q

Subproject 02 - Fire Protection Improvements, LANL, Los Alamos, New Mexico

TEC	Previous	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start - Completion Dates
$16,900	$ 6,570	$ 5,450	$ 4,880	$ 0	$ 0	$ 0	4Q 1997 - 4Q 1999

This project received its final funding in FY 1999. No additional funding is required.

Project Milestones:

FY 1999: Complete Construction	4Q
FY 2000: Start of Operations	3Q

Subproject 03 - 138kV Substation Modernization, NTS, Las Vegas, Nevada

TEC	Previous	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start - Completion Dates
$ 11,992	$ 1,000	$ 2,667	$ 6,350 [c]	$ 1,975	$ 0 [c]	$ 0	4Q 1997 - 4Q 2000

This project will modernize one major substation (Frenchman Flat Substation), one switching center (Mercury Switching Center), and one tap station (Valley Tap) on the 138 kilovolt (kV) transmission system loop at the Nevada Test Site (NTS). It will also provide for the installation of a SCADA fiber-optics communication loop. The Mercury Switching Center serves as a termination point for the incoming power line from Nevada Power Company (NPC).

No major site improvements are proposed for the modernized facilities except possible site and access road grading.

Frenchman Flat Substation (FF), Canyon Substation (CA), Mercury Switching Center (MSC), and Valley Tap (VAT) will each require modifications to the control buildings. Each building will provide an adequate environment for electrical relays, switchgear, breaker control panels, and telecommunications equipment. Each control building will contain a heating, ventilation, and air conditioning HVAC system; a fire detection and alarm system; electrical power for interior and exit lighting; battery-powered emergency lighting; telephones; and fully insulated walls and ceilings. The substation, switching center and tap station will employ new gas breaker technology, microprocessor relays, supervisory control and data acquisition (SCADA) control of major equipment, and new SCADA fiber-optic cable for telecommunication requirements (relaying, metering, and telephone system).

The Frenchman Flat Substation is an important part of the overall NTS power system and feeds critical loads associated with laboratories' activities.

The Mercury Switching Center is the termination point for the NPC 138 kV transmission line, which provides the primary power source to the NTS. NPC metering is also located at this facility.

The Valley Tap Switchstation will be a relaying point on the 138 kV transmission loop to allow proper sectionalizing of the loop during fault conditions. This will maintain most of the users in service including Systems which accounts for over a third of the NTS power usage.

A SCADA fiber-optics loop will enhance or upgrade the existing communications system. This fiber-optics loop will employ approximately 115 miles of fiber-optic cable wrapped around the existing overhead static wire on the NTS 138 kV transmission line.

---

[c] A reprogramming action that received final Congressional approval on November 5, 1998, increased FY 1999 funding by $3,683,000 and eliminated the FY 2001 funding requirement.

The 138 kV transmission loop with its associated facilities is the backbone of the entire NTS power system. Reliable power for all weapons testing programs, future missions, the Yucca Mountain Project, environmental programs, and many other projects and programs conducted at the NTS are dependent upon the reliability of these facilities. Maintenance of aging and failing equipment is becoming increasingly more difficult because many replacement parts are no longer available. The Mercury Switching Center is a key substation at the NTS and connects to the outside utility company (NPC), which provides electrical power to the site. Equipment failures in these facilities have a significant impact upon all NTS programs and the reliability of the entire power system.

Existing 138 kV power facilities at the NTS are approximately 28 to 38 years old. The substation and switching center to be modernized in this project are among some of the oldest facilities at the NTS. Over the past several years increased outages due to equipment failure have occurred on a more frequent basis and will continue to accelerate until replaced.

The existing power line carrier communications system used for supervisory control has been in service long past its useful life span, is obsolete and unreliable. Current power line carrier replacement projects have improved the communication capability as a stop gap measure only, using old existing fiber-optic cables and borrowed microwave facilities. When the new SCADA fiber-optic loop is installed, it will provide adequate speed and capacity for modern relaying, SCADA, and metering facilities. A new communications loop using fiber-optics technology is the most practical solution to provide a long-term, reliable communication system for the NTS power system.

This project is needed in order to avoid future high maintenance expenses and frequent power interruptions that the NTS has experienced during critical times, to reduce the risk of serious or fatal injuries to the workers who maintain the deteriorating system, and to enable NTS activities to activate its readiness capability, if called upon.

Project Milestones:

FY 1999:	Complete design and start construction on the SCADA fiber-optic communication loop	3Q
	Complete design and start construction on the 138 kV relay grades	4Q
	Start design for replacing circuit switchers at VAT and FF	4Q
FY 2000:	Complete construction of the SCADA fiber-optic communications loop	1Q
	Start design modifications for MSC transfer bus	2Q
	Complete design and start construction for replacing circuit switchers at VAT and FF	3Q
	Complete construction on the 138 kV relay upgrades	4Q
	Complete design and start construction on MSC transfer bus	4Q

Subproject 04 - Roof Reconstruction - Protection of Real Property, LLNL, Livermore, California

TEC	Previous	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start - Completion Dates
$7,810	$ 3,000	$ 4,810	$ 0	$ 0	$ 0	$ 0	2Q FY 1998 - 2Q FY 1999

This project received its final funding in FY 1998. No additional funding is required.

Project Milestones:

FY 1999: Complete construction 2Q

Subproject 05 - Storm Drain, Sanitary Sewer, and Domestic Water Systems, Modernization, SNL, Albuquerque, New Mexico

TEC	Previous	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start - Completion Dates
$15,374	$ 0	$ 1,483	$ 7,326	$ 665	$ 0	$ 5,900	1Q 1999 - 4Q 2003

Much of the storm drain system, sanitary sewer system, and water distribution system at SNL have been in place for 30 to 50 years. Studies and video inspection have shown that the systems are in need of rehabilitation and expansion. As time passes, utilities that support DOE programs will be threatened, and the probability of losses of equipment and time will increase. Systems in deteriorated condition have high maintenance costs.

This subproject at SNL will: (1) rehabilitate and enlarge the storm drain system to reduce the risk of flooding of existing facilities, reduce or eliminate risks of soil and groundwater contamination, and minimize maintenance costs caused by the erosion of unlined channels; (2) rehabilitate the sanitary sewer system to address the issues of old, deteriorating sewer lines, and the threat of contamination of soil and water due to leakage by rehabilitating sewer lines and manholes; and (3) improve the water distribution system and fire protection by tying into the new Kirtland Air Force Base (KAFB) lines, improving electronic controls, installing water meters, and replacing several deteriorated water lines.

One of Sandia's environmental missions is to be in full compliance with the Federal environmental regulations, including all appropriate permitting. Regulatory drivers for this subproject include the Safe Drinking Water Act, National Pollutant Discharge Elimination System, 40 CFR 122, 123, and 124, the Clean Water Act, DOE Order 6430.1A, and Tiger Team Finding SW/CF-04.

Storm Drain System

Comprehensive drainage system analyses have been completed for SNL. These system analyses showed that six facilities in Technical Areas I, II, and IV would be impacted by the 100-year floodplain, including Building 880, which houses several Cray mainframe computers, key to a number of programs. Eight facilities in Technical Areas III and V would be impacted by the 100-year floodplain. Improvement to and expansion of the storm drain system as described below would remove the facilities in Technical Areas I, II, III, IV, and V from the 100-year floodplain.

Camera equipment was used to inspect the storm drain lines in 1992 and showed that approximately 26,524 feet of storm drain systems require major repair or replacement to alleviate flooding and

structural failure. The majority of the failing system is in Technical Area I and has exceeded its 40-year design life.

A sedimentation and capacity analysis performed for existing earth-lined channels determined that existing utilities adjacent to the channels are at risk to damage due to erosion of the channel flow. The results show that no matter how well the channels are maintained, failure is imminent. Failure will lead to roads being washed out leading to Technical Area IV, overtopping of the channel, and possibly flooding of facilities. This project proposes to line the existing channels with concrete to prevent erosion, increase capacity, protect utilities, and reduce the amount of sediment carried downstream.

The following improvements will be made to the Storm Drain System:

- Enlarge the 9th Street and 17th Street storm drains to accommodate the 100-year developed-conditions runoff, including the diversion of flows from the 14th Street and G Street intersection.
- Line the 9th Street, 14th Street, 17th Street, and a portion of the 20th Street channels to eliminate erosion and minimize sediment transport.
- Install a storm-drain pipe in the 20th Street channel from Harding Blvd. to G Street.
- Construct berms, channels, and inlets and upsize culverts in Technical Areas III and V.
- Further integrate streets and storm inlets to ensure that storm flows can reach the storm sewer systems.
- Replace deteriorated storm drain inlets and manholes.

Sanitary Sewer System

A condition assessment report for the sewer system was completed in 1992 using in-line camera inspection data. The report was updated in 1995. The report categorized 25 percent of the sanitary sewer lines in Technical Areas I, II, and IV, and 164 sewer manholes as in either "poor" or "fair" condition. This means that several miles of pipe have a high probability of leaking industrial wastewater into the surrounding soil through cracks, separated joints, and corroded pipes. The worst section of pipe are also in danger of collapsing and backing wastewater up into buildings, many of which are critical to the mission of SNL. The proposed project will mitigate the poor condition of the system.

The following improvements will be made to the Sanitary Sewer System:

- Rehabilitate approximately 22,000 linear feet of the existing, deteriorated system using u-liner, slip lining, and open cut methods.
- Repair approximately 100 sewer manholes that are in "fair" or "poor" condition.

Water Distribution System

Under National Fire Protection Association codes, redundant water supply is required for fire protection. An important part of this project is to improve fire protection by providing a redundant water supply and a properly grided system. Kirtland Air Force Base (KAFB) is installing a new supply and distribution system. This project makes several ties to the SNL system to improve water distribution and fire protection in Technical Areas I, II, and IV.

The existing water distribution system does not have electronic storage-tank monitoring devices needed to monitor the system properly. SNL is responsible via an interagency agreement with the Air Force for the operation and maintenance of the water system within SNL boundaries. With basic electronic monitoring, SNL will be able to monitor the system with confidence.

SNL is currently unable to monitor water consumption. As part of a Memorandum of Understanding with Federal and state agencies, SNL has agreed to cooperate in a water conservation effort. This project will provide meters at tie-in points to the KAFB system and will provide consumption data. This data will be used as part of a water conservation effort.

The following improvements will be made to the water distribution system:

- Install electronic monitoring equipment on the system.
- Install water meters at connections between Sandia and KAFB.
- Rehabilitate or replace deteriorated water lines.

Project Milestones:

FY 1999:	Complete Title II Design for the Storm Drains	2Q
	Start Construction on the Storm Drains	2Q
	Start Construction on the Water System Meters and Controls	2Q
	Complete Construction on the Sanitary Sewers	4Q
	Complete Construction on the Water System Meters and Controls	4Q
FY 2000:	Complete 9th Street Storm Drain System	3Q

Subproject 06 - Site 300 Fire Station/Medical Facility, LLNL, Livermore, California

TEC	Previous	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start - Completion Dates
$ 5,350	$ 0	$ 900	$ 4,450	$ 0	$ 0	$ 0	3Q 1999 - 4Q 2000

This project received its final funding in FY 1999. No additional funding is required.

Project Milestones:

FY 1999:	Complete Title II Design	1Q
	Start Construction	3Q
FY 2000:	Complete Construction	4Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	5,232	4,580
Design Management Costs (1.4% of TEC)	1,041	939
Project Management Costs (0.9% of TEC)	635	524
Total Design Costs (9.3% of TEC)	6,908	6,043
Construction Phase		
Improvements to Land	11,335	11,335
Buildings	8,616	8,616
Special Equipment	8,235	8,235
Other Structures	7,452	7,452
Utilities	14,219	13,847
Standard Equipment	200	200
Removal Cost Less Salvage	704	704
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	2,906	2,918
Construction Management (2.9% of TEC)	2,175	1,991
Project Management (2.1% of TEC)	1,522	1,384
Total Construction Costs (77.3% of TEC)	57,364	56,682
Contingencies		
Design Phase (1.5% of TEC)	1,122	1,206
Construction Phase (11.9% of TEC)	8,832	10,295
Total Contingencies (13.4% of TEC)	9,954	11,501
Total, Line Item Costs (TEC) [d]	74,226	74,226

5. Method of Performance

Design and procurement of the conventional facilities will be performed under negotiated architect-engineer contracts. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding.

[d] Rates used for escalation were taken from applicable DOE Departmental Price Change Indices, applied to the mid-point of the construction schedule.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total

2001	0	0	71

[a] Includes appropriation of $1,800,000 plus an internal reprogramming of $180,000 that was provided to allow management efficiencies achievable through coordination of engineering and design contracts.

3. Project Description, Justification and Scope

The Processing and Environmental Technology Laboratory (PETL) is a new laboratory/office facility to be located on a presently vacant site. The proposed building is a three-story building with a partial basement. The building will contain approximately 151,435 gross square feet with a total net square feet of 79,163. The Office/Laboratory consists of two primary functional areas, laboratory and office space. The offices are located at the perimeter of the facility, and the laboratories are in the center, and the service area is located at the west end. The building is designed to meet the latest ES&H requirements for facilities of this type. Vibration isolation, pedestrian circulation, emergency egress, separation between laboratory and technician work stations, and separate laboratory service corridors which serve as secondary emergency exits are all design responses to identified user requirements. The building will have a modular design to facilitate varying the size of laboratory and office spaces in minimum time and at low costs, as user requirements change. The building is oriented on an east-west axis to achieve maximum opportunity for solar gain along the south elevations.

Generally, interior walls are gypsum board over metal studs. Appropriate fire separation barriers will be provided as required by the Life Safety Code and the DOE order for fire protection. The structural system will consist of steel and/or concrete framing as required to meet the users' vibration criteria for sensitive equipment. Laboratory floor systems will likely be constructed with waffle or pan joist framing. The exterior finish of the building will be a low maintenance product that is designed to integrate with the existing campus architecture.

The heating, ventilating, and air conditioning systems include a double duct, variable air volume (VAV), perimeter heating/cooling system, and a core or interior single duct VAV system. Heating will be provided by piped hot water generated by a gas-fired boiler. A large thermal storage water tank filled with chilled water from existing chillers in Building 858 will provide cold water for building cooling and test equipment. Interior plumbing systems will include sanitary waste, domestic hot and cold water, compressed air, natural gas, and chilled water supply and return. Exhaust will be provided by utility fans located at the roof level, connected to exhaust duct risers in chases. Site utilities include a primary electric feeder, signal duct, water, natural gas, and sanitary sewer. Area improvements will include security fencing, storm drain inlets, and service and driveway areas. Landscaping, including trees, shrubs, irrigation systems and gravel, will be provided consistent with existing landscape practices.

The PETL is an important element that will enable the Department of Energy (DOE) Stockpile Stewardship and Management program to use an aggressive R&D program to develop production processes which will offer significant cost reductions and minimize the use of toxic materials. The synergism represented by PETL meets the DOE's objective in that it collocates individuals responsible for identifying and developing new materials and processes with those translating them to application.

The focus of PETL is the development, characterization, and application of modern processing while at the same time ensuring the safety of the environment and personnel, and producing products required for nuclear weapons applications. PETL allows the integration of real-time, on-line diagnostics, and test structures in processing lines for "self-identification" of processing problems. The substitution of environmentally safer processing chemicals will be analyzed to minimize design impact and to assess the affect on long-term compatibility. Analytical support for production of non-nuclear components will replace services provided by integrated complex plants, as the manufacturing complex is reduced in size and Manufacturing Development Engineering (MDE) increases.

Because DOE is faced with developing a more efficient complex to produce and to dismantle weapons, as well as to address ES&H issues affecting operations and nuclear weapon production, additional space is needed for efforts involving materials compatibility, aging, and reliability. These efforts are essential in certifying the reliability of the nuclear weapons stockpile.

PETL occupants will include: the Materials and Process Sciences Center, the Engineered Materials and Processes Center, and parts of the Environment Center and the Microelectronics Center. It will provide facilities for staff seeking timely solutions to the following critical problems:

- Assuring safety and reliability of a smaller stockpile incorporating new materials and processes for production.
- Elimination of some materials from nuclear weapons because of production/usage restrictions, or total bans, and increased requirements to minimize occupational exposure with minimum effect on the reliability of nuclear weapons.
- Substitution of environmentally safer materials and processes during nuclear weapon production, with minimum effect on the reliability of nuclear weapons.
- Elimination/reduction of hazardous waste (radioactive, mixed, or chemically hazardous) during nuclear weapon production and better treatment (including detoxification or stabilization) of newly generated hazardous wastes.
- Dismantling nuclear weapons in an environmentally acceptable and safe manner.
- Compliance by SNL and the Nuclear Weapons Complex with ES&H laws, regulations, DOE orders, and industry standards.

Currently, materials activities are divided among nine different buildings. PETL will allow these activities to be centralized into one facility. Because most of the current laboratories are located in old facilities, the move to PETL will assist in conforming to current and expected regulations, DOE orders, and best industry ES&H practices. The new building is designed to conduct environmentally and occupationally safe R&D involving hazardous materials used in weapon production.

Removal Plan:

The following buildings will be vacated by organizations proposing to move to the PETL:

Building	Year Acquired	Building Size (Net Square Feet)	Space Vacated (Net Square Feet)	Organization(s)
805	1959	48,471	40,923	1800
806	1961	39,640	8,565	1800
807	1966	52,845	3,561	1800
823	1982	79,667	3,503	6600
828	1946	11,475	1,064	1800
894	1950	75,514	302	1800
T-47	1979	3,273	1,356	1800
897	1995	81,534	3,000	1800
858	1985	71,648	5,437	1300
Total			67,711	

Building 828 is considered substandard and included in the SNL substandard and temporary abandoned building decontamination and disposal program under a separate, future expense-funded project. It is expected the other space vacated by future PETL occupants will be backfilled by technical and administrative organizations as part of the Lab-wide space planning strategy.

Project Milestones:

FY 1999:	Complete site construction (Chilled Water Tank)	2Q
FY 2000:	Equipment procurement	3Q
	Occupy building	3Q
	Complete building construction	4Q

3. Project Description, Justification and Scope

The Project provides for the design, procurement, construction, assembly, installation, and acceptance testing of the National Ignition Facility (NIF), an experimental inertial confinement fusion facility intended to achieve controlled thermonuclear fusion in the laboratory by imploding a small capsule containing a mixture of the hydrogen isotopes, deuterium and tritium. The NIF is being constructed at the Lawrence Livermore National Laboratory (LLNL), Livermore, California as determined by the Record of Decision made on December 19, 1996, as a part of the Stockpile Stewardship and Management Programmatic Environmental Impact Statement (SSM PEIS).

The mission of the National Inertial Confinement Fusion (ICF) program is to achieve controlled thermonuclear fusion in the laboratory. This program supports the DOE mandate of maintaining nuclear weapons science expertise required for stewardship of the stockpile, testing of nuclear weapons effects, and the development of fusion power by providing a database for inertial fusion ignition. As a key element of the Stockpile Stewardship Program, the NIF is designed to achieve propagating fusion burn and modest (1-10) energy gain within 2-3 years of full operation and to conduct high energy density experiments, both through fusion ignitions and through direct application of the high laser power. This mission was identified in the NIF Justification of Mission Need, which was endorsed by the Secretary of Energy. Identification of target ignition as the next important step in ICF development for both defense and non-defense applications is consistent with the earlier (1990) recommendation of DOE's Fusion Policy Advisory Committee, and the National Academy of Sciences Inertial Fusion Review Group. In 1995, the DOE's Inertial Confinement Fusion Advisory Committee affirmed the program's readiness for an ignition experiment. A review by the JASONs in 1996 affirmed the value of the NIF for stockpile stewardship.

The NIF project supports the DOE mandate to maintain nuclear weapons science expertise required for stewardship of the stockpile. After the United States announcement of a moratorium on underground nuclear tests in 1992, the Department established the Stockpile Stewardship program to ensure the preservation of the core intellectual and technical competencies in nuclear weapons. In addition, as a means of reducing the danger posed by nuclear weapons proliferation, the President announced that the United States would seek a zero yield Comprehensive Test Ban Treaty (CTBT). The treaty was signed on September 24, 1996, and submitted to the Senate for ratification on September 23, 1997. One of the six safeguards that defines the terms of the CTBT is the conduct of the Stockpile Stewardship program to ensure the safety and reliability of the stockpile. The NIF is one of the most vital facilities in that program. The NIF will provide the capability to conduct laboratory experiments to address the high energy density and fusion aspects that are so important to both primaries and secondaries in stockpile weapons.

At present, the Nation's computational capabilities and scientific knowledge are inadequate to ascertain all of the performance and safety impacts from changes in the nuclear warhead physics packages due to aging, remanufacturing, or engineering and design alterations. Such changes are inevitable if the warheads in the stockpile are retained well into the next century, as expected. In the past, the impacts of such changes were evaluated through nuclear weapon tests. Without underground tests, we will require better, more accurate computational capabilities to assure the reliability and safety of the nuclear weapons stockpile for the indefinite future.

To achieve the required level of confidence in our predictive capability, it is essential that we have access to near-weapons conditions in laboratory experiments. The importance of nuclear weapons to our national security requires such confidence. For detonation of weapon primaries, that access is provided in part by hydrodynamic testing. For secondaries and for some aspects of primary performance, the NIF will be a principal laboratory experimental physics facility.

The most significant potential commercial application of ICF in the long term is the generation of electric power. Consistent with the recommendations of the Fusion Policy Advisory Committee, the NIF will provide a unique capability to address critical elements of the inertial fusion energy program by exploring moderate gain (1 to 10) target designs, establishing requirements for driver energy and target illumination for high gain targets, and developing materials and technologies useful for civilian inertial fusion power reactors.

The ignition of an inertial fusion capsule in the laboratory will produce extremely high temperatures and densities in matter. Thus, the NIF will also become a unique and valuable laboratory for experiments relevant to a number of areas of basic science and technology.

The NIF is an experimental fusion facility consisting of a laser and target area, and associated assembly and refurbishment capability. The laser will be capable of providing an output pulse with an energy of 1.8 megajoules (MJ) and an output pulse power of 500 terawatts (TW) at a wavelength of 0.35 micrometers (μm) and with specified symmetry, beam balance and pulse shape. The NIF design provides an experimental facility to house a multibeam line, neodymium (Nd) glass laser capable of generating and delivering the pulses to a target chamber. In the target chamber, a positioner will center a target containing fusion fuel, a deuterium-tritium mixture, for each experiment. Diagnostics provided by this project will provide the test data to demonstrate subsystem performance and initial operations.

The NIF experimental facility, titled the Laser and Target Area Building, will provide an optically stable and clean environment. This laser building will be shielded for radiation confinement around the target chamber and will be designed as a radiological, low-hazard facility capable of withstanding the natural phenomena specified for the LLNL site. The baseline facility is for one target chamber, but the design shall not preclude future upgrade for additional target chambers.

The NIF project consists of conventional and special facilities.

- Site and Conventional Facilities include the land improvements (e.g., grading, roads) and utilities (electricity, heating gas, water), as well as the laser building, which has an approximately 20,300 square meters footprint and 38,000 square meters in total area. It is a reinforced concrete and structural steel building that provides the vibration-free, shielded, and clean space for the installation of the laser, target area, and integrated control system. The laser building consists of two laser bays, each 31 meters (m) by 135 m long, and a central target area--a heavily shielded (1.8 m thick concrete) cylinder 32 m in diameter and 32 m high. The laser building includes security systems, radioactive confinement and shielding, control rooms, supporting utilities, fire protection, monitoring, and decontamination and waste handling areas. Optics assembly and refurbishment capability is provided for at LLNL by incorporation of an optics assembly area attached to the laser building and minor modifications of other existing site facilities.

- Special facilities include the Laser System, Target Area, Integrated Computer Control System, and Optics.
  - The laser system is designed to generate and deliver high power optical pulses to the target chamber. The system consists of 192 laser beamlets configured to illuminate the target surface with a specified symmetry, uniformity, and temporal pulse shape. The laser pulse originates in the pulse generation system. This precisely formatted low energy pulse is amplified in the main amplifier. To minimize intensity fluctuation, each beam is passed through a pinhole in a spatial filter on each of the four passes through the amplifier and through a transport spatial filter. The beam transport directs each high power laser beam to an array of ports distributed around the target chamber where the frequency of the laser light is tripled to 0.35 μm, spatially modulated by phase plates and focused on the target. Systems are provided for automatic control of alignment and the measurement of the power and energy of the beam. Structural support and auxiliary systems provide the stable platform and utilities required.
  - The target area includes a 10 m diameter, low activation (i.e., activated from radiation) aluminum vacuum chamber located in the Target Area of the laser building. Within this chamber, the target will be precisely located. The chamber and building structure provide confinement of radioactivity (e.g., x-rays, neutrons, tritium, and activation products). Diagnostics will be arranged around the chamber to demonstrate subsystem performance for project acceptance (TEC) and initial operations (TPC). Structural, utility and other support systems necessary for safe operation and maintenance will also be provided in the Target Area. The target chamber and staging areas will be capable of conducting experiments with cryogenic targets. The Experimental Plan indicates that cryogenic target experiments for ignition will be needed 2-3 years after completion of the project. Therefore, the targets and this cryogenic capability will be supplied by the experiments. The NIF project will make mechanical and electrical provisions necessary to position and align the cryogenic targets within the chamber. The baseline is for indirectly driven targets. An option for future modifications to permit directly driven targets is included in the design.
  - The integrated computer control system includes the computer systems (note: no individual computer will cost over $100,000) required to control the laser and target systems. The system will provide the hardware and software necessary to support NIF operations. Also included is an integrated timing system for experimental control of laser and diagnostic operations. Safety interlocks and access control will also be provided.
  - Thousands of optical components will be required for the 192 beamlet NIF. These components include laser glass, lenses, mirrors, polarizers, deuterated potassium dihydrogen phosphate crystals, pulse generation optics, debris shields and windows, and the required optics coatings. Optics includes quality control equipment to receive, inspect, characterize, and refurbish the optical elements.

Project Milestones:

Project milestones for FY 1999 and FY 2000 include:

- FY 1999
  - Special Equipment Installation Started 1Q
  - Target Bay ready for Target Chamber Installation 2Q
  - Optics Assembly Building Complete (certified cleanrooms) 4Q
- FY 2000
  - Switchyard #2 Steel Structures Complete 1Q
  - Optics Facilitization Complete 1Q
  - Conventional Construction Complete and following will be commissioned for installation of Special Equipment:
    - Switchyard #2 3Q
    - Laser Bay #2 4Q
    - Target Bay 4Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	101,143	76,883
Design Management Costs (2.1% of TEC)	21,900	18,387
Project Management Costs (2.1% of TEC)	22,000	15,100
Total Design Costs (13.9% of TEC)	145,043	110,370
Construction Phase		
Improvements to Land	1,800	1,800
Buildings	170,724	159,280
Special Equipment	520,802	515,700
Utilities	500	500
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	73,250	73,250
Construction Management (2.2% of TEC)	22,800	21,500
Project Management (3.0% of TEC)	31,500	31,500
Total Construction Costs (78.5% of TEC)	821,376	803,530
Contingencies		
Design Phase (0.0% of TEC)	1,000	11,800
Construction Phase (7.5% of TEC)	78,281	120,000
Total Contingencies (7.6% of TEC)	79,281	131,800
Total, Line Item Costs (TEC) [a b]	1,045,700	1,045,700

The cost estimate assumes a project organization and cost distribution consistent with the management requirements appropriate for a DOE Strategic System as outlined in the DOE Order 430.1, Life Cycle Asset Management and the NIF Project Execution Plan. Actual cost distribution will be in conformance with accounting guidelines in place at the time of project execution.

[a] Escalation rates taken from the FY 1998 DOE escalation multiplier tables.

[b] Based on completion of Title II design for Conventional Facilities and 89 percent of Title II design for Special Equipment as of December 1998.

5. Method of Performance

The NIF Laboratory Project Office (consisting of LLNL, LANL, SNL, and UR/LLE and supported by competitively-selected contracts with Architect Engineering firms, a Construction Manager, equipment and material vendors, and construction firms) will prepare the design, procure equipment and materials, and perform conventional construction, safety, system analysis, and acceptance tests. DOE will maintain oversight and coordination through the Headquarters Office of Inertial Fusion and the National Ignition Facility Project and the field office. DOE conducted the site selection and the NEPA determination. LLNL was selected as the construction site in the Record of Decision made on December 19, 1996. The procurement and installation/test of special equipment will be performed by the NIF Laboratory Project Office. Inspection and Title III engineering contracts for the conventional systems will be competitively awarded. NIF start-up will be conducted by the NIF laboratory operations staff.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs [c]							
Total facility costs							
Design	96,199	46,844	2,750	250	0	0	146,043
Construction	12,085	118,545	245,617	214,190	181,200	128,020	899,657
Total facility costs (Federal and Non-Federal)	108,284	165,389	248,367	214,440	181,200	128,020	1,045,700
Other project costs							
R&D necessary to complete construction [d]	34,552	50,574	14,234	1,940	0	0	101,300
Conceptual design cost [e]	12,300	0	0	0	0	0	12,300
NEPA documentation costs [f]	3,166	588	846	300	150	0	5,050
Other project-related costs [g]	16,385	2,430	2,235	5,050	6,120	2,330	34,550
Total other project costs	66,403	53,592	17,315	7,290	6,270	2,330	153,200
Total Project Cost (TPC)	174,687	218,981	265,682	221,730	187,470	130,350	1,198,900
Budget Authority (BA) requirements							
TEC [h]	169,300	197,800	284,200	248,100	74,100	72,200	1,045,700
OPC [i]	101,000	31,300	6,800	5,900	5,900	2,300	153,200
Total, BA requirements	270,300	229,100	291,000	254,000	80,000	74,500	1,198,900

[c] Prior year actuals are changed to reconcile with DOE Financial Information System (FIS) costs through FY 1998 and cost profiles for FY 1999 and beyond are updated to reflect project-to-date actuals and contingency allocations as of December 10 ,1998.

[d] Costs include optics vendor facilitization ($73,600,000) and optics quality assurance ($27,700,000).

[e] Includes original conceptual design report completed in FY 1994 ($12,000,000) and the conceptual design activities for the optical assembly and refurbishment capability and site infrastructure ($300,000).

[f] Includes preparation of the NIF portion of the Stockpile Stewardship and Management Programmatic Environmental Impact Statement ($3,050,000) and environmental monitoring and permits ($2,000,000).

[g] Includes engineering studies (including advanced conceptual design) of project options ($5,800,000); assurances, safety analysis, and integration ($9,450,000); start-up planning, management, training and staffing ($8,930,000); procedure preparation ($1,000,000); operating spares ($600,000); startup ($6,550,000); and Operational Readiness Review ($2,220,000).

[h] Specific long-lead procurements and contracts (e.g., building construction; major laser, optics, target area special equipment) require BA in advance of costs.

[i] Specific long-lead procurements and contracts (e.g., optics facilitization) require BA in advance of costs.

7. Related Annual Funding Requirements

(dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project–30 years)		
Facility operating costs [j]	21,200	20,600
Facility maintenance and repair costs [k]	33,200	32,400
Programmatic operating expenses directly related to the facility [l]	61,100	59,600
Capital equipment not related to construction but related to the programmatic effort in the facility [m]	200	200
GPP or other construction related to the programmatic effort in the facility [n]	200	200
Utility costs [o]	9,000	8,800
Other costs [p]	6,300	6,200
Total related annual costs (operating from FY 2003 through FY 2032)	131,200 [q]	128,000 [r]

[j] Includes operator labor, engineering support and materials for upgrades and modifications, and consumables for operation of special equipment.

[k] Includes cost of labor, engineering support, and consumables for special equipment maintenance and refurbishment, including optics. Also includes maintenance for the laser building and support buildings.

[l] The current NOVA experimental program, including LLNL, LANL, SNL, and General Atomics, is approximately $41,100,000 annually. Based on use of complex cryogenic targets, increased diagnostics support, and higher levels of three dimensional physics modeling, the annual direct NIF experimental program costs are estimated at $61,100,000 This primary experimental operating expense will be included in the base Inertial Confinement Fusion Program budget. Additional program costs will be associated with use of the facility.

[m] Fabrication accounts, procurements, such as small lasers and some laser parts, Computer-Aided Design systems, etc. to support upgrades.

[n] Minor additions and modifications to the facility related to programmatic effort

[o] Electricity only. Gas, sewer, water, etc. are paid out of the General and Administrative budget.

[p] Nitrogen and argon for laser and transport beam tubes, stock inventory, and procurement support.

[q] In FY 2000 dollars.

[r] In FY 1999 dollars

Stockpile Management

Program Mission

The Weapons Stockpile Management program supports the enduring stockpile as directed in the Nuclear Weapons Stockpile Plan; assures the availability of adequate supplies of tritium to meet the requirements of the enduring stockpile; provides safe and secure storage of nuclear materials and components to prevent proliferation of capabilities, technologies and systems; provides the ability to respond to potential or real weapon incidents/accidents, and also to respond to continuing and evolving nuclear terrorist threats; and provides a flexible infrastructure capable of supporting changing stockpile sizes.

Program Goal

- Provide high confidence in the safety, security, reliability and performance of the enduring U.S. stockpile, without nuclear testing, to ensure the effectiveness of the U.S. nuclear deterrent while simultaneously supporting U.S. arms control and nonproliferation objectives.
- Provide the ability to resume U.S. underground nuclear testing and reconstitute nuclear weapons production capacities, consistent with Presidential directives, the Nuclear Posture Review, and the START I treaty, should national security so demand in the future.

Program Objectives

There are four national security objectives from the U.S. Department of Energy Strategic Plan upon which this program and budget are based; three of these apply to Stockpile Management:

- Maintain confidence in the safety, reliability and performance of the nuclear weapon stockpile without nuclear testing.
- Ensure the vitality of DOE's national security enterprise.
- Reduce nuclear weapon stockpiles and the proliferation threat caused by the possible diversion of nuclear materials.

Strategies

Weapons Stockpile Management supports the following strategies from the national security section of the U.S. DOE Strategic Plan:

- Extend the life of U.S. nuclear weapons by continuing the Stockpile Life Extension Program and stockpile maintenance activities.
- Improve detection and prediction capabilities for assessing nuclear weapon component performance and the effects of aging.
- Continually evaluate the safety, reliability and performance of the nuclear weapon stockpile.
- Provide a reliable source of tritium for the nuclear weapons stockpile.
- Provide an appropriately sized, cost effective, safe, secure and environmentally sound national security enterprise.

- Ensure that sufficient scientific and technical personnel are available to meet DOE's long term national security requirements.
- Ensure and enhance protection of nuclear materials, sensitive information, and facilities.
- Maintain test readiness and maintain and enhance emergency response and management capabilities to address any nuclear weapons, radiological or other emergency in the U.S. or abroad.
- Dismantle nuclear warheads that have been removed from the U.S. nuclear weapons stockpile in a safe and secure manner.

Performance Measures

For FY 2000, the significant overall performance measures for the Stockpile Management program include:

- Meeting production schedules in the Program Control Documents (PCD) for gas generators, reservoirs, and recertified neutron generators such that no weapon is inoperable due to the lack of these replacement components.
- Meeting the annual weapons alteration and modification schedules contained in the Production and Planning Directive (P&PD) and further delineated in the Program Control Document (PCD).
- Maintain production schedule of replacement parts for the W87 Life Extension Program.
- Adhere to schedules for the safe and secure dismantlement of about 375 warheads that have been removed from the U.S. nuclear weapons stockpile.
- Adhering to schedules in the Enhanced Surveillance Program (ESP) Plan for activities that enhance knowledge of weapon-relevant physical processes affecting aging and operation of weapon components. Focus remains on conclusion of the ESP by the end of FY 2002.
- Certifying that standards for the safety, reliability, and performance of the nuclear weapons stockpile are met.
- Completing revalidation of the W76 using two teams of experts from the design labs.
- Assuring that all facilities required for successful achievement of the Stockpile Stewardship and Management Plan are operational.
- Meet the established schedules for downsizing and modernizing our production facilities.
- Adhere to schedules set forth in the Advanced Design and Production Technology Plan.
- Meet schedules to rebuild, qualify and certify Trident II pits by FY 2001 and develop intermediate pit production capability of 20 pits per year at the Los Alamos National Laboratory by 2007.
- Continue, in FY 2000, material protection, control, and accountability upgrades at three DOE facilities with weapons-usable material. Prepare to transition Building 3019 at the Oak Ridge National Laboratory to the Office of Environmental Restoration and Waste Management in FY 2001.
- No loss of U.S. origin nuclear materials in the U.S. and abroad from theft, loss, or illicit trafficking.

- Maintaining robust emergency response assets in accordance with Presidential Decision Directive 39, The Atomic Energy Act and Executive Order 12656 to ensure Departmental response to any nuclear weapons or radiological emergency in the United States or abroad.
- Continuing ongoing efforts of exercises, training and drills to improve response readiness to any possible weapons of mass destruction and terrorist threat contingency.
- Implementation of the December 22, 1998, tritium source decision.

Significant Accomplishments and Program Shifts

During FY 1998 and FY 1999, implementation of the Stockpile Management Program continued in accordance with the Stockpile Stewardship and Management Plan and resulted in the following accomplishments:

- Delivered limited life components consistent with Production and Planning Directive 98-0.
- Supported weapon refurbishment consistent with Production and Planning Directive 98-0.
- Successfully completed certification of the safety and reliability of the U.S. nuclear weapons stockpile according to DOE/DoD procedures.
- Delivered first W88 early development unit pit in February 1998.
- Delivered the first five of 21 new safeguards transporters in FY 1998.
- Continuing ongoing efforts of exercises, training and drills to improve response readiness to any possible weapons of mass destruction and terrorist threat contingency.
- Adhering to schedules for the safe and secure dismantlement of 1,062 nuclear warheads in FY 1998 and about 275 in FY 1999 that have been removed from the U.S. nuclear weapons stockpile.
- Beginning Title I design for Stockpile Management Restructuring Initiative projects at the Savannah River Site and the Y-12 Plant to downsize production capacities.
- Completing resumption of Phase A of the Y-12 special nuclear material operations .
- Completed consolidation transfer of all pits from SRS to Pantex.
- Plan to complete Y-12 receipt of HEU parts and Pantex receipt of pits from RFETS in FY 1999.
- Implemented additional high explosive tests into the surveillance program (high explosive divergence and detonator booster performance tests).
- Flew first enhanced fidelity instrumented flight test.
- Completed preparation for accelerated aging experiments for plutonium.
- Completed modeling of safety and reliability critical strong links and firesets.
- Implemented Secure Connectivity between the plants and the laboratories, including secure E-mail and File Transfer Protocol.
- Demonstrated collaborative exchange of assembly product models for concurrent evaluation of SLEP and alternative designs between the plants and the laboratories.

Budget Structure

The Weapons Stockpile Management decision unit budget request is organized in the following manner:

Core Stockpile Management: This program includes lifetime surety, maintenance, surveillance, evaluation, repair, and reliability of the enduring stockpile; weapons dismantlement and disposal; maintenance of weapons design and production capability to include archiving, life extension studies, and retrofits; development of safe weapon assembly and disassembly processes; development and operation of safe, secure systems for transporting nuclear weapons and components; and operation of a complex that meets environment, safety, and health requirements. This program also includes the consolidation of nonnuclear manufacturing efforts within the weapons complex, including the transfer and requalification of 25 technologies and processes at various receiver sites through nonnuclear reconfiguration.

Enhanced Surveillance: The Enhanced Surveillance Program has been implemented to address the uncertainty of the aging stockpile. The absence of new weapon system development and a downsized production complex makes it difficult to correct defects as rapidly as before. The ESP will develop tools, techniques, and models for measuring, qualifying, calculating, and predicting the effects of aging on weapons materials and components and understanding these effects as they affect weapons safety and reliability. Stockpile Management funding supports this effort at the plants and laboratories.

Advanced Manufacturing, Design and Production Technologies: The Advanced Manufacturing, Design & Production Technologies program will focus on re-engineering and modernizing the weapons complex into a modern, agile, and fully integrated operation capable of responding to a wide range of production requirements. This effort encompasses enterprise integration which is aimed at improving information flow and the way the complex accomplishes its day-to-day business; agile manufacturing which is concerned with the development of computer aided/automated direct manufacturing systems utilizing new secure connectivity; process development which focuses on continuous and innovative improvement of individual manufacturing procedures and incorporation of advanced systems into the complex; and the development and documentation of a hedge strategy to rapidly expand production capability in case of a national security requirement.

Radiological/Nuclear Accident Response: This program ensures the maintenance of the Department's technical and operational capabilities for responding to radiological accidents/incidents or malevolent nuclear incidents worldwide. Radiological/Nuclear Accident Response assets include the Nuclear Emergency Search Team, Federal Radiological Monitoring and Assessment Center, Aerial Measuring System, Atmospheric Release Advisory Capability, Accident Response Group, Radiological Assistance Program, and Radiation Emergency Assistance Center/Training Site.

Tritium Source: This program will implement the Secretarial Record of Decision, as announced in December 1998, which selected the Commercial Light Water Reactor option as the primary technology for the production of tritium with the linear accelerator to be developed as backup technology.

Materials: Responsibility for funding the majority of these activities has been transferred to the Office of Environmental Management. Residual activities include the processing of highly enriched uranium scrap from across the complex, the storing and safeguarding of excess uranium-233 at the Oak Ridge National Laboratory (ORNL), and the recovery of plutonium-242 and fabrication of californium sources at ORNL.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request

Explanation of Funding Changes from FY 1999 to FY 2000

The FY 2000 request for Stockpile Management is approximately $54 million below the FY 1999 obligational level. Minor growth is reflected in the Enhanced Surveillance (ESP) and Advanced Manufacturing, Design Production Technologies (ADAPT) areas to continue moving the complex toward the technological state it must achieve for modern operations. Funding also increases by $3 million to support implementation of the Secretarial decision on the new Tritium Source announced on December 22, 1998. These minor increases are more than offset by Infrastructure reductions in core operations and maintenance and construction funding. No FY 2000 funding is being requested for Project 99-D-123, Replace Mechanical Utility Systems at the Y-12 Plant or for Project 99-D-125, Replace Boilers and Controls at the Kansas City Plant. These projects have been deferred to allow execution of Congressionally directed external assessment of these projects to be completed. Any recommendations related to the scope or schedule of these projects will be addressed in the FY 2001 budget submission. Additionally, no FY 2000 funding is being requested for project 97-D-122, Nuclear Materials Storage Facility Renovation at Los Alamos National Laboratory. Questions regarding approach, design and costs remain. Answers to these questions and accompanying decision process are out of sync with the FY 2000 budget cycle. It is anticipated that additional information will be provided to Congress once a path forward is developed. Additional details on these changes are provided within the section titled, "Detailed Program Justification."

The Stockpile Management budget was formulated based on the following priorities: maintain infrastructure essential for operations; support limited life component exchange; provide for stockpile surveillance/evaluation; support enhanced surveillance focused on efforts supporting Stockpile Life Extension Program decision points; support the W87 LEP and directed weapon modifications and alterations; reestablish pit production capability and capacity; support commitments to entities external to Defense Programs, such as the Defense Nuclear Facilities Safety Board (DNFSB); support the ADAPT program and remaining ESP tasks consistent with program plans; and support the dismantlement of retired weapons.

The request is consistent with these priorities, recognizing that the deployment of resources must be balanced to support activities with specific near-term deliverables while moving the complex toward the long-term technological state it must achieve for modern operations. Stockpile maintenance efforts will focus on limited life component exchange consistent with the START I stockpile, the W87 Life Extension Program (LEP), and alterations to the B61 and B83. Stockpile Evaluation funding is driven by lab testing and flight testing for the W76, W87 and W88. Dismantlement work will focus on continuation of the W56 and W79, and startup efforts of the B53 for projected dismantlement of

approximately 375 weapons. Funding for the Transportation Program decreases by $3.8 million. While deliveries of new SafeGuards Transporters (SGT) for FY 1999 and FY 2000 are constant (six per year), funding requirements for the Transportation Program declines in FY 2000, reflecting the inclusion of long-lead procurement in the FY 1999 program. Defense Programs had originally planned to produce seventeen SGTs to replace older Safe Secure Trailers (SST). However, based on cost benefit analysis of maintaining the older SST fleet or procuring additional SGTs, DP has decided to exercise its option to replace 4 additional SSTs with SGTs. These four additional units are scheduled for delivery in FY 2001 and will bring the fleet of SGTs up to 21 units.

Recapture of pit production efforts technologies for the W88, B61-7 and W87 will continue at LANL. Fabrication of W88 pits for certification and qualification will continue toward the goal of providing war-reserve pits for the stockpile in 2001. Safety infrastructure replacements and pit manufacturing improvements will be supported through the Transition Manufacturing and Safety Equipment initiative. Stockpile Management Restructuring Initiative (SMRI) efforts will continue at the four production plants with the goal of having a smaller and more cost effective complex in place by FY 2005. ESP efforts will continue the development of predictive capabilities and diagnostic tools to provide critical aging data needed to support the Stockpile Life Extension Program (SLEP) decision process. ADAPT will continue to develop and deploy advanced product design and manufacturing technologies needed for a modern, effective and efficient design and production operation. Examples include the development and deployment of an integrated set of product and process simulation tools for neutron generator product realization and the development and deployment of advanced processing technologies needed to reestablish pit production capability to meet SLEP requirements.

Stockpile Management Restructuring Initiative

The Stockpile Management Restructuring Initiative (SMRI) supports the implementation of Departmental decisions related to production facility downsizing and modernization consistent with the Stockpile Stewardship and Management Programmatic Environmental Impact Statement (PEIS) and the Tritium Supply and Recycling Programmatic Environmental Impact Statement Records of Decision (ROD). The ROD for restructuring the stockpile management complex was announced on December 19, 1996 and the ROD for the Tritium Supply and Recycling PEIS was announced on December 5, 1995. They involve the downsizing in place of weapons assembly/disassembly and high explosives at the Pantex Plant, nonnuclear component fabrication at the Kansas City Plant, weapons secondary and case fabrication at the Y-12 Plant, and the consolidation of existing tritium operations at the Savannah River Site. In FY 1998, the Department began Title I design for the SMRI projects at the Savannah River Site and the Y-12 Plant. In FY 1999, the Department will focus on completing Title I and starting Title II design for the SMRI projects at Savannah River and Y-12 and beginning the Title I Design for the SMRI projects at the Kansas City and Pantex Plants. FY 2000 activities include completing and continuing Title I and II design activities and continuing or beginning contract activities at the SMRI project sites. The FY 2000 request includes $72 million in operations and maintenance and construction funding to support these efforts. Funding associated with the SMRI will continue through FY 2004 and physical construction through FY 2005.

Pit Production and Plutonium Handling Infrastructure Improvements

At the Los Alamos National Laboratory, Defense Programs is re-instituting a war reserve pit production capability that has not existed since production activities ceased at the Rocky Flats Plant. In accordance with the Record of Decision on the Programmatic Environmental Impact Statement, the current

objective is to establish a long-term capacity for manufacturing up to 50 pits/year with a single shift of personnel. In the nearer term, we will achieve an annual capacity of 20 pits by 2007. A decision will be made on the specific manufacturing capacity to be put in place and how best to achieve that capacity through discussions with the Department of Defense.

The Pit Production Program consists of several parts: 1) a project to assure initially the capability to build war reserve pits has been captured; 2) a development and manufacturing period focused on meeting near term stockpile support requirements; 3) emplacement of a set manufacturing capacity for long term support of the stockpile; and 4) development of a contingency plan to allow the Department to move to higher rates of manufacturing should unforeseen requirements emerge in the future.

In FY 1998, sufficient work through the Pit Rebuild Program was completed to verify that the Los Alamos National Laboratory has the capability to build W88 war reserve pits. Work in FY 1999 and FY 2000 will build on the FY 1998 program: approximately 30 pits will be fabricated for certification and qualification with the goal of having a war reserve W88 pit available for the stockpile in 2001. Fabrication of W88 pit for the stockpile will be continuous to assure "lot" integrity for certification purposes, with small down time periods for facility maintenance and replacement of aged manufacturing equipment as required. The Capability Maintenance Improvement Project, now planned as a FY 2002 new start, will be the construction project for facility improvements/upgrades beyond maintenance and replacement in-kind of equipment necessary to support the near-term manufacturing requirements. In addition, Technology Development Units of the B61-7 and W87 will be built.

Development of a contingency plan for larger quantity manufacturing is planned once sufficient information from the Pit Rebuild Program and subsequent manufacturing of war reserve pits clarifies the processes and specific equipment for manufacturing.

Plutonium handling infrastructure improvements are supported under the Transition Manufacturing and Safety Equipment initiative and the following construction projects: 99-D-132 Nuclear Materials Safeguards and Security Upgrades, 97-D-122 Nuclear Materials Storage Facility Renovation, and 95-D-102 Chemistry and Metallurgy Research Building Upgrade Project.

Production Capacity for START I

Consistent with the Administration's "Lead and Hedge" strategy, the FY 2000 request includes $20.3 million to continue efforts initiated in FY 1999 to support capacity expansion for production of limited life components at the Kansas City Plant, Sandia National Laboratories, and Los Alamos National Laboratory, in order to support START I requirements or to return to START I levels in a timely manner once START II is ratified (hedge strategy). This $20.3 million includes $11.7 million in construction funding (Project 99-D-122, Rapid Reactivation, Various Locations) for facility modifications at SNL and additional equipment required to support the additional capacity requirements at SNL and LANL. Specifically, it will support the design, construction, and installation of a third target loader within existing space of the Neutron Tube Target Loading Facility at LANL; rearranging existing space in, and adding additional space to, the current Reservoir Assembly Facility; and rearranging existing space within Building 870, adding additional space in an adjacent building, and the procurement of additional production equipment at SNL. It also includes $8.6 million in operations and maintenance funding which provides project support and management for construction activities, NEPA Documentation, component prebuilds, installation of equipment, qualification and process prove-in, and additional manpower to support the increased production levels. This additional capacity is scheduled to be on line

and qualified for war reserve production by FY 2003. To support START I requirements through FY 2003, neutron generators returned from the field will be recertified and reapplied for their remaining life and 544 neutron generators will be shipped from inventory at Pinellas.

Weapons Production Complex Infrastructure

The nuclear weapons complex is expected to experience ongoing consolidation over the next five to ten years. The goal of the consolidation effort is to configure into a complex that is smaller, more flexible, and much less expensive to operate. By the year 2001, nonnuclear manufacturing and processing capabilities will be consolidated at the Kansas City Plant, the Savannah River Site, the Los Alamos National Laboratory (LANL), and Sandia National Laboratories (SNL).

Several important Environmental Impact Statements (EIS) have recently been completed or are underway within the Department that will assist in defining alternatives that will lead to a consolidated nuclear weapons complex in the twenty-first century: 1) a Stockpile Stewardship and Management PEIS which was completed in early FY 1997 2) a Pantex Site-wide Environmental Impact Statement (SWEIS) which was completed in early FY 1997; 3) a LANL SWEIS which is scheduled for completion by the end of the 2nd quarter of FY 1999; 4) a SNL/NM SWEIS which is scheduled for completion by the end of FY 2000; and 5) a Notice of Intent to prepare a Y-12 SWEIS is expected to be published in February 1999 with a goal of completion by 3rd quarter of FY 2000.

The Oak Ridge Operations Office and the Y-12 Plant have initiated the Y-12 Site Integrated Modernization (Y-SIM) Program. This effort will plan and implement the strategic modernization of key process facilities at the Y-12 Plant through the next decade. The program will be executed in phases involving a series of capital projects. In FY 2000, activities will include: requirements development & verification, facility assessment, operating plan development, technology assessment & planning, alternatives development, site selection & characterization, utility & infrastructure plans, safety authorization basis, plant concepts/cost/schedule, and baseline selection. In concert with this effort, a SWEIS is being initiated. In FY 2000, the estimated funding required for the modernization planning effort is $10 million and the funding required for the SWEIS is $15 million.

On June 4, 1998, the Department issued a public notice that it was actively considering a concept for consolidating up to six existing contracts for nuclear weapons production activities into a single contract. Departmental analysis indicated that a consolidated contract approach would provide clearer lines of authority and responsibility, improve information sharing, cooperation and technical integration, and provide cost savings through single business and technical support efficiencies and eliminate duplicative functions among multiple contractors. This notice requested that written comments be submitted by July 15, 1998, and invited interested parties to request one-on-one meetings with Department officials. The Department received oral or written comments from 37 individuals, 17 companies, 2 community interest groups and 1 union.

Following analysis of stakeholder comments, the Department has modified its contract consolidation proposal to include three sites: the Pantex Plant in Amarillo, Texas; the Kansas City Plant in Kansas City, Missouri; and the Y-12 Plant in Oak Ridge, Tennessee. On December 21, 1998, the Secretary announced that he had ordered a review of the management structure throughout the Department before making a final decision on the consolidation proposal. This review will be conducted by an internal task force and will look at broad management issues, including the responsibilities and reporting relationships between field offices and headquarters; the governance structure for headquarters, field

operations, contractors and facilities; career development opportunities for employees, and management and accountability on large construction and cleanup projects. The contracts for the Y-12 and Kansas City Plants will be extended 15 months, expiring in June 2001. The Department will exercise options on the Pantex contract so that it will also expire in June 2001. These extensions will provide the time needed to conduct a competitive procurement process and transition to a new contract.

Tritium

On December 5, 1995, DOE issued a Tritium Supply and Recycling Record of Decision (ROD), that selected the two most promising alternative technologies for tritium production and established a dual-track strategy that would, within 3 years, select one of those technologies to become the primary tritium supply technology. The other technology, if feasible would be developed as a backup tritium source. Under the dual-track strategy, DOE would: 1) initiate the purchase of an existing commercial reactor (operating or partially complete) or irradiation build, and test critical components of an accelerator system for tritium production. Any new facilities that might be required, the production-scale accelerator and a Tritium Extraction Facility to support the commercial reactor alternative, would be constructed at DOE's Savannah River Site in South Carolina. The ROD also stated that DOE's Fast Flux Test Facility at the Hanford Reservation in Washington would be examined for a possible tritium production role although it had been previously rejected as a reasonable alternative.

On December 22, 1998, the Secretary of Energy announced his decision to select the use of commercial light water reactors for tritium production. The preferred reactors are the Watts Bar reactor and Sequoyah reactors located in Tennessee. Each of these reactors is operated by the Tennessee Valley Authority, an independent government agency. The linear accelerator option was designated a "backup" technology. The Fast Flux Test Facility will have no tritium production role. This ROD revises the December 1995 Tritium Supply and Recycling Record of Decision and completes the process of selecting a single technology for tritium production.

Site Description

Weapons Stockpile Management activities are conducted at four production facilities and three national laboratories. The production facilities include the Kansas City Plant-Kansas City, Missouri, operated by

Allied Signal Aerospace; the Pantex Plant-Amarillo, Texas, operated by Mason & Hanger; the Y-12 Plant-Oak Ridge, Tennessee, operated by Lockheed Martin Energy Systems; and the Savannah River Site-Aiken, South Carolina, operated by Westinghouse Savannah River Company. The national laboratories include Sandia National Laboratories-Albuquerque, New Mexico, and Livermore, California, operated by Lockheed Martin; Los Alamos National Laboratory-Los Alamos, New Mexico; and Lawrence Livermore National Laboratory-Livermore, California, operated by the University of California. Other miscellaneous locations are funded through the Weapons Stockpile Management Program as noted.

Kansas City Plant

The Kansas City Plant is located on 141 acres of the Bannister Federal Complex within the city limits of Kansas City, Missouri, about 12 miles south of downtown. The Kansas City Plant is the main facility in the nuclear weapons complex for the manufacture and procurement of nonnuclear components for nuclear weapons, including electrical, electronic, electromechanical, mechanical, plastic, and nonfissionable metal. The broad range of components and devices procured from U.S. industry is supported by an extensive system to qualify suppliers and accept products.

The Kansas City Plant provides a broad range of standard industrial processes (e.g. plating, machining, metal deposition, molding, painting, heat treating, and welding), some of which are uniquely tailored to meet special weapon reliability requirements. Delivery of nonnuclear components for the B-61 Mod 11 was completed in 1997. The Kansas City Plant evaluates components and subsystems removed from the stockpile for reuse or testing. The plant is participating with the other plants and laboratories in the Enhanced Surveillance Program to predict component and material lifetimes, critical elements of the Stockpile Life Extension Program, and in Advanced Manufacturing, Design and Production Technologies (ADAPT) program to develop modular, scalable, and environmentally sound manufacturing processes.

Los Alamos National Laboratory

LANL is located on about 28,000 acres adjacent to the town of Los Alamos, New Mexico, which is approximately 25 miles northwest of Santa Fe. Specific LANL stockpile management activities include plutonium fabrication and processing technology development with support from the Lawrence Livermore National Laboratory (LLNL); oversight of tritium reservoir surveillance, testing, and tritium recycle technology; support of high explosive safety and assembly/disassembly operations at the Pantex Plant; detonator development and surveillance; beryllium fabrication; neutron tube target loading, and pit support component production and surveillance.

A plutonium pit manufacturing mission is being reestablished at LANL to replace units destructively tested in the surveillance program and to replace pits in the future should surveillance indicate a problem with a pit. DOE is instituting a phased approach to assure the capability to manufacture is retained and then to establish a capacity to manufacture a number of pits per year.

LANL also participates in the Enhanced Surveillance Program and the Dual Revalidation program.

LANL has a major role in DOE's backup technology for a new tritium production source. LANL directs the APT National Project Office which is responsible for the engineering, development and demonstration activities to verify technical issues and the preliminary design of the APT.

LANL's role in research and development is discussed further in the Stockpile Stewardship decision unit.

Pantex Plant

The Pantex Plant is located on approximately 10,177 acres about 17 miles northeast of Amarillo, Texas. Pantex is the only facility in the complex for quantity assembly/disassembly of nuclear weapons.

Plutonium pits from dismantled weapons are stored at Pantex. The site has been designated as the permanent location for strategic reserve pit storage and the interim storage location for surplus pits resulting from dismantlement activities and the planned closure of the Rocky Flats Site.

Pantex also fabricates high explosives used in nuclear weapons and performs modifications and surveillance of nuclear weapons scheduled to remain in the future stockpile.

Pantex is participating with the other plants and the laboratories in the Enhanced Surveillance Program and in Advanced Manufacturing, Design and Production Technologies (ADAPT). A five-year agreement with the State of Texas commits DOE to fund the Amarillo National Resource Center for Plutonium. FY 1999 is the last year funding is provided under the current agreement. DOE has received inquiries from the State requesting the extension of the agreement for another 5-year period.

Beginning in 1999, the assembly/disassembly and the high explosives fabrication facilities will be appropriately downsized to support the future stockpile. By approximately 2005, these facilities will be about two-thirds their current size. This downsizing will involve modifications and consolidations within the existing footprint.

Sandia National Laboratories

SNL is located on the 75,520-acre Kirtland Air Force Base military reservation about 6.5 miles east of downtown Albuquerque, New Mexico. It occupies about 18,000 acres on the Kirtland reservation and has additional facilities in Livermore, California, and in Tonopah, Nevada.

SNL is responsible for the nonnuclear components and systems engineering for all nuclear weapons and is a crucial point of contact with DoD in the areas of weapon requirements, system design, logistics, surveillance, training, and dismantlement. SNL manufactures certain nonnuclear components including neutron generators and is capable of providing an assured source of radiation hardened electronics.

SNL participates in the ADAPT program, the Enhanced Surveillance Program, and the Dual Revalidation program.

SNL's role in research and development is discussed further in the Stockpile Stewardship decision unit.

Nevada Operations Office

NTS encompasses approximately 867,000 acres in Nye county in southern Nevada, about 65 miles northwest of Las Vegas.

DOE's Nuclear Emergency Search Team, based at NTS, can respond to any type of emergency involving radioactive materials in the U.S. or abroad.

The Nevada Test Site role in Test Readiness and Experimentation is discussed in the Stockpile Stewardship decision unit.

Y-12 Plant

The Y-12 Plant is located on about 800 acres of the almost 35,000-acre Oak Ridge Reservation located about 20 miles west of Knoxville, Tennessee. Y-12 maintains the only capability in the nuclear weapons complex to fabricate quantity uranium and lithium components and parts for nuclear weapons, including secondaries and radiation cases. All current nuclear weapons have components produced at Y-12.

Y-12 has historically stored highly enriched uranium (HEU) and lithium for the nuclear weapons complex and Y-12 is now designated the permanent location for the storage of strategic reserves of these materials. Y-12 also evaluates components and subsystems returned from the stockpile, dismantles nuclear weapons secondaries returned from the stockpile and processes recovered special nuclear materials for storage.

Y-12 is participating with the other plants and the laboratories in the Enhanced Surveillance Program to predict component and material lifetimes, a critical element of the Stockpile Life Extension Program, and in the Advanced Manufacturing, Design and Production Technologies (ADAPT) program.

Lawrence Livermore National Laboratory

LLNL is located on about 821 acres in Livermore, California. A 7,000-acre auxiliary testing range is located about 18 miles east of the Livermore site. Along with participation in the Enhanced Surveillance Program, the Advanced Manufacturing, Design and Production Technologies (ADAPT) program, and the Dual Revalidation program, specific LLNL stockpile management activities include the support of high explosive safety and assembly/disassembly operations at the Pantex Plant, and oversight of uranium and case fabrication and processing technology with support from the Y-12 Plant and LANL.

LLNL's role in research and development is discussed further in the Stockpile Stewardship decision unit.

Savannah River Site

The Savannah River Site occupies approximately 198,000 acres about 12 miles south of Aiken, South Carolina on the state line with Georgia. Augusta, Georgia is about 16 miles northwest of the site. The primary DP mission at the Savannah River Site (SRS) is the recycling of tritium from the weapons stockpile and the loading and surveillance of tritium reservoirs.

SRS tritium facilities will be upgraded and consolidated to support the use of an existing commercial light water reactor (CLWR). A new tritium extraction facility will be constructed at SRS.

All Other Sites

Stockpile Management activities in support of the Tritium Source initiative are also conducted at the Pacific Northwest Laboratory and Chicago Operations Office. Safe and secure storage of excess U-233 under the Materials program takes place at the Oak Ridge National Laboratory. Radiological/Nuclear Accident Response activities are also conducted at the Oak Ridge Institute for Science and Education.

Core Stockpile Management

Mission Supporting Goals and Objectives

The Core Stockpile Management operations and maintenance program includes procurement of materials (exclusive of nuclear materials); fabrication and assembly of nuclear weapons and weapon components; lifetime surety, maintenance and reliability assessments of the enduring stockpile; weapon dismantlement and disposal; maintenance of a production capability; development and operation of safe, secure systems for transporting nuclear weapons and weapon components; preparation, issuance, and maintenance of field training manuals; and facility startup and standby operations.

Ongoing Activities

- Support the warhead dismantlement/disposal and storage program;
- Support modifications, repairs and retrofit programs;
- Support the limited life component exchange program;
- Provide quality evaluations, special testing, and surveillance of nuclear weapon systems;
- Acquire a pit rebuild capability and limited capacity to meet near-term stockpile requirements;
- Maintain and improve upon essential technologies and capabilities; and
- Maintain the weapons complex infrastructure at a level necessary to accomplish mission requirements.

Budget Contents

Core Stockpile Management operations and maintenance funding is broken into 14 major categories: **Stockpile Maintenance, Stockpile Evaluation, Dismantlement, Materials Recycle and Recovery, Storage, Transportation, Pit Production, Containers, Field Engineering, Training and Manuals, Complex Downsizing, Project Support/Facility Startup/Standby/D&D of Facilities, Special Projects and Other, Capital Equipment, and General Plant Projects.**

Stockpile Maintenance includes limited life component exchange, maintenance, and retrofit activities on various weapon systems in the enduring stockpile to maintain War Reserve weapons and components.

Stockpile Evaluation includes new material laboratory tests, new material flight tests, stockpile laboratory tests, stockpile flight tests, quality evaluations, special testing, and surveillance of weapon systems to ensure quality evaluation and assessment of the reliability of War Reserve weapons and components.

Dismantlement includes all activities for weapons associated with retirement, disassembly, component characterization, and disposal and reclamation of materials and components; the engineering, development, testing, certification, procurement, and refurbishment of containers required for interim storage; and the staging and storage of weapons, components, and materials awaiting dismantlement. In FY 1998, the Department has carried out a robust dismantlement program and disassembled 1,062

weapons, primarily consisting of the W69. The majority of W69 units were completed in FY 1998 with the residual units scheduled for completion in FY 1999.

Materials Recycle and Recovery includes the recycle and recovery of plutonium, enriched uranium, and tritium from fabrication and assembly operations, limited life components, and dismantlement of weapons and components. Involves the process in recycling and purifying the above materials to meet specifications for safe, secure, and environmentally acceptable storage, including meeting the directive schedule for tritium reservoir refills.

Storage provides for the cost of storage of weapons material or components to be stored for the foreseeable future. Does not include the cost of temporary storage of materials awaiting processing, staging for dismantlement, or any other interim storage.

Transportation provides for the safe, secure movement of nuclear weapons, strategic quantities of Special Nuclear Material, selected nonnuclear weapon components, and limited life components to and from military locations and between nuclear complex facilities within the continental United States. Supports the level of weapon deliveries and stockpile modifications specified in the Production and Planning Directive. Provides operational fleet vehicles and communications systems through repair and refurbishment, and modifications to enhance safety and security. This program element does not include the cost for the couriers and other administrative personnel (federal employees) who execute this program. These costs include federal employee salaries and benefits, travel, and training, and are funded in the Weapons Activities Program Direction decision unit.

Pit Production includes operating support and the procurement of equipment for the reestablishment of a war reserve pit production capability at LANL and the initiation of the manufacturing of quantity pits for certification and ultimate placement into the nuclear weapons stockpile.

Containers includes research and development, design, recertification and maintenance, off-site transportation certification of component containers in accordance with federal regulations, off-site transportation authorization of non-certifiable nuclear materials transportation configuration; test and evaluation, production/procurement, fielding and maintenance, and decontamination and disposal to provide adequate quantities of containers to support the nuclear weapons mission (transportation and storage).

Field Engineering, Training and Manuals includes costs incurred for technical training of military and contractor personnel participating in the Joint Task Group evaluations of new weapons prior to complete engineering release.

Complex Downsizing includes operating support of the construction projects to consolidate and downsize the weapons production complex. Activities include conceptual design, NEPA documentation, Preliminary Safety Analysis Reports, facilities acceptance, pre-operational readiness, component prebuilds, qualification and process prove-in, workforce restructuring, and facility shutdown.

Project Support/Facility Startup/Standby and Decontamination and Disposition of Facilities includes operating support of construction projects including conceptual design, NEPA documentation, Preliminary Safety Analysis Reports, facilities acceptance, pre-operational readiness, plant support costs during construction, activation and startup. Includes the cost of Enriched Uranium Operations at the Y-12 Plant. Also includes the cost of maintaining standby facilities for future use and the costs for decontamination and disposition of production equipment, facilities and, land.

Special Projects and Other includes programmatic activities coordinated and contracted through the Albuquerque, Oak Ridge, and Savannah River Operations Offices and Headquarters. These special projects, often one-time efforts or complex-wide efforts, do not fit easily into other budget categories and require special control or visibility. Funding is also includes funding responsive to the Department's Implementation Plan for the Defense Nuclear Facilities Safety Board recommendation 97-2 related to Nuclear Criticality.

Core Stockpile Management Construction

A detailed listing of individual construction line items follow. Further project justification can be found in the Construction Project Data Sheets which are included with this budget submission. No FY 2000 funding is being requested for Project 99-D-123, Replace Mechanical Utility Systems at the Y-12 Plant or for Project 99-D-125, Replace Boilers and Controls at the Kansas City Plant. These projects have been deferred to allow execution of Congressionally directed external assessment of these projects to be completed. Any recommendations related to the scope or schedule of these projects will be addressed in the FY 2001 budget submission. Additionally, no FY 2000 funding is being requested for project 97-D-122, Nuclear Materials Storage Facility Renovation at the Los Alamos National Laboratory. Questions regarding approach, design and costs remain. Answers to these questions and accompanying decision process are out of sync with the FY 2000 budget cycle. It is anticipated that additional information will be provided to Congress once a path forward is developed. Additional details on these changes are provided within the section titled, "Detailed Program Justification."

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Operations and Maintenance					
Stockpile Maintenance	457,146	551,162	552,692	1,530	0.3%
Stockpile Evaluation	250,554	243,074	271,218	28,144	11 6%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Stockpile Maintenance			
■ Support Production and Planning Directive schedule for limited life component exchange consistent with START I and/or the ability to reactivate to START I	151,622	167,121	168,135

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Support weapons modifications, alterations and repairs in accordance with Production and Planning Directive schedule for the W87 Life Extension Program, B61 Alts 335 and 339, and the B83-1 Quality Improvement Program	305,524	384,041	384,557
Total, Stockpile Maintenance	457,146	551,162	552,692
Stockpile Evaluation			
■ Conduct new material laboratory tests/stockpile laboratory tests	69,499	65,214	73,782
■ Conduct new material flight tests/stockpile flight tests	112,705	100,497	117,346
■ Conduct surveillance testings	68,350	77,363	80,090
Total, Stockpile Evaluation	250,554	243,074	271,218
Dismantlement			
■ Disassembly of retired weapons	66,641	50,450	36,254
■ Characterization and disposition of components from dismantlement	14,772	1,198	1,334
■ Staging and storage of weapons, components or nuclear materials awaiting dismantlement.	10,696	12,531	3,644
Total, Dismantlement	92,109	64,179	41,232
Materials Recycle and Recovery			
■ Development and implementation of new processes or improvements to existing processes for fabrication and recovery operations for plutonium and uranium, and for material stabilization, conversion, and storage; and recycle and recovery of material from fabrication and assembly operations, limited life components, and dismantlement/disposal of weapons and components	86,170	97,901	108,970
■ Support for DNFSB recommendation 94-1 at LANL related to stabilization of uranium and plutonium residues	26,349	34,404	35,720
Total, Materials Recycle and Recovery	112,519	132,305	144,690

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Storage			
■ Storage of weapons material or components to be stored for the foreseeable future	88,454	98,517	101,086
Transportation			
■ Provide safe, secure movement of nuclear weapons, strategic quantities of Special Nuclear Material, selected nonnuclear weapon components, and limited life components to and from military locations and between nuclear complex facilities within the continental United States	16,175	16,965	17,160
■ Support activities necessary to improve or purchase new facilities or equipment; effect economies of operations; reduce or eliminate health, fire and security problems; and maintain, refurbish, and/or modify fleet equipment operations	36,955	34,835	29,880
■ Support activities to continually track and privately communicate with convoys	11,335	12,000	12,960
Total, Transportation	64,465	63,800	60,000
Pit Production			
■ Recapture the capability to build war reserve pits and achieve an annual production capacity of 20 pits per year by 2007	79,088	86,555	90,867
■ Replace in-kind equipment to address facility/system safety and reliability issues through the Transition Manufacturing and Safety Equipment Initiative	0	15,000	25,000
■ Preparatory efforts to support longer-term capacity requirements	3,800	2,200	625
Total, Pit Production	82,888	103,755	116,492

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Containers			
■ Research and development of transportation and storage containers	6,988	7,167	4,070
■ Recertification and maintenance of transportation and storage containers	7,479	4,774	5,803
■ Production/procurement of transportation and storage containers	7,413	15,473	15,883
Total, Containers	21,880	27,414	25,756
Field Engineering, Training and Manuals			
■ Technical training of military and contractor personnel participating in the Joint Task Group evaluations of new weapons prior to complete engineering release	6,364	5,700	5,900
Total, Field Engineering, Training and Manuals	6,364	5,700	5,900
Complex Downsizing			
■ Complete Nonnuclear Reconfiguration	22,438	1,092	0
■ Stockpile Management Restructuring Initiative-Kansas City Plant	2,196	5,499	8,155
■ Stockpile Management Restructuring Initiative-Pantex Plant	385	1,057	2,339
■ Stockpile Management Restructuring Initiative-Savannah River Site	3,297	2,300	2,700
■ Stockpile Management Restructuring Initiative-Y-12 Plant	6,031	11,902	13,594
Total, Complex Downsizing	34,347	21,850	26,788
Project Support/Facility Startup/Standby and Decontamination and Disposition of Facilities			
■ Operating support of construction projects	20,554	32,804	22,836
■ Enriched Uranium Operations at the Y-12 Plant	60,648	30,035	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Maintaining standby facilities for future use and decontamination and disposition of production equipment, facilities and land	2,265	5,163	7,133
Total, Project Support/Facility Startup/Standby and Decontamination and Disposition of Facilities	83,467	68,002	29,969
Special Projects and Other			
■ Items at Headquarters/Other include nuclear criticality, Defense Programs Analysis Group, Amarillo National Resource Center for Plutonium, and Environmental Surety	16,535	50,454	40,257
■ Items at the Albuquerque Operations Office include support for aviation services, radiation effects research, support for environmental impact statements, and other complex-wide efforts	2,118	9,633	11,226
■ Funding at the Oak Ridge Operations Office provides support for resumption activities and manufacturing process and stockpile support systems at the Y-12 Plant	52,177	33,389	20,269
■ Funding at the Savannah River Operations Office provides for Safeguards and Security Costs for the Tritium area at the Savannah River Site and for other activities that provide direct programmatic support	6,737	5,576	5,854
Total, Special Projects and Other	77,567	99,052	77,606
Capital Equipment			
■ Capital equipment is required by the four production plants and three weapons laboratories to maintain the capabilities necessary for stockpile maintenance, stockpile evaluation, and dismantlement activities.	33,505	20,102	1,250

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
General Plant Projects			
■ General Plant Projects provide funding for low cost construction projects (less than $5 million) required to maintain the infrastructure and ongoing Stockpile Management programs of the four production plants and the three weapons laboratories.	13,558	23,842	2,642
Construction			
■ See "Capital Operating Expenses and Construction Summary" for details	83,370	97,658	94,679
Total, Core Stockpile Management	1,502,193	1,620,412	1,552,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Stockpile Maintenance	
■ FY 1999 and FY 2000 funding for LLCE component support is largely driven by production costs for the W76 neutron generator which is scheduled for delivery in October 1999	+1,014
■ FY 1999 and FY 2000 funding for stockpile refurbishment is driven by schedules to meet the first delivery unit (FDU) for the W87 Life Extension Program in December 1998 and ramp up to steady state production	+15,948
■ Other refurbishment efforts during the FY 1998-FY 2000 time frame include the B61 Alts 335 and 339, and the B83-1 Quality Improvement Program	-15,432
Total, Stockpile Maintenance	+ 1,530
Stockpile Evaluation	
■ Increase is driven by lab test and flight test requirements for the W76, W87 and W88 and doubling up of B-61 testing to meet schedule requirements associated with the expiration of the Nuclear Explosive Safety Study	+28,144

	FY 2000 vs. FY 1999 ($000)
Dismantlement	
■ This decrease reflects workload efficiencies, few start-ups, and reduced costs associated with staging of warheads. FY 1999 efforts will focus on completion of the W69 and ramp-up of the W79 and W56 for projected dismantlements of approximately 275 weapons. In FY 2000, dismantlement is scheduled to begin on the B53 and continue on the W56 and W79, for projected dismantlement of approximately 375 weapons	-22,947
Materials Recycle and Recovery	
■ This increase of about 10 percent is reflected at the Y-12 Plant. Funding requirements for this category increase as Enriched Uranium Operations are resumed. This is driven by operation of the recovery furnace in Building 9206 and the production of enriched uranium buttons to support casting needs	+12,385
Storage	
■ This 2.6 percent increase is reflected at the Y-12 Plant and is driven by the development and implementation of storage technologies to improve nuclear materials accountability in storage and processing facilities, and storage area modifications to enable the Plant to meet its dismantlement mission	+2,569
Transportation	
■ The decrease of $3.8 million is driven by reduced funding requirements for the SafeGuards Transporter. While deliveries for FY 1999 and FY 2000 are constant (six per year), funding decreases because of the inclusion of long-lead procurement in the FY 1999 program	-3,800
Pit Production	
■ Funding for Transition Manufacturing and Safety Equipment needed for building the W88 pit and meeting the FY 2001 stockpile delivery commitment, and continued safe facility operations	+10,000
■ Efforts to continue the recapture of required technologies for the W88, B61-7, and W87 and fabrication of W88 pits for certification and qualification will continue with the goal of providing war-reserve pits for the stockpile in 2001	+2,737
Total Funding Change, Pit Production	+12,737

	FY 2000 vs. FY 1999 ($000)
Containers	
■ Funding for containers reflects a decrease of about 6 percent over the FY 1999 level which is driven by the completion of the design efforts and the reduced repackaging effort associated with the AL-R8 Sealed Insert Upgrade. The Department has been conducting R&D efforts on this container as an option for long-term storage of pits and will complete the design review in FY 1999	-1,658
Field Engineering, Training and Manuals	
■ There is no significant change between the two years in this category	+200
Complex Downsizing	
■ FY 2000 funding for Complex Downsizing increases by about 23 percent over the FY 1999 level driven by increases in operating support of the Stockpile Management Restructuring Initiative at the Kansas City and Y-12 Plants	+4,938
Project Support/Facility Startup/Standby and Decontamination and Disposition of Facilities	
■ The $35 million decrease from FY 1999 is largely driven by the completion of Enriched Uranium Operations Process Based Restart at the Y-12 Plant in FY 1999..	-30,035
■ There are also decreased requirements for construction project support at the Pantex Plant	-7,998
Total Funding Change, Project Support/Facility Startup/Standby and Decontamination and Disposition of Facilities	-38,033
Special Projects and Other	
■ Reduced funding for Environmental Surety efforts at INEEL and other special projects	-3,326
■ Completion of cooperative agreement with the state of Texas for funding of the Amarillo National Resource Center for Plutonium	-5,000
■ Termination of contractor support to the Oak Ridge Operations Office supporting Enriched Uranium Operations process based restart and reduced funding for manufacturing process and stockpile support systems at the Y-12 Plant	-13,120
Total, Special Projects and Other	-21,446

	FY 2000 vs. FY 1999 ($000)
Capital Operating Expenses and General Plant Projects	
■ The decrease from FY 1999 is driven by the nonrecurring Congressional add-on for infrastructure and maintenance needs in FY 1999	-40,052
Core Stockpile Management Construction	
■ The decrease is driven by the deferral of FY 1999 to allow execution of Congressionally directed external assessment of thee projects to be completed. Additionally, no FY 2000 funding has been requested for the Nuclear Materials Storage Facility Renovation. Questions regarding approach, design and cost remain. These decreases are partially offset by an increase for the CMR Upgrade Project	-2,979
Total Funding Change, Core Stockpile Management	-68,412

Capital Operating Expenses & Construction Summary

Capital Operating Expenses

(dollars in thousands)

Core Management	FY 1998	FY 1999	FY 2000	$ Change	% Change
Capital Equipment	33,505	20,102	1,250	-18,852	-93.8%
General Plant Projects	13,558	23,842	2,642	-21,200	-88.9%
Total, Capital Operating Expenses	47,063	43,944	3,892	-40,052	-91.1%

Enhanced Surveillance

Mission Supporting Goals and Objectives

The Enhanced Surveillance Program is a complex-wide initiative developing predictive measures to address the maintenance needs of the stockpile. The basic goals of the enhanced surveillance program are to predict defects that might occur in the enduring stockpile due to aging or other reasons, to develop a means to assess safety and reliability impacts, and to ensure problems are corrected before they reduce safety or reliability. Enhanced surveillance techniques will extend capabilities to predict the effects of materials aging on components and weapons performance, to determine which components are liable to fail, and to estimate failure dates. Successful completion of key activities under this 5-7 year program will provide the diagnostic tools and data essential to advance warning of stockpile defects and essential to Stockpile Life Extension Program planning. The Enhanced Surveillance Program will build upon existing Defense Programs' research and development, testing (nonnuclear), and stockpile evaluations/surveillance activities and will develop new predictive models, new techniques for data analysis, and may eventually lead to in-situ, real-time, non-destructive monitoring for warheads. The Enhanced Surveillance Program Plan issued by Headquarters and updated on an annual basis includes 10 focus areas consisting of tasks with detailed schedules, milestones, and deliverables. Each task description also includes site participants, required site funding, risk assessment, and discussion of leveraged work funded through other sources.

Ongoing Activities

- Adhering to schedules in the Enhanced Surveillance Program (ESP) Plan for activities that enhance knowledge of weapon-relevant physical processes affecting aging and operation of weapon components.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Enhanced Surveillance	48,714	81,511	85,290	3,779	4.6%
Total, Enhanced Surveillance	48,714	81,511	85,290	3,779	4.6%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Delivery of diagnostic tools for surveillance of nuclear components	14,736	25,447	22,617
■ Delivery of diagnostic tools for surveillance of nonnuclear components	11,508	19,020	23,366
■ Delivery of predictive capabilities for nuclear components	13,170	20,858	17,989
■ Delivery of predictive capabilities for nonnuclear components	9,300	16,186	21,318
Total, Enhanced Surveillance	48,714	81,511	85,290

Explanation of Funding Changes from 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ Increase reflects transitioning of laboratory demonstrated tools into plant operations and the acceleration of research vital to providing SLEP with data upon which to base stockpile retrofit decisions, especially for the W76 and W80 warheads	+3,779
Total Funding Change, Enhanced Surveillance	+3,779

Advanced Manufacturing, Design & Production Technologies

Mission Supporting Goals and Objectives

The goal of the Advanced Manufacturing, Design and Production Technologies initiative is to reengineer the weapons complex product realization capabilities and support the Stockpile Life Extension Program by developing, validating, and implementing advanced tools, manufacturing processes, and practices needed to design, develop, and fabricate nuclear weapons systems and components of improved quality at reduced cost. The application of advanced manufacturing technologies will radically change the way the DOE designs, builds, and test systems and components by infusing new product and process technology and adopting modern business and engineering practices. ADAPT is the Defense Programs' vehicle for improving product realization within a downsized enterprise. ADAPT cuts across all levels of process and product development from the manufacture of materials to the integration of thousands of parts into a weapon. The requirements and objectives for the ADAPT Program and other advanced manufacturing programs are set forth in the Stockpile Stewardship Plan (Green Book) and are further refined in the ADAPT Master Plan. Major long term goals include the reduction of the occurrence of design and manufacturing defects in replacement hardware by a factor of ten and the reduction of the time and cost required to realize these products by a factor of two.

The ADAPT program has four elements:

- Enterprise Integration (EI), which provides new and improved information tools for DOE nuclear weapons design and manufacturing activities;
- Integrated Product and Process Design (IPPD)/Agile Manufacturing(AM), which develops and deploys new design and manufacturing capabilities;
- Process Development (PD), which develops and implement new production processes and continuously improves existing processes; and
- Hedge Technologies (HT), which performs development activities to prepare to respond to possible contingencies.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Advanced Manufacturing, Design and Production Technologies	90,098	79,520	85,000	5,480	6.9%
Total, Advanced Manufacturing, Design and Production Technologies	90,098	79,520	85,000	5,480	6.9%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Process Development	47,593	42,709	41,750
■ Enterprise Integration	19,500	17,399	17,350
■ IPPD/Agile Manufacturing	22,084	19,012	25,150
■ Hedge Technologies	921	400	750
Total, ADAPT	90,098	79,520	85,000

Explanation of Funding Changes from 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ In Enterprise Integration, both the Integrated Production Scheduling System (IPSS) and the Enterprise Modeling (EM) efforts will receive additional funding. The IPSS will complete a first prototype in the 3rd quarter of FY 1999 and the EM user's environment will be completed in the 4th quarter of FY 1999. Development of these tools is being accelerated so that they will be available to support outyear Stockpile Life Extension Program (SLEP) refurbishment schedules.	-49
■ In IPPD/Agile Manufacturing, the increase will be applied to continued accelerated development, installation and evaluation of the Production Realization Environment and collaboration tools and databases to support the ongoing development projects to ensure availability of key tools and processes on schedules dictated by SLEP.	+6,138
■ In process development, funding will be used to further develop processes needed to support emerging SLEP activities.	-959
■ The increase for Hedge Technologies in FY 2000 reflects continued work on preconceptual design planning for Rapid Reconstitution of Pit Production.	+350
Total Funding Change, ADAPT	+5,480

Radiological/Nuclear Accident Program

Mission Supporting Goals and Objectives

The Radiological\Nuclear Accident Program provides the capability for DOE to immediately respond to radiological accidents/incidents worldwide. This program provides overall program management and organizational structure during both emergency and non-emergency conditions for the personnel, equipment, and activities that collectively comprise the response capability. The emergency response assets are staffed primarily by engineers, scientists, and other technical personnel from the national laboratories, production facilities, and other DOE management and operating contractors supporting the nuclear weapons complex. The funding for this program is allocated to 15 nation-wide Department locations with the Nevada and Albuquerque Operations Offices, and the Los Alamos (LANL), Lawrence Livermore (LLNL), and Sandia National Laboratories (SNL) receiving the majority of the funding.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Radiological/Nuclear Accident Response	78,808	76,200	77,600	+1,400	0.0%
Total, Radiological Nuclear Accident Response	78,808	76,200	77,600	+1,400	0.0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Nuclear Emergency Search Team			
■ Provides the U.S. Government's technical response to an act of nuclear terrorism. NEST is directed by DOE Headquarters and utilizes the expertise throughout the weapons complex, i.e., LANL, LLNL, SNL, Nevada Operations Office, Oak Ridge Institute for Science and Technology, and the Pantex plant.	44,511	43,816	45,239
Federal Radiological Monitoring and Assessment Center			
■ FRMAC is a single source of compiled and quality controlled radiological monitoring and assessment data for any federal agency, State, Tribal or local authority involved in resolving a radiological incident. FRMAC is managed by the Nevada Operations Office.	1,579	1,217	1,217
Atmospheric Release Advisory Capability			
■ ARAC, located at LLNL, provides rapid predictions and projections of the dosage and amount of radio nuclides potentially transported, diffused and/or deposited into the atmosphere and the resulting impact on people and the environment.	6,838	5,701	4,846
Aerial Measurement System			
■ (AMS) located at the Nevada Operations Office, is an aerial detection system capable of measuring gamma radiation for locating and tracking airborne radiation	10,120	9,980	9,980
Accident Response Group			
■ ARG is responsible for the resolution of accidents or significant incidents involving U.S. nuclear weapons. ARG is managed by the Albuquerque Operations Office.	12,412	12,084	12,084

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Radiological Emergency Assistance Center/Training Site			
■ REAC/TS, located in Oak Ridge, provides medical advice, specialized training, and on-site assistance, in the treatment of all types of radiation exposure accidents	994	974	1,174
Radiological Assistance Program			
■ RAP provides a local capability and first response to request for assistance during a radiological accident or incident. There are eight RAP regions: Brookhaven Area Office, Oak Ridge Operations Office, Savannah River Operations Office, Albuquerque Operations Office, Chicago Operations Office, Idaho Operations Office, Oakland Operations Office, and the Richland Operations Office.	2,354	2,288	2,860
Special Applications			
■ Provides for classified activities and exercises associated with the seven emergency response assets; includes costs associated with Technical integration activities that are crosscutting to the emergency response assets, and contractor support to achieve projected objectives related to the NEST and ARG activities	0	140	200
Total, Radiological/Nuclear Accident Response	78,808	76,200	77,600

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ The increase in the FY 2000 funding level will ensure that all activities will be maintained at the current readiness level for all assets	+1,400
Total Funding Change, Radiological/Nuclear Accident Response	+1,400

Tritium Source

Mission Supporting Goals and Objectives

On December 5, 1995, DOE issued a Tritium Supply and Recycling Record of Decision (ROD), that selected the two most promising alternative technologies for tritium production and established a dual-track strategy that would, within 3 years, select one of those technologies to become the primary tritium supply technology. The other technology, if feasible would be developed as a backup tritium source. Under the dual-track strategy, DOE would: 1) initiate the purchase of an existing commercial reactor (operating or partially complete) or irradiation build, and test critical components of an accelerator system for tritium production. Any new facilities that might be required, the production-scale accelerator and a Tritium Extraction Facility to support the commercial reactor alternative, would be constructed at DOE's Savannah River Site in South Carolina. The ROD also stated that DOE's Fast Flux Test Facility at the Hanford Reservation in Washington would be examined for a possible tritium production role although it had been previously rejected as a reasonable alternative.

On December 22, 1998, the Secretary of Energy announced his decision to select the use of commercial light water reactors for tritium production. The preferred reactors are the Watts Bar reactor and Sequoyah reactors located in Tennessee. Each of these reactors is operated by the Tennessee Valley Authority, an independent government agency. The linear accelerator option was designated a "backup" technology. The Fast Flux Test Facility will have no tritium production role. This ROD revises the December 1995 Tritium Supply and Recycling Record of Decision and completes the process of selecting a single technology for tritium production.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Operating Expenses					
Accelerator Production of Tritium	131,251	85,000	57,000	-28,000	-32.9%
Light Water Reactor Target Development	52,089	56,000	49,000	-7,000	-12.5%
Total, Operating Expenses	183,340	141,000	106,000	-35,000	-24.8%
Construction					
Construction, APT	67,865	20,000	31,000	+11,000	+55.0%
Construction, CLWR	9,650	6,000	33,000	+27,000	+450.0%
Total, Construction	77,515	26,000	64,000	+38,000	+146.2%
Total, New Tritium Source	260,855	167,000	170,000	+3,000	+1.8%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Accelerator Production of Tritium (Operations & Maintenance)			
■ Development and demonstration of key components of the linear accelerator and target/blanket technologies. Development activities include demonstration of integrated high-power operation of the Low Energy Demonstration Accelerator, fabrication and high-field testing of a prototypic superconducting radio-frequency cryomodule and high-power couplers, materials performance analysis, target/blanket development, and validation of neutron and tritium production codes	131,251	85,000	57,000
Commercial Light Water Reactor (Operations & Maintenance)			
■ Continue the Tritium Producing Burnable Absorber Rod (TPBAR) Technology which will include: transfer designer-of-record activities to manufacturer, establish TPBAR manufacturing processes, conduct Lead Test Assembly destructive tests, complete component performance tests, procurement of long-lead materials for fabrication of TPBAR, award contract for long-term transportation, develop TPBAR handling processes and procedures, submit requests to the Nuclear Regulatory Commission to amend Watts Bar and Sequoyah reactor operating licenses	52,089	56,000	49,000
Accelerator Production of Tritium (Construction)			
■ Continue preliminary design of the accelerator, target/ blanket, tritium separation, and balance of plant facilities. During preliminary design, design packages will be developed for each major facility subsystem and prototype design will be completed for a few key items that would be needed early in construction should APT be activated as the primary tritium production source.	67,865	20,000	31,000

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Commercial Light Water Reactor (Construction)			
■ Begin detailed design (Title II) of the Tritium Extraction Facility and begin site preparation	9,650	6,000	33,000
Total, Tritium Source	260,855	167,000	170,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ The FY 2000 budget request includes $170.0 million, $3 million increase over the FY 1999 request, to begin site preparation for construction of the Tritium Extraction Facility at the Savannah River Site and continue preliminary design of essential elements of the APT	+3,000
Total Funding Change, Tritium Source	+3,000

Materials

Mission Supporting Goals and Objectives

Congress, in the FY 1998 Energy & Water Appropriations Act, transferred responsibility for DP materials at the Rocky Flats Environmental Technology Site and the Fernald Environmental Management Project (FEMP) to the Office of Environmental Restoration and Waste Management (EM) in order to simplify the management issues associated with environmental restoration activities at these sites. Consistent with this action by Congress, the Department (in FY 1999) transferred management and funding responsibility for materials at remaining EM-landlord locations from Defense Programs to EM (Idaho, Richland, and Savannah River). DP retains ownership of national security materials. Also included in the transfer are certain neutron source disposition activities at LANL.

Beginning in FY 1999, the Materials program supports only programmatic activities that include: the operation of Building 9206 at Y-12 Plant until phaseout and transfer to Building 9212; decontamination and refinement of surplus precious metals; operation of U-233 Storage and Distribution Center at ORNL; the recovery of materials from irradiated targets and the manufacture of radiation sources for Defense Programs and for other federal civilian and defense activities at the ORNL Radiochemical Engineering Development Center; and the processing of highly enriched uranium scrap from across the DOE complex to improve the accuracy of measurements, to allow for increased efficiencies in storing the materials, and to allow for other beneficial uses of the materials.

Funding Schedule

	(dollars in thousands)				
	FY 1998	FY 1999	FY 2000	$ Change	% Change

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- Total Estimated Cost has decreased $4,100,000 to $22,900,000 and the Total Project Cost has decreased $3,925,000 to $29,852,000 as a result of the descoping of certain production equipment from this line item and inclusion of FY 1997 and FY 1998 operating activities.
- Project start date has slipped six months due to delay in release of FY 1999 funds. Funding is being withheld pending completion of Congressionally mandated external reviews.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1999 Budget Request *(Preliminary Estimate)*	1Q 1999	Various [a]	3Q 1999 [a]	4Q 2001	27,000	33,777
FY 2000 Budget Request *(Current Baseline Estimate)*	3Q 1999	Various [a]	1Q 2000 [a]	4Q 2001	22,900	29,852 [b]

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	11,200	11,200	6,900
2000	11,700	11,700	9,600
2001	0	0	6,400

[a] Project activities will be coordinated and phased with ongoing facility operations at SNL, KCP, and LANL; most equipment requirements are drawn from reuse of preexisting equipment specifications developed for Non-Nuclear Reconfiguration (NNR).

[b] Descoping of production equipment at Kansas City Plant results in a reduction to total estimated cost and total project cost of $4,100,000. Inclusion of FY 1997 and FY 1998 operating activities results in a $175,000 increase in total project costs.

3. Project Description, Justification and Scope

The FY 1993 Nonnuclear Reconfiguration Project (NNR), Project Number 93-D-123, was initiated to downsize the nonnuclear manufacturing component of the nuclear weapons complex while maintaining production capacities at a certain level. The reservoir production mission was transferred to the Kansas City Plant (KCP), the neutron generator production mission was transferred to the Sandia National Laboratories (SNL), and the neutron tube target loading mission was transferred to the Los Alamos National Laboratory (LANL). The production capacity for the reconfigured production complex was based upon a START II requirement base for decreased stockpile levels, but production capacities were not impacted. Subsequent direction has required the production complex to support a START II stockpile level while protecting the capability of reconstituting back to a START I level, referred to as START II with Hedge. As a result, the KCP, SNL, and LANL submitted plans and budget requirements to acquire the increased capacity necessary to support reconstitution of START I (START II with Hedge) levels.

The existing nuclear weapons complex was scoped under NNR using START II as criteria for equipment and facility requirements. This project will increase the complex's capability to protect START I (START II with Hedge) requirements. Minor facility modification and additional equipment is required, and therefore, included under this line item, to increase capacity to provide START I (START II with Hedge) requirements.

Rapid Reactivation will make use of the FY 1993 NNR Project Development, planning and management tools and documentation to the greatest extent practical. Rapid Reactivation activities for the Los Alamos and Kansas City subprojects are within the activity envelope of the Environmental Assessment conducted for nonnuclear manufacturing consolidation, which resulted in a Finding of No Significant Impact. The SNL requires preparation of an Environmental Assessment, which will be completed in FY 1999. All existing environmental and safety documentation will be appropriately reviewed for currency and adequacy, updated as required.

Rapid Reactivation requirements necessitate scope of work activities as follows: (1) The LANL subproject consists of designing, constructing, and installing a third target loader within the existing space of the Neutron Tube Target Loading facility (NTTL); (2) The Kansas City Plant subproject consists of rearranging existing space in, and adding additional space to, the current Reservoir Assembly Facility, and the procurement of additional production/process equipment; and (3) the SNL subproject consists of rearranging existing space within Building 870, adding additional space to adjacent buildings, and the procurement of additional production equipment.

Incorporation of these product line enhancements into KCP, SNL, and LANL facilities will be accomplished by rearranging and upgrading space within existing buildings, purchasing new product equipment, installation of some of the transferred and new equipment and associated support systems. Due to production schedules and other time constraints, interim equipment staging and testing may precede final equipment placement and the capital interim activities associated with final placement.

Sandia National Laboratories: Neutron Generators Facilities (NGF): TEC - $15,600,000

TEC	Previous	FY 1999	FY 2000	Outyear	Construction Start-Completion Dates
$15,600	$ 0	$ 5,630 [c]	$9,970 [c]	$ 0	3Q 1999 - 4Q 2001

The SNL subproject consists of rearranging existing space within Building 870, adding additional space to adjacent buildings, and the procurement of additional production equipment.

Kansas City Plant: Reservoir Assemblies and Testing: TEC - $4,400,000

TEC	Previous	FY 1999	FY 2000	Outyear	Construction Start-Completion Dates
$ 4,400 [d]	$ 0	$ 4,400	$ 0	$ 0	3Q 1999 - 4Q 2000

The Kansas City Plant subproject consists of rearranging existing space in, and adding additional space to, the current Reservoir Assembly Facility, and the procurement of additional production/process equipment.

Los Alamos National Laboratory: Neutron Tube Target Loading: TEC - $2,900,000

TEC	Previous	FY 1999	FY 2000	Outyear	Construction Start-Completion Dates
$ 2,900	$ 0	$ 1,170	$1,730	$ 0	3Q 1999 - 4Q 2000

The LANL subproject consists of designing, constructing, and installing a third target loader within the existing space of the Neutron Tube Target Loading facility (NTTL).

Project Milestones

FY 1999: Title I/II design complete; initiate procurement and construction.

FY 2000: Continue procurement; continue installation and complete physical construction at Los Alamos National Laboratory and the Kansas City Plant.

[c] FY 1999 subproject funding increased (FY 2000 correspondingly decreased) to reflect priorities given removal of high priority Kansas City Plant equipment scope.

[d] Subproject TEC reduced as a result of descoping certain production equipment from this line item, based upon receipt of $4,000,000 FY 1998 Congressional add-on funding for equipment procurement.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	731	731
Design Management Costs (0.8% of TEC)	190	190
Project Management Costs (0.4% of TEC)	94	94
Total Design Costs (4.4% of TEC)	1,015	1,015
Construction Phase		
Buildings	5,303	5,303
Special Equipment	7,428	7,428
Standard Equipment	4,230	7,400
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	1,010	1,010
Construction Management (2.1% of TEC)	475	475
Project Management (1.1% of TEC)	261	261
Total Construction Costs (81.7% of TEC)	18,707	21,877
Contingencies		
Design Phase (0.7% of TEC)	157	160
Construction Phase (13.2% of TEC)	3,021	3,948
Total Contingencies (13.9% of TEC)	3,178	4,108
Total, Line Item Costs (TEC) [e]	22,900	27,000

5. Method of Performance

Design and inspection shall be performed under a negotiated architect-engineering contract. Construction and procurement shall be accomplished by fixed-price contracts awarded after competitive proposals and administered by the DOE and Contractor staff. However, operating contractor personnel may perform design and construction roles for activities determined to be cost effective. Procurement of standard equipment will be administered by the DOE and Contractor staff on the basis of competitive proposals.

[e] Escalation rates taken from the FY 1999 DOE escalation multiplier tables.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs							
Total facility costs							
Design	0	0	1,172	0	0	0	1,172
Construction	0	0	5,728	9,600	6,400	0	21,728
Total facility costs (Federal and Non-Federal)	0	0	6,900	9,600	6,400	0	22,900
Other project costs							
Conceptual design cost	100	0	0	0	0	0	100
NEPA documentation costs	0	25	50	0	0	0	75
Other project-related costs	0	0	2,547	2,440	1,790	0	6,777
Total other project costs	100	25	2,597	2,440	1,790	0	6,952
Total Project Cost (TPC)	100	25	9,497	12,040	8,190	0	29,852

7. Related Annual Funding Requirements

(FY 2001 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project–30 years)		
Total related annual funding (operating from FY 2001 through FY 2030) [f]	0	0

[f] Activities will principally reside within the footprint of existing facilities.

99-D-127, Stockpile Management Restructuring Initiative—Kansas City Plant, Kansas City, Missouri

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

The Total Estimated Cost (TEC) has decreased from $122.5 million to $119.5 million and the Total Project Cost (TPC) has increased from $139.5 million to $139.7 million. The reduction in TEC is due to compressing the schedule from seven years to six years, thereby reducing escalation, and incorporating changes in scope. Scope changes include deletion of the West Data Center relocation and F-Aisle modification project, the addition of a downsized cafeteria relocation and the addition of equipment procurement to replace heat treat equipment unlikely to survive relocation.

The increase in TPC is the result of including an additional $3.2 million for equipment engineers that was pointed out in the project's independent assessment.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1999 Budget Request *(Preliminary Estimate)*	1Q 1999	2Q 2004 [a]	3Q 1999	3Q 2006	122,500	139,500
FY 2000 Budget Request *(Current Baseline Estimate)*	2Q 1999	3Q 2004	3Q 1999	2Q 2005	119,500	139,700

[a] The work packages will be phased as required to maintain production operations. Title I design, Title II design and construction of work packages occur simultaneously after 3rd Qtr. FY 1999.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	13,700	13,700	9,725
2000	17,000	17,000	18,139
2001	29,200	29,200	24,529
2002	31,300	31,300	32,901
2003	14,000	14,000	17,999
2004	14,300	14,300	16,131
2005	0	0	76

3. Project Description, Justification and Scope

The end of the Cold War radically changed the defense posture of the United States, calling for significant changes and reductions in nuclear weapons complex structure and operations. The initial phase of this retrenchment began when the Department of Energy (DOE) decided to cease nonnuclear production at three plants and consolidate most of its nonnuclear manufacturing at the Kansas City Plant. However, even with the influx of new missions, the downturn in defense production meant continued reductions in operating costs and work force.

The Stockpile Management Restructuring Initiative provides a cost-effective plan that capitalizes on the Kansas City Plant's logistic and manufacturing expertise to ensure quality nonnuclear products through the year 2010 and beyond. Furthermore, the initiative minimizes DOE costs in the near term by lessening risks and reducing operating expenditures concurrent with capital investments. It also provides the technical capability, production capacity, and flexibility necessary to allow the Kansas City Plant to support scheduled nonnuclear production and a wide range of unanticipated production requirements, confidently and effectively.

The Stockpile Management Restructuring Initiative will allow the Kansas City Plant's infrastructure to be altered and greatly reduced from the current plant profile, substantially reducing costs to operate the Kansas City Plant. The restructuring initiative consists of changing the existing plant and operational approach in four major aspects: 1) physically reducing the size of the facility, 2) changing the approach to manufacturing from product-based to process-based, 3) reducing the support infrastructure appropriate for the right-sized operation, and 4) further streamlining the organizational structure to focus directly on the core manufacturing mission.

Currently, the Kansas City Plant consists of approximately 3.2 million square feet of floor space contained in three connected buildings: the main building, the manufacturing support building (MSB) and the technology transfer center (TTC). Approximately 3 million square feet of floor space is core stockpile management funded. Much of the floor space is underutilized and costly to maintain. The Kansas City Plant will be rearranged into three business units and a support operations business unit to bring about an overall reduction in total managed floor space, streamline operations, and produce

increased long-term operating efficiencies in manufacturing processes. The approximate square footage of each business unit after consolidation is as follows:

	Square Ft.
Electrical Products Business Unit	236,000
Mechanical Business Unit	350,000
Engineered Materials Business Unit	198,000
Support Operations Business Unit	850,000
Vacant, Unallocated and Unusable	666,000
Total	2,300,000

Electronics Products Business Unit (EPBU) Technology Overview

The electronics products factory includes three process modules: microelectronics, interconnects, and final assembly. Each electronic process module will fabricate all product lines that require the processes of that module. In addition to the three process modules, there will be three manufacturing areas for specialized products: Joint Test Assembly (JTA), Special Electronic Assembly (SEA), and Test Equipment.

The three process modules are:

Microelectronics: All substrates, hybrid microcircuits, chip packages, and leadless chip carriers that require clean room processing are fabricated in the state-of-the-art microelectronics module. The module is located in the new microelectronics facility which was completed in June 1995 and will become fully operational in September 1998.

Interconnects: The interconnects module contains all the processes used to attach and interconnect components. This includes processes such as welding, conventional hand soldering, wave soldering, vapor phase soldering, and belt furnace re-flow soldering. In addition to printed wiring assemblies, interconnect products, such as cables and junction boxes, can be fabricated in this module.

Final Assembly: The fabrication of complete electronic systems is performed in the final assembly module. This consists of the assembly and encapsulation of all components required for complete electronic products. Procured components, printed wiring assemblies, and manufactured hardware are assembled to produce complete electronic systems such as radars, programmers, trajectory sensing, and firesets.

Mechanical Business Unit (MBU) Technology Overview

The Mechanical Business Unit will consist of 14 modules which will fabricate or procure all required product lines. This is a process-based approach for most mechanical technologies, complemented by generic product-based manufacturing departments, mechanical support laboratories, and engineering services as follows:

Mechanical Welding: Mechanical Welding is a process-based activity group providing welded mechanical hardware and welding operations in common support of factory operations. The in-place

consolidation will combine operations which currently exist in Welding Operations, Interim Reservoir Welding, Model Shop and Tool Room, and the Mechanical Welding Laboratory.

Sheet Metal and Mechanical Assembly: The sheet metal fabrication assembly area will provide common support for a range of mechanical and electromechanical products, and includes typical sheet metal processes as well as laser marking.

Electromechanical Assembly: Electromechanical Assembly will be restructured in a downsized and consolidated operation to provide support of stronglinks and other miniature assemblies which have design features that include miniature solenoids, ceramic electrical headers, miniature springs, friction reducing coatings and bearings, low resistance electrical contacts, magnetically coupled switching, and a host of other unique designs. Most miniature mechanisms require assembly in a Class 100 clean environment, utilizing clean benches within a class 100,000 clean room.

Heat Treating and Abrasive Blasting: The heat treat and abrasive blasting areas provide service for all mechanical product lines. Included in the relocation of the Heat Treat department is the replacement of a portion of the furnaces and support equipment which will not survive the relocation due to their poor condition. The structural integrity of the furnaces being replaced is very poor and modifications would be required to refurbish fire brick and heating elements and the equipment may not survive the relocation. Due to the large size of these furnaces and the criticality of this equipment as a unique capability, new furnaces will be procured and installed in the new location prior to excess of the old equipment.

Mechanical Machining: Mechanical machining and inspection will be a downsized and consolidated operation that will fabricate hardware through traditional and non-traditional means in sizes ranging from large case-type housings to miniature piece parts for assemblies. The machined hardware provided by this module will support requirements of all programs at KCP for both internal and external customers.

Reservoir Fabrication and Assembly: Reservoir production responsibility was transferred from the DOE's Rocky Flats Plant to the Kansas City Plant through the nonnuclear reconfiguration program. Because of special handling, cleaning and contamination considerations associated with reservoir production, KCP's reservoir facility contains most processes necessary to manufacture, test and inspect a wide variety of production reservoirs. SMRI implementation will not change the Reservoir facility.

TSD Products Manufacturing: TSD Products Manufacturing supports the secure transportation needs for the DOE Transportation Safeguards Division including refurbishment of existing trailers, original manufacture of the new design Safeguards Transporter Trailer (SGT) and multiple short-term special maintenance activities. The TSD manufacturing area will be consolidated by combining the secure trailer sheet metal area with the primary SGT assembly facility.

Mechanical Support Laboratories: Support laboratories for Mechanical Operations will continue to provide the current types of support, though in a smaller footprint through consolidation.

Plastics Molding & Filled Elastomers: This area supports injection, compression, and transfer molding of thermoset and thermoplastic compounds, and material preparation and compression molding of filled elastomeric products.

Cellular Silicone Production: The Cellular Silicone processing operations will not be consolidated with other operations for material incompatibility reasons. The activities associated with the production of cellular silicone products require three major processes: urea screening; silicone base and cellular silicone compounding; and cellular silicone molding, part processing, and product inspection.

Foam Products: Foam Products is a process-based approach, which has combined equipment needed for fabrication of rigid polyurethane foams, filled elastomer foams and foam desiccant product lines.

Plastics Machining, Assembly & Inspection: In the Plastics Machining, Assembly & Inspection module, the manufacturing and machining of all Special Plastics Case Assemblies and Subassemblies, Gas Getters, Composites, and all other plastic products and the related inspection of these products will be consolidated. This consolidation allows for some enhanced utilization of floor space and equipment.

Plating & Painting: These two process modules provide custom metal finishing services to the entire plant. They are not undergoing consolidation as part of the SMRI project.

Engineered Materials Business Unit (EMBU) Technology Overview

The engineered materials factory consists of four processing modules as follows:

Model Shop and Tool Room: The Model Shop and Tool Room is a support organization that will provide prototype and evaluation hardware, tool and gage fabrication and maintenance, special grinding of cutting tools, and limited tool design in support of unique and short-cycle time needs of production operations.

Engineering Laboratories: The Engineered Materials Business Unit contains several large laboratories. Except for the Nuclear Grade Steels Receiving and Inspection, and Environmental & Non-Destructive test labs, the Engineering Laboratories will remain unchanged by the SMRI project.

Engineering Services: The Engineered Materials Business Unit provides document control, drafting, and other support services for the other business units. These functions are primarily office areas, and are not modified in the SMRI project.

Metrology: Metrology provides calibration services to the plant and will not be modified under SMRI.

Support Operations Technology Overview

Support operations includes boilerhouses, waste management operations, patrol headquarters, stores (including enduring stockpile), maintenance, cafeteria, offices and other functions that are essential for plant operations. Included under this function is the physical plant separation work for walls and utilities and security guard support during construction. Also included is the construction and relocation of a downsized cafeteria. These functions, generally placed in the category of support, are common to plant operations and are not assigned to a specific factory.

Physical Plant Separation: Maximum Foreseeable Fire Loss (MFL) rated separation between the DOE and GSA will be provided by construction of fire rated subdivision walls. Major air handling and utilities systems serving both DOE and GSA will be separated to allow for independent maintenance of these services on both sides of the separation line after the SMRI project is complete.

Stores: New stores will occupy approximately 21 areas, down from the existing 70. Gages and fixtures, chemicals, and some of the production and non-production stores areas will remain in their current locations. Bulk materials and large production and non-production areas will be relocated and resized to meet future stores requirements. This bulk storage area will be located in a high-roof, unexcavated area of the plant which is adjacent to a new high-rack storage area.

Enduring Stockpile: This project provides space for enduring stockpile inventory and to construct fire-rated storage facility enclosures to limit the Maximum Foreseeable Loss (MFL) in accordance with DOE dollar limits. Sites will be provided for a proposed short-term storage of DOE-managed Enduring Stockpile materials. Approximately 105,000 square feet of plant floor space within the new boundaries derived from the facility consolidations will be allocated for the storage of these materials. Thirteen plant areas will be dedicated to this purpose and will be upgraded in place to meet the enduring stockpile storage criteria.

Project Milestones:

FY 1999: A-E work initiated 1Q

FY 2000: Maintain schedules to complete construction by 2Q 2005

4. Details of Cost Estimate

	(dollars in thousands) Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	8,451	8,145
Design Management Costs (1.1% of TEC)	1,268	2,280
Project Management Costs (0.4% of TEC)	422	250
Total Design Costs (8.5% of TEC)	10,141	10,675
Construction Phase		
Buildings	46,381	47,855
Standard Equipment	32,210	35,373
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	3,440	3,270
Construction Management (5.4% of TEC)	6,477	2,370
Project Management (2.4% of TEC)	2,850	1,900
Total Construction Costs (76.5% of TEC)	91,358	90,768
Contingencies		
Design Phase (1.5% of TEC)	1,799	2,215
Construction Phase (13.6% of TEC)	16,202	18,842
Total Contingencies (15.0% of TEC)	18,001	21,057
Total, Line Item Costs (TEC) [b]	119,500	122,500

5. Method of Performance

Design and inspection will be performed under KCP negotiated architect-engineer contract. Construction will be accomplished either by fixed-price contract awarded after competitive proposals or by cost plus incentive fee contracts. All contracts will be administered by AlliedSignal.

[b] The Conceptual Design Report was completed in March 1997. Escalation is calculated to the midpoint of each activity. The escalation rates used were provided by the Independent Cost Estimating Group dated January 1997. Overhead estimates were calculated at a factor of 14 percent for procurement and 85 percent for internal labor. Escalation rates were taken from the FY 1999 DOE escalation multiplier tables.

6. Schedule of Project Funding

(dollars in thousands)

Total related annual costs (operating from FY 2005 through FY 2034)	18,474	32,598

99-D-128, Stockpile Management Restructuring Initiative— Pantex Plant, Amarillo, Texas

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- Since the submittal of the FY 1999 data sheet, two events have occurred, significantly altering the scope of this project. These were a reevaluation of the activity levels for the Weapons complex and the Congressionally mandated Independent External Assessment (IEA). The first resulted in the need for the Weapons Complex to not downsize as much as previously planned. The second recommended a reevaluation of the project that included enhancing operational flexibility for a potential increase in weapons work and moving routine relocation activities and smaller subprojects out of the project. The recommended reevaluation was performed and resulted in deleting eight subprojects and the Mortgage Reduction Initiative (MRI) from the project.

  The MRI shuts down approximately 230 facilities putting them into Long Term Caretaker (LTC) status at an average cost of $43,000 per facility. The reevaluation determined that these small, routine, low cost efforts were more appropriately performed outside the line item project.

  The reevaluation of the Small Components, NDE Radiography, Gas Analytical Laboratory, Weapons Staging, and the Laundry subprojects revealed that the need for enhancing operational flexibility, as recommended in the IEA, necessitated changes in the locations and/or scopes of these subprojects. In addition, all of these were determined to be independent, relatively low cost ($1,500,000 to $4,000,000), routine relocations that could be performed for less cost and in less time if performed outside the line item project.

  The Metrology, Records Storage, and Maintenance Shops subprojects were reevaluated, and all were determined to be low cost ($2,600,000 to $4,000,000), routine relocations that could be performed for less cost and in less time if performed outside the line item project.

  The reevaluation of the Mass Properties subproject revealed that the function, as pointed out in the IEA, could not be relocated as originally planned; so it has been rescoped to be relocated to a new location.

  The reevaluation of the HE Formulation subproject revealed the need to delete the relocation of equipment from building 11-016; so that work and the placing of building 11-016 in LTC status were deleted from the project.

  The reevaluation of the 35 Account subproject, which includes placing facilities vacated by the 35 Account relocation into LTC status, revealed that two buildings will still be required; so placing them into LTC status was deleted.

  In addition, the burden rates, overhead rates, security guard costs, and Other Project Costs (OPC) were corrected. The OPC increased after completion of a detailed, resources and labor hours "bottom up" estimate.

As a result of the above changes, the Total Estimated Cost (TEC) had a net reduction of $30,100,000, the OPC had a net reduction of $1,262,000, the Total Project Cost had a net reduction of $31,362,000, and the completion of the project was reduced by two years.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1999 Budget Request *(Preliminary Estimate)*	2Q 1999	2Q 2003 [a]	4Q 2000	4Q 2006	42,380	49,600
FY 2000 Budget Request *(Current Baseline Estimate)*	3Q 1999	4Q 2001 [a]	2Q 2000	4Q 2004	13,218	17,863

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	1,108	662	627
2000	3,429	3,660	3,730
2001	4,985	5,200	2,092
2002	3,300	3,300	5,141
2003	286	286	1,518
2004	110	110	110

3. Project Description, Justification and Scope

The Pantex Plant Stockpile Management Restructuring Initiative (SMRI) Project will provide for the design and construction for various relocation and upgrades and for the shutdown of obsolete structures. The project will help to reduce the plant footprint by consolidating functions into fewer and more modern facilities.

The scope for this project has been established based upon the Department of Energy's (DOE) directed workload for the Pantex Plant. This directed workload is the weapons work Pantex is directed to do through Program Control Documents (PCDs), Retirement/Disposal Program Control Documents, the Quality Assurance Production Plan (QAPP), and other special written requests provided by DOE.

The technical baseline for this project has been broken up into three parts that are detailed below:

---

[a] Phased design and construction will be required to minimize impact to plant operations.

Relocation of High Explosive Formulation to 11-050

This portion of the SMRI project will remove existing High Explosive (HE) machining equipment from Building 11-050 following startup of HE machining operations in Building 12-121. Building 11-050 will be modified to receive the HE formulation related operations currently performed in Building 12-019 East and Building 12-017, and selected operations and equipment from Building 11-017: Following modifications to Building 11-050 the required equipment from these building will be relocated and the equipment put into operation in Building 11-050. Finally, Building 12-019 East will be placed into a long-term caretaker status. Equipment and support items will be procured and/or relocated as required and any items that cannot be successfully relocated will be replaced. This portion of the SMRI project will be designed to meet the applicable DOE and regulatory requirements in place at the start of Title I design.

Relocate Mass Properties

This portion of the SMRI project will relocate the Mass Properties function to Buildings 12-084 and 12-104 and will consist of modifications to the buildings to accept the mass properties operations from Building 12-060. Four existing pieces of equipment will be replaced by procuring two new, more technically advanced pieces of equipment. Equipment and support items will be procured and/or relocated as required and any items that cannot be successfully relocated will be replaced. This portion of the SMRI project will be designed to meet the applicable DOE and regulatory requirements in place at the start of Title I design.

Relocate 35 Account Materials

This portion of the SMRI project will relocate the 35 Account warehousing activities in Buildings 12-005A, 12-005B, 12-010, 12-009, and Ramp 12-R-010 into Building 12-118. The 35 Account activities include materials in contact with a weapon or weapon component during a weapon assembly, disassembly or test units. Typical materials include such items as epoxy resin, paint, dry air, rubber gloves and acetone. Equipment and support items will be procured and/or relocated as required and any items that cannot be successfully relocated will be replaced. This portion of the SMRI project will be designed to meet the applicable DOE and regulatory requirements in place at the start of Title I design. Buildings 12-005A, 12-005B, 12-010, and 12-R-010 will be placed into Long-term Caretaker status.

Project Milestones:

FY 1999: A-E Work Initiated	3Q
FY 2000: Construction Start	2Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	1,210	2,740
Project Management costs (4.4% of TEC)	579	650
Total Design Costs (13.5% of TEC)	1,789	3,390
Construction Phase		
Improvements to Land	61	264
Buildings	4,298	11,555
Other Structures	510	6,745
Utilities	20	60
Standard Equipment	2,873	1,521
Removal Cost Less Salvage	35	825
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	146	385
Construction Management (5.8% of TEC)	773	414
Project Management (3.4% of TEC)	455	10,059
Total Construction Costs (69.4% of TEC)	9,171	31,828
Contingencies		
Design Phase (2.7% of TEC)	358	1,332
Construction Phase (14.3% of TEC)	1,900	5,830
Total Contingencies (17.1% of TEC)	2,258	7,162
Total, Line Item Costs (TEC) [b]	13,218	42,380

5. Method of Performance

The design services (Title I, II, and III) will be accomplished by an outside A-E firm and will be administered by the Operating Contractor (Mason and Hanger Corporation). Mason and Hanger Corporation will perform portions of the design for selected projects.

The construction services of this project will be performed by an outside construction contractor operating under a contract to be awarded on the basis of competitive bids. This contract will be administered by the Operating Contractor (Mason and Hanger Corporation).

Construction Management Services will be performed by the DOE Operating Contractor.

[b] Escalation rates taken from the FY 1999 DOE escalation multiplier tables. The previous estimate was based on the Independent Cost Reviews (ICR 6/97 and 8/97) of the Conceptual Design Report (Revision 1) and included security guard costs under project management. The current estimate is based on new burden rates and correctly includes security guard costs under construction management.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs							
Total facility costs							
Design	0	0	627	1,152	289	79	2,147
Construction	0	0	0	2,578	1,803	6,690	11,071
Total facility costs (Federal and Non-Federal)	0	0	627	3,730	2,092	6,769	13,218
Other project costs							
Conceptual design cost	768	0	0	0	0	0	768
NEPA documentation costs	297	51	60	40	33	72	553
Other ES&H costs	0	40	43	20	38	97	238
Other project-related costs	0	384	497	480	782	943	3,086
Total other project costs	1,065	475	600	540	853	1,112	4,645
Total Project Cost (TPC)	1,065	475	1,227	4,270	2,945	7,881	17,863

7. Related Annual Funding Requirements

(FY 2004 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project--30 years)		
Facility operating costs	355	1,036
Facility maintenance and repair costs	218	259
Programmatic operating expenses directly related to the facility	1,418	12,253
Capital equipment not related to construction but related to the programmatic effort in the facility	350	1,860
Utility costs	106	367
Total related annual costs (operating from FY 2004 through FY 2033)	2,447	15,775

99-D-132, Nuclear Materials Safeguards and Security Upgrades Project, Los Alamos National Laboratory, New Mexico

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- The National Academy of Engineering (NAE) assessment has been completed, project start will be delayed until 2nd quarter of FY 1999, with the project funding profiles adjusted accordingly.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1999 Budget Request *(Preliminary Estimate)*	1Q 1999	1Q 2001	3Q 2000	3Q 2004	60,746 a	70,920
FY 2000 Budget Request *(Current Baseline Estimate)*	2Q 1999	1Q 2001	3Q 2000	3Q 2004	60,746 [a]	70,920

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1999	9,700	9,000	8,000
2000	11,300	10,288	8,742
2001	18,000	16,962	18,000
2002	11,800	14,278	15,340
2003	9,946	6,646	6,700
2004	0	3,572	3,964

[a] TEC and Financial Schedule reflects Phase 1 only. Phase 2 cost estimate and funding profile will be completed as part of future conceptual design efforts.

3. Project Description, Justification and Scope

The Nuclear Material Safeguard and Security Project (NMSSUP) replaces the existing Los Alamos National Laboratory-wide security system, addresses Special Nuclear Material (SNM) facility requirements, and addresses malevolent vehicle threats at key nuclear facilities. Assessments of the LANL safeguards and security system have identified numerous system deficiencies due to aging equipment and outdated technologies. The NMSSUP will provide a reliable safeguards and security system to ensure the protection and control of SNM, classified matter, and Departmental property supporting current missions at LANL.

The NMSSUP is broken into two phases to accomplish the project goals. The currently requested Phase 1 will provide for the replacement of safeguard and security control systems (computers/communications links, etc.) and modification of related facilities. A planned Phase 2 may replace or build perimeter detection systems and address the threat of public traffic on uncontrolled roads near key nuclear facilities.

This project is to provide necessary upgrades to the existing Laboratory-wide security systems to bring them into compliance with DOE Order 5632.1C and to address deficiencies cited in the pending Los Alamos National Laboratory (LANL) Site Safeguards and Security Plan (SSSP). The systems being upgraded have been in operation for up to 14 years, have exceeded their useful design life, and are in need of replacement. Funding is required to continue safe, secure, economical operation of the Laboratory.

The Phases of the security system to be upgraded or replaced may include the following:

Phase 1

A new security system will be installed to include multiple host computers, operator interface consoles, upgrades to existing facilities, and a dedicated communications system. Existing facilities will be upgraded to serve as a Central Alarm Station (CAS) and Secondary Alarm Station (SAS) which will house the host computers and security monitoring personnel. To support the transition of the TA-55 local assessment facility for operation as the new CAS, an un-staffed assessment console room at TA-64-1 will be provided. Additional detail is provided below.

Control System

The project will replace the existing Laboratory security system, Basic Rapid Alarm Security System (BRASS), computers and software with Argus, a security system provided by Lawrence Livermore National Laboratory (LLNL). The CAS and SAS will be reconfigured, and minor remodeling of the badging office will be performed to accommodate Argus enrollment stations.

Facilities

CAS (TA-55-142) will be upgraded to house the host system computer and new operator consoles. A small utility building will be constructed to accommodate facility support equipment, and provide space for supervisory personnel.

SAS (TA-3-440) will be upgraded to house the host system computer and new operator consoles. A small utility building will be constructed to accommodate facility support equipment. Limited Area

fencing and barricades will be installed to enclose the SAS to provide proper security. This facility will also house the training console to support the Argus system.

TA-64-1 will be upgraded to house a new un-staffed assessment console to support the transition of the TA-55-142 local assessment room for operation as the CAS. This area will continue to house and support the existing LANL fire protection control and alarm system on the existing BRASS.

Communications System

A new fiber optic communications network will replace the existing telephone circuits connecting the security control computers to the field concentrators. Phase 1 will install the portion of the communications system that connects the new host computers to the security concentrators at LANL's Category I SNM facilities TA-55 and TA-18. In addition, the communications circuits needed to connect the computers in the CAS, SAS, and the un-stalled assessment console room will be installed in Phase 1. Because Phase 1 involves installing fiber-optic bundles coming out from the CAS and SAS, those bundles will be sized with adequate capacity in Phase 1 to accommodate the number of fibers needed to support Phase 2.

Planned Phase 2

Category 1 SNM Facilities and NMSM Facilities

Includes protection of the following Category 1 SNM Facilities, such as:

- TA-55, Plutonium Facility.
- TA-18, Los Alamos Critical Experiments Facility (LACEF).

Phase 2 may also evaluate requirements for controlling proximity of public traffic to TA-3 facilities and modify traffic profiles and patterns if needed and address SSSP requirements as necessary to reduce overall security risks at LANL.

Project Milestones

FY 1999:	Start design and procurement activities for the control system, facility modifications, and communication system	1Q
FY 2000:	Start construction of facility modifications, control and communications system	3Q

4. Details of Cost Estimate

	(dollars in thousands) Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	4,930	4,930
Design Management costs (1 9% of TEC)	1,200	1,200
Project Management costs (1.3% of TEC)	800	800
Total Design Costs (11.4% of TEC)	6,930	6,930
Construction Phase		
Improvements to Land	5,625	5,625
Buildings	6,964	6,964
Special Equipment	21,540	21,540
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	4,290	4,290
Construction Management (3.5% of TEC)	2,136	2,136
Project Management (8.7% of TEC)	5,261	5,261
Total Construction Costs (75.4% of TEC)	45,816	45,816
Contingencies		
Design Phase (1.7% of TEC)	1,050	1,050
Construction Phase (11.4% of TEC)	6,950	6,950
Total Contingencies (13.2% of TEC)	8,000	8,000
Total, Line Item Costs (TEC) [b]	60,746	60,746

5. Method of Performance

Engineering, design and inspection will be accomplished under a negotiated architect-engineer (A-E) contract. Construction and procurement will be accomplished by fixed-price contracts awarded on the basis of competitive bidding. The computer system will be procured and installed through a cooperative agreement with Lawrence Livermore National Laboratory.

[b] Escalation rates taken from the FY 1999 DOE escalation multiplier tables. TEC and Financial Schedule reflect Phase 1 only. Phase 2 cost estimate and funding profile will be completed as part of the future conceptual design efforts.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1998	11,000	11,000	5,092
1999	27,500	27,500	18,108
2000	21,800	21,800	25,700
2001	24,200	24,200	32,400
2002	10,800	10,800	14,000
2003	2,200	2,200	2,200
2004	900	900	900

[a] Reflected changes from including scope and associated funding to process tritium containing gases from the Commercial Light Water Reactor (CLWR), which was originally included in the Tritium Extraction Facility (Line Item 98-D-125).

[b] Reflects changes in schedule due to delayed start of design on most processes in Building 233-H.

3. Project Description, Justification and Scope

In 1994, production operations were curtailed at three of the seven weapons production facilities (Mound in Ohio, Pinellas in Florida, and Rocky Flats in Colorado). Their production responsibilities were transferred to two of the remaining four production plants (Kansas City Plant and Savannah River Site (SRS) and to two of the national laboratories (Los Alamos National Laboratory (LANL) and Sandia National Laboratory, New Mexico). After the closure of these production operations, studies were continued to determine the optimum size and configuration of the nuclear weapons complex. It was recognized that the remaining four production facilities provided excess capacity than that required to support the projected stockpile, and that further closure and consolidation or significant downsizing of operations was necessary. Studies were begun in late 1994 to address whether the reduced stockpile levels necessitated further plant closures and consolidation/collocation at the weapons laboratories or supported the downsizing of operations at the existing production plants. These studies were used to assess all reasonable alternatives which required little or no construction of new facilities. The result of these in-depth programmatic assessments culminated in the development and approval of the Justification of Mission Need document and the Critical Decision I authorization for the Stockpile Management Restructuring Initiative (SMRI) on April 2, 1996.

The SMRI will support the implementation of Departmental decisions related to production facility downsizing or relocation of missions consistent with the Stockpile Stewardship and Management (SSM) Programmatic Environmental Impact Statement (PEIS) and the Tritium Supply and Recycling PEIS Records of Decision (ROD). The preferred alternative for restructuring the stockpile management complex was announced by the Secretary of Energy on February 28, 1996. The Secretary of Energy approved a ROD for the Tritium Supply and Recycling PEIS on December 5, 1995.

The goal of the Stockpile Management Program, as implemented by the SMRI, is to attain the following objectives: (1) fully support the evaluation, enhanced surveillance, maintenance, and repair of the enduring stockpile; (2) provide flexibility to respond to new requirements or to achieve further reductions in the stockpile size; (3) maintain and improve (where necessary) the manufacturing technology necessary to fully support the stockpile; and (4) achieve significant reductions in operating costs for the complex.

The SMRI involves (1) the downsizing of weapons assembly/disassembly and high explosives missions at the Pantex Plant; (2) downsizing nonnuclear component manufacturing at the Kansas City Plant; (3) downsizing weapons secondary and case fabrication at the Oak Ridge Y-12 Plant; and (4) consolidation of existing tritium operations at the SRS.

No new facilities are being proposed for implementing the SMRI. Existing facilities will be utilized to the maximum extent possible. All existing facilities that have been identified for utilization under each site specific recommended alternative will be repaired, upgraded, and/or modified to meet current environment, safety, and health requirements. In addition, they will be configured to maximize effectiveness and efficiency in support of the site-specific downsizing and/or consolidation management capability requirements for the smaller stockpile.

The Tritium Facility Modernization and Consolidation work package will relocate several process systems and equipment and/or process functions from Buildings 232-H into existing buildings within the Tritium Facility. High and Moderate hazard processes will be relocated into Building 233-H.

Low Hazard processes will be relocated to the North end of Building 234-H. The Building 233-H and 234-H service support systems will be upgraded to accommodate the additional loads.

The consolidation of Tritium processing activities into Buildings 233-H, 249-H, and the newer portion of 234-H will improve the safety of operations, reduce environmental releases, improve productivity, and significantly reduce future operating costs.

The consolidation of equipment into fewer operating buildings will allow for the reduction of maintenance, operations, and support staffing. The closure of 232-H will further reduce the Defense Programs operating budget for the Savannah River Site (SRS). It is estimated that financial pay back for this project can be realized in approximately four years.

The scope of work also includes work that was transferred from the Tritium Extraction Facility, Line Item 98-D-125. These are increases in capacities and flows in the primary separation system, process stripper/tritium recovery system, glovebox stripper/tritium recovery system. Also added is an isotope separation process. These additions will allow the Consolidation project to handle additional process and waste gases from any new tritium source.

Project Milestones

FY 1999: Physical construction start

FY 2000: A-E Work Completed 3Q

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	13,370	13,370
Design Management Costs (0.4% of TEC)	413	413
Project Management Costs (1.0% of TEC)	987	987
Total Design Costs (15.0% of TEC)	14,770	14,770
Construction Phase		
Improvements to Land	100	100
Buildings [c]	5,300	5,300
Special Equipment	36,345	36,345
Standard Equipment	3,080	3,080
Removal Cost Less Salvage	1,645	1,645
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	7,034	7,034
Construction Management (2.0% of TEC)	1,995	1,995

98-D-124, Stockpile Management Restructuring Initiative—Y-12 Consolidation, Y-12 Plant, Oak Ridge, Tennessee

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- The original scope of 98-D-124, Stockpile Management Restructuring Initiative--Y-12 Consolidation, was based on the assumed activity levels for the weapons complex evaluated by the Programmatic Environmental Impact Statement (PEIS) and the Record of Decision (ROD). To see if excessive downsizing or impact to meeting mission requirements may occur, a Y-12-specific evaluation, the Y-12 Capacity Study, was begun in 1997, and the project scope was also evaluated against the Nuclear Weapons Production and Planning Directive (P&PD) 99-0 and the Albuquerque Workload Planning Guidance (AWLPG) 99-0 (U). The completed studies revealed that the initial project scope, if completed, would downsize the Y-12 Plant to a point that would impact the expected mission requirements. Consequently, the project scope has been reduced with the following changes:
  - Building 9201-5W will be returned to active status rather than placed in Cold Stand-by.
  - The existing Special Material Purification Facility will be restarted rather than install a new Special Material Pilot Plant Facility in Building 9805-1.
  - Building 9204-2 will remain in active status and the following subprojects will be deleted: Lithium Equipment Relocation to Building 9204-2E; and Lithium Equipment Relocation to Building 9998 G3. The Ceramic Machining Operations, with appropriate enclosure and ventilation, will be relocated to Building 9204-2 instead of Building 9998 G3.
  - A work package has been added to refurbish two Induction Casters in Building 9998.
  - All natural phenomena upgrades have been deleted from the project.
  - The scope changes reduce the TEC from $42,500,000 to $24,800,000.
  - The OPC has been reduced from $10,300,000 to $8,400,000 due to reductions in the need for safety documentation resulting from not relocating equipment to the basement of Building 9204-2E and Building 9998, G3.

3. Project Description, Justification and Scope

In 1994, production operations were curtailed at three of the seven weapons production facilities (Mound in Ohio, Pinellas in Florida, and Rocky Flats in Colorado). Their production responsibilities were transferred to two of the remaining four production plants (Kansas City Plant and Savannah River Site (SRS)) and to two of the national laboratories (Los Alamos National Laboratory (LANL) and Sandia National Laboratories, New Mexico). After the closure of these production operations, studies were continued to determine the optimum size and configuration of the nuclear weapons complex. It was recognized that the remaining four production facilities provided excess capacity than that required to support the projected stockpile, and that further closure and consolidation or significant downsizing of operations was necessary. Studies were begun in late 1994 to address whether the reduced stockpile levels necessitated further plant closures and consolidation/collocation at the weapons laboratories or supported the downsizing of operations at the existing production plants. These studies were used to assess all reasonable alternatives which required little or no construction of new facilities. The result of the programmatic assessments of these alternatives studies culminated in the initial development of the Stockpile Management Restructuring Initiative (SMRI). In 1995 the Department formally evaluated production facility downsizing and relocation of missions in the Stockpile Stewardship and Management (SSM) Programmatic Environmental Impact Statement (PEIS). The preferred alternative for restructuring the stockpile management complex was approved by the Secretary of Energy on December 19, 1996.

The goal of the Stockpile Management Program is to attain the following objectives: (1) fully support the evaluation, enhanced surveillance, maintenance, and repair of the enduring stockpile; (2) provide flexibility to respond to new requirements or to achieve further reductions in the stockpile size; (3) maintain and improve (where necessary) the manufacturing technology necessary to fully support the stockpile; and (4) achieve significant reductions in operating costs for the complex.

The SMRI involves (1) the downsizing of weapons assembly/disassembly and high explosives missions at the Pantex Plant; (2) downsizing nonnuclear component manufacturing at the Kansas City Plant; (3) downsizing weapons secondary and case fabrication at the Oak Ridge Y-12 Plant; and (4) consolidation of existing tritium operations at the SRS.

The original scope of 98-D-124, Stockpile Management Restructuring Initiative--Y-12 Consolidation, was based on the assumed activity levels for the weapons complex evaluated by the Programmatic Environmental Impact Statement (PEIS) and the Record of Decision (ROD). To see if excessive downsizing or impact to meeting mission requirements may occur, a Y-12-specific evaluation, the Y-12 Capacity Study, was begun in 1997, and the project scope was also evaluated against the Nuclear Weapons Production and Planning Directive (P&PD) 99-0 and the Albuquerque Workload Planning Guidance (AWLPG) 99-0 (U). The completed studies revealed that the initial project scope, if completed, would downsize the Y-12 Plant to a point that would impact the expected mission requirements. Therefore, the project scope was reduced.

No new facilities are being proposed for implementing the SMRI. Existing facilities will be utilized to the maximum extent possible. All existing facilities that have been identified for utilization under each site-specific recommended alternative will be repaired, upgraded, and/or modified to meet current environment, safety, and health requirements. In addition, they will be configured to maximize effectiveness and efficiency in support of the site-specific downsizing and/or consolidation management capability requirements for the smaller stockpile.

The consolidation of the Canned Subassemblies mission at Y-12 will reduce the existing Defense Programs (DP) manufacturing footprint to approximately 1,200,000 square feet of active production space, a reduction of 50 percent. The consolidation work will take place in Buildings 9201-5N, 9204-2E, 9204-2, 9201-5W, 9212, and the 9215/9998 complex and peripheral support buildings. The facilities work required includes (1) capital equipment relocation; (2) capital equipment procurement and installation; and (3) reactivation of 9201-5W.

The primary purpose of this project is to complete the overall downsizing of the Y-12 manufacturing footprint. This project is part of a long range consolidation plan that began in 1992. Along with previously completed projects and other currently funded consolidation projects, SMRI completes the consolidation of manufacturing operations into a smaller footprint area. After completing process consolidation activities at Y-12 and the subsequent safe and compliant shut down of excess facilities, an annual savings of $10 million to $12 million dollars has been projected.

This Y-12 downsizing will consolidate secondary and case manufacturing processes into a significantly smaller production footprint.

The activities associated with the project centralizes the DP production functions in the western area of the Y-12 Plant. The subprojects will consist of the following tasks:

- Relocation and/or hook-up of several machine tools to Building 9215 M-wing for the Enriched Uranium machining function.
- Placing Building 9201-5W Machine Shop in active status to meet the current projected workload.
- Providing a depleted uranium sawing operation, and a furnace for dismantled weapon material consolidation in Building 9212 A-2 wing.
- Refurbish casting furnaces (2) in Building 9998.
- Relocating Ceramic Machining equipment to Building 9204-2 Area and providing enclosures and ventilation.
- Restart the existing Special Material Purification Facility in Building 9404-11.

Project Milestones:

FY 1999: Physical construction start 2Q

FY 2000: Maintain schedules to complete construction by 4Q 2004

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications - $1,055)	1,810	4,200

98-D-125 Tritium Extraction Facility, Savannah River Plant, Aiken, South Carolina

(Changes from FY 1998 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- The funding profile shown on this Data Sheet is based on completion of Conceptual Design, and reflects current programmatic direction resulting from the Secretary of Energy's December 1998 decision that the Commercial Light Water Reactor (CLWR) will be the primary new source for production of tritium. A project rebaselining will be completed by March 1999 to fully assess and document baseline changes resulting from the technology selection and completion of Preliminary Design.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete

[a] The FY 1999 budget request for the Tritium Supply Program was $157,000,000 in operating funds to pursue the tritium option selected by the Department in December 1998. No capital funding was requested. Congress appropriated $167,000,000 (operating). To fund necessary TEF construction activities in FY 1999, the Department requested $6,00,000 of the $167,000,000 be reprogrammed to capital funds. Approval of the reprogramming was granted January 1999.

[b] Final system turnover to integrated startup testing.

2. Financial Schedule

(dollars in thousands)

2005	25,000	25,000	26,000
2006	12,000	12,000	14,239

3. Project Description, Justification and Scope

Tritium is a radioactive isotope of hydrogen used in all of the Nation's nuclear weapons. Without tritium, nuclear weapons will not work as designed. At present, no tritium is produced by the U.S. for the nuclear weapons stockpile. Radioactive decay depletes the available tritium by approximately 5.5% each year. In order for these weapons to operate as designed, tritium must be periodically replaced. Although tritium has not been produced by the U.S. for the stockpile since the shutdown of the last production reactor in 1988, tritium requirements have been met through reuse of tritium recovered from dismantled weapons. In order to maintain the START I force structure and five year reserve approved by the President in the 1996 Nuclear Weapons Stockpile Memorandum, a new production capability should come on line about 2005. To meet this date, site preparation and construction of the Tritium Extraction Facility (TEF) must begin in FY 2000. As part of the dual track production strategy, stated in the Record of Decision for the Tritium Supply and Recycling Final Programmatic Environmental Impact Statement, issued on December 5, 1995, the CLWR TEF shall be constructed at the Savannah River Site. The CLWR TEF shall provide the capability to receive and extract gases containing tritium from CLWR Tritium Producing Burnable Absorber Rods (TPBAR), or other targets of similar design. The TEF will provide shielded remote TPBAR handling for the extraction process, clean-up systems to reduce environmental impact from normal processing and accidental releases, and delivery of extracted gases containing tritium to the Tritium Recycle Facility for further processing.

The TEF will consist of a concrete industrial facility constructed partly below grade. The facility is divided into two major areas: (1) a 15,500 square foot remote handling area (RHA) and (2) a 26,500 square foot tritium processing building. The tritium processing building will be entirely above-ground; the floor of the RHA will be below grade. Major processes and operation systems included within the TEF will be: (1) the Receiving, Handling, and Storage System that will support all functions related the receipt, handling, preparation, and storage of incoming TPBAR and outgoing radioactive waste materials; (2) the Tritium Extraction System that will remove tritium and other gases from the TPBARs, remove contaminates from the gas stream, and store the tritium/helium mixture; (3) the Tritium/Product Process Systems that will separate and purify process gases from the irradiated TPBARs; (4) the Tritium Analysis and Accountability Systems that will support monitoring and tritium accountability; (5) the Solid Waste Management System that will receive solid waste generated by TEF for management and storage prior to disposal in the E-Area vaults; and (6) the Heating, Ventilation, and Air Conditioning System that would provide and distribute conditioned supply air to the underground RHA and the above ground tritium processing area and also discharge exhaust air to the environment via a 100-foot stack.

With CLWR as a basis, the TEF will provide steady-state production capability to the Tritium Recycle Facility (Building 233-H) of as much as 3Kg of tritium per year, if needed. Final purification of gases containing tritium shall be performed in the augmented process equipment located in the Tritium Recycle Facility.

The TEF shall have an operational life span of at least 40 years, minimize radiological and chemical releases to the environment; and minimize waste generation. The TEF security requirements shall be such that TEF is designated as an exclusion area and tritium processing facilities are to be located above ground.

Project Milestones

As baselined, the TEF will be dependent on the Tritium Modernization and Consolidation Project. With this project being completed during 3rd Quarter FY 2004, the final tritium systems will be available for processing extraction gases to ensure weapons stockpile requirements will be met in CY 2005.

98-D-126, Accelerator Production of Tritium, Various Locations

(Changes from FY 1998 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

In December, 1998 the Department selected the Commercial Light Water Reactor (CLWR) to serve as the primary source of tritium with APT to be developed as a backup capability. As backup, a development and demonstration program and preliminary design of the APT plant will be completed. Capital funding is necessary in FY 2000 to continue preliminary design of the APT plant. Detailed planning for APT as backup is underway. This budget request is based on best available planning information.

The FY 1999 budget request for the Tritium Supply Program was $157,000,000 in operating funds to pursue the tritium option selected by the Department in December 1998. No capital funding was requested. Congress appropriated $167,000,000 (operating). To fund necessary APT design activities in FY 1999, the Department requested $20,000,000 of the $167,000,000 operating funds be reprogrammed to capital funds. Approval of the reprogramming was granted in January 1999.

1. Construction Schedule History

Congress appropriated $167,000,000 (operating) To fund necessary APT design activities in FY 1999, the Department requested $20,000,000 of the $167,000,000 be reprogrammed to capital funds. Approval of the reprogramming was granted January 1999.

[b] The FY 2000 budget request is based on selection of APT as backup to the primary tritium production source. As backup, development and demonstration and preliminary design of the APT plant will be completed. Capital funding requested for FY 2000 is necessary to continue preliminary design activities.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
1998	67,865	67,865	36,722
1999	20,000 [c]	20,000	46,157
2000	31,000 [d]	31,000	38,795
2001	26,000	26,000	23,191
Total	144,865	144,865	144,865

3. Project Description, Justification and Scope

In December, 1998 the Department selected the CLWR to serve as the primary source of tritium with APT to be developed as a backup capability. As backup, an engineering development and demonstration program and preliminary design of the APT plant will be completed.

Tritium is a radioactive isotope of hydrogen used in all of the Nation's nuclear weapons. Without tritium, nuclear weapons will not work as designed. At present, no tritium is produced by the U.S. for the nuclear weapons stockpile. Radioactive decay depletes the available tritium by approximately 5.5% each year. A tritium production capability is required to maintain the nuclear defense structure.

The Secretary of Energy issued a Record of Decision for the Tritium Supply and Recycling Final Programmatic Environmental Impact Statement on December 5, 1995. That Record of Decision announced a plan to pursue a dual track production scenario to ensure an adequate tritium supply, which authorized work to 1) design, build, and test critical components of an accelerator system for tritium production; and 2) purchase an existing CLWR or irradiation services with an option to purchase the reactor for conversion to a defense facility.

On December 22, 1998 the Department selected CLWR to serve as the primary source of tritium with APT to be developed as a backup capability. As such APT must be prepared to be activated as the primary source relatively quickly for some years. To meet this mission the project will complete an engineering development and demonstration program and complete preliminary design for an accelerator-based plant to produce tritium. As the backup, the APT project continues two major activities: 1) the development and demonstration of key components of the linear accelerator and

[c] The FY 1999 budget request for the Tritium Supply Program was $157,000,000 in operating funds to pursue the tritium option selected by the Department in December 1998. No capital funding was requested. Congress appropriated $167,000,000 (operating). To fund necessary APT design activities in FY 1999, the Department requested $20,000,000 of the $167,000,000 be reprogrammed to capital funds. Approval of the reprogramming was granted January 1999.

[d] The FY 2000 budget request is based on selection of APT as backup to the primary tritium production source. As backup, development and demonstration and preliminary design of the APT plant will be completed. Capital funding requested for FY 2000 is necessary to continue preliminary design activities.

target/blanket technologies, and 2) the preliminary design of the APT plant. The program will complete its work in an orderly manner over a period of three years. At the end of that period the program will have proved all major technologies and produced a preliminary design of the plant with prototype designs for a few items advanced beyond preliminary design. Together these results and a site specific Environmental Impact Statement will make it possible, if necessary, to quickly start construction and to build an APT plant in a relatively short period of time. The three year period for completion of engineering development and demonstration and design will avoid an abrupt stop with concomitant major personnel layoffs.

Development activities include: demonstration of integrated high-power operation of the Low Energy Demonstration Accelerator (LEDA) up to 8 MeV, fabrication and high-field testing of a prototypic superconducting radio-frequency cryomodule and the high-power couplers that bring RF power into the superconducting cavities, materials performance analysis, target/blanket development, and validation of neutron and tritium production codes. The results of the development and demonstration program will be fully documented. Facilities with radioactive material will be cleaned up following completion of testing.

Preliminary design packages will be developed for each major facility subsystem and prototype design (with drawings) will be completed for a few key components needed early in construction. A Preliminary Design report will be prepared to fully document the design. Necessary environment, safety and health analysis and documentation will be completed to facilitate a rapid start of construction.

Project Milestones

FY 1998: Begin engineering design of the APT plant

Complete Modular Design Study of the APT plant

FY 1999: Continue engineering development and demonstration activities, including:

- Demonstration of radio frequency quadrupole operation

Complete Environmental Impact Statement for the Savannah River Site

Continue engineering design of the accelerator, target/blanket, and balance of plant facilities

FY 2000: Continue engineering development and demonstration activities

Continue engineering design of the accelerator, target/blanket, and balance of plant facilities

	(dollars in thousands) Current Estimate [e]	Previous Estimate [f]
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	108,649	254,566
Design Management Costs (6.0% of TEC)	8,692	26,567
Project Management Costs (5.0% of TEC)	7,243	22,139
Total Design Cost (86.0% of TEC)	124,584	303,272
Contingencies		
Design Phase (14.0% of TEC)	20,281	139,505
Total Line Item Cost [g]	144,865	442,777

5. Method of Performance

A multi-laboratory project team led by Los Alamos National Laboratory and supported by the Prime Contractor, Burns and Roe Enterprises, Incorporated (BREI), and the Savannah River Site Operator, Westinghouse Savannah River Company, are responsible for engineering development and demonstration. Other participating Laboratories include Brookhaven National Laboratory, Lawrence Livermore National Laboratories, Sandia National Laboratory, Pacific Northwest National Laboratory, Idaho National Engineering Laboratory, Thomas Jefferson National Accelerator Facility, and Oak Ridge National Laboratory.

The APT Prime Contractor (BREI), under a competitive bid cost-plus-incentive fee contract to the Department is responsible for the design of the plant. The Prime Contractor is performing the design with support from the project team, subcontractors, and consultants as necessary.

---

[e] The Current Estimate is based on selection of APT as backup to the primary tritium production source. The estimate is the cost of completing preliminary design.

[f] The FY 1998 Budget Request was for design only of the APT plant. This estimate includes the full cost of preliminary and final design, based on preconceptual design estimates. Construction is not included.

[g] Escalation rates taken from the FY 2000 DOE escalation multiplier tables issued with the current budget calls.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs							
Total facility costs							
Design [h]	0	67,865	20,000	31,000	26,000	0	144,865
Total facility costs (Federal and Non-Federal)	0	67,865	20,000	31,000	26,000	0	144,865
Other project costs							
Conceptual design cost [i]	38,611	0	0	0	0	0	38,611
NEPA documentation [j]	3,650	2,000	1,000	0	0	0	6,650
Other ES&H costs [k]	14,139	9,000	2,000	2,000	2,000	2,000	31,139
Other project related costs [l]	128,100	120,251	82,000	55,000	33,000	21,000	439,351
Total other project costs [g]	184,500	131,251	85,000	57,000	35,000	23,000	515,751
Total project costs	184,500	199,116	105,000	88,000	61,000	23,000	660,616

7. Related Annual Funding Requirements

(dollars in thousands)

	Current Estimate [m]	Previous Estimate [n]
Related annual costs		
Total related annual costs	NA	NA

[h] Preliminary design packages will be developed for each major facility subsystem and prototype design will be completed for a few key components needed early in construction

[i] The APT Conceptual Design Report was completed April 1997.

[j] NEPA documentation costs include permitting/licensing, and preparation of the APT Environmental Impact Statement for the Savannah River Site.

[k] Other ES&H costs include the safety analysis/assessments, preliminary safety analysis reports, technical safety requirements, and safety reviews. Necessary environmental, safety and health analysis and documentation will be completed to facilitate rapid start of construction (if needed in the future)

[l] Other project related costs include engineering development and demonstration and program / project management.

[m] Annual operating costs are not applicable to APT as backup.

[n] Annual operating costs are not applicable because the FY 1998 Budget Request was for design only of the APT plant.

97-D-123 Structural Upgrades, Kansas City Plant, Kansas City, Missouri

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left mar gin.)

Significant Changes

- The Total Project Cost (TPC) increases from $19.8 million to $21.2 million due to the application of burden on Other Project Costs (OPC) which previously had not been burdened.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1997 Budget Request (*Preliminary Estimate*)	2Q 1997	3Q 1998	3Q 1998	3Q 2003	18,000	19,800
FY 1998 Budget Request	2Q 1997	3Q 1999	3Q 1998	3Q 2003	18,000	19,800
FY 1999 Budget Request[a]	1Q 1998	3Q 1999	3Q 1998	3Q 2003	18,000	19,800
FY 2000 Budget Request (*Current Baseline Estimate*)	1Q 1998	4Q 1999	2Q 1999	2Q 2003	18,000	21,200

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1997	1,400	0	0
1998	0	1,400	0
1999	6,400	6,400	4,600
2000	4,800	4,800	5,600
2001	5,400	5,400	5,100
2002	0	0	2,000
2003	0	0	700

[a] Reflected baseline changes to ensure that all areas within the Stockpile Restructuring Initiative (SMRI) footprint are repaired/reinforced.

3. Project Description, Justification and Scope

This project is required to correct structural overstress caused by gravity loads and will reinforce masonry walls to resist seismic loading within the DOE controlled portion of the Bannister Federal Complex to ensure life safety. On December 16, 1993, a Kansas City Susceptibility Review and Walkdown was held at the Kansas City Plant by Albuquerque Operations Office, and Headquarters. This review was initiated as a result of a September 1993 report by an outside structural consulting firm that documented two principal areas of concern: existing structural overstresses and numerous unreinforced interior masonry walls. It was determined during the review that the structural overstresses and unreinforced masonry walls findings were an immediate concern.

To provide an immediate response to initiate risk reduction and potential loss of government assets, structural modifications were incorporated into all ongoing projects which appreciably renovated affected areas. Deficiencies in the remainder of the plant not affected by on-going projects are being addressed in this line item submission.

The first part of this line item is required to provide structural overstress relief in accordance with current building code and DOE Order requirements to ensure life safety. This type of overstress is caused by gravity loads (dead loads, live load and snow load) and wind loading only. Overstressed locations will be repaired to reduce the possibility of structural failure and bring the structure into compliance with DOE Orders and codes.

The second part of this line item is required to reinforce masonry walls to resist the seismic loading up to a "500 year event." The existing masonry walls will fall at a "100 year event." Approximately 40 percent of the masonry walls in the DOE controlled part of the Federal Complex (upon completion of the Stockpile Management Restructuring Initiative Line Item) are not reinforced to resist seismic loading. Seismic codes were not in place when the Kansas City Plant was constructed. Potential seismic overstresses have been identified because of the presence of many unreinforced masonry walls added to the building for fire protection purposes. Failure of these walls would constitute a life safety hazard in the event of seismic activity.

The Federal Complex is currently occupied by several Federal Government Agencies. Corrective activities will be performed in DOE controlled areas only, unless an item is identified through the engineering study that would affect both DOE and the General Services Administration. This project will include the following upgrades:

- Column ribs will be post tensioned on end bays to increase bending moment capacity. This will be done by tensioning two steel rods underneath the subject ribs. The rods will be anchored into the end bay roof beam and bolted through to the interior roof beam.
- Selected rib ends will be supported with steel suspenders and long threaded rods through the roof shell or saddles and fastened to the roof beams to increase rib shear capacity and overcome the member strength loss due to existing cracking caused by excessive shear loading.
- Roof shell openings will be reinforced with steel straps adjacent to openings and parallel to the barrel axis. This provides a means of externally reinforcing the thin concrete shell.
- The mezzanine roof slab will be reinforced with intermediate steel beams supported by the concrete roof support beams.

- Supplemental support will be provided to mezzanine concrete roof structure integrity. This would stop further deterioration of the shell.
- Roof shell cracks will be injected with epoxy to reestablish roof structure integrity. This would stop further deterioration of the shell.
- Structural steel blocking will be attached to the roof structure on each side of existing masonry walls. This will eliminate drift during seismic activity and ultimately failure of the walls independent of the remaining structure. This blocking would be spaced approximately 4 feet center to center. The blocking would consist of steel angles fastened to a horizontal surface with the vertical leg of the angle placed against the top of the masonry wall and flat plates fastened to vertical surfaces of the roof structure and lapped down over the top course of the masonry walls.
- Steel strong-backs will be installed adjacent to masonry walls. This strong-back will be a structural tube fixed to the building floor at the bottom of the wall and roof structure at the top. The wall would be bolted to the strong-backs at approximately 4 feet centers. The strong-backs themselves would be on 8 foot centers. This would prevent a tall wall from collapse during a seismic event that produced lateral movement normal to the wall.
- The top of free-standing masonry walls will be supported with roof structure mounted braces. These braces would then be mounted to a steel strut fastened to the roof.

Main Manufacturing Building Overstresses Under Gravity Loading:

- Roof Ribs - 4 percent of the ribs are overstressed.
- Roof Beams - < 1 percent of the beams are overstressed.
- Roof Shell With Openings - 34 percent of the roof shells are overstressed.
- Columns - 0 percent of the columns are overstressed.
- Basement Level Supported Floor Slab - 5 percent of the floor slab is overstressed.
- 2nd Level Supported Floor Slab - 6 percent of the floor slab is overstressed.

Seismic events at KCP can be generated by two faults. The New Madrid Fault is approximately 250 miles east of the Kansas City Plant. The New Madrid fault system extends 120 miles from the area of Charleston, Missouri and Cario, Illinois through New Madrid, Missouri and to Marked Tree, Arkansas. It crosses five state lines and crosses the Mississippi River in three places and the Ohio River in two places. The fault is active, averaging more than 200 measured events per year (1.0 or more on the Richter scale). Tremors large enough to be felt (2.5-3.0 on the Richter scale) are noted annually. Every 18 months the fault releases a shock of 4.0 or more capable of local minor damage. Magnitudes of 5.0 or greater occur about once per decade, can do significant damage, and can be felt in several states. A damaging earthquake along the fault of 6.0 or greater occurs about every 80 years with the last one in 1895. A major earthquake along the fault of 7.5 of greater happens every 200-300 years, with the last one in 1812. A quake of this magnitude would be felt throughout half of the United States. This information is based on a document titled "About the New Madrid Fault" from Southeast Missouri State University Center for Earthquake Studies, David Stewart, Director. The document is undated.

The other fault that could affect the Kansas City Plant is the Humbolt Fault Zone (Nehemma Ridge) located approximately 80 miles west of Kansas City in the Manhattan-Wamego, Kansas area. The largest earthquake that has occurred in Kansas is a probable Richter magnitude of about 5.2-5.3, which occurred in 1867 and events of this size can be expected to occur every 100 years. An earthquake of Richter magnitude 6.0-6.5 at this fault is likely to occur on average once in about 1000 years. This information is based on a document titled "Kansas Geological Survey" from the University of Kansas on October 10, 1990 by Don W. Steeples, Ph.D., Seismologist and Deputy Director.

In March 1994, the KCP was placed in performance Category 1, based on an extensive study of mission dependency of specific KCP operations, Production Risk Evaluation Program, and the hazard assessment in the Site Safety Assessment. This recommendation was agreed to by KCAO, AL, DOE-HQ, and AlliedSignal. A site specific Seismic Hazard Analysis was performed during the first quarter of FY 1994 by DOE-HQ for the KCP. This resulted in a reduction of the seismic zone factor from 0.15g to 0.06g. The Design Basis Earthquake (DBE) of 0.06g is comparable to a 500-year event. The former values are required by the 1994 Uniform Building Code for Zone 2A where the KCP is located. The lower seismic zone factor resulted in significant reduction in the calculations used in the analysis and has been taken into account in the cost estimate. The existing masonry walls are currently protected to a 100-year event.

The applicable DOE Orders and Codes that apply to this project are as follows:

- DOE Order 420.1, "Facility Safety."
- Executive Order 12941 "Seismic Safety of Existing Federally Owned or Leased Buildings."
- The American Institute of Steel Construction (A.I.S.C.), American Concrete Institute (A.C.I.), and Uniform Building Code (UBC) define analysis and design requirements for corrective actions.

The consequence of not funding this line item is a continued life safety risk due to structural overstresses and, in the event of seismic activity, potential failure of unreinforced masonry walls. This project is in accordance with current mission needs and is being coordinated with the Stockpile Management Restructuring Initiative.

Project Milestones

FY 1998: A-E work initiated

FY 1999: A-E work completed

Physical construction starts

FY 2000: Maintain schedules to complete physical construction by 2Q 2003

4. Details of Cost Estimate

	(dollars in thousands) Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	1,626	815
Design Management Costs (2.8% of TEC)	504	252
Project Management Costs (0.3% of TEC)	49	25
Total Design Costs (12.1% of TEC)	2,179	1,092
Construction Phase		
Buildings	10,830	10,830
Standard Equipment	360	360
Inspection, Design and Project Liaison, Testing, Checkout and Acceptance	918	1,660
Construction Management (4.7% of TEC)	842	842
Project Management (1.1% of TEC)	195	471
Total Construction Costs (73.0% of TEC)	13,145	14,163
Contingencies		
Design Phase (0.7% of TEC)	131	200
Construction Phase (14.1% of TEC)	2,545	2,545
Total Contingencies (14.9% of TEC)	2,676	2,745
Total, Line Item Costs (TEC) [b]	18,000	18,000

Overhead rates were calculated at a factor of 14 percent for procurement and 77 percent for internal labor.

5. Method of Performance

Design and inspection shall be performed under an AlliedSignal-negotiated architect-engineer subcontract. Construction will be accomplished by fixed price subcontracts awarded after competitive proposals and administered by AlliedSignal.

[b] Escalation rates taken from the FY 1997 DOE escalation multiplier tables. Escalation rates are calculated to the midpoint of each activity.

6. Schedule of Project Funding

(dollars in thousands)

1998	5,000 [g]	10,800	2,813
1999	5,000 [h]	10,200	14,729
2000	18,000 [i]	18,000	19,729
2001	20,450	20,450	21,179
2002	20,900	20,900	20,900
2003	19,800	19,800	19,800
2004	17,210	17,210	18,275

3. Project Description, Justification and Scope

The project has been restarted to address safety and reliability requirements as an outcome of the facility Basis for Interim Operation (BIO) review and associated Technical Safety Requirements (TSRs). Ongoing programmatic reviews and incorporation of corrective actions and lessons learned from Phase 1 Assessments will be utilized to ensure that required upgrades will be completed within current TEC of $174,100,000.

---

[e] $6,250,999 was reprogrammed to CMR, Phase 1 subproject of Nuclear Weapons Research, Development and Testing Facilities Revitalization Phase 3 (90-D-102) from Special Nuclear Materials Laboratory Replacement Project (88-D-105). Reprogramming 91-R-14 was executed in FY 1992.

[f] $1,000,000 was reprogrammed by DOE Internal Reprogramming to the CMR Upgrades Project (95-D-102) in the 1st Qtr. FY 1996 from Special Nuclear Materials Laboratory Replacement Project (88-D-105).

[g] Congress provided appropriations below the original request ($15,700,000) based on DOE input relating to estimated impact of project suspension.

[h] FY 1999 funding reduction from that presented in the FY 1998 CPDS is based on suspension and restart activities and Congressional reductions Funding in FY 1999 will be applied to Phase 1 design construction and Phase 2 design work.

[i] The FY 2000 funding request will be applied to ramp-up of construction projects supporting Basis for Interim Operations (BIO), safety systems, and Phases 1 and 2 design and construction. The FY 2000 funding of $18.0 million is based on current need requirements.

The Chemistry and Metallurgy Research (CMR) Building is the largest structure at the Los Alamos National Laboratory (550,000 square feet). Construction of the CMR Building was completed in 1952. Most of the major mechanical and electrical equipment has reached the end of its design life.

Since its construction over 40 years ago, the CMR Building has been used for research, development, and analytical work with plutonium, uranium and their alloys, and other materials in support of weapons, nuclear materials, and other Laboratory programs. This work continues to be essential to the nation's weapons program, with the principal activities in the building being in support of the plutonium research, development, and demonstration activities conducted at the Laboratory's Plutonium Handling Facility at TA-55. The activities that are critical to these plutonium operations are:

- Essential daily analytical chemistry and metallurgical services on plutonium and other actinides.
  - Analyses of plutonium metal preparations for the Laboratory's Weapons Research, Development, and Test Programs.
  - Analyses required for development and demonstration of new and improved processing methods for scrap recovery.
  - Analyses required for accountability and verification of material received or shipped and for on-site transfers.
- The CMR Building future role is also essential for support of several major Defense Programs areas which include:
  - Enhanced Safety and Reliability of Nuclear Weapons
  - Lead Technical Laboratory for Pu and U Processing
  - Weapons Dismantlement and Component Storage
  - Materials Disposition
  - Nonproliferation
  - Pit Production

The primary purpose of this project is to upgrade facility systems and infrastructure that have been in continuous operation for over 40 years and are near the end of their useful life. Such upgrading will ensure the continued safety of the public and Laboratory employees and increase the operational safety, reliability and security of essential activities. Increased safety, reliability, and security are critical to the continued operation of the Laboratory's Stockpile Management Programs and other national defense programs.

The Special Nuclear Materials Laboratory (SNML) Project was authorized (88-D-105) to replace the CMR Building at Los Alamos National Laboratory. In FY 1990, the project was put on hold pending a substantive review of the project including other potential options for providing the necessary specialized Laboratory space. As the planned completion date of the SNML continued to be pushed back, it became necessary to provide interim upgrades to CMR to allow its safe and reliable use;

$6,250,000 was reprogrammed (91-R-14, executed in FY 1992) from the SNML line item to Project 90-D-102, Nuclear Weapons Research, Development and Testing Facilities Revitalization, Phase 3 (WRD&T Revit., 3), subproject CMR Upgrades (Phase 1). Later in FY 1991, it was decided not to proceed with the construction of SNML but provide interim upgrades to CMR (Phase 1) and to identify further upgrades based on safety and risk assessment, for continued long-term operations. The result of these safety and risk assessments is an Interim Safety Analysis Report (ISAR). The findings of the ISAR are the basis for the scope of CMR Upgrades Phase 2, which was combined with Phase 1 to produce this stand alone line item in FY 1995.

The ISAR includes an analysis of risks associated with natural phenomena design basis accidents, current operations, and comparison to DOE Design Criteria (6430.1A). The ISAR was utilized as the basis to identify and prioritize upgrades that would be required to continue operations in a safe, secure, and reliable manner for at least the next 20 years.

CMR Phase 1 Upgrade

TEC	Previous	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start-Completion Dates
$51,600	$ 51,000	$ 600	$ 0	$ 0	$ 0	$ 0	3Q 1993 - 4Q 1999 [j]

Phase 1 was formerly part of WRD&T Revitalization, Phase III with a TEC of $49,500,000. Based upon the 1995 baseline change proposal and the completion of the CDR, the TEC changed to $51,600,000 and completion date changed from 3rd Qtr. FY 1996 to 3rd Qtr. FY 1999.

Phase 1 of this project consists of required and urgent capital equipment replacements and upgrades in the CMR Building. Individual tasks were initially identified by a panel commissioned by the Deputy Assistant Secretary for Military Application (DASMA) in July 1990, as the minimum essential effort required to maintain operations in the CMR Building while a Safety Analysis Report (SAR) was prepared.

The equipment replacements and upgrades included:

- **Continuous Air Monitor (CAM) Installations**
  Install a new CAM system in the Wings 3, 5, 7, and 9 laboratories. Upgrades include installation of CAMs, Fixed head Air Samplers (FAS), and glovebox hand monitors as required by DOE Order 5480.11 and AR 3-7. Remote monitoring capabilities at the Health Physics office and a data logging system are also included. Existing vacuum systems in Wings 3, 5, and 7 will be utilized while the vacuum system in Wing 9 will be expanded.

[j] Phase 1 Upgrade Project has been restarted to address safety and reliability requirements as an outcome of the facility; Basis for Interim Operations (BIO) Review and Associated Technical Safety Requirements (TSRs).

- **HVAC Blowers and Motors**
  Replace existing laboratory exhaust fans in the CMR Building and provide vibration analysis for approximately twenty exhaust fans in the CMR Building. Immediate needs are to replace the 200 HP exhaust fans on the first floor of the filter towers in Wings 3, 5, and 7. Other exhaust fans may require replacement contingent on the scope of the Phase 2 Confinement Zone Separation upgrade.

- **Electrical Upgrades**
  The Distribution Analysis and Power Planning Evaluation and Reporting (DAPPER) software will be used for analysis, calculations, and record drawings for all electrical upgrades. Provisions to incorporate a future facility computer monitoring and limited control system will be provided as part of the Electrical Upgrades.

  Exterior Electrical Upgrades: Replace inadequately sized exterior sectionalizing switches, eliminate existing exterior single point failures, modify exterior underground electrical system to allow switching and maintenance functions, upgrade existing controls and correct deficiencies to the existing administration wing, and Wings 1, 3, 4, and 9 substations.

  Substations Upgrade: Replace substations in Wings 2, 5, and 7.

  Wing Electrical Upgrades: Upgrade the interior low voltage power distribution system for all wings except 2 and 4 in the CMR Building. This includes the replacement of power and lighting panel boards, laboratory power panel boards, bus ways, motor control centers, replacement of all obsolete branch and feeder wiring systems, rewiring of laboratories, and upgrading the emergency and exit lighting systems.

  Electrical Upgrades to Support Safe Standby, Wings 2 and 4: Upgrade the interior low voltage power distribution system in Wings 2 and 4, which is necessary for safety systems.

  Spinal Corridor Cable Tray: Provide a cable tray system in the attic spinal corridor.

  Grounding and Lightning Protection: Upgrade the CMR Building grounding and lightning protection systems.

- **Stack Monitors Upgrade**
  Provide a stack effluent monitoring system for the CMR Building that is in compliance with DOE and EPA requirements. Each stack will be evaluated to determine the type of monitoring required. Each stack system will be stand alone, consisting of in-line samplers, CAMS, vacuum pumps, and associated tubing, wiring, and signal processing equipment. This upgrade also

includes a data collection system from all of the stack CAM's to the CMR operations room and the ES&H operations room. The stack effluent monitoring will be in compliance with 40 CFR 61 and DOE Order 6430.1A.

- **Uninterruptable Power Supply (UPS) Installation**
  This Upgrade is in support of the Stack Monitors Upgrade. There will be one UPS supporting the stack monitoring data collection computer systems. The UPS will be capable of providing backup power to the stack effluent monitoring systems for a 4 hour period.

- **Duct Modification**

  Backdraft Dampers: Provide positive shutoff intake backdraft dampers in the supply air ductwork in Wings 2, 3, 4, 5, 7, and 9.

  Duct Washdown Upgrade: Upgrade the existing exhaust duct washdown system in Wings 3, 5, and 7. This includes replacement of piping, valves, and spray heads and installation of new flow measurement devices.

- **Sanitary Sewer Upgrades**
  This subproject was completed 3rd Quarter of FY 1994.

- **Acid Vents and Drains Upgrades**
  Aging piping and a lack of gradient in the acid drain system in the basement of the CMR Building has led to corrosion and clogging of the system. This upgrade includes evaluation and documentation of the existing system, prioritization of the system deficiencies, and cost estimates to correct each deficiency for Wings 3, 5, and 7. Construction will include replacement of piping and components including threaded nipples, fittings, valves, flanged fittings, and gaskets with compatible new components. Remaining system replacement will be incorporated in Phase 1.

- **Fire Hazard Analysis (Formerly Fire Protection Upgrades)**
  This subproject was completed in the 2nd Qtr. FY 1996.

- **Safety Analysis Report**
  This subproject was completed in the 4th Qtr. FY 1995.

- **Engineering Assessments/CDR/EA**
  Engineering Assessment--This project was completed 2nd Qtr. FY 1996.
  An environmental assessment, including all aspects of Phase 2, has been prepared and approval based upon the conceptual design report. This EA assessed the environmental impact of construction as represented by the Phase 2 scope of work.

CMR Phase 2 Upgrade
The Phase 2 components are needed to maintain infrastructure, improve safety for public and workers and enhance environmental management.

TEC	Previous	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start-Completion Dates
$122,500	$ 6,140	$ 4,400	$ 5,000	$ 18,000	$ 20,450	$ 68,510	2Q 1997 - 4Q 2004 [h]

Based upon completion of the CDR for the Phase 2 scope, the TEC for this phase was increased from $85,000,000 to $122,500,000. The construction start date changed from 2nd Qtr. FY 1996 to 2nd Qtr. FY 1997 and the end date changed from 4th Qtr. FY 2003 to 4th Qtr. FY 2004.

The scope of the following subprojects is being reviewed in FY 1998 based on ongoing programmatic evaluations and incorporation of corrective actions and lessons learned from the Phase 1 assessments to ensure that required upgrades will be completed within the current TEC of $174,100,000.

The additional long term upgrades developed by the Phase 2 CDR process are:

- **Seismic and Tertiary Confinement (Wings 3, 5, 7, and 9)**
  Structural strengthening to meet the seismic criteria for hazard Category 2 operations. Modification of the existing exterior structural openings in these wings to create a tertiary confinement barrier. Structural strengthening of the Administration Wing (which houses the Operations Center) to meet the seismic criteria for worker safety. Hardening of building openings to security requirements which are also being modified for tertiary confinement. These openings include doors, windows, louvers, etc.

- **Ventilation and Confinement Zone Separation (Wings 3, 5, 7, and 9)**
  Renovate the mechanical systems and the related control systems to replace components that are near the end of their useful lives and to improve confinement zone separation throughout each Wing. Architecturally modifying Wings 3, 5, and 7 to create a secondary confinement barrier.

---

[c] Project has been restarted to address safety and reliability requirements as an outcome of the facility; Basis for Interim Operations (BIO) Review and Associated Technical Safety Requirements (TSRs).

[i] The FY 2000 funding request will be applied to ramp-up of construction projects supporting BIO, safety systems, and Phases 1 and 2 design and construction. The FY 2000 funding of $18.0 million is based on current need requirements.

[h] FY 1999 funding reduction from that presented in the FY 1998 CPDS is based on suspension and restart activities and Congressional reductions. Funding in FY 1999 will be applied to Phase 1 design construction and Phase 2 design work.

Providing an alarm for each enclosure to alert workers when the mechanical systems are not operating according to safety standards for the facility. Providing a central, chilled water plant to support the mechanical systems' renovations to the building.

- **Standby Power (Wings 3, 5, 7, and 9)**
  Provide standby electrical power to operate the most important mechanical systems at a reduced level sufficient to maintain negative pressure in the laboratory enclosures. This will reduce possibility of spread of contamination due to the loss of offsite power to the ventilation system.

- **Communications (Wings 3, 5, 7, and 9)**
  Improve emergency communications systems thereby improving worker safety.

- **Wing 1 (HVAC) Upgrades/Wing 1 Interim Decontamination**
  Decontaminate the unoccupied, contaminated laboratories in Wing 1, modifying the HVAC exterior intake and exhaust locations for Wing 1 to improve worker health and safety.

- **Operations Center (Administration Wing)**
  Improve the ergonomics and reliability of the building's central monitoring and control capabilities. Install transfer capability and wiring from the standby power generator to the CMR Operation Center to support all functions or systems required to recover the facility after significant accidents.

- **Process Chilled Water (Wings 3, 5, and 7)**
  Replace the 2 existing 40 year old evaporative coolers in each Wing with a single refrigeration unit to provide chilled water for process equipment. Also, replace the existing 40 year old process chilled water piping system with a new piping system.

- **Main Vault**
  CAMs - Install new Canberra CAMs in the vault, ASM 2000 controllers in the anteroom, and incorporate remote monitoring (similar to Wing CAM systems) to the ES&H office. This upgrade would utilize the generic design established for the Wing CAMs.

- **Acid Vents and Drains (Wings 3, 5, and 7)**
  Correct deficiencies not covered in Phase 1 upgrades (Phase 1 addresses major leaks and flanges). Correct area with inadequate slope, replace branches and risers to laboratories as required, and upgrade the ventilation of the system.
- **Fire Protection Upgrades (Entire Facility)**
  Correct fire protection system deficiencies as identified in the 1992 NFPA 101 analysis, and the Fire Hazard Analysis completed in Phase 1. Deficiencies will be prioritized in a cost benefit analysis which will be completed in Phase 1. Examples of current identified deficiencies are: Add check valves in fire protection risers, add backflow preventors in the sprinkler system, provide fire dampers in duct penetrations, replace fire alarm panels.

- **Exhaust Duct Washdown Recycling System (Wings 3, 5, and 7)**
  This recycling system will significantly reduce the waste stream from the facility. The reduction in the waste stream will reduce the demands on the current waste treatment plant.

- **Wings 2 and 4 Safe Standby**
  This upgrade includes the costs necessary to establish a safe standby condition for Wings 2 and 4 pending future programmatic use. Included are identification of safety systems required for safe standby deactivation/decontamination of abandoned systems and gloveboxes, removal of all radioactive materials and chemicals, and removal or stabilization of all loose contamination.

- **ES&H Support Activities**
  Additional enhanced ES&H support activities based on the lessons learned from Phase 1 are being incorporated. These efforts include waste management, waste minimization, ES&H support, risk analysis, and ES&H equipment including personnel protective equipment.

Project Milestones

FY 1999: Start -	Phase 1 - Stack Monitors
	Phase 1 - Ductwork (Duct Washdown)
	Phase 2 - Portion of Fire Protection (Fire Alarm Panels, Combustible Loading) [k]
	Phase 2 - Portion of Wings 2 and 4 Safe Standby (HVAC DP Indicators)
	Phase 2 - Portion of Ventilation and Confinement Zone (HVAC DP Indicators, Wing 9 Ventilation, Air Compressors) [k]
	Phase 2 - Portion of Communications (EPAS) [k]

[k] Activities to be completed per the Technical Safety Requirements (TSR) Implementation Plan schedules.

	Complete -	Phase 1 - Ductwork (Duct Washdown) Phase 2 - Portion of Fire Protection (Fire Alarm Panels, Combustible Loading) [k] Phase 2 - Portion of Wings 2 and 4 Safe Standby (HVAC DP Indicators) [i] Phase 2 - Portion of Ventilation and Confinement Zone (HVAC DP Indicators, Air Compressors) [k] Phase 2 - Portion of Communications (EPS) [k]
FY 2000:	Start -	Phase 1 - Sanitary Sewer Phase 1 - Acid Vents and Drains Phase 1 - Continuous Air Monitors Phase 1 - Electrical Phase 1 - Power Distribution Phase 1 - Fire Protection Phase 2 - Portion of Ventilation and Confinement Zone (HVAC Testing and Balancing, Controls Upgrades)
	Complete -	Phase 1 - Sanitary Sewer Phase 1 - Acid Vents and Drains Phase 1 - Stack Monitors Phase 1 - Continuous Air Monitors Phase 1 - Fire Protection Phase 2 - Portion of Ventilation and Confinement Zone (Wing 9 Ventilation, HVAC Testing and Balancing)

[k] Activities to be completed per the Technical Safety Requirements (TSR) Implementation Plan schedules.

[i] The FY 2000 funding request will be applied to ramp-up of construction projects supporting BIO, safety systems, and Phases 1 and 2 design and construction. The FY 2000 funding of $18.0 million is based on current need requirements.

Phase 2 Subtotal	31,753	16,798	57,990	250	15,715	122,500
Total Estimated Cost	42,870	30,803	77,640	4,174	18,619	174,100

Engineering, design, and inspection cost-of-services were estimated from historical records and experience with drawing and man hour requirements established for each discipline, ED&I represents approximately 15 percent of TEC. ED&I costs captured in Phase 1 included Phase 2 planning and CDR development for Phases 1 and 2. Phase 2 ED&I represent approximately 17.7 percent of Phase 2 TEC.

Contingencies represent approximately 10.7 percent of TEC. The contingency rate is the result of a contingency analysis of various items based on relative risk ratings compared to ratings of relative importance of a particular item to the project. The analysis of various items results in different contingency rates depending on the item. The contingency rate shown here is an average rate resulting from the contingency analysis and weighing according to the item's relative cost.

4. Details of Cost Estimate [l] [p]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design and Management Costs		
Preliminary and Final Design Costs (Drawings and Specifications)	25,989	25,989
Design Management Costs (2.7% of TEC)	4,814	4,814
Project Management Costs (6.7% of TEC)	11,744	11,744
Total Design Costs (24.4% of TEC)	42,547	42,547
Construction Phase		
Special Equipment	77,640	77,640
Other Structures	4,174	4,174
Construction Management (3.1% of TEC)	5,391	5,391
Project Management (14.7% of TEC)	25,729	25,729
Total Construction Costs (64.9% of TEC)	112,934	112,934
Contingencies		
Design Phase (2.9% of TEC)	5,031	5,031
Construction Phase (7.8% of TEC)	13,588	13,588
Total Contingencies (10.7% of TEC)	18,619	18,619
Total, Line Item Costs (TEC) Phase 1 and Phase 2 [q]	174,100	174,100

5. Method of Performance

Procurement will be accomplished under fixed-price subcontracts awarded on the basis of competitive bidding. Consideration will be given to cost-plus-fixed fee on decontamination and refurbishment work on the CMR. Upgrades construction will be done by fixed price contractors and the Laboratory's support services subcontractor. The operating contractor and contracted Architect-Engineers will perform construction inspection.

6. Schedule of Project Funding

(dollars in thousands)

---

[l] The estimates does not include site overhead/landlord costs since FY 1992 was the first year of project funding.

[p] Project management and contingency were prorated based on the ratio of total design (27.4%) and construction (72.8%) costs. Previously project management and contingency were not required to be broken out by the design phase and the construction phase when the project was baselined.

[q] Escalation rates taken from the FY 1995 DOE escalation multiplier tables.

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project costs							
Total facility costs							
Design	36,505	600	1,700	2,500	3,000	3,273	47,578
Construction	20,170	2,213	13,029	17,229	18,179	55,702	126,522
Total facility costs (Federal and Non-Federal)	56,675	2,813	14,729	19,729	21,179	58,975	174,100
Other project costs							
Other project-related costs	11,268	1,700	2,000	2,000	2,000	30,567	49,535
Total other project costs	11,268	1,700	2,000	2,000	2,000	30,567	49,535
Total Project Cost (TPC)	67,943	4,513	16,729	21,729	23,179	89,542	223,635

7. Related Annual Funding Requirements

(FY 2004 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project–40 years)		
Facility operating costs	10,000	10,000
Facility maintenance and repair costs	2,500	2,500
Programmatic operating expenses directly related to the facility	30,000	30,000
Capital equipment not related to construction but related to the programmatic effort in the facility	1,000	1,000
GPP or other construction related to the programmatic effort in the facility	1,000	1,000
Utility costs	2,450	2,450
Total related annual costs (operating from 2004 through FY 2043)	46,950	46,950

88-D-123 Security Enhancements, Pantex Plant, Amarillo, Texas

(Changes from FY 1996 Significant Changes Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

- FY 2000 funding request to increase project total estimated cost (TEC) by $6,200,000.
- Extend the project completion from 4th quarter FY 1998 to 4th quarter FY 2000.
- Increase the other project costs (OPC) costs associated with the schedule extension.

1. Construction Schedule History [a]

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1988 Budget Request *(Preliminary Estimate)*	1Q 1988	2Q 1992	2Q 1988	1Q 1994	109,700	114,700
FY 1989 Budget Request	1Q 1988	2Q 1992	2Q 1988	3Q 1994	109,700	114,700
FY 1990 Budget Request	2Q 1988	2Q 1992	4Q 1988	4Q 1995	109,700	114,700
FY 1991 Budget Request	2Q 1988	2Q 1992	4Q 1988	3Q 1996	109,700	114,700
FY 1992 Budget Request	3Q 1988	3Q 1994	4Q 1988	3Q 1996	109,700	114,700
FY 1994 Budget Request	3Q 1988	1Q 1995	3Q 1990	4Q 1997	125,000	130,000
FY 1995 Budget Request	3Q 1988	4Q 1995	3Q 1990	4Q 1997	125,000	130,000
FY 1996 Budget Request	3Q 1988	4Q 1995	3Q 1990	4Q 1997	125,000	130,000
FY 1997 Budget Request	3Q 1988	4Q 1995	3Q 1990	4Q 1997	125,000	130,000
FY 2000 Budget Request *(Current Baseline Estimate)*	3Q 1988	3Q 1996	3Q 1990	4Q 2000	131,200	143,600

[a] No Construction project data sheet was included with the budget requests for FY 1993, FY 1998 and FY 1999.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design/Construction			
1988	5,700	5,700	69
1989	7,500	3,500	2,586
1990	5,417	2,417	3,514
1991	18,244	23,701	8,407
1992	30,000	30,692	15,042
1993	0	372	9,700
1994	20,000	1,862	10,647
1995	15,000	21,707	20,015
1996	13,400	20,992	21,896
1997	9,739	5,922	14,867
1998	0	2,786	6,568
1999	0	4,849	7,479
2000	3,500	3,500	7,000
2001	2,700	3,200	3,420

The Security Enhancements Project was initiated in 1988 to address security risks at Pantex. Twelve subprojects were identified to address these risks. The project is currently 94 percent complete, with ten of the twelve subprojects 100% complete, and an eleventh fully funded. The project is currently in the final stages, activation and cut over to the new system.

This project has seen a cost growth of about $9.0 million due to enhanced mission criteria, directed scope changes, and software development cost overruns. Actions have been taken to manage spending and control costs within the existing funding limits. However, an additional $6.2 million is required to finish the project.

The funding increase will assure successful activation of the Electronic Enhancements subproject and complete procurement and installation of the Aircraft Detection System (ADS). ADS is a high security priority and will reduce security costs by $1.5 million per year.

Discussion:

The SEP is currently ninety-four (94) percent complete, of which ten (10) of the twelve (12) subprojects are 100% complete and operational. The remaining subprojects to be completed are Security Command Center Expansion, and the Electronic Enhancements subproject which includes the Aircraft Detection System (ADS). In reference to the open subprojects, the Security Command Center Expansion subproject is ninety-three (93) percent complete and fully funded with the remaining activity contingent upon the demolition of the existing security system, scheduled for the end of the project. The Electronic Enhancements Subproject is eighty-eight (88) percent complete with ninety-five (95) percent of the hard construction activity completed. The remaining activities are primarily associated with the validation/cut over of operations from the old system to the new ARGUS system, and the procurement

and installation of the ADS. If no additional funds are provided, the site will be required to accept risk and higher operational costs, estimated to be a minimum of $1.5 million per year.

The shortfall has resulted from the need to support changed requirements and costs associated with LLNL.

- In January 1995, the DP Baseline Change Control Board approved BCP04, providing $2.5 million in support of the SNM Component Facility Backfit activity to reconfigure the vaults to "stage right", to be consistent with operations in Zone 4 and the upgrades in design to meet DOE Order 6430.1A non-reactor nuclear facility requirements.
- March 1996, the DP Baseline Change Control Board rejected the project's request for $2.5 million to address directed changes. The Board approved the required work be incorporated through the use of contingency funds. Electronic Enhancements project contingency was decremented $1.5 million to address changed Life Safety Code/Security requirements. Other subproject funds were decremented to address an increase in capability to store Strategic Reserve Pits.
- $5.0 million has been reallocated to cover software development cost overruns by LLNL. Several factors have contributed to these overruns. The system is "technologically advanced" and has resulted in a higher number of technical issues to be resolved than anticipated by LLNL, as part of the system development. Another contributing factor was the unavailability of a factory test bed large enough to prove functionality before being installed in the field at Pantex. This has resulted in a higher number of unforeseen software problems and configuration issues requiring LLNL resolution to meet security requirements and functionality.

In conclusion, the Security Enhancement Project has been conscientiously managed within the TEC funding level of $125 million. $9.0 million of $13.6 million in increased scope requirements and cost overruns have been absorbed within previously appropriated funds. It should be understood that the complexity of the Pantex environment provides a worst case test bed for this project as all modules are being implemented at this site. Successful implementation at the Pantex site should provide lessons learned in assuring a high probability of successful implementation at other sites.

3. Project Description, Justification and Scope

This project identifies subprojects required to enhance the Pantex security posture.

These subprojects reflect the best security enhancement from information and emphasis known to date. The scope and priority of each subproject is subject to subsequent revision to reflect the results of further vulnerability assessments, field exercises, and inspections and management direction. This is required to assure that the results of further threat scenario analysis are considered in the actual implementation of the subprojects. The project costs reflect this.

The Production Zone (Zone 12 South), the Special Nuclear Material (SNM) Isolation Area, the Staging Area (Zone 4 West), and the general site include projects which enhance Pantex physical protection, detection alarm assessment, SNM facilities, safeguards of SNM, access control, and security training.

Each subproject includes associated site work for drainage, roads, parking, and utilities. Also included are foundations, walls, roofs, doors, windows, water, sewer, HVAC mechanical equipment, fire protection, alarms, lights, and electrical power to make it functional and satisfy general facility design requirements.

a. Subproject 01 - SNM Component Staging Facility

TEC	Previous TEC from FY 1996 CPDS	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start-Completion Dates
$24,531 [b]	$22,300	$0	$0	$0	$0	$0	1st Qtr FY 1991-2nd Qtr. FY 1998

This subproject is complete. Authorization for facility operation was issued July 1998.

b. Subproject 02 - Protected Area Enhancements

TEC	Previous TEC from FY 1996 CPDS	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start-Completion Dates
$ 2,834 [b]	$ 4,600	$0	$0	$0	$0	$0	3rd Qtr FY 1990-2nd Qtr FY 1991

This subproject is complete. Key Decision 4 was issued September 1992.

c. Subproject 03 - Electronic Enhancements

TEC	Previous TEC from FY 1996 CPDS	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start-Completion Dates
$81,183 [c]	$74,270	$0	$0	$3,500	$2,700	$0	4th Qtr. FY 1993-4th Qtr FY 2000

This subproject is for the replacement and enhancement of electronic security systems at the Pantex Plant. This subproject includes a Closed-Circuit Television Surveillance System, an Aircraft Detection System, and a Compartmentation and Security Alarm System Upgrade. Major systems to be included are: the

[b] Current TEC reflects final subproject costs

[c] Estimated cost at project completion

PIDAS in Zones 4 and 12, the Interior Security Alarm Systems (ISAS), the Compartmentation, and the Aircraft Detection System (ADS). Other systems required to support the above include: Closed-Circuit Television (CCTV) systems, telecommunications, computerized processing systems, and operator interface consoles located in the Security Command Center (SCC); and the Alternate Command Post (ACP). The other subprojects, integrated into the above security systems, are Radio Communications equipment, and procurement and installation of PPIV, both integrated with Security Alarm System upgrades (Argus Access Control).

This subproject is to accomplish several tasks. Upgrading and enhancing the alarm systems include the responsibility to integrate as well as to modernize. Secured radio broadcasts will add to the security effectiveness at Pantex. Following are the detailed justifications:

- PIDAS: The existing PIDAS in Zones 4 and 12 have been in place for several years. Both systems have aged and are increasingly difficult to maintain. As a first line of defense against intruders into SNM areas and as a means of detecting insiders attempting to escape with stolen material, it is important for PIDAS to perform as well as possible.
- ISAS: The Interior Security Alarm Systems (ISAS) are also several years old and are of many incompatible varieties. The ISAS will be replaced with a single integrated system providing a composite risk reduction of 2-3 orders of magnitude, a single-man-machine interface, a single maintenance program and the reliability of a redundant system.
- ADS: The Aircraft Detection System (ADS) is required in order to detect the intrusion of rotary or fixed wing aircraft into the plant. The topographical features of the Pantex Plant include flat, treeless terrain with no tall buildings. Such terrain does not inhibit low flying or landing aircraft.
- Radio Communications: Construction of this activity was completed March 1998.
- Compartmentation: Compartmentation provides additional protection against the outsider and reduces the risk against the insider. To the outside, Compartmentation offers another obstacle and at the very least an additional delay because each work area becomes a vault which is in a locked condition. To the insider, Compartmentation is a deterrent that makes it harder to accomplish his goal. To security, Compartmentation increases the delay time for the outsider and reduces the number of potential insiders possible in a particular area. Compartmentation also raises the number of insiders needed to accomplish successfully their goal, thus making detection of the insider easier. Compartmentation is an effective method of reducing the risks associated with the insider threat by limiting the number of personnel with access to production work areas. Independent, as well as "in-house," security analysis initiated Compartmentation, based on assessments of targets, insider vulnerability, and procedural noncompliance.

d. Subproject 04 - Central Shipping and Receiving Facility

TEC	Previous TEC from FY 1996 CPDS	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Construction Start-Completion Dates

This subproject will consist of two activities, facility expansion and facility renovation to the Security Command Center, Building 12-75, Computer Room.

Facility Expansion is complete. Key Decision 4 was issued October 1996.

Renovation of the existing computer room will be performed at the completion of the Pantex/Argus system cut-over.

Project Milestones

FY 1999: Electronic Enhancements subprojects:

Aircraft Detection System (ADS): Design and Procurement

Perimeter Intrusion Detection & Assessment System (PIDAS): Complete system Cut-Over

Interior Security Alarm System (ISAS): Start System Cut-Over

Compartmentation: Start System Cut-Over.

Positive Personnel Identification and Verification (PPIV): Start-up of booths located at Station A, B, 20, 26, 28, 30, 88 and Gate MW-20.

[b] Current TEC reflects final subproject costs.

[c] Estimated cost at project completion.

FY 2000: Electronic Enhancements subprojects:

Interior Security Alarm System (ISAS): Complete System Cut-Over

Compartmentation: Complete System Cut-Over

Aircraft Detection System (ADS): Start-up

5. Method of Performance

The design services (Studies, Title I, Title II, and partial Title III) will be accomplished by outside A-E firms and will be administered by the Department of Energy or the Operating Contractor (Mason & Hanger-Silas Mason Co., Inc.).

The construction services of this project will be performed by outside construction contractors operating under fixed-price, lump-sum contracts to be awarded on the basis of competitive bids. These contracts will be administered by DOE, and/or the Operating Contractor. The construction contractors will perform all work in accordance with the construction documents.

All equipment not specified to be procured and/or installed by the construction contractors will be procured and/or installed by the operating contractor (Mason & Hanger-Silas Mason Co., Inc.).

Construction Management Services will be performed by the DOE, Operating Contractor, and/or by a construction management firm under contract to DOE or the Operating Contractor.

Final connections for new security alarms, fire alarms and specific communications equipment will be accomplished by the Operating Contractor.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Outyears	Total
Total project cost							
Total facility Cost							
Design	21,864	600	249	412	15	0	23,140
Construction	84,869	5,968	7,230	6,588	3,405	0	108,060
Total facility costs (Federal and Non-Federal)	106,733	6,568	7,479	7,000	3,420	0	131,200
Other project costs							
R&D necessary to complete construction	172	0	0	0	0	0	172
Conceptual design cost	233	0	0	0	0	0	233
NEPA documentation costs	15	0	0	0	0	0	15
Other project-related costs	4,580	3,520	2,000	1,500	380	0	11,980
Total other project costs	5,000	3,520	2,000	1,500	380	0	12,400
Total Project Cost (TPC)	111,733	10,088	9,479	8,500	3,800	0	143,600

7. Related Annual Funding Requirements

(FY 2000 dollars in thousands)

	Current Estimate	Previous Estimate
Related annual costs (estimated life of project–25 years)		
Facility operating costs	1,000	1,000
Programmatic operating expenses directly related to the facility	1,000	1,000
Total related annual funding (operating from FY 2000 through FY 2024)	2,000	2,000

Weapons Activities Program Direction

Mission Supporting Goals and Objectives

Program Direction provides funds for all Federal personnel-related expenses for Defense Programs offices at the Department of Energy (DOE) Headquarters and the Albuquerque, Nevada, Oak Ridge, Oakland, and Savannah River Operations Offices. At the Albuquerque and Nevada Operations Offices, Defense Programs also provides for technical and administrative Federal support for other DOE programs. Funding is provided for technical support throughout the Defense Programs complex in the areas of environment, safety, and health; safeguards and security; National Environmental Policy Act compliance; and compliance with Federal and state legislation, response to Defense Nuclear Facilities Safety Board recommendations, Departmental Executive Orders, and Departmental Strategic Alignment Initiatives (SAI).

Performance Measures

- Continue to meet or exceed reductions in Strategic Alignment Initiative Federal Staffing targets while providing program, policy, and operational oversight of the Stockpile Stewardship Program.
- Continue to implement the recommendations of the 120-Day Study.
- Undertake an independent assessment of the Stockpile Stewardship Program and its implementation throughout the DP national security enterprise.

[a]This FTE level represents an employment ceiling. Defense Programs anticipates an employment level below the ceiling.

[b]This FTE level represents an employment ceiling. Defense Programs anticipates an employment level below the ceiling.

[c]Reflects reduction of $284,000, the Weapons Activities Program Direction allocated share of the bottom line Weapons Activities appropriations reduction for the use of prior year balances.

[d]Reflects reduction of $4,603,000, the Weapons Activities Program Direction allocated share of the bottom line Weapons Activities appropriations reduction for the use of prior year balances.

[e]This FTE level represents the employment ceiling. Defense Programs anticipates a total employment level below the ceiling.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
In FY 1998 Defense Programs aggressively sought to reduce its staffing levels in order to come into line with the Department's Strategic Alignment Initiative staffing targets. As a result of these efforts, DP's actual staffing was reduced by about 160 during FY 1998, of which 88 were incentivized separations, 17 were involuntarily separated, and the remainder through normal departures and retirements. The estimated cost of these incentivized and involuntary separations in FY 1998 was about $4.7 million.	133,379[a]	143,627	146,948
In FY 1999, 18 staff were transferred from the Office of Environmental Management to DP to support the oversight of waste management activities at the Los Alamos and Sandia National Laboratories and the Pantex Plant.		1,440	1,476
Begin in FY 1999 5 Annual Payments to convert the TSD couriers to a 20 year retirement schedule		3,500	3,500
Total, Salaries and Benefits	133,379	148,567	151,924
Travel			
Travel includes funding for the transportation of Government employees, their per diem allowances while in authorized travel status, and other expenses incidental to travel. Travel also includes transportation of things; an example, the transportation of household goods related to a permanent change of station. A significant element of this category is the travel for the Transportation Safeguards Division (TSD) couriers which has been low through FY 1998.	8,547	10,647	10,956

[a]Does not reflect use of $13,085,000 in prior year balances to mitigate effects of reduced appropriations, consistent with the FY 1998 Energy & Water Development Appropriations Conference Report (H.R. 105-271).

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Support Services			
Technical support includes services to determine feasibility of design considerations, development of specifications, system definition, system review and reliability analyses, economic and environmental analyses, test and evaluation, surveys or reviews to improve the effectiveness, efficiency, and economy of technical operations.	23,257	17,487	16,255
Management Support services include analysis of workload and work flow, directives management studies, automatic data processing, manpower systems analyses, assistance in the preparation of programs plans, training and education, and any other reports or analyses directed toward improving the effectiveness, efficiency, and economy of management and general services.	21,236	18,992	20,157
Total, Support Services	44,493	36,479	36,412
Other Related Expenses			
Contractual support and other related expenses for the Albuquerque and Nevada Operations Offices where Defense Programs acts as the Department's landlord and is responsible for providing federal work space and maintenance support at these locations (decrease in FY 1999 from FY 1998 reflects transfer of LANL fire protection services contract to LANL from AL).	26,751	21,610	26,849
Defense Programs makes an annual $250,000 payment in lieu of taxes to the County of Los Alamos.	250	250	250
Support to the Los Alamos County School District and annual endowment payments to the Foundation to support educational enrichment activities in northern New Mexico [Funding responsibility for payments to the Los Alamos School District and the Foundation transferred to Weapons Stockpile Stewardship, Education in FY 2000].	11,100	10,000	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Provide support to northern New Mexico tribal governments to aid them in their ongoing efforts to protect Tribal rights and assist departmental decision-making relative to the Los Alamos National Laboratory [Funding responsibility for the Tribal agreements is proposed to be transferred to Weapons Stockpile Stewardship, Special Projects in FY 2001]	500	750	750
Contractual support and other related expenses for DP federal staff at Operations Offices where DP is not the landlord	4,901	4,384	4,455
Contractual support, other related expenses, and the Headquarters Working Capital Fund: During FY 1998, Defense Programs returned approximately 8,500 square feet of office space to the Department. Not only will this reduce DP's costs, it should reduce total Department costs as it will allow other organizations to vacate currently leased off-site space Also included in this category is DP's allocated share of ongoing Department activities that provide benefit to Defense Programs. In FY 1998 these activities included the National Science Bowl ($100,000); the Diversity Partnership Program ($60,000); the Research and Development In the United States (RaDIUS) database ($45,000); the Department's Strategic Plan ($205,000); the Visitor Assignment Management System ($50,000); the Quality Assurance Working Group ($150,000); the Safety Management Implementation Team ($165,000); the Condition Assessment System ($150,000); and the Environmental Liability Assessment ($30,000)	10,825	9,313	10,404
Provide to management and operating contractors research, development and technical assistance on compliance and improvement issues related to environment, safety, health, safeguards and security [Funding responsibility for ES&H and S&S technical support is proposed to be transferred to Weapons Stockpile Management in FY 2001].	9,254	8,000	4,500
Total, Other Related Expenses	63,581	54,307	47,208
Total, Program Direction	250,000	250,000	246,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 1999 vs FY 2000 ($000)
Salaries & Benefits	
■ A small increase, about 2 percent, covers a portion of the annual cost of living pay raises and locality adjustments. The rest of the annual increases will be funded by allowing DP's workforce to decline in size through attrition.	3,357
Travel	
■ A small increase in federal travel is requested to support ongoing oversight of increasing contractor activities.	309
Support Services	
■ Funding is requested in FY 2000 to conduct a study of the management implementation of the Stockpile Stewardship Program, consistent with the Defense Programs Performance Plan	2,000
■ Funding increase to reflects the transfer of funding of an Amarillo Area Office support contract previously included within Weapons Stockpile Management.	2,600
■ Other Advisory & Assistance activities are reduced consistent with ongoing strategic alignment initiatives, representing a 13 percent decrease from the FY 1999 program level	-4,667
Total, Support Services	-67
Other Related Expenses	
■ Funding is increased by $7.0 million to reflect the transfer of funding for the Amarillo, Kansas City and Kirtland Area Offices (Albuquerque Operations Office). Previously, these offices were funded from within Weapons Stockpile Management, however, they have been transferred in FY 2000 in order to show the full cost of providing federal program and operational oversight. This increase is partially offset by other contractual support requirement reductions.	6,401
■ Transfer of funding responsibility for Community Assistance (Los Alamos School District and the foundation for educational enrichment in Northern New Mexico) to Weapons Stockpile Stewardship	-10,000
■ Reduce direct support for inter-contractor ES&H and S&S technical assistance	-3,500
Total, Other Related Expenses	-7,099
Total Funding Change, Program Direction	-3,500

Other Defense Activities

Proposed Appropriation Language

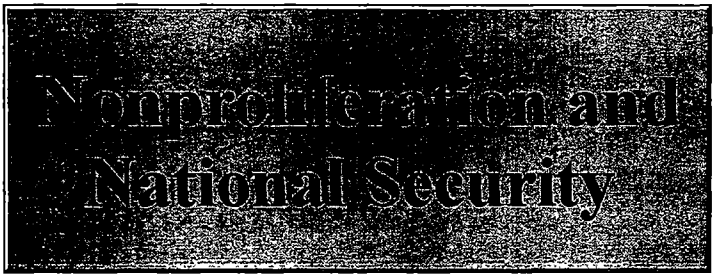
For Department of Energy expenses, including the purchase, construction and acquisition of plant and capital equipment and other expenses necessary for atomic energy defense, other defense activities, in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101 et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion, [$1,696,676,000, to remain available until expended] *$1,792,000,000,* to remain available until expended: *Provided, That not to exceed $3,000 may be used for official reception and representation expenses for transparency activities and not to exceed $2,000 for the same purpose for national security and nonproliferation activities. Further, for the forgoing purposes, $1,792,000,000, to become available October 1, 2000 and remain available until expended, of which not to exceed $3,000 may be used for official reception and representation expenses for transparency activities and not to exceed $2,000 for the same purpose for national security and nonproliferation activities.* (Energy and Water Development Appropriations Act, 1999.)

[For an additional amount for "Other Defense Activities", for expenditures in the Russian Federation to implement a United States/Russian accord for the disposition of excess weapons plutonium, $200,000,000, to remain available until expended: Provided, That none of the funds may be obligated until the Department of Energy submits to Congress a detailed budget justification for use of these funds, and the proposal has been approved by the House and Senate Committees on Appropriations: Provided further, That the entire amount shall be available only to the extent an official budget request for a specific dollar amount that includes designation of the entire amount of the request as an emergency requirement as defined by the Balanced Budget and Emergency Deficit Control Act of 1985, as amended, is transmitted by the President to the Congress: Provided further, That the entire amount is designated by the Congress as an emergency requirement pursuant to section 251(b)(2)(A) of the Balanced Budget and Emergency Deficit Control Act of 1985, as amended.]

[For an additional amount to purchase natural uranium associated with the 1997 and 1998 deliveries under the United States-Russia HEU Purchase Agreement (hereinafter, "the Agreement"), $325,000,000, to remain available until expended, which shall be available only to the extent an official budget request for a specific dollar amount that includes designation of the entire amount of the request as an emergency requirement as defined in the Balanced Budget and Emergency Deficit Control Act of 1985, as amended, is transmitted to the Congress: Provided, That the entire amount is designated by the Congress as an emergency requirement pursuant to section 251(b)(2)(A) of the Balanced Budget and Emergency Deficit Control Act of 1985, as amended: Provided further, That such uranium is located in the United States at the time purchase, and shall become part of the inventory of the Department of Energy: Provided further, That such funds shall be available only upon conclusion of a long-term agreement by the Government of the Russian Federation and commercial partners for the sale of uranium to be derived from deliveries scheduled for 1999 and thereafter under the Agreement. (Omnibus Consolidated and Emergency Supplemental Appropriations Act, 1999, Public Law 105-277, Division B, Title I, chapter 2.)

Explanation of Change

Changes in the appropriation language include the number of vehicles required; a request for appropriations covering two years; addition of language covering limits on official reception and representation expenses; and deletion of language pertaining to the one-time emergency appropriations for plutonium disposition and uranium disposition.



Nonproliferation and
National Security

Nonproliferation and National Security

Executive Budget Summary

Mission

The worldwide proliferation of Weapons of Mass Destruction (WMD) and their missile delivery systems has emerged as one of the most serious dangers confronting the United States. This problem is continuing and evolving, with far-reaching consequences for international security and stability.

The President has made nonproliferation one of the nation's highest National Security priorities. For FY 2000, he has proposed an expanded, multi-agency threat reduction initiative for the Russian WMD complex. At least 20 countries -- some of them hostile to the United States -- already have or may be developing WMD through the acquisition of dual-use technology, indigenous development and production, and/or support from rogue supplier states.

Based on the highly specialized scientific, technical, analytical, and operational capabilities of the Department and its National Laboratories, the Department of Energy (DOE), through its Office of Nonproliferation and National Security, is uniquely suited to provide leadership in national and international efforts to reduce the danger to U.S. National Security posed by WMD. The Office of Nonproliferation and National Security accomplishes this mission by: (1) **preventing** the spread of WMD materials, technology, and expertise; (2) **detecting** the proliferation of WMD worldwide; (3) **reversing** the proliferation of nuclear weapons capabilities; and (4) **responding** to WMD emergencies.

Strategy

In order to reduce the international proliferation threat, the Office of Nonproliferation and National Security is focusing its resources and expertise on the following near-term priorities: (1) securing nuclear materials, technology, and expertise in Russia and the Newly Independent States; (2) maintaining effective protection, control, and accountability of nuclear materials, technology, and expertise in the United States; (3) limiting weapons-usable fissile materials worldwide; (4) developing new technologies against emerging chemical and biological threats; (5) developing and integrating a program for preventing, detecting and responding to nuclear terrorism and smuggling; (6) enabling transparent and irreversible nuclear reductions; (7) supporting the implementation of a Comprehensive Test Ban Treaty (CTBT); (8) controlling nuclear exports; (9) strengthening the nuclear nonproliferation regime; and (10) reducing the threat posed by the operation of unsafe nuclear facilities worldwide.

Some of our most important international activities include: conducting the government-to-government and laboratory-to-laboratory programs of cooperation between U.S. nuclear experts and their counterparts at nuclear facilities and institutes in the former Soviet Union to improve materials protection, control and accountability; assisting Russia and the Newly Independent States in establishing and enhancing nuclear material export control systems; developing technologies and systems to detect the proliferation of WMD and to monitor and verify existing treaties; working with the Democratic

Peoples Republic of Korea (DPRK) to maintain the integrity of long-term storage of the spent fuel canisters at Nyongbyon nuclear site prior to their removal from North Korea; working with the private sector to engage WMD weapons scientists, engineers, and technicians in the former Soviet Nuclear Cities in activities which reduce the proliferation threat and promote their transition to non-defense sector employment; and providing technical support for long-term monitoring of Iraqi facilities and other nuclear safeguards and emergency programs of the International Atomic Energy Agency (IAEA). In addition, we are providing unique and in-depth technical, policy, and research expertise as part of the U.S. Government's integrated efforts to implement a CTBT. We also provide emergency management experts to assist other foreign governments in reviews of their emergency preparedness plans and capabilities.

In concert with our international activities, we are responsible for wide-ranging activities to accomplish nonproliferation and national security goals in the United States. These activities include: directing a rigorous safeguards and security program for the entire Department of Energy complex, thereby ensuring the security of our own nuclear materials, technology and expertise; declassifying millions of DOE documents while protecting critical information that has the potential to facilitate the proliferation of weapons of mass destruction; managing and improving the Department's emergency management and response capability and providing assistance to other government agencies as well as state, tribal, and local governments; and maintaining a security investigations and reinvestigations program for both Federal and contractor employees of the Department. DOE also provides technical, analytical, policy and implementation support to the efforts of the nation's policy community to deal with nonproliferation issues.

In FY 2000, the Department will achieve its nonproliferation and national security priorities by: (1) providing materials protection, control and accountability for fissile materials in Russia and the Newly Independent States; (2) working to complete installation of MPC&A upgrades on all Russian Naval fresh fuels by December 2000; (3) cooperating with authorities in the former Soviet Union to redirect scientific intellectual capital through the science and technology centers and the Initiatives for Proliferation Prevention Program; (4) promoting the transition of nuclear weapons workers to non-defense work through the Russian Nuclear Cities Initiative; (5) shipping stabilized fuel canisters from the Aktau site in Kazakhstan and putting them in underground storage silos for long-term storage; (6) enhancing efforts to detect and stem the proliferation of chemical and biological weapons and to respond to potential terrorist use of such weapons; (7) concentrating efforts toward limiting the production and use of weapons-usable fissile materials in the civil sector by reducing and eventually eliminating the use of highly enriched uranium and promoting alternatives to the civil use of plutonium, continuation of the Reduced Enrichment for Research and Test Reactors (RERTR) Program, and by purchasing, where appropriate, at-risk weapons-usable nuclear materials; (8) providing necessary research, technology development, analysis, and training as part of the U.S. Government's efforts to complete and implement a CTBT; (9) developing and implementing an integrated approach to nuclear smuggling, terrorism, and emergency response; (10) enabling transparency and irreversibility in the nuclear weapon dismantlement process; (11) strengthening the international nonproliferation regime through measures which include our efforts in North Korea, negotiation of an international fissile

material cutoff convention and cooperation with and support for the IAEA safeguards programs, including the facilitation of IAEA inspections in the United States.

During FY 2000, DOE will support the President's initiative on Keeping America Secure for the 21st Century by increasing funding to accelerate the development and fielding of key technologies to improve the U.S. capability to prepare for and respond to domestic terrorism involving chemical and biological agents. In addition, we will initiate design of the Nonproliferation and International Security Center at Los Alamos National Laboratory, Los Alamos, New Mexico.

The Department will sustain support to the domestic safeguards and security of nuclear weapons, nuclear materials, classified information and facilities against theft, sabotage, espionage, and terrorist activities. A major emphasis will be support to the Declassification program and implementation of Section 3161 of the National Defense Authorization Act for FY 1999. In addition, DOE will support a Critical Infrastructure Program to help insure protection of certain critical national infrastructures against both physical and cyber attacks. It will also maintain an emergency management program for response to domestic hazards and to provide assistance internationally.

Beginning in FY 2000, NN will budget for the International Nuclear Safety Program. The Program supports international nuclear safety cooperation, and addresses safety issues associated with nuclear materials facilities in Russia. In addition NN will budget for the Highly Enriched Uranium Transparency Implementation program that is responsible for insuring that the nonproliferation aspects of an agreement between the United States and the Russian Federation are met.

Finally, in support of all of the Department's nonproliferation capabilities, we will continue to develop technologies and systems for detecting, characterizing, and monitoring proliferant activities worldwide.

[1]Program Offices are providing funding for Security Investigations to be used for all contractor personnel in the field. For FY 1999 $20 million appropriated plus $15 million may be allocated through Congressional Notification letter, and for FY 2000 a request of $20 million.

[2]Includes $35.0 million from AID.

Nonproliferation and Verification Research and Development

Program Mission

The Department of Energy (DOE) Nonproliferation and Verification Research and Development (R&D) Program is devoted to conducting applied research, development, testing, and evaluation of science and technology for strengthening the U.S. response to National Security threats and threats to world peace posed by the proliferation of nuclear, chemical, and biological weapons and special nuclear material diversion. Activities are focused on the development, design, prototype construction and production of operational sensor systems needed for proliferation detection, proliferation prevention, treaty monitoring, and support to related intelligence activities.

The DOE will continue to leverage its considerable nuclear nonproliferation R&D base to address important objectives including: nuclear warhead dismantlement initiatives; countering nuclear smuggling and terrorism; applying DOE's resident chemical and biological science expertise to support U.S. preparation for and response to the use of chemical and biological agents; and supporting Law Enforcement agencies. All activities also support the timely transfer of tested prototype systems to other U.S. Government agency users. The program also supports commercialization of technologies and contributes to the Small Business Innovation Research (SBIR) and the Small Business Technology Transfer (STTR) programs.

Program Goal

The program goal is to enhance U.S. National Security through needs-driven research and development, with emphasis on developing the requisite fundamental science and technology to detect and prevent nuclear proliferation, meet U.S. treaty monitoring goals, and assist in equipping domestic agencies to mitigate against potential threats to the U.S. from chemical and biological agents.

Program Objectives

- Develop and demonstrate technologies needed to remotely detect the early stages of a proliferant nation's nuclear weapons program.
- Develop and demonstrate technologies to locate, identify, and characterize nuclear explosions underground, underwater, in the atmosphere, and in space. Delivery of these R&D products will enhance the Comprehensive Test Ban Treaty (CTBT) ratification process.
- Produce operational satellite-based nuclear test monitoring sensor systems.
- Develop and demonstrate detection technologies for nuclear materials protection, control, and accounting; nuclear warhead dismantlement monitoring; and intelligence support.

- Develop and demonstrate technologies to detect and deter the diversion and smuggling of nuclear weapons and special nuclear material, and to support Law Enforcement forensics.
- Transition developed technologies to other agencies; for example, the Military (counter proliferation) and Law Enforcement (counter narcotics).
- Develop and test, in partnership with the Department of Defense (DoD) and other agencies, capabilities that dramatically improve our ability to detect the proliferation of chemical and biological agents at an early stage, and to minimize the consequences of potential use of chemical or biological agents.

Performance Measures

Proliferation Detection

- Complete laboratory testing of lidar science base/prototype instrument for detection and classifying chemical effluents related to proliferation activities. Ready for integration into an aircraft.
- Following launch of the Multispectral Thermal Imager (MTI) small satellite in FY 2000, the sensor will be operated on-orbit- to provide data for scientific analysis by DOE and other agencies to demonstrate thermal imaging technology for nonproliferation treaty monitoring and other National Security and civil applications.
- Complete field testing of a passive spectral imaging system for remote detection and characterization of chemical effluents related to proliferation activities.

Treaty Monitoring

- Deliver the hardware, software and analytical capability to the U.S. National Data Center to evaluate CTBT data and to make verification assessments.
- Deliver three operational nuclear treaty monitoring sensor systems per year to the U.S. Air Force (USAF) Global Positioning System (GPS) spacecraft integrating contractor.

Deterrence and Detection Technologies

- Develop analytical methods to enhance U.S. laboratory equipment for monitoring nuclear proliferation and for supporting forensic investigations of intercepted nuclear materials by domestic or international Law Enforcement agencies.
- Achieve major technical advances in the areas of chemical and biological detection, analysis, transport modeling, and decontamination; define and evaluate system concepts for two demonstration projects that integrate current capabilities in these technical areas.
- Develop detection technology for U.S. Law Enforcement and Intelligence agencies to provide new capabilities to respond to incidents and threats involving weapons of mass destruction. Technology will provide a rapid, sensitive and specific detection capability for domestic first responders or unattended applications.

Significant Accomplishments and Program Shifts

Proliferation Detection

- Field testing of a passive spectral imaging system for remote detection and characterization of chemical effluents related to proliferation activities will be completed. The program will conduct experimentation and modeling to extend passive special imaging capability beyond test libraries to best estimates of levels expected for actual nuclear proliferation signatures.
- Complete construction of the MTI small research satellite that will demonstrate and evaluate space-based multispectral and thermal imaging technology for nonproliferation treaty monitoring and other National Security and civilian applications.
- Hyperspectral algorithms will be developed and demonstrated to identify ecological regions that may have been affected by effluents from proliferation activities and potential causes of the ecological changes will be identified.
- Develop Interferometric Synthetic Aperture Radar (IFSAR) terrain mapping algorithms for treaty monitoring purposes, and provide the DoD with algorithms for their use in battle damage assessment and terrain elevation determination.

Treaty Monitoring

- Provide uninterrupted capability for continuous worldwide monitoring for atmospheric nuclear explosions, with sensors designed, developed, and produced by the program and deployed on the Air Force GPS satellite constellation. Research focus will continue to shift from the cold war Nuclear Explosion Detection (NUDET) mission to the emerging nuclear test threats from threshold states. Working closely with the U.S. Air Force, a replenishment plan will be implemented to ensure future GPS payloads address new threats.
- Work accomplished by the U.S. CTBT research and development program to detect underground, underwater, atmospheric, and space nuclear detonations will result in the delivery of integrated analysis software products to the U.S. National Data Center as well as providing support for commercialization of previously provided radionuclide and infrasound prototype detection systems. Research focus will shift toward calibration of globally distributed monitoring stations and associated monitoring equipment and data analysis tools.
- Following successful launch aboard an Air Force Pegasus-XL launch vehicle, the Fast On-orbit Recording of Transient Events (FORTE) small satellite is demonstrating advanced radio frequency technologies for monitoring the CTBT. FORTE is also providing scientists information on lightning and the structure of the ionosphere for possible use in weather forecasting and understanding the relationship of the ionosphere to environmental phenomena affecting the Earth.
- Reduce funding to the CTBT program will be used as an offset to the growing priorities of the Chemical and Biological Nonproliferation program and the new construction of the Nonproliferation and International Security Center at LANL.

Deterrence and Detection Technologies

- Analytical methods to enhance U.S. laboratory equipment capabilities to monitor nuclear proliferation and to support forensic investigations of intercepted nuclear materials by domestic and international Law Enforcement agencies will be developed.
- Undertake a comprehensive research and development program for detection and analytical technologies which integrate arms control, counter proliferation and counter terrorism objectives in order to prevent nuclear smuggling and terrorism using weapons of mass destruction (WMD).
- Within the chemical and biological nonproliferation research program, major advances have occurred in the development of new detection and forensic analysis technologies. In the detection area major technical successes have occurred that will enable the power of conventional laboratory instrumentation to be put into a hand-held device. In the biological forensics area, new techniques for strain analysis of high-priority threat pathogens are a key step in the detection of engineered organisms, and the identification of the geographical origin of biological agents samples to aid in the identification of proliferants.
- Increase funding for the Chemical and Biological Nonproliferation program due to the increased threat of terrorist use of chemical and biological weapons. Deterrence and Detection Technologies activities have been refocused to accommodate the priorities of the growing chemical and biological weapon threat as well as the new construction of the NISC at LANL.

Nonproliferation and International Security Center

- The Nonproliferation and International Security Center (NISC) will house approximately 465 people in a 164,000 square foot area at the Los Alamos National Laboratory. The facility will house laboratories for physics, electronics, and instrumentation development along with technical work spaces and administrative functions. The NISC will also include areas for program management, safeguard assessments, and intelligence activities.

Funding Profile

(dollars in thousands)

Albuquerque Operations Office

The Albuquerque Operations Office will provide administrative support for financial assistance awards to selected recipients who have submitted unsolicited proposals relevant to CTBT research and development activities. The Albuquerque Operations Office also oversees work at the Directed Energy Directorate of the Air Force Research Laboratory, located at the Kirkland Air Force Base in New Mexico. The Directed Energy Directorate will instrument the ARGUS RC-135 research aircraft which will be used to conduct remote chemical detection experiments using DOE sensors. The Directed Energy Directorate will integrate DOE prototype equipment on the aircraft and conduct field test over sites in the U.S.

Ames Laboratory

Ames Laboratory will develop standard methods for state-of-the-art commercial systems to enable U.S. forensics laboratories to attribute future terrorism associated with WMD. These research results will be transferred to local U.S. Law Enforcement agencies to improve investigations and for mitigation of the consequences of nuclear material release during foreign testing, terrorism or accidents.

Argonne National Laboratory

Argonne National Laboratory will conduct research on deployable arms control technology which can be used to analyze signatures from the production or reprocessing of nuclear weapon material, participate as a member of the Radiation Detection Panel, provide technical advisor services on nuclear systems for treaty monitoring, and develop nuclear material measurement techniques which can be used during investigations and for mitigation of the consequences of nuclear material release during foreign testing, terrorism or accidents.

Brookhaven National Laboratory

Brookhaven National Laboratory will develop stand-off detection and analysis technologies for arms control, nonproliferation and counter terrorism applications.

Environmental Measurements Laboratory

The Environmental Measurements Laboratory (EML) will provide advisory and quality assurance services to the radionuclide subsystem being installed internationally for the CTBT. EML is the leading candidate to replace the McClellan AFB radionuclide laboratory specified in the treaty when McClellan AFB is closed.

Idaho National Engineering and Environmental Laboratory

The Idaho National Engineering and Environmental Laboratory (INEEL) will participate as a member of the Radiation Detection Panel and will develop detection technologies for arms control applications using accelerator systems. INEEL is a member of an interlaboratory group to develop technologies to counter terrorism and search/locate Highly Enriched Uranium. Additionally, INEEL will develop modeling capabilities for the design and test of specific advanced materials.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory will be a participant in the interlaboratory effort to develop a room temperature high resolution gamma spectrometer based on cadmium zinc telluride (CZT) materials.

Lawrence Livemore National Laboratory

Lawrence Livermore National Laboratory (LLNL) will develop specific geographical regional models to improve U.S. technical capability and confidence to locate and identify seismic events to support CTBT verification assessments, gamma ray imaging technology for arms control applications, advanced technologies to search and locate special nuclear material used in a threatening manner, analytical methods to use the investment of "smart highway systems" to detect WMD during crisis situations and consequence management, and forensics methods for law enforcement which will improve the U.S. capability to investigate the threat of WMD. LLNL will conduct research in the areas of active (lidar) and passive hyperspectral remote chemical detection, including hardware and software (algorithm) development and field testing systems onboard aircraft. LLNL personnel will provide planning for experiments conducted at the chemical gas release facility at the Nevada Test Site which is used to test all remote chemical detection sensors. LLNL will have a key role in the development of CBW transport modeling capabilities for prediction in urban areas and supports our development of DNA diagnostics for forensic analysis.

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL) will provide the U.S. National Data Center with improved analytic tools and sensors for discriminating small earthquakes and industrial activities from clandestine nuclear explosions. LANL will continue to develop the next generation electromagnetic pulse sensor and radiation sensor systems for satellite-based systems. The laboratory will investigate remote unattended methods to monitor SNM in long-term storage for arms control and domestic safeguards, including unmanned systems which can strengthen internal safeguards by monitoring fissile materials in support of future arms control negotiations (e.g. START III) and other international safeguards initiatives. LANL will provide analysis of neural network applications to supply low cost and simple detection technology for treaty monitoring, regional and bilateral conflict resolution and advanced concepts for counter terrorism response. LANL will continue developing innovative algorithms and specialized processors to process voluminous quantities of remote sensing data into the specific information required by decision makers. LANL will continue developing a CO2 laser system and performing modeling and calibration for the MTI satellite sensors for surface temperature measurements. LANL is central to development of DNA diagnostics for forensic analysis, and in development of a biological detection system capable of biological agent strain differentiation.

Nevada Operations Office

The Nevada Operations Office will support experimental field tests at the HAZMAT Spill Center, a facility managed by the Nevada Operations Office and located at the Nevada Test Site. The HAZMAT Spill Center will be used because it is a unique, one-of-a-kind facility, built to conduct testing using hazardous materials under controlled conditions. The Nevada Operations Office will be the contracting office for grants to universities that participate in various detection and analysis research projects in partnership with the DOE National Laboratories.

Oak Ridge Y-12 Plant

The Oak Ridge Y-12 Plant will support the development of sampling technology and measurement protocols to improve the application of non-nuclear monitoring technology to detect and track nuclear materials production. To support this nonproliferation mission, Y-12 collaborates with Oak Ridge National Laboratory (ORNL) to develop concepts and prototype advanced monitoring tools for analytical systems to be used by DoD special operations and U.S. domestic Law Enforcement. ORNL will conduct research to support cooperative monitoring requirements for bilateral nonproliferation and arms control initiatives with Russia. ORNL will provide leading-edge research into candidate materials which could replace exiting nuclear detectors used for gamma spectroscopy and neutron detection. ORNL will continue investigation of small portable mass spectroscopy units and the application of micro-fluidics systems for "lab-on-a-chip" concepts. ORNL will continue development of an advanced mass spectrometer for real-time detection and identification of biological pathogens.

Pacific Northwest National Laboratory

The Pacific Northwest National Laboratory (PNNL) will continue the development of laboratory methods and hand-held detection technologies in support of strategic arms control and National Security applications. The laboratory will support efforts to detect and characterize signatures from nuclear test monitoring systems. The laboratory will be a strong participant in the development of advanced forensics methods that are necessary to address WMD contaminated evidence analysis by Law Enforcement. PNNL will provide collaborative statistical support to other DOE National Laboratories conducting research and development for the CTBT program. Areas of research include discrimination algorithms to support geographical regional models; and overall statistical assessments to increase confidence in the CTBT monitoring system. PNNL will continue developing a heterodyne technique to increase the detection sensitivity of laser chemical-detection systems and algorithms for processing hyperspectral, ultraspectral and laser data for chemical detection, identification, and quantification.

Remote Sensing Laboratory

The Remote Sensing Laboratory will lead a consortium of universities to develop research tools which will enhance the capability of multispectral and hyperspectral sensors and data processing to detect proliferation activities.

Sandia National Laboratories

The Sandia National Laboratories (SNL) will develop, demonstrate, and validate improvements to existing and planned information system technologies to provide capabilities for highly automated, high confidence data processing and analysis in support of nuclear explosion monitoring. SNL will support the U.S. program to detect nuclear detonations from satellites by providing systems engineering, the optical sensors and the on-orbit processing and power conditioning technologies. In partnership with U.S. Law Enforcement, the laboratory will develop nuclear detection systems to interdict smuggled nuclear materials in transit across U.S. borders. SNL will participate in a multilaboratory effort to develop CZT as a room temperature spectrometer and in a consortium of national labs and academic institutions to develop micro-technologies for detection and analysis of chemicals. SNL will continue development of advanced Synthetic Aperture Radars and analysis methods for mapping, and the detection of proliferation events. SNL will continue development of an ultraviolet lidar system for remote detection of chemicals. SNL will continue managing, integrating, assisting in launch, and operation of the MTI satellite for measurements of surface temperatures. SNL will continue developing a "chemistry laboratory on a chip," a technology that will bring the power of an analytical laboratory down to a hand-held format. In addition, SNL will continue development of environmentally friendly CBW decontaminations foams.

Savannah River Technology Center

The Savannah River Technology Center (SRTC) will provide ground-based monitoring systems to analyze data collected by the MTI satellite in order to validate atmospheric and facility models based on ground-truth information. SRTC will support development of methods to exploit environmental sampling and provide advisory services for testing of new concepts to detect undeclared nuclear reprocessing.

Washington Headquarters

The DOE Headquarters transfers funding as required to the SBIR and STTR programs. In addition, DOE Headquarters manages funding transfers to other government agencies such as the Departments of the Navy, Air Force, and the Health and Human Services to provide their expertise to the Nonproliferation and Verification R&D Program.

Proliferation Detection

Mission Supporting Goals and Objectives

Develop and demonstrate innovative proliferation detection technologies including active (lidar-based) and passive hyperspectral electro-optical remote chemical effluent detection, space-based multispectral and thermal imagery, and advanced data analysis.

The multilaboratory and joint interagency projects within this activity area are comprised of comprehensive, end-to-end research and development efforts that (1) examine the nature of proliferation targets to determine remotely observable signatures, (2) conduct phenomena modeling to understand the environment's effects on observables and how these effects can be taken into account, (3) develop sensor systems to remotely detect and measure the observable, and (4) develop techniques to interpret the data and produce meaningful information.

These activities are closely coordinated with other Government agencies and, beginning FY 1999 and continuing in FY 2000, the methodology and experience that have resulted in significant advances in the nuclear proliferation detection mission area, are applied to the chemical and biological weapons proliferation arena. Many of the sensor systems and base technology designed to detect chemical signatures from nuclear weapons activities can be used to detect chemical signatures from chemical and potentially biological weapons activities.

Research to apply lidar for remote chemical detection will continue with ground and aircraft-based field tests of prototype detection systems to evaluate performance and to investigate concepts to extend designs to operate beyond their current limitations. Experimentation will continue to enhance analytical performance to distinguish nuclear proliferation signatures from background noise and to define the performance envelope of remote chemical detection systems developed by DOE as well as other agencies. Development of a short-range chemical effluent detection lidar system for use onboard an unmanned aerial vehicle (UAV) will accelerate, with plans to complete and test the system in FY 2001.

Following launch of the MTI small satellite in early FY 2000, operational testing and data collection will begin. MTI satellite data will demonstrate and evaluate multispectral and thermal imaging technologies for the passive, noncooperative detection and characterization of nuclear proliferant activities. Coordination with arms control, military, and other users of MTI data to refine test plans and operation concepts will continue.

In the area of hyperspectral remote chemical detection technology, field testing and development of exploitation techniques of an airborne, high spectral resolution imaging spectroradiometer for passive detection of nuclear proliferation chemical effluents will continue. This is part of an interagency effort to develop this technology. Particular emphasis will be given to developing computer tools to assist an analyst in extracting key information from the voluminous data supplied by the sensor. Chemical

effluent signature analysis research conducted for lidar development activities will be applied to passive imaging detection problems.

In FY 2000, activities will shift to begin to leverage the best capabilities of lidar and passive spectral sensing technologies into an integrated system. Based on extensive ongoing research and testing, the limitations of each technology may be compensated by the unique capabilities of the other, thereby producing a significant breakthrough and a national capability to collect chemical effluent information from great distances.

Synthetic aperture radar (SAR) algorithm development will be continued. This effort produces new methods of exploiting existing SAR systems to detect underground nuclear testing, and has resulted in many spin-off applications to other Government agencies.

The proliferation detection area is developing "onboard intelligence" methods that enable sensors to transmit "information" vice raw data back to the user. As a result, sensors can act more autonomously and will require less time and resources to provide the desired information to the end user.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Proliferation Detection	64,789	67,416	67,500	+84	0%
Total, Proliferation Detection	64,789	67,416	67,500	+84	0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Proliferation Detection			
■ Provide innovative and unconventional algorithms in order to reduce, in real time, voluminous quantities of remote sensing (radar, passive/active optical and radio-frequency) data into the specific information required by decision makers	8,309	8,583	9,263

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Important technical issues will be resolved through laboratory and field testing of next generation systems. These issues have major impacts on implementing lidar or a hybrid lidar into a fully operational system. Several laboratories are tasked to work cooperatively because this technical area is very challenging. An intermediate UAV based prototype will provide immediate limited utility to users, as well as identify technical challenges that require further development	24,160	26,266	27,070
■ The MTI small satellite will demonstrate absolute temperature measurement from space for the passive, noncooperative detection and characterization of proliferant activities. Satellite sensor data will become available in FY 2000 and will be analyzed by numerous organizations throughout the Government and academia	23,080	17,324	13,100
■ Continued emphasis will be placed on hyperspectral imaging technology. This area will work extensively with data taken by an airborne system and will develop new analysis techniques that will fully utilize the information available in a spectral image. Key enabling technologies will be identified and pursued	9,240	15,243	14,643
■ The evaluation of a remote chemical sensor system that leverages the capabilities of both passive hyperspectral and active lidar technology will be initiated to demonstrate, on a limited basis, all operational characteristics of a future world-wide proliferation monitoring sensor system	0	0	3,424
Total, Proliferation Detection	64,789	67,416	67,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Proliferation Detection	
■ Increase in lidar activities due to laser and component purchases for a UAV system	+804
■ Increase in synthetic aperture radar activities	+837
■ Decrease due to completion of MTI satellite construction costs in FY 1999 with only satellite launch and operations in FY 2000	-4,224
■ Small decrease in hyperspectral work as focus shifts to integrated lidar/hyperspectral system development	-600
■ Activities shift to exploit capabilities of hyperspectral and lidar remote chemical detection techniques in a common system architecture	+3,267
Total Funding Change, Proliferation Detection	+84

Treaty Monitoring

Mission Supporting Goals and Objectives

Develop and demonstrate technologies for monitoring international treaties banning the explosive testing of nuclear devices. Develop and field sensors and algorithms, which will, in a timely manner detect, locate, identify, and characterize nuclear explosions which occur in the atmosphere, in space, underground, and underwater. Address requirements for both international and independent U.S. national monitoring.

The Treaty Monitoring program is one of the DOE's longest standing nonproliferation initiatives. The concept of a U.S. national capability using satellite-borne nuclear explosion surveillance came about during interagency discussions from 1959 to 1962, leading to deployment of the original satellite explosion detection sensors. During the 39 years of this program, more than 100 DOE satellite payloads have been launched, using U.S. Air Force and National Aeronautics and Space Administration boosters. The national need for worldwide cognizance of nuclear explosions is as important as ever in this time of high nuclear proliferation concern.

National responsibility for executing CTBT R&D was consolidated within this DOE program in 1993. The R&D goal is to develop and demonstrate technologies for monitoring existing test ban treaties and the CTBT. Building on the delivery of radionuclide and infrasound prototypes to the U.S. National Data Center for commercialization, the DOE program is shifting toward calibration for the seismic, radionuclide, hydroacoustic and infrasound stations which enable treaty monitoring. This research and development program addresses both international and U.S. national monitoring requirements of a CTBT. Detection technologies are developed to detect nuclear explosions underground, underwater, in the atmosphere, and in space.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Treaty Monitoring	78,034	77,499	73,500	-3,999	-5.2%
Total, Treaty Monitoring	78,034	77,499	73,500	-3,999	-5.2%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Treaty Monitoring			
■ Produce, deliver, and operationally support three (3) Global Positioning System (GPS) satellite nuclear explosion detection flight systems per year, to maintain continuous, worldwide, monitoring capability as on-orbit GPS satellites age and are replaced. Develop and demonstrate the next generation of satellite-based optical, electromagnetic pulse, and radiation sensor systems to detect nuclear explosions in Earth's atmosphere and in space	48,995	49,940	48,920
■ Characterize explosion-like signals from natural and industrial sources to increase the reliability of analysis to distinguish natural events and industrial activity from nuclear weapons testing. Transfer enhanced regional data evaluation and explosion identification capabilities including calibration data, when possible, to the CTBT U.S. National Data Center (NDC). Provide NDC with operational support for its seismic, radionuclide, hydroacoustic, and infrasound sensor systems to enable the NDC to perform its nuclear treaty monitoring mission and to make verification assessments	29,039	27,559	24,580
Total, Treaty Monitoring	78,034	77,499	73,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Treaty Monitoring	
■ Delivery of the second installment of the operational and seismic part of the U.S. National Data Center's Knowledge Base moves to FY 2001 from FY 2000. This funding decrease will be used as an offset to the growing priorities of the Chemical and Biological Nonproliferation program and the new construction of the Nonproliferation and International Security Center at LANL	-3,999
Total Funding Change, Treaty Monitoring	-3,999

Deterrence and Detection Technologies

Mission Supporting Goals and Objectives

Our goals in this area are: (1) the development of enabling technologies to inhibit nuclear materials diversion in nonproliferation, arms reduction and counter terrorism applications, and (2) the development of advanced technologies to dramatically improve early detection capabilities, and preparation and response capabilities in general, to address the terrorist use of chemical or biological agents.

The technology development activities supported under this area are broadly aimed at deterring the terrorist of use of WMD. The initiatives in the nuclear areas focus on the development of technology to safeguard nuclear materials, to provide intelligence and warning of illicit nuclear materials, on detection of the transit of nuclear material, and on the materials analysis required to support Law Enforcement. In FY 2000, the nuclear R&D activities will focus on the development of technologies to counter nuclear smuggling and terrorism threats. Developed systems will enhance the U.S. capability to: conduct wide area searches; remotely monitor the storage of nuclear material placed under IAEA safeguards or under bilateral agreements with Russia; develop collection and analysis tools to detect proliferation activities associated with WMD production and military operations; and develop a new generation of cost-effective detection systems based on micro technologies. A closer partnership with U.S. Law Enforcement agencies will be constructed during FY 2000 to share field and laboratory systems. Ongoing research on technologies which can be exploited by the intelligence and Law Enforcement agencies will be accelerated.

The goal of the chemical and biological nonproliferation research and development program is to reduce the U.S. vulnerability to the use of chemical or biological agents through the development of advanced technologies and capabilities. A key element of the program is the formulation of architectures that bring together operational and technological components to develop systems that address key elements of the chemical and biological threat. This program builds upon ongoing activities in other agencies, and addresses key areas in which DOE has expertise.

Preparing and ultimately responding to the use of chemical or biological agents is a complex problem to which there is no "silver bullet". Because of these challenges, chemical and biological terrorism is most effectively addressed in an end-to-end, layered approach. Such a layered approach must involve deterring the use of such weapons, preparing key facilities and cities for the possible use of such agents, having systems in place to rapidly detect the use, and should use be detected, being able to effectively respond. Technology is a key component of all of these areas-our initiative focuses on the development of enabling technology to dramatically improve the U.S. ability to prepare for and respond to the use of such weapons, and on a close linkage between technology development and systems analysis and integration efforts.

The chemical and biological nonproliferation R&D initiative builds upon over $1 billion per year that DOE invests in related technologies and the chemical and biological sciences in areas that range from genomic sequences, to the development of new DNA diagnostics, to advances computer simulation tools. The DOE efforts are complementary to, and closely linked (via formal coordination mechanisms) to those of the DoD and other agencies.

Funding Schedules

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Deterrence and Detection Technologies	62,036	62,085	74,000	+8,915	13.7%
Total, Deterrence and Detection Technologies	62,036	65,085	74,000	+8,915	13.7%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Deterrence and Detection Technologies			
■ Radiation Detection: Develop and maintain the technology base for key radiation detection and characterization technologies and systems which underpin U.S. national security capabilities in the areas of safeguarding nuclear material, combating terrorism, nonproliferation, and arms control. Develop innovative concepts to increase sensitivity, resolution, range, fieldability, and simplify system operations and interpretation of data. Develop, integrate, and demonstrate high resolution radiation detection systems which operate at room temperature or with compact coolers, systems with the capability to detect special nuclear material at long ranges, and detectors with novel hardware and software information barriers to protect sensitive weapons information for systems used with international organizations or international agreements.	16,768	16,151	14,975

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Materials Analysis: Develop advanced field and laboratory capabilities for the detection and analysis of proliferation-related activities primarily in support of the law enforcement, intelligence, and arms control communities. Advance the state of technology in both field and laboratory forensics analysis applied to weapons of mass destruction and other threats to national security. Develop automated gaseous and particulate collection systems and integrate with automated in-field analysis capability for possible remote, unattended operation. Develop novel approaches to enhance the capability of new sensor systems to discriminate between proliferation chemicals of interest and "normal" background. Develop innovative ways to reduce the per sample cost for laboratory analysis.	12,405	12,763	11,600
■ Micro Technologies: Develop micro technologies which will enable the miniaturization of detection and analysis systems that can be readily deployed with a human operator or can be operated remotely and/or unattended in support of law enforcement, intelligence, and arms control missions. Develop and demonstrate prototype miniature chemical sensors, arrays of micro-sensors, and "smart" networks which will reduce false alarms and enhance the probability of detecting activities of concern.	14,865	12,955	11,500
■ Chemical and Biological Nonproliferation: Development of advanced technologies to respond to the chemical and biological threat. Critical research to develop and test fast and selective detection technologies, predictive plume transport models suitable for urban areas, new recovery and restoration concepts, and advanced biological forensics methods for proliferation detection and attribution.	17,998	18,497	31,152
■ SBIR/STTR: Funding for the SBIR and STTR programs are contained in the Detection and Deterrence Technology subprogram. In FY 1998, $5,141,000 was transferred to the DOE SBIR and STTR programs. The FY 1999 and FY 2000 amounts are the estimated requirement for the continuation of these programs	0	4,719	4,773
Total, Deterrence and Detection Technologies	62,036	65,085	74,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Deterrence and Detection Technologies	
■ Chemical and Biological Nonproliferation: Due to the increased threat of potential terrorist use of chemical and biological weapons, the Nonproliferation and Verification R&D program has refocused priorities	+12,655
■ The Materials Analysis, Micro Technologies, and Radiation Detection activities have been reduced to offset the priorities of the Chemical and Biological Nonproliferation program and the construction of the Nonproliferation and International Security Center at LANL	-3,794
■ SBIR/STTR	+54
Total Funding Change, Deterrence and Detection Technologies	+8,915

Capital Operating Expenses and Construction Summary

Capital Operating Expenses

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Capital Equipment	2,971	4,411	4,300	-111	-2.5%

2001	7,000	7,000	6,724
2002	36,000	36,000	30,312
2003	9,769	9,769	18,464
2004	0	0	71

3. Project Description, Justification and Scope

Proposed construction project - We live in a rapidly changing world in which threats involving the proliferation of weapons of mass destruction (NBC - nuclear, biological and chemical) and their potential use by rogue states or terrorists loom over all of us. The Department of Energy Office of Nonproliferation and National Security (DOE-NN) and the Office of Intelligence (DOE-IN) have the responsibility for major programs to counter these threats. Most are time urgent and have sensitive national security implications. For example, controlling nuclear materials in states of the Former Soviet Union, verifying the Comprehensive Test Ban Treaty (CTBT), countering nuclear smuggling,

safeguarding nuclear materials and weapons and, most recently, countering threats involving chemical and biological agents and helping enable the START process to continue downsizing nuclear weapon stockpiles. These programs are truly important to the security of the United States and the world, and the national laboratories through DOE-NN and DOE-IN are the major agents responsible for carrying out this work.

Los Alamos supports these DOE-NN and DOE-IN programs through: 1) a diverse and robust R&D program to develop detection systems and technology; 2) assessing foreign nuclear weapon capabilities and responding to nuclear-related emergencies; and 3) for many years, providing much of the technology and expertise needed to verify treaties and implement various safeguards regimes to ensure compliance with terms and conditions of treaties and agreements. In 1993 the Laboratory consolidated major programs and capabilities in detection R&D, intelligence, nuclear safeguards and emergency response into a new organization called Nonproliferation and International Security (NIS). This organization is the laboratory's prime responder to DOE-NN and DOE-IN programmatic needs, including approximately $100 million per year in funded effort for DOE plus about $25 million in related work for other federal agencies. Unfortunately, the full benefit of this synergistic organization has been handicapped by being located in facilities scattered across the 43-square-mile Los Alamos site. Many NIS operations are performed in substandard facilities. The Laboratory Capital Assets Management Plan (CAMP) ranks the quality of all Laboratory space using six Condition Assessment Survey codes ranging from "Excellent" down to "Fail". Of the groups proposed for consolidation in the new facility, 74% are currently in space classified as "Poor", "Fail", or "Fair". The 50 buildings housing NIS personnel include many "temporary" trailers and transportables. These old and substandard structures are energy inefficient, and they are a negative factor in recruiting top scientific staff as we try to maintain our status as a world-class laboratory and division.

Based on a recent study of a similar R&D organization (Kraut, Robert E., Carmen Egido, and Jolene Galegher, "Patterns of Contact and Communication in Scientific Research Collaborations," Intellectual Teamwork - Social and Technological Foundations of Cooperative Work (Lawrence Erlbaum Associates, Inc., New Jersey, 1990), Chap.6.) the following improvements in scientific collaborations and technical communications are projected:

- Increases in number of scientific collaborations - Collaboration rate strongly facilitated. Upper speculative bound is 87% increase. Likely increase is at least 10%.
- Increase in frequency of technical communications - Collaboration increase exponentially with proximity. Internal communications will at least double and very likely will increase by much more than double.

In addition, the study provided a preliminary estimate of the following less dramatic but quantifiable productivity improvements in addition to the non-quantifiable but very significant scientific creativity and productivity gains:

- Savings in support-function consolidation - 0.85% of NIS labor budget (about $0.5 million per year).
- Savings of intra-division travel time - 2.0% of NIS labor budget (about $1.2 million per year).

Los Alamos proposes to consolidate this unique national resource physically as well as organizationally near the Laboratory hub by co-locating all NIS activities in new and existing facilities within convenient walking distance in TA-3 (except for the high-security nuclear activities in TA-18/36 and the Center for International Security Affairs in TA-66, neither of which would be desirable or practical to move). The CAT I nuclear operations at TA18/36 have special security and safety requirements that would be very difficult to move. The activities at TA66 require open access by foreign nationals and can not be conducted in the secure NISC facility. To accomplish this consolidation will require the construction of a major new facility – the Nonproliferation and International Security Center (NISC). This consolidation will enhance program synergy and effectiveness by co-location of the NIS nonproliferation, arms control, treaty verification, and intelligence functions near the scientific, technological, and information sources that support these programs.

Los Alamos will initiate Title I/II design in FY2000. This schedule is necessary because of several urgent new requirements to which DOE-NN and DOE-IN must respond and to which the full capabilities of the national laboratories, especially Los Alamos, must be applied. Specific examples include:

- Former Soviet Union (FSU), Nuclear Materials Protection, Control, and Accounting (MPC&A) Program B - The threat to U.S. national security from the loss of significant quantities of FSU nuclear material has been reduced but is far from eliminated. Until these vast amounts of material are safeguarded fully, this threat remains grave.
- Helsinki Agreements - Agreements reached recently by Presidents Clinton and Yeltsin in Helsinki, including preliminary START III treaty parameters, add significantly to the technical challenges facing DOE-NN and DOE-IN.
- Comprehensive Test Ban Treaty (CTBT) Verification - The U.S. Senate soon will consider ratification of the treaty. Verification of international compliance with the terms of this treaty will be the major issue in the debate. Assuring the President and Congress that DOE can develop technologies to adequately verify the treaty is a political as well as a daunting technical challenge facing DOE-NN and DOE-IN.
- Nuclear, Biological, and Chemical (NBC) Proliferation and Terrorism - DOE-NN and DOE-IN are now responsible for developing and providing detection, assessment, and response technologies across the entire NBC spectrum. Reducing the NBC threat requires timely warning (intelligence) and advanced detection technology (monitoring). Adequate intelligence and monitoring require the application of leading-edge science and technology across a broad spectrum.

Los Alamos recently launched major efforts aimed at countering nuclear smuggling and chemical or biological weapons and is prepared to launch a major effort in support of the recent Helsinki Accords to continue the START process. NISC will give an appropriate focus and stature to Los Alamos efforts in nonproliferation, arms control, and national security commensurate with the contributions the Laboratory is making and on an equal footing with the Laboratory's historic nuclear weapons mission.

The NISC facility will be a new structure rising four stories above a one-level basement. A one-story high-bay area and basement will be provided on the west end of the structure. The high-bay area will be

used to support the development of special equipment and instruments. About 465 people will be housed in this 164,000 square foot facility. The second, third, and fourth floors each contain approximately 30,000 square feet. The ground floor includes about 36,000 square feet while the basement is around 37,000 square feet. The roof is accessible by stairs and freight elevator and this area is about 1,000 square feet. The fourth floor, housing intelligence activities, will be an accredited SCIF. Access to the SCIF will be limited to one location that will be controlled by a guard during normal operating hours. The third floor will contain program management and safeguard assessment functions. Anticipating that SCIF related activities could increase, the third floor will be constructed in such a manner that it could become an accredited SCIF in the future. Laboratories for physics, electronics, and instrumentation development along with technical work spaces and administrative functions will be distributed throughout the second and first floor, as well as the basement. Conference rooms will be provided on every floor with larger facilities being located on the first floor. A portion of the basement will be devoted to optic laboratories. In addition, the basement will house nuclear safeguard technology activities. These activities will be classified as radiological because of the use of sealed radioactive sources to execute their mission. The basement also will contain vaults to store the sealed sources including special nuclear materials (SNM). Two specially shielded rooms will be included for high radioactive research activities. These "special rooms" will require 5-ton bridge cranes. Because of the classified nature of many of the activities in this facility, the building, with the exception of the high bay area and machine shop, will be accessible to cleared personnel only.

A structural steel framing system of construction utilizing cost-effective design concepts will be employed to provide maximum open space, flexibility and economy for the upper floors of NISC. A 30 ft. x 30 ft. structural module was selected to accommodate a 10 ft. x 12 ft. office typical element. Floors will be concrete over metal deck supported by steel beams and girders. A 16 ft. floor to floor height was selected for the upper floors while the basement with its heavier industrial occupancy will be 20 ft., floor to floor. The basement walls will be constructed of reinforced concrete. Passenger and elevators service all floors. In addition to these elevators, an industrial type (10,000 lb.) elevator will service the basement from the loading dock outside the high-bay entrance. The high-bay also will contain a 10-ton bridge crane to accommodate the loading and unloading of heavy instrumentation. This bridge crane will extend outside the building and be able to operate on the loading dock. The building will be heated, cooled and ventilated from modular indoor air handling units on each floor. Chilled water will be provided for cooling while heating will be accomplished by hot water. Variable air volume (VAV) air conditioning units will deliver conditioned air to the occupied spaces. Units will provide a minimum amount of outside air at all times. When outdoor ambient conditions are favorable, an economizer cycle will provide "free" cooling with outside air. The same type of system will be included in the high bay and machine shop, but will be roof mounted. The main building chillers will also be located on the roof of the high bay structure. Temperature control will be from room thermostats. A complete packaged direct digital control (DDC) automatic temperature control system will be included. Roof drains will be connected to site storm drain system. Roof drains will be de-coupled as they penetrate the roof, fourth floor, and third floor. An automatic wet-pipe fire protection system will be extended throughout the building. The system will be hydraulically designed and conform to NFPA 13 for Ordinary Hazard Group II as a minimum or as determined PHA. Plumbing fixtures including electrical water coolers will be selected to provide access to individuals with disabilities. The building will require the installation of

a 3-phase outdoor unit substation that will include walk-in switchboard. Power will run to each electrical room where it will be distributed. Isolation power will be available for sensitive electronic equipment and computer loads. Power will be distributed throughout the building at 480Y/277V and 208Y/120V. Motors one horsepower or greater will be supplied with power at 480V. Generally, lighting will be flourescent and powered at 277V. The building will be equipped with communication systems that include telephone, open data communications, and a protected transmission system. The SCIF will require an internal warning light signaling system as well as an intrusion alarming system.

Site improvements will include a new service drive to access the high bay assembly area and machine shop functions as well as normal deliveries. A concrete walk with steps will provide pedestrian access to the main entrance to the building. Disabled access will be provided by means of a concrete walk with appropriate ramps. Existing surface drainage and new building roof drainage will be conveyed to existing storm drainage systems. The site, which is a one square block parking area, contains three office-transportable structures as well as a vacated gasoline refueling and service facility. Removal of these facilities will enable parking facilities to be expanded. Gasoline storage tanks, fuel lines, and pumps were removed by the Laboratory in 1997 and will not be part of NISC construction project. Existing asphalt paving will be removed and the site will be regraded. Access drives and parking areas will receive base course and asphaltic concrete paving. The parking areas will be stripped to accommodate approximately 956 cars. The NISC will be built on a current shared parking lot. The parking lot will be restored to accommodate approximately the original number of cars. Non-paved areas surrounding the building will be landscaped. Landscaping will consist of ground cover and trees similar to those on site. All landscaped areas will be irrigated by an automatic underground system.

Water service for both portable and fire protection will consist of an 8-inch pipe construction, approximately 320 feet long, into an existing 10-inch water main that lies adjacent to the site. A new 6-inch sewer line approximately 320 feet long will convey sanitary waste from the new building to an existing manhole. An existing 8-inch steam line with a 4-inch condensation line is located across the street from the building site. These lines will be connected together at a steam pit south of the building from which a 4-inch steam line and 3-inch condensation line will be extended into the building. A 2500-kVA, 13.2KV-480Y/277V, 3-phase outdoor unit substation, which will include a walk-in switchboard with secondary feeders routed to each of the basement electrical rooms, will be located along the north side of the building in the area of the electronics equipment lab. Power to this unit substation will be an underground feed from 13.2KV circuit. The primary feeder cable to the new unit substation will be 3-#4/0 15KV shielded, type MV90 conductors approximately 200 ft. in length and run in a concrete encased ductbank to switchgear unit.

NISC will vacate space in all or parts of seven permanent structures at both the TA-35 and TA-3 Technical Areas. The vacated space will be available for use by other DOE projects at Los Alamos. In addition, about 24 trailers and transportables, representing about 27,096 square feet will be removed and salvaged. Buildings in the TA-3 Technical Area to be demolished include SM-36 and SM-224. Demolition totals about 5,482 square feet.

Related Construction Project - The Strategic Computing Complex (SCC), an FY 2000 Line Item project, is designed to be constructed directly to the north of the proposed NISC project. The Laboratory's SCC and NISC teams will coordinate design of facility and site features to assure optimum configuration and compatibility of the two facilities as the designs are developed. In addition, construction execution issues will be addressed.

4. Details of Cost Estimate[a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs, (Design, Drawings, and Specifications)	4,318	0
Design Management costs (0.52% of TEC)	304	0
Project Management costs (1.37% of TEC)	805	0
Total Engineering design inspection and administration of construction costs (9.23% of TEC)	5,427	0
Construction Phase		
Improvements to Land	2,588	0
Buildings	30,775	0
Special Equipment	2,030	0
Other Structures	0	0
Utilities	482	0
Standard equipment	3,483	0
Major computer items	0	0
Removal cost less salvage	418	0
Inspection, design and project liaison, testing checkout and acceptance	1,947	0
Construction Management (2.70% of TEC)	1,585	0
Project Management (2.41% of TEC)	1,419	0
Total Construction Costs	44,727	0
Contingencies		
Design Phase (1.33% of TEC)	781	0
Construction Phase (13.33% of TEC)	7,834	0
Total contingencies on NISC (14.66% of TEC)	8,615	0
Total, Line Item Costs (TEC)	58,769	0

[a]Cost estimate is based on Conceptual Design Report of July 1, 1998. Escalation is applied according to DOE approved escalation rates (FY98-2.4%, FY99-2.5%, FY00-2.6%, -FY01-2.6%, FY02-2.5%, FY03-2.6%,FY04-2.9%).

5. Methods of Performance

Design and inspection will be performed under a negotiated architect-engineer contract. Construction and procurement will be accomplished by a fixed price contract awarded on the basis of competitive bidding.

6. Schedule of Project Funding

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project cost

Arms Control & Nonproliferation

Program Mission

Arms Control and Nonproliferation is the focal point within the Department for activities which support the President's arms control and nonproliferation policies, goals and objectives, as well as statutorily-mandated activities. The major functional areas of the program include: Policy and Analysis; Reduced Enrichment Research and Test Reactor (RERTR); International Safeguards; Export Control Operations; Treaties and Agreements; International Security; and International Materials Protection, Control, and Accounting (MPC&A). The program provides leadership and representation for the Department in the international arms control and nonproliferation community and the U.S. Government's interagency process, as well as for the U.S. Government in national and international arms control and nonproliferation negotiations, agreements and interactions.

Program Goal

Reduce the threat of nuclear proliferation by integrating and orchestrating the Department's assets and efforts, including those of its national laboratories and contractors, by providing major policy and technical support to the U.S. Government's foreign policy and national security objectives in the areas of arms control and nonproliferation, and to the international arms control and nonproliferation community. The Department provides policy and technical leadership for national and global nonproliferation efforts to reduce the continuing and new global nuclear dangers.

Program Objectives

- Secure Nuclear Materials and Expertise in Russia, the Newly Independent States (NIS), and the Baltics.
- Limit Weapons-Usable Fissile Materials.
- Promote Transparent and Irreversible Nuclear Reductions.
- Strengthen the Nuclear Nonproliferation Regime.
- Control Nuclear Exports.

Performance Measures

- For Russia, the NIS and the Baltics, continue International MPC&A upgrades at the 50-plus sites (including transportation systems) that use or store weapons-usable nuclear materials and maintain the original schedule to complete installation of all upgraded materials protection, control and accounting systems on 80-100 most vulnerable buildings by the end of calendar year 2002, including

training and operation arrangements of protection systems with the Russian Ministry of Interior (MVD).

- Replace unilateral nuclear export controls with multilateral controls. Initiate negotiations for the adoption of upgrades to multilateral export controls for nuclear-propulsion and nuclear weapons codes.
- Continue efforts to ensure transparent and irreversible nuclear reductions by supporting analysis and technology development for transparency activities related to START III and other initiatives focused on verified warhead dismantlement.
- Under Initiatives for Proliferation Prevention (IPP), engage weapons scientists, engineers and technicians in peaceful projects at their institutes.
- Complete ratification and implementation of U.S. protocol for International Atomic Energy Agency (IAEA) "Strengthened Safeguards System," including supporting U.S. responsibilities for declarations and on-site inspections at DOE facilities.
- Maintain integrity of long-term storage of the spent fuel canisters at Nyongbyon nuclear site prior to their removal from North Korea.
- Place additional U.S. excess nuclear weapons material under IAEA inspection under the "Trilateral Initiative;" develop IAEA verification regime for U.S. excess materials and Russian excess material to be placed in the Mayak Fissile Material Storage Facility.
- Transfer responsibility for all non-Russian nuclear facilities where material protection, control, and accounting upgrades have been completed to International Safeguards for continuing activities to sustain achievements.
- Complete the ratification and implementation of the Comprehensive Test Ban Treaty (CTBT), including supporting U.S. responsibilities for on-site inspections at DOE facilities.
- Maintain core competency as technical experts to U.S. Government (USG) agencies in nuclear export control discussions, through workshops and exchanges.
- Continue technical exchanges with China, consistent with USG policy.
- Engage the Baltics, Caucasus and Central Asia in nuclear export control initiatives.
- Continue leadership to reduce and limit the use of highly enriched uranium (HEU) and plutonium in civil energy fuel cycles, and especially those in regions or countries of proliferation concerns.
- Expand applications of cooperative monitoring as a methodology to reduce regional or bilateral tensions.
- Under the Nuclear Cities Initiative (NCI) assist in the development of suitable and gainful civilian employment for skilled scientific personnel in the 10 nuclear cities as Minatom begins to down size its nuclear weapons facilities.
- Complete canning operations for the Spent Fuel Activities in Kazakhstan by securing entire in-pool spent fuel inventory at the BN-350 reactor in Aktau, Kazakhstan. The in-pool inventory of 2000

assemblies will be secured in 400 welded stainless steel canisters and returned to in-pool storage under improved physical security and IAEA safeguards.

Significant Accomplishments and Program Shifts

- Rapidly expanded DOE's efforts to secure the hundreds of tons of nuclear material in Russia, the NIS and the Baltics in order to implement systematic and rapid MPC&A upgrades. Accelerated effort in the naval and transportation sectors. Also provided leadership to improve export control systems in these states.
- Implement IAEA verification on U.S. excess material to promote international confidence in irreversible removal of such material from weapons. Facilities under IAEA inspection include those for plutonium storage, HEU storage and HEU downblending. Increasing focus is being placed on developing international verification approaches for fissile material disposition programs.
- Broaden IPP engagement of institutes formerly engaged in development and production of biological and chemical weapons.
- After the completion of the canning of the spent nuclear fuel at Yongbyon, activities will shift to minimize the corrosion of the spent fuel and maintain the integrity of the storage canisters prior to removal from North Korea.
- Continue activities that strengthen the international nonproliferation regime by supporting such global treaties as the Nuclear Non-Proliferation Treaty (NPT) and the CTBT; advancing a negotiating mandate for the Fissile Material Cutoff Treaty (FMCT); promoting full compliance with the IAEA strengthened safeguards protocol; and progressing on START III and regional arms control programs in areas of high tension.
- Prepare U.S. facilities for transparent nuclear warhead reductions and assist Russian technical experts to develop methods and techniques for commensurate activities.
- Assist the CTBT Organization in development and refinement of the verification and on-site inspection regime to include conducting trial inspections at DOE facilities and cooperative activities with Russia and other key states.
- Spent Fuel Activities in Kazakhstan will complete canning operations at the BN-350 reactor in Aktau and activities will shift to completing system development and procurement of the cask transportation system to transport fuel canisters to the storage facility.

Funding Profile

Site Description

Argonne National Laboratory

In support of Export Control Operations, provides unique technical support in the areas of nuclear and nuclear-related dual-use export license evaluations, particularly those related to the fuel cycle; training and assistance to Ukraine on export controls; and administers the Nonproliferation Graduate Program. In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the Ukraine. In support of RERTR objectives, develops low-enriched uranium (LEU) fuels to convert research and test reactors; conducts safety analysis of reactors; expedites return of U.S.-origin research reactor spent nuclear fuel from overseas; develops processes for producing molybdenum-99; and develops advanced high-density LEU fuels for Russian/Chinese designed reactor. In support of International Safeguards, promotes peaceful use of atomic energy and bilateral nuclear cooperation efforts through "sister lab" arrangements. In support of IPP, creates nuclear/chemical/biological projects in the NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out NCI program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Brookhaven National Laboratory

In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the former Soviet Union, particularly at the Luch Site, and maintains the database of MPC&A site data and progress. In support of Policy and Analysis efforts, supports the control and elimination of nuclear weapons material by assisting in the implementation of the U.S.-Russian agreement to shutdown production reactors, developing nuclear monitoring technology, and working with foreign nuclear programs to reduce all civilian use of plutonium and HEU; provides analytical and technical support to ongoing negotiations and in preparation for the implementation of agreements and treaties, such as the FMCT negotiations, by providing technical support related to safeguards/verification of fissile material processing, and hosts workshops to move negotiations forward in the Conference on Disarmament; and negotiates the implementation of HEU transparent and irreversible nuclear reductions to confirm that Russian nuclear weapons are being dismantled and the excess fissile materials removed are not reused for military purposes. In support of International Safeguards, improves the cost-effectiveness of the IAEA in detecting clandestine nuclear activities and safeguarding declared nuclear material by: implementing an IAEA verification experiment on excess HEU downblending operation at Portsmouth Gaseous Diffusion Plant; and supporting DOE involvement in U.S. policy formulation for IAEA safeguards. In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues,

provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Idaho National Engineering Laboratory

In the area of Policy and Analysis, supports START III efforts by maintaining the development of radiation signatures from U.S.-weapon systems based on enhancements to INEL-developed inspection technologies. In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Kansas City Plant

In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Lawrence Berkeley National Laboratory

In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Lawrence Livermore National Laboratory

In support of Export Control Operations, provides unique technical support in the areas of nuclear and nuclear-related dual-use export license evaluation, in particular, end user analyses and specific weaponization technologies; multilateral negotiation within the Nuclear Suppliers Group (NSG); and training and assistance to potential nuclear suppliers on export controls, with special emphasis on Russia and the Southern Tier States. In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the former Soviet Union, especially for some Navy projects and large defense sites. In support of Policy and Analysis efforts, supports the control and elimination of nuclear weapons material by assisting in the implementation of the U.S.-Russia agreement to shutdown production reactors, developing nuclear monitoring technology, and working with foreign nuclear programs to reduce all civilian use of plutonium and HEU; provides analytical and technical support to ongoing negotiations and in preparation for the implementation of agreements and treaties, specifically providing conference and technical support to the Biological Weapons Convention (BWC) compliance protocol; supports bilateral negotiations with Russia to implement transparent and irreversible nuclear reductions which would confirm that Russian nuclear weapons are being dismantled and the excess fissile materials that are removed are not reused for military purposes by providing technical and non-technical input on Warhead Dismantlement Regime Protocol for START III and Radiation Measurements technical input for the Laboratory-to-Laboratory and Mayak Transparency programs; provides detailed technical expertise on the nuclear weapons and nuclear power programs in states of proliferation concern and helps to formulate strategies in arms control, cooperative monitoring, and energy security used by the U.S. to prevent nuclear weapons testing and a nuclear arms race; promotes effective implementation of On-Site Inspections (OSI) under the CTBT by providing technical expertise in the areas of monitoring, development of equipment specification, procurement, and the conduct of inspection simulations; supports the interagency and U.S. delegations to the CTBT Preparatory Commission (PrepCom) and its verification Working Group; provides in expertise seismic monitoring, geophysical phenomena associated with nuclear testing, and nuclear weapons testing issues; participates in U.S. scientific cooperative programs with Russian and Chinese counterparts on non-weapons programs including exchanges in such areas as nonproliferation, arms control, and verification technology. In support of International Safeguards, improves the cost effectiveness of the IAEA in detecting clandestine nuclear activities and safeguarding declared nuclear material by: supporting DOE representation on the U.S./Russia/IAEA Joint Working Group; identifying U.S. excess fissile material vulnerabilities; and operating the Information Tracking and Analysis (ITA) Program (consisting of ITA, Nuclear Materials Management and Safeguards System (NMMSS), and ITA-International) which tracks and analyzes U.S. and foreign nuclear activity to satisfy statutory requirements and international obligations and to support U.S. nonproliferation policy. In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Los Alamos National Laboratory

In support of Export Control Operations, provides unique technical support in the areas of nuclear and nuclear-related dual-use export license evaluations, in particular the weaponization technologies; multilateral negotiation within the NSG; training and assistance to Kazakhstan and other NIS on export control laws; and provides for development and implementation of the Proliferation Information Network System (PINS) and the NSG Information Sharing System. In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the former Soviet Union. In support of RERTR objectives, provides technical support in the development of LEU targets, as an alternative to HEU targets, for use in the production of medical isotopes. In support of Policy and Analysis efforts, supports the control and elimination of nuclear weapons material by assisting in the implementation of U.S.-Russian agreements to shutdown production reactors by providing staff for U.S. monitoring teams and technical support on monitoring plutonium; supports the DOE position for FMCT negotiations, by providing technical support related to Hanford site facilities and safeguards/verification of plutonium reprocessing; promotes effective implementation of OSI under the CTBT by providing technical expertise in visual (ground and air) inspections and geographic data integration; provides expertise in monitoring and nuclear weapons testing issues in support of the interagency and U.S. delegations to the CTBT PrepCom and its verification Working Group; participates in U.S. scientific cooperative programs with Russian and Chinese counterparts on non-weapons programs, including exchanges on such subjects as nonproliferation, arms control, and verification technology; as a design laboratory, supports the Warhead Dismantlement and Transparency program, specifically focusing on Mayak Transparency efforts in the development of radiation signatures. In support of International Safeguards, improves the cost-effectiveness of the IAEA in detecting clandestine nuclear activities and safeguarding declared nuclear material by: serving as the leading contributor for strengthening of nuclear safeguards in Asia and the Pacific Rim countries; participating in "sister lab" arrangements; assisting DOE in providing support to the IAEA for development and implementation of environmental sampling, unattended nondestructive assay systems, and remote monitoring systems; and developing technologies for safeguarding of nuclear materials declared excess to the U.S. and Russian weapons programs. In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

National Renewable Energy Laboratory

In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve

other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

New Brunswick Laboratory

In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the former Soviet Union.

Nevada Operations Office

In support of Policy and Analysis efforts, supports the interagency and U.S. delegations to the CTBT PrepCom and its verification Working Group for the implementation of the CTBT verification system and U.S. ratification of the Treaty; provides expertise and analysis during OSI and in the development of equipment specifications; and manages the conduct of inspections at the test site.

Oak Ridge National Laboratory

In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the former Soviet Union, particularly with a lead on some Navy projects. In support of International Safeguards, improves the cost-effectiveness of the IAEA in detecting clandestine nuclear activities and safeguarding declared nuclear material by: encouraging safeguards technology development through cooperation agreements with Latin American countries; participating in "sister lab" arrangements; improving techniques for analyzing environmental samples; providing technical support for the Subcommittee on Technical Program and Cooperation; and implementing IAEA safeguards at Oak Ridge. In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of Policy and Analysis efforts, the Oak Ridge Y-12 facility, provides analytical and technical support to ongoing FMCT negotiations and preparation for the implementation of such agreements and treaties; provides technical support related to safeguards/verification measures and/or uranium enrichment processes and facilities; supports work with Russia to negotiate and implement transparent and irreversible nuclear reductions, to confirm that Russian nuclear weapons are being dismantled and the excess fissile materials that are removed are not reused by demonstrating various transparency techniques, to analyze START III monitoring options at OR Y-12, and to manage all Laboratory-to-Laboratory program contracts focusing on analytical impacts on monitoring plants; provides detailed technical expertise on the nuclear weapons and nuclear power programs in states of proliferation concern and helps to formulate strategies in arms control, cooperative monitoring, and energy security used by the U.S. to prevent nuclear weapons testing

and a nuclear arms race. In support of Export Control Operations, the Oak Ridge Y-12 facility provides unique technical support in the areas of nuclear and nuclear-related dual-use export license evaluations, particularly fuel cycle technologies; multilateral negotiations within the NPT Exporters Committee; training and assistance to Russia on export controls and illicit trafficking; and to the interagency Nuclear Export Violations Working Group. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Oakland Operations Office

In support of the Democratic Peoples Republic of Korea (DPRK) Spent Fuel Activities, works to minimize corrosion of spent fuel and maintain integrity of storage canisters, prior to the spent fuel's ultimate disposition, in accordance with the October 1994 "Agreed Framework" signed by the U.S. and DPRK governments. In support of Policy and Analysis efforts, supports the control and elimination of nuclear weapons material by assisting in the implementation of the U.S.-Russian agreement to shutdown production reactors, developing nuclear monitoring technology, working with foreign nuclear programs to reduce all civilian use of plutonium and HEU, and periodically reporting on nuclear materials in the U.S. that are subject to agreements; provides detailed technical expertise on the nuclear weapons and nuclear power programs in states of proliferation concern and helps to formulate strategies in arms control, cooperative monitoring, and energy security used by the U.S. to prevent nuclear weapons testing and a nuclear arms race. In support of International Safeguards, manages the ITA Program which tracks and analyzes U.S. and foreign nuclear activity to satisfy statutory requirements and international obligations and to support U.S. nonproliferation policy.

Pacific Northwest National Laboratory

In support of Export Control Operations, provides unique technical support in the areas of nuclear and nuclear-related dual-use export license evaluations, in particular those requiring DOE Part 810 authorization; training and assistance to potential nuclear suppliers on export controls and illicit trafficking, in particular Ukraine and Russia; and technology security. In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the former Soviet Union, with emphasis on material control and accounting at various civilian sites and coordination with Russian Ministry of Interior (MVD) and Ministry of Atomic Energy (MINATOM). In support of the DPRK Spent Fuel Activities, provides fuel canning technical support, working in accordance with the "Agreed Framework" signed by the U.S. and DPRK governments. In support of Policy and Analysis efforts, supports the control and elimination of nuclear weapons by assisting in the implementation of the U.S.-Russian agreement to shutdown Russian plutonium production reactors and storage sites, and by providing staff support during monitoring visits to shutdown U.S. production reactors at the Hanford site; provides analytical and technical support to ongoing negotiations and in preparation for the implementation of such agreements and treaties as the BWC Compliance Protocol and related technical papers, and for support to FMCT negotiations related to Hanford site facilities, safeguards/verification of plutonium reprocessing, and utilization of Hanford

facilities to demonstrate such approaches for fissile material reprocessing; supports U.S.-Russian bilateral negotiations for implementation of transparent and irreversible nuclear reductions in order to confirm that Russian nuclear weapons are being dismantled, and to ensure that excess fissile materials removed are not reused by providing a weapons design expert and Executive Secretary to the Mayak Transparency negotiations; provides detailed technical expertise on the nuclear weapons and nuclear power programs in states of proliferation concern and helps to formulate strategies in arms control, cooperative monitoring, and energy security used by the U.S. to prevent nuclear weapons testing and a nuclear arms race; promotes effective implementation of the CTBT verification system by providing technical expertise in the area of radionuclide monitoring. In support of International Safeguards, improves the cost-effectiveness of the IAEA in detecting clandestine nuclear activities and safeguarding declared nuclear material by: conducting technical consultations on information analysis software and hardware tools and expertise in environmental sampling and analysis; promoting the effective safeguarding of nuclear materials through bilateral safeguards agreements with Argentina, Brazil, European Atomic Energy Community (EURATOM), South Korea, and Japan, emphasizing information management and environmental sampling; and supporting the further implementation of IAEA safeguards at DOE facilities in the U.S. through the development of approaches, technical consultation to sites, trilateral discussions with the Russian Federation, and policy analysis. In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Pantex

In support of International MPC&A, installs equipment and inventories nuclear materials, particularly at former nuclear weapons facilities. In support of Policy and Analysis efforts, supports Russian negotiation and implementation of transparent and irreversible nuclear reductions to confirm that Russian nuclear weapons are being dismantled and the excess fissile materials that are removed are not reused for military purposes by specifically supporting Mayak Transparency Program efforts.

Sandia National Laboratory

In support of Export Control Operations, provides unique technical support in the areas of nuclear and nuclear-related dual-use export license evaluations, in particular, certain weaponization technologies; and training and assistance to potential nuclear suppliers on export controls, both domestically and abroad. In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the former Soviet Union, with an emphasis on physical protection at various defense and civilian sites. In support of the DPRK Spent Fuel Activities, provides inspection tools and support to minimize corrosion of spent fuel and maintain integrity of

storage canisters, prior to the spent fuel's ultimate disposition, in accordance with the "Agreed Framework" signed by the U.S. and DPRK governments. In support of Policy and Analysis efforts, provides analytical and technical support to ongoing FMCT negotiations by providing technical physical protection support related to nuclear material safeguards/verification; supports U.S.-Russian negotiations to implement transparent and irreversible nuclear reductions, in order to confirm that Russian nuclear weapons are being dismantled and excess fissile materials removed are not reused for military purposes, specifically focusing on the Laboratory-to-Laboratory Dismantlement Transparency Program efforts; provides detailed technical expertise on the nuclear weapons and nuclear power programs in states of proliferation concern and helps to formulate strategies in arms control, cooperative monitoring, and energy security used by the U.S. to prevent nuclear weapons testing and nuclear arms race; provides technical expertise in the areas of inspections, data surety and authentication, and training programs; supports the interagency and U.S. delegations to the CTBT PrepCom and its verification Working Group; provides OSI expertise in key areas of the development of the CTBT International Data Center, protection of data transmitted, and verifiable assessments; participates in U.S. scientific cooperative programs with Russian and Chinese counterparts on non-weapons programs, including such subjects as nonproliferation, arms control, and verification technology. In support of International Safeguards, improves the cost-effectiveness of the IAEA in detecting clandestine nuclear activities and safeguarding declared nuclear material by: providing technical support for IAEA and United Nations Special Commission (UNSCOM) inspections in Iraq; assisting DOE when it leads U.S. interagency physical protection visits; participating in International Physical Protection Advisory Service (IPPAS) mission of implementing physical protection improvement; and providing assistance to the IAEA in implementing remote monitoring systems to streamline nuclear safeguards. In support of IPP, creates nuclear/chemical/biological projects with NIS institutes to prevent "brain drain," facilitate broad access to former weapons facilities and openness between DOE laboratory scientists and their NIS colleagues, provide long-term commercial employment at NIS institutes, involve other USG agencies with similar interests, and enhance technology for environmental safety of nuclear materials. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Savannah River Operations Office

In support of Export Control Operations, provides unique technical support in the areas of nuclear and nuclear-related dual-use export license evaluations within its area of expertise (e.g., tritium production); and technology security and nonproliferation domestic training. In support of International MPC&A, installs equipment, inventories nuclear materials, and establishes a self-sustaining security infrastructure in the former Soviet Union, including the training of inspectors. In support of the DPRK Spent Fuel Activities, provides fuel canning site contractor to minimize corrosion of spent fuel and maintain integrity of storage canisters, prior to the spent fuel's ultimate disposition, in accordance with the "Agreed Framework" signed by the U.S. and DPRK governments. In support of Policy and Analysis efforts, supports the control and elimination of nuclear weapons by assisting in the implementation of the U.S.-Russia Plutonium Production Reactor Agreement (PPRA) by providing staff for U.S. monitoring teams to shutdown Russian plutonium production reactors and subject storage sites,

supporting monitoring visits to shutdown U.S. production reactors at the Savannah River Site, developing nuclear monitoring technology, and working with foreign nuclear programs to reduce all civilian use of plutonium and HEU. In support of International Safeguards, improves the cost-effectiveness of the IAEA in detecting clandestine nuclear activities and safeguarding declared nuclear material by: developing verification techniques for excess fissile material storage and disposition options at the Savannah River Site; and supporting UNSCOM and IAEA Action Team by providing technical experts, analyses, equipment and training. In support of NCI, creates permanent commercial jobs to employ displaced nuclear weapons scientists and to carry out program objective of creating economic opportunities in the closed nuclear cities of the Russian Federation.

Policy and Analysis

Mission Supporting Goals and Objectives

Policy and Analysis provides technical expertise and analytical support for arms control and nonproliferation treaty and agreement policy formulation, negotiation, and implementation at DOE facilities and in regional security. Assistance is provided to the State Department for increased contact with potential proliferant states to explore motives driving proliferation aspirations, and to engage DOE technical resources for training, confidence-building measures, implementation and verification of treaties, cooperative monitoring, and application of technology to facilitate proliferation prevention and reversal of nuclear weapons buildup. Resources are applied for global and regional arms control and nonproliferation treaties (NPT, CTBT, FMCT) and cooperative analysis of nuclear fuel cycles that can destabilize international relations and threaten regional security. Analysis is performed on measures and verification options for a multilateral fissile material production cutoff convention and bilateral cutoff with Russia; implementing a reciprocal monitoring regime for U.S./Russian nuclear weapon dismantlement and fissile material disposition; developing and refining procedures for confirming stockpiles of materials removed from weapons, and alternative cost-effective dismantlement transparency, verification, and chain of custody measures. In addition, analysis is performed on verification of nuclear-weapon-free zones, securing HEU in the former Soviet Union (FSU), and regional confidence-building. Assistance is also provided for implementation of the U.S./Russian agreement for exchange of technical information on nuclear warhead safety and support of projects for continued employment of FSU scientists in non-weapon activities.

Performance Measures

- Limit weapons-usable fissile materials through worldwide stockpile reductions of plutonium and HEU, the shutdown of production reactors, focus on proliferation implications of and solutions for key nuclear fuel cycle decisions, and development and implementation obligations under Agreements for Cooperation with other states.
- Provide analytical and technical support to ongoing negotiations and in preparation for implementation of agreements and treaties on such issues as transparency, inspection of sensitive DOE facilities, and verification.
- Work with Russia to negotiate and implement transparent and irreversible nuclear reductions, to confirm that Russian nuclear weapons are being dismantled and to ensure that excess fissile materials removed from dismantled Russian nuclear weapons are not reused in new nuclear weapons. Core elements of this program include the Laboratory-to-Laboratory Warhead Dismantlement Transparency Program, HEU Purchase Agreement Transparency, Mayak Fissile Material Storage Facility Transparency, and START III.
- Continue to support technical programs on regional nonproliferation and security exchanges, involving such concerns as cooperative monitoring, verification, arms control and nonproliferation

training, and trans-border environmental impacts that erode regional stability in the Middle East, South Asia and Northeast Asia.

- Support CTBT implementation, including support for ratification, U.S. responsibilities in the PrepCom, and development of procedures for OSI both internationally and at DOE facilities.
- Continue U.S. scientific cooperative programs with Russian and Chinese scientific counterparts on non-weapons programs, including exchanges on such subjects as nonproliferation, arms control, and verification technology. Expand program to include other areas of concern consistent with USG policy.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Policy and Analysis	19,571	24,071	27,521	+3,450	+14.3%
Total, Policy and Analysis	19,571	24,071	27,521	+3,450	+14.3%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Program Objective—Limit Weapons-Usable Fissile Materials			
Under the direction of the U.S.-Russian PPRA, conduct seven monitoring visits to shutdown Russian and U.S. reactors, operating Russian reactors, and Russian Plutonium oxide storage facilities, and participate in two meetings of the Joint Implementation and Compliance Commission. Implement agreements for cooperation and peaceful uses of nuclear energy to include, exchanges of nuclear material accounting records, and international consultations.	1,520	1,520	1,520
Conduct eight weeks of negotiations, consultations anticipated to last several weeks, and maintain technical experts to support deliberations, studies, and domestic and international exercises and/or conduct multilateral verification workshops.	750	750	750
Program Objective—Promote Transparent and Irreversible Nuclear Reductions			
Promote transparent and irreversible nuclear reductions by working with the Russian Federation to negotiate treaty and other legally binding agreements which allows confirmation that Russian nuclear weapons are being dismantled and that excess fissile materials removed from dismantled Russian nuclear weapons are not reused in the production of new nuclear weapons. The core elements of this program include the negotiation of a START III Treaty, currently planned to begin immediately following ratification of START II by the Russian Duma, which will actually mandate the elimination of quantities of nuclear weapons in addition to further reductions in nuclear delivery systems. Through the Laboratory-to-Laboratory Warhead Dismantlement Transparency Program maintain a technical dialog with Russian scientific and technical organizations.	6,110	11,110	16,010

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Program Objective—Strengthen the Nuclear Nonproliferation Regime			
Support technical and policy analysis efforts in nuclear weapons arms control, confidence building, and other regional security actions, and support activities such as the Cooperative Monitoring Center and other programs that promote regional stability, security, and nonproliferation efforts in South Asia, Northeast Asia, and Middle East regions consistent with USG policy.	6,550	6,200	5,500
Support CTBT ratification (testimony, Q&A's, briefings), provide technical experts to domestic and international meetings of the CTBT PrepCom and Working Group B, draft and refine procedures for OSI, conduct trial inspections and table top exercises, and continue cooperative CTBT related projects with Russia, China, France, and Israel.	2,196	2,196	1,846
Support scientific cooperative programs and exchanges with Russian and Chinese scientific counterparts on nonproliferation, arms control and verification technology, and continue to expand the program to include other countries and areas of concern.	2,445	2,295	1,895
Total, Policy and Analysis	19,571	24,071	27,521

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs.FY 1999 ($000)
Additional funds increase and expand U.S. access at Russian facilities under additional HEU Purchase Agreement transparency measures; provide for the evaluation and testing of START III radiation measurement technologies to ensure no release of classified information; and provide for lab-to-lab contracts with the Russians that require demonstration of their transparency technologies to the U.S.	+4,900
Reduce policy and technical support for arms control and nonproliferation cooperative monitoring and security exchange programs promoting regional stability in the Middle East, South and Northeast Asia; and limit cooperative monitoring and arms control training and information exchange workshops and conferences.	-700
Reduce CTBT support to the interagency preparatory committee and development of the on-site inspection teams.	S-350
Reduce support to U.S. scientific cooperative non-weapons programs.	-400
Total Funding Change, Policy and Analysis	+3,450

Reduced Enrichment Research and Test Reactor (RERTR)

Mission Supporting Goals and Objectives

RERTR supports development of LEU fuels to further LEU conversion of research and test reactors; expedited return of U.S. origin research reactor spent fuel from overseas; and development of targets and chemical processes for producing molybdenum-99 using LEU.

Performance Measures

- Continue cooperative activities with Russian laboratories on implementation of Russian agreements and the development of LEU fuels for Russia.
- Support the return of U.S.-origin spent nuclear research reactor fuel from abroad under the Environmental Impact Statement and the conduct of IAEA laboratory cooperation to facilitate receipt of U.S.-origin spent nuclear fuel.
- Conduct exchange visits with Chinese laboratories and cooperative exchanges with China on RERTR, as well as development of a joint plan for reactor conversion with China.
- Initiate development of high density LEU fuels for research reactors, and continue development of LEU targets for molybdenum-99 production, beginning with U.S.- Korean, and U.S.-Argentine cooperation on production using LEU.
- Continue conversion efforts of U.S. reactors and pursue cooperation on reactor conversion with Eastern Europe and South Africa.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
RERTR	6,222	6,000	5,822	-178	-3.0%
Total, RERTR	6,222	6,000	5,822	-178	-3.0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Program Objective—Limit Weapons-Usable Fissile Materials			
Maintain the program's computational database, develop analytical capabilities, study foreign research and test reactors conversion of U.S. origin HEU, and study U.S. reactor conversion.	850	700	850
Develop fabrication techniques for research and test reactor fuels of very-high-density, low-enrichment uranium for use in research reactors unable to use current technology LEU fuels. Program is progressing from sample-size to full-size fabrication and testing to qualify new LEU fuels, and demonstrate the same performance with the new LEU fuels as achieved with current HEU fuels.	2,472	3,022	3,500
Provide alternative targets and chemical processes to allow use of LEU to produce molybdenum-99, fission-product for use in medical applications including develop target fabrication technology, chemical process technology for recovery and purification, and/or adapt technology for disposing of radioactive waste, and obtain FDA approval to market the drug using LEU instead of HEU.	800	800	800
Provide the Executive Branch with a technical/economic evaluation of each significant request for export of HEU, and support implementation of the U.S. Government's Foreign Research Reactor Spent Fuel Return policy.	150	150	150
Enable Russia to complete the Soviet Union RERTR program, established in 1978, by supporting Russian institutes participating in the program, providing reactor analyses and fuel expertise from U.S. experts, and jointly assessing the feasibility of converting Soviet-designed reactors, (e.g., in the Czech Republic, Hungary, Poland, Kazakhstan, Uzbekistan, Ukraine, etc.).	1,750	1,028	322

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Encourage establishment of a Chinese RERTR program by supporting the design and operation of research and test reactors that would use LEU fuel, supporting the development and fabrication of LEU fuels for Chinese-designed reactors, and converting from HEU to LEU fuels.	200	300	200
Total, RERTR	6,222	6,000	5,822

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Program scope regarding the conversion of Soviet-designed reactors is reduced.	-178
Total Funding Change, RERTR	-178

International Safeguards

Mission Supporting Goals and Objectives

International Safeguards provides policy and technical leadership and funds efforts to strengthen the nuclear nonproliferation regime, particularly with respect to global nuclear material security. These efforts improve the cost-effectiveness of the IAEA in detecting clandestine nuclear activities and safeguarding declared nuclear material. New approaches, such as environmental monitoring, remote monitoring, and information management tools are addressed. Policy and technical support is provided to DOE program offices and sites for the implementation of IAEA inspection of U.S. excess material at DOE sites under bilateral and trilateral (with Russia) arrangements. Verification measures are developed, in coordination with the international Policy and Analysis activity and the DOE Office of Research and Development, for implementing the FMCT. IAEA technical assistance programs that promote peaceful use of atomic energy and bilateral nuclear cooperation efforts through "sister lab" arrangements are supported. Agreements for safeguards cooperation are negotiated and implemented for improved material protection, control, accountancy, and transparency with other countries, regions, and international organizations, including Argentina, Australia, Brazil, Brazilian-Argentine Agency for Nuclear Material Control and Accounting (ABACC), China, EURATOM, France, IAEA, Japan, South Africa, and South Korea. Manage the physical protection program to ensure that all countries that possess U.S.-origin nuclear materials are adequately protecting them against, theft, sabotage, and nuclear smuggling. Manage and operate the ITA Program (consisting of ITA, NMMSS, and ITA-International) which tracks and analyzes U.S. and foreign nuclear activity to satisfy statutory requirements and international obligations and to support U.S. nonproliferation policy. Transfer non-Russian facilities, where security upgrades have been completed under the International MPC&A program, to International Safeguards.

Performance Measures

- Provide technical experts, training and/or equipment to IAEA and UNSCOM for inspections in Iraq and/or North Korea.
- Provide technical advice, support, and technologies (e.g., environmental monitoring, remote monitoring, and information management tools) to IAEA for development of new strengthened safeguards policies and methods.
- Per the Nuclear Non-Proliferation Act (NNPA) of 1978, Section 202, provide training on safeguards and physical protection to nationals of nuclear developing countries, and lead USG teams on visits to countries with U.S.-origin nuclear material to ensure adequate physical protection.
- Analyze and implement policy on U.S., IAEA and Russian trilateral verification program to develop and apply IAEA measures on U.S. and Russian excess nuclear weapons material.

- Per Presidential Decision Directive (PDD) 41, continue IAEA inspections on current U.S. nuclear material under IAEA safeguards, and make additional excess fissile material available for IAEA inspections.
- Promote peaceful use of atomic energy through support to IAEA technical cooperation activities, sister laboratory arrangements, and promotion of NPT.
- Continue cooperation with South American, African, Asian, and European partners to strengthen safeguards on nuclear material.
- Provide physical protection technical assistance to countries with which DOE has bilateral agreements and to the IPPAS in order to prevent nuclear smuggling.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
International Safeguards	18,751	21,391	21,851	+460	+2.2%
Total, International Safeguards	18,751	21,391	21,851	+460	+2.2%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Program Objective—Strengthen the Nuclear Nonproliferation Regime			
Provide technical assistance to IAEA and UNSCOM for inspections in Iraq and North Korea through September 2000.	1,100	1,100	1,100
Provide remote monitoring systems in ten countries; conduct two strengthened safeguards workshops; support analysis of up to 250 Network of Analytical Laboratories samples; conduct tutorials and red team exercise; prepare Protocol declarations for 15 DOE sites; establish information management system for U.S. Strengthened Safeguards Protocol declarations; conduct security reviews at all 15 DOE sites.	3,700	4,740	4,900
Provide safeguards training to 30-plus participants from 20-plus countries; conduct two physical protection courses.	500	500	500
Implement U.S./Russian/IAEA Trilateral Initiative by representing DOE, on a quarterly basis, to the Joint Working Group; identifying excess fissile material attributes verifiable by IAEA; selecting, testing, and evaluating verification measurement technologies; developing information barrier technology to prevent disclosure of sensitive data to IAEA inspectors; developing, testing, and evaluating IAEA methods to monitor excess fissile material; and identifying U.S. excess fissile material vulnerabilities.	400	2,500	2,600
Implement the President's Excess Fissile Material Policy by maintaining the implementation plan, developing and negotiating techniques for excess fissile material storage and disposition options, and making additional excess fissile material available for IAEA inspection; implement U.S./IAEA Safeguards Agreement; establish safeguards approaches for three DOE sites, implement IAEA safeguards (36 inspections) at three DOE sites, implement IAEA inspection activities on HEU downblending operations at two facilities, and conduct three outreach tutorials and activities.	2,700	2,500	2,600

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Chair monthly IAEA meetings; develop four technical training courses; develop five action sheets for sister laboratory agreements; establish one additional technology exchange arrangement.	550	550	550
Conduct Nondestructive Assay (NDA) course in China; conduct four safeguards meetings in China; conduct workshops for South American safeguards inspectors; complete five Japan safeguards tasks; complete NDA projects with Republic of Korea; complete construction of Japanese clean chemistry laboratory; evaluate two fuel transfer campaigns at Embalse; complete one site visit to each of five NIS countries.	3,401	3,101	3,201
Lead USG teams on visits to countries with USG-origin nuclear material and host visits by physical protection officials from four new countries.	400	400	400
Expand IPPAS missions to include one Latin American and one NIS country; provide four additional countries with physical protection assistance.	1,000	1,000	1,000
Operate ITA Program including NMMSS; develop new nuclear waste material accounting software; maintain minimal level of activity at NIS facilities.	5,000	5,000	5,000
Total, International Safeguards	18,751	21,391	21,851

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Additional funds for developing verification techniques needed at Savannah River; preparing for stabilization of Pu under safeguards at Hanford and Rocky Flats Environmental Technology Site (RFETS); implementing of strengthened safeguards support work with Korea; and implementing remote monitoring systems.	+460
Total Funding Change, International Safeguards	+460

Export Control Operations

Mission Supporting Goals and Objectives

Export Control Operations advance U.S. nonproliferation export control objectives by developing and implementing policies, regulations, and procedures to halt the spread of weapons of mass destruction and their related technologies; promote and extend multilateral-bilateral nuclear supply arrangements in support of U.S. nonproliferation policy; control the export of nuclear and nuclear-related equipment, materials, and technologies as mandated by law and in accordance with national security objectives; and provide leadership, unique technical expertise, and training for the U.S. and international nonproliferation communities.

Performance Measures

- Continue government-to-government export control initiatives and on-going lab-to-lab cooperative agreements to develop the necessary infrastructure to ensure control over nuclear and nuclear-related dual-use equipment, material, and technology in Russia and the NIS.
- Participate in DOE, USG, and multilateral initiatives to combat nuclear smuggling and the illicit transfer of technologies for the production and utilization of special nuclear material as well as dual-use technologies in Russia and the NIS.
- Review and provide recommendations to the Nuclear Regulatory Commission and the Department of Commerce on nuclear and nuclear-related dual-use export licenses, representing DOE on all interagency fora (e.g., the Advisory Committee on Export Policy and the Interagency Working Group on Nonproliferation and Export Controls) in support of mandated licensing policy responsibilities.
- Administer, for the Department, the controls on the transfer of technology and assistance under 10 CFR Part 810.
- Ensure the viability of PINS to support the DOE export license processing system. Continue development of analytical tools which support implementation of DOE's export licensing review responsibilities under the NNPA.
- Ensure that DOE surplus equipment and technology is disposed of in a responsible manner and that technology transfers are consistent with regard to U.S. nonproliferation policy.
- Establish a program to support U.S. Customs domestically with technical evaluations of nuclear and nuclear-related shipments; and U.S. Customs and the NSG through an NSG/Customs hotline to help aid in the interdiction of illicit transfers.
- Conduct technology security reviews for DOE-funded foreign travel, visits and assignments to DOE facilities, technical exchanges, and export of DOE-controlled technology.

- Serve as the principal U.S. agency in negotiating controls over nuclear and nuclear-related dual-use materials, equipment, and technologies, especially within the NSG and the NPT Exporter's Committee (Zangger Committee). Includes ongoing activities to harmonize unilateral and multilateral controls as mandated by PDD-13.
- Upgrade, implement and support a computerized information sharing system in the NSG for the timely sharing of export denials among the 35 subscribing governments of the dual-use regime.
- Serve as principal technical agency responsible for continued dialogue with China to develop an effective export control system.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Export Control Operations	14,952	14,215	14,052	-163	-1.1%
Total, Export Control Operations	14,952	14,215	14,052	-163	-1 1%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Program Objective—Secure Nuclear Materials and Expertise in Russia, the Newly Independent States (NIS), and the Baltics			
Conduct two to three export control workshops for government and technical officials in Russia, Ukraine, and Kazakhstan.	400	300	300
Initiate three technical studies on nuclear proliferation to strengthen export control practices in Russia, Ukraine, and Kazakhstan.	300	200	200
Ensure that three jointly-developed nuclear export control databases are operating and assisting authorities in export control license reviews in Russia and Ukraine; and develop a system for Kazakhstan.	400	300	300
Implement plans to educate nuclear producers and exporters on national and international norms of export control in Russia, Ukraine, and Kazakhstan.	400	300	300
Work with multilateral players via two seminars to engage export control officials in the Baltics and Southern Tier to familiarize them with export control procedures.	415	415	415
Implement a training program for 100-200 Russian border and custom officials.	400	400	400
Develop indigenous training courses that Russian technical experts and MINATOM officials can use in training 1,000-2,000 border and custom officials.	200	200	200
Identify and install appropriate customs/border equipment needed to help prevent illicit transfers from leaving Russia.	400	400	400

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Program Objective—Strengthen the Nuclear Nonproliferation Regime			
Participate in negotiations to control conversion technology associated with plutonium, uranium, and thorium (add six new controls to multilateral list). Also, investigate, via two technical studies, the likelihood to adding nuclear propulsion technologies to the control list. Technologies such as weapons simulation codes, which may be significant under stockpile stewardship programs, also will be considered for control on a multilateral level, resulting in up to 10 new controls for the multilateral list	1,885	1,848	1,885
In FY 1998, conducted two seminars in support of regional export control/NPT transparency seminars within the Western Hemisphere	100	0	0
Support activities associated with the USG implementation of the Enhanced Safeguards Protocol (93+2)	200	200	0
Continue development and dissemination of technical training tools (three new commodities guides) to support the multilateral regimes, as well as UNSCOM/IAEA Action Team's activities associated with the monitoring and control of exports and imports of nuclear and nuclear-related materials, equipment, and technologies	100	0	0
Upgrade the NSG Information Sharing System to meet current industry standards and expand its capabilities to allow subscribing governments (35 terminals) to share information documents with others	575	575	575
Program Objective—Control Nuclear Exports			
Review and provide more than 2,500 recommendations to the Department of Commerce on the dual-use commodities related to the non-nuclear weapons of mass destruction (WMD), which include chemical and biological warfare (CBW) and missile items, representing DOE on all the interagency fora, including the SHIELD for CBW and the Missile Technology Advisory Committee (MTAC)	6,282	6,282	6,282
Ensure that the downsizing and dismantlement efforts throughout the DOE complex and disposal of excess materials, equipment, and technology at multiple DOE sites proceed responsibly, in strict adherence to U.S. nonproliferation policy and without inadvertent support to proliferants	1,105	1,105	1,105

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Serve as the principal USG technical agency in continuing dialogue with China to develop an effective export control system within, including nonproliferation cooperation under the DOE/China agreement now being negotiated and three joint workshops of DOE laboratories and Chinese institutes.	100	0	0
Administer the Department's export control licenses (up to 50) on nuclear technology and services required by Section 57b of the Atomic Energy Act and implemented under DOE regulations 10CFR Part 810.	685	685	685
Implement an outreach program with five DOE weapons laboratories and contractors, providing guidance regarding export-controlled technology and U.S. export control regulations to DOE and the national laboratories.	1,005	1,005	1,005
Total, Export Control Operations.	14,952	14,215	14,052

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Terminate support activities associated with the USG implementation of the Enhanced Safeguards Protocol (93+2).	-163
Total Funding Change, Export Control	-163

International Materials Protection, Control, and Accounting

Mission Supporting Goals and Objectives

International MPC&A activities are designed to support cooperation under agreements established with Russia, the NIS, and the Baltics for the protection of "direct use" nuclear materials. The focus is on key facilities and institutions that possess or process significant quantities of nuclear weapons-usable materials that are of nonproliferation concern. Expertise in the planning and implementation of systems and procedures to enhance protection of such materials is provided. These activities support the integration of nuclear materials security equipment and procedures into systems that are effective and are maintainable and sustainable by the cooperating countries. Efforts also promote the diffusion of nuclear materials security technologies, concepts, and expertise to different types of operating facilities where systems will be implemented. International MPC&A activities enhance U.S. national security and reduce the threat of nuclear proliferation and nuclear terrorism by improving the security of all weapons-usable nuclear materials (not in weapons) in the FSU. The International MPC&A priority is to rapidly secure all material where it currently is kept. Goals include installing MPC&A equipment, beginning nuclear material inventorying, beginning to change the Soviet security culture and beginning to establish a self-sustaining security infrastructure. Funding provides for MPC&A upgrades for defense related sites in Russia including uranium and plutonium cities, the nuclear weapons complex, maritime fuel locations, and transportation vehicles. MPC&A upgrades for civilian and regulatory related sites in Russia including large fuel facilities, reactor-type facilities, regulatory systems and organizations, and training programs and centers are also funded. MPC&A upgrades in Kazakhstan, Ukraine, Belarus, Uzbekistan, Latvia, Georgia, and Lithuania were completed in FY 1998.

Performance Measures

- Continue International MPC&A upgrades at the 50-plus sites that use or store weapons-usable nuclear materials and maintain the original schedule to complete installation of upgraded materials protection, control and accounting systems on 80-100 most vulnerable buildings by the end of calendar year 2002.
- Complete installation of MPC&A upgrades at Russian Navy Sites including one Northern Fleet Site, one Pacific Site, three floating platforms, and two Navy regulations and training programs.
- Continue to sustain the MPC&A upgrades at the 12 completed reactor-type facilities to ensure successful operation.
- Complete railcar and truck transportation projects to secure material transport for at least 10 major nuclear weapons, naval, and large fuel facilities.
- Continue cooperation with the Russian Ministry of Interior (MVD) to ensure successful operation of completed physical protection systems, including approval and implementation of a joint DOE-MVD work plan.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
International MPC&A	137,008	140,082	145,000	+4,918	+3.5%
Total, International MPC&A	137,008	140,082	145,000	+4,918	+3.5%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Program Objective—Secure Nuclear Materials and Expertise in Russia, the Newly Independent States (NIS), and the Baltics			
Continue to install MPC&A upgrades for defense-related sites in Russia, including five major uranium and plutonium cities, three nuclear weapons complex sites, 10 Russian Navy projects, and security upgrades for 31 railcars and 50 trucks used for transporting nuclear material.	63,504	82,280	78,028
Continue to install MPC&A upgrades for civilian and regulatory-related sites in Russia, including six large fuel facilities, 14 reactor-type facilities, 10 nuclear regulatory projects, and six training and education projects.	63,900	54,802	41,668
Completed MPC&A upgrades at four sites in Kazakhstan, four sites in Ukraine, and five sites in the NIS, one each at Belarus, Uzbekistan, Latvia, Georgia, and Lithuania.	9,604	0	0
Install MPC&A upgrades at Russian Navy sites including one Northern Fleet site, one Pacific site, three floating platforms, and two Navy regulations and training programs. Cooperate with the Russian Ministry of Interior (MVD) in the operation of U.S.-installed physical protections systems at 80-100 facilities/buildings and continue infrastructure projects to sustain security upgrades over the long-term, including two in-country equipment manufacturing projects, three training projects, and two transportation systems projects.	0	3,000	25,304
Total, International MPC&A	137,008	140,082	145,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
MPC&A upgrades for defense-related sites in Russia: decrease is a result of rapid upgrades being completed on all 31 Russian railcars used to transport nuclear materials.	-4,252
MPC&A upgrades for civilian and regulatory-related sites in Russia: decrease is a result of rapid upgrades being completed at 10 reactor-type facilities.	-13,134
Increase required to complete rapid security upgrades and cooperation on projects not foreseen in 1996 resulting from unprecedented programmatic successes in other areas of International MPC&A cooperation, as well as emerging new high priority opportunities.	+22,304
Total Funding Change, International MPC&A	+4,918

Treaties and Agreements

Mission Supporting Goals and Objectives

The Treaties and Agreements subprogram supports implementation of bilateral or multilateral, Presidentially-directed or Congressionally-mandated arms control and nonproliferation initiatives, agreements and treaties. In addition, it provides for unexpected, unbudgeted responses to arms control and nonproliferation requirements of an immediate nature based on urgent U.S. national security needs, as well as preparations to meet new transparency or verification requirements arising out of ongoing negotiations that are consistent with U.S. national security and without compromising proliferation sensitive information.

Performance Measures

- Continue support for Russian and other FSU activities related to specific agreements such as those resulting form the Gore/Chernomyrdin and Gore/Kiriyenko Commissions; the HEU Purchase Agreement, and other opportunities to secure through purchase at-risk weapons-usable materials; and activities related to bilateral and trilateral excess fissile materials inspections among Russia, the IAEA, and the U.S.
- Support the Year 2000 NPT Review Conference and achieve the CTBT, the Chemical Weapons Convention (CWC), and the BWC; address unexpected requirements concerning treaty or agreement negotiations; and support activities in response to urgent U.S. national security requirements.
- Provide technical support and personnel to UNSCOM to ensure no re-initiation of WMD programs in Iraq.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Treaties and Agreements	3,528	3,813	3,583	-230	-6.0%
Total, Treaties and Agreements	3,528	3,813	3,583	-230	-6.0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Program Objective—Secure Nuclear Materials and Expertise in Russia, the Newly Independent States (NIS), and the Baltics			
Provide support for Russian and other FSU activities, including work on converting three plutonium production reactors in Russia and other activities under the Gore/Chernomyrdin and Gore/Kiriyenko Commissions.	300	300	300
Program Objective—Limit Weapons-Usable Fissile Materials			
Support HEU purchase agreement (buying 500 metric tons of weapons-origin HEU), and other opportunities. Secure at-risk nuclear materials in the 15 former Soviet Republics.	500	500	500
Provide support to bilateral and trilateral activities to inspect 30 metric tons of excess plutonium and hundreds of tons of excess HEU.	1,000	1,000	900
Program Objective—Strengthen the Nuclear Nonproliferation Regime			
Support U.S. participation in the Year 2000 NPT Review Conference and PrepCom Conferences. Additional support for the CTBT Organization, the BWC and CWC.	1,500	1,785	1,655
Continue technical support to UNSCOM on Iraq.	228	228	228
Total, Treaties and Agreements	3,528	3,813	3,583

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Reflects minor reductions across the board to address shifts in priorities.	-230
Total Funding Change, Treaties and Agreements	-230

International Security

Mission Supporting Goals and Objectives

International Security supports the implementation of security commitments made by the Administration regarding the NIS of the FSU and the DPRK. Specific efforts are:

Spent fuel activities in the DPRK include arresting the corrosion of the spent fuel from the 5MW research reactor in Nyongbyon, North Korea; and safely canning and storing spent fuel prior to its ultimate disposition in accordance with the "Agreed Framework" signed by the governments of the U.S. and DPRK.

Spent Fuel Activities in Kazakhstan support the urgent security and storage requirements for plutonium-bearing spent fuel located at a reactor in Aktau, Kazakhstan. The objective of this activity is to secure approximately three tons of weapons-grade plutonium for long-term safeguard monitoring and storage.

The IPP in the NIS, transferred from Defense Programs, Weapons Activities in FY 1996, was designed to reduce the global nuclear danger through focused, cooperative projects involving the ten major DOE laboratories and science and engineering institutes in Russia, Ukraine, Kazakhstan and Belarus. Some of these projects will involve cost-sharing with U.S. industry. Major initiatives include preventing "brain drain" by engaging scientists, engineers, and technicians in non-weapons-related projects; motivating participation in proliferation prevention activities; facilitating continued access to NIS facilities through technical engagement with personnel; and establishing self-sustaining commercial linkages that will support future independent commercial projects and assure a Federal exit strategy. Cooperative, cost-sharing projects are aimed at establishing direct partnerships that will provide for long-term commercial employment of key scientists, engineers, and technicians.

The NCI contributes to nonproliferation goals and reduces the global nuclear danger in direct and concrete ways. By working closely with the Ministry of Atomic Energy of the Russian Federation (Minatom), the representatives of the government and private sectors of the United States will assist in the development of suitable and gainful employment in the commercial sector for skilled scientific personnel of the Russian nuclear complex. Of the approximately 170,000 employees who work directly at the nuclear weapons facilities in the ten nuclear cities of the Russian Federation, many are considered as potential proliferation risks due to their direct knowledge of nuclear weapons technology. These individuals will likely be among those who lose their jobs when the production of the weapons facilities is scaled back. It is in the U.S. interest to support Minatom in this undertaking to prevent the potential brain drain to countries with the means and the intention to gain access to nuclear technology.

Performance Measures

Spent Fuel Activities in the DPRK

- Implement long-term maintenance of water treatment and fuel canning equipment including crane maintenance replacement equipment, materials consumed in maintenance, fuel for site power and heat for winter visits; and associated shipping costs. Conduct on-site inspections in combination with follow-up trips to repair equipment or recan spent fuel if necessary.
- Carry out technical studies to analyze safety issues, characterize fuel, and develop disposition options. Train DPRK staff to maintain essential site equipment.
- Provide a trained team of U.S. experts to conduct regular health physics tests and maintain necessary certifications.
- Address and resolve problems with canister integrity, water clarity, and other issues which would impact IAEA safeguards activities.

Spent Fuel Activities in Kazakhstan

- Design and procure spent fuel cask transportation system for transporting spent fuel canisters from Aktau to Baikal-1 storage facility.
- Complete construction of underground silo storage facility for the fuel canisters at the Baikal site.
- Complete design and begin development and installation of the safeguards monitoring and physical protection systems for approximately 500 underground silos at the Baikal-1 storage facility.

Initiatives for Proliferation Prevention (IPP)

- Create cooperative, cost-sharing projects aimed at establishing direct partnerships which will provide for long-term commercial employment of key scientists, engineering, and technicians.
- Carry out other IPP project and support activities to keep NIS institutes viable as stable places of peaceful employment; to engage NIS weapons scientists, engineers and technicians in peaceful, commercial activities to prevent "brain drain;" to facilitate broad access to NIS chemical, biological and nuclear weapons facilities in order to achieve close 1/1 working relationships of DOE laboratory scientists and engineers with their NIS colleagues to promote openness and transparency; and to focus on "closed cities."
- Involve other agencies having similar technological interest, such as NIH, USDA, and Department of State in IPP projects.
- Conduct specific projects involving technologies, the development of which supports enhanced safety, security and accountability of nuclear materials (for example, neutron emission technology to counter nuclear smuggling).

Nuclear Cities Initiative (NCI)

- Create jobs in the civilian sector in each of the target nuclear cities for nuclear scientists, engineers and technicians.

- Work with Minatom in the diversification of the economy of the nuclear cities and in creating an environment for further business development.
- Carry out of a number of social initiatives including exchanges in medical, educational, and woman's leadership training programs undertaken in support of NCI job creation efforts.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Spent Fuel Activities in the DPRK	4,968	2,328	2,171	-157	-6.7%
Spent Fuel Activities in Kazakhstan [a]	0	15,000	16,000	+1,000	+6.7%
Initiatives for Proliferation Prevention (IPP) [b]	29,600	22,500	30,000	+7,500	+33.3%
Nuclear Cities Initiative (NCI) [c]	0	7,500	30,000	+22,500	+300.0%
Total, International Security	34,568	47,328	78,171	+30,843	+65.2%

[a] FY 1998 efforts funded at $10M from a combination of prior year balances and FY 1998 budget authority available to the Arms Control and Nonproliferation Program.

[b] FY 1999 efforts funded at $25M from a combination of prior year balances and $22.5M in FY 1999 budget authority, including $15M as requested, $4.5M from funding for International MPC&A, and $3.0M from funding for other Arms Control and Nonproliferation functional areas (RERTR, International Safeguards, and Export Control Operations).

[c] FY 1999 efforts funded at $15M from a combination of prior year balances and $7.5M in FY 1999 budget authority from funding for International MPC&A.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Program Objective—Strengthen the Nuclear Nonproliferation Regime			
Spent Fuel Activities in the DPRK			
Provide equipment replacement and maintenance, and purchase fuel sources for equipment operation in the DPRK	2,468	1,028	1,028
Conduct two, two-week visits to perform on-site inspections, prepare for two additional follow-up visits to repair equipment, and perform several technical analyses on safety, fuel composition, and disposition	1,100	700	650
Provide two DPRK personnel maintenance training sessions, one refresher training course for U.S. experts, and up to three health physics tests	400	100	50
Resolve eight weeks of technical problems impacting IAEA activities	1,000	500	443
Total, Spent Fuel Activities in the DPRK	4,968	2,328	2,171
Program Objective—Secure Nuclear Materials and Expertise in Russia, the NIS, and the Baltics			
Spent Fuel Activities in Kazakhstan			
At the BN-350 Aktau reactor, secure 350 tons of spent fuel (3,000 individual assemblies) containing three tons of plutonium in 500 welded stainless steel canisters (six assemblies per canister). The 350 tons of spent fuel will be placed in a facility containing underground silos for long-term dry storage. Each of the underground silos will be instrumented with nuclear material safeguards technology in order to detect with continuous, unattended monitoring from a remote location, any diversion of the spent fuel material.	0[a]	15,000	16,000
Total, Spent Fuel Activities in Kazakhstan	0	15,000	16,000

[a] FY 1998 efforts funded at $10M from a combination of prior year balances and FY 1998 budget authority available to the Arms Control and Nonproliferation Program.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Initiatives for Proliferation Prevention (IPP)			
Under IPP, engage about 1,000 scientists, engineers, and technicians in 50 projects to provide long-term commercial employment at nuclear (MINATOM/Academy of Science) NIS institutes.	13,100	10,125	13,500
Engage about 200 scientists, engineers and technicians in 10 projects to provide long-term commercial employment at chemical/biological NIS institutes.	2,000	1,500	2,000
Engage about 700 scientists, engineers and technicians in 50 projects to prevent "brain drain" and promote openness between DOE laboratory scientists and their NIS colleagues at nuclear (MINATOM/Academy of Science) institutes.	7,100	5,325	7,100
Engage about 200 scientists, engineers and technicians in 10 projects to prevent "brain drain" and promote openness between DOE laboratory scientists and their NIS colleagues at chemical/biological institutes.	5,000	3,750	5,000
Create five projects involving other USG agencies with similar interests.	1,000	750	1,000
Create five projects involving technology to enhance environmental safety, security and accountability of nuclear materials.	1,400	1,050	1,400
Total, Initiatives for Proliferation Prevention (IPP)	29,600	22,500[a]	30,000
Nuclear Cities Initiative (NCI)			
Create approximately 1,000 permanent commercial jobs employing displaced nuclear weapons scientists and engineers.	0	5,000	20,000
Carry out program objective of creating commercial economic opportunities in the closed, nuclear cities of Russia.	0	2,500	10,000
Total, Nuclear Cities Initiative (NCI)	0	7,500[b]	30,000
Total, International Security	34,568	47,328	78,171

[a] FY 1999 efforts funded at $25M from a combination of prior year balances and $22.5M in FY 1999 budget authority, including $15M as requested, $4.5M from funding for International MPC&A, and $3.0M from funding for other Arms Control and Nonproliferation functional areas (RERTR, International Safeguards, and Export Control Operations).

[b] FY 1999 efforts funded at $15M from a combination of prior year balances and $7.5M in FY 1999 budget authority from funding for International MPC&A.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Spent Fuel Activities in the DPRK	
Reduce the number of technical analysis because technical data/information has been analyzed prior and during canning.	-50
Reduce training courses to half since DPRK and U.S. technical experts will have gained the skills need to performed the needed tasks during the four years of canning and the first year of implementing the long-term maintenance program.	-50
Reduce time spent on resolving problems impacting IAEA by one week because the main activities during long-term maintenance have been discussed and IAEA's position and comments will have been integrated into the long-term maintenance agreement.	-57
Total, Spent Fuel Activities in the DPRK	-157
Spent Fuel Activities in Kazakhstan	
Additional funds for Kazakhstan Spent fuel Activities to stabilize and secure fuel canisters and emplace them in underground storage silos under safeguards monitoring and physical protection systems for long-term storage.	+1,000
Initiatives for Proliferation Prevention (IPP)	
Funding increase supports commercialization by adding up to three Thrust II projects with chemical and biological institutes and up to five Thrust II projects with nuclear institutes.	+7,500 [c]
Nuclear Cities Initiative (NCI)	
Additional funds support implementation of the Russian NCI to facilitate restructuring of the Russian nuclear weapons complex and expand non-weapons sector economic opportunities for Russian nuclear specialists. This effort was endorsed at the July 1998 Gore-Kiryenko Commission meeting and it supports a government-to-government agreement signed by Secretary Richardson and Minister Adomov in September 1998.	+22,500 [d]
Total Funding Change, International Security	+30,843

[c] FY 1999 efforts funded at $25M from a combination of prior year balances and $22.5M in FY 1999 budget authority, including $15M as requested, $4.5M from funding for International MPC&A, and $3M from funding for other Arms Control and Nonproliferation functional areas (RERTR, International Safeguards, and Export Control Operations).

[d] FY 1999 efforts funded at $15M from a combination of prior year balances and $7.5M in FY 1999 budget authority from funding for International MPC&A.

Nuclear Safeguards and Security

Program Mission

The Nuclear Safeguards and Security Program provides effective policy, programmatic direction and training for the protection of the Department of Energy's (DOE) nuclear weapons, nuclear materials, classified information, and facilities. The program provides technology development and technical support to domestic safeguards and security activities as well as implementation of effective classified information and information control policies. The program will help ensure protection of certain critical national infrastructures against both physical and cyber attacks.

Program Goal

Support the National Security of the United States by assuring the effective, cost-efficient protection of the DOE's nuclear weapons, nuclear materials, classified information, and facilities against theft, sabotage, espionage, and terrorist activity.

Program Objectives

- Strengthen support to field elements to facilitate implementation of cost-saving safeguards and security measures.
- Develop Department-wide strategic and long-range planning for domestic nuclear safeguards and security.
- Modernize safeguards and security management information systems.
- Provide a domestic technology and systems development program to ensure the availability of state-of-the-art technical capabilities for the protection of sensitive DOE facilities, special nuclear materials, and national security interests including classified matter.
- Ensure availability of state-of-the-art technical capabilities for accountability and control of nuclear material recovered from disassembled nuclear weapons returned from the stockpile, and storage of special nuclear materials.
- Support the role of the Safeguards and Security Nonproliferation and National Security Institute (formerly the Central Training Academy).
- Develop programs to support the standardization and accreditation of physical security systems.
- Maximize public access to DOE information while protecting national security.

- Provide leadership in jointly assessing sector vulnerabilities, recommending remedial plans, and developing systems and plans for identifying, countering, and recovering from attacks.

- Build an effective partnership between government and infrastructure owners and operators, with increased sharing of information relating to infrastructure threats, vulnerabilities, and the interdependencies.

- Educate and inform decision-makers and private industry, government, and the general public about infrastructure assurance, especially the importance of protecting their own information.

Performance Measures

- Through the Nonproliferation and National Security Institute, conduct 148 safeguards and security training courses with approximately 176 iterations to protect domestic safeguards and security resources.

- Modify current technologies for safeguards and security applications or develop new technologies to reduce the backlog of documented and validated field user needs by about 50%.

- Begin classification guidance streamlining initiative, issuing 40 guides in the new format.

- Conduct two pilot vulnerability assessments to develop guidance for overall program direction.

Significant Accomplishments and Program Shifts

- Comprehensive continuous review and analysis of program requirements coupled with advances in safeguards and security technologies have resulted in millions of dollars in savings and cost avoidance for the Department, i.e., a heartbeat detector to automatically detect personnel hidden in vehicles, thus saving cost of protective force personnel physically searching each vehicle; portals to automatically detect the potential theft of special nuclear materials; automated information system alarms to automatically detect anomalous activities, evaluate them, and appropriately respond to prevent potential attacks to classified computer systems; continuous automated vault inventory systems to monitor and confirm the presence of special nuclear materials in storage rather than the expense and exposure from a physical inventory; and nondestructive assay measurement technologies to quantify special nuclear materials without removing materials from their containers.

- The Safeguards and Security program has been and will be the key deterrent in preventing major incidents (i.e., theft, sabotage, terrorist activity, etc.) across the complex at 16 domestic weapons sites.

- Enhanced training technology applications and applied a broader range of technologies to Departmental training, i.e., expanded use of interactive television, mobile training team, and televideo conferences to provide requisite training for a larger number of students without funding increases.

54-291 99 - 13

- The Declassification program has played a key role in implementing the Department's Openness Initiative by maximizing public access to Departmental information while protecting our national security posture, thus rebuilding the public's trust in the Department of Energy.

- The DOE Information Assurance program continues support in deterring major incidents involving compromise of classified information in energy information. This includes expansion of information assurance forensics analysis capabilities to support investigations and prosecutions of unauthorized disclosures of classified information, unauthorized intrusions into departmental networks, and providing input into the information systems security technology development program to develop new technology in response to new, unidentified network intrusion methods. Also reflected is the transfer of approximately $1.3 million for activities developed under Technology and Systems Development to Operational Support in order to implement the classified information systems security program throughout the Department.

- Reallocated funding of $5.0 million, which supported a one-time effort in FY 1999 to eliminate vulnerabilities identified in the Department of Justice report on "Vulnerability Assessment of Federal Facilities," was transferred to the Technology Development Program primarily supporting efforts to correct vulnerabilities and evolving threats facing the Department.

Site Description

Los Alamos National Laboratory

Work at Los Alamos National Laboratory (LANL) is designed to address current, evolving, and future needs, primarily in the areas of materials control and accounting (MC&A) and computer security. Activities in MC&A include the development of measurement technologies and instrumentation to quantify difficult-to-measure or shielded special nuclear materials. LANL also develops standards for special nuclear materials to calibrate instruments around the complex. Other activities include evaluating commercial measurement systems and the development of MC&A training. Computer security efforts are focused on developing a capability to perform classified processing across multiple platforms and participation in the tri-laboratory effort to automatically detect suspicious activities on computer networks and automatically provide a response capability. Support is also provided for the Declassification Productivity Initiative by providing automated tools that improve the efficiency of document classification/declassification reviews.

Sandia National Laboratory

Sandia focuses on development of technologies and systems required to protect the Department from catastrophic consequences such as use of nuclear energy for malevolent purposes or the erosion of national security secrets through theft or diversion of classified materials or information. Technical assistance is provided for assessment of site vulnerability analysis and site safeguards and security plans. Support is also provided for the Declassification Productivity Initiative by providing automated tools that improve the efficiency of document classification/declassification reviews. The technology development program focuses on physical security technologies to secure the DOE complex. Activities include providing new detection capabilities to automatically detect unauthorized access, explosives, or other contraband. Sandia will develop advanced barrier technologies to prevent or substantially delay attacks. Technological solutions will also be provided to address new threats, such as chemical and biological weapons. In addition, Sandia will continue to maintain a core technical capability in interior and exterior sensors, alarm communications, access delay, and entry control. Computer security activities include participation in the tri-laboratory effort to automatically detect suspicious activities on computer networks and automatically provide a response capability. Assistance is also provided in developing comprehensive classification guidance for nuclear safety, ES&H, and dismantlement/reuse; reviewing declassification proposals and field office classification appraisals; and updating nuclear weapon guides.

Argonne National Laboratory

Argonne provides technical and programmatic development assistance in support of DOE's initiative to establish an effective national infrastructure assurance program that is supportive of, and harmonized, with national infrastructure assurance efforts.

Brookhaven National Laboratory

Brookhaven supports the technology development program in the area of material control and accounting to increase assurance regarding special nuclear materials and other fissile materials by developing measurement capabilities for fuel.

Idaho National Engineering and Environmental Laboratory (INEL)

INEL provides Idaho-based field expertise, technical assistance, and engineering support for the development, review, evaluation, and implementation of security-related requirements to effectively meet DOE's goals. This includes review and evaluation of security design requirements to support nonproliferation; engineering support for validation, justification, and site safeguards and security plan reviews; and development and refinement of security design criteria.

Nevada Operations Office

Activities will be conducted at the Remote Sensing Laboratory and the Special Technologies Laboratory. Activities will focus on evaluating existing and new measurement technologies to determine their feasibility at DOE sites. Efforts also include developing technologies to assist protective force personnel, including night vision goggles and investigating the use of ultraviolet tags to differentiate between the adversary and site personnel.

Oak Ridge, Lockheed Marietta Energy Systems

At Oak Ridge, technical assistance is provided for the development, maintenance, and conducting of courses and workshops that evaluate and ensure Information Systems Security certification; Master S&S Agreement/Site S&S Plan verification/validation; and physical protection systems. The technology development program support in physical security and material control and accounting addresses needs for protecting nuclear weapons, nuclear material, classified information, and other vital DOE assets (nonnuclear and unclassified). Expertise is provided in the document classification/declassification initiative and for classification guidance update and streamlining. The Declassification Productivity Initiative is supported by providing automated tools that improve the efficiency of document classification/declassification reviews.

Oak Ridge Institute for Science & Education/Oak Ridge Associated Universities

At Oak Ridge, technical support provides implementation, training, operation, and quality assurance of the Personnel Security Assurance Program, and a variety of research and analysis activities in support of the personnel security function. Technical assistance supports the classification/declassification program in the verification for review of classified and historical information for accuracy and compliance with DOE's openness policy.

Richland, Battelle Memorial Institute/Pacific Northwest Laboratory (PNL)

PNL provides technical expertise, assistance, training, and awareness in support of information security. This includes the identification, inquiry, and resolution of security problems across DOE; and analysis of incidents and facility survey information. They also assist with the implementation of the Department's information assurance initiative and related activities to ensure effective and efficient identification of threats and vulnerabilities to DOE's distributed information and telecommunication systems. Technical assistance is provided that supports special nuclear material consolidation, Master S&S Agreement, Site S&S Plan support, and vulnerability assessment reviews and performance testing.

Richland, Fluor-Daniel Hanford

Provides Hanford-based field expertise, technical support and assistance for the review, update and consolidation of safeguards and security orders and policies and field guidance to cost effectively meet department goals and objectives. Support is provided for the classification/declassification initiative by improving the access capability to DOE's OpenNet data base.

Lawrence Livermore Laboratory (LLNL)

Technical support is provided for DOE's Information Systems Security Program for analysis and recommendations for policies, guidance, and information assurance tool development for all aspects of information systems security. The technology development program at LLNL is concentrated in computer security, physical security, and materials control and accounting (MC&A). LLNL provides the Department with many tools to detect and respond to attacks to information system networks. The laboratory is also a participant in the tri-laboratory effort to automatically detect suspicious activities on computer networks and automatically provide a response capability. Physical security activities focus on providing software and interface upgrades to the Department's standardized access control system and evaluating low cost access control technologies for implementation throughout the DOE. In MC&A, measurement solutions for heterogeneous materials are being developed and implemented around the complex. Classification/declassification is supported through development of operational tools to improve the productivity of document reviewers.

Savannah River Site

Work at Savannah River supports materials control and accounting through the development, deployment and operation of a fully developed, ready to use, software application for nuclear materials accounting throughout the DOE complex. This technology will allow for greater reliability, efficiency, and cost savings through increased standardization and use of advanced software technologies. The classification/declassification program is supported through the development and streamlining of classification guidance.

Operational Support

Mission Supporting Goals and Objectives

Safeguards and Security Operational Support provides essential technical and analytical expertise to ensure effective and efficient security; a protective force for Headquarters operations; reviews which ensure cost-saving measures in safeguards and security throughout the Department; and standardized training responsive to the challenges of the changing post-cold war era. This support provides for the overall improvement of safeguards and security activities.

Subprogram activities in this section of the budget include the following:

- **Nonproliferation and National Security Institute (NNSI) (formerly Central Training Academy)** is the Center of Excellence for safeguards and security training and training development. NNSI uses both traditional and distance learning technologies to provide onsite and facility training for safeguards and security personnel ensuring that DOE maintains a well-trained workforce to protect the nation's vital nuclear and energy interests against espionage, sabotage or theft. NNSI assesses safeguards and security field training needs and site training program performance and develops training courses to meet those needs. Distance Learning Training includes satellite transmission of NNSI training to multiple DOE sites and, through the use of modern interactive technology, allows each student to be part of the instructional process. Computer-based training, interactive audio/video training and correspondence courses are also provided.

- **Information Security** provides support across the department in the areas of classified matter protection and control, technical security, information systems security (information assurance), operations security, and foreign ownership, control or influence. The accelerated information assurance program will provide a capability for ensuring that the resources and methods necessary to identify and prosecute unauthorized intruders of departmental networks are effective and available. The information assurance activities will also provide a capability to evaluate proposed security measures within the Department's complex network environment. The Information Security Resource Center (ISRC) incorporates technical expertise and professional development training to ensure that the five disciplines of information security function in an integrated, cohesive manner. The Technical Surveillance Countermeasures (TSCM) program, one of the five disciplines, ensures and enhances the security provided for Departmental facilities and programs in the greater Washington, D.C. area. The Information Assurance Outreach Program provides a vehicle for providing technical expertise, assistance, and awareness training in information security disciplines to energy sector companies, particularly in the area of information assurance (information systems security). The information security program provides matrix support to various Departmental programs, such as the critical infrastructure program and the counterterrorism/counterintelligence programs.

- **Security Education Briefing and Awareness** provides support for Security Education Briefing and Awareness to reflect changing policies and procedures. Coordinates and participates in security

education workshops and meetings for the exchange of resources and dissemination of security education information and assists contractors in establishing supporting briefing materials.

- **Personnel Security** evaluates, reviews, and develops guidance and documents for use in evaluating the Personnel Security Assurance Program (PSAP) as it relates to medical, psychological, legal, security, and management components. Researches and prepares technical documents to support the Personnel Security activities. Provides technical assistance and operational support to the Personnel Security program manager to determine current status of science and technology in the component areas.

- **Additional Support** provides Headquarters and field elements with support to implement cost-saving safeguards and security measures. This support includes technical assessments, risk management/ vulnerability assessment expertise, engineering assistance, surveys, and performance testing. Enhancements to the DOE safeguards and security risk management process were necessary in FY 1998 to address changes in Departmental priorities, changes in technology, and increased emphasis on the application of appropriate technologies. FY 1999 will continue the established program as a phased process within the Department. FY 2000 activities and funding levels are formulated to incorporate enhanced risk management tools currently under development and to assist/train all Departmental elements in their correct use. Additional Support also provides for technical background on policy issues, administrative and technical guidance in the development of computer security policy for systems possessing national security interest data (unclassified and classified), and the security alarm system at Headquarters.

  The Safeguards and Security Information Management System (SSIMS) tracks and reports classified safeguards and security issues from all DOE field sites. SSIMS allows OSS to conduct continuous reviews of the security measures in place at DOE/contractor facilities, ensuring compliance with DOE policy requirements and monitoring the effectiveness of Departmental policy involving the protection of national security assets. SSIMS funding will maintain a database information system detailing facility findings, ratings, and general operational status; assist in technical performance review of system software; provide training support for data base users and document and course material update; provide additional system and development support; and computer software and hardware, including minor upgrades to existing system.

  The Headquarters Guard Contract provides security for the protection of Government property, classified matter, and personnel at headquarters buildings.

- **Critical Infrastructure Protection Program** will carry out the national mandates of the Critical Infrastructure Protection directive and Presidential Decision Directive 63 regarding critical infrastructure protection. These mandates obligate DOE to partner with the private sector in ensuring the viability of the energy sector infrastructures nationwide. In addition to responsibilities for its own critical infrastructure, the Department is primarily responsible for ensuring that the DOE national laboratories' capabilities are fully utilized in regards to developing flexible, evolutionary approaches that span both public and private sectors, and protect both domestic and international security.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Nonproliferation and National Security Institute (NNSI)	7,813	7,813	8,813	+1,000	+12.8%
Information Security	2,770	3,814	6,464	+2,650	+69.5%
Security Education Briefing and Awareness	181	181	181	0	0
Personnel Security	485	485	485	0	0
Additional Support					
Headquarters Guard Contract	7,000	7,000	7,654	+654	+9.3%
Other	3,481	9,437	3,937	-5,500	-58.3%
Total Additional Support	10,481	16,437	11,591	-4,846	-29.5%
Critical Infrastructure Protection Program	0	0	2,100	+2,100	+100.0%
Total, Operational Support	21,730	28,730	29,634	+904	+3.1%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Nonproliferation and National Security Institute			
■ Conduct approximately 148 courses with 176 classroom iterations, emphasizing "Online Training." Funding increase in FY 2000 allows the development of approximately 30 new courses to meet identified field site training needs for chemical/biological equipment, response to weapons of mass destruction, and advanced physical security systems. Funding will also reduce accumulated, deferred infrastructure maintenance/replacement backlog by 25%, including such things as required fire alarms, mandatory "Americans with Disability Act" (ADA) upgrades, lighting, and required fire sprinklers.	7,750	7,750	8,750
■ Provides funding to support NNSI's equipment-related needs such as replacement of outdated interactive television technology equipment	63	63	63
Total, Nonproliferation and National Security Institute	7,813	7,813	8,813

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Information Security			
■ The Information Security Resource Center (ISRC) in FY 2000 continues to provide technical expertise, assistance, training, and awareness in an integrated manner across the five disciplines of information security. Activities support the identification, investigation, and resolution of security problems across the department, especially in the area of unauthorized disclosures and compromises of classified information; analysis of incidents and facility survey information to identify problems within the information security program; and analysis of foreign ownership, control or influence (FOCI) in determinations of contracts within the various program elements of DOE dealing in classified information. Increase in funding is based on the continuing, increasing trend of unauthorized disclosures or compromises of classified information throughout DOE and the increasing complexity of FOCI issues.	1,152	1,152	1,602
■ The Information Assurance Outreach Program (IAOP) in FY 2000 continues to provide technical advice and awareness to energy sector elements in support of the Presidential Decision Directive (PDD 63) on Critical Infrastructure Protection. The IAOP provides unbiased capability to energy sector companies in the areas of information assurance including vulnerability testing, design reviews, independent verification and validation of information system security measures, and awareness of emerging information assurance issues. IAOP activities provide basic level of assurance that key energy sector assets are protected in a reasonable manner that ensures that national and economic security concerns of the country are not adversely affected by terrorist activities. Funding levels are based on industry requests for support activities and ensures support is provided to systems and areas that would have a high impact on national and economic security missions.	1,500	1,500	1,450

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The Information Assurance Program provides continuation of the accelerated development and deployment of capabilities within the information systems security (information assurance program) in FY 2000, supporting various departmental programs and missions including counterintelligence, counterterrorism, and internal critical infrastructure protection. Activities include expansion of information assurance forensics analysis capabilities to support investigations and prosecutions of unauthorized disclosures of classified information, unauthorized intrusions into departmental networks, and providing input into the information systems security technology development program to develop new technology in response to new network intrusion methods. Activities also include developing and verifying unique, trusted solutions to the next generation of departmental specialty networks such as the control systems for the National Ignition Facility (NIF) and the Accelerated Strategic Computing Initiative (ASCI); and enhancements to commercially available information systems security products to ensure classified information is appropriately protected from unauthorized access or disclosure. Funding levels have been determined based on the rate of technological advances and, in the case of forensics, based on similar activities within the Department of Defense. . . .	0	1,000	2,000
■ Reflects a transfer of activities for implementation of the Information Systems Security Program (Information Assurance) in FY 2000 which were previously developed under the Technology Development program. These elements include Baseline Skills Evaluation and Certification (training and education), the Computer Incident Advisory Capability (CIAC), the internal Advice and Assessment Program, and the operation of the DOE Information Systems Security Server. This funding level provides the basic architecture and baseline support in the effective implementation of the classified information systems security program throughout DOE. Funding levels were derived based on past activity levels.	0	0	1,250

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Provides for continuation of on-site technical support for information security in the areas of technical reviews of technology transfer issues and the conduct of inquiries into unauthorized disclosures of classified information, emphasizing computer forensics	118	162	162
Total, Information Security	2,770	3,814	6,464
Security Education Briefing and Awareness			
■ Provide security awareness throughout the DOE complex through education programs			
■ Support security awareness and education through information exchange by planning and conducting a Security Education Special Interest Group (SE/SIG) workshop			
■ Maintain the SE/SIG electronic bulletin board	181	181	181
Personnel Security			
■ Operate Center for Human Reliability Studies			
■ Support personnel security activities through guidance and product development, update and revise personnel security materials			
■ Serve as technical liaison with Department of Defense (DOD) Personnel Security Research Center, DOD Polygraph Institute and similar agencies and institutions			
■ Upgrade and maintain Personnel Security Assurance Program (PSAP) electronic bulletin board; evaluate and modify PSAP training materials	485	485	485
Additional Support			
■ Headquarters Guard Contract - Ensure a sound protection program is offered to Headquarters employees and facilities through use of 41 static posts and roving patrols, 16 supervisors, 4 managers, and 13 instructors, receptionists and administrative assistants. FY 2000 increase is required to cover normal escalation and inflation along with marginal flexibility in adjusting to technological changes and a follow-on contract	7,000	7,000	7,654
■ Support operational, maintenance, and enhancement costs for SSIMS	300	300	300

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Provides for installation and maintenance of residential alarm systems for senior level DOE management, and support and corrective/preventative maintenance of alarm systems and metal detectors at both headquarters facilities. Provides for engineering support, minor enhancements, and modifications to the headquarters access control systems. Increased funding in FY 2000 is for maintenance of new alarm system and vehicle barrier systems whose installation began in FY 1999 in response to eliminating/mitigating vulnerabilities identified in the Department of Justice Report on "Vulnerability Assessment of Federal Facilities."	753	753	883
■ Support the headquarters protective force radio system maintenance at the 90% operational level. Increased funding is due to past shared funding effort of system with Office of Human Resources and Administration which will now be sole responsibility of the Office of Safeguards and Security.	50	50	85
■ Perform physical security system reviews. In FY 2000, additional field evaluations are necessary to support enhanced vulnerability assessment process.	676	654	821
■ Provide risk management/vulnerability assessment program verifications and validation. In FY 2000, additional field evaluations are necessary to support enhanced vulnerability assessment process.	819	797	965
■ Assist in the development of DOE Orders and program policies on security requirements; develop database of electronic security systems components that will help users identify and manage system component lifecycle replacement issues; provide technical support in reviewing and validating assessment of security system requirements at DOE sites; supports expertise required for development of explosive detection support procedures; and provides for development of training course outlines for security system implementation and development of a certification process for security systems for determining how certified systems are meeting user needs versus their protection requirements.	387	387	387

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ In FY 1999, provided for the procurement and replacement of security locks meeting Federal Specification FF-L-2740A for containers holding sensitive classified material	0	1,000	0
■ Supports capitalized computer equipment requirements and modification and/or replacement parts to the Headquarters alarm and access control system. In FY 1999 work was initiated to begin alarm system replacement and installation of vehicle barrier systems at Headquarters for compliance with the Department of Justice Report on "Vulnerability Assessment of Federal Facilities."	496	5,496	496
Total, Additional Support	10,481	16,437	11,591
Critical Infrastructure Protection Program (CIPP)			
■ Provides expert technical assistance to the Energy Sector Coordinator in establishing collaborative working relationships between the government and the energy industry, facilitates development of information collection and sharing, and assists in the validation of industry-led vulnerability analyses	0	0	1,500
■ Supports implementation of a vulnerability assessment capability and a CIPP implementation tracking system	0	0	600
Total, Critical Infrastructure Protection Program	0	0	2,100
Total, Operational Support	21,730	28,730	29,634

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($ 000)
Nonproliferation and National Security Institute	
■ Nonproliferation and National Security Institute increase supports the development of 30 new courses meeting identified training needs for chemical/biological equipment, response to weapons of mass destruction, and advanced physical security systems and maintenance or replacement upgrades of existing infrastructure	+1,000
Information Security	
■ The Information Security Resource Center has increased emphasis in support of activities that identify and resolve security problems, particularly unauthorized disclosures and compromises of classified information and those associated with foreign ownership, control, and influence determinations	+450
■ Small decrease to the Information Assurance Outreach Program based on reduced industry requests for support activities	-50
■ Information Assurance Program provides for continuation of accelerated development and deployment of capabilities within the information systems security, supporting various departmental programs including counterintelligence, counterterrorism, and internal protection	+1,000
■ Reflects a transfer of activities that were developed under the Technology and Systems Development program to an implementation effort for the classified information systems security program throughout the Department	+1,250
Additional Support	
■ Headquarters Guard Contract provides for escalation associated with a follow-on contract	+654
■ Increased costs for maintenance of new alarm system and vehicle barrier systems in response to report on "Vulnerability Assessment of Federal Facilities"	+130
■ Reflects shift of shared funding responsibility totally to the Office of Safeguards and Security for maintenance of the Headquarters protective force radio system	+35
■ Supports requirement for additional field evaluations and physical security system reviews for enhanced vulnerability assessment process	+335
■ Reflects reduction for the FY 1999 funding for procurement of security locks that meet Federal Specification FF-L-2740A	-1,000
■ Reflects reduction to Headquarters facility upgrades. This upgrade was an FY 1999 activity that should be completed by year end	-5,000
Critical Infrastructure Protection Program (CIPP)	
■ Provides technical assistance to the Energy Sector Coordinator in establishing collaborative working relationships between the government and the energy sector	+1,500

	FY 2000 vs. FY 1999 ($ 000)
■ Supports implementation of a vulnerability assessment capability and a CIPP implementation tracking system	+600
Total Funding Change, Operational Support	+904

Technology and Systems Development

Mission Supporting Goals and Objectives

The Technology and Systems Development program's mission is to develop new technologies or modify commercial systems to protect the National nuclear complex, special nuclear materials, classified information and other critical assets. The threats facing DOE facilities and sites continue to evolve and present many challenges to the Department. Traditionally, the Technology and Systems Development Program was concerned with nuclear material control and accounting, but now is faced with other threats including weapons of mass destruction, terrorism, cyber attacks and the insider. Although the Department is no longer in a production mode, it is disassembling nuclear weapons and has received weapons grade materials from other countries. All of these weapons grade components and materials have resulted in increased nuclear material inventories which the Department must properly protect and account for. Technology continues to be the key to protect and secure the Department's facilities and assets. Safeguards and Security deficiencies requiring technical solutions have been identified and validated from safeguards and security managers around the DOE complex. Currently, the Domestic Safeguards and Security program can partially address approximately 50% of its domestic requirements. The program continues to provide technical solutions to meet our customers' needs. A few past accomplishments include the Enclosed Space Detection System to detect persons hidden inside vehicles; an Integrated Physical Security System (ARGUS); a Network Intrusion Detector that is implemented not only throughout the DOE, but DOD as well to detect unauthorized access to computer networks; and nondestructive assay systems that accurately quantify nuclear materials without exposing personnel to radiation. The program will continue to strive to sustain and utilize core security technologies and expertise, but also provide technical defenses against chemical and biological terrorism, cyber attacks, large bombs, and other contraband.

The Technology and Systems Development program is divided into the following subprograms:

Science and Technology Development Projects includes all activities ranging from basic research to full scale development and activities necessary to modify a proved technology for safeguards and security applications.

Technology Application includes site implementation of a technology or system that will address a safeguards and security deficiency and technology transfer to a qualified manufacturer.

Technology Support, Assistance, and Consultation Tasks includes technical training, technical support to Headquarters, technical workshops and seminars, and technical support and assistance to the DOE complex.

Each subprogram is concentrated in the following disciplines:

Physical Security: Activities are focused in detection, access control, alarm control and display, alarm assessment, adversary barriers/delay, and protective force subsystems.

Material Control and Accounting: Efforts are focuses in nuclear material measurements, material accounting, material control, training, and statistical methods.

Information Security: Projects are focused on advice and assessment, education and awareness, incident response, detection tools, technical assistance, and system integration, and information assurance.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Science and Technology Development Projects	17,975	19,877	24,154	+4,277	+21.5%
Technology Application	2,523	1,417	1,066	-351	-24.8%
Technology Support, Assistance, and Consultation Tasks	3,122	3,326	2,250	-1,076	-32.4%
Total, Technology and Systems Development	23,620	24,620	27,470	+2,850	+11.6%
Crosswalk of Disciplines					
Physical Security	7,419	9,318	11,128	+1,810	+19.4%
Material Control and Accountability	10,296	9,796	10,072	+276	+3.8%
Information Security	5,905	5,506	6,270	+764	+13.9%
Total	23,620	24,620	27,470	+2,850	+11.6%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Physical Security			
■ Correct vulnerabilities at DOE sites to protect DOE sites and assets from outside attacks, such as terrorists, and also from insider collaboration. In FY 2000, funds have been increased in this area to develop solutions to address the evolving threats that the Department faces. (SNLA, LLNL, Remote Sensing Lab/NV, and OR/LMES)	3,976	4,735	5,420
■ Provide required upgrades to the Department's standardized integrated access control system. These upgrades include replacing the obsolete database interface and software, as well as testing the system against new DOE performance requirements (LLNL)	300	950	1,450
■ Explosives Detection. Evaluate commercial explosives detection systems to determine applicability to the Department. FY 2000 will focus on developing a low cost capability to detect explosives hidden in vehicles. (SNLA)	530	680	980
■ Test and evaluate physical security equipment to characterize their performance and determine their applicability to DOE sites. (SNLA)	1,205	1,365	1,340
■ Prevent/delay attacks to DOE sites by developing robust barriers that resist known penetration attacks. Current barriers have proven to be inadequate. Increase in funding supports additional efforts focused on testing and implementing effective barriers to decrease potential vulnerabilities to the DOE complex. (SNLA)	470	450	650
■ Develop tools to assess the Department's risk to chemical and biological weapons. Increased funding allows the evaluation of detectors to determine their best configuration for application to DOE sites to provide early detection of a possible terrorist attack. (SNLA)	400	500	750
■ Develop tools to simulate DOE sites and perform risk analyses to determine the optimum security needs within current constraints. (SNLA)	150	250	150
■ Capital Equipment	388	388	388
Total, Physical Security	7,419	9,318	11,128

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Material Control and Accounting (MC&A)			
■ Extend measurement capabilities to account for 100% of the DOE's special nuclear materials inventory. i.e., scrap and residues. (LANL, LLNL)	6,472	4,427	4,542
■ Provide contraband detection technologies to detect materials hidden or shielded within packages or vehicles. (LANL)	500	650	350
■ Evaluate commercial MC&A systems and technologies to determine their applicability to DOE. (LANL)	250	460	535
■ Develop special nuclear material standards to calibrate instruments. Efforts are reduced due to completion of a set of standards. (LANL)	250	800	650
■ Provide required modules to the Department's standard material control and accounting system. Increase permits system to be integrated into other safeguards and security systems. (SRS)	800	800	1,200
■ Develop DOE courses to keep personnel abreast of latest MC&A technologies and issues impacting the DOE complex. (LANL)	850	855	900
■ Provide technical assistance and maintenance to DOE sites for fielded MC&A systems. (LANL, LLNL, & Science & Tech Lab/NV)	810	1,440	1,531
■ Capital Equipment	364	364	364
Total, Material Control and Accounting	10,296	9,796	10,072
Information Security			
■ Complete Phase II of Automated Information Systems Alarms Project (LANL, Science & Tech Lab/NV, LLNL)	2,325	2,325	2,325
■ Develop advanced tools and technologies to detect/prevent penetrations to computer networks. Increased funds will be used to provide advanced tools to respond to the dynamic threats facing computer system networks. (LLNL, LANL)	2,745	2,321	3,085
■ Provide technical assistance on current threats to DOE information networks and determine mitigation strategies. (LLNL)	450	450	450
■ Provide low cost experience-based training for network system administrators. (LLNL)	200	225	225
■ Capital Equipment	185	185	185

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Total, Information Security	5,905	5,506	6,270
Total, Technology and Systems Development	23,620	24,620	27,470

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($ 000)
Science and Technology Development Projects	
■ The increase provides for additional support to physical security (+1,810) to correct vulnerabilities at DOE sites by developing solutions to address evolving threats from terrorist and insider collaboration, provide required upgrades to DOE's standardized integrated access control system, develop robust barriers to better resist penetration attacks and evaluate technologies to protect DOE facilities and personnel from chemical and biological weapons. In MC&A, additional efforts will focus on advanced measurement technologies (+$276) and developing additional modules for the Department's standardized material control and accounting system (+$375). Activities will also be accelerated to ensure the integrity of classified computer systems within the Department (+$1,052) including the development of advanced computer security tools (+$764)	+4,277
Technology Application	
■ Efforts to assist sites with implementation of material control and accounting technologies will be completed and activities will shift to developing technical solution to address vulnerabilities	-351
Technology Support, Assistance, and Consultation Tasks	
■ Efforts will be redirected from providing technical support to Headquarters on MC&A, computer security, and physical security issues to developing solutions to correct deficiencies at DOE sites	-1,076
Total Funding Change, Technology and Systems Development	+2,850

Classification/Declassification

Mission Supporting Goals and Objectives

The majority of the Classification/Declassification program is now funded in the Nonproliferation and National Security Program Direction budget. The portion of the Classification/Declassification program funded here is primarily provided by Management and Operating contractors in the field in support of the ongoing base program as well as support of the declassification initiative. The ongoing base classification program includes the routine review and development of classification guidance. The declassification initiative program includes development and utilization of advanced technologies to improve the efficiency and productivity of the document declassification review process. Also, included in the declassification initiative is the development of specific guidance to implement approved Fundamental Classification Policy Review recommendations, while undertaking a restructuring and streamlining of the entire classification guide system, ultimately improving classification and declassification efficiency. These efforts under the Classification/Declassification program will maximize public access to the Department's information, consistent with nonproliferation and national security objectives.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Classification/Declassification	1,850	1,850	1,996	+146	+7.9%
Total, Classification/Declassification	1,850	1,850	1,996	+146	+7.9%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Classification/Declassification			
Development of state-of-the-art technology for document declassification to improve efficiency and effectiveness of declassification			
■ Test and evaluate prototype declassification technology in FY 1998	775	0	0
■ Limited expansion of electronic document declassification system and testing the application of the declassification tools against a set of documents in FY 1999	0	625	0
■ Set up test capability at one field location in FY 2000	0	0	771
Development of guidance to implement Fundamental Classification Policy Review (FCPR) recommendations under streamlined system, improving overall effectiveness of the classification guidance system			
■ Continue effort to develop specific classification guidance implementing FCPR using page change method through mid-FY 1999	1,075	612	0
■ In late FY 1999, transition into classification guidance streamlining method to implement FCPR. In FY 2000 continue classification guidance streamlining, issuing in the streamlined format 40 guides containing updated guidance	0	613	1,225
Total, Classification/Declassification	1,850	1,850	1,996

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($ 000)
■ Allows for testing the application of declassification tools at one field location ...	+146
Total Funding Change, Classification/Declassification	+146

Capital Operating Expenses and Construction Summary

Capital Operating Expenses

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Capital Equipment	1,496	6,496	1,496	-5,000	-77%
Total, Capital Equipment	1,496	6,496	1,496	-5,000	-77%

Security Investigations

Program Mission

The Security Investigations Program funds background investigations for all DOE federal staff and all Headquarters contractors, who, in the performance of their official duties, require access authorizations for Restricted Data, National Security Information, or special nuclear material. User programs will fund field office requests for background investigations for contractors and non-federal employees who are not included in the Security Investigations Program budget.

Program Goal

Support the common defense and security of the United States by ensuring that only appropriate personnel are authorized access to classified information, special nuclear material, or occupy sensitive positions.

Program Objectives

- Ensure the timely and efficient processing and adjudication of initial access authorization requests and reinvestigations.
- Reduce the types and numbers of access authorizations, consistent with DOE mission changes, the downsizing of the nuclear weapons complex, and other classified programs and activities.
- Support development and implementation of an electronic network among DOE field offices, DOE contractors, the Office of Personnel Management (OPM) and other Federal agencies to reduce the overall access authorization processing time.

Performance Measures

- Conduct approximately 17,379 personnel security investigations and reinvestigations for the total DOE-wide program.
- Reduce the numbers and levels of access authorizations as the programmatic need for them diminishes.

Significant Accomplishments and Program Shifts

The FY 1998 appropriation for this program was $30 million - paid through a single decision unit: Security Investigations.

In order to encourage further reductions in the number of security clearances, the cost of investigations requested by the field offices for all contractors and non-federal employees will be allocated to four user

programs. The cost of investigations for all federal employees (DOE-wide) and Headquarters requirements will continue to be allocated to the Security Investigations Program.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request
Security Investigations					
Security Investigations	30,000	30,000	0	30,000	30,000
Off-sets from Program Organizations	0	-20,000	0	-20,000[a]	-20,000
Total, Security Investigations	30,000	10,000	0	10,000	10,000

Public Law Authorization:
Public Law 83-703, "Atomic Energy Act of 1954"

[a]The Controller's Office notified the Congress that the Department may allocate up to $35 Million from Program Organizations to fund security investigations. It is not known at this time what will actually be spent by each program.

Funding by Site

(dollars in thousands)

Site Description

Oak Ridge Institute of Science and Education

The Oak Ridge Institute for Science and Education (ORISE) located in Oak Ridge, Tennessee, carries out national and international programs in science and engineering education, training, and management systems, energy and environment systems, and medical sciences. ORISE conducts these programs for the U.S. Department of Energy through a management and operating contract with Oak Ridge Associated Universities (ORAU). Established in 1946, ORAU is a not-for-profit consortium of 62 colleges and universities. ORISE supports the personnel security research and analysis activities of the Office of Safeguards and Security. They provide DOE with technical support for implementation, training, operation, and quality assurance of the personnel security process, and a variety of research and analysis activities in support of personnel security function. They also develop and distribute briefing materials as required by the refresher briefing provisions in DOE O 470.1, Chapter 4, "Safeguards and Security Awareness Program. Materials are delivered to all DOE and DOE contractor sites required to provide refresher briefings to employees.

Security Investigations

Mission Supporting Goals and Objectives

The Security Investigations Program funds background investigations for DOE federal staff and Headquarters contractors who, in the performance of their official duties, require access authorizations for Restricted Data, National Security Information, or special nuclear material. Security Investigations are required in order to be in compliance with Section 145 of the Atomic Energy Act of 1954, as amended, Title 10, Code of Federal Regulations, Part 710, and Executive Order 12968, which mandate that access authorizations (security clearances) are required for access to classified information or special nuclear material. The Department utilizes the services of the Office of Personnel Management (OPM) to conduct security investigations which serve as the basis for these access authorizations. The cost of security investigations is set by OPM depending on the type and level of investigation needed.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Federal Bureau of Investigations Background Investigations	49	49	66	+17	+34.7%
Office of Personnel Management					
Initial Background Investigations	4,989	4,940	9,926	+4,986	+100.9%
Reinvestigations	21,726	21,666	16,454	-5,212	-24.1%
National Agency Checks	576	635	444	-191	-30.1%

Subtotal, Security Investigations	30,000	30,000	30,000	0	0.0%
Off-sets from Program Organizations	0	-20,000*	-20,000	0	0.0%
Total, Security Investigations	30,000	10,000	10,000	0	0.0%

*The Controller's Office notified the Congress that the Department may allocate up to $35 Million from Program Organizations to fund security investigations. It is not known at this time what will actually be spent by each program.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Federal Bureau of Investigations (FBI)			
■ Conduct up to 12 initial FBI background investigations and reimburse the FBI for fingerprint cards and name checks. This represents an increase of 3 cases over FY 1998 and FY 1999 estimates, and allows for gradual cost increases for fingerprint cards and name checks	49	49	66
Office of Personnel Management			
■ Anticipate 3,214 OPM initial (Single Scope Background) investigations in FY 2000. Increase is necessary to meet field office requirements such as the accelerated closure plan at Rocky Flats Environmental Technology Site, accelerated cleanup efforts at Oak Ridge's K-25, Y-12 and Oak Ridge National Laboratory, and the removal of spent fuel in the 100K Basins at Richland. The 1,607 cases projected in FY 1999 and 1,623 cases funded in FY 1998 have proven inadequate to meet program requirements due to developing programs, accelerated cleanup efforts, and an increase in the number of "L" initial upgrades from National Agency Checks to full-field background investigations based on derogatory information uncovered in the initial review of security forms	4,989	4,940	9,926
■ Perform 10,300 OPM periodic reinvestigations (for Single Scope Background Investigations) in FY 2000. Project 13,800 cases in FY 1999 and conducted 13,848 cases in FY 1998	21,726	21,666	16,454
■ Conduct 3,865 National Agency Checks (NAC's) in FY 2000. Plan to support 5,518 NAC's in FY 1999 and 5,013 NAC's in FY 1998	576	635	444
Total, Office of Personnel Management	27,291	27,241	26,824
Related Security Investigations Activities			
■ Continue operation and maintenance of the Electronic Transfer Program throughout DOE	2,000	2,000	2,400
■ Continue to support Accelerated Access Authorization Program (AAAP)	400	400	400

■ Provide support for miscellaneous costs involved in maintaining a viable personnel security program	260	310	310
Total, Related Security Investigations Activities	2,660	2,710	3,110
Subtotal, Security Investigations	30,000	30,000	30,000
Off-sets from Program Organizations	0	-20,000[a]	-20,000
Total, Security Investigations	10,000	10,000	10,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Federal Bureau of Investigations (FBI)	
■ Federal Bureau of Investigations funding level reflects price increases for provided services	+17
Office of Personnel Management	
■ Initial Office of Personnel Management (OPM) background investigation estimates are based on specific site and contractor needs. Increase is necessary to meet field office requirements, such as the accelerated closure plan at Rocky Flats Environmental Technology Site, accelerated cleanup efforts at Oak Ridge's K-25, Y-12, and Oak Ridge National Laboratory, and the removal of spent fuel in the 100K Basins at Richland	+4,986
■ OPM reinvestigation activities have been reduced in order to meet increased initial investigation requirements. A $20 million off-set from program organizations would be inadequate and additional backlogs could be anticipated	-5,212
■ National Agency Checks are now budgeted for initial "L" clearances only. Changes in the Executive Order 12968 Investigative Standards have revised the reinvestigation requirements for "L" clearances from 5 years to 10 years	-191
Related Security Investigations Activities	
■ Enhance the Electronic Transfer Program to support additional functionality and security features	+400
Total, Security Investigations	0

[a]The Controller's Office notified the Congress that the Department may allocate up to $35 Million from Program Organizations to fund security investigations. It is not known at this time what will actually be spent by each program.

Emergency Management

Program Mission

The Office of Emergency Management serves as the point of contact and control for all Departmental emergency management and threat assessment related activities and ensures an integrated response to emergencies affecting Departmental operations and activities or requiring Departmental assistance. The principal mission of the Office is to provide comprehensive, integrated emergency planning, preparedness, and response programs throughout the Department and to provide threat assessment support to the Department's Headquarter and field operations. The Office operates the Headquarters Emergency Operations Center, Communications Center and the Department's emergency communications network; develops and operates reliable capabilities to detect and assess developing emergency situations and threats; provides rapid credibility assessment of nuclear threats and potential smuggling activities; responds to emergencies; and issues all policy and guidance for the Department's emergency programs. This program also operates the HAZMAT Spill Center, which supports the formulation of emergency management policy for hazardous materials and conducts research in partnership with government and industry.

Program Goal

Support the National Security of the United States by ensuring an integrated Departmental response to all emergencies and assessing the credibility of threats and smuggling activities.

Program Objectives

- Maintain national security and ensure protection of workers, the public, and environment.
- Execute an integrated Departmental program in support of other U.S. Government agencies for combating terrorism and supporting crisis and consequence management to any terrorist act.
- Maintain the capability to provide technical advice and assistance to Departmental elements for cost effective implementation of emergency management programs.
- Develop, maintain, and promulgate policy; planning and preparedness guidance; and readiness assurance activities.

- Assess threats to DOE personnel, operations, and facilities from foreign and domestic adversaries and provide timely reports.
- Assess the credibility of nuclear threats received worldwide as well as support efforts for the prevention of illicit nuclear materials trafficking.
- Operate and maintain the Headquarters Emergency Operations Center, Communications Center and the Department's emergency communications network.
- Provide program management for operations of the HAZMAT Spill Center program.
- Maintain emergency programs to minimize adverse impacts on national security and public safety.
- Promote the Department's emergency policy interests in international fora.
- Support deployment and operational capabilities of nuclear and chemical dispersal models for emergency planning, preparedness and response to situations involving Departmental operations and activities.

Performance Measures

- Demonstrate improvement of a comprehensive management system to ensure effective Departmental response to all DOE emergencies.
- Maintain robust emergency response assets in accordance with Presidential Decision Directive 39, the Atomic Energy act, Executive Order 12656, and Federal Emergency Plans.
- Conduct twelve (12) emergency management system training and technical assistance conferences and workshops.
- Conduct three (3) technical threat awareness and two (2) weapons of mass destruction training courses.
- Conduct six (6) emergency management system technical assistance visits.
- Conduct four (4) evaluations of Department-wide drills and exercises.
- Conduct four (4) appraisals of Departmental emergency programs.
- Conduct thirty five (35) weeks of testing at the HAZMAT Spill Center.

- Provide situation assessments within one (1) hour after identification of a potential emergency.
- Support the increased role and visibility of the Department as a leader in the formulation of National Security related policies for combating terrorism and nuclear materials trafficking.
- Conduct thirty (30) threat assessments.

Significant Accomplishments And Program Shifts

Planning and Preparedness

- Conducted emergency management system appraisals and evaluated Department-wide drills and exercises.
- Increased customer involvement in planning, preparedness, and readiness assurance activities.
- Improved collaborative efforts with Federal, state, tribal and industry entities to prepare for and respond to emergencies involving Departmental operations and activities.
- Continued expansion of the Headquarters emergency operations center voice, data, and video connection to include additional DOE sites and other Federal agencies.

Training and Outreach

- Improved operation of DOE's emergency management system and emergency facilities through technical assistance, and enhanced training and assistance workshops.
- Provided training to the Counter Terrorism Community on national security activities involving weapons of mass destruction.
- Conducted Threat Awareness seminars for DOE, industry, law enforcement, and Intelligence Community.

Response

- Provided situation reports and assessments for developing emergencies.
- Provided assessments of threats to DOE facilities and interests and collaborated with the FBI's National Center for the Analysis of Violent Crime for joint information and data sharing.

- Provided rapid credibility assessment of any nuclear threats involving nuclear weapons, devices or materials, and supported rapid credibility assessment of potential nuclear weapons or materials smuggling activities.

- Provided, through the Atmospheric Release Advisory Capability Program, plume modeling and dispersion for radioactive material and chemical agent releases to the atmosphere.

Counterterrorism

- Provided an annual report on illicit nuclear material transactions.

- Improved support to other U.S. Government agencies in combating nuclear terrorism and providing crisis and consequence management to any terrorist act.

- Continued leadership role of the Department in the formulation of national security related policies for nuclear materials trafficking.

- Built upon and leveraged extensive DOE capabilities and assets to ensure effective emergency response to counter terrorism.

Site Description

Brookhaven National Laboratory

Funding for technical support to the Subcommittee on Consequence Assessment and Protective Actions, which provides technical recommendations on emergency response to radiological and hazardous materials to protect health and safety of workers and the public.

Lawrence Livermore National Laboratory

Funding for nuclear forensics program to develop capability to determine origin of stolen/smuggled nuclear materials and for Atmospheric Release Advisory Capability which provides plume modeling for emergency events, a critical element for protection of workers and public.

Los Alamos National Laboratory

Supports the Emergency Operation Center system, connecting Operations Offices, laboratories, and relevant other Federal agencies by voice, video, and data to ensure cohesive and effective response to emergencies.

Nevada Operations Office

Funding for: threat assessment program, providing a national information resource and capability to assess the credibility of radiological and extortion threats; the HAZMAT Spill Center, a research and demonstration facility available on a user-fee basis to private and public sector test and training sponsors concerned with safety aspects of hazardous materials; and continuing emergency management activities including specialized training for DOE and stakeholders in subject areas such as weapons of mass destruction.

Richland Operations Office

Funding to conduct emergency management training activities to ensure comprehensive response to the spectrum of possible emergencies across the DOE complex.

Pacific Northwest Laboratory

Funding for SPIRE program (Spatial Paradigm for Information Retrieval and Exploration) to apply state-of-the-art analytical tools providing rapid understanding of large textual databases; and for emergency management assistance for technical reviews and appraisals of the Department's emergency management system.

Oak Ridge Operations Office

Funding for technical expert assistance for emergency management system appraisals and training development; for the behavioral assessment program to determine credibility of communicated threats; and for Emergency Management Issues Special Interest Group program, which provides up to date training and information to emergency managers from across DOE complex.

Washington Headquarters

Funding for Emergency Operations Center and Communications Center maintenance and support; support service contractor for Emergency Operations Center and Communications Center; and for maintenance and expansion of communications systems connecting DOE complex and selected other Federal agencies. The Emergency Operations Center and Communications Center are essential for Departmental response to emergencies that may occur at DOE facilities, elsewhere in the United States, and in foreign countries when assistance is requested.

Operating Expenses

Mission Supporting Goals and Objectives

The Office develops and implements specific programs, plans and systems to minimize the impact of emergencies on national security, worker and public safety, and the environment. The Office provides overall coordination and consultation regarding the Department's Emergency Management System, including emergency assistance and mobilization under the Federal Response Plan to radiological and non-radiological hazardous materials events, and in the event of malevolent threats and nuclear materials smuggling. The Office promulgates Departmental requirements and implementing guidance, and conducts readiness assurance activities to ensure an effective emergency management system is in place at Departmental facilities. The Office also coordinates inter-agency and intra-Departmental emergency planning, preparedness and exercises, and coordinates with state and local governments, international agencies, foreign governments, and industry on emergency planning, preparedness and exercise issues.

Another mission area is to identify and assess hostile threats to Departmental facilities, interests and personnel, assess the credibility of nuclear threats received world-wide, and support U.S. Government and allied nations efforts for the prevention of illicit nuclear materials trafficking worldwide. The Office operates and maintains the Headquarters 24-hour per day emergency operations facilities and 24-hour communications center for the collection and processing of information relative to emergency notifications. In addition, the Office is responsible for reporting and support of emergency management activities at the Headquarters level. The Office also implements a security program for the protection of Office information, equipment, and facilities.

To effectively implement its mission, the Office develops and maintains capabilities to efficiently integrate and coordinate a Departmental response to all emergencies. The Office provides liaison and coordination regarding operational emergency response activities, ensuring that the Department responds capably to possible emergency situations that may occur at DOE facilities, elsewhere in the United States, and in foreign countries when assistance is requested. Additionally, the HAZMAT Spill Center provides the DOE community, other governmental agencies, and private sector customers with a unique training, testing, and technical center for hazardous materials research relating to emergency management.

These activities are in support of the Atomic Energy Act of 1954, as amended, Presidential Decision Directives 39, 41, 62, 63, and 67, Executive Orders 12656 and 12919, the Defense Production Act of 1950 as amended, Presidential Review Directive 47, and environment related regulations including the Resource Conservation and Recovery Act, Superfund Amendments and Reauthorization Act of 1986, Comprehensive Environmental Response Compensation and Liability Act, and Clean Air Act Amendments of 1990.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	%Change

	20,000	21,000	21,000	0	0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY1999	FY2000
Emergency Management			
■ Operate nation-wide voice, data, and video link-up of DOE Operations Offices and select National Laboratory emergency operation centers, and expand system to include additional laboratories, DOE sites, and selected Federal agencies. Operate the 24-hour Watch Office and Communications Center.	4,600	4,700	4,700

(dollars in thousands)

	FY 1998	FY1999	FY2000
■ Conduct planning, training and readiness assurance activities to ensure effective implementation of the Department's emergency management system. Provide emergency management, assessment, and threat awareness training, and assistance workshops to Departmental elements, Federal, state, local, and tribal governments, and international community. Develop new training to meet specific needs.	3,300	3,500	3,500
■ Conduct technical assistance visits to assist Departmental elements in determining program weaknesses and cost effective means for making improvements. Evaluate tests and exercises of Departmental programs to demonstrate effective emergency response. Write after-action reports with findings and recommendations for all emergency situations and exercises involving Office of Emergency Management Staff and ensure follow-up of appropriate corrective actions to enhance the emergency management system.	1,900	2,200	2,200
■ Respond to natural and man-made disasters to provide damage assessments and technical assistance to state and local governments and industry in restoration of essential energy services and consequence management. Assist in the preparation of State energy emergency plans and prepare situation reports on energy emergencies for senior Departmental officials.	1,100	0	0
■ Continue to operate the communicated threat assessment program to provide a national capability to assess the credibility of radiological and extortion threats. Continue to strengthen the analytical data base.	3,100	4,000	4,000

(dollars in thousands)

	FY 1998	FY1999	FY2000
■ Provide support to increase the role and visibility of the Department as a leader in the formulation of national security related policies for nuclear materials trafficking and enhance the nuclear materials trafficking hotline. In support of U.S. Government agencies, maintain data on the flow and composition of nuclear smuggling focusing on the quality of smuggled material, the source of the material, and the intended use of the smuggled material. Enhance operational capability for response to situations to obtain samples of intercepted materials.	700	900	900
■ Strengthen and expand the Department's support for crisis and consequence management in combating terrorism and nuclear material trafficking. Initiate a program in support of interagency and Departmental exercises to ensure adequate and comprehensive response to counter terrorism.	1,200	1,300	1,300
■ Expand and integrate the Atmospheric Release Advisory Capability (ARAC) plume modeling for chemical and hazardous materials releases involving Departmental activities.	600	600	600

	(dollars in thousands)		
	FY 1998	FY1999	FY2000
HAZMAT Spill Center			
■ Continue user-sponsored spill tests for both government and industry at the HAZMAT Spill Center; provide spill test results to Departmental elements, other government agencies, industry and the general public for use in hazards mitigation and emergency responder training programs	1,500	1,500	1,500
Emergency Operations Support Service Contract			
■ Staff the 24-hour Watch Office and Communications Center.	2,000	2,300	2,300
Total, Emergency Management	20,000	21,000	21,000

HEU Transparency Implementation

Program Mission

The Highly Enriched Uranium (HEU) Transparency Implementation program is responsible for ensuring that the nonproliferation aspects of the February 1993 agreement between the United States and the Russian Federation are met. This Agreement covers the purchase over 20 years of low enriched uranium (LEU) derived from at least 500 metric tons of HEU removed from dismantled Russian nuclear weapons. Under the Agreement, conversion of the HEU components into LEU is performed in Russian facilities. The purpose of the program is to put into place those measures agreed to by both sides, that permits the U.S. to have confidence that the Russian side is abiding by the Agreement.

Program Goal

- The goal of the HEU Transparency Implementation Program is to support the implementation of United States nonproliferation policy by providing confidence that Russian LEU sold to the United States Enrichment Corporation (USEC) is derived from HEU removed from dismantled Russian nuclear weapons.

Program Objectives

- Implement and support transparency monitoring activities in Russia and the United States at each country's uranium processing facilities subject to the Agreement.
- Collect and analyze monitoring and other information to determine overall confidence that the Russians are converting HEU from dismantled Russian nuclear weapons into LEU.
- Provide assistance in the development and negotiating of new transparency measures.

Performance Measures

- Monitor the dilution of 30 metric tons of HEU to LEU from dismantled Russian nuclear weapons for purchase by the USEC.
- Conduct 24 special monitoring inspections in Russian facilities and maintain permanent presence offices in Russia to have confidence that the LEU being purchased by USEC has been derived from HEU removed from dismantled Russian nuclear weapons.
- Maintain the UF6 flow and enrichment measurement nondestructive assay (NDA) systems at the blend points at two Russian HEU dilution facilities. Collect and analyze resultant information from both sites where such equipment will have been installed.

- In conjunction with interagency staff, compile and analyze collected data and information into an assessment of confidence of compliance with the nonproliferation objectives of the HEU agreement.

Significant Accomplishments and Program Shifts

Program Shifts

In October 1998, as part of the Office of International Nuclear Safety and Cooperation, the HEU Transparency Implementation Program was moved to the Office of Nonproliferation and National Security (NN). Additionally, the budget request for the Program was moved to Other Defense Activities for FY 2000. Previously, the Program had been funded as part of Uranium Programs. This document represents the first stand-alone funding request for the HEU Transparency Implementation Program.

Historical and Planned Accomplishments

HEU Transparency Implementation activities began in FY 1993 as a result of wording contained in the February 1993 bilateral HEU Purchase Agreement. Significant historical and planned accomplishments are provided below.

- Provided technical, logistical, and document preparation support for various bilateral negotiation meetings resulting in the bilateral signing of a Memorandum of Understanding on Transparency (1993), a Protocol on HEU Transparency Arrangements in Furtherance of the Memorandum of Understanding (1994), and 16 Annexes to the Protocol governing transparency monitoring activities in both Russia and the U.S. (1994-1997).

- Conducted six familiarization visits (1993-1997) to four Russian sites where HEU is stored and processed into LEU for delivery to the U.S.

- FY 1995 through FY 1997 conducted 10 special monitoring visits to three Russian sites. During FY 1998 conducted 13 special monitoring visits to four Russian sites. In FY 1999, plans are to conduct 24 special monitoring trips to four Russian sites. In FY 2000, plans are to conduct 24 special monitoring trips to four Russian sites.

- In August 1996, opened a permanent U.S. monitoring office in Novouralsk, Russia. The office has a staff of up to four U.S. technical experts. In FY 1999, plans are to include permanent presence staff as members of special monitoring visit teams. A permanent presence office will be maintained in Russia in FY 2000..

- FY 1995-FY 1997 developed non-intrusive NDA flow and enrichment monitoring equipment for use on process pipes in the three Russian blending facilities. During FY 1997 conducted five technical installation visits to two Russian blending facilities and installed the electronic control units at the blend points. FY 1997-FY 1998 fabricated the flow and enrichment measuring systems for the two facilities and prepared necessary documentation required to obtain a Russian license to allow the equipment to be installed in Russian facilities. During FY 1998, demonstrated at the Paducah

Gaseous Diffusion Plant that the monitoring equipment will work on pipes with 1.5 percent UF6 gas flow. Plans are to install the equipment in one Russian blending facility in FY 1998-FY 1999 and a second facility in FY 1999. Installation at a third facility will be delayed until after FY 2000 due to budget constraints.

- FY 1995 started data analysis activities to evaluate confidence that the Russians are abiding by the Agreement. During FY 1997 determined through data analysis that the contents of one container of Russian LEU shipped to USEC did not appear to be derived from Russian HEU. Subsequent discussions with the Russian Government during FY 1997 and FY 1998 led to the exclusion of this container from the HEU Purchase Agreement deliveries.

- FY 1998 developed a centralized data base and the formation of two assessment teams to evaluate confidence that the Russians are taking HEU from dismantled nuclear weapons and converting it into LEU. Actual accountability and material transfer documents from the Russian facilities are now available for evaluation in conjunction with first-hand monitoring data. In FY 1999 expand access to centralized data base to enhance analysis of data.

Site Description

Argonne National Laboratory

Argonne National Laboratory (ANL) is one of DOE's largest research centers. It is also the nation's first national laboratory chartered in 1946. Argonne occupies two sites. The Illinois site is surrounded by forest preserve about 25 miles southwest of Chicago's Loop. Argonne West site occupies about 900 acres about 50 miles west of Idaho Falls in the Snake River Valley. Argonne also maintains offices in the Washington, D.C. metropolitan area. ANL provides the HEU Transparency Implementation program with technical experts to serve as monitors on trips to Russian facilities involved in the conversion of HEU into LEU; technical assistance in the coordination of monitoring activities in Russia; and, in data analysis and confidence assessment of information gathered from monitoring activities.

Brookhaven National Laboratory

Brookhaven National Laboratory (BNL) is a DOE scientific research laboratory located on Long Island, New York. BNL provides the HEU Transparency Implementation program with personnel to serve as monitors on trips to Russian facilities involved in the conversion of HEU into LEU and technical personnel to assist in the analysis of information received from monitoring activities in Russia.

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL) is a DOE weapons laboratory located in Los Alamos, New Mexico. LANL provides the HEU Transparency Implementation program with non-intrusive nondestructive assay equipment for measuring the enrichment of uranium hexaflouride gas in pipes. This equipment is scheduled to be installed in one Russian HEU dilution facility at the end of FY 1998, a second facility in FY 1999, and a third facility after FY 2000 at the current FY 2000 funding level. The equipment once installed will provide continuous monitoring of the enrichment flowing through the pipes. This information will provide high confidence that the Russians are diluting HEU with low enriched uranium to produce reactor grade LEU for shipment to the United States. LANL personnel are also used to prepare technical manuals related to the assembly, operation, and maintenance of the enrichment measurement equipment; training of both Russian and U.S. personnel on the installation, operation and maintenance of the equipment; and, assistance in installing the equipment on the pipes in the Russian facilities. LANL equipment experts are also used as monitors on trips to Russia to ensure that the monitoring equipment is operating properly and as special monitors at weapon component conversion facilities.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory (LLNL) is a DOE weapons laboratory located in Livermore, California and has offices in the Washington, D.C. metropolitan area. LLNL provides to the HEU Transparency Implementation program technical personnel to serve as U.S. monitors to Russian

facilities where HEU is converted into LEU; overall coordination for all U.S. monitoring trips; coordination of training courses for personnel to serve as monitors; health and safety monitoring of all personnel serving on trips to Russia, procurement, maintenance, and technical troubleshooting for hand held nondestructive analysis equipment used for measuring the enrichment of uranium in Russian containers; and, the collection and analyses for all information obtained from monitoring activities to determine the confidence levels that the Russians are abiding by the agreement; provides logistical and technical support for the bilateral Transparency Review Committee meetings, and provides technical support at meetings dealing with transparency issues. They also provide technical support and expertise on the U.S. Portsmouth GDP and commercial reactor fuel fabrication facilities, subject to the Agreement.

Lockheed Martin Energy Systems (LMES)

Lockheed Martin Energy Systems (LMES) is a DOE contractor with personnel at Y-12 and the Oak Ridge National Laboratory (ORNL) located in Oak Ridge, Tennessee. LMES also provides funding for Lockheed Martin Utility Services personnel at the Portsmouth Gaseous Diffusion Plant located in Piketon, Ohio, and the Paducah Gaseous Diffusion Plant located in Paducah, Kentucky. LMES/LMUS provides technical personnel to serve as U.S. monitors to Russian facilities where HEU is converted into LEU and as permanent presence monitors at the UEIE facility. LMES personnel participate in the training of personnel to serve as monitors and host and conduct training classes at the Y-12 plant. ORNL personnel developed non-intrusive nondestructive assay equipment for measuring the flow of uranium hexafluoride gas in the blending pipes. They are also responsible for the development, procurement, preparation of technical manuals, training of Russian and U.S. personnel, shipment of equipment, licensing in Russia, and installation of non-intrusive flow and enrichment measurement equipment on pipes in the Russian HEU dilution facilities; assistance in the analysis confidence assessment of information obtained from monitoring activities in Russia; and, assistance in hosting Russian monitoring visits to the Paducah and Portsmouth Gaseous Diffusion Plants. They also developed a demonstration test stand for the Flow and Enrichment measurement system and had the system licensed and installed at Paducah to demonstrate the operability and sensitivity of the equipment to be installed in the Russian facilities.

New Brunswick Laboratory

New Brunswick Laboratory (NBL) is a totally owned DOE lab staffed with Federal employees. NBL provides technical experts to serve as monitors on trips to Russian facilities involved in the conversion of HEU into LEU. Being Federal employees, NBL personnel serve as Team Leaders and Heads of Delegation for groups conducting HEU Transparency monitoring activities at facilities in Russia.

Oakland Operations Office

DOE's Oakland Operations Office (OAK) has offices in Berkeley and Livermore, California. Personnel at the Livermore, California office provide contract procurement and administrative oversight on contracts providing logistical and other services to U.S. monitors while conducting monitoring activities in Russia. Specifically, OAK oversees and funds a contract with the Pragma Corporation in McLean, Virginia that provides direct support through the American Business Center in Yekaterinburg, Russia,

for U.S. personnel assigned to a permanent monitoring office at Novouralsk, Russia; assistance as needed for U.S. personnel serving on special monitoring visits to Russian processing facilities; and transfer of funds to Russian facilities for reimbursable expenses associated with monitoring activities, including the installation of flow and enrichment equipment on the pipes in the Russian dilution facilities.

Oak Ridge Operations Office

DOE's Oak Ridge Operations Office (ORO) located in Oak Ridge, Tennessee, maintains and provides services as required under the bilateral transparency agreements for a permanent Russian monitoring office inside the secure area at the Portsmouth Gaseous Diffusion Plant and provides support to Russian monitors conducting monitoring activities at the Portsmouth plant. They also provide technical personnel to serve as U.S. monitors to Russian facilities where HEU is converted to LEU.

Pacific Northwest National Laboratory

The Pacific Northwest National Laboratory (PNNL) is a DOE research laboratory located in Richland, Washington. PNNL has provided technical expertise to evaluate the applicability of advance flow technology equipment for use in Russia. PNNL also provides funding for travel costs for a PNNL employee based in Oak Ridge, Tennessee who serves as a technical expert on monitoring trips to Russian facilities involved in HEU to LEU conversion. The PNNL expert also participates in meetings associated with the analysis and confidence assessment of information obtained from monitoring activities.

Remote Sensing Laboratory

The Remote Sensing Laboratory (RSL) is a DOE laboratory located in Las Vegas, Nevada, and has offices in the Washington, DC metropolitan area. RSL provides technical experts to serve as monitors on trips to Russian facilities involved in the conversion of HEU into LEU.

Sandia National Laboratory New Mexico

Sandia National Laboratory is a DOE weapons research laboratory with facilities in Livermore, California and Albuquerque, New Mexico (SNL). SNL provides technical experts to serve as monitors on trips to Russian facilities involved in the conversion of HEU into low enriched uranium (LEU); provides for the procurement, installation, replacement, and disposal of radioactive sources required for operating the flow and enrichment monitoring equipment to be installed in the Russian HEU dilution facilities; construction of secure housings for the enrichment monitoring equipment developed by the LANL; acts as an adviser on appropriate tamper indicating devices to ensure U.S. equipment, in Russian facilities, is not unknowingly compromised; and, coordinates Russian visits to the United States for discussions related to use of U.S. monitoring equipment in Russian facilities and Russian visits to U.S. facilities subject to Russian monitoring activities.

Highly Enriched Uranium (HEU) Transparency Implementation

Mission Supporting Goals and Objectives

- *Provide support to U S facilities subject to Russian monitoring* - Under the terms of the Transparency agreements the Russian Federation may conduct monitoring visits to the Portsmouth Gaseous Diffusion Plant (PGDP) and to the five U.S. nuclear fuel fabricators that process material received from Russia subject to the Agreement. Support includes conducting pre-Russian visit trips; preparation of summary reports tracking HEU from Russia through U.S. facilities; providing interpreters for the visits; and maintaining a permanent Russian monitoring office at the Portsmouth plant.

- *Assist Russian personnel while in the U.S.* - Russia has the right to conduct up to 10 five-day monitoring trips to the U.S. nuclear fuel fabricators each year and up to six visits to the Portsmouth Gaseous Diffusion Plant each year. Additionally, Russia may have up to four individuals staff a permanent monitoring office at the Portsmouth plant. Support includes providing escorts while the Russians are in the U.S. to answer questions, and provide miscellaneous assistance as requested.

- *Conducting both special and permanent monitoring activities in Russian facilities* - Russian processing of HEU into LEU is being conducted at five processing plants located at four sites. Existing agreements permit the U.S. to conduct up to six special monitoring visits at each site and to have a permanent presence office at three Russian facilities. During FY 1998, one U.S. permanent presence office was maintained at the Ural Electrochemical Integrated Enterprise (UEIE) in Novouralsk, Russia. Activities include maintaining a pool of 200 technical experts that can serve as monitors; training of U.S. personnel serving as monitors, team leaders, and technical installers; coordinating trips to Russia; monitoring personnel's health; and providing necessary monitoring equipment.

- *Perform analysis and confidence assessments* - Collect, analyze, and evaluate all monitoring information and information from other sources to a confidence assessment of Russian compliance with the Agreement.

- *Develop new transparency measures* - Evaluate the effectiveness of existing monitoring activities, develop improved measures, and implement improvements as appropriate. Develop, fabricate, and install and use special monitoring nondestructive assay instruments to fulfill monitoring objectives.

- *Provide support in the development and negotiation of Transparency agreements including providing representation activities* - The addition of new Russian facilities requires the development and negotiation of facility specific agreements governing monitoring activities at those facilities. Problems and differences of opinion in existing monitoring agreements necessitate development of new language and negotiation strategies. The Transparency program personnel provide recommendations on draft language, proposes negotiation strategies, and provide technical and logistical support at bilateral meetings. Interagency coordination of strategies and implementing details is included in this activity.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Russian Monitoring in the U.S.	0	0	1,000	1,000	>999
Technical Support, Management, Health, Data Analysis, Confidence Assessment	0	0	3,500	3,500	>999
Permanent Monitoring Office in Russia	0	0	4,265	4,265	>999
Special Monitoring Visits to Russia	0	0	4,135	4,135	>999
Monitoring Equipment	0	0	2,850	2,850	>999
Total, HEU Transparency Implementation	0[1]	0[a]	15,750	15,750	>999

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Russian Monitoring in the U.S.			
■ Portsmouth PPO Support	0	0	500
■ U.S. Nuclear Fuel Fabricator Support	0	0	250
■ Assistance to Russians during monitoring visit	0	0	250
Total, Russian Monitoring in the U.S.	0	0	1,000

Total, Monitoring Equipment	0	0	2,850
Total HEU Transparency	0	0	15,750

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Program transferred from the Uranium Programs budget	13,600
Increased permanent presence office staff	940
Develop equipment for SCH	560
Increased cost of Russian monitoring visits	650
Total Funding Change, HEU Transparency Implementation	15,750

International Nuclear Safety

Program Mission

The International Nuclear Safety and Cooperation activity is a major component of the Department's nuclear safety and national security mission. It is designed to reduce the national security and environmental threats posed by the operation of unsafe nuclear facilities worldwide, especially Soviet-designed plants, and assists the host countries to implement a self-sustaining nuclear safety improvement program capable of reaching internationally accepted safety practices. The activity supports international nuclear safety cooperation, including participation with international nuclear safety organizations. In this context, it addresses safety and environmental protection issues associated with nuclear materials facilities in the former Soviet Union. This activity originated from U.S. commitments made at the 1992 G-7 Summit to help reduce the risks associated with the continued operation of Soviet-designed reactors.

The 1986 disaster at the Chornobyl nuclear power plant revealed many flaws in the Soviet approach to nuclear power. The reactors and nuclear infrastructures left behind by the Soviet government continue to operate in nine countries. These reactors, including one that still operates at the Chornobyl site, suffer from deficiencies in training, safety procedures, and safety infrastructure. Some problems have been exacerbated by the breakup of the Soviet Union--equipment shortages are commonplace and many nuclear professionals suffer from low or erratic pay. These conditions are in addition to and exacerbated by serious flaws in the designs of some of the reactors. If not corrected, these conditions pose a continued risk of a reactor accident in Ukraine, Russia, Armenia, Kazakhstan, Lithuania, Slovakia, Czech Republic, Hungary and Bulgaria.

If another major nuclear accident occurred, the United States and the international community would be forced to deal with the political, economic and environmental destabilization of politically sensitive regions. This concern led the U. S. Government to conclude that enhancing the safety of Soviet-era nuclear reactors and establishing improved safety infrastructures in the countries that operate them is a vital national security interest of the United States. The U. S. and other Western countries have the technologies and skills to work with these nations to address nuclear safety challenges with a relatively modest investment. Rather than providing billions of dollars in foreign aid to correct all of the problems directly, the safety program helps the host countries structure their nuclear industry to address safety issues, to prevent accidents, and, as their economies improve, to increase their own funding for nuclear safety. These activities are essential to preserving these emerging, democratic, free market economies.

While serving an immediate, national security need, the program also: (1) provides an entry for U.S. industry into the economies of the host countries, which could lead to significant business opportunities in the future; and (2) addresses nuclear safety issues which, if not dealt with, could further erode public confidence in nuclear energy in the United States and other countries. In addition, the program reduces the likelihood of a nuclear accident that could adversely affect our allies and friendly countries in Europe, as well as U.S. military and civilian personnel in these countries.

Nuclear cooperation also provides opportunities for U.S. corporations to make their expertise and capabilities known to other counties, both those needing to upgrade their level of safety and those advanced countries that have their own international nuclear safety programs. Finally, the nuclear cooperation program provides opportunities to encourage other countries to support U.S. nuclear nonproliferation objectives and policies.

Program Goal

- The goal is to reduce the national security and environmental risks of nuclear power plants and nuclear facilities worldwide, especially Soviet-designed reactors, and to assist the host countries to implement self-sustaining nuclear safety improvement programs capable of reaching internationally accepted safety practices. The program supports international nuclear safety cooperation through project activities in host countries and through participation with international nuclear safety organizations. Project activities are focused to address the most significant safety issues in selected countries, including primarily those with Soviet-designed reactors.

Program Objectives

- A primary objective is to reduce risks at the 65 remaining Soviet-designed nuclear power plants and to assist the 9 host countries to implement self-sustaining nuclear safety improvement programs capable of reaching internationally accepted safety practices without encouraging long-term operation of RBMK and VVER-440/230 type plants.

- A complementary objective is to facilitate cooperation in nuclear safety worldwide. This includes participation with international nuclear safety organizations such as the International Atomic Energy Agency (IAEA), the European Bank for Reconstruction and Development (EBRD) (Nuclear Safety Account) and the Nuclear Energy Agency (NEA) of the Organization of Economic Cooperation and Development (OECD). Activities emphasize improving safety, including multi-lateral cooperation on the safety of Soviet-designed reactors, the socioeconomic aspects of reactor shutdown, and the environmental aspects associated with nuclear materials, including the effects of the Chornobyl accident, and establishing safety-based nuclear infrastructures, including bilateral cooperation on nuclear safety and environmental centers.

- Another complementary objective is to reduce the nuclear danger associated with the facilities for the treatment, storage and disposition of highly enriched uranium and plutonium derived from various origins, including dismantled warheads, as directed in the FY 1999 National Defense Authorization Act.

- The program also assists other Federal agencies that carry out related activities such as the cessation of weapons grade plutonium production in Russia and a variety of projects supporting shutdown of the Chornobyl nuclear power plant and improvement of the nuclear power infrastructure in Ukraine.

Performance Measures

Activities are divided into key technical areas as follows: management and operational safety projects, engineering and technology projects, plant safety assessments, fuel cycle safety projects, nuclear regulatory and institutional framework projects, and Chornobyl initiatives. Advancements are needed in each of these areas to improve safety in the host countries. The technical areas were selected based upon the results of IAEA studies that summarize and prioritize hazards at Soviet-designed plants. The selection criteria for projects in these technical areas address: priority of safety needs; cost-effectiveness; and host-country commitment to ensure sustainability after U.S. support ends. In addition, work is selected in coordination with other bilateral and internationally sponsored safety programs to ensure U.S. projects complement activities undertaken by others. End point criteria for each specific technical area have been established to ensure that program activities are aimed toward a defined and successful completion.

The following significant accomplishments are planned for completion in FY2000 and will be used to measure performance:

- Complete full-scope simulator for Russia's Kalinin plant unit 1, and Ukraine's South Ukraine unit 3. Complete Slovakia's Trnava Training Center full scope simulator upgrade.
- Complete safety parameter display system at Russia's Kursk plant unit 3, and at Ukraine's South Ukraine plant unit 2, Rivne plant unit 3, Zaporizhzhya plant unit 3, and Armenia's plant unit 2.
- Complete in-depth safety assessment at Russia's Novovoronezh plant.
- Complete implementation of a configuration management program at Russia's Balakovo plant and at Ukraine's Zaporizhzhya plant.
- Complete implementation of event analysis and reporting program at Ukraine's Zaporizhzhya plant.
- Complete transferring training methodology, including implementation of highest priority courses, at all plants in Russia, Ukraine, Lithuania, Bulgaria, and Armenia.
- Complete improvements in nondestructive examination in-service inspection and safety maintenance technology transfer to the Armenia plant and to plants in Russia and Ukraine.
- Complete implementation of a reliability database in Russia and Ukraine for use by all plants in those countries.
- Complete control and protection system upgrade at Lithuania's Ignalina plant unit 2.
- Complete first safety analysis joint projects with international nuclear safety center in Russia.

- Identify and initiate technology transfer and cooperative project activities at environmental centers in the U.S. and Russia.

- Conduct initial nuclear materials safety activities in Russia: training, joint program plan, materials safety masters degree program, and initial safety assessments.

- Complete an in-depth safety assessment at Russia's Leningrad plant.

Significant Accomplishments and Program Shifts

- In October 1998, the Department of Energy transferred the Office of International Nuclear Safety and Cooperation to the Office of Nonproliferation and National Security (NN).

- The Office has the same mission, and also addresses the safety of Russian materials facilities, and coordinates and cooperates on nuclear safety worldwide.

- Numerous projects have been completed and safety has been improved at plants in eight countries with Soviet-designed nuclear power plants. Many of the projects have reduced risks immediately by decreasing the likelihood of equipment malfunction and operator error. Others promote safety in the long-term by improving technical skills and fostering a culture in which safety is the top priority. Specific accomplishments include:

  - Nuclear training centers were established at the Balakovo site in Russia and the Khmelnytskyy plant in Ukraine. U.S.-trained instructors have in turn trained more than 3,000 workers on maintenance, operations, and employee safety.

  - Simulator projects have been completed for training reactor operators: Khmelnytskyy unit 1 full scope simulator; Novovoronezh unit 3 analytical simulator; Chornobyl unit 3 analytical simulator. These simulators are critical for training plant personnel to operate the reactors safely.

  - Projects have been completed to improve safety procedures and practices for quality assurance, configuration management, event analysis and reporting, emergency operating instructions, safety maintenance, and nondestructive examination. More than 200 staff members from 14 nuclear reactor sites in Russia, Ukraine, Armenia, Lithuania, Slovakia, Czech Republic, Hungary and Bulgaria have worked with personnel at 12 U.S. nuclear power plants. U.S. specialists transferred technology for developing symptom-based emergency operating instructions to pilot plants in these countries. Symptom-based instructions enable control room operators to stabilize a reactor quickly during an abnormal event. Pipe lathe/weld preparation machines were provided to the five plants with RBMK reactors, enabling workers to cut and replace flawed pipes with precision. Previously, workers cut pipes by hand, increasing the difficulty of welding in a new pipe and thus the risk of subsequent leaks that could lead to a loss-of-coolant accident. Equipment for valve-seat resurfacing, vibration monitoring and shaft alignment, and nondestructive examination was provided also.

- Fire safety equipment was provided to plants in Armenia, Ukraine, Russia and Bulgaria. Russia's Kola and Kursk plants and Bulgaria's Kozloduy plant received backup power systems for emergency shutdowns. Russia's Kursk and Novovoronezh plants have received a mobile pumping unit for emergency water supplies. With U.S. support, Kola personnel have reduced leaks in the radiation confinement system. Bulgaria's Kozloduy plant received thermal imaging hardware that identifies "hot spots" in the plant's electrical system. U.S. and host country experts have defined methodologies for conducting fire hazards analysis at Soviet-designed reactors, and pilot analyses are under way at Russia's Smolensk plant and Ukraine's Zaporizhzhya plant. After U.S. training, companies in Ukraine and in Russia developed the capability to manufacture fire doors that meet international standards.

- Safety Parameter Display Systems (SPDS) enable control room operators to assess abnormal conditions rapidly and take corrective actions. SPDS projects have been completed at Kursk unit 2; Novovoronezh units 3 and 4; Chornobyl unit 3; Khmelnytskyy unit 1, Zaporizhzhya unit 5, and South Ukraine unit 1.

- Computer analysis codes and methodologies were transferred to host-country specialists to assess plant safety and set priorities for safety upgrades. Plant analyzers were provided for Bulgaria's Kozloduy plant and for Lithuania's Ignalina plant. International nuclear safety centers in the U.S. and Russia have been established to sponsor projects to improve information sharing and safety improvement.

- At Ukraine's Zaporizhzhya plant, cooling ponds for storing spent fuel rods are nearly full. The Program delivered equipment and trained personnel to build and regulate a safe, modern dry-cask storage system. The system will reduce the need to send spent fuel to Russia for reprocessing, which will alleviate national security concerns, and still allow the plant to operate.

- U.S. and Ukrainian specialists established the International Chornobyl Center for Nuclear Safety, Radioactive Waste and Radioecology in the town of Slavutich, near Chornobyl, to support projects in data analysis, spent fuel management, and reactor closure. Projects have been completed at Chornobyl's operational unit 3 reactor to improve training, safety maintenance, fire protection, and procedures for safer operations.

Funding Profile

(dollars in thousands)

	FY 1998 Appropriation	FY 1999 Appropriation	FY 2000 Request
International Nuclear Safety	70,000	30,000	34,000
Total, International Nuclear Safety [a]	70,000	30,000	34,000

Funding by Site

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Richland Operations Office					
Pacific Northwest National Laboratory	61,500	23,000	25,450	2,450	10.6%
Chicago Operations Office					
Argonne National Laboratory	5,100	4,600	6,050	1,450	31.5%

[a] Total includes funding that the program received from AID for nuclear safety and cooperation activities for Ukraine and Armenia in FY1998 ($35 million). Total excludes funding that the program may receive from AID for nuclear safety and cooperation activities in Ukraine and Armenia in FY 1999 and FY 2000.

[b] Funding provided to Department of Energy Headquarters, support offices in Paris and Tokyo, other laboratories and miscellaneous contractors.

Site Description

Pacific Northwest National Laboratory

The Pacific Northwest National Laboratory (PNNL) is one of the U.S. Department of Energy's multi-program national laboratories. PNNL is the lead laboratory for the Soviet-designed reactor safety activities. Staff at PNNL provides management, technical, contracting, and administrative support to the program in the areas of Soviet-designed reactor safety and international cooperation.

Argonne National Laboratory

Argonne National Laboratory (ANL) is one of DOE's largest research centers. It is also the nation's first national laboratory chartered in 1946. Argonne occupies two sites. The Illinois site is surrounded by forest preserve about 25 miles southwest of Chicago's Loop. The Argonne West site occupies about 900 acres about 50 miles west of Idaho Falls in the Snake River Valley. Argonne also maintains offices in the Washington, D.C. metropolitan area. ANL oversees the nuclear plant in-depth safety analyses and international nuclear safety center portions of the program.

Brookhaven National Laboratory

Brookhaven National Laboratory (BNL) is a DOE scientific research laboratory located on Long Island, New York. BNL oversees simulator installation and training program implementation.

International Nuclear Safety

Mission Supporting Goals and Objectives

Specific activities at Soviet-designed nuclear power plants and facilities supporting the goals and objectives are described below.

Objectives will be achieved through completion of a series of joint U.S./host country projects in which U.S. technology, equipment, methods and experience are transferred in the areas of training and simulators, operating and emergency procedures, safety maintenance, safety system upgrades, fire safety, reactor safety analysis, and regulatory improvement. U.S. studies show that operator error is a significant factor in nuclear accidents. Most of the projects, especially emergency operating instructions, training, simulators, and safety parameter display systems (SPDS), directly support improving the capability of operators. More than 200 individual projects have been initiated with the participation of 20 Soviet-designed plant sites and include the participation of 46 U.S. commercial companies to provide equipment and technical expertise.

Nuclear training centers have been established at the Balakovo site in Russia and the Khmelnytskyy plant in Ukraine. U.S.-trained instructors have trained more than 3,000 workers. Instructors developed and conducted job-specific maintenance and operations courses, along with courses in employee safety and supervisory skills. These instructors will work with U.S. experts to transfer the training methodology and materials to other plants in Russia, Ukraine, and other countries with Soviet-designed reactors.

Simulator projects have been completed for training reactor operators: Khmelnytskyy unit 1 full scope simulator; and Novovoronezh unit 3 and Chornobyl unit 3 analytical simulators. Additional simulator projects are in progress at:

- Kola unit 4 full scope simulator; Balakovo unit 4 analytical simulator and full scope simulator upgrade; Kalinin unit 2 full scope simulator; Bilibino analytical simulator
- South Ukraine units 1 and 3 full scope simulators; Rivne unit 3 full scope simulator; Zaporizhzhya unit 1 full scope simulator and unit 5 full scope simulator upgrade
- Trnava training center full scope simulator upgrade

Follow-on activities after completion of simulators include: maintenance and support for initial simulator operations; modification of a simulator to include SPDS capability; and provision of simulator training materials.

Management and operational safety is improved by projects at pilot plants to develop modern safety procedures and practices for quality assurance, configuration management, event analysis and reporting, emergency operating instructions, safety maintenance, nondestructive examination, and use of a reliability database to prioritize activities. More than 200 staff members from 14 nuclear reactor sites in Russia, Ukraine, and Central and Eastern European countries have worked with personnel at 12 U.S.

nuclear power plants. U.S. specialists transferred skills for developing symptom-based emergency operating instructions to pilot plants in Ukraine, Russia, and Central and Eastern Europe. Symptom-based instructions enable control room operators to stabilize a reactor quickly during an abnormal event. Pipe lathe/weld preparation machines were provided to the five plants with RBMK reactors. Previously, workers cut pipes by hand, increasing the difficulty of welding in a new pipe and thus the risk of subsequent leaks that could lead to a loss-of-coolant accident. Valve-seat resurfacing equipment, vibration monitoring and shaft alignment systems and nondestructive examination equipment also were provided

SPDS's enable control room operators to assess abnormal conditions rapidly and take corrective actions. SPDS projects have been completed: Kursk unit 2; Novovoronezh units 3 and 4; Chornobyl unit 3; Khmelnytskyy unit 1; Zaporizhzhya unit 5; South Ukraine unit 1. SPDS projects are underway at:

- Kursk units 3 and 4; Leningrad units 3 and 4; Smolensk units 2 and 3
- South Ukraine unit 2; Zaporizhzhya units 1, 2, 3, 4 and 6
- Armenia unit 2.

SPDS projects are planned for South Ukraine unit 3; Rivne unit 3; Leningrad unit 2; and Smolensk unit 1.

Fire safety and other hardware upgrades are provided to selected plants. Equipment was provided to plants in Armenia, Ukraine, Russia and Bulgaria. Russia's Kola and Kursk plants and Bulgaria's Kozloduy plant received backup power systems to supply electricity during emergency shutdowns. Russia's Kursk plant and Novovoronezh plant received mobile pumping units for emergency water supplies. With U.S. support, Kola personnel substantially reduced leaks in the radiation confinement system. Bulgaria's Kozloduy plant received thermal imaging hardware that identifies "hot spots" in the plant's electrical system. U.S. and host country experts have defined methodologies for conducting fire hazards analyses at Soviet-designed reactors, and pilot analyses are under way at Russia's Smolensk plant and Ukraine's Zaporizhzhya plant. After U.S. training, companies in Ukraine and in Russia have manufactured more than 800 fire doors that meet international standards. The doors are for four plants. Safety upgrades are planned for the three Russian plutonium production reactors once they are converted to civilian operations.

Safety analysis activities and safety assessment infrastructure projects will be provided to selected plants. In-depth safety assessments (ISA) are conducted to determine the most significant risks and set priorities for safety upgrades. ISA projects are in progress at:

- Kola units 1, 2 and 4; Kursk unit 1; Leningrad unit 2; Novovoronezh units 3 and 4
- Zaporizhzhya plant; Rivne plant; Khmelnytskyy plant; South Ukraine plant

Computer analysis codes and methodologies are transferred to host-country specialists to assess plant safety, identify risks, and set priorities for safety upgrades. Plant analyzers were provided to Bulgaria's Kozloduy plant and to Lithuania's Ignalina plant. International nuclear safety centers were established in the U.S. and Russia to sponsor projects to improve information sharing and safety improvements

through prompt analysis of potential safety problems. The centers provide a repository of nuclear safety information and maintain a core knowledge base through shared information and leveraged funding through joint projects. Several projects are underway. Companion centers are planned in other countries, such as Kazakhstan.

At the Zaporizhzhya plant in Ukraine, cooling ponds for storing spent fuel rods are nearly full. The U.S. has delivered equipment and trained Ukrainian personnel to build and regulate a safe, modern dry-cask storage system. The system will reduce the need to send spent fuel to Russia for reprocessing, which will alleviate national security concerns, while still allowing the plant to operate.

The program has reduced risks at Chornobyl's operational unit 3 reactor with projects on training, safety maintenance, and fire protection. U.S. and Ukrainian specialists established the Chornobyl Center for Nuclear Safety, Radioactive Waste and Radioecology in the town of Slavutich, near Chornobyl. The Center provides technical support to the Ukrainian nuclear power industry and serves as a focal point for international cooperation at Chornobyl. Joint projects in data analysis, spent fuel management, and reactor closure are under way. The plan is for the Center to continue operations on its own after it is fully established.

Nuclear safety regulatory and legislative support is planned for several countries, including Russia and Ukraine, in order to develop a strong and independent regulatory infrastructure in the area of nuclear facilities. Support includes topical workshops and development of technical standards.

Projects are planned to support the restructuring and commercialization of the nuclear industries so that, as economies improve, there will be increased revenues available for nuclear safety upgrades.

The Office supports representation at IAEA, EBRD, and NEA activities. Activities include representation at coordinating committees (e.g., Japan, European Commission, Korea, China), workshops, student exchanges, and support of cooperation offices for U.S. personnel in Paris and Tokyo. Activities will provide technical cooperation and support on a variety of nuclear safety topics to improve safety or to address the environmental aspects associated with nuclear materials from power plants, submarines, and other nuclear facilities. Activities address decommissioning and the effects of the Chornobyl accident.

Activities include establishing international environmental safety centers in the U.S. and Russia. The centers will develop and maintain the infrastructure necessary to manage nuclear facility cleanup, facility conversion to other uses, and waste disposition; and to develop and implement specific environmental safety projects. The centers will be established based on the existing DOE-supported international nuclear safety center model. The centers will focus on cooperative activities to mitigate the environmental effects of our respective defense and civil nuclear programs while contributing to the redeployment of Russian scientists. Addressing critical nuclear-related environmental issues will reduce the risk that they will lead to significant threats to human health or the environment. The centers would also serve as a means for U.S. companies to develop and demonstrate environmental technologies for use at U.S. sites and to demonstrate their capabilities in foreign markets.

Activities also address safety infrastructure. This support will help prevent a repeat of safety problems which developed in the former Soviet Union.

Project activities include conducting a series of workshops on nuclear materials safety management; conducting joint facility safety research, university advanced degree programs and on-site safety management training, and conducting lab-to-site comparative technical studies of safety processes and procedures involving plutonium storage, conversion and transportation.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
International Nuclear Safety	70,000	30,000	34,000	4,000	13%
Total, International Nuclear Safety *	70,000	30,000	34,000	4,000	13%

* Total includes funding that the program received from AID for nuclear safety and cooperation activities for Ukraine and Armenia in FY1998 ($35 million). Total excludes funding that the program may receive from AID for nuclear safety and cooperation activities in Ukraine and Armenia in FY 1999 and FY 2000.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Operational safety. Conduct projects at pilot plants to improve quality assurance, configuration management, event analysis and reporting, emergency operating instructions, safety maintenance, nondestructive examination, and reliability database	7,185	3,974	4,450
■ Training and simulators. Transfer training methodology and highest priority training courses from training centers to other plants at all countries with Soviet-designed plants. Provide simulators or simulator support to selected plants, including simulator training, engineering support, and spare parts for Russia, Ukraine, Slovakia, and Bulgaria. Full scope simulators for Rivne units 2 and 3, South Ukraine units 1 and 3, and Zaporizhzhya units 1 and 5	19,486	880	1,400
■ Engineering and technology. SPDSs for Leningrad unit 2, Smolensk units 2 and 3, and Novovoronezh units 3 and 4. Fire safety and other hardware upgrades for Russia and Ukraine: Smolensk, Seversk units 1-2, South Ukraine units 1-3. Battery supply for Ignalina, Balakovo. Ignalina control and protection system upgrade units 1-2. Ignalina electronic module replacement unit 2. Upgrades to Armenia plant: fire safety, cooling ponds, steam isolation valves, and feedwater system	15,192	11,026	12,700
■ Safety assessment infrastructure. Provide and train in use of U.S. safety codes to evaluate safety issues in all countries with Soviet-designed plants. Kola, Kursk, Leningrad and Novovoronezh safety evaluations. In depth safety assessments for Khmelnitsky unit 1, South Ukraine unit 1, and Rivne unit 1	12,987	4,500	4,500
■ Nuclear safety regulatory and legislative support. Develop an independent regulatory infrastructure for nuclear facilities, including topical workshops and development of technical standards	1,150	450	450
■ International nuclear safety centers. Complete selected analytical projects and maintain a safety database of nuclear data	1,500	1,320	1,650

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ International nuclear safety activities support and infrastructure. Support Department of Energy representative in Paris at the U.S. Mission to the Organization for Economic Cooperation and Development and the U.S. Embassy in Tokyo to maintain constructive engagement in promoting nuclear safety and curbing nuclear proliferation. Infrastructure support activities, including IAEA, EBRD, and NEA activities; coordinating committees, workshops, student exchanges	1,000	1,100	1,200
■ Program management and administration. Senior technical management, foreign support offices, financial management, quality assurance, contracts administration, and information and communications products and services	5,000	5,000	4,800
■ Chornobyl Center for Nuclear Safety, Radioactive Waste and Radioecology and it's technical branch Slavutich Laboratory for International Research and Technology; project and infrastructure support, monitoring of Chornobyl shelter implementation plan	0	1,100	1,200
■ Kazakhstan safety infrastructure and nuclear safety center, address fuel transfer issues, shutdown and decommissioning planning	0	500	350
■ Chornobyl heat plant	3,000	0	0
■ International environmental safety centers. Initiate technology transfer and cooperative projects in the U.S. and Russia	0	100	800
■ Nuclear materials safety. Complete advanced workshops and training on nuclear materials safety, and curriculum for nuclear materials safety graduate degree program in Russia. Complete initial assessment of safety management systems at Russian nuclear materials facilities	0	50	500
■ Nuclear Fuels Qualification. Project will provide Ukraine the capability to obtain fuel from a qualified U.S. Vendor	3,500	0	0
Total, International Nuclear Safety [a]	70,000	30,000	34,000

[a] Total includes funding that the program received from AID for the nuclear safety and cooperation activities for Ukraine and Armenia in FY1998 ($35 million). Total excludes funding that the program may receive from AID for nuclear safety and cooperation activities in Ukraine and Armenia in FY 1999 and FY 2000.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ Engineering and technology. Project to implement safety parameter display system at Leningrad plant unit 2.	2,350
■ Training and simulators. Project to integrate the safety parameter display system capability into the Leningrad plant full-scope simulator.	500
■ International environmental safety centers. Centers will support timely and economic mitigation of several of the world's most unstable environmental sites, and lower the risk of further environmental disasters	700
■ Nuclear materials safety. Project to reduce the nuclear danger associated with the facilities for the treatment, storage and disposition of highly enriched uranium and plutonium derived from various origins, including dismantled warheads as directed in the FY 1999 National Defense Authorization Act	450
Total Funding Change, International Nuclear Safety	+4,000

Nonproliferation and National Security Program Direction

Mission Supporting Goals and Objectives

The Nonproliferation and National Security (NN) program direction budget provides for all Federal personnel required at DOE Headquarters, and three field offices to carry out the program's mission in a cost effective and efficient manner.

Program Goal

Provides the salaries and benefits, travel, support service contracts, and other related expenses associated with the overall management, direction, and administration of the following programs:

Verification and Control Technology
- Nonproliferation and Verification Research and Development
- Arms Control and Nonproliferation

Nuclear Safeguards and Security
Security Investigations
Emergency Management
International Nuclear Safety (FY 2000 only)
Highly Enriched Uranium Transparency Implementation Program (FY 2000 only)
Intelligence (FY 1998 and FY 1999 only)

Program Objectives

- To provide Salaries and Benefits for NN Federal compensation including overtime, awards, lump sum leave payments, transit subsidy, contributions to employee benefits, and associated escalation.
- To provide travel funds that are required to carry out program mission while away from official duty stations, per diem allowances as well as local travel, and to fund the Executive Protection Security Program travel which has been realigned in FY 2000 from the Office of the Secretary of Energy to the Office of Nonproliferation and National Security. Travel is an essential part of staff duties in order to conduct hands-on operations both domestically and internationally, participate in highly technical agency and interagency committees, and to ensure appropriate Government representation in policy meetings.
- To provide Support Services contracts funding for multiple program areas:
  - provide Support Services contracting funding for the Classification/Declassification mission at DOE. Supports review of documents under Executive Order 12958 and Public Law 105-261 and provides funds dedicated to declassification/litigation support review

activities to avoid contempt and monetary sanctions under the Freedom of Information Act.

- provide technical, analytical, administrative, and operational support in multiple program areas such as arms control; safeguards and security; emergency management; and research and development. The daily operation and associated technical direction of the contracts remain with Federal program managers in each organization.
- beginning in FY 2000 also provides Support Services for the Department's Critical Infrastructure Protection (CIP) Program.

- To provide Other Related Expenses, including the working capital fund (space, utilities, general printing, graphics, copying, supplies, telephones, etc.), general office automation support, operation and maintenance of equipment, and other miscellaneous services.

Performance Measures

The principle objective of Program Direction is to provide the appropriate level of funding in the four categories supported in this budget: Federal salaries and benefits, travel, support services, and other related expenses.

- The ultimate measure for success in the Program Direction subprogram is whether the Federal personnel in the various programs in Nonproliferation and National Security have their salaries and benefits provided, travel funding is adequate to allow the appropriate amount of onsite supervision by the Federal staff, and the level of support services provided to the Federal staff is adequate to allow NN to perform its programmatic goals and objectives.
- The performance measure for the support of the business line activities funded under the Working Capital Fund (WCF) is to control costs associated with these business lines where possible and to adequately fund these activities through the budget process. NN regularly monitors all business lines funded in the WCF and has reduced, to the extent possible, utilization of services provided through this fund. Further per capita reductions, in keeping with good business practices, in utilization of the services provided through this fund is a performance measure NN sets for itself in this account.

[a] FY 1998 and FY 1999 Appropriation included Intelligence program funding.

[b] In FY 2000 the International Nuclear Safety Program and Highly Enriched Uranium (HEU) Transparency Programs were transferred into the Nonproliferation and National Security Program. Funding for the HEU program was formerly in the Energy Supply Research and Development appropriation.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Headquarters federal staffing is driven by specific functional responsibilities as well as management and direction requirements.			
■ NN is the focal point within the Department for activities that support the President's nonproliferation policy, goals and objectives, and activities which assist other Departmental and field elements achieve their missions.			
■ The Intelligence program was budgeted for in this account in FY 1998 and FY 1999. The program is transferred out of NN in the FY 2000 budget.			
■ Staff directs and manages multiple technology and research and development tasks.			
■ NN staff serves as the Headquarters operational element for activities such as emergency management, security, and declassification and classification operations.			
■ Staff develops department-wide policy and plans for national security programs such as safeguards and security, declassification and classification. NN is directly responsible for management of the New Brunswick National Laboratory, the Nonproliferation and National Security Institute in Albuquerque, New Mexico, and the HAZMAT Spills Test Facility at the Nevada Test Site.			
■ The International Nuclear Safety staff and program, were combined with the NN program in FY 2000. The staff directs and manages multiple projects designed to reduce risks at nuclear power plants worldwide.	41,310	41,321	39,481
Travel			
■ Includes domestic and foreign trips necessary to conduct nonproliferation and national security business.			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ International travel is necessary due to the continuous work with international agencies and the Former Soviet Union republics. Domestic travel includes national security assistance and interface with field offices, laboratories and local governments.			
■ Nonproliferation issues and program interface also require domestic travel.			
■ FY 2000 provides travel for the Executive Protection Security personnel. This activity has been realigned from the Office of the Secretary of Energy to the Office of Nonproliferation and National Security ($366).	2,206	2,244	2,700
Support Services			
■ Provides an invaluable resource of highly specialized and analytical expertise required to meet critical nonproliferation and national security issues.			
■ Provides support to declassification objectives while ensuring that national security is not jeopardized through inadvertent release of classified nuclear related design information.			
■ Provides implementation of cost-saving safeguards and security measures, technical, analytical and support expertise essential to a balanced safeguards and security program. Provides technical expertise capable of addressing technology advancements and the dynamic changing environment associated with weapons returns, arms control, and nonproliferation.			
■ Provides support to objectives of the arms control materials protection, control and accounting program and to provide technical assistance appraisals, emergency response tests and exercises.			
■ Provides technical analyses and support of future proliferation detection and treaty verification; and to review and assess technology and program status.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Provides a proactive program that interfaces with the private sector, other government agencies, and the executive branch in establishing mutual support arrangements in the furtherance of the DOE Critical Infrastructure Protection Program.	22,327	26,226	32,208
Other Related Expenses			
■ Includes Headquarters space, utilities, general printing, graphics, copying, supplies, telephones, general automation support, payroll outsourcing, postage, and other miscellaneous expenses associated with office operations.			
■ Similar support is provided to the Federally staffed New Brunswick Laboratory.			
■ NN funding for the Working Capital Fund is included in this subprogram.	17,057	17,109	16,061
Total, Program Direction	82,900	86,900	90,450

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Salaries and Benefits	
■ The Intelligence program is not included in the FY 2000 request but was included in the FY 1999 and FY 1998 appropriations. The International Nuclear Safety Program and the Highly Enriched Uranium Transparency Program is budgeted for in the FY 2000 request but not in NN's FY 1999 appropriation. The change is a net reduction in Salaries and Benefits following the transfer out of the Intelligence program, the addition of the International Nuclear Safety Program and the Highly Enriched Uranium Transparency Implementation Program, and some escalation.	-1,840
Travel	
■ Travel increase is the net result of transfer out of the Intelligence Program and the transfer in of the International Nuclear Safety Program and the Highly Enriched Uranium Transparency Implementation Program, the realignment of the Executive Protection Security personnel travel costs, and a small increase for escalation.	+456
Support Services	
■ Support Services - Other is a net reduction resulting from the transfer out of the Intelligence program, a reduction to partially fund escalation for federal salaries and benefits, and to fund Executive Protection Security Program travel that has been realigned into the NN program.	-2,297
■ Support Services - Declassification have been increased to fund implementation of Public Law 105-261 and to support halting the growth of the FOIA backlog.	+7,379
■ Support Services - CIP is an increase to fund the Critical Infrastructure Protection Program.	+900
Related Expenses	
■ Other Related Expenses have been reduced to partially fund escalation for Federal salaries and benefits, transfer out of Intelligence, and transfer in of HEU and International Nuclear Safety Program.	-1,048
Total Funding Changes, Program Direction.	+3,550

Intelligence

Intelligence

Executive Budget Summary

Mission

The Intelligence mission is to provide the Department, other US Government policymakers, and the Intelligence Community with timely, accurate, high impact foreign intelligence analyses; to provide quick-turnaround, specialized technology applications and operational support to the intelligence, special operations, and law enforcement communities; and to ensure that the Department's technical, analytical and research expertise is made available to the Intelligence Community in accordance with Executive Order 12333, "United States Intelligence Activities." The Office of Intelligence supports the National Security business line of the DOE Strategic Plan.

Strategy

The post-Cold War environment continues to evolve and remain uncertain. Consequently, the nature and scope of the Department's Intelligence Activities continue to be influenced by a variety of international events and trends Proliferation of nuclear weapons and materials into the hands of rogue states and terrorist groups continues to be a danger. The Office of Intelligence continues to be committed to preserving a modus operandi that allows its resources and programs to be receptive on short notice to changing world situations. Technical and analytical intelligence support to US efforts will be instrumental in improving nuclear materials protection, control, and accountability in the former Soviet Union; assisting in the safe and secure dismantlement of former Soviet nuclear weapons; verifying foreign compliance with international treaties and other commitments in the nuclear arena; limiting and redirecting North Korea's nuclear weapons program; assess international terrorism and support US nuclear-related operations, addressing the challenge of global nuclear proliferation through the innovative and broad application of DOE assets; encouraging and facilitating the application of DOE laboratory expertise to Intelligence Community technology development requirements; and providing specialized technical support to operations in the intelligence, law enforcement, and special operations communities.

The Office of Intelligence will continue to make the Department's unique expertise available to the other Intelligence Community members and policy agencies. We will continue to use the unique expertise in the National Laboratory complex to analyze foreign nuclear capabilities and address issues of nuclear proliferation. The FY 2000 strategic focus for this office is to continue to be a center of excellence for support to national policymakers.

Major Changes

The Office of Intelligence, formerly part of the Office of Nonproliferation and National Security, was reorganized into an independent office.

Program Performance Measures

The most meaningful performance measure for the Office of Intelligence is the contribution of its intelligence products (briefings, studies, assessments, analyses, technologies, and operational support) to the attainment of US national security objectives, particularly in the areas of nonproliferation, counterproliferation, international arms control treaties, counterterrorism, and special operations/low-intensity conflict. Our intelligence products and unique support will assist decisionmakers in the

formulation and implementation of new policy initiatives to meet changing global realities. We will provide early warning to decisionmakers of local, regional, or international crisis situations that require modified or new policy actions or initiatives, enhance existing policies through the provision of value-added intelligence information to decisionmakers; develop specialized technology applications to meet short term national security requirements; assess international terrorism for DOE policy makers; provide a conduit for timely nuclear and nuclear-related intelligence assessments and reporting to support U.S. operations; and provide on-call, rapid response technical capabilities to support specialized intelligence, as well as other government operational missions.

Lawrence H. Sanchez

Date 1/21/99

Intelligence

Program Mission

The Intelligence mission is to provide the Department, other US Government policymakers, and the Intelligence Community with timely, accurate, high impact foreign intelligence analyses; to provide quick-turnaround, specialized technology applications and operational support to the intelligence, special operations, and law enforcement communities; and to ensure that the Department's technical, analytical and research expertise is made available to the Intelligence Community in accordance with Executive Order 12333, "United States Intelligence Activities." The Office of Intelligence supports the National Security business line of the DOE Strategic Plan.

Program Goal

The goal of the Intelligence Program is to support the National Security of the United States and have a direct impact on the policy making process by providing actionable intelligence and/or analytical and technology support to the Intelligence Community. Analysis from the Department's intelligence program serves the following core policy areas: nuclear proliferation and weapons analysis; science and technology (S&T), energy security; nuclear energy, safety and waste; and the development of specialized technology applications and operational support to meet national security missions.

Program Objectives

The objectives are to provide technical and analytical intelligence support to US efforts to:

- Improve nuclear materials protection, control, and accountability in the former Soviet Union.
- Assist in the safe and secure dismantlement of former Soviet nuclear weapons.
- Conclude a Fissile Materials Cut-off Treaty.
- Verify foreign compliance with international treaties and other commitments in the nuclear arena.
- Limit and redirect rogue nations' nuclear weapons programs.
- Address the challenge of global nuclear proliferation through the innovative and broad application of unique DOE capabilities.
- Help identify low probability/high impact scenarios in worldwide nuclear proliferation and weapons development.
- Facilitate the identification and transition of DOE technologies to meet near-term operational requirements of the Intelligence Community.
- Develop specialized technology applications to meet short-term national security requirements.
- Provide on-call, rapid response technical capabilities to support specialized operations.
- Support DOE policy development related to international terrorism and provide a conduit for timely, focused nuclear and nuclear-related intelligence reporting and assessments for US operations.

Performance Measures

Performance measures related to the Intelligence Program are qualitative rather than quantitative

- Provide advance warning of political or economic developments which have a high probability of producing energy supply disruptions
- Provide timely, detailed technical intelligence assessments and reporting that support Departmental, military, and Intelligence Community nuclear-related missions
- Maintain intelligence core capabilities at DOE's National Laboratories in nuclear weapons, nonproliferation, nuclear energy, safety, and waste, nuclear weapons science and technology; and fossil energy.
- Transition DOE technologies that meet near-term national security requirements from across the intelligence, special operations, and law enforcement communities
- Provide rapid identification and provision of unique DOE expertise and technologies to support US operations.
- Provide intelligence analysis of foreign nuclear weapons programs and related technologies and industries to help inform development of US policies on issues such as nuclear weapons dismantlement, fissile materials production and protection, and nonproliferation initiatives

Significant Accomplishments and Program Shifts

- Served as the lead analytical agency in various intelligence analyses.
- Based on an U.S Secret Service requirement, developed a prototype system for tagging and tracking vehicles. The tag is made up of a chemical compound that can easily be sprayed onto a target and has unique characteristics that generate several measurable signatures (e.g., UV absorption, UV fluorescence, and infrared fluorescence). When interrogated with a UV/IR light source, the tag can be detected with an optical sensing device
- Developed a prototype mobile, wireless, Intranet Protocol (IP)-based computer communications network that incorporates low probability of detection/low probability of intercept characteristics. The system provides a secure, flexible, mobile communications network that can support a variety of field operations.
- The Counterterrorism Analysis Cell was established to maintain an interface with the Intelligence Community, coordinate and obtain information on DOE intelligence requirements, support DOE policy development related to international terrorism, and provide a conduit for timely, focused nuclear and nuclear-related intelligence reporting and assessments for US operations.

Site Description

Argonne National Laboratory

Argonne National Laboratory is one of the U.S Department of Energy's largest research centers It is also the nation's first national laboratory, chartered in 1946. Argonne occupies two sites. The Illinois site is about 25 miles southwest of Chicago's Loop. Argonne-West is about 50 miles west of Idaho Falls, Idaho It is the home of most of Argonne's major nuclear reactor research facilities. Argonne research falls into four broad categories. Basic science includes experimental and theoretical work in materials science, physics, chemistry, biology, high-energy physics, and mathematics and computer science, including high-performance computing. In the scientific facilities program, the laboratory designs, builds and operates sophisticated research facilities, such as the Advanced Photon Source, the Intense Pulsed Neutron Source, and the Argonne Tandem Linear Accelerator System, that would be too expensive for a single company or university to build and operate. For energy research, Argonne is developing advanced batteries, fuel cells, and electric power generation and storage systems. It is also working to improve the safety and longevity of both American and Soviet-designed nuclear reactors. Environmental management research includes alternative energy systems; environmental risk and economic impact assessments; hazardous waste site analysis and remediation planning; electrometallurgical treatment to prepare spent nuclear fuel for disposal; and new technologies for decontaminating and decommissioning aging nuclear reactors

Environmental Management and Enrichment Facilities

The Environmental Management and Enrichment Facilities (EMEF), formerly the K-25 Site, is managed by Bechtel Jacobs Company, Limited Liability Corporation (LLC) in Oak Ridge, Tennessee; Paducah, Kentucky; and Portsmouth, Ohio. The primary mission is to innovatively lead and cost-effectively manage programs in environmental remediation, waste management, technology development and demonstration, education and training, and technology transfer for DOE, other federal agencies, and the public. Specifically, EMEF manages the Toxic Substances Control Act (TSCA) Incinerator, a unique mixed waste treatment facility; the risk-based cleanup programs for contaminated facilities and natural resources that fully involved regulators and the public; the complaint and safe waste management at the DOE Oak Ridge Operations Office sites, including minimization, treatment, storage, and disposal for all programs and activities, the centers at the East Tennessee Technology Park (ETTP) that demonstrate advance environmental technologies, decontamination and decommissioning, and waste management; research, development, and demonstration of innovative technologies for environmental restoration and waste management leading to the most technically efficient and cost-effective programs; and ETTP services and facilities.

Idaho National Engineering and Environmental Laboratory

The Idaho National Engineering and Environmental Laboratory (INEEL) is located on 890 square miles in the southeastern Idaho desert. Other INEEL research and support facilities are located in nearby Idaho Falls. INEEL is home to the largest concentration of technical professionals in the northern Rocky Mountain region. Operated by Lockheed Martin Idaho Technologies Company for the U S. Department of Energy, it is the scene of some of the most advanced research programs in the world. Today, the INEEL is solving critical problems related to the environment, energy production and use, U.S. economic competitiveness, and national security. Application areas include, natural resource processing

and environmental management, spent nuclear fuel management, environmental technology development, mixed waste characterization and treatment, non- and counter-proliferation, advanced manufacturing, alternate energy supply and energy efficiency, and transportation technologies. The present mission of the INEEL is to develop, demonstrate, deploy, and transfer advanced engineering technology and systems to private industry to improve U S. competitiveness and security, the efficient production and use of energy, and the quality of life and the environment worldwide.

Kansas City Plant

The Kansas City Plant has been producing high quality electrical, mechanical, and engineered materials for weapons production since 1949. Owned by the Department of Energy and operated by Allied Signal Federal Manufacturing & Technologies, the Kansas City Plant offers a world-class technology base to industry and other government entities. Recently, it has been tasked by the Department of Energy to help American business compete by sharing our expertise In a time of transition and change, it is transferring its technology and know-how to private industry. In 1994, the 258,000 square-foot Technology Transfer Center opened at the Kansas City Plant. That same year the plant assumed management responsibilities for the Department of Energy's Kirtland Operations in Albuquerque, NM. That facility employs about 260 associates. Today, the Kansas City Plant employs about 3,300.

Lawrence Livermore National Laboratory

Lawrence Livermore is located in California's Lawrence Livermore is located in California's Tri-Valley region east of San Francisco The mission of the Lawrence Livermore National Laboratory (LLNL) is to apply science and technology in the national interest. LLNL's focus is on global security, global ecology, and bioscience. Its primary mission is to ensure that the nation's nuclear weapons remain safe, secure, and reliable and to prevent the spread and use of nuclear weapons worldwide. Livermore is the site for the National Ignition Facility, which will be the world's largest laser system and will provide the means for investigating the thermonuclear physics of weapons in the absence of nuclear testing and for exploring the promise of fusion energy. Livermore pursues projects aimed at significant, large-scale innovations in energy production to ensure abundant, clean, and affordable energy for the future. Environmental efforts will be directed at demonstrating effective remediation technologies, advancing the science base for environmental regulation, and modeling more accurately regional weather and global climate conditions. LLNL also serves as an effective national resource in the stewardship of nuclear materials The Laboratory's bioscience research will advance human health through efforts focused on genomics, disease susceptibility and prevention, and improved healthcare and medical biotechnology. Laboratory employees are working with industrial and academic partners to increase national economic competitiveness and improve science education.

Los Alamos National Laboratory

The Los Alamos laboratory, located with the town of Los Alamos approximately 35 miles northwest of Santa Fe, occupies 43 square miles of land in Northern New Mexico. Owned by the Department of Energy, Los Alamos has been managed by the University of California since 1943, when the Laboratory was born as part of the Manhattan Project to create the first atomic weapons during World War II. Los Alamos National Laboratory's central mission is reducing the danger of nuclear weapons and nuclear materials worldwide. Their statutory responsibility is the stewardship and management of the nuclear stockpile.

Reducing global nuclear danger involves five areas Stockpile stewardship ensures that the U.S has safe, secure, and reliable nuclear weapons Stockpile management provides capabilities ranging from dismantling to remanufacturing the stockpile. Nuclear materials management ensures the availability and safe disposition of plutonium, highly enriched uranium, and tritium. Nonproliferation and counterproliferation help to deter, detect and respond to the proliferation of weapons of mass destruction. Environmental stewardship provides for the remediation reduction of wastes from the nuclear weapons complex

Pacific Northwest National Laboratory

The Pacific Northwest National Laboratory, in Richland, Washington, is a United States Department of Energy multiprogram national laboratory operated by Battelle The total staff employment for 1996 was 3,326. The Laboratory focuses on research and development related to waste management, environmental restoration, global environmental change, energy and national security The Laboratory supports these areas with underlying technical capabilities, which integrate technical areas of expertise from many scientific disciplines Atmospheric Sciences, Biotechnology, Chemical Instrumentation and Analysis, Computer and Informational Sciences, Design and Manufacturing, Engineering, Ecological Science, Electronics and Sensors, Experimental Toxicology, Health Protection and Dosimetry, Hydrologic and Geologic Sciences, Marine Sciences, Materials Sciences and Engineering, Molecular Science, Nuclear Science and Engineering, Process Science and Engineering, Risk and Safety Analysis, Socio-Technical Systems Analysis, Statistics and Applied Mathematics, Thermal and Energy Systems. In addition, the Laboratory has an impressive catalogue of award-winning capabilities and technologies developed by its staff. The Environmental Molecular Sciences Laboratory (EMSL) is a new facility built to attain an understanding of the physical, chemical, and biological processes needed to solve critical environmental problems

Nevada Operations Office

DOE Nevada maintains the capability at the Nevada Test Site and other facilities and sites to implement DOE initiatives in stockpile stewardship, crisis management, waste management, environmental management, nondefense research and development, and work for others; as well as supporting other DOE programs. The HAZMAT Spill Center, located at Department of Energy's Nevada Test Site near Mercury, Nevada, is a unique, one-of-a-kind facility built to conduct hazardous materials testing and training under controlled conditions. A Joint Demilitarization Technology (JDT) Program has been established between the Departments of Defense and Energy. The JDT Program will demonstrate and validate environmentally acceptable technologies for resource recovery and recycling, alternative destruction, or treatment technologies as appropriate to excess stockpile and obsolete munitions. The Dipole Hail test program at the Nevada Test Site evaluates the functional disruption conventional high explosives have on underground activities Radioactive Waste Acceptance Program manages radioactive waste in a safe and compliant manner at the Nevada Test Site.

The Office of Scientific and Technical information

The Department of Energy (DOE) Office of Scientific and Technical Information (OSTI), operating from Oak Ridge, Tennessee, ensures overall stewardship and accessibility for the scientific and technical information (STI) generated and acquired by Department of Energy programs. With its annual research

and development budget of over $6 billion, the Department is a major U.S source of information derived from scientific and technical studies, work, or investigations which relate to research, development, and demonstration. OSTI supports the Department's and the Nation's energy goals related to basic and applied energy research, U.S. competitiveness, national security, and environment, safety, and health by providing information services to the Department, national laboratories, and other DOE contractors

Pantex Plant

Pantex is located 17 miles northeast of Amarillo, Texas. The Pantex Plant mission is to anticipate and satisfy U.S. Department of Energy (DOE) requirements by providing competitive, quality, on-time products and services that exceeds expectations and are achieved in a manner that protects the environment, ensures the safety and health of employees and the public, and protects our national security

Pantex Plant's primary mission is to: assemble nuclear weapons for the nation's stockpile; disassemble nuclear weapons being retired from the stockpile; evaluate, repair, and retrofit nuclear weapons in the stockpile; demilitarize and sanitize components from dismantled nuclear weapons; provide interim storage for plutonium pits from dismantled nuclear weapons; develop, fabricate, and test chemical explosives and explosive components for nuclear weapons; and to support DOE initiatives.

Sandia National Laboratory

The Sandia National Laboratory is operated for the U.S. Department of Energy by the Sandia Corporation, a Lockheed Martin Co. Starting in 1945 in Albuquerque, New Mexico, as part of the Manhattan Project, which built the first nuclear weapons, Sandia, today, has two primary facilities, one in Albuquerque and one in Livermore, California. It employs about 7,500 people and manages more than $1.2 billion of work per year. Scientist at Sandia design all non-nuclear components for the nation's nuclear weapons, perform a wide variety of energy research and development projects, and do assignments that respond to national security threats -- both military and economic. Sandia encourages and seeks with appropriate U.S. industry and government groups to collaborate on emerging technologies that supports its mission.

Savannah River Technology Center (SRTC)

The Savannah River Site (SRS) is a key Department of Energy (DOE) facility, focusing on national security work; economic development and technology transfer initiatives; and environmental and waste management activities. Owned by DOE and operated under contract by the Westinghouse Savannah River Company (WSRC), the complex covers 310 square miles, bordering the Savannah River between western South Carolina and Georgia for 27 miles. About 16,000 people are employed at SRS. The site's overall budget is about $1.6 billion. SRS was constructed during the early 1950s to produce the basic materials used in the fabrication of nuclear weapons, primarily tritium and plutonium-239. All five of the original SRS production reactors are permanently shut down. The future of SRS lies in three areas: reducing the nuclear danger; transferring applied environmental technology to government and non-government entities; and forming economic and industrial alliances.

Mission Supporting Goals and Objectives

Provide analysis and reporting on the status and direction of emerging nuclear weapons programs of proliferant nations; countries engaged in the supply of nuclear technology, equipment, and material to proliferant and established nuclear programs; the production and disposition of fissile material worldwide, with special emphasis on the implications of the breakup of the former Soviet Union and its impact on the control and accountability of special nuclear material in its possession; international terrorism for DOE policy makers, foreign nuclear weapons and nuclear related facilities/infrastructure, design, development, and employment of nuclear weapons, improvised nuclear and/or radiation dispersal devices, and illicit trafficking of related materials and components, the foreign economic threat to U.S. energy resources and U.S. energy security, the impact of changes in global energy and energy production markets on U.S. industrial competitiveness, while emphasizing opportunities and challenges to U.S. exports; the identification and characterization of foreign nuclear facilities posing a risk to human health and the environment; foreign technology plans, priorities, and commercial applications of leading edge technologies deemed critical by the Department and the White House Office of S&T Policy; and foreign dual-use technologies in Russia and China. Facilitate the transition of enabling technologies to meet near-term national security requirements within the intelligence, special operations, and law enforcement communities. Maintain an on-call capability to rapidly identify and provide technical support to agencies' varied missions and operations where unique DOE expertise/technologies may be of assistance. Maintain liaison throughout the community for the coordination of operational requirements, identification of applicable DOE technology, and formulation of appropriate investment strategies for developing new capabilities.

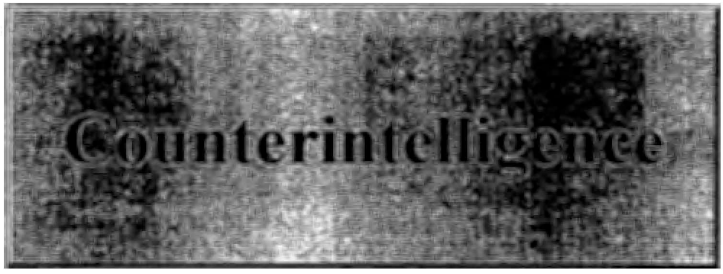
Explanation of Funding Changes from FY 1999 to FY 2000

There are no funding changes.



Counterintelligence

Counterintelligence

Executive Budget Summary

Mission

The Counterintelligence (CI) mission is to provide the Department of Energy (DOE), other U.S. Government policymakers, and the Intelligence Community (IC) with the capability to successfully identify, neutralize, and deter intelligence threats directed at the Department's facilities, personnel, information, and technologies.

The Department of Energy Counterintelligence Program is established in accordance with Presidential Decision Directive/NSC-61 (PDD-61), "U.S. Department of Energy Counterintelligence Program," dated February 11, 1998; Executive Order 12333, "U.S. Intelligence Activities", dated April 12, 1981; and, "The Atomic Energy Act of 1954, as amended." In accordance with PDD-61, the DOE Office of Counterintelligence (OCI) was established in March 1998. The Office of Counterintelligence is responsible for ensuring effective counterintelligence programs throughout the Department of Energy complex, including at the department's laboratories.

Strategy

The Department of Energy has long been and remains an attractive target for foreign intelligence services due to its substantial weapons and non-weapons related scientific expertise. Specifically, the Department's goal of technological superiority requires that DOE scientists interact with their international counterparts on a regular basis. This interaction, while essential, often results in concerns of a counterintelligence nature. Therefore, in order to protect against espionage and other threats, DOE established its own Counterintelligence Program in 1988.

Since its inception, the CI Program has been fraught with systemic problems. Several U.S. Government reports published over the past ten years, including two studies conducted by the General Accounting Office, one by the Federal Bureau of Investigation (FBI), and others by U.S. Intelligence Community (USIC) groupings, concluded that the Department was not doing enough to adequately protect its property and personnel against the collection activities of foreign intelligence services. These reports resulted in the signing of PDD-61 which galvanized senior level USIC and Departmental interest in the Department's CI Program. The PDD mandated numerous changes to DOE's CI Program, addressing for the first time the structural flaws identified in the aforementioned U.S. Government reports.

In response to the requirements of PDD-61, Secretary of Energy Peña reorganized the CI activities of the Department, creating an independent Office of Counterintelligence that reports

54-291 99 - 16

directly to the Secretary of Energy, as apposed to sub-elemental function reporting to the Director of the Office of Nonproliferation and National Security. Mr. Edward J. Curran, a senior Foreign Counterintelligence Official at the FBI was appointed as Director of the Office of Counterintelligence. Pursuant to PDD-61, the Department is in the process of making significant improvements to its CI Program.

Major Changes

The Department's newly established OCI published a classified report 90 days after the PDD was signed. The report was based on three months of field research and subsequent analysis by professional counterintelligence officers from the USIC, and set forth 46 specific and substantive recommendations aimed at strengthening the Department's CI Program. The majority of the recommendations were aimed at creating a more centralized Program, with the resources necessary to carry out the analytical, investigative, personnel security, information security, and training aspects of OCI's mission. Specifically, the report's major findings focus on: 1) Accountability of Laboratory Directors for CI activities at their locations; 2) Organization and management of the CI Program; 3) Security Programs that support the CI mission; 4) Weaknesses in the Foreign Visits and Assignments Program; 5) The Counterintelligence-Cyber threat; and 5) FBI and Intelligence Community relationships. As the direct result of the report findings, DOE has requested from the Congress a significant increase in the fiscal year 1999 and 2000 budget for counterintelligence activities. The requested levels provide for mission essential counterintelligence analyses, debriefings, training, information technology, and counterintelligence inspections throughout the DOE Complex. The report and its recommendations were endorsed by Secretary Richardson in November 1998 and the Department has recently begun implementing these recommendations.

The Department's conduct of highly advanced research and development activities ensures that it will always be a target for foreign intelligence services. With the implementation of the report recommendations and establishment of an aggressive CI Program at the Department of Energy, the Department's personnel and sensitive technologies will be much less vulnerable to future exploitation by foreign intelligence services. The new Office of Counterintelligence provides the first ever centrally managed Counterintelligence Program within DOE, including mission essential counterintelligence analyses, debriefings, training, information technology, and counterintelligence inspections throughout the Complex.

Edward J. Curran

Edward J. Curran

Date 1/21/99

Counterintelligence

Program Mission

The mission of the Office of Counterintelligence is to develop and implement an effective Counterintelligence Program throughout the Department of Energy whose goal is to identify, neutralize and deter foreign government or industrial intelligence activities directed at or involving DOE programs, personnel, facilities, technologies, classified information and unclassified sensitive information. The DOE CI Program is established in accordance with PDD-61; Executive Order 12333, "U.S. Intelligence Activities", dated April 12, 1981; and, "The Atomic Energy Act of 1954, as amended." The DOE OCI is responsible for approving, conducting, and coordinating all policy and investigative matters with the FBI at Headquarters and the Field. OCI's relationship with the FBI is defined by: Executive Order 12333, PDD-61; Director of Intelligence Directive 5/1; Section 811 (c) of the Intelligence Authorization Act of 1995, and the "Memorandum of Understanding between the Department of Energy and the FBI", dated October 7, 1992.

Program Goal

The goal of the Counterintelligence Program is to enhance the protection of sensitive technologies, information, and expertise against foreign intelligence, industrial intelligence, and terrorist attempts to acquire nuclear weapons information or advanced technologies from the National Laboratories.

Program Objectives

The Director of the Office of Counterintelligence will direct five core Departmental wide policy and programmatic components from Headquarters to include the Counterintelligence Analysis Program; the Counterintelligence Investigations Program; the Counterintelligence Evaluation Board/Security; the Counterintelligence Inspections Program; and the Counterintelligence Training Program. All Headquarters and Field counterintelligence activities are directed by the Director of the Office of Counterintelligence.

- The CI Analysis Program is predicated on the findings of multiple US Government studies on DOE that state that there is currently a dearth of strategic, value-added analysis to support DOE's counterintelligence efforts and that such analysis is an essential element of an effective program. These studies found that DOE Counterintelligence Officers (CIOs) in the field have little time to dedicate to such analysis, and that they are not well positioned to exploit the collective knowledge of the USIC or the cumulation of raw data generated by the various national laboratories.

- The CI Investigations Program mission is to develop and implement an effective defensive counterintelligence investigative program throughout the Department. The

Program focus is to detect and neutralize foreign government or industrial intelligence activities in the United States directed at, or involving, DOE programs, facilities, technology, personnel, unclassified sensitive information and classified information.

- The CI Evaluations Board will conduct comprehensive security and counterintelligence vetting of all DOE personnel assigned to Special Access Programs, Personnel Assurance Programs, and Personal Security and Assurance Programs to include financial disclosure and polygraph.
- The CI Inspections Program will ensure the adherence of Departmental elements to PDD-61 and other existing requirements.
- The Training Program will establish the criteria for and ensure the professional training of Counterintelligence Officers throughout DOE.

Funding Profile

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request
Counterintelligence	7,641	15,641	0	15,641	18,641
Contribution from labs	0	0	0	0	12,559
Total, Program Level	7,641	15,641	0	15,641	31,200

Budget Request

The FY 2000 budget request for the Office of Counterintelligence is $18.641 million. The Department plans to supplement that funding with an additional $12.559 million that will be obligated to the national laboratories from other DOE defense programs, but spent under the direction of the Director of the new Office of Counterintelligence. Thus, the requested program level for the new Office is $31.2 million. The FY 2000 budget provides for mission essential counterintelligence analyses, debriefings, training, information technology, and counterintelligence inspections throughout the DOE Complex, all of which are necessary and mandated by PDD-61 for the Department to have an aggressive Counterintelligence Program. The $31.2 million program level enables the Director of the Office of Counterintelligence to meet the requirements of PDD-61 by ensuring the establishment of and programmatic functionality of the Department's Counterintelligence analysis program; inspection program; training program; financial disclosure program; and polygraph program, as well as enhancing the Counterintelligence personnel at the Department's Laboratories.

Worker and Community Transition

Worker and Community Transition

Program Mission

The Office of Worker and Community Transition was formed in September 1994 to mitigate the impacts on workers and communities caused by changing Department of Energy (DOE) missions, consistent with Section 3161 of the Defense Authorization Act of 1993. The Department will continue to experience restructuring of its contractor work force in Fiscal Year 1999 and beyond. These adjustments will be driven by changes in the management of the strategic stockpile and shifts in skill mix requirements. Changes in contracting mechanisms will also involve significant employment adjustments beyond net reductions in total DOE contractor employment.

The Office of Worker and Community Transition has been and will continue to be a major management tool for streamlining the Department of Energy yet maintaining effectiveness during a major downsizing activity that began in FY 1993. During that time, the Office has developed the expertise to oversee work force planning for the Department, assist in developing benefits packages for displaced workers, oversee labor relations efforts, lessen the impact of downsizing on affected workers and communities by fostering alternative employment opportunities, and integrate asset disposition, where possible, into community transition efforts. Through the actions of this Office, significant cost savings have been realized, far exceeding the amount spent on the entire program. By helping the sites expeditiously separate workers, large quantities of payroll costs have been saved. By transferring property to local authorities as part of the community transition program, the Department has been able to save millions of dollars in operating costs and projects currently planned will produce more savings. The Mound Facility is an example of the future savings that are possible. Expedited closure made possible through the community transition program will save the Department $150 - $200 million in operating costs.

Consistent with the Department's initiatives to promote best business practices, guidance for work force restructuring at DOE sites reflects lessons learned in the private sector, including the use of comprehensive work force planning. Private companies increasingly undertake work force restructuring strategies similar to those adopted by the Department. For example, a March 1995 report by the General Accounting Office surveying 25 major companies, including firms with considerable federal contracting such as General Electric, Grumman and Honeywell, experiencing work force restructuring, found that "at least 18 (72%) provided various incentives to encourage employees to voluntarily leave." These included early retirement, lump sum incentive payments, tuition, medical benefits and outplacement assistance similar to those provided at DOE sites. A survey conducted by Actuarial Sciences Associates, Inc., of mid-1990s downsizing practices of 60 major companies "confirm that it is common for employers that wish to downsize first to offer either an exit incentive retirement or resignation program (or sometimes both sequentially), and only then to utilize layoffs to the extent downsizing is still needed. This, indeed, is *the* classic exit incentive strategy and it is probably motivated more by the desire to be humane and to preserve employee morale." Further, worker insecurity about their treatment in the event of additional work force changes often severely decreases productivity among remaining workers.

The Department, however, is motivated by more than the desire to emulate the best business practices of the private sector. Regardless of the employer — whether it is public or private — major decreases in regional work force have negative economic and social effects. The economic effects include both the obvious lost individual income and tax revenue as well as the secondary impacts, as disposable income decreases within the community, of corresponding decreases in businesses that supported the affected workers. Social effects have been observed for individual workers — including those who remain as well as those who leave — and the community in which they live. Increases in social problems, e.g., substance abuse, spousal abuse and suicide, have been shown to increase in communities where large numbers of job layoffs are occurring.

While private companies may use work force change strategies similar to those of the Department, those measures may only partially mitigate the impacts mentioned above, especially if replacement jobs are not available. Private companies are free to leave to the community and other Federal, state, and local units of government the responsibility of bearing the remaining economic and social costs if replacement jobs are not available, although the employer must endure the loss of productivity caused by workers' uncertainty about the future. The Federal government, as simultaneously the employer, provider of many social services, and recipient of tax revenue, has a comprehensive interest in decreasing the cumulative economic and social impacts caused by significant changes in its funded work force. Community transition assistance helps attract or retain job opportunities which can: (1) decrease the loss of individual income, tax revenue, and secondary job losses; (2) decrease the social problems and the corresponding cost of social services (borne by other Federal agencies and state and local units of government) caused by DOE work force restructuring, and; (3) help to develop alternative employment which would contribute to maintaining productivity in remaining workers by providing confidence that other employment opportunities will be available in the event of further downsizing.

The Worker and Community Transition budget provides funding for activities associated with enhanced benefits beyond those required by contract, existing company policy or collective bargaining agreements at defense nuclear facilities, and is part of the overall Department's Other Defense Activities budget request. In addition, Congress has identified this appropriation as the only authorized source of funding for local impact assistance to communities affected by work force reductions at defense nuclear facilities.

The Office of Worker and Community Transition coordinates policy direction and implementation for field operations involving work force planning, restructuring, labor standards and relations, community transition activities, and asset management across the Department. This program also provides for the personal and contractual services for all federal management, and administrative personnel to carry out the Worker and Community Transition mission including related costs such as space, materials, utility, supplies, communication and building maintenance at DOE Headquarters.

During Fiscal Year 1997, the functions of the Office of Asset Management were added to those of the Office of Worker and Community Transition. This was done because asset management implementation actions are focusing on pilot project proposals, such as recovery of precious metals from weapons components and electronic scrap recycling and use, which are designed to provide a financial return to the Federal government through the disposition of the assets as well as stimulating regional and local economic development. Because asset disposition and stimulating economic development can conflict or complement each other, dependent upon the coordination between the two programs and the

individual circumstances of each case, the combination of the two programs is expected to reduce the conflicts and increase the benefits of asset disposition.

A further integration of asset management and community transition involves re-industrialization. This activity locates excess Department of Energy facilities and equipment that must be maintained, with the cost of maintenance accruing to the Department. In the reindustrialization process, businesses are recruited to make use of these excess Department of Energy facilities and equipment. As part of the terms for the use of the Department's assets, the private businesses will assume maintenance responsibilities. The Department would then receive a return on its investment in the assets as well as be relieved of the cost of asset maintenance. At the same time, private industry is making use of former Department equipment to produce goods and services and provide jobs located in affected communities. Further, workers who had been affected by work force restructuring should be highly competitive for jobs operating that equipment.

Through its programs, the Office of Worker and Community Transition is contributing to achieving Objective CM-3 of the September 1997 Strategic Plan for the Department of Energy. That objective stated that the Department would, "Use efficient and effective corporate management systems and approaches to guide decision making, streamline and improve operations, align resources and reduce costs, improve the delivery of products and services, and evaluate performance."

Program Goals

- Mitigate the impacts on workers and communities from contractor work force restructuring at defense sites, and assist community planning for all site conversions, while humanely and cost-effectively managing the transition to the reduced work force that will better meet ongoing mission requirements through the application of best business practices.
- Reduce the cost of managing the Department of Energy inventory of underutilized assets through the application of private sector business principles to the Department's asset disposition efforts.

Program Objectives

- *To facilitate work force planning by Department contractors* — develop a process and tools for projecting contractor work force requirements at each site on the basis of mission, budget estimates, and work force skills, to assure that priority missions can be accomplished safely and efficiently.
- *To restructure the Department of Energy contractor work force* — establish work force restructuring policy, coordinate and implement work force restructuring, and evaluate the outcomes of work force restructuring plans consistent with section 3161 of the National Defense Authorization Act for Fiscal Year 1993, the contract reform initiative, and other Departmental policies.
- *To provide fair treatment to workers who must be displaced throughout the Department* — within budget constraints, provide benefits to affected workers, such as: incentives or other options to minimize involuntary layoffs; adequate advanced notification; retraining for other employment and

rehiring preference to displaced workers where practicable; relocation assistance and outplacement assistance; and local community impact assistance, consistent with best business practices.

- *To manage contractor labor relations* — establish policy for contractor labor relations, oversee the collective bargaining process, and assist field organizations in labor/management relations.
- *To assist community transition* — develop policies for community transition, and assist communities affected by Departmental changes by facilitating their economic development planning and plan implementation activities to produce alternative replacement employment sources in affected communities.
- *To identify and dispose of assets that are excess or unneeded for current Department missions* — develop asset inventory procedures, develop and implement pilot projects designed to accelerate asset dispositions, establish a DOE-wide asset management recovery and disposition program, and work with field and program managers to develop cost-effective methods for asset disposition.

Performance Measures

- Through effective work force planning, the number of jobs vacated through incentivized and non-retirement separations that have to be filled by employees from outside the DOE complex will be 2 percent or less.
- Limit involuntary separations to 60 percent of all separations while assuring maintenance of the essential work force skills mix.
- At least 60 percent of separated workers seeking new jobs are reemployed within two years of separation.
- Manage gross adjustments in the contractor work force affecting an estimated 3,000 to 5,000 workers in FY 2000. Provide separation benefits at an average cost per separated worker of less than $25,000 (basic separation costs would be paid by the affected program and enhanced benefits would be paid by the worker transition program). Overall reductions in the work force are estimated to be approximately 2,000 positions.
- Achieve annual cost savings from compensation for separated workers that is at least three times the one-time cost of separation.
- Through community assistance, create or retain about 1,700 jobs in FY 2000. Maintain the average cost per job at less than $10,000. The cumulative number of jobs created or retained will be 15,000 - 20,000 by the end of FY 1999 and 20,000 - 30,000 by the end of FY 2000.
- Twenty-five collective bargaining agreements are renegotiated or renewed with no unresolved labor-management disputes.
- Implement initiatives to accelerate asset conversion and reuse that will result in more than $1 billion in long-term savings to the Department and facilitate economic diversification of local communities.

Significant Accomplishments and Program Shifts

- At the Mound Facility, an agreement to expedite the plant closure was completed. Dependent upon appropriations, funding will be provided that will allow the Department to close and dispose of the plant three years earlier than planned and save between $150 - 200 million in operating costs.
- The program successfully managed the reduction of about 46,000 contractor personnel in six years (Fiscal Year 1993 - 1998).
- Nearly two thirds of separations to-date have been voluntary, with an average (including workers separated through attrition) separation cost of approximately $18,000 per position. When attrition is excluded, average separation costs have been approximately $23,000.
- Based on the average cost per contractor worker, total annual recurring savings to-date for the 46,000 prime contractor positions eliminated is in excess of $3.3 billion for salaries and benefits.
- Utilized the Community College Network Program (C2Net) to tailor new retraining programs for displaced workers at sites, such as, Portsmouth, Ohio, Grand Junction, Colorado, and Amarillo, Texas.
- Used oversight and intervention to forestall or resolve serious conflicts in labor and management relations at Pantex, Argonne, Mound, Los Alamos, and Fernald.
- Provided local impact assistance to affected communities that cumulatively created or retained over 16,000 private sector jobs through the end of FY 1998, with an anticipated additional 17,000 jobs by the end of the year 2001. One job has been created or retained to date for each $9,500 provided to affected communities by the program. This figure compares favorably with the experience of other Federal agencies in similar efforts.
- Achieved $ 32.89 million in total proceeds returned to the Treasury through the completed Asset Sales Initiative.

[a]Includes $3,500,000 Program Direction costs and $1,247,000 not allocated during FY 1998

[b]Includes $3,900,000 Program Direction costs.

[c]Includes $3,500,000 Program Direction costs and $14,500,000 not designated at this time.

[d]An additional $20,000,000 in a reimbursable account established by United States Enrichment Corporation (USEC) for worker and community transition activities is not included in this table for FY 1999 and FY 2000. The funds are designated for Paducah and Portsmouth which are administered by the Oak Ridge Operations Office.

Site Description

Kansas City Field Office

The Kansas City Field Office is a former weapons facility that experienced a significant down-sizing in FY 1998. Funding was provided during that fiscal year for work force restructuring. But, because of the size and relative health of the Kansas City economy, no community transition funding was requested.

Los Alamos National Laboratory

The Los Alamos National Laboratory has experienced significant work force adjustments in past fiscal years. Because of its isolated location, the Laboratory has constituted a significant portion of the local economy. Worker transition funding was provided to satisfy current needs for worker benefits: Community transition funding has been provided to assist the local community in diversifying their economic base while taking advantage of the human resources of the facility. At this time, the community reuse organization is not expecting a need during FY 1999 or FY 2000. However, their estimate may change depending upon events that occur in the future.

Pantex Plant

The Pantex Plant is located in Amarillo, Texas, and has been dismantling nuclear weapons. Worker transition funding has been provided to satisfy the existing need to pay worker benefits. Community transition funding has been provided to assist the affected community in the planning to diversify their economy. Although their planning has not yet progressed to the point that they are prepared to estimate a need for community assistance, the CRO may request community transition funding in the future, possibly during FY 1999 or FY 2000.

Sandia National Laboratory

Worker transition funding was provided to the Sandia Laboratory in order to satisfy the benefit payments of workers. Community transition funding was provided to help the affected community plan to diversify the local economy. Those planning efforts are not yet completed. Therefore, the CRO for the Sandia Laboratory may later request funding for FY 1999 and/or FY 2000.

Headquarters

Any funding which has not been committed is reserved at headquarters. Since the work force restructuring is counter-cyclic, i.e., it has the greatest activity when other budgets are decreasing and vice versa. Until the other program budgets are known, it is not possible to estimate where work force restructuring funding will be needed. Estimates have been made for FY 1999 based upon appropriations for other programs. However, the majority of the work force restructuring funding for FY 2000 is now

shown as being at Headquarters because the sites that will be experiencing work force restructuring are unknown at present.

Community transition is also counter-cyclic but is a longer-term process which enables better estimates of anticipated needs. Funding allocations in this program depend upon the submission of adequate proposals from the local community. Although estimates of funding have been made for FY 2000, the allocation of estimated funding among sites will depend upon the relative merits of program proposals not yet submitted and the local communities' management of their respective programs. Since both of these factors are currently unknown, many of these estimates are subject to change.

Idaho Operations Office

The funding for the Idaho Operations Office is primarily to satisfy the Department's obligations under a legal settlement for the nuclear spent fuels program. Under that settlement, the Department agreed to provide $30 million to the State of Idaho over five calendar years, dependent upon appropriations being adequate. The Department made the first payment of $3 million in FY 1996 followed by $6 million in successive fiscal years. Funding will be complete with a $3 million payment to be made in FY 2001 (calendar year 2000).

Nevada Operations Office

The funding for the Nevada Operations Office was provided to the CRO to diversify the regional economy to develop replacement industry that can utilize the skills of the workers affected by downsizing. During FY 1998, the Department provided funding for a set of projects totaling $5 million. The CRO does not expect to request additional funding during FY 1999 or FY 2000 but changing circumstances could cause them to revise their estimates.

Lawrence Livermore National Laboratory

Work force restructuring assistance was provided to the Lawrence Livermore Laboratory to satisfy the need for benefits for workers affected by downsizing. At this time, no funding needs are estimated for FY 1999 or FY 2000.

Fernald National Laboratory

The Fernald Laboratory has only recently experienced work force restructuring. Therefore, the need to develop alternative employment in a diversified economy had not previously been a concern. With recent work force restructuring actions and the intention to completely close and demolish the facility in the future, replacement employment has become important. Because reindustrialization of the site will not be possible, all new employment opportunities will need to come from hiring outside the Fernald facility at other businesses in the community or new businesses that open. The funding for FY 1999 and FY 2000 is for the purpose of creating or maintaining jobs within the Fernald Laboratory community.

Mound Area Office

The FY 1999 and FY 2000 funding for the Mound Facility is to honor the Department's commitment, contingent upon appropriations, to accelerate the transfer of the entire facility out of the Department's ownership. The local community reuse organization would then use the facility to attract replacement industry to employ former workers. The Department would experience significant savings of $150 - 200 million since it would be saved having to pay operating costs three years earlier than previously planned.

Oak Ridge Operations Office

The funding for the Oak Ridge office includes both worker and community transition funding. The work force restructuring funding included more than $2 million in FY 1998 to pay the benefits of workers affected by downsizing. The FY 1999 budget includes an additional $2 million for such purposes with up to 1000 workers estimated to be affected by restructuring during FY 1999. The community transition funds are to assist in attracting replacement industries for this latest group of displaced workers. An important element of the replacement industries is the reindustrialization program. This program consists of an effort to attract industries that can use excess Department of Energy facilities and equipment. The reindustrialization program will reduce the Department's maintenance costs as well as provide similar employment using familiar equipment for former workers.

Paducah Site Office

On June 30, 1998, the United States Enrichment Corporation (USEC) signed a two-year agreement with the Department to provide $20 million reimbursable account for work force restructuring and community transition activities similar to those at other sites. The $20 million will provide for the expected cost of work force restructuring and a portion of the expected costs for community transition. The funding would be shared with the Portsmouth facility.

The funding within FY 1999 and FY 2000 will be from the USEC account. If funds become available, some other allocations for community transition may be possible.

Portsmouth Site Office

On June 30, 1998, the United States Enrichment Corporation (USEC) signed a two-year agreement with the Department to provide $20 million in a reimbursable account for work force restructuring and community transition activities similar to those at other sites. The $20 million will provide for the expected cost of work force restructuring and a significant portion of the expected costs for community transition. The funding would be shared with the Paducah facility.

The funding within FY 1999 and FY 2000 will be from the USEC account. If funds become available, some other allocations for community transition may be possible.

Richland Operations Office

The funding for the Richland Office includes $2 million for work force restructuring activities during FY 1999 to provide enhanced benefits for up to 1000 workers affected by restructuring activities. The estimated needs for community transition is $4 million in FY 1999 and up to $5 million could be provided in FY 2000. This funding will assist the local community reuse organization in further diversifying the economy. An important element of the effort to diversify the economy includes reindustrialization of the Hanford site. In this program, the CRO seeks to attract industries that can use excess Department of Energy facilities and equipment. The reindustrialization program will reduce the Department's maintenance costs as well as provide similar employment using familiar equipment for former workers.

Rocky Flats Office

The Rocky Flats Office experienced a work force downsizing in FY 1998 that required the use of almost $5 million of the funding indicated for that year. The balance of the funding was for the community reuse organization to assist in diversifying the local economy. During FY 1999, the estimated need is for funding for enhanced benefits for about 500 - 700 workers. At this time, the CRO has not estimated any need for community transition funding. However, circumstances may change and funding may be requested at some time in the future.

Savannah River Operations Office

Most of the funding for the Savannah River Operations Office is for work force restructuring activities. The balance is for community transition. However, circumstances may change and additional community transition funding may be needed.

Worker and Community Transition

Mission Supporting Goals and Objectives

The activities of the work force restructuring program establish policy for, coordinate implementation of, and evaluate the outcomes of work force restructuring consistent with section 3161 of the National Defense Authorization Act for Fiscal Year 1993, the contract reform initiative, best business practices and other Departmental policies as well as Objectives CM-2 and CM-3 of the Strategic Plan. The functions of the work force restructuring program include providing guidance to DOE field management for developing work force restructuring plans; assuring adequate advance notification for planned reductions; reviewing and approving voluntary incentive programs to encourage workers with redundant skills to separate; reviewing draft work force restructuring plans prior to circulation for stakeholder review and comment; approving necessary involuntary separations; providing enhanced benefits to former defense program contractor employees being separated; and submitting final work force restructuring plans to the Congress. Based on Secretarial direction, work force restructuring objectives are considered for reductions that exceed a threshold of 100 workers at any site, including those not specifically covered by section 3161, in a single year. This activity assures that necessary work force reductions are conducted in a manner that encourages voluntary separations, assists displaced workers in securing new employment, provides basic benefits for a reasonable transition period, and is consistent with cost guidance and best business practices. The activity makes critical priority decisions to match these objectives with fiscal constraints.

Work force planning assures that contractor work force restructuring is conducted in a manner that assures that critical skills for ongoing mission requirements are retained, enhances efficiency, and accurately forecasts mission performance implications of potential future budget reductions. This goal is being achieved through the development of an integrated work force planning process based on a uniform work force data base and classification system for Department contractor employment. It supports the Departmental objective of realigning efforts to areas of maximum efficiency without jeopardizing critical task assignments.

Management of contractor labor relations establishes policy for such activities, oversees the collective bargaining process, and assists field organizations in labor/management relations. These activities promote an improved working relationship between labor and management in the Department's contractor work force. The result is uniform application of relevant labor standards, increased productivity, enhanced safety and security, and a reduction in disruptive labor disputes. The function also helps to implement the contract reform initiative, outsourcing policy and other elements of strategic alignment.

Section 3161 of the FY 1993 Defense Authorization Act establishes an objective for the Department to "provide local impact assistance to communities that are affected by the restructuring plan" and to coordinate such assistance with other federal programs. This activity also provides an informational clearinghouse to assist local community economic development planning; identifies potential sources of both public and private funding outside the Department; and, on a high priority basis, funds projects that have a high probability of producing positive results for displaced workers and their affected communities. The Office has established criteria for evaluating community transition funding proposals and has signed an interagency agreement with the Department of Commerce to utilize its independent

expertise to evaluate and approve proposals. The Department, in close cooperation with parties in the affected communities, also seeks to utilize excess Departmental assets to help create economic activity and produce replacement employment for workers displaced by work force restructuring plans.

The mission of the asset management program is to develop a corporate strategy for the disposition of materials and assets in response to new missions for the Department along with a declining budget and resultant reductions both in the number of persons employed by the Department of Energy and the size of the physical plant. Elements of the strategy include the development of guidance and managing the implementation of the asset management program, assisting program managers in reducing the real and personal property holdings of the Department and in responding to new Departmental missions. The program is also developing procedures for asset sales and transfers, leasing and donation procedures, and material and asset management programs in field and program offices. Asset management program implementation actions now are focusing on pilot project proposals, such as recovery of precious metals from weapons components, electronic scrap recycling and reuse, sale of heavy water, facilities reuse, and the disposition of unneeded assets, which are designed to provide a financial return to the Federal government while reducing the overhead expenses of the Department through the disposition of the assets as well as stimulating regional and local economic development. The funding for the asset management program is included in program direction.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000[a]	$ Change	% Change
Work Force Restructuring	18,054	9,400	9,400	0	0.0%
Community Transition Assistance	39,605	16,600	17,100	+500	3.0%
Total, Worker and Community Transition	57,659	26,000	26,500	+500	1.9%

[a]FY 2000 estimates are preliminary. Because the Worker and Community Transition Program is counter-cyclic, more exact estimates will depend on other program funding during FY 2000.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Work Force Restructuring			
Reviewed and approved work force restructuring actions affecting about 3,000 prime contractor positions during FY 1998. Review and approve work force restructuring plans and actions that could affect 3,000 to 5,000 workers in both FY 1999 and FY 2000, based on currently projected Departmental activities. Affected sites — as accurately as they can be determined at present — are addressed in the discussion of site funding. Through language in the FY 1998 appropriations legislation, funding under authority of Sec. 3161 provides only for the enhanced benefits of separations.			
The funding shown does not include the enhanced benefits for workers at the gaseous diffusion plants at Paducah and Portsmouth until after June 30, 2000. Up to that date, those benefits will be paid from a reimbursable account provided by the United States Enrichment Corporation (USEC).			
Coordinate work force planning activities to retain critically needed skills to meet ongoing missions in the face of an additional adjustments in the contractor work force (on top of the 29% reduction that has occurred between FY 1994-97), and to review and fund requests for enhanced separation benefits from field offices.			
Continue to assist field offices in maintaining early and open communication between labor unions and management and in the conduct of negotiations.			
The elements of work force planning and labor negotiations will impact the achievement of the performance measures discussed earlier. For work force restructuring, the measures include outside hiring levels, number of involuntary separations, reemployment of workers, and reducing the size of the work force while keeping separation payments within a target level.			
The proposed level of funding considered both the estimated number of workers to be separated and the individual cost of each worker	18,054	9,400	9,400
Total, Work Force Restructuring	18,054	9,400	9,400

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Community Transition Assistance			
Approved community transition projects which have created or retained approximately 16,000 jobs as of the end of FY 1998. About 3,300 of the jobs created or retained resulted from FY 1998 funding. Additional funding is expected to create about 550 jobs in FY 1999, and 350 in FY 2000. (See also jobs created in the State of Idaho and at the Mound Facility, discussed below)	33,605	5,600	6,100
Under the terms of a legal settlement with the State of Idaho, the Department is committed to provide a total of $30 million over the calendar years 1996 - 2000, contingent upon appropriations, to the State of Idaho. This funding is expected to create about 600 jobs per year.	6,000	6,000	6,000
At the Mound Facility, the Department has committed to providing $15 million over three years, contingent upon appropriations, to accelerate the reuse of the site following its sale. The funds would be used in conjunction with other grants to perform site improvement work which would make the Mound Facility more marketable. This funding is expected to create a total of about 1,500 jobs, with about 500 jobs each fiscal year to result from the funding. The Department would save $150 - 200 million by this early closure because it could stop paying the operating costs three years earlier than had been planned.	0	5,000	5,000
Total, Community Transition Assistance	39,605	16,600	17,100
Total, Worker and Community Transition	57,659	26,000	26,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Community Transition Assistance	
■ If the funding required for work force restructuring activity is less than what is presently assumed, the Department would propose to make the difference available for community transition	+500
Total Funding Change, Worker and Community Transition	+500

Worker and Community Transition Program Direction

Mission Supporting Goals and Objectives

Program direction provides funding for administrative support to ensure that all operations are conducted in the most effective and efficient manner. This element also provides for the personnel and contractual services of all federal management and administrative personnel to carry out the missions of the Office of Worker and Community Transition at Department of Energy Headquarters and Field Offices.

Program direction has been grouped into four categories:

Salaries and Benefits provides for all the salaries, other benefits, e.g., employer contribution to retirement, employer contribution to health benefits and awards for superior service. The employees funded by this category perform strategic planning for the program, integrate internal and external policies and directives; represent the Office both within and outside the Department; provide technical direction and guidance for programs and projects; perform program assessment; and exercise internal controls.

Travel is provided for the traveling and per diem expenses of program staff in the performance of their official duties. Under certain circumstances, travel expenses of non-government personnel or government personnel from other programs may be compensated if they are serving a mission of the Office. Specifically, staff travel to affected communities to provide technical and program assistance to field offices, contractor employees, and community representatives and conduct program assessments. They also participate in meetings, conferences, and training selected to increase their professional expertise and program effectiveness.

Support Services for the Office of Worker and Community Transition consists of the payment for management support services of non-government personnel. These personnel assist the staff of the Office of Worker and Community Transition in accomplishing their missions by providing technical support, performing or assisting in program analyses, and assisting in the subsequent preparation of reports. The support services personnel also provide general program management functional support.

Other Related Expenses includes the necessary materials, services, utilities, and office space needed to conduct the program in an efficient manner. The major portion of this category consists of the items included in the working capital fund. This working capital fund includes such items as, office space; telephones; printing and duplicating services; and computer network connections and technical support. The other portion of other expenses includes procurement of supplies for the conduct of office functions.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Headquarters

Travel	75	85	85	0	0.0%
Support Services	776	932	572	-360	-38.6%
Other Related Expenses	521	581	593	+12	+2.1%
Total, Program Direction	3,500	3,900	3,500	-400	-10.3%
Full Time Equivalents	27	24	22	-2	-8.3%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Staff oversaw actions to achieve approximately 5,000 prime contractor reductions in FY 1998 and will oversee 3,000 to 5,000 employment changes in FY 1999 and FY 2000. They will work to streamline the approval of work force restructuring plans and develop and implement policies to integrate contract reform mechanisms. They will provide oversight of upcoming labor negotiations at four sites. They will continue efforts to mitigate impacts on communities affected by work force reductions. Staff will develop a corporate asset and privatization program during each of FY 1999 and FY 2000.			
During FY 1998, the Asset Management Program staff completed an inventory of unneeded Departmental materials and assets to be made available for sales or transfers. The Asset Management Program has the goal of realizing $15 million in asset sales during each of FY 1998, 1999, and 2000.	2,128	2,302	2,250
Travel			
Travel will enable staff to provide technical assistance to field offices on work force planning and community transition. Staff will also be able to assist field offices in labor negotiations, conducting program assessments, and providing technical assistance in asset management. Training is also included in this cost category. The increased funds would allow a staff member to enroll in the Federal Executive Institute training program during each of FY 1999 and FY 2000	75	85	85

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Support Services			
A major element of technical support during FY 1999 will consist of assisting the Office of Worker and Community Transition in implementing the new Work Force Information System (WFIS). This system will allow the department and its site management contractors to assess the skills of the present work force in comparison to projected needs and match the skills of workers identified for separation with the needs of vacancies Overall, this system should lead to better personnel management, reduce separation costs, and contribute to retaining important skills.			
The management support includes performing general management functions and conducting analyses and assessments and assisting in the preparation of the subsequent reports.	776	932	572
Other Related Expenses			
The amount in this category consists mainly of the working capital fund. Space rental, telephones, copiers and printing, computer support, general office supplies, and mailing costs are included in this fund. Other expenses are for items not encompassed by the working capital fund, e.g., computer software and professional journals.	521	581	593
Total, Program Direction	3,500	3,900	3,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Expenses	
■ Decrease of $20,000 in Salary and Benefits is due to the reduction in FTE's partially offset by a projected pay increase	-52
Travel	
■ No change is expected in Travel	0
Support Services

Fissile Materials Control and Disposition

Fissile Materials Disposition

Program Mission

In the aftermath of the Cold War, significant quantities of weapons-usable fissile materials (primarily plutonium and highly enriched uranium) have become surplus to national defense needs both in the United States and Russia. The Department of Energy's (DOE) Office of Fissile Materials Disposition is responsible for implementing a path forward for the storage of weapons-usable fissile materials and the disposition of fissile materials declared surplus to national defense needs. The efforts undertaken by the Office of Fissile Materials Disposition contribute to the Administration's approach to reduce the nuclear danger and the threat of proliferation. The Department will irreversibly dispose of the Nation's surplus plutonium and highly enriched uranium, reduce the number of sites where surplus weapons-usable materials are stored, and provide key negotiation and technical support for efforts to attain reciprocal actions for the disposition of surplus Russian plutonium.

In January 1997 the Department issued a Record of Decision covering the storage of all weapons-usable fissile materials and the disposition of surplus plutonium. Key elements are:

Future Storage
The Department is reducing the number of sites where plutonium is stored through a combination of storage and disposition alternatives. Surplus plutonium pits from Rocky Flats and SRS have been moved to Pantex to be stored, along with other surplus pits residing at Pantex, in upgraded facilities.

In August 1998, the Department issued an amended Record of Decision to remove all surplus non-pit plutonium from Rocky Flats by 2002, in accordance with the Department's June 1998 Accelerated Closure Pilot Project that calls for closing the site by 2006. The plan calls for the Department to transfer surplus non-pit plutonium from Rocky Flats to Savannah River for storage in a modified building 105-K. The expanded storage vault in the Actinide Packaging and Storage Facility at SRS will be used to store the non-pit material to be transferred from the Hanford Site. The amended Record of Decision is expected to result in a cost reduction to the Department of approximately $1.3B by eliminating plutonium storage at the Rocky Flats and Hanford sites several years sooner than originally planned.

In FY 2000 DOE will begin shipment of the surplus non-pit material from Rocky Flats to building 105-K at SRS. DOE will complete upgrades for storage of surplus plutonium pits at the Pantex Plant and begin storage of surplus pits in upgraded facilities.

Plutonium Disposition
The Department is proceeding with a hybrid plutonium disposition strategy that includes immobilization of surplus weapons plutonium with ceramic material and burning of surplus plutonium as mixed oxide (MOX) fuel in existing domestic commercial reactors to achieve the spent fuel standard. The Department plans on immobilizing non-pit surplus plutonium which is not suitable for use in MOX fuel without extensive purification, but reserves the option to immobilize the entire 50 metric tons (mt) of

declared surplus. The Administration will not construct new facilities for disposition of U.S. plutonium unless there is significant progress on plans for plutonium disposition in Russia. The success of these efforts will directly contribute to national security, enhance cooperation with Russia, and attain reciprocal action for the disposition of Russian surplus plutonium.

In FY 2000 DOE will begin design of an Immobilization and Associated Processing Facility; complete Title I and initiate Title II design of a full-scale Pit Disassembly and Conversion Facility and a MOX Fuel Fabrication Facility; continue testing of the pit disassembly and conversion prototype for disassembling plutonium weapons components and converting the plutonium to stable forms suitable for international inspection and disposition; establish the technical baseline for ceramic immobilization plant process; and initiate a MOX lead test assembly program. These implementation efforts will directly contribute to the advancement of U.S. and international nonproliferation interests and to improving the cost-effectiveness of the Department's management of stockpiles of surplus fissile materials.

Uranium Disposition

The Program's efforts will continue to focus on implementing the July 1996 Record of Decision to disposition up to 85% of the surplus highly enriched uranium (HEU) by down-blending it with other uranium materials to commercially-usable low enriched uranium, thereby advancing U.S. nonproliferation goals, reducing storage and security costs, and providing revenues to the Treasury from the commercial sale of these surplus assets over time. The remaining surplus HEU, originally determined to be in forms unsuitable for commercial use, was to be down blended and disposed of as waste. Subsequently, it was determined that the material is in forms suitable for down-blending and sale or suitable for disposition as waste without down blending.

To date, approximately 174.3 mt of HEU have been declared excess to national security needs. Some of that material is in the form of spent fuel, and not available for down-blending. Because of the various forms of HEU and the availability dates from weapons dismantlement and site cleanup operations, blending would take place over an estimated 15 to 20-year period. Title to 63 mt has already been transferred to the United States Enrichment Corporation (USEC). DOE expects that an additional 33 mt of off-specification HEU will be down blended and transferred to the Tennessee Valley Authority (TVA). (Additional quantities would be available after that date.) Ten mt of high quality excess HEU (currently under IAEA safeguards at the Oak Ridge Reservation) may also be down blended for commercial sale resulting in receipts starting in FY 2003.

In FY 2000 DOE will continue to transfer surplus HEU to USEC for blend down; continue plans and initiate testing for disposition of 33mt of off-specification HEU by blend down and irradiation in TVA reactors (generating receipts for the U.S. Treasury from TVA's savings in fuel costs); plan for the blend down and sale of 10mt of HEU currently under IAEA safeguards (generating receipts to partially offset future budget requests); and issue a draft environmental impact statement on disposition of approximately 1mt of U-233.

Cooperation and Reciprocity with Russia and Other Nations
In addition to domestic-based activities, FY 2000 efforts will focus on work with Russia on programs to facilitate the disposition of surplus Russian weapons plutonium. Plans are to implement a U.S./Russian accord (currently being negotiated) for disposition of excess weapons plutonium with participation from other nations. A series of collaborative disposition efforts which include analyses and small-scale tests and demonstrations of plutonium disposition technologies will continue. Technical areas being jointly evaluated include: burning the surplus plutonium in reactors; immobilization of plutonium in solid matrices; and stabilization of liquid and other forms of nuclear materials. The Department's work will directly facilitate progress with Russia in the safe, secure, verifiable disposition of surplus Russian plutonium in a manner that helps preclude its reuse in nuclear weapons.

Program Goal

Reduce the global nuclear danger by eliminating inventories of surplus weapons-usable fissile materials through strategies and implementing actions to provide safe, secure, cost effective and inspectable storage of U.S. weapons-usable fissile materials, and dispose of these surplus materials in accordance with terms set forth in agreements between the United States and Russia.

Program Objectives

- *To Provide a Department-wide Storage Configuration for Surplus Weapons-Usable Fissile Materials that is Safe, Secure, Environmentally Sound, Inspectable and Cost-effective* - Strategies are: (1) Eliminate the storage of separated, weapons-usable plutonium at the Rocky Flats Environmental Technology Site and the Hanford Site; (2) Utilize existing facilities and infrastructure to the extent practical and upgrade, as necessary, these facilities to meet safety, security, and inspection requirements; and (3) Design and construct a facility for surplus non-pit materials at the Savannah River Site (EM Project 97-D-450) and upgrade buildings for surplus pit materials at Pantex (MD Project 97-D-140). Continue the storage of surplus plutonium at the Idaho Engineering and Environmental Technology Site and Los Alamos National Laboratory, pending disposition.

- *To Eliminate the Stockpile of Surplus Uranium* - Strategies are: (1) Decrease site inventories of surplus highly enriched uranium and associated management costs by down blending HEU for subsequent sale; (2) Engage the private sector, to the extent practical, to process and disposition surplus highly enriched uranium, thereby developing the industrial infrastructure to accommodate the blend down of increased quantities of surplus HEU to commercially-usable low enriched uranium over time; and (3) Where practical, generate revenues from the disposition of HEU for the Treasury and to partially offset future budget requests.

- *To Eliminate the Stockpile of Surplus Weapons-Usable Plutonium* - Strategies are:
1) Demonstrate the early feasibility of an integrated process for the disassembly and conversion of plutonium from weapons components into forms suitable for international inspection and disposition; (2) Design, construct and operate necessary facilities to disposition surplus plutonium; (3) Rely on commercial industry for disposition activities to the extent practical; and (4) Decrease inventory of surplus plutonium and associated management costs.

- *Conduct Joint Technical Activities with Russia and Other Nations in Support of U S Efforts to Encourage Russia to Dispose of Stockpiles of Excess Weapons Plutonium* - Strategies are: (1) Support government-wide efforts to negotiate bilateral or multilateral agreements necessary to implement the disposition of U.S. and Russian plutonium no longer required for defense purposes; (2) Conduct jointly with Russia tests and demonstrations of plutonium disposition technologies; and (3) Contribute to an international effort to implement plutonium disposition in Russia.

Performance Measures

Future Storage

- Complete the upgrade of storage facilities at the Pantex Plant for storing surplus plutonium pits.

Uranium Disposition

- Transfer 7mt of the 50mt of surplus HEU to USEC for downblending to LEU for sale and subsequent use in commercial nuclear reactors.

Plutonium Disposition

- Establish technical baseline for ceramic immobilization plant process.
- Complete Title I and initiate Title II design for the Pit Disassembly and Conversion Facility.
- Complete Title I and initiate Title II design for the MOX Fuel Fabrication Facility.
- Initiate Title I design for the Immobilization and Associated Processing Facility.

Cooperation and Reciprocity With Russia and Other Nations

- Continue small scale tests and demonstrations in accordance with the U.S./Russian Scientific and Technical Cooperation Agreement.
- Begin to implement a bilateral agreement with Russia for disposing of plutonium in Russia.

NEPA

- Issue a draft environmental impact statement on disposition of U-233 and conduct public outreach, including public meetings.

Significant Accomplishments and Program Shifts

Future Storage

- Completed shipment of surplus weapons pits from Rocky Flats to Pantex.
- Completed shipment of surplus weapons pits from SRS to Pantex.
- Accelerated the timetable for reducing the number of sites where plutonium is stored.
- Completed design for a future storage facility at SRS for surplus non-pit materials and issued a Request for Proposal (RFP) for construction of the Actinide Packaging and Storage Facility (EM Project 97-D-450).

Uranium Disposition

- Signed a Memorandum of Agreement with USEC for the transfer and blend down of 50mt of surplus HEU.
- Began shipping HEU to USEC's blending subcontractor.
- Prepared a Project Plan for the transfer and subsequent blend down of approximately 33mt of surplus off-specification HEU to the Tennessee Valley Authority (TVA).
- Blended down the first installment of off-specification HEU for lead test assemblies for TVA.

Plutonium Disposition

- Pit Disassembly and Conversion
  - Started operation of the pit disassembly and conversion prototype.
- Immobilization
  - Established baseline immobilization form.
  - Completed conceptual design of the Immobilization and Associated Processing Facility.
  - Immobilized plutonium waste form included in repository technical baseline program.
- MOX/Reactor
  - Issued an RFP, solicited and evaluated proposals for the selection of a private contractor consortium to provide MOX fuel fabrication and irradiation services.

- Initiated tests of MOX fuel made from weapons-derived plutonium in the Advanced Test Reactor (ATR) in Idaho.

- Conducted preliminary experiments on the effects of gallium on fuel performance.

Cooperation and Reciprocity With Russia and Other Nations

- Negotiated a Scientific and Technical Cooperation Agreement with Russia, signed by the Vice President of the United States and the Russian Prime Minister, to proceed with tests and demonstrations for surplus plutonium disposition up to and including pilot scale.

- Supported negotiations which resulted in a Joint Statement of Principals for Management and Disposition of Plutonium Designated as No Longer Required for Defense Purposes with Russia, signed by the President of the United States and the President of the Russian Federation.

- Initiated feasibility studies on a plutonium conversion system in Russia.

- Initiated testing in Russia of processes for converting plutonium metal to specification oxide.

- Continued small-scale tests in Russia of vitrification and performed analysis of using MOX fuel in Russian reactors.

- Started discussions on U.S./Russian plutonium disposition accord.

NEPA

- Issued an amended Record of Decision to remove and ship all weapons-usable surplus non-pit plutonium from Rocky Flats to SRS by 2002, and remove and ship Hanford surplus weapons-usable plutonium to SRS during 2002 through 2005, in accordance with the Department's June 1998 Accelerated Closure Pilot Project.

- Prepared analyses and issued a draft environmental impact statement which identified preferred sites for the facilities for implementing the hybrid disposition approach for surplus plutonium disposition.

- Issued environmental assessments (EAs) on the operation of the pit disassembly and conversion prototype.

Site Description

Lawrence Livermore National Laboratory

The Lawrence Livermore National Laboratory (LLNL) serves as the lead laboratory in the development of technologies that will lead to immobilization of surplus plutonium materials into disposition forms that meet the spent fuel standard. LLNL develops technical and engineering data on the preferred ceramic plutonium form (using can-in-canister technology) to support facility design and qualification for repository disposal. LLNL supports the design of an immobilization facility which will contain systems for converting various incoming plutonium materials into a uniform oxide feed, blending the oxide feed with other materials into ceramic discs and placing these discs into small cans, which in turn are placed into a larger canister subsequently filled with high level vitrified waste. LLNL also performs research and development tasks and design support for the pit disassembly and conversion demonstration and full-scale facility. In addition, LLNL is conducting initial immobilization feasibility studies for possible disposition of surplus Russian plutonium.

Los Alamos National Laboratory

The Los Alamos National Laboratory (LANL) serves as the lead laboratory in the development and demonstration of a weapons pit disassembly and conversion process. This process establishes a basis for conversion of all surplus weapon pit types into an oxide powder form suitable for inspection and disposition. The Advanced Recovery and Integrated Extraction System (ARIES) at LANL serves as the current system demonstration project. A production-scale facility will be supported through the development of a knowledge base from the demonstration facility activities and through LANL's assistance in the procurement of design services for the full-scale facility. The pit disassembly and conversion team consists of LANL, LLNL, and Sandia National Laboratory (SNL). LANL has the lead on MOX fuel technology supporting Oak Ridge National Laboratory (ORNL) in the program's efforts to transform the plutonium powder produced from surplus weapons pits to commercial spent nuclear fuel. LANL performs a spectrum of research and development tasks and technical support for a MOX fuel fabrication facility which will convert the plutonium oxide powder to MOX fuel suitable for use as a fuel source in U.S. commercial nuclear reactors. LANL is capable of producing MOX fuel for reactor

test demonstration purposes. LANL also serves as the lead for the design of a plutonium conversion line in Russia which will convert surplus Russian plutonium from metal to oxide for fabrication into MOX fuel or other disposition approaches.

Oak Ridge National Laboratory

The Oak Ridge National Laboratory (ORNL) serves as the lead laboratory in the development of technologies that will enable disposition of surplus plutonium materials by burning as MOX fuel in commercial reactors. ORNL performs research and development on gallium effects on MOX fuel, develops technical and engineering data on fabrication of domestic lead fuel assemblies to reactor specifications, and conducts reactor licensing. ORNL also serves as the lead for the Parallex heavy water reactor (CANDU) fuel and irradiation experiments and the development of gas reactor technology in Russia for plutonium disposition Physics support is also provided for analysis of Russian VVER-1000 reactors for disposition of Russian plutonium. In addition, ORNL serves as the lead for U-233 disposition activities.

Savannah River Site

The Savannah River Site (SRS) provides technology support for immobilization of surplus plutonium in the areas of ceramic form development and immobilization process and equipment development. In addition, SRS provides support in disposition of off-specification HEU at TVA and disposition of U-233. SRS is the lead on the construction of the Actinide Packaging and Storage Facility (EM Project 97-D-450).

All Other Sites

The Argonne National Laboratory (ANL) and the Pacific Northwest National Laboratory (PNNL) provide support to LLNL by performing immobilization performance testing activities. The Y-12 Site and the Oak Ridge Operations Office serve as the lead for all HEU disposition activities. The Sandia National Laboratory (SNL) provides support for pit disassembly and conversion, Russian activities, and U.S. program integration activities. The Pantex Site provides support for upgrades for storage of surplus pit materials from Rocky Flats and SRS. The Nevada Operations Office (NV) contracts for repository analysis support associated with disposition technologies. The Federal Energy Technology Center (FETC) contracts for environmental analysis support for disposition technologies. The Chicago Operations Office (CHO) provides procurement support for the private contractor consortium to provide MOX fuel fabrication and irradiation services and the contractor to provide design services for the pit disassembly and conversion facility.

Operation and Maintenance

Mission Supporting Goals and Objectives

In the aftermath of the Cold War, significant quantities of weapons-usable fissile materials (primarily plutonium and highly enriched uranium) have become surplus to national defense needs both in the United States and Russia. The threat that nuclear weapons or materials could fall into the wrong hands through theft or diversion is a clear and present danger. The danger exists not only in the potential for proliferation of nuclear weapons, but also in the potential for environmental, safety and health consequences if surplus fissile materials are not properly managed. United States policy is to seek to eliminate, where possible, accumulation of stockpiles of highly enriched uranium and plutonium, and to ensure that where these materials already exist they are subject to the highest standards of safety, security, and international accountability.

This budget reflects funds necessary to continue implementing the consolidated storage and disposition of surplus weapons-usable fissile materials based upon the Department's January 1997 and August 1998 Records of Decision. Cost and schedule estimates for plutonium disposition are based on conceptual design estimates pending completion of detailed cost estimates following site selection, contract award for a consortium to provide MOX fuel fabrication and irradiation services, and Title I design for disposition facilities. Funds requested for implementation of HEU disposition are based upon the Department's July 1996 Record of Decision to blend down U.S. surplus highly-enriched uranium to low-enriched uranium for peaceful use as commercial reactor fuel. Key storage and disposition decisions are:

Future Storage

- **Rocky Flats**: Phase out storage of all weapons-usable plutonium at Rocky Flats Environmental Technology Site; move pits to Pantex during a two year period beginning in 1997, and move separated and stabilized non-pit materials to Savannah River during a two-year period beginning in 2000.

- **Pantex**: Upgrade facilities at Pantex to store surplus plutonium pits including pits from Rocky Flats and SRS.

- **Savannah River**: Upgrade building 105-K at SRS to store surplus, non-pit plutonium materials currently at the Rocky Flats Environmental Technology Site. The Department will begin moving the Rocky Flats material in 2000 and finish in 2002. Expand the planned Actinide Packaging and Storage Facility to be built at SRS to store surplus, non-pit plutonium materials currently at SRS and surplus non-pit plutonium materials from the Hanford Site pending the start of plutonium disposition. The Department will begin moving the Hanford material in 2002 and finish in 2005 (EM Project 97-D-450).[a]

Plutonium Disposition

The Department plans to dispose of quantities of surplus plutonium by immobilizing it in ceramic form surrounded by vitrified high level waste and by burning surplus plutonium as mixed oxide (MOX) fuel in existing, domestic reactors. While both approaches are viable for the disposition of surplus weapons usable plutonium, the program needs to optimize the technical approach and finalize cost estimates. Accordingly, the Department's plans include completing the necessary process development and small-scale technology tests, including "can-in-canister" immobilization tests and tests of MOX fuel fabrication and irradiation, and obtaining detailed cost proposals from industry.

For the immobilization approach, the Department needs to finalize the process for formulating plutonium in ceramic materials, the production processes, and the assessment of the impact of impurities on the surplus plutonium forms. Title I design of a Immobilization and Associated Processing Facility will begin in FY 2000.

For the MOX burning in existing reactors approach, the Department needs to complete the procurement process to select a private consortium to provide a MOX Fuel Fabrication Facility and irradiation services, and finalize experiments on potential impacts of other materials alloyed in plutonium pits on fuel performance. Title I design of a MOX Fuel Fabrication Facility will be completed early in FY 2000 and Title II will commence.

Other Disposition-Related Activities

- Complete design and operational testing of the processes that would be used to convert the plutonium from pits and other forms into oxide powder which would serve as feed material for both the disposition technologies as well as for international inspection. Title I design of a Pit Disassembly and Conversion Facility will be completed early in FY 2000 and Title II will commence.

- Continue disposition of surplus HEU by down-blending with other uranium materials to commercially-usable low enriched uranium and subsequent sale.

---

[a]EM Project 97-D-450, Actinide Packaging and Storage Facility (APSF), will be reevaluated and may not be constructed. If the reevaluation results in a decision not to move forward with APSF, the Department would develop an amended Record of Decision to address the movement of non-pit material from the Hanford Site to SRS and where it will be stored.

- Issue a draft environmental impact statement on disposition of U-233 . This effort will provide the initial step toward the ultimate disposition decision in accordance with Defense Board recommendations.

- Select sites for constructing and operating a pit disassembly and conversion facility, a MOX fuel fabrication facility, and an immobilization and associated processing facility. The Savannah River Site has been identified as the Department's Preferred Site for all three plutonium disposition. Final selection of the site(s) for plutonium disposition will be made in a Record of Decision scheduled for the spring of 1999.

- Continue and expand a range of U.S. and U.S.-Russian small-scale tests and demonstrations of plutonium disposition technologies is needed to build trust and cooperation and help prepare for reciprocal implementation of future plutonium disposition actions and agreements . This work will complete the technical knowledge base, identify viability of certain technologies, and demonstrate the practical usefulness of some of the technologies that might be employed for disposition of surplus weapons plutonium.

- Provide oversight and management of plutonium disposition activities in Russia as defined in the U.S./Russian accord currently being negotiated.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Future Storage	330	930	4,300	3,370	362.4%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Future Storage			
■ Prepare a site-specific storage facility conceptual design for pit materials and resolve issues related to storage operations	330	930	0
■ Begin operation of the upgraded storage area at Pantex for surplus plutonium pit materials (shared with Defense Programs)	0	0	4,300
Total, Future Storage	330	930	4,300
Disposition			
■ Highly Enriched Uranium (HEU) Disposition			
▸ Conduct surplus HEU planning, management, characterization, and project management	1,966	1,030	1,139
▸ Complete certification and procure new shipping containers for surplus HEU metal and oxides	943	915	565
▸ Carryout off-specification surplus HEU fuel project with TVA	556	900	1,050
▸ Provide support for transfer of 50mt of surplus HEU to USEC	489	450	499
■ U233 Disposition			
▸ Work on strategy, regulatory issues, environmental data collection for U233 disposition	500	900	2,535

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Plutonium Disposition			
▸ Complete construction and perform initial testing of the pit disassembly and conversion prototype system	19,120	0	0
▸ Continue Phase II testing of the LANL prototype system to disassemble and convert surplus plutonium pits to oxide	0	17,430	18,867
▸ Conduct repository analyses associated with disposition technologies	850	1,660	2,175
▸ Conduct performance testing and qualification of ceramic immobilization form, analyze first stage immobilization process and equipment development, and establish technical baseline for ceramic immobilization plant process	31,000	32,000	32,315
▸ Procure plutonium disposition services including fuel qualification, licensing, and initiate a lead test assembly program (irradiation tests)	20,516	25,594	35,772
■ Cooperation and Reciprocity With Russia and Other Nations			
▸ Continue small-scale tests involving burning the surplus plutonium in reactors and immobilization of plutonium in solid matrices; develop roadmap to support negotiating and financing plutonium disposition in Russia; and expenditures in the U.S. to implement a U.S./Russian accord for disposition of excess weapons plutonium (oversight and management)	11,700	24,945	24,945
▸ Conduct joint U.S. Russian development program of gas reactor technology to dispose of surplus Russian plutonium with $3M in Russia (Russia matches contributions or provides contributions in kind) and $2M in the U.S	0	5,000	0
Total, Disposition	87,640	110,824	119,862

(dollars in thousands)

Future Storage	
■ The increase is due to the start of operations at the upgraded storage facility at Pantex for surplus pit materials	+3,370
Disposition	
■ The increase is due to the start of U-233 disposition activities and procurement of lead test assembly equipment for the MOX fuel approach	+9,038
Technical Integration, Support & Associated Technologies	
■ The net decrease is due to a reduction in support services activities moved to Program Direction in accordance with Congressional direction	-399
NEPA Compliance	
■ The increase is for environmental analyses associated with the disposition of U233, partially offset by a reduction in support services outreach activities moved to Program Direction in accordance with Congressional direction	+1,385
Total Funding Change, Operation and Maintenance	+13,394

Russian Plutonium Disposition

Mission Supporting Goals and Objectives

In the aftermath of the Cold War, significant quantities of weapons-usable fissile materials have become surplus to national defense needs both in the United States and Russia. The Presidents of the United States and the Russian Federation affirm the intention of each country to remove by stages approximately 50 mt of plutonium from their nuclear programs, and to transform this material so that it can never be used in nuclear weapons. Both sides have agreed to develop strategies for the management and disposition of plutonium which will be described in a bilateral agreement currently being negotiated.

The Department of Energy's (DOE) Office of Fissile Materials Disposition is responsible for funding initial expenditures in the Russian Federation to implement a United States/Russian accord for the disposition of Russian excess plutonium. The $200M provided in FY 1999 represents initial funding required to provide United States assistance to Russia to begin implementing a plutonium disposition accord.

The U.S objective is to negotiate an accord specifying the technological approach and the facilities to be constructed in Russia in the initial phase of United States/Russia cooperation, which would have an annual capacity of two tons of plutonium per year. The two governments would further agree to a concept for a subsequent phase of cooperation that would increase the rate of plutonium disposition in Russia to 5 mt per year or more.

Detailed strategies will be defined in the accord. A detailed budget justification and obligation plan will be submitted to Congress once strategies are defined as negotiations progress. Obligation of these funds is contingent upon a signed accord and Congressional approval of the budget justification (in preparation). These funds will be expended in the Russian Federation over a 2-3 year period following completion of the accord. Beyond that, the Administration plans to seek financing for a portion of this program from the international community, both the private and public sector. If, however, the program requires additional future appropriations, the Administration is committed to funding adequate resources in the normal budget process.

The Department's work will directly facilitate progress with Russia in the safe, secure, transparent disposition of surplus Russian plutonium in a manner that precludes its reuse in nuclear weapons.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Russian Plutonium Disposition	0	200,000	0	-200,000	-100%
Total, Russian Plutonium Disposition	0	200,000	0	-200,000	-100%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Russian Plutonium Disposition			
■ Implement a U.S./Russian accord for disposition of excess weapons plutonium. Initial funds are primarily for design and to begin construction of Russian disposition facilities to be specified in the accord. The U.S. and Russia have not yet agreed on rates, techniques, and facilities for plutonium disposition, but discussions include a plutonium conversion facility and a MOX fuel fabrication facility. These funds will be expended over a 2-3 year period following completion of the accord	0	200,000	0
Total, Russian Plutonium Disposition	0	200,000	0

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Russian Plutonium Disposition	
■ The decrease is due to a one-time emergency appropriation of $200,000,000 in FY 1999 for Russian plutonium disposition activities	-200,000
Total Funding Change, Russian Plutonium Disposition	-200,000

Fissile Materials Disposition Program Direction

Mission Supporting Goals and Objectives

Program direction provides overall management, oversight, staffing, and administrative support necessary to carry out the mission of the Fissile Materials Disposition Program. Operations are conducted in an efficient and streamlined manner consistent with National Performance Review objectives. Program direction has been grouped into four categories:

Salaries and Benefits provides for Federal personnel compensation to include SES and other awards, overtime, lump sum leave payments, transit subsidy costs, and employer's contribution to employees' benefits.

Travel includes domestic and foreign trips necessary to conduct business in carrying out the mission of the program. International travel is frequent in that Fissile Materials Disposition program officials work closely with Russian and other G-7 scientists and government officials on plutonium disposition issues.

Support Services include program analyses and office operations functions which result in improving the effectiveness, efficiency, and economy of management and general administrative services. Activities also include outreach and project scheduling.

Other Related Expenses include employee training; interpreter services; subscriptions; building occupancy; telecommunications; supplies; copiers; postage; printing and graphics; payroll outsourcing; and other miscellaneous expenses associated with office operations.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salaries and Benefits	3,132	3,334	4,884	1,550	46.5%
Travel	240	300	300	0	0.0%
Support Services	232	232	1,223	991	427.2%
Other Related Expenses	741	722	936	214	29.6%
Total, Program Direction	4,345	4,588	7,343	2,755	60.0%
Full Time Equivalents[a]					
Headquarters	25	28	28	0	0.0%
Field	2	4	11	+7	21.0%
Total, Full Time Equivalents	27	32	39	+7	21.0%

[a]FTEs above FY 1998 request 25 (+2) and FY 1999 request (+7) of 25 were funded from prior balances

Detailed Program Direction Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Federal Staff provide management oversight and technical support for the safe, secure, environmentally sound future storage of all weapons-usable fissile materials and the disposition of fissile materials declared surplus to national defense needs. The increase is due to +14 FTEs over the FY 1999 funding request for 25 FTEs. Eleven of the +14 FTEs are in the field for oversight and project management of plutonium disposition facility activities . .	3,132	3,334	4,884
Travel			
Funding supports domestic and foreign trips required to provide management oversight and technical support to the program, and ensure cooperation and collaboration with Russia and other nations on the disposition of plutonium	240	300	300
Support Services			
Funding supports office operations functions designed to improve overall effectiveness. Support Services reflects an increase for activities moved from program funding in accordance with Congressional direction	232	232	1,223
Other Related Expenses			
Supports employee training, office automation support and activities funded by the Working Capital Fund. The increase is due to an FTE increase of +14 and allowable inflation for Working Capital Fund activities and other office operations	741	722	936
Total, Program Direction	4,345	4,588	7,343

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ The increase is for +14 FTEs over FY 1999 base funding for 25 FTEs (+7 FTEs were funded in FY 1999 with prior year balances). Of the +14, +11 FTEs are in the field for oversight and project management of design of three plutonium disposition facilities. Three FTEs are in Headquarters to support Russian activities. Salary adjustments in accordance with allowable inflation factors are also included.	+1,550
Support Services	
■ The increase includes support services activities moved from program funding in accordance with Congressional direction. Activities include outreach and project scheduling activities	+991
Other Related Expenses	
■ The increase is directly related to the FTE increase and will cover space, AOSS equipment and other miscellaneous costs	+214
Total Funding Change, Program Direction	+2,755

Support Services

2001	20,000	20,000	23,751
2002	0	0	5,000

3. Project Description, Justification and Scope

In the aftermath of the Cold War, significant quantities of weapons-usable plutonium have become surplus to national defense needs both in the United States and Russia. The Department issued a Record of Decision (ROD) on the Storage and Disposition of Surplus Weapons-Usable Fissile Materials in January 1997. This decision calls for DOE to pursue a hybrid approach for plutonium disposition that allows for immobilization of surplus weapons plutonium in ceramic matrix and burning of some of the surplus plutonium as mixed oxide fuel (MOX) in existing domestic reactors. In order to implement the hybrid approach, surplus classified nuclear weapons components (pits) must first be disassembled and the resulting plutonium converted to an unclassified oxide powder form. No such facilities currently

---

[a]Site preparation will begin in 2Q FY 2001

[b]Preliminary cost estimates for the Pit Disassembly and Conversion Facility are based upon conceptual estimates. The preliminary estimates are: Total Estimated Cost (TEC) – approximately $346,000,000 and Total Project Cost (TPC) – approximately $586,000,000. These estimates are used for the purpose of requesting design and long lead equipment funding only. Future construction funding will be based upon Title I cost estimates. The Administration will not construct new facilities for disposition of U.S. plutonium unless there is significant progress on plans for plutonium disposition in Russia.

exist in the United States. A Pit Disassembly and Conversion Facility will provide the U.S. with the capability to transform classified plutonium weapons pits to an unclassified oxide form suitable for disposition and international inspection.

The Pit Disassembly and Conversion Facility is a complex consisting of a hardened building that will contain the plutonium processes in a safe and secure manner and conventional buildings and structures that will house support personnel, systems and equipment. The plutonium processing building will be a material access area, require approximately 150,000 square feet, and house the following key systems: pit shipment, receiving, assay and storage; pit plutonium metal extraction and conversion to oxide; and plutonium oxide packaging, assay, storage and shipment. Also included are facilities for recovery, decontamination, and declassification of other special nuclear material and non-special nuclear material resulting from pit disassembly. In addition, there are facilities to accommodate IAEA safeguards for specific portions of the processes and facility. The conventional buildings and structures, requiring approximately 50,000 square feet, will house offices, change rooms, an analytical chemistry laboratory, a central control station, waste treatment, packaging, storage and shipment systems. The facility will have the capacity to process 3.5 metric tons of surplus plutonium per year.

The Pit Disassembly and Conversion Facility project consists of: design and construction of the buildings and structures, design, procurement, installation, testing and start-up of equipment to disassemble pits and convert the plutonium from pits to oxide form, as well as associated supporting equipment, components and systems. The facility is planned to be operated for a ten year period beginning in FY 2005 and then decontaminated and decommissioned over a three to four-year period. Four sites (Hanford, Idaho National Engineering and Environmental Laboratory, Pantex, and Savannah River) are being considered for the full-scale Pit Disassembly and Conversion Facility. In December 1998 the DOE identified Savannah River Site as the preferred location to build the Pit Disassembly and Conversion Facility. A final decision on where to locate the facility is scheduled for the spring of 1999 in the ROD following the issuance of an Environmental Impact Statement

This budget request precedes upcoming site selection decisions that will define the scope of the Pit Disassembly and Conversion Facility. As a result, funds requested for Title I and II facility design are based on a conceptual design for a new facility with established general support infrastructure. The Title I & II funding request will not prejudice the final ROD, but helps assure that construction funding is available to support prompt implementation of Title I design following the ROD in the spring of 1999 and continue design in FY 2000.

Note that current construction cost estimates are preliminary and will be revised and final baselines established after completion of Title I design. The final baseline will be used to measure performance.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs, (Design, Drawings, and Specifications)	33,383	33,383
Design management costs @ 10% of above costs	3,908	3,908
Total, design phase	37,291	37,291
Contingencies at approximately 27% of above costs		
Design phase	10,105	10,105
Long lead equipment *	21,355	21,355
Total Agency Requirement (Design and Long Lead Equipment)	68,751	68,751

5. Method of Performance

Method of performance will not vary by location. It is expected that a cost plus fixed fee contract will be the most appropriate and cost beneficial for the design work. It is anticipated that the construction procurement will be a fixed price contract awarded on the basis of competitive bidding.

*Equipment included in the long lead items are: robotic cranes and track mounted robots in the shipping and receiving system, vault doors in the storage system, material control and accountability computer system, the californium shufflers, and equipment for the waste assay system.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total

2002	20,000	20,000	20,106

3. Project Description, Justification and Scope

In the aftermath of the Cold War, significant quantities of weapons-usable plutonium have become surplus to national defense needs both in the United States and Russia. The Department issued a Record of Decision (ROD) on the Storage and Disposition of Surplus Weapons-Usable Fissile Materials in January 1997. This decision calls for DOE to pursue a hybrid approach for plutonium disposition that allows for immobilization of surplus weapons plutonium in ceramic form and burning of some of the surplus plutonium as mixed oxide fuel (MOX) in existing domestic reactors. The immobilization process that the Department plans to use is the can-in-canister approach in which cans of plutonium immobilized with ceramic material would be arrayed within large canisters into which intensely radioactive high-level waste would be poured. The resulting large, heavy, radioactive waste canisters increase the proliferation resistance of the immobilized plutonium. The waste canisters containing the immobilized weapons plutonium would ultimately be disposed of in a geologic repository.

---

*Preliminary cost estimates for the Immobilization and Associated Processing Facility are based upon conceptual estimates. The preliminary estimates are: Total Estimated Cost (TEC) – approximately $547,000,000 and Total Project Cost (TPC) – approximately $828,000,000. These estimates are used for the purpose of requesting design funding only. Future construction funding will be based upon Title I cost estimates. The Administration will not construct new facilities for disposition of U.S. plutonium unless there is significant progress on plans for plutonium disposition in Russia.

The Immobilization and Associated Processing Facility will contain all the systems required for: (1) Plutonium Conversion: receiving stabilized non-pit plutonium and converting the material to an acceptable oxide feed form; (2) Initial Immobilization: blending the plutonium oxide feed with precursor materials and solidifying the resultant product into ceramic forms, and placing the ceramic forms into small cans; and (3) High Level Waste (HLW) Immobilization: placement of the small cans into a larger canisters which is filled with borosilicate glass containing HLW and sealed. In the Programmatic Environmental Impact Statement (PEIS), DOE narrowed the field of candidate disposition sites for the Immobilization and Associated Processing Facility to Savannah River and Hanford. Both sites have an existing or planned HLW immobilization infrastructure as well as general support infrastructure in place such as a fire department, security protection forces, and water and sewage treatment plants. In a Notice of Intent to prepare the site specific EIS, DOE identified the Savannah River Site as the preferred site for the Immobilization and Associated Processing Facility. A final decision on where to locate the facility is scheduled for the spring of 1999 in the ROD following the issuance of an Environmental Impact Statement.

The Immobilization and Associated Processing Facility is a complex consisting of a hardened building that will contain the plutonium processes in a safe and secure manner and conventional buildings and structures that will house support personnel, systems and equipment. The seismically hardened new construction will require approximately 150,000 square feet, and house the following key systems: material receipt and storage, oxide fuel feed preparation; metal fuel feed preparation; grinding; material unpacking and sorting; metal conversion to oxide; impure oxide feed preparation; materials characterization; materials control and accountability; in-process storage; feed batching; ceramic feed preparation; pellet characterization; sintering; recycle; can loading; can characterization; can storage; canister loading and assembly; and the canister transport system. In addition, conventional building space requiring approximately 50,000 square feet to house office space, change rooms, and utilities will be constructed. The existing site infrastructure containing the analytical laboratory and the Actinide Packaging and Storage Facility (originally planned for completion before construction of the Immobilization facility) of approximately 30,000 square feet will be used for sample analysis and storage of select incoming materials.*

The Department plans on immobilizing non-pit surplus plutonium which is not suitable for use in mixed oxide fuel without extensive purification, but reserves the option to immobilize the entire 50mt of declared surplus. Because of the time required to prepare some materials for immobilization, ten years is the estimated time to immobilize up to 50mt after which the facility will be decontaminated and decommissioned over a three to four-year period. The facility will begin operations in FY 2006.

This budget request precedes upcoming site selection decisions that will define the scope of the Immobilization and Associated Processing Facility. As a result, funds requested for facility design are based on DOE's can-in-canister approach utilizing the existing HLW and the Defense Waste Processing

*EM Project 97-D-450, Actinide Packaging and Storage Facility (APSF), will be reevaluated and may not be constructed and therefore will not be available to provide necessary receipt and storage functions required for the immobilization facility. The preliminary estimates for the immobilization facility do not include a minimum of 10,000 sq. ft for these functions should APSF not be constructed.

Facility (DWPF) with existing general support infrastructure. The Title I funding request will not prejudice the final decision, rather, it would help assure that construction funding is available to support prompt FY 2000 implementation of Title I design following the ROD in the spring of 1999.

Note that current construction cost estimates are preliminary and will be revised and final baselines established after completion of Title I design.. The final baseline will be used to measure performance.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs, (Design, Drawings, and Specifications)	46,327	0
Design management costs @ 8% of above costs	3,996	0
Total, design phase	50,323	0
Contingencies at approximately 35% of above costs		
Design phase	17,613	0
Total Agency Requirement (Design Only)	67,936	0

5. Method of Performance

Method of performance will not vary by location. It is expected that a cost plus fixed fee contract will be the most appropriate and cost beneficial for the design work. It is anticipated that the construction procurement will be a fixed price contract awarded on the basis of competitive bidding.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1999 Budget Request *(A-E and technical design only)*	1Q 1999	4Q 2001	N/A	N/A		
FY 2000 Budget Request *(Preliminary Estimate)*	2Q 1999	4Q 2001	1Q 2002	4Q 2005	*	*

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
1999	28,000	28,000	15,000
2000	12,375	12,375	20,700
2001	10,000	10,000	14,675

3. Project Description, Justification and Scope

In the aftermath of the Cold War, significant quantities of weapons-usable plutonium have become surplus to national defense needs both in the United States and Russia. The Department issued a Record of Decision (ROD) on the Storage and Disposition of Surplus Weapons-Usable Fissile Materials in January 1997. This decision calls for DOE to pursue a hybrid approach for plutonium disposition that allows for immobilization of surplus weapons plutonium in ceramic form and burning of some of the surplus plutonium as mixed oxide fuel (MOX) in existing domestic reactors. A Mixed Oxide (MOX) Fuel Fabrication Facility will provide the U.S. with the capability to convert specification plutonium dioxide derived from surplus weapons grade plutonium stocks to MOX fuel suitable for use as a fuel source in U.S. commercial nuclear reactors, with subsequent disposal of the spent fuel to be carried out in accordance with the Nuclear Waste Policy Act.

---

*Preliminary cost estimates for the Mixed Oxide Fuel Fabrication Facility are based upon conceptual estimates. The preliminary estimates are: Total Estimated Cost (TEC) – approximately $383,000,000 and Total Project Cost (TPC) – approximately $575,000,000. These estimates are used for the purpose of requesting design funding only. Future construction funding will be based upon Title I cost estimates. The Administration will not construct new facilities for disposition of U.S. plutonium unless there is significant progress on plans for plutonium disposition in Russia

The MOX Fuel Fabrication Facility will contain all the systems required for: receiving plutonium oxide from the Pit Disassembly and Conversion Facility; processing and blending of fuels materials, fabrication of fuel pellets, loading pellets into rods, assembly of completed fuel bundles and shipment to commercial reactors for irradiation. The facility will meet current commercial standards for nuclear fuel manufacturing utilizing the extensive experience base of European fabrication of MOX fuel. The facility will be licensed by the Nuclear Regulatory Commission and operated by a private sector consortium for the Department. Four sites (Hanford, Idaho National Engineering and Environmental Laboratory, Pantex, and Savannah River) are being considered for the MOX Fuel Fabrication Facility. Several proposed sites have general support infrastructure in place such as a fire department, security protection forces, and water and sewage treatment plants. In June 1998 the DOE announced the Savannah River Site as the preferred location to build the MOX Fuel Fabrication Facility. A final decision on where to locate the facility is scheduled for the spring of 1999 in the ROD following the issuance of an Environmental Impact Statement.

The MOX Fuel Fabrication Facility will require approximately 120,000 sq. ft of hardened building which will contain the following systems: plutonium oxide and oxide receiving and storage; MOX powder preparation; pelletizing; sintering; pellet grinding and inspection; fuel rod loading and rework; fuel rod inspection and storage, fuel bundle assembly; clean scrap recovery, processing and recycle; analytical laboratory, contaminated waste, and interim storage vaults. In addition, approximately 55,000 sq. ft. of conventional structures are required adjacent to the fuel fabrication structure to house offices, change rooms, operator training and process demonstration, mechanical shops, utility building, warehouse, and entry portals. Accountability systems essential for use by the IAEA will be in place for the purpose of international safeguards. It is estimated that the facility will be operational for a ten- to fifteen-year period beginning in FY 2007 after which the facility will be decontaminated and decommissioned over a three to four year period.

This budget request precedes upcoming site selection and procurement decisions that will define the scope of the MOX Fuel Fabrication Facility. As a result, funds requested for facility design are based on conceptual design estimates for a new facility with existing site support infrastructure. Irradiation will take place in existing U.S. light water commercial nuclear reactors. The Title I & II funding request will not prejudice the final ROD, but helps assure that construction funding is available to support prompt implementation of preliminary design following the ROD in the spring of 1999 and continue design in FY 2000.

The Department is currently engaged in processes to select a consortium and a site for the MOX Fuel Fabrication Facility. Both decisions could affect the cost of the facility. Note that current construction cost estimates are preliminary and will be revised and final baselines established after completion of Title I design. The final baseline will be used to measure performance.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs, (Design, Drawings, and Specifications)	37,803	37,803
Design management costs @ 9% of above costs	3,908	3,908
Total, design phase	41,711	41,711
Contingencies at approximately 21% of above costs		
Design phase	8,664	8,664
Total Agency Requirement (Design Only)	50,375	50,375

5. Method of Performance

The method of performance will not vary by location. A Request for Proposals was issued by the Chicago Operations Office for the procurement of a consortium to provide fuel fabrication and irradiation of MOX fuel (teaming of MOX fuel fabricator and reactor irradiation service providers). Design, construction, licensing and operation of a MOX Fuel Fabrication Facility, reactor modifications, MOX fuel design and qualification will be accomplished by the selected consortium. Costs associated with design, licensing, construction and startup of the MOX Fuel Fabrication Facility and design, licensing and retrofitting reactors to burn MOX fuel will be reflected in the final contract price. The procurement calls for a base contract with three options. The base contract covers the design and licensing of the MOX Fuel Fabrication Facility, fuel qualification program and reactor license modifications. Sequential contract options cover construction, operations and facility deactivation. It is expected that an incentive contract with the consortium will be the most appropriate and cost beneficial for the design and construction work. The construction would be through fixed price subcontracts to the extent practical, with a cost-type contract for construction management services. The MOX Fuel Fabrication Facility will be Government-owned but operated by the contractor consortium.

It is expected that during the operational phase of the consortium contract, facility operational costs will be offset by the value of the MOX fuel which will displace the low-enriched uranium (LEU) that the utilities would have otherwise purchased. The value of DOE's share of these fuel savings, less the facility operational costs, may provide a positive revenue stream to the government on a life cycle cost basis.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Design Cost						
Design	0	0	28,000	12,375	10,000	50,375
Plant Engineering & Design (PE&D)	0	0	0	0	0	0
Operating expense funded equipment	0	0	0	0	0	0
Total Design Costs (Federal and Non-Federal)	0	0	28,000	12,375	10,000	50,375
Other Project Costs						
R&D necessary to complete project	0	0	0	0	0	0
Conceptual design costs	0	0	0	0	0	0
Decontamination and Decommissioning (D&D)	0	0	0	0	0	0
NEPA documentation costs	0	0	0	0	0	0
Other project related costs	0	0	0	0	0	0
Total Other Project Costs	0	0	0	0	0	0
Total Agency Requirement (Design only)	0	0	28,000	12,375	10,000	50,375

7. Related Annual Funding Requirements

(dollars in thousands)

	Current Estimate	Previous Estimate
Annual Facility Operating Costs	[b]	

8. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, OMB Circulars, Federal Property Management Regulations, and Nuclear Regulatory Commission licensing standards. This facility will be NRC licensed. The preliminary total estimated cost estimates for the project include the costs of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

[b]Related annual costs will be defined during the Title I design effort and reflected in the FY 2002 budget request.

Environment, Safety
and Health

Environment, Safety and Health

Executive Budget Summary

Mission

The Office of Environment, Safety and Health (EH) is committed to protection of Department of Energy (DOE) workers, the public, and the environment. This commitment is demonstrated by continuous improvement in program and policy development; independent oversight of the status of environment, safety, health, and safeguards and security programs; and sharing of technical resources, assistance and information. EH applies its resources to DOE activities in order to prevent accidents or injuries to workers and the public, and harm to the environment. EH is the Department's major source of expertise in disciplines such as environmental protection, nuclear safety engineering, public health, industrial hygiene, radiation protection, construction safety, epidemiology, and occupational medicine. The EH goal is to leverage resources and skilled personnel to efficiently provide DOE's line management programs with the tools and independent program assessments required to preserve safety and to effectively protect national security interests at DOE sites. Open communication, participation, and performance feedback on EH activities are integral to EH's success.

The Environment, Safety and Health program is funded in three appropriations: (1) Energy Supply, (2) Other Defense Activities, and (3) Defense Environmental Restoration and Waste Management. The Energy Supply EH program consists of: Technical Assistance, National Environmental Policy Act (NEPA), Management and Administration, and a Program Direction decision unit which includes the EH Working Capital Fund. The Other Defense Activities EH program includes: Oversight, Domestic and International Health Studies programs, Radiation Effects Research Foundation (RERF) program, and a Program Direction decision unit. In addition, the Defense Environmental Restoration and Waste Management appropriation supports an additional increment of health studies at sites where the Department's Environmental Management program conducts cleanup.

DOE has transitioned to new missions which include weapons dismantlement, environmental cleanup, and facility decontamination and decommissioning. Residual hazards at DOE facilities, especially in the nuclear weapons complex, are the result of more than 50 years of nuclear materials production and processing under less than optimum conditions, the impacts of which are still being characterized. DOE harbors the largest inventory of hazardous nuclear materials in the world outside of the former Soviet Union, as well as large quantities of hazardous chemicals. Due in large part to the sudden end of the Cold War, and the resultant rapid shutdown of the production and processing facilities, much of this material (including plutonium, spent nuclear fuel, highly enriched uranium, radioactive waste, radioactive isotopes, and hazardous chemicals) is stored in aging and deteriorating facilities, and under conditions that are in themselves hazardous. There is still a lack of reliable data for many of these facilities on the most basic safety issues, such as non-compliant electrical and ventilation systems. In addition to these challenges, the problem of secure storage of special nuclear material and classified information remains.

The EH mission is one of DOE's highest priorities. EH technical experts work with line program managers to develop tools needed to manage environment, health, and safety at DOE facilities more effectively and at less cost to taxpayers. EH has demonstrated that the Department can do its work better,

more safely, and at less cost by integrating environment, health, and safety into the planning and execution of work. EH will continue to work with its partners in the field to ensure that safety is no longer viewed as an "add-on" that produces only paper and needless cost, but as an asset that allows efficient targeting of the most urgent risks, most efficient use of limited resources, and effective accomplishment of work.

The need for effective programs to identify environment, safety, and health concerns at the project and individual activity level remains critical. Emphasis has been placed on assuring that prior commitments to fund programs to reduce environment, safety, and health concerns are met represent important accomplishments, but more remains to be done. The downsizing and realignment of the weapons production efforts will necessitate changes in the conduct of operations. In addition, the limitations on funding Environmental Management work as needs increase will create conflicts between meeting details of compliance agreements negotiated in earlier years and organizing efforts to pursue an integrated approach to risk reduction. EH's analytical products are shared DOE-wide to assist the sites in appropriate and timely resolution of identified and emerging environment, safety, and health concerns.

Mission Supporting Goals and Objectives

The EH overall major goals and objectives are as follows:

- Provide a standardized corporate independent oversight process to appraise the effectiveness of environment, safety, health and safeguards and security programs throughout DOE. To accomplish the goal of corporate independent oversight, the following objectives have been established: (1) identify, prioritize, and target Departmental needs for independent oversight; (2) incorporate DOE's guiding integrated safety management policy and principles into all oversight activities; (3) sustain a coordinated and consistent independent oversight for DOE; (4) administer an enforcement program that appropriately penalizes significant violations of nuclear safety requirements; and (5) disseminate lessons learned to reinforce good practices.
- Provide quality, timely, efficient, and effective corporate support and technical services. To accomplish this goal, the following objectives have been established: (1) provide Departmental environment, safety, and health crosscutting programs and technical services that are aligned with critical missions and integral to mission accomplishment; (2) evaluate operational performance data and identify for corporate assessment and action those vulnerabilities that pose urgent risks to DOE workers, the public, and mission accomplishment; (3) continue ongoing partnerships with private industry, government agencies, and national safety organizations to promote information exchange and program benchmarking to enhance DOE safety programs; and (4) improve corporate services through feedback and performance measures.
- Provide Departmental requirements, guidance, and policy for environment, safety and health program implementation and measurement. To accomplish this goal, the following objectives have been developed: (1) support ongoing field analysis, interpretation, and application of "WorkSmart" standards (safety guidelines) and provide needed regulatory interpretations and implementation guidance; (2) interface with outside regulators and provide comments on pending regulations pertinent to DOE and regulatory policies and actions having impact on DOE missions; (3) continue stewardship and improve effectiveness of the new environment, safety,

and health orders; and (4) develop, issue, and implement technical standards for DOE activities based on appropriate consensus standards.

- Provide a National Environmental Policy Act (NEPA) process that fosters sound Departmental planning and decision-making and builds public trust through effective process implementation. To accomplish this goal, EH has established the following objectives: (1) ensure timely and adequate completion of NEPA reviews through technical assistance, independent policy review, and approval recommendations for major programmatic environmental impact statements (EISs), site-wide and other EISs, and related NEPA documents; (2) ensure the consistency and quality of NEPA documents and increase the efficiency of NEPA personnel by determining and responding to customer needs; (3) issue guidance on selected technical and policy topics; (4) conduct workshops for Headquarters and field personnel; and (5) participate in NEPA process improvement teams and other initiatives that foster continuing improvement in the NEPA process.
- Ensure environment, safety, and health performance and management accountability. To accomplish this goal, EH has established the following objectives: (1) develop and support implementation of DOE-wide environment, safety, and health budget and planning process that defines scope, identifies costs, prioritizes activities based on relative risk, and allocates resources based on established commitments in a visible manner for implementation of environment, safety, and health program activities; (2) improve environment, safety, and health performance through the application of total quality approaches to management processes; and (3) integrate environment, safety, and health in all Departmental business functions.
- Support realignment of contract terms and conditions to incorporate environment, safety, and health management systems development needed to move towards a corporate business performance mode. To accomplish this goal, EH has established the following objectives: (1) identify ways for line program management to improve environment, safety, and health performance as part of work execution systems; and (2) integrate environment, safety, and health in all Departmental business functions.
- Conduct EH's mission in an open, trustworthy and responsive manner. To accomplish this goal, EH's objectives are: (1) establish and implement programs that strengthen the public's trust, confidence, credibility and respect in and for EH; and (2) support the Department's efforts to reduce the volume of national security information and minimize future classification.
- Promote the health and safety of DOE's workers and communities surrounding Departmental sites and reduce radiation and hazardous exposure through understanding of radiation effects and other hazards on humans. To accomplish this goal, EH's objectives are: (1) assist the field in the identification and application of effective approaches to prevent injury and illness; and (2) support the development of domestic and international health effects information on populations exposed to releases of varying levels of ionizing radiation.

The legal requirements that affect the activities of the EH organization include all environmental, safety, and health Federal regulations, as well as legislation such as the Atomic Energy Act of 1954, as amended, and the National Defense Authorization Act for Fiscal Year 1995.

Strategy

The Office of Environment, Safety and Health's (EH) intent is to assure that quality, objectivity, responsiveness and innovation are hallmarks of all EH activities.

EH's commitment to ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Department activities is our strategic objective, part of our performance agreement with the President, and a key part of the DOE Strategic Plan. To accomplish this objective, EH integrates and embeds sound environment, safety, and health management practices into the performance of DOE's day-to-day work. EH ensures that environment, safety and health priorities are clearly identified and given appropriate consideration for funding. EH is working with the Nuclear Regulatory Commission (NRC) and the Occupational Safety and Health Administration (OSHA) to evaluate the costs and benefits of external regulation of DOE safety and health activities. Pilot programs are being conducted.

Another strategic objective is to continually work with the public community in an open, frank, and constructive manner as a good neighbor and public partner. To accomplish this objective, EH fosters strong partnerships with neighboring DOE communities, regulators, and other stakeholders to determine priorities and solutions. In addition, EH increases public awareness of DOE's mission by improving the quality, timeliness, frequency, and sufficiency of information disseminated on the Department's functions, successes, lessons learned and future activities. EH focuses on developing management-level analytical products, reducing redundancies, and enhancing staff development. EH serves its principal customers in the following major areas: (1) development of Departmental environment, safety, and health requirements, guidance and interpretations that are effective and efficient to guide program implementation; (2) improvement of environment, safety and health performance and management accountability by supporting the integration of environment, safety, and health considerations into the Department's business and budget planning processes; (3) provision of critical corporate environment, safety and health support and services, including regulatory and industry interface, technical assistance to improve program management and execution, and to assist in the efficient and effective implementation of requirements; and (4) conduct independent oversight activities that provide a comprehensive status of environment, safety, health, and safeguards and security performance at DOE facilities.

One of DOE's greatest challenge is performing new types of hazardous work safely and securely at facilities that were designed to meet the requirements of outdated rules and orders. Many old, poorly-maintained facilities do not meet current building codes and safety standards. WorkSmart standards provide a graded approach to developing safety standards that allow the Department to tailor the standards to the work and the facilities. Pilot applications of this process indicate that worker safety can be enhanced while program costs are reduced.

The EH independent oversight program has been extremely useful in helping the Department effectively identify and target unacceptable risk. Comprehensive environment, safety and health evaluations provide DOE management with validated, professional appraisals of the site's performance by identifying areas of greatest risk in terms of both immediate hazards and overall program management. The foundation of this approach is an assessment of management effectiveness based on DOE's integrated safety management policy and the guiding principles of safety management contained in that policy. These assessments supply DOE management with validated, professional appraisals of the site's performance.

Using the guiding principles of safety management permits objective program analysis. Although much effort remains, changes in the Department's ability to apply resources to areas of greatest need have already been observed, and will become increasingly evident in efficiency in addressing environment, safety, health, and safeguards and security issues.

The rapid transition of the Department to a business management model with its emphasis on gaining cost-efficiencies, privatization and innovative management structures in the field has brought concomitant changes in how EH functions. Special emphasis will be given to self-assessment and self-reporting by field elements as a source of performance information, coupled with increased emphasis on EH performance analysis. Likewise, increased priority will be given to help move DOE line management from outdated environment, safety and health management approaches and systems to programs that facilitate the exchange of innovative business or environment, safety and health management practices that are preventive and cost-efficient in nature. From a technical safety assistance perspective, special emphasis will be given to urgent programmatic needs such as safely managing the decommissioning and decontamination of aging DOE facilities and hazardous waste.

EH will continue to build on its strong record of cutting costs without risking the safety and health of DOE workers, the quality of the environment, or the quality of the health studies program. Even as challenges have grown, the EH budget has been reduced by cutting administrative overhead costs and focusing on the highest priority needs. An EH staffing plan has identified the most critical functions and closely matched personnel to fit those needs. Functions of lower priority will continue to be eliminated. This will result in a cut in Federal personnel from 375 in FY 1998 to 355 in FY 1999 with 345 full-time-equivalents in FY 2000. EH has also analyzed how it utilizes support contractors and established specific criteria for their limited use. While EH has some unique national-level experts, technical contractual services continues to be more practical and cost-effective, providing a surge pool of technical expertise on an as needed basis. The evolving needs for national-level expertise in a multitude of disciplines can best be met through the use of contractors who can rapidly respond to the continually changing skill mix required of EH activities across the DOE complex.

The medical surveillance for the former workers program, required by the 1993 Defense Authorization Act, could potentially cost hundreds of millions of dollars. EH has worked during the past three years to develop a cost-effective approach that relies on feasibility studies to target populations most at risk. In FY 1996, EH awarded contracts to six consortia of universities, labor unions, and health specialists. In FY 1997, each of these consortia began conducting the feasibility assessment phases of their projects. In addition, EH issued a request for proposals for major sites not addressed as part of the first solicitation. In FY 1998, the medical surveillance phase of the first set of projects began, and the feasibility assessments for the four newly awarded cooperative agreements were initiated. In FY 1999, all ten projects will be in the implementation phase of their medical surveillance programs.

DOE, in partnership with the Department of Health and Human Services (HHS), has begun a process that will produce a strategy to include a public health agenda for each DOE site. Developed in coordination with HHS, this strategy will have clearly defined goals, objectives, and priorities for health activities to ensure that the issues of greatest concern to DOE workers and communities are addressed. All newly-funded health activities conducted by HHS will be consistent with the priorities established in this strategy.

In the Defense Environmental Restoration and Waste Management Appropriation, DOE supports public health studies in conducting a range of health-related activities. These activities are managed by EH and will be included in the public health agenda being developed in partnership with HHS.

Major Changes

The Department has consolidated the management of Health Studies in the Office of Environment, Safety and Health to provide a focal point for ensuring that the results of these efforts are used for the maximum benefit of DOE workers and communities.

The Department funds a large number and wide variety of epidemiologic and other health-related activities to address the potential effects of DOE operations on the health of DOE workers and communities. Through a Memorandum of Understanding with the Department of Health and Human Services (HHS), studies of worker and community health are funded through the Office of Environment, Safety and Health under the Other Defense Activities account, and are administered by the HHS/CDC. Prior to FY 1999, similar activities were separately funded by the Office of Environmental Management under the Defense Environmental Restoration and Waste Management Appropriation, and were independently conducted by HHS under its statutory authority under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). Management of all HHS health studies (conducted by both CDC and ATSDR) was consolidated under EH in FY 1999.

The funding request for Public Health Activities in the Defense Environmental Restoration and Waste Management Appropriation for Fiscal Year 2000 is $20,000,000. These studies have been transferred by the Congress for the Office of Environment, Safety and Health to manage. This request could include funding for the Hanford Medical Monitoring Program and the Iodine-131 Exposure Registry, should they be incorporated into the DOE/HHS public health agenda for Hanford and base Public Health program activities at DOE sites. Should the medical monitoring program or exposure registry not be included in the Hanford health agenda for FY 2000 or be modified from current proposals, the Department will submit an appropriate Reprogramming Request.

Subtotal, Environment, Safety and Health	159,268	153,898	162,750	+8,852	+5.8%
Use of prior year balances	-2,373	-5,078	0	+5,078	+100.0%
Total, Environment, Safety and Health	156,895	148,820	162,750	+13,930[a]	+9.4%

[a]The total change of $13,930,000 from FY 1999 to FY 2000 primarily results from: 1) an increase of $8,000,000 in the Defense EM Public Health Activities program (from $12,000,000 in FY 1999 to $20,000,000 in FY 2000) which Congress transferred from EM for EH to manage, and 2) the net effect of the FY 1999 allocated share of congressionally prescribed reductions in the Energy Supply and Other Defense Activities appropriation.

Program Performance Measures

EH places its emphasis on accident prevention and excellence in protecting worker and public safety and health and achieving effective environmental standards. Success will be measured by fewer radiological and toxicological contamination events, fewer abnormal operating events, and fewer procedural violations.

EH serves as the Departmental advocate for institutionalizing effective and integrated safety management, which focuses on the key tenets of work planning, hazard analysis and hazard control. Success is measured by the implementation of enhanced work planning systems at DOE sites.

EH incorporates the existing risk-based environment, safety, and health planning and budgeting process into all new major Management and Operating and Management and Integrating Contractors contracts scheduled for renewal. Success is measured by inclusion of environment, safety, and health provisions in 100 percent of the Management and Operating and Management and Integrating Contractors contracts.

EH supports the systematic collection, analysis, and sharing of data on worker illness and injury. Success is measured by the early detection of emerging health issues and the implementation of improved health and safety practices at DOE sites.

EH performs vulnerability studies to identify environment, safety, and health vulnerabilities across the complex. Success will be measured by the reduction of the number of unaddressed serious vulnerabilities at DOE facilities from the current several dozen to zero by the end of FY 2000.

EH's multi-disciplinary, fully integrated oversight process for environment, safety, health, and safeguards and security evaluations has matured. Oversight activities serve as a catalyst for improvement and bring significant issues to senior management's attention. Success will be measured by downward trends in previously identified issues that lead to environmental releases, occupational injury and illness and recurrence of accidents.

EH is implementing nuclear safety standards for work in progress that will provide for the health and safety of workers, the public and the environment. Success will be measured by the effectiveness in implementing and complying with these nuclear safety standards on a DOE-wide basis.

The field, contractors, and outside organizations continue to adopt EH standards. Success is measured by a decrease in lost work days due to occupational illness or injury, a decrease in the number of personnel contaminations with radionuclides, and a decrease in the number of serious accidents where policy is a root cause of the problem.

David Michaels, PhD, MPH
Assistant Secretary
Environment, Safety and Health

Environment, Safety and Health Other Defense Activities

Program Mission

The Office of Environment, Safety and Health (EH) is a corporate resource that provides leadership and Departmental management excellence to protect the workers, the public, and the environment. This commitment to excellence is demonstrated by continuously striving for improvement by: developing meaningful programs and policies; conducting independent oversight of environment, safety, health, and safeguards and security performance; and providing technical assistance, resources, and information sharing. Open communication, participation, and performance feedback on EH activities from affected parties are integral to EH's success. The hallmark and highest priority of all EH activities is daily excellence in the protection of the workers, the public, and the environment. The Office of Environment, Safety and Health defense activities are concentrated into three business functions within one decision unit: Oversight, Health Studies, and the Radiation Effects Research Foundation (RERF) support; and a program direction decision unit.

Oversight activities provide information and analysis needed to ensure that the Department of Energy (DOE) and contractor management, the public, the Secretary of Energy, and the Assistant Secretary for Environment, Safety and Health have an accurate, comprehensive understanding of the effectiveness, vulnerabilities, and trends of the Department's environment, safety, health, and safeguards and security policies and programs. These activities include the EH Residents program, Independent Evaluations, Accident Investigation, Analysis, Price-Anderson Amendments Act Enforcement, and the Departmental Representative to the Defense Nuclear Facilities Safety Board (DNFSB).

Health Studies activities include Occupational Medicine (medical surveillance); Epidemiologic Studies (surveillance and communication of worker injury and illness); Public Health Activities (health studies, health education and promotion, etc., at DOE sites); and International Health Programs (Marshall Islands program and health studies in the former Soviet Union).

Radiation Effects Research Foundation (RERF) activities DOE supports analysis of the medical effects of radiation with the intention of contributing to the maintenance of the health and welfare of atomic bomb survivors and to the enhancement of worldwide radiation protection practices and standards.

Program Goal

The goal of the EH Defense activities is to continually provide excellent Department-wide environment, safety, health, and safeguards and security support to:

- Provide consistent, multidisciplinary, credible independent oversight processes for evaluating the effectiveness of environment, safety, health, and safeguards and security programs.
- Promote actions that prevent recurrence of worker injuries, property damage and environmental damage due to accidents.

- Coordinate processes with field and program offices and report evaluation results to DOE senior management, the Congress, and the Defense Nuclear Facilities Safety Board.
- Ensure initiatives relative to environment, safety, health, and safeguards and security throughout the complex are analyzed and disseminated as appropriate.
- Ensure that follow-up and corrective actions for all EH oversight activities are effective.
- Ensure increased contractor accountability for safety through oversight of the Price-Anderson Amendments Act.
- Promote high quality workplace medical services to DOE and contractor employees.
- Use epidemiologic analysis and public health activities to examine associations between exposures or conditions at DOE sites and potential adverse health effects among groups of workers and offsite populations to develop appropriate public health responses.
- Manage the health and environmental programs in the Marshall Islands for those exposed to ionizing radiation.
- Expand the knowledge of dose-response relationships of health effects of radiation using workers and populations with unique exposure to radiation as a result of accidents or environmental contamination in the former Soviet Union.
- Continue United States participation in support of the Radiation Effects Research Foundation.

Program Objectives

- Identify, prioritize, and conduct evaluations to determine the effectiveness of the Department's environment, safety, health, and safeguards and security policies and programs by providing coordinated and consistent independent oversight to customers.
- Report evaluation results to DOE senior management, the Congress, and the Defense Nuclear Facilities Safety Board.
- Provide information to line management that helps improve the performance and effectiveness of the Department's Federal workforce and contractor employees in matters related to environment, safety, health, and safeguards and security.
- Conduct and/or monitor accident investigations with a focus on identifying systemic causes so that further accidents can be prevented.
- Encourage contractors to voluntarily comply with nuclear safety requirements by encouraging proactive contractor initiatives to identify deficiencies before actual problems occur.
- Collect, analyze and disseminate lessons learned and exemplary practices to improve performance and technical safety.

- Support the systematic collection, analysis, and sharing of data on worker injury and illness with the intent of detecting emerging health issues and evaluating the impacts of changes in health and safety practices at DOE sites.
- Develop and implement, in partnership with the Department of Health and Human Services, a consolidated and coherent strategy for public health activities at DOE sites, which includes a public health agenda for each site.
- Investigate the effects of radiation exposure on the exposed populations in the Marshall Islands.
- Investigate the effects of radiation exposure on the children and workers exposed by the Chernobyl accident and exposed populations in the former Soviet Union.
- Collect and analyze data on the effects of radiation exposure on the survivors of the bombings of Hiroshima and Nagasaki, Japan.
- Support studies to assess the health of the DOE workforce and of populations living near DOE sites in order to determine whether worker or community health has been negatively impacted by DOE operations and disseminate findings.
- Identify, address, resolve, and close management and technical issues in order to ensure protection of public health and safety.
- Provide information to line managers that helps to improve the performance and effectiveness of the Department's workforce and contractor employees in matters related to environment, safety, health, and safeguards and security.
- Provide occupational and environmental health information to DOE workers, DOE communities and the general public.

Performance Measures

Performance measures are primarily qualitative rather than quantitative. However, some performance measures are:

- Downward trends in the numbers of previously identified environmental releases that reoccur.
- Decreased rates of occupational injury and illness.
- Downward trends in the recurrence of accidents.
- Increased customer satisfaction with oversight priorities, timeliness, consistency, and quality.
- Significant reductions in recurrence of environment, safety, health, and safeguards and security issues.
- Decreased radiological exposures and number of nuclear safety violations.
- Identification of at-risk worker populations and employment of appropriate mitigation measures to avoid adverse health outcomes by implementing a program that will establish systematic linkages between job and task analyses, exposure assessments, medical monitoring, and

epidemiological analysis. Continue shift from a reactive approach to emphasizing excellence and prevention in protecting worker and public safety and health.

- Initiation of investigation of reported health concerns within 30 days of identification.
- Satisfaction of former workers that issues surrounding their potential for occupationally-related disease are being addressed.
- Reduced number of outstanding actions and commitments for resolving environmental, health and safety issues identified by the Defense Nuclear Facilities Safety Board.
- Through studies of international populations, increased information defining the relationship between ionizing radiation dose and its effect on human health.
- Increased stakeholder satisfaction with access to information on DOE public and occupational health initiatives.
- Through studies of DOE community and worker population, increased information defining the relationship between exposures resulting from DOE facility operations and their effects on human health

Significant Accomplishments and Program Shifts

The Department has consolidated the management of Health Studies in the Office of Environment, Safety and Health to provide a focal point for ensuring that the results of these efforts are used for the maximum benefit of DOE workers and communities. The funding for these programs continues to be split between the Other Defense Activities and the Defense Environmental Restoration and Waste Management appropriations.

Significant Accomplishments and program shifts are defined within the respective business line description that follows.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request

Site Description

Albuquerque Operations Office

Albuquerque Operations Office is located on Kirtland Air Force Base in Albuquerque, New Mexico. The primary mission continues to be stewardship and maintenance of the Nation's nuclear weapons stockpile. In addition to the national security mission, the Operations Office also devotes significant resources to restoring and improving the environmental quality of operations. Albuquerque participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site.

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL), located in the town of Los Alamos approximately 35 miles northwest of Santa Fe, New Mexico, is a national resource for solving complex scientifical problems. LANL provides materials to communicate beryllium health risks and assists in the development of a test for screening of chronic beryllium disease through the collection and transmission of worker health, exposure, and demographic data at the site.

Pantex Plant

Pantex Plant, located on a 16,000-acre site on the High Plains of the Texas Panhandle, northeast of Amarillo, Texas, is America's only nuclear weapons assembly and disassembly facility. Pantex participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site.

Sandia National Laboratories

Sandia National Laboratories' main laboratory is located on Kirtland Air Force Base in Albuquerque, New Mexico. Sandia participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site.

Chicago Operations Office

Chicago Operations Office, Chicago, Illinois, is responsible for overseeing the operation of contractor-operated, multi-program laboratories such as Argonne National Laboratory, near Chicago, and Brookhaven National Laboratory. Technical support is provided to the Headquarters staff for the Departmental Representative to the Defense Nuclear Facilities Safety Board (DNFSB). The representative coordinates and tracks the resolution of findings and recommendations from the DNFSB.

Brookhaven National Laboratory

Brookhaven National Laboratory is located in Upton, New York on Long Island. As a non-defense research institution, BNL is dedicated to basic and applied investigation in a multitude of scientific

disciplines. BNL participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site and provides support to the EH medical line management program.

Idaho Operations Office

Idaho Operations Office, Idaho Falls, Idaho, uses applied engineering to clean up the cold war legacy, execute multi-program missions, and the Idaho National Engineering and Environmental Laboratory's expertise with emerging technology to meet the Nation's needs.

Idaho National Engineering and Environmental Laboratory

Idaho National Engineering and Environmental Laboratory (INEEL) is located 44 miles outside of Idaho Falls, Idaho. Lockheed Martin Idaho Technologies Company, as the prime contractor, participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site.

Nevada Operations Office

Nevada Operations Office, Las Vegas, Nevada, oversees and takes responsibility for the operations and programs of the Nevada Test Site. DOE Nevada maintains the capability at the Nevada Test Site and other facilities and sites to implement DOE initiatives in stockpile stewardship, crisis management, waste management, environmental, safety, and health management and programs, as well as supporting other DOE programs.

Bechtel Nevada

Bechtel Nevada manages operations at the Nevada Test Site and its related facilities and laboratories. Bechtel Nevada participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site and provides logistical support for medical care delivery to the Rongelop and Utirik exposed populations in the Marshall Islands.

Oakland Operations Office

Oakland Operations Office, Oakland, California, has multi-program expertise in the following areas: national security; environment, safety and health; and biomedical/environmental sciences. Oakland's core competencies to support the success of these programs include: program/project execution; laboratory contract management; environment, safety, health, and safeguards and security oversight; and business operations support. Oakland provides technical assistance in awarding grants and cooperative agreements in support of the Marshall Islands medical program, the Former Workers Program, and the International Health Studies program (i.e., Radiation Effects Research Foundation, Marshall Islands, and dosimetry studies).

Lawrence Berkeley Laboratory

Lawrence Berkeley Laboratory, Berkeley, California, pursues basic and applied research that advances the frontiers of science and solves a broad spectrum of national problems. It is a multi-program laboratory that serves the Nation's needs in technologies and environment, safety and health activities. Lawrence Berkeley Laboratory provides continuing support for the Comprehensive Epidemiologic Data Resource project.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory (LLNL) is located in California's Tri-Valley region east of San Francisco provides continuing support to the Marshall Islands program by providing environmental sampling and analysis to determine the radiological conditions at the affected atolls.

Oak Ridge Operations Office

Oak Ridge Operations Office, Oak Ridge, Tennessee, is responsible for research and development, defense programs, environmental management, and environment, safety and health activities. There are three major plant complexes on the Oak Ridge Reservation: Oak Ridge National Laboratory; Y-12 Plant; and the East Tennessee Technology Park, as well as the Oak Ridge Institute for Science and Education and the American Museum of Science and Energy.

Oak Ridge Institute for Science and Education

Oak Ridge Institute for Science and Education (ORISE) is a Department of Energy facility managed and operated by Oak Ridge Associated Universities. It is a resource for science education programs to train the workforce in health, safety, and security, emergency preparedness and response, and radiological site characterization activities. ORISE also provides technical expertise to the follow-up study of beryllium workers throughout the DOE complex; provides EH support to REAC/TS (Radiation Emergency Accident Center/Training Site); and support to the Former Workers program. ORISE will also support the medical monitoring of former radiation workers at Rocky Flats.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL), Roane County, Tennessee, is a multi-program science and technology laboratory. Scientists and engineers at the laboratory participate and support environment, safety, and health activities; increase the availability of clean, abundant energy; restore and protect the environment; and contribute to national security. ORNL assists with the beryllium rulemaking task that was begun in FY 1998.

Ohio Field Office

Ohio Field Office is comprised of the Fernald Area Office, the Miamisburg Area Office, the West Valley Area Office, the Ashtabula Area Office, the Columbus Area Office, and the Ohio Support Office (also

located at Mound Plant in Miamisburg, Ohio). The Ohio Field Office develops strategies to control lost-time accidents and worker's compensation claims, and implements a team approach to ensure a safe work ethic. The Ohio Field Office is responsible for environmental restoration, waste management, and other programmatics at its four area offices. The Ohio Field Office ensures that the environment and the health and safety of DOE employees, contractor employees, and the general public are protected.

Fluor Daniel Fernald

Fluor Daniel Fernald is a global engineering, construction and diversified services corporation located in Cincinnati, Ohio. In August 1992, DOE awarded Fluor Daniel Fernald a five-year cleanup contract with a two-year contract extension in December 1997. The company is responsible for managing Fernald's environmental restoration activities, including managing existing waste, as well as any waste generated during cleanup activities, and the safe handling and processing of raw materials and products resulting from past operations at Fernald. This includes all environment, safety and health activities. The company participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site.

Richland Operations Office

Richland Operations Office, Richland, Washington, manages waste products; develops, applies, and commercializes technologies; manages environment, safety and health activities; and supports cleanup and environmental restoration. Richland also provides technical support to the U.S. Transuranium Registries for the study of biokinetics of transuranium radionuclides in humans to evaluate high priority cases and publish results of radiochemical analyses, and supports international health study efforts.

Hanford Environmental Health Foundation

Hanford Environmental Health Foundation (HEHF), Richland, Washington, provides occupational health services through health risk management and occupational health services to personnel at Hanford. Through these services, HEHF strives to maximize the health and safety of Hanford personnel while minimizing personnel and occupational heath risks. HEHF participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory (PNNL), Richland, Washington, develops and delivers new and effective environment, safety and health technologies. PNNL also provides technical support in preparing policies, procedures, and guides, as well as developing materials that address the oversight process and protocols that are used for program implementation, planning, analysis of evaluation results and trends, and compilation of policy issues related to the evaluations. PNNL also provides technical support for recurring safety management evaluations, safeguards and security inspections, as well as site profile development, accident investigations, and other special studies and reviews. PNNL also assists in tracking and trending corrective action, developing and disseminating lessons learned, and tracking issues related to the program for follow-up and analysis. PNNL provides support to the epidemiologic

surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site, and the international health studies program.

Rocky Flats Field Office

Rocky Flats Field Office, Golden, Colorado, is responsible for managing waste and materials, cleaning up and converting the Rocky Flats Environmental Technology Site to beneficial use in a manner that is safe, environmentally and socially responsible, physically secure and cost-effective. The Rocky Flats Office supports the Beryllium Workers Health Surveillance Program and the Former Radiation Worker Surveillance Program including screening and diagnostic medical evaluations for chronic beryllium disease to former employees participating in the program.

Kaiser-Hill Company

Kaiser-Hill Company, Golden, Colorado, is responsible for the management of the Rocky Flats site and team integration. The company participates in the epidemiologic surveillance program through the collection and transmission of worker health, exposure, and demographic data at the site.

Savannah River Site

Savannah River Site, Aiken, South Carolina, is responsible for serving the national interest by ensuring that programs, operations and resources are managed in a safe, open and cost-effective manner to: support current and future national security requirements; reduce the global nuclear proliferation danger; protect and restore the environment while managing waste and nuclear materials; and conduct mission-supportive research and technology development. Savannah River Operations provides technical support to the epidemiologic surveillance program through collection and transmission of worker health, exposure, and demographic data at the site.

All Other Sites - Headquarters (Includes Commercial Contracts, Other Federal Agencies, and Universities)

The evolving short term needs for national-level expertise in a multitude of disciplines can best be met through the use of contractors who can rapidly respond to the continually changing skill mix required of EH across the DOE complex. Contract support is also more practical and cost-effective to provide a surge pool of technical expertise effectively and efficiently. In addition, contractors provide legal, technical, and analytical services to support the investigation of alleged violations of the Price-Anderson legislation.

Contractors also provide technical expertise in conducting oversight activities at DOE facilities. These activities include inspections, safety management evaluations, safeguards and security evaluations, special studies, site profiles, and analyses utilizing specialized technical expertise to obtain an appropriate skill mix and surge capability.

Under a Memorandum of Understanding, the Department of Health and Human Services provides support to DOE in health studies of DOE workers and communities around DOE sites. Wire payments are made to various agencies and institutions of the former Soviet Union to continue work performed by the International Health Studies office.

Oversight

Mission Supporting Goals and Objectives

The mission of the independent Oversight program is to provide the information and analysis needed to ensure that the Secretary of Energy, Assistant Secretary for Environment, Safety and Health, Department and contractor management, Congress, workers, unions, and the public have an accurate and comprehensive understanding of the effectiveness, vulnerabilities, and trends of the Department's environment, safety, health, safeguards and security policies and programs. The primary goal of the Office of Oversight is to be a catalyst that promotes constructive change in the Department's environment, safety, health, safeguards and security management programs. This goal is accomplished by: providing an independent evaluation and analysis of the status of environment, safety, health, safeguards and security programs; accurately reporting the status to DOE managers and other constituents; and conducting timely follow-up activities to validate that appropriate corrective actions are being taken.

The Office of Oversight conducts independent assessments that are reported directly to DOE senior management and Congress. These reviews are a critical aspect of DOE's ability to verify that it can protect the environment, workforce, and public. The reviews can be a key factor in DOE management decisions about contracts or the future of DOE facilities (e.g., the decision to terminate the Brookhaven contract). Accordingly, the independent oversight mission receives intense scrutiny and must perform with a high level of excellence. Therefore, it must use national-level experts that have unquestioned credentials for its ongoing inspection and evaluation efforts.

In essence, the Office of Oversight needs the technical support of national-level experts that are at least comparable to Federal personnel at the excepted service level. While EH has some unique, national-level experts, only a few are available to support oversight activities. Further, because of the nature of the activities, contract support continues to be more practical and cost-effective to provide a surge pool of technical experts than expanding the Federal oversight staff for a number of reasons:

- Peak loads associated with onsite inspections make it more effective and efficient to use contractor personnel who are tasked only when needed.
- The need for evaluators with national-level expertise in over 50 different technical disciplines (ranging from industrial hygiene to nuclear material control and accountability) is more efficiently provided by contractors. The needs for various technical expertise are continually evolving and frequently change as new needs are identified (e.g., the Brookhaven tritium contamination prompted a need for expert-level groundwater modeling personnel). Such evolving needs can best be met through use of contractors as the Federal staff and personnel systems are unable to rapidly respond to the continually changing skill mix.

Similarly, because of the nature of Oversight activities and the intense scrutiny that Oversight is under, Oversight reviews must be performed in a manner that is demonstrably unbiased. A critical aspect of an unbiased review is that Oversight's personnel must be able to participate without even the perception of a conflict of interest. The EH staff (i.e., non-Oversight staff) perform technical assistance activities and thus have a significant potential bias in that they would be in the position of evaluating their own work

and/or advice. Such conflicts of interest present a significant problem to using EH staff to support Oversight assessments.

The mission of the independent oversight program is accomplished through the following key activities:

EH Residents provide real time feedback on the status of field environment, safety, health, safeguards and security programs. The EH Residents evaluate performance through a comprehensive surveillance program, follow-up and verify closure of identified deficiencies, and provide regular updates on the status of corrective actions and upgrades.

Evaluations of environment, safety, health, safeguards and security policies and implementation of policies by DOE line management organizations are performed. Evaluations are an independent assessment of Departmental performance against orders, standards, policies, and other pertinent regulations, with a particular emphasis on DOE line management performance with respect to the Department's integrated safety management policy.

Accident Investigation Program ensures that accidents occurring at DOE sites are adequately investigated such that root causes are determined, lessons learned are disseminated, and corrective actions are implemented and verified. The Office of Oversight conducts systematic investigations of the most serious (Type A) accidents and guides and monitors the conduct of less serious accidents (Type B) that are performed by the field elements. The Office of Oversight also provides guidance for performing investigations and performs analysis of trends and precursors.

Analysis ensures the integrated collection, analysis, and dissemination of results of oversight activities. The oversight analysis activity analyzes data obtained from oversight evaluations, provides the information necessary to plan and schedule evaluation efforts, and maintains the supporting infrastructure elements to ensure that adequate follow-up is performed at DOE sites.

Enforcement provides oversight of the Price-Anderson Amendments Act enforcement activities of the Department. This primarily includes conducting investigations and technical evaluations of DOE contractors performing nuclear operations at DOE sites that are indemnified under the Price-Anderson Amendments Act. Contractors are encouraged to be proactive in identifying and correcting nuclear safety deficiencies to minimize enforcement actions.

Defense Nuclear Facilities Safety Board (DNFSB) Liaison provides effective cross-organizational leadership in resolving Board-related technical and management issues necessary to ensure public health and safety. This office represents the Secretary in regular and continuing interactions with the Board, and advises the Secretary, Deputy Secretary, Under Secretary, Secretarial Officers, and other Department Executives of the Board's priorities, concerns, actions and plans.

The following commitments made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy have been accomplished:

- Through independent oversight, provide information and analysis of the effectiveness, vulnerabilities, and trends of the Department's ES&H and safeguards and security policies and programs to the Secretary and senior line management.
- Consider stakeholder concerns in formulating oversight evaluations; and provide stakeholders with the result of EH's independent oversight studies.

Significant Accomplishments

EH Residents

- The EH Residents continue to collect beneficial data from numerous sources and at sites they are assigned to monitor. They consistently tour the facilities, respond to events, identify safety concerns, provide real-time updating, and communicate with line management. They have performed over 200 comprehensive EH Resident surveillances and follow-up activities, including following up on occurrence reports, accident investigations, and Office of Oversight evaluations, reviews and special studies. The process has matured and developed which leads to efficiencies in operations. (FY98: $500; FY99: $350; FY00: $350)
- Develop methods and procedures for collecting, collating, evaluating, and retrieving data in the field. The EH Residents have well-developed procedures and processes that define how they do business. This included the development of an "issues tracking system" designed to track issues identified as the result of EH Residents surveillance activities, occurrence reports, accident investigations, and Office of Oversight evaluation and review activities. (FY98: $100; FY99: $50; FY00: $50)
- Provide information to DOE management on problem areas by performing special reviews, such as the EH Residents review of radiation protection effectiveness across the Department's complex. Perform other special reviews as needed to increase the effectiveness of EH Residents oversight and follow-up of issues identified as the result of Office of Oversight activities. (FY98: $100; FY99: $100; FY00: $100)
- Provide input to the 20 site profiles maintained by the Office of Oversight. The profiles are updated twice each year and validated with field managers by the EH Residents to ensure accuracy. The profile updating process, which includes EH Residents participation, provides a consistent and uniform approach for maintaining an accurate and current profile of the status of hazards, strengths, weaknesses, and upgrades at key DOE facilities. Additionally, the profiles provide a basis for DOE-wide priorities and focus assessments on significant problems and trends. This was the first comprehensive compendium of environment, safety, and health issues at DOE facilities. The process has matured and streamlined for cost-effective operations.
  - Subsequent efforts provided field-validated input to site profiles for additional facilities and expanded the scope to include safeguards and security issues.
  - Continued monitoring field activities, participated in planning and conduct of comprehensive evaluations, and provided input to maintain the site profiles. Published the weekly summary of major EH Residents issues provided to senior DOE managers and to the Secretary of Energy's staff. Continued follow-up activities to ensure DOE managers have current and validated information. Program recognized complex-wide as an important element in a comprehensive system of oversight, site profiles, monitoring, follow-up, and continual updating of status. (FY98: $200; FY99: $100; FY00: $100)

Evaluations

- Conduct environment, safety, and health (ES&H) evaluations consisting of reviews of 4-6 major sites per year using the integrated safety management system policy and the safety management template as a framework for evaluating line management performance. Promote improvements in line management, reliability of safety systems, and programs essential to ES&H. Evaluations have identified and continued to identify significant, systemic ES&H vulnerabilities. They have provided a clear, positive benefit to the Department through safety risk and liability reduction, significant cost reductions, and the elimination of unwise expenditures. These evaluations are the Department's comprehensive and integrated approach to internal independent oversight of DOE and contractor line management. (FY98: $3,100; FY99: $3,100; FY00: $3,100)
- Conduct an ongoing program of safeguards and security evaluations and site profiles of major sites each year, which determines the effectiveness of the protection of nuclear weapons components, special nuclear material, and classified and sensitive information. Through the development of safeguards and security profiles, the Office of Oversight has maintained a comprehensive baseline of safeguards and security programs throughout the Department. By applying the guiding principles of safety management, safeguards and security evaluations and site profiles have been enhanced. (FY98: $1,900; FY99: $1,900; FY00: $1,900)
- Perform special reviews and studies of policies, programs, and their implementation in the field to identify program an be corrected. Streamlining of operations has produced cost effective results. (FY98: $1,100; FY99: $1,000; FY00: $1,000)
- Continue to conduct the first systematic follow-up program designed to determine the effectiveness of actions taken to correct weaknesses identified as the result of oversight evaluations or resulting from accident investigations. Particular attention is placed on sites previously identified as having significant ES&H problems, such as Los Alamos, Brookhaven, Rocky Flats, and Hanford. Follow-up activities are particularly important in implementing accountability of line management for ES&H performance and in protecting the environment and ensuring the safety and health of workers and the public. Data from this program are used to develop site profiles for senior DOE managers in site-specific decisionmaking. Procedures for follow-up activities have been re-vamped for efficiency and conduct of operations. (FY98: $3,300; FY99: $2,200; FY00: $2,200)
- Continue the qualification standards program. Office of Oversight personnel achieved greater than 90 percent of the qualification standards during the first year. Personnel development and requalification programs are ongoing. (FY98: $240; FY99: $150; FY00: $150)
- Continue the certification program for safeguards and security personnel by administering challenging certification tests designed to demonstrate safeguards and security topical knowledge and the ability to apply that knowledge to real-world problems. (FY98: $100; FY99: $100; FY00: $100)
- Continue to revise and refine evaluation methods and procedures that focus on the principal elements of the integrated safety management program that include line management accountability, clear roles and responsibilities, technical competence, balanced priorities, identification of safety standards and requirements, hazard controls, and operations authorization.

This also includes the dissemination of useful tools to increase the effectiveness of field programs. (FY98: $400; FY99: $350; FY00: $350)

- Conduct an ongoing program of environmental audits in compliance with the Executive Order, "Greening the Government Through Leadership Environmental Management." As part of this compliance audit function, facility level environmental regulatory audits, routine environmental regulatory compliance audits, environmental management systems audits, audits of compliance with toxic release inventory reporting and emergency planning and reporting requirements will all be conducted. (FY98:$00; FY99: $00; FY00: $800)
- Develop and maintain a safety management template and a comprehensive set of performance objectives and criteria that consistently promote and reinforce effective application of the safety management principles. The template, performance objectives and criteria are periodically updated and enhanced to increase the effectiveness of the Office of Oversight evaluation program. (FY98: $100; FY99: $100; FY00: $100)

Accident Investigation Program

- Conduct Type A accident investigations at DOE facilities. This is accomplished with a focus on management systems to achieve the ultimate objective of preventing accidents and injuries. Continue streamlining and enhancing the accident investigation program to be more effective in reducing accidents (e.g., reports that focus on lessons learned) and more useful to management (e.g., streamlined reporting procedures that result in more concise reports in a shorter period of time). Continue to update policies and procedures and to enhance the investigative process. (FY98: $100; FY99: $100; FY00: $100)
- Continue a program to present accident investigation techniques, revise methods for implementing the accident investigation program, develop functional program materials for DOE Headquarters and field personnel, identify precursors to accidents including a review of the Type B accident investigations performed by the field, disseminate lessons learned, and follow-up on corrective actions. (FY98: $200; FY99: $200; FY00: $200)

Analysis

- Develop and maintain a core analysis capability solely dedicated to the analysis of data collected by Office of Oversight activities and available from Departmental databases and other sources. It includes subject matter expertise, policy analysis, coordination of follow-up efforts, data analysis, and reporting (including annual reports and special papers). Provide analytical information to keep the Office of Oversight, DOE Headquarters, and field managers informed and, ultimately, to help improve ES&H and S&S programs at DOE facilities. Identify trends and issues that are beneficial to the Office of Oversight in its evaluation planning and scheduling efforts. The process has matured and developed providing efficiencies of operations. (FY98: $650; FY99: $400; FY00: $400)
- Develop a program infrastructure that provides for an effective independent oversight program, including policies and procedures, handbooks, information management systems, and tools. Develop an electronic document management and tracking system that provides for retention,

storing, and tracking of Office of Oversight documents, as well as linkage to DOE information databases and other information sources. (FY98: $100; FY99: $100; FY00: $100)

- Develop a comprehensive certification program, including office-specific qualification program standards, and appraisal analysis of management systems. Program has been developed. (FY98: $150; FY99: $0; FY00: $0)
- Develop 20 site profiles. Update and disseminate the site profiles based on input from EH Residents, Office of Oversight evaluations and reviews, and other sources. The Office of Oversight ensures that the most significant issues and findings at all key sites, and the status of their corrective actions, are documented in the site profiles. The site profiles are revised twice each year. (FY98: $100; FY99: $100; FY00: $100)

Enforcement

- In cooperation with DOE Field and Program Offices, conduct the Price-Anderson Amendments Act Enforcement program at each DOE nuclear site and perform nuclear safety enforcement activities. Perform Price-Anderson-related investigations and technical evaluations of DOE nuclear safety requirements involving DOE indemnified contractors utilizing a process that provides for an orderly transition to an external enforcement regulator in the future. Encourage contractors to proactively identify and correct nuclear safety deficiencies using an enforcement approach similar to the commercial nuclear industry. Iincreased on-site reviews need to be conducted for a more robust nuclear safety enforcement program. (FY98: $975; FY99: $800; FY00: $975)

Defense Nuclear Facilities Safety Board Liaison

- Coordinate the Board recommendation process through line organizations by developing responsive implementation plans, resolving technical and management issues, completing commitments, and ultimately closing recommendations. Historically, the Department receives 4-5 major Board recommendations each year and is actively working 15-20 open recommendations. Also, the Board activities and actions will increase. (FY98: $200; FY99: $150; FY00: $200)
- Manage the Department's interface activities and provide direction and advice to line managers on Board-related matters. Participate in, and manage preparation and follow-up for over 300 annual meetings and site visits between Department staff and Board staff. (FY98: $150; FY99: $150; FY00: $150)
- Coordinate responses to Board reports and inquiries. Manage the Department's Safety Issues Management System (SIMS) for Board-related issues, commitments, and actions, which tracks over 1000 Department commitments and actions related to Board recommendations and other correspondence. (FY98: $100; FY99: $100; FY00: $100)
- Maintain the Department's central repository of official Board communications and make this information available to Department and contractor personnel complex-wide. Annually, 250-350 pieces of Board/Department correspondence are received and addressed. This information is available to the public on the Internet. Over 1400 pieces of Board/Department correspondence

are available on the web site in multiple file formats for customer convenience. Documents are posted in 1-3 business days to facilitate action. The Board activities and actions will increase. (FY98: $150; FY99: $100; FY00: $150)

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
EH Residents	900	600	600	0	0.0%
Evaluations	10,240	8,900	9,700	+800	9.0%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
EH Residents			
■ The primary functions of the EH Residents, comprehensive and systemic surveillances and follow-up activities of evaluation results, are well established. They provide the day-to-day, real time monitoring of environment, safety, and health (ES&H) and safeguards and security (S&S) activities at the sites, as well as the follow up of corrective actions associated with previously identified issues and deficiencies. Experience since late 1994 and the application of zero-based budgeting procedures have demonstrated that this funding level is appropriate with increased efficiencies in operations. These on-site functions of data collection will continue to be key to the independent oversight program well into the future. Particularly with regard to the performance measures, increased customer satisfaction relative to timeliness, consistency, quality, and the reduction in recurrence of ES&H and S&S issues. Environment, safety, and health are identified as one of the three areas critical to the success of the Department's business lines identified in its strategic plan	500	350	350
■ To accomplish its mission, the Office of EH Residents have developed methods and tools to collect data and provide for real-time updating of issues. An "issues tracking system" was developed early on and, through experience, has proven to be invaluable. Other methods and procedures utilized in the Resident program are well developed, such as surveillances which coincide with major site issues working with the Field Managers. This funding level is considered appropriate for sustaining and continuing to improve these important operational mechanisms. The funding level was primarily derived through experience and zero-based budgeting techniques. The methods and procedures for collecting data are key to effective mission accomplishment and, in turn, help ensure the safety and health of workers and the public	100	50	50

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Special reviews conducted by the EH Residents have provided important insights for the independent oversight program and for the DOE. By pooling their collective knowledge and experience, the Residents are particularly qualified to conduct special reviews in the field which will become even more important in the future as the program continues to improve. These reviews, which are topical in nature like the radiation protection special review requested by the Defense Nuclear Facilities Safety Board, along with the follow-up activities, are considered essential. The funding level is considered appropriate and was derived through recent experience–radiation protection reviews and a review of the Department's Computerized Accident/Injury reporting system (CAIRS)–and zero-based budgeting techniques. These functions are directly linked to the performance measures, particularly decreased radiological exposures and number of nuclear safety violations, and the decreased rates of occupational injury and illness. These also are important objectives outlined in the EH strategic plan.	100	100	100

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Provide field input to the Office of Oversight site profiles that provide a consistent and uniform approach for maintaining an accurate and current profile of the status of hazards, strengths, weaknesses, and upgrades at key DOE facilities. Provide a basis for DOE-wide priorities and focus assessments on significant problems and trends. In subsequent efforts, provide field-validated input to site profiles for additional facilities and expand the scope to include safeguards and security issues. Development and semiannual updating is one of the most important Office of Oversight innovations, and the EH Residents provide the most important means of obtaining accurate information for maintaining the site profiles. The profiles are recognized Department-wide and have become an important tool in effectively accomplishing the independent oversight mission. Therefore, the funding level is considered appropriate in maintaining this important effort and increasing its effectiveness in the years to come. The funding level was determined through extensive experience in producing the 20 profiles (i.e., obtaining data, updating, validating the profiles with the field, and publishing) and in comparison with mission requirements and other oversight products to ensure cost-effectiveness, timeliness, consistency, and quality. The profiles not only provide important information relative to key sites, but also identify issues and the status of the issues at these sites. Using the profiles as a baseline, trends can be identified (e.g., environmental releases, recurrence of accidents, corrective action effectiveness, etc.) that assist in accomplishing the goals outlined in the EH strategic plan.	200	100	100
Total, EH Residents	900	600	600

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Evaluations			
■ Conduct an ongoing program of environment, safety, and health evaluations of 4-6 major sites per year. Office of Oversight identify, and continue to identify, significant, systemic ES&H vulnerabilities. These evaluations serve as the Department's comprehensive and integrated approach to internal, independent oversight of DOE and contractor line management. They provide a clear, positive benefit to the Department through safety risk and liability reduction, significant cost reduction, and the elimination of unwise expenditures. In short, these comprehensive evaluations have become the focal point of the independent oversight program in the areas of environment, safety and health. The funding level is based on experience in conducting the evaluations, as well as zero-based budgeting determinations. Integrated management evaluations of ES&H programs directly relate to the performance measures relative to ES&H issues, oversight priorities, injury and illness, and the safety and health of workers and the public. Environment, safety, and health is one of the three areas critical to the success of the DOE business lines outlined in the DOE strategic plan. . .	3,100	3,100	3,100
■ Conduct an ongoing program of safeguards and security evaluations consisting of reviews of major sites each year. These oversight functions, that directly relate to DOE's national security interest outlined in its strategic plan, are well developed. They predate the Office of Oversight by over eight years in the form of the Office of Security Evaluations, incorporated as part of the Office of Oversight in late 1994. The funding level has been developed over a long period of time, through numerous budget preparations, and is well established. The funding level is appropriate, and therefore, represents a continuation of this important program, the only one of its kind in the Department. The program has directly contributed to significant reductions in recurrence of safeguards and security issues and is linked to fulfilling the national security responsibilities outlined in the strategic plans, specifically: to effectively support and maintain a safe, secure, and reliable enduring stockpile.	1,900	1,900	1,900

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Special studies and reviews have been an important part of the Office of Security Evaluations and, later, the Office of Oversight. Issues and problems not normally covered by the more traditional oversight functions (i.e., safety management evaluations, safeguards and security inspections, EH Residents surveillances and follow-up activities, and analysis efforts) are often referred to the Office of Oversight. For example, reports have included the Molten Salt Reactor Experiment, Occurrence Reporting Programs within DOE, the Aviation Safety Review, the Brookhaven National Laboratory Tritium Plume Interim Review, the Employee Assistance Program Referral Option Review, and the Emergency Management Review. All are examples of the kinds of reviews and special studies conducted by the Office of Oversight that have contributed to a particular issue in which senior DOE managers were interested. This has been a recurring and appropriate function for the independent oversight program, a program best suited to provide an unbiased evaluation of a particular Departmental issue. The funding level is appropriate especially with increased efficiencies of operations, and is determined over time through experience in dealing with the more non-traditional type of oversight reviews and studies–over 38 reviews and special studies since late 1994. This function is linked to increased customer satisfaction with oversight priorities, timeliness, consistency, and quality. Also, by providing senior managers with an independent view of particular issues, this function directly supports DOE's four business lines listed in its strategic plan: energy resources, national security, environmental quality, and science and technology.	1,100	1,000	1,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The follow-up function is relatively new and has gained a great deal of momentum over the past few years. "Follow-up" is an essential ingredient in the oversight program in determining the effectiveness of actions taken to correct weaknesses identified as the result of evaluations, accident investigations, and special studies and reviews. The funding level has been determined through careful study and zero-based budgeting techniques, and as the result of recent experience in this important area as well as change in procedures for efficiency and streamlining of operations. The performance measures linked to this important function are: (1) downward trends in previously identified issues; (2) decreased rates of occupational injury and illness; (3) downward trends in recurrence of accidents; and (4) a significant reduction in recurrence of ES&H and safeguards and security issues. Also, the function is directly related to an increase of customer satisfaction with oversight priorities, timeliness, consistency, and quality. All follow-up activities directly relate to accomplishment of the ES&H and national security goals discussed in the DOE and EH strategic plans (i.e., national security and environmental quality).	3,300	2,200	2,200
■ The conduct of evaluations requires the efforts of qualified, experienced inspectors and evaluators. In addition to recruiting qualified staff, the Office of Oversight has developed programs to ensure these individuals maintain a high degree of competence. Qualification standards and re-qualification programs have been mainstays within the independent oversight program since its inception. In fact, the original overall program was developed for the Office of Security Evaluations. The funding level is appropriate and is well established. This internal, continuous improvement program directly supports the mission of the Office of Oversight and, therefore, contributes directly to the strategic goals of EH and the Department.	240	150	150

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The certification program is specifically designed for safeguards and security personnel and focuses on "certification." The program is well developed, and its funding level has been determined over a long period of time and through numerous budgeting efforts. The certification of safeguards and security inspectors directly relates to the Office of Oversight mission of conducting safeguards and security evaluations, maintaining safeguards and security profiles on key DOE sites, and providing senior DOE management with an independent view of the status of safeguards and security policies and programs throughout the complex.	100	100	100
■ As a direct result of the experiences and expertise developed within the Office of Oversight, it is able to provide tools and share information (handbooks, videotapes, and lessons learned) with numerous organizations within the Department. This is an important "information sharing" effort carried out by an organization in an ideal position to do so. The funding level has been determined by experience and by the expressed needs of the ES&H and S&S communities. The funding level is important and appropriate. The function has much to do with sharing lessons learned and is tied directly to performance measures relating to trends, consistency, and quality of oversight products. The function enhances the independent oversight program and directly contributes to the ES&H and S&S goals of EH and the Department as expressed in the strategic plans.	400	350	350

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Conduct an ongoing program of environmental audits in compliance with the Executive Order, "Greening the Government Through Leadership in Environmental Management." These evaluations serve as the Department's comprehensive and integrated approach to compliance with environmental regulations for Executive Agencies. Requirements of the Executive Order that will be accomplished are: development and implementation of a regulatory compliance audit program; facility level environmental regulatory compliance audits; routine environmental regulatory compliance audits or environmental management systems audits (every three years); reviews and audits of compliance with toxic release inventory reporting and emergency planning and reporting requirements; and updating audit protocols with the requirements of DOE's environmental management systems. Some environmental areas for review are toxic release inventory and emergency planning, environmental monitoring, pollution prevention effectiveness, waste characterization.	0	0	800
■ The comprehensive set of performance objectives and criteria is a primary tool used to ensure consistency and thoroughness in the conduct of ES&H reviews and integrated safety management evaluations. The template was originally developed by the Office of Oversight and has received Department-wide recognition. The performance objectives and criteria provide the detail necessary to carry out the oversight evaluations. The funding level is appropriate and was derived since the creation of the Office of Oversight in late 1994 and as the result of numerous safety management evaluations and individual efforts. The funding level is well developed and directly relates to ES&H issues mentioned in the performance measures. Specifically, a significant reduction in recurrence of ES&H issues, satisfaction with oversight quality, and ensuring the safety of workers and the public. The template, performance objectives, and criteria have proven extremely valuable in fulfilling the mission of the Office of Oversight and, therefore, directly relate to the successful accomplishment of the goals listed in the EH and DOE strategic plans	100	100	100
Total, Evaluations	10,240	8,900	9,700

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Accident Investigation			
■ The DOE Accident Investigation Program was assigned to the Office of Oversight in 1995. Since then, the program has been streamlined. Accidents are now responded to in a highly coordinated, timely, and focused manner. The funding level was determined by experience with the new, streamlined program, by zero-based budget processes, and by comparison to the previous program, which was much more costly. The functions related to the program link directly to the downward trend in the recurrence of accidents performance measure. Also, the program is linked to the strategic plans relative to worker safety and environmental quality	100	100	100
■ Develop functional program materials and present accident investigation techniques and revised methods for implementing the accident investigation program to DOE Headquarters and field personnel. These materials have been developed or updated (i.e., the DOE Order) since the program was transferred to the Office of Oversight. The effort was successful and is appropriate. The information is incorporated into the Office of Oversight's analysis effort to provide a comprehensive program. The funding level was determined through experience and the actual cost of developing the necessary materials and methods used in fulfilling the goals of the program. This program is now well established and will continue to be enhanced in the years to come	200	200	200
Total, Accident Investigation	300	300	300

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Analysis			
■ The Office of Oversight has developed a core analysis capability solely dedicated to the analysis of data collected by oversight activities and available from Departmental databases and other sources. The analysis data feeds into all oversight activities for planning purposes. The funding level was established based on experience and a mature process providing for efficiencies in operations of streamlining activities and by zero-based budget techniques. The effort directly links to all performance measures relating to measuring trends in ES&H and S&S and other areas of interest. Additionally, the analysis group enables the Office of Oversight to better focus its resources and its evaluations efforts.	650	400	400
■ Develop and maintain the independent oversight program infrastructure, including procedures, handbooks, information management systems, and tools.	100	100	100
■ Developed the infrastructure and programmatic guidance for the comprehensive certification program that includes the technical qualification program standards and appraisal analysis of management systems.	150	0	0
■ Develop, disseminate, and update the site profiles based on input from the EH Residents, Office of Oversight evaluations and reviews, and other sources	100	100	100
Total, Analysis	1,000	600	600
Enforcement			
■ Continue to conduct approximately 10 full field investigations resulting in formal enforcement actions involving Notices of Violation related to Price-Anderson Amendment Acts enforcement activities.	975	800	975
Total, Enforcement	975	800	975
Defense Nuclear Facilities Safety Board Liaison			
■ Coordinate the Board recommendation process.	200	150	200
■ Manage the Department's interface activities.	150	150	150
■ Coordinate responses to Board reports and inquiries.	100	100	100

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Maintain the Department's central repository of official Board communications.	150	100	150
Total, Defense Nuclear Facilities Safety Board Liaison	600	500	600
Total, Oversight	14,015	11,700	12,775

Explanation of Funding Changes from FY1999 to FY2000

	FY 2000 vs. FY 1999 ($000)
Evaluations	
■ Conduct an on going program of environmental audits in compliance with the Executive Order, "Greening the Government Through Leadership in Environmental Management."	+800
Enforcement	
■ Conduct increased site reviews and emphasis on a more robust nuclear safety enforcement program	+175
Defense Board Liaison	
■ Responding to Board actions based on increased activities	+100
Total Funding Change, Oversight	+1,075

Health Studies

Mission Supporting Goals and Objectives

The Health Studies program promotes the health and safety of DOE's workers and communities surrounding Department sites, and supports studies to understand the effects of radiation and other hazards associated with the DOE operations on humans. It is comprised of four programs: Occupational Medicine, Public Health Activities, Epidemiologic Studies, and International Health Programs. Additional funding for Public Health Activities is included in the Defense Environmental Restoration and Waste Management Appropriation.

Occupational Medicine provides the Department's occupational medicine clinics with policies, guidance and tools necessary for them to identify and track occupationally related health effects among worker populations, effectively communicate to workers the reasons for and results of medical testing and surveillance conducted, and identify opportunities to prevent or mitigate work-related injuries and illnesses.

Public Health Activities support health studies, health education and promotion, and other public and occupational health related initiatives at DOE sites pursuant to a consolidated and coherent strategy which includes a public health agenda for each site. Community and worker health studies are conducted in partnership with the Centers for Disease Control and Prevention (CDC) and the Agency for Toxic Substances and Disease Registry (ATSDR) under a Memorandum of Understanding (MOU) with the Department of Health and Human Services (HHS). This program supports studies to assess the health of populations living near or working at DOE sites in order to determine if the health of workers and nearby communities has been impacted by DOE operations. Information from the health studies is communicated to the DOE workforce, line management and community stakeholders. Additional funding for this initiative is found in the Defense Environmental Restoration and Waste Management portion of this budget.

Epidemiologic Studies collect worker injury and illness surveillance data on the current workforce needed to identify emerging worker health issues associated with job exposures and to evaluate the impact of health and safety practices at DOE facilities. This program includes communication of occupational and environmental health information to DOE workers, DOE communities, and the general public. The program facilitates interventions that reduce or eliminate worker risks and provides a means to evaluate these corrective actions once implemented.

International Health Programs provide health and environmental programs in the Marshall Islands for those populations and land areas exposed to radioactive fallout from the U.S. atmospheric nuclear testing program in the Pacific. In addition, research programs are supported to expand the knowledge of radiation health effects among workers and populations exposed to ionizing radiation as a result of accidents or environmental contamination in the former Soviet Union and Spain.

Significant Accomplishments

Occupational Medicine

Medical Surveillance of Current and Former Workers

- Provide medical monitoring for current and former DOE employees at risk for occupational disease, particularly chronic beryllium disease. Plan and implement expanded medical surveillance and disease prevention and exposure control programs across DOE sites for workers who have been exposed to beryllium. Continue to support the research and innovation in exposure assessment and medical surveillance. Continue support for DOE former workers program, in response to Section 3162 of the Defense Authorization Act of 1993, by conducting the second phase of the ongoing pilot program at ten DOE sites for evaluating the health of former workers who may be at significant risk due to past occupational exposures. (FY98: $9,650; FY99: $10,681; FY00: $10,681)

  - Complete an additional four needs assessments for establishing the basis of a more detailed program of medical follow-up and, at six sites, begin to implement a medical surveillance program for former workers.

- Continue testing and demonstration of the Medical Surveillance Information System (MSIS). (FY98: $900; FY99: $850; FY00: $850)

  As part of this program, the following commitment made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy has been accomplished:

  - Through a pilot linkup with the Y-12 site, demonstrate capability of the relational software developed as part of the Medical Surveillance Information System (MSIS) to allow DOE occupational medicine staff (and other Headquarters and site health professionals) to look at worker cohorts and analyze site-wide and complex-wide worker health trends.

- Continue technical assistance visits to site occupational medicine clinics to support Operations Office efforts in providing direction in the efficient delivery of quality occupational medical services. Serve as a focal point for communication within the Department on occupational health by preparing and disseminating health risk and protection data and facilitating the sharing of information between and among research and operating organizations. Update and revise the occupational medicine section of DOE Order 440.1, "Worker Protection Management for DOE Federal and Contractor Employees." Complete medical standards rulemaking for the Personnel Assurance Program; the Protective Force Medical Standards (10 CFR 1046), and the Personnel Security Assurance Program (10 CFR 710). Continue to survey DOE sites on the degree of workplace violence, prepare a Departmental workplace violence policy for Secretarial issuance, and establish a repository for workplace violence information and analysis. Provide occupational medicine expert consultation and specific studies to address concerns associated with the operation of DOE site occupational medicine programs. Issue guidance for the medical aspects of the site Contractor Employee Assistance Program. (FY98: $485; FY99: $400; FY00: $400)

- Continue to assist DOE with the Radiation Emergency Accident Center/Training Site (REAC/TS) support. (FY98: $300; FY99: $300; FY00: $300)

Public Health Activities

- Continue collaboration in epidemiologic studies conducted under the Memorandum of Understanding (MOU) with the Department of Health and Human Services (HHS), including environmental dose reconstruction projects at major DOE sites, single and multi-site cancer mortality studies of DOE workers, and community outreach and educational efforts. As part of this collaboration, develop a credible, coherent DOE/HHS public and occupational health agenda of activities at DOE sites. Conduct workshops and meetings with stakeholders as part of the agenda-setting process. Two million dollars was included in FY 1998 for the Hanford Thyroid Disease Study, which was completed at the end of that fiscal year. (FY98: $16,000; FY99: $13,900; FY00: $13,825)

  As part of this program, the following commitment made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy has been accomplished:

  - Develop a coordinated health agenda with the Department of Health and Human Services that is responsive to stakeholder and customer needs.

Epidemologic Studies

- In FY 1998, studies conducted under the State Health Agreement Program were completed and the program was ended. (FY98: $4,000; FY99: $0; FY00: $0)
- Continue epidemiologic surveillance of DOE workers; add the Oak Ridge Reservation to the epidemiologic surveillance program; add selected dosimetry information to epidemiologic surveillance data collection; analyze data collected by DOE for other purposes to determine their potential value for, and use in, epidemiologic analyses; make reports and health information available through the Comprehensive Epidemiologic Data Resource and through other Internet access; publish findings in annual epidemiologic surveillance reports; provide briefings and written materials to stakeholders on completed studies; identify emerging health issues requiring evaluation and conduct follow-up investigations; and continue communication activities with affected workforces and communities. (FY98: $2,050; FY99: $2,300; FY00: $2,300)

  Under this program, the following commitments made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy have been accomplished:

  - Expand the current ten-site illness and injury surveillance program for current workers to include the major three facilities at the Oak Ridge Reservation.
  - Complete the review of site epidemiological records that are prohibited from destruction because of their potential use in health studies and identify those series of records that no longer need to be maintained.
  - Establish and maintain a database of FY 1998 access issues and problems relating to health research at DOE sites in order to provide detailed and accurate information for analyzing what kinds of access problems remain and how to solve them.
- Continue national and international efforts to analyze biokinetic parameters for deposition and retention of transuranics in humans to improve dosimetry models and occupational radiation

standards. Publish approximately ten peer-reviewed articles documenting research findings, including one that characterizes a new dosimetry model for americium-241. (FY98: $1,000; FY99: $1,000; FY00: $1,000)

International Health Programs

Marshall Islands

- Provide special medical care and necessary environmental monitoring in the Marshall Islands. Provide medical surveillance and care for the Rongelap and Utirik populations exposed to fallout from the Castle Bravo atmospheric nuclear test in 1954 and provides environmental monitoring and dose assessment for the Bikini, Enewetak, Rongelap and Utirik atolls, which were most heavily contaminated by fallout from the U.S. nuclear weapons testing in the Pacific. These activities are mandated by Public Law 99-239, the Compact of Free Association Act of 1986. (FY98: $6,800; FY99: $6,800; FY00: $6,800)

  Under this program, the following commitments made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy have been accomplished:

  - Award and implement a New Cooperative Agreement for Medical Care Delivery in the Marshall Islands.
  - Make available 10,000 documents related to Nuclear Weapons Testing in the Marshall Islands on the Internet.

European Programs

- Continue, in collaboration with the National Cancer Institute, long-term leukemia, thyroid disease and ocular cataract studies of the Chernobyl accident. (FY98: $1,500; FY99: $1,500; FY00: $1,500)
- Continue U.S.-Russian collaborative research efforts involving the conduct of full-scale cohort studies in the South Ural region to investigate the health effects on workers and local populations associated with radiation exposures from the operations of the Mayak weapons facility in Russia. Begin support of molecular epidemiology, biomarker, and biological tissue bank projects. (FY98: $3,000; FY99: $3,000; FY00: $3,000)

  Under this program, the following commitments made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy have been accomplished:

  - Complete microfilming of the epidemiological and radiation health records associated with the Mayak Production Association in Russia.
- Continue U.S. collaboration with Spain in the Project Indalo program of environmental surveillance and medical monitoring for the effects of plutonium contamination. (FY98: $300; FY99: $300; FY00: $300)

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

[a]In addition, $12 million for Public Health Activities was funded in the Defense Environmental Restoration and Waste Management Appropriation in FY 1999.

[b]In addition, $20 million for Public Health Activities was funded in the Defense Environmental Restoration and Waste Management Appropriation in FY 2000.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Occupational Medicine

Medical Surveillance of Current and Former Workers

- In light of the number of cases of chronic beryllium disease in the DOE workforce, expand the current program of medical screening of former workers exposed to beryllium to complete screening of all former workers at 16 sites where beryllium was used but testing has not been conducted to date. Pilot programs conducted at Rocky Flats and Y-12 facilities provide the basis for estimating the costs of identifying, locating and screening beryllium-exposed former workers for the additional sites to be added to this program. Continue program to support research and innovation in the early detection of sensitization to beryllium in DOE workers.

  Continue support for policy development and execution of a beryllium disease prevention and exposure control program for current and future workers exposed to beryllium with the objective of: defining operational safety parameters; establishing improved medical surveillance programs; and facilitating information exchange for the prevention of chronic beryllium disease.

  Continue support for the DOE former workers program, in response to Section 3162 of the Defense Authorization Act of 1993, by conducting the second phase of the ongoing pilot program of 10 projects at 9 DOE sites for evaluating the health of former workers which may be at significant risk due to past occupational exposures. This pilot program will cover approximately one quarter of all the DOE sites and approximately 5 percent of the workforce. The budget requested for FY 2000 allows all ten ongoing projects to continue in the medical monitoring phase (Phase II).

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The full scale deployment of the pilot program is justified on the basis that all the initial Phase I reports identified groups of former DOE workers at each site with significant exposures to selected hazards. Experience from the conduct of the initial 6 Phase II pilot projects have provided the basis for establishing the budgets necessary for full scale program deployment. This portion of the program will be completed by the end of FY 2002. More detailed descriptions of individual medical surveillance projects can be found at the end of this document.			
Under this program, the following commitments made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy will be accomplished:			
▸ Continue to survey current and former workers for sensitivity to exposure to beryllium and the presence of chronic beryllium disease.			
▸ Survey selected former workers and workplace hazards pursuant to Public Law 102-484, Section 3162, to examine possible links between hazardous substances and exposures during work and their adverse health effects.	9,650	10,681	10,681
■ Conduct pilot demonstrations of the Medical Surveillance Information System (MSIS) at Oak Ridge (Y-12 and K-25), Savannah River, Allied Signal-Kansas City, Sandia, Rocky Flats, and Morgantown Energy Technology Center sites. Automated linkage of employee medical, exposure and job information into a single record is a critical component in the ability of DOE health professionals to identify and, where appropriate, intervene in emergent site-wide and complex-wide worker health problems. Such relational data bases do not currently exist within the DOE complex, and the MSIS must be tested and demonstrated at a variety of sites using actual site data to verify its validity and ensure its adoption and use. After successful demonstration of the system during the pilot phase, a cost-sharing arrangement with sites will be developed to implement complex-wide linkage of the MSIS by FY 2003. After the system becomes fully operational, annual costs will be limited to those necessary for system maintenance and upgrades.	900	850	850

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue level of effort support of Operations Offices in their efforts to provide efficient delivery of quality occupational medicine services to workers. Develop implementation guidance for the revised occupational medicine section of DOE Order 440.1, "Worker Protection Management for DOE Federal and Contractor Employees." Continue to play a central role in facilitating communication and coordination among the occupational medicine clinics and occupational health researchers in the complex by sponsoring meetings, establishing web sites, and facilitating formal and informal communications which help disseminate information from health studies and surveillance projects.	485	400	400
■ Continue level of effort support of the Radiation Emergency Accident Center/Training Site (REAC/TS) program which provides rapid response medical expertise and training to address radiological accidents. Such a capability is of continuing importance, particularly in light of the opening of the Waste Isolation Pilot Plant and the potential for accidents associated with the transport of transuranic waste to New Mexico	300	300	300
Total, Occupational Medicine	11,335	12,231	12,231

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Public Health Activities			
■ Continue occupational and community health studies at and around DOE sites under the Department of Health and Human Services (HHS) Memorandum of Understanding (MOU). As long-time DOE workers and residents near DOE facilities age, there will likely be an increased ability to detect late health effects of exposures associated with DOE operations. The results of a number of studies conducted to date have suggested the need for further research designed to help understand the long-term health impacts of exposure to low levels of radiation. The program of occupational and community studies conducted by HHS under its MOU with DOE offers an expanded basis upon which radiation protection standards and practices can be refined and improved. By engaging in a joint agenda setting process, DOE and HHS have worked together to develop a coherent, credible set of research priorities across the DOE complex. This agenda will be an invaluable tool in determining which studies are critical to pursue in both the near and long term. DOE's FY 2000 request enables the Department to provide only about two-thirds of the level of funding for projects which HHS has recommended to DOE for FY 2000	16,000	13,900	13,825
Total, Public Health Activities	16,000	13,900	13,825

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Epidemologic Studies			
■ The State Health Agreement program was concluded at the end of FY 1998, and no further funding is requested..	4,000	0	0
■ Continue the ongoing program of epidemiologic surveillance to enhance DOE's ability to protect worker health by monitoring the health of active workers and identifying potential health risks and occupational illnesses. Ongoing health monitoring of workers in this multi-site program provides a mechanism to improve the understanding of health effects associated with work at DOE sites. The program facilitates communication of this improved understanding to workers. Epidemiologic surveillance also facilitates evaluation of the effectiveness of risk reduction efforts through its ongoing monitoring of health trends. The program supports the Department's only multi-site health information database linked to current workers and has contributed to the development of automated medical data management systems at several DOE sites. Key features of the program include a review of the health of women in the DOE workforce, development of automated health data management and industrial hygiene exposure data systems at several participating sites, and continue operation of the Comprehensive Epidemiologic Data Resource and other internet sites to ensure dissemination of health information to DOE workers, DOE communities, and the general public. The budget request will support an expanded surveillance system which includes incorporation of all three facilities at Oak Ridge into the overall program and will provide an enhanced capability to assess worker health in relation to occupational radiation exposures by increasing the collection of dosimetry data and their integration into the system.	2,050	2,300	2,300

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue support of the U.S. Transuranium and Uranium Registries (USTUR), a major component of DOE's long-standing programs to develop and refine radiological protection standards that are in world-wide use to help ensure a safe workplace. The Registries have become a unique resource of data, capabilities and materials for studying the deposition, biokinetics and dosimetry of long lived, alpha-emitting materials, including uranium and plutonium, in humans. Based on voluntary enrollment of occupationally exposed individuals, the Registries perform postmortem radiochemical and histopathologic analyses of donated tissues to obtain data fundamental to determining internal doses and bioeffects due to intake of these radioactive materials. Continued evaluation and refinement of biokinetic models is essential to demonstrate that occupational doses are being appropriately calculated. Another important capability of the USTUR is its provision of assistance and consultations to other U.S. and foreign researchers, governmental agencies and the public on the modeling and measurement of internal depositions. This is facilitated by the Registries' function as a repository of donated tissues, histopathology slides, similar tissues and materials from animal studies, and associated databases to ensure their availability for use by all interested researchers. The provision of these services in an academic setting maximizes both openness and cost-effectiveness. The budget request is based on experience in running the program to date, the waiting list of donors, and the continued demand for and use of the Registries analytical capabilities.	1,000	1,000	1,000
Total, Epidemiologic Studies	7,050	3,300	3,300

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
International Health Programs			
Marshall Islands			
■ Continue the provision of mandated special medical care and ensure full follow-up on diseases potentially associated with radiation exposure resulting from the nuclear tests in the Marshall Islands. Utilize a new medical contractor to deliver year around community-based medical services that encourage community involvement and provide more extensive medical care for the Rongelap and Utirik exposed populations. Continue characterization of the residual levels of radionuclides in the environment, development of mitigation strategies to reduce uptake of these radionuclides in local food products, and monitor individual dose assessments needed by the local atoll communities to make informed decisions on plans to resettle the Bikini and Rongelap Islands.	6,800	6,800	6,800
European Programs			
■ Continue support of Chernobyl-related health effects studies. Combined, the long-term leukemia, thyroid disease and ocular cataract studies of populations and workers affected by the Chernobyl accident represent the largest prospective research of the health effects of environmental exposure to radiation outside of the study of Japanese A-bomb survivors. They involve the medical monitoring of a large number of people known to be exposed to high levels of radiation and offer a basis for the development of better tools for assessing populations at risk and improved radiation standards for workers and the general populations. In particular, the thyroid disease studies in Ukraine and Belarus will provide valuable information relevant to populations living downwind from Hanford, the Nevada Test Site, and other DOE sites, as well as populations throughout the U.S. who were exposed to radioiodine (I-131) as a result of atmospheric testing of nuclear weapons. The Joint Coordinating Committee for Civilian Nuclear Reactor Safety (JCCCNRS) recently signed 30-year protocols calling for U.S. participation (DOE and NCI) for these three long-term studies through FY 2026..	1,500	1,500	1,500

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Continue the Joint Coordinating Committee for Radiation Effects Research (JCCRER) program in collaboration with Russia and other U.S. agencies. This program continues to have the potential for a very strong return on investment by providing, within the next several years, a continuing source of new information on the effects of chronic exposure to low dose rate radiation. This information will ultimately be important for setting worker and public radiation protection standards. The focus of ongoing JCCRER efforts is epidemiologic and dose reconstruction studies based on worker and population radiation health data. Six major environmental and occupational health studies are underway. In addition, valuable records are currently being preserved on microfilm. It is anticipated that ongoing DOE-supported epidemiologic and dose reconstruction studies will continue through April 2000. The microfilming effort, which is included in the Secretary's performance agreement with the President, is expected to continue through FY 2000 and to result in the filming of an estimated 3 million pages of critical records. Additionally, DOE issued a request for applications in June 1997 for new U.S.-Russian collaborative population-bases studies (to build on ongoing work) related to molecular epidemiology, biomarkers, biological tissue banks, and epidemiology. All current projects are scheduled to be completed by FY 2003. In contrast to DOE's support of studies of Japanese atomic bomb survivors, which has been ongoing for over 50 years, analysis of available Russian data has just begun. The outcomes of this research will determine whether and what kind of future work will be conducted.			
Under this program, the following commitment made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy will be accomplished:			
▸ Continue Support of Health Impact Analyses of Russian Workers and Communities Exposed to Relatively High Radiation Levels As a Basis for Validating Current U.S. and DOE Radiation Protection Standards	3,000	3,000	3,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue the Project Indalo program which consists of environmental surveillance and medical monitoring conducted since 1966. Over 800 residents have been tested throughout the 31-year program. Since 1984, approximately 150 different people are tested annually; about 50 may have been internally contaminated. In the summer of 1998, the U.S. and Spain chartered a four-person panel of outside, independent experts who reviewed and summarized the scientific and technological aspects of the program in Palomares and made recommendations on future directions for the program. Based on these recommendations, the program's work has been revised to address a more focused set of environmental and medical concerns..	300	300	300
Total, European Programs	4,800	4,800	4,800

Radiation Effects Research Foundation (RERF)

Mission Supporting Goals and Objectives

The United States has supported studies for the past 50 years on the health effects of radiation on the survivors of the Hiroshima and Nagasaki atomic bombings. The Atomic Bomb Casualty Commission (ABCC) began studies in 1947, funded by the Atomic Energy Commission, with the National Academy of Sciences as the support services grantee responsible for setting up and running the laboratories in accordance with a U.S. presidential directive. In April 1975, the Radiation Effects Research Foundation (RERF) was established as the full successor to the ABCC and was designated to continue the research according to an agreement between the governments of the United States and Japan.

The DOE is committed to the support of the atomic bomb survivor studies as long as valuable health effects information is to be gained by further follow-up of the survivors. Approximately 64,000 survivors are currently being followed in the RERF studies.

Significant Accomplishments

- Continue RERF program research. Data obtained at the RERF is used for radiation risk assessment by various national and international agencies, and is used to update and verify radiation protection standards throughout the world. No epidemiologic study of late radiation effects has been as informative or influential as that of the A-bomb survivors, and the world scientific community has a stake in maintaining the strength of the RERF program. In 1996, an International Blue Ribbon Panel's report was released that made recommendations on current and future research at the RERF. The Panel's report identified specific aspects of the RERF program as having direct benefits to Japanese A-bomb survivors, and subsequently the Japanese government assumed responsibility for funding these parts of the program. (FY98: $14,000; FY99: $14,000; FY00: $13,500)

Environment, Safety and Health - Other Defense Activities

Program Direction

Mission Supporting Goals and Objectives

Program Direction in this account provides overall direction and support for the Office of Environment, Safety and Health (EH) defense programs to ensure that all operations are conducted in the most efficient, effective manner.

Program Direction in this account has been grouped into the following categories:

Salaries and Benefits provide funding for a Federal staff (FY98: 200 FTE; FY99: 226 FTE; FY00: 221 FTE) who have the technical expertise required to carry out the essential EH mission. The EH mission requires experts to: develop overall environment, safety and health policy for DOE sites and facility operations; provide a central and coordinated source of technical expertise to all field elements; provide a central clearing house for information, analysis and feedback regarding new efforts, present activities, and unforeseen occurrences taking place at the multitude of diverse facilities within the DOE complex; provide the Department with independent oversight capability, as well as health studies endeavors; and perform activities relative to environment, safety and health programs across the DOE complex.

Travel includes all costs of transportation, subsistence, and incidental travel expenses of EH's Federal employees in accordance with Federal Travel Regulations. This also includes travel costs associated with a permanent change of duty station.

Support Services are not provided for in this decision unit, consistent with Congressional direction.

Other Related Expenses includes training for Federal staff.

Significant Accomplishments

Salaries and Benefits

- Salaries and Benefits funding requirements support EH staff working on Defense activities. Overall, salaries and benefits are in line with the full-time-equivalents (FTE) requested and include the 4.1% Economic Assumption provided by the Office of Management and Budget (OMB). (FY98: $19,500; FY99: $23,485; FY00: $23,285)

Travel

- Travel requirements are consistent with support for the EH Federal staff and include the 2.1% Economic Assumption as provided by the OMB. (FY98: $500; FY99: $1,284; FY00: $1,284)

Other Related Expenses

- Includes tuition costs for EH Federal employees. (FY98: $0; FY99: $0; FY00: $200)

Funding Schedule

(dollars in thousands)

Hearings and Appeals

Office of Hearings and Appeals Program Direction

Mission Supporting Goals & Objectives

The Office of Hearings and Appeals (OHA) conducts all of the Department of Energy's adjudicative process and provides various administrative remedies. OHA holds evidentiary hearings in cases involving the eligibility of employees to hold security clearances and "whistleblower" complaints involving any of the Department's 120,000 contractor employees. OHA also considers appeals of adverse determinations concerning requests for information under the Freedom of Information and Privacy Acts, and issues determinations involving requests for exception based upon claims of hardship or inequity resulting from the application of any DOE order, rule, regulation or other requirement. Other responsibilities include considering appeals of determinations by the Office of Civilian Radioactive Waste Management of payments-equal-to-taxes for eligible jurisdictions, and of determinations by the Office of Environmental Management concerning contributions to, and reimbursements from, the Uranium Enrichment Decontamination and Decommissioning Fund. OHA continues to be assigned further responsibilities.

OHA's goal is to promote successful and uninterrupted DOE operations through the deliberate, expeditious and equitable resolution of all claims of adverse impact emanating from the operations of the Department. In pursuing this objective, OHA issues timely, high quality, articulate decisions that consider and balance the Congressionally mandated objectives underlying each proceeding, the rights and interests of individual litigants, and the interests of customers, stakeholders and other concerned parties such as the public, state and federal governments. In cases involving access to classified information and other secure materials, for example, the employment interests of individuals are weighed against the national interest in restricting access only to trustworthy employees. Where "whistleblower" complaints are concerned, the interests of the Department lie in promoting an atmosphere in which employees may raise concerns about fraud, waste, abuse, safety and health without fear of retaliation while ensuring that DOE's contractors may manage their operations in the manner they believe is most efficient. All funding for OHA is for Program Direction, which provides the federal staffing resources and associated costs required to carry out its mission.

Performance Measures

Some specific measures of performance are:

- The quality of OHA decisions as measured by the record of being upheld upon appeal and review of feedback received from the courts and OHA customers and stakeholders.
- The number of decisions issued. The number of cases decided does not alone reflect the accomplishments of OHA. While some cases are relatively straightforward and can be resolved in a few days, others consume hundreds of hours of high-level professional time. For example, many

whistleblower cases consume several months, involving multiple pre-hearing conferences, lengthy evidentiary hearings with many witnesses, the review of hundreds of pages of documents, and the drafting of a detailed and lengthy decision.

- Meeting time deadlines. OHA continuously monitors the status of each case pending before the office to determine whether resolution of the matter is proceeding on schedule and whether deadlines are being met.
- Responsiveness to customer needs, as measured by feedback received.

Significant Accomplishments and Program Shifts

- As a result of the Secretary's Openness Initiative, all contractor employee whistleblower cases previously under the jurisdiction of other headquarters offices — principally the Office of the Inspector General — will become the responsibility of OHA. This includes a backlog of over 50 open case investigations and the hearings that will follow the completion of these investigations. Whistleblower proceedings are (with the exception of a few isolated matters) the most labor intensive of OHA's activities. The amendments to the regulations will shift nearly all responsibilities under the whistleblower program from the Office of the Inspector General (IG) to OHA. As a result, OHA will take on the added responsibility for conducting investigations of whistleblower complaints and will issue all initial agency decisions. OHA estimates that these new responsibilities will increase its workload by 35 percent.
- Once the transfer of the whistleblower function to OHA is completed, the Office of Inspector General will transfer to OHA some of the funding necessary to perform that work. In addition, to maintain its *current* level of activities, OHA will receive funding from other program offices for which OHA provides adjudicative services.
- OHA was delegated the responsibility of conducting investigations of three EEO complaints involving the Office of Civil Rights (which normally investigates EEO complaints but could not do so in these cases because of the possible conflict of interest). OHA successfully completed each investigation and issued a detailed report within the applicable regulatory deadline.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salaries and Benefits	1,725	1,805	2,375	+570	+31.6%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Compensation for civilian employees, including performance awards. With this funding:			
■ OHA resolved 203 cases in FY 1998, and expects to resolve about 240 cases in FY 1999 and 250 cases in FY 2000. OHA issues high-quality decisions and has had, and projects that it will continue to have, a singularly successful record of having virtually all of its decisions upheld on judicial review.			
■ In cases in which there is a statutory or regulatory deadline, OHA will meet that deadline virtually without exception. Freedom of Information Act appeals are, for example, resolved within the 20-day statutory deadline.			
■ As required by the Congress in amendments to the Freedom of Information Act, OHA will make its decisions available on its Internet web site (generally on the day they are issued) where they are easily available to all interested persons.			
■ OHA will utilize alternative dispute resolution methods where they can be more efficient or of benefit to the parties. For example, OHA mediated a recent dispute between the Energy Information Administration (EIA) and an electric utility concerning whether EIA could continue to make public certain information provided by the utility. OHA considered the public interest in release of the data against the utility's need to respond to an increasingly competitive market for electricity. Instead of ruling strictly on the legal merits of the matter — and possibly generating a large number of similar cases — OHA facilitated an agreement between the utility and EIA on the releasibility of the information pending public hearings and further review of the issue by EIA. As a result, EIA is now modifying its approach and is coordinating its policy regarding confidentiality with that of other government agencies such as the Federal Energy Regulatory Commission	1,725	1,805	2,375
Travel			
For transportation to DOE field sites to conduct hearings and whistleblower investigations	35	60	80

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Support Services Funding for computer support of the office information system and for assistance in maintaining OHA's Home Page on the Internet for the benefit of the public	30	30	20
Other Related Expenses These include funding for employee training, charges by the Working Capital Fund for base services: rent, utilities, telephone, supplies, postage, building operations, photocopies, telecommunications, printing (including publication of federal register notices, and printing of decisions), and Automated Office Support System support and maintenance. OHA also pays certain services directly, including timesharing (Westlaw) and purchase of computer equipment and software	510	505	525
Total, Program Direction	2,300	2,400	3,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ Increase in salaries and benefits is due to general pay increases, promotions and within grade increases and an increase of four FTEs associated with a portion of the increased responsibilities OHA will receive pursuant to pending amendments to the DOE's Contractor Employee Protection (Whistleblower) Program. The amendments to the regulations will shift all responsibilities under the whistleblower program from the Office of the Inspector General (IG) to OHA. OHA will take on the added responsibility for conducting investigations of whistleblower complaints and will issue all initial agency decisions	+570
Travel	
■ Increase reflects increased travel to DOE field sites to conduct investigations and hearings consistent with OHA's new responsibilities for DOE's Contractor Employee Protection (Whistleblower) Program	+20

	FY 2000 vs. FY 1999 ($000)
Support Services	
■ Decrease in support services is due to reduced use of contractor	-10
Other Related Expenses	
■ Increase in other related expenses is due to increased Whistleblower work and an increase for the Working Capital Fund due to primarily to projected increases in rent	20
Total Funding Change, Office of Hearings and Appeals Program Direction	+600

Naval Reactors

Naval Reactors

Program Mission

Naval Reactors has complete responsibility for Naval nuclear propulsion work, beginning with technology development and continuing through reactor operation and, ultimately, ensuring appropriate and responsible reactor plant disposal. The Program's efforts have ensured, and continue to ensure, the safe operation of the many reactor plants in operating nuclear powered submarines and surface ships -- comprising over 40% of the Navy's major combatants, the successful deployment of the advanced fleet reactor for the SEAWOLF class, and the on schedule development of the reactor plant for the VIRGINIA class. Most recently, Naval Reactors is beginning design work on a reactor plant for a new class of aircraft carriers being planned by the Navy.

Naval Reactors is principally a technology program in the business of power generation for military application. The Program's far-sighted development work ensures nuclear propulsion technology provides options to maintain and upgrade current capabilities, as well as meet future threats. Work is integrated as advances in various functional disciplines coalesce into the technology applicable to a Naval nuclear plant. The presence of radiation dictates a careful, measured approach to developing nuclear technology, evolving needed components and systems, and implementing them into existing or future plant designs. Intricate engineering challenges and long lead time to fabricate the massive, complex components require many years before introduction into the fleet.

Program Goal

Facilitate U.S. national security through the application of nuclear energy for propulsion of warships.

Program Objective

Meet requirements for nuclear propulsion by providing the Navy with long-lived, militarily effective reactor plants and ensuring their continued safe and viable operation.

Performance Measures

The following high-level performance measures represent the principal outcomes of Naval Reactors' work. Due to the integrated nature of research and development for nuclear propulsion work, effort overlaps between the measures. For example, the first two performance measures on meeting Navy goals for extended warship operation and ensuring the safety and reliability of reactor plants in Navy warships are closely related. Efforts within each performance measure can impact safety as well as endurance. In a similar manner, work on the new concept steam generator is aimed at improving safety and performance, but also benefits the endurance and acoustic goals. Despite the cross benefits, separate measures are appropriate since they reflect major, important goals of Naval Reactors' work. In the cases where effort overlaps multiple performance measures, the work is identified under the performance measure which represents the work's principal benefit.

The performance measures are integrated into the detailed program justifications within the budget. Thus, within each of the Detailed Program Justifications, Naval Reactors identifies the relevant performance measures from the list below, the principal activity areas necessary to ensure the performance measure outcome (summarized below), and verifiable supporting activities for each area. Decades will pass before overall success can be assessed, due to the inherent intervals between the time a technology is conceived, developed, applied in the fleet and proven over the operating life of the ship.

- **Conduct planned development, testing, examination and evaluation of nuclear fuel systems, materials, and manufacturing and inspection methods to ensure Naval nuclear reactors are able to meet Navy goals for extended warship operation.**

  As the Navy downsizes the fleet, demands on remaining ships increase. Each ship must carry more of the burden, be available for missions more of the time, and stay in service longer. To support these operational demands, materials, components and systems must be operationally reliable for longer periods than ever before. For example, plants originally designed for a twenty-year service life are now being called upon to serve up to about fifty years. Exhaustive testing, performance enhancements and development efforts are needed to ensure that component and system endurance -- despite potential corrosion, cracking, mechanical strain, and irradiation -- can be assured throughout extended lifetime.

  Development efforts to date have yielded significant advantages. Enhanced component reliability and improved predictive techniques have allowed the Navy to extend the intervals between major maintenance periods, increasing ship on-line time and, thus, the Navy's war fighting capability, while reducing cost. However, these advancements also generate new development and analysis challenges. For example, the longer intervals between maintenance periods reduce opportunities to examine and/or replace aging components and systems. Thus, more extensive analytical and testing efforts are required to verify materials and component performance. In a similar vein, development of a life-of-the-ship core offers major advantages in terms of ship availability, as well as reducing cost, radiation exposure and waste generation; but a life-of-the-ship core also reduces mid-life opportunities to examine components and help ensure integrity. Testing and verification, therefore, is of paramount importance.

  These efforts are especially challenging given the demanding nature of nuclear propulsion

technology. Components and materials must perform reliably within the harsh environment of a reactor plant. Comprehensive and rigorous analyses are needed to ensure the ability to withstand the deleterious effects of irradiation, corrosion, high temperature and pressure over a lifetime measured in decades. In addition, Naval reactor plants must be rugged enough to accommodate ships' pitching and rolling; have the resilience to respond to rapidly-changing demands for power; be robust enough to withstand the rigors of battle; and be safe and easily maintainable for the sailors who live next to them.

The following activity areas are necessary to ensure the outcome of this performance measure:

- Improve nuclear heat source (core) design and analysis methods and develop improved designs to satisfy service life requirements.
- Evaluate and test improved core manufacturing processes and inspection techniques to support extended life reactors.
- Examine removed fuel cells at end-of-life and perform non-destructive examinations of irradiated test specimens to confirm predicted performance and validate design methods.
- Develop improved nuclear fuel, core and reactor structural materials which extend core lifetimes up to the life of the ship, and evaluate irradiation tests of new and existing materials to verify acceptable lifetime performance and to improve predictive capabilities.
- Test and evaluate plant materials to characterize the long term effects of the harsh operating environment and qualify improved materials and processes to ensure endurance requirements will be met.
- Conduct irradiations testing and perform detailed examinations to provide data for material performance characterization and prediction.

- **Complete scheduled design, analysis, and testing of reactor plant components, systems, and performance to ensure the operational safety and reliability of reactor plants for use in Navy nuclear powered warships so they can fulfill their national defense mission.**

Naval Reactors expects to be responsible for the operation of on average over 100 reactors powering 40% of the Navy's major combatants. This is equal to the entire U.S. commercial nuclear power generating industry and nearly as many reactors as the next two largest nuclear power generating nations combined (France and Japan). These plants operate over lifetimes of up to five decades. Challenges to the reliability and integrity of the plants change and grow over the long life. Continuous monitoring and analyses are thus vital to ensure they continue to perform safely and reliably. Also, new knowledge gained during the years of operation must be assessed against the operating plants.

Since nuclear powered warships account for such a large portion of the Navy's combatant fleet, the successful operation of the reactor plants is a key factor in the Navy's ability to perform its national defense role. To date, nuclear powered ships have steamed more than 115 million miles without a reactor accident or a significant release of radioactivity to the environment. The continued ability of the Navy to benefit from nuclear propulsion is dependent on continuance of this record.

The following activity areas are necessary to ensure the outcome of this performance measure:

- Design and test improved reactor equipment including advanced control rod drive mechanisms.
- Perform physics testing and analysis to confirm expected fuel system and core performance and develop improved analysis methods for predicting core performance that reduce design approximations, uncertainties, and associated conservatism.
- Conduct reactor safety and shielding analyses for nuclear reactor plants to ensure containment of radiation and proper protection of personnel.
- Ensure satisfactory reactor plant operation throughout life and improve steam generator, energy conversion, and steam generator chemistry technologies to enhance performance and reduce maintenance costs.
- Develop instrumentation and control equipment to replace obsolete equipment and improve reliability and performance.
- Develop and test reactor plant components and applicable technologies which address known limitations and improve performance and reliability of components.
- Perform reactor plant analyses to assure safe operation and improve reactor plant chemistry controls to reduce corrosion and plant radiation levels.

■ **Accomplish planned core and reactor component/system design and technology development efforts to support the Navy's acoustic requirements.**

One of the greatest advantages provided by submarines is stealth. Stealth allows submarines to operate undetected, conducting surveillance or performing offensive missions with minimal concern for defensive needs, providing, in effect, a tremendous force multiplier. This capability must be maintained in the face of ever improving means of detection. In order to do so, Naval Reactors must ensure the reactor components and systems used in submarines meet tightening Navy operating parameters for quieting.

The following activity area is necessary to ensure the outcome of this performance measure:

- Develop and qualify improved core and reactor component thermal and hydraulic designs.

- **Maintain a utilization factor of at least 90% for prototype plants to ensure their availability for scheduled testing, training, and servicing needs, and provide for development of servicing equipment and testing of plant components, materials and procedures.**

  Naval Reactors has two operating land based prototype Naval nuclear propulsion plants at the Kesselring site in New York and also is the principal customer of the Advanced Test Reactor (ATR) located at the Idaho National Engineering and Environmental Laboratory.

  The prototype plants in New York are an essential component in meeting Naval Reactors' mission of ensuring the safe and reliable operation of Naval reactor plants. Prototypes provide platforms for conducting testing under actual operating conditions, which can not be duplicated in the laboratory. This testing yields important technical data and experience, and allows potential problems to be identified and addressed before they occur in operating reactor plants. The prototypes are used to test new components and to verify reactor performance predictions by depleting the core faster than would be done in an operating shipboard plant. For example, the advanced fleet reactor, now used in the SEAWOLF Class attack submarine, has accumulated the equivalent of 15 years of fleet operation. The prototypes also are used to train Navy nuclear plant operators.

  Operation of the ATR provides a unique capability to irradiate test specimens, which are then examined to provide data on the effects of radiation on materials. The ATR's arrangement permits varying conditions within the reactor test loops allowing accelerated life testing of materials, a major benefit.

  The goal for operating the prototypes and the ATR is a 90% utilization factor. Utilization factor is a measure of prototype and ATR availability for planned testing, training, or maintenance. To meet this goal, Naval Reactors must be forward thinking in identifying potential problems before they occur.

  At the end of life, servicing organizations must remove the core from a reactor plant. This is an extremely critical operation given the radioactivity inherent in the spent fuel. If the reactor plant is to remain in service a new core must be installed at this point. Fuel transfer equipment is designed for safe operation under all possible normal and abnormal conditions, and thorough evaluations are made of the design and fabrication processes. Engineering models are tested to demonstrate proper operation and detailed procedures are prepared to cover use of the equipment.

  The following activity areas are necessary to ensure the outcome of this performance measure:

  - Operate land-based test reactor plants to provide for prototypical testing, core depletion analysis, and reactor plant operator training.
  - Service land-based test reactor plants to ensure they continue to operate safely and efficiently, and develop equipment and procedures to provide for safe and efficient servicing of nuclear reactor plants.
  - Operate and service the ATR to provide for materials irradiations testing.

- **Meet cost and schedule goals to safely and responsibly inactivate shutdown land-based reactor plants in support of the Department's environmental clean-up goals.**

  Naval Reactors has shutdown six prototype plants no longer required for testing. These six plants are located at three sites. Based on the projected future use of each one of those sites by Naval Reactors, different degrees of inactivation appropriately were chosen as the goals for the various facilities at the start of this effort. With the shutdown of the S1C plant, there is no future need for the Windsor Site. As such, Naval Reactors is demolishing all structures, remediating the area, recycling/disposing of waste material, and releasing the site for unrestricted use. While the S3G and D1G prototype plants at the Kesselring Site in New York are shutdown, Naval Reactors is still operating two prototype plants at that site. Thus, Naval Reactors intent has been to remove the reactor plants and engine room components from the shutdown plants, but leave the supporting buildings for potential future uses. At the NRF site in Idaho, Naval Reactors has shutdown all three plants -- S5G, S1W, and A1W; however, Naval Reactors will continue to operate the Expended Core Facility at that site for the long term. As a result, and in recognition of the other shutdown reactor plants on the INEEL site, the inactivation plan for NRF included defueling the shutdown plants, placing them in an environmentally benign lay-up condition, and remediating various facilities and supporting systems.

  Naval Reactors original intent was to complete the noted inactivation effort by 2002. To date, Naval Reactors has made good progress -- defueled six of the seven reactors (one plant has two reactors) with defueling work underway on the remaining reactor and, as noted below, work is well underway on other aspects of the inactivation. However, the need to fund other priorities within Naval Reactors Development precludes accomplishing the original schedule. Public opinion, publicized in numerous newspaper articles published during and after the Environmental Impact Statements public comment period for the New York and Connecticut prototype plants, support prompt inactivation. Prompt dismantlement is also consistent with the Department's environmental clean-up goals, and is the most efficient and cost effective approach to this work.

  The following activity areas are necessary to ensure the outcome of this performance measure:

  - Continue inactivation efforts at the Windsor site in Connecticut to eliminate surplus facilities, remediate and dismantle plant facilities and release applicable areas.
  - Continue inactivation efforts at the Kesselring Site in New York to eliminate surplus facilities, remediate and dismantle plant facilities and release applicable areas.
  - Continue inactivation efforts at the Naval Reactors Facility in Idaho to eliminate surplus facilities, remediate and dismantle plant facilities and release applicable areas.

- **Ensure no personnel exceed Federal limits for radiation exposure and no significant findings result from environmental inspections by state and federal regulators.**

  Over time, the harmful effects of materials previously thought safe such as asbestos and PCBs have become known. In addition, sensitivity has increased concerning the environmental quality of ground water and air. These trends have resulted in stricter government regulations on environmental quality. Despite these stricter government regulations, Naval Reactors continues to have an outstanding environmental performance record.

Since 1967, the Naval Reactors Program has voluntarily utilized a limit of five rem per year, and no Program personnel have received greater than five rem in a year since then. Additionally, we have had an aggressive program to minimize exposure to as low as reasonably achievable such that since 1980, no Program personnel have received over two rem in any one year. During 1997, average occupational radiation exposure for Program personnel was again a small fraction of the 300 millirem of radiation exposure received by an average American in one year due to radiation naturally present in the environment.

When properly and diligently dealt with, nuclear propulsion is a safe, efficient power source, and is environmentally less damaging than other sources. Naval Reactors cleans up after itself in a rigorous, environmentally safe, and correct manner - including properly maintaining our facilities.

The following activity areas are necessary to ensure the outcome of this performance measure:

- Conduct radiological control, environmental, and safety operations necessary to protect laboratory employees, minimize release of hazardous effluents to the environment, and comply with all applicable regulations.
- Conduct ongoing clean up of test facilities to reduce hazards to personnel, and reduce potential liabilities due to changing conditions or accidental releases.

- **Complete 90% of VIRGINIA class plant development and testing work by the end of FY 2000.**

The VIRGINIA class will provide needed capability for the Navy at an affordable price. Naval Reactors is well along on the reactor plant intended for this ship. This plant encompasses Naval Reactors most advanced component and system technology, with a life-of-the-ship reactor core, a simplified plant arrangement and fewer components compared to previous designs.

- **Complete initial development efforts on a reactor plant for a new aircraft carrier.**

On October 5, 1998, the Navy decided on nuclear propulsion for use in a future aircraft carrier class, designated CVNX. Since developing the reactor plant for the NIMITZ Class in the 1960's, we have designed and built three generations of new submarine reactor plants. Applying these developments to a reactor plant for CVNX will allow incorporation of significant design improvements for simplicity, maintainability, and reliability.

Performance Measure Funding Matrix

FY 2000

Performance Measures	Budget Categories (dollars in thousands)			
	Reactor Technology & Analysis	Plant Technology	Materials Development & Verification	Evaluation and Servicing
Meet Navy goals for extended warship operation, through:				
Nuclear heat source design and analysis methods	50,000			
Core manufacturing processes and inspection techniques	18,000			
Removed fuel cell and irradiated test specimen examination				18,000
Fuel, core and reactor structural material development & testing			43,800	
Plant materials development and testing			38,000	
Irradiations testing and examination			43,000	
Ensure safety and reliability of reactor plants, through:				
Reactor equipment design & testing	44,000			
Physics testing and analysis	20,000			
Safety and shielding analyses	13,000			
Steam generator, energy conversion, and chemistry technologies improvements		23,000		
Instrumentation and control equipment development		45,000		
Reactor plant components development & testing		35,200		
Reactor plant performance analyses and chemistry control		8,000		
Support Navy's acoustic requirements, through:				
Core and reactor component thermal and hydraulic design	16,000			
Ensure prototype plant availability, through:				
Operation of land-based test reactor plants				32,000
Servicing of land-based test reactor plants				14,000
Operation and servicing of the advanced test reactor				18,000
Inactivate shutdown prototype plants, through:				
Inactivation efforts in Connecticut				7,000
Inactivation efforts in New York				19,400
Inactivation efforts in Idaho				17,000
Maintain outstanding environmental performance, through:				
Radiological, environmental and safety operations	35,000			
Cleanup of test facilities				25,000

The funding profiles for the following performance measures are included as subsets of the above funding matrix, since the data was extracted without consideration to the broader applicability and benefit of the work to other reactor plant types. Much of Naval Reactors' technology is generic in nature as all Naval reactor plant types are based on pressurized water reactor technology. As such, demarcating work between plant types and between operating plant and new plant development efforts is arbitrary, and not properly reflective of the way work is actually accomplished. However, this table does give insight into the effort benefitting the next generation and new aircraft carrier reactor plant developments.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Next Generation Reactor plant development and testing	80,000	50,000	40,000
Development of new reactor plant for a future aircraft carrier	35,000	60,000	80,000

Significant Accomplishments and Program Shifts

- With the declining number of ships, the Navy's dependence on each ship grows as they are called upon to rapidly respond to crises world-wide. Nuclear-powered warships, which will continue to comprise 40% of the Navy's major combatants, offer significant advantages in dealing with widely dispersed crises and threats with fewer ships -- their stealth, firepower, versatility, virtually unlimited high-speed endurance, and independence from logistics support make these ships especially well-suited to the future missions of the Navy. Nuclear powered submarines are typically the first U.S. forces to arrive on scene. They reconnoiter and secure the area for following forces. For example, in 1996, submarines were an essential component of the Navy force deployed to the Taiwan strait, chosen for their surveillance capabilities and specialized, hard-to-detect weaponry. Aircraft carriers provide our most visible forward presence. The nuclear carrier can sprint from one theater to another without stopping to refuel and can remain on station a higher percentage of the time than conventional carriers. These advantages were demonstrated recently by the USS NIMITZ's 7000 mile high speed transit from the South China Sea to the Arabian Gulf and by the transit of the USS GEORGE WASHINGTON from the Mediterranean Sea to the Arabian Gulf.
- Naval Reactors' careful engineering and approach to safety ensured the Program has never had a Naval nuclear accident or significant release of radioactivity to the environment. This environmental and safety record has endured almost 50 years and has been essential to nuclear-powered warships safely steaming over 115 million miles. This accomplishment is the result of thorough development, testing, and analysis of cores, components, and systems; stringent quality standards and rigorous training; and detailed analysis of operating components/plants to verify expected performance. The former Soviet Navy's nuclear propulsion safety record offers a stark contrast — they suffered casualties because of risks and inadequacies the U.S. would not tolerate.
- As the operating lives of Naval nuclear plants are extended beyond their original design lifetimes, Naval Reactors' efforts are intended to ensure these plants continue to perform safely and reliably. Careful, detailed validation and improvement efforts are necessary to support the Navy's decision to keep ships in service for up to 40-50 years vice original expectations.
- Continuing development efforts are yielding greater capabilities. Ongoing efforts in metallurgy,

thermal hydraulics, instrumentation and control, structural mechanics, manufacturing processes, physics, and nuclear design/analysis methods provide the base for future propulsion plant development and improvements to existing ones. Naval Reactors is investigating new structural materials, coolant chemistries, reactor plant arrangements, core configurations, manufacturing techniques, plant and facility monitoring equipment, and heat exchange methods. Features sought are enhanced power density, longer life, increased resilience, reduced corrosion, ease of operation, and affordability. Major efforts for the near future include upgrades to existing components and equipment to help extend operating ship lifetimes and improve overall reactor plant performance, development/testing of the next generation reactor components and systems for the Navy's VIRGINIA class -- including the first true life-of-the-ship core, which will obviate the need for expensive refuelings, and the new concept steam generator, which should greatly reduce corrosion concerns and improve acoustic performance -- and initial development of a reactor plant for a new aircraft carrier.

- The Program's cost-saving initiatives have led to shutting down six of eight land-based prototype plants. Naval Reactors is inactivating and laying up the shutdown plants to place them in an environmentally benign state pending full dismantlement at some future date. Efforts to reduce costs continue, but are not as dramatic.

Funding Profile

(dollars in thousands)

	FY 1998 Comparable Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request

Site Description

Bettis Atomic Power Laboratory

The Bettis Atomic Power Laboratory is a government-owned, contractor-operated laboratory solely dedicated to Naval nuclear propulsion work. Bettis' mission is directed toward ensuring the continued safe and reliable operation of nuclear reactor propulsion plants for Naval surface ships and submarines through design, development, testing and operational follow. Bettis has a specialized testing facility for full scale steam generator testing, a control drive mechanism test facility and the expended core facility in Idaho for examination of spent nuclear fuel.

Idaho National Engineering & Environmental Laboratory

The Idaho National Engineering and Environmental Laboratory (INEEL) is a multi-disciplinary laboratory that applies its engineering and scientific capabilities to key national security areas such as reactor safety and improvement, waste removal and advanced energy production. Naval Reactors funding at the INEEL is for activities conducted at the site's Advanced Test Reactor (ATR). The ATR is the only facility in the Nation capable of performing material irradiation testing. The facility is Naval Reactors' main source of data on the performance of reactor fuel, poison, and structural materials under irradiated conditions.

Idaho Operations Office

The Idaho Operations Office provides review and approval of technical safety requirements, criticality safety activities, restart authorizations and oversight of the Idaho National Engineering & Environmental Laboratory to verify safety and administrative compliance.

Knolls Atomic Power Laboratory

The Knolls Atomic Power Laboratory is also a government-owned, contractor-operated laboratory solely dedicated to Naval nuclear propulsion work. KAPL's mission also is directed toward ensuring the continued safe and reliable operation of nuclear reactor propulsion plants for Naval surface ships and submarines through design, development, testing and operational follow. KAPL has fuel manufacturing development capabilities, unique thermal-hydraulic test capabilities, and two prototype nuclear propulsion plants at the Kesselring Site for operational testing of new technologies under typical operating conditions prior to fleet introduction.

Pittsburgh Naval Reactors Office

The Pittsburgh Naval Reactors Office maintains oversight of the Bettis Atomic Power Laboratory.

Schenectady Naval Reactors Office

The Schenectady Naval Reactors Office maintains oversight of the Knolls Atomic Power Laboratory.

All Other Sites

Naval Reactors Headquarters administers the Naval Nuclear Propulsion Program. The Lawrence Livermore National Laboratory Atmospheric Release Advisory Capability provides the emergency response and management efforts related to real-time consequence assessment of atmospheric release of radioactive and toxic chemical material. The Oak Ridge National Laboratory Radiation Shielding Information Center performs collection evaluation and dissemination of information related to nuclear radiation transport.

Plant Technology

Mission Supporting Goals and Objectives

Plant Technology encompasses development, testing and analysis of components and systems which transfer, convert, control and measure power created by the reactor. Components sustain wear through operation that threatens reactor plant integrity, and new components and systems are needed to support new applications either in existing or new reactor plants. Thus, the principal thrust is to develop and apply predictive, analytic, and testing tools to find potential problems to enable corrective actions and the continued safety of operating plants. This, or changing performance requirements, may lead to the need to develop new or modified components and systems. The advances achieved in the various applicable technologies such as manufacturing/welding processes, fluid dynamics, models and analysis methods and thermal-hydraulics have enhanced operating plant performance and allowed major improvements in performance for new reactor plants. For example, the reactor plant now under development for the VIRGINIA class will be simpler, hence more reliable, and more power dense than previous plants because of the continuing advances. These advances and the results of continuing technological progress are being assessed for possible use in a reactor plant for a new aircraft carrier with development expected in future years.

A reactor plant provides a harsh environment for machinery. The constant exposure to water at high temperature and pressure is corrosive. Harmful corrosive environments exist in the steam generators due to the intense boiling environment inherent in the transfer of reactor heat to the turbines. Besides dealing with this continuing problem, Naval Reactors is pursuing technologies to greatly reduce corrosion through fundamental design changes. Also, machinery such as pumps with constantly rotating or operated parts wear and require lubrication. Obviously, to the extent this wear can be abated through the application of better materials and lubricants, as well as more resilient designs, the longer and more reliable the component and system. A constant concern is in improving or correcting one area, another will be made worse thus necessitating extensive and comprehensive testing.

Likewise, a continuing effort is devoted to applying the latest advances in electronics to instrumentation and control equipment and systems. Due to rapid degradation and obsolescence, this equipment must be replaced during the lifetime of an operating plant. While this presents a continuing challenge, there are advantages to this given the rapid technical advances. For example, the accuracy and reliability of the instrumentation can affect the useable power obtained from the reactor.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Plant Technology	112,900	111,100	111,200	+100	0.1%
Total, Plant Technology	112,900	111,100	111,200	+100	0.1%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
I. Complete scheduled design, analysis, and testing of reactor plant components, systems, and performance to ensure the operational safety and reliability of reactor plants for use in Navy nuclear powered warships so they can fulfill their national defense mission.			
A. Ensure satisfactory reactor plant operation throughout life and improve steam generator, energy conversion, and steam generator chemistry technologies to enhance performance and reduce maintenance costs.			
Steam generators must provide a safe interface between the reactor plant and the power turbines, transferring heat from the reactor plant to produce steam to run the power turbines. Hot water from the reactor flows through a bundle of thin-walled tubes within the steam generator. A shell containing the turbine water surrounds these tubes where it is boiled to steam. The integrity of steam generator components must be maintained in order to prevent radioactive contamination of the steam which is piped out of the steam generator to the power turbines.			
Maintaining steam generator integrity requires development of water chemistries and evaluation of corrosion effects. Trace impurities can become highly concentrated by the boiling process in areas of low flow and form deposits. The concentration of impurities in these deposits becomes corrosive and threatens the integrity of the unit. Development efforts are therefore required to evaluate potential corrosion mechanisms, devise methods to locate and remove deposits, minimize input of these impurities and continually test water chemistries and corrosion inhibitors for benefits and drawbacks to ensure they mitigate the consequences of these impurities.			
Development is also underway to test other ways to transfer energy. For example, the intent of the new concept steam generator is to minimize the propensity for concentration of impurities and eliminate low flow regions resulting in an inherently more corrosion resistant, reliable design. Efforts concentrate on building test units to demonstrate and qualify the process on a large scale. These test units will then be used to confirm the expected performance benefits.	35,000	25,000	23,000

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

FY 1998 Examine steam generator sludge and corrosion samples to characterize thermal hydraulic, chemistry and corrosion behavior.

Perform testing of chemistry additives and corrosion inhibitors for eventual long term use.

Begin design of in-plant corrosion monitors for more detailed examination of chemistry and corrosion trends in several types of steam generators.

Continue fabrication of the new concept steam generator manufacturing demonstration unit full assembly and prepare for performance testing.

FY 1999 Evaluate steam generator sludge/corrosion samples and compare to test results to develop improved corrosion control and predictive tube corrosion models.

Continue testing necessary for long term use of potential new chemistry additives and corrosion inhibitors.

Continue design and begin testing in-plant corrosion monitors for several types of steam generators.

Initiate the manufacturing demonstration unit thermal and hydraulic testing.

FY 2000 Continue steam generator simulator testing and analysis for development of improved corrosion control and predictive models.

Continue testing of chemistry additives and corrosion inhibitors for long term use.

Accomplish additional testing of several types of steam generators with advanced in-plant corrosion monitors.

Identify and incorporate improvements to the new concept steam generator technology based on lessons learned from the manufacturing demonstration unit testing.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
B. Develop instrumentation and control equipment to replace obsolete equipment and improve reliability and performance.			
Naval reactor plants rely on instrumentation to monitor plant conditions, take corrective action and determine position and speed of the control rods used to regulate the reactor. Safe and reliable operation of the plant is dependent on the reliability and performance of this equipment. In addition, highly accurate and reliable equipment can increase actual usable power available from the reactor.			
Rapid technical advances in the electronics industry provide opportunities to improve equipment. The downside of these advances is rapid obsolescence because industry does not maintain the parts or capability to support older equipment. Due to its nature -- circuit cards and numerous interconnected small electrical components -- and obsolescence, lifetimes are much more limited than for heavy reactor equipment. As a consequence, this equipment must be replaced periodically over the life of a plant. Development concentrates on adapting equipment to reactor plant specifications that are more functionally integrated, less costly to support and more flexible to more easily incorporate future technological advances. The focus is on solid-state, microprocessor-based electronics technology which is simpler, more reliable and quieter.	45,900	41,000	45,000

Verifiable Supporting Activities:

FY 1998 Modify standardized instrumentation and control designs to incorporate lessons learned from testing and begin hardware qualification testing.

Develop engineering models of advanced pressure and flow sensors to be compatible with standardized instrumentation and control systems in various reactor plant types.

Complete compatibility testing of a new rod control system for the next generation reactor rod drive mechanisms.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000

FY 1999 Continue qualification testing of standardized instrumentation and control hardware and continue design documentation of system software.

Continue engineering model development and testing of advanced pressure and flow sensors and prepare for qualification testing.

Examine potential instrumentation and control technologies for application in a reactor plant for a possible new aircraft carrier.

Begin development of instrumentation for OHIO and LOS ANGELES class submarine reactor plants using standardized building blocks.

FY 2000 Conduct testing of various standardized instrumentation applications, conduct qualification testing of software building blocks and modify as necessary.

Continue development of instrumentation for OHIO and LOS ANGELES Class submarine reactor plants using standardized building blocks.

Perform qualification testing of advanced pressure and flow sensors to ensure compatibility with standardized instrumentation and control.

Begin identification of functional requirements for a new aircraft carrier reactor plant instrumentation system.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
C. Develop and test reactor plant components and applicable technologies which address known limitations and improve performance and reliability of components.			
Naval Reactors evaluates current technologies and applies them to develop simpler components which maximize plant efficiency, reliability and safety. For example, the main coolant pump used in the NIMITZ Class carrier reactor plant, originally designed in the early 1960's, is being redesigned for backfit to incorporate current technologies which will address known problems and thus improve its performance and enhance reliability over the pump's operating life.			
Effort also is focused on optimizing reactor plant arrangement to achieve simplicity, resulting in fewer components. The fewer the number of components and systems, the less the maintenance, space and power needs. This results in cost savings, enhanced reliability, greater ease of operation and more power available for other uses in the ship. An important consideration is flow through each component and system in the reactor plant because the pressure drop associated with each component has an affect on flow through the core. Deviations from nominal flow can cause a heat level imbalance within the core, thus tight tolerances are necessary to ensure the entire plant operates safely and efficiently	23,000	36,100	35,200

Verifiable Supporting Activities:

FY 1998 Perform next generation reactor coolant pump qualification testing.

Finalize redesign of the main coolant pump used in the NIMITZ Class carrier reactor plant and begin fabrication of the qualification unit.

Begin feasibility studies of components and systems for a reactor plant for a new aircraft carrier in support of the Navy's assessment of alternatives.

(dollars in thousands)

		FY 1998	FY 1999	FY 2000
FY 1999	Develop the next generation reactor primary fluid system design and complete coolant pump qualification testing.			
	Complete qualification unit fabrication and initiate qualification testing of the redesigned NIMITZ Class carrier main coolant pump including flow testing.			
	Continue feasibility studies and initiate conceptual definitions of a reactor plant for a new aircraft carrier.			
FY 2000	Complete test procedures associated with initial construction of the next generation reactor.			
	Continue qualification and flow testing of the redesigned NIMITZ Class carrier main coolant pump.			
	Initiate design of components, such as the main coolant pump and pressurizer, and arrangements for the reactor plant for a new aircraft carrier.			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
D. Perform reactor plant analyses to assure safe operation and improve reactor plant chemistry controls to reduce corrosion and plant radiation levels.			
The reactor core heats water which flows through the steam generator. The steam generator transfers the heat to the turbine cycle water by producing steam for power . Any corrosion products present in the reactor water will be carried through the plant and irradiated in the core. Additionally, excessive build-up of corrosion products in the core acts as insulation and narrows water channels, reducing flow and heat transfer.			
Chemistry controls are aimed at reducing corrosion. Development effort aims at maintaining water chemistry within operating parameters to provide as benign an environment as possible, thus protecting the components and systems of the reactor plant. A key factor in the development process is a continuous flow of data from test facilities and operating plants.			
Detailed reactor system performance analyses are also performed to ensure naval reactor plants are safe during normal, transient and casualty conditions. The performance analyses establish operating limits and automatic protection systems set points which ensure the plant will operate safely and reliably during operation.			
Through continuous improvement in chemistry, reactor protection system analyses and advances in metallurgy discussed in the Materials Development and Verification category, Naval Reactors has been able to maintain consistently low radiation levels while enhancing reliability and correspondingly reducing maintenance costs.	9,000	9,000	8,000
Verifiable Supporting Activities:			
FY 1998 Perform verification of the core performance model by comparing with expended core data.			
Begin to evaluate an alternate chemistry for reactor water treatment in several types of reactor plants.			
Begin the initial start-up reactor protection analysis for the next generation reactor.			
Conduct channel closure/ end-of-life reactor systems performance analysis for the advanced fleet reactor.			

(dollars in thousands)

		FY 1998	FY 1999	FY 2000
FY 1999	Continue analysis of core performance by isolating the effects of water acidity and temperature.			
	Continue the alternate chemistry treatment test for possible future use in several plant types.			
	Perform the protection analysis for the next generation reactor.			
	Initiate analysis to extend advanced fleet reactor protection basis to end-of-life.			
FY 2000	Incorporate results of isolation tests in the core performance model.			
	Conclude whether to implement alternate chemistry use for reactor water treatment on several plant types.			
	Perform the initial start-up test protection analysis for the next generation reactor, and develop a design basis for the reactor protection analysis under abnormal operating conditions.			
	Continue end-of-life advanced fleet reactor performance analysis.			
Total, Plant Technology		112,900	111,100	111,200

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ I.A Decreases to reflect progress on new concept steam generator.	- 2,000

Reactor Technology & Analysis

Mission Supporting Goals and Objectives

The work in this category ensures the continued safe operation of existing reactors, and develops new reactors with improved power capabilities, endurance, reliability and efficiency, and greater simplification. Reactor Technology and Analysis efforts support the performance measures of meeting Navy goals for extended warship operation, ensuring the operational safety and reliability of reactor plants for Navy warships, supporting Navy acoustic requirements, and ensuring continued excellence in radiological and environmental control.

Improved nuclear heat source design and analysis methods are needed to satisfy service life requirements. Limitations in these analytical techniques necessitate design conservatism, which must be reduced to increase the operating margin for reactors. Emphasis in this area is on thermal-hydraulics, structural and fluid mechanics, vibration analyses and nuclear core design and analysis work to more accurately predict reactor performance and reduce design conservatism. Improved core manufacturing processes and inspection techniques also are being pursued to support extended life requirements.

Effort also is underway to improve analysis tools and understanding of basic nuclear data. This will aid in improving Naval Reactors ability to predict performance over the longer lifetimes. Other efforts in this area are dedicated to designing and testing simpler, more reliable reactor equipment; performing analyses to ensure reactor safety; and developing improved shield designs to reduce cost and radiation levels.

Development and qualification of core and reactor component thermal and hydraulic designs is aimed at improvements in power and flow which facilitate improved acoustic performance. Radiological and environmental monitoring and controls ensure operations are conducted without adverse impact on employees or the environment

	FY 1998	FY 1999	FY 2000
I. Conduct planned development, testing, examination and evaluation of nuclear fuel systems, materials, and manufacturing and inspection methods to ensure Naval nuclear reactors are able to meet Navy goals for extended			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
A. Improve nuclear heat source (core) design and analysis methods and develop improved designs to satisfy service life requirements.			
The reactor design codes used in support of current designs were necessarily constrained in their modeling capability due to computational limitations and limited test data. As a result of the limitations in design codes, conservative procedures and designs are necessary to ensure safety and acceptability.			
However, supporting extended service life requirements necessitates reducing this design conservatism to extend the operating margin for current reactors. Reducing this conservatism safely requires extensive testing to provide data for the qualification of new analytical models and to aid in establishing new, or revising existing, core performance criteria. Engineering analyses and testing in the areas of nuclear analysis, thermal-hydraulics, structural mechanics, fluid mechanics, dynamic structural load tests and vibration are needed to confirm the acceptability and performance of the core and reactor components.			
Extended service life requirements are also being met through development of improved designs, such as the next generation reactor for the Navy's VIRGINIA class and in the future an improved reactor for future aircraft carriers. The core for the VIRGINIA class will be the first designed from inception to last the life of the ship. Development effort for new core designs entails validating key structural, thermal-hydraulic, and nuclear calculations to provide design assurance. Key components and design features are tested under prototypic operating conditions to demonstrate the mechanical, thermal-hydraulic and flow-induced vibration acceptability of the design and manufacturing processes	61,000	52,000	50,000

Verifiable Supporting Activities:

FY 1998 Conduct shock and vibration testing of the next generation reactor mechanical test cell and commence analysis of results.

Develop detailed design of test program to qualify fluid mechanics and thermohydraulic models.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

FY 1999 Assess and resolve implications of reactor test program on design margin and design bases for next generation reactor.

Assess feasibility and potential benefits of high temperature reactor concepts.

Initiate qualification of improved reactor code and design procedures using thermal-hydraulic data.

Initiate conceptual design of an advanced core for use in a reactor plant intended for a new aircraft carrier.

FY 2000 Incorporate experimental results to update analysis methods for the next generation reactor. Review engineering designs, analyses and test work to assure next generation reactor will perform as expected.

Evaluate technical requirements for reactors with high temperature capability.

Develop and qualify code and design procedure using test data.

Initiate reference design for an advanced core for use in a reactor plant intended for a new aircraft carrier.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
B. Evaluate and test improved core manufacturing processes and inspection techniques to support extended life reactors.			
Earlier Naval core designs result in hot spots in the fuel during operation, and margins are built into the fuel designs and operating limits to compensate. The current fuel manufacturing process, the Modified Fuel Process (MFP), reduces hot spots and allows cores to operate with higher energy density needed for longer endurance. However, this process is expensive and technically challenging. Continuing effort is aimed at improving fuel manufacturing to develop a process which can deliver a high power core at lower cost.			
Naval Reactors needs manufacturing process improvements to support new core design features, discussed above, and must develop new processing methods to manufacture cores with improved capabilities to meet design requirements and objectives. In addition, the experience gained by doing manufacturing and inspection process development can be applied in ensuring manufacturability of new core designs and preparing manufacturing contract specifications.			
The intent of manufacturing and inspection development efforts also is to reduce cost compared to current processes. Other efforts include developing more cost-effective processes for fuel elements, fuel assemblies, and core structural components. Test specimens are manufactured for in-reactor tests to qualify design and process changes for ultimate application in core design and manufacturing.	20,000	15,000	18,000

Verifiable Supporting Activities:

FY 1998 Establish manufacturing capability to pilot advanced fuel process concepts.

Develop advanced systems with reduced cost.

FY 1999 Conduct initial demonstration of the new fuel system manufacturing process.

Continue development of advanced fuel systems.

Investigate new manufacturing and inspection technologies to reduce core cost and improve core

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
FY 2000 Model key manufacturing processes and demonstrate advanced processing technologies on mockups.			
Begin qualification of advanced fuels and processing techniques.			
Develop new and emergent manufacturing and inspection technologies to improve core operation, solve technical problems and reduce core cost.			
II. Complete scheduled design, analysis, and testing of reactor plant components, systems, and performance to ensure the operational safety and reliability of reactor plants for use in Navy nuclear powered warships so they can fulfill their national defense mission.			
A. Design and test improved reactor equipment including advanced control rod drive mechanisms.			
The control rods directly control reactivity in the reactor. Regulation of the reactivity, and reactor safety and reliability, demand the mechanisms which drive the control rods perform without incident.			
Current mechanism designs are based on 1960s technology. Development efforts are focussed on incorporating a new design which would virtually eliminate inadvertent scrams and improve reliability of performance. Other planned improvements include: a simpler design, improved lifetime features, and additional operating flexibility.			
New reactor heavy equipment, including reactor vessel, closure head, closure studs, and a core basket, also must be developed and qualified to accommodate new core designs. Effort during the budget period is focussed on the equipment for the next generation reactor and for a reactor for a new aircraft carrier. Detailed three-dimensional structural analyses are performed to ensure these important components are not over stressed	29,000	39,000	44,000

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

FY 1998 Test and resolve design issues for extended life of control rod drive mechanisms.

Perform testing of control drive mechanism lead units, including life, thermal, and shock and vibration testing.

Carry out design/structural analysis validation and continue fit up and alignment studies of reactor equipment for the next generation reactor.

Conduct analysis of stress-strain relationships and cyclic loading.

FY 1999 Conduct control drive mechanism lead unit life testing and examinations.

Begin life testing of prototypical production unit control drive mechanisms.

Evaluate concepts for control drive mechanisms for a new aircraft carrier.

Assess sizing of reactor equipment for a new aircraft carrier based on analytical and experimental methods.

FY 2000 Complete remaining control drive mechanism lead unit testing, examination and reports.

Perform any needed testing and resolve design issues arising from receipt inspection or power unit assembly for the next generation reactor.

Initiate reference designs for reactor equipment and an improved control drive mechanism for use on a new aircraft carrier.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
B. Perform physics testing and analysis to confirm expected fuel system and core performance and develop improved analysis methods for predicting core performance that reduce design approximations, uncertainties, and associated conservatism.			
The first cores Naval Reactors developed had expected service lives of two years. Subsequent development efforts have allowed extending this service life to over twenty years, and development is underway to deliver a life-of-the-ship core which will last over thirty years. While yielding significant advantages in terms of reduced radiation exposure, reduced cost, and increased ship availability, the longer core life is pushing nuclear analysis tools beyond proven experience. These tools are limited in their ability to accurately predict core physics performance at later phases of life. Naval Reactors is developing improved methods and tools to provide continued assurance of safe and reliable operation at stages in life which extend well beyond current operating experience.			
In addition, current physics methods use approximations which limit design precision and require allowances be built into the design. Naval Reactors is improving design methods and software to reduce the degree of conservatism. For example, advancements in computer capability are being exploited to provide more precise calculations of core performance over lifetime. This will allow a reduction in uncertainties and biases currently applied to core reactivity predictions. These reductions can lead to reduced costs and improved reactor performance through more accurate predictions of power levels in the various regions of a core under transient and steady-state conditions.			
Qualification of these improved analytical and design methods requires extensive testing; comparison of calculations to experimental results and operating experience; and validation of predictions against prototype core measurements. Differences between calculations and experimental results are resolved and the results factored into improved methods and computer programs. Efforts also are focussed on improving measurements of basic nuclear data and determining experimental programs required to improve the data. This includes measurement of nuclear cross sections which underlie all reactor physics calculations	21,000	20,000	20,000

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

FY 1998 Analyze physics results from middle-of-life operation of the advanced fleet reactor prototype core.

Correlate advanced fleet reactor physics data to expand model qualification base.

Achieve improvement in speed for deterministic solution of neutron transport equation.

Establish core concepts to support design basis decisions for a reactor for a new aircraft carrier.

Conduct physics analysis of expended fuel data from the S8G prototype core to confirm predictions and methods.

FY 1999 Evaluate advanced fleet reactor prototype physics data for the most reactive time in life.

Develop a parallelized version of the Monte Carlo program to achieve a large reduction in time for solving the neutron transport equation.

Develop affordable core design concepts to support design basis for a reactor for a new aircraft carrier.

Analyze physics data from the D2W prototype expended core examination.

		(dollars in thousands)		
		FY 1998	FY 1999	FY 2000
FY 2000	Evaluate physics data from late-in-life operation of the advanced fleet reactor and qualify model predictions against the measured data.			
	Incorporate improvements to major nuclear design programs.			
	Start reference design effort for more affordable core design for an advanced aircraft carrier.			
	Apply improved physics methods, modeling procedures and cross section data to reduce reactivity bias.			
	Analyze physics data from the NIMITZ prototype expended core examination to validate physics predictions and methods.			
C. Conduct reactor safety and shielding analyses for nuclear reactor plants to ensure containment of radiation and proper protection of personnel.				
Naval Reactors conducts reactor safety analyses of all plants and new core designs to confirm the adequacy of the design and assure public health and safety. Safety assessments are conducted for specific reactor plant designs to identify any potential safety vulnerabilities and to assess the likelihood of a core damaging casualty. Severe accident assessments are conducted for specific reactor plant designs to evaluate containment integrity for postulated accident scenarios.				
In addition, shielding analyses are conducted to ensure containment of radiation and continued safe operation. New shield materials are sought to improve shield effectiveness, while eliminating the use of hazardous materials such as lead. Shielding methods improvements more accurately predict the effectiveness of the radiation shielding and the extent of radiation reactor components and materials receive. This allows shielding to be better optimized to reduce radiation exposure to personnel and equipment during reactor plant and servicing operations and during the handling and shipment of spent nuclear and other highly radioactive materials		11,000	13,000	13,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Verifiable Supporting Activities:			
FY 1998 Improve analysis methods.			
Continue no-lead shield design with evaluation of alternatives for eliminating lead from shielding.			
FY 1999 Further develop analysis methods.			
Complete the CVN 77 shield design.			
Develop and qualify improved shield design methods.			
FY 2000 Develop and qualify improved shield design methods.			
Establish initial design methods for a reactor intended for a new aircraft carrier.			
III. Accomplish planned core and reactor component/system design and technology development efforts to support the Navy's acoustic requirements.			
A. Develop and qualify improved core and reactor component thermal and hydraulic designs.			
Work in this area is focused on improving thermal hydraulic analytical models and codes. Improved tools will enable a more accurate determination of flow requirements, increasing the margin between operating conditions and performance limits.			
For additional explanation, please refer to classified addendum.	18,000	19,000	16,000

(dollars in thousands)		
FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

FY 1998 Initiate model and code development and fundamental testing to extend the advanced computational fluid dynamics code.

Evaluate application of modified hydraulic design to future core designs.

FY 1999 Develop models and perform fundamental testing for the application of the advanced computational fluid dynamics code to additional areas.

Develop models and conduct testing to extend the qualified range of the thermal and hydraulic design procedures.

Develop models and conduct testing for extension of modified hydraulic design code to future core designs.

FY 2000 Validate and qualify advanced computational fluid dynamics code for additional application.

Validate the advanced code for use in modified hydraulic design analysis.

Develop and qualify improved shield design methods.

Establish initial design methods for a reactor intended for a new aircraft carrier.

IV. Ensure no personnel exceed Federal limits for radiation exposure and no significant findings result from environmental inspections by state and federal regulators.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
A. Conduct radiological control, environmental, and safety operations necessary to protect laboratory employees, minimize release of hazardous effluents to the environment, and comply with all applicable regulations.			
Radiological materials must be properly controlled to protect the health and safety of workers, the public and the environment. Naval Reactors has developed and enforces strict compliance with requirements for safe handling and disposal of radiological material. Additional procedures are in place to ensure environmental compliance. The principal focus of these environmental efforts is to prevent the generation of environmental hazards, by reducing wastes and preventing pollution.			
Training is conducted to ensure radiological, safety and environmental requirements are understood. In addition, personnel and affected work areas receive routine radiological monitoring to ensure exposure is within minimal limits. Environmental monitoring confirms operations do not impact the surrounding community, and emergency response capabilities are in place to control or mitigate any problems.	32,000	34,000	35,000
Verifiable Supporting Activities:			
All Years Survey and document radiological conditions; train personnel for all phases of radiological work and environmental work.			
Minimize the production and safely dispose of all waste in accordance with applicable regulations.			
Audit compliance to all regulations to ensure effectiveness of controls

Materials Development & Verification

Mission Supporting Goals and Objectives

Materials Development & Verification provides the high performance materials necessary for Naval reactor plant applications. This work principally supports the performance measure to ensure Naval nuclear reactor plants are able to meet Navy goals for extended warship operation. Ensuring materials will withstand the rigors of the harsh environment -- irradiation, high temperature, high pressure, and corrosion -- over a number of decades is a central element to providing longer lived reactor plants. This challenge is compounded by the inability to examine or replace materials in the reactor plant once assembled. Thus, candidate materials must be identified and developed, and these materials, plus materials currently in use, must be extensively and strenuously tested to assure they can meet demand. The materials are also continuously reassessed based on evolving knowledge, and analytical and testing techniques.

Developing and qualifying these high performance materials requires conducting tests of varying periods, up to many years; collecting test data from prototypical specimens and materials removed from service; and assembling that data into improved predictive models. The ability of these models to accurately predict material performance is vital to operating plant safety and to qualifying materials for longer lifetimes.

Work in this category is divided into three areas: core and reactor structural materials, plant materials, and irradiations testing. The first two areas concern the different challenges and demands placed on materials based on their location and function. For example, core materials are subject to more intense irradiation and higher heat levels, while plant materials are more susceptible to stress and cracking. Irradiation testing is used to support both core and plant material development, but is highlighted to reflect the fundamental impact of radiation on material performance.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Materials Development & Verification	115,000	119,500	124,800	+5,300	4.4%
Total, Materials Development & Verification	115,000	119,500	124,800	+5,300	4.4%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
I. Conduct planned development, testing, examination and evaluation of nuclear fuel systems, materials, and manufacturing and inspection methods to ensure Naval nuclear reactors are able to meet Navy goals for extended warship operation.			
A. Develop improved nuclear fuel, core and reactor structural materials which extend core lifetimes up to the life of the ship, and evaluate irradiation tests of new and existing materials to verify acceptable lifetime performance and to improve analytical capabilities.			
Materials used in a reactor core as fuel, poison, cladding, and structural pieces must be capable of maintaining their mechanical integrity in an operating reactor environment which subjects them to the harmful effects of irradiation, pressure, corrosion, and heat. This demand is further exacerbated by their need to endure this harsh environment over increasing time periods. In order to support core life expectations of more than 30 years, development and testing of economically attractive materials with improved physical or nuclear characteristics is being pursued. Improvements in material characteristics offer the potential for increased core lifetime, reductions in analytical conservatism and cost savings.			
The ability to qualify materials for specific applications is dependent upon fabrication process development, and through testing and development of predictive models to cover design applications. Materials used in long life core designs must be qualified in advance by collecting data on their performance during tests, examining their condition after testing and at end of use, and assembling the collected data into sound predictive models	37,000	40,500	43,800

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

Materials work supporting long life core concepts, by nature, involves extended testing conducted over many years. The verifiable supporting activities described below provide examples of materials data generated each year thus representing outcomes within the continuing general scope of work.

FY 1998 Develop an improved predictive model for corrosion performance.

Complete next phase of post irradiation crack growth rate testing of X750 and A625 materials.

Develop improved fuel material processing technique to reduce costs and environmental wastes.

Conduct initial evaluations of fuel specimens subjected to various conditions in support of improved performance limits.

FY 1999 Upgrade fuel performance modeling to support improved fuel performance analysis.

Complete post irradiation crack growth rate testing to determine whether the effect of radioactive fluence on stress corrosion cracking resistance of X750 and A625 can be reduced.

Evaluate acceptability of fuel manufactured with a new production process that reduces cost and utilizes environmentally friendly materials.

Conduct destructive evaluation of fuel specimens which underwent performance testing and assess changes to design bases.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

FY 2000 Reevaluate model based on latest irradiated materials data.

Conduct testing of prototypic X750 fasteners to provide temperature dependencies for use in a predictive cracking model.

Complete interim evaluation of initial high temperature fuel material irradiations tests to assess performance.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
B. Test and evaluate plant materials to characterize the long term effects of the harsh operating environment and qualify improved materials and processes to ensure endurance requirements will be met.			
Materials used throughout the reactor plant are critical as degradation can lead to reduced performance, shorter lifetime, increased maintenance, or component failure. Consequently, Naval Reactors' efforts are focused on developing and qualifying materials to assure their endurance commensurate with the need to support increasingly longer lived nuclear cores. In dealing with material degradation, a leading concern is stress corrosion cracking, the damage potentially occurring to materials carrying high tensile loads exposed to fluids, radiation, or high temperatures. Other plant material concerns include embrittlement resulting from irradiation, and the use of cobalt in plant materials. Cobalt is used in certain alloys because of its contribution to strength and wear resistance, but has a propensity to remain irradiated longer than other materials, complicating servicing and inactivation. Development and qualification of low or non-cobalt materials is underway.			
Naval Reactors employs various methods to test, evaluate, and develop improved plant materials. For example, autoclave corrosion test facilities are used to create a hot, pressurized environment to recreate, under accelerated conditions, what the material would experience over a longer period of time in an operational reactor plant. Materials which have been in service are examined to provide critical operating data. In addition, destructive and non-destructive testing and examination provides valuable data on material performance and reliability. Non-destructive testing is generally less expensive and allows repeated examination of materials, as well as analysis of the material condition of components still in service, however, some key data on the strength and vulnerabilities of materials can only be obtained through destructive means. An example of destructive testing is measuring the onset of cracking in a material which is intentionally subjected to controlled destructive conditions of stress and corrosion.	40,000	39,000	38,000

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

Because understanding the long term behavior of materials and phenomenon such as stress corrosion cracking is an incremental learning process, the verifiable supporting activities described below represent accomplishments of milestones within the continuing overall effort.

FY 1998 Conduct destructive and non-destructive examinations of component samples removed from operating plants, including a post-service exam of an improved stress corrosion cracking resistant alloy.

Complete initial testing of new low-cobalt alloys and select candidates for continued development.

Conduct thermal embrittlement testing for pressure vessel materials made by the most current material fabrication process.

Complete testing to demonstrate adequacy of valve fasteners for an extended lifetime.

FY 1999 Continue stress corrosion cracking testing and evaluation and complete preliminary version of an advanced predictive model.

Conduct advanced testing of promising new low-cobalt alloys.

Complete first phase of program to evaluate effects of chemistry and material microstructure on irradiation damage in pressure vessel materials.

Improve testing capabilities by developing laser spectroscopy techniques to study low level contaminants in water and monitor stability of additives.

		(dollars in thousands)		
		FY 1998	FY 1999	FY 2000
FY 2000	Complete current phase of crack growth rate testing of corrosion resistant materials to support model refinements.			
	Continue development of low cobalt alloys.			
	Conduct testing to evaluate long term temperature and irradiation embrittlement behavior of a reactor vessel structural material.			
	Perform testing to extend lifetime of high strength fasteners.			
	Improve crack growth rate and corrosion fatigue testing capabilities by developing advanced non destructive testing methods and automated data acquisition techniques.			

C. Conduct irradiations testing and perform detailed examinations to provide data for material performance characterization and prediction.

Irradiation is the most invasive factor to which reactor materials are exposed, compounding the demands caused by other environmental factors. The Advanced Test Reactor (ATR), located at the Idaho National Engineering and Environmental Laboratory, is Naval Reactors' main source of data on the performance of reactor fuel, poison, and structural materials under irradiated conditions. ATR's high operating flux characteristics allow approximations of lifetime effects from nuclear reactor operation to be obtained in a much shorter time. While operation of the facility is funded in the Evaluation and Servicing budget category, work here includes fabricating test specimens for insertion into the ATR, designing irradiation test trains to expose materials to selected reactor conditions, and conducting post-irradiation detailed examinations to analyze how the material stood up to reactor operating conditions. Test trains are specially engineered structures which hold material specimens in place during irradiation, and are periodically inserted and withdrawn allowing acquisition of data from a wide variety of materials and configurations. The test train's internal arrangement and location in the ATR determines the exposure to specific conditions. 38,000 40,000 43,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Verifiable Supporting Activities:			
Testing and collection of data from these tests is an ongoing, often long term activity. The verifiable supporting activities indicate the start or completion of significant testing efforts. These activities should be viewed as a part of the overall continuing effort.			
FY 1998 Commence irradiation testing of advanced fuel samples at various temperatures.			
Irradiate samples to investigate fundamental corrosion processes.			
FY 1999 Complete irradiation of pressure vessel fracture toughness specimens.			
Complete irradiation of samples to investigate cracking phenomenon.			
FY 2000 Initiate irradiation of advanced fuel samples using enhanced facilities for control of sample temperatures during irradiation.			
Initiate irradiation of vendor fuel samples to demonstrate acceptability of newly established production process.			
Total, Materials Development & Verification	115,000	119,500	124,800

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
■ I.A Increase in core and reactor structural materials reflects increased emphasis required to support resolution of emergent issues arising from recently identified performance findings, as well as increased testing to support qualification for extended lifetime	+3,300
■ I.B. Decrease reflects reduced efforts on destructive examination and testing of components removed from operating plants and reduced effort to develop lower cost manufacturing methods	-1,000
■ I.C. Irradiations testing increases reflect development of improved testing capabilities needed to conduct on-line monitoring of radiation effects. This capability will facilitate improved material performance data and understanding of effects, and will permit faster access to data. Improved capability is necessary to support qualification and validation of material performance for longer life. Also reflects increased cost of irradiations testing in the Advanced Test Reactor	+3,000
Total Funding Change, Materials Development & Verification	+5,300

Evaluation & Servicing

Mission Supporting Goals and Objectives

Evaluation and Servicing work encompasses the operation, maintenance, and servicing of land-based prototype Naval nuclear propulsion plants and the Advanced Test Reactor, the examination of expended cores to validate end-of-life predictions, and the preservation of environmental quality at all Naval Reactors' sites.

Evaluation and Servicing supports the performance measures for ensuring the availability of prototype plants for testing and training, safely and responsibly inactivating shutdown prototype plants, supporting Navy goals for extended warship operation, and maintaining excellence in radiological and environmental control.

Keeping the prototype plants and the Advanced Test Reactor running efficiently is essential, as information obtained from testing provides valuable feedback for designing new cores and supporting operating fleet reactor plants. Testing of materials, components, cores, and systems in these reactor plants provides important technical data and experience under actual operating conditions.

The accumulation of operational data from the prototype and fleet operating plants, expended core examinations, and increases in the capability of computer modeling have enabled Naval Reactors to shut down six of the Program's eight prototype plants resulting in substantial cost savings. Work is aimed at inactivating and laying up the shutdown plants to place them in an environmentally benign state.

End-of-life fuel cell examinations and non-destructive examinations of irradiated test specimens contribute to extended warship operation by validating design predictions and providing information which can be used to improve future designs.

The Evaluation and Servicing category also funds ongoing clean up of facilities at all Naval Reactors sites to reduce hazards to personnel, and reduce potential liabilities due to changing conditions or accidental releases.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Evaluation & Servicing	166,020	163,589	149,400	-14,189	-8.7%
Total, Evaluation & Servicing	166,020	163,589	149,400	-14,189	-8.7%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
I. Maintain a utilization factor of at least 90% for prototype plants to ensure their availability for scheduled testing, training, and servicing needs, and provide for development of servicing equipment and testing of plant components, materials and procedures.			
A. Operate land-based test reactor plants to provide for prototypical testing, core depletion analysis, and reactor plant operator training.			
Naval Reactors operates the MARF and S8G prototypes on an around-the-clock basis to test and evaluate new/improved equipment, components, materials and operating procedures. Each prototype provides a unique testing environment. A major focus is to quickly deplete the advanced fleet reactor in S8G since the information gained will validate the predictions for the cores installed in SEAWOLF class submarines and provide data useful in the development of long lived cores. The MARF prototype is depleting the developmental materials core at varying power levels, and periodic physics tests are being performed to determine how the nuclear fuel reacts with an advanced poison material being tested in that core. These tests are conducted multiple times over the life of the core to verify predicted behaviors as the fuel depletes.			
Over the budget period, Naval Reactors will perform routine maintenance on MARF and S8G to ensure the plants remain in a safe condition and can carry out their testing mission. Other necessary work supporting safe, effective prototype operation includes: operating support systems essential for reactor plant operations; maintaining technical manuals to reflect changes in operating and test procedures; monitoring plant and equipment performance to ensure problems are promptly identified and resolved; performing routine radiological monitoring of plant operations and personnel radiation exposure; maintaining proper plant and support system chemistry control; and replacing plant components as they age to ensure continued, reliable plant operations.	31,000	31,000	32,000

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

FY 1998 Meet depletion objectives for MARF and S8G cores.

Conduct the fourth MARF high power physics test and issue report.

FY 1999 Meet depletion goals for MARF and S8G.

Conduct the fourth MARF low power physics test and issue report.

FY 2000 Deplete the MARF and S8G cores according to depletion objectives.

Conduct the fifth MARF high power physics test and issue report.

Inspect pressurizer heater wells in MARF.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

B. Service land-based test reactor plants to ensure they continue to operate safely and efficiently, and develop equipment and procedures to provide for safe and efficient servicing of nuclear reactor plants.

Naval Reactors also performs major servicings on the prototypes to ensure continuing operability. Anticipated major servicings over FYs 98-00 focus on inspecting and cleaning the steam generators. This must be done periodically as solid particles settle out of the boilerwater in the low flow areas where steam generator tubes and support plates meet. These particles form a sludge, which, if not removed, could cause chemical corrosion in the metal tubes and supporting plates. Performing these inspections and cleanings on prototype plants not only keeps them operating efficiently and safely, but increases our knowledge of how fast sludge is accumulating and how corrosion is occurring in shipboard steam generators.

Naval Reactors ensures the feasibility of defueling and refueling operations is taken into consideration as part of design and development of new reactor cores. Efforts in this area currently are focused on the next generation reactor and a future aircraft carrier plant. Specifically, Naval Reactors is evaluating the next generation reactor design to ensure provision for reactor maintenance and defueling capability. Included in this effort is the design of all power unit loading, maintenance, and defueling equipment, and preparation of planning documents and analyses required for shipment and installation of the next generation reactor power unit and shipment and disposal of recoverable irradiated fuel and irradiated core components. Naval Reactors also is looking into reactor servicing concepts for a new aircraft carrier. 5,000 14,000 14,000

Verifiable Supporting Activities:

FY 1999 Inspect the two MARF steam generators.

Perform qualification testing on next generation reactor control drive mechanism seal welding machines.

Complete development of next generation reactor defueling procedures.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
FY 2000 Inspect one steam generator and clean both steam generators in S8G.			
Perform scoping studies to evaluate preliminary core and reactor servicing equipment design concepts for a new aircraft carrier.			
C. Operate and service the Advanced Test Reactor to provide for materials irradiations testing.			
As the principal customer of the Advanced Test Reactor (ATR), Naval Reactors funds operation and maintenance of the reactor to support material irradiation testing. This is the only facility in the Nation capable of performing these tests. The ATR provides the ability to irradiate five train-type experiments with various flux conditions in pressurized water loops at the same time. Actual testing is funded in the Materials Development and Verification category.			
The ATR is the main source of test data on the performance of reactor fuel, poison, and structural materials under irradiated conditions. The irradiation test program supports operating Naval reactor plants, supports material selections made for the VIRGINIA class reactor plant, and supports database development that positions Naval Reactors to better understand emergent problems with existing reactors and to make informed material selections for new reactor designs.	15,000	16,000	17,000
Verifiable Supporting Activities:			
All Years Meet operating efficiency goals.			
II. Meet cost and schedule goals to safely and responsibly inactivate shutdown land-based reactor plants in support of the Department's environmental clean-up goals.			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
A. Continue inactivation efforts at the Windsor site in Connecticut to eliminate surplus facilities, remediate and dismantle plant facilities and release applicable areas.			
The S1C plant is defueled and significant progress has been made on dismantlement. In 1996 an Environmental Impact Statement and Record of Decision recommending prompt dismantlement of the S1C reactor compartment were issued. Work to date has resulted in approximately 26 buildings/structures being demolished and disposal of over 9,000 tons of construction debris, over 1,000 tons of recycled steel, over 6,000 tons of PCB and asbestos contaminated waste, and 1100 cubic yards of radiological waste. The major remaining work efforts at this site center around reactor compartment dismantlement.	25,020	22,000	7,000

Verifiable Supporting Activities

FY 1998	Separate the S1C reactor pressure vessel from its supporting structures and package for disposal.
	Separate, package, and ship the steam generators and reactor coolant pumps.
FY 1999	Complete primary shield tank removal, package, and ship out for disposal.
	Complete reactor compartment removal and disposal activities.
FY 2000	Complete building demolition.

B. Continue inactivation efforts at the Kesselring site in New York to eliminate surplus facilities, remediate and dismantle plant facilities and release applicable areas.			
The S3G and D1G plants at the Kesselring site in New York are defueled. The S3G engine room has been completely dismantled. In 1997, an Environmental Impact Statement and Record of Decision recommending prompt dismantlement of the S3G and D1G reactor compartments were issued.	20,000	14,000	19,400

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

FY 1998 Complete D1G reactor compartment asbestos removal.

Complete servicing equipment disposal from D1G defueling.

FY 1999 Continue dismantlement activities, including preparations for S3G pressure vessel removal.

FY 2000 Continue inactivation efforts, including completion of S3G pressure vessel removal.

C. Continue inactivation efforts in Idaho to eliminate surplus facilities, remediate and dismantle plant facilities and release applicable areas.

Work continues on the S1W, A1W, and S5G plants at the NRF site in Idaho. Defueling of the S5G plant will complete in FY 1998. The A1W plant has two reactors, one of which is defueled. Preparatory work is underway on the other reactor with defueling scheduled in FY 1999. Naval Reactors also will perform minimal site environmental remediation to support the spent fuel agreement with the State of Idaho..... 31,000 25,589 17,000

Verifiable Supporting Activities:

FY 1998 Complete S5G defueling.

Complete servicing equipment disposal from A1W-B defueling.

FY 1999 Complete servicing equipment disposal from S5G defueling.

Complete the lay-up work for the S5G plant.

Defuel the A1W-A plant.

Decontaminate the S1W retention basin

		(dollars in thousands)		
		FY 1998	FY 1999	FY 2000
FY 2000	Complete servicing equipment disposal from A1W-A defueling.			
	Complete the lay-up work for the A1W plant.			
	Continue environmental remediation efforts stipulated in the spent fuel agreement with the State of Idaho.			
III. Ensure no personnel exceed Federal limits for radiation exposure and no significant findings result from environmental inspections by state and federal regulators.				
A. Conduct ongoing clean up of test facilities to reduce hazards to personnel, and reduce potential liabilities due to changing conditions or accidental releases.				
Operation of test, examination, and manufacturing facilities has involved the use of hazardous materials. Decontamination and remediation efforts limit the hazards to personnel, reduce the potential environmental liabilities due to changing conditions or accidental releases, and provide more usable space for future operations. These efforts reduce the current and future hazards from materials such as asbestos, heavy metals, chemicals, and radioactivity.				
The facilities are first characterized to determine the extent and nature of clean up needed. The results of these characterizations are analyzed and the efforts are prioritized based on regulatory requirements and resources available to perform the work. As such, the order in which the following verifiable supporting activities are performed is subject to change based on this prioritization process. The activities identified are, however, representative.		25,000	25,000	25,000

(dollars in thousands)		
FY 1998	FY 1999	FY 2000

Verifiable Supporting Activities:

FY 1998 Conduct asbestos abatement actions at the Naval Reactors Facility (NRF) site.

Renovate the radioactive materials laboratory at the Knolls site.

Release the NRF #2 Spray Pond for non-radiological demolition.

Decontaminate floor space in the N-building and various rooms in the CX building at the Bettis Pittsburgh site.

FY 1999 Process for disposal historical waste from the L-Building at the Bettis Pittsburgh site.

Remove asbestos from various buildings and laboratories at the Bettis Pittsburgh site.

Continue Knolls site remediation activities.

FY 2000 Initiate remediation of obsolete fuel processing facility at the Bettis Pittsburgh site.

Conduct remediation activities at Bettis Pittsburgh for disposition of historically contaminated facilities and equipment.

Continue the renovation of various areas at the Knolls site.

Continue remediation efforts at NRF in support of CERCLA and voluntary consent order requirements.

IV. Conduct planned development, testing, examination and evaluation of nuclear fuel systems, materials, and manufacturing and inspection methods to ensure Naval nuclear reactors are able to meet Navy goals for extended warship operation.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
A. Examine removed fuel cells at end-of-life and perform non-destructive examinations of irradiated test specimens to confirm predicted performance and validate design methods.			
Data obtained from the examinations of in-service components and specimens provides valuable information on material and component characteristics and performance in the harsh reactor environment. The results of examinations are used to reduce uncertainties in behavior of cores and components, to produce improvements in existing ship performance, and to extend reliable operational life. Predictive and analytical tools are updated based on differences between calculations and observed performance.	14,000	16,000	18,000

Verifiable Supporting Activities:

FY 1998 Prepare the necessary procedures and schedules for examinations, assembly, shipment, receipt, and disassembly of about fifteen irradiation tests each year.

Begin A4W prototype expended core component examinations.

Begin D2W prototype expended core component examinations.

FY 1999 Prepare the necessary procedures and schedules for examinations, assembly, shipment, receipt, and disassembly of about fifteen irradiation tests each year.

Complete data collection for highest priority A4W prototype expended core component examination.

Receive ASNPP fuel from the A1W prototype.

		(dollars in thousands)		
		FY 1998	FY 1999	FY 2000
FY 2000	Prepare the necessary procedures and schedules for examinations, assembly, shipment, receipt, and disassembly of about fifteen irradiation tests each year.			
	Complete data collection for highest priority D2W prototype expended core component examinations.			
Total, Evaluation and Servicing		166,020	163,589	149,400

Program Direction

Mission Supporting Goals and Objectives

Due to the critical nature of nuclear reactor work, Naval Reactors is a centrally managed organization. This places a heavy burden on the Federal employees who oversee and set policies/procedures for developing new reactor plants, operating existing nuclear plants, facilities supporting these plants, contractors, and the Bettis and Knolls Atomic Power Laboratories. In addition these employees interface with other DOE offices and local, state, and Federal regulatory agencies. Ten FTE's at the Idaho Operations Office oversee operation of the advanced test reactor, which Naval Reactors uses for materials irradiation and testing. Program direction has been grouped into four categories:

Salaries and Benefits provides for Federal personnel compensation, including awards, lump sum leave payments, and employer contribution to employees' benefits.

Travel includes necessary trips to our various sites to carry out the mission of the Naval Reactors Program.

Support Services are not used by Naval Reactors.

Other Related Expenses include training, building occupancy, telecommunications, postage, payroll processing, ADP maintenance, and other miscellaneous expenses associated with the Working Capital Fund, and Program operation.

90-N-102, Expended Core Facility Dry Cell, Naval Reactors Facility, Idaho

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

Total Estimated Cost and Total Project Cost have been increased by $1,900,000 for design and facility modifications in anticipation of using a larger spent fuel cask within the Dry Cell to accommodate longer fuel modules than are currently used.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1990 Budget Request (*Preliminary Estimate*)	1Q 1990	3Q 1991	3Q 1991	4Q 1995	48,000	49,936
FY 1996 Budget Request[a]	1Q 1990	4Q 1991	2Q 1993	4Q 1998	48,646	51,027
FY 1998 Budget Request[b]	1Q 1990	2Q 1999	2Q 1993	4Q 2001	62,046	79,604
FY 1999 Budget Request[c]	1Q 1990	2Q 2000	2Q 1993	4Q 2002	84,946	96,117
FY 2000 Budget Request[d] (*Title I Baseline*)	1Q 1990	2Q 2000	2Q 1993	4Q 2002	86,846	98,694

[a] This budget request reflects changes due to a June 1993 Court Injunction which placed the Dry Cell Project on hold, until an agreement was reached between the Department of Energy and State of Idaho in October, 1995.

[b] This budget request added the East End Modification to accommodate Dry Fuel Storage. (Therefore, includes preliminary estimate for East End Modification)

[c] This budget request added the West End Modification to accommodate return of spent fuel from the Idaho Chemical Processing Plant to the Expended Core Facility. (Therefore, includes preliminary estimate for West End Modification)

[d] This budget request includes additional funding to perform design and facility modifications to accommodate the potential use of a larger fuel module within the Dry Cell. In addition, the Title I design for the East End Modification has been completed.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
1990	3,546	3,546	1,564
1991	4,000	4,000	3,129
1992	15,000	15,000	4,238
1993	13,600	13,600	10,078
1994	0	0	2,410
1995	0	0	555
1996	3,000	3,000	7,557
1997	8,000	8,000	13,908
1998	3,100	3,100	5,878
1999	5,800	5,800	3,538
2000	12,000	12,000	13,070
2001	13,400	13,400	8,651
2002	5,400	5,400	12,868

3. Project Description, Justification and Scope

The Expended Core Facility (ECF) Dry Cell Project will consist of a dry shielded fuel handling, disassembly, examination and loading facility, a decontamination shop, and a shielded repair shop, equipment to load spent fuel in dry storage containers, an area for overpack assembly, and an interim storage pad. Two dry storage container loading stations will be constructed, one at the east end and one at the west end of the shielded cell. The shielded facility and shops will be located in the existing ECF building South Bay and will be connected to the existing ECF water pits. The west end loading station, a fuel receipt transfer bay, spares storage, control room, and a mockup training area will be included as an approximately 22,300 square foot addition to the east and south of the existing 215,000 square foot ECF building. The addition will be of concrete and steel construction, steel reinforced concrete floor, and metal deck roof with a built-up elastomeric covering. A temporary shield wall will be constructed at the west end of the repair cell to provide for expansion of the shielded cell for the west end dry loading station in parallel with fuel handling operations in the east end loading station.

The dry shielded facility design will incorporate high density concrete radiation shielding and highly filtered air ventilation for radiological contamination control. Shielded lead glass windows and viewing aids will be provided at the various stations. The facility will include automated equipment for fuel module disassembly, examination, and interim dry storage. Features of the production line include the water pit to dry cell delivery system, the examination system, the cutting system for separation of modules, and the prepared fuel loading station. The dry (unmoderated) environment of the shielded cell allows efficient material handling with a high degree of safety. The dry cell and interim storage pad will have a design life of 40 years.

The Dry Cell Project consists of three separate tasks: the Dry Cell task; the East End Modification task; and the West End Modification task.

The Dry Cell task provides work areas and equipment needed to more efficiently handle expended nuclear cores. Existing ECF underwater equipment was not capable of handling the larger and heavier modules now received at ECF. These underwater fuel disposal methods are personnel intensive and have significant technical disadvantages. These technical disadvantages include extremely difficult equipment and facility maintenance; poor visibility; time-consuming shipping cask loading; and a significant burden of deliberately redundant administrative and physical controls for nuclear safety. The use of a dry cell significantly reduces these disadvantages. This task is approximately 99 percent complete.

The East End Modification task provides facilities and equipment for loading dry storage containers. An interim storage pad will be provided for in-process handling, staging, and interim storage of naval spent nuclear fuel. Adjacent to the interim storage pad, an area for assembly of overpacks will be constructed. The overpack assembly area and interim storage pad will add an additional 35,000 square foot structure separate from the existing ECF building. This task is approximately 13 percent complete. The TPC for the East End Modification increased by $677,000 due to the procurement of additional weld mockups for the East End Modification checkout.

The West End Modification task is for the design and fabrication of the equipment to handle the spent fuel and container components and design and construction of a second loading station and support systems. The West End Modification task will provide an approximately 60 foot extension to the Dry Cell shielded cell, a cask transfer pit below the west extension, and a building addition.

The TEC and TPC for the West End Modification increases by $1,900,000 to incorporate increased crane capacity and height, increased shielded cell height, and increased transfer pit depth to provide the flexibility necessary to handle future spent fuel components which may be longer than those currently handled at ECF.

A two loading Station arrangement will allow for processing fuel returned from INTEC in the West End Loading Station while concurrently processing spent fuel received directly from the fleet for dry storage in the east loading station. The increased capacity of the overall Dry Cell operations will facilitate a more rapid return of spent fuel from INTEC (8 versus 13 years). In addition, the arrangement allows future packaging of special case waste through one of the loading stations without interruption of dry storage container loading.

The project is scheduled to complete in September 2002. Through FY 2000, 79% of the project is expected to be completed.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design costs (Design Drawings and Specifications)	12,830	12,830
Design Management costs (2.8 % of TEC)	2,415	2,415
Project Management costs (2.6 % of TEC)	2,290	2,290
Total, Engineering design, inspection, and administration of construction costs (20% of TEC)	17,535	17,535
Construction Phase		
Buildings	35,540	30,344
Special Equipment	11,080	12,620
Standard Equipment	5,927	5,927
Inspection, design and project liaison, testing, checkout and acceptance	9,474	9,474
Project Management (2.6 % of TEC)	2,290	2,290
Total, Construction Costs	64,311	60,655
Contingencies		
Design Phase (0.6 % of TEC)	500	500
Construction Phase (5.2 % of TEC)	4,500	6,256
Total, Contingencies (5.8 % of TEC)	5,000	6,756
Total Line Item Cost	86,846	84,946
Less: Non-Agency Contribution	0	0
Total, line item costs	86,846	84,946

The cost estimate is based on the Dry Cell task being 99 percent complete, the East End Modification task Title I design being completed and the west End Modification task conceptual design being completed.

5. Method of Performance

Contracting arrangements are as follows:

a. Construction design will be performed under an Engineering Services Subcontract. Equipment will be designed by the operating contractor.

b. Construction and procurement will be accomplished by fixed price contracts awarded on the basis of competitive bidding.

c. Title III Inspection: By Engineering Services Subcontractor under operating contractor surveillance.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project cost						
Facility Cost						
Design	10,718	1,206	3,258	2,374	479	18,035
Construction	32,721	4,354	0	10,696	21,040	68,811
Total, Line item TEC	43,439	5,560	3,258	13,070	21,519	86,846
Operating expense funded equipment	50	380	200	3,375	462	4,467
Total Facility Costs (Federal and Non-Federal)	43,489	5,940	3,458	16,445	21,981	91,313
Other project costs						
Conceptual design cost	1,500	200	0	0	0	1,700
Decontamination and Decommissioning	0	250	500	250	100	1,100
NEPA Documentation Costs	2,500	0	0	0	0	2,500
Other project-related[a] costs	1,445	236	0	0	400	2,081
Total, Other project costs	5,445	686	500	250	500	7,381
Total Project Cost (TPC)	48,934	6,626	3,958	16,695	22,481	98,694

[a] Includes operating expense funded equipment, operating costs for decontamination and decomissioning (removal of existing structures and removal of the temporary west shield wall), preparation of environmental impact statement, and procurement of several prototype items to support equipment design and confirm system operations, for facility startup, and for operator training.

7. Related Annual Funding Requirements

	(FY 2002 dollars in thousands)	
	Current Estimate	Previous Estimate
Facility operating costs[a]	4,227	4,227
Utility costs[b]	539	539
Total related annual funding	4,766	4,766
Total operating costs (operating from FY 2002 through FY 2042)	190,640	190,640

[a] Includes personnel, materials, and capital equipment costs for operation, maintenance, and repair

[b] Includes electrical power, steam heat, and maintenance items such as utility lines, valves, and pumps.

98-D-200, Site Laboratory and Facilities Upgrade, Various Locations

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

None.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1998 Budget Request *(Preliminary Estimate)*	1Q 1998	4Q 1998	1Q 1999	4Q 2001	15,700	18,660
FY 1999 Budget Request	1Q 1998	1Q 1999	2Q 1999	4Q 2001	5,900	9,860
FY 2000 Budget Request *(Title I Baseline)*	1Q 1998	1Q 1999	2Q 1999	4Q 2001	15,700	19,860

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
1998	5,700	5,700	1,184
1999	7,000	7,000	6,421
2000	3,000	3,000	6,730
2001	0	0	1,365

3. Project Description, Justification and Scope

The Site Laboratory and Facilities Upgrade project will upgrade various support systems and facilities at the Bettis Atomic Laboratory in West Mifflin, PA and the Knolls Atomic Power Laboratory in Schenectady, NY. The following are the principal areas.

Upgrading materials and chemistry facilities at both laboratories to develop, test, and evaluate high temperature advanced metals, metal and ceramic alloys; analyze and certify the quality of nuclear fuel; and improve radioactive specimen preparation and examination work.

At the Knolls Site existing space will be upgraded to include new energy efficient lighting, new heating, ventilation, and air conditioning systems, and energy efficient windows. A shielded sample storage area, containments and hoods, glove boxes, and a transmission electron microscope will be installed for preparation of radioactive test samples. Examination of these samples is needed to support core and structural materials work. An inductively coupled plasma mass spectrometer will be installed to determine trace element composition at levels 10 to 50 times lower than present capability.

At the Bettis site about 5,000 square feet of existing space will be upgraded to include installation of new heating, ventilation and air conditioning equipment, high efficiency/alternating current melting furnaces for high temperature alloy fabrication, powder metallurgy equipment for fabrication of ceramic and metallic materials, and materials evaluation equipment for analyzing the mechanical, chemical, and material properties of the developed materials.

Replacing the main outdoor substation at the Bettis laboratory which is approaching 50 years of age. The normal useful life for a substation is 30 years. Replacement is necessary to maintain a reliable source of electrical power distribution at the site. Also, projected increased power demands to support development and testing programs require an increase in the load capacity of the substation.

The Bettis-Pittsburgh site distributes all electrical power received from the local utility company through the existing main outdoor substation which consists of four 23,000 volt transformers, three 23,000 volt circuit breakers, aerial switches and lightning protectors, and 13,200 volt switchgear. The upgraded main outdoor substation will replace the existing transformers and breakers with 138,000 volt equipment and provide modern 13,200 volt switchgear that uses vacuum breaker technology. Land improvements include grading of a 34,000 square foot plot of ground, installation of fencing and structural supports, and installation of a 200 foot access road.

Energy Supply

Proposed Appropriation Language

For expenses of the Department of Energy activities including the purchase, construction and acquisition of plant and capital equipment and other expenses necessary for energy supply, and uranium supply and enrichment activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101 et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion; and the purchase of not to exceed [22] *1* passenger motor [vehicles] *vehicle* for replacement only[, $727,091,000, of which not to exceed $3,000 may be used for official reception and representation expenses for transparency activities], *$841,888,000 to remain available until September 30, 2001, of which $820,953 shall be derived by transfer from the Geothermal Resources Development Fund, and of which $5,000,000 shall be derived by transfer from the United States Enrichment Corporation Fund. (Energy and Water Development Appropriation Act, 1999.)*

[*SEC 108.* An additional amount of $60,000,000 for Department of Energy—Energy Programs, "Energy Supply", is hereby appropriated to remain available until September 30, 2000.] *(Omnibus Consolidated and Emergency Supplemental Appropriations Act, 1999, Public Law 105-277, Division A, Section 108.)*

Explanation of Change

–Language provides that funding will remain available for 2 years.

–All remaining unobligated balances are transferred from the Geothermal Resources Development Fund and the account will be closed.

– $5 million is transferred from the United States Enrichment Corporation Fund for the disposition of depleted uranium hexafluoride inventory as authorized by P.L. 105-204.

Energy Supply

Solar and Renewable Resources Technologies

Executive Budget Summary

Mission

The Energy Efficiency and Renewable Energy (EERE) program supports the Department of Energy's strategic objectives of increasing the efficiency and productivity of energy use, while limiting environmental impacts; reducing the vulnerability of the U.S. economy to disruptions in energy supplies; ensuring that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact; supporting U.S. energy, environmental, and economic interests in global markets; and delivering leading-edge technologies that are critical to the DOE mission and the nation. EERE activities funded under the Energy and Water Development Appropriation are designed to advance a broad range of renewable electric, fuel, and related storage and power delivery technologies to provide the nation with a more reliable, affordable and clean energy supply.

EERE's programs work in cost-shared partnerships with the nation's manufacturers, utilities, states, and the public to advance the development and facilitate the deployment of renewable energy technologies. By accelerating the use of renewable energy, EERE's programs help to strengthen the economy, improve the environment, and ensure a more secure future.

Strategy

The EERE strategic goals reflect the Administration's emphasis on Federal energy R&D for delivering significant benefits to the nation. In its 1997 review of the national energy R&D portfolio, the President's Committee of Advisors on Science and Technology recommended increases in a number of renewable energy R&D programs. The Committee noted that renewable technologies produce near-term and rapidly expanding public benefits, including air emissions reductions, reduced dependence on imported oil, and lower costs to households and firms. The Committee called for significant expansion of renewable energy programs in order to meet the energy challenges and opportunities of the 21st century.

EERE plays a leading role in implementing several Administration priorities. The President's Million Solar Roofs Initiative, implemented by the EERE Office of Utility Technologies, is aimed at facilitating the installation of photovoltaic and solar hot water systems on one million buildings across the nation by 2010.

Under a Distributed Generation initiative, EERE is coordinating program efforts that advance small-scale, on-site power generation as an alternative to centralized baseload power generation. Technologies for distributed generation, including photovoltaics, concentrating solar power, fuel cells, gas turbines, hydrogen production and storage, and hybrid fossil/renewable power systems, can greatly reduce both

energy use and carbon emissions. As part of these efforts, EERE has launched the Combined Heat and Power initiative to develop and deploy systems that produce both electricity and thermal energy from a single power source. Recent studies indicate that widespread use of combined heat and power could sufficiently reduce greenhouse gas emissions. Also under the Distributed Generation initiative, demonstrations of residential and building-sized hydrogen/natural gas fuel cells for off-grid applications are underway.

A transmission reliability program, launched in FY 1999, seeks to ensure an efficient, reliable power delivery system in the U.S. during the electricity industry's transition to competitive markets. This program will develop advanced technologies that will enable the lowest cost efficient power delivery systems with integration of distributed generation resources. These technologies will likely include real time controls for reliable, efficient operation of our Nation's power system under both normal and emergency conditions.

An electricity restructuring initiative, also launched in FY 1999, seeks to provide unbiased technical assessments to Federal and State officials on restructuring issues related to energy efficiency and renewable energy. These assessments assist decision makers to develop and coordinate utility restructuring legislation and regulations that include suitable policy and market mechanisms for renewable energy and energy efficiency.

During the 20th century, our nation's economy has depended heavily on imported fossil fuels. Biomass — a renewable alternative — represents a tremendous, largely untapped, domestic resource for our energy future. By investing in a bioenergy industry today, we can cultivate and harness these renewable resources to fuel our cars, power our homes and industries, and supply our chemical needs in the 21st century. The Department of Energy, along with other federal agencies and private partners, is launching a national partnership to develop an integrated industry to produce power, fuels, and chemicals from crops, trees, and wastes. By making a "ton of biomass" a viable market competitor to a barrel of oil or a railroad car of coal, this initiative will help grow the U.S. economy, strengthen U.S. energy security, protect the environment, and revitalize rural America. This effort will integrate the efforts from existing DOE R&D in biomass power, transportation biofuels and the forest products and agriculture Industries of the Future to enable technologies that produce different combinations of power, fuels, chemicals and other products from different feedstocks in different areas of the country. It is only through the integration of these efforts that biomass will be an effective competitor to imported fossil fuels.

Program Drivers - EERE's programs target Federal resources in key areas that provide critical national benefits; stimulate complementary private investments; leverage market forces; and respond to five significant drivers:

- National Security;
- Economic Competitiveness;
- Environmental Quality;
- Climate Change; and,
- Electricity Restructuring.

- **National Security** - During the past 25 years, three major disruptions in the world oil market have shaken the global economy. In 1997, U.S. net oil imports accounted for approximately 49

percent of domestic petroleum consumption. By 2020, U.S. net oil imports are expected to grow to over 70 percent of domestic petroleum consumption, with Persian Gulf nations accounting for over 64 percent of the world's oil exports. In 2020, U.S. net annual expenditures for imported crude oil and products are projected to exceed $180 billion in current dollars. Given historical precedents and future oil market trends, the United States has a critical interest in diminishing the nation's reliance on foreign oil through the use of indigenous renewable energy sources. EERE's efforts to implement a smart energy policy recognize this security concern and work to reduce U.S. dependence on foreign oil. As a related benefit, EERE's work on renewable energy reduces the U.S. trade deficit by reducing costly energy imports.

- **Economic Competitiveness** - In addition to reducing the nation's vulnerability to disruptions in energy supplies, EERE's research and development efforts advance U.S. economic interests. Carried out in partnership with industry, national laboratories, and universities, EERE's research and development programs are designed to maintain America's technological expertise and competitive advantage in the global market. A smart energy policy, as promoted by EERE's programs, strengthens the nation's economic power. EERE's investments not only lay the foundation for a more sustainable energy future but also open markets for U.S. manufacturers of advanced renewable energy technologies and related power technologies.

  EERE also sponsors international programs to promote U.S. renewable energy technologies and services in international markets, to help ensure that U.S. companies are competitive in the large and growing global marketplace. The World Bank has estimated that, over the next four decades, developing countries alone will require five million megawatts of new electrical capacity to meet the needs of their citizens and their expanding economies. (The world's total installed capacity today is three million megawatts.) This demand represents a tremendous potential for job creation and technology sales, even if renewable technologies only capture a fraction of the worldwide market.

- **Environmental Quality** - Air pollution, particularly in urban centers, ranks high among the nation's most pressing environmental concerns. In advancing a smart energy policy, EERE programs work to mitigate and minimize the environmental costs associated with energy use. Renewable technologies advanced by EERE offer a cleaner, environmentally responsible option for generating power.

- **Climate Change** - The President's FY 2000 budget request for EERE programs is a major element of his proposal to invest $6.3 billion over five years to reduce greenhouse gas emissions to below 1990 levels by 2008 - 2012 through energy technology research and development and tax incentives. In 1997, a major study conducted by five national laboratories documented the critical role that development and deployment of renewable energy technologies can play in reducing greenhouse gases. Given the cost savings associated with these technologies, the study noted that aggressive investment in energy R&D and deployment could lead to significant emissions reductions without raising the nation's energy bill.

- **Electricity Restructuring** - EERE is working with utilities, industry, states, and consumers to ensure that electricity restructuring results in a competitive and effective electric power industry. Power market restructuring presents an opportunity to reduce energy costs, advance the use of energy efficient and renewable energy technologies, and provide affordable services with reduced environmental impacts.

Major Changes

Managing for Results - Since the beginning of FY 1998, the Department has put in place a new management team for the Office of Energy Efficiency and Renewable Energy (EERE). This new team has been resolving long-standing management issues and is committed to making further improvements. Specific reforms that have been accomplished in the past year as well as new initiatives are summarized below:

- **Strategic Planning for Results and Technology Roadmaps** - Consistent with the Government Performance and Results Act, EERE is developing a new strategic plan with a focus on results. This plan builds on the technology roadmaps that the Department and the Office are developing. In addition, it will sharpen the Office's focus on procurement and business strategies that will improve the efficiency and effectiveness of operations.

- **Increasing Competition and Refining Merit Review Processes** - EERE is increasing the amount of its program funds that are awarded on a competitive basis, and this approach is expected to improve the quality of the resulting work products. In 1998, the Department competed the roughly $1 billion management and operating contract for the National Renewable Energy Laboratory, and the resulting contract strengthens the laboratory's management team and sharpens its mission focus.

  During the past year, EERE also has issued a broad-based solicitation for proposals on information dissemination and outreach activities. This solicitation involves competitive applications for approximately $13,500,000 million in work activities, much of which had been awarded on a non-competitive basis in the past. In 1998, the Office also issued a broad-based solicitation for research, development, and demonstration (RD&D) proposals and issued various targeted solicitations for proposals in specific technology areas.

  In 1998, EERE also has refined its objective merit review processes through new regulations and additional guidance and training. These reviews of proposals by independent experts are expected to assure the selection of the highest quality projects.

- **Managing Smarter** - EERE has made notable progress in reducing uncosted obligations. Since the beginning of FY 1996, we have reduced the uncosted balances in the Solar and Renewable Resources Technologies by nearly 62 percent, from a beginning balance FY 1996 of nearly $268,000,000 to an ending FY 1998 balance of approximately $102,000,000. While this represents substantial progress in addressing this Congressional concern, EERE has taken steps toward further reducing uncosted balances. We are working to accelerate the obligation and costing of funds and we are also examining other steps that can reduce these balances without compromising sound management practices. In addition, just like any good business, EERE has

focused on assuring that its workforce for the 21st Century includes adequate staff with necessary skills to manage long-term projects supported by recent budget increases.

- **Strengthening Program Integration** - Since the solutions to our energy efficiency and renewable energy challenges cross sector lines, EERE is focusing increased attention on stimulating increased integration across technologies and across their applications. Two leading efforts are the Bioenergy Initiative and the EnergySmart Schools Initiative.
- **Leveraging Federal Investments by Expanding Partnerships with Federal, State and Other Entities** - EERE is strengthening its partnerships with other government entities and the private sector to better leverage the Federal investment in RD&D and to facilitate the deployment of new technologies. These partnerships involve other components of the Department of Energy (the Offices of Fossil Energy, Nuclear Energy, and Science) and other Federal agencies. EERE also has begun an initiative with the States to establish a much closer working relationship with State organizations pursuing energy technology RD&D. EERE also works closely with national laboratories, businesses, universities, non-profit organizations, and the Congress to: set research and development priorities; conduct high-priority research; facilitate the deployment of technologies by the private sector, and disseminate information. In many cases, EERE activities are jointly funded with private sector or other public sector entities. EERE is also strengthening the role of its Regional Support Offices in delivering services at the state and local level.
- **Increasing Emphasis on Project Management** - In 1999, EERE will place an increased emphasis on strengthening systems necessary to manage effectively the cost, schedule, and performance of projects. This emphasis is increasingly important as the Offices intensifies its role in demonstration projects.
- **Emphasizing Program Evaluation and Continuous Improvement** - EERE is committed to following best business practices, which involve effective performance measurement and refinement of program strategies as new information is obtained. EERE has discontinued activities that have not met pre-determined goals and will continue to modify its strategies based on its program analysis and evaluation results.

FY 2000 Congressional Budget Request

In support of its priorities, EERE submits the following FY 2000 budget request. The table covers both the Energy and Water Development and Interior and Related Agencies Appropriations. A more detailed table for the Solar and Renewable Resources Technologies follows.

Office of Energy Efficiency and Renewable Energy

FY 2000 Congressional Budget Request

(in thousands of dollars)

	FY 1998	FY 1999	FY 2000	$ Change

Solar and Renewable Resources Technologies

Program Mission

The mission of the Solar and Renewable Resources Technologies program is to lead the national effort to develop renewable energy technologies and to accelerate their acceptance and use, nationally and internationally. Within the Office of Energy Efficiency and Renewable Energy (EERE), the program supports research and development of clean, reliable renewable energy technologies and cutting edge power delivery technologies that will improve the performance and efficiency of electric power systems.

The Solar and Renewable Resources Technologies program contributes to national energy security, enhances U.S. economic competitiveness, and reduces the environmental impacts of energy-related activities. The program provides additional clean-power options for a restructured electricity supply industry and clean liquid biofuels for the transportation sector. The EERE Office of Power Technologies implements most of program activities, while the EERE Office of Transportation Technologies administers the transportation biofuels program.

Program Goals and Objectives

To improve the Nation's overall economic, energy security, and environmental health through the development of clean, competitive power technologies for the 21st century.

The principal strategy for the Solar and Renewable Resources Technologies program is to invest in renewable energy technologies research and development focused on core technology needs. This research and development provides the technological advances needed to develop competitive new energy systems and create the basis for industry investment in product development. Areas addressed include materials and component improvement, conversion efficiency, system integration, system control, and evaluation of component lifetime. While such fundamental research is necessary, it must be complemented with evaluation of system performance under real world conditions. Experience has shown that user acceptance and industry commercialization investment requires confidence in the day-to-day performance, operating cost, system reliability, and operating lifetime of renewable energy and power delivery technologies. The program's activities thus include prototype evaluation and system field tests where appropriate, to establish a basis for predicting operation and maintenance costs.

Since program success depends on industry's ultimate commercialization of the program's technologies under development, partnership with industry is essential. These partnerships include industry co-investment at increasing levels as technologies near the pre-commercialization stage.

Additionally, the program utilizes the talents found at the National Laboratories and within the state, university, and other research organizations across the U.S. in order to achieve its research and development objectives. This not only helps us to accomplish our R&D mission, but the States are also encouraged to share "lessons learned" through their own peer network activities. Similarly, we also partner with a number of universities across the country to conduct both fundamental and applied research. Whenever possible, we encourage our partners to provide viable prototype power technology

54-291 99 - 23

systems to schools and other educational facilities so that they may continue to receive the benefits of these clean power systems once our research work is done.

Specific program objectives include:

- **To triple the installed U.S. electricity production capacity of non-hydropower renewable energy systems by 2010** – Increase capacity by 7,000 MW to 25,000 MW (base year is 1996) through advances in conversion technology and reductions in capital cost.
- **To achieve sufficient advances in high temperature superconductivity by 2010** – Advances will result in commercial introduction by industry of at least two power system devices, such as superconducting motor, generator, transformer, transmission cable or fault current limiter.
- **To achieve sufficient component and system integration improvements by 2010** – Improvements will result in commercial availability of energy storage systems for large scale power quality and solar or wind applications from at least three companies.
- **To achieve sufficient levels of biofuel ethanol technology advancement** – Advancements will establish at least three commercial plants that use agricultural and/or municipal solid wastes by 2004, and will demonstrate an industrial ethanol site that uses energy crops by 2005.

Attainment of these objectives will contribute to Departmental strategic objectives as stated in the Department of Energy Strategic Plan of September 1997. These strategic objectives are to reduce the vulnerability of the U.S. economy to disruptions in energy supplies; to ensure adequate and affordable energy supplies in a competitive marketplace while importing environmental quality; to increase the efficiency and productivity of energy use; and to support U.S. energy and economic competitiveness in global markets.

The table below reflects projected aggregated benefits to the nation resulting from the Solar and Renewable Technologies program investments in technology advancements. Primary Energy Displaced refers to fossil fuels not consumed because electricity production from renewable energy sources will have displaced them or because energy has been saved through the use of advanced system technologies.

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.10	1.50	3.60
Energy Savings ($ Billions)	0.20	1.40	5.80
Carbon Displaced Millions Metric Tons Carbon Equivalent (MMTCE)	3.00	30.00	64.00
Oil Displacement (Million of Barrels per Day)	0.00	0.17	0.48

As a comparison, estimated energy displaced in 2020 would be equal to today's electricity consumption of the five-state region comprised of Indiana, Illinois, Ohio, Michigan, and Wisconsin.

Investments in research and development of renewable energy technology are essentially investments in renewable energy reserves -- in the same sense that significant oil or coal reserves add a measure of energy security for the nation. Technological advances often make renewable energy systems economically competitive, and while these renewable technologies may not immediately enter the

marketplace, they nevertheless become national assets. Unlike fossil fuel reserves, these renewable technology reserves will not be depleted.

Performance Measures

At the level of resources proposed in this budget request, significant progress is anticipated throughout the next five-year period. Demonstrative indicators of such progress in Renewable Energy and Power Delivery Technologies will be:

FY 2001- 2006 Performance Measures

Photovoltaic Energy Systems

- Photovoltaic modules will be commercially available at approximately $4 per watt in quantity orders, as opposed to $5 per watt in 1997, a 20% decrease in cost.

Concentrating Solar Power Program

- Dispatchable concentrating solar power systems will be capable of producing power at $0.06 to $0.08KWh.

Wind Energy Systems

- Wind turbines capable of providing electricity at 2.5 cents per kilowatt-hour in good (15 mph) wind regions will be introduced commercially.

Biomass/Biofuels Energy Systems - Transportation

- A three-fold improvement from 1998 levels of cellulase enzyme activity for converting cellulosic biomass to ethanol will be demonstrated, resulting in a 200% reduction in production costs.

Geothermal

- Geothermal drill bits that provide double the life and double the penetration rate of today's drill bits will be commercially available. (Drilling typically accounts for 30% or more of geothermal project cost.)

Electric Energy Systems and Storage

- **High Temperature Superconducting** - Testing will be in progress on a 5000 horsepower superconducting motor with half the losses of a comparable motor today. (In the United States, two-thirds of today's electricity is consumed by operating motors.)
- **Energy Storage Systems** - Tests of an advanced battery storage systems requiring a projected 20% less square footage and with a 20% longer life than today's systems will be underway at a user site. (System space requirements are a critical factor in many customer evaluations, and system lifetime is a major factor in life cycle cost.)

Significant Accomplishments and Program Shifts

Photovoltaic Energy Systems

- Achieved an increase in U.S. photovoltaic module production output of 14 megawatts in 1997, in comparison to 1996 output.

Concentrating Solar Power Program

- Achieved 153 hours of continuous power generation at the Solar Two power tower, which uses molten salt as heat transfer energy source system.

Biomass/Biofuels Energy Systems - Biopower Systems

- Completed operational testing of the Vermont indirect biomass gasifier and produced clean biogas.
- Completed engineering design for Minnesota Gasification Project for a power plant for gasification of alfalfa stems.

Biomass/Biopower Energy Systems

- **Transportation** - Established partnership with the timber industry, United States Forest Service, and local communities to evaluate environmental effects of forest watershed management when forest thinnings are created to suppress potential forest fires and used to produce ethanol, electricity, and bio-products.

Wind Energy Systems

- Established the National Wind Technology Center as accepted site for collection of wind turbine certification data.

Geothermal

- Attracted over 200 utilities to participate in the geothermal heat pump consortium.

Hydropower

- Completed conceptual design for advanced "fish friendly" hydroturbine.

Electric Energy Systems and Storage

- **Transmission Reliability** - Completed Technology Characterizations for all Office of Power Technologies programs, in cooperation with the Electric Power Research Institute (EPRI), and identified specific advancements needed for each technology to reach program goals.
- **High Temperature Superconducting** - Achieved high temperature superconductor with current carrying capability of 1,000,000 amperes per square centimeter in laboratory tests, over 1,000 times more capacity than copper wire.
- **Energy Storage Systems** - Completed assembly of storage program's first transportable battery energy storage system (TBESS); installed TBESS at utility customer site for evaluation.

Funding Profile

Site Description

Albuquerque Operations Office

Albuquerque Operations Office (ALO) is a Department of Energy Office located in Albuquerque, New Mexico. ALO provides procurement services and oversight of funding for work being conducted at Golden Field Office, Los Alamos National Laboratory, National Renewable Energy Laboratory, Sandia National Laboratories, and the six DOE Regional Support Offices located in Atlanta, GA, Boston, MA, Chicago, IL, Denver, CO, Philadelphia, PA, and Seattle, WA. AL also administers the Solar and Renewable Energy Photovoltaic Energy Systems Program.

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL), located in Los Alamos, NM. LANL conducts research on the Electric Energy Systems High Temperature Superconductivity Program and the Hydrogen Research Program. LANL supports the Electric Energy Systems High Temperature Superconductivity Program by working to develop more efficient electrical transmission and distribution cables, power transformers, and large motors for industrial use. LANL is also studying the use of flywheel energy systems for efficient storage of electricity.

LANL serves as the lead laboratory in the research and development of proton exchange membrane fuel cells for direct hydrogen applications. This includes the application of new material systems, components, and construction techniques to meet the efficiency and cost targets associated with their industry CRADAs. LANL has developed a number of critical technologies for the most advanced fuel cell stacks.

Sandia National Laboratories

Sandia National Laboratories (SNL), located in Albuquerque, NM, Livermore, CA and Tonapah, NV, perform research for the Concentrating Solar Power, Photovoltaic Energy Systems, Geothermal Energy

Building Technology Research Programs. SNL serves as the lead laboratory in the development of reliable, economically-competitive, Concentrating Solar Power (CSP) technologies. SNL serves as the primary engineering and testing site for the CSP Program by operating the National Solar Thermal Test Facility (NSTTF). NSTTF covers 110 acres and includes five distance test areas: the Central Receiver Test Facility with a central tower and 222 heliostats; the Modular Solar Industrial Retrofit Trough Facility; the Engine Test Facility; and the Distributed Receiver Test Facility with two 75-kilowatt parabolic dishes. DOE has designated the NSTTF and the Solar Furnace as National User Facilities where qualified researchers from industry, academia, and other laboratories can use the facilities, making it possible for high-risk, high-payoff technologies to be developed and tested.

SNL supports the Photovoltaic Energy Systems Program with the principal responsibility for crystalline cell research, concentrating collector development, and systems and balance-of-systems technology development. Cell research activities support promising new concepts and innovative device fabrication techniques. Indoor and outdoor measurement and evaluation facilities provide support to industry for cell, module, and systems measurement, evaluation and analysis. Systems level work concentrates on application engineering, database development and technology transfer.

SNL serves as the lead laboratory for coordination of the Geothermal Drilling research. In cooperative projects with the U.S. geothermal industry, SNL performs research on advanced drilling systems, drilling measurement and control, drilling hardware development, and design and testing of high-temperature wellbore instrumentation. SNL coordinates the activities of universities and commercial research firms to rapidly bring promising geothermal drilling and instrumentation technologies to commercial availability.

The SNL Wind Energy Department staff work closely with counterparts at the National Renewable Energy Laboratory to provide the Wind Energy Systems Program and the U.S. wind industry with engineering expertise to further the program's knowledge and goals.

In support of the Electric Energy Systems Energy Storage Systems Program, SNL develops improved energy storage systems components including power conversion electronics and modular multi-functional energy storage systems. SNL characterizes the performance of integrated systems with customer-site data collection and identifies and evaluates the benefits of storage technologies in specific applications. SNL cooperates with industry partners in implementing the Program to increase awareness of the benefits of energy storage and options of providing storage alternatives.

As the lead engineering laboratory for the Solar Buildings Technology Research Program, SNL works with manufacturers to assist them in lowering the cost of solar products by introducing advanced manufacturing practices. SNL also provides technical support to assist builders and utilities in overcoming problems with the design or installation of solar water heating systems.

National Renewable Energy Laboratory

The National Renewable Energy Laboratory (NREL) located in Golden, Colorado, conducts fundamental and applied materials research on photovoltaic devices, photovoltaic module and systems development, data collection and evaluation on solar radiation, and cost-shared government/industry partnerships for the Photovoltiac Energy Systems Program. Basic research teams investigate a variety of photovoltaic materials, such as amorphous silicon, polycrystalline thin films, high-efficiency materials and concepts,

and high-purity silicon and compound semiconductors. NREL conducts simulated and actual outdoor tests on photovoltaic cells, modules and arrays. The test results are used in developing standards and performance criteria for industry.

NREL is the lead laboratory for the National Wind Energy Systems Program performing research in aerodynamics, structural dynamics, and advanced components and control systems related to wind energy. The National Wind Technology Center, located at NREL, provides research and testing facilities for fatigue testing of turbine blades, dynamometer testing of control and generator systems, atmospheric testing of turbines, and certification testing which is required for sales and operation in western Europe.

NREL serves as the lead laboratory supporting industry's development of biomass power technologies. These technologies include those based on combustion and gasification of biomass feedstocks. NREL is responsible for the development of advanced analytical methodologies (chemical and life-cycle) that are used to facilitate industry commercialization. These analyses include complete economic assessments of the relevant biomass technologies. NREL works with industry and academia to arrive at consensus points on technology costs and environmental performance. NREL also developed and operates a Thermochemical Users Facility. This state-of-the-art facility enables the private sector to cost-effectively test their power generating technologies and unit operations in a fully-instrumented pilot facility.

NREL is the lead laboratory for the Biofuels-Transportation Program. The Laboratory conducts biotechnology research and engineering development of biological systems for the conversion of biomass to fuels and chemicals, such as ethanol. Also, the Biofuels Program has established the Alternative Fuels User Facility at NREL which includes laboratories, integrated bench scale process equipment, and a one ton per day process development unit.

NREL serves as the lead laboratory for the Solar Buildings Technology Research Program. In this role, NREL coordinates tasks with the Sandia National Laboratories and directs technical tasks that are subcontracted to universities and industry. The primary goal of this program is to develop a low cost solar water heater. NREL also has research tasks to explore solar applications such as crop drying, absorption cooling, space heating, and solar lighting. NREL supports cooperative solar projects with builders and utilities by providing technical information about solar water heaters to the builders and utilities and receiving input from them to help guide the research program.

NREL also provides on-going research and development for the Geothermal Energy Systems, Electric Energy Systems and Storage, and the Concentrating Solar Power Programs.

Golden Field Office

The Golden Field Office (GO) located in Golden, CO, provides procurement services and oversight of work being performed at the National Renewable Energy Laboratory, as well as administering and managing projects for the Biomass/biofuels Energy Systems Program, the Electric Energy Systems and Storage Program, the Photovoltaic Energy Systems Program, the Concentrating Solar Power Program, and the Renewable Energy Production Incentive Program. Go manages Gasifier demonstration projects to advance technologies to convert biomass-wood and agricultural stock and waste into electricity.

GO manages the Superconductivity Partnership Initiative (SPI) for the Electric Energy Systems High Temperature Superconductivity Program. The SPI is 50% cost-shared with industry and consists of six projects to develop first-of-a-kind designs for more efficient power cables, transformers, industrial motors and flywheel energy systems.

GO manages two projects for the Photovoltaic Energy Systems Program, which are designed to increase market penetration and integrate PV product development. These projects are the Technology Experience to Accelerate Markets in Utility Photovoltaics (TEAM-UP) and the Building Opportunities in the United States for Photovoltaics (PV:BONUS) programs. GO utilizes cooperative agreements and requests for proposals to help industry realize the benefits of using photovoltaic systems and devices.

GO works with DOE program managers in the overall operation and management of the Concentrating Solar Power Program, including the contractual relations with industry partners. GO manages the Solar Two Project in Barstow, CA, and participates in the Solar Two Consortium. GO project managers are responsible for all technical and contractual requirements associated with the successful conduct and completion of the Solar Two Project.

GO is the lead office for the administration of the Renewable Energy Production Incentive (REPI) Program. REPI encourages the acquisition of renewable energy generation systems by state and local governments and non-profit electric cooperatives by providing financial incentive payments for energy generation systems which use solar, wind, geothermal or biomass technologies.

Chicago Operations Office

The Chicago Operations Office (CH), located in Argonne, IL, provides procurement services and oversight of funding for work being performed at Argonne National Laboratory and Brookhaven National Laboratory. CH also administers Solar and Renewable Energy programs such as the Biomass/biofuels Energy Systems and the Hydrogen Research Programs.

Argonne National Laboratory

Argonne National Laboratory (ANL), located in Argonne, IL, performs research and development for the Electric Energy Systems High Temperature Superconductivity Program to help in the development of more efficient electrical transmission and distribution cables, power transformers, and large motors for industrial use.

Brookhaven National Laboratory

Brookhaven National Laboratory (BNL), located on Long Island, NY, performs research and development for the Electric Energy Systems High Temperature Superconductivity (HTS) Program, and the Photovoltaic Energy Systems Program. BNL supports the HTS program by working with National Laboratory/industry teams and universities to undertake research on fundamental wire processing and application issues.

BNL has the responsibility for environmental, health and safety (ES&H) impacts associated with photovoltaic energy production, delivery and use. BNL conducts ES&H audits, safety reviews and incident investigations, and assists industry to identify and examine potential ES&H barriers and hazard control strategies for new photovoltaic materials, processes and application options before their large-scale commercialization.

Idaho Operations Office

The Idaho Operations Office (ID), located in Idaho Falls, ID, provides procurement services and oversight of funding for the Idaho National Engineering and Environmental Laboratory. ID also administers Solar and Renewable Energy programs such as the Renewable Indian Energy Resources and the Hydropower Programs, and is the principal field administrator of the Geothermal Energy Systems Program.

Idaho National Engineering and Environmental Laboratory

Idaho National Engineering Laboratory (INEEL), located in Idaho Falls, ID, performs research and development for the Hydropower and Geothermal Energy Systems Programs. INEEL has been the principal DOE laboratory for the Hydropower Program since the program's inception in 1977. INEEL serves as the engineering technical monitor for the Advanced Hydropower Turbine System Program and the Renewable Indian Energy Resources hydropower projects located in Alaska.

INEEL serves as the lead laboratory for coordination of the Geothermal Exploration and Geothermal Reservoir Technology research. In cooperative projects with the U.S. geothermal industry, INEEL performs research on fluid flow and solute transport modeling in hydrothermal reservoirs and conducts site investigations of geothermal resource potential. INEEL coordinates and interacts with other National Laboratories, universities, and commercial research institutions to consolidate their contributions to the research and technology development and thereby increase the utilization of geothermal energy resources.

Oak Ridge Operations Office

The Oak Ridge Operations Office (OR), located in Oak Ridge, TN, provides procurement services and oversight of funding for the Oak Ridge National Laboratory and the Office of Scientific and Technology Information. OR also administers the Solar and Renewable Energy Biomass/biofuels Energy Systems Program.

Office of Scientific and Technology Information

The Office of Scientific and Technology Information (OSTI), located in Oak Ridge, TN, performs standard distribution for all programs under the Office of Power Technologies including: Photovoltaic Energy Systems; Concentrating Solar Power; Biomass/biofuels Energy Systems; Wind Energy Systems; Geothermal Energy Systems; Hydrogen Research; and the Electric Energy Systems High Temperature

Superconductivity Programs. This distribution consists of publishing and maintaining on-line full text of eight electronic current awareness publications and the production of CD-ROM disks containing Photovoltaic reports.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL), located in Oak Ridge, TN, performs research and development on the Electric Energy Systems Transmission Reliability, the Biomass/biofuels Energy Systems, and the Hydropower Programs. ORNL is part of a national laboratory/industry/university consortium that was formed to support research in Transmission Reliability of electric energy systems. This consortium is a new initiative for fiscal year 1999. It is anticipated that ORNL will perform electric power system studies related to the impact of distributed resources on electric power distribution systems, perform an assessment of the technology and R&D control needs for real time system control, and assist in designing a test bed for field or simulation testing of distributed resource concepts.

ORNL manages the Bioenergy Feedstock Development Program (BFDP) to develop new and improved sources of biomass feedstocks for biomass energy systems. ORNL provides technical leadership for the program and actively fosters alliances among universities, other government agencies and industry. Major current components of the BFDP include energy crop development, environmental research, residue and forests research, resource economics, demonstration project support and evaluation, and communication. These efforts compliment the National Renewable Energy Laboratory and the Sandia National Laboratories' programs.

ORNL has the primary responsibility for environmental analysis and is the environmental technical monitor for the Advanced Hydropower Turbine System Program. This includes the technical oversight of laboratory biological experiments on stresses experienced by turbine-passed fish.

Richland Operations Office

The Richland Operations Office (RL), located in Richland, WA, provides procurement services and oversight of funding for the Pacific Northwest Laboratory.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory (PNNL), located in Richland, WA, performs some on-going research for the Hydrogen Research Program.

Oakland Operations Office

The Oakland Operations Office (OAK), located in Oakland, CA, provides procurement services and oversight of funding for the Lawrence Berkeley and the Lawrence Livermore National Laboratories.

Lawrence Berkeley National Laboratory

Lawrence Berkeley National Laboratory (LBNL), located in Berkeley, CA, performs analyses of opportunities for wind energy applications in the restructured electricity market and administers various utility restructuring activities. In support of utility restructuring, LBNL conducts policy and technical analyses on utility regulatory policies at the state and federal levels. LBNL provides technical support to state organizations such as the public utility commissions and state energy offices on utility restructuring issues. LBNL provides guidance and support to the private and public market components of the utility industry, including the energy services industry, regional market transformation consortia, and public and private utilities.

LBNL also supports the analyses and proposed implementation of the Administration's proposed legislation on utility restructuring.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory (LLNL), located in Livermore, CA, performs research and development for the Hydrogen Research Program. LLNL serves as the lead laboratory in the research and development of a high temperature solid oxide electrolyzer and two different systems for pressurized gas storage of hydrogen. LLNL is developing the materials and technical and engineering data on the preferred configuration for a solid oxide system that will simultaneously reform natural gas to hydrogen using the waste heat for a higher round trip efficiency. LLNL is capable of producing composite storage tanks for environmental testing to verify the advantages of various engineering concepts designed to increase storage capacity while reducing the costs of manufacturing the tanks.

Federal Energy Technology Center

The Federal Energy Technology Center (FETC) provides research and development on Solar and Renewable Energy programs with a major emphasis on the Hydrogen Research Program and some on-going research for the Biomass/biofuels Energy Systems Program. FETC will administer a cooperative agreement with Virginia Accelerator Corporation for an electron scrubbing demonstration project.

Headquarters and All Other Sites

The Office of Energy Efficiency and Renewable Energy (EE) funds research at six regional support offices located in Atlanta, GA, Boston, MA, Chicago, IL, Denver, CO, Philadelphia, PA, and Seattle, WA, and also provides funding at DOE Headquarters for various Solar and Renewable Energy procurements and interagency agreements in support of the EE mission.

Capital Operating Expenses & Construction Summary

Capital Operating Expenses

Solar Building Technology Research

Mission Supporting Goals and Objectives

Program Mission

The mission of the Solar Buildings Technology Research Program is to conduct research essential to the development of advanced solar thermal building technologies. These technologies can significantly contribute to the domestic energy needs of the United States.

The program supports DOE's mission to foster a secure and reliable energy supply that is environmentally sound and economically sustainable.

Program Goals and Objectives

Roof Integrated Solar Water Heater

The primary goal of the Solar Building Technology Program is to reduce the system cost and improve the reliability of solar water heating. The objective is to reduce the life-cycle cost from today's $0.08/kWh (thermal equivalent) to $0.04/kWh by FY 2003. Achieving this goal will make solar water heaters increasingly competitive in the residential market and reverse the trend that has seen their annual sales decrease from over 100,000 in the early 1980's to less than 8,000 in 1997. A second goal is to increase builder and consumer confidence in solar technology as it is applied to residential, commercial, and industrial buildings. There are two objectives supporting this goal: (1) assisting industry in the establishment of performance and reliability standards accepted throughout the U.S.; and (2) understanding the needs of builders and consumers.

Strategic Approach

This Program will be implemented in partnership with manufacturers, equipment suppliers, and installers. The existing solar thermal industry, however, consists of small, under-capitalized companies which do not have the capital resources or in-house technical expertise to overcome significant technical and market barriers presented by the fragmented infrastructure of builders, suppliers and consumers.

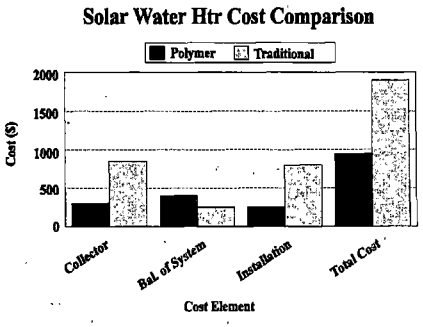
Another part of the program's strategy is to work closely with Federal agencies (e.g. HUD's "Partnership for Advancing Technology in Housing") and state energy offices (e.g. California Energy Commission). Cost sharing from government, utility, builder, and solar industry partners should be approximately $2,000,000 in FY 2000.

The Program's strategic approach consists of three key activities which will lead to cost competitive solar water heaters and increased consumer confidence in the technology: quality assurance, precompetitive field validation, and technology development.

Quality Assurance - The program will support development of models that estimate technology performance and reliability. These models will be the basis for voluntary national standards for solar water heating systems.

Precompetitive Field Validation - The program will work with builders, utilities, and energy service companies to identify the improvements necessary to make solar technology fully acceptable for the residential construction and commercial building markets. It will use their input to guide the program's R&D activities and validate those improvements through cost-shared field tests.

Technology Development - The major thrust for the program will be focused on developing a new generation solar water heater that reduces the cost and increases the service life of the technology. Contracts with universities and industry provide the mechanism for the new technology. Cost reductions will be realized through improved manufacturing processes, the use of less expensive materials (see chart), innovative design, and better integration of the solar collector into the building. This activity is supportive of recommendations by the President's Committee of Advisors on Science and Technology to establish an initiative on low cost solar water heaters. This also supports DOE's strategic goal of promoting the development of competitive and environmentally sound energy markets in the U.S. In addition, R&D would explore the feasibility of solar lighting (i.e. using fiber optics or light pipes to bring solar light into interior rooms).



Program Benefits

At the proposed funding levels, the Solar Building Technology Research Program is expected to yield the following benefits:

Metrics	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.03	0.11
Energy Savings ($ Billions)	0.00	0.15	0.75
Carbon Displaced (MMTCE)	0.05	0.47	1.70

These benefits are derived from displaced energy consumption in residential and commercial buildings which collectively consume approximately a third of the primary energy used in the U.S. The Solar Buildings Program addresses a market that consists of 95 million households, 4.5 million commercial buildings, 9 million pools and spas, and 750,000 industrial processes that use steam at temperatures less than 400F. An estimated 1.2 million solar domestic water heaters have been installed in the U.S. with an additional 500,000 expected by 2010. Each system provides approximately 3000 kWh per year thermal

equivalent (10 MBTU/year). By the year 2020, solar energy could displace 0.11 quads of the thermal energy needed by the buildings market. Reducing the use of fossil fuels by that amount would improve the quality of our air, and reduce greenhouse gas emissions by 1.70 MMT (carbon equivalent).

Performance Measures

FY 2000 Performance Measures

- Achieve $0.07 per kWh (projected delivered energy cost) for solar water heating systems through improved manufacturing processes.

FY 2001-2006 Performance Measures

- Achieve $0.04 per kWh (projected delivered energy cost) for solar water heating systems due to low cost *next generation* solar water heating technology.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

- In collaboration with the Solar Rating and Certification Corporation developed procedures for the voluntary industry certification of solar energy equipment to provide performance verification.
- Provided technical and field monitoring assistance to industry, Federal, and state governments for the installation of hundreds of solar water heating systems since the late 1970's. The performance history of some of these systems will be used to help develop reliability standards.
- Developed solar domestic hot water systems with levelized energy cost of $0.08/kWh, a reduction from about $0.20/kWh in the mid 1980's.
- Developed transpired collector technology for preheating building ventilation air with levelized energy cost of $0.04/kWh and 30 year lifetimes.

FY 1998 Accomplishments

- Support was provided to expand the rating and certification procedures for new system designs being developed by industry.
- A Cooperative Research and Development Agreement was initiated with the Salt River Agricultural Improvement and Power District to develop a low cost solar water heater. Cooperative projects were also established with Eugene Water and Electric Board and Lakeland Electric and Water. Similar solar water heating projects were established with several builders: including Pulte Homes and CAVCO Industries. Technical support (e.g. system evaluation) was provided to each. In addition, a study concluded that builders were concerned about the cost, aesthetics, and reliability of solar water heaters. Another study indicated considerable interest in solar water heaters among potential home buyers if a reliable, low cost system was an option.
- Completed the first phase of four contracts with solar manufacturers, which identified and quantified manufacturing improvements that could lead to cost reductions up to 20%. Selected contracts for

phase 2, which will assist the manufacturers in implementing improvements in welding, system control, and component design.

- Completed first phase of seven industry and three university contracts selected to evaluate concepts that have the potential to significantly reduce solar water heating costs. Concepts included freeze and overheating protection, polymer based systems, and use of heat pipes that could eliminate the need for pumps and controllers. It was shown that polymer materials have been developed which have the potential for withstanding high temperature and exposure to solar radiation. These polymers would replace the copper and glass that make up present solar water heaters. In addition, designs were developed which simplify the systems by eliminating the need for pumps and controllers, thus making the systems potentially more reliable.
- A Cooperative Research and Development Agreement (CRADA) with Energy Laboratory, Inc. (ELI) led to the development of *Black Crystal*, a selective absorbing coating for solar heat collectors that has the potential for replacing black chrome as the industry standard. Black Crystal does not have the environmental problems associated with chrome and can be produced with a fraction of the energy.
- Completed evaluation of four solar absorption A/C concepts. Studies completed during FY 1998 indicate that further solar absorption cooling R&D is not warranted at this time.

FY 1999 Planned Accomplishments

- Complete development of a standardized wind loading rating for solar collectors on roofs.
- A task will be initiated to develop models that can be used to establish reliability standards for solar water heaters.
- Universities and industry will complete feasibility studies of ten solar water heater concepts exploring the use of low cost materials (e.g. lightweight polymers which offer savings in the cost of the collector and its installation) and components (e.g. heat pipes which could lower cost by eliminating the need for pumps and controllers, and increasing system reliability). The best of these will form the basis of the *next generation* solar water heaters. Prototypes will be built and tested in the laboratory to determine their performance under a variety of simulated weather conditions. Accelerated tests will be conducted to predict the longevity of the polymer components; a critical question that must be answered. Existing methods of predicting the lifetime of polymers, however, are unable to predict as far into the future as the 10 to 15 years (minimum) that the solar system must work. Research will begin at NREL on developing an "ultra accelerated" method of predicting polymer lifetime.
- Implement manufacturing improvements that will lead to solar technologies capable of producing hot water at $0.07/kWh.
- Continue the Cooperative Research and Development Agreement with the Salt River Agricultural Improvement and Power District (SRP), whose goal is to develop a solar water heater that could provide hot water at a levelized cost of $0.06 to $0.07/kWh. Provide technical support to other utilities and builders that have established solar water heating programs. This effort is limited to technology development and includes system evaluation, analysis of system performance, and

assistance in solving problems such as materials degradation that industry is incapable of solving by itself.

FY 2000 Planned Accomplishments

- Expand existing certification procedures to include reliability standards.
- Complete the collaborative projects with utilities and builders established during FY 1998 and assess their impact on improving solar water heating technology. Complete CRADA with Salt River Project that has potential to reduce cost of solar water heat to $0.06/kWh.
- Achieve $0.07/kWh (projected delivered energy cost) for solar water heating systems through improved manufacturing processes.

FY 2001-2004 Planned Accomplishments

- Assist industry and state led efforts for the development of voluntary national installer certification standards and licensing procedures to assure quality installations of systems.
- Work with builders and utilities to test prototype *new generation* solar water heaters. This would include systems instrumented to obtain data concerning long term performance & reliability, materials & component longevity, and performance in a variety of climates.
- In collaboration with industry, develop next generation of solar equipment to provide reliable energy at $0.04/kWh for solar water heating.

Program Completion

Successful completion of the Solar Building Technology program will be attained when the Program's cost goal is reached ($0.04/kWh levelized life-cycle cost). It is expected that attaining this goal will make solar water heaters competitive with electric water heaters in many areas of the U.S. and natural gas water heating in some areas. As important, however, this translates to a family being able to purchase a solar water heater for about $1,000 and realizing a payback of that investment in about 4 years.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Space Conditioning and Water Heating	2,625	3,600	5,500	1,900	52.8%
Total, Solar Building Technology Research ..	2,625	3,600	5,500	1,900	52.8%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Space Conditioning and Water Heating			
■ **Quality Assurance** - The Solar Rating and Certification Corp (SRCC) will complete the task to make U.S. solar water heater standards compatible with international standards, thus enabling U.S. companies to more easily compete in international markets. Information related to problems associated with residential solar water heating systems in California, Oregon, and Florida will be put into a database and used to help in the development of reliability standards.			
■ The establishment of solar industry reliability standards for solar water heating systems will compliment the performance standards already established. It will benefit manufacturers by providing them information on which parts of their solar water heating system need improvement and will provide consumers information that will enable them to trade-off cost with performance and reliability. Consumer confidence in solar technology is necessary if DOE is to achieve its mission of developing solar energy as a reliable, environmentally sound option. This activity will continue through 2005. Its focus will evolve from developing performance standards to developing reliability standards and standards for installers of solar water heating systems that can be used as guidelines by states. The funding level is estimated to be sufficient to support the establishment of the reliability standards. This is based on experience in developing performance standards. . . .	140	100	300
■ **Precompetitive Field Validation** - Cooperative projects with utilities and builders will be continued to eliminate technical barriers that limit the use of solar water heaters. A CRADA with Salt River Project will be completed that develops a lower cost, roof integrated solar water heater. Technical support to Pulte Homes and CAVCO Industries will be provided.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Cooperative agreements with utilities and builders help maintain relationships that are important because they provide data from "real-life" systems that are not duplicated by researchers and engineers under controlled test conditions at NREL and Sandia. This data helps guide technology development activities and insures that the technology will satisfy the needs of those who sell it, install it, and buy it. This activity will continue through 2005, when the new, low cost solar water heater evaluation is completed. The funding level is determined necessary to support all existing cooperative agreements.	1,005	0	500
■ **Technology Development** - Research will focus on the two concepts which have the greatest potential for achieving the program's cost goal. Both systems are likely to be polymer based. Design improvements will be made to the prototypes tested during FY 1999 and new systems will be built and tested to determine their ability to withstand overheating and freezing. The accelerated lifetime testing of several polymer formulations will continue, as will the development of an "ultra accelerated" method of predicting polymer lifetime. A study will be completed to determine the potential of using fiber optics or light pipes to bring sunlight into the interior of buildings.			
■ This is an R&D effort that is attempting to use new materials and new designs to significantly decrease the cost of solar water heaters. As such, it entails a significant technical risk, but the amount was deemed appropriate for this stage of the research. Industry has indicated it is unable or unwilling to support this type of activity without DOE assistance. It will support the laboratory, university, and industry R&D that made great strides in FY 1998 to place the cost goal within reach. The funding level was determined by the Technology Managers at NREL and Sandia to be the minimum amount necessary for achieving the $0.04/kWh cost goal by 2003.	1,480	3,500	4,700
Total, Solar Building Technology Research.....	2,625	3,600	5,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Space Conditioning and Water Heating	
■ **Quality Assurance** - Builders and home buyers have emphasized the importance of reliability when considering solar water heaters. The increase would continue the effort begun in FY 1999 to establish voluntary reliability standards as a complement to the existing performance standards.	+200
■ **Precompetitive Field Validation** - A number of builders and utilities have established solar water heating programs. The increase would enable DOE to provide them technical support that is beyond the capability of the solar industry.	+500
■ **Technology Development** - The technology development program is expanded to reduce the cost of solar water heating technology to $0.04/kWh or less by FY 2003. Achieving this goal will make it competitive in wide areas of the U.S. This funding supports university and industry R&D.	+1,200
Total Funding Change, Solar Building Technology Research	+1,900

Photovoltaic Energy Systems

Mission Supporting Goals and Objectives

Program Mission

The mission of the National Photovoltaics Program is to conduct the research and development (R&D) necessary to enable photovoltaics (PV) to become a significant contributor to the United States domestic energy needs. The resources dedicated to R&D, in partnership with industry and academia, have advanced PV from a laboratory novelty to a growing U.S. industry that has the worldwide lead, with more than 40% of the cell and module sales. The challenge for the DOE PV program is to continue an effective and productive role in advancing PV technology and maintaining and enhancing a growing U.S. industry.

Program Goals and Objectives

By 2004, in partnership with the photovoltaic industry, universities and national laboratories, the National Photovoltaic Research Development & Deployment (RD&D) Program will 1) increase the efficiency of commercial modules from the current 7% to 12% when made from lower cost thin film materials and from the current 13% to 16% when made from more costly crystalline silicon materials; 2) reduce the retail sales price of commercial modules by 40% from current average costs of about $4.25/Watt; 3) increase the lifetime of fielded systems from the current 10-15 years to greater than 25 years; and 4) increase the U.S. PV industry cumulative sales of power modules from 265 Mega Watts (MW) in 1997 to 1000MW (U.S. and export sales). These advancements are necessary to develop cost competitive products that can sustain the emerging PV industry and will also ensure successful implementation of the Million Solar Roof Initiative. By the year 2004 we will have reached 60% of the program's technical goals and industry will have introduced products into the market place such that there will be 500MW of cumulative installed systems in the U.S. By the year 2004, based on the current U.S. PV industry growth rate, the U.S. PV industry will have captured 50% of the world market.

In addition to the 5-year goal, the Photovoltaic Program has established near-term (FY 2000) and longer term goals to ensure steady progress and successful implementation of the Program. Success will be attained when photovoltaics can provide more cost competitive electricity than other forms of electrical generation. The PV Program's near-term goal is for PV to produce electricity at $0.12 to $0.20/kilowatt hour (kWh) by 2000, based on installed system costs of $3.00 to $7.00 $/Watt and module efficiencies of 10-16%. The longer term goal is to reach $0.06/kWh electricity with installed system costs from $2.00 to $4.00/Watt. PV must also be more reliable and convenient to use than the next best alternative for each application. Therefore, the program is working towards system lifetimes greater than 20 years and with manufacturers to simplify system design and develop uniform standards.

Strategic Approach

The Federal government invests in PV to help establish a domestic energy option that can also protect the environment and foster an emerging high-technology industry that creates high-value jobs. Industry's stake in opening new markets and applications has increased because of rising competition. DOE's strategy is to concentrate on areas of high-risk, high-payoff research and development where private sector companies traditionally under invest and where DOE has the most valuable expertise and can make a significant impact with limited funds.

This strategy includes conducting fundamental research on several photovoltaic semiconductor materials to resolve issues that limit current technology, and to conduct basic R&D for breakthrough, non-conventional PV technologies aimed at dramatic cost/kW reductions. In addition, advanced materials and devices work will continue cost-shared research with industry to improve device efficiency and stability, particularly for large-area thin film deposition systems. Process R&D will be conducted by way of cost-shared industry research (greater than 50% by industry) to reduce module manufacturing costs, improve module performance, and stimulate investment in new manufacturing lines. These research activities are core program efforts to develop the advanced technologies that are essential to maintaining U.S. competitiveness in the next 5 to 10 years. To further support the strategy, module reliability research will be conducted to improve lifetime in the field, and system component reliability efforts will be increased to help improve the lifetime of fielded systems. Efforts to deploy PV systems in cost-shared utility projects designed to establish technical and economic validation in specific high-value applications will also be conducted. In addition, research and analysis relating to restructuring in the electric utility industry will be conducted on issues associated with integration of PV systems into an increasingly competitive industry framework.

In summary, the FY 2000 budget presents a balanced effort in fundamental and applied research, materials and device development, process R&D, module reliability, and system testing and evaluation. A major portion of this work will be undertaken via competitive procurement resulting in highly leveraged cost-shared projects with the emergent PV industry.

This balanced, aggressive set of research activities will maintain industry growth and momentum, two important ingredients necessary to successfully meet program goals. The PV industry lost market share during the 1980's when budgets were reduced. The industry (with Federal research and support) has worked very hard over the past ten years to re-establish small, incremental market increases in spite of strong foreign competition. In 1997, the U.S. PV industry had its largest increase in sales of modules in over a decade, yet could only gain one percentage point in market share, from 43% to 44%. This is significant in two ways: the momentum of the program is at its highest in ten years, but foreign competition is also the strongest it has ever been. The proposed FY 2000 budget will help maintain industry's growth and momentum during a period of strong foreign competition.

The Photovoltaics R&D program is complemented by the Million Solar Roofs Initiative - which seeks to facilitate the installation of photovoltaic and solar hot water systems on one million buildings across our nation by 2010. These installations will result in substantial field experience with this technology by electric utilities, engineers, developers and others and decreases in production costs by manufacturers as market demand increases.

Program Benefits

Metrics	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.01	0.05
Energy Savings ($ Billions)	0.00	0.02	0.16
Carbon Displaced (MMTCE)	0.00	0.08	0.72

The U.S. photovoltaic industry has been growing at an average annual rate of 24% over the past eight years and is now the leader in sales throughout the world. In 1997, over 70% of sales were exported to foreign markets. The strong and aggressive DOE R&D Program has been the key to enabling the U.S. PV industry to be the technology and product leader in a very competitive and rapidly growing global marketplace.

In 2010, photovoltaic systems are estimated by McNeil Technologies to produce approximately 3,000MW, the same electricity generating capacity as 3-5 coal-fired plants, which will reduce annual carbon dioxide emissions equivalent to what is now produced by 850,000 cars.

Performance Measures

FY 2000 Performance Measures

- Increase the conversion efficiency of commercial thin film modules from the current 7% to 10% and from the current 14% to 15% for crystalline silicon.
- Develop a 13%-efficient stable prototype thin-film module.

FY 2001 - 2006 Performance Measures

- Test a low-cost, stable module encapsulant compatible with 30-year module life.
- Achieve greater than 300 megawatts of cumulative installed PV systems in the U.S.
- Increase the efficiency of commercial thin film modules to 12% and crystalline silicon modules to 16%.
- Test fielded PV system compatible with 25-year life.
- Increase the U.S. PV industry cumulative sales of power modules from 265 megawatts in 1997 to one gigawatt.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

- The first commercial copper indium diselenide (CIS) thin film module at 9.5% efficiency was achieved by Siemens Solar Industries in Camarillo, California.

- Two new photovoltaic manufacturing plants came online in 1997: a 5MW amorphous thin film plant by United Solar in Troy, Michigan, and a 10MW amorphous thin film plant by Solarex in Virginia.
- A new photovoltaic roofing shingle was commercialized by United Solar which won awards for best new product of the year by Popular Science and Discovery magazines.

FY 1998 Accomplishments

- Developed an 18% efficient prototype thin-film solar cell.
- Achieved retail sales of 8% efficient cadmium telluride (CdTe) large area modules by industry.
- Established at least 9 State and community partnerships for the Million Solar Roofs Initiative.
- Two new photovoltaic alternating-current (AC) modules commercialized by Advanced Energy Systems and Ascension Technology won awards for best new product of the year by Popular Science magazine. The modules feature built-in microinverters that allow them to act as their own AC generators.
- Initiated the government, industry, state and community partnerships to put solar energy systems on one million roofs.

FY 1999 Planned Accomplishments

- Complete Phase 2 Preliminary Engineering Development and initiate Phase 3 Prototype Development/Field Verification for the PV:BONUS project.
- Develop 13% efficient stable prototype amorphous silicon solar cells.
- Develop codes, standards and safety specifications for residential PV roof systems.
- Support the Million Solar Roofs Initiative by installing 15,000 energy systems and establishing up to 16 additional major partnerships.
- Complete round 3 projects initiated in FY 1998 under the Partnerships for Technology Introduction and implemented through the Utility Photovoltaic Group (UPVG).

FY 2000 Planned Accomplishments

- Develop 13% efficient stable prototype thin film module (either CdTe or CIS).
- Identify 2-4 new and novel materials and cell devices with potential for low cost future generation PV options.
- Develop low cost options for 35% high efficiency tandem concentrator cell.
- Identify a low cost, stable module encapsulant compatible with 30-year module life.
- Install 26,000 solar energy systems in support of the Million Solar Roofs Initiative, bringing the total number of installed systems to 51,000.

Program Completion

Successful completion of the Photovoltaic program will be attained when the cost of PV generated electricity is cost competitive with conventional distributed power generation ($0.06/kWh). With continued support for a strong and aggressive R&D Program, this goal can be met in the 2010 to 2015 time frame.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Fundamental Research	11,000	11,000	20,309	+9,309	+84.6%
Advanced Materials and Devices	24,000	27,000	27,000	0	0.0%
Collector Research and Systems Development	29,691	34,200	46,000	+11,800	+34.5%
Total, Photovoltaic Energy Systems	64,691	72,200	93,309	+21,109	+29.2%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Fundamental Research			
■ **Measurement and Characterization** - Support industry and university research groups in advancing material and cell technologies by characterizing cell materials and devices, and reducing efficiency limiting defects in cell materials. The funding level is considered appropriate based on laboratory scientific staff experience, and through the development of a comparative analysis with similar research activities. Most PV companies cannot afford large teams with expensive laboratory facilities of their own to conduct long-term, high-risk basic research activities.	5,500	5,500	5,500
■ **Basic Research/University Programs** - Improve the understanding of defects in conventional crystalline silicon and thin film materials that limit efficiency. Support research to advance the understanding of cell material growth, deposition processes, semiconductor theory, and characterization methods and standards. Begin second year of university research on new and novel materials and cell devices. The funding level is considered appropriate based			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
on laboratory scientific staff experience, and through the development of a comparative analysis with similar research activities. Most PV companies cannot afford large teams with expensive laboratory facilities of their own to conduct long-term, high-risk basic research activities.	5,500	5,500	5,500
■ **Non-Conventional Breakthrough R&D** - Issue new competitive solicitation on basic R&D for breakthrough, non-conventional PV technologies - liquid cells, polymers, biochemical and biomimetic processes, etc. - aimed at dramatic cost/kW reductions. The funding level is considered appropriate based on laboratory scientific staff experience, through the development of a comparative analysis with similar research activities, and the PV industry's inability to fund long-term basic research on their own.	0	0	4,309
■ **High Performance Advanced Research** - Begin High Performance PV Initiative to support research to substantially increase the efficiency of two key photovoltaic technologies: multijunction concentrating cells and large-area, monolithically interconnected thin films. Fundamental research aimed at major innovations is required to essentially double the conversion efficiency of thin films from their current 8-10% to 15-20%, and to increase III-V-based multijunction cells from 30% to 40% under 500X concentration. In-house national laboratory expertise as well as competitive solicitations to universities and industry will be used to conduct innovative research on thin films and provide insights into III-V-based semiconductor material systems and devices.			
■ Research on thin films will include copper indium gallium diselenide (CIGS), cadmium telluride (CdTe), multijunction amorphous silicon with reduced Stable Wronski effect, film crystalline silicon materials, and multijunction combinations of the above.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Research on III-V-based material systems will include 2-, 3-, and 4-junction cells made up of gallium arsenide (GaAs), gallium indium phosphide (GaInP), gallium indium arsenide nitride (GaInAsN), and other quaternary materials. Successful development of the 4-junction cell will allow a 33% efficient concentrating module under 500X concentration. Both the enhanced thin film approach and the multijunction III-V approach will yield dramatically reduced dollar per watt values for terrestrial photovoltaics. The funding level is considered appropriate based on staff experience and historical precedence in similar research activities.	0	0	5,000
Total, Fundamental Research.	11,000	11,000	20,309

Advanced Materials and Devices

■ **Thin Film Partnership Program** - Pursue efforts within the thin film partnership program to achieve cost-effective thin film technologies by supporting research teams made up of leading scientists from industry, universities and national laboratories, who work together to define and carry out shared activities. Industry and university participants are selected through competitive solicitations. FY 1999 activities will support the second year of 3-year cost-shared contracts with industry to develop a 13% efficient prototype stable amorphous silicon module; solve degradation of copper indium diselenide (CIS) modules due to water vapor ingress; establish reliable high-throughput, high-yield CIS deposition processes to achieve prototype 13% efficient large area modules; and identify stress induced loss mechanisms for cadmium telluride (CdTe) based cells. The funding is considered appropriate based on staff experience and historical precedence in similar activities. Developing thin film technologies is a major thrust of the Program and receives the most funding because most scientists agree that thin film technologies have the best chance for attaining the Program's long-term goal of $0.06/kWh.	0	0	19,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Increase funding for 4-5 additional Thin-Film Partnership industrial contracts. Achieve 13% efficient stable amorphous silicon cells; 10% stable amorphous silicon modules; and a large increase in the commercial production of 8.5% efficient CdTe thin film modules. The funding is considered appropriate based on staff experience and historical precedence in similar activities. Developing thin film technologies is a major thrust of the Program and receives the most funding because most scientists agree that thin film technologies have the best chance for attaining the Program's long-term goal of $0.06/kWh.	16,000	19,000	0
■ **Crystalline Silicon/High Efficiency Devices and Reliability** Support research on silicon defects and high efficiency devices. Work with high efficiency concentrator cell industry to develop low cost options for 35% tandem cells. Develop innovative silicon crystal growth methods with improved throughput, conversion efficiency, and lower energy and materials cost than current methods. Conduct environmental stress testing of emerging PV modules developed through Thin Film Partnership and PVMaT programs. The funding level is considered appropriate and represents core program efforts to develop the advanced technologies that are essential to maintaining U.S. competitiveness and attaining near; mid- and long-term goals.	8,000	8,000	8,000
Total, Advanced Materials and Devices	24,000	27,000	27,000
Collector Research and Systems Development			
■ **Manufacturing R&D** - Complete second year and begin third year of 3-year Photovoltaic Manufacturing Technology (PVMaT) contracts to accelerate cost reductions and produce higher performance modules. These contracts address manufacturing R&D related to PV system components other than modules, such as batteries and inverters, to improve and reduce overall system costs. Issue a new competitive solicitation in FY 2000 to develop new material and insitu process diagnostics needed for PV module scale-up and successful manufacturing.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
All new contracts will exceed 50% cost-sharing. The funding is considered appropriate based on an extensive industry-wide survey that concluded that PWMat is the single most effective project that assists U.S. industry in reducing costs. Industry cost-sharing averages 40% (small business: 30%; large business: 50%) which further substantiates industry's support.	0	0	16,000
■ Fully fund 15-18 new three year PVMaT contracts to improve module manufacturing processes. These contracts are expected to achieve manufacturing cost reductions of 50% from 1996 levels. Completed third year of PVMaT three-year contracts initiated in FY 1996 to reduce manufacturing costs and improve processing of thin film technologies and balance of system components. Awarded additional three-year contracts that emphasized advanced manufacturing technologies for producing higher performance and lower cost commercial thin film and thin silicon modules.	9,000	10,600	0
■ **Systems Engineering & Reliability** - Conduct system engineering tests to validate the performance, safety, reliability and cost of fielded systems and components. Support development of domestic and international standards and codes, and procedures for certifying performance of commercial systems. Achieve fundamental understanding of photo/thermal/chemical/environmental factors that influence the stability of encapsulated materials and performance of PV cells in modules. Provide $1,500,000 to support ongoing research at the SE and SW regional experiment stations.			
Systems engineering and reliability research is critical to achieving the Program's goal of developing modules and systems that can last 30 years in the field. Cost competitiveness for PV generated electricity is directly dependent on payback over the life of the system under actual operative conditions. The funding level in considered appropriate based on the critical role system reliability plays in the success of the Program.	0	0	16,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Support efforts to develop codes, standards and safety specifications for building integrated residential and commercial systems. Continue efforts to evaluate and monitor utility grid tied systems. Maintain reliability research to improve system component performance and reduce O&M costs. Collaborate with U.S. industry to increase system and balance-of-systems efficiency and reliability to achieve additional cost-reduction of about 35% for installed systems in the year 2000 (a savings of about $2.50 per watt from the present $8.00 per watt for installed systems) and resulting from improved design, efficiency and quality control.	12,387	16,000	0
■ **PV Building Integrated R&D** - Complete Phase 3 Prototype Development/Field Verification contracts for PV:BONUS II. Assess technical progress and marketing contractors' success of PV:BONUS to determine future activities. Increase R&D on advanced PV Building concepts, tools, and modeling procedures in support of industry efforts for technology development/deployment to address technical barriers to expanded markets for PV in the buildings sector. Continue development of PV integrated design concepts and engineering practices to expand use of PV in residential and commercial buildings. The funding is considered appropriate based on a comparative analysis with similar product development R&D efforts, and to successfully complete the multi-year PV:BONUS II project and honor all contractual commitments.	0	0	5,000
■ Fund Phase 2 Preliminary Engineering Development contracts for PV:BONUS II and initiate Phase 3 Prototype Development/Field Verification by awarding PV Building Integrated contracts to best Phase 2 performers. Provide technical support for accelerated use of renewables in as many as one million new buildings by 2010. The funding is considered appropriate to successfully complete the multi-year PV:BONUS II project and honor all contractual commitments.	0	2,300	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Assessed the performance of installed systems. Completed Phase I Concept/Business Plan Development activity for the initial awardees under PV:BONUS II. Selected most attractive performers for the Phase 2 Preliminary Engineering Development of new PV building integrated products. Conducted generic technology development research to address technology barriers and industry priorities and needs for expanding market opportunities in the building sector.	1,500	0	0
■ **Partnerships for Technology Introduction** - Complete testing and verification of all utility and residential grid-tied PV systems installed through previous energy partnerships. Issue new competitive solicitation in FY 2000 for highly leveraged projects emphasizing building integrated applications, including public and private school buildings. All new projects will exceed 50% cost sharing. The funding is considered appropriate because efforts to deploy new products and validate them in the field are critical to meeting the Program's goals and strategy to increase user acceptance in the utility sector.	0	0	6,000
■ No new contracts are planned for FY99. The new projects initiated in FY98 emphasizing building integrated applications will be completed and testing and verification activities will be conducted in FY99. Complete fabrication of the eight utility grid-tied PV systems under UPVG. Issue new solicitation for projects emphasizing building integrated applications.	1,804	3,800	0
■ **Million Solar Roofs (MSR) Initiative** - In FY99, up to 16 additional major Partnerships will be added to the 9 existing Partnerships established in FY98. These 20 to 25 Partnerships have made preliminary commitments to install over 750,000 solar energy systems by 2010. In FY 2000, we will significantly expand work on financing mechanisms, measurement and evaluation, technical standards and infrastructure such as net metering capability in support of the State and Local Partnerships. Technical assistance will be provided to the Partnerships to familiarize them with solar			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
energy technologies and evaluate their capabilities and limitations and will support consumer education efforts through the Partnerships and in conjunction with utilities. General training and technical assistance will be provided to Partnerships, utilities, industry groups, financial institutions and governmental entities. Establishment of a national MSR registry jointly with state and local governments, utilities and other MSR partners will be fully implemented. The funding level is appropriate based on comparative analysis of similar activities. Also fulfills strategic objectives in Presidential Initiative.	0	0	3,000
■ Conduct training workshops on the design, operation, maintenance, and repair of solar technologies. These workshops will be for state and local agencies, builders, designers, and developers. Begin development of an outreach program to educate consumers about solar technology and familiarize them with the MSR initiative. An additional 15 major partnerships will be formed. Partners will be provided technical assistance as needed. The funding level is appropriate based on comparative analysis of similar activities. Also fulfills strategic objectives in Presidential Initiative.	0	1,500	0
■ Developed and implemented Million Solar Roofs Action Plan in response to Presidential Initiative. Coordinated activities with other Federal Agencies (e.g. HUD, EPA, DOD). Formed 9 partnerships that include commitments for a total of 506,400 solar roofs by 2010.	5,000	0	0

Concentrating Solar Power Program

Mission Supporting Goals and Objectives

Program Mission

The Concentrating Solar Power (CSP) Program works with U.S. industry to develop economically competitive CSP technologies which will improve our nation's energy security through greater diversity of supply; reduce greenhouse gas emissions; and create business opportunities for U.S. industry both here and abroad, resulting in jobs for U.S. workers. CSP technologies will be able to take advantage of utility restructuring by providing technology options capable of providing a significant contribution to state-sponsored portfolio standards and system benefit charge (renewable energy incentive) programs.

Solar Dish/Engine System on Display at the Pentagon

- 25kW power
- Hybrid Stirling (Solar/Natural Gas)
- Near-term energy cost < 20¢/kWh

Program Goals and Objectives

CSP technologies use various mirror configurations to concentrate the heat of the sun to produce electric power. The current CSP Program portfolio contains systems which range in size from the 10-25kW dish/engine demonstration units, for remote and distributed power applications, to the 354MW of parabolic trough systems which have been producing reliable solar power in Southern California for over 10 years. The CSP portfolio also includes power towers, like the 10MW Solar Two plant, which has the unique ability to utilize thermal storage to put "sun in a bottle" for use when the sun is not shining. Because of their use of heat, all CSP technologies can be hybridized with other fuels to provide high-value dispatchable power on demand. These attributes, along with world record solar-to-electric conversion efficiencies, make CSP an attractive renewable energy option in the U.S. Southwest and other sunbelt regions around the world.

Our role at DOE, is to provide innovative and viable technology options that U.S. industry can then take to the marketplace. The five-year goal of the CSP Program is to work with U.S. industry to develop reliable distributed CSP systems (i.e., 4,000 hrs. between failures) and dispatchable systems capable of producing power in the $0.06 to $0.08/kWh range. Achievement of these program objectives will further the Comprehensive National Energy Strategy (CNES) goals of (1) improving global environmental quality, (2) providing future generations with a robust portfolio of clean and reasonably priced energy sources, and (3) promoting the development of open, competitive, international energy

markets. With MW-scale systems, CSP technologies have the potential to make a significant contribution to DOE's Strategic Plan objective to develop renewable technologies capable of doubling non-hydroelectric renewable energy generating capacity by 2010.

Strategic Approach

Over the past ten months, the CSP Program has undergone the most significant overhaul in its history, including a change in name (from Solar Thermal Energy Systems to Concentrating Solar Power). All program elements have undergone extensive review and revision, and all members of the CSP Program's constituency have had opportunities to participate. The objective has been to focus resources on activities which are appropriate to the emerging restructured utility environment and which can be carried out in a reasonable time frame with a conservative budget. Management strategies have been revised where needed, and a new five-year plan has been developed. Rather than focus on specific projects, "paths" addressing core program priorities have been defined and program elements to support these paths have been identified. The result is a Federal program with an appropriate government role which is enthusiastically supported by industry, in tune with current U.S. electricity trends, and poised to provide a significant contribution to the nation's energy needs. FY 2000 is the first budget year for which planning and decision making are guided by the revised program and new multi-year plan, although implementation of the path concept has begun in FY 1999. Program activities are categorized by the four paths described below.

The first path, *Develop and Demonstrate High-Reliability Distributed Power Systems,* initially focuses on improving the reliability of dish/engine systems for emerging markets for distributed energy sources. Distributed power refers to power generated close to the point of demand. These markets currently support remote power prices that can exceed $0.30/kWh. Activities undertaken on this path will result in orders of magnitude improvements in system reliability, and will achieve energy costs in the $0.09 to $0.11/kWh range within six years.

The second path, *Reduce Costs of Dispatchable Solar Power,* includes initial activities in two areas: advanced trough component R&D and the development of high-temperature CSP systems. Dispatchable power refers to power available during periods of peak demand, even when the sun is not shining. Recent trough technology roadmapping exercises with industry have identified opportunities for cost reductions which will provide a leading position for U.S. industry in bidding on international projects currently before the World Bank, and will re-open a domestic market for trough systems. High-temperature system development will take the lessons learned from the Solar Two power tower, which is completing its operation in mid FY 1999, and will apply them to advanced high-temperature component technologies, including those with storage capabilities. Early demonstrations and development efforts, supported by both green power markets and multilateral organizations such as the Global Environment Facility, will lead to a "next generation" of plant designs capable of producing dispatchable power for $0.6 to $0.08/kWh within five years. Since these systems are capable of meeting highly-valued daytime peaking power needs, they will be competitive at these prices.

Penetration of broader domestic and international markets will require longer-term research into advanced technologies. This will be covered by Path 3, *Develop Advanced Components and Systems.* Development of advanced technologies (e.g., heat-pipe receivers, high-temperature components,

advanced materials), coupled with economies of scale arising from expansion into high-value markets, will allow CSP systems to compete in dispatchable and distributed markets for $0.04 to $0.06/kWh. At these prices, U.S. industry will be able to make CSP systems a self-sustaining component of the energy economy.

In parallel with these three major technology paths, we will also pursue a fourth path which is low in cost, but essential to keeping program activities on track: *Expand Strategic Alliances and Market Awareness.* This path will keep our technology efforts focused on the most critical needs of U.S. industry, ensure a technology capable of meeting market needs, and support domestic and international information flow and policy decisions favorable to renewable energy.

Program Benefits

Metrics	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.00	0.03
Energy Savings ($ Billions)	0.00	0.01	0.09
Carbon Displaced (MMTCE)	0.00	0.06	0.42

These benefits correspond to providing enough electricity for 350,000 homes in the year 2000.

Performance Measures

FY 2000 Performance Measures

- Achieve 1,000 hours of unattended operation on a single dish/engine system in field testing.
- DOE advanced technology used by U.S. trough team in competitive project bid.

FY 2001 - 2006 Performance Measures

- Reduce installed costs below $3,500/kW for dispatchable solar power systems.
- Achieve 4,000 hours of unattended operation on dish/engine systems in field testing.
- Validate feasibility and complete conceptual design of high-temperature concentrating solar system capable of generating power for $0.04/kWh.

Significant Accomplishments and Program Shifts

Pre-1998 Accomplishments

- Achieved a 29.4% world record solar-to-electric system conversion efficiency with the Advanco dish/Stirling system.

- The ten-year-old Solar Electric Generating Systems (SEGS) trough plants continue to operate reliably, and through improved O&M technologies and modest design upgrades, produce more energy annually than when new.
- The Solar Two power tower achieved an instantaneous power production of 11 MW (one MW, or 10%, higher than rated capacity) and demonstrated power production at night using molten salt (solar-on-demand capability).

FY 1998 Accomplishments

- Solar Two: completed 100 hour acceptance test; generated power continuously for 153 hours (over 6 days) using sun and stored hot salt; and achieved over 1,500 MW and 80% availability over a 30-day period.
- Installed 2 technology validation 25kW dish/engine systems in the field, including a successful demonstration at the Pentagon.
- Installed four mass producible heliostats – two at lab sites (for reliability testing and wind load studies) and two in a utility environment.
- Fabricated and tested hybrid solar/natural gas heat-pipe receiver design for distributed power systems capable of increasing performance by 25% over current direct illuminated receiver (DIR) design.
- Published initial set of technology characterizations for parabolic troughs, power towers, and dish/engine systems.

FY 1999 Planned Accomplishments

- 750 hours of reliable operation on a single distributed CSP system.
- Reduce parasitic power usage at Solar Two from 25MWh to the design goal of 11MWh/day.
- Developed molten-salt technology improvements which will simplify the process and lessen the cost of energy storage.
- Developed a lightweight structural facet which will decrease the cost and increase the reliability of concentrators for both distributed and dispatchable solar power systems.
- The Solar Two Power Tower project, demonstrating the dispatchability of solar power during periods of peak demand, direct funding for this project will be ended. Any further efforts that may be justified will be as part of a new cost-shared contract agreement.

FY 2000 Planned Accomplishments

- Initiate U.S. Trough Project to develop advanced trough components for near-term applications.
- Develop and test off-grid capability for remote power systems; install unit on Indian reservation for testing.
- Build first advanced DECC distributed solar power system; begin field testing.

FY 2001 - FY 2004 Planned Accomplishments

- Perform reliability testing on distributed solar power systems in the field, achieving 80% availability over a 6-month period.
- Complete conceptual design of thermal storage option for trough systems.
- Field-test distributed power systems in a variety of user environments (e.g., end-of-line, land-fill gas sites, remote locations) accumulating in excess of 10,000 hours of on-sun operating data.
- Scale-up and field-test advanced trough components capable of generating power for $0.08/kWh).

Program Completion

Distributed power systems must first validate acceptable reliability and operating characteristics in their applications, and then progress with reducing installed costs. Field validations for grid-connected reliability will be completed by 2004, with achievement of 4,000 hours mean time between failures (MTBF). Reliability for off-grid applications will be established by 2006, achieving reliability targets that will be significantly higher than for grid-connected applications. By the year 2004, component cost reduction activities are expected to achieve system designs with energy costs reaching $0.11/kWh or less in high-volume production; this will be competitive in selected distributed markets.

For CSP technologies competing in dispatchable power markets, the program will achieve cost reductions to $3,500/kW or less by 2002, and $3,000/kW or less by 2004. Energy costs will be $0.08/kWh or less by 2004. The CSP Program will end direct support of the Solar Two power tower in FY 1999. Follow-on activities involving high-temperature component R&D with applications to advanced CSP applications will be initiated. By the year 2003, design specifications will be fixed for the advanced CSP high-temperature systems. These systems will represent the next reduction in costs for the technology. Cost projections for high-temperature systems are in the $0.04 to $0.06/kWh range (50% of current dispatchable CSP technology costs). The current trough roadmap defines specific component development programs with high cost-reduction potential.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Distributed Power System Development	3,550	5,300	6,700	+1,400	+26.4%
Dispatchable Power System Development	6,850	5,970	5,340	-630	-10.6%
Advanced Component and System Research	5,117	4,990	5,960	+970	+19.4%
Strategic Alliances and Market Awareness	800	740	850	+110	+14.9%
Total, Concentrating Solar Power Program	16,317	17,000	18,850	+1,850	+10.9%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Distributed Power System Development			
■ **System Reliability** – The CSP Program will be working with three industry partnerships to develop and demonstrate reliable dish/engine systems. Under the Utility Scale Joint Venture Project (USJVP), two 25kW systems were built in FY 1998, and a third in FY 1999. All three of these systems will undergo intensive reliability monitoring in FY 1999, and early FY 2000, with a near-term goal of reaching 1,000 hours mean time between failure (MTBF). A second team, under the Dish/Engine Critical Components (DECC) Initiative, began their Phase I design and fielded one 25kW system in FY 1998. In FY 1999, additional components will be assembled and tested, with several full-scale Phase II prototypes to be installed in FY 2000. This activity is built around design improvements that will increase overall system reliability. Cost-share for both of these projects is 50%. A third project was launched in FY 1999 to field an advanced-technology 10kWe solar-powered dish/engine system at a remote, off-grid site in the Southwestern U.S. (e.g., an Indian reservation in Arizona or New Mexico). In FY 2000, the off-grid capability of the system will be developed and tested. These systems will have an early market entry price of less than $0.20/kWh, and are equally suited for either stand-alone operation or for being hybridized with natural gas or diesel fuel. This funding level, based on program staff experience and analysis of cost-sharing potential, will support the performance and reliability monitoring required to reach the goal of 4,000 hours MTBF, which is essential for commercial viability.....	3,550	5,300	5,100
■ **System Testing and Field Validation** – Field validation efforts will begin under the USJVP as it enters Phase III, and for the DECC under Phase II, with the opportunity to install multiple systems at sites in the U.S. Southwest. Systems will be installed at different types of user sites (e.g., hybrid dish/engine systems at land-fill gas facilities). This level of funding, based on program staff experience and analysis of cost-sharing potential, will supply the objective data necessary for product improvements aimed at giving U.S. industry a viable distributed solar power option.....	0	0	960

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Cost Reduction** – The SolMaT Initiative is directed at developing manufacturing techniques to reduce the cost of low-volume production. Distributed SolMaT activities will include manufacturing design improvements, facet production verification, and advanced receiver development. Funding for the early project phases is cost-shared 20% to 35 % with industry. This level of funding, based on program staff experience, is required to initiate these fundamental cost-reduction activities aimed at lowing the cost of manufacturing at low volumes.	0	0	640
Total, Distributed Power System Development.	3,550	5,300	6,700

Dispatchable Power System Development

■ **Cost Reduction** – Based on the results of industry's Trough Technology Roadmapping efforts in FY 1998, a number of component and system improvements were identified as being able to reduce the costs of near-term trough plants from the current $0.10 to $0.12/kWh to $0.06 to $0.08/kWh. To meet this need, the USA Trough Initiative was launched in FY 1999. FY 2000 work will focus on optimization of the collector design, improved system integration with conventional combined-cycle and heat-recovery plant layouts, and the evaluation of storage concepts. With appropriate R&D, these incremental improvements can collectively have a major impact on near-term costs. The USA Trough Initiative, which is heavily cost-shared by private industry, will provide a leading position for U.S. industry in bidding on international projects currently before the World Bank, with the potential to re-open a domestic market for trough systems. Additional activities include a SolMaT effort to develop low-cost drives and concentrators, and R&D for high-temperature system designs. Independent review boards, such as the President's Committee of Advisors on Science and Technology (PCAST), support this high-temperature work based on its potential of providing renewable power in the $0.04/kWh range. This level of funding, based on program staff experience and analysis of cost-sharing potential, is required to develop dispatchable systems capable of producing $0.06 to

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
$0.08/kWh power within five years, and prove their long-term potential for costs in the $0.04/kWh range.	1,700	1,130	3,320
■ **System Testing and Field Validation** – Work will include the field testing of the new parabolic trough concentrator designs. The decreased funding level is due to planned project completion and phase-out of direct Federal support for the Solar Two Project.	3,000	3,360	530
■ **Reliability and Lifetime Improvement** – The recent outstanding performance of some of the Solar Electric Generating System (SEGS) plants has been credited in large part to the O&M improvements achieved through the CSP program. Cost-shared technical support, tracking, and evaluation will be expanded to other sites. Special attention will be given to increasing the lifetime and maintainability of trough receiver tubes. In addition, the Solar Two evaluation and lessons learned document will be completed. This level of funding, based on program staff experience, is required to support the technology and O&M improvements necessary to guarantee the availability of reliable systems for use in near-term markets.	2,150	1,480	1,490
Total, Dispatchable Power System Development	6,850	5,970	5,340
Advanced Components and Systems Research			
■ **High Efficiency System Designs** – Activities include advanced research into high-efficiency system designs that will produce the long-term technological advances required for CSP to compete in both distributed and large-scale dispatchable power markets. Work will include advanced hybrid system designs, investigations of high-temperature working fluids and materials, and the expansion of advanced trough component research. Based on overall budget constraints, this level of funding is required to pursue the most critical technology advances that will drive costs down and move CSP technologies closer to becoming a viable option for U.S. industry to meet the demand for emission-free power.	2,698	1,780	1,800

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Field Operations & System Analysis** – Funding supports the development of advanced control systems, technology characterization updates, and system modeling. These funds also go to maintain the national laboratory facilities where much of the world-leading solar R&D is conducted. These efforts provide invaluable cost and technical data for each technology and serve as tools for project developers and researchers alike. This level of funding, based on program staff experience, is required to accomplish these tasks.....	469	1,410	1,860
■ **Concentrators** – Project work will focus on the development of advanced reflective materials, advanced drives, and concentrator structural design optimization, with applications for both distributed and dispatchable systems. Research will include the development of materials such as the revolutionary ultra-thin glass, which has the potential to greatly reduce the cost and improve the durability of the mirrors. This level of funding, based on program staff experience, is required to accomplish the critical component R&D that will be incorporated in the next generation systems.....	1,600	1,220	1,330
■ **Long-Term R&D** – Funding will support the advancement of several existing small projects from the design phase into the development of prototypes. These projects, including thermo-acoustic power and combined CSP and thermo-photovoltaic systems, have the potential to provide reliable distributed power options with the advantage of fewer moving parts, and an inroad into smaller residential markets where on-site power is in demand. This work will evolve to include activities such as heat-absorber materials, high temperature volumetric receivers, and advanced fuels and chemicals applications. The increased level of funding, based on program staff experience, is needed to carry these advanced concepts through the design phase and into working prototypes that get incorporated into advanced CSP systems capable of achieving costs in the $0.04 to $0.06/kWh range.....	350	580	970
Total, Advanced Component and System Research.....	5,117	4,990	5,960

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Strategic Alliances & Market Awareness			
■ This path covers technology transfer, communication activities, and makes the world renowned technical expertise of SunLab researchers available to U.S. industry, Federal and State legislators, and world organizations involved in renewable energy development. Analyses and studies will be conducted in FY 2000 to ensure that the CSP Program is focused on the needs of industry and the realities of the marketplace. Activities include the development of direct-normal insolation (DNI) maps, technology roadmaps, and web-based communications to make laboratory R&D more accessible to researchers. This level of funding, based on historical staff experience, is required to accomplish these tasks.	800	740	850
Total, Concentrating Solar Power Program	16,317	17,000	18,850

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 (000)
Distributed Power System Development	
■ Increased funding reflects an increase in the number of systems undergoing reliability and field testing as the USJVP, DECC, and Remote Power System projects move into their latter phases.	+1,400
Dispatchable Power System Development	
■ Reduced funding for Solar Two, since testing will be complete; offset to some extent by an increase in funding for the USA Trough Project to develop advanced trough components.	-630
Advanced Component and System Research	
■ Increase for reflective materials, concentrator structural design improvements, and advanced power conversion systems in order to meet long-term cost goals of $0.04 to $0.06/kWh.	+970

	FY 2000 vs. FY 1999 (000)
Strategic Alliances and Market Awareness	
■ Increase includes additional analysis of domestic markets in order to take advantage of restructuring opportunities.	+110

Biomass/Biofuels Energy Systems - Power Systems

Mission Supporting Goals and Objectives

Program Mission

The Biomass Power Systems Program mission is to integrate sustainable biomass feedstock production with efficient biomass power generation to enable biopower to be a major cost-competitive contributor to power supplies in both domestic and international energy markets.

Program Goals and Objectives

By 2004, in collaboration with USDA, power producers, manufacturers, farmers, and foresters, the Biomass Program will have engaged in research and development activities to increase the viability of clean, efficient, biomass technologies for a variety of markets to achieve an additional 3,000MW of new biomass power capacity in the U.S., increasing the total to 10,000MW of domestic capacity. The program will benefit the American taxpayer by: helping to revitalize rural economies by providing jobs linked to renewable power production and co-products such as fuel, fiber, and feed; diverting biomass residues from the waste stream; and improving the environment in the near term through reduction in greenhouse gas emissions.

Significance of the Biomass Power Systems Program Goal to the Strategic Goal. Biomass Power Systems will be a major contributor toward meeting or exceeding the Solar and Renewable goal of doubling the renewable energy output by 2010. Biomass Power contributes to several of the objectives of the Energy Resources Strategic Goal in the DOE Strategic Plan.

Strategic Approach

Biomass is a local power solution with global benefits. The goal of the Biomass Power Systems Program is to develop and validate clean, efficient, renewable, biomass-based electricity generation technologies and operational systems with sustainable biomass supplies. We have three major energy technology thrust areas: 1) co-firing biomass with fossil fuels such as coal and natural gas, 2) small modular biomass power system and 3) advanced biomass gasification. We have begun a concentrated effort to demonstrate near-term benefits of modifying coal plants to allow 3% to 15 % of the fuel to come from biomass resources such as wood residues and from energy crops such as fast-growing willow trees. The Small Modular Systems Development Initiative will serve to bring viable biomass technologies into the global marketplace in the near term. Advanced gasification technologies are beginning to make a mark today, but will play a strong role in the longer-term. In addition, cost-competitive feedstock development and resource assessment are indispensable components of an integrated national biomass strategy. Increasing yield and decreasing production costs are critical to the penetration of biomass into the marketplace.

During the 20th century, our nation's economy has depended heavily on imported fossil fuels. Biomass —a renewable alternative—represents a tremendous, untapped, domestic resource for our energy future.

By investing in a bioenergy industry today, we can cultivate and harness these renewable resources to fuel our cars, power our homes and industries, and supply our chemical needs in the 21st century. The Department of Energy, along with other federal agencies and private partners, is launching a national partnership to develop an integrated industry to produce power, fuels, and chemicals from crops, trees, and wastes. By making a "ton of biomass" a viable market competitor to a barrel of oil or a railroad car of coal, this initiative will help grow the U.S. economy, strengthen U.S. energy security, protect the environment, and revitalize rural America. This effort will integrate the work from existing DOE R&D in transportation biofuels, biomass power and the Forest Products and Agriculture Industries of the Future programs to enable technologies that produce different combinations of fuels, power, chemicals and other products from different feedstocks in different areas of the country. It is only through the integration of these efforts that biomass will be an effective competitor to imported fossil fuels.

The program is expanding its focus to include a full complement of efficient biomass technologies, size ranges, and feedstocks (agricultural residues, wood residues, energy crops, etc.). The program is working to balance the research and demonstration efforts to most effectively advance the technology. Toward this goal, we are asking for increased support for thermochemical conversion research over the five-year period as we maintain support for large demonstration projects. We think that additional simulations and performance modeling in the laboratory will allow us to save time and money during field demonstration projects. To take advantage of additional feedstocks, we are beginning the Cooperative Agricultural Residues to Energy Initiative aimed at pairing animal producers, local energy producers (such as electric cooperatives), and state health, environmental and energy officials to develop projects which use animal manure or litter to produce power, making productive use of an environmental hazard. Increased focus on feedstock production, processing and handling is also necessary to advance biomass energy technology.

We remain committed to forging partnerships with other Federal agencies, communities, power generators, manufacturers, farmers and foresters to fully demonstrate sustainability of clean, renewable, biomass power. Although several of the technologies are nearing commercial viability, the Federal dollars help to reduce the risk that pioneer developers and power producers experience when initially using a new technology. Without the encouragement and support of the Biomass Power Systems Program, it's unlikely that clean and efficient biomass power would be produced in significant quantities.

Program Benefits

Metrics	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Qdads)	0.03	0.42	0.53
Energy Savings ($ Billions)	0.00	-0.15	-0.21
Carbon Displaced (MMTCE)	0.62	10.49	12.95

The primary energy displaced in 2010 will be enough to power 5.2 million U.S. homes, and 9.0 million homes in 2020.

The carbon reductions achieved are equivalent to removing 2.5 million vehicles from U.S. highways by 2010, and 11 million vehicles by 2020 (8% of today's total U.S. vehicles).

Performance Measures

FY 2000 Performance Measures

- Develop successful quantitative modeling tools to assist industry increase use of combustion and cofiring of biomass fuels and coal.
- The Biomass Power Systems Program will successfully complete engineering, installation and commissioning of the catalytic gas conditioning and compression system at Vermont's biomass gasification facility through partnerships with the private sector. Long-term operational testing of the gasifier will provide the forest products industry with performance data for implementation of these systems in that sector.
- Successful completion of the NIPSCO Bailly Cofiring demonstration will facilitate diffusion of biomass and coal cofiring throughout the industry.
- Assist the private sector in the selection of high-yield hybrid poplar clones and the production of cuttings (millions) for commercial planting.

FY 2001 - 2006 Performance Measures

- Complete successful demonstration of the benefits of integrated gasification combined cycle in Vermont which will have applications to the Forest Products and other industries as they implement capital replacement projects with advanced gasification technology power houses.
- Complete demonstration of prototype units for three high efficiency and low emissions small biomass gasification (or combustion) concepts integrated with modular power generating systems. These systems will be ready for diffusion and dissemination at national and international levels.
- Develop and demonstrate high yield short rotation plants and grasses for biomass power uses. For instance, successful high yield varieties of willows, poplars, and switchgrasses. In excess of 5,000 new acres of different high-yielding varieties will be planted by the private sector and used in power applications.
- Generate 2 GWe (0.05 Quads/y) from biomass and coal cofiring offsetting 4 million metric tons of fossil carbon per year.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

- Conducted critical and pioneering applied research, pilot testing, and feasibility studies in the areas of biomass combustion and biomass gasification, which provided the foundation for advanced and improved technology development. Examples include:

- Successfully reduced alkali metals in pyrolysis oils using fundamental understanding of alkali behavior gained from basic laboratory research and field measurements.
- Developed industry guidelines for direct combustion of high alkali biomass feedstocks.
- Successfully operated a small (200kW) gas turbine with biomass synthesis gas.
- Pioneering studies on overall emissions of biomass-based power systems that demonstrated "carbon closure."

FY 1998 Accomplishments

- Successfully demonstrated sustained operation of the Battelle/FERCO advanced biomass gasifier in Burlington, Vermont, at the McNeil Biomass Power Station.
- Initiate co-firing demonstrations with modifications started at two power stations.
- Completed feasibility studies for ten diverse small modular systems.

FY 1999 Planned Accomplishments

- Complete design and site preparation to begin gasifier construction in Minnesota for the MnVAP Biomass Power for Rural Development project.
- Complete design of power plants modifications for co-firing of Biomass with coal activities.
- Solicited and selected small modular systems for testing and demonstrations.
- Development of a technology roadmap for bioenergy technologies.

FY 2000 Planned Accomplishments

- Successfully demonstrate sustained operation of the total Vermont biomass system (gasifier, gas clean up, and advanced biogas turbine).
- Complete the power plant retrofit for co-firing switchgrass with coal in Iowa for the Chariton Valley Biomass Power for Rural Development project.
- Complete three projects which will be co-firing with biomass on a regular basis.
- Complete testing of two to three small modular systems.
- Complete resource database for biomass crops and residues.
- Complete laboratory testing of a fuel cell and 2 types of engines coupled with the lab-scale biomass gasifier.

FY 2001 - 2006 Planned Accomplishments

- Complete demonstration of two to three of the most promising Small Modular Systems Initiative projects.
- Complete the development of 2 high-yield woody biomass crop clones and release them to nurseries.
- Complete the Small Modular Systems Initiative with two to three small-scale biomass systems poised for rapid commercialization by the private sector.

- Complete all three Biomass Power for Rural Development projects with more than 100MW of new biomass power generating capacity.
- Complete development of 3 high-yield willow clones which increase yields by at least 20%.
- Complete the Co-firing Initiative with new facilities that were in the partnership. Facilities are co-firing biomass on a regular basis.
- Operate five or more successful demonstration projects with animal manure as a fuel for electricity production as part of the Cooperative Agricultural Residues to Energy Initiative.

Program Completion

Completion of the program is anticipated to be in 2008, depending on the state of adoption of the technology. Modest support for research and development to further increase efficiency and decrease emissions from biomass power plants may be important beyond this time frame.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Thermochemical Conversion	1,500	1,550	2,700	+1,150	+74.2%
Systems Development	21,017	26,350	32,150	+5,800	+22.0%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Thermochemical Conversion

- **System Integration Research** - This funding supports research on gas treatment/cleanup options to power highly

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
efficient, environmentally-benign small power systems which are needed in national and domestic markets. It also supports various demonstration efforts (e.g., Vermont gasifier) identified as critical to industry. The focus of this phase is the development of performance parameters for integrated gasification power producing systems. This funding level is based on sustaining a multi-year program as it moves into the testing phase at NREL Thermochemical User Facility. Thermochemical conversion research is the foundation of the Biomass Power Program and plays a key role in providing data for critical planning and decision-making processes. Efficient and cost-effective analysis produced in a laboratory setting enables the program to make sound decisions on technology prior to field demonstration and validation.	880	900	1,400
■ **Co-firing/Ash Deposition** - This effort conducts research to minimize problems related to the high alkali metal contents of many biomass fuels which can lead to fouling, slagging, and corrosion in conventional biomass furnaces and boilers, and in pulverized fuel utility boilers cofiring biomass and coal. Funding levels increase is to incorporate results from research on formation, evolution and reaction of chemical compounds in gasification and combustion environments into databases and models. This effort conducts research to minimize problems related to the high alkali metal contents of many biomass fuels which can lead to fouling, slagging, and corrosion in conventional biomass furnaces and boilers, and in pulverized fuel utility boilers cofiring biomass and coal. These research results are directly linked to the Department's performance measure for co-firing.	350	350	500
■ **Systems Analysis and Modeling** - The impact of a restructuring environment on technology development needs to be assessed. The level of NOx emissions will be modeled and verified. This activity leads to maximizing pollution reduction and minimizing the need for incentives.	270	300	600

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Capital Equipment** - Gas cleaning integration modules, conversion devices, and analytical equipment will be purchased in support of systems integration research. This equipment is essential to the laboratory as accuracy and precision in research are afforded by having up-to-date equipment.	0	0	200
Total, Thermochemical Conversion.	1,500	1,550	2,700
Systems Development			
■ Hawaii Gasification Project completion and close out.	600	0	0
■ The Vermont Gasifier Project will demonstrate a pilot-scale state-of-the-art gasifier combined with an advanced turbine, producing approximately 8-12MW of electricity from wood. Gasification vessel completed and tested (FY 1998). A hot-gas clean up unit will be installed and the integrated combined cycle gasification system will be operated for 1,000 hours at double the efficiency of direct-fired biomass units (FY 2000).	1,550	3,000	5,500
■ The three (3) Biomass Power for Rural Development Projects constitute a Presidential Initiative which began in 1996 that will demonstrate the sustainability of closed-loop energy crops. Specific program objectives include: 1) facilitate the transition from the use of residues to the integrated use of dedicated energy crops and residues; 2) facilitate the expansion of agriculture and its related infrastructure for large-scale energy crop production; and 3) invest in the stewardship of our air, water, and soil resource to produce electricity, goods, and services. It is predicted that by FY 2020, over 10 million acres of energy crops could be in place, supporting over 260,000 U.S. jobs.			
▸ Minnesota Valley Alfalfa Producers - The Minnesota 75 MW gasifier is fueled with alfalfa stems. This project demonstrates a modern biomass power system that will use alfalfa stems for 75 MW of electric power production			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

and will market the co-product of alfalfa leaves as animal feed. With the completion of the Engineering Design in FY 1999, construction begins in FY 2000. The funding level represents the DOE cost share. Funds are requested for the project to fulfill DOE commitments to the Minnesota Valley Alfalfa Producers (MnVAP) who have signed a power purchase agreement with Northern States Power. The plant is scheduled to open in 2001. Funds will ensure that this date is met.

- New York Willow Co-firing - The project is demonstrating and quantifying the environmental and economic benefits of cofiring willow and coal in existing power plants with several companies and farmer groups. In the year 2000, up to 600 acres of willow will be planted. Testing of cofiring willow and coal will be conducted and completion of retrofit of two additional coal plants. Funds are required to complete the planned effort in the year 2000. This will enable the timely completion of DOE commitments to the Salix Consortium.

- Iowa Switchgrass Co-firing - The project is working to establish switchgrass to generate up to 35MW of power by cofiring with coal. In the year 2000, up to 3600 acres of switchgrass will be planted. Retrofitted plant testing will begin. These funds will enable the timely completion of DOE commitments to the Chariton Valley Resource Conservation and Development, Inc.

  In the year 2000, these three projects will be in advanced stages of construction, planting, and testing at various facilities which require substantial government cost share. The level of funding is based on the scope of work as described above. 17,367 15,450 17,250

- **Co-firing Biomass with Coal Initiative** - Extensive testing and trials have shown that biomass can replace up to 15% of the total energy input in existing coal power plants, thus allowing a direct opportunity for carbon mitigation (an estimated 16-24 million metric tons of carbon in 2010), which

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
has been identified as the most cost-effective method of carbon mitigation for utilities. Biomass co-firing also reduces SOx, and potentially, NOx emissions. The DOE initiative will focus on increasing power producer knowledge and confidence through a series of cost-shared co-firing demonstrations in power plants. This initiative will work towards increasing co-firing capacity. In FY 2000, baseline data developed from retrofitting and testing activities at the four established sites will be used to extend the scope of the co-firing initiative to additional sites and to demonstrate sustained operations at selected sites. These research results are directly linked to the Department's performance measure for co-firing.	0	2,500	5,400
■ **Small Modular Systems Development** - Initiated 2-3 Phase II development projects and began implementation of projects. These funds will also bring to completion the DOE commitment to the previously awarded ten contracts to the developers of modular systems. Federal support is required to bring to commercial market readiness of biomass-based generation systems that will provide power in the range of electrical generation sizes of 5 kW to 5 MW for domestic and international markets. The development of these systems will be cost-shared. Funding is being provided for feasibility studies, prototype demonstration, and proceeding to full system integration and development of fully mature business strategies. Current global markets projections for these systems are in the range of 40 GW with an annual growth projection 4 percent per year. Increased funding is needed for the testing and demonstration of promising innovative prototype systems.	1,500	2,000	4,000
■ $750,000 is being allocated for the Plumas county ethanol project. The program is currently waiting contact by Plumas county. $1,000,000 is being provided for the demonstration of black liquor gasification; a competitive solicitation process will be conducted with an award being anticipated for the 3rd quarter of FY 2000. $300,000 for the Vermont methane energy production project has been forwarded to the Vermont			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
State Energy Office. $100,000 is being provided to evaluate the amount, distribution, and best method of extraction and utilization of methane gas from Sunrise Mountain Landfill in Nevada. Funds have been sent to the Nevada State Energy Office. $1,250,000 in funding for the Consortium of Plant Biotechnology has been forwarded to this organization.	0	3,400	0

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Thermochemical Conversion	
■ This increase is necessary to continue critical basic research in biomass combustion and gasification characteristics, especially relating to cofiring biomass with coal (a major near-term, low-cost market opportunity) and as applied to integrated gasification power producing systems. Funding level increase to incorporate results from research on formation evolution and reaction of chemical compounds in gasification and combustion environments into databases and models.	+1,150
Systems Development	
■ This increase is primarily to support the projects undertaken in the construction and testing of Biomass Power for Rural Development Initiative ($1,800,000) and the Vermont gasification systems ($2,500,000), the development of new small-modular biopower systems ($2,000,000), and includes the support of cost-shared utility scale cofiring demonstrations ($2,900,000), and the inclusion of earmarks in FY 1999 (-$3,400,000).	+5,800
ATS/Biomass for Cogeneration	
■ No change.	0

	FY 2000 vs. FY 1999 ($000)
Feedstock Development	
■ This program will require additional funding for testing of promising new hybrids developed by the program for grasses and Short Rotation Woody Crops specifically for biopower applications.	+800
Regional Biomass Energy Program	
■ The decrease in funding is based on the program's use of the existing infrastructure to deploy biomass technologies through cost-shared grants and activities with State energy offices and Federal and regional organizations.	-250
Total Funding Change, Biomass/Biofuels Energy Systems - Power Systems.	+7,500

Biomass/Biofuels Energy Systems–Transportation

Mission Supporting Goals and Objectives

Program Mission

The mission of the Biofuels Energy System–Transportation program, managed by the Office of Energy Efficiency and Renewable Energy's Office of Transportation Technologies, is to research, develop, and demonstrate cost competitive technologies for the production of liquid transportation fuels, in collaboration and partnership with industry, other government organizations, academic institutions, and others. In support of this mission, the program pursues the development of low-cost biomass energy feedstocks and cost competitive, highly efficient conversion technologies for liquid fuels production from cellulosic methods. Biomass feedstocks include agricultural residues (e.g., rice straw/husks, bagasse), forest wastes/residues, (e.g., sawdust, thinnings), and energy crops, i.e., trees and grasses grown specifically for use as energy feedstocks. Based on its near-term potential, the program focuses on the production of ethanol.

Program Goals and Objectives

For the ethanol program, production cost goals have been established. The goals provide the direction for the research and development activities supported by the program. By the year 2000, the goal is to demonstrate technologies, in partnership with industry, that are capable of producing ethanol at a cost of $1.13 per gallon (1996 dollars). This goal applies to green field facilities, although most of the demonstration projects currently under consideration are retrofits of existing facilities or add-ons to biomass power facilities, which significantly lowers the capital investment costs and results in an estimated ethanol production cost of $0.70 to $0.90. Currently, three highly leveraged partnerships to build ethanol demonstration facilities have been established. Each of these facilities is being financed with an 80 percent or higher private sector investment and a 20 percent or less DOE cost share. Additional partnerships will be established that will ultimately lead to the design and construction of cellulose-to-ethanol facilities. By the year 2004, at least three ethanol facilities will be in operation using biomass wastes, and a partnership with the corn ethanol industry will complete pilot-scale testing on ethanol production from corn stover. These partnerships are essential components for achieving our programmatic goals in a cost-effective manner.

Also in partnership with industry, the goal by the year 2005 is to demonstrate technologies capable of economically producing ethanol from energy crops, such as switchgrass. Since energy crop technologies complement various end use applications, funds are requested by both Biomass/Biofuels Energy Systems-Transportation ($5,500,000) and Biomass/Biofuels Energy Systems-Power Systems ($3,100,000). Under Biofuels Energy Systems the intent is to develop and demonstrate technologies capable of producing ethanol at a cost of $0.72 per gallon by the year 2010. To accomplish the program's cost goals and proceed beyond the first demonstration facilities, research, development and demonstration activities are conducted in accordance with integrated biomass feedstock and conversion systems. Energy cropping systems using the best varieties and management practices must be developed through breeding and reliable field testing in the different growing regions in the United States across a

wide range of sites and conditions. Once developed, these cropping systems will be capable of providing reliable biomass feedstock supplies for the production of fuels, chemicals, and electricity. Recent success with integrated crop systems in the Northwest obtained biomass production levels of over five times that of natural systems and serves as a model to develop the technology nationwide. Clones developed through DOE-funded research have led to the commercial deployment of 60,000 acres in the Northwest.

Specific areas within the conversion process (conversion of feedstocks to products such as ethanol) have been identified which offer the most significant opportunities for efficiency improvements and cost reductions. These areas include improvements in enzyme production and efficiency (so that less enzyme is needed), pretreatment methods that prepare the biomass for conversion to ethanol, and fermentation organisms to convert the range of sugars that can be found in the differing types of biomass materials. The program will also evaluate potential cost reductions based on possible co-products, including electricity and industrial chemicals. Biomass/Biofuels Energy Systems-Transportation and Biomass/Biofuels Energy Systems-Power Systems are conducting analyses of biomass resource availability in a coordinated fashion. Most of the research and development activities for feedstock and conversion improvements are conducted through the Department's national laboratories, using in-house capabilities, subcontracted researchers and facilities at universities, other government agencies such as the United States Department of Agriculture, and industrial scientists with the best expertise and experience.

The Biofuels Energy Systems-Transportation program is also exploring opportunities to produce renewable fuels for heavy vehicle use by supporting biodiesel production activities. These activities include research to lower the costs of biodiesel and the testing and development of new fuel formulations for heavy vehicle use. Niche opportunities for biodiesel are available in environmentally sensitive areas, such as underground mining, marine, and fragile ecosystems (e.g., National Parks). Diethyl ether (DEE) made from ethanol is a fuel that will also be evaluated for its application to heavy vehicle use. DEE's high cetane number and other fuel properties make it particularly attractive for heavy vehicle application.

The Regional Biomass Energy Program (RBEP), funded as a part of this Biofuels Energy Systems-Transportation program (with an additional $1,000,000 being requested by the Biomass Power program in the Office of Power Technologies) plays a significant role in technology deployment. RBEP, through its local and regional contacts, transfers current and reliable information on biomass development activities to potential users. This includes economic and technical information, as well as State and local regulatory, environmental, and market considerations for the production of fuels, chemicals, and electricity. Existing organizations, such as the Coalition of Northeastern Governors, Council of Great Lakes Governors, the DOE Atlanta Regional Support Office, the DOE Seattle Regional Support Office, and the DOE Denver Regional Support Office, serve as RBEP hosts and contacts for their respective regions in the United States.

Strategic Approach

During the 20th century, our nation's economy has depended heavily on imported fossil fuels. Biomass — a renewable alternative — represents a tremendous, untapped, domestic resource for our energy

By investing in a bioenergy industry today, we can cultivate and harness these renewable resources to fuel our cars, power our homes and industries, and supply our chemical needs in the 21st century. The Department of Energy, along with other federal agencies and private partners, is launching a national partnership to develop an integrated industry to produce power, fuels, and chemicals from crops, trees, and wastes. By making a "ton of biomass" a viable market competitor to a barrel of oil or a railroad car of coal, this initiative will help grow the U.S. economy, strengthen U.S. energy security, protect the environment, and revitalize rural America. This effort will integrate the work from existing DOE R&D in transportation biofuels, biomass power and the Forest Products and Agriculture Industries of the Future programs to enable technologies that produce different combinations of fuels, power, chemicals and other products from different feedstocks in different areas of the country. It is only through the integration of these efforts that biomass will be an effective competitor to imported fossil fuels.

A strong Biofuels program is consistent with the recommendations by many internal and external studies that have examined various DOE programs. For example, the PCAST report, and reports on actions to reduce global warming omissions, recommend increased funding for biofuels on the basis that biofuels constitute the most promising and reasonable supply-side alternative for reducing carbon emissions in the transportation sector.

The Comprehensive National Energy Strategy also encourages the deployment and development of advanced biofuels technologies to diversify our energy options, promote domestic rural economic development, and reduce carbon emissions in the transportation sector. A strategy cited DOE's Strategic Plan states, "In FY 2000, startup of a demonstration facility that converts low-cost waste biomass into ethanol at a production cost of $1.13 per gallon (1996 dollars) compared to $1.22 per gallon in 1996." The Office of Transportation Technologies' Strategic Plan identifies a biofuels milestone in 2001 as "pilot demonstration (of ethanol production) with wastes." The Biofuels Energy Systems-Transportation goals and strategies are consistent with the various levels of DOE strategic planning.

Program Benefits

Metrics	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.36	1.00
Energy Savings ($ Billions)	0.00	0.00	0.07
Carbon Displaced (MMTCE)	0.00	6.70	19.00
Oil Displacement (million barrels per day)	0.00	0.20	0.50

Performance Measures

FY 2000 Performance Measures

- Establish economic feasibility of enzymatic conversion of cellulose to ethanol (on site *Trichoderma reesei* production) at the bench scale.

- Select partner to demonstrate enzymatic conversion of cellulose to ethanol as an add-on to corn-to-ethanol facility.
- Establish partnership with equipment manufacturers and other groups for R&D of harvesting, handling, and storage alternatives for switchgrass.
- Ethanol production cost competitive in the oxygenate market for acid hydrolysis plants with shared infrastructure (e.g., colocated with biomass power plants) and with access to biomass feedstocks at less than $5 per dry ton.

FY 2001 - 2006 Performance Measures

- Select enzyme manufacturing partner to develop advanced cellulase enzyme system. (2001)
- In partnership with USDA, complete development of integrated equilibrium economics model for energy crops. (2002)
- Ethanol production cost competitive in the oxygenate market for acid hydrolysis plants with shared infrastructure (e.g., colocated with biomass power plants) and with access to biomass feedstocks at less than $10 per dry ton. (2003)
- Demonstrate 3-fold improvement (from 1998 base) of cellulase enzyme activity. (2004)
- Ethanol production cost competitive in the oxygenate market for enzyme hydrolysis plants with shared infrastructure (e.g., colocated with biomass power plants or corn ethanol plants) and with access to biomass feedstocks at less than $15 per dry ton. (2006)
- Begin development of enzymatic conversion technologies with appropriate industry partners. (2002)
- In partnership with USDA, complete development of integrated equilibrium economics model for energy crops. (2002)
- Begin commercial demonstration of softwoods to ethanol and electricity. (2003)
- Complete pilot testing of countercurrent pretreatment reactor with industry. (2003)
- Demonstrate 3-fold improvement (from 1998 base) of cellulase enzyme activity. (2004)
- Conduct pilot testing with ethanol partner for energy crop conversion. (2004)
- Begin small commercial scale demonstration of enzymatic process in collaboration with a corn-ethanol producer. (2005)
- Demonstrate first-of-a-kind switchgrass conversion to ethanol at a production plant. (2005)
- Demonstrate improved enzymatic hydrolysis technology at the pilot scale. (2006)

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

- Received the prestigious R&D 100 award for developing *Zymomonas mobilis*, a fermentation organism capable of converting 30% of available sugars to ethanol. (1995)

- Successfully operated the process development unit in an integrated continuous mode with an industry partner at the National Renewable Energy Laboratory's Alternative Fuels User Facility. (1996)
- Developed hybrid poplar clones in the feedstock development activity which have been planted commercially by industry on over 75,000 acres in the Pacific Northwest. (1997)
- Established a partnership with BC International for the first domestic biomass ethanol production facility in Louisiana. (1997)

FY 1998 Accomplishments

- Completed bench-scale development and formed partnership for converting softwoods to ethanol using dilute acid hydrolysis.
- Expanded switchgrass breeding activities and initiated a 20-acre research test to validate the yield and cost of switchgrass production.
- Collaborated with biomass power program to initiate a large scale switchgrass planting activity.
- Completed bench- and pilot-scale testing of converting sugar cane bagasse to ethanol.
- Completed separate competitive solicitations to develop advanced enzymes, to produce the next generation fermentation organisms, and to conduct bioethanol feasibility studies at corn-to-ethanol plants.

FY 1999 Planned Accomplishments

- Complete at least one feasibility study of corn-add-on facility for the conversion of cellulosic feedstocks.
- Establish partnership with timber industry, United States Forest Service, and local communities to evaluate environmental and social effects of watershed forest management to suppress forest fires through production of ethanol and electricity using forest thinning.
- Complete bench scale testing of rice straw conversion to ethanol.

FY 2000 Planned Accomplishments

- Successfully demonstrate conversion of agricultural waste to ethanol at a small commercial scale using a genetically engineered organism.
- Successfully demonstrated concentrated acid conversion of rice straw at a small commercial scale, integrated with byproduct recovery.
- Complete engineering feasibility of softwood feedstocks representative of Alaska, in collaboration with industry partners.
- Release new improved hybrid poplar clones for public use.

FY 2001 - 2004 Planned Accomplishments

- Complete pilot scale R&D of rice straw conversion to ethanol and electricity. (2001)

- Start up municipal solid waste-to-ethanol plant. (2001)
- Complete pilot scale R&D of softwood conversion to ethanol and electricity. (2002)
- Complete pilot scale testing of conversion technologies in cooperation with corn ethanol industry. (2003)
- Complete pilot testing of advanced fermentation organism with ethanol partner for energy crop conversion. (2004)

Program Completion

The program is anticipated to be completed in 2015, depending on the state of adoption of the technology. Modest support for research and development to further increase process efficiencies and reduce costs of producing biofuels from energy crops for transportation purposes may be required beyond this time frame.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Ethanol Production	25,027	35,950	37,441	1,491	4.1%
Biodiesel Production	800	750	1,000	250	33.3%
Feedstock Production	2,500	2,800	5,500	2,700	96.4%
Regional Biomass Energy Program	2,000	2,250	3,500	1,250	55.6%
Integrated Bioenergy Research and Development	0	0	6,000	6,000	>999.9%
Total, Biomass/Biofuels Energy Systems - Transportation	30,327	41,750	53,441	11,691	28.0%

Detailed Program Justification

(dollars in thousands)

FY1998	FY 1999	FY 2000

Ethanol Production

- **Advanced Fermentation Organisms R&D** - Research and development of advanced fermentation organisms to improve conversion process efficiency, including the development of *Zymomonas mobilis* with enhanced capabilities (FY 1998) and the development of organisms with increased stability, robustness, and ability to ferment mixed sugars from waste

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
feedstocks and the model energy crop switchgrass (FY 1999) to improve process efficiency and lower the cost of ethanol production from biomass.			
■ Testing of these strains at pilot scale and small scale commercial facilities will be completed to demonstrate reliable performance of these first generation organisms. Research and development of advanced (second generation) organisms, such as *Lactobacillus*, that can ferment additional biomass feedstocks with greater efficiencies will provide further cost reductions and the potential for expanding biomass ethanol applications. This funding level is considered appropriate based on extensive experience with laboratory and pilot scale operations and personnel costs.	1,960	2,200	3,000
■ **Advanced Cellulase R&D** - Analyses indicate that the production of ethanol, using enzymes for the breakdown of biomass materials to sugars for fermentation, is limited to a great degree by the high cost of enzymes. Research and development partnerships with enzyme producers will be established to provide more productive, lower cost cellulase systems. Collaborations with enzyme and biomass ethanol producers will be developed to accelerate the use of commercially-available cellulase systems. The funding level was determined based on cellulase colloquys with industrial experts and potential cost-sharing and program reviews..	2,455	4,547	5,500
■ **Pretreatment R&D** - Physical and/or chemical pretreatment of biomass facilitates enzyme and fermentation reactions, thereby improving process efficiency and lowering costs. An advanced pretreatment reactor, the countercurrent pretreatment reactor, was designed, fabricated and delivered to the National Renewable Energy Laboratory process development unit in FY 1998. In FY 1999, focus is on installation of the reactor system. In addition, bench scale testing of more cost-effective pretreatment technology options, with assessment of for softwoods feedstocks potential chemical co-products, will improve process economics of producing ethanol from forest thinnings.			

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
■ In FY 2000, shakedown and testing of the countercurrent reactor system will be completed and an industrial partnership will be established for commercial demonstration of pretreatment technology. Funding level is considered appropriate based on experience with operations and personnel costs and cost-sharing by industry partner.	1,960	2,800	5,508
■ **Consortium for Plant Biotechnology Research** - Seventeen grants were competitively awarded to University members in FY 1998 and fifteen awards were made in FY 1999 for basic research. The 50:50 cost-shared, long term R&D projects with The Consortium for Plant Biotechnology Research, Inc., (CPBR) for peer-reviewed, basic university research will not be continued in order to focus on more applied research activities that support program goals and objectives.	2,455	1,250	0
■ **Integrated Process Development** - In FY 1999, integrated bench-scale studies will evaluate the overall process and performance of softwood thinnings from private and public forests, including National Forests, in cooperation with industrial partners. Technologies for the coproduction of ethanol and high value products will be researched and developed by the Michigan Biotechnology Institute (MBI). DOE will provide $3,000,000 to MBI, in accordance with Congressional guidance.			
■ Integrated bench-scale and pilot-scale testing of the overall process (handling, pretreatment, fermentation) will evaluate performance, efficiency, and costs for conversion of agricultural waste feedstocks, such as rice straw. Softwood feedstocks, such as thinnings from private and public forests, will be tested at the NREL Biofuels User Facility/Process Development Unit, in support of commercial partners considering the production of ethanol and integrated co-products. Analytical studies will assess the process economic goals. The development of coproducts and by-product utilization will continue to provide a means for expanded technology demonstrations and lower ethanol production costs. Funding is considered appropriate based on standard cost-estimating practices implemented and validated at the laboratory (operations and personnel costs).	8,265	11,500	11,500

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
■ **Feasibility Studies** - Several cost shared feasibility studies were completed in FY 1998. Feasibility studies are an integral part of assessing the technical and economic viability of individual ethanol production facilities. Therefore they will be continued under the activity Cellulose-to-Ethanol Production Facilities, in FY 1999 and FY 2000.	841	0	0
■ **Cellulose-to-Ethanol Production Facilities** - Laying the groundwork for a broad-based cellulosic biomass-to-ethanol industry, cost-shared partnerships to design and construct ethanol production facilities are being developed. In FY 1998, an additional commitment to design and construct biomass waste-to-ethanol facilities was obtained. DOE's commitment for the BC International (BCI) project, initiated in FY 1997, was $4,000,000, with BCI cost-share of $27,600,000, or 87%. An additional $750,000 was included under Biomass Power for the Gridley, California project. A minimum 50% cost share was required from any partner entering into an agreement.			
■ In FY 1999, DOE's commitment with BCI for the Jennings, Louisiana plant will be completed, in accordance with Congressional guidance. An additional commitment with an industrial partner will be established, leading to the design and construction of an ethanol facility in Rio Linda, California. DOE share for the Rio Linda facility is $4,000,000, in accordance with Congressional guidance. An additional commitment with industry partners will be established, leading to the design and construction of commercial demonstration facilities in targeted areas of California and Alaska.			
■ In FY 2000, support of commitments established in fiscal years 1998 and 1999 will continue. Softwood pilot scale testing will accelerate deployment through continued support of integrated bench-scale enzymatic hydrolysis testing. Partnerships will be developed to demonstrate enzymatic conversion of cellulosic biomass to ethanol in support of the corn ethanol industry. Partnerships will also be established to demonstrate coproduction of ethanol at coal-fired power stations. Funding level is considered appropriate, providing minimum cost-share in some cases (20%) by DOE and are based on prior experience with these types of partnerships.	7,091	13,653	11,933
Total, Ethanol Production	25,027	35,950	37,441

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
Biodiesel Production			
■ **Biodiesel Production Technologies** - Based on a technoeconomic assessment, research and development will improve biodiesel process technology, using waste grease streams to lower production costs. In addition, improved oilseed production research and development will be conducted to lower biodiesel production costs. Working with industry, activities to facilitate market penetration will continue that will lead to increased biodiesel production and use. Funding level is considered appropriate and depends on cost-sharing to be successful. Research and development based on work involved and personnel requirements.	600	750	1,000
■ **Waste Oil Assessment** - An evaluation of the quantity, availability, and potential of waste oils as a transportation fuel was completed.	200	0	0
Total, Biodiesel Production.	800	750	1,000
Feedstock Production			
■ **Biomass Feedstock Development Centers** - Research will be conducted to develop economically viable model energy crops at integrated biomass feedstock development centers in the Pacific Northwest (poplars), Southeast (switchgrass), Midwest/Plains States (switchgrass and poplars) and Northeast/Lake States (willow). At these centers, breeding to select for higher yields and other desirable traits is linked closely with studies on management, physiology, growth-limiting factors, and advanced biotechnology. Field studies to evaluate nutrient effects on carbon sequestration and storage will be added to provide additional vital information on energy crops. Funding level determined from prior experience with work involved and makes use of experts at universities and U.S. Department of Agriculture over four regions of the U.S.	1,600	1,600	4,000

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
■ **Environmental Effects of Energy Crop Deployment** - Research to evaluate the effects of large scale deployment of energy crops on the environment, such as water and soil quality, chemical fates, and biodiversity will provide credible data that can be used to guide deployment in a manner that ensures energy and environmental benefits. Funding level is considered appropriate based on the level of effort which makes use of existing field sites.	400	225	225
■ **Energy Crop Seedling/Planting Stock Selection Research** - Advanced biotechnology and other methods will develop techniques that can be used to select energy crop seedlings or other planting stocks that are less susceptible to disease and/or pests, reducing the risk of mortality and increasing technical/economic viability. Desirable genotypes of switchgrass will be selected, propagated, and transferred to greenhouse/field tests to verify the selection process. Funding level is based on level of effort for this university project.	100	100	100
■ **Large Scale Woody Crop Plantation Research** - Research will be conducted to develop and evaluate management techniques to overcome the water use efficiency constraints in the Southeast. Technical assistance and cost sharing will be provided for existing large scale plantings in the Midwest/North Central region to obtain performance and cost data. Funding level was determined from level of effort needed to provide technical assistance by a laboratory expert for these large scale plantings and low level cost share.	150	125	125
■ **Switchgrass Variety Testing and Scale-up Research** - Switchgrass variety field tests are being conducted in the major growing regions of the U.S. Field trials established at five USDA National Plant Materials Testing Centers will evaluate newly developed switchgrass lines. Cost-shared 100-300 acre scale-up plantings of switchgrass will be evaluated to provide yield, operational issues, and cost data. Field tests and scale-up data will be collected and evaluated and field trials near waste-to-ethanol facilities/sites will be established. Funding level is considered appropriate based on level of effort, work scope and use of university and U.S. Department of Agriculture expertise and facilities.	200	500	500

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
■ **Feedstock Composition and Multi Product Use** - Altering plant composition to improve conversion efficiencies will provide potential benefits and cost reductions in the production of fuels, chemicals and electricity. The tailoring of plants so that all components of the plant can effectively be used to produce multiple products will provide potential cost reductions and broader opportunities for adaptation of feedstock production systems. Plant biotechnology research will be initiated, based on co-product potentials and strategies identified in FY 1999. Funding level is appropriate considering the work scope involved.	0	100	200
■ **Mechanization Research** - Mechanization systems for energy crops, to lower harvesting/handling costs, will address a major obstacle to the widespread use of energy crops. Cost-shared opportunities for switchgrass handling and storage, specifically as a means of improving the ethanol production costs, will be explored. Handling and storage systems for the use of agricultural residues to produce ethanol will be evaluated to improve costs and process efficiencies. Funding level was determined by work scope and requires cost sharing.	50	150	350
Total, Feedstock Production	2,500	2,800	5,500
Regional Biomass Energy Program			
■ **Regional Biomass Resource Activities** - Regionally-focused activities with State and local governments, together with industry will further develop the capability to produce and use biomass resources for multiple products. Funding level is determined based on extensive prior experience with this activity and cost share requirements.	1,650	1,650	2,000
■ **Biofuels Production Resource Activities** - Using the regional program infrastructure, support will be provided for cost-shared site studies for biofuels production facilities, including resource assessments and analyses of local, State, and regional nontechnical issues.			
■ The potential of biodiesel will be improved by testing new biodiesel fuel formulations to enhance fuel performance of high			

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
efficiency engines, in collaboration with the Office of Heavy Vehicle Technologies in the Office of Transportation Technologies, USDA, and the National Biodiesel Board. Funding level is considered appropriate based on work scope and prior experience in this activity plus cost share.	350	600	1,500
Total, Regional Biomass Energy Program.	2,000	2,250	3,500

Integrated Bioenergy Technology Research and Development

- Coordination and integration of biomass related activities are critical to the future economic viability of biomass based products such as fuels, chemicals, and electricity. Increased collaboration among industry partners, stakeholders, DOE programs, and DOE laboratories is resulting in converging opinions on an industry R&D agenda and will lay the foundation for accelerating the development and use of diverse bioenergy feedstocks and enhance their capabilities to produce a variety of products responsive to market demands, thereby increasing the prospects for a broad-based bioenergy industry in the U.S. A total systems analysis will be initiated, with industry participation, to support the goal of optimizing the integration of bioenergy feedstocks, equipment, and end products for biomass energy systems. High priority technologies and processes will be identified, based on this and previous analyses, and provide a road map of future bioenergy system R&D needs. Common linkages and synergies will be identified and applied between fermentation, gasification, and other biomass-related activities currently funded by the Department. Existing and planned technology development projects supported by the Department's Biofuels, Biopower, and Industrial Programs will be re-evaluated and enhanced to allow for integrated processing of diverse feedstocks and options for a variety of products. The funding level is based on previous experience with similar projects, anticipated laboratory in-house costs, data gathered from stakeholders and the level of effort required to accomplish program goals. 0 0 6,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Ethanol Production	
■ Conduct advanced fermentation organism R&D at the pilot and small commercial scale in partnership with industry.	+800
■ Increase support for advanced cellulase research, including collaboration with enzyme and ethanol producers to accelerate the use of commercially-available cellulase systems.	+953
■ Increase support for shakedown, testing, and commercial demonstration of the countercurrent pretreatment reactor that will substantially lower biomass conversion costs for ethanol and other products.	+2,708
■ Discontinue support for The Consortium for Plant Biotechnology Research activities, which are geared to basic research and no longer meet program goals.	-1,250
■ Decrease support for industrial partnerships in order to focus on the development of the countercurrent pretreatment reactor.	-1,720
Total, Ethanol Production	+1,491
Biodiesel Production	
■ Conduct research and development to improve biodiesel technology and lower costs of production.	+250
Feedstock Production	
■ Increase is to fully support feedstock development centers, scale-up research, and mechanization research for the production of fuels and coproducts, in collaboration with Biopower Energy Systems.	+2,700
Regional Biomass Energy Program	
■ Increase to support the conduct cost shared site studies for biofuels production facilities and regionally focused activities that will include fuel formulation testing to improve biodiesel performance.	+1,250
Integrated Bioenergy Technology Research and Development	
■ Facilitate development of the bioenergy industry vision and roadmap and fund highly leveraged R&D for highest priority technologies.	+6,000
Total Funding Change, Biofuels Energy Systems	+11,691

Wind Energy Systems

Mission Supporting Goals and Objectives

Program Mission

The mission of the Wind Energy Systems Program is to enable U.S. industry to complete the research, testing, and field verification needed to fully develop advanced wind energy technologies that lead the world in cost-effectiveness and reliability. This mission is an investment in assuring that the United States will fully capitalize on an industrial development opportunity that can create thousands of jobs for the Nation, while increasing domestic and worldwide use of a technology that provides substantial environmental and energy security benefits.

Program Goals and Objectives

The Wind Program has established the following goals as measures of success in accomplishing its mission:

- Enable U.S. industry to capture 25% of worldwide markets for wind energy by 2005 (sales of over 1,000 MW worth over $1 billion each year), and
- Achieve 10,000 MW of wind generating capacity in the United States by 2010 (approximately 1,850 MW on-line in 1998).

The following objectives support achievement of the Program's goals:

- By 1999, U.S.- based wind turbine certification agent established.
- By 2002, wind turbines capable of 2 ½ cents/kWh at 15 mph wind sites available from U.S. companies.
- By 2004, three U.S. companies competing in utility-scale wind turbine markets.

These goals are directly supportive of broader Departmental strategic plans and objectives. The year 2010 capacity goal is a key contribution to realizing the Department's Comprehensive National Energy Strategy goal to achieve 25,000 MW of non-hydroelectric renewable generating capacity by 2010. Without the wind energy contribution of 10,000 MW by 2010 supported by the Wind Program's proposed strategy, this objective is not likely to be achieved. Wind capacity additions provide an energy security benefit since the resource is indigenous and renewable. Wind energy capacity additions make significant contributions responding to environmental objectives such as global warming mitigation and clean air by displacing emissions from fossil-fueled electric generation sources. National economic development objectives are supported by increasing the United States' share of the rapidly growing global market for wind energy systems.

Strategic Approach

During the 1990s, wind energy has been the fastest growing source of energy in the world, increasing at a rate of over 25% per year. Capacity additions in 1998 of over 2,000 MW brought total worldwide installed wind generating capacity to 9,600 MW, with industry sales over $2 billion. Improvements in wind energy technology have substantially reduced costs and increased reliability over the last decade. As a result, numerous organizations including the Royal Dutch Shell Group, the World Energy Council, and the European Commission have issued statements affirming a strong future for wind energy. The growth in wind energy use will displace airborne emissions, increase energy security, and provide economic growth opportunities throughout the world.

Installation of wind power stations in Europe and developing countries has accounted for most of the recent worldwide capacity increase, with wind turbines supplied primarily by European companies. Wind power development in the United States is beginning to recover from several years of stagnation, with approximately 200 MW added in 1998 and several hundred more forecast for 1999. However, the future of wind energy in the United States is still highly uncertain as electric power markets deregulate and increase emphasis on low cost of energy production. Continued wind energy technology development is needed to close the cost gap between wind and fossil power generation to assure the viability of wind energy in new competitive power markets, and to allow U.S. technology to compete overseas.

Wind Energy: A New Cash Crop for the Midwest

This 107 MW wind power plant, located in farmland near Lake Benton, Minnesota, was the world's largest wind generation facility at the time of its completion in 1998 by Enron Wind Corporation. Enron has publicly credited their research partnerships with the Department as essential to the development of the technology making this wind plant possible. Enron's turbine manufacturing subsidiary, Zond Energy Systems Inc. of Tehachapi, California, partnered with the Department under its wind turbine research and field verification programs for the development of the Z-550, Zond's first commercial wind turbine. The technical assistance, testing capabilities, and utility operating experience made possible by the Department's Wind Program were critical to the successful development of Zond's Z-750 turbine used in the Minnesota project. Enron Wind Corp. has several hundred additional megawatts of wind power now under development.

Action must be taken now to help strengthen and expand the U.S. industry, or foreign wind turbine manufacturers are likely to continue capturing a vast majority of the domestic and worldwide wind energy business. The Wind Program's proposed plan is a recovery strategy for the U.S. wind industry that has resulted from numerous meetings with wind industry leaders, electric utility representatives, and the wind energy research community. The strategy, which includes several elements that are already underway in the Wind Program, will bolster the U.S. wind industry through an aggressive program of:

- Continued applied research to develop cutting edge tools and concepts for wind energy system design efforts, technologies to expand wind energy applications, and strategies to assure cost-effective wind plant operation.

This activity provides the fundamental technological underpinnings needed to support the Program's partnerships with industry for advanced technology R&D.

Outcome from core research activities will be carried further through R&D partnerships between government and industry to develop and test innovative components and subsystems for use in new turbine designs, and to attract new participants to the U.S. wind industry. The WindPACT (Wind Partnerships for Advanced Component Technologies) project will continue U.S. technological improvement beyond the next-generation turbines to pave the way for further U.S. technology cost reductions. These reductions, as well as the emergence of new companies in support of the year 2004 objective, will contribute to increasing U.S. market share by 2005, as well as lead to increased domestic deployment of wind energy in support of the 2010 capacity goal. Wind energy expertise and innovative concepts available only from the Wind Energy Systems Program are the key to WindPACT for developing advanced technologies and rapidly cultivating wind energy technology capabilities in companies new to the wind industry.

- Continued turbine research and field verification. The role of the Turbine Research activity is to provide an opportunity for U.S. industry to apply the technology breakthroughs and design tools from Applied Research in developing advanced technology wind turbines. This role is implemented through close partnerships between the Wind Program's National Laboratories and U.S. companies via competitively awarded, cost-shared subcontracts, typically with 20% to 30% industry share. U.S. wind turbine manufacturers are thinly capitalized and for the most part incapable of financing a major turbine R&D project without government support at the front end. As the project develops, the industry partner assumes more of the cost-sharing. Wind turbines that result from the Next Generation, Near Term, and Small Wind Turbine projects under Turbine Research are critical to fulfilling the Program's cost of energy, market share, and domestic capacity goals.

  Field verification is an essential component of the technology development cycle, and also assures performance is proven to investors and financiers. New technologies enabling use of wind energy in hybrid power systems will also benefit from field verification in prototypic remote applications. The financial resources required to complete research and development leading to advanced technology, fully proven wind turbine and hybrid systems have been well beyond what the U.S. wind industry could afford during times of stagnant and uncertain domestic markets. Federal support of such efforts allows U.S. industry to begin positioning for technological leadership now, rather than waiting to establish enough financial capability to independently undertake the R&D needed to, as a minimum, simply maintain competitiveness.

- Continued priority focus on enhancing U.S. wind turbine certification capabilities and providing U.S. participation in the development of international consensus standards for wind turbine design, testing, and operation. These efforts will ensure that U.S. industry can meet certification requirements of many worldwide market opportunities for wind energy on a level playing field with foreign competition, in support of achieving the year 2005 market share goal.

- Facilitated transition to restructured electric power markets in the United States through Federally supported analysis activities and partnerships with wind farm operators to characterize power systems integration considerations of wind project performance, and to explore strategies to improve wind energy acceptance by system operators, power marketers and aggregators, and customers. U.S. manufacturers and developers are just beginning to recognize and adjust to the requirements of the

restructured marketplace and have not yet operated projects in which factors such as ancillary services have come in to play. The Wind Program's planned efforts in this area will lead to expanded opportunities for wind energy in the United States needed to meet the goal of 10,000 MW installed wind capacity by 2010.

Program Benefits

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.02	0.21	0.61
Energy Savings ($ Billions)	0.04	0.52	1.76
Carbon Displaced (MMTCE)	0.39	3.52	10.05

By 2000, the annual amount of energy generated from wind in the United States will be equivalent to the annual electricity needs of over 800,000 average households.

Performance Measures

FY 2000 Performance Measures

- Three prototypes will be installed for field testing under the Small Wind Turbine project.
- A prototype cold weather wind turbine will be installed at the National Wind Technology Center for certification and long-term reliability testing.
- 2,300 MW of domestic wind generating capacity achieved.

FY 2001 - 2006 Performance Measures

- Three new small wind turbines and one cold weather turbine will be commercially available to compete in international markets.
- Next generation turbines will be in operation, capable of producing electricity at $0.025/kWh at sites with 15 mph annual average windspeeds.
- Two additional U.S. companies will provide utility-scale wind turbines, compared with one in 1999.
- U.S. industry will capture 25% of the world market for wind energy.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

- Advanced airfoils developed by the Wind Program have been adopted in three commercially available U.S. wind turbines, resulting in an increase in efficiency of up to 30% compared with

previously available blade designs. Several computational codes that are key to wind turbine design are now available or improved as a result of the Program's core R&D efforts.

- Zond Energy Systems' emergence as the leading wind turbine manufacturer in the United States followed successful collaborative efforts with Wind Program through a Turbine Research partnership formed in 1993, and a continuing partnership under the Turbine Verification Program. Zond, now the turbine manufacturing subsidiary of Enron Wind Corporation, publicly recognizes the critical technical contributions made by the Wind Program to the success of their technology.

FY 1998 Accomplishments

- Completed field experiment at the National Wind Technology Center (NWTC) to obtain detailed aerodynamic and structural measurements on an operating wind turbine rotor.
- Initiated two new cost-shared projects with host utilities for field verification of advanced wind turbine technologies.
- Obtained National Wind Technology Center accreditation for performing testing in compliance with International Standards Organization (ISO) requirements.

FY 1999 Planned Accomplishments

- Complete validation of advanced wind turbine design codes for application to extremely lightweight, flexible designs.
- Complete installation of prototype wind turbine under Near Term Research and Testing project, and begin field testing.
- Establish a U.S.-based wind turbine certification agent.
- Competitively select at least five distributed power field verification projects using smaller (≤ 100kW) wind turbines.

FY 2000 Planned Accomplishments

- Complete testing of the highly instrumented aerodynamics research turbine, previously tested at the NWTC, in the NASA Ames Research Center's 80 by 120 foot wind tunnel to establish steady inflow baseline performance data.
- Complete Near Term Research and Testing project.
- Complete first year of operation of five distributed power field verification projects using smaller (≤ 100KW) wind turbines.
- Operate utility-scale wind farms in eight additional U.S. states, compared to five at the beginning of 1998.

FY 2001 - 2004 Planned Accomplishments

- In 2001, the Small Wind Turbine and Cold Weather Turbine projects will be complete. In 2003, the Next Generation Turbine project will be complete.
- Cooperative Research and Testing - In 2002, at least one regional wind monitoring network will be in operation.

Program Completion

Success of the Wind Program will be gauged by completion of year 2005 and 2010 goals. In 2005, if the United States has achieved a 25% share of the world wind energy market, the program will transition away from aggressive technology development activities, and into a reduced maintenance level, providing industry unique services such as certification testing, support for resolving crosscutting issues in the industry (such as power systems integration studies), and research to improve and maintain the analytical tools needed by industry for their own technology development activities. If the capacity goals of 2010 are achieved, then an evaluation will be conducted to determine the appropriate level, if any, for continued Federal support for the U.S. wind industry.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Applied Research	11,101	10,700	13,500	+2,800	+26.2%
Turbine Research	13,000	16,400	20,200	+3,800	+23.2%
Cooperative Research and Testing	8,027	7,671	11,900	+4,229	+55.1%
Total, Wind Energy Systems	32,128	34,771	45,600	+10,829	+31.1%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Applied Research

- The core research element of Applied Research focuses on advancing the U.S. wind energy technology base through research, testing, and analysis on the complexities of wind and how it interacts with wind turbine rotors, how wind turbine structures and materials react and withstand the forces of wind over time, and how all parts of wind energy systems - blades, drivetrains, generators, power convertors, control systems, and towers - can be optimized for cost effectiveness and reliability. These efforts culminate in improved computational codes for wind turbine design, and identification and verification of improved wind turbine design features. Industry has relied on the Department and its laboratories for this type of research because individual

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
industry members are under-capitalized, have had little research capability, and are focused primarily on developing products. The funding level requested is based on historical experience in planning and managing numerous core research projects, and will support core research in aerodynamics, wind characteristics and forecasting, structural dynamics, and advanced components, such as adaptive blades and direct drive variable speed generators, to provide breakthrough technologies to improve cost/performance of wind technology. Field testing will be conducted at the National Wind Technology Center to further understandings of ambient inflow, turbulence, complex terrain, and rotor dynamics, leading to improved wind turbine design tools. Activities under the core research component of Applied Research are consistent with the recommendations of the President's Committee of Advisors on Science and Technology (PCAST) report on energy research and development to support research on computational fluid dynamics, light weight adaptive structures, advanced control systems, variable speed and direct drive generators.	8,801	8,600	8,000
■ Promising research ideas and concepts generated in Applied research activites will be further developed and tested by a joint team of industry and laboratory researchers under a new activity, Wind Partnerships for Advanced Component Technologies (WindPACT). Two to three R&D subcontracts will be competitively selected to explore potential concepts such as light-weight and direct-drive generators, flexible and articulated rotors, feedback controls for load alleviation, and high efficiency power converters. WindPACT will provide the avenue needed to continue transfer of technology from the Program's core research activities to industry, beyond what will occur in the next-generation turbine efforts. The added technology advancement will contribute to entry of additional U.S. wind companies with leading-edge, highly cost-effective			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
products making a contribution to meeting the program's 2005 25% world market share goal, as well as the 2010 domestic capacity goal. The funding requested will support an appropriate level of laboratory effort to bring two to three candidate technology concepts to the stage of development needed to then initiate competitively selected multi-year industry partnerships.	0	0	3,000
■ The Wind Program relies on universities (including Historically Black Colleges and Universities (HBCUs) and Hispanic Educational Industries) to provide new theories and concepts for improved wind technologies. Funding requested is required to support a new competitive solicitation for advanced aerodynamic modeling codes, wind turbine controls research, and to continue materials research with Montana State University in coordination with the Office of Science (formerly the Office of Energy Research).	1,000	1,100	1,000
■ Applied Research also includes R&D for technologies that enable wind to be used in stand-alone, hybrid power systems. The combined use of wind turbines with diesel generators and other renewables and storage systems is a potentially major market for U.S. technology. The major research issue is design of a control system to allow the diesels to be turned off when possible to reduce overall consumption of diesel fuel. In addition to control systems R&D, the Program is supporting a control system field verification project in Alaska, with approximately 60% of project funding provided by sources other than the Department. The requested funding level is based on the anticipated laboratory in-house, consultant, and hardware costs for completing testing of a new wind hybrid power system, with an industrial partner, using the NWTC wind/hybrid test facility. The funding will also continue support of hybrid wind projects in Alaska, and evaluation of commercial control systems at the NWTC hybrid power test bed and at the USDA research facility in Bushland, Texas.	1,000	700	1,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Avian concerns can pose a significant challenge to siting and operation of wind turbines. For this reason, continued research is needed to identify mitigation measures that would reduce adverse impacts that might otherwise occur, and to provide guidance for appropriate siting of wind facilities. The requested funding level is based on requirements for supporting laboratory in-house costs, and initiation of a subcontracted control study of avian impacts at an operating wind facility.	300	300	500
Total, Applied Research.	11,101	10,700	13,500

Turbine Research

■ The Next Generation Turbine project is the Wind Program's primary investment in achieving a cost of energy from wind of $0.025/kWh by 2002. This project is focused on completing research and development with two industry partners leading to state-of-the-art utility scale (500kW - 2MW) wind turbines. Requested funding is based on projected spending for the two cost-shared industry subcontracts (30% industry share), and will support component qualification testing and final design of engineering and manufacturing development turbines.	5,000	3,100	8,000
■ Conduct Near Term Research and Testing project to support U.S. industry in reducing costs, enhancing reliability, and obtaining certification for wind turbines targeted for near-term markets. The funding level requested is based on projected spending requirements for one subcontract and will support final design and field testing of a 750 kW prototype turbine, and completion of the project.	2,000	3,600	400
■ Conduct Small Wind Turbine projects to assist U.S. industry in research and development of wind turbines in the 8-40 kW range for stand-alone, remote, hybrid, and home/farm power applications. The requested funding level is based on spending projections for three subcontracts, and will support completing installation and beginning field testing of three small wind turbine prototypes.	500	700	1,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The Wind Program will take the lead in completing prototype development, testing, and field verification for the Cold Weather Turbine project, targeted for locations such as Alaska and the South Pole, as the third phase of a Small Business Innovation Research effort begun by the National Science Foundation and the National Aeronautics and Space Administration. The project will employ direct-drive generator technology developed under the Wind Program's Next Generation Innovative Subsystems project to be completed in FY 1999. The requested funding level is based on projected spending for one industry subcontract, and will support completing research and development for the cold weather turbine prototype, and initial testing at the National Wind Technology Center and a location in Alaska.	0	300	800
■ The supporting research and testing element of Turbine Research assures that industry's wind turbine R&D efforts take full advantage of the Wind Program's technology developments, and provides resources to conduct testing and analysis otherwise unavailable to industry. Field verification of new wind turbine technologies serves a vital function in Turbine Research by continuing close technical support through industry's initial installation of turbines in actual utility operating environments. Further, field verification projects provide an avenue for accelerating the regional diversification of wind energy by supporting installation of advanced wind technologies in several new areas across the Nation. Funding requested for supporting research and testing is based on previous experience with the level of support needed for Turbine Research and Turbine Verification Program activities, and the industry and utility cost-sharing level of 20% to 75%. The funding will support design review, analysis and testing services needed for several new on-going Turbine Research subcontracts with industry. In addition, field verification projects will be initiated that will be tailored to satisfy specific regional needs. Technical and data analyses support will be continued for ongoing Turbine Verification Program projects as well as for smaller wind turbine field verification projects initiated in FY 1999. ...	5,500	8,700	10,000
Total, Turbine Research.	13,000	16,400	20,200

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Cooperative Research and Testing			
■ Cooperative Research and Testing will provide support to the U.S. wind industry, focused through the National Wind Technology Center, in resolving near-term technical problems and providing technical support for competing in world markets. The requested funding level is based on past experience in the level of support needed to complete activities that assist the U.S. wind industry in resolving near-term technical problems and enhancing technology transfer, providing technical support for the U.S. manufacturers competing in world markets, and supporting domestic field verification projects such as the Navy wind project on San Clemente Island, and estimated cost-sharing of 50%.	3,600	1,500	3,000
■ Initiate a new cooperative effort with industry, Hybrid Systems for Village Power, that will follow from the ongoing hybrid field verification projects in Alaska and provide additional opportunities for field verification of new wind hybrid power systems technologies developed under Applied Research. This project will verify and improve technologies that enable reducing fuel use and emissions at existing stand-alone diesel power systems in Alaska and other States, U.S. trust territories, Native American communities, and in many overseas remote applications. The requested funding level is based on the Wind Program's previous experience with the cost of similar field verification and hybrid systems projects. Two to three projects will be competitively selected and cost-shared by the local utility and/or village.	0	0	2,500
■ Continue support for developing international consensus standards for wind turbine design, and the establishment of wind turbine certification capability in the United States. Both of these activities are essential to maximizing U.S. industry's prospects for international sales, and thus increased market share. The requested funding is based on anticipated laboratory in-house costs, consulting and equipment costs for internationally-accepted standards			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
activities and continued certification program development and testing for the newly established U.S. based wind turbine certification agent.	2,000	3,371	2,500
■ The Wind Energy Systems Program seeks to competitively fund the startup and infrastructure costs of a voluntary Wind Performance Monitoring Network in the Midwest in which the operator would become self-supporting after the initial startup. The result of this effort will be verifiable data on long term performance of these new wind projects, especially concerning ancillary service requirements, and strategies to accelerate the use of wind energy by wind developers, power marketers, renewable and other power aggregators and power system operators. The Wind Performance Monitoring Network is vital to the overall Wind Program effort to study and understand the integration of wind energy into the electric power systems to facilitate utility sector acceptance. As a high capital cost, low fuel cost option, wind energy is currently at a disadvantage in the restructured marketplace that favors low capital, low fuel cost options such as natural gas. In addition, the rules of the emerging marketplace require that each generating project pay for its share of costs related to transferring power to point of use and providing a secure system. FERC calls these costs 'ancillary services' and requires a generator to provide or acquire them. Also, the variation of the wind resource across a region is critical to determining the value of wind energy in the new competitive marketplace. The requested funding level is based on laboratory in-house costs for on-going studies and to initiate the wind monitoring network.	1,127	1,500	2,600
■ Continue operation of the National Wind Technology Center operations to maintain world class research and testing capabilities and facilities for the U.S. wind industry. The requested funding level is based on requirements for laboratory site support staff, contractors and equipment.	1,300	1,300	1,300
Total, Cooperative Research and Testing	8,027	7,671	11,900
Total, Wind Energy Systems	32,128	34,771	45,600

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Applied Research	
■ The increase supports the Wind Partnerships for Advanced Component Technologies project which will develop 2-3 innovative concepts in the laboratory, and competitively select industry partners for further development. . .	+2,800
Turbine Research	
■ The increase supports planned higher spending on next generation turbine subcontracts in FY 2000 as these efforts enter a peak period of engineering development and hardware procurement.	+3,800
Cooperative Research and Testing	
■ The increase supports Hybrid Systems for Village Power project and a Wind Monitoring Network in which several new partners will be competitively selected to carry out field activities for these projects.	+4,229
Total Funding Change, Wind Energy Systems	+10,829

Renewable Energy Production Incentive

Mission Supporting Goals and Objectives

Program Mission

The mission of the Renewable Energy Production Incentive (REPI) is to encourage the acquisition of renewable energy generation systems by state and local governmental entities and non-profit electric cooperatives. For these tax-exempt owners of new renewable energy generation systems, REPI provides financial incentives that are comparable to the value of either production tax incentives or investment tax credits that are available to the private-sector owners of certain types of new renewable energy generation systems. For comparability, new renewable energy generation systems that use solar, wind, geothermal, or closed-loop biomass technologies receive priority for REPI payments over systems that use allowable open-loop biomass technologies. Each qualified facility, first operated in the fiscal year 1994-2003 time frame, is eligible for incentive payments for the net electricity produced during the first 10 fiscal years of its operation, subject to the availability of annual appropriations.

Program Goals and Objectives

A major goal in the annual budget request for REPI is to provide financial incentives for public entities that acquire new renewable energy generation facilities that are comparable to the tax incentives that are available to the private sector. In order to accomplish this goal and to maintain a balanced portfolio for the Solar and Renewable Energy account, full incentive payment funding is planned for all new qualified facilities that use solar, wind, geothermal, and closed-loop biomass technologies. A lesser level of payments is planned for new qualified facilities that use open-loop biomass technologies.

Strategic Approach

Both the Department's Strategic Plan and the Comprehensive National Energy Strategy have a goal of doubling the non-hydroelectric renewable energy generating capacity by 2010. The portfolio of renewable energy research and development programs is improving the performance and reducing the cost of these technologies. However, temporary government support, as envisioned in the report of the President's Council of Advisors on Science and Technology, is needed to facilitate the demonstration and use of these technologies. REPI provides this temporary financial support to the non-Federal public sector. This financial support is comparable to the value of tax incentives that are being provided to the private sector for the near-term acquisition and operation of solar, wind, geothermal, and closed-loop biomass generation systems.

Program Benefits

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.02	0.10
Energy Savings ($ Billions)	0.00	0.05	0.25
Carbon Displaced (MMTCE)	0.09	0.33	1.43

Performance Measures

- FY 1998 appropriations provided incentive payments for qualified facilities that generated approximately 460[a] million kilowatt-hours in fiscal year 1997.
- It is anticipated that REPI will annually facilitate the addition of new qualified facilities to the program through fiscal year 2003 with these facilities producing approximately one billion kilowatt-hours of electricity in fiscal year 2003.

Significant Accomplishments and Program Shifts

FY 1998, FY 1999, and FY 2000 appropriations will be sufficient to make production incentive payments for all of the electricity generated by qualified facilities which use solar, wind, geothermal, or closed-loop biomass technologies. Only a portion of the electricity produced by qualified facilities which used open-loop biomass technologies will receive incentive payments, determined by the availability of remaining appropriated funds.

Program Completion

The last fiscal year of electric production that is eligible for payments under this program is FY 2012. Therefore, production incentive payments using FY 2013 appropriations, if provided, will be the final planned activity for this program.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Renewable Energy Production Incentive	2,954	4,000	1,500	-2,500	-62.5%
Total, Renewable Energy Production Incentive	2,954	4,000	1,500	-2,500	-62.5%

[a]The change from 570 to 460 is due to a recent discovery by the Golden Field Office of an error in computations by the applicant of the program's largest qualified facility.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Annual Production Incentive Payments			
■ Payments will be provided to the owners of approximately 25 qualified facilities at the rate of about $0.017/kWh. Make full production incentive payments for all the electricity produced by qualified facilities that use solar, wind, geothermal, or closed-loop biomass technologies. This provides comparability to tax incentives provided to private sector owners of similar systems. Payments for only a small portion of the electricity, on a pro rata basis, will be made to owners of facilities that use open-loop biomass technologies.	2,954	4,000	1,500
Total, Renewable Energy Production Incentive	2,954	4,000	1,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Renewable Energy Production Incentive	
■ The decrease is due to shift of funds to higher priority R&D activities. Since comparable incentives are not provided to private sector owners of these systems, provide a lesser level of incentive payments to qualified facilities that use open-loop biomass technologies.	-2,500
Total Funding Change, Renewable Energy Production Incentive.	-2,500

Solar Program Support

Mission Supporting Goals and Objectives

This budget category consists of two components: Electricity Restructuring and Competitive Solicitation. Each is discussed individually below.

Program Mission

Electricity Restructuring - The mission of the Electricity Restructuring program is to provide unbiased technical assessments to Federal and State officials of utility restructuring issues relating to renewable energy and energy efficiency. The assessments will help decision makers at the Federal and State levels both develop and coordinate utility restructuring regulations and legislation to ensure suitable policy and market mechanisms for renewable energy and energy efficiency.

Competitive Solicitation - The mission of this program is to obtain, analyze, and disseminate essential cost and operational information necessary to overcome the perceptions of risk in selecting renewable energy and hybrid renewable energy generation/cogeneration systems for use in the competitive electric market.

Program Goals and Objectives

Electricity Restructuring - The goal of Solar Program Support is to assist State, regional, and Federal agencies in developing utility restructuring concepts for energy efficiency and renewable energy technologies and programs. A key objective is to assess the costs and benefits of renewable portfolio standards, public benefits funds, consumer information and disclosure provisions, green marketing programs, distributed generation concepts, and other policy and market mechanisms for energy efficiency and renewable energy technologies in restructured utility markets. Another objective is to provide unbiased information and materials to State, regional, and Federal decision makers on the costs and benefits on utility restructuring concepts for energy efficiency and renewable energy technologies and programs. Also, to assist in the coordination of Federal, regional, and State agencies in the implementation of utility restructuring legislation and regulation for energy efficiency and renewable energy technologies and programs following enactment of Federal legislation.

Competitive Solicitation - Through a technology-focused and competitive process, carry out targeted field validation efforts that simultaneously: 1) prove the availability of clean, affordable, and reliable electric power supply options for many remote and/or economically challenged regions of the Nation; and 2) obtain essential data on operational performance, reliability, and benefits of renewable energy and hybrid renewable energy generation/cogeneration systems in various geographic locations and climatic conditions.

The objectives from this effort will be to make information resulting from these validation efforts available, in easy-to-understand format, to decision makers considering additional or replacement power generation systems; and substantially contribute to the achievement of tripling renewable energy

generation capacity (non-hydroelectric) in the U.S. by 2010, consistent with both the Department's Strategic Plan and the Comprehensive National Energy Strategy.

Strategic Approach

Electricity Restructuring - The Electricity Restructuring Program seeks to inform state energy and environmental policy officials about the potential effects of utility restructuring policies and regulations on the development and deployment of renewable and energy efficiency technologies and programs. This is accomplished through technical analysis and assistance to key state officials on policy and market based mechanisms for supporting renewable and energy efficiency technologies in competitive utility markets.

The program accomplishes this mission by sponsoring technical analysis and outreach to disseminate findings quickly and cost effectively. The program establishes partnerships with State, regional, and national organizations that have roles in utility restructuring legislation and regulation.

The program is critical to the future of energy efficiency and renewable energy technologies in restructured electricity markets. Federal electricity restructuring legislation is pending. Some States have implemented electricity restructuring legislation and/or regulations, others have not. There is no national effort, other than this program, aimed at achieving better Federal-State coordination on electricity restructuring and energy efficiency and renewable energy technologies and programs.

Competitive Solicitation - Competition resulting from the restructuring of the electric utility industry will favor the selection of systems with low first costs over systems with higher first costs, but comparable or lower life-cycle costs. From a risk perspective, energy providers will also select advanced generation technologies that have evolved from familiar fossil-fuel technologies, which have had long service lives and high levels of reliability and scheduled availability. Emerging generation technologies, such as renewable energy, are at a market selection disadvantage due to the lack of comparable cost and operational information. This multi-year program is directed at obtaining vital cost and operational information for a wide variety of systems in various sectors (including Federal facilities and Native American localities) and various geographic regions. By 2004, the program will have completed planned funding of cost-shared field verification projects for renewable energy and hybrid renewable energy generation/cogeneration systems.[a]

The portfolio of renewable energy research and development programs is improving the performance and reducing the cost of these technologies. However, reports such as that by the President's Council of Advisors on Science and Technology indicate that R&D alone is not sufficient to launch new technologies in the market. Among the substantial market barriers discussed in this report are the perceptions of risk with new emerging technologies, such as renewable energy generation. To address these perceptions of risk, this program funds a spectrum of cost-shared field verification projects in various geographic regions to obtain the needed cost and operational information for these renewable energy systems.

---

[a]Hybrid systems could include combinations of renewable energy generation technologies, integrated renewable energy/energy storage systems, and integrated systems utilizing renewable energy and fossil fuels (such as natural gas or coal).

The Competitive Solicitation program is designed to combine the various activities previously conducted under two separate line items (the Renewable Indian Energy Resources and Federal Buildings/Remote Power programs) into a single, integrated effort that provides highly cost-shared competitive awards to projects selected across a diverse range of geographic locations. A deliverable requirement is 3 years of operational information on field verification projects, including the amount of electric generation and system outage information, if any.

The program is composed of three competitive components: systems benefitting Native Americans, systems benefitting Federal facilities, and systems that would be selected in an open portion of the solicitation. Cost-sharing requirements for all work would be in the ratio of 3 non-DOE dollars to each DOE dollar of funding for systems benefitting Federal facilities and systems selected under the open portion.

For systems benefitting Native Americans, the cost-sharing of 25 percent or greater per DOE dollar of funding would be encouraged. Where feasibility studies are funded, the same cost-sharing goals apply. For systems benefitting Federal facilities, the provisions of Executive Order 12902, "Energy Efficiency and Water Conservation at Federal Facilities" will be applied. Since this Executive Order requires comprehensive facility audits, the funding of feasibility studies will not be required to ensure a viable pool of field verification projects. These projects will be competitively selected under a process managed by the Department's Federal Energy Management Program. The other two categories (systems benefitting Native Americans and systems selected under the open portion) will be administered through a competitive financial assistance process. In order to ensure a viable pool of field verification projects over the time frame of this program, a portion of the funding for these categories in FY 2000 will be used for cost-shared feasibility studies. These studies will address the economics, needed licenses and permits, and potential environmental issues for the proposed field verification project.

Assuming level funding over the six-year life of the Competitive Solicitation program, up to 200 field verification projects utilizing renewable energy will be installed in various locations across the Nation (the actual number of projects depends upon the size and cost of projects selected from the annual competitions).

Program Benefits

Metrics	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.00	0.00
Energy Savings ($ Billions)	0.00	0.00	0.00
Carbon Displaced (MMTCE)	0.01	0.06	0.06

Although the primary purpose of this program is field verification of various power generation systems that utilize renewable energy technologies, the impact upon the lives of those receiving the electricity from these systems is not insignificant. In fact, once all the projects are completed these systems will produce the amount of electricity needed to power more than 22,500 homes across the Nation.

Performance Measures

FY 2000 Performance Measures

Electricity Restructuring

- Increased consistency between State and proposed Federal legislation in the key parameters for renewable portfolio standards, public benefits funds, net metering programs, and consumer information and disclosure provisions.
- Increased number of publications, technical analyses, and presentations for State officials on electricity restructuring issues.
- Increased level of understanding by State officials on electricity restructuring issues as demonstrated by State policy decisions to support public benefit mechanisms.
- Development of at least two regional market strategies, indexes, for energy efficiency technology deployment and effectiveness measurement techniques for use by States in their restructuring legislation and regulations.

Competitive Solicitation

- Not applicable - new program in FY 2000. See Planned Accomplishments for projected FY 2000 achievements for this program.

FY 2001 - 2006 Performance Measures

Electricity Restructuring

- Increased number of information publications, materials, industry web site access, conference presentation over FY 2000.
- Development of two additional regional market strategies for energy efficiency technology deployment.
- Legislation enacted by all States consistent with proposed Federal electricity restructuring legislation requirements for public benefits.

Competitive Solicitation

- The six year program will result in at least 100 cost-shared field verifications of renewable energy and renewable energy hybrid generation/cogeneration systems of various system configurations for various geographic regions.
- The direct savings of the systems should be approximately $4,500,000 annually in energy costs. Indirect savings will be substantially higher; the cost and operational information from these systems will address the market perceptions of risk in the selection of these systems and thereby facilitate the selection of similar systems.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

Electricity Restructuring

- No program funds available.

Competitive Solicitation

- No program.

FY 1998 Accomplishments

Electricity Restructuring

- No program funds available.

Competitive Solicitation

- No program.

FY 1999 Planned Accomplishments

Electricity Restructuring

- Funding for this program was appropriated through Solar Program Direction.
- Reports on the impacts and implementation policies of State restructuring legislation and regulations on renewable and energy efficiency technologies.
- Two regional workshops on electricity restructuring issues.
- Technical assistance on electricity restructuring issues provided to States, individually.
- Technical assistance to State organizations on electricity restructuring issues.

Competitive Solicitation

- No program.

FY 2000 Planned Accomplishments

Electricity Restructuring

- Reports on the impacts and implementation policies of State restructuring legislation and regulations on renewable and energy efficiency technologies.
- Two regional workshops on electricity restructuring issues.
- Technical assistance on electricity restructuring issues provided to Sates, individually.
- Technical assistance to State organizations on electricity restructuring issues.

Competitive Solicitation

- Competitively aware approximately 1-25 field validation projects and initiate development of same. Selected projects will reflect a range of technology applications and a diversity of geographic locations and climate conditions.

FY 2001 - 2004 Planned Accomplishments

Electricity Restructuring

- Reports on the impacts and implementation policies of State restructuring legislation and regulations on renewable and energy efficiency technologies.
- Two regional workshops on electricity restructuring issues.
- Technical assistance on electricity restructuring issues provided to States, individually.
- Technical assistance to State organizations on electricity restructuring issues.

Competitive Solicitation

- A sufficient range of 100-200 highly leverages (a minimum of 50% cost-share is required except in the Native American component which requires 25%), competitively-awarded projects would be funded under this program. Projects would be selected based upon criteria ensuring technology and configuration variety, high value of data to be received, and geographic/climate diversity. Such a diverse array of projects operating under a range of conditions is essential in order to reduce the perceptions of risk surrounding the development of power generation facilities that utilize renewable energy technologies, and to obtain the hard performance data required by potential decision makers, investors and financial institutions.

Program Completion

Electricity Restructuring

The Electricity Restructuring program will be completed by FY 2005, as all States implement their individual and Federal restructuring requirements.

Competitive Solicitation

Assuming level funding over the planned six-year lifetime of this program, final cost-shared field verification project awards will be made by FY 2005. Projects initiated in FY 2005 should be completed by the end of FY 2006. Data on operational performance, system reliability, and other essential project information is required from each project once its operation begins so that this information can be consolidated and shared with decision makers considering the use of renewable or hybrid renewable power when they are faced with adding new or replacing existing power supplies. The comparatively small, but vital, project information collection component of this effort is projected to continue until approximately FY 2009 - FY 2010, at which time the entire program will conclude.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Electricity Restructuring					
Technical Analysis & Technical Assistance	0	0	2,000	+2,000	>999.9%
Competitive Solicitation					
Feasibility Studies	0	0	1,000	+1,000	>999.9%
Field Verification Projects	0	0	7,000	+7,000	>999.9%
Subtotal, Competitive Solicitation	0	0	8,000	+8,000	>999.9%
Total, Solar Program Support	0	0	10,000	+10,000	>999.9%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Electricity Restructuring

- **Technical Analysis and Assistance** - Electricity restructuring information and analyses will be disseminated to State and regional electricity agencies, power supplies, energy service companies, and other market participants on energy efficiency and renewable energy technologies in competitive electric markets. The information will focus on what has worked in one region or state to assist other states in development of their policies or restructuring. Publications, presentations, web site development will be used to disseminated these "lessons learned." Substantive expertise in utility regulations, energy technologies, and power systems is required to provide accurate, unbiased analyses of the changing competitive marketplace.

  Specific analytic activities include analysis of policy mechanisms such as information disclosure provisions, renewable portfolio standards and public benefits funds. Analysis of future utility and regulatory systems such as distributed power, bid-based pools, and real-time pricing will be performed. Analysis of market mechanisms such as labeling of electricity products for consumers, "green" certification, and energy services strategies will also be completed. Technical assistance will be provided to support regional State, and Federal decision makers in the

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
electricity restructuring process. Funds will be provided if selected in a competitive solicitation process, to key electric utility governmental associations, such as the National Association of State Legislatures, National Association of State Energy Offices, and others. The funds will support regional networks, seminars, workshops, information dissemination mechanisms such as web sites, in order to inform decision makers on electric restructuring and the role of energy efficiency and renewable energy technologies. These activities will ensure that State have the most recent, accurate, and unbiased information available on electric restructuring and the impacts on renewable and energy efficiency technologies.			
The funding level for the technical analysis and assistance activities is appropriate given the expected number of States (30) that will be implementing electricity restructuring activities in FY 2000. The level of funds is also based on experience with competitive selection of State organizations for technical assistance as appropriate to meet the informational and technical analytic needs of State decision makers.	0	0	2,000
Competitive Solicitation			
■ Conduct cost-shared feasibility studies required to ensure a viable pool of field verification projects. These funds will enable the competitive selection of cost-shared feasibility studies which will provide a pool of viable field verification projects in the remaining years of the program. Any unnecessary amount of this requested portion of the Competitive Solicitation would be applied to field verification project completion.	0	0	1,000
■ Cost-shared field verification projects to obtain needed cost and operational information. A sufficient range of 100-200 highly leveraged (a minimum 50% cost-share is required except for the Native American component which is 25%), competitively-awarded projects would be funded over the lifetime of this program. Projects (approximately 15-25)			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
would be selected based upon criteria ensuring technology and configuration variety, high value of data to be derived, and geographic/climate diversity. Such a diverse array of projects operating under a range of conditions is essential in order to obtain the hard performance data required by potential decision makers, investors and financial institutions and to reduce the perceptions of risk surrounding the development of power generation facilities that utilize renewable energy technologies. The funding levels requested below were established through experience-based estimates of the range of possible projects and required cost-share levels, are consistent with program goals and objectives, are equivalent to the combined funding levels of the former Renewable Indian Energy Resources Program and the Federal Buildings/Remote Power Program from which this consolidated program is derived, and are sufficient to meet anticipated FY 2000 needs.	0	0	7,000
Total, Competitive Solicitation	0	0	8,000
Total, Solar Program Support	0	0	10,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Electricity Restructuring	
■ $1,900,000 for Electricity Restructuring, previously funded under Program Direction, is increased $100,000 under Solar Program Support. These funds will provide increased technical analysis on electric restructuring impacts on renewable and energy efficient technologies which will be disseminated to State decision makers.	+2,000
Competitive Solicitation	
■ The $8,000,000 will initiate this activity to include $1,000,000 for feasibility studies to support competitive selection of cost-shared feasibility studies to ensure a pool of viable field verification projects, and $7,000,000 for the initial round of projects.	+8,000
Total, Funding Change, Solar Program Support	+10,000

International Solar Energy Program

Mission Supporting Goals and Objectives

Program Mission

The Solar International Program's mission is to encourage the acceptance and use of U.S. renewable energy technologies by developed transition and developing countries in support of U.S. national interests and policies. The Solar International Program, achieves its mission by advancing technology development and deployment based on selection and implementation of priority activities, working cooperatively with the private sector, federal agencies, and others.

Program Goals and Objectives

EERE activities carried out jointly with other countries contribute directly to fulfilling critical Department of Energy missions — achieving efficiency in energy use, diversity of energy supply, a more productive and competitive economy, improved environmental quality, and enhanced energy security.

Widespread use of U.S. energy efficiency and renewable energy technologies can help meet the energy needs of developed, transition and developing countries; reduce the rate of consumption of finite global resources; and address local and transnational environmental issues. More efficient use of fossil fuels and increased use of renewable energy improves U.S. energy security. By shifting consumption away from traditional, but non-sustainable energy resources, the local environmental impacts of fossil fuel production and consumption can be mitigated, while concurrently reducing regional instability by reducing competition for scarce resources.

Expanding U.S. exports will help U.S. industries achieve manufacturing economies of scale. This will contribute to the cost competitiveness of U.S. energy efficiency and renewable energy technologies both domestically and internationally by lowering their unit costs. In addition, increased sales of U.S. energy efficiency and renewable energy technologies create jobs in the high-technology sector, where U.S. labor enjoys a comparative advantage and salaries are markedly higher than in other sectors. These efforts, and others, help U.S. industry gain a foothold in the fastest growing, and often most difficult-to-penetrate, international markets for energy products and services. Such sales by U.S. industry also generate the revenue needed to support continued domestic research and development toward improving technology and product performance. Without increasing research and development expenditures, other nations will continue to erode the U.S. technological advantage built during the 1980's.

Facilitating international technology cooperation advances U.S. interests in global energy and environmental objectives in bilateral and multilateral discussions, agreements and treaty negotiations. Developing and facilitating the deployment of appropriate technologies offers U.S. industries the opportunity to adapt existing or emerging technologies to meet unique needs and conditions of developing and transition countries. Technologies that may face significant commercial barriers domestically may be readily adaptable to large and growing markets in the developing world.

Given the large number of requests for international initiatives and activities, the Office of Energy Efficiency and Renewable Energy will use a set of evaluation criteria to assist with selection of priority

activities. These criteria will consider whether the proposed activity advances U.S. strategic interests and policies; the DOE mission; opportunities for leveraging U.S. funds; national, regional or global impacts; potential for replication; contribution to technology development; commitments by other partners; likely impact on U.S. market competitiveness; and other relevant factors. EERE international activities will be screened, ranked, and implemented appropriately.

Strategic Approach

The International Solar Energy Program and U.S. Initiative on Joint Implementation will be refocused in FY 2000 using the three specific elements of Emerging Global Environmental and Energy Issues, Market and Trade Development, and Energy and Environmental Security.

While the use of essentially all renewable energy and energy efficiency technologies can help mitigate global climate change and other associated environmental and health threats, the Emerging Global Environmental and Energy Issues element will be implemented specifically through and in conjunction with the U.S. Initiative on Joint Implementation (USIJI). USIJI is a DOE-lead interagency program that supports the development of flexibility mechanisms under the U.N. Framework Convention on Climate Change (FCCC) such as Joint Implementation (JI), Clean Development Mechanism (CDM), and Emissions Trading. Meaningful participation by developing countries in the proposed 1997 Kyoto Protocol to the U.N. FCCC will also be accelerated.

The Market and Trade Development element will accelerate reductions in technology production costs and advance deployment of technologies through overseas market expansion. It will stimulate global economic development and regional economic stability, and accelerate domestic economic growth and employment. This element will be implemented in key regions through bilateral (e.g, Gore-Mbeki) and multilateral (e.g., Asia Pacific Economic Cooperation, Hemispheric Initiatives and International Energy Agency) technology cooperation activities and information dissemination. The program will facilitate private sector technology development and deployment in strategic and emerging markets will be stimulated through project based activities.

The Energy and Environmental Security element is designed to advance U.S. strategic interests in bilateral and multilateral energy and environmental security activities and will provide specialized assistance in the utilization of appropriate technologies. This element will be implemented in support of existing and emerging bilateral and multilateral treaties and agreements (e.g., U.S.-China Energy Efficiency and Renewable Energy Protocol). In addition to these planned activities the program will help meet U.S. obligations and commitments to provide disaster relief and assistance by facilitating greater use of energy efficiency and renewable technologies that are appropriate for local conditions. These activities will be consistent with applicable legislative and budgetary authorities.

Program Benefits

Metrics

By FY 2005, the Solar International Program will stimulate $10.00-$20.00 in exports for every dollar spent.

The International Solar Energy Program will yield benefits in terms of the environmental and energy savings in the countries purchasing the technologies, while increasing U.S. exports, jobs, and Federal tax revenues.

Performance Measures

FY 2000 Performance Measures

- Provide technical assistance to U.S. companies and key developing and transition countries interested in participating in Joint Implementation, and the other flexible market based mechanisms under the U.N. Framework Convention on Climate Change. Co-sponsor two project development activities.
- Accept 5-10 projects that satisfy the interagency U. S. Initiative on Joint Implementation program's established criteria.
- Provide technical assistance support to the implementation and evaluation of five technology deployment projects initiated by the private sector or other parties in selected key countries.
- Educate other agencies involved in disaster relief in the opportunities for using energy efficiency and renewable energy technologies to meet humanitarian and economic redevelopment needs of disaster stricken communities.
- Provide technical assistance to one-to-two disaster relief efforts which demonstrate the benefits of energy efficiency and renewable energy technologies.

FY 2001 - 2006 Performance Measures

- Co-sponsor six project development activities in key regions and in key developing and transition countries to build greater capacity in other nations and their local organizations to facilitate meaningful participation in Joint Implementation, and the Clean Development Mechanism under the U.N. Framework Convention on Climate Change (FCCC). These activities would also include technology cooperation efforts that facilitate local acceptance and use of U.S. technologies, and meet U.S. commitments to promote clean energy technologies under the U.N. FCCC.
- Sponsor three project development events in the U.S. for developing private sector interest in Joint Implementation, Clean Development Mechanism and Technology Cooperation.
- Accept 5-10 projects that meet the criteria established by the interagency U.S. Initiative on Joint Implementation (USIJI). Build greater capacity for U.S. companies and other project developers to effectively prepare project proposals with sufficient information to satisfy the established USIJI program criteria.
- Facilitate implementation of 10-20 private or multi-lateral technology projects as a result previous year's efforts to verify the effectiveness of energy efficiency and renewable energy technologies deployed.
- U.S. agencies involved in world wide disaster relief successfully incorporate energy efficiency and renewable energy technologies into their standard practices.

Significant Accomplishments and Program Shifts

Pre-1998 Accomplishments

- The International Solar Energy Program identified 175 project opportunities for the renewable industry, valued at approximately $1.5 billion, and helped 16 projects secure outside funding totaling $200 million.
- The International Solar Energy Program assisted private industry primarily by providing technical and project assistance in instituting greenhouse gas emission mitigation projects in other countries to increase exports of U.S. technologies. Seven projects have been identified representing $40 million in private investment and built technical capacity, both domestically and internationally.

FY 1998 Accomplishments

- Accepted eight projects into the International Solar Energy Program which have established a baseline scenario representing 17.6 million metric tons of CO2 sequestered/displaced over the project life at an aggregate investment of $23.3 million by investor organizations.
- Co-sponsored five technical assistance and training activities in Canada, Japan, China, Malaysia, and South Africa.
- Ten projects implemented with technical assistance provided by the International Solar Energy Program.
- Provided technical assistance to four countries interested in participating in the U.N. Framework Convention on Climate Change and implementing a Joint Implementation Program.
- Provided technical assistance to 10 project developers in the areas of methodological development and implementation, assistance with obtaining financing, and in-country activities.
- Other efforts within the International Solar Energy Program were not funded in FY 1998.

FY 1999 Planned Accomplishments

- Accept 10 projects into the Joint Implementation Program which have established a baseline scenario representing 20 million metric tons of CO2 sequestered/displaced over the project life at a cost of $25 million.
- Co-sponsor three Joint Implementation/Clean Development Mechanism activities in Asia, Africa, and Latin America. These activities would include a variety of project development, technical assistance, and local training and institutional capacity building.
- Provide technical assistance to five countries interested in participating in the U.N. Framework Convention on Climate Change and implementing a Joint Implementation Program.
- Provide technical assistance to five project developers in areas of methodological development and implementation, assistance in obtaining financing, and in-country activities.
- Stimulate demonstration projects through market and trade development activities, including field validation, in Asia/Pacific, Latin America, Africa, and transition countries.

- Advance Energy and Environmental Security interests in up to 10 bilateral and multilateral negotiations or agreements.

FY 2000 Planned Accomplishments

- Provide technical assistance to developing countries interested in establishing Joint Implementation Offices or developing joint implementation projects.
- Provide technical assistance to U.S. companies and developing country participants in preparing projects for consideration as joint implementation projects.
- Undertake Market and Trade Development activities to reduce non-technical barriers (e.g, financing, resources, tariffs, and local prohibitions).
- Assist other agencies involved in disaster relief efforts in utilizing energy efficiency and renewable energy technologies to meet humanitarian and economic redevelopment needs of disaster stricken communities.
- Provide technical assistance to one-to-two disaster relief efforts which demonstrate the benefits of energy efficiency and renewable energy technologies in different settings.

FY 2001 - 2006 Planned Accomplishments

- Provide technical assistance to developing countries, U.S. companies, and others in estimating the climate impacts of joint implementation projects.
- Participate in international pilot projects testing carbon credit trading programs and the evaluation of the results.
- Participate with international organizations in drafting monitoring and verification protocols for measuring the actual carbon benefits from joint implementation projects.
- Adapt trade development activities to be appropriate for local cultural conditions in various regions with specific market needs.
- Implement effective agreements among U.S. agencies that provide rapid response to worldwide disaster relief utilizing energy efficiency and renewable energy technologies.

Program Completion

Completion of the Joint Implementation Program is anticipated when the instruments of the Kyoto Protocol have been established and accepted by the international community.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
USIJI	1,375	6,350	6,000	-350	-5.5%

(dollars in thousands)

	FY 1998	FY 1999	FY 2000

USIJI

- The FY 2000 request represents the refocused activities of the International Solar Energy Program and U.S. International Joint Implementation supporting Congressional direction to continue U.S. participation in Climate Change activities conditioned upon "meaningful participation" by developing countries. Support development and implementation of the U.N. Framework Convention on Climate Change's flexibility mechanisms to facilitate private sector project development in developing countries utilizing renewable energy, energy efficiency, and other "clean energy technologies." Technology cooperation activities also facilitate private sector deployment of these technologies. Conduct activities in support of national action plans in selected key countries for capacity building. Initiate process for developing methodologies needed for joint implementation projects and Clean Development Mechanism and emissions trading.

[a]The FY 1999 EWD appropriation was $1,375,000. An additional $2,600,000 provided as part of the FY 1999 Omnibus Consolidated Appropriation Act funding package will be allocated across the three program focus areas: Emerging Global Environmental and Energy Issues; Market and Trade Development; and Energy and Environmental Security. The total for the International Solar Energy Program is $6,350,000.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Focus on developing highly leveraged renewable energy field validation projects in order to educate regional energy decision makers on the benefits of U.S. technologies with a view toward replication using private sector and multi-lateral financing. Provide technical assistance to ongoing and prospective field validation projects in various regions to enhance lessons learned and probability of successful replication. Support technical and information dissemination assistance to multi-agency effort to mitigate effects of regional disasters worldwide	1,375	6,350	6,000
Total, International Solar Energy Program	1,375	6,350	6,000

Geothermal

Mission Supporting Goals and Objectives

Program Mission

The mission of the Geothermal Energy Program is to work in partnership with U.S. industry to establish geothermal energy as a sustainable, environmentally sound, economically competitive contributor to the U.S. and world energy supply.

Program Goals and Objectives

Working in close cooperation with its stakeholder community, the Geothermal Energy Program has developed a set of goals for the year 2010, as specified in the Geothermal Energy Strategic Plan (June 1998) which has been endorsed by U.S. Industry. These goals, include:

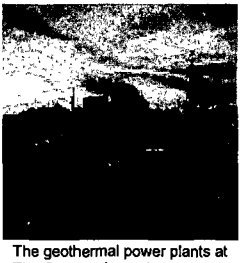
- Strategic Goal 1 — Electric Power Generation: Supply the electrical power needs of 7 million U.S. homes (equivalent to 10,000 MW of generation).
- Strategic Goal 2 — Direct Use Applications and Geothermal Heat Pumps: Supply the heating, cooling, and hot water needs of 7 million U.S. homes (equivalent to saving 4,000 MW of generation).
- Strategic Goal 3 — International Geothermal Development: Meet the basic energy needs of 100 million people in developing countries through sales of U.S. technology and services (equivalent to 10,000 MW of generation).
- Strategic Goal 4 — Science and Technology: Accelerate the development of U.S. geothermal science and technology to maintain world leadership.
- Strategic Goal 5 — Future Geothermal Resources: Develop new technology to meet 10 percent of U.S. non-transportation energy needs within the following 25 years.

A corollary technical objective is to reduce the levelized cost for geothermal electric power generation from the current $0.035/kWh to less than $0.03/kWh by the year 2010, a reduction of 25% from 1997 levels. This objective derives from Strategic Goal 1. Overall, the strategic plan contains some 18 objectives derived from the goals.

Strategic Approach

The Geothermal Energy Program directly supports four of the five goals of the DOE Comprehensive National Energy Strategy (1998): (1) Geothermal heat pumps will significantly increase energy efficiency in the building sector, including Federally-owned buildings. (2) Geothermal electricity will contribute 10,000 MW to the overall goal for renewables of at least 25,000 MW by 2010, while helping to promote energy production and use in ways that respect health and environmental values. (3) Enhanced Geothermal Systems technology offers an attractive, long-term option for an energy resource

that is extremely plentiful with few adverse effects. And (4) the Program expects to accelerate the deployment of clean, safe, and efficient geothermal systems around the world. The Department's Comprehensive National Energy Strategy supports the development of renewable technologies, such as geothermal energy, to increase domestic energy production in an environmentally-responsible manner.



The geothermal power plants at The Geysers in northern California.

The Program's R&D activities closely align with its mission and strategic goals. With improved exploration methods, industry will locate and characterize new geothermal fields more accurately, reducing the risk of development. Better technology for drilling wells will make it possible to access deeper resources and reduce costs, thereby expanding the economic resource base. Advances in energy conversion will establish air-cooled binary technology as a means of generating competitively-priced electricity from more plentiful lower-temperature resources. Studies of reservoir behavior will improve the management of geothermal fields, allowing fields to operate for over 100 years as sustainable commodities.

Geothermal electric generation projects are capital-intensive enterprises, with the major expenses being incurred before the plant begins to produce revenue. The high-cost components of a geothermal development project include (1) drilling of exploration, production, and injection wells, and (2) plant equipment and construction. The primary risk in a geothermal project is confirmation of a viable reservoir, which usually requires extensive drilling and well testing. To reduce the risks and costs in geothermal development, the Program's research strategy involves:

Southeast Geysers Effluent Pipeline Project

In late 1997, a novel project to generate electricity from treated wastewater began in Northern California. The geothermal industry and various government agencies, including DOE, joined forces to build the Southeast Geysers Effluent Pipeline. The pipeline project takes treated wastewater and uses it to produce additional steam at The Geysers, the largest geothermal power plant development in the world.

Labeled "environmentally superior," the project consists of a 29-mile, 20-inch diameter pipeline that carries 7.8 million gallons of water per day from the Lake County Sanitation District in Clearlake to The Geysers. At The Geysers, the secondarily-treated water is injected deep into the hot rocks that comprise the geothermal reservoir. The water boils into steam which is recovered by production wells and then used in turbine/generator machinery to generate electricity. The steam allows the generation of up to 70 megawatts of additional power.

Knowing where to inject the treated wastewater is important for maximizing steam production. DOE marshaled the resources of its national laboratories and other contractors to understand fluid flows and chemical interactions deep within the reservoir, thereby assisting industry in determining an optimum injection strategy.

A public/private partnership between the sanitation district representing the communities of Clearlake, Lower Lake, and Middletown, and three Geysers steam suppliers made the project a reality. This project successfully brought together the sanitation district, which was searching for a way to dispose of wastewater, and the steam suppliers, who needed additional sources of water for their depleted reservoir. Both Federal and state governments were instrumental in providing partial funding. The project was honored with three awards in 1998 the California State Association of Counties 1998 Challenge Award of Merit, the California Governor's 1998 Environmental & Economic Award of Recognition, and the Water Reuse Association of California 1998 Award of Merit.

- improving technologies for exploration, detection of fractures and permeable zones, well siting, and fluid injection;
- decreasing the cost of drilling and completing geothermal wells; and
- reducing the capital, operation, and maintenance costs of geothermal power plants.

The proposed activity level is sufficient to maintain geothermal R&D at a level of effort that results in continuous technology advances. A few new initiatives, such as the Geothermal Advanced Drilling System (GADS), may produce revolutionary changes which will accelerate development and use of geothermal resources, providing a reliable alternative source capable of supplying a significant fraction of the nation's energy needs.

The U.S. geothermal industry is too small to maintain independent research capabilities. Also, the international competition for geothermal power development projects is intense. The chief competition comes from Italy, Japan, and New Zealand, but other countries have become active as well. If the U.S. industry is to maintain its current world-leadership position, create new jobs, and help to expand the U.S. economy, assistance from the DOE Program is vitally important.

The proposed R&D program is based upon the Department's interaction with industry stakeholders and geothermal experts at universities and the national laboratories to develop a balanced portfolio of core (basic and applied) research, and well-focused technology development thrusts. The budget supports the five goals of the Geothermal Energy Strategic Plan. Cost-shared activities in reservoir technology, exploration, drilling, and energy conversion will leverage the R&D funds and facilitate technology transfer.

Annual royalties paid to the Government for geothermal power production on Federal lands exceed the Program's budget. For example, since 1995 the geothermal budget has averaged about $30 million, whereas royalty payments have exceeded $40 million annually. A recent study suggests that with continued development of geothermal resources those payments could double within 15 years.

Program Benefits

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.05	0.18	0.25
Energy Savings ($ Billions)	0.11	0.46	0.71
Carbon Displaced (MMTCE)	1.08	3.09	4.06

Scaled for the year 2004, these benefits correspond to supplying the electrical power needs of 2.5 million U.S. homes (3,300MW electricity generation capacity (MWe)) and 40 million people in developing countries using U.S. technology (4,000MWe).

Performance Measures

FY 2000 Performance Measures

- Complete a five-MW Kalina Cycle (advanced heat recuperation technology) demonstration geothermal power-plant.
- Complete laboratory evaluation of a direct contact condenser for binary cycles using mixed working fluids.
- Select one partner for demonstration of small-scale distributed power generation.
- Initiate development of high-temperature, "keep-a-live" battery prototype for powering electronic equipment in wells.
- Perform initial field test validating the usefulness of a high-speed data link for well drilling.
- In cooperation with the geothermal industry, complete testing and evaluation of three alternative methods for producing seismic energy for application to 3D seismic imaging of fractured geothermal reservoirs, and incorporate the best source technology in an exploration system to locate and characterize new geothermal fields.
- In joint DOE-industry projects, examine and assess a variety of chemicals for use as tracers for the flow of injected fluid through geothermal reservoirs, and confirm five new tracers that are environmentally compatible, stable at high temperatures, and detectable in minute quantities.

FY 2001 - 2006 Performance Measures

- Complete demonstration of economic benefits of a Kalina cycle in a geothermal power plant application.
- Complete demonstration of small-scale distributed power generation.
- Complete development and field testing of high-temperature, downhole fluid sampler.
- Initiate full scale validation and verification of a high-speed data link which will be ready for commercial use by 2006.
- Provide the geothermal industry with a scientific analysis of the effectiveness of 3D seismic surveys in the exploration for fractured geothermal reservoirs, and give guidance on the economic value of 3D seismic surveys versus other exploration methods.
- Through joint testing with industry, provide an evaluation of the borehole electromagnetic imaging tool to locate productive fractures in geothermal reservoirs and supply the computer algorithms for rapid and accurate interpretation to allow decisions to be made during drilling.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

- Demonstrated the use of slimhole drilling for geothermal exploration, thereby reducing exploration drilling costs by 30 to 50% relative to standard 1995 technology.
- Developed the original design bases for polycrystalline diamond compact (PDC) drill bits. These were being used in about 40 percent of oil and gas drilling worldwide as of 1997.
- Developed technologies that achieved up to 10% improvements (relative to 1990 levels) in efficiency of power plants operating with high non-condensible gas concentrations (at The Geysers, CA) and with reduced brine temperatures (at Mammoth, CA).
- Increased annual installations of geothermal heat pumps by over 20% in 1997 through a collaborative public outreach effort with the Geothermal Heat Pump Consortium

FY 1998 Accomplishments

- Baker Hughes, a major drilling services company, signed a licensing agreement with Sandia National Labs for wireless telemetry technology to communicate with tools placed in wells up to two miles deep.
- Core-tube data logger was commercialized by Boart Longyear, a supplier of drilling equipment, for geothermal and mineral exploration activities.
- Completed conceptual design of an air-cooled trilateral cycle power module for village power applications.

FY 1999 Planned Accomplishments

- Complete development of specialized drilling equipment under the NADET program.
- Complete field test of insulated drill pipe with an industrial partner to provide much lower bottomhole fluid temperatures during drilling to increase tool life, improve drilling mud properties, and improve the operating environment for downhole electronics.
- Complete design and testing of three seismic source instruments to generate shear waves for geothermal 3-D seismic exploration.
- Complete design of a borehole electromagnetic logging tool to identify productive fractures.
- Field test improved-efficiency power generation technologies, including small-scale power modules, to increase electrical power output per pound of brine by 20%.
- Establish geothermal heat pumps as the technology of choice for schools, and install 10,000 units in Federal buildings.

FY 2000 Planned Accomplishments

- Complete improved injection techniques for proper fluid management in order to operate a geothermal field in a sustainable mode for over 100 years.

- Assist the U.S. geothermal industry, through cost-shared (50:50) field testing and evaluation research, in the development of two 40 megawatt power plants in the United States.
- Select an industrial partner for the cost-shared (50:50) development of an Enhanced Geothermal System at a working U.S. geothermal field.
- Evaluate the use of 3D seismic exploration methods to locate and characterize new geothermal fields through collaborative research with industry.
- Develop smart systems that integrate individual geophysical methods and provide a more reliable exploration target.
- Field test a new, innovative electromagnetic exploration tool to locate subsurface fractures.
- Complete field testing of improved PDC bits designed for hot, hard rock to double bit life and penetration rates thereby reducing well costs by about 5%.
- Complete a field test of a hard-wired, high-speed data link as a component of the Geothermal Advanced Drilling System to continually monitor and control drilling functions downhole.
- Complete development of high-temperature unshielded electronics and batteries for logging tools that will operate at temperatures exceeding 300°C.
- Complete construction of an 8MW Kalina cycle demonstration power plant that uses advanced heat recuperation technology. The non-Federal share of costs of this demonstration is over 60%. Advanced heat recuperation technology increases the energy conversion efficiency by about 20%, allowing the development of lower-temperature resources.
- Field test heat exchanger tube coatings that reduce fouling rates by 30%.
- Complete field tests of gas monitors that reduce plant operating and maintenance costs by over 5%.

FY 2001 - 2004 Planned Accomplishments

- Following the conclusion of 3-D seismic studies and development of borehole electromagnetic imaging technology to identify fractured geothermal reservoirs, exploration data from seismic, electromagnetic, geochemical, and geological investigations integrate into a comprehensive dynamic model of the geothermal reservoir.
- Building on the wireless data telemetry technology Sandia licensed to Baker Hughes in 1998, complete the high-speed diagnostics-while-drilling (DWD) system. This will greatly improve drilling operations while providing an additional 20% reduction in well costs.
- Conduct initial testing and evaluation of the Geothermal Advanced Drilling System combining state-of-the-art components.
- Incorporate the analytical tools developed with the completion of the improved injection technology for sustainable field operation in FY-2000 into an innovative technique for numerical modeling of geothermal reservoirs.
- Create an Enhanced Geothermal System at a geothermal field with an industrial partner.

- Following commercial-scale testing of the Kalina Cycle (ammonia-water system), initiate testing of advanced binary power plants using mixed working-fluid cycles.
- Initiate new cost-shared direct use applications systems to evaluate innovations that reduce operating and maintenance costs.

FY 2000 Program Shifts

- The Enhanced Geothermal Systems (EGS) initiative will focus on extending the productivity and lifetime of geothermal reservoirs through rock fracturing and stimulation techniques. In addition to extending the lifetime of existing geothermal fields, EGS technology will expand the U.S. geothermal resources available for utilization.
- The new Geothermal Advanced Drilling System (GADS) initiative is a systems approach to reducing drilling costs for drilling in deep, hot, hard rock environments. In conjunction with EGS, GADS will give economic access to geothermal resources contained in rocks at great depth.
- The new Modular Power Systems initiative will begin development of a small-scale power module for the production of electricity at distributed or off-grid sites. Many small-scale power modules eventually will be installed worldwide as a result of this initiative.

Program Completion

The Strategic Plan for the Geothermal Energy Program is based on the assumption that, given the necessary resources, the Program will be completed in 2010. Certain elements are expected to end sooner, such as Geothermal Heat Pump Deployment (2000). The Program goals and their associated objectives as specified in the Strategic Plan will be achieved in partnership with industry and other stakeholders to create technology that reduces the cost and risk of producing all forms of geothermal energy.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Geothermal Electric R&D	22,294	22,000	29,500	+7,500	+34.1%
Geothermal Heat Pumps	6,400	6,500	0	-6,500	-100.0%
Total, Geothermal	28,694	28,500	29,500	+1,000	-66.0%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Geothermal Electric R&D			
■ **Reservoir Technology** - The program will perform water injection test at a commercial site at Dixie Valley, develop a suite of chemical tracers for tracing the flow of injected water and use field test data to improve reservoir models. Industry is cost sharing the field testing of tracers and reservoir model improvements. These efforts will lead to proper fluid management which will allow a geothermal field to operate in a sustainable mode for over 100 years. Research in support of the proposed Santa Rosa pipeline to The Geysers will be conducted. Initiate the Enhanced Geothermal Systems (EGS) initiative will focus on extending the productivity and lifetime of geothermal reservoirs. The EGS initiative calls for conducting a large-scale stimulation, water injection, and circulation experiment at an operating U.S. geothermal field. With industry cooperation and support in the form of cost sharing, this effort will accelerate the use of EGS in the U.S. by at least five years and restore the U.S. as a world leader in EGS technology development. The funding is appropriate to support joint DOE/industry R&D critical to sustaining improvements in maintaining the U.S. technology.	4,387	5,500	8,000
■ **Exploration** - Finding and assessing a viable resource is the stage of geothermal development with the highest risk. Greater effectiveness in locating geothermal resources will reduce the number of non-productive wells that are drilled. The program will evaluate through field testing various 3D seismic exploration strategies. Neural networks for integrating geophysical methods will be evaluated, followed by smart systems using the best neural network. The funding is appropriate as it directly supports the Geothermal Strategic Plan goal of developing future geothermal resources.	5,600	5,500	7,000
■ **Drilling Technology** - The drilling of wells constitute up to one half of the cost of a geothermal power plant. The program will complete the testing of improved PDC bits, unshielded high-temperature logging tools, and a high-temperature casing inspection tool. A successor to the National Advanced			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Drilling and Excavation Technologies (NADET) program, the Geothermal Advanced Drilling System will be initiated in order to insure that drilling costs that increase linearly with depth as opposed to the exponential increases that exist today. Thus, the huge geothermal resources contained in rocks at great depth will become economically accessible. One element of the Geothermal Advanced Drilling System is a high speed data link that will transmit a variety of real-time drilling data to the surface for decision making during operations. This data stream will be of great benefit to drillers and will allow faster, cheaper drilling. About 50% of the cost of the high-speed datalink system will be provided by major private sector partners and most other projects have same level of cost-sharing by industry partners. Based on DOE's interactions with the U.S. geothermal industry, the funding is appropriate for the high priority of reducing drilling costs.....	6,900	5,000	7,500
■ **Energy Conversion Technology** - The Kalina Cycle, a new plant design for more efficient and cost effective electrical generation will be tested in partnership with Exergy, Inc. Construction of this demonstration of advanced heat recuperation technology will be completed. The non-Federal share of costs of this demonstration is over 60%. Based on prior technology assessments performed by national laboratories, a cost sharing partner for demonstration of a small-scale geothermal power module will be competitively selected. Modular geothermal power plants offer flexibility in deployment, allowing less risky, incremental development of a geothermal field. Some geothermal fields are located on the fringes of existing power grids where modular, small-scale geothermal power plants can maintain voltage levels and provide other valuable power quality assistance. Modular geothermal power plants can also support mini-grids in remote applications. The funding is appropriate for continuation of this important R&D and achieving the goals in the Geothermal Strategic Plan.	5,119	6,000	7,000

Hydrogen Research

Mission Supporting Goals and Objectives

Program Mission

The mission of the Hydrogen Research and Development program is to enhance and support the development of cost competitive hydrogen production and storage technologies, and provide for integrated systems. Hydrogen can serve as an energy carrier that can reduce adverse environmental impacts, improve national security, by facilitating the penetration of renewable energy resources into the U.S. energy mix.

Program Goals and Objectives

Over the next five years, hydrogen is expected to make a significant penetration in several niche markets as concerns increase for energy security and global climate change. The Proton Exchange Membrane (PEM) fuel cell is the primary technology that will advance hydrogen into these niche markets and eventually into more mainstream applications such as large-scale electricity generation and transportation. The Hydrogen Program will cost-share the introduction of new hydrogen-based technologies to: provide distributed electrical generation; reduce the use of petroleum; increase the use of domestic energy resources; and increase the efficiency of, and reduce emissions from, existing fossil energy systems.

Development of critical technologies to lower the cost of hydrogen production, storage and utilization is vital for the introduction of hydrogen into the energy infrastructure. The Program facilitates the introduction of these technologies in high priority areas -- such as renewable/hydrogen electric generation systems, refueling stations for hydrogen vehicles and electricity for Native American villages and other remote locations. These crucial activities reduce dependency on expensive oil products, promote rural electrification, and economic development, and use grid-independent systems, while reducing NOx, SOx, and CO_2 emissions. These areas are goals outlined in the DOE Strategic Plan: (1) Objective 1, Strategy 4 to develop alternative transportation fuels and more efficient vehicles that can reduce year 2010 projected oil imports; (2) Objective 2, Strategy 3 to develop renewable energy technologies and supporting policies capable of doubling non-hydroelectric renewable energy generating capacity; and (3) Objective 3, Strategy 2 to increase the efficiency and productivity of energy use by 2010, limit energy related releases of NOx, SOx, and CO_2, and particulates, and other wastes by as much as 5 percent relative to projected emissions.

The Core Research and Development effort will:

- Achieve hydrogen production costs of $12.00 - $15.00 per million Btu for pressurized hydrogen from natural gas and biomass when systems are produced in quantity;
- Develop safe, low-cost, hydrogen storage technology for on-board a vehicle to achieve a 350 mile range; and safely store hydrogen on vehicles to achieve 350 mile range; and
- Develop a reversible fuel cell at <$600/kW when systems are produced in quantity.

The Technology Validation effort will:

- Install a wind/reversible fuel cell in a remote Arctic location;
- Install distributed refueling stations that demonstrate co-production of hydrogen and electricity from natural gas. The hydrogen will be less than $1.20 per gallon equivalent and an electricity production cost less than $0.06 per kWh when systems are produced in quantity; and
- Install a liquid-fueled PEM fuel cell for remote and village power applications.

Strategic Approach

The Hydrogen Program utilizes the core competency of the National Laboratories, universities, and industry to develop and demonstrate the processes and technologies needed to produce, store, transport, and utilize hydrogen safely in various applications. Reduction of greenhouse gases is a major emphasis of the Hydrogen Program, consistent with the objectives of the DOE Strategic Plan. Major initiatives in the Program to meet these objectives include: (1) the transitional use of natural gas as the feedstock for the production of hydrogen while renewable resource technology is under development; (2) the introduction of PEM fuel cells for cogeneration systems integrated with natural gas reformers; (3) the development of codes and standards to ensure the safest technologies are produced and ready for market penetration; and (4) the use of domestic resources to produce hydrogen as a future energy carrier.

To achieve its mission, the hydrogen program has four strategies: (1) expand the use of hydrogen in the near-term by working with industry, including hydrogen producers, to improve efficiency, lower the emissions, and lower the cost of technologies that produce hydrogen from natural gas and to introduce renewable-based production options; (2) work with fuel cell manufacturers to develop hydrogen-based electricity storage and generation systems that will enhance the introduction and penetration of distributed, renewable-based utility systems; (3) coordinate with the Department of Defense and DOE's Office of Transportation Technologies to demonstrate safe and cost-effective fueling systems for hydrogen vehicles in urban non-attainment areas and to provide onboard hydrogen storage systems; and (4) work with the National Laboratories to lower the cost of technologies that produce hydrogen directly from sunlight and water.

The FY 2000 request continues to implement the program outlined in the Department's Hydrogen Multiyear Plan and recommended by the Hydrogen Technical Advisory Panel (HTAP) report, including increased collaboration with the Office of Fossil Energy (FE) and the Office of Science (formerly the Office of Energy Research). The Program has already initiated one co-funded project with FE in advanced reforming for the production of "syngas," a blend of carbon monoxide and hydrogen. The syngas is used by the "Gas to Liquids Program" to produce new liquid fuels while the Hydrogen Program is using the technology for distributed production systems at refueling centers. The Hydrogen Program is pursuing other technologies, such as producing hydrogen from low rank coal with integrated carbon sequestration, or producing high-value carbon products in cooperation with FE's Vision 21 plan.

The market conversion to widespread hydrogen is a long-term option which requires the development and introduction of a number of critical technologies. These include low-cost, high-density storage systems, low-cost PEM fuel cells, and small load-following reformers for distributed production systems. This technology has received a major boost due to three ihdustry-led developments: the

Daimler Benz and Ballard joint venture to produce fuel cell vehicles by 2004; the Plug Power joint venture to produce hundreds of natural gas reformer/ PEM fuel cell systems for home cogeneration; and General Public Utilities' joint venture with Ballard to produce 250 kWe PEM fuel cells by 2002. These activities are providing market pull to other manufacturers of hydrogen energy systems. Increased hydrogen activity will open up markets for renewable technologies, such as wind and photovoltaics, by providing energy storage options.

Program Benefits

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.09	0.60
Energy Savings ($ Billions)	0.00	0.10	1.63
Carbon Displaced (MMTCE)	0.07	1.35	9.31

The estimated benefits are based on a contribution of hydrogen fuel cells to the Nation's future electricity generation mix. Hydrogen fuel cells are expected to account for 36 GW, a 4.2% share of the projected U.S. total power by the year 2020. If this Program is implemented as proposed, the Renewable Energy Penetration Model projects installation of an additional 21 GW of fuel cells between 2016 - 2020, which equates to 27% of all new electric capacity in the U.S. This 57 GW of electrical generation can provide enough power to support a city of 10 million homes and businesses.

Performance Measures

FY 2000 Performance Measures

- Demonstrate a 3-fold increase in hydrogen production from biologically catalyzed process.
- Demonstrate 600 mAmps per square centimeter at 0.5 volts in a low-cost manufactured stainless steel PEM fuel cell configuration.

FY 2001-2006 Performance Measures

- Demonstrate carbon dioxide free production of hydrogen using a plasmatron (electric torch) at a scale of 30 kW.
- Demonstrate Ion Transport Membrane technology at 10kW for applications at a distributed production facility.
- Construct a pilot plant for fabrication of carbon nanostructures for 4 percent hydrogen by weight storage.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

Over the last three years, the Hydrogen Program has had significant programmatic and technical accomplishments towards meeting its goals. These include:

- Researchers have been granted over 18 patents.
- Four researchers have been named Distinguished Scientists, by the American Institute of Chemical Engineers, the American Chemical Society, the Columbus Award, and the President's Award.
- NREL researchers have demonstrated: (1) a triple junction semiconductor for splitting water with a measured solar to hydrogen efficiency greater than 12.5%. (Prior to this the highest recorded efficiency was 7.3%.) (2) A biologically catalyzed water gas-shift catalysis process with over 90% conversion of carbon monoxide to hydrogen was demonstrated.

FY 1998 Accomplishments

- Completed Technology Roadmaps for the Core R&D Program, Technology Validation, and Analysis and Outreach activities that define the goals and objectives to be accomplished over the next five years. This activity is a key part of a deliverable for the Report to Congress due in January 1999.
- At the University of Hawaii, a state-of-the-art bioreactor was installed in a collaborative project with the Japanese and Italians to produce hydrogen using microalgae.
- An innovative PEM fuel cell constructed of stainless steel was tested at atmospheric pressure and temperature for over 2000 hours without any degradation of performance.
- Completed the prototype of a low-cost thick film solid state hydrogen sensor.

FY 1999 Planned Accomplishments

- Initiate a resource assessment for the Montana Trade Port Authority for the construction of a solid waste hydrogen fuel cell manufacturing facility.
- Successfully operate a 50kW renewable hydrogen refueling station at Sunline Transit in the City of Palm Springs.
- Issue a solicitation for the construction of a refueling station to be built in Nevada to service Las Vegas.
- Operate a cryogenic gas tank for vehicle storage to support a 400 mile range configuration for 100 refilling cycles.
- Complete scale-up of Sorbent Enhanced Reformer concept and perform economic analysis of system used for central generation of hydrogen.
- Demonstrate a photochromic method for rapidly identifying algae that will produce hydrogen from water, without being inhibited by by-product hydrogen.
- Three Alaska Remote Power activities will be initiated: an integrated wind/reversible fuel cell system for a remote village to be tested at the University of Alaska; an arctic lab at the University of

Alaska; and a project to be initiated on a fuel cell power system (known as autothermal reformer) that uses diesel oil to produce hydrogen for a residential fuel cell.

- Complete the feasibility study on the Montana Trade Port Authority.

FY 2000 Planned Accomplishments

- A new metal hydride complex (alanates) has been developed with a hydrogen capacity in excess of 5% by weight and energy storage efficiency greater than 74% and will be demonstrated in a system.
- Successfully operate a reversible fuel cell with 60% round-trip efficiency in a remote Arctic application.
- Operate a quick-fill refueling station to be built in Nevada to service Las Vegas shuttle buses, and Nevada Test Site and Nellie Air Force Base vehicles.
- Achieve long-term stability of catalysts for carbon monoxide.
- Demonstrate a 3-fold increase in hydrogen production at 15 atmospheres using photosynthetic bacteria for the water gas shift reaction.
- Demonstrate over 90% absorption of carbon dioxide in a dual bed Sorbent enhanced reformer reactor used for hydrogen production.
- Demonstrate a solar-to-hydrogen efficiency greater than 12% for a III-V tandem cell and greater than 8% for amorphous silicon photoelectrochemical systems.
- A lightweight tank will be fabricated to validate a new class of magnesium-based metal hydrides with 4.5% by weight storage at a dehydriding temperature of 150° C.
- Demonstrate improved catalyzed hydride concept.
- A solicitation will be issued for innovative ideas, components, and concepts for compression and storage systems for both stationary and mobile applications.
- Demonstrate a fiber optic sensor using tungsten oxide to indicate hydrogen leaks in a vehicular application.
- Demonstrate PEM fuel cell performance of 600 mAmps per square centimeter at .5 volts for a metal separator plate configuration.

FY 2001 - 2004 Planned Accomplishments

- Successfully operate for three months the carbon dioxide free production of hydrogen using a plasmatron (electrical torch) at a scale of 30kWe.
- Demonstrate a 1kWe solid oxide fuel cell with integrated natural gas reformer for one year.
- Operate a single-stage 150 square meter photobiological reactor to produce hydrogen from water using oxygen tolerant mutants.
- Successfully deploy and operate small liquid fueled reformer/PEM fuel cells in an arctic environment.

- Install advanced refueling stations for fleets of vehicles that demonstrate the ability to provide hydrogen at $1.00/gallon equivalent and electric power at $0.05/kWh for mass-produced systems.
- Successfully operate a pilot plant for a biological water gas shift catalyst using reformed biomass for one year.
- Demonstrate 8% efficiency for hydrogen production and greater than 3,000 hours operation in an outdoor photoelectrochemical system using amorphous silicon.
- Successfully operate for one year an advanced chemical hydride fuel refueling station to service fleets of hydrogen vehicles. Install advanced chemical hydride storage tanks on vehicles.

Program Completion

The program will be completed in FY 2020 after the following strategic objectives have been achieved:

- FY 2002 - Non-energy (capital and operating) cost of electricity from hydrogen-based storage systems will be lowered to $0.05/kWh. Plant cost of renewable hydrogen produced at atmospheric pressure, from sunlight and water not using electrolysis will be reduced to$9.00-$15.00/MMBtu. The cost of hydrogen delivered to a vehicle at pressure will be reduced to $12.00-$15.00/MMBtu when systems are produced in quantity.
- FY 2008 - Hydrogen use increases from 0.3Quad/yr (as a chemical feedstock to produce reformulated gasoline), to 0.4Quad/yr (as a transportation fuel and chemical feedstock).
- FY 2010 - Deployment of new hydrogen production technologies to convert natural gas for fuel cell applications will reduce emissions by: 61,000 tons per year NOx, 1,000,000 tons per year CO, and 46 million tons per year CO_2. Hydrogen-based systems will begin to displace fossil fuels in utility, building, and vehicle applications leading to 0.1Quad/yr .
- FY 2020* - Hydrogen-based systems will begin to displace fossil fuels in utility, building, and vehicle applications leading to 1 Quad use.
- Renewable energy based hydrogen production will contribute the equivalent of 10Quad/yr in the primary energy market.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Core Research and Development	6,975	9,088	14,100	+5,012	+55.1%
Technology Validation	6,361	10,993	11,420	+427	+3.9%
Analysis and Outreach	2,470	2,169	2,480	+311	+14.3%
Total, Hydrogen Research	15,806	22,250	28,000	+5,750	+25.8%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Core Research & Development			
■ **Thermal Processes** - Support will be provided for installation and operation of two process development units to demonstrate production of hydrogen, one using biomass and one using natural gas. Performance characteristics will be determined. Research will be supported for fabrication and operation of a 6kW integrated plasma reformer, for operation and performance characterization of a supercritical biomass gasification reactor, development of a liquid fueled reformer, and for the manufacture of ion transport membrane reactor technology in a collaboration with the Office of Fossil Energy.			
The funding level is appropriate and was derived through past experience and evaluation by experts in a peer review of on-going efforts. This is linked to the goals and objectives outlined in the R&D Technology roadmap.	2,957	4,559	5,880
■ **Photolytic Processes** - Research will be supported to genetically engineer marine algae to split sea water to hydrogen and oxygen, for fabrication of a modular photo electrochemical production cell, lifetime testing of high efficiency coated cells, developing higher efficient multijunction amorphus silicon semi-conductors, and the operation and design of a process development unit to biochemically react waste carbon monoxide to produce hydrogen at near 100% efficiency using an engineered strain of microbes.			
The Hydrogen Program in conjunction with the National Science Foundation, conducted a Peer Review of the renewable-based production technologies. This information provided the most important tool to determine if the funding levels requested were appropriate. Through analysis, the experts determined the funding level was appropriate to meet the goals outlined in the R&D Technology roadmap.	1,780	1,700	2,630

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ **Storage** - Develop technology for the continuous production of carbon based hydrogen storage materials including nanotubes, for fabrication of four lightweight metal hydride storage modules, for fabrication of an integrated reformer into a vehicle, and for the validation of advanced pressurized gas storage technologies. The funding level was determined through project reviews with program participants to provide on-board hydrogen storage systems for vehicles and for distributed generated systems to support the collaboration with the Office of Transportation Technologies.	1,848	1,829	3,090
■ **Utilization** - Develop end-use technologies, sensors, and other processes that can effectively use the system advantages of converting chemical energy to electrical energy. The program co-funds and co-manages these projects in collaboration with the DOE Office of Transportation Technologies' Fuel Cell Program. The following technologies are included: PEM fuel cell and reversible fuel cell technologies, internal combustion engines, hydrogen detectors and measurement sensors. Support will be provided for the prototype design, fabrication and field testing of a newly developed solid-state hydrogen leak detectors; for development of a 50kW scaleable modular PEM fuel cell readily adaptable to inexpensive mass production; and for fabrication of a 25kW fuel cell for integration into a small stationary power system. The funding level is based on extensive experience with the development of PEM fuel cells and sensors to meet key programmatic milestones for demonstrating safe end-use systems	390	1,000	2,500
Total Core Research and Development.	6,975	9,088	14,100
Technology Validation			
■ Install and demonstrate several solar and wind/reversible hydrogen generation and storage fuel cell systems and confirmation of the economic viability of these systems for remote and on-grid utility applications.	1,500	2,524	2,765

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Install and demonstrate liquid fuel cell (PEM) systems for use in a remote village in an arctic environment.	0	2,823	3,030
■ Demonstrate technologies for hydrogen infrastructure for fueling of hydrogen vehicles. The later activity will include work initiated in FY 1999 for a natural gas based refueling station to be located in Nevada to service a fleet of vehicles with advanced hydride and cryo-pressure tanks installed.	1,261	2,675	5,625
■ Broad based solicitation for storage systems on vehicles.	600	0	0
■ Initiated Russian American Fuel Cell Consortium Projects. .	3,000	0	0
■ Fabricate high-pressure hydrogen storage tanks for vehicles. Complete the construction of one joint-venture renewable hydrogen venture.	0	2,971	0
The level of funding requested for technology validation activities was determined by analysis of individual component technologies to provide a hydrogen fueling station, on-board hydrogen storage for vehicle validation projects, three PEM fuel cell systems for distributed remote power projects, and a 100kW reversible fuel cell system for an arctic environment. Prior experience and contractor proposals were used in this assessment.			
Total, Technology Validation.....	6,361	10,993	11,420

Analysis and Outreach

■ Conduct economic analyses and technical assessments for technologies being developed and demonstrated, in addition support will be provided for similar studies on hydrogen systems involving technologies from production to end use, to provide insight into the applications most likely to be commercially viable and identify areas of further needs in R&D and technology validation. Initiate resource assessment in Montana to determine feasibility of a solid waste hydrogen fuel cell manufacturing facility in the community. Continue development of educational materials

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
including an interactive CD ROM for middle and high school students, a curriculum module to teach chemistry on the basis of hydrogen and the environmental impact of fuels, and the production of an adult educational film on hydrogen use in energy applications, as well as several topical films.			
The funding level is appropriate as determined by the Secretary's Hydrogen Technical Advisory Panel and by the Program's Peer Review Team.	2,470	2,169	2,480
Total, Hydrogen Research	15,806	22,250	28,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Core Research and Development	
■ **Thermal Processes** - The Program will fully fund two thermal conversion processes that produce hydrogen from natural gas with a 20-30% increase in efficiency over conventional processes; and one award to integrate the biologically catalyzed water gas shift process to a pyrolysis reactor to verify process performance.	+1,321
■ **Photolytic Processes** - The Program will award multiple cooperative agreements; at least one award to integrate the new strains of algae into a bioreactor system for process development and characterization; one award to scale-up photoelectrochemical processes to characterize the materials performance and engineering requirements.	+930
■ **Storage** - The Program will award at least one project to complete the characterization of the family of new metal hydride materials to reduce the pyrophoric sensitivity of the alloys; and at least one award to assemble carbon absorbents into a laboratory scale storage system for characterization and demonstration.	+1,261
■ **Utilization** - The Program will fund the prototype design, fabrication and field testing of newly developed solid state hydrogen leak detectors; and for fabrication of a 25kW fuel cell for integration into a small stationary power system.	+1,500
Total, Core Research and Development	+5,012

	FY 2000 vs. FY 1999 ($000)
Technology Validation	
■ The Technology Validation Program will award cooperative agreements for additional stand-alone power generation systems using proton exchange membrane fuel cells to produce electricity and generate hydrogen.	+427
Analysis and Outreach	
■ The Analysis and Outreach Program will award a cooperative agreement for the production of an educational video on hydrogen technologies and complete the resource assessment in Montana.	+311

Hydropower

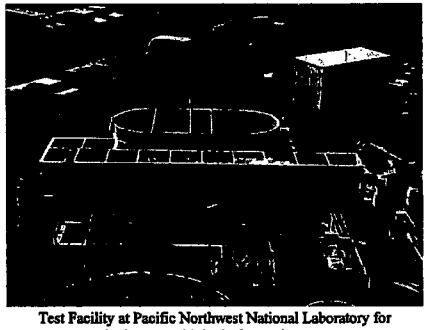
Mission Supporting Goals & Objectives

Program Mission

The mission of the U.S. Department of Energy's Hydropower Program is to improve the technical, societal, and environmental benefits of hydropower resources by conducting collaborative research and development with industry and other Federal agencies.

Program Goals and Objectives

Working with industry and other Federal agencies, the Hydropower Program's research and development activities will provide a biological and engineering basis for a new generation of hydropower turbines. Successful development will reduce turbine-induced fish mortality to 2% or less, compared to current levels ranging up to 30% or greater, and maintain dissolved oxygen levels of at least 6 mg/liter, ensuring compliance with water quality standards. This program addresses the goal stated in the Comprehensive National Energy Strategy (CNES) "to promote energy production and use in ways that respect health and environmental values - improving our health and local, regional and global environmental quality." To meet this goal, one of the strategies proposed in the CNES is to "maintain the viability of existing hydropower sources". Specifically, CNES states that "the development of advanced hydropower turbines to repower existing dams has the potential to avoid some of the environmental challenges posed by conventional hydropower plants and extend the life of existing hydropower plants to help preserve their contribution to U.S. energy production."



Test Facility at Pacific Northwest National Laboratory for hydropower biological experiments.

Strategic Approach

Hydropower currently generates about 10% of the nation's electricity. However, existing generation is in jeopardy, due to a combination of real and perceived environmental problems, regulatory complexity and pressures, and changes in energy economics. New hydropower resources are often not being developed for similar reasons. Current hydropower technology, while essentially emission-free, can have undesirable environmental effects such as fish injury and mortality from passage through turbines and the alteration of downstream water quality and quantity. Incorporation of advanced turbine technology could provide estimated capacity improvements of 4,000MW at existing federal facilities, 1,300MW at existing non-Federal facilities requiring relicensing over the next 12 years, and 4,800MW of new capacity.

In FY 2000 the program will complete the proof-of-concept testing of an innovative design selected through a competitive bidding process. Biological performance will be determined and test results provided to industry. Experiments to establish biological performance criteria will continue, providing biologists and engineers with quantitative data on fish behavior and response in the turbine environment. Final engineering designs for turbines with advanced features to improve dissolved oxygen conditions will begin.

The DOE program is intended to develop hydropower technology with wide applicability. Much of the research presently carried out by Federal hydropower operators, as well as utilities, is site-specific, addresses specific environmental and equipment problems, and has limited general applicability. Moreover, with deregulation utilities are beginning to reduce their research activities, and utility organizations which sponsor R&D are losing membership and cannot maintain these activities at previous levels. Research funded by the few US manufacturers is aimed at minor improvements to the product line, is usually proprietary, and for that reason again lacks general applicability.

Program Benefits

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.01	0.08	0.18
Energy Savings ($ Billions)	0.02	0.20	0.53
Carbon Displaced (MMTCE)	0.15	1.35	3.00

Performance Measures

FY 2000 Performance Measures

- Proof-of-concept testing of advanced turbine conceptual design completed in FY 2000; biological performance predictions verified and test results provided to industry.

FY 2001-2006 Performance Measures

- Completion of full-scale advanced turbine prototype testing in FY 2005, successfully demonstrating the capability of maintaining dissolved oxygen levels of 6 mg/liter.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

- Completed conceptual designs for advanced turbines.

FY 1998 Accomplishments

- Hydropower resource assessments completed for all 50 states, providing a more accurate estimate of viable undeveloped hydropower potential (~30,000MW).
- Conducted laboratory biological studies of the effects of shear stresses on turbine-passed fish.

FY 1999 Planned Accomplishments

- Begin proof-of-concept testing of advanced turbine conceptual design to verify predicted biological performance.
- Begin design of instrumentation for real-time visualization and accurate simulation of fish passing through turbines

FY 2000 Planned Accomplishments

- Complete proof-of-concept testing of conceptual turbine design.

FY 2001-2004 Planned Accomplishments

- Complete experiments to establish biologically-based performance criteria for advanced turbine design.
- Complete final engineering designs for turbines with advanced dissolved oxygen features; begin model fabrication and testing.
- Complete model testing of turbines with advanced dissolved oxygen features.
- Complete design of fish passage visualization/simulation instrumentation.
- Complete final engineering designs for turbines with advanced fish passage features.
- Complete model testing of turbine designs with advanced fish passage features.

Program Completion

Program completion is envisioned for the 2008 time frame assuming levels of funding sufficient to achieve the successful demonstration of biological performance of advanced hydropower technology.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Advanced Turbine Research and Development	729	3,250	7,000	+3,750	+115.4%
Total, Hydropower	729	3,250	7,000	+3,750	+115.4%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Advanced Turbine Research & Development			
■ Complete the pilot-scale laboratory proof-of-concept testing of the conceptual design to verify biological criteria and predicted biological performance using live fish. The funding level is based on previous turbine research efforts and anticipated laboratory in-house costs.	0	2,170	2,500
■ Complete the biological experiments and instrumentation development to establish biologically-based performance criteria required for advanced turbine development. The funding level is based on account experience the funding level requested is considered adequate.	729	1,080	2,500
■ Initiate competitively-selected cost-shared engineering design of turbines with advanced dissolved oxygen features. As the engineering design phase is a pre-commercialization activity, cost-sharing of at least 20% will be a requirement in the competitive solicitation. Experience with the competitive solicitation in the conceptual design phase demonstrated the limited ability of industry to cost-share in pre-commercialization activities. The full-scale prototype testing phase planned for FY 2002 will require at least 50% cost-sharing. It is anticipated that turbine manufacturers responding to a solicitation for this phase will be teamed with a developer in order to achieve this level of cost-sharing. The funding level is based on previous experience, anticipated in-house laboratory efforts and expected level of cost-sharing.	0	0	2,000

Renewable Indian Energy Resources Program

Mission Supporting Goals and Objectives

The FY 1998 and FY 1999 Energy and Water Development Appropriations Report language for Solar and Renewable Energy designated funding for supporting the construction of hydropower and related projects under the Renewable Indian Energy Resource. No funding is requested for any additional activities in FY 2000. Instead, DOE proposes to integrate this program's activities with that of the Federal Buildings/Remote Power line item and create a single, competitive-based, geographically and technologically diverse competitive solicitation program addressing American Indian energy needs. (This program would fall under the Solar Program Support line item).

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Electric Energy Systems and Storage

Mission Supporting Goals and Objective

Program Mission

Transmission Reliability - The mission of the Transmission Reliability Program is to develop technologies and policy options that will maintain and improve the reliability of the nation's electricity delivery system during the transition to competitive power markets.

High Temperature Superconducting R&D - The Department leads the national effort to capture the energy savings potential of superconductivity - the ability of certain materials to be high capacity carriers of electricity without having the resistance losses inherent in normal conductors, such as copper. The mission is to perform research that will create the electricity superhighway of the future by dramatically improving the way electricity is generated, delivered and used.

Energy Storage Systems -The Energy Storage Systems (ESS) Program will work in the new electricity marketplace with its increased emphasis on distributed resources and energy services to develop state-of-the-art energy storage technologies.

The mission is to perform research that provides energy storage systems that create increased value for renewable power systems, and enhance power quality, reliability, productivity and efficiency for electricity users and providers in a competitive electricity infrastructure.

Program Goals and Objectives

Transmission Reliability - The goal of the Transmission Reliability Program is to insure an efficient, reliable power delivery system in the U.S. during the electricity industry transition to competitive markets, through development of advanced technologies that allow lowest-cost, efficient power delivery systems, and integration of distributed resources.

The objectives of the program are to insure the reliability and security of the Nation's electric power system, increase utilization of renewable energy sources, enable customer choice in power quality and self-generation options, provide the capability for information flow needed for the efficient operation of competitive markets, enable significant reduction of air emissions, and enable distributed utility options that integrate natural gas and electric power delivery benefits.

The Program will contribute to the goals and objectives of the Comprehensive National Energy Strategy by supporting competitive and efficient electric systems; ensuring energy system reliability, flexibility, and emergency response capability; accelerating the development and market adoption of environmentally friendly technologies; and developing technologies that expand long term energy options.

The program is projected to be five-years in duration and will ensure that research and development for reliable system and competitive markets is maintained until new market and/or regulatory structures are developed that provide the incentives for the private sector to assume this work. To insure that competitive markets are driving technology choices, any hardware development would be at least 50%

cost-shared by the private sector, and Federal support for hardware demonstration would be limited to test and evaluation activities. The Program also provides a Federal electric power system technical capability to support government policy decision-making during this transition. The Program will be reassessed each year to determine the need for Federal involvement depending on the nature and implementation needs of new regulations, and the impact of market forces.

High Temperature Superconducting R&D - The DOE program is accomplishing two major technological goals: solving the difficult problem of manufacturing electrical wires from the family of brittle ceramic superconducting materials, while in parallel, creating designs of super efficient electrical systems such as motors, transmission cables, generators, transformers and current limiters that use these wires. The products will be resistance-free electrical wires that carry 100 times the current of conventional alternatives and the design of advanced systems that have only half the energy losses and are half the size of conventional alternatives of the same power rating.

Superconductivity will bring a more fundamental change to electric power technology than has occurred since electricity use became widespread over a century ago. The potential is for an energy revolution as profound as the impact fiber optics has had on communication. The fiber optic "information superhighway" was constructed by replacing copper wires with a higher capacity alternative. Superconducting provides an "energy superhighway" that greatly improves efficiency and capacity. The economic (several billion dollars per year market by 2020) and energy impacts (offset potential of 40 medium size conventional generation plants in the U.S. alone) are predicted to be huge.

Perhaps the most important aspect of superconductivity is the contribution it can make in deregulating the electric utility industry. Superconducting transmission lines can provide efficient paths for power to flow from generation sites to load centers with minimal visual or environmental impacts. Superconductivity can also provide many cost and reliability advantages such as increased generator stability, system power control and protection from damaging "fault currents" caused by lightening strikes and other accidents.

The High Temperature Superconducting R&D (HTS) program fits uniquely into Goal I of the Comprehensive National Energy Strategy by increasing the efficiency and economic performance of the national energy system while helping to protect the environment and enhance national security. The superconductor in an HTS transformer reduces electricity energy losses to approximately one-eighth of the level of conventional transformers. The electric losses in HTS cables are approximately half those of conventional overhead transmission lines. Note that the electric energy losses on the United States electric grid due to inefficiencies are greater than all the electricity consumed in the continent of Africa. Consequently, High Temperature Superconductivity devices will make a significant contribution toward increasing the efficiency and economic performance of the U.S. electric system.

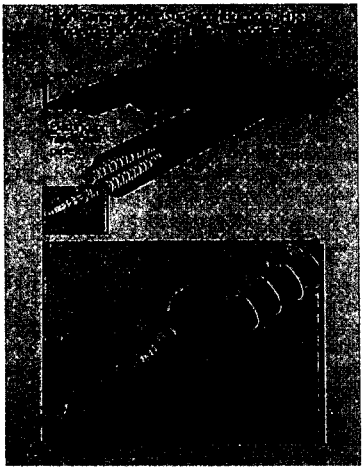
Introduction of HTS technology will affect the environment in two important ways. First, pollution will be reduced. If the entire electric grid and large electric motors were converted to superconductors, CO_2, SOx, and NOx would be reduced by 17,000 thousand metric tons, 300 thousand metric tons and 120 thousand metric tons respectively. The savings in CO_2 are approximately 1% of the total carbon

emissions in the U.S. in 1996. The second area where superconductivity will help improve the environment is by putting unsightly overhead transmission lines underground and reducing the area necessary for power delivery corridors. Finally, superconducting will increase the security of the U.S. electric grid by reducing the exposure of these facilities to acts of vandalism and terrorism.

"Power Line Makes Use of a Miracle of Physics

After 87 years of alternating exuberance and disappointments, and a decade after a famous conclave of physicists at which the key to success seemed to be within reach, the world's first superconducting power line is about to become a reality."

NY Times - November 3, 1998 describing the DOE project to provide electricity to downtown Detroit using a superconducting cable.



Underground HTS cables can carry three to five times more current than conventional copper cables.

Energy Storage Systems -The Energy Storage Systems program is working to create energy storage technologies with a cost goal of $700 per/kW and an energy density goal of 5 kWh per square foot by the year 2003.

The Energy Storage Systems program will develop integrated, cost-effective energy storage systems for the three thrust areas of renewables, reliability (including power quality), and productivity. These systems will offer multiple benefits for electricity providers over a wide array of applications, ranting from small scale remote installations to major industrial facilities. Among these benefits are reduced cost to the U.S. economy of power quality and reliability problems; enhanced utility and customer choices in responding to electric industry restructuring; and increased economic value of renewables and distributed resources.

The ESS Program will work with renewable programs and industry partners to develop integrated systems that increase the value of electricity derived from intermittent wind and solar sources by making the power available regardless of when it is generated. Projects will be initiated that will improve the performance of energy storage technologies in hybrid systems. Recent research has projected a world market for photovoltaic hybrids of $4,000,000,000 by the year 2000.

Energy storage systems will improve the reliability and security of the Nation's electricity transmission and distribution system, helping to meet the objectives of ensuring energy system reliability, flexibility, and emergency response capability as outlined in the Comprehensive National Energy Strategy. Transmission and distribution system productivity and efficiency will be enhanced by storage systems that correct the brief power outages and distortions estimated to cost U.S. industry over $100,000,000,000 a year.

Energy storage systems can also provide significant productivity gains for large electricity users and providers, increasing the competitiveness of U.S. industry. The ESS Program will develop systems for distributed siting that offer multiple benefits for the user including avoidance of peak demand charges, reduced equipment failures, from power-quality problems.

Federal involvement through the ESS Program is critical to the long-range development of conventional and emerging storage technologies. These storage technologies are key to increasing the value of DOE's renewable energy programs for both grid-connected and remotely-sited systems. Energy storage systems integrated with distributed resources into the electric distribution systems, provide the customers with energy control options for maintaining system reliability.

Strategic Approach

Transmission Reliability - The Transmission Reliability Program will be implemented through a National laboratory/electric industry partnership to conduct research on the reliability of the Nation's electricity infrastructure. This strategic partnering approach will insure that research and development (R&D) is defined and initiated that meets electric industry needs, and can be transition for further development or deployment by the industry. The Program will collaborate with industrial and academic partners to develop technologies that promote competitive markets, ensure system reliability (adequacy and security), increase network capacity for large scale, long distance power transfers, and promote integration of distributed resources, including renewable generation and storage. The Program will also examine how market stimuli, and Federal and State regulation combined with the development and application of advanced technologies can be structured to assure incentives for private funding for reliability R&D, and additions of new technologies during and after the transition to competition.

The Transmission Reliability Program focuses on applying advanced computing, sensing, power electronics, communications, and control technologies to provide real time system control for reliable, efficient operation of the Nation's electric power system under both normal and emergency operating conditions. These fundamental technologies will be developed into advanced systems applications under the Power Systems Reliability and Distributed Power activities.

Power Systems Reliability will develop control and information systems to monitor and control the power system in real time, and advanced power electronics to accomplis fast, high-power switching under real time system control. Real time system control will apply next generation hardware, and develop advanced power system algorithms which will allow operators to measure the status of the system in real time, thereby allowing maximum integration of advanced technologies into the power system to ensure system reliability, save capital costs by more fully utilizing existing utility assets, and enable competitive markets. Advanced power electronics will adapt existing high-efficiency, low-cost power converter designs for both transmission and distribution system control equipment. This activity will also develop advanced switching devices materials such as silicon carbide, which result in significantly higher capacity, lower cost, and lower loss power conversion equipment than today's power converters provide.

Distributed Power supports development of technologies, and removal of barriers to enable the integration of distributed generation and storage into the electric and natural gas systems. Distributed technologies include renewable resources, fuel cells, microturbines, battery and flywheel storage, and

direct load control. Integration of these technologies offers environmental and economic benefits, and extends competition to the retail customer level. To enable successful integration of distributed resources into the distribution system, the program will address technical, regulatory, and institutional issues. The program will develop technology solutions to allow safe and reliable distributed power system operation that provides both local and transmission-level benefits. In addition, the Federal government will address technical and regulatory barriers that are common to local electricity distributors, and facilitate work with State and local governments to address other institutional barriers.

Distributed power supports strategic research, systems integration, and institutional issue activities. Strategic Research activity will develop advanced system operational concepts for the integration of small, modular generation and storage technologies into the distribution system. System integration issues, including safety, reliability, power quality, interconnection, and environmental issues related to distributed generation and storage, will be identified through modeling and other engineering analyses, case studies and hardware system integration testing and demonstration. The Institutional Issues activity will identify and assess the impacts of current practices, planning methodologies, power systems engineering training, policies, regulations, ownership structures, and other institutional issues on distributed power applications.

High Temperature Superconducting R&D - To accomplish its mission, the High Temperature Superconducting (HTS) program has mobilized the resources of U.S. industry, national laboratories and universities in a high-risk, parallel development approach: research on the underlying technology, superconducting wires, is being done at the same time applications systems are being designed. This approach will effectively reduce the time to introduction of full-scale systems by a decade or more. A strategic alignment is followed in the program structure, with two industry-led initiative elements and a government lead research element.

The very successful Superconductivity Partnership Initiative (SPI) element supports aggressive industry-lead projects to design advanced electrical applications. SPI projects include generators, transformers, motors, transmission cables, current controllers, flywheel energy systems and magnetic separation systems. A unique SPI feature is that each project involves vertically integrated teams (typically including an electric utility, a system manufacturer and a superconducting wire supplier as well as one or more national laboratories). This vertical integration has proven a powerful way to include customer focus and leverage resources.

The industry-led Second Generation Wire Initiative is exploiting breakthroughs at Los Alamos and Oak Ridge National laboratories that promise unprecedented current-carrying capacity in high-temperature superconducting wires. These breakthroughs, which made headlines worldwide, will allow long wire lengths to behave as a single crystal, thus eliminating internal barriers to current flow that may limit the use of wires now being manufactured. Several industry teams are now working with the national laboratories to scale up the new discoveries.

The Strategic Research program element provides the underlying knowledge base needed for the success of the above industry-led projects. The Second Generation Wire Initiative evolved from five years of strategic research that achieved world record performance breakthroughs in short wire samples. Strategic Research will continue on wire processing as well as exploratory research on innovative systems. In addition, research and analysis will be conducted on issues associated with integration of superconducting systems into an increasingly competitive and restructured industry framework.

Energy Storage Systems - The ESS program works with a diverse group of partners to met end user needs. The Program cooperates extensively with electricity users and providers, equipment manufacturers, system integrators, academic and research organizations. This cooperation helps identify merging trends, and supports development of energy storage systems that will play a vital role in a restructured electricity marketplace. Collaboration with industry partners also allows the ESS Program to leverage resources through cost-shared agreements. In FY 1998, the Program received over $1,600,000 in cos-sharing commitments from its industry partners.

The following projects supported by the Program and its partners will contribute to an increase in new storage technology, and save U.S. consumers billions of dollars in energy-related costs: 1) development and testing of factory-integrated PV/storage systems as part of the Renewable Generation and Storage (RGS) project. The RGS project is a major component of the Storage 2000 Initiative, a joint DOE/industry initiative to accelerate technology development for emerging needs in a restructured electricity marketplace; 2) design of a storage-based power quality system to enhance the reliability and security of the Nation's electricity transmission and distribution system in the restructured electricity marketplace; 3) completion of the Mobile PQ 2000 project with the demonstration of a transportable power quality system by an ESS partner; 4) testing of the Advanced Battery Energy Storage System (ABESS), a transportable, modular zinc/bromine battery system that will increase productivity and efficiency for end users; and 5) development of critical storage components such as power conversion systems and controls in a cost-shared program with industry.

Program Benefits

Transmission Reliability

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.02	0.12	0.13
Energy Cost Savings ($ Billions)	0.00	0.00	0.00
Carbon Displaced (MMTCE)	0.50	2.00	3.00

Using real time control and information systems along with fast, power electronic switching, power systems will quickly evolve that require less conventional power transmission equipment and less reserve generation capacity, while maintaining overall reliability. These systems will allow energy savings and air emissions reductions from less run-time of standby fossil-fired generation, and capital savings through greater utilization of existing system facilities. The Program also performs a vital Federal role by enabling system benefits and competitive wholesale and retail markets through maximum integration of other DOE-developed technologies such as renewable energy resources, energy storage, superconducting equipment, and fuel cells.

High Temperature Superconducting R&D

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.00	0.01
Energy Cost Savings ($ Billions)	0.00	0.24	1.03
Carbon Displaced (MMTCE)	0.00	0.00	0.14
Direct Electricity Displaced (Billion kWh)	0.00	3.30	14.2
Direct Coal Displaced (Million Short Tons)	0.00	0.72	2.80

Other major benefits are expected in electricity grid capacity and reliability as superconducting technologies are introduced. These benefits may be necessary to meet expected new patterns (and large increases) of electricity flow from producers to consumers as markets are deregulated.

Conservative estimates of gradual technology penetration show that within 20 years over 300,000 households could be supplied by the gains in efficiency due to superconductivity. Efficiency gains possible with an all HTS system represent the electrical needs of 8,000,000 households.

Energy Storage Systems

Metric	FY 2000	FY 2010	FY 2020
Primary Energy Displaced (Quads)	0.00	0.00	0.00
Energy Cost Savings ($ Billions)	0.00	0.00	0.00
Carbon Displaced (MMTCE)	0.01	0.02	0.03

These benefits correspond to powering approximately 1,000 homes in the year FY 2000 with renewable generation and storage systems. Energy displaced and carbon reduction result from enhanced integration of renewable energy resources into the electricity market, and peak load reduction. Improved productivity and electric power reliability resulting from improved power quality account for the non-energy cost savings.

Performance Measures

FY 2000 Performance Measures

Transmission Reliability

- Develop plan for distributed power technologies demonstration test bed.
- Complete draft of uniform interconnection standard for distributed resource technologies.
- Complete action plan for addressing institutional and regulatory barriers for distributed power.

High Temperature Superconducting R&D

- The second generation wire being produced in the program must exceed 100 meters in length and 500 amperes per square millimeter in current density are expected.

- The first-of-a-kind superconducting cable to be installed in downtown Detroit must be flexible enough to be installed under city streets without damage and be able to carry the electrical load efficiently and reliably.
- The superconducting power transformer must carry its rated load efficiently and reliably.

Energy Storage Systems

- Increase the energy available in battery storage systems to 3.0kWh/square foot.

FY 2001 - 2006 Performance Measures

Transmission Reliability

- Develop computer software to simulate real time control algorithms for real time systems control, including reactive power and voltage control.
- Test intelligent distributed control agent to provide control and information for distributed power management.
- Complete Phase I of distributed power system integration tests.
- Test high voltage power electronic converter for power transmission application.
- Test device-grade, high band-gap switching material for power converter at intermediate voltages.

High Temperature Superconducting R&D

- Develop the capability to manufacturer kilometer lengths of high capacity wire (current-carrying ability of 1,000 amperes per square millimeter cross-section) at a potential cost of $0.01/ampere-meter.
- The first-of-a-kind systems installed during this period must show significant improvements over conventional systems in terms of efficiency, capacity and reliability.

Energy Storage Systems

- Reduce the cost of energy storage systems to $700/kW.
- Increase the energy available in energy storage systems to 5.0kWh/square foot.

Significant Accomplishments and Program Shifts

Pre-FY 1998 Accomplishments

Transmission Reliability

- No program established.

High Temperature Superconducting R&D

- Program participants have set most of the world's technological milestones in the last several years, including those for motors (200 horsepower motor tested), cables (50 meter, 3,000 ampere cable began testing), and transformers (1 MVA unit tested). Four R&D 100 awards were won, as well as

the DOE award for Solid State Physics and the Lockheed Martin Corporation's NOVA award for teamwork.

Energy Storage Systems

- In FY 1997, a 1.4 MWh energy storage system was installed on the Annette Island Reserve in southeast Alaska, home to the 1,700-member Metlakatla Indian tribe. The system, built with technical assistance from the ESS Program and charged by hydropower, eliminates continual use of a 3.3 MW diesel engine. In the first eight months of operation, fuel use was reduced by 180,000 gallons, resulting in a cost savings of over $39,000 a month.
- A 3.5 MWh battery energy storage system was installed at a lead battery recycling plant in Vernon, CA. The system supports critical plant loads during power outages to prevent violations of lead emissions standards and has greatly reduced the plant's costly non-compliance fines. The system has provided peak shaving and uninterrupted power since 1996.
- The PQ 2000 energy storage system was installed at an industry site in Homerville, GA. The 1 MW, 10-second, factory-assembled system corrected over 90% of the plant's power quality disruptions during the first six months of operation. In 1997, DOE, AC Battery and other industry partners, received the prestigious R&D 100 award for the PQ 2000 energy storage system.

FY 1998 Accomplishments

Transmission Reliability

- No program established.

High Temperature Superconducting R&D

- Six teams were selected for funding in the Superconductivity Partnership Initiative (SPI) in a free and open competition. The winners proposed to develop near and long term designs for power cables and transformers, a flywheel power system using superconducting bearings, and a magnetic separation system.
- The SPI 3,000 amp transmission cable was completed, and initial scale-up requirements were met for wire processing breakthroughs by the national laboratories.

Energy Storage Systems

- Completed three studies that define the present and future needs of users of RGS systems, and determine the application requirements of the RGS systems that would meet these needs.
- Field tests of the Mobile PQ 2000 power quality storage system were initiated at a utility site.
- Completed assembly and testing of a small-scale test module zinc/bromine battery with four times the energy density of today's lead acid batteries.

Electric and Magnetic Fields

- Completed planned health effects research and exposure assessments leading to a risk assessment by the National Institute of environmental Health Sciences in 1998.

- Conducted and disseminated a risk evaluation by an international panel of experts concerning health effects from exposure to electric and magnetic fields, and document research results.

FY 1999 Planned Accomplishments

Transmission Reliability

- Completed workshops and six studies to identify and define needs for reliability research in a restructured U.S. electricity industry.

High Temperature Superconducting R&D

- The world's first high-field (1.0 Tesla) superconducting magnet will be built that operates a liquid nitrogen temperatures; a facility designed to manufacture continuous lengths of second generation superconducting wire will be built; and the world's largest HTS motor (1,000 horsepower) will be tested at an industrial site.

Energy Storage Systems

- Develop a test bench-scale hybrid storage/generation hardware and control configurations to assess the optimum use of storage in RGS systems under the Storage 2000 Initiative.
- Develop critical storage components such as power conversion systems and controls in a cost-shared program with industry.

Climate Challenge

- Maintain existing partnership agreements to ensure year 2000 pledge reductions of at least 47 million metric tons of carbon equivalent.
- Expand voluntary industry/government collaboration to reduce greenhouse gases by catalyzing a Climate Change forum with over 600 utility partners to exchange lessons-learned on cost-effectively reducing greenhouse gases.

FY 2000 Planned Accomplishments

Transmission Reliability

- Complete multi-year demonstration plan for distributed technologies test bed.
- Complete draft of uniform interconnection standard for distributed generation and storage technologies.
- Identify regulatory and institutional barriers to distributed power, and develop and begin implementation of an action plan to address these.
- Complete models to simulate ancillary services market designs.

High Temperature Superconducting R&D

- A 3-phase superconducting cable will be the world's first to supply power to a manufacturing complex. The cable will be 30.5 meters long, and will carry 1,250 amperes of current at 12,500 volts. The equivalent power would serve a city of 25,000 people. Construction of a research facility for continuous manufacturing of second generation wire will begin.

- An advanced, and environmentally friendly, 10 mega volt amperes power transformer will be the first to provide electrical service to a manufacturing facility. Half the size and more efficient than conventional alternatives, this superconducting transformer also eliminates oil cooling that can cause fire and pollution problems.
- Technology of "second generation" HTS wires will have advanced to 100 meter lengths being manufactured able to transmit 100 amperes through a one millimeter wire cross-section (over 100 times the capacity of conventional wires).

Energy Storage Systems

- Initiate a substation power quality system project with an industry partner; the system will improve the reliability of the Nation's electricity infrastructure.
- Begin the testing phase of Advanced Battery Energy Storage System (ABESS) project; this technology will increase productivity and efficiency for large end users.
- Complete a cost-shared demonstration of a customer-sited storage system with a major utility; this system will provide cost-savings, load management, and controllable reserve margins for energy providers of the future.
- Complete the Transportable Battery energy Storage System (TBESS) project; an ESS partner will then undertake commercialization of the mobile power quality system.

FY 2001 - 2004 Planned Accomplishments

Transmission Reliability

- Complete evaluation of the correlation between satellite-synchronized system measurements and model predictions of known power system events.
- Deliver software to implement real-time data system for reactive power analysis of large systems.
- Complete assessment of intelligent distributed control agents.
- Complete design of distributed power system integration tests to identify safety, power quality, interconnection, and environmental issues related to distributed generation and storage.
- Initiate large scale simulator tests of real time system control aimed at reducing air emissions and increasing system reliability.
- Complete laboratory development of techniques for production of high purity silicon carbide for advanced power electronic switches.
- Complete Phase I distributed power system integration tests.
- Begin tests of advanced high efficiency, high voltage power electronic converters for power transmission applications.

High Temperature Superconducting R&D

- A number of world-class accomplishments will be achieved. A 5,000 horsepower motor will be run under actual operating conditions to complete the SPI motor project; power will be supplied to businesses in a downtown metropolitan area to complete a SPI cable project; an advanced design 10

MW power transformer will be operated at an electric utility substation; and continuous lengths of high performance second generation wire will become available for incorporation into SPI equipment designs.

Energy Storage Systems

- Complete development and testing of several integrated PV/storage systems as part of the RGS project.
- Test the substation power quality system with industry partners.
- Develop improved advanced storage (e.g., flywheels or SMES) components with industry partners designed for power quality and reliability systems.
- Complete the ABESS project; industry will begin commercialization.

Program Completion

Transmission Reliability

This is projected to be a five-year program to ensure that research and development for reliable systems and competitive markets is maintained until new market and/or regulatory structures are developed that provide the incentives for the private sector to assume this work. Continued involvement with electricity industry participants will ensure that his R&D supports technologies that will integrate into, and be adopted under future operational/market scenarios. The program will be reassessed each year to determine the need for Federal involvement depending on the nature and implementation needs of new regulations, and the impact of market forces under both Federal and State regulations.

High Temperature Superconducting R&D

The program supports basic research on wire materials processing and design of first-of-a-kind systems in order that HTS power applications are brought to widespread use in the shortest possible time.

Basic research activities will be completed during FY 2004 - FY 2006 resulting in practical wires from U.S. manufacturers that can achieve 1,000 amperes per square millimeter of cross-sectional area while operating at liquid nitrogen temperatures in a field of 3 Tesla. "Practical wires" imply flexibility, ruggedness, and affordability when produced in sufficient quantity.

Energy Storage Systems

The Energy Storage Program research and development is focused on enhancing the performance and reliability while reducing the cost of energy storage systems for the competitive electric power marketplace. These energy storage technologies include battery, flywheel, superconducting magnetic energy storage (SMES) and high energy density capacitor systems.

Basic development activities will be completed during FY 2004-FY 2006 with the completion of performance evaluations of systems that meet the cost and energy density goals for the Program.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Transmission Reliability	0	3,000	4,000	+1,000	+33%
High Temperature Superconducting R&D	31,579	32,500	31,000	-1,500	-4.6%
Energy Storage Systems	3,839	4,500	6,000	+1,500	+33%
Climate Challenge	0	100	0	-100	0.0%
Electric and Magnetic Fields R&D	7,844	0	0	0	0.0%
Total, Electric Energy Systems and Storage	43,262	40,100	41,000	+1,900	+4.7%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Transmission Reliability

- **Power System Reliability** - Develop real-time measurement and control systems to collect and apply power system data in real time to ensure and enhance electric power system security and reliability, reduce air emissions, and enable efficient markets. Investigate incremental modifications to grid system models to take advantage of real time data. Evaluate data requirements and develop models for ancillary services markets. The funding level is considered appropriate as a ramp-up level from the FY 1999 program start, with the projected placement of additional industry cost-shared contracts under the National laboratory/electric industry partnership to support transmission reliability of the electric infrastructure. The program was formulated after electric industry views on the direction, content and priorities of the program were solicited at a workshop with broad industry representation, and through discussions with EPRI at the yearly DOE/EPRI Sustainable Electric Partnership Executive Conference.

  Develop performance and cost models for advanced multi-level inverters for power system applications, and identify applications for simulation tests. Assess state of the development of high band-gap materials for high capacity power electronic switching devices, and initiate silicon carbide

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
material development. These technologies allow the grid to be operated in real time to enable competitive markets, and maximize use of existing rights of way.	0	2,500	3,800
■ **Distributed Power (DP)** - Initiate multi-year cooperative efforts with industry and state energy agencies to develop innovative concepts for electric power system design utilizing distributed generation and storage resources. Identify applications and market mechanisms to realize benefits of distributed power and quantify potential benefits.			
Initiate activities, including modeling and case studies, for system integration tests of distributed generation and storage to examine safety, reliability, power quality, interconnect, environmental and other issues related to distributed generation and storage, and interactions of gas and electric distribution systems. With industry, draft interconnect standard for distributed generation and storage. Identify institutional barriers to the deployment and utilization of distributed resources, and develop and implement strategies for minimizing the effect of these barriers. The DP program was formulated after electric industry views on the content and priorities of the program were solicited at a workshop with broad industry representation. The level and distribution of funding in DP is appropriate to initiate the Program based on the status of research in these areas determined from industry.	0	500	200
Total, Transmission Reliability	0	3,000	4,000

High Temperature Superconducting R&D

■ **Superconductivity Partnership Initiative** - Activities will support six major projects to develop first-of-a-kind electrical systems that can provide quantum improvements to the efficiency and capacity of the national grid. These include transmission cables, transformers, large motors, flywheel energy systems and magnetic separation systems that meet performance goals. The programs's past experience has demonstrated that this extremely ambitious schedule is possible within the funding requested because of careful planning and leveraging of resources. Leveraging includes the 50% cost share that the program has been able to

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
attract, even though the projects are very high risk. Additional leveraging occurs because the project teams are typically a vertically integrated consortium of companies containing a future product use (an electric power company), a manufacturer, and a superconducting component supplier.	14,000	14,500	14,000
■ The Second Generation Wire Initiative is crucial to producing superconducting wire that meets the program's performance goals. High-performance, low-cost wire is the key to the success of the Superconductivity Partnership Initiative projects. Four industrial consortia will be working with the national laboratories to scale up discoveries that are the basis for this initiative. Wire performance goals of length, current density and cost will be met. The performance goals are very ambitious but past success indicates that the prospects are good for meeting them at the requested funding level. Private sector participants' 50% cost-sharing leverages program funds. The program has drawn upon some of the finest expertise available and feels that the requested funding will provide the resources necessary to meet program goals.	8,000	8,000	8,000
■ The Strategic Research program component has been the incubator for discoveries and innovations now being pursued in the two above initiatives. The entire program depends on continued results from in-house national laboratory research and joint research being carried out with private companies under 50% cost-shared agreements. This activity provides fundamental knowledge needed in the above two initiatives. The requested level of funding has been sufficient to provide the critical masses of multi-disciplinary research teams that have contributed breakthroughs in the past. Important research leveraging is obtained through complementary work funded by the DOE Office of Basic Energy Science, program funded work at several universities and leveraged research at the National Institute of Science and Technology (two NIST dollars for every program dollar).	9,579	10,000	9,000
Total, High Temperature Superconductivity.	31,579	32,500	31,000

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Energy Storage Systems			
■ **Storage Systems Integration** - Demonstrate advanced integrated systems based on end user needs in the areas of reliability, power quality and renewables. Initiate one to two new Renewable Generation and Storage (RGS) projects that will produce improved integrated PV/storage hybrid systems, enabling the increased utilization of renewable generation at a lower cost and with reduced maintenance requirements. Continue and complete multi-year project to develop and test the Mobile PQ 2000, a state-of-the-art, transportable system that provides premium power services to commercial and industrial customers. Begin testing phase of ongoing Advanced Battery Energy Storage System (ABESS) project. This Technology will increase productivity and efficiency for large electricity users by allowing them to manage the costs of energy usage using low-cost, small size batteries. Initiate development of a new energy storage system under the Storage 2000 initiative to improve transmission and distribution stability. This new system will improve the reliability of the nation's electricity infrastructure in a competitive marketplace, and improve power quality. The funding level and program elements for systems integration were established through a series of meetings with the photovoltaic and battery industries, and a separate series of executive conferences with the electric service provider industry.	1,950	2,200	3,000
■ **Key Components for Storage Systems** - Begin testing prototype power controller software that provides improved switching and optimal control strategies for hybrid (e.g. PV/diesel/storage) systems. This technology will maximize performance and reduce cost by decreasing maintenance and extending component lifetimes. Begin development of remote power systems testing requirements for international project with industrial R&D funding body. This project will greatly			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
improve the reliability of modular renewable energy systems not connected to utility grids. The funding level and identification of key components for development were established through stakeholder and industry reviews, and evaluation of the performance of existing systems. The funding level is appropriate based on industry assessments and program experience in these technologies.	1,350	1,400	2,100
■ **Analysis and Utility Competition** - Use models and engineering assessment tools to produce unbiased system studies, opportunities analyses, and technology assessments of potential high-value energy storage applications. Begin the first phase of a Handbook on Energy Storage for Renewable Systems that provides technical guidelines to members of the renewables and storage communities for improved integration of energy storage with renewables. Complete quantitative analysis of the impact of energy storage on reliability for energy providers in a restructured electricity marketplace. The funding level is appropriate based on extensive program experience in analyzing similar opportunities and benefits for application of storage technologies to enhance power quality for utility and industrial application.	539	900	900
Total, Energy Storage Systems.	3,839	4,500	6,000
Climate Challenge			
■ Engage in dialogue with electric utility industry to design a voluntary program for the post-2000 period. Then renegotiate individual agreements with utilities to include voluntary utility commitments in the post-2000 period. Continue to compile and report utility industry pollution reduction accomplishments.	0	100	0
Electric and Magnetic Fields R&D			
■ Completed experiments to identify the biophysical basis for replicable EMF biological effects and relevant EMF exposure parameters. Completed intensive research begun in FY 1996			

	(dollars in thousands) FY 1998	FY 1999	FY 2000
to replicate key findings, using advanced EMF exposure systems at four Government laboratories. Completed a risk evaluation of potential human health effects from exposure to electric and magnetic fields (by NIEHS). Continued intensive communication program, including publication and distribution of booklets updated with most recent information. Carryover balances will be used to complete a few unfinished studies in FY 1999.			
■ In FY 1998, $1,000,000 was provided for aluminum matrix composite (AMC) conductors: Conduct utility case studies on the value of AMC conductors for increasing the capacity of transmission lines; investigate alternative materials and compositions; and investigate more efficient and economical manufacturing processes as directed by Congress.	7,844	0	0

Solar and Renewable Program Direction

Mission Supporting Goals and Objectives

Program Direction provides the Federal staffing resources and associated funding to support the management and oversight of the Solar and Renewable Energy Programs. This activity includes all funding for support service contractors, equipment, travel, crosscutting activities, and Assistant Secretary initiatives. This permits the continuation of a diverse array of Solar and Renewable projects to be integrated into a national portfolio of world renown research. Program Direction encompasses two principal activities: (1) Headquarters executive and program management; and (2) program operations at the Golden Field Office and the Idaho Operations Office.

Secretary Richardson announced in November that based on a review of the Department's staffing, the reductions had far exceeded the final FY 2000 Strategic Alignment Initiative (SAI) goals, and in fact the aggressive downsizing was now having a negative impact on technical and professional positions. As a part of the Workforce 21 initiative the Office of Energy efficiency and Renewable Energy completed a comprehensive workforce analysis for the Fiscal years 1999 and 2000, including and in-depth review of requirements for each of the component EE organizations. A total of 51% of the 155 positions that EE lost to downsizing since 1995 were technical and professional personnel, this has impaired EE's ability to deliver on its mission requirements. Further, the downsizing eliminated many lower and mid-level technical and professional employees and this is now straining EE's ability to develop successors to our retiring employees. Based on current business-as-usual staffing projections, by January 1999, 48 more technical and professional staff will be eligible for retirement, and by FY 2003 as many as 131 technical and professional employees will be eligible for retirement.

The FY 2000 Congressional Budget Request lays the foundation to off-set the adverse impacts of the downsizing. Additionally, EE has adopted smarter, more effective business and management practices, and as revealed in the workforce analysis these efforts have greatly reduced the need for most but not all of the staff lost due to downsizing. The requirements for Solar and Renewable programs could be accomplished with additional staffing above the current FY 1999 staffing levels. These new positions are consistent with EE's Workforce 21 strategy, which is to concentrate the majority of the critical hires to the technical and professional category, leaving the clerical/administrative and manager/supervisor staffing levels virtually the same.

Performance Measures

- Responsiveness to national energy policy goals and objectives.
- Continued improvement in the utilization of Federal staffing, travel, and support service contractor funding.
- Continued reductions in fiscal year-end uncosted obligations.
- Continued increase in competitive contract awards.
- Cost sharing and leveraging of program resources to enhance the program's impact.

- Improvement in environment, safety, and health compliance.
- Ensuring that all Federal employee costs, travel, support service contracts, ASEE initiatives, and crosscutting activities are supported from within Program Direction.
- Committed to creating and maintaining an environment that is free from discrimination.

Detailed Program Justification

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
Salaries and Benefits			
■ Staff funded in this decision unit provide the executive management, program oversight, analysis, and information required for the effective implementation of the Solar and Renewable Resources Technologies Programs. The staff are also responsible for the development of policies, strategic plans and related guidance to program offices; the evaluation of program performance; the formulation, defense and execution of the Solar and Renewable budgets; and communications with the public and stakeholders regarding policies, budgets, program performance and related issues. Additionally, Solar Program Direction supports staff at the Golden Field Office and the Idaho Operations Office. Based on the completion of a comprehensive Workforce 21 analysis, additional critical professional/technical FTEs have been identified to ensure that EE's ability to deliver on its mission requirements is not impaired. EE is committed to reduce the costs for all administrative activities and achieve savings through a more streamlined and efficient management of federal staffing levels in this account. The requested FTEs are consistent with EE's Workforce 21 strategy, which is to concentrate the majority of the critical hires to the technical and professional category, leaving the clerical/administrative and manager/supervisor staffing levels virtually the same. The FY 2000 Congressional Request for Program Direction provides for staffing adjustments resulting from Workforce 21.	10,459	10,065	11,670
Travel			
■ Travel has been substantially reduced from previous years through the use of teleconferencing facilities for the conduct of oversight activities of some field organizations. The escalation of travel costs preclude further reductions without impacting EE's ability to achieve its missions requirements.	404	405	440

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000

Support Services

- Includes all funding for support service contractors, equipment, crosscutting activities, and Assistant Secretary initiatives. Such activities include the development and evaluation of performance measurement and quality metrics for the Solar and Renewable Energy Programs. These activities are expected to achieve efficiency savings throughout the programs, and return to the taxpayer program cost savings far in excess of the expenditure. The support, will enable adoption of sound business practices called forth under the Government Performance and Results Act (GPRA) of 1993 and the Government Management Reform (GMRA) Act of 1994. Other support services include activities such as mailroom and travel processing.

  In FY 1999, a total of $1,900,000 is included for electricity restructuring activities including $1,500,000 in the original appropriation and $400,000 in the Omnibus Consolidated Appropriation Act. The Department is currently working on a program plan to Congress describing this new program including the discrete role the Department would play that is not duplicative of services provided by the private sector, state governments, or other Federal agencies. Also, within the $1,500,000 for restructuring, funds are provided for financial and technical assistance to states undergoing restructuring, including $150,000 for electricity restructuring activities of the California Energy Commission. In FY 2000, the electricity restructuring activities are included in the Congressional Request under Solar Program Support. 3,161 5,890 5,121

Other Related Expenses

- This activity includes the Working Capital Fund (WCF) and contractual services associated with landlord support of the Golden Field Office. Funding for the WCF in FY 1998 through FY 2000 is $1,581,000; $1,690,000, and $1,690,000 respectively. Rent is the largest component of the Working Capital Fund (FY 1998 through FY 2000 is $985,000; $926,000, and $890,000 respectively). The balance of the Other Related Expenses is for Golden landlord requirements

	(dollars in thousands)		
	FY1998	FY 1999	FY 2000
such as rental payments to GSA, expendable office supplies and materials, telecommunications and utilities, training, purchase of goods and services from Government accounts, printing and graphics, postage, maintenance and service agreements, and publications. The total costs for the Golden Office are split between the Energy Supply Appropriation and the Interior and Related Agencies Appropriation.	1,627	1,740	1,940

Federal Buildings/Remote Power Initiative

Mission Supporting Goals and Objectives

Program Mission

The Federal Buildings/Remote Power Initiative identifies and documents the economic benefit of using renewable energy technologies in applications that are currently cost-effective in the marketplace.

Program Goals and Objectives

Over the course of the Initiative, the program will demonstrate that renewable energy technologies are economical, reliable, and easy to operate.

Strategic Approach

The Federal building portion of the initiative provides financial cost-sharing assistance to Federal agencies that are seeking to incorporate renewable energy technologies into their power supply porfolio, such as wind development in San Clemente Island, California, solar domestic hot water collectors in Pearl Harbor, Hawaii; and geothermal gradient technologies at the Naval support facility in Diego Garcia. The Remote power portion of the initiative works to deploy renewable technologies--including solar, wind, fuel cell, and biomass power--in remote areas of the United States, and to develop and demonstrate their reliability, economics, and environmental benefits when compared to diesel generators.

Program Benefits

The Federal Buildings/Remote Power Initiative is supportive of the specific program mission, goals and objectives, and benefits of the participating technologies. In FY 2000, those specific sections are indicated in the individual requests of those participating technologies and in the Competitive Solicitation section of the Solar Program Support request.

Significant Accomplishments and Program Shifts

FY 1998 Accomplishments

- More than 70 applications were submitted under the Federal Buildings Initiative. Awards were made to 26 proposals resulting in 277 renewable systems being installed at Federal Facilities.
- Pursuant to a competitive Remote Power solicitation, 23 projects were funded resulting in a 10 to 1 leveraging of Federal funds.

FY 1999 Proposed Accomplishments

- The Federal Buildings Initiative will solicit additional proposals which will specifically include Native American projects involving Federal facilities.
- The Remote Power Initiative will conduct two project solicitations, one directed specifically toward Native American proposals for off-grid and grid-compatible projects on native lands.

Funding Schedule

(dollars in thousands)

Executive Budget Summary

Mission

The Office of Nuclear Energy, Science and Technology (NE) is home to much of the Federal Government's expertise in nuclear technology. This expertise is critical to assuring that, through its unique technical resources, the United States Government has the ability to respond to issues related to nuclear technology, including energy resource issues, matters of national security, nuclear engineering education, nuclear research, and the production and distribution of isotopes for medical and research uses. The United States relies on nuclear energy technology to provide about a fifth of its electricity, to provide critical isotopes for health care and industry, to explore the solar system, and to enhance the nation's security. Many other countries in the world are even more reliant on nuclear energy, and nuclear energy will continue to become increasingly important as the next century unfolds. Because of our reliance on this vital technology for economic, energy, and national security, the Department of Energy invests in services, products, and technologies that are beyond the capability of private industry alone.

This budget is the second to be prepared under the Government Performance and Results Act of 1993. The Act requires Government agencies to prepare strategic plans, performance plans, and performance reports that measure progress against goals. The Department's Strategic Plan consists of four Business Lines and a Corporate Management activity. NE's many diverse programs contribute to the success of all of the Department's business line goals. Working with industry, academia, the national laboratories, other Government agencies, and international partners, the Office has established goals that derive from the Department's strategic plan and guide our day-to-day activities. NE's goals by DOE Strategic Plan objective follow:

- *Energy Resources Objective 2* - Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact.
  - Support innovative nuclear energy research and science (see Nuclear Energy Research Initiative)
  - Address critical technology issues associated with existing nuclear power plants (see Nuclear Energy Plant Optimization)
- *Science and Technology Objective 2* - Deliver leading-edge technologies that are critical to the DOE mission and the Nation.
  - Provide compact, safe, reliable nuclear power systems and related technologies to space, national security, and other customers (see Advanced Radioisotope Power Systems)
  - Develop technologies for production and application of isotopes, support vital, advanced research that applies to DOE-produced research isotopes, and ensure a reliable supply of medical, research, and industrial isotopes (see Isotopes Production and Distribution)
  - Manage DOE nuclear facilities in a safe, environmentally-sound, and cost effective manner and provide for the easy, cost-efficient use of relevant facilities by non-Federal researchers (see TRA Landlord)

- *Science and Technology Objective 4* - Use DOE assets as part of an Administration-wide effort to advance the Nation's science education and literacy.

  - Support improved U.S. nuclear education and research infrastructure (see University Reactor Fuel Assistance and Support)

- *Environmental Quality Objective 6* - Reduce the life-cycle costs of environmental cleanup.

  - Manage DOE facilities in a safe, environmentally-sound, and cost effective manner (see Uranium Programs)
  - Support implementation of the Secretary's anticipated April 1999 decision regarding future operation of FFTF for the future production of medical and industrial radioisotopes and other nuclear research and irradiation activities or permanent deactivation (see Fast Flux Test Facility)
  - Develop technologies needed to meet DOE spent nuclear fuel management and facility shutdown commitments (see Termination Costs)

In addition, NE is continuing to streamline its operations and organization to respond to the National Partnership for Reinventing Government objectives to make Government more effective, efficient, and responsive.

Strategy

In accomplishing its program objectives, the Office of Nuclear Energy, Science and Technology will engage research institutions in industry, U.S. universities, national laboratories, international organizations, and other countries in cooperative and collaborative efforts. The major program elements that contribute to the mission are: Advanced Radioisotope Power Systems, University Reactor Fuel Assistance and Support, TRA Landlord, Nuclear Energy Plant Optimization, Nuclear Energy Research Initiative, Termination Costs, Fast Flux Test Facility, Isotope Production and Distribution, Uranium Programs, and Program Direction. Program accomplishments that will enable NE to achieve it's mission are identified in the detailed program budget submissions. Programs that make up the NE budget are funded in the Energy Supply appropriation account.

Funding Summary

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Energy Supply			
Nuclear Energy R&D	54,246	73,766	87,345
Termination Costs	88,149	85,000	65,000
Fast Flux Test Facility	0	30,000 [a]	30,000
Isotope Support	19,473	21,500	21,000
Uranium Programs	44,633 [b]	49,000 [b]	41,000
Program Direction	21,000 [c]	24,700 [c]	24,960
Use of Prior Year Balances	-8,221	-3,546	0
Total, Energy Supply	219,280	280,420	269,305

Major Changes

The International Nuclear Safety Program and Highly Enriched Uranium Transparency Program have been moved to the Office of Nonproliferation and National Security (NN) and are not included in the FY 2000 Office of Nuclear Energy, Science and Technology budget request. In addition, the Department's budget includes a new program, the Nuclear Energy Plant Optimization program.

Major Issues

Fast Flux Test Facility (FFTF)

In the Spring of 1999, the Department will decide whether to permanently deactivate the FFTF or to conduct an Environmental Impact Statement to consider its operation in support of a range of national research reactor requirements. The FY 2000 request would fund minimum surveillance and maintenance of the FFTF to keep it in a safe and environmentally-compliant condition. The FY 2000 request is adequate to support minimum surveillance and maintenance of the facility, however funding above the FY 2000 request level would be required to restart, permanently shutdown, or maintain the facility in its current condition.

---

[a] Excludes $9.2 million of prior year balances reprogrammed into this account in FY 1998.

[b] Includes funding for Transparency Measures ($15.4 million in FY 1998 and $13.6 million in FY 1999) which transferred to the Office of Nonproliferation and National Security.

[c] Includes funding for Salaries, Benefits, Travel, and administrative expenses associated with the International Nuclear Safety Program and Transparency Measures which ($3.125 million in FY 1998 and $3.458 million in FY 1999, plus $192K in prior year funds) transferred to the Office of Nonproliferation and National Security.

Termination Costs

After completion of the operational phase of the electrometallurgical treatment technology demonstration project on spent Experimental Breeder Reactor-II (EBR-II) fuel, the Department will evaluate the suitability of the technology for full-scale treatment of the remaining inventory of EBR-II spent fuel. The Department's decision to proceed with electrometallurgical processing will be based, in part, on the results from the National Academy of Sciences' review, as well as the completion of an Environmental Impact Statement. The FY 2000 budget request provides limited funding for the application of electrometallurgical technology since full-scale processing of EBR-II spent fuel will not commence immediately after completion of the demonstration project.

Site Funding

Site funding is provided in individual decision units.

Program Performance Measures

Key program performance measures used to judge the effectiveness of each program element are shown below. In addition to the technical effectiveness measures shown, program progress, customer satisfaction, and employee satisfaction are monitored to ensure that NE's programs are relevant and managed in a cost-effective manner.

Advanced Space Power Systems (ST-2)

- In FY 1998, executed a multi-year contract for the development of highly efficient radioisotope power systems in support of NASA's future mission requirements. **(Fully Successful)**
- In FY 2000, complete an Environmental Impact Statement and establish a Record of Decision on whether to proceed to develop a domestic plutonium-238 production capability for future space missions.
- Complete development and initiate operations for startup by the end of FY 2000 of a capability to recover plutonium-238 scrap for reuse for ongoing and future missions.
- Develop a new technologically-advanced power system for 21st century space exploration and test a demonstration unit in FY 2000.

University Reactor Fuel Assistance and Support (ST-4)

- Support U.S. universities' nuclear energy research and education capabilities by:
  - Providing fresh fuel to all university reactors requiring this service.
  - Funding universities with research reactors for reactor upgrades and improvements (at least 20 in FY 1999; and at least 23 in FY 2000).
  - Partnering with private companies to fund DOE/Industry Matching Grants Program for universities (19 or more in FY 1999; and 17 or more in FY 2000).
  - Increasing the funding for Reactor Sharing in FY 1999 by 40 percent over FY 1998, and in FY 2000 by 20 percent over FY 1998, enabling each of the 26 schools involved in the program to improve the use of their reactors for teaching, training, and education within the surrounding community.

- Attract outstanding U.S. students to pursue nuclear engineering degrees by:
  - Increasing the number of Fellowships (from 14 in FY 1998 to 22 in FY 1999 and 18 in FY 2000).
  - Increasing the number of Nuclear Engineering Education Research Grants (in FY 1999 existing and new grants will total 43; and in FY 2000 existing and new grants will total approximately 45).
  - Providing summer on-the-job training to junior and senior nuclear engineering scholarship recipients (29 in FY 1999, 25 in FY 2000).

Test Reactor Area Landlord (ST-2)

- Continue to upgrade the physical plant and site infrastructure in accordance with the long range plan to ensure safe and reliable operation of Test Reactor Area site facilities.

Nuclear Energy Plant Optimization (ER-2)

- In FY 1999, complete Memorandums of Understanding with the Nuclear Regulatory Commission and the Electric Power Research Institute (EPRI) to guide future implementation of the Joint DOE-EPRI Strategic Research and Development Plan to Optimize U.S. Nuclear Power Plants.

- In FY 2000, implement a cooperative R&D program to address technical questions that could prevent continued operation of current nuclear plants by working with industry, universities, and national laboratories.

Nuclear Energy Research Initiative (ER-2)

- In FY 1999, establish a peer-reviewed Nuclear Energy Research Initiative, initially funded at $19 million, to select and conduct investigator-initiated innovative scientific and engineering research that will address the issues facing the future of nuclear power in the U.S., including proliferation concerns, economics, and the management of nuclear waste.

- In FY 2000, advance the state of scientific knowledge and technology to enable incorporation of improved proliferation resistance in the design, development, and deployment of new reactor and nuclear fuel systems.

- In FY 2000, improve the understanding of reactor systems, component technology and nuclear fuel performance so one or more new reactor and one or more new fuel cycle concepts are identified which offer improved proliferation resistance, and the prospects of improved performance and efficiency, lower cost, and enhanced safety.

- In FY 2000, identify one or more proliferation resistant reactor concepts for low power and/or modular design applications.

Termination Costs (EQ-6)

- Complete the demonstration of the electrometallurgical spent fuel treatment technology by the end of FY 1999 using Experimental Breeder Reactor-II spent nuclear fuel.

- Complete the conversion and disposition of 100 percent of the secondary sodium coolant from the Experimental Breeder Reactor-II and 40 percent of the Fermi reactor sodium coolant in storage at Argonne National Laboratory-West.

- Determine by September 1999 whether electrometallurgical waste forms perform better than borosilicate glass under conditions consistent with the requirements being developed for the Department's geological repository license application.

- In FY 2000, complete the draining and processing of EBR-II primary sodium.

- In FY 2000, complete a National Environmental Policy Act review on the use of electrometallurgical technology to treat EBR-II and other sodium-bonded fuel in the Department's spent fuel inventory.

- In FY 2000, complete documentation of the operational phase of the demonstration project and resulting data from the electrometallurgical technology demonstration.

- Develop technical basis to support a DOE decision in FY 2000 on future application of the electrometallurgical treatment technology in the disposition of DOE spent nuclear fuels.

- In FY 2000, develop preliminary cost estimates and schedules for deactivating the Fuel Conditioning Facility and the Sodium Processing Facility.

Fast Flux Test Facility (EQ-6)

- Maintain the Fast Flux Test Facility in a safe, environmentally-compliant standby condition to permit implementation of an anticipated Secretarial decision in FY 1999 to deactivate or pursue potential restart to support a range of national research reactor requirements.

- In FY 2000, meet all Federal and State safety and environmental requirements for the Fast Flux Test Facility while implementing a Secretarial decision on the facility.

Isotope Production and Distribution (ST-2)

- In FY 1998, completed 80 percent of the Sandia Hot Cell Facility construction modifications and processing equipment installation activities needed to achieve the facility capability to process 100 percent of the U.S. demand for molybdenum-99. **(Fully Successful)**

- In FY 1999, initiate construction and commissioning of the Los Alamos Target Irradiation Station, improving isotope quality and improving operating efficiency.

- In FY 1999, complete equipment installation necessary for an emergency backup supply of molybdenum-99, issue a request for proposals to privatize molybdenum-99 production and business activities by May 1999, and after evaluation, award a contract by September 1999 to the most qualified firm.

- By the end of FY 2000, complete at least 60 percent of the construction of the Los Alamos Target Irradiation Station, which is needed for the production of short-lived isotopes for medical research.

- In FY 2000, implement the Advanced Nuclear Medicine Initiative by providing isotopes or financial assistance for up to five researchers.

- Complete privatization activities associated with production and sales of commercial isotopes by the end of FY 2000.

- Supply quality stable and radioactive isotopes for industrial, research, and medical applications that continue to meet customer specifications and maintain 95 percent on-time deliveries. **(Fully Successful in FY 1998)**

- In FY 2000, invest in two new process development technologies as requested by researchers that enhance isotope production, services and delivery application systems.

- Respond to customer requests for information within 48 hours.

- Keep customer complaints to less than four percent of all deliveries made.

- Hold annual stakeholder meetings in conjunction with international and regional trade shows.

Uranium Programs (EQ-6)

- In FY 1998, completed the dilution of about 14 metric tons of excess highly enriched uranium (approximately 3.5 metric tons in FY 1998) to LEU at the Portsmouth Gaseous Diffusion Plant. **(Fully Successful)**

- In FY 1998, completed 80 percent of the final Programmatic Environmental Impact Statement for selecting the long-term management strategy for the depleted UF_6. **(Successful)**

- Meet all commitments to the Ohio Environmental Protection Agency and the Defense Nuclear Facilities Safety Board to ensure the safety of the Department's inventory of depleted uranium hexafluoride.

- In FY 2000, through the National Environmental Policy Act decision-making process, establish and begin implementing a long-term strategy for the management of the Department's depleted uranium hexafluoride inventories.

- Meet all legal commitments for post-retirement life and medical costs for retirees who supported the Uranium Enrichment Program before July 1, 1993.

- Maintain compliance with the Toxic Substances Control Act (TSCA), the Uranium Enrichment TSCA Federal Facilities Compliance Agreement (FFCA), DOE orders and other requirements and perform minimal corrective maintenance and inspections.

1-26-99

William D. Magwood, IV **Date**
Director, Office of Nuclear Energy, Science and Technology

Nuclear Energy R&D

Program Mission

The mission of the Nuclear Energy Research and Development program is to conduct advanced research and development in areas such as nuclear power and space power systems. In addition, this program supports nuclear engineering education and the enhancement of the Nation's nuclear science infrastructure.

The Nuclear Energy Research and Development program supports the DOE Strategic Plan and the FY 2000 Performance Plan as follows:

- *Energy Resources Objective 2* - Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact.

  - FY 2000 Strategy - Nuclear Energy Plant Optimization (NEPO)

  The Department will conduct government-industry cost-shared, peer-reviewed research and development to address the issues associated with long term operation of existing nuclear power plants and to apply new technology to improve plant reliability and availability. The program will be conducted on a 50-50 cost-shared basis with industry consistent with the updated Joint DOE-Electric Power Research Institute Strategic Research and Development Plan to Optimize U.S. Nuclear Power Plants to be issued in FY 1999. The Department and NRC coordinate program planning to assure that their research and development activities are complimentary, cost-effective, and without duplication. The Subcommittee on Operating Nuclear Power Plant Research, Coordination, and Planning of the Nuclear Energy Research Advisory Committee (NERAC) will provide the Department advice on the conduct of the NEPO research and development program and prioritize the research the Department will conduct with industry.

  - FY 2000 Strategy - Nuclear Energy Research Initiative (NERI)

  The Department will conduct investigator-initiated, peer-reviewed research and development at universities, national laboratories, and industrial organizations to advance the scientific knowledge base and develop new technologies that will, as anticipated by the President's Committee of Advisors on Science and Technology (PCAST) Panel on Federal Energy Research and Development, address the principal obstacles to the expanded use of nuclear energy, and advance the state of nuclear technology for a competitive marketplace. The Nuclear Energy Research Advisory Committee will provide the Department advice on the NERI research and development program.

- *Science and Technology Objective 2* - Deliver leading-edge technologies that are critical to the DOE and the Nation.

  - FY 2000 Strategy - Advanced Radioisotope Power Systems

  The Department will develop, demonstrate, test, and deliver advanced radioisotope power systems for space and national security missions.

  - FY 2000 Strategy - TRA Landlord

  The Department will identify, fund, and perform site maintenance, construction upgrade projects, and environmental compliance activities in accordance with DOE, Federal, and State requirements.

- *Science and Technology Objective 4* - Use DOE assets as part of an Administration-wide effort to advance the Nation's science education and literacy.

  - FY 2000 Strategy - University Reactor Fuel Assistance and Support

  The Department will support and promote university, college, and precollege technology programs that deliver information and contribute to learning in nuclear science and engineering education, enable advanced educational research opportunities, build capabilities at educational institutions, and improve educational opportunities for diverse groups.

Program Goals

Advanced Radioisotope Power Systems (ST-2)

- Provide compact, safe, reliable nuclear power systems and related technologies to space, national security and other customers.

University Reactor Fuel Assistance and Support (ST-4)

- Support improved U.S. nuclear education and research infrastructure.

TRA Landlord (ST-2)

- Manage DOE nuclear facilities in a safe, environmentally-sound, and cost effective manner and provide for the easy, cost-efficient use of relevant facilities by non-Federal researchers.

Nuclear Energy Plant Optimization (ER-2)

- Conduct cooperative, cost-shared, peer-reviewed R&D with industry to reverse the trend of premature closures of existing operating commercial nuclear power plants. This R&D will address the complex technical issues associated with managing the long-term effects of plant aging while improving plant reliability and efficiency.

Nuclear Energy Research Initiative (ER-2)

- Sponsor investigator-initiated, peer-reviewed R&D on new technologies that will address the principal obstacles to the future use of nuclear energy, and advance the state of nuclear technology for a competitive marketplace.

Program Objectives

Advanced Radioisotope Power Systems (ST-2)

- Maintain and enhance the U.S. capability to build advanced radioisotope power supplies for ongoing and future national security applications and NASA space exploration missions. *(Program Objective 1)*

- Develop a new advanced, highly efficient radioisotope power system that meets more stringent weight requirements of future space missions and reduces the amount of Pu-238 that is used. *(Program Objective 2)*

University Reactor Fuel Assistance and Support (ST-4)

- Provide fuel assistance, fellowship grants, reactor upgrade funding, and other assistance to U.S. universities, in cooperation with industry. *(Program Objective 1)*

TRA Landlord (ST-2)

- Ensure that TRA common use facilities and the utility infrastructure are maintained and operated to meet the requirements of tenant programs and in accordance with Federal and state environment, safety and health laws and regulations. *(Program Objective 1)*

Nuclear Energy Plant Optimization (ER-2)

- Implement selected activities from the DOE/EPRI Joint Strategic R&D Plan in cooperation with the utility industry, universities, national laboratories, and the Nuclear Regulatory Commission to develop advanced technologies and methodologies that will enhance nuclear generation capability, productivity, and economics. *(Program Objective 1)*

Nuclear Energy Research Initiative (ER-2)

- Develop new reactor concepts, and scientific and technology breakthroughs in nuclear energy which enhance the performance, efficiency, reliability, proliferation-resistance, and economics of nuclear power. *(Program Objective 1)*

Performance Measures

Advanced Radioisotope Power Systems (ST-2)

- In FY 1998, executed a multi-year contract for the development of highly efficient radioisotope power systems in support of NASA's future mission requirements. *(Performance Measure supports Program Objective 2)* **(Fully Successful)**

- In FY 2000, complete an Environmental Impact Statement and establish a Record of Decision on whether to proceed to develop a domestic plutonium-238 production capability for future space missions. *(Performance Measure supports Program Objective 1)*

- Complete development and initiate operations for startup by the end of FY 2000 of a capability to recover plutonium-238 scrap for reuse for ongoing and future missions. *(Performance Measure supports Program Objective 1)*

- Develop a new technologically advanced power system for 21st century space exploration and test a demonstration unit in FY 2000. *(Performance Measure supports Program Objective 2)*

University Reactor Fuel Assistance and Support (ST-4)

- Support U.S. universities' nuclear energy research and education capabilities by: *(Performance Measure supports Program Objective 1)*
  - Providing fresh fuel to all university reactors requiring this service.
  - Funding universities with research reactors for reactor upgrades and improvements (at least 20 in FY 1999; and at least 23 in FY 2000).
  - Partnering with private companies to fund DOE/Industry Matching Grants Program for universities (19 or more in FY 1999; and 17 or more in FY 2000).
  - Increasing the funding for Reactor Sharing in FY 1999 by 40 percent over FY 1998, and in FY 2000 by 20 percent over FY 1998, enabling each of the 26 schools involved in the program to improve the use of their reactors for teaching, training, and education within the surrounding community.

- Attract outstanding U.S. students to pursue nuclear engineering degrees by: *(Performance Measure supports Program Objective 1)*
  - Increasing the number of Fellowships (from 14 in 1998 to 22 in FY 1999 and 18 in FY 2000).
  - Increasing the number of Nuclear Engineering Education Grants (in FY 1999 existing and new grants will total 43; and in FY 2000 existing and new grants will total approximately 45).
  - Providing summer on-the-job training to junior and senior nuclear engineering Scholarship recipients (29 in FY 1999; and 25 in FY 2000).

TRA Landlord (ST-2)

- Continue to upgrade the physical plant and site infrastructure in accordance with the long range plan to ensure safe and reliable operation of Test Reactor Area site facilities. *(Performance Measure supports Program Objective 1)*

Nuclear Energy Plant Optimization (ER-2)

- In FY 1999, complete Memorandums of Understanding with the Nuclear Regulatory Commission and the Electric Power Research Institute (EPRI) to guide future implementation of the Joint DOE-EPRI Strategic Research and Development Plan to Optimize U.S. Nuclear Power Plants. *(Performance Measure supports Program Objective 1)*

- In FY 2000, implement a cooperative R&D program to address technical questions that could prevent continued operation of current nuclear plants by working with industry, universities, and national laboratories. *(Performance Measure supports Program Objective 1)*

Nuclear Energy Research Initiative (ER-2)

- In FY 1999, establish a peer-reviewed Nuclear Energy Research Initiative, initially funded at $19 million, to select and conduct investigator-initiated innovative scientific and engineering research that will address the issues facing the future of nuclear power in the U.S., including proliferation concerns, economics, and the management of nuclear waste. *(Performance Measure supports Program Objective 1)*

- In FY 2000, advance the state of scientific knowledge and technology to enable incorporation of improved proliferation resistance in the design, development, and deployment of new reactor and nuclear fuel systems. *(Performance Measure supports Program Objective 1)*

- In FY 2000, improve the understanding of reactor systems, component technology and nuclear fuel performance so one or more new reactor and one or more new fuel cycle concepts are identified which offer improved proliferation resistance, and the prospects of improved performance and efficiency, lower cost, and enhanced safety. *(Performance Measure supports Program Objective 1)*

- In FY 2000, identify one or more proliferation resistant reactor concepts for low power and/or modular design applications. *(Performance Measure supports Program Objective 1)*

Significant Accomplishments And Program Shifts

Advanced Radioisotope Power Systems (ST-2)

- Initiate testing of a new advanced radioisotope power system that is lighter and requires less plutonium-238 to support future NASA missions.

- Initiate startup of a capability to recover plutonium-238 scrap for reuse for ongoing and future missions.

University Reactor Fuel Assistance and Support (ST-4)

- Award fellowships to outstanding and promising M.S. and Ph.D. students engaged in nuclear science research and training to ensure an adequate supply of trained nuclear personnel.

- Award Nuclear Engineering Education Research grants to competitively selected universities which promote innovative research in nuclear engineering technologies.

TRA Landlord (ST-2)

- Continue the final construction phases of the TRA Fire and Life Safety Upgrade construction project on schedule.

- Begin the construction phase of the TRA Electrical Utility Upgrade construction project.

Nuclear Energy Plant Optimization (ER-2)

- In FY 1999, update the DOE - Electric Power Research Institute (EPRI) Strategic Research and Development Plan to Optimize U.S. Nuclear Power Plants consistent with the recommendations of the President's Committee of Advisors on Science and Technology (PCAST) Panel on Federal Energy Research and Development and the NERAC Subcommittee on Operating Nuclear Power Plants Research, Coordination, and Planning.

- In FY 2000, implement the DOE - EPRI Strategic Plan working with national laboratories, the Nuclear Regulatory Commission, universities and industry conducting a cooperative R&D program guided by an industry/government coordinating committee.

Nuclear Energy Research Initiative (ER-2)

- In FY 1998, establish a Nuclear Energy Research Advisory Committee which will provide independent expert advice on the implementation of DOE nuclear energy R&D including the NERI program, with the first meeting held on November 17 and 18, 1998.
- In FY 1999, initiate the investigator proposed, peer-reviewed Nuclear Energy Research Initiative as recommended by the President's Committee of Advisors on Science and Technology (PCAST) Panel on Federal Energy Research and Development.
- In FY 2000, issue the second phase of grants and cooperative agreements under the investigator proposed, peer-reviewed Nuclear Energy Research Initiative.

Site Descriptions

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL) is a U.S. Department of Energy (DOE) scientific research laboratory located in New Mexico. A portion of the Plutonium Facility-4 at the Technical Area-55 at LANL is dedicated to plutonium-238 (Pu-238) processing. This capability is the only existing Pu-238 processing capability within the DOE complex and is used to process and encapsulate Pu-238 used in radioisotope power sources for the National Aeronautics Space Administration (NASA) space exploration missions and national security applications.

Sandia National Laboratories

Sandia National Laboratories (SNL) is a U.S. Department of Energy scientific research laboratory located in New Mexico. SNL has unique analytical and testing capability used to evaluate radioisotope power system response during hypothetical launch accidents. These capabilities are used to support preparation of Safety Analysis Reports.

Argonne National Laboratory

Argonne National Laboratory (ANL) is a U.S. Department of Energy scientific research laboratory located in Argonne, Illinois. ANL has an ongoing program in cooperation with the governments of Germany, France and Japan in the area of international student exchange. This program sends highly qualified U.S. students to study nuclear engineering at facilities in the above three countries for a 3-4 month period and permits students from those countries to study nuclear engineering at ANL.

Idaho National Engineering and Environmental Laboratory

The Idaho National Engineering and Environmental Laboratory (INEEL) is an extensive research and engineering complex that has focused on some of the most advanced energy research in the world since 1949. In recent years, in addition to continued operation of complex nuclear and non-nuclear facilities, the INEEL has initiated technology development in applied environmental science and engineering. The Idaho Test Reactor Area (TRA) is located within the INEEL. Since the early 1950s, test reactors, laboratories, hot cells and supporting facilities have been built at TRA. The principal facility operating at TRA is the Advanced Test Reactor (ATR). The ATR is one of the world's largest and most advanced test reactors. It provides both vital irradiation testing for reactor fuels and core components and isotopes critically needed by medicine and industry. Other facilities currently operating on the site are: the ATR Critical Facility reactor, the TRA Hot Cells and the INEEL Applied Engineering and Development Laboratory. ATR operations and a wide variety of scientific research projects are planned to continue at TRA until well into the twenty-first century. The following facilities at TRA are shutdown in a surveillance and maintenance status awaiting decontamination and decommissioning: the Materials Test Reactor (MTR), the MTR Canal, the Engineering Test Reactor, the Coupled Fast Reactivity Measurement Facility, and the Advanced Reactivity Measurement Facility. TRA is operated for the

Department by Lockheed Martin Idaho Technologies Company. Responsibility for TRA Landlord resides with the Office of Nuclear Energy, Science and Technology. The TRA Landlord account provides for maintaining and upgrading TRA common use facilities and the utility infrastructure to ensure that programmatic, reliability and ES&H requirements are met.

INEEL manages the University Reactor Fuel Assistance Program to provide fuel for university test, research, and training reactors, the shipping of spent fuel from university reactors to Savannah River, and conversion of university reactors from high enriched uranium (HEU) to low enriched uranium (LEU). INEEL provides management, quality assurance, procurement, and technical assessment and review associated with the manufacturing, shipment, and receipt inspection assessment and evaluations of replacement fuel and the conversion of HEU fuel to LEU fuel for university reactors, and the shipping of spent fuel from these reactors.

Mound Plant

The Mound Plant is located in southwest Ohio with the city of Miamisburg. Previously, the main mission of the Mound Plant was to manufacture components for nuclear weapons for Defense Programs. As part of the Department's Non-nuclear Consolidation Plan, the Department decided to consolidate Defense Program activities to other sites and transferred the Mound site to the Office of Environmental Management for cleanup and transition of the facilities and properties to commercial operations. Only the facilities used to assemble and test radioisotope power systems used for NASA space exploration missions and national security applications remain in use by DOE Programs. The program is currently conducting a study on whether to consolidate and maintain the radioisotope power system assembly and test capability as a stand-alone operation at the Mound site or transfer the operation to another Department site.

Oak Ridge National Laboratory

The Oak Ridge National Laboratory (ORNL) is a U.S. Department of Energy scientific research laboratory located in Oak Ridge, Tennessee. The ORNL has developed the unique capabilities for fabricating carbon insulator and iridium heat sources components for radioisotope power sources used for NASA space exploration missions and national security applications. These sophisticated heat source components are necessary for the safe operation of these power systems during normal operation and during launch, reentry or other deployment accidents.

Savannah River Site

The Savannah River Site is located in the Central Savannah River Area of South Carolina. The Office of Nuclear Energy, Science and Technology is maintaining the Plutonium Fuel Form Facility in a safe environmentally shutdown mode until the facility is transferred to the Office of Environmental Management for decontamination and decommissioning.

All Other Sites

Funding supports a commercial contract to develop national security missions and an Interagency Agreement with the Navy Department to provide specialized safety analyses for the Advanced Radioisotope Power Systems.

Includes funding for the Nuclear Energy Research Initiative which is a new competitive, investigator-initiated program in FY 1999 that is in the solicitation phase as this document is being prepared; therefore, the universities, national laboratories and industrial organizations who will perform the scientific and engineering research have not yet been identified.

Funding in FY 2000 for the Nuclear Energy Plant Optimization program is also shown in this category. Decisions regarding the specific 50-50 cost-shared, peer-reviewed research and development activities to be conducted and the performing organizations will be made following the FY 1999 update of the Joint DOE-EPRI Strategic Research and Development Plan to Optimize U.S. Nuclear Power Plants. In formulating this program, the Department will utilize the advice of the Subcommittee on Operating Nuclear Power Plant Research, Coordination and Planning of the Nuclear Energy Research Advisory Committee.

Funding is also included for nuclear engineering fellowships and scholarships for outstanding graduate and undergraduate students which is awarded through a peer-reviewed, competitive process. The peer review committee is composed of nuclear engineering professors representing a broad spectrum of nuclear engineering programs throughout the U.S. The funding is then administered and awarded by the South Carolina University Research and Education Foundation for the Department of Energy.

Advanced Radioisotope Power Systems

Mission Supporting Goals and Objectives

The Advanced Radioisotope Power Systems program supports the development, demonstration, testing, and delivery of power systems required by the United States to support space exploration and special national security activities. Radioisotope power systems, for example, are the enabling technology for space and national security applications requiring proven, reliable and maintenance-free power supplies capable of producing up to several kilowatts of power and operating under severe environmental conditions for many years. Previous NASA space exploration missions that have used radioisotope power systems include the Apollo lunar scientific packages and the Pioneer, Viking, Voyager, Galileo and Ulysses spacecrafts. More recent missions that used radioisotope power systems are the Mars Pathfinder mission launched in December 1996 and the Cassini mission to Saturn launched in October 1997. Without these power systems, many of the NASA missions to explore deep space and surfaces of planets and moons could not be performed. A recent General Accounting Office report entitled "Space Exploration - Power Sources for Deep Space Probes" dated May 1998, reinforces the need for these systems.

Through early FY 1998, the Department's activities have focused on: (1) fabricating and delivering to NASA three new radioisotope thermoelectric generators (RTGs) and 157 heater units for the Cassini mission; (2) supporting NASA in obtaining approval to launch Cassini; (3) implementing emergency preparedness plans and operations for the Cassini launch which occurred on October 15, 1997; and (4) supporting ongoing national security missions. In FY 1998 program emphasis transitioned from Cassini-specific efforts to maintaining the facilities and expertise that are required to produce radioisotope power systems and; (1) developing and testing an advanced power system for future NASA missions, such as the Europa Orbiter or Pluto/Kuiper Express, that will occur soon after the turn of the century; and (2) a new national security mission which will require delivery of several RTGs over the next decade.

With NASA's current emphasis on smaller and less expensive spacecraft, future missions require an advanced power system that is more efficient, lighter weight, and uses less radioisotope fuel. Efforts are underway to meet this requirement by developing an Advanced Radioisotope Power System (ARPS) that uses a new technology called AMTEC. In FY 2000, the program will complete fabrication and initiate testing of module units of this technology for future space missions, proceed to design and initiate fabrication of a full scale qualification unit of the advanced power system and continue safety testing in support of preparation of environmental documentation and Safety Analysis Reports to cover the near-term NASA space missions. For the new national security mission, the program will continue testing of the more efficient thermoelectric element that will be used for this mission, proceed with design and fabrication of a new, improved RTG, continue development of the safety test data and proceed with the preparation of the Safety Analysis Report.

In FY 2000, the program will also continue developing new, non-mission-specific technologies that could be used in power supplies that could cover a range of power levels required to support future NASA space missions. These technologies include advanced conversion concepts, new materials, and new heat sources. Also, the program will continue to maintain the Plutonium Fuel Form Facility at the Savannah

River site in an environmentally sound, safe shutdown condition until it is transferred to the Office of Environmental Management (EM) for decontamination and decommissioning.

The Department is charged with the development of nuclear technologies and systems by the Atomic Energy Act of 1954, as amended, and is authorized by the Act to possess special nuclear materials and operate nuclear facilities. To meet this charter, the Department has developed the program capabilities and facility infrastructure to produce and deliver radioisotope power systems. To maintain the long-term viability for the program, and the space exploration and national security missions it enables, the Department must maintain these capabilities and the associated facility infrastructure as the sole national capability to produce radioisotope power systems.

The facility infrastructure for producing the power systems has been consolidated over the past few years to the three main operations described below. Without this infrastructure, radioisotope power systems cannot be produced, and without these power systems, critical national security activities and NASA missions to explore deep space and the surfaces of neighboring planets will not be possible. The facility infrastructure which must be sustained includes:

- **Iridium and Carbon Heat Source Component Fabrication Facilities at Oak Ridge National Laboratory**

  The Oak Ridge National Laboratory (ORNL) has developed the unique capability of fabricating carbon insulators and iridium cladding used to encapsulate and contain the plutonium-238 (Pu-238) pellets. These sophisticated heat source components are necessary for the safe operation of the radioisotope heat source during normal operation and during launch, reentry or other deployment accidents. The Department maintains its capabilities in this area through small scale production campaigns of these components for upcoming space missions and terrestrial applications. Advanced fabrication processes are being developed to improve the performance and to reduce the cost of fabricating these components. The materials properties of these components are characterized for input to mission safety analyses for the launch or deployment approval process. ORNL also performs materials testing and precious metal iridium inventory management for the Department's activities at other sites.

- **Plutonium-238 Processing and Encapsulation Facilities in the Technical Area-55 Complex at Los Alamos National Laboratory**

  The Department maintains a facility within the Plutonium Facility-4 at the Technical Area-55 at the Los Alamos National Laboratory (LANL) dedicated to Pu-238 processing. This is the only facility in the United States that can perform these operations. LANL receives the Pu-238 powder, performs incoming inspections, processes the powder through a complex set of operations to a pellet form, encapsules the pellets in the iridium cladding fabricated at ORNL, performs final inspection, and ships the encapsulated pellets to Mound (see following discussion) for assembly into heat sources. The Department maintains these operations through small-scale fabrication campaigns of encapsulated pellets for use in upcoming missions. LANL maintains the Pu-238 inventory for the Department. A Pu-238 scrap recovery line is being developed to recycle scrap for use on future programs. Startup activities to bring the scrap recovery line to full operation should be initiated by

the end of FY 2000. To minimize waste disposal costs, a new process is being developed to recover Pu-238 from the waste and dispose of the remaining byproducts. LANL also conducts safety and qualification tests on Pu-238 heat source components. LANL also fuels and assembles radioisotope heater units used on NASA space missions.

An important element of maintaining the operational readiness of the facilities is the repair and upgrading of equipment. Over the next several years, LANL will complete the program to replace equipment and glove boxes that have reached their useful lifetimes as a result of the large Pu-238 processing campaign required for the Cassini mission.

- **Heat Source and Power System Assembly and Testing Facilities at the Mound Site**

The Department maintains and operates facilities at the Mound site for heat source and power system assembly and testing. These operations have been primarily conducted in two buildings identified as Buildings 38 and 50. Heat source modules were assembled in Building 38 as iridium encapsulated Pu-238 pellets were received from LANL and carbon components were received from ORNL. The national security power systems were also assembled in Building 38. The assembly of the heat sources into the generators and the acceptance testing and related functions are carried out in Building 50. This building is totally dedicated to the radioisotope power systems program. Since the power systems program used only a small part of Building 38, and this is an old building that is scheduled for demolition by EM as a part of the overall cleanup of the Mound site, the Department is consolidating the power systems efforts from Building 38 into Building 50. This consolidation will be completed in early FY 2000 to allow EM to proceed with their planned decontamination and decommissioning of Building 38.

The Department conducted an evaluation of transferring and consolidating the Mound operations at another site to streamline program operations and reduce infrastructure costs. Seven other sites as well as the option of remaining at Mound were included in the evaluation. Preparation of an Environmental Impact Statement (EIS) was initiated on five sites and the Mound site as a no action alternative. Since the rest of the Mound site is scheduled for cleanup and transfer to the private sector, the program efforts would become a stand alone operation at Mound. This stand alone operation at Mound is being more fully analyzed in terms of cost, safety, safeguard and security issues and a decision to proceed with the EIS is pending.

As part of its overall support of the power systems program, Mound also stores and maintains a spare RTG used for the Cassini Mission in monitored storage. In addition, Mound is developing new fabrication processes, including performing weld development studies for the heat source for the RTGs for the new national security mission and developing plans for the assembly and testing of the new advanced power system the Department is developing for future NASA missions. Mound also fabricates components for heater units which are fueled and assembled at LANL.

Another key issue facing the program is assuring that there is a long term supply of the Pu-238 isotope that is used in these power systems. Most of the current inventory of Pu-238 was produced in the reactors and processing facilities at Savannah River. However, the facilities used to produce the material are either shutdown or being phased out. The planned space and national security missions will exhaust the current inventory by the middle of the next decade and, unless an assured supply is established, the ability to support future space missions will be lost. Therefore, the Department is considering the potential of establishing a domestic supply using existing facilities to produce this non-weapons form of plutonium. An Environmental Impact Statement is being prepared as part of the planning and decision process.

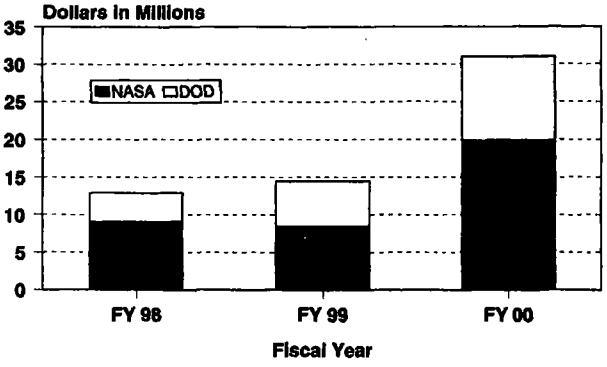
The Department recognizes the need to minimize the costs associated with maintaining the programs and facility infrastructure associated with this program. As requested by Congress in the FY 1999 report language, a summary report has been prepared and transmitted separately that describes the action taken and considered to streamline the program to minimize costs.

54-291 99 - 29

Funding Schedule

	(dollars in thousands)				
	FY 1998	FY 1999	FY 2000	$ Change	% Change
Radioisotope Power Systems	32,097	29,200	27,600	-1,600	-5.5%
Special Applications	2,000	2,000	2,000	0	0.0%
Plutonium-238 Acquisition and Processing	5,810	5,800	7,400	+1,600	+27.6%
Total, Advanced Radioisotope Power Systems	39,907	37,000	37,000	0	0.0%

User Funding*



* The funds appropriated in Energy Supply are used to sustain the program and facility infrastructure that allows the Department to fulfill its charter to maintain radioisotope power system production capabilities for future space and national security missions. The user funding is provided to DOE by the sponsoring mission agencies for mission-specific development and hardware fabrication efforts. In FY 2000, NASA is expected to provide DOE with $19.9 million and DOD with $11.1 million.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Radioisotope Power Systems			
■ Provide RTGs that satisfy NASA power requirements for the Cassini mission and supported Cassini launch in October 1997	3,974	0	0
■ Maintain the program and facility operations and capabilities for current and future space and national security missions. Prepare facility operations for conduct of new NASA space missions and the new national security mission.			
▸ Maintain iridium and carbon heat source component operations at ORNL. In FY 1998, 1999 and 2000 conduct production campaigns to fabricate components for new missions. In FY 1999, implement improved production process and complete qualification runs in FY 2000.	3,300	3,350	3,500
▸ Maintain Pu-238 processing and encapsulation operations at LANL. Conduct production runs in FY 1998, 1999, and 2000 to encapsulate Pu-238 for new missions. In FY 1999, initiate safety and qualification testing of Pu-238 purchased from Russia. In FY 2000, complete qualification of Russian Pu-238 and initiate production of heater units for new missions.	6,800	7,300	7,050
▸ Maintain and operate Mound facilities and maintain shipping casks. In FY 1998, 1999, and 2000 conduct production runs for heat sources. In FY 2000, initiate preparation of assembly and testing operations for new NASA space missions and new national security missions.	7,400	7,700	7,800

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ Perform safety model development and analyses, review safety analyses reports, conduct performance and safety testing of advanced concepts, perform theoretical performance analyses for advanced concepts, perform future missions conceptual design studies, prepare environmental documentation, and perform safety analyses and prepare safety analyses reports for shipping casks, maintain and certify shipping casks, maintain the PuFF facility in a safe shutdown mode, and conduct special studies	5,172	2,570	2,600
▸ Continue program with industry, universities and laboratories to develop advanced technologies (converters, materials) for use in power systems with ranges of power levels for future NASA missions. Demonstrate use of a light weight, highly efficient converter technology for use in a power system for space or terrestrial mission. Develop and test heat sources for advanced systems	2,597	5,421	5,510
▸ Continue facility modifications to allow consolidation of heat source and RTG assembly and testing operations into a single facility at the Mound Plant site	1,854 [a]	700 [a]	0
▸ Capital equipment funding for routine equipment replacement and procuring equipment for developing, assembling and testing new advanced power system	1,000	2,000	1,000
▸ FY 99/00 Small Business Innovative Research and Small Business Technology Transfer programs	0	159	140
Total, Radioisotope Power Systems	32,097	29,200	27,600

[a] The Department had notified Congress that this funding was being redirected to prepare an Environmental Impact Statement on the potential relocation of Mound plant functions. If a decision is made to remain at Mound, the remaining funding will be used to support consolidation at Mound for stand alone operation, including updating Mound environmental documentation.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Special Applications			
■ Satisfy user requirements to support ongoing and new national security programs	2,000	2,000	2,000
Plutonium-238 Acquisition and Processing			
■ Develop Pu-238 scrap and waste recovery and disposal capabilities at Los Alamos National Laboratory for reuse of Pu-238 for future national security and NASA space missions			
▸ Perform design and safety analyses for scrap recovery line, purchase glove box equipment and initiate installation and perform bench scale testing for process equipment	1,575	0	0
▸ Complete installation of glove boxes, complete bench scale testing and initiate installation of process equipment	0	2,300	0
▸ Complete installation of scrap recovery line and initiate startup activities for full operation. Initiate conceptual design and safety analyses for waste recovery line and waste recovery by-products disposal. Procure long-lead time equipment.	0	400	2,100
▸ Capital equipment funding	1,625	400	260
■ Evaluate and implement options for meeting near-term and long-term supply needs for Pu-238			
▸ Evaluate use of DOE reactor facilities for domestic production of Pu-238 and initiate preparation of conceptual design and preliminary cost estimate for the processing lines for target fabrication, target processing and neptunium storage facilities at the HFIR complex at ORNL	1,150	0	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ Continue evaluation of DOE reactor facilities for domestic production of Pu-238, develop test target design, complete conceptual design of processing and storage facilities, and prepare environmental impact statement for domestic production of Pu-238.	1,460	2,700	0
▸ Maintain option for a domestic supply option by obtaining a Record of Decision for domestic production of Pu-238, initiating test target irradiations, and proceeding with detail design of processing and storage facilities that will be built if decision is made to proceed	0	0	4,290
▸ Capital equipment funding	0	0	750
Total, Plutonium-238 Acquisition and Processing	5,810	5,800	7,400
Total, Advanced Radioisotope Power Systems	39,907	37,000	37,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Radioisotope Power Systems	
■ The funding reduction defers lower-priority capital equipment expenditures.	-1,600
Plutonium-238 Acquisition and Processing	
■ The increase in the Plutonium Acquisition and Processing sub-element is to ensure a long-term supply of Pu-238 by establishing a domestic Pu-238 production capability. With the expected new near-term space and national security missions, the current inventory of Pu-238 will be exhausted. In early FY 2000, the Environmental Impact Statement will be completed and a Record of Decision issued on whether to proceed to establish a domestic Pu-238 production capability. This capability is required to replenish the inventory and establish an assured long-term supply of Pu-238 for future missions.	+1,600
Total Funding Change, Advanced Radioisotope Power Systems	0

University Reactor Fuel Assistance and Support

Mission Supporting Goals and Objectives

To retain the capability in the U.S. to conduct research, address pressing environmental challenges, and help preserve the nuclear energy option, we must maintain the infrastructure necessary to educate and train the next generation of scientists and engineers. The University Reactor Fuel Assistance and Support program provides funding for our university nuclear engineering programs and university research reactors which play a major role in providing this education and training.

University nuclear engineering programs supply highly skilled workers to companies in fields such as electricity generation, medical research and supply, environmental restoration, and advanced materials, as well as to government agencies and national laboratories. To help ensure the continued viability of these programs, the Department provides assistance through nine distinct programs which include the DOE/Industry Matching Grants program. The Department also provides research funding to faculty through the Nuclear Engineering Education Research (NEER) program, and academic assistance through our Scholarships and Fellowships program for outstanding students in nuclear engineering and health physics.

University research reactors in the United States form a fundamental and vital component of our national research and education infrastructure. Research conducted using these reactors is critical to many national priorities such as health care, materials science, and energy technology. Currently, there are 28 operating university research reactors on 26 campuses in 20 states. University reactors are the source of neutrons for research in such diverse areas as medical isotopes, human health, life sciences, environmental protection, advanced materials, lasers, energy conversion, and food irradiation. University research reactors directly support the development of highly qualified, technically knowledgeable personnel needed by national laboratories, private industry, the Federal government and academia, for basic and applied research critical to U.S. technological competitiveness. In addition , with the help of the Reactor Sharing program, many of the reactors serve as centers for education programs offered to other colleges and universities and high school students and teachers who come to the reactor for instructional programs and research.

The University Reactor Fuel Assistance and Support program provides funding for shipment of fresh fuel to and spent fuel from university research reactors through our Fuel Assistance program allowing universities to continue their important research and education activities. The Reactor Upgrade program also provides funding for equipment upgrades at the reactors, to increase their value as research tools, supports students and faculty in the area of radiochemistry through our Radiochemistry program, provides educational assistance primarily in the form of scholarships and fellowships to minority, Hispanic and American Indian students within our Minority Support program and a new initiative in FY 2000 provides funding to prepare students for nuclear engineering and science careers by way of the Nuclear Education Recruitment program.

Funding Schedule

	(dollars in thousands)				
	FY 1998	FY 1999	FY 2000	$ Change	% Change
University Reactor Fuel Assistance and Support	7,000	11,000	11,345	+345	+3.1%
Total, University Reactor Fuel Assistance and Support	7,000	11,000 [a]	11,345	+345	+3.1%

[a] Excludes $225K included in a FY99 reprogramming.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
University Reactor Fuel Assistance and Support			
■ Continue to supply fresh fuel to and ship spent fuel from all university reactors requiring these services and begin conversion of a university reactor from high enriched uranium (HEU) to low enriched uranium (LEU) during FY 2000.	2,100	2,300	2,800
■ Continue the Matching Grants Program in FY 2000, which supports education, training, and innovative research at participating universities. Provide grants of up to $50,000 (which are matched by industry) to 17 universities in FY 1998, up to19 or more in FY 1999 and 17 or more in FY 2000. An evaluation of the five year trial of the matching grants program conducted in FY 1997 recommended continuation and expansion of the program.	800	1,000	800
■ Provide fellowships in FY 2000 for outstanding and promising United States M.S. and PhD. students engaged in nuclear science research and training at multiple U.S. universities and scholarships to undergraduate students. Also support development of education programs in nuclear engineering and related scientific fields at minority serving institutions. A total of 14 fellowships and 62 scholarships were awarded for FY 1998, approximately 22 fellowships and 67 scholarships are expected for FY 1999 and 18 fellowships and 62 scholarships are planned for FY 2000.	1,100	1,400	1,300
■ The Reactor Sharing program allows students and faculty at institutions without reactors to have access to university reactors for training, education, and research purposes. This program also allows the universities with reactors to conduct educational outreach programs in their local communities. In FY 1998, FY 1999 and FY 2000, 23 grants are planned with the level of funding for individual reactors varying each year.	500	700	600

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue in FY 2000 with the third year of the reactor upgrade program to assist in addressing the backlog of maintenance and upgrade of items confronting university-owned research reactors. The program provides for replacement of outdated equipment, maintenance of reactor systems, and upgrading of experimental capabilities at 16 university reactors in FY 1998, and approximately 20 and 23 reactors in FY 1999 and FY 2000 respectively. The purpose of this program is to ensure that these valuable educational and research tools are available into the next decade	300	800	845
■ The Nuclear Engineering Education Research Grants Program was reinstated in FY 1998 with the awarding of 19 grants. In FY 1999, existing and new grants will total 43; and in FY 2000 existing and new grants will total approximately 45 to provide for innovative research in nuclear engineering at U.S. universities	2,200	4,500	4,500
■ Begin a program in FY 2000 to support nuclear engineering education recruitment activities in conjunction with a professional society with expertise in nuclear science and technology to ensure a highly informed group of students entering university nuclear engineering and related scientific courses of study	0	0	200
■ In FY 2000, the radiochemistry program will continue to provide faculty support and student fellowships and scholarships to help educate a new generation of radiochemists to address the technical challenges associated with radioactive wastes and contaminated sites	0	300	300
Total, University Reactor Fuel Assistance and Support	7,000	11,000*	11,345

* Excludes $225K included in a FY99 reprogramming.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
University Reactor Fuel Assistance and Support	
■ Increase in reactor fuel account, reactor upgrades and a new initiative in nuclear engineering education recruitment with decreases in matching grants, fellowships and scholarships, and reactor sharing	+345
Total Funding Change, University Reactor Fuel Assistance and Support	+345

Test Reactor Area Landlord

Mission Supporting Goals and Objectives

The Idaho Test Reactor Area (TRA) is located within the Idaho National Engineering and Environmental Laboratory (INEEL). Since the early 1950s, test reactors, laboratories, hot cells and supporting facilities have been built and operated there. Currently operating on the site are: (1) the Advanced Test Reactor (ATR), which is the world's largest and most advanced test reactor, (2) the ATR Critical Facility reactor, (3) the TRA Hot Cells which process and ship vital isotopes for medicine and industry produced in the ATR, (4) the INEEL Applied Engineering and Development Laboratories and (5) a major industrial machine shop facility that supports not only TRA facilities but also performs support work for all of INEEL. Vital nuclear reactor testing, isotope production and other scientific research are planned to continue until well into the twenty-first century.

TRA Landlord Mission Supporting Goals and Objectives:

- Ensuring an adequate maintenance program is conducted to maintain the site common facilities and utility infrastructure in accordance with DOE, Federal and State of Idaho environmental, safety and health (ES&H) standards and regulations and to ensure reliable program support for tenant programs.

- Ensuring an adequate upgrade construction program is conducted to the site buildings and utility infrastructure to meet programmatic, reliability and ES&H requirements. Most of the TRA Landlord buildings and utility systems are more than 40 years old, and, given the projected indefinite continuing mission of the site, upgrades must be made to the buildings and especially to the utility infrastructure as these facilities and systems are at or near the end of their useful life or do not meet current ES&H requirements.

- Ensuring environmental compliance for the site including identification of legacy waste and mitigation in accordance with DOE, Federal and State of Idaho regulations and specific legal agreements entered into with the State of Idaho.

Planned FY 2000 TRA Landlord accomplishments include: providing construction projects operating support, conducting routine maintenance and repair on common site facilities and utility systems, ensuring site environmental compliance including cleanup of legacy waste, procurement of General Purpose Capital Equipment (GPCE), and conducting General Plant Projects (GPP) and Line Item Construction Projects (LICP). The FY 2000 budget provides for continuation of the LICP to improve fire safety for TRA site to meet current Federal, State and Department of Energy (DOE) fire safety standards. In July, 1998, a malfunctioning CO2 fire suppression system resulted in a fatality and multiple injuries. A Type A investigation was conducted by the Office of Environment, Safety and Health and appropriate actions were taken to ensure such an accident would not occur again. The principal fire safety improvements in FY 2000 will be continuing the process of upgrading fire doors, fire suppression systems, alarm systems, and smoke detectors. The FY 2000 budget provides for continuation of the TRA Electrical Utility Upgrade LICP to reconfigure the 40 year old electrical utility system to meet current needs and to replace aged switchgear, panels and transformers for which

maintenance parts are no longer available or which are at end of useful life and beyond economical repair. The planned GPPs for FY 2000 are to provide upgrades to the TRA Retention Basin, the TRA Evaporation Pond and the TRA Laboratory Radioactive Effluent System.

The TRA Landlord line item has been underfunded for several years. It is important that the Department take action in FY 2000 to address the aging infrastructure of the site to ensure that programmatic, environment, safety and health requirements are met.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Operations and Maintenance	2,914	4,000	6,070	+2,070	+51.8%
Construction	4,425	2,766	2,930	+164	+5.9%
Total, Test Reactor Area Landlord	7,339	6,766	9,000	+2,234	+33.0%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Operations and Maintenance			
■ Provide engineering planning, development, design, project validation and construction management for the Fire & Life Safety LICP, the Electrical Utility Upgrade LICP and GPP projects	841	815	950
■ Continue required preventive maintenance and necessary routine repair activities to correct site deficiencies identified during facility inspections and assessments to ensure that TRA Landlord facilities are maintained in compliance with programmatic and ES&H requirements	584	472	570
■ Continue to procure GPCE to support TRA Landlord requirements	90	140	240
■ Conduct GPP such as the TRA Retention Basin Upgrade, the TRA Evaporation Pond Upgrade and the TRA Laboratory Radioactive Effluent System Upgrade	974	1,290	1,110
■ Continue environmental compliance legacy waste cleanup activities in accordance with DOE, Federal and State of Idaho regulations and specific agreements with the State of Idaho.	425	1,283	3,200
Total, Operations and Maintenance	2,914	4,000	6,070
Construction			
■ Continue the TRA Fire & Life Safety LICP	4,425	2,425	1,500
■ Continue the TRA Electrical Utility Upgrade LICP	0	341	1,430
Total, Construction	4,425	2,766	2,930
Total, Test Reactor Area Landlord	7,339	6,766	9,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Operations and Maintenance	
■ Construction operating support escalated for inflation and project requirements	+135
■ Maintenance and repair increased due to projected work scope	+98
■ GPCE increased due to planned requirements	+100
■ GPP decreased due to planned requirement.....	-180
■ Projected requirements for Environmental Compliance increased in FY 2000 due to mandatory legacy waste cleanup activities.	+1,917
Total, Operations and Maintenance	+2070
Construction	
■ TRA Fire & Life Safety LICP decreased for next phase of work.	-925
■ TRA Electrical Utility Upgrade LICP increased for next phase of work.	+1,089
Total, Construction	+164
Total Funding Change, Test Reactor Area Landlord	+2,234

95-E-201, Fire and Life Safety Improvements, Idaho National Engineering and Environmental Laboratory, Idaho

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin)

Significant Changes

The Office of Nuclear Energy, Science and Technology (NE) directed changes to the Funding Appropriation Profile results in a 24 month schedule increase and Total Project Cost (TPC) increase of $292K.

Activities are progressing based on the approved requirements. The work is being accomplished based on the Conceptual Design documents and developed detail Title II Design packages. The Project has been divided into eleven (11) work package design, construction and close out activities, to allow for administration, control and coordination with the operating Test Reactor located at the Test Reactor Area (TRA) and other interface issues at the TRA facility. This work corrects numerous Life Safety and Fire Protection and Detection deficiencies that were identified within the TRA operational areas, including the Advanced Test Reactor (ATR), that were identified in eight fire safety assessments including the DOE Tiger Team Assessment. The work to correct the deficiencies is to maintain the safety of site operations and ensure public safety is not jeopardized. The activities within the ATR are to maintain the facility within the requirements as defined within the Technical Specification Requirements, Facility Safety Analysis Requirements (TSR/SAR) and other documents that make-up the ATR Safety Authorization basis for operation.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete

3. Project Description, Justification and Scope

Project Description

This project provides for the Design, Procurement, Construction and System Operational testing activities to correct fire and life safety code deficiencies at the TRA. Specific improvements are:

- Modifications to or replacement of deficient fire barriers to meet code and reduce Maximum Possible Fire Loss (MPFL) or smoke damage impacts to personnel and property.
- Additions, modifications, or new automatic fire suppression systems to meet code requirements for operations personnel life safety and to reduce Maximum Credible Fire Loss (MCFL) potentials to acceptable improved risk levels as required by DOE Order 5480.7.
- Additions or modifications to existing building heating and ventilating systems to control fire and smoke spread, smoke detection, upgrades or replacement of interior doors to provide smoke and fire barriers, protection of structural support members, and sealing of penetrations in fire barriers (existing walls and floors) to provide effective control of property damage and life safety protection.
- Modifications and expansion of the fire detection and alarm system and removal of obsolete equipment to meet codes and provide TRA system compatibility with the Idaho National Engineering and Environmental Laboratory (INEEL) wide system.

- Addition of fully redundant water supply, consisting of new Underwriters Laboratories (UL)-listed and Factory Mutual (FM)-approved fire pumps and a tank capable of delivering 100 percent of the highest demand for volume, pressure, and duration, to meet reliability requirements of DOE Order 5480.7.

- Additions or modifications to existing fire water distribution piping, hydrants and valves.

- Upgrades to the site Raw Water Storage Tanks. The tanks are old and have conical steel roofs which have deteriorated to the point that the corrosion is exposing TRA drinking water to rain, biological contamination and ATR Cooling tower exhaust condensate. The tanks require rework to meet the existing TRA seismic qualification requirements. The tanks are designated as the ATR emergency core cooling storage system and are required to be in service and provide for water storage during reactor operations and shutdown modes.

Justification

To upgrade TRA's Fire and Life Safety Systems for compliance with applicable sections of the Code of Federal Regulations (CFR), DOE fire safety requirements, the National Fire Protection Association (NFPA) Codes and Standards including the National Electrical Code (NEC). The need for corrective actions were defined by the INEEL Operating Contractor and by numerous DOE fire safety assessments.

Regulation Drivers

The NFPA Life Safety Codes (NFPA Standard 101), NFPA Fire Protection/Prevention/Detection requirements, the NEC (NFPA Standard 70), Occupational Safety and Health Administration (OSHA) (29 CFR 1910), and DOE Order 5480.7.

National Environmental Policy Act (NEPA) documentation requirements - Finalization of Air Permit Completed in FY98. (As tasks are worked, continual review to ensure that all NEPA requirements are identified and met is accomplished.)

Raw Water Storage Tank System required to meet DOE seismic and water storage requirements.

Radiological Controls

Work is being performed within radiological buffer areas. There is a potential for encountering radioactive contamination. This issue will be handled with applicable radiological surveys, work reviews and zoning of work area accordingly.

Asbestos

Asbestos and asbestos contaminated materials will be encountered on this project. Proper controls, abatement work instructions and disposal methods will be performed in accordance with LMITCO Industrial Hygiene and Environmental requirements in accordance with 29CFR 1926.1101, ASBESTOS.

Lead

Lead painted materials will be encountered on this project. Proper controls, abatement work instructions and disposal methods will be performed in accordance with LMITCO Industrial Hygiene and Environmental requirements in accordance with 29CFR 1926.62, LEAD.

Scope

Tasks initially defined the activities that reflected work areas and the priority of needed corrective actions. The directed funding profile by budget year requires work be sequenced and structured to reflect the available budget funding. The addition of the work defined as tasks required an integration into the phased work schedule of the TRA Fire and Life Safety project. The defined budget profile has required that each phase be evaluated based on the planned reactor operations schedule and FY budget.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design Costs (Design Drawings and Specifications)	1,601	1,601
Design Management Costs (0.2% of TEC)	32	32
Project Management Costs (0 4% of TEC)	68	68
Total, Design and Management Costs (11.0% of TEC)	1,701	1,701
Construction Phase		
Improvements to Land	155	155
Buildings	8,160	8,160
Utilities	3,137	3,137
Standard Equipment	648	648
Construction Management (1.6% of TEC)	251	251
Project management (4.6% of TEC)	711	711
Total, Construction Costs	12,100	12,100
Contingencies (4.4% of TEC)	683	683
Total, Line Item costs (TEC)	15,446	15,446

5. Method of Performance

The Department of Energy Idaho Operations Office (DOE-ID) shall be responsible for implementation of the project, including selection of principal contractors and approval of specified procurement actions. DOE-ID project management shall be performed by the Construction Management Group in the Office of Program Execution. Safety, environmental, and other project support shall be furnished to the project on an as-needed basis by the DOE-ID matrix organization.

The design, project management, and construction management shall be performed under a negotiated contract with the operating contractor. Construction and procurement shall be accomplished by fixed price contracts awarded on the basis of competitive Best Valve bidding process. Inspection may be performed by another agent. Check-out of systems, and maintenance of the completed project shall be performed by the operating contractor.

The INEEL Operating Contractor's (OC) Project Manager shall be responsible for the entire project: design; all construction activities at the TRA/INEEL site, construction subcontracting, direction of the activities of construction subcontractors, and performance and management of construction activities as required to complete the project in a timely, safe, and cost-effective manner.

The Life Safety deficiencies identified have been divided to be work packages (tasks) based on areas and type of work activity to allow for performance under a controlled work plan and the defined priority of the identified deficiencies. The designs are evaluated based on the method of work and area controls. The packages have been developed for subcontracting actions to utilize the available qualified craft within the area to accomplish the needed modifications to correct the life safety and fire protection and detection corrections identified. The work is on going to accomplish the corrections needed At the Test Reactor Area (TRA). The work has been divided into 11 Phases as follows:

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1997	FY 1998	FY 1999	Outyears	Total

99-E-200, Electrical Utility Upgrade, Idaho National Engineering and Environmental Laboratory, Idaho

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

Date construction ends is extended 1 1/4 years from 3rd Quarter FY2002 to 4th Quarter FY2003.

To maintain TEC of $6.7M, scope and construction costs are reduced from $4,328K to $4,043K (total change of $285K) to address escalation and extended project duration costs due to the funding profile changes.

Due to the extended schedule, operating funds to support the project have increased by $240K to $860K, increasing the TPC from $7,320K to $7,560K.

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
1999	341	341	341
2000	166	166	166
Construction			
2000	1,264	1,264	318
2001	1,944	1,944	2,890
2002	2,311	2,311	2,311
2003	674	674	674

3. Project Description, Justification and Scope

The Test Reactor Area (TRA) was established in the early 1950's with the development of the Materials Test Reactor. Two other major test reactors followed. The electrical distribution system supplying power to these programs included 13.8kV and 2400 volt equipment. Over the past 40 years, the electrical distribution system has been modified many times to accommodate operating requirements of the users.

The TRA Electrical Utility Upgrade Project provides for the design, procurement, and construction activities to correct specific electrical deficiencies in the 13.8kV and 5kV class equipment at the TRA. The scope addresses:

a) Increased reliability by replacement of 30 to 40 year old switchgear, transformers and panelboards.
b) Modification of the standby power system and elimination of the redundant battery banks and associated equipment.
c) Consolidation and reconfiguration of the electrical distribution system to avoid safety hazards while considering provisions for future expansion.
d) Simplification of switchgear use by utilizing common voltages.) Reconfiguration to allow preparation for demolition of facilities.
e) Abatement of hazards, including electrical shock.

This project proposes to upgrade portions of the TRA electrical distribution system to address deterioration, configuration, load requirements, and standby power requirements. The upgrades will result in a reliable and maintainable electrical distribution system that meets the current and projected needs of tenant programs.

Since the 1950's, when electrical distribution equipment was first being installed at the TRA, numerous modifications to the system have been accomplished. These modifications, while providing immediate solutions to specific problems, did not always address optimum system operation. The cumulative effect of changes over time and the deterioration of the system with age has resulted in decreased reliability and maintainability. Changing user requirements have resulted in potential safety concerns such as overloading of equipment. This project addresses usage, configuration, and deterioration of the electrical system.

The project scope typically includes, but is not limited to replacement of selected switchgear and facility transformers, modifications to electrical services and panels, construction of underground ductbanks, replacement of power cables and control wiring, and modifications to instrumentation and control equipment.

The conceptual design has identified major items of scope, however, these identified items and additional deficiencies identified during studies and design efforts will be prioritized and completed under this project as funding allows.

The requested FY 2000 budget appropriation will be used to complete design activities and start construction activities.

Nuclear Energy Plant Optimization

Mission Supporting Goals and Objectives

The U.S. has entered a period of change and uncertainty in the electricity sector. With the deregulation of electricity production, many unprecedented issues are challenging utilities, regulators, and the Federal Government. New technologies are altering the fuel choices made by utility planners. Environmental laws are causing the closure of older fossil-fuel plants, and many U.S. nuclear plant owners are approaching a critical decision point as to whether their plants should be shutdown at or before their initial license period, or whether they should apply for a twenty-year extension on that license.

The DOE's Energy Information Administration (EIA) anticipates that, even with aggressive implementation of energy efficiency measures, U.S. electricity consumption will increase 1.4 percent each year through 2020 – the equivalent of building seven large 1000-megawatt power plants every year. During this same period, the EIA projects approximately 127,000 megawatts of existing electricity generating capacity will be retired because of age, competitive pressures, and as part of U.S. utility efforts to meet clear air standards. As a result, the EIA estimates the U.S. must build the equivalent of over 1,000 new fossil fuel generating plants by 2020 to meet growth in demand and offset plant retirements. Building these plants will require a huge economic investment in new baseload generating capacity during the next two decades, and when in operation, these plants will emit large quantities of air emissions.

Continued operation of existing nuclear plants through their original license term and a 20-year renewed license term would delay the need to build more baseload power plants. Existing U.S. nuclear power plants are a vital component of the U.S. energy diversity strategy. Nuclear power plants have operated safely and reliably in the U.S. for decades and are capable of doing so for many decades to come. These plants provide approximately 20 percent of all the electricity generated in the United States. They operate year-round, in all weather conditions without emitting air pollutants.

Environmental issues associated with the burning of fossil fuels, including global climate change, are increasing in importance. To reduce the greenhouse gas (GHG) emissions that contribute to this problem, a comprehensive strategy that combines increased energy efficiency with greater use of nuclear and renewable energy will be required.

Nuclear energy is the only proven large-scale power source that has unlimited potential to provide clean and reliable electricity into the next century. Nuclear power plants do not produce environmentally damaging emissions. As much as 90 percent of the carbon dioxide avoided by U.S. utilities over the last 25 years is attributable to nuclear energy. Continued operation of existing nuclear power plants avoids over 620 million tons of carbon dioxide annually. Nuclear energy's avoidance of greenhouse gas emissions and other pollutants, therefore, is necessary to help the U.S. meet its international commitments to address concerns for global warming.

Globally, nuclear energy is growing in importance as an energy source for expanding economies. U.S. nuclear technology is often the preferred option for countries seeking the best in safety, efficiency, and

economics. U.S. leadership in these markets has been of great strategic importance to the United States, because it provides this nation with a prime seat at the table with other countries as they explore and implement nuclear power technologies. This presence has enabled the U.S. to exercise great international leadership in areas such as nuclear safety, non-proliferation, trade, and the environment.

The U.S. is at a critical juncture with regard to the continued operation of its nuclear power plants. Licenses for U.S. nuclear power plants will begin to expire in large numbers in 2010; licenses for 13 plants representing some 11,700 MWe will expire in 2014 alone. Faced with regulatory, and economic uncertainties, some utilities already have exercised their option to close nuclear facilities well before their license expiration date. This trend has resulted in the premature closing of 6 reactors, a loss of approximately 4,000 megawatts of U.S. generating capacity, in the past four years. Unless reversed by critical near-term action, this trend is expected to continue and could potentially accelerate as the uncertainties of deregulation come into play.

The President's Committee of Advisors on Science and Technology (PCAST) Panel on Federal Energy R&D identified the critical role of nuclear power in its report of November 5, 1997. The Panel's report recommended that the Department work with its laboratories and industry to develop a program to address the problems that may prevent the continued operation of existing nuclear power plants.

Recognizing the broad national strategic interests served by nuclear power and consistent with the Comprehensive National Energy Strategy, the Department proposes a new Nuclear Energy Plant Optimization (NEPO) program starting in FY 2000 in response to the recommendations of PCAST. The Department, national laboratories, and the electric utility industry's Electric Power Research Institute (EPRI) developed the Joint DOE-EPRI Strategic Research and Development Plan to Optimize U.S. Nuclear Power Plants. This report, issued March 20,1998, utilized input from the national laboratories, NRC, and other key stakeholders. The purpose of this Strategic Plan, which will be updated in FY 1999, is to help the federal government and private sector jointly identify, prioritize, and execute the essential peer-reviewed R&D needed over the next 10 to 12 years to sustain operation of existing nuclear power plants, based on strategic national goals that both industry and government endorse. The work performed in this program will be prioritized by the Nuclear Energy Research Advisory Committee (NERAC) Subcommittee on Operating Nuclear Power Plant Research, Coordination and Planning. NERAC will also guide the application of peer review and the competitive selection of performers.

The goal of the NEPO program is to ensure that current nuclear plants can continue to deliver adequate and affordable energy supplies up to and beyond their initial 40-year license period by resolving open issues related to plant aging, and by applying new technologies to improve plant economics, reliability, and availability.

The objectives related to this goal are:

- Managing long-term effects of component aging: Component and structure material degradation occurs in nuclear plants as a result of long-term operation and exposure of materials to harsh environmental conditions. R&D conducted under NEPO will provide a better understanding of degradation mechanisms and how they occur, enabling development of cost-effective aging management strategies which will provide capabilities to easily prevent, detect or repair the degradation.

- Improving nuclear power plant capacity factors: This objective focuses on improving the long-term economic performance of current plants through development of technologies that will improve equipment reliability, lower operating costs, and increase power output while maintaining high levels of safety.

- Generation optimization through efficiency and productivity improvements: Current nuclear plants were designed and are operating with technology developed over twenty-five years ago. As these nuclear plants age, components and parts degrade or become obsolete, introducing inefficiencies, added costs, and unreliability. There have been significant technology advancements over the past twenty-five years that are applicable to power generation, particularly in computers, communications, materials, sensors and digital electronics, and artificial intelligence, providing more accurate, reliable and cost-effective technologies. Further research and technology developments will produce new technology applications that will make nuclear plant operation and maintenance processes more economical and increase overall plant output. Demonstrations of technology performance will be an integral part of this R&D effort in order to achieve regulatory acceptance of these new technologies.

The R&D performed by the nuclear industry - totaling approximately $100 million each year - is critical to the maintenance of safe and economic operation of U.S. nuclear power plants. However, the nuclear industry's primary interest is to invest the bulk of its R&D spending on short-term payback, low-risk activities that are needed to enhance day-to-day operational performance and safety. DOE's role in nuclear energy R&D is the same as in other areas of DOE energy research: to address the difficult technology issues that it is better equipped to solve than industry--because of the unique facilities and capabilities available to DOE, the lack of market incentive for industry to develop technologies important to the national interest, or because of the long-term and/or high-risk nature of the research.

The Department and the Nuclear Regulatory Commission (NRC) have established close coordination in research program planning to assure that the work performed by each organization is complementary to the other, cost-effective, and without duplication. The role of the NRC is very different from that of DOE. DOE's role is to develop technologies to address operational issues at nuclear power plants. NRC's role is to assure that it can provide the public with independent assurance that the technologies developed by DOE or industry for use in nuclear power plants are safe. NRC conducts confirmatory research as part of its responsibility to develop rules or regulations for use of new technology in nuclear

power plants. Although DOE's proposed R&D includes areas in which NRC has ongoing programs, the focuses of the two programs are distinct. Finally, to assure that NRC and DOE remain fully coordinated in all aspects of their research programs, the Department has invited the NRC to select a high-level representative to serve as an ex-officio member of the NERAC.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Nuclear Energy Plant Optimization	0	0	5,000	+ 5,000	+100.0%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Nuclear Energy Plant Optimization			
■ NEPO is proposed as a new program to address problems that will likely prevent the continued operation of many existing nuclear power plants. Funds provided by DOE will be matched by industry in conducting the proposed peer-reviewed R&D to include: managing long-term effects of component aging; improving nuclear power plant capacity factors; and generation optimization through efficiency and productivity improvements.	0	0	5,000
Total, Nuclear Energy Plant Optimization	0	0	5,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Nuclear Energy Plant Optimization	
■ The NEPO Program is a new program for FY 2000 to conduct innovative nuclear energy R&D as recommended by the PCAST Panel on Federal Energy Research and development. Matching funds are to be provided by industry. The activities funded under NEPO will be based on the critical R&D needs defined in the Joint DOE-EPRI Strategic R&D Plan to Optimize U.S. Nuclear Power Plants	+ 5,000
Total Funding Change, Nuclear Energy Plant Optimization	+ 5,000

Nuclear Energy Research Initiative

Mission Supporting Goals and Objectives

The Nuclear Energy Research Initiative (NERI) involves the research and development of new technologies to address the key issues affecting the future of nuclear energy, in particular, proliferation resistant reactors and fuel cycles; new reactor designs with higher efficiency, lower cost, and improved safety to compete in the global market; low output reactors; and new techniques for on-site and surface storage and permanent disposal of nuclear waste. [a]

A primary mission of the Department of Energy is to help assure that the United States maintains a flexible and diverse portfolio of energy supply options to power economic growth and enhance the quality of life for the American people. Nuclear energy currently provides about 20 percent of U.S. electricity generation and can contribute a significant portion of U.S. electrical energy production for many years to come. As we now enter a new millennium, the Nation faces new issues associated with energy supply and environmental policy. The potential role of nuclear power to address these new challenges, such as global climate change, will depend upon the ability of the Federal government, universities, national laboratories, industry, and others to pool their talents and creatively address the key challenges affecting the future of nuclear energy. This was clearly articulated in the President's Committee of Advisors on Science and Technology (PCAST) Panel's November 5, 1997, report to the President on Federal Energy Research and Development.

The United States has always been the world leader in both the policy and technical aspects of nuclear energy. The United States has more nuclear power plants in operation today than any other nation and most of the world's operating nuclear power plants are based on U.S. light water reactor technology. U.S. nuclear power plant technology has been exported and adapted for use in France, Japan, South Korea, and many other countries. Many countries, particularly the fast-growing economies in Asia, are interested in building new plants based on U.S. designs. Given the projected growth in global energy demand as developing nations industrialize; our vital strategic interests in addressing global climate change, nuclear non-proliferation, nuclear safety, and economic competitiveness; and our need to satisfy growing domestic needs for energy in an environmentally responsible manner, the United States must maintain its scientific and technological leadership in nuclear energy. This leadership provides the U.S. a "seat at the table" when it comes to negotiation of policy issues related to non-proliferation and related topics.

While nuclear power presents significant environmental and other benefits, several important issues impede nuclear energy's future--among these are issues related to the disposal of nuclear waste; international concerns about nuclear materials proliferation; public concerns about safety, and nuclear power's problematic economic record in the United States. Industry and government share in the

---

[a] As noted in the "Federal Energy Research And Development For The Challenges Of The Twenty-First Century" Report of the Energy Research and Development Panel, The President's Committee of Advisors on Science and Technology (PCAST), November 1997

responsibility for these problems and it is in the long-term strategic interests of the Nation that they be addressed and resolved. In particular, because no new nuclear power plants are expected to be built in this country for at least another decade, it is important that the government take appropriate action both to address key issues and to maintain a viable technology infrastructure in the United States. To date, current trends in industry, government, and universities are in contrast with the vital strategic needs of the Nation:

- Because of the lack of near-term economic incentives to conduct long-term research, U.S. industry's support of advanced nuclear research continues to shrink;
- University nuclear engineering and research programs face severe challenges and reduced funding, paralleling the reduced outlook for nuclear energy-related jobs in industry; and
- The role of the Federal Government in nuclear energy research has already changed--the funding for the Department's nuclear energy research activities has been sharply reduced in recent years.

Recognizing the important national need to address these issues, the PCAST Panel on Federal Energy Research and Development determined that establishing nuclear energy as a viable and expandable option was important, and recommended that the Department establish a new nuclear energy research program to address the problems of nuclear waste, proliferation, safety and economics. Specifically, the PCAST panel recommended the Department initiate a new nuclear energy research initiative based on competitive selection of research proposals from the national laboratories, universities and industry to "address the key issues affecting the future of fission energy including: proliferation-resistant reactors or fuel cycles; new reactor designs with higher efficiency, lower-cost, and improved safety to compete in the global market; lower output reactors for use where large reactors are not attractive; and new techniques for on-site and surface storage and for permanent disposal of nuclear waste.".

The Department endorsed this recommendation and proposed the creation of the NERI in FY 1999. To achieve this goal, the following objectives have been established for NERI:

- Develop advanced concepts and scientific breakthroughs in nuclear fission and reactor technology to address and overcome the principal technical and scientific obstacles to the expanded use of nuclear energy in the U.S. including issues involving nuclear proliferation, unfavorable economics, and nuclear waste disposition;
- Advance the state of nuclear technology to maintain a competitive position in overseas markets and a future domestic market;
- Promote and maintain a nuclear science and engineering infrastructure to meet future technical challenges; and
- Improve performance, efficiency, reliability, and economics to enhance nuclear energy application.

NERI will feature a competitive, investigator-initiated, peer-reviewed selection process to fund innovative nuclear energy-related research at universities, national laboratories, and industry. The Department believes that by funding creative research ideas at the Nation's science and technology institutions and companies, the United States will find new solutions to issues such as nuclear safety, power plant economics, proliferation, and nuclear waste. NERI program funding will be utilized to fund both the research and development activities and the independent merit review (peer review) to evaluate the scientific and technical merit of the proposals submitted.

Scientific and engineering research requested in the FY 1999 program solicitation reflects stakeholder input from universities, national laboratories, and industry resulting from a major workshop with over 126 participants held in Washington, D.C. on April 22-23, 1998. In addition, the Office of Nuclear Energy, Science and Technology works closely with the Office of Science in both the implementation of NERI and peer review to ensure that the program is implemented consistent with recommendations of PCAST, and peer reviewed consistent with the Office of Science process.

This research initiative will be managed by the Department's Office of Nuclear Energy, Science and Technology with external oversight provided on a periodic basis by the Nuclear Energy Research Advisory Committee (NERAC) to guide the strategic focus of research. The Department will continue to encourage joint research and development activities among universities, national laboratories, and industry; as well as the involvement of foreign research organizations. The Department will solicit proposals from the scientific and technical community for research that is relevant to addressing the vital issues facing nuclear energy. NERI will include an independent peer review process to evaluate and select specific research proposals to ensure the scientific and technical merit and relevancy of the research. NERI activities will continue to be coordinated with other relevant DOE program offices to assure that the best use is made of the Department's financial, intellectual, and physical resources.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Nuclear Energy Research Initiative *	0	19,000	25,000	+6,000	+31.6%
Total, Nuclear Energy Research Initiative ...	0	19,000	25,000	+6,000	+31.6%

* NERI is a new program in FY 1999 that is in the solicitation phase as this document is being prepared; therefore the research activities cannot be specified.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Nuclear Energy Research Initiative			
■ Continue the NERI program which was initiated in FY 1999 to stimulate innovative research to address the difficult issues that compromise nuclear energy's potential as a viable and expandable future electricity option. DOE proposed the NERI program to encourage innovation and foster new ideas from our nation's leading researchers at universities, national laboratories and industry to address the issues of proliferation, nuclear waste, reactor safety and nuclear plant economics. Resolution of these issues through a successful NERI program will help to make nuclear energy a viable electricity option for the next century. Given the projected growth in global energy demand as developing nations industrialize, and the desire to reduce regional and global air pollution, it is vitally important to achieve this objective. The FY 1999 NERI solicitation requested research proposals with periods of performance up to 3 years, the first year to be funded with FY 1999 appropriations and the second year with FY 2000 appropriations. Hence, a substantial portion of the requested $25 million will be used to continue research proposals awarded in FY 1999. Approximately $6 million will be available for new research proposals under a FY 2000 solicitation.	0	19,000	25,000
Total, Nuclear Energy Research Initiative	0	19,000	25,000

Termination Costs

Program Mission

The Termination Costs Program is a key component of the Department's energy supply and research missions and is directed at:

- Ensuring the cost-effective, environmentally-compliant operation of Office of Nuclear Energy, Science and Technology (NE) sites and facilities;
- Maintaining the physical and technical infrastructure necessary to support research and technology development by U.S. and overseas researchers;
- Demonstrating the acceptability of electrometallurgical technology for preparing DOE spent nuclear fuel for ultimate disposal; and
- Placing unneeded facilities in industrially safe and environmentally compliant conditions for low-cost, long-term surveillance.

Termination Costs supports the DOE Strategic Plan and the FY 2000 Performance Plan as follows:

- *Environmental Quality Objective 6* - Reduce life-cycle costs of environmental cleanup.

  - FY 2000 Strategy - The Department will reduce operating costs by continuing deactivation of surplus nuclear facilities and placing them in a radiologically and industrially safe shutdown condition. The Department will also demonstrate the viability of electrometallurgical technology for application to DOE spent nuclear fuel management needs.

Program Goal

- To contribute to the nation's nuclear science and technology infrastructure through the development of innovative technologies for spent fuel storage and disposal and the effective management of active and surplus nuclear research facilities.

Program Objectives

- Demonstrate the viability of electrometallurgical technology and the resulting waste forms for application to DOE spent nuclear fuel management needs, including the preparation of EBR-II and other DOE sodium-bonded spent nuclear fuel for disposition in a geological repository. *(Program Objective 1)*
- Place the EBR-II and other surplus facilities at the Argonne National Laboratory-West (ANL-West) site near Idaho Falls, Idaho in a radiologically and industrially safe shutdown condition for low-cost, long-term surveillance and maintenance. *(Program Objective 2)*

- Maintain ANL-West site safety, security, and safeguards infrastructure and ensure all nuclear materials are secure and handled safely in a manner which protects workers, the public, and the environment. *(Program Objective 3)*

- Maintain the ANL-West site waste management and technology development support needed to meet the Department's commitments to the State of Idaho. *(Program Objective 4)*

Performance Measures

- Complete the demonstration of the electrometallurgical spent fuel treatment technology by the end of FY 1999 using Experimental Breeder Reactor-II spent nuclear fuel. *(Performance Measure supports Program Objective 1)*

- Complete the conversion and disposition of 100 percent of the secondary sodium coolant from the Experimental Breeder Reactor-II and 40 percent of the Fermi reactor sodium coolant in storage at Argonne National Laboratory-West. *(Performance Measure supports Program Objective 2)*

- Determine by September 1999 whether electrometallurgical waste forms perform better than borosilicate glass under conditions consistent with the requirements being developed for the Department's geological repository license application. *(Performance Measure supports Program Objective 1)*

- In FY 2000, complete the draining and processing of EBR-II primary sodium. *(Performance Measure supports Program Objective 2)*

- In FY 2000, complete a National Environmental Policy Act review on the use of electrometallurgical technology to treat EBR-II and other sodium-bonded fuel in the Department's spent fuel inventory. *(Performance Measure supports Program Objective 4)*

- In FY 2000, complete documentation of the operational phase of the demonstration project and resulting data from the electrometallurgical technology demonstration. *(Performance Measure supports Program Objective 1)*

- Develop technical basis to support a DOE decision in FY 2000 on future application of the electrometallurgical treatment technology in the disposition of DOE spent nuclear fuels. *(Performance Measure supports Program Objective 4)*

- In FY 2000, develop preliminary cost estimates and schedules for deactivating the Fuel Conditioning Facility and the Sodium Processing Facility. *(Performance Measure supports Program Objective 2)*

Significant Accomplishments And Program Shifts

- Demonstration of the electrometallurgical technology for treatment of sodium-bonded EBR-II fuel and blanket assemblies was initiated in June 1996.
- EBR-II defueling was completed in December 1996.
- In FY 1997, an Environmental Assessment and Finding of No Significant Impact were issued for the shutdown of the EBR-II, including the conversion of the sodium coolant to an environmentally acceptable form suitable for disposal.
- In FY 1998, modifications to the Sodium Process Facility were completed to enable processing of legacy Fermi reactor sodium and EBR-II sodium into a waste form suitable for disposal.
- In FY 1999, complete the draining and processing of the 17,000 gallons of sodium coolant from the EBR-II secondary heat transport system.
- In FY 1999, complete the operational phase of the electrometallurgical treatment technology demonstration project.
- In FY 2000, complete a National Environmental Policy Act review and issue a Department decision on the use of the electrometallurgical technology to treat the remaining inventory of EBR-II spent fuel and other DOE sodium-bonded spent fuel.
- In FY 2000, complete all sodium coolant processing at ANL-West.

Site Description

Argonne National Laboratory

Argonne National Laboratory (ANL) is one of the U.S. Department of Energy's largest research centers. It is also the nation's first national laboratory, chartered in 1946. Argonne National Laboratory is located at two sites. The Illinois site, ANL-East, is the main laboratory and occupies 1500 acres, surrounded by a forest preserve about 25 miles southwest of Chicago's Loop. The Idaho site, ANL-West, occupies about 900 acres on the Idaho National Engineering & Environmental Laboratory site, about 35 miles west of Idaho Falls in Southeastern Idaho's Snake River Valley.

Typically, basic research is conducted at the ANL-East laboratory near Chicago, with large-scale testing and development conducted at the Idaho site, ANL-West. For example, experiments, modeling and analyses at ANL-East developed the electrometallurgical technology that is now being demonstrated with spent nuclear fuel at ANL-West. The capabilities of ANL-West also include nuclear fuel development, post-irradiation examinations, waste and nuclear material characterization, and development of dry, interim storage for spent fuel and other materials.

Activities under the Termination Costs program use a number of significant facilities at ANL-West, including the Hot Fuels Examination Facility (HFEF), Fuel Conditioning Facility (FCF), Fuel Manufacturing Facility (FMF), Sodium Process Facility (SPF), and Radioactive Scrap and Waste Facility (RSWF).

The HFEF is a versatile modern hot cell facility that is operated to characterize and package spent fuel and radioactive waste, including high-level waste which could ultimately be placed in a geologic repository. The FCF is being used to demonstrate the electrometallurgical treatment technology on spent fuel removed from the Experimental Breeder Reactor-II (EBR-II), a research reactor at ANL-West that is

[a] Includes $12 million appropriated for Nuclear Technology R&D under Other Defense Activities.

being deactivated. The FMF is currently being used to develop and test fuel for research reactors, and to verify suitability of waste forms that would result from electrometallurgical treatment. The SPF is being used to convert the legacy sodium from the Fermi reactor in Michigan which is stored at ANL-West and the sodium coolant from EBR-II into a chemically stable, low-level waste form. The RSWF provides a fully permitted interim storage capability for a wide variety of experimental spent fuels and radioactive scrap. Other facilities at ANL-West, such as the Zero Power Physics Reactor and the Transient Reactor Test Facility, while not currently operating, provide a number of reactor physics, core design, nuclear materials, and waste treatment testing capabilities.

Termination Costs

Mission Supporting Goals and Objectives

Activities at ANL have four principal goals that support accomplishment of the overall mission of the Termination Costs program. These are:

- Deactivate unneeded facilities, including the EBR-II, and secure them in a radiologically and industrially safe shutdown condition for low-cost, long-term surveillance and maintenance.
- Ensure that the site is maintained in a safe and environmentally compliant manner, that Departmental assets are available as needed to support national objectives, and that all nuclear materials are appropriately stored and safeguarded.
- Conduct advanced research and development in the area of the treatment of DOE spent nuclear fuels using electrometallurgical methods. (formerly Nuclear Technology R&D)
- Complete analysis of the data resulting from the electrometallurgical technology demonstration project, support the National Environmental Policy Act review of electrometallurgical technology for spent fuel disposition, and implement the resulting Record of Decision.

In addition to deactivation activities, Termination Costs program includes activities formerly funded under the Nuclear Technology R&D Program. These activities support the Department's mission to manage approximately 2,700 metric tons of spent nuclear fuel currently in its inventory. These activities could reduce life-cycle costs by developing and deploying an innovative spent fuel treatment technology to solve currently intractable problems. Efforts in this area are important to the Department's strategic environmental quality goal to aggressively address the legacy of civilian nuclear research and development programs, minimize waste volumes, safely manage nuclear materials, and permanently dispose of the Department's radioactive wastes.

The challenge of effectively managing the large inventory of DOE spent nuclear fuel is greatly complicated by the fact that it consists of about 150 different fuel types. Some of these spent fuels present special problems, (*e.g.*, the presence of hazardous materials such as sodium). Other spent fuels are damaged, such as the core debris from Three Mile Island unit 2. Spent fuel with these characteristics may not be acceptable for disposal in current form in a geologic repository and therefore must be treated. A prime example of this type of challenge is the EBR-II spent fuel at the ANL-West site. The EBR-II spent fuel is a metal fuel form containing elemental sodium as a bonding agent. Sodium metal is highly reactive; it burns in air and can explode when exposed to water. Because the sodium is partially absorbed by the uranium fuel elements, mechanical means are not fully effective in removing sodium. Therefore, the Department plans to treat this fuel to create a waste form acceptable for disposal. Currently, the only treatment process that the Department has found that can adequately remove the sodium from EBR-II spent fuel is the electrometallurgical treatment technology developed by ANL. In FY 1996, the Department completed an environmental assessment for the demonstration of electrometallurgical technology to treat EBR-II fuel and blanket assemblies. This demonstration project,

limited to 125 EBR-II driver and blanket assemblies, is being conducted at ANL-West and is scheduled for completion in FY 1999.

Under the Nuclear Technology R&D program, ANL-East conducted electrometallurgical treatment R&D to support the timely completion and accurate assessment of the EBR-II spent fuel treatment demonstration project at ANL-West. In addition to direct analytical support to demonstration operations, limited R&D efforts were directed at increasing the understanding and managing the remaining technical challenges of applying the electrometallurgical technology to spent nuclear fuel. Waste form fabrication and performance results from the demonstration project will be used by the Department in evaluating this technology for application to other DOE-owned spent fuel. The electrometallurgical treatment technology is not being developed to address commercial spent fuel.

A National Academy of Sciences (NAS) panel, working through the National Research Council, has been providing an ongoing independent evaluation of the development of electrometallurgical technology and the demonstration project. Based on their reviews, the Academy supports completion of the electrometallurgical technology demonstration project and the subsequent analysis of the laboratory results. The NAS is currently scheduled to issue a final report on the electrometallurgical technology in December 1999. The NAS review is crucial to the Department's assessment of the demonstration project and any decision to proceed with further application of electrometallurgical technology to the remaining inventory of EBR-II spent fuel and other sodium-bonded fuel.

The FY 2000 budget request provides funding to develop and test waste stream treatment process equipment of a scale suitable for spent fuel inventory treatment, conduct long-term tests to characterize performance of reference waste forms in accordance with established testing protocol, and develop waste form qualification plans and modeling which can be used to gain Nuclear Regulatory Commission approval for emplacement of metal and ceramic waste forms in a geologic repository.

After completion of the operational phase of the electrometallurgical demonstration project, the Department will evaluate the suitability of the technology for full-scale treatment of the remaining inventory of EBR-II spent fuel. The Department's decision to proceed with electrometallurgical processing will be based, in part, on the results from the National Academy of Sciences' review, as well as the completion of an Environmental Impact Statement. Thus, the FY 2000 budget request provides limited funding for the application of electrometallurgical technology since full-scale processing of EBR-II spent fuel will not commence immediately after completion of the demonstration project.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Total Funding Change, Termination Costs	-20,000

Fast Flux Test Facility

Program Mission

The Fast Flux Test Facility (FFTF) program provides for the safe and cost-effective maintenance of the FFTF. The FFTF was placed on standby in 1993 after the Department determined that it had sufficient research reactor capabilities to carry out its missions. However, since that time, the Department has terminated one major research reactor project and shutdown three of its operating research reactors. As a result, the Department is considering whether to propose the operation of the FFTF to meet various national isotope production and research needs. The Secretary has indicated that a decision will be made during the Spring of 1999 as to whether to initiate an Environmental Impact Statement to analyze the potential restart of the FFTF, or to proceed with the facility's permanent deactivation.

The Fast Flux Test Facility program supports the DOE Strategic Plan and the FY 2000 Performance Plan as follows:

- *Environmental Quality Objective 6* - Reduce life-cycle costs of environmental cleanup.

  - FY 2000 Strategy - The Department will reduce operating costs by continuing deactivation of surplus nuclear facilities and placing them in a radiologically and industrially safe shutdown condition. At the requested budget level, some plant systems required for operation would be permitted to fail.

Program Goal

- To support implementation of the Secretary's anticipated Spring of 1999 decision regarding future operation of FFTF. The Department is considering whether FFTF, which is located at the Hanford site near Richland, Washington, should be used for the future production of medical and industrial radioisotopes and other nuclear research and irradiation activities. If the Department decides that FFTF is not needed for any future mission, the facility will be permanently deactivated.

Program Objective

- To maintain FFTF and the adjacent Fuels and Materials Examination Facility (FMEF) in a safe standby condition pending an April 1999 decision by the Secretary of Energy to: restart the facilities for medical isotope production, nuclear research, and other irradiation purposes; resume deactivation of the facilities; or maintain the facilities in standby for potential future use.

Performance Measures

- Maintain the Fast Flux Test Facility in a safe, environmentally-compliant standby condition to permit implementation of an anticipated Secretarial decision in FY 1999 to deactivate or pursue potential restart to support a range of national research reactor requirements.

- In FY 2000, meet all Federal and State safety and environmental requirements for the Fast Flux Test Facility while implementing a Secretarial decision on the Facility.

Significant Accomplishments And Program Shifts

- In FY 1997, completed the construction of a RCRA-compliant Sodium Storage Facility to safely store the sodium coolant from FFTF primary and secondary heat transport systems.

- In FY 1997, a Secretarial decision was made to maintain FFTF in standby condition and to evaluate the tritium and medical isotope production capabilities of the facility.

- In December 1998, a Secretarial decision was made to not use FFTF for tritium production and to make a decision on any future missions for the facility by April 1999.

  - In the Spring of 1999, the Department will decide whether to terminate the FFTF or restart it to support a range of national research reactor requirements. The FY 2000 request would fund minimum surveillance and maintenance of the FFTF to keep it in a safe and environmentally-compliant condition. The FY 2000 request is adequate to support minimum surveillance and maintenance of the facility, however funding above the FY 2000 request level would be required to restart, permanently shutdown, or maintain the facility in its current condition.

Funding Profile

Site Description

Hanford Site

The FFTF, located at the Department's Hanford Site, near Richland, Washington, is a U.S. Government-owned 400 megawatt-thermal sodium-cooled, fast-neutron flux reactor originally intended for irradiation testing of nuclear reactor fuels and materials for the U.S. liquid metal reactor (LMR) program. The FFTF is the largest and most modern facility of its kind in the world.

The design, operation, and maintenance of FFTF was conducted in accordance with the standards established by the Office of Reactor Development and Technology (RDT) and the American National Standards Institute (ANSI), and the codes established by the American Society of Mechanical Engineers (ASME). An independent safety review of the design and construction of FFTF was conducted by the U.S. Nuclear Regulatory Commission (NRC) at the request of the Energy Research and Development Administration. The objective of the safety review was "to provide an in-depth technical review of the design of the FFTF comparable to that of a licensed plant." The NRC safety review was directed at "evaluating the adequacy of the design to ensure safe operation of the plant" and resulted in the issuance of a Safety Evaluation Report in August 1978.

The FFTF is an array of buildings and equipment arranged around a reactor containment building. The reactor vessel is located in a shielded cell in the center of the containment. Heat is removed from the reactor vessel by liquid sodium circulated through three primary loops (including primary pumps, piping and intermediate heat exchangers) also located in cells in containment. Secondary sodium coolant loops transport the reactor heat from the intermediate heat exchangers to the air-cooled tubes of the dump heat exchangers.

---

[a] $41.7 million included in the Nuclear Materials and Facilities Stabilization budget for the Office of Environmental Management. $9.2 million of this was reprogrammed from Uranium Programs for deactivation activities at FFTF in FY 1999.

[b] Excludes $9.2 million of prior year balances reprogrammed into this account in FY 1998.

The FFTF includes facilities for receiving, conditioning, storing, installing and removing from the core all routinely replaced core components, and storing irradiated fuel. Post-irradiation examination and packaging capabilities are also available. Utilities and services at FFTF include onsite emergency generation of electrical power, heating and ventilation, radiation monitoring, fire protection, auxiliary cooling systems for cell atmospheres and some components.

The FFTF is in standby with the reactor completely defueled. The main heat transport system is being operated at approximately 400°F. Essential systems, staffing, and support services are being maintained. Standby surveillance and maintenance activities are being performed to ensure that there is: (1) no degradation of key plant systems; (2) retention of the authorization basis and configuration control; (3) maintenance of key staffing, qualifications, and training; and (4) full compliance with Federal and state safety and environmental requirements.

The FFTF was operated from April 1982 to April 1992 in support of various Department programs such as material testing for fusion, space reactor, and international fast reactor programs. The facility played a key role in LMR development and testing activities as it provided a test bed for demonstrating and evaluating the performance of fuel assembly and core designs in a prototypic LMR environment. The FFTF is widely considered the Department's best nuclear facility in terms of conduct of operations.

The FFTF has been in a hot-standby condition since December 1993. In November 1995, the Department decided to limit deactivation work at FFTF to those activities which would not prohibit the facility from being returned to service in order to study the facility's capability for tritium and medical isotope production. In January 1997, the Department decided to continue to maintain the facility in standby to further evaluate the tritium and medical isotope production capabilities of the facility and to determine what role, if any, the facility could play in the Department's tritium production strategy.

In December 1998, the Secretary announced his decision not to use FFTF for tritium production and to decide in the Spring of 1999 whether the facility would be used to support any other missions. The Secretary has tasked the Department's Nuclear Energy Research Advisory Committee to complete its review of the nation's nuclear science and technology infrastructure in time to inform the Spring 1999 decision. Potential future missions for FFTF include medical isotope production, advanced materials research, plutonium-238 production, and nuclear energy research and development.

The requested funding level supports minimum surveillance of the FFTF while it remains on standby. However, the requested funding level will permit some plant systems required for operation to fail.

Fast Flux Test Facility

Mission Supporting Goals and Objectives

The FFTF is a multi-use facility capable of supporting the Department's strategic missions of energy resources, science and technology, and national security. The FY 2000 budget request is based on performing activities which are required to maintain the facility in a safe and environmentally-compliant condition. The FY 2000 request would allow some key plant components required for operations to fail.

Additional funding would be required to restart, deactivate, or maintain the FFTF in its current condition.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Fast Flux Test Facility (FFTF)	0 [a]	30,000 [b]	30,000	0	0.0%
Total, Fast Flux Test Facility	0 [a]	30,000 [b]	30,000	0	0.0%

[a] $41.7 million included in the Nuclear Materials and Facilities Stabilization budget for the Office of Environmental Management. $9.2 million of this was reprogrammed from Uranium Programs for deactivation activities at FFTF in FY 1999.

[b] Excludes $9.2 million of prior year balances reprogrammed into this account in FY 1998.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Fast Flux Test Facility			
■ Continue FFTF standby activities, such as continuing to maintain FFTF systems in compliance with Federal and State regulations and permit requirements	0	30,000	30,000
Total, Fast Flux Test Facility	0[a]	30,000[b]	30,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Fast Flux Test Facility	
■ The FY 2000 funding request would provide funding for minimum surveillance and maintenance of the FFTF to keep it in a safe condition and in compliance with Federal and State environmental regulations. At the requested funding level, some plant systems necessary for operation would be permitted to fail.	0
Total Funding Change, Fast Flux Test Facility	0

[a] $41.7 million included in the Nuclear Materials and Facilities Stabilization budget for the Office of Environmental Management. $9.2 million of this was reprogrammed from Uranium Programs for deactivation activities at FFTF in FY 1999.

[b] Excludes $9.2 million of prior year balances reprogrammed into this account in FY 1998.

Isotope Support

Program Mission

The mission of the Isotope Program is to serve the national need for a reliable supply of isotope products, services and related technology used in medicine, industry, and research. The program supports development of new or improved isotope products and services that are used in medical diagnoses and therapy, and other applications that are in the national interest. Prices charged for these products and services may not always achieve full-cost recovery to the Government. The Department encourages private sector investment in new isotope production ventures and will sell or lease its facilities and inventories for commercial purposes. If private sector production of a given isotope becomes well established, DOE will no longer supply that isotope.

All appropriations for the Isotope Support decision unit fund a payment into the Isotope Production and Distribution Fund as required by P.L. 101-101 and as modified by P.L. 103-316. Requested funding is required to maintain financial continuity of radioactive and stable isotope research, development, production, processing, distribution, and associated services to commercial and research customers. Funding will also be used to provide radioisotopes and enriched stable isotopes for research and development, medical diagnosis and therapy, isotopes applications, to support nuclear medicine research, and to support administrative activities.

By August 1999, the Department will complete the modification of facilities at Sandia National Laboratories, New Mexico, required to support molybdenum-99 (Mo-99) production sufficient to meet 100 percent of U.S. demand. The revision of all safety documentation and operational procedures for the facilities, started in fiscal year 1998, and will be completed in fiscal year 1999. The Department's capital investment in the Mo-99 project will thus be completed in fiscal year 1999 and the goal of achieving a backup supply of Mo-99 will have been met. Mo-99 is the most widely used isotope. Isotopes are used in over 40,000 medical procedures per day in the U.S. to diagnose maladies, such as cancer and heart disease. The Mo-99 project will be at a point that 1) production of Mo-99 can be mobilized on an emergency basis if the foreign supply of Mo-99 is significantly disrupted, and 2) the Sandia facilities are ready for the private sector to make further investments to take the project to routine commercial production.

The fiscal year 2000 budget request for Isotope Support is $21,000,000. This budget request combined with projected revenues of $10,000,000 should provide the Isotope Production and Distribution Fund sufficient capital to meet total estimated program expenses of $31,000,000.

Isotopes supports the DOE Strategic Plan and the fiscal year 2000 Performance Plan as follows:

- *Science and Technology Objective 2* - Deliver leading-edge technologies that are critical to the DOE mission and the Nation

  - Fiscal Year 2000 Strategy - The Department will develop new or improved isotope products and services that enable medical diagnoses and therapy, and other applications that are in the national interest, and encourage private sector investment in new isotope production ventures and sell or lease facilities and inventories for commercial purposes.

Program Goals

- Support, in collaboration with other Federal agencies, vital, advanced research that applies to DOE-produced research isotopes. *(Program Goal 1)*

- Develop new isotopes and isotope application technology to meet future national needs. *(Program Goal 2)*

- Provide a reliable supply of quality products and services based on customers' needs. *(Program Goal 3)*

Program Objectives

- Work with stakeholders, customers, and advisory groups to identify and develop new applications utilizing isotope products and technologies. *(Program Objective 1 supports Program Goal 2)*

- Support and encourage advanced research applying DOE-produced research isotopes. *(Program Objective 2 supports Program Goal 1)*

- Invest in new product processes and application development initiatives. *(Program Objective 3 supports Program Goal 2)*

- Manage and operate the Isotope Program in a cost-effective manner that best serves the interests of its customers and the U.S. taxpayers. *(Program Objective 4 supports Program Goal 3)*

- Continue to improve product quality and services and enhance customer satisfaction. *(Program Objective 5 supports Program Goal 3)*

- Ensure that environmental safety, health, and transportation safeguards requirements are met in the conduct of Isotope Program site activities. *(Program Objective 7 supports Program Goals 1, 2, and 3)*

- Achieve maximum private sector involvement in isotope activities by identifying those with privatization potential and then assisting the private sector in privatizing those that are commercially viable. *(Program Objective 8 supports Program Goal 3)*

Performance Measures

- In FY 1998, completed 80 percent of the Sandia Hot Cell Facility construction modifications and processing equipment installation activities needed to achieve the facility capability to process 100 percent of the U.S. demand for molybdenum-99. **(Fully Successful)**

- In FY 1999, initiate construction and commissioning of the Los Alamos Target Irradiation Station, improving isotope quality with greater operating efficiency.

- In FY 1999, complete equipment installation necessary for an emergency backup supply of molybdenum-99, issue a request for proposals to privatize molybdenum-99 production and business activities by May 1999, and after evaluation, award a contract by September 1999 to the most qualified firm.

- By the end of FY 2000, complete at least 60 percent of the construction of the Los Alamos Target Irradiation Station, which is needed for the production of short-lived isotopes for medical research.

- In FY 2000, implement the Advanced Nuclear Medicine Initiative by providing isotopes or financial assistance for up to five researchers.

- Complete privatization activities associated with production and sales of commercial isotopes by the end of FY 2000.

- Supply quality stable and radioactive isotopes for industrial, research, and medical applications that continue to meet customer specifications and maintain 95 percent on-time deliveries. **(Fully Successful in FY 1998)**

- In FY 2000, invest in two new process development technologies, as requested by researchers, that enhances isotope production, services and delivery application systems.

- Respond to customer requests for information within 48 hours.

- Keep customer complaints to less than four percent of all deliveries made.

- Hold annual stakeholder meetings in conjunction with international and regional trade shows.

Significant Accomplishments And Program Shifts

- Researchers throughout the United States are assessing radioisotopes that emit alpha and beta particles that can destroy cancer cells and reduce tumors. For example rhenium-188 is a beta-emitting radioisotope that may prove useful in treating several cancers. Alpha-emitters such as bismuth-213 also have shown certain cancer therapy properties. Also, use of radioisotopes for the prevention of restenosis in helping arteries stay unclogged after coronary angioplasty. The Department will continue to provide limited support for production. Any changes or increases in

demand, due to success in pre-clinical trials, will require a change in production capability and additional resources.

- There is a growing demand for a reliable year-round supply of short-lived accelerator-produced isotopes for medical research. The Department is attempting to make accelerator isotopes available for up to 52 weeks. Without the completion of the Los Alamos Target Irradiation Station, the Department's ability to produce most important short-lived research isotopes will be virtually eliminated, resulting in a crucial shortage of research isotopes.

- The Isotope Program will seek cooperative supply agreements with other isotope manufacturers.

- Privatization of selected Isotope Program activities will result in a decrease in both expenses and resources. The program will continue to seek opportunities for the private sector to assume its activities.

- Continue to produce and distribute essential isotopes to meet national demand when no domestic or private sector capability exists; where unique Government production facilities are needed such as nuclear reactors or large accelerators; or where non-Federal productive capacity is insufficient to meet U.S. needs.

- Measure and enhance customer satisfaction by actively soliciting customer feedback and seeking to implement their recommendations.

Funding Profile

Site Descriptions

Los Alamos National Laboratory

Los Alamos National Laboratory (LANL) is a U.S. Department of Energy (DOE) scientific research laboratory located in New Mexico. The Isotope Production Facility at LANL operates about 22 weeks per year. This accelerator facility produces radioisotopes using either the primary proton beam or neutrons from the beam stop of the Los Alamos Neutron Science Center (LANSCE), a half-mile-long accelerator that delivers medium energy protons. The unique characteristics of the LANSCE accelerator include a high energy, high beam current that allows production of higher quality radioisotopes, as well as exotic radioisotopes that cannot be produced in other facilities. Three major products produced at the site are germanium-68, a calibration source for positron emission tomography (PET) scanners; strontium-82, the parent of rubidium-82, used in cardiac PET imaging; and sodium-22, a positron-emitter used in neurologic research.

[a] Since the Isotope Program operates like a business, funding at isotope production sites can increase or decrease depending on demand, cash collections, production efficiencies, and availability of facilities.

[b] Reflects an additional $3,700,000 provided through a transfer of appropriations to accelerate the capability to process 100 percent of the U.S. demand for Mo-99.

Sandia National Laboratory

Sandia National Laboratory (SNL) is a U.S. Department of Energy (DOE) scientific research laboratory located in New Mexico. SNL's Annual Core Research Reactor (ACRR) is a 2 megawatt, pool-type research reactor that is used to produce isotopes for medical applications. The ACRR is a highly flexible facility applied to the mission requirements of the Department in both isotope and national security applications.

Mo-99 is a precursor of technetium-99m, an isotope that is used in over 36,000 medical procedures per day in the United States to diagnose maladies such a cancer and heart disease. Sixty percent or more of the U.S. supply currently depends on a single aging reactor in Canada that will cease isotope production in the year 2004. The vulnerability of the Canadian supply was demonstrated when the labor force at the reactor site went on strike in June 1977 and May 1998. The ACRR and SNL's nearby Hot Cell Facility, along with LANL's Chemistry and Metallurgy Research Facility, have been modified for production of Mo-99 and related medical isotopes on an emergency basis if the foreign supply of Mo-99 is significantly disrupted. The capital investment to prepare for Mo-99 production will be completed in fiscal year 1999. The Mo-99 facility will be ready for the private sector to make further investments to implement routine commercial production.

Brookhaven National Laboratory

Brookhaven National Laboratory (BNL) is a U.S. Department of Energy (DOE) scientific research laboratory located on Long Island, New York. The Brookhaven Linear Isotope Producer (BLIP) at BNL uses a linear accelerator that injects 200 million-electron-volt protons into the 33 billion-electron-volt Alternating Gradient Synchrotron. The BLIP facility operates about 16 weeks per year and produces radioisotopes such as strontium-82, germanium-68, copper-67, and others that are used in medical diagnostic applications. BNL is also active in the development of new isotope processes and delivery systems.

Oak Ridge National Laboratory

Oak Ridge National Laboratory (ORNL) is a U.S. Department of Energy scientific research laboratory located in Oak Ridge, Tennessee. The High Flux Isotope Reactor (HFIR) at ORNL provides one of the world's highest steady-state neutron fluxes. The reactor is normally scheduled to operate about 43 weeks per year to support primary missions other than isotope production. Isotope products made at this facility include: tungsten-188, rhenium-186, californium-252, and iridium-192. One target position with hydraulic capability to simultaneously load and unload up to eight target cans is available and is heavily used for medical radioisotope production. Additional peripheral target positions will become available in the second half of fiscal year 1998. The program depends heavily on HFIR for isotope production.

The electromagnetic calutrons at ORNL separate isotopes with the same atomic number, but different mass, to produce enriched stable isotopes. During this process, mixed isotope material is vaporized (heated) and then ionized. The ionized particles are accelerated, and their trajectories are bent by a magnetic field. The lighter particles separate from the heavier particles as they travel in an arc and are deposited on collectors, from which they are removed, chemically purified, and placed in inventory as enriched stable isotopes. Fifty-five chemical elements can be isotopically separated in the calutrons to produce 225 enriched stable isotopes. Currently, the calutrons are placed in a cold-standby mode with minimum maintenance.

All Other Sites

This category includes providing direct assistance to Universities or research institutions, or to DOE laboratories yet to be determined for producing isotopes or related reviews or to fund isotope related research based on a peer-reviewed selection process.

Operation and Maintenance

Mission Supporting Goals and Objectives

The Department, through the Isotope Program, provides radioactive and stable isotope products and associated services to a wide and varied domestic and international market. Ultimate applications of isotope products include medical research and health care, industrial research and manufacturing, education, and national defense. The Isotope Program mission is to serve the national need for a reliable supply of isotope products services and related science and technology used in medicine, industry, and research. The program supports development of new or improved isotope products and services that enable medical diagnoses and therapy, and other applications that are in the national interest. Prices charged for these products and services may not always achieve full-cost recovery to the Government. The Department encourages private sector investment in new isotope production ventures and will sell or lease its facilities and inventories for commercial purposes. If private sector production becomes well established, DOE will no longer supply that particular isotope.

Many uses for isotopes have emerged over the past generation as an adjunct of nuclear research, defense, and power development programs. As the range of available isotopes and the recognized uses for them have increased, isotope applications have become necessary to achieve progress in medical research and practice, new industrial processes, and scientific methodology.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Operation and Maintenance	19,473	15,500	13,000	-2,500	-16.1%
Construction	0	6,000	8,000	+2,000	+33.3%
Total, Isotope Support	19,473	21,500	21,000	-500	-2.3%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Operations and Maintenance			
■ Isotope Production and Distribution maintains core personnel and operating capability at three of five sites and partial operations at a fourth isotope production site. The calutrons and the remaining sites will be maintained in a standby status. This will enable the production, packaging and distribution of radioactive and stable isotopes for about 18 major products, services, and processing of many forms and types of stable isotopes from inventory. This estimate was based on serving about 200 customers and over 1,100 deliveries. Limited support will also be provided for the separation of uranium, from existing stockpiles at Oak Ridge, for an expanding alpha-emitter isotope market. Maintain nuclear facility operations	10,330	10,300	10,500
■ Mo-99 Initiative			
▸ Conduct Operational Readiness Review for modified reactor, complete Hot Cell Facility major construction modifications for establishing full processing capacity, and initiate fabrication of the targets at the Los Alamos Chemistry and Metallurgy Research facility for future Mo-99 production	9,143	0	0
▸ Continue target production, install production scale target processing equipment in Hot Cell Facility, thus completing DOE's investment in this project. Complete the Mo-99 initiative	0	5,200	0
Total, Mo-99 Initiative	9,143	5,200	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Advanced Nuclear Medicine Initiative			
▸ Sponsor nuclear medical science using a peer review selection process. DOE support will be in two forms: direct research financial assistance and making isotopes available for research at prices that researchers can afford; ▸ Encourage the training of individuals in nuclear medicine methods by establishing university scholarships and fellowships for nuclear medicine specialists and by sponsoring summer internships at appropriate institutions; ▸ Initiate a focused program to apply alpha-emitting isotopes available in the U.S. from the DOE to fight a spectrum of malignant diseases including most common cancers and infectious diseases such as meningitis and AIDS. Non-malignant applications may include treatment of other immune disorders and of rheumatoid and degenerating joint diseases.	0	0	2,500
Total, Operation and Maintenance	19,473	15,500	13,000
Construction			
■ Complete engineering, design, and construction work inside the existing beam tunnel. Engineering and design of the new tunnel section and target station will be completed. Construction of the target station and new beam tunnel section will be started in FY 1999 and completion is expected in FY 2001. Any delay in schedule will result in a shortage of isotopes, loss of $1.5 million of revenue and incurred fixed costs of $2.3 million.	0	6,000	8,000
Total, Isotope Support	19,473	21,500	21,000

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Operations and Maintenance	
■ Complete the Mo-99 initiative	-5,200
■ Implement the Advanced Nuclear Medicine Initiative	+2,500
■ Increase in production costs	+200
Total, Operations and Maintenance	-2,500
Construction	
■ Construct the Los Alamos Target Irradiation Station for accelerator, medical, and research isotopes	+2,000

FY 2000 Budget request *(Current Baseline Estimate)*	1Q 1999	4Q 1999	1Q 2000	3Q 2001	14,000	15,520

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
1999	6,000	6,000	4,217
2000	8,000	8,000	7,430
2001	0	0	2,353

3. Project Description, Justification and Scope

This project proposes to build a new target irradiation facility for the production of radioisotopes at the Los Alamos Neutron Science Center (LANSCE) accelerator. The project started in FY 1999 will include installation of a beam switching device at the point where the beam is diverted, construction of a short beam line to the targeting area, and construction of a target handling facility with a beam stop. This facility will utilize a 100 MeV proton beam obtained by diverting a portion of the main LANSCE beam before it enters the final portion of the accelerator and directing it to a new targeting area dedicated to isotope production. In most cases production of radioisotopes is both more efficient and more selective with low beam energies (100 MeV) than with the high beam energy currently being used at Los Alamos (800 MeV). Therefore, once the new facility is in operation, the program will continue to produce most of the same isotopes, but with greater efficiency.

The proposed target irradiation facility will replace the existing Isotope Production Facility, which is located at TA-53 in building MPF-3 at the east end of Area A of LANSCE. However, Area A, where the existing Isotope Production Facility is located, will be rendered inoperable by the proposed reconfiguration of the LANSCE accelerator complex thereby, preventing Los Alamos to produce these isotopes.

The Isotope Program has been one of the more successful and visible ongoing activities at Los Alamos. It has used the unique capabilities of the Laboratory's facilities and staff to respond to a well recognized national need for radioisotope production and development. Today there are many customers in industry, research institutions, the medical community, academia, and other agencies who purchase the 30+ radioisotopes produced in the Isotope Production Facility at LANSCE. Because the current Laboratory plan to redirect the focus of the LANSCE accelerator complex toward neutron science, this has placed the use of the existing Isotope Production Facility in jeopardy. This change in focus can be viewed as an opportunity for the Isotope Production and Distribution Program to construct a dedicated radioisotope production facility which can operate on a noninterference basis with any of the proposed LANSCE configurations while at the same time operating at a lower beam intensity than the present Isotope Production Facility. This new facility would advance the Department of Energy's objective to be a reliable domestic source of research radioisotopes crucial for the future of industry, education and medicine.

The proposed facility would be located on the north side of the LANSCE linear accelerator (linac) building near the west end of the accelerator complex. A beam line would be built from the transition region between the Drift Tube Linac and the Side-Coupled Cavity Linac extending to the northeast to a targeting facility located to the north of Sector A. The new beam line will be approximately 100 feet in length with the beam line center expected to be between 20 and 35 feet below grade. The targeting facility would be located within a new building located above the end of the beam line. This building will be approximately 3000 square feet in area, and will house all the necessary equipment and control systems for carrying out target irradiations. This building will include a high bay area with overhead cranes.

This project will include design, excavation, and construction of the beam line tunnel, design and construction of the beam line and its control systems, design and construction of the building to house the targeting facility, and design and construction of the target handling and control systems. The beam tunnel construction modification must be completed during the LANSCE accelerator outage in 1999.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design	1,537	1,292
Design Management costs @ 20.9% of Design [a]	321	321
Project Management costs @ 19.7% of Design	303	211
Total, Design Phase	2,161	1,824
Construction Phase		
Improvements to Land	521	625
Buildings	3,229	3,129
Special Equipment	3,296	3,175
Utilities	158	61
Inspection, design and project liaison, testing, and acceptance	852	842
Construction Management @ 3.7% of Construction	298	290
Project Management @ 9.6% of Construction	773	568
Total, Construction Phase	9,127	8,690
Contingencies @ 24% of Design and Construction		
Design	737	496
Construction	1,975	1,055
Total, Contingencies	2,712	1,551
Total, line item costs (TEC)	14,000	12,065

5. Method of Performance

Procurement will be accomplished under fixed-price contracts awarded on the basis of competitive bidding. Utilities upgrades will be done by fixed price contractors and the Laboratory's support services contractor. The M & O contractor and contracted Architect-Engineers will perform construction inspection.

[a] Percentages are calculated for Current Estimate numbers only.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1999	FY 2000	FY 2001	Outyears	Total
Project cost						
Facility cost						
Design	0	2,805	91	0	0	2,896
Construction	0	1,412	7,339	2,353	0	11,104
Total, Line Item (TEC)	0	4,217	7,430	2,353	0	14,000
Other project costs						
Conceptual Design costs	545	0	0	0	0	545
Other ES&H costs	93	0	0	0	0	93
Other project related costs [a]	827	0	0	55	0	882

Total Project Cost (TPC)	1,465	4,217	7,430	2,408	0	15,520

7. Related Annual Funding Requirements

(FY 2003 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs	285	285
Annual facility maintenance/repair costs	111	111
Utility costs	39	39
Total related annual funding	435	435
Total operation cost (operating from FY 2003 through FY 2022)	8,700	8,700

[a] Other project related costs - This item includes the costs for creating as-builds for the existing facility beamline, shielding calculations, and engineering studies to refine the magnet, beamline and target designs to integrate into the existing facility.

Isotope Production and Distribution Program Fund

Program Mission

The Isotope Production and Distribution Program Fund provides all funds to the Isotope program which serves the national need for a reliable supply of isotope products, services and related technology used in medicine, industry, and research. As the range of available isotopes and the recognized uses for them have increased, isotope applications have become essential to progress in medical research and practice, new industrial processes, and scientific methodology. A substantial infrastructure has been built around the use of isotopes. Therefore, an adequate supply of medical and research isotopes is essential to the Nation's health care system, and to basic research and industrial applications that contribute to national economic competitiveness. The Department supports nuclear medicine research through direct financial assistance and by providing isotopes to researchers at reduced prices. The Department also encourages private sector investment in new isotope production ventures and will sell or lease its facilities and inventories for commercial purposes. If private sector production of a given isotope becomes well established. DOE will no longer supply that isotope.

Program Goals

Program goals for the Isotope Production and Distribution Fund are discussed in the Isotope Support section.

Program Objectives

Program objectives for the Isotope Production and Distribution Fund are discussed in the Isotope Support section.

Performance Measures

Performance measures for the Isotope Production and Distribution Fund are discussed in the Isotope Support section.

Funding Profile

No funds are requested for the Isotope Production and Distribution Fund. The budgetary resources for the Fund are received as spending authority from offsetting collections from two sources: (1) expenditure transfers of all appropriated funds from Energy Supply-Isotope Support; and (2) revenues from the sales of goods and services to the public. See the Isotope Support section for justification of the $21.0 million request for budget authority. Sales in FY 1998 were $11.0 million, and are estimated at $10.0 million for both FY 1999 and FY 2000.

Uranium Programs

Program Mission

This program supports important government activities related to the Federal uranium enrichment program that were not transferred to the United States Enrichment Corporation (USEC Inc.). In particular, this program addresses the facility and environmental legacies associated with the enrichment program, management of government assets, and associated research and development.

One of the principal missions of Uranium Programs activities is to effectively manage the Department's depleted uranium hexafluoride (DUF_6) inventories. The Department's major mission for depleted uranium is to ensure that an estimated 46,400 cylinders of depleted uranium hexafluoride are maintained in an environmentally responsible manner by conducting annual cylinder inspections, and developing and implementing options to repair cylinders exhibiting accelerated corrosion. In addition, the Department will complete an evaluation of a long-term management strategy options for the DUF_6 as part of a programmatic environmental impact statement. NE expects to issue a record of decision on this program in mid-FY 1999.

In addition to appropriations received for management of DOE-generated depleted uranium hexafluoride, the Department received in FY 1998 $66 million from the U.S. Enrichment Corporation for the management and disposition of about 11,200 additional USEC-generated depleted uranium cylinders. In response to the FY 1999 appropriations language, the Department submitted, on December 17, 1998, its initial plan for applying the $66 million received from USEC. These funds are administered in accordance with the terms of the two Memoranda of Agreement (MOAs) and related correspondence for activities required to accept and maintain the USEC material.

On July 21, 1998 the President signed P.L. 105-204, an act requiring that the Secretary of Energy prepare a plan and proposed legislation for the disposition of depleted uranium hexafluoride. This plan is being prepared and is expected to be submitted to Congress with the President's new legislative budget proposals.

Other Uranium Programs activities at the gaseous diffusion plants in Portsmouth, Ohio; Paducah, Kentucky; and Oak Ridge, Tennessee include maintenance of facilities and grounds, cleaning legacy PCB spills in the leased areas of the diffusion site consistent with the Federal Facilities Compliance Act, guarding and protecting HEU material stored at the Portsmouth site, and addressing financial liabilities by paying post retirement life and medical costs for retired contractor personnel at the diffusion sites and power suppliers, and by providing legal representation for existing lawsuits. Lastly, after assisting in the transfer of regulatory oversight of the leased facilities and obtaining an initial certificate of compliance from the Nuclear Regulatory Commission (NRC), the Department continues to review and update Safety Analysis Reports (SARs) as necessary, for the non-leased facilities and assist the NRC in preparing annual congressional reports on the status of the diffusion plants.

NE is also responsible for the management and disposition of the Department's excess natural uranium inventories. These excess inventories include uranium originally purchased for government purposes, and inventories received from the U.S./Russia Highly Enriched Uranium Purchase Contract as directed by the USEC Privatization Act. In FY 1999, NE will administer $325.0 million provided in the emergency appropriations bill (P.L. 105-277) for the purchase of natural uranium pursuant to 1997 and 1998 deliveries under the U.S./Russian HEU Agreement.

Uranium Programs supports the DOE Strategic Plan and the FY 2000 Performance Plan as follows:

Environmental Quality Objective 6 - Reduce life-cycle costs of environmental cleanup.

- FY 2000 Strategy - The Department will reduce the disposition cost of depleted uranium by exploring and developing alternative government uses for the material. Perform depleted uranium hexafluoride cylinder maintenance activities that are protective of workers and the environment.

Program Goals

- Manage Office of Nuclear Energy, Science and Technology (NE) facilities at Portsmouth, Ohio; Paducah, Kentucky; and Oak Ridge, Tennessee in a safe, economic, and environmentally-sound manner. *(Program Goal 1)*

- Ensure that the estimated 46,400 cylinders of depleted uranium hexafluoride within the DOE inventory are maintained in an environmentally responsible manner by conducting annual inspections and exploring options to effectively treat cylinders that exhibit accelerated corrosion, and conducting cost-shared projects with industry for the conversion of UF_6 to uranium oxide and/or metal. The Department is completing an environmental impact statement on the long-term management of its inventory of depleted uranium. A record of decision will be issued by mid-FY 1999. *(Program Goal 2)*

- Maintain in an environmentally safe condition the cylinders of DUF_6 received from USEC. *(Program Goal 3)*

- Prudently manage the Department's inventory of excess natural uranium, including Russian uranium transferred to the Department from USEC as required by the USEC Privatization Act. *(Program Goal 4)*

Program Objectives

- Manage the collection and disposal of PCB spills at the leased gaseous diffusion plants and maintain the non-leased facilities in a safe and environmentally-sound condition. *(Program Objective 1 supports Program Goal 1)*

- Manage the pre-existing liabilities incurred before the creation of the USEC in 1993 and manage the additional liabilities as a result of the 1996 legislation supporting the privatization of USEC. *(Program Objective 2 supports Program Goal 1 and 2)*

- Manage and disposition natural uranium and depleted uranium hexafluoride inventories in a safe, economic, and environmentally-sound manner. *(Program Objective 3 supports Program Goal 3)*

Performance Measures

- In FY 1998, completed the dilution of about 14 metric tons of excess highly enriched uranium (approximately 3.5 metric tons in FY 1998) to LEU at the Portsmouth Gaseous Diffusion Plant. *(Performance Measure supports Program Objective 3)* **(Fully Successful)**

- In FY 1998, completed 80 percent of the final programmatic environmental impact statement for selecting the long-term management strategy for the depleted UF_6. *(Performance Measure supports Program Objective 3)* **(Successful)**

- In FY 1999, remove all highly enriched uranium oxides from the Portsmouth site. *(Performance Measure supports Program Objective 5)*

- Meet all legal commitments for post-retirement life and medical costs for retirees who supported the Uranium Enrichment Program before July 1, 1993. *(Performance Measure supports Program Objective 2)*

- Maintain compliance with the Toxic Substances Control Act (TSCA), the Uranium Enrichment TSCA Federal Facilities Compliance Agreement (FFCA), DOE orders and other requirements and perform minimal corrective maintenance and inspections. *(Performance Measure supports Program Objective 1)*

- Meet all commitments to the Ohio Environmental Protection Agency and the Defense Nuclear Facilities Safety Board to ensure the safety of the Department's inventory of depleted uranium hexafluoride. *(Performance Measure supports Program Objective 3)*

- In FY 2000, through the NEPA decision-making process, establish and begin implementing the long-term strategy for the management of the Department's depleted uranium hexafluoride inventories. *(Performance Measure supports Program Objective 3)*

Significant Accomplishments And Program Shifts

- The transparency measures program has been transferred from of the Office of Nuclear Energy, Science and Technology to the Office of Nonproliferation and National Security, and beginning in FY 2000 is no longer included in the Uranium Programs budget.

- In FY 1999, complete the transfer of remaining highly enriched uranium oxides at the Portsmouth Site to USEC for dilution to low enriched uranium as authorized by the USEC Privatization Act of 1996 (P.L. 104-134, Subchapter A).

- A Memorandum of Agreement between DOE and USEC dated May 18, 1998 was signed that provided for USEC to pay DOE $16 million in complete satisfaction of USEC's obligation for all costs associated with the storage of the depleted uranium generated by USEC during the pre-privatization period. On June 30, 1998, USEC and DOE signed another Memorandum of Agreement under which 16.6 million kgU of USEC depleted uranium generated after privatization will transfer to DOE, in exchange for $50 million. On December 17, 1998, the Department submitted its initial plan to Congress for applying the $66 million received from USEC under the two MOAs.

- A draft programmatic environmental impact statement (PEIS) on the long-term management of the Department's depleted uranium was issued for public comment on December 24, 1997. The Department plans to issue the final PEIS in the second quarter of FY 1999 and the related record of decision (ROD) in mid-FY 1999.

- Conduct demonstration projects that have the objectives of: (1) reducing the eventual disposal cost of depleted uranium; and (2) stimulating the use of depleted uranium and thereby reduce the level of material that must be disposed in the future.

- On July 21, 1998, the President signed P.L. 105-204, an act requiring that the Secretary of Energy develop a plan and proposed legislation for the disposition of depleted uranium hexafluoride and for the construction of, beginning no later than January 31, 2004, facilities at Paducah and Portsmouth to treat and recycle depleted uranium hexafluoride consistent with the National Environmental Policy Act. This plan is being prepared and is expected to be submitted with the President's new legislative budget proposals.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request
Uranium Programs					
Operation and Maintenance	41,633	49,000	0	49,000	41,000
Construction	3,000	0	0	0	0
Total, Uranium Programs [a] [b]	44,633 [c]	49,000 [d]	0	49,000 [d]	41,000

[a] The HEU Transparency Measures program transferred to the Office of Nonproliferation and National Security and beginning in FY 2000 is no longer included in the Uranium Programs budget.

[b] Additional funding from the MOAs between USEC and DOE will be used in FY 1999 and FY 2000 for depleted uranium cylinder maintenance; construction of cylinder yards at Paducah and Portsmouth; and other depleted uranium activities.

[c] Excludes $19.2 million reprogrammed to the Uranium Enrichment Decontamination and Decommissioning Fund ($10.0 million) and the Fast Flux Test Facility ($9.2 million).

[d] Excludes $325 million emergency appropriation (P.L. 105-277) for the purchase of natural uranium associated with 1997 and 1998 deliveries under U.S./Russian HEU purchase agreement.

Site Descriptions

Oak Ridge Operations

The Oak Ridge Operations (ORO) Office is one of the major Field Offices that support the U. S. Department of Energy's Nuclear Energy Program Office. ORO is responsible for fulfilling DOE's contractual liability with respect to retired management and operating contractor employees of the Paducah and Portsmouth facilities as well as retired power supplier employees, and for representing DOE in litigation activities arising from Uranium Enrichment activities prior to July 1, 1993. ORO also provides support for planning, developing, and executing strategies for the disposition of the DUF_6 inventory.

ORO is located in three sites: the Ohio site near Portsmouth, Ohio, the Kentucky site near Paducah, Kentucky, and the Tennessee site located in Oak Ridge Tennessee.

East Tennessee Technology Park (formerly K-25 site)

The East Tennessee Technology Park (ETTP) is located in Oak Ridge, Tennessee, and is responsible for supporting the nuclear safety activities required to meet Departmental obligations under the Energy Policy Act of 1992 by assisting the NRC in the preparation of an annual report to Congress on the status of health, safety, and environmental conditions at the GDPs, Management Oversight of the Enrichment Facilities Operations, the management of U.S. Department of Energy liabilities arising from Uranium Enrichment activities prior to July 1, 1993, the DUF_6 Cylinder Maintenance project which has the responsibility to safely store the existing inventory of DUF_6 until ultimate disposition of the material, the DUF_6 Conversion tasks, and the administration of the Lease Agreement between DOE and the United States Enrichment Corporation (USEC Inc.).

Paducah Gaseous Diffusion Plant

The Paducah Gaseous Diffusion Plant is located on 3,423 acres near Paducah, Kentucky, and is responsible for supporting several activities including: (1) review and update of Safety Analysis Reports as necessary, and assistance with the preparation of NRC's annual report to Congress; (2) the maintenance of nonleased facilities which includes effort in both active and inactive facilities to protect the safety and health of personnel and the environment as well as biological monitoring activities at the Paducah Gaseous Diffusion Plant; (3) the PCB Program which includes activities related to achieving and maintaining compliance with Toxic Substance Control Act of 1976 (TSCA), the Uranium Enrichment TSCA Federal Facilities Compliance Agreement, and DOE Orders and other applicable requirements. Specific PCB activities include oversight of the collection and containment system, management of TSCA regulated PCB spill sites, and management of waste generated from these activities; and (4) the DUF_6 Cylinder Maintenance activity which has the responsibility to safely store the existing inventory of DUF_6 until ultimate disposition of the material.

Portsmouth Gaseous Diffusion Plant

The Portsmouth Gaseous Diffusion Plant is located on 3,714 acres near Portsmouth Ohio, and is responsible for supporting several activities including: (1) the HEU Equipment Shutdown and Inventory Disposition Program which removes all HEU materials (materials with assays greater than 20%) from the Portsmouth site, as well as buffering shut down production equipment for nuclear criticality safety purposes, program and business management, safety authorization basis management, and other technical support associated with HEU material; (2) review and update Safety Analysis Reports as necessary, and assistance with the preparation of NRC's annual report to Congress; (3) the maintenance of nonleased facilities which includes effort in both active and inactive facilities to protect the safety and health of personnel and the environment of nonleased facilities at the Portsmouth Gaseous Diffusion Plant; (4) the PCB Program which includes activities related to achieving and maintaining compliance with Toxic Substance Control Act of 1976 (TSCA), the Uranium Enrichment TSCA Federal Facilities Compliance Agreement, and DOE Orders and other applicable requirements. Specific PCB activities include oversight of the collection and containment system, management of TSCA regulated PCB spill sites, and management of waste generated from these activities; and (5) the DUF_6 Cylinder Maintenance activity which has the responsibility to safely store the existing inventory of DUF_6 until ultimate disposition of the material.

Argonne National Laboratory

Argonne National Laboratory, through its offices at 9700 S. Cass Avenue, Argonne, Illinois and at 955 L'Enfant Plaza, Washington, D.C., is providing scientific and engineering expertise to the U.S. Department of Energy Office of Nuclear Facilities Management related to management of depleted uranium hexafluoride.

As part of this support, Argonne is conducting engineering and cost evaluations of options for storage and use of the depleted uranium inventory. Argonne is supporting the Department by managing a programmatic environmental impact statement that examines the environmental, health, safety and socioeconomic impacts of alternative management strategies for the depleted uranium inventory. In addition, Argonne is examining potential uses of materials derived from depleted uranium hexafluoride that can provide an overall economic benefit to the Government.

Lawrence Livermore National Laboratory

Lawrence Livermore National Laboratory, through its Germantown, Maryland office and parent Livermore, California facility, provides scientific and engineering expertise related to management of DUF_6.

Areas of technical expertise provided include: materials technology, testing expertise and testing facilities, safety analyses, quality program analyses, transportation safety analyses, facility design and development, engineering analysis, cost modeling and analysis, and other technical support as requested.

Pacific Northwest National Laboratory

Pacific Northwest National Laboratory is located in Richland, Washington and provides scientific and engineering expertise related to management of depleted uranium.

Areas of technical expertise provided include: material properties research, alloy development, thermo-mechanical processing, coatings technology, fabrication technology development, depleted uranium product development, and other technical support as requested.

All Other Sites

Funding provided to universities, industry, other federal agencies, and other activities to support Uranium Programs activities.

Operation and Maintenance

Mission Supporting Goals and Objectives

Uranium Programs' activities are primarily focused on accomplishing three major goals:

The first goal is to manage facilities not leased by the USEC in a safe, economic, and environmentally-sound manner. Uranium Programs activities at the gaseous diffusion plants in Portsmouth, Ohio; Paducah, Kentucky; and Oak Ridge, Tennessee include maintenance of facilities and grounds, cleaning legacy PCB spills, guarding and protecting HEU material stored at the Portsmouth site, addressing financial liabilities by paying post retirement life and medical costs for retired contractor personnel at the diffusion sites and power suppliers, providing legal representation for existing lawsuits, and reviewing and updating Safety Analysis Reports (SARs) as necessary, for the non-leased facilities and assisting the NRC in preparing annual congressional reports on the status of the diffusion plants. Highlights in support of this goal include:

- Consistent with the requirements of the 1992 Energy Policy Act, continue to pay retired employee post-retirement life and medical benefits and legal representation on behalf of DOE for lawsuits against DOE.

- Continue residual safeguards and security costs for a small contingent of guards and one building with HEU inventories as most material is removed from the HEU building X-326 at Portsmouth, and perform maintenance and surveillance of the shut down HEU equipment.

- The major activity related to nuclear safety was completed March 3, 1997, when the NRC assumed the regulatory authority of the leased gaseous diffusion plants. For FY 2000, Uranium Programs will continue review and update Safety Analysis Reports (SARs) as necessary, for the non-leased facilities, and assist with preparation of NRC's annual report to Congress.

- Continue to perform routine maintenance activities at the non-leased facilities. Activities include safety and health inspections, and corrective maintenance. The program will maintain PCB troughing systems in the process buildings leased to USEC, which involves routine inspections, repairs, spill cleanup and laboratory analysis.

The second goal is to ensure that the estimated 46,400 cylinders within the DOE inventory of depleted uranium hexafluoride are maintained in an environmentally responsible manner by conducting annual inspections and exploring options to effectively treat cylinders that exhibit accelerated corrosion. The Department is completing an environmental impact statement on the long-term management of its inventory of depleted uranium hexafluoride. We expect to issue a record of decision (ROD) by mid-FY 1999.

The DUF_6 Cylinders and Maintenance program maintains the current DOE-generated DUF_6 inventory to assure safe storage. Cylinder management involves the general maintenance and monitoring of the estimated 46,400 DUF_6 cylinders, including such activities as:

- Annually inspect DUF_6 cylinders, repair defective cylinder valves as required, maintain procedures for conduct of operation, and maintain data base, including updating of inspection data. Conduct quadrennial inspections of other DUF_6 cylinders. Develop remote sensing inspection technologies to detect cylinder leaks and determine cylinder wall condition.

- Relocate DUF_6 storage cylinders to permit 100 percent visual inspection and ultrasonic inspection and procure concrete saddles (cylinders sit on saddles).

- Continue the control of cylinder corrosion by surface cleaning and painting.

- Construction and reconstruction of cylinder storage yards.

In addition to appropriations required for management of DOE-generated depleted uranium hexafluoride, the Department received in FY 1998 $66 million from the U.S. Enrichment Corporation for the management and disposition of about 11,200 of additional USEC-generated depleted uranium cylinders. In response to the FY 1999 appropriations language, the Department submitted, on December 17, 1998, its initial plan for applying the $66 million received from USEC. These funds are administered in accordance with the terms of the two Memoranda of Agreement (MOAs) and related correspondence for activities required to accept and maintain the USEC material. The Department will revise its plan for applying the $66 million received from USEC and intends to include the revisions in the President's *Plan for the Conversion of Depleted Uranium Hexafluoride* required under P.L. 105-204.

The draft *Programmatic Environmental Impact Statement for Alternative Strategies for the Long-Term Management and Use of Depleted Uranium Hexafluoride* (PEIS) was issued in December 1997 and the final PEIS identifying the Department's preferred alternative is currently scheduled for completion in February 1999. The record of decision (ROD) for the proposed action is scheduled to be issued in mid-FY 1999.

As discussed above, the Department will submit a plan to begin construction of DUF_6 conversion facilities at the GDP sites by January 2004. To support construction start in January 2004, the Department has requested $5.0M in appropriations to conduct NEPA and procurement activities. This law authorized the use of approximately $373 million identified by USEC for the disposition of DUF_6, and specifically, to enable the construction of plants to convert the material. The Department's plan will be forwarded by the President with his FY 2000 legislative proposals.

The third goal of Uranium Programs is to manage the sale of the Department's excess inventory of natural uranium. The sale of these inventories is accomplished in a manner which will maximize the return to the U. S. government while ensuring such sales meet the intent of the USEC Privatization Act and do not have an adverse material impact on domestic uranium industries. The Department performs analysis in consultation with the uranium industry in support of the Secretary of Energy's determination with regard to the sale of excess Departmental uranium on the uranium industries.

Funding Schedule

	(dollars in thousands)				
	FY 1998	FY 1999	FY 2000	$ Change	% Change
Highly Enriched Uranium Equipment Shutdown and Inventory Disposition	0	11,500 [a]	3,700	-7,800	-67.8%
Maintenance of Leased and Non-Leased Facilities Including Corrective Actions and Nuclear Safety	3,807	7,757	10,400	+2,643	+34.1%
Pre-existing Liabilities	8,587	6,037 [b]	8,400	+2,363	+39.1%
Depleted Uranium Hexafluoride Cylinders and Maintenance	12,863	10,126	10,874	+748	+7.4%
Depleted Uranium Hexafluoride Conversion	976	0	7,563 [c]	+7,563	+100.0%
Transparency Measures [d]	15,400	13,580	0	-13,580	-100.0%
SBIR	0	0	63	+63	+100.0%
Total, Operation and Maintenance [e]	41,633 [f]	49,000 [g]	41,000	-8,000	-16.3%

[a] Excludes $8.0 million in prior year balances.

[b] Excludes $2.55 million of prior year balances.

[c] Includes $5 million requested from P.L. 105-204.

[d] The HEU Transparency Measures program transferred to the Office of Nonproliferation and National Security and beginning in FY 2000 is no longer in the Uranium Programs budget.

[e] Additional funding from the MOAs between USEC and DOE will be used in FY 1999 and FY 2000 for depleted uranium cylinder maintenance; construction of cylinder yards at Paducah and Portsmouth; and other depleted uranium activities.

[f] Excludes $19.2 million reprogrammed to the Uranium Enrichment Decontamination and Decommissioning Fund ($10.0 million) and the Fast Flux Test Facility ($9.2 million).

[g] Excludes $325 million emergency appropriation (P.L. 105-277) for the purchase of natural uranium associated with 1997 and 1998 deliveries under U.S./Russian HEU purchase agreement.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Highly Enriched Uranium Equipment Shutdown and Inventory Disposition			
■ Residual safeguards and security costs for a small contingent of guards and one building as all material is removed from HEU building X-326 by the end of FY 1999	8,563	7,107	2,420
■ Surveillance and maintenance activities associated with the 158 permanently shut down cells in the HEU building X-326	520	807	761
■ Removal of HEU material and power and utilities required for the 158 shutdown cells in X-326 and limited operation of building X-345 (HEU vault)	4,430	3,074	281
■ Oversight and management of the HEU removal program is reduced as material is dispositioned	438	512	238
■ No work scope for IAEA inspections support in FY 1999 and FY 2000	49	0	0
■ The Department received a one-time credit for the purchase of contractual services from the USEC associated with a higher than expected quantity of low enriched uranium that USEC was able to derive from the dilution of highly enriched uranium transferred by the Department. The credit was subsequently used as a funding source for the $19.2 million reprogramming to the Uranium Enrichment Decontamination and Decommissioning Fund ($10.0 million) and the Fast Flux Test Facility (FFTF) ($9.2million)	-14,000	0	0
Total, Highly Enriched Uranium Equipment Shutdown and Inventory Disposition	0	11,500 [a]	3,700

[a] Excludes $8.0 million of prior year balances.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Maintenance of Leased and Non-Leased Facilities Including Corrective Actions and Nuclear Safety			
■ Management of PCB activities associated with maintaining compliance with the Toxic Substance Control Act (TSCA), the Uranium Enrichment TSCA Federal Facilities Compliance Agreement (FFCA), DOE orders and other requirements	3,060	3,621	4,211
■ Minimal corrective maintenance and inspection of 5 active and 29 inactive facilities at the Portsmouth and Paducah sites	4,522	3,234	4,989
■ Support for Annual Report to Congress on the status of environmental, safety, and health (ES&H) conditions at the Gaseous Diffusion Plants, as required by the Energy Policy Act of 1992, and the annual Safety Analysis Report (SAR) update for the non-leased facilities	1,075	392	800
■ Environmental monitoring activities as required by the Kentucky Pollutant Discharge Elimination System (KPDES) including toxicity monitoring for liquid effluents, in-stream monitoring for PCBs in fish, in-stream ecological monitoring of the biotic community, and a small mammals study.....	350	510	400
■ The Department received a one-time credit for the purchase of contractual services from the USEC associated with a higher than expected quantity of low enriched uranium that USEC was able to derive from the dilution of highly enriched uranium transferred by the Department. The credit was subsequently used as a funding source for the $19.2 million reprogramming to the Uranium Enrichment Decontamination and Decommissioning Fund ($10.0 million) and the Fast Flux Test Facility ($9.2 million).	-5,200	0	0
Total, Maintenance of Leased and Non-Leased Facilities Including Corrective Actions and Nuclear Safety	3,807	7,757	10,400

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Pre-Existing Liabilities			
■ Contractual liability for Lockheed Martin Energy Systems (LMES) post-retirement life and medical expenses for 2,300 employees with service prior to July 1, 1993	6,942	5,362 [a]	8,000
■ Outside counsel attorney fees and expenses for about 7 open class action, unfair labor practices, civil rights/wrongful discharge and other litigation against the Department	1,645	675	400
Total, Pre-Existing Liabilities	8,587	6,037	8,400
Depleted Uranium Hexafluoride Cylinders and Maintenance			
■ Relocation of a few DOE cylinders to improve storage conditions	2,495	300	70
■ Personnel, equipment, and materials to recoat about 1,200 DOE cylinders to provide a barrier between the cylinder wall and the moist environment that contributes to the deterioration of the cylinder	2,279	4,300	2,454
■ Personnel and materials necessary to monitor cylinder and storage yards. Conduct annual inspections, quadrennial inspections, and wall thickness inspections at Paducah, Portsmouth, and Oak Ridge	796	1,200	1,400
■ Management and general maintenance of an estimated 46,400 cylinders and 16 cylinder yards at Paducah, Portsmouth and Oak Ridge	4,756	3,426	6,450
■ Materials and personnel performing engineering development type work necessary to sustain, optimize and enhance the cylinder storage system	567	900	500
■ PEIS scheduled to be released early FY 1999	1,970	0	0
Total, Depleted Uranium Hexafluoride Cylinders and Maintenance	12,863	10,126	10,874

[a] Excludes $2.55 million of prior year balances.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Depleted Uranium Hexafluoride Conversion			
■ Research and development on alternative uses of depleted uranium hexafluoride for possible government applications which may reduce the cost of Federal Government Programs.	976	0	2,563
■ Preparation of site specific NEPA activities in accordance with the P.L. 105-204 plan to begin construction of a conversion facility(s) by FY 2004	0	0	3,000 [a]
■ Preparation of Request for Proposals for a conversion facility(ies) to meet the schedule in accordance with P.L. 105-204	0	0	2,000 [a]
Total, Depleted Uranium Hexafluoride Conversion	976	0	7,563
Transparency Measures			
■ The transparency measures program has been transferred from of the Office of Nuclear Energy, Science and Technology to the Office of Nonproliferation and National Security, and beginning in FY 2000 is no longer included in the Uranium Programs budget	15,400	13,580	0
Small Business Innovative Research and Small Business Technology Transfer Programs			
■ FY 99/00 Small Business Innovative Research and Small Business Technology Transfer Programs	0	0	63
Total, Operation and Maintenance	41,633	49,000 [b]	41,000

[a] Funds requested from the USEC account under P.L. 105-204.

[b] Excludes $325 million emergency appropriation (P.L. 105-277) for the purchase of natural uranium associated with 1997 and 1998 deliveries under U.S./Russian HEU purchase agreement.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Highly Enriched Uranium Equipment Shutdown and Inventory Disposition	
■ Safeguards costs will decrease once the Department's HEU oxide inventories are removed from the Portsmouth site during FY 1999	-7,800
Maintenance of Leased and Non-Leased Facilities Including Corrective Actions and Nuclear Safety	
■ Reflects increased costs for PCB disposal and other corrective maintenance activities	+2,643
Pre-existing Liabilities	
■ Funding in FY 1999 was supplemented by prior year balances of $2.55 million within the pre-existing liabilities account. Therefore, there is no real increase in this activity in FY 2000	+2,363
Depleted Uranium Hexafluoride Cylinders and Maintenance	
■ Reflects a minimal increase for the continuation of required depleted uranium cylinders and cylinder yard maintenance activities.	+748
Depleted Uranium Hexafluoride Conversion	
■ Reflects implementation of research and development activities associated with finding alternative government uses for depleted uranium hexafluoride	+2,563
■ Funds requested from the USEC account under P.L. 105-204.	+5,000
Total, Depleted Uranium Hexafluoride Conversion	+7,563

	FY 2000 vs. FY 1999 ($000)
Transparency Measures	
■ The Transparency Measures program has been transferred from of the Office of Nuclear Energy, Science and Technology to the Office of Nonproliferation and National Security, and beginning in FY 2000 is no longer included in the Uranium Programs budget	-13,580
Small Business Innovative Research and Small Business Technology Transfer Programs	
■ Funding required to support the Small Business Innovative Research and Small Business Technology Transfer Programs	+63
Total Funding Change, Operation and Maintenance	-8,000

Capital Operating Expenses & Construction Summary

Capital Operating Expenses

(dollars in thousands)

Program Direction

Mission Supporting Goals and Objectives

The Office of Nuclear Energy, Science and Technology (NE) Program Direction account funds expenses associated with the technical direction and administrative support of NE programs.

Program Direction has been grouped into four categories:

Salaries and Benefits provides salary and benefits funding for Headquarters and Operations Office personnel providing technical direction to Nuclear Energy Research and Development activities, Isotope programs, Termination Cost programs, Uranium programs, as well as Office of Science funded energy research reactor operations (*e.g.*, the High Flux Isotope Reactor at the Oak Ridge National Laboratory), transition activities at the Fast Flux Test Facility (FFTF), and activities funded by other Federal agencies and foreign governments. This category includes funding for other personnel compensation, such as, cash incentive awards and overtime pay.

Travel includes funding for transportation of Headquarters and Operations office employees associated with NE programs, their per diem allowances while in authorized travel status, and other expenses incidental to travel.

Support services includes funding for technical and management support services provided to NE Headquarters and Operations office employees.

Other related expenses includes funding for administrative expenses, such as: training, computer hardware and software acquisitions, modifications, and publication and subscription services. In FY 1997, the Department's central administrative office established a Working Capital Fund to provide funding for mandatory administrative costs, such as, rent and telephone services. Payments into this fund are continued as part of the other related expenses category.

In FY 2000 the salary, benefits, travel, and related administrative expenses for the International Nuclear Safety Program and the Highly Enriched Uranium Transparency Measures Program have not been included based on the reassignment of these functions to the Office of Nonproliferation and National Security.

Funding Schedule

[a] The salary, benefits, travel, and related administrative expenses for the International Nuclear Safety Program and the Highly Enriched Uranium Transparency Measures Program have not been included in FY 2000 based on the reassignment of these functions to the Office of Nonproliferation and National Security.

[b] Excludes $2.15 million included in a reprogramming.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
NE Headquarters has streamlined its organizational structure from a multilayered organization to a single layered organization; downsized from 258 employees in 1993 to a current level of 96 employees (excluding 27 International Nuclear Safety and Highly Enriched Uranium Transparency Measures Programs employees reassigned to the Office of Nonproliferation and National Security); met strategic Alignment Initiative staffing targets; met or exceeded National Performance Review targets; retrained and redeployed administrative staff to reduce dependence on contractors; and redirected and realigned staff (most recently in August 1998) to accomplish program goals efficiently and effectively. NE field staffing has also been reduced from 75 in August 1995 to a current level of 47. The current assignment of NE field employees includes Chicago Operations Office (12), Idaho Operations Office (1), Oakland Operations Office (2), Oak Ridge Operations Office (27), and the Richland Operations Office (5). FY 1998 and FY 1999 salaries and benefits include appropriated funds for employees reassigned on October 11, 1998 to the Office of Nonproliferation and National Security. The FY 2000 salaries and benefits amount does not include funds for INSP and HEU Transparency Measures Program staff. As part of the Department's Workforce 21 initiative, authorization has been requested for twelve additional Headquarters positions in accordance with the January 11, 1999 NE Workforce Staffing Plan ...	17,135	17,259	15,890

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Travel			
In accordance with the Departmental initiative to reduce travel costs, a series of actions have been taken to reduce Headquarters travel. Guidelines were issued to eliminate unnecessary or low value travel, multiple travelers to the same location/meeting are being limited. Conference attendance is being severely limited. Use of video-conferencing is encouraged whenever possible. NE field employees travel costs are similarly included in the Departmental travel costs reduction initiative. FY 1998 and FY 1999 travel includes appropriated funds for International Nuclear Safety and Highly Enriched Uranium Transparency Measures Programs Headquarters and Operations Office travel expenses. The FY 1999 travel budget also includes funding provided to support the temporary overseas assignment of one Operations Office employee to the Nuclear Energy Agency. The FY 2000 amount does not include Headquarters and Operations Office expenses for INSP and HEU Transparency Measures Program travel based on the reassignment of these programs to the Office of Nonproliferation and National Security on October 11, 1998.	768	884	718
Support Services			
In accordance with the Departmental initiative to reduce the level of support services contracting, NE has reduced Headquarters support services contracting from $10.6 million in support services contracts in FY 1995. NE's FY 1998 support services contracting (Headquarters and Field) was $ 6.809 million (including amounts in program budgets). Beginning in FY 1999, in accordance with Congressional direction, all funds for support services contracting were included in the Program Direction budget. FY 1999 funds include both Headquarters ($ 3.2 million) and Field ($ 0.5 million) support services contracting. FY 1999 funding does not include $2.15 million pending submittal of a reprogramming request for essential support services. FY 2000 funding is based on the revised FY 1999 request level. Support services for NE Field employees are in accordance with Operations Office plans to reduce support services contracting as part of the same Departmental support services cost reduction initiative	514	3,700 *	5,850

* Excludes $2.15 million included in a reprogramming.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Other Related Expenses			
FY 1998 and 1999 amounts include appropriated funds for International Nuclear Safety and Highly Enriched Uranium Transparency Measures Programs other related expenses. The FY 2000 amount does not include expenses for the INSP and HEU Program based on the October 11, 1998 reassignment of these programs to the Office of Nonproliferation and National Security. The single largest expenditure ($1.35 million in FY 2000) in the other related expenses category is earmarked for the Headquarters Working Capital Fund (WCF). Compared to FY 1998, FY 1999 WCF funding increased $110K, primarily for additional office space costs occasioned by the transfer of the International Nuclear Safety Program and the Highly Enriched Uranium Transparency Measures Program staff from NE to NN. Operations Office funding also increased ($170K) in accordance with annual operations plans. The Other Related Expense category also includes a payment for the recovery of Departmental Administration and Security Investigations costs incurred by Departmental elements with regard to NE's Isotope Program. Finally, this category includes expenses for ADP hardware and software support, training, periodicals and subscriptions, etc. ...	2,583	2,857	2,502

Environment, Safety and Health

Executive Budget Summary

Mission

The Office of Environment, Safety and Health (EH) is committed to protection of Department of Energy (DOE) workers, the public, and the environment. This commitment is demonstrated by continuous improvement in program and policy development; independent oversight of the status of environment, safety, health, and safeguards and security programs; and sharing of technical resources, assistance and information. EH applies its resources to DOE activities in order to prevent accidents or injuries to workers and the public, and harm to the environment. EH is the Department's major source of expertise in disciplines such as environmental protection, nuclear safety engineering, public health, industrial hygiene, radiation protection, construction safety, epidemiology, and occupational medicine. The EH goal is to leverage resources and skilled personnel to efficiently provide DOE's line management programs with the tools and independent program assessments required to preserve safety and to effectively protect national security interests at DOE sites. Open communication, participation, and performance feedback on EH activities are integral to EH's success.

The Environment, Safety and Health program is funded in three appropriations: (1) Energy Supply, (2) Other Defense Activities, and (3) Defense Environmental Restoration and Waste Management. The Energy Supply EH program consists of: Technical Assistance, National Environmental Policy Act (NEPA), Management and Administration, and a Program Direction decision unit which includes the EH Working Capital Fund. The Other Defense Activities EH program includes: Oversight, Domestic and International Health Studies programs, Radiation Effects Research Foundation (RERF) program, and a Program Direction decision unit. In addition, the Defense Environmental Restoration and Waste Management appropriation supports an additional increment of health studies at sites where the Department's Environmental Management program conducts cleanup.

DOE has transitioned to new missions which include weapons dismantlement, environmental cleanup, and facility decontamination and decommissioning. Residual hazards at DOE facilities, especially in the nuclear weapons complex, are the result of more than 50 years of nuclear materials production and processing under less than optimum conditions, the impacts of which are still being characterized. DOE harbors the largest inventory of hazardous nuclear materials in the world outside of the former Soviet Union, as well as large quantities of hazardous chemicals. Due in large part to the sudden end of the Cold War, and the resultant rapid shutdown of the production and processing facilities, much of this material (including plutonium, spent nuclear fuel, highly enriched uranium, radioactive waste, radioactive isotopes, and hazardous chemicals) is stored in aging and deteriorating facilities, and under conditions that are in themselves hazardous. There is still a lack of reliable data for many of these facilities on the most basic safety issues, such as non-compliant electrical and ventilation systems. In addition to these challenges, the problem of secure storage of special nuclear material and classified information remains.

The EH mission is one of DOE's highest priorities. EH technical experts work with line program managers to develop tools needed to manage environment, health, and safety at DOE facilities more effectively and at less cost to taxpayers. EH has demonstrated that the Department can do its work better,

more safely, and at less cost by integrating environment, health, and safety into the planning and execution of work. EH will continue to work with its partners in the field to ensure that safety is no longer viewed as an "add-on" that produces only paper and needless cost, but as an asset that allows efficient targeting of the most urgent risks, most efficient use of limited resources, and effective accomplishment of work.

The need for effective programs to identify environment, safety, and health concerns at the project and individual activity level remains critical. Emphasis has been placed on assuring that prior commitments to fund programs to reduce environment, safety, and health concerns are met represent important accomplishments, but more remains to be done. The downsizing and realignment of the weapons production efforts will necessitate changes in the conduct of operations. In addition, the limitations on funding Environmental Management work as needs increase will create conflicts between meeting details of compliance agreements negotiated in earlier years and organizing efforts to pursue an integrated approach to risk reduction. EH's analytical products are shared DOE-wide to assist the sites in appropriate and timely resolution of identified and emerging environment, safety, and health concerns.

Mission Supporting Goals and Objectives

The EH overall major goals and objectives are as follows:

- Provide a standardized corporate independent oversight process to appraise the effectiveness of environment, safety, health and safeguards and security programs throughout DOE. To accomplish the goal of corporate independent oversight, the following objectives have been established: (1) identify, prioritize, and target Departmental needs for independent oversight; (2) incorporate DOE's guiding integrated safety management policy and principles into all oversight activities; (3) sustain a coordinated and consistent independent oversight for DOE; (4) administer an enforcement program that appropriately penalizes significant violations of nuclear safety requirements; and (5) disseminate lessons learned to reinforce good practices.
- Provide quality, timely, efficient, and effective corporate support and technical services. To accomplish this goal, the following objectives have been established: (1) provide Departmental environment, safety, and health crosscutting programs and technical services that are aligned with critical missions and integral to mission accomplishment; (2) evaluate operational performance data and identify for corporate assessment and action those vulnerabilities that pose urgent risks to DOE workers, the public, and mission accomplishment; (3) continue ongoing partnerships with private industry, government agencies, and national safety organizations to promote information exchange and program benchmarking to enhance DOE safety programs; and (4) improve corporate services through feedback and performance measures.
- Provide Departmental requirements, guidance, and policy for environment, safety and health program implementation and measurement. To accomplish this goal, the following objectives have been developed: (1) support ongoing field analysis, interpretation, and application of "WorkSmart" standards (safety guidelines) and provide needed regulatory interpretations and implementation guidance; (2) interface with outside regulators and provide comments on pending regulations pertinent to DOE and regulatory policies and actions having impact on DOE missions; (3) continue stewardship and improve effectiveness of the new environment, safety,

and health orders; and (4) develop, issue, and implement technical standards for DOE activities based on appropriate consensus standards.

- Provide a National Environmental Policy Act (NEPA) process that fosters sound Departmental planning and decision-making and builds public trust through effective process implementation. To accomplish this goal, EH has established the following objectives: (1) ensure timely and adequate completion of NEPA reviews through technical assistance, independent policy review, and approval recommendations for major programmatic environmental impact statements (EISs), site-wide and other EISs, and related NEPA documents; (2) ensure the consistency and quality of NEPA documents and increase the efficiency of NEPA personnel by determining and responding to customer needs; (3) issue guidance on selected technical and policy topics; (4) conduct workshops for Headquarters and field personnel; and (5) participate in NEPA process improvement teams and other initiatives that foster continuing improvement in the NEPA process.
- Ensure environment, safety, and health performance and management accountability. To accomplish this goal, EH has established the following objectives: (1) develop and support implementation of DOE-wide environment, safety, and health budget and planning process that defines scope, identifies costs, prioritizes activities based on relative risk, and allocates resources based on established commitments in a visible manner for implementation of environment, safety, and health program activities; (2) improve environment, safety, and health performance through the application of total quality approaches to management processes; and (3) integrate environment, safety, and health in all Departmental business functions.
- Support realignment of contract terms and conditions to incorporate environment, safety, and health management systems development needed to move towards a corporate business performance mode. To accomplish this goal, EH has established the following objectives: (1) identify ways for line program management to improve environment, safety, and health performance as part of work execution systems; and (2) integrate environment, safety, and health in all Departmental business functions.
- Conduct EH's mission in an open, trustworthy and responsive manner. To accomplish this goal, EH's objectives are: (1) establish and implement programs that strengthen the public's trust, confidence, credibility and respect in and for EH; and (2) support the Department's efforts to reduce the volume of national security information and minimize future classification.
- Promote the health and safety of DOE's workers and communities surrounding Departmental sites and reduce radiation and hazardous exposure through understanding of radiation effects and other hazards on humans. To accomplish this goal, EH's objectives are: (1) assist the field in the identification and application of effective approaches to prevent injury and illness; and (2) support the development of domestic and international health effects information on populations exposed to releases of varying levels of ionizing radiation.

The legal requirements that affect the activities of the EH organization include all environmental, safety, and health Federal regulations, as well as legislation such as the Atomic Energy Act of 1954, as amended, and the National Defense Authorization Act for Fiscal Year 1995.

Strategy

The Office of Environment, Safety and Health's (EH) intent is to assure that quality, objectivity, responsiveness and innovation are hallmarks of all EH activities.

EH's commitment to ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Department activities is our strategic objective, part of our performance agreement with the President, and a key part of the DOE Strategic Plan. To accomplish this objective, EH integrates and embeds sound environment, safety, and health management practices into the performance of DOE's day-to-day work. EH ensures that environment, safety and health priorities are clearly identified and given appropriate consideration for funding. EH is working with the Nuclear Regulatory Commission (NRC) and the Occupational Safety and Health Administration (OSHA) to evaluate the costs and benefits of external regulation of DOE safety and health activities. Pilot programs are being conducted.

Another strategic objective is to continually work with the public community in an open, frank, and constructive manner as a good neighbor and public partner. To accomplish this objective, EH fosters strong partnerships with neighboring DOE communities, regulators, and other stakeholders to determine priorities and solutions. In addition, EH increases public awareness of DOE's mission by improving the quality, timeliness, frequency, and sufficiency of information disseminated on the Department's functions, successes, lessons learned and future activities. EH focuses on developing management-level analytical products, reducing redundancies, and enhancing staff development. EH serves its principal customers in the following major areas: (1) development of Departmental environment, safety, and health requirements, guidance and interpretations that are effective and efficient to guide program implementation; (2) improvement of environment, safety and health performance and management accountability by supporting the integration of environment, safety, and health considerations into the Department's business and budget planning processes; (3) provision of critical corporate environment, safety and health support and services, including regulatory and industry interface, technical assistance to improve program management and execution, and to assist in the efficient and effective implementation of requirements; and (4) conduct independent oversight activities that provide a comprehensive status of environment, safety, health, and safeguards and security performance at DOE facilities.

One of DOE's greatest challenge is performing new types of hazardous work safely and securely at facilities that were designed to meet the requirements of outdated rules and orders. Many old, poorly-maintained facilities do not meet current building codes and safety standards. WorkSmart standards provide a graded approach to developing safety standards that allow the Department to tailor the standards to the work and the facilities. Pilot applications of this process indicate that worker safety can be enhanced while program costs are reduced.

The EH independent oversight program has been extremely useful in helping the Department effectively identify and target unacceptable risk. Comprehensive environment, safety and health evaluations provide DOE management with validated, professional appraisals of the site's performance by identifying areas of greatest risk in terms of both immediate hazards and overall program management. The foundation of this approach is an assessment of management effectiveness based on DOE's integrated safety management policy and the guiding principles of safety management contained in that policy. These assessments supply DOE management with validated, professional appraisals of the site's performance.

Using the guiding principles of safety management permits objective program analysis. Although much effort remains, changes in the Department's ability to apply resources to areas of greatest need have already been observed, and will become increasingly evident in efficiency in addressing environment, safety, health, and safeguards and security issues.

The rapid transition of the Department to a business management model with its emphasis on gaining cost-efficiencies, privatization and innovative management structures in the field has brought concomitant changes in how EH functions. Special emphasis will be given to self-assessment and self-reporting by field elements as a source of performance information, coupled with increased emphasis on EH performance analysis. Likewise, increased priority will be given to help move DOE line management from outdated environment, safety and health management approaches and systems to programs that facilitate the exchange of innovative business or environment, safety and health management practices that are preventive and cost-efficient in nature. From a technical safety assistance perspective, special emphasis will be given to urgent programmatic needs such as safely managing the decommissioning and decontamination of aging DOE facilities and hazardous waste.

EH will continue to build on its strong record of cutting costs without risking the safety and health of DOE workers, the quality of the environment, or the quality of the health studies program. Even as challenges have grown, the EH budget has been reduced by cutting administrative overhead costs and focusing on the highest priority needs. An EH staffing plan has identified the most critical functions and closely matched personnel to fit those needs. Functions of lower priority will continue to be eliminated. This will result in a cut in Federal personnel from 375 in FY 1998 to 355 in FY 1999 with 345 full-time-equivalents in FY 2000. EH has also analyzed how it utilizes support contractors and established specific criteria for their limited use. While EH has some unique national-level experts, technical contractual services continues to be more practical and cost-effective, providing a surge pool of technical expertise on an as needed basis. The evolving needs for national-level expertise in a multitude of disciplines can best be met through the use of contractors who can rapidly respond to the continually changing skill mix required of EH activities across the DOE complex.

The medical surveillance for the former workers program, required by the 1993 Defense Authorization Act, could potentially cost hundreds of millions of dollars. EH has worked during the past three years to develop a cost-effective approach that relies on feasibility studies to target populations most at risk. In FY 1996, EH awarded contracts to six consortia of universities, labor unions, and health specialists. In FY 1997, each of these consortia began conducting the feasibility assessment phases of their projects. In addition, EH issued a request for proposals for major sites not addressed as part of the first solicitation. In FY 1998, the medical surveillance phase of the first set of projects began, and the feasibility assessments for the four newly awarded cooperative agreements were initiated. In FY 1999, all ten projects will be in the implementation phase of their medical surveillance programs.

DOE, in partnership with the Department of Health and Human Services (HHS), has begun a process that will produce a strategy to include a public health agenda for each DOE site. Developed in coordination with HHS, this strategy will have clearly defined goals, objectives, and priorities for health activities to ensure that the issues of greatest concern to DOE workers and communities are addressed. All newly-funded health activities conducted by HHS will be consistent with the priorities established in this strategy.

In the Defense Environmental Restoration and Waste Management Appropriation, DOE supports public health studies in conducting a range of health-related activities. These activities are managed by EH and will be included in the public health agenda being developed in partnership with HHS.

Major Changes

The Department has consolidated the management of Health Studies in the Office of Environment, Safety and Health to provide a focal point for ensuring that the results of these efforts are used for the maximum benefit of DOE workers and communities.

The Department funds a large number and wide variety of epidemiologic and other health-related activities to address the potential effects of DOE operations on the health of DOE workers and communities. Through a Memorandum of Understanding with the Department of Health and Human Services (HHS), studies of worker and community health are funded through the Office of Environment, Safety and Health under the Other Defense Activities account, and are administered by the HHS/CDC. Prior to FY 1999, similar activities were separately funded by the Office of Environmental Management under the Defense Environmental Restoration and Waste Management Appropriation, and were independently conducted by HHS under its statutory authority under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). Management of all HHS health studies (conducted by both CDC and ATSDR) was consolidated under EH in FY 1999.

The funding request for Public Health Activities in the Defense Environmental Restoration and Waste Management Appropriation for Fiscal Year 2000 is $20,000,000. These studies have been transferred by the Congress for the Office of Environment, Safety and Health to manage. This request could include funding for the Hanford Medical Monitoring Program and the Iodine-131 Exposure Registry, should they be incorporated into the DOE/HHS public health agenda for Hanford and base Public Health program activities at DOE sites. Should the medical monitoring program or exposure registry not be included in the Hanford health agenda for FY 2000 or be modified from current proposals, the Department will submit an appropriate Reprogramming Request.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request

[a]The total change of $13,930,000 from FY 1999 to FY 2000 primarily results from: 1) an increase of $8,000,000 in the Defense EM Public Health Activities program (from $12,000,000 in FY 1999 to $20,000,000 in FY 2000) which Congress transferred from EM for EH to manage, and 2) the net effect of the FY 1999 allocated share of congressionally prescribed reductions in the Energy Supply and Other Defense Activities appropriation.

Program Performance Measures

EH places its emphasis on accident prevention and excellence in protecting worker and public safety and health and achieving effective environmental standards. Success will be measured by fewer radiological and toxicological contamination events, fewer abnormal operating events, and fewer procedural violations.

EH serves as the Departmental advocate for institutionalizing effective and integrated safety management, which focuses on the key tenets of work planning, hazard analysis and hazard control. Success is measured by the implementation of enhanced work planning systems at DOE sites.

EH incorporates the existing risk-based environment, safety, and health planning and budgeting process into all new major Management and Operating and Management and Integrating Contractors contracts scheduled for renewal. Success is measured by inclusion of environment, safety, and health provisions in 100 percent of the Management and Operating and Management and Integrating Contractors contracts.

EH supports the systematic collection, analysis, and sharing of data on worker illness and injury. Success is measured by the early detection of emerging health issues and the implementation of improved health and safety practices at DOE sites.
