- Continue transfer of spent nuclear fuel from wet storage at the Chemical Processing Plant-603 to wet storage at the Chemical Processing Plant-666 and dry storage at the Interim Fuel Storage Facility (FY 1999).
- Complete prototype system for non-destructive assay of spent nuclear fuel by September 1, 1999, (FY 1999).
- Transfer the Plutonium Focus Area to the Office of Science and Technology (FY 1999).
- Complete Phase I of the Advanced Mixed Waste Treatment Project, including the National Environmental Policy Act evaluation; the Department of Energy Environment, Safety, and Health Authorization; environmental regulatory permitting, and associated design in support of an Idaho Settlement Agreement milestone to complete construction of a mixed waste treatment facility by December 31, 2002, (FY 1999).
- Prepared Federal Facilities Compliance Act Annual Mixed Waste Report to Congress (FY 1998).
- Completed comparisons of Waste Acceptance Criteria for six waste management disposal sites for potential integration opportunities (FY 1998).
- Prepare Integrated Burn Plan for the Department Incinerator System Team (FY 1999).
- Complex-Wide Waste Acceptance Audit Team will begin audits of generators sending waste to the DOE disposal sites (FY 1999).

- Commercial Treatment and Disposal Site Audit Team will audit commercial sites used by the DOE with the results being accepted by all DOE generating sites rather than each DOE site sending its own team (FY 1999).
- Implementation and oversight of the standardized mixed low-level waste characterization program (FY 1999).
- Carry out activities in order to meet the Idaho Settlement Agreement, Federal Facility Compliance Agreement, Federal Facility Agreement/Consent Order, and other regulatory requirements in a safe and environmentally acceptable manner (FY 2000).
- Obtain a Record of Decision for High-Level Waste and Facilities Disposition Environmental Impact Statement, submit Tank Closure Plan for one tank, and negotiate with State for plan and schedule for treatment of calcined high-level waste (FY 2000).
- Commence negotiations with the State of Idaho to develop a mutually agreeable schedule to place Spent Nuclear Fuel into dry interim storage in support of Settlement Agreement, and continue moving TMI-2 fuel from wet to dry interim storage per Settlement Agreement milestone to complete by June 1, 2001 (FY 2000).
- Continue to reduce risk of Spent Nuclear Fuel placed in vulnerable storage by conducting activities such as the transfer of Spent Nuclear Fuel form first generation to second generation dry storage wells at CPP-749 and complete transfer of Spent Nuclear Fuel in CPP-603 aged wet storage to improved storage locations (FY 2000)
- Comply with Federal Facilities Agreement/Consent Order schedules and milestones for the assessment and cleanup of Test Area North, Test Reactor Area, Idaho Nuclear Technology Engineering Center, Central Facilities Area, Power Burst Facility, Radioactive Waste Management Complex, Pit 9 Remediation, and for site-wide monitoring (FY 2000).

Site Description

Idaho National Engineering and Environmental Laboratory

The Idaho National Engineering and Environmental Laboratory, established as the National Reactor Testing Station in 1949, occupies 890 square miles in the Snake River Plain of Southeastern Idaho.

Over the years, 52 reactors have been constructed and operated at the Idaho National Engineering and Environmental Laboratory. The Idaho National Engineering and Environmental Laboratory has nine primary facilities as well as administrative, engineering, and research laboratories in Idaho Falls, approximately 50 miles east of the site. Other activities at the Laboratory over the last five decades include nuclear technology research, defense programs, engineering testing and operations, as well as ongoing projects to develop, demonstrate, and transfer advanced engineering technology and systems to private industry. These activities have resulted in an inventory of high-level waste and an inventory and continued generation of transuranic waste, mixed low-level, and low-level waste. Waste storage, treatment, and disposal capabilities for these ongoing programs are provided through operations at the Waste Reduction Operations Complex, the Radioactive Waste Management Complex, Test Area North, and the Idaho Nuclear Technology Engineering Center (formerly the Idaho Chemical Processing Plant) The Idaho National Engineering and Environmental Laboratory is responsible for storing and dispositioning 570 m^3 of spent nuclear fuel from a number of sources, including the Navy, foreign and domestic research reactors, and some commercial reactors with the Department of Energy owned fuel. Environmental remediation activities are required at ten Waste Area Groups encompassing 50 different operable units, which are comprised of 508 total release sites and facilities. Five Waste Area Groups are part of this appropriation. Potential release sites include tanks, spills, disposal sites, wastewater disposal systems, leach pits, trenches, rubble piles, ponds, cooling towers, wells, landfills, storage areas, and surplus buildings.

Infrastructure projects (ground, roads, general purpose buildings, utilities, communications, computers and information, fleet management, emergency services, analytical laboratories, and environmental test facilities) ensure the integrity of required facilities until all commitments are completed. Site-wide core support functions include Integrated Facility Planning, Emergency Preparedness, Seismic and Environmental Monitoring, and Safety and Health Corrective Actions. Other ongoing activities include regulatory affairs, nuclear safety, radiation protection, utility operations and maintenance, quality assurance, work control, document control, warehousing, and facility management In addition, general plant projects and installation of General Purpose Capital Equipment, Line-Item Construction Projects ensure the site facilities can support basic mission needs

Infrastructure Operations at the Idaho Nuclear Technology Engineering Center directly support the high-level waste, spent nuclear fuel, and deactivation programs This program provides operations and maintenance of non-process services including utilities, facilities, roads/grounds, equipment/materials management, and custodial care. Crosscutting technical services at the Idaho Nuclear Technology Engineering Center, such as engineering, nuclear safety and management oversight, will also be provided.

Detail Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The Idaho National Engineering and Environmental Laboratory is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the "Accelerating Cleanup: Paths to Closure." Estimates for the remediation work were derived from the "Idaho National Engineering and Environmental Laboratory Cost Estimating Handbook", which uses approved rates based on historical work performed at the site. Army Corps of Engineers performed an independent review of the Environmental Management baseline at the Idaho National Engineering and Environmental Laboratory.			
HQNP-SI01-LT-ID / Security Investigations			
Funding will be used to perform new security investigations and re-investigations for non-Federal employees in accordance with DOE Order requirements for the Idaho site.			
HQNP-SI01-LT-ID	0	508	508

Metrics
No quantifiable corporate performance measures are associated with this project.

ID-CTREXC-101 / Low-Level Waste/Mixed Low-Level Waste Center of Excellence

The Low-Level Waste/Mixed Low-Level Waste Center of Excellence (the Center) will analyze critical waste management issues, formulate effective solutions with respect to those issues, and assist the Department of Energy Headquarters in establishing policies, which are put into practice by the Department of Energy low-level waste and mixed low-level waste programs nationwide.

- Activities are being curtailed in FY 2000, due to overall budget constraints and other higher priority efforts.

	FY 1998	FY 1999	FY 2000
ID-ER-102 / Test Reactor Area Remediation (WAG 2)			
This project provides for the assessment and remediation of the Test Reactor Area as required by the Federal Facilities Agreement/Consent Order and the Comprehensive Environmental Response, Compensation and Liability Act at the Idaho National Engineering and Environmental Laboratory.			
■ Complete Operable Unit 2-13 field remedial action under comprehensive Record of Decision including regulatory inspection and certification of field remedial activities.			
■ Submit final Remedial Action Report for Operable Unit 2-13 to regulators for review and approval.			
■ Initiate long-term surveillance and monitoring activities at Operable Unit 2-13.			
ID-ER-102	1,647	2,893	1,660
Metrics

Assessments	15.0	0.0	0.0
Cleanups	7.0	0.0	6.0
ID-ER-103 / Idaho Nuclear Technology and Engineering Center (formerly Idaho Chemical Processing Plant) Activities (WAG3)			
This project is to complete assessment, remedial design/remedial action cleanup, and long-term monitoring and maintenance activities for the Idaho Nuclear Technology and Engineering Center (used for storage and reprocessing spent nuclear fuel.)			
■ In accordance with the Record of Decision issued in FY 1999, activities in FY 2000 are:			
■ Begin the Tank Farm Soils Interim Actions (Surface Water Controls).			
■ Provides for perched water recharge controls.			
■ Continue monitoring of the Snake River Plain Aquifer.			
■ Continue the separate tank farm Remedial Investigation/Feasibility Study.			
■ Initiate source control remediation.			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Complete Remedial Design/Remedial Action Work Plan.			
■ Complete design and siting for the Idaho National Engineering and Environmental Laboratory Comprehensive Environmental Response, Compensation, and Liability Act Disposal Facility.			
The End State for Waste Area Group-3 is projected to be FY 2044. All contaminated soil areas will be remediated by FY 2006. Tank Farm Soils and soils under buildings will be under institutional controls to meet remedial action objectives. An interim remedy will be implemented at the Tank Farm by FY 2005 (limited contaminated soil removal and redirection of surface water infiltration). Remediation of the Tank Farm will follow the Tank Farm Remedial Investigation/Feasibility Study Record of Decision. Operations at the Waste Area Group will cease in FY 2035. Decontamination and decommissioning of buildings will be completed in FY 2044.

ID-ER-106 / Radioactive Waste Management Complex (WAG 7)

This project is to complete assessment and remediation activities for the Radioactive Waste Management Complex, which was an 88 acre burial ground for transuranic, radioactive, and hazardous waste. The site was in operation from 1952 to 1970. The focus of this project is cleanup of radioactive and hazardous contaminants in accordance with a 1993 Record of Decision; to continue work on the Remedial Investigation/Feasibility Study to be completed in March 2000; and complete a final Record of Decision for all of Waste Area Group 7 in December 2002. Located within the Radioactive Waste Management Complex is the one acre Pit 9 Site. Pit 9 has been selected to demonstrate the feasibility of retrieving and treating transuranic, radioactive, and hazardous contaminants from waste burial sites in accordance with a 1993 Interim Record of Decision. The Alternate Pit 9

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue operation of the Operable Unit 7-08 vadose zone vapor vacuum extraction project.			
■ Complete treatability studies for in-situ grouting and hot in-situ vitrification of radioactive waste.			
■ Continue collection and analysis of groundwater, perched water, and lysimeter water samples.			
■ Begin construction of the Pit 9 double enclosed retrieval structure.			
■ Begin procurement of major waste retrieval and treatment equipment, and structural components in support of Pit 9 assessment activities.			
■ Complete Pit 9 soil and contaminant treatability studies.			
■ Complete Alternate Pit 9 Stage I Remedial Action Report.			
■ Complete Alternate Pit 9 Stage II Remedial Design in support of Federal Facility Agreement and Consent Order milestones.			
ID-ER-106	39,053	23,700	7,013*
* The total FY 2000 funding for this effort is $50,013,000. $43,000,000 of Pit 9 uncosted carryover will be available to provide for the Pit 9 phased alternative approach.			

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

ID-ER-107 / Pit 9 Remediation (contract management)

As a result of the termination of the Pit 9 subcontractor, the project has since been restarted under a three-stage alternate approach. The work under the phased approach will be tracked under PBS ID-ER-106. Funding contained in this PBS supports ongoing legal activities resulting from the original Pit 9 subcontract termination.

- Continue support for project office as well as legal fees associated with Pit 9.

ID-ER-108 / Site-wide Monitoring Area Remediation

Waste Area Group 6/10 consists of 38 potential release sites, which require assessment as stipulated in the Federal Facilities Agreement/Consent Order and Comprehensive Environmental Response, Compensation, and Liability Act. The Operable Unit 10-4 Record of Decision, to be submitted in July 1999, will describe the final remedial actions which must be performed at these sites. Funding supports all regulatory requirements and completion of all remedial activities by FY 2005.

- Provide general risk assessment support activities for all Waste Area Groups.
- Provide Hydrologic Data Repository Support.
- Complete Operable Unit 10-04 Idaho National Engineering and Environmental Laboratory Site-Wide Remedial Investigation/Feasibility Study Report.
- Complete Operable Unit 10-04 Comprehensive Idaho National Engineering and Environmental Laboratory Site-Wide Remedial Investigation/Feasibility Study Proposed Plan and submit for public comment.
- Complete Operable Unit 10-04 Remedial Design/Remedial Action scope of work.
- Complete Operable Unit 10-04 Remedial Design/Remedial Action field activities at six sites.
- Continue long-term site-wide monitoring of groundwater, ecological receptor, and unexploded ordnance sites
- Maintain instutional controls at potential unexploded ordnance sites.

ID-ER-109 / Remediation Operation

This activity provides program management and support for assessment and cleanup projects conducted under the Federal Facilities Agreement/Consent Order, the Decontamination and Decommissioning and Deactivation Program, and the Surplus Facilities Surveillance and Maintenance Project. The work scope for remediation operations provides for system planning and control, technical program integration, community relations, environmental/safety/health and quality planning and support, integrated project management reporting, cost engineering system management, configuration management and control, data management, decontamination and decommissioning program management and support, remedial designs/ remedial action program support, and Headquarters interface support, and the DOE Idaho remediation programmatic support. Other activities supported include: the State of Idaho's involvement in the remediation program required by the Federal Facility Agreement and Consent Order; technical data development by the United States Geological Survey; and the university research foundation support to DOE to address stakeholder concerns, as well as, technical support contracts and grants to Indian tribes.

These activities are necessary to support and manage cost-effective remediation, decontamination, decommissioning, and deactivation programs with State and stakeholder involvement using state of the art cleanup techniques.

- Continuation of program implementation responsibilities as defined in the planning descriptions in accordance with strategy for cost-effective program implementation.
- Implementation of the wide variety of remediation related technical scope, including preparation of regulatory documents, preparation of baselines, management of data systems, and support for environmental, health and safety, and quality control requirements.
- Support of State of Idaho under the Federal Facility Agreement and Consent Order.

ID-ER-110 / Decontamination and Decommissioning

This project is to eliminate the hazards posed by inactive radiologically contaminated facilities at the Idaho National Engineering and Environmental Laboratory, which may cause risk to site workers and the environment. The program end date for this project is FY 2044.

- Complete the decontamination and decommissioning assessments at: Test Area North-609, Equipment Maintenance Shop; Test Area North-726, Hot Liquid Storage Vault; Test Area North-725, Exhaust Stack; Test Area North-647, Containment Storage Building; Test Area North-648, PREP; Test Area North-616, Liquid Waste Treatment Facility; Test Area North-704, Engineering Test Reactor Primary Filter Pit; Test Area North-705, Engineering Test Reactor Secondary Filter Pit; Test Area North-644, Heat Exchanger Building; Test Area North-755, Engineering Test Reactor Filter Pit Building; Test Reactor Area-655; Air Intake Building; Test Reactor Area-706, Delay Tanks; Test Reactor Area-643, Compressor Building; Test Reactor Area-760, Engineering Test Reactor Warm Waste Station; and Idaho Chemical Processing Plant-642, Hot Waste Pump House Pit (15) total.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Complete decontamination and decommissioning (removal of all hazardous and radioactive waste and dismantlement of buildings) of facilities at: Test Area North-609, Equipment Maintenance Shop; Test Area North-656, Change Room; Test Reactor Area-655, Air Intake Building, Test Reactor Area-704, Engineering Test Reactor Primary Filter Pit; Test Reactor Area-705, Engineering Test Reactor Secondary Filter Pit; Test Reactor Area-706, Delay Tanks; Test Reactor Area-755, Engineering Test Reactor Filter Pit Building; Test Reactor Area-760, Engineering Test Reactor Warm Waste Station; Test Reactor Area-660, Advanced Reactivity Measurement Facility; Chemical Processing Plant-642, Hot Waste Pump House Pit; Central Facility Area-716, Sewage Pit Septic Tank (11) total.

ID-HLW-101 / High-Level Waste Pretreatment

The mission of this project is to safely store and pretreat high-level waste and other waste stored or managed by the Idaho Nuclear Technology and Engineering Center High-Level Waste Program, including: high-level liquid waste, sodium bearing waste, calcined solid waste, debris, and filters. Debris and filter waste from the Idaho Nuclear Technology and Engineering Center area is treated to remove the hazardous constituents such that it can be disposed as low-level waste.

Via a modification to a Consent Order on hazardous waste management with the State of Idaho, the Department of Energy agreed to place the calciner in standby by the end of April 1999, pending completion of an Environmental Impact Statement on the path forward for treatment and disposal of the liquid sodium bearing waste and calcine. This Environmental Impact Statement also addresses closure of the Idaho Nuclear Technology and Engineering Center waste facilities.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Maintain calciner facility in standby while continuing to operate the evaporators and debris and filter treatment operations within the calciner facility			
■ Operate the High-Level Liquid Waste Evaporator to concentrate and reduce the volume of liquid stored in the tank farm.			
■ Transfer of liquid waste from generators in the Idaho Nuclear Technology and Engineering Center area and retooling of the piping system to segregate Resource Conservation and Recovery Act waste from non-Resource Conservation and Recovery Act waste. New waste discharged to the tank farm will be minimized, segregated, and treated for disposal as low-level waste.			
■ Continue surveillance and maintenance of the calcine bin sets. Maintain safe and compliant storage of calcine and liquid waste.			
■ Perform treatment of mixed low-level waste debris from the Idaho Nuclear Technology and Engineering Center prior to land disposal.			
■ Start up upgraded debris treatment operations.			
■ Operate the filter leach process to reduce stored backlog of 250 highly contaminated filters and projected inventory of newly spent filters prior to land disposal.			
■ Perform laboratory sample analyses to support process operations at the Idaho Nuclear Technology and Engineering Center waste facilities.			
■ Technology development (laboratory and pilot plant activities) of the methods recommended for final treatment of the liquid waste and calcine will continue but will increase as the focus shifts to a recommended technology.			
■ Initiate conceptual design for upgrades to the calciner to meet the new Environmental Protection Agency Maximum Achievable Control Technology Rule (to be implemented in FY 2002-2005) if a decision is made to select the calciner for pretreatment of the sodium-bearing waste.

ID-HLW-103 / High-Level Waste Treatment and Storage

This project is to design, construct, and operate the facilities needed to convert the pretreated waste and treat remaining liquid waste by 2035 to a final disposable form that is road ready to ship out of the State of Idaho. Calcined and remaining liquid waste requires additional treatment to be suitable for disposal in a geologic repository. The work performed under this project is for new facilities required to complete the high-level waste mission and for demonstration projects and other development work necessary to implement the selected technology(ies).

The Department of Energy is currently preparing an Environmental Impact Statement, which will determine the path forward on treatment and disposal of remaining liquid waste and calcine. The Environmental Impact Statement also addresses closure of the Idaho Nuclear Technology and Engineering Center's high-level waste facilities. The Environmental Impact Statement is analyzing a full range of reasonable options for treating the waste, including options that depend on resuming pretreatment of waste and those, which do not convert liquid waste to calcine. The Environmental Impact Statement treatment options look at various options for treatment and disposal of the waste, including vitrification, ceramification, radionuclide separation, grouting the low activity fraction of the waste, disposal in geologic repository, near surface disposal, above ground disposal.

- Issue the Record of Decision for the Idaho National Engineering and Environmental Laboratory High-Level Waste and Facility Disposition Environmental Impact Statement.
- Begin negotiating with the State of Idaho on the plan and schedule for treatment and disposal of the calcine.
- If immobilization technologies are selected in the Record of Decision, a conceptual design will be initiated.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Sample and analyze the calcine and the liquid waste in the tanks to provide characterization data This data is necessary for permitting current and future waste treatment facilities and for delisting petitions, which affects the acceptability of final waste form in a geologic repository.			
■ Perform scalable demonstration projects associated with radioactive waste minimization, the Maximum Achievable Control Technology offgas sampling, and high temperature operation of the calciner. These projects are necessary to meet new regulatory requirements and Settlement Agreement milestones. Higher temperatures are needed to operate the calciner to treat sodium bearing waste and increase throughput. Demonstration projects are needed to confirm the results of engineering studies that only minimal modifications are needed to operate the calciner at higher temperature.			
ID-HLW-103	18,312	13,053	24,674

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

ID-HLW-105 / Low Activity Waste Treatment

The purpose of this project is to close the tanks after treatment operations are completed in accordance with the requirements of the Resource Conservation and Recovery Act, and prior to final Comprehensive Environmental Response, Compensation, and Liability Act closure. The project includes development and demonstration of the method to treat and dispose of newly generated liquid waste to support tank closures.

By FY 2005, the Department of Energy will immobilize the tanks heels in place for two of the 300,000 gallon tanks in the high-level waste tank farm. This will be followed by the immobilization of tank heels and closure of three additional tanks by FY 2009, with the remaining tanks ready for closure by FY 2012. It is expected that grouting systems will be used to grout tank heels and to treat newly generated low-level liquid waste that would otherwise have been put into the high-level waste tank farm.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Conceptual design for closure of the emptied tanks in the tank farm will be completed.			
■ Draft tank closure plans will be prepared and the public comment process initiated.			
■ Develop alternative methods for treating newly generated liquid waste.			
ID-HLW-105	0	2,108	5,712

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

ID-LRP-101 / Environmental Engineering and Science Center

Provides for activities under the Idaho Long-Range Plan, including complex-wide integration and systems engineering support.

- Funding is continued in the Defense Science and Technology Budget request for FY 2000.

ID-LRP-101	8,000	61	0

Metrics
No quantifiable corporate performance measures are associated with this project.

ID-OIM-101 / Site-wide Landlord Operations

This project performs core functions for site-wide base support, facility upgrades, capital acquisitions, and facility disposal initiatives. Also included in this project is an initiative to demolish and dispose of surplus non-radioactively contaminated buildings and facilities that are deteriorating and pose a possible physical hazard to site personnel.

- Continue Emergency Preparedness, Seismic Monitoring, Environmental Monitoring, Integrated Planning Activities, and Meteorological Monitoring.
- Complete approximately 20 percent of backlog of maintenance and repair safety and health corrections items.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Purchase, install, and make fully operational all approved FY 1999 and prior general purpose/capital equipment acquisitions. The equipment is used for security, radiological monitoring, calibrations, telecommunications and maintenance, and supports environmental compliance, the Resource Conservation and Recovery Act, and Safety Requirements.			
■ Complete construction of five of eight previously approved general plant projects. The projects support telecommunications, fire suppression, emergency response, and emissions monitoring.			
■ Operation and maintenance of the Experimental Breeder Reactor-I National Monuments as required by the Historic Sites Act.			
■ Upgrade antiquated sitewide computer systems.			
■ Funding of the Citizens Advisory Board and Payments-in-Lieu-of-Taxes for state and county.

ID-OIM-102 / Idaho Nuclear Technology and Engineering Center (Formerly Idaho Chemical Processing Plant) Infrastructure Operations

This project is to perform the core functions required by multiple and varied programs at the Idaho Nuclear Technology and Engineering Center (formerly the Idaho Chemical Processing Plant) including operation, nuclear safety engineering environmental compliance, maintenance of the non-process plant facilities and services; including utilities and plant-wide infrastructure. These core functions support other programs in meeting regulatory and the Idaho Settlement Agreement requirements relative to the High-Level Waste and Spent Nuclear Fuel Programs.

- Incorporate process efficiencies identified through activity-based cost estimating methodology.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Upgrade and repair utility and facility structures and systems.			
■ Provide the utilities, landlord services, roads and grounds, non-process facilities, nuclear safety, environmental compliance, and plant-wide infrastructure supporting the high-level waste, spent nuclear fuel, and facility deactivation programs.			
■ Maintain structural roof and interior/exterior building integrity.			
■ Provide crosscutting services such as nuclear safety analysis; environmental, safety and health oversight; and quality assurance to the facility deactivation, high-level waste, and spent nuclear fuel programs.			
■ Provide engineering, document control, and work control support to the various programs.			
■ Provide stewardship and management of special nuclear material.			
■ Install, implement, and maintain the Idaho Nuclear Technology and Engineering Center Computerized Maintenance System.			
■ Perform Russian Criticality Experiments.			
■ Implement plant-wide computer-based training and maintained plant-wide training requirements.			
■ Begin construction of the Chemical Processing Plant 606 upgrades - General Plant Project.			
■ Initiate conceptual design of two Line-Item Construction Projects: Cathodic Protection System and the Process Water Treatment System.			
■ Begin construction on the Telephone Switchgear Facility - General Plant Project.			
■ Provide safeguards and security for the stewardship of special nuclear material and spent nuclear fuel.			
■ Proper material management practices and safeguard and security measures would be provided to ensure that the special nuclear material contained in Chemical Processing Plant-651 Building is adequately protected and cared for per DOE Orders 5632.1c and 5500.3a.

ID-OIM-116 / Environmental Legacy Compliance (VCO)

This project will fund corrective actions required to bring the Idaho National Engineering and Environmental Laboratory into regulatory compliance with Resource Conversation and Recovery Act as directed by the State of Idaho Division of Environmental Quality and the Department of Energy. Seven items in the Voluntary Consent Order must be addressed by FY 2000, six of which are funded by Environmental Management, and one by the Office of Nuclear Energy.

- Complete Inadequate Hazardous Waste Determination on Test Reactor Area Legacy Waste and disposition of 25 percent of waste.
- Submit determination report for Active Hazardous Waste Tanks to be placed on permit or closed.
- Complete system identification for the Idaho Nuclear Technology and Engineering Center active systems. Complete system identification for remaining systems for tanks requiring Hazardous Waste Determination or Verification of empty.
- Transfer New Waste Calcining Facility to Chemical Processing Plant-601 D-Cell for Storage of Calcine and Calcine Handling Tools at New Waste Calcining Facility.
- Characterize Chemical Processing Plant-603 Basin Water Sand Filter and Demineralization System.
- Submit draft Resource Conversation and Recovery Act closure plan and schedule for Division of Idaho Environmental Quality review and the Department of Energy revision for Test Reactor Area-630.

ID-SNF-101 / National Spent Nuclear Fuel Program

This project is to facilitate implementation of the Department of Energy's Spent Nuclear Fuel research, development, and testing of technologies for treatment, shipment, and disposal.

- Provide to the Office of Civilian Radioactive Waste Management all outstanding information on the Department of Energy's Spent Nuclear Fuel needed to issue the final Environmental Impact Statement for the repository and to support the preparation of a Nuclear Regulatory Commission license application by compiling information from all DOE spent nuclear fuel sites.
- Complete the electrometallurical treatment qualifications of product form for disposal.
- Continue core science and exploratory studies to ensure acceptance of DOE spent fuel by the DOE Office of Civilian Radioactive Waste Management.
- Support repository design to accommodate DOE spent fuel and EM specific requirements.

ID-SNF-102 / Integrated Spent Nuclear Fuel Program

This project is to support compliance with the Idaho Settlement Agreement through program management and support, technology development, continued fuel receipts, and fuel shipments to other Department of Energy sites.

Beginning in FY 1999, the Foreign Research Reactor Spent Nuclear Fuel Program work scope was moved to ID-SNF-103 for improved operational coordination.

- Finalize preparations for shipping and receipt of spent nuclear fuel from West Valley, beginning in FY 2001, in support of agreement with the New York State regulators.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Initiate negotiations with the regulators in December 1999 to establish a schedule to transfer all spent nuclear fuel out of wet storage.			
■ Provide technology development to support Spent Nuclear Fuel transfers to dry storage and ultimate out-of-State disposal.			
■ Provide Spent Nuclear Fuel data to the National Spent Nuclear Fuel Program to support repository Environmental Impact Statement and license application.			
ID-SNF-102	20,683	9,159	7,689

Metrics

This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

ID-SNF-103 / Emptied Spent Nuclear Fuel Facilities

This project is to remove all spent nuclear fuel from the following facilities at the Idaho National Engineering and Environmental Laboratory: Chemical Processing Plant-603 and Chemical Processing Plant-666 underwater basin storage; Test Area North underwater pool and dry pad storage; Chemical Processing Plant-749 Dry Storage Facility; Irradiated Fuel Storage Facility; Department of Energy Dry Storage Facility; and Privatized Dry Storage Facility. This project also manages the receipt of Foreign Research Reactor spent nuclear fuel in support of the United States non-proliferation policy.

- Continue the receipt of the Naval and Advanced Test Reactor Spent Nuclear Fuel.
- Continue removal of the Three Mile Island-2 fuel from wet storage with planned completion in FY 2001 per the Idaho Settlement Agreement.
- Continue wet spent nuclear fuel storage in the Chemical Processing Plant-666, while awaiting future dry storage.
- Complete transfer of spent nuclear fuel from first to second generation storage at the Chemical Processing Plant-749.
- Continue to receive shipments of foreign research reactor spent nuclear fuel and perform associated stakeholder activities.

ID-WM-105 / AMWTP Production Operations			
The Idaho Settlement Agreement requires a minimum of 3,100 m^3 of stored transuranic waste to be shipped out of the state by December 2002 (discussed under ID-WM-103 in the Defense Site/Project Completion Budget account). The approximately 61,900 m^3 of stored transuranic waste remaining will be treated in the privatized Advanced Mixed Waste Treatment Project to meet the Waste Isolation Pilot Plant waste acceptance criteria or other appropriate disposal facility requirements before it is shipped for disposal. This project supports Phase I of the Advanced Mixed Waste Treatment Project, including preliminary facility and process design activities; environmental regulatory permitting; National Environmental Policy Act evaluation; the Department of Energy Environment, Safety and Health Authorization; other project/technical support; and Phase III of the project, which includes payments to the vendor for operating the facility after construction. The capital asset acquisition of the Advanced Mixed Waste Treatment Project (ID-WM-104) is discussed in the Defense Environmental Management Privatization Budget account. All stored transuranic waste is planned to be removed from Idaho by December 31, 2015, but no later than December 31, 2018, as required by the Idaho Settlement Agreement. The Advanced Mixed Waste Treatment Project will treat mixed waste streams identified in the Idaho National Engineering and Environmental Laboratory Site Treatment Plan required by the Federal Facility Compliance Act of 1992. The Advanced Mixed Waste Treatment Project will undergo decontamination and decommissioning and the Resource Conservation and Recovery Act closure after scheduled completion of treatment in FY 2015, unless DOE extends the contract to treat additional Idaho National Engineering and Environmental Laboratory and non-Idaho National Engineering and Environmental Laboratory waste.			
■ Provides for project and technical support for the Advanced Mixed Waste Treatment Project, for Phase II (construction) efforts.			
ID-WM-105	3,212	8,610	527

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Metrics

This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

ID-WM-106 / Site-wide Environmental Protection

This project is responsible for implementing programs that are mandatory for environmental compliance at the Idaho National Engineering and Environmental Laboratory. This project provides and interprets data needed to ensure protection of human health and the environment. Compliance with regulations is achieved by interpreting the regulations and their impact on the Idaho National Engineering and Environmental Laboratory, providing site-wide guidance, preparing permit applications for well drilling activities, ponds, storm water, air, establishing monitoring/surveillance programs for air, water, soils, and biota, preparing the required reports and maintaining project files according to Quality Assurance Management System.

- Support environmental, safety, health, quality, and risk Assessments and audits.
- Perform independent oversight and monitoring of the Idaho National Engineering and Environmental Laboratory operations via the State of Idaho and monitoring and surveillance of water and air quality by the U.S. Geological Survey; pursue cooperative research opportunities.
- Submit the Wastewater Land Application Annual Report summarizing sample results and operational performance, National Pollution Discharge Elimination System Discharge Monitoring Report summarizing storm water discharges, the National Emission Standards for Hazardous Air Pollutants Annual Report compiling radiological air effluent releases, and the Lockheed Martin Idaho Technology Company Site-wide Environmental Monitoring Report summarizing site-wide environmental monitoring activities, and drinking water reports.
- Submit the annual State of Idaho Well Permit Application.
- Environmental monitoring activities to support DOE Orders 5400.1 and 5820.2a will be completed.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The floodplain assessment required by 100 CFR 1021 and 1022 will be completed.

ID-WM-108 / Integrated Waste Operations Program

This project defines technical, regulatory, and integrating initiatives targeting cost efficiencies that could not be achieved within the individual projects. This project includes those activities that crosscut all other waste management projects. This project also provides funding for waste operations, technical, regulatory, projects integration, safety and health corrective action plans and integrated data management.

- Maintain the Site Treatment Plan mixed waste inventory and hold quarterly Idaho National Engineering and Environmental Laboratory and State of Idaho meetings.
- Add new off-site mixed waste streams to the Idaho National Engineering and Environmental Laboratory Site Treatment Plan and complete mixed waste treatment arrangement.
- Perform preventative maintenance on packaging; renew Certificates of Compliance; complete study for a single packaging custodian for the Idaho National Engineering and Environmental Laboratory; and provide engineering support for shipments of all waste types and spent nuclear fuel.
- Update the "Accelerating Cleanup: Paths to Closure" document, as necessary, to reflect changes to the management baseline.
- Develop and implement the Idaho National Engineering and Environmental Laboratory Integrated Waste Tracking System to track site-wide waste inventory.
- The Environmental Monitoring and Oversight Agreement with the State of Idaho, the Environmental Research Foundation, the Citizens Advisory Board, the Environmental Permitting with the State of Idaho, and funding for the United States Geological Survey will be provided.

	(dollars in thousands)

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
HQNP-SI01-ID / Security Investigations	
■ No change in FY 2000.	0
ID-CTREXC-101 / Low-Level Waste/Mixed Low-Level Waste Center of Excellence	
■ Decrease reflects no FY 2000 activity.	-395
ID-ER-102 / Test Reactor Area Remediation (WAG 2)	
■ Decrease in funding is due to decrease in activity as project nears completion.	-1,233
ID-ER-103 / Idaho Chemical Processing Plant Activities (WAG 3)	
■ Increase reflects moving from Pre-Record of Decision, (preparation of documents) to actual remediation.	2,411
ID-ER-106 / Radioactive Waste Management Complex Activities (WAG 7)	
■ Reflects implementation of alternate Pit 9 activities. Funding supports purchase of major waste retrieval and treatment equipment as well as building components, material handling cells, and off-gas system and filters. The decrease in FY 2000 funding will be offset by the use of prior year funding of $43,000,000 that was originally appropriated for this work scope.	-16,687
ID-ER-107 / Pit 9 Remediation	
■ Decrease reflects reduced program support funding. As a result of the termination of the Pit 9 subcontractor, this remediaiton project has been restarted under PBS ID-ER-106 using a three stage alternate approach.	-562

	FY 2000 vs. FY 1999 ($000)
ID-ER-108 / Site-wide Monitoring Area Remediation	
■ Increase in funding reflects increase in a number of sites to be evaluated and native American concerns with economic risk.	2,615
ID-ER-109 / Remediation Operations	
■ Decrease reflects program now devoted to remediation versus assessment activities; and curtailment of other activities such as the National Recognition and New Business Development initiate, as cost savings measures.	-4,888
ID-ER-110 / Decontamination and Decommissioning	
■ Increase will allow ten additional assessments and decommissioning of three facilities.	2,527
ID-HLW-101 / High-Level Waste Pretreatment	
■ The increase will expedite debris treatment operations and increase processing of contaminated filters.	205
ID-HLW-103 / High-Level Waste Treatment and Storage	
■ Increase includes projected ramp up of work associated with technology demonstration and conceptual design associated with selected technologies.	11,621
ID-HLW-105 / Low Activity Waste Treatment	
■ Increase to begin accelerated conceptual design for closure of waste tanks and develop alternative methods for treating newly generated liquid waste.	3,604
ID-LRP-101 / Environmental Engineering Center	
■ Funding for FY 2000 is requested in the Defense Science and Technology Budget request.	-61
ID-OIM-101 / Site-wide Landlord Operations	
■ Increase includes funding for the facility disposal initiative, business systems upgrade, and environmental compliance corrective activities.	5,022
ID-OIM-102 / Idaho Nuclear Technology and Engineering Center (formerly Idaho Chemical Processing Plant) Infrastructure Operations	
■ Decrease reflects completion of several projects, shift in surveillance and maintenance requirements, and reduced funding for training.	-8,882
ID-OIM-116 / Environmental Legacy Compliance (VCO)	
■ Increase provides for additional corrective actions required to bring the Idaho National Engineering and Environmental Laboratory into regulatory compliance.	9,077

	FY 2000 vs. FY 1999 ($000)
ID-SNF-101 / National Spent Nuclear Fuel Program	
■ Decrease reflects peak in FY 1999 of workscope to provide information on DOE Spent Nuclear Fuel activities for the Office of Civilian Radioactive Waste Measures repository viability assessments Environmental Impact Statement and Nuclear Regulatory Commission license application. Some work scope moved out to FY 2001.	-11,817
ID-SNF-102 / Integrated Spent Nuclear Fuel Program	
■ Reduced technology development associated with fuel transfers to dry storage and repository preparations.	-1,470
ID-SNF-103 / Emptied Spent Nuclear Fuel Facilities	
■ Decreased activities associated with the Chemical Processing Plant-603 as fuel transfers are completed and the facility is transferred to deactivation. Also, decreased fuel transfer preparations from Chemical Processing Plant-666 requiring extended underwater storage and decreased funding for Foreign Research Reactor fuel receipts due to reduced shipments and previously established receipt protocols and equipment and procedural standardization.	-7,319
ID-WM-105 / AMWTP Production Operations	
■ Decrease reflects completion of all Phase I activities in FY 1999, leaving only minimal requirements for project and technical support during Phase II (construction) efforts.	-8,083
ID-WM-106 / Site-wide Environmental Protection	
■ The increase supports the Idaho National Engineering and Environmental Laboratory in performing additional Clean Air Act Title V permitting and environmental monitoring activities, negotiations or regulatory interpretations with the State of Idaho, and flood plains assessments required under 10 CFR 1021 and 1022.	520
ID-WM-108 / Integrated Waste Operations Program	
■ Decrease reflects completion of safety and health corrective action plans, stemming from the July 1998 Idaho National Engineering and Environmental Laboratory worker fatality.	-1,998
Total Funding Change, Idaho	-25,793

Major Issues

- Delay in opening the Waste Isolation Pilot Plant for receipt of mixed transuranic waste jeopardizes Idaho's ability to meet the Settlement Agreement Milestones to ship 3,100 cubic meters of transuranic waste out of Idaho by December 31, 2002.
- To meet the Settlement Agreement, DOE spent fuel must be included in the Nuclear Regulatory Commission license application for High-Level Waste/Spent Fuel Repository being submitted by the Post 2006 National Spent Fuel Program. Adequate funding must be provided in FY 2000 to support this activity.
- Idaho's budget request is compliance-based. Only minimal mortgage reduction activities will be funded in the FY 2000 request, requiring a continued high-level of surveillance and maintenance (costs) for abandoned (contaminated) facilities.

2056

Nevada

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Environmental Management, Post 2006 Completion program, carried out by the Nevada Operations Office, is to characterize and perform corrective actions, as applicable, at inactive sites and facilities contaminated as the result of historic nuclear testing activities conducted at the Nevada Test Site, Tonopah Test Range, and Nellis Air Force Range in Nevada, and eight other locations in five states: Amchitka Island in Alaska, Rulison and Rio Blanco in Colorado; Salmon in Mississippi; Central Nevada Test Area and Project Shoal in Nevada; and Gasbuggy and Gnome Coach in New Mexico. The mission at the Nevada Test Site also includes the treatment, storage, and/or disposal of radioactive low-level waste, mixed low-level waste, transuranic waste, mixed transuranic waste, hazardous legacy wastes, and wastes generated as the result of the Department's activities across the complex

Program Goal

The Nevada Operations Office is committed to ensuring its site and activities pose no undue risk to the public and worker safety; and to maintain compliance with applicable environmental and other requirements. Planned actions are designed to address the Department's environmental mortgage by characterizing and performing applicable corrective actions at the Nevada Test Site and associated off-site locations, enhancing strategies to safely accept and dispose of low-level waste, removing stored transuranic and mixed waste for disposition, and closing on-site disposal areas in compliance with regulatory requirements. For contaminated surface sites outside the Nevada Test Site, Nellis Air Force Range, and the Tonopah Test Range boundaries, the goal is to characterize, perform applicable corrective actions, and restore the surface areas for alternative uses and/or relinquish to the Bureau of Land Management by the end of FY 2006. Institutional control of the subsurfaces will be retained by the Department of Energy and the ground water will be monitored for up to 100 years to ensure there is not risk to the public.

Program Objectives

The objective of the Nevada Operations Office Environmental Management Program is to address the legacy of contamination resulting from approximately 1,054 above and below-ground nuclear tests, of which 928 occurred at the Nevada Test Site. The test site will be remediated consistent with an end state which incorporates cleanup standards developed for an institutional land use scenario, with the expectation that the land will remain under the control of the government. Nine Environmental Management Program elements (four Environmental Restoration, three Waste Management, Agreements-in-Principles/Grants, and Program Integration) have been developed to characterize and remediate, as applicable, inactive sites and facilities and for waste management operations.

The environmental restoration program includes the Soils Project which addresses radiologic contamination in the surface soils. The Underground Test Area Project, which addresses subsurface contamination and groundwater protection, remains the highest priority activity within the Nevada Operations Office Environmental Management Program. The Underground Test Area Project end state is the implementation of a comprehensive groundwater model and monitoring network to assure that groundwater protection is achieved. The Industrial Sites Project addresses contamination resulting from use of support facilities such as leach fields, muck piles, sumps, and injection wells. Decontamination and Decommissioning activities, conducted as part of the Industrial Sites Project, will be completed within ten years. The Offsites Project addresses contamination resulting from historic testing activities which occurred at eight sites in five states (Arkansa, Colorado, Missouri, New Mexico, and Nevada).

The waste management program will continue to characterize, segregate, and repackage the transuranic /mixed transuranic waste at the Waste Examination Facility in anticipation of shipping the waste to the Waste Isolation Pilot Plant for disposal. Transuranic waste shipments are scheduled to begin in FY 2000. The balance of the Waste Management Program addresses the treatment, storage, and/or disposal of mixed low-level and low-level wastes. Nevada will continue to accept and dispose of low-level waste from off-site and on-site generators.

Agreements-in-Principle/Grants provide funding for state oversight activities and support of Department initiatives. Program Integration includes those activities common to all projects including quality assurance, health and safety, project planning and control, technical and regulatory support, and contractual support.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by site table; as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Completed characterization (FY 1998) and initiate remediation of Clean Slate 2 Plutonium Dispersion Site (FY 1999).
- Completed Frenchman Flat Contaminant Boundary Modeling (FY 1998) and complete Containment Boundary Report and Correction Action Decision Document (FY 1999).
- Completed Western Pahute Mesa Corrective Action Investigation Plan (FY 1998).
- Completed Final Bullion Forced Gradient Experiment Report (FY 1998).
- Completed construction of 6 drill pads and 35 miles of roads in support of deep ground water monitoring well installation on Nellis Air Force Range (FY 1998).
- Completed remediation of 15 Resource Conservation and Recovery Act industrial sites in FY 1998 and complete nine more in FY 1999 on the Nevada Test Site and Tonopah Test Range.

- Completed remediation of surface ground zero mud pits at the Project Salmon Site, MS (FY 1998) and complete subsurface Record of Decision (FY 1999).
- Negotiated and put in place a joint Department of Energy/State oversight agreement with the State of Nevada for the Department of Energy low-level waste disposal operations at the Nevada Test Site (FY 1998).
- Complete remediation of Clean Slate 1 Plutonium Dispersion Site (FY 1999).
- Initiate installation of four deep ground water monitoring wells for monitoring contaminated ground water flow toward Oasis Valley, Nevada from the Nevada Test Site (FY 1999).
- Completed ground water modeling effort at Amchitka Island, Alaska (FY 1999).
- Complete disposal of approximately 11,059 m^3 (FY 1998) and 37,742 m^3 (FY 1999) of the Department of Energy complex low-level wastes at the Nevada Test Site
- Complete treating approximately 15 m^3 (FY 1998) and 91 m^3 (FY 1999) of transuranic waste, making it disposal ready for shipment to the Waste Isolation Pilot Plant in New Mexico.
- Issue Draft Environmental Assessment on Internal Transportation of Low-Level Waste to the Nevada Test Site (FY 1998), which addresses stakeholder concerns associated with transportation through the populated Las Vegas corridor, for public review.

Site Description

Nevada Test Site

The Nevada Test Site is located 65 miles northwest of the city of Las Vegas and encompasses 1,350 square miles, an area roughly the size of Rhode Island. The activities are wide-spread, as well as geographically diverse, and are the result of approximately 1,054 historical above-ground and below-ground nuclear tests, which were conducted primarily at the Nevada Test Site. In addition to surface cleanup, the regional ground water model indicates a high potential for migration of underground contaminants toward public receptors.

The Nevada Test Site mission also includes safe storage and disposal of radioactive wastes generated by the Department of Energy activities throughout the complex. Storage of transuranic waste and disposal of low-level waste, the low-level wastes that are received from the on-site and off-site generators, are conducted according to the current Nevada Test Site Environmental Impact Statement Record of Decision and other regulatory requirements.

Detail Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Nevada Operations Office Environmental Management Program is managed through a performance-based management and operating contract and a cost-plus incentive fee architect-engineer service contract to assure the most cost efficient service to the Government. All supporting subcontracts are subject to an internal "make/buy" review process and have a fixed cost ceiling, requirements for safety and health, well-developed performance criteria, and specific quality standards. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. Costs estimating, project planning and baseline methods, and project scope for the Environmental Restoration Program were independently validated by the Army Corps of Engineers and the Department of Energy's Core Technical Group in 1997. The Department of Energy's Core Technical Group completed similar activities for the Waste Management program in 1998. These validations include 100 percent of the projects described in this section, and the funds requested for FY 2000 are appropriate to perform the activities based on cost estimates developed using both historic costs for conducting similar activities and typical unit and time and materials costs found in private industry.

NV202 / AIPs/Grants

This project provides support for grants and various agreements with the states where the Department of Energy - Nevada Operations Office environmental management activities are occurring or are scheduled as the result of previous historical testing activities. Funding supports regulator oversight of the Nevada Operations Office activities within the states including surveillance and monitoring activities, and supports the outreach program, which include community involvement mechanisms, educational endeavors, and various research and development projects.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Funding of Agreements-in-Principle/Grants facilitates ongoing dialogue with regulators and stakeholder groups to develop common approaches and agreements if aggressive "Paths to Closure" goals are to be met. In many instances, funding provided through the Agreements-in-Principle is required for compliance with the Federal Facility Compliance Act and the Comprehensive Environmental Response, Compensation, and Liability Act. In other instances, the Agreements-in-Principle fund contractual agreements with various States to provide regulatory oversight, establish specific site sampling and monitoring requirements, and facilitate the undertaking of appropriate corrective actions. The grant programs fund stakeholder involvement and independent third-party oversight of the Department of Energy programs.			
NV202	3,736	3,473	4,068

Metrics
No quantifiable corporate performance measures are associated with this project.

NV211 / Soils

The Soils project addresses contaminated surface and shallow subsurface soils of the Nevada Test Site, the Tonopah Test Range, and the Nellis Air Force Range complex. Contamination is the result of the historic Department of Energy, Nevada Operations Office aboveground and near-surface nuclear detonations, safety shot tests, rocket engine development, and hydronuclear tests. The contaminations of concern are primarily americium, plutonium, depleted uranium as well as other transuranic, radionuclides, and fission products. In addition, there are potential sites where metals, particularly lead, will be of concern. The Soil Project will complete characterization of all sites comprising the project, complete remediation of surface soils to an established level and remediate only the hot spots located within sites identified as future testing zones at the Nevada Test Site, and maintain access control to the sites.

- Complete assessment of Clean Slates 3 Plutonium Dispersion Site; continue assessment and complete Corrective Action Investigation Plan for GMX Site; complete assessment of Project 57 Site.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Funding of Soils projects will focus on remediation sites outside the Nevada Test Site boundaries to reduce human health risks associated with exposure to radiological contamination. These activities result in reduced out year mortgage costs by eliminating the need for institutional control through site closure. Funding supports closure of sites prior to FY 2006.			
NV211	1,460	6,056	5,696

Metrics
No quantifiable corporate performance measures are associated with this project.

NV212 / Underground Test Area

The Underground Test Area Project focuses on the 921 underground nuclear detonations that were conducted in 88 shafts and tunnels on the Nevada Test Site between 1951 and 1992. The underground test areas have been grouped into six units, each of which is based upon geography and other elements common to the detonation locations. The six corrective actions units have contaminant sources that differ from each other and hydro geologic characteristics specific to their geographic location. Tritium is the contaminant of concern for the next 100 years, because it is the most mobile. Corrective action activities are required under terms of a Federal Facility Agreement and Consent Order negotiated by the Department of Energy and the Department of Defense with the State of Nevada. This agreement outlines the approach for identifying, prioritizing, investigating, and remediating the sites.

- Complete Corrective Action Investigation Plan for Yucca Flat; Complete installation of four deep ground water monitoring wells to monitor potential contaminant migration in the Oasis Valley area.
- Funding supports ground water monitoring wells modeling activities to assess the potential for contaminant migration as required by the Federal Facilities Agreement and Consent Order.

Remedial Action/Release Sites			
Assessments	0.0	10.0	0.0

NV214 / Industrial Sites

The Industrial Sites Project includes buildings, structures, equipment, and areas used in support of past nuclear testing activities. Within the Industrial Sites Project, there are approximately 456 remaining Corrective Action Sites that require some level of investigation; some Corrective Action Sites may require remediation. The Corrective Action Sites have been organized into over 256 similar groups or Corrective Action Units. The majority of the sites are located on the Nevada Test Site and some are located on the Tonopah Test Range. Site contaminants include chemicals, lead, explosives, unexploded ordinance items, and radioactive and mixed waste. The Project will complete characterization and required remedial actions and implement required monitoring activities at all sites.

- Complete Corrective Action Decision Documents for 7 Corrective Action Units on the Nevada Test Site and 2 Corrective Action Units on Tonopah Test Range; complete remediation of 1 Corrective Action Unit on the Nevada Test Site and 1 Corrective Action Unit on Tonopah Test Range.
- Funding supports characterization and remediation of various corrective action units as legally required by the Federal Facilities Agreement and Consent Order. Aggressive characterization will reduce or eliminate the need for remediation and post-closure expenditures at many sites, effectively reducing mortgage costs. Funding will accomplish the end state more quickly and cost-effectively and assure that the "Paths to Closure" goals are attained.

NV240 / Off-Sites

In addition to the Nevada Test Site, underground nuclear testing activities have been conducted at eight locations in five different states as part of the Nuclear Weapons Testing, the Vela Uniform, and the Plowshare Programs. Characterization of both the surface and subsurface environment will be conducted in order to minimize risk to the public and environment. If necessary, remediation activities will be conducted to allow release of the surface areas for alternative use and/or relinquished to the Bureau of Land Management. Subsurface areas will be modeled and monitored. Subsurface restrictions will remain in effect to prohibit access to radioactive contamination, and ground water will be monitored for a period of 100 years to ensure lack of access to contaminated ground water. Corrective actions of off-site locations within the State of Nevada are required under terms of an agreement negotiated with the state regulator. Parameters of corrective activities are identified within the Corrective Action strategy appendix to the agreement. Corrective measures are not established with the other four States, but are expected to parallel those established for the off-site locations within the State of Nevada. Cleanup levels required at each site will be negotiated with individual host states.

- Complete surface Closure Report and subsurface Corrective Action Plan for the Central Nevada Test Area, Nevada; initiate remediation of surface sites at the Project Salmon Site, Mississippi; continue long-term ground water monitoring at eight off-site test locations.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Funding supports characterization and remediation of various corrective action units as required by Agreements-in-Principle with the States of Nevada, Mississippi, and Alaska Access to these sites is largely uncontrolled and aggressive characterization supports timely assessment of site risk and supports releasing the surface areas for alternative use and/or relinquished to the Bureau of Land Management. Adequate characterization allows focused remediation and eliminates the need for remediation and post-closure expenditures at many sites. Funding will assure that the "Paths to Closure" goals are attained

NV350 / Transuranic Waste/Mixed Transuranic Waste

The Transuranic/Mixed Transuranic project will store, characterize, segregate, repackage, and ship transuranic and mixed transuranic waste for disposal at the Waste Isolation Pilot Plant in order to meet the requirements of the Resource Conservation and Recovery Act. The Rocky Flats waste stream must be declassified before it can be shipped to the Waste Isolation Pilot Plant for disposal Previously disposed transuranic and mixed transuranic waste in the Greater Confinement Disposal facility at the Nevada Test Site will be addressed in a Performance Assessment to determine the potential for future environmental and health risks. Planning, data collection, and analysis related to completion of the Performance Assessment, and subsequent permanent closure of the Greater Confinement Disposal facility, have been in progress in order to meet 40 CFR 191. Based on the results of this Performance Assessment, the Department of Energy will determine whether the waste may be closed in place or otherwise managed appropriately.

- Continue characterization and repackaging of transuranic/mixed transuranic waste in the Waste Examination Facility.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Complete radiography, radioassay, and headspace gas sampling of more than 50 percent of transuranic/mixed transuranic waste.			
■ Continue with preparation of disposal ready transuranic/mixed transuranic waste for future shipment to the Waste Isolation Pilot Plant.			
■ Finalize Greater Confinement Disposal Draft Performance Assessment; and continue with its internal peer review.

NV360 / Mixed Low-Level Waste

This project manages the Nevada Test Site's mixed low-level waste in accordance with the Nevada Test Site Federal Facilities Compliance Act, Site Treatment Plan, and Mutual Consent Agreement and to protect against potential risk to human health and the environment. Management of mixed low-level waste includes researching treatment options, selecting preferred and alternative treatment methods, verifying that the waste meets the applicable Waste Acceptance Criteria required by treatment and disposal site(s), shipping the waste to the selected site, and tracking the waste through disposal. The newly generated mixed low-level waste is stored temporarily as needed within the time frame negotiated with the State of Nevada pending treatment and disposal. Tracking, reporting, and coordination with the State of Nevada are accomplished by periodic meetings, annual updates, reporting of waste movement, and maintenance of database.

- Continue to interact with the State regulators for newly generated and legacy mixed low-level waste and manage them accordingly.

NV370 / Low-Level Waste

This project operates and maintains a low-level waste disposal facility in a manner that ensures safety, efficiency, and compliance with all applicable regulations. It will accomplish cradle to grave tasks from the acceptance of low-level waste through closure of waste disposal units at the Nevada Test Site. The major activity is the disposal of low-level waste generated at the Nevada Test Site and other Department of Energy and Department of Defense sites, at two disposal units in Areas 3 and 5. With the natural conditions of closed desert basins, low rainfall, high aridity, great depths to ground water, and relatively slow movement of ground water off-site, the Nevada Test Site is ideally suited for this role as the disposer of the low-level waste. Supporting tasks include the on-site waste generator project, the integrated waste disposal units closure project, base operations and maintenance, technical support, routine site monitoring, maintaining performance assessments, site characterization, update the National Environmental Policy Act requirements general plant projects and capital equipment. The Nevada Test Site low-level waste disposal capabilities are anticipated to be needed through FY 2070 to support the remaining Department of Energy remediation efforts and other related radioactive waste generating activities. Disposal and permanent closure of specific filled disposal units will continue through FY 2070. Long-term surveillance and maintenance of disposal units will be conducted through FY 2100.

- Continue to dispose on-site and off-site generated low-level waste at the Nevada Test Site.
- All other low-level waste support work will continue.
- Update and maintain performance assessments for Areas 3 and 5 disposal sites.

	(dollars in thousands)

NV400 / Program Integration

Program Integration provides financial, professional, administrative, and crosscutting support of environmental management activities at the Nevada Test Site, Tonopah Test Range, and eight off-site locations in Alaska, Colorado, Mississippi, Nevada, and New Mexico. Overall management is most efficiently accomplished by integrating the functions that are common to all project activities. These functions include administrative support, strategic initiatives, budget formulation, project planning and control, baseline revision and maintenance, Quality Assurance, Health and Safety, and stakeholder involvement activities.

- In all years, provides for: Program Integration including the site strategic and program planning and integration, as well as program management and control. These activities include the Paths to Closure; Strategic Plans; Program and Project Plans; project and cost control systems; community and stakeholder meetings and workshops regarding DOE/EM activities; training; safety and health documentation; Operation and Maintenance Plans and Contingency Plans; quality assurance and self-assessment; maintenance of Performance Measurement System to support the Government Performance and Results Act; cost estimate reviews and cost validations; and local transportation planning.

Oak Ridge

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Post 2006 Completion Environmental Management account, carried out by the Oak Ridge Operations Office is to direct and monitor environmental restoration, waste management operations, and materials stabilization activities on the Oak Ridge Reservation in Tennessee and at several off-site properties. The legacy waste at Oak Ridge includes 60 percent of the total the Department of Energy complex low-level waste inventory, 48 percent of the complex-wide mixed low-level waste inventory, and 80 percent of the total Department complex remote-handled transuranic waste inventory in storage at the three Oak Ridge sites. These large volumes, as well as all of the hazardous, sanitary, and industrial waste annually generated from mission activities, are safely stored, treated, and disposed in compliance with regulations. Spent nuclear fuel containing 0.25 metric ton of heavy metal is currently in storage at the Oak Ridge National Laboratory, awaiting transfer to the Idaho National Engineering and Environmental Laboratory and the Savannah River Site.

Program Goal

The Oak Ridge Operations Office is committed to have all spent nuclear fuel shipped to the Idaho National Engineering and Environmental Laboratory and the Savannah River Site for long-term storage by FY 2003, have all legacy transuranic waste treated and disposed by FY 2006, have all legacy mixed waste treated and disposed by FY 2008, have all remedial action sites completed by FY 2013, and have all legacy low-level waste disposed by FY 2019. The Oak Ridge Operations Office is further committed to ensuring its sites and activities pose no undue risk to the public and worker safety and maintain compliance with applicable environmental and other requirements.

Program Objectives

By FY 2006, all legacy transuranic waste will be treated and disposed, 95 percent of all legacy mixed waste will be treated and disposed, and 60 percent of all legacy low-level waste will be disposed. Additionally, Oak Ridge is involved in innovative technology demonstrations to identify more effective and efficient ways to treat waste. Remedial actions will be completed, including the Oak Ridge National Laboratory gunite tanks, cleanup of off-site properties, and an 85 percent reduction in the Environmental Management footprint of the Oak Ridge Reservation. These activities assume a cumulative enhanced performance efficiency of about 30 percent.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table; as well as, at a project level in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Awarded the innovative Management and Integration contract for the environmental management activities at the Oak Ridge, Paducah, and Portsmouth sites (FY 1998).
- Performed all necessary activities to compliantly treat, store, and dispose all applicable waste types at Oak Ridge (FY 1998/FY 1999).
- Awarded the commercial Broad Spectrum Mixed Waste Treatment procurement contracts (FY 1998).
- Awarded the Transuranic Privatization treatment contract (FY 1998).
- Completed three waste management line-item construction projects (FY 1998).
- Stabilized 0.032 m^3 (0.013 MTHM) of spent nuclear fuel in FY 1998 and 0.132 m^3 or 0.015 MTHM to stabilize in FY 1999.
- Completed all shipments (11 canisters) of aluminum clad fuel to the Savannah River Site (FY 1998).
- Retrieved and repackaged 15 canisters of spent nuclear fuel for shipment to the Idaho National Engineering and Environmental Laboratory (FY 1998).
- Award contract to construct and operate an on-site disposal cell for cleanup waste, pending regulatory approvals (FY 1999).
- Issue Phase I Record of Decision for the Bear Creek Valley Watershed.
- Issue decision documents to conduct removal actions for the Upper East Fork Poplar Creek plume and salvage yard projects.
- Eliminate 37 percent of the legacy mixed waste stored on the three Oak Ridge sites, and Paduch and Portsmouth (FY 1999).
- Complete removal of spent nuclear fuel from Facility 7823 (FY 1999).
- At the Oak Ridge Reservation, will commercially treat and dispose of 150 metric tons of hazardous waste, dispose of 68,000 m^3 of sanitary and industrial waste in the Department of Energy landfills on the Y-12 Plant site, treat over 1,949 m^3 of mixed low-level waste (14 percent of the total Oak Ridge Reservation inventory) and dispose of 4,749 m^3 (17 percent of inventory) of mixed low-level waste, treat over 2,378 m^3 of solid low-level waste and treat and dispose of over 286,000 m^3 of low-level and nonradioactive wastewater, and manage the safe storage of 2,539 m^3 of transuranic waste (FY 2000).

- Complete fabrication and testing of uranium conversion equipment at the Molten Salt Reactor Experiment at the Oak Ridge Reservation and complete planning, design, and documentation for the fuel salt removal process, which will lead to the removal and conversion of uranium in FY 2001, meeting a commitment to the Defense Nuclear Facility Safety Board under recommendation 94-1 (FY 2000).

Site Description

Oak Ridge Reservation

The Oak Ridge Reservation encompasses about 37,000 acres and is comprised of three facilities; the Y-12 Plant, which was a uranium processing facility and now dismantles nuclear weapons components and serves as the nation's storehouse for special nuclear materials; the East Tennessee Technology Park, which was a uranium enrichment facility and is now being transitioned through reindustrialization; and the Oak Ridge National Laboratory, which conducts applied and basic research in energy technologies and in the physical and life sciences.

East Tennessee Technology Park

The East Tennessee Technology Park site occupies 1,500 acres adjacent to the Clinch River, some 13 miles west of Oak Ridge, Tennessee. It was originally built as an uranium enrichment facility using uranium hexafluoride for Defense Programs. The majority of the 125 major buildings on the site are now inactive since uranium enrichment production ceased in 1985. The site is being transitioned to the private sector through reindustrialization. Most Oak Ridge legacy waste is stored the East Tennessee Technology Park and the Toxic Substances Control Act incinerator is operating on the East Tennessee Technology Park.

Oak Ridge National Laboratory

Activities carried out at the Oak Ridge National Laboratory historically have supported both the defense production operations and civilian energy research effort. This group of facilities requires cleanup resulting from a variety of research and development activities, which were supported from past DOE programs and many facilities were supported by multiple programs over a long period of time.

The Oak Ridge National Laboratory currently conducts applied and basic research in energy technologies and the physical and life sciences. Transuranic, mixed low-level, hazardous and sanitary, and industrial waste are managed at the three Oak Ridge Reservation facilities. Although the operations are different the waste generated from these operations is essentially the same.

Due to past efforts conducted, funding for annual assessment/cleanup has been split between two appropriation accounts and in FY 2000 the majority of support will be funded under the Defense Environmental Restoration and Waste Management Appropriation.

Y-12

The Y-12 site is approximately 811 acres and is located about two miles southwest of Oak Ridge, Tennessee. The Y-12 has 15 operable units within three areas; Chestnut Ridge, Upper East Fork Poplar Creek, and Bear Creek Valley. The types of contamination include radioactive, hazardous, and mixed wastes. The West End Treatment Facility treats organic liquid waste produced by the Defense Programs. The sanitary landfills for all of the Oak Ridge sites operate at Y-12.

Off-site

The Off-Site Program is not on the Oak Ridge Reservation and includes the Lower East Fork Poplar Creek, the Clinch River/Poplar Creek, the Atomic City Auto Parts Site, the Oak Ridge Tool and Engineering Site, and the David Witherspoon Site. All waste types are stored, treated, and disposed in compliance with regulations.

Oak Ridge Operations Office

The Oak Ridge Operations Office manages, coordinates, tracks, and assists in the implementation of the Environmental Management program among the various sites. Oak Ridge is the lead site for the National Metal Recycle Program and supports crosscutting integration efforts related to the Oak Ridge sites. In addition, the Oak Ridge Operations Office manages oversight agreements with the State of Tennessee, Ohio, and Kentucky and provides funding for all off-site projects.

Detail Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Oak Ridge Operations Office is managed through an incentivized management and integration contract, with fixed-price subcontracts, to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site, except for the low-level waste management operations, as outlined in the "Accelerating Cleanup: Paths to Closure." The projects included in this section of the budget have had an independent cost review of the scope, and the funds requested for FY 2000 are appropriate to perform the activities based on awarded fixed-price contracts.

■ Close Area IV of the landfill on the Y-12 site.			
OR-38110	5,681	4,799	7,026

Metrics
No quantifiable GPRA metrics are associated with the PBS.

OR-38111 / Mixed Low-Level Waste Management

This project is to perform all necessary activities to compliantly store, treat, and dispose of mixed low-level waste generated from three Oak Ridge sites (Oak Ridge National Laboratory, the Y-12 Plant, and the East Tennessee Technical Park) in accordance with the Oak Ridge Federal Facilities Compliance Act Site Treatment Plan and a Federal Facilities Compliance Agreement. The Toxic Substances Control Act incinerator annually treats about 1,000 m^3 of mixed waste. The commercial Broad Spectrum mixed waste contracts started treatment of up to 36,500,000 kg of legacy mixed waste from across the Department of Energy Complex in FY 1999. Treatment and disposal of Oak Ridge legacy mixed waste is expected to be completed by FY 2008. These activities are essential for the successful execution of the ongoing Defense Programs and Science Office missions.

- Treat 1,949 m^3 (8 percent of the total inventory) and dispose of 4,749 (18 percent) m^3.

OR-38112 / Low-Level Waste Management			
Perform all necessary operational activities to compliantly store, treat, and dispose of solid low-level waste generated on the three Oak Ridge sites (Oak Ridge National Laboratory, the Y-12 Plant, and the East Tennessee Technology Park). These activities are essential for on-going Defense and Science Office missions.			
■ 2,378 m^3 of solid low-level waste will be treated.			
■ 286,000 m^3 of liquid low-level waste and 510,000 m^3 of nonradiological wastewater will be treated and disposed as generated.			
■ Dispose of 4,781 m^3 of solid low-level waste.			
■ Provide compliant operation of the Gaseous Waste Collection and Treatment System at the Oak Ridge National Laboratory.			
■ Process depleted uranium chips as generated on the Y-12 Plant.

OR-38113 / Transuranic Waste Management

Perform all necessary activities to compliantly store and collect the Oak Ridge National Laboratory transuranic waste. These activities are essential for on going Science program mission. These activities are also required by the 49 Code of Federal Regulations, Department of Transportation regulations, Resource Conservation and Recovery Act, Toxic Substance Control Act, and to support the privatization contract. In FY 1998, awarded the privatization contract to treat and prepare transuranic waste for disposal in the Waste Isolation Pilot Plant by FY 2006.

■ Complete site utilities project to support the privatization contract.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Phase I of the privatization contract will be completed including treatment facility design, obtain all necessary licenses and permits, and submit all the National Environmental Policy Act analysis data.

OR-42101 / Y-12 East Fork Poplar Creek Remedial Action

Conduct assessment, cleanup, and pre-decommissioning, surveillance and maintenance activities. These activities are conducted in accordance with the current project baseline for scope, schedule and cost, and are consistent with the Federal Facilities Agreement milestones as agreed with the Environmental Protection Agency for mercury release, Dense Non-Aqueous Phase Liquids and other activities under the Comprehensive Environmental Response, Compensation, and Liability Act.

- The Upper East Fork Poplar Creek Record of Decision will be issued for approval.
- The Upper East Fork Poplar East End Dense Non-Aqueous Phase Liquid project construction and implementation will continue.
- Continue surveillance and monitoring support for decommissioning and remedial action sites.
- Continue support for Reduction of Mercury in Plant Effluents Program and Integrated Water Quality Program.

OR-63101 / NMFS - Defense

The nuclear materials facility stabilization activities provides for the safe storage, packaging, and shipment of Spent Nuclear Fuel located at the Solid Waste Storage Area on the Oak Ridge Reservation. The Spent Nuclear Fuel inventory consists of .09 metric tons of heavy metal (MTHM) in aluminum-clad fuel to be shipped to the Savannah River Site by FY 1998 and .16 metric tons of heavy metal in stainless steel, zirconium, and graphite-clad spent nuclear fuel to be shipped to the Idaho National Engineering and Environmental Laboratory by FY 2003. In FY 2000, the requested level of funding will allow the planned project scope and schedule for the spent nuclear fuel program to be maintained and will resolve the Defense Nuclear Facilities Safety Board spent nuclear fuel storage vulnerability. The funding level being requested is appropriate for these activities based on the current baseline. This project is split funded with the Non-Defense Environmental Management Appropriation (total funding $9,937,000).

- Will retrieve and repackage the remaining 16 canisters of spent fuel for shipment to the Idaho National Engineering and Environmental Laboratory.
- Will install the remaining 12 liners in the 7827 facility completing the Defense Nuclear Facilities Safety Board vulnerability resolution.
- Continue deactivation and surveillance and maintenance activities for the isotope facilities previously funded under the Non-Defense Environmental Management Appropriation.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
HQNP-SI01-LT-OR / Security Investigations	
■ Decrease in the estimated number of investigations to be processed.	-98
OR-38109 / Hazardous Waste Management	
■ The increase is due to expected hazardous waste generation increases from the Defense Programs and Science Offices, and increased waste generation activity in decontamination and decommissioning at the East Tennessee Technology Park.	904
OR-38110 / Sanitary/Industrial Waste Management	
■ The increase is due to closure of Area IV and opening of a new cell of the landfill at the Y-12 Plant site.	2,227
OR-38111 / Mixed Low-Level Waste Management	
■ The increase is due to the Broad Spectrum Treatment contracts becoming fully operational; and an increase in other new waste streams treatment; and increases in disposal operations.	7,395
OR-38112 / Low-Level Waste Management	
■ The increase is due to additional treatment and disposal of legacy waste. The increase also reflects restoration of the low-level waste base program activities that were significantly reduced in FY 1999.	5,080

	FY 2000 vs FY 1999 ($000)
OR-38113 / Transuranic Waste Management	
■ The decrease is due to the completion of the transuranic sludge transfer and road project in FY 1999, which supports the transuranic privatization contract. The decrease also reflects reduced FY 2000 Phase I privatization project funding requirements.	-4,058
OR-42101 / Y-12 East Fork Poplar Creek Remedial Action	
■ The increase is due to record of decision approval; increased surveillance and maintenance and the Dense Non-Aqueous Phase Liquid project construction and implementation.	2,129
OR-42102 / Y-12 Bear Creek Remedial Action	
■ No significant change.	222
OR-43101 / ORNL Melton Valley Watershed D&D - Defense	
■ This project is a net decrease (defense and non-defense). Less work has been planned for this project in FY 2000 in order to direct funding to compliance activities. In FY 1999 these activities are in the Non-Defense Environmental Management Appropriation at a level of $33,434,000.	24,307
OR-43102 / ORNL Melton Valley Watershed Remedial Action - Defense	
■ This project is a net decrease (defense and non-defense). Slightly less work has been planned for this project in FY 2000. In FY 1999 these activities are in the Non-Defense Environmental Management Appropriation at a level of $2,573,000.	1,300
OR-43103 / ORNL Bethel Valley Remedial Action - Defense	
■ This project is a net increase (defense and non-defense). Increased work includes sludge removal and transfer activities; remediated of the radiactive waste tanks for main plan inactive tank; and to complete plume source removal action at the Corehole 8. In FY 1999 these activities are in the Non-Defense Environmental Management Appropriation at a level of $18,473,000.	28,569
OR-43104 / ORNL Bethel Valley D&D - Defense	
■ This project is a net decrease (defense and non-defense). Less work has been planned for this project in FY 2000. In FY 1999 these activities are in the Non-Defense Environmental Management Appropriation at a level of $5,197,000.	3,629

	FY 2000 vs. FY 1999 ($000)
OR-44103 / ETTP D&D - Defense	
■ The increase is in scope of deactivation work at the Centrifuge Facility.	4,694
OR-44105 / ETTP Landlord - Defense	
■ No significant change.	-40
OR-48103 / Off-site Remedial Action - Defense	
■ The increase is due to the majority of activities being transferred to the Defense Environmental Restoration and Waste Management Appropriation in FY 2000; and additional contract transition activities.	6,241
OR-48104 / Directed Support - Defense	
■ The increase is due to increased Agreements-in-Principle and other directed activities and to provide funding for the National Center of Excellence for Metal Recycling.	1,264
OR-63101 / NMFS - Defense	
■ This increase is due to the final installation of the remaining new liners in the 7827 facility, which will complete the resolution of the spent fuel vulnerability identified by the Defense Nuclear Facilities Safety Board. Increase also reflects the majority of activities being transferred to the Defense Environmental Restoration and Waste Management Appropriation in FY 2000.	4,040
Total Funding Change, Oak Ridge	87,805

Richland

Mission Supporting Goals and Objectives

Mission

The Mission of the Hanford site, managed by the Richland Operations Office, is to protect the health and safety of the public, workers, and the environment; control hazardous materials; and utilize the assets (people, infrastructure, and site) for others missions. Under the Defense Environmental Management, Post 2006 Completion account, the site manages surface land and water, the Vadose Zone, groundwater, facilities, property and special nuclear materials inventories, for the purpose of cleaning up the contaminated material and preventing further contamination from reaching the Columbia River. The major site efforts included in this part of the budget are: the Tank Waste Remediation System project in the central plateau (200 Area) of the site; Environmental Restoration, including the decontamination and decommissioning of reactors and facilities in the 100 Area along the Columbia River, and the cleanup of the contaminated soil and water throughout the site; Waste Management activities which are primarily carried out in the 200 and 300 Areas of the site; management of the on site Analytical Laboratories and of Pacific Northwest National Laboratory, which provide services to the various cleanup efforts onsite; and the Landlord program, which maintains the site infrastructure, vital to the cleanup effort. The Hanford site is the nation's largest former nuclear weapons production site, and the Hanford cleanup project is the largest, most technically complex, environmental cleanup project yet undertaken.

Program Goal

The ultimate program goal for the Hanford site is to protect the Columbia River. There are several major efforts required to accomplish this goal. These efforts include: removal and treatment of waste now stored in 177 underground high level waste tanks; cleanup and safe disposal in the central area of the site of surface contamination along the Columbia River; monitoring, mitigation, and remediation of chemical and radioactive contaminants that have migrated into the vadose zone and groundwater beneath the site; management of large volumes of liquid and solid wastes generated as a result of site cleanup; and management of the site infrastructure for the duration of the cleanup, which will go on for many years. The efforts described above are governed by the Hanford Federal Facility Agreement and Consent Order, commonly referred to as the Tri-Party Agreement, which was negotiated among the Department of Energy, the State of Washington and the Environmental Protection Agency.

Many interim activities are being conducted to resolve the most urgent risks at the Hanford site. By 2006, Hanford plans to have all essential site infrastructure completed to support the privatization contractor's treatment facilities, upgrade tank retrieval systems, complete necessary upgrades of tank infrastructure and transfer lines, have storage facilities available for receipt of immobilized waste, and be prepared to deliver wastes to support hot operations of the privatized facilities. In succeeding years, Hanford will provide interim storage of the immobilized wastes treated by the privatization contractor. By 2018, approximately 10 percent of the wastes, involving about 25 percent of the highest risk wastes, will be treated and safely stored. Thereafter, the site will proceed with the second phase of the privatization effort.

Hanford also has a goal of cleaning up the contaminated soil and buildings to levels supportive of future use targets and/or to regulator specified levels as prescribed by the Comprehensive Environmental Response, Compensation, and Liability Act/Resource Conservation and Recovery Act decisions. Hanford intends to aggressively clean up the contaminated soil and buildings in the 100 and 300 Areas and dispose of remediation waste in the on site Environmental Restoration Disposal Facility. Hanford currently has 1,629 release sites awaiting remediation and 692 buildings and facilities awaiting decommissioning. Remediation actions will protect the Columbia River and near shore environment, reduce contamination entering the groundwater and control the migration of plumes that threaten groundwater quality.

In addition, Hanford will dispose solid wastes consistent with national policies for management of transuranic, low-level, low-level mixed, and hazardous wastes. Hanford will continue to receive onsite and off-site wastes for disposal in the 200 Area. Retrieved transuranic waste will be processed and shipped off-site to the Waste Isolation Pilot Plant.

Program Objectives

The near term program objective for the high-level waste tank farms is to perform interim stabilization of the remaining 29 single shell tanks by pumping their contents to safer, newer double shell tanks. Also, Hanford will close unreviewed safety questions, work toward closure of the waste level rise in tank SY-101, and complete the sluicing campaign in tank 106-C, resolving safety concerns with that tank.

The site will continue decontamination and decommissioning of surplus facilities including interim safe storage and final disposition of the 100 Area reactors. Contaminated material will continue to be excavated and disposed in the Environmental Restoration Disposal Facility. Cells 1 and 2 will be interim closed pending final closure of the Environmental Restoration Disposal Facility. The site will implement a science and technology roadmap for the Groundwater/Vadose Zone Integration program to support site assessment and remediation and system assessment capability development.

Hanford will continue processing transuranic and low-level mixed waste through the Waste Receiving and Processing facility and be ready to ship transuranic waste to the Waste Isolation Pilot Plant. Hanford will also continue to dispose of low-level mixed and low-level wastes, including low-level waste received from offsite generators Site support will continue to be provided including maintenance, upgrades, and replacement of the general purpose infrastructure required throughout the Hanford site

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table; as well as, at a project level in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Completed seven waste site remediations in the Hanford 100 Area in 1998 with 258,000 m^3 (534,000 tons) of soil removed, and in FY 1999, 29 more waste site remediation completions are scheduled with 171,225 m^3 (365,000 tons) of soil removed, thereby reducing risk of mixed low-level contamination from reaching the Columbia River and meeting the Tri-Party Agreement commitments. In FY 2000, 14 waste site remediations are scheduled, with 126,169 m^3 (277,766 tons) of soil removed, in addition to the completion of backfill of ten waste sites.
- Completed barrier testing in the Hanford 200 Area in FY 1998. In FY 1999, the 200 Area implementation plan will be completed thereby meeting the Tri-Party Agreement commitments
- Completed two waste remediations in the Hanford 300 Area with 53,917 m^3 (117,000 tons) of soil removed (FY 1998), and is scheduled to complete three more waste site remediations with 78,107 m^3 (162,895 tons) of soil removed in FY 1999, thereby reducing risk of mixed low-level contamination from reaching the Columbia River and meeting the commitments of the Tri-Party Agreement. In FY 2000, plan two waste site completions with 12,083 m^3 (24,600 tons) of soil to be sent to the Environmental Restoration Disposal Facility.
- The Environmental Restoration Disposal Facility received 308,295 m^3 (669,000 tons) of contaminated soils and debris resulting from site remediation and began the facility expansion with Cells 3 and 4 (FY 1998) and is scheduled to receive 254,859 m^3 (541,000 tons) of contaminated soil and debris and complete the expansion of Cells 3 and 4 (FY 1999), thereby safely storing the environmental restoration waste and meeting the commitments Tri-Party Agreement. In FY 2000, the interim closure of Cells 1 and 2 will be complete, and 142,181 m^3 (314,400 tons) of soil will be disposed of.
- The Facility Surveillance and Maintenance project completed stabilization of seven radioactive waste area sites preventing spread of contaminants, completed three corrective actions to specific facilities in 100 Area Risk Assessment corrective actions (FY 1998), and is scheduled to complete the stabilization of five waste sites, preventing spread of contaminants (FY 1999), thereby reducing environmental risk. In FY 2000, this project will continue surveillance and maintenance of surplus facilities and reactors as well as continuing the Canyon Disposal Initiative.

- The Hanford decontamination and decommissioning project completed the interim safe storage of 105-C Reactor and initiated the interim safe storage of 105-F and 105-DR Reactors (FY 1998) and is scheduled to continue the interim safe storage of 105-F and 105-DR Reactors (FY 1999), thereby reducing mortgage, reducing environmental risk, protecting the Columbia River, and meeting the commitments of the Tri-Party Agreement. In FY 2000, the project will continue decontamination and decommissioning of 233-S building, continue interim safe storage of 105-F and 105-DR reactors, and begin characterization of 224B facility.
- The ground water project continued operations of five pump and treat systems to reduce contamination and contain flow of plumes, and continued operation of the carbon tetrachloride vapor extraction system (FY 1998/FY 1999), thereby reducing the risk of low-level contamination from reaching the Columbia River, and meeting the commitments of the Tri-Party Agreement.
- The Hanford Site Groundwater/Vadose Zone Integration Project was established in FY 1998. This science-based project includes participation of the DOE national laboratories and incorporates peer review. Through 1998 the project has developed a Science and Technology Roadmap in cooperation with the Department of Energy national laboratories; established a nationally recognized Expert Review Panel; initiated, with the direct participation of stakeholders, definition of an assessment tool to address the impact of all Hanford Site wastes; and issued the draft project specification and long-range plan. In FY 2000, implementation of the science and technology roadmap to support site assessment and remediation and system assessment capability development will commence.
- Completed 16 Tank Characterization Reports and met all the Defense Nuclear Facilities Safety Board 93-5 commitments (FY 1998).
- Complete all Tank Characterization Reports required by the Tri-Party Agreement commitments and close the Defense Nuclear Facilities Safety Board Recommendation 93-5 (FY 1999).
- Closed organic complexant unresolved safety question for all tanks; resolved organic complexant safety issue; closed flammable gas unreviewed safety question for double-shell tanks and single-shell tanks; and provide annual update to Basis for Interim Operations of the Tank Farms (FY 1998).
- Resolve organic solvent safety issue; resolve high-heat safety issue; and resolve criticality safety issue (FY 1999).
- Complete negotiation of a Consent Decree for tank interim stabilization with the State of Washington This resolves the announced lawsuit (FY 1999).
- Issued regulatory guidance, completed review and approval of the Phase I-A submittals, and did a readiness-to-proceed (to Phase I-B) evaluation of both privatization contractors, evaluated vendors' conceptual design and issued decision to proceed to Part B, Phase I of the privatization contract; prepared the Privatization Authorization-to-Proceed package and documentation for Congressional Report to proceed with Phase I Privatization (FY 1998).
- The planned schedule of activities by the privatization contractor, BNFL, Inc., for treatment and immobilization of tank wastes has changed since the FY 1999 Congressional Budget Request. Accordingly, activities supporting privatization have being re-prioritized (PROGRAM SHIFT).

- Prepared documentation to support AP106/108 tank turnover to a privatization contractor, and issued Phase I Site Characterization Data Report (FY 1998).
- Submitted Project Management Plan for Immobilized Tank Waste Storage and Disposal Project to Washington State Department of Ecology (Tri-Party Agreement M-90-01); validated Immobilized Low Activity Waste project for grout vault modification; and initiated conceptual design for additional disposal capacity (needed when grout vaults reach capacity) (FY 1998).
- The Tank Waste Remediation System issued annual update on the Multi-Year Work Plan; completed the Tank Waste Remediation System technical baseline to support project design requirements; and issued draft Management Support Project transition plan (FY 1998).
- Complete demonstrations in preparation for delivery to the privatization contractor; additional vadose zone characterization will allow further definition of tank retrieval and closure requirements (FY 1999).
- Complete documentation for tank and land turnover to Phase I Privatization Contractor, finalize planning for construction of roads and decommissioning of a monitoring well that interferes with the Privatization Contractor's facility (FY 1999).
- Complete Immobilized Low Activity Waste Disposal Facility conceptual design and validate project for additional disposal capacity; establish processing parameters for incorporation of the vitrification of Cs/Sr capsule contents into Phase II Privatization scope; revalidate Immobilized High-Level Waste Storage project (FY 1999).
- Completed Replacement Cross-Site Transfer System (93-D-182), securing a compliant, double-contained cross-site transfer line meeting the Tri-Party Agreement milestones (FY 1998).
- Completed Tank Farm Ventilation Upgrade (89-D-173), and placed AY/AZ Tank Farm ventilation systems in service, meeting the Tri-Party Agreement milestones (FY 1998).
- Established and started implementation of planned interim stabilization of remaining 29 single shell tanks containing free liquids. Started pumping three tanks and completed pumping another; agreed to milestones with the State of Washington (FY 1998) resolving potential lawsuit.
- Completed expense funded construction of a project for sluicing tank C-106 and commence sluicing to remove high heat sludge.
- Initiated off-site shipment of mixed low-level waste to Idaho for thermal treatment (FY 1998).
- Completed shut-down of the Hanford railroad and transferred the 1100 area to the Port of Benton (FY 1998).
- Started operations of the Waste Receiving and Processing transuranic waste processing line (FY 1998), and have prepared about 20 m^3 of non-mixed transuranic waste ready for shipment to the Waste Isolation Pilot Plant for disposal (FY 1999).
- Provided 23,500 student days of Hanford safety and health training and conducted two large scale emergency response field exercises in the United States by leveraging other organization's training (FY 1998), and is scheduled to provide 24,000 more student days of Hanford training (FY 1999).

- Declassified 103,545 pages of documents after reviewing 209,866 pages and completed Nature Conservancy activities, (FY 1998); and scheduled to review 240,000 pages in FY 1999. Also in FY 1999, the program is scheduled to complete the Westinghouse Hanford contract closeout.
- The Landlord project deactivated three facilities, decommissioned twenty-two facilities, and monitored thirty-eight deactivated and ten active facilities. Two construction projects were completed: Water System Upgrade Reservoir (general plant funded) and 324 Facility Compliance/Renovation (95-D-454). Shut down two central steam plants, which reduced soil and air pollution by six hundred tons per year and reduced liquid effluent discharged to the ground by 57 million gallons (FY 1998).
- The Landlord project is scheduled to complete the disposal of four contaminated rail cars, deactivate fifty facilities and monitor forty deactivated and 400 active facilities. The 200-East Area Sanitary Water Effluent and 200-West Area Regional Drainfield projects are scheduled for completion, which will reduce over 12 million gallons of liquid effluent from being discharged to the soil column (FY 1999).
- The Tank Waste Remediation System issue annual update on the Multi-Year Work Plan; submit Project Baseline Summaries; upgrade Systems Engineering Management Plan; and update and issue final Management Support Project transition plan (FY 1999).

Site Description

Richland Operations Office -- Hanford Site

The United States Department of Energy's Richland Operations Office manages the Department's Hanford Site, in Southeastern Washington State The 1,465 square kilometer (560 square mile) site is bounded on the north by over 50 miles of the Columbia River, and to the south by Rattlesnake Ridge. The flat plateau containing the Hanford site is the only section of the mid-Columbia River that is not confined by gorges, and is known as the Hanford Reach The Department leases some of Hanford's land to the State of Washington which in turn leases it to the US Ecology and the Washington Public Power Supply System.

Hanford was established in secrecy during World War II to produce plutonium for the nation's nuclear weapons. Peak production years were reached in the 1960s when 9 production reactors were in operation along the river. The last to be decommissioned was N-Reactor and its fuel in the K-Basins is now being relocated to higher ground in the central plateau, known as the 200-Area. The 200-Area had been the site of major nuclear chemical processing plants which were all shut down by the early 1990s. The 200-Area is now the core of major waste management operations, and includes 177 underground storage tanks containing the high-level waste from past processing operations. A major effort to immobilize these wastes by vitrification is underway by a privatization contractor. The Plutonium Finishing Plant is one of the last production facilities that will remain operational -- to process remaining plutonium materials. Other areas of the site include the Fast Flux Test Facility (400-Area) which does not currently have a mission (currently budgeted and managed by the Office of Nuclear Energy); research and development activities by Pacific Northwest National Laboratories in the 300-Area; and support facilities in the 1100-Area, most of which have been turned over to the local communities.

The Hanford mission is now site cleanup and environmental restoration, including the groundwater/vadose zone integration project to protect the Columbia River. The cleanup is covered by a 1989 consent agreement between the Department of Energy, the Environmental Protection Agency, and the Washington State Department of Ecology. This Tri-Party Agreement contains enforceable milestones for bringing Hanford into compliance with the Comprehensive Environmental Response, Compensation, and Liability Act and the Resource Conservation and Recovery Act. Most of the Hanford budget is directed at compliance with these milestones. Additionally, the Defense Nuclear Facilities Safety Board takes great interest in safety at Hanford and has issued recommendations which are the basis for the Defense Nuclear Facilities Safety Board commitments that are also high priority budget items.

Office of River Protection

In order to more effectively manage the Tank Waste Remediation System, and in response to Section 3139 of the *Strom Thurmond National Defense Authorization Act for Fiscal Year 1999*, the Secretary of Energy established the Office of River Protection at the Hanford, Washington, site. The Manager of this Office will be a high level Departmental management official responsible for managing all aspects of the Tank Waste Remediation System, including the privatized contract for treatment and immobilization of tank waste, and the non-privatized operations, maintenance, engineering and construction activities in the tank farms. The Office of River Protection reports directly to the Assistant Secretary of Environmental Management and receives administrative support from the Manager, Richland Operations Office. The Department was further required by Congress to provide an "integrated management plan for all aspects of the Hanford tank farm operations including roles, responsibilities, and reporting relationships." This plan, entitled "The Office of River Protection Integrated Management Plan for the Hanford Tank Waste Remediation System" has been delivered to the Senate Committee on Armed Services and the House Committees on Commerce and on National Security. The plan describes the Tank Waste Remediation System project and provides details of the roles and responsibilities of key Department officials in executing this project. The Manager of the Office of River Protection will maintain an effective, highly skilled staff to manage the complex Tank Waste Remediation System activities and ensure proper integration of the non-privatized work scope with the needs of the privatization contract to lead to successful immobilization of high-level wastes and the ultimate protection of the Columbia River resources.

Detail Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Site is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. Approximately 50 percent of the projects included in this section of the budget, and over 90 percent of the compliance costs, have had an independent cost review of the scope, and the funds requested for FY 2000 are appropriate to perform the activities based on estimated project progress and accumulated cost management success.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
HQNP-SI01-LT-RL/Security Investigations			
Funding will be used to perform new security investigations and re-investigations for non-Federal employees in accordance with DOE Order requirements for the Richland Site.			
■ Provide for contractor security investigations and re-investigations.			
HQNP-SI01-LT-RL	0	791	807
Metrics			
No quantifiable corporate performance measures are associated with this project.			
RL-ER01 / 100 Area Remedial Action			
This project's mission is to accomplish the remediation of over 400 past practice waste sites, in six separate reactor areas of the Hanford site to release the property for other beneficial use.			
■ Backfill 10 completed waste sites at 100 BC Source Area.			
■ Remediate 3 waste sites and dispose of 11,481 tons (5,288 m^3) of soil at 100 DR Source Area.			
■ Remediate 1 waste site and dispose of 124,572 tons (57,406 m^3) of soil at 100 FR Source Area.			
■ Remediate 10 waste sites and dispose of 132,845 tons (59,390 m^3) of soil at 100 HR Source Area.			
■ Dispose of other 100 Area Waste: 8,868 tons (4,085 m^3).			
■ Total waste sent to the on-site Environmental Restoration Disposal Facility is 277,800 tons (128,000 m^3).

RL-ER03 / 300 Area Remedial Action			
This project's mission is to accomplish the remediation of over 100 past practice waste sites, just north of the city of Richland and adjacent to the Columbia River at the Hanford site to release the property for other beneficial (industrial) use.			
■ Continue closeout activities for 300-FF-1 source area, including two waste site completions. Send 24,600 tons (12,083 m^3) of waste to the Environmental Restoration Disposal Facility.			
■ Continue with feasibility studies and proposed plan for the 300-FF-2 source term.			
■ Complete 417 assessments in 300-FF-1 and 300-FF-2 Source Areas.

	FY 1998	FY 1999	FY 2000
RL-ER04 / Environmental Restoration Disposal Facility			
This project's mission is to provide for the long-term Comprehensive Environmental Response, Compensation, and Liability Act waste disposal needs of the Hanford Environmental Restoration Program. The facility is located in between the 200 East and 200 West Areas.			
■ Complete interim closure construction for cells 1 and 2 of the disposal cell.			
■ Transport and dispose of over 314,400 tons (142,181 m^3) of low-level waste, some of which comes from decontamination and decommissioning, and the bulk from the 100 and 300 Area cleanups.			
RL-ER04	21,383	29,952	16,030
Metrics No quantifiable corporate performance measures are associated with this project.			
RL-ER05 / Facility Surveillance and Maintenance			
This project's mission is to provide surveillance and maintenance of over 1,200 waste sites and 700 facilities assigned to the Environmental Restoration Project. The sites and facilities are located throughout the Hanford site.			
■ Continue surveillance and maintenance of surplus facilities and reactors.			
■ Continue stabilization and radiological surveys of waste sites and complete annual herbicide spraying.			
■ Continue nuclear facility and facility transition support.			
■ Continue Canyon Disposition initiative at minimal funding level.			
RL-ER05	10,742	13,844	12,278
Metrics No quantifiable corporate performance measures are associated with this project.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
RL-ER06 / Decontamination and Decommissioning			
This project's mission is to decontaminate and decommission inactive facilities and to provide for interim safe storage and final disposition of the surplus reactors.			
■ Continue decontamination and decommissioning of 233-S building.			
■ Continue Interim Safe Storage Activities for the 105-DR and 105-F reactors.			
■ Begin characterization efforts associated with 224B facility.			
RL-ER06	17,675	11,540	10,769

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

RL-ER07 / Post Closure Surveillance and Maintenance			
This project's mission is to provide long-term surveillance and maintenance of waste sites after the completion of remediation, and of facilities, after decontamination and decommissioning. Post remediation monitoring is required under the Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation, and Liability Act.			
■ Post remediation monitoring per the close out of the 1100 Area National Priority List site.			
■ The FY 1998 estimate reflects deobligation and transfer of FY 1998 Budget Authority to other activities. Project was funded using FY 1997 carryover.			
RL-ER07	-10	59	60

Metrics
No quantifiable corporate performance measures are associated with this project.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
RL-ER08 / Ground Water Management			
This project's mission is the remediation of ground water and the long-term protection of the ground water resources of the Hanford site.			
■ Identification and tracking of radiological and hazardous contaminants in the ground water of the entire Hanford site.			
■ Perform well monitoring and 100/200 area pump and treat and vapor extraction activities.			
■ Support continued sampling, analysis, interpretation, and reporting of ground water condition.			
RL-ER08	20,603	19,152	19,394
Metrics No quantifiable corporate performance measures are associated with this project.			
RL-ER10 / Program Management and Support			
This project's mission is to provide programmatic oversight for individual Environmental Restoration Project Areas by ensuring that requisite management systems, project infrastructure and regulatory framework are in place and maintained until project completion.			
■ Safety, quality assurance, regulatory compliance, data management systems, engineering, project controls, and public support for the Environmental Restoration project essential services.			
■ Comprehensive Environmental Response, Compensation, and Liability Act Grants, site-wide assessments, special studies.			
RL-ER10	31,302	32,923	32,837
Metrics No quantifiable corporate performance measures are associated with this project.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

RL-HM01 / HAMMER

This project's mission is to provide employees of the Department and its contractors with the prerequisite safety and health training required for working on site, as well as the hazardous materials and emergency response training necessary for site operations. Realistic, hands-on props boost student achievement and help to improve clean up efficiency. Training costs are reduced by using advanced training technologies and by training other, non-DOE, organizations.

- Provide 28,000 student days of safety and health training for site workers.
- Provide a variety of other training and information services, including: the Hanford Safety and Health Library, Learning Resource Center, distance learning technology, and computer-based training.
- Provide safety and health degree programs (i.e., industrial hygiene) through distance learning.
- Increase the use of hands-on props event simulation in training.
- Evaluate training class.

RL-HM01	4,883	5,800	5,900

Metrics
No quantifiable corporate performance measures are associated with this project.

RL-OT01 / Mission Support

This project's mission is to: operate the fundamental technical and business systems required for keeping the site open and performing clean up work; integrate contractor efforts to eliminate counterproductive or under productive workscope; provide environmental surveillance, including air/surface/liquid effluent monitoring; perform environmental/ecological/cultural management; maintain regulatory and technical baselines; and monitor risks to public safety.

- Continue the site operations and support services described above.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Regulatory compliance work includes: produce 20 documents for the National Environmental Protection Agency and 10 documents for the Resource Conservation and Recovery Act; produce 35 notices of construction; implement the Radiation and Protection of the Public and the Environmental Law (10 CFR 834); maintain and operate a steel head salmon management plan (Endangered Species Act); document historic site buildings (National Historic Preservation Act); and conducting other regulatory compliance work at the site level.			
■ Business and national program work includes operating and maintaining: an accelerated cleanup plan; integrated priority lists; multi-year work plans; project baseline summaries; and an Integrated Planning, Accountability and Budget reporting/management System.			
RL-OT01	22,857	26,180	25,866

Metrics
No quantifiable corporate performance measures are associated with this project.

RL-OT04 / Richland Directed Support

This project's mission is to provide support for contract closure activities, stakeholder activities, and public entitlement and assistance programs.

- Review 240,000 pages of documents for declassification.
- Continue support for: downwinder litigation, air emissions monitoring, Resource Conservation and Recovery Act mixed waste fee, State of Washington and State of Oregon oversight, emergency preparedness grants, and Hanford Advisory Board and miscellaneous grants and activities.

RL-OT04	25,595	24,641	16,400

Metrics
No quantifiable corporate performance measures are associated with this project.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

RL-RG01 / TWRS Regulatory Unit

This project funds the Richland Regulatory Unit that regulates the Tank Waste Regulatory System Privatization Contractor in the areas of nuclear, radiological, and process safety. The Regulatory Unit develops regulatory guidance, and reviews and approves contractor submittals to assure the contractor achieves adequate safety. This project will end if the Nuclear Regulatory Commission assumes regulatory authority. This is not expected to occur before FY 2006.

- Continue review of safety baseline documentation to enable the vendor (BNFL, Inc.) to proceed into the next stage of design.
- Issue needed regulatory guidance.
- Continue oversight and inspection in support of preconstruction activities.

RL-RG01	4,090	5,039	5,663

Metrics
No quantifiable corporate performance measures are associated with this project.

RL-ST01 / PNNL Waste Management

This project provides the Pacific Northwest National Laboratory with waste management services and compliant operations in support of science and technology development for the multi-program needs.

- Maintain minimum safe conditions and compliant operations of the Pacific Northwest National Laboratory facilities; create operational drawings for the 325 Building gas, vacuum, and fire sprinkler piping.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Manage the consolidation, packaging, and transportation of currently generated Pacific Northwest National Laboratory wastes (283 m^3 of low-level waste; 34 m^3 of mixed low-level waste; 7 m^3 of transuranic waste; and 50 metric tons of hazardous wastes) for treatment and/or disposal; operate the permitted hazardous waste storage unit, the 90-day storage area, and the new 3,000 gallon Radioactive Liquid Waste Tank; verify compliance of Laboratory facility effluents.			
RL-ST01	14,851	15,020	13,961

Metrics

No quantifiable corporate performance measures are associated with this project.

RL-TP02 / WESF Sub-Project

Provides for safe, compliant, and cost effective storage of about 150,000,000 curies of encapsulated radioactive cesium and strontium until it can be treated in the FY 2013 - FY 2017 time period.

- Provide minimum surveillance and maintenance to maintain the facility safety basis.
- Initiate the Waste Encapsulation and Storage Facility Safety Analysis Report.
- Provide new method for non-destructive testing the integrity of 1,900 cesium and strontium capsules in order to identify problem capsules before they fail.
- Improve leak detection system in capsule storage pool to allow quicker isolation of a capsule in the event a capsule leak occurred.

RL-TP02	13,263	10,900	14,700

Metrics

This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

RL-TP13 / Landlord Project

This project's mission is to maintain, upgrade, replace, construct, purchase, perform surveillance on, deactivate and dispose of general purpose infrastructure and capital equipment throughout the Hanford site to support cleanup.

- Continue the support services described above at the minimum levels necessary to maintain safe site operation, which include:
  - Complete 200-West Area Fire Station Renovation;
  - Shutdown abandoned septic systems in the outer areas and at 20 buildings;
  - Dispose of three contaminated rail cars;
  - Mitigate chlorine contamination in the 200 Area infrastructure;
  - Replace 621A Building generator;
  - Refurbish two building exteriors and provide surveillance and maintenance for 375 vacant buildings;
  - Monitor 39 deactivated buildings; and
  - Maintain 60 miles of core site roads to avoid replacement.
- Replace two electric utility trucks with manlifts, and replace an ambulance and aerial-ladder fire engine.

RL-TP13	13,123	12,599	14,000

(dollars in thousands)

RL-TW01 / Tank Waste Characterization

This project's mission is to provide characterization for tank waste safe storage, operations, and retrieval/disposal. Includes analysis and improvements of sampling equipment and methods, and also supports Technology Development needs.

- Complete all Tank Characterization Reports required by the annually negotiated Waste Information Requirements Document under Tri-Party Agreement-M-44 and revised reports.
- Provide sample material to BNFL.
- Provide data management and interpretation support to the Tank Waste Remediation System program.

RL-TW01	40,987	36,800	26,097

No quantifiable corporate performance measures are associated with this project.

RL-TW02 / Tank Safety Issue Resolution Project

This project's mission is to provide an adequate safety basis for the management and storage of waste by the Tank Waste Remediation System; to develop and maintain an integrated authorization basis, and to resolve existing safety issues and associated Unreviewed Safety Questions.

- Develop operational safety Authorization Basis amendments and work toward closure for the waste level rise Unreviewed Safety Question in Tank 101-SY. Complete the final waste transfer and dilution, which began in FY 1999. Begin second waste transfer and dilution campaign as required.

54-291 99 - 67

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Complete the annual Authorization Basis update and upgrade for facilities ancillary to the tank farms. Maintain the Unreviewed Safety Question process and manage the licensing process.			
■ Continue with technical work required to resolve the flammable gas safety issue.			
RL-TW02	28,636	19,900	26,691

Metrics
No quantifiable corporate performance measures are associated with this project.

RL-TW03 / Tank Farms Operations

This project's mission is to operate, maintain, and upgrade tank farm facilities to safely receive and store waste until it is retrieved; operate the single-shell tank interim stabilization program.

- Maintain waste within the single-shell tank system, including storage and transfer of waste.
- Maintain waste within the double-shell tank system.
- Perform interim stabilization of single-shell tanks. This project includes $35,110,000 for interim stabilization to support activities to be performed under the Consent Decree.
- Continues funding and construction of the Tank Farm Restoration and Safe Operations construction line-item (97-D-402). Included in the funding totals are $13,961,000 in FY 1998, $22,723,000 in FY 1999, and $20,516,000 in FY 2000 for the line-item.

RL-TW04 / Retrieval Project			
This project's mission is to retrieve wastes from the single-shell and double-shell tanks and designated miscellaneous underground storage tanks; provide the waste to privatization contractor for treatment, and close waste tanks in accordance with regulatory requirements. These tanks are essential to successfully meld the operations of the Tank Waste Remediation System and the privatization contract. Otherwise, the wastes can not be successfully transferred, treated, and immobilized.			
■ Start the production phase by completing startup activities and readiness-for-delivery of feed to the privatization contractor by FY 2002.			
■ Complete sluicing campaign and initiate Tank 106-C heel removal and continue vadose zone characterization that will provide sufficient data to begin the National Environmental Policy Act closure process.			
■ Perform hydraulic sluicing and heel removal technology demonstration;			
■ Perform retrieval using the Initial Single Shell Tank Retrieval System; and			
■ Develop mixer pump technology and install retrieval systems for the Double Shell Tank retrieval.			
■ Continues funding and construction of the Initial Tank Retrieval System construction line-item 94-D-407. Included in the funding totals are $10,100,000 for FY 1998, $32,860,000 for FY 1999, and $4,060,000 for FY 2000 for the line-item.

RL-TW05 / Process Waste Support			
The Process Waste Support Project provides for pretreatment and immobilization of the waste in the Hanford Tank Farms.			
■ Integrate the operations of the Tank Waste Remediation System and the Privatization contractor to ensure the success of the mission of the Disposal Program and meet the Tri-Party Agreement milestones.			
■ Perform assessments of the privatization contractor to assure that the contract requirements are met, and that the privatization contractor's proposals provide the best value for the Department of Energy.			
RL-TW05	18,158	2,168	10,241
Metrics No quantifiable corporate performance measures are associated with this project.			
RL-TW08 / Process Waste Privatization Infrastructure			
This provides the required facilities, physical interfaces and systems to assure integration of the privatization contractor with Hanford, and also covers the cost of water and electricity used by the privatization vendor essential to meeting major Tri-Party Agreement milestones M-50 and M-51. Failure to develop the infrastructure may cause delay or failure of the privatization effort, and risk imposition of significant penalties by the State of Washington.			
■ Complete turnover of the site to privatization contractors.			
■ Finalize site development and installation of construction utilities.			
■ Finalize construction of production utilities.			
■ Continues funding and construction of the Privatization Phase I Infrastructure Support construction line-item (99-D-403). Included in the funding totals $14,800,000 in FY 1999, and $13,988,000 in FY 2000 for the line-item.

RL-TW09 / Immobilized Tank Waste Storage and Disposal Project

Provides safe storage and final near surface disposal at Hanford for immobilized low activity waste, interim storage for immobilized high-level waste, other high-level waste products, and provide for final disposition of Hanford cesium/strontium capsules.

- Initiate conceptual design, submit a Part B permit application, and issue a Preliminary Safety Analysis Report for the immobilized tank waste storage and disposal project.

RL-TW09	10,776	9,200	7,652
Metrics			
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.			

RL-TW10 / TWRS Management Support

The Management Support Project provides program management services and oversight for the Tank Waste Remediation System.

- Primary activities include executive management and strategic planning, systems engineering, and administration of program services. These tasks are required for normal project planning and execution. Also includes funds for contractor incentive fee.

RL-TW10	38,087	34,217	38,320

RL-VZ01 / Groundwater/Vadose Zone Integration

The project mission is to integrate ongoing groundwater treatment projects and ongoing studies on the vadose zone across the Hanford Site, determine the cumulative impacts of all Hanford Site wastes on the region and its peoples, apply sound science and technology, and partner with regulators, stakeholders, and Tribal Nations.

- Development of Revision "0" of the (System Assessment Capability) tool to address impacts of all Hanford Site waste.
- Implementation of science and technology roadmap to support site assessment and remediation and system assessment capability development.
- Provides for expert panel peer review.
- Provides for public involvement and outreach
- Continues integration management of planning, execution, and reporting.

RL-VZ01	0	6,700	11,325

Metrics
No quantifiable corporate performance measures are associated with this project.

RL-WM03 / Solid Waste Storage and Disposal

Provides centralized facilities for storage of radioactive low-level mixed and transuranic wastes and for disposal of solid radioactive low-level waste for on-site and off-site generators. Included are management operations, surveillance, monitoring and limited maintenance of facility building, burial grounds, and current waste inventories, and receipt of waste from on-site and off-site generators.

- Dispose of about 2,500 m^3 of mixed low-level waste.
- Dispose of about 3,800 m^3 of low-level waste
- Complete transition of the Transuranic Storage and Assay Facility and initiate transition of the Nonradioactive Dangerous Waste Storage Facility to Hanford's Facility Deactivation Program and the Landlord Program.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Provide for minimum safe and compliant condition for receipt and storage of low-level waste, mixed low-level waste, and transuranic waste. Provide for disposal of low-level waste, mixed low-level waste, and hazardous waste from on-site and off-site generators, and preparation of transuranic waste for shipment to the Waste Isolation Pilot Plant.			
■ Complete the development of a deep disposal trench in the Low-Level Burial Ground for sufficient low-level waste disposal capacity.			
■ Complete the development of the Solid Waste Environmental Impact Statement.

RL-WM04 / Solid Waste Treatment

This project provides on-site and commercial mixed waste treatment, waste verification and repackaging, and decontamination services to customers throughout the Hanford site. The work is performed in existing facilities at Hanford including the Waste Receiving and Processing Facility and limited decontamination services at the T-Plant complex.

- Continue preparation of disposal ready transuranic waste for future shipments to the Waste Isolation Pilot Plant.
- Fund Waste Receiving and Processing Facility transuranic and mixed low-level waste processing line operations.
- Complete and maintain the Waste Isolation Pilot Plant certification activities.

	(dollars in thousands)

RL-WM05 / Liquid Effluents Project

Manages and integrates the current and future liquid effluent streams on the Hanford site through the timely storage, treatment, including volume reduction for the tank farms, and disposal.

- Reduce about 1,000,000 gallons of high-level waste tank volumes through the 242-A Evaporator.
- Provide site-wide liquid effluent services at five liquid effluent facilities.

RL-WM05	30,378	29,359	30,988

Metrics
No quantifiable corporate performance measures are associated with this project.

RL-WM06 / Analytical Services

Provides for integrated waste and environmental sample analysis, process control support, field and sampling services, development services and expertise through on-site analytical laboratories or commercial services. Of significance is the analytical support to the Tank Waste Remediation System, spent nuclear fuel program, solid wastes, liquid effluent, and environmental restoration activities.

(dollars in thousands)

Total, Richland	647,198	665,992	687,397

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
HQNP-SI01-LT-RL / Security Investigations	
■ No significant change	16
RL-ER01 / 100 Area Remedial Action	
■ This increase in funding is required to handle additional waste volume being excavated in the 100 Areas	4,057
RL-ER02 / 200 Area Remedial Action	
■ This decrease in funding in FY 2000 reflects postponement of all restoration activities in the 200 Area until FY 2001	-1,967
RL-ER03 / 300 Area Remedial Action	
■ This decrease in funding provides for completion of two release sites in FY 2000, following three release site completions in FY 1999. The Milestone M-16-03D is in the process of being re-negotiated	-1,513
RL-ER04 / Environmental Restoration	
■ This decrease in funding is linked to completion of a major facility expansion in FY 1999. No facility expansion will be conducted in FY 2000; transportation and disposal activities continue in FY 2000	-13,922

	FY 2000 vs. FY 1999 ($000)
RL-ER05 / Facility Surveillance and Maintenance	
■ The slight decrease in funding reflects a combination of completion of backlogged corrective maintenance activities on surplus facilities (100-N Area), less waste sites where surveillance and maintenance is needed (due to completions) and efficiencies realized through remote monitoring.	-1,566
RL-ER06 / Decontamination and Decommissioning	
■ No significant change.	-771
RL-ER07 / Long-Term Surveillance and Maintenance	
■ No significant change.	1
RL-ER08 / Ground Water Management	
■ No significant change.	242
RL-ER10 / Program Management and Support	
■ No significant change.	-86
RL-HM01 / HAMMER	
■ Cost increase represents minimum allowance for growth in health and safety training.	100
RL-OT01 / Mission Support	
■ No significant change.	-314
RL-OT04 / Richland Directed Support	
■ Cost decrease is due to the scheduled closeout of the Westinghouse Hanford contract; the completed implementation of the Hanford Health Information Network; and complete settlements for payments-in-lieu-of-taxes and suspension of current payments.	-8,241
RL-RG01 / TWRS Regulatory Unit	
■ Small increase is needed for review of additional BNFL, Inc. deliverables. This project is mandatory because the Tank Waste Remediation System privatization contractor cannot proceed if the regulatory unit does not carry out its nuclear safety regulatory responsibilities.	624

	FY 2000 vs. FY 1999 ($000)
RL-ST01 / PNNL Waste Management	
■ Decrease reduces legacy waste and contamination management efforts at the Pacific Northwest National Laboratory facilities.	-1,059
RL-TP02 / WESF Sub-Project	
■ Increase allows for cesium/strontium capsule storage and leak detection system upgrades; as well as facility safety analysis report revision.	3,800
RL-TP13 / Landlord Project	
■ Cost increase is due to utility and emergency vehicle replacements, automation upgrades, and road refurbishment.	1,401
RL-TW01 / Tank Waste Characterization	
■ The decrease assumes the Defense Nuclear Facilities Safety Board Recommendation 93-5 will be closed before FY 2000, in which case the need to sample tanks for safety-related reasons significantly decreases. The Tri-Party Agreement milestones for characterization should not be affected. However, the reduced budget may not support characterization infrastructure to respond to emerging needs.	-10,703
RL-TW02 / Tank Safety Issue Resolution Project	
■ The increase is to maintain integrated authorization basis for the management and storage of waste by the Office of River Protection, and will fund a second transfer of waste from SY-101, as required.	6,791
RL-TW03 / Tank Farms Operations	
■ The funding fully supports activities within the planned baseline scope, with a major increase related to the stabilization of high-level waste tanks as a result of the Consent Decree	37,940
RL-TW04 / Retrieval Project	
■ The decrease is because construction for the Initial Tank Retrieval System (94-D-407) is being delayed to meet the new privatization schedule. It will still provide timely feed delivery to the BNFL, Inc. to support the 90 percent confidence level schedule.	-9,301

	FY 2000 vs. FY 1999 ($000)
RL-TW05 / Process Waste Support	
■ The increase is needed because the privatization contractor will be moving from design into the construction phase, which requires more DOE support.	8,073
RL-TW08 / Process Waste Privatization Infrastructure	
■ No significant change.	514
RL-TW09 / Immobilized Tank Waste Storage and Disposal Project	
■ Decrease is due to slow-down of design efforts because the BNFL, Inc. schedule allows delay in availability of storage facilities.	-1,548
RL-TW10 / TWRS Management Support	
■ Increase related to systems engineering efforts aimed at resolving numerous issues in the tank farms, such as single shell tank pumping in response to the Consent Decree.	4,103
RL-VZ01 / Groundwater/Vadose Zone Integration	
■ The increase in funding is to support the continued development of the system assessment capability, which will assess the impacts of all Hanford Site wastes and the implementation of the applied science aspects of the science and technology roadmap with specific emphasis on the vadose zone and inventory technical elements.	4,625
RL-WM03 / Solid Waste Storage and Disposal	
■ Increase is due to the preparation of disposal ready transuranic wastes for shipment to the Waste Isolation Pilot Plant.	2,068

	FY 2000 vs. FY 1999 ($000)
RL-WM04 / Solid Waste Treatment	
■ Increase for the Waste Receiving and Processing Plant treatment of transuranic waste for the Waste Isolation Pilot Plant	3,270
RL-WM-05 / Liquid Effluents Project	
■ Increase provides for a 242-A evaporator campaign, which is used to reduce high-level waste tank volumes	1,629
RL-WM06 / Analytical Services	
■ No significant change	-67
Total Funding Change, Richland	28,196

Savannah River

Mission Supporting Goals and Objectives

Mission

The Savannah River Site is a key United States Department of Energy facility in accomplishing the mission of the Defense Environmental Management, Post 2006 Completion account.

The Savannah River Cleanup Program has as its mission the treatment and disposal of the legacy materials and wastes that resulted from the production of nuclear materials during the Cold War. This legacy includes contaminated facilities and land areas, many of which still contain nuclear materials and wastes. The Savannah River Site, located near Aiken, South Carolina, covers over 300 square miles and includes five nuclear reactors, two chemical separations facilities, fuel and target fabrication facilities, tritium processing facilities, a heavy water facility, two high-level waste tank farms, low-level waste storage and disposal facilities, a high-level waste treatment facility, the Savannah River Technology Center, and numerous administrative and technical support facilities. Additionally these facilities have varying degrees of environmental contamination (soil and groundwater); the majority of which will require some remedial action to address environmental and health risks.

The Savannah River Cleanup Program is composed of the following major elements: spent nuclear fuel management, nuclear materials stabilization, waste management (high-level, transuranic, hazardous, mixed low-level, and other), deactivation, remediation, and supporting landlord requirements. This account funds all activities whose life-cycle will be completed after FY 2006.

Program Goal

The Savannah River Site is committed to managing the spent nuclear fuel, stabilizing nuclear materials, and managing all types of wastes using currently available (or near-term) technology and facilities. Eventually, the nuclear materials would be dispositioned and the remaining spent nuclear fuel and wastes would be sent to geologic repositories. To the extent possible (to be determined through technical analyses, National Environmental Policy Act review, and the regulatory process) Savannah River may be able to assist other sites in elimination of their Cold War "legacies". The Savannah River Site intends to complete stabilization of all on hand spent nuclear fuel requiring stabilization and all nuclear materials in FY 2006. Foreign Research Reactor spent nuclear fuel will continue to be accepted until FY 2009 and Domestic Research Reactor spent fuel will continue to be received at the Savannah River Site well beyond this date. This spent nuclear fuel will be prepared and stored in a form that can be shipped to a geologic repository beginning approximately 2015. Approximately seventeen hundred canisters of high-level waste, representing 33 percent of inventoried high-level waste, will be vitrified by FY 2006. Some of the major inactive processing facilities will be deactivated by FY 2006 and most high-risk release sites will be remediated by that time.

Due to the variety and amounts of nuclear materials and wastes on-site, the extent of facility and land contamination, and its potential to help solve cleanup issues at other "legacy" sites in the Department of Energy complex, the Savannah River Site will have a "long-term" cleanup mission extending beyond FY 2006. After FY 2006, the focus will be on receiving a small amount of foreign research reactor fuel and a continuing quantity of domestic research reactor spent nuclear fuel; managing the high-level, transuranic, hazardous, mixed low-level, and other wastes through about FY 2035; deactivating facilities as missions are completed and the facilities become excess; and remediating the remaining low risk sites.

Program Objectives

In FY 2000, 67 casks of spent nuclear fuel are expected to be received from foreign and domestic sources and the fuel (i.e., not the casks) safely stored in Savannah River's basins. One-hundred canisters of high-level waste will be produced at the Defense Waste Processing Facility and 348 m^3 of high-level waste will be treated. The Consolidated Incinerator Facility will continue to operate and will treat mixed low-level waste, and hazardous waste. Approximately 70,000 m^3 of other waste will be treated at the Effluent Treatment Facility and disposed of on-site.. No facilities will be deactivated in order to avail funding for higher priority activities, although 15 release sites (about 3 percent of the release sites) will be remediated in FY 2000.

The goal of the Spent Nuclear Fuel program is to support the U.S. nonproliferation policy through implementing the Foreign Research Reactor Spent Fuel Acceptance program and to manage the spent nuclear fuel currently at the site (foreign and domestic research reactor spent nuclear fuel, as well as the Savannah River Site production reactor spent nuclear fuel) by stabilizing the fuel or preparing it for long-term disposition in a Federal repository. Some of the spent nuclear fuel currently on-site (aluminum based or declad spent nuclear fuel in a degraded condition) is considered to be "at-risk" and is scheduled to be shipped to the canyon facilities for processing. Potentially difficult to dispose of spent nuclear fuel is currently being evaluated for processing in the canyons in preparation for eventual disposition. Savannah River plans to prepare other intact fuel for ultimate disposal in a geologic repository through a program in which the intact fuel is treated by one of two alternative candidate technologies (direct co-disposal or dilution by melting followed by co-disposal). To support this approach, the Savannah River Site has included in this budget request a design only line-item project to design a transfer and storage facility to receive, treat, and/or package spent nuclear fuel in canisters and safely dry-store this spent nuclear fuel in a "road-ready" form until a geologic repository is available. In addition to providing needed storage capacity, this facility will also permit an accelerated closure of the Receiving Basin for Offsite Fuel, which is being used for wet storage on an interim basis.

The Savannah River Site waste management activities encompass all types of waste generated and stored at the Savannah River Site. The High-Level Waste program integrates management of existing and new facilities to volume reduce, treat, and vitrify high-level waste for final disposal and to empty storage tanks so they can be closed. Savannah River has an estimated 125,398 m^3 (approximately 34,000,000 gallons) of high-level waste in the form of liquid, sludge and salt cake. This volume represents about 480,000,000 curies of radioactivity and is stored in 49 active tanks in two "tank farms" and related high-level waste facilities. Included are operation of the high-level waste evaporators to provide space in the tank farms to handle waste generated by the stabilization of nuclear materials, the continued safe storage of existing and newly generated high-level waste, the operation of the Defense Waste Processing Facility to vitrify high-level waste, the operation of Extended Sludge Processing to provide sludge feed for the Defense Waste Processing Facility, and operation of the Glass Waste Storage Building to store "road ready" vitrified high-level waste. The operation of the Saltstone Facility has been curtailed until an alternative for salt processing is implemented. The In-Tank Precipitation and Late Wash facilities were expected to pretreat the salt portion of the high-level waste. Due to technical issues concerning the generation of larger than anticipated amounts of benzene, all activities for pre-treatment of the salt feed have been suspended A salt processing systems engineering evaluation is in progress. All known salt processing options will be evaluated against the high-level waste system requirements and the best option will be selected in FY 2000. In order to support this activity, a supplemental Environmental Impact Statement will be prepared to assist in the decision making process.

Savannah River also manages varying amounts of other waste types. Efforts to reduce the legacy volume of waste at the site will be curtailed in the low-level waste and hazardous waste areas Major activities in solid waste management include: continued off-site shipment of hazardous waste and polychlorinated biphenyl waste, identified in the Site Treatment Plan, initial shipments of transuranic waste to the Waste Isolation Pilot Plant, continued operation of the Effluent Treatment Facility, and continued sanitary waste operations.

The Savannah River Site has identified over 300 currently inactive legacy facilities in a position to be deactivated. Facility assessments are being undertaken to provide condition / hazard characterization, and to establish documented surveillance and maintenance plans. However, full development and implementation of facility disposition plans have been deferred for these facilities in order to avail funding for higher priority activities. This budget does not include any significant activity related to facility deactivation.

The environmental restoration activities encompass all aspects of assessment, and remediation of facilities and release sites (including associated ground water) that are no longer a part of active operations at the Savannah River Site. There are currently 477 release sites at Savannah River. These release sites are grouped into six watershed areas: Flood Plain Swamp, Fourmile Branch, Lower Three Runs, Pen Branch, Steel Creek, and Upper Three Runs. Primary on-site contaminants include various nuclides (including plutonium, tritium, and uranium), volatile organic compounds, heavy metals, and solvents. Restoration activities are conducted at the Savannah River Site pursuant to the Resource Conservation and Recovery Act, Comprehensive Environmental Response, Compensation, and Liability Act, the site Federal Facilities Agreement (August 1993), several settlement agreements, and a consent decree. Through FY 1998, 175 release sites were completed. In FY 1999, 12 release sites are forecast for completion, and this FY 2000 budget will result in completion of an additional 6 release sites. The Savannah River Site's objective for environmental restoration remediation activities is to have most high-risk release sites in remediation by FY 2006.

Landlord activities are directed toward the management of general purpose infrastructure and site-wide program support that are essential for accomplishing essential missions at the Savannah River Site and maintaining the viability of the site for potential new missions in areas such as non-proliferation. Specific examples of infrastructure and support systems include: grounds, roads, general purpose buildings, utilities, communications, computers and information management, fleet management, maintenance and fabrication, emergency services, safeguards and security, land management, analytical laboratories, and environmental test facilities. Other examples include grants to two states for emergency management purposes to three counties and for payment-in-lieu-of-taxes; and to several universities for research in support of Site missions. It also includes interagency agreements, plus a cooperative agreement with the University of Georgia for managing the Site ecology laboratory

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table, as well as, at a project level in the Detailed Program Justification

Significant Accomplishments and Program Shifts

- Achieved space gain of 2,500,000 gallons (FY 1998) and 2,900,000 gallons (FY 1999) in tank farm through evaporation.
- Closed the second high-level waste tank (FY 1998).
- Produced 250 canisters (FY 1998) and 200 canisters (FY 1999) of vitrified high-level waste at the Defense Waste Processing Facility.
- Disposed of approximately 800 low-level waste drums, which were formerly managed as transuranic waste (FY 1998).

- Performed equipment upgrades, training and procedure development, and startup activities necessary to support the shipment of transuranic waste to the Waste Isolation Pilot Plant (FY 1998/FY 1999).
- Operation of the Consolidated Incinerator Facility to treat mixed low-level waste and low-level waste (FY 1998/FY 1999).
- Commence operation of the Replacement High-Level Waste Evaporator (FY 1999).
- Pursue alternate technologies for salt processing (FY 1999).
- Completion of 63 release site assessments (FY 1998) and 27 release site assessments (FY 1999).
- Completion of 60 release site remediations (FY 1998) and 12 release site remediations (FY 1999).
- Remediation of 360,000,000 gallons of ground water thru FY 1999, and removal of 115,000 lbs. of volatile organic compound (FY 1999).
- Executed the 320-M Laboratory deactivation plan - written and approved in FY 1997.
- Resumed operation of the M-Area Vitrification Facility shutdown in FY 1997 for melter replacement (FY 1998).
- Deactivation planning for the 320-M Target Fabrication Facility, the 313-M Target Slug Fabrication Facility, 322-M Metallurgical Laboratory, and the 321-M Fuel Fabrication Facility (FY 1998).
- Complete vitrification of all M-Area waste tank sludge (FY 1999).
- Complete deactivation of the Liquid Effluent Treatment Facility (FY 1999).
- Receive 35 casks of foreign research reactor spent nuclear fuel and 37 casks of domestic research reactor spent nuclear fuel (FY 1999)
- Demolition of the P and C powerhouses (FY 1998).
- Completed R-Reactor disassembly basin precharacterization sampling (FY 1998).
- Began operation of the C-Area Decon Facility (FY 1998).
- Initiated development of facility documentation and a surveillance and maintenance plan for P-Area (FY 1999).
- Deactivation of the R-Reactor disassembly basin (FY 1999).
- Vitrify an additional 100 canisters of high-level waste and evaporate 3.8 million gallons of high-level waste to provide additional tank space (FY 2000).
- Prepare 3 shipments of disposal-ready transuranic waste for shipment to the Waste Isolation Pilot Plant (FY 2000).
- Complete 6 release sites and complete assessments for 25 others (FY 2000).
- Receive 29 casks of Foreign Research Reactor Spent Nuclear Fuel (FY 2000).

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Site Description

Savannah River Site

The complex covers 198,344 acres, or 310 square miles encompassing parts of Aiken, Barnwell, and Allendale counties in South Carolina, bordering the Savannah River.

The site is owned by the Department of Energy and operated by an integrated team led by Westinghouse Savannah River Company. Under the contract that went into effect October 1, 1996, the Westinghouse Savannah River Company is responsible for the site's nuclear facility operations; Savannah River Technology Center; environment, safety, health, and quality assurance; and all of the site's administrative functions. The team also includes Bechtel Savannah River Inc. (parent company: Bechtel National Inc.), which is responsible for environmental restoration, project management, engineering and construction activities; Babcock and Wilcox Savannah River Company (parent Company: Babcock and Wilcox Government Group), which is responsible for facility decontamination and decommissioning; and the British Nuclear Fuel Limited Savannah River Corporation (parent company: British Nuclear Fuel Limited, Inc.), which is responsible for the Site's solid waste program. Wackenhut Services, Incorporated, is responsible for the Sites physical security program.

Due to past operations and disposal practices, the Savannah River Site was placed on the Comprehensive Environmental Response, Compensation, and Liability Act National Priorities List by the Environmental Protection Agency in 1989. In 1993, the Savannah River Site entered into a Federal Facility Agreement with the Environmental Protection Agency and the South Carolina Department of Health and Environmental Control to ensure that the environmental impacts associated with past and present activities at the site are thoroughly investigated and that appropriate corrective/remedial action is taken, as necessary, to protect the public health and welfare and the environment. In addition to the Federal Facility Agreement, the Savannah River Site has also entered into assessment/clean-up of several portions of the Site via Resource Conservation and Recovery Act permits as required by several settlement agreements.

Detailed Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

The Savannah River Site is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure* plan. The funds requested for FY 2000 are appropriate to perform the activities based on the use of the "Activity-Based Costing Methodology" and on an independent review of the programmatic assumptions and projected scope. All construction line-item projects were validated and many projects received an independent cost estimate review.

HQNP-SI01-LT-SR / Security Investigations

Non-Federal security investigations will be performed in accordance with DOE Order requirements.

- Funding will be used to perform new security investigations and re-investigations for non-Federal employees for the Savannah River Site.

HQNP-SI01-LT-SR	0	1,804	1,800

Metrics

SR-DO02 / WSI Landlord Project

Wackenhut Services, Incorporated-Savannah River Site is the Management and Operating contractor for security services at the Savannah River Site. The Wackenhut Services, Incorporated-Savannah River Site provides, trains, and maintains a uniformed protective force for the physical protection of the Department of Energy security interests and other related duties. Responsibilities include protection against theft of Special Nuclear Material and government property, prevention of radiological, toxicological and industrial sabotage, and protection of site employees and the public. The contractor employs armed and unarmed security personnel, supervisors, management, and other administrative and support personnel to meet the varied requirements of the contract.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Increase of protective force staffing at 100-K in support of increased material protection requirements for plutonium storage.			
■ Continue to enforce security requirements for the site as outlined in the DOE Orders, the Site Safeguards and Security Plan and as specified in the Management and Operations contract.

SR-DO03 / Savannah River Natural Resource Management and Research Institute

The Savannah River Natural Resource Management and Research Institute conducts a program of natural management and research to provide sustainable forest products within a National Environmental Research Park, enhance biological diversity, protect threatened, endangered, and sensitive species, and provide quality habitat for wildlife.

The Savannah River Institute manages the Savannah River Site secondary road system, maintains the exterior boundaries, participates in waste-site closure projects, and provides aerial photo services. Also, the Savannah River Institute provides a wildland fire program that ensures on-site initial attack capability as well as fire prevention, presuppression, and detection program. Smoke emissions are managed to reduce negative impacts to personnel and facilities. Planning, public affairs, health and safety, administration, and the Historically Black Colleges and Universities environmental field station, and a natural resources science, math, and engineering education program are integral components of the resource management activities of the Savannah River Institute.

- Manage forest and land resources on a 300 square mile site.
- Document endangered wildlife and plant life.
- Perform watershed stabilization and erosion control.
- Continue maintenance of secondary roads and bridges.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Perform biological evaluations.			
■ Perform prescribed burning.			
■ Perform research on flora and fauna.

SR-DO04 / Ecology Lab Project

The Savannah River Ecology Laboratory is a research unit of the University of Georgia operating on the Savannah River Site for over forty years. The laboratory works closely with other contractors to provide an independent academic assessment of Site clean-up and continuing operations. The Savannah River Ecology Laboratory is conducting research, which will provide the Site operational personnel with information aimed at reducing the cost of clean-up and remediation while ensuring a biodiversity to the restored environment.

In addition, the Savannah River Ecology Laboratory has provided the Department of Energy with important data relating to the regulatory requirements for endangered plants and animals. The Savannah River Ecology Laboratory has a laboratory and field-research program recognized by scientists from all over the world. The laboratory has published over 2000 articles in peer reviewed journals and has more than 25 books authored by its scientific staff.

The facilities of the Savannah River Ecology Laboratory consist of unique research labs with specialty instruments to special outdoor facilities such as greenhouses, aviaries, experimental ponds, a rhizotron, animal care facility, and a specially equipped distance learning classroom. The laboratory has a program, which reaches out to our stakeholders in the area of the Savannah River Site, and provides classroom programs and information on the benefits of the Savannah River Site as a National Research Park.

■ Conduct studies in radioecology and ecological stewardship.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue active research in environmental chemistry/hydrogeochemistry; environmental computational chemistry; phytoremidation, ecological stewardship; ecotoxicology, remediation, and risk assessment; and radioecology.

SR-DO05 / DOE External Program Support

Funding is provided to the South Carolina Department of Health and Environmental Control for oversight of the Savannah River Operations Office activities to be carried out under the Federal Facilities Agreement.

- The United States Army Corps of Engineers, the United States Forestry Service, and the United States Geological Survey will provide program support to the environmental restoration division.
- University research grants will be provided to support the environmental restoration program.
- Funding is provided under the Agreements-in-Principle for the South Carolina Department of Health and Environmental Control Emergency Preparedness/Planning, Emergency Monitoring and Oversight, and the Georgia Emergency Management Agency for oversight of emergency preparedness activities and non-regulatory environmental monitoring programs.
- The State of the South Carolina Department of Health and Environmental Control will provide oversight of cleanup activities performed under the Federal Facilities Agreement.

FY 1998	FY 1999	FY 2000

SR-DO07 / DOE Program Support

The overall purpose of this project is to enlist off-site resources to independently verify site characteristics in a global sense, and create a culture within surrounding communities, which enables the Savannah River Site continuation of environmental restoration and waste management missions, which need public trust and confidence.

Program support will be provided for payment-in-lieu-of-taxes, Historically Black Colleges and Universities, South Carolina Water Resources Commission, South Carolina Universities and Research and Education Foundation, interagency agreements, such as with the Office of Personnel and Management for investigations of the Spent Nuclear Fuel project and the Departmental initiatives.

This program also supports the operation and maintenance of a public reading room, which houses documents relative to the Savannah River Site, Defense Nuclear Facilities Safety Board and other Department of Energy sites to maintain stakeholder involvement. Funding is provided for consultants assisting the Department of Energy-Savannah River on labor law and other issues. Other activities include support for cooperative and interagency agreements providing long-term observation networks to monitor water level, flow paths, water quality, and to detect changes as ground water pumpage increases or decreases. Also, supports training and the stewardship program.

- Continuation of the National Environmental Training Organization funded by Savannah River.
- Monitor the flow of the Site's wastewater effluents and streams.
- Complete Environmental Impact Statements, as required.
- Support compliance with the Clean Water Act.
- Perform archaeological field reviews, and curation of artifacts in compliance with the Archaeological Resource Protection Act and Historic Preservation Act.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Make payment-in-lieu-of-taxes to the counties of Aiken, Allendale, and Barnwell.			
■ Limited support for the Historically Black Colleges and Universities and other grants.			
SR-DO07	5,999	10,923	7,208

Metrics

SR-ER01 / Flood Plain Swamp Project

The Flood Plain Swamp Watershed project is one of six geographical divisions of the Savannah River Site for the purpose of implementing the Federal Facility Agreement. The Flood Plain Swamp Watershed Project contains three primary areas: the D-Area, TNX Area, and the West M Area. Portions of the D Area were used from the mid-1950's through the mid-1980's for disposal of coal ash, oil, chemicals, and general debris. The TNX was also operated during the same time-frame for the purpose of conducting pilot tests to support the Savannah River Site activities and operations. Portions of the West M Area were used for disposal of waste before government control of the Site and for disposal of general debris after the Site started operations.

Remediation of the Flood Plain Swamp Watershed project will consist of the following:

- Preliminary evaluation of known suspect areas to determine if action is necessary;
- Investigation and analysis of the identified waste units and any suspect areas identified through preliminary evaluations to determine further investigation and possible required remediation;
- Implementation of remediation technologies to mitigate the impact of contaminants of concern on human health and the environment, and
- Post-action monitoring to ensure that the implemented technology was effective.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ TNX-Area Groundwater subproject: Operate two Geo Siphon Cells and begin installation of additional cells and vapor extraction units.			
■ TNX-Area Old TNX Seepage Basin subproject: Begin remedial action at this basin.			
■ D-Area Oil Seepage Basin subproject: Complete remedial action at this basin.			
■ D-Area Waste Oil Facility subproject: Continue assessment work at this facility.			
■ Flood Plain Swamp Integrator Operable Unit subproject: Complete work plan preparation for this subproject and begin field start for monitoring.			
■ Savannah River Integrator Operable Unit subproject: Continue field monitoring at this subproject.

SR-ER02 / Four Mile Branch Project

The Four Mile Branch Watershed project is one of six geographical divisions of the Savannah River Site for the purpose of implementing the Federal Facility Agreement. The Four Mile Branch Watershed project contains sites in five area: the E-Area, C-Area, N-Area, F-Area, and the H-Area. The E-Area consists of several adjacent facilities that were former or are current disposal sites for hazardous and radioactive wastes and spent solvent generated from plant processes. The C-Area consists of several facilities that were former disposal sites for hazardous and/or radioactive wastes and spent solvents generated from the operation of the C-Reactor Facilities. The N-Area consists of two burning/rubble pits that were used between 1951 and 1973 for the disposal of various waste materials including hazardous substances like organic chemicals of unknown use and origin. The F- and H-Areas consist of several former or current disposal, storage, or treatment facilities for hazardous and radioactive

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Remediation of the Four Mile Branch Watershed project will consist of the following:

- Preliminary evaluation of suspect areas to determine if action is necessary;
- Preliminary investigation and analysis of identified waste units and any suspect areas identified through preliminary evaluations to determine further investigation and possible required remediation;
- Implementation of remediation technologies to mitigate the impact of contaminants of concern on human health and the environment;
- Analysis of the impact on the watershed;
- Post-action monitoring to ensure that the implemented technology was effective.

- Burial Ground Complex subproject: Obtain final Record of Decision and continue remediation for the 76 acre Old Radioactive Waste Burial Ground including grouting of 22 underground solvent tanks.
- Mixed Waste Management Facility Ground water subproject: Begin design phase of the ground water remediation system. Begin interim action for this subproject.
- F and H-Area Seepage Basin Ground water subproject: Operate two major water treatment units to remove radioactive and hazardous contaminants and establish hydraulic control of tritium contamination.
- H Retention Basin subproject: Complete remedial design for this basin.
- C Reactor Seepage Basin subproject: Complete assessment and begin remedial design at this basin.
- C Reactor Ground water subproject: Continue assessment work at this Subproject.
- Road A Chemical Basin subproject: Continue assessment work at this basin.
- F and H Inactive Sewer Line subproject: Continue remedial action at this basin.
- F Retention Basin subproject: Continue remedial action at this basin.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ C-Area Hazardous Material Unit subproject: Complete remedial action at this unit.			
■ Central Shops Hazardous Material Unit subproject: Begin well monitoring at this subproject.			
■ Four Mile Branch Integrator Operable Unit subproject. Continue monitoring actions at this subproject.

SR-ER03 / Lower Three Runs and Operations Project

The Lower Three Runs and Operations project is one of six geographical divisions of the Savannah River Site for the purposes of implementing the Federal Facility Agreements. The Lower Three Runs and Operations project comprises two areas: R-Area and P-Area and Bingham Pump Outage Pits in R-, L-, P-, and K-Reactor Areas. Past disposal practices associated with historical reactor operations have produced waste units within the K-, P-, and R-Reactor Areas. Monitoring well data collected from the P- and R-Reactor Areas indicates the ground water is contaminated with tritium, chlorinated volatile organic, other radionuclides, heavy metals, and sulfate.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Remediation of the Lower Three Runs Watershed project in accordance with Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation, and Liability Act will decrease human and environmental risks to acceptable levels. The Lower Three Runs Watershed project will require remediation of primary source material, affected soils, affected surface water pathways, and affected ground water. Remediation of the Lower Three Runs Watershed project will consist of preliminary evaluation of suspect areas to determine if action is necessary, preliminary investigation and analysis of identified waste units and any suspect areas identified through preliminary evaluations to determine further investigation and possible required remediation, implementation of remediation technologies to mitigate the impact of contaminants of concern on human health and the environment, analysis of the impact on the watershed, post-action monitoring to ensure that the implemented technology was effective.			
■ R-Reactor Seepage Basin subproject: Complete the Record of Decision for this subproject.			
■ P-Reactor Seepage Basin subproject: Complete workplan for this subproject.			
■ P-Reactor Groundwater subproject: Begin workplan development for this subproject.			
■ R-Area Hazardous Material Unit 131-R/1R subproject: Complete workplan for this subproject.			
■ Bingham Pump Hazardous Material Unit subproject: Continue remedial action at this subproject.			
■ Continue Assessment and Remediation Work at the following Operations subprojects: R-Area Acid/Caustic Basins, Gunsite 218, Par Pond Sludge Application Site, Lower Three Runs Ash Basin, Lower Three Runs Integrator Operable Unit, Post Closure Monitoring and Maintenance, Vegetation Removal, Engineering Technical Initiatives, Waste Operations, Watershed Assessment, Waste Certification/Coordination, Technology Demonstration, Facility Support - Operations, Investigation Derived Waste, Site Evaluations, Well Sampling and Analysis.

Remediation of the Upper Three Runs Watershed project will consist of preliminary evaluation of suspect areas to determine if action is necessary, preliminary investigation and analysis of identified waste units and any suspect areas identified through preliminary evaluations to determine further investigation and possible required remediation, implementation of remediation technologies to mitigate the impact of contaminants of concern on human health and the environment, analysis of the impact on the watershed, and post-action monitoring to ensure that the implemented technology was effective.

Remediation of the Upper Three Runs Watershed project will consist of the following:

- Preliminary evaluation of suspect areas to determine if action is necessary;
- Investigation and analysis of the identified waste units and any suspect areas identified through preliminary evaluations to determine further investigation and possible required remediation; and,
- Implementation of remediation technologies to mitigate the impact of contaminants of concern on human health and the environment, and post-action monitoring to ensure that the implemented technology was effective.

- Old F-Area Seepage Basin subproject: Continue post closure well monitoring at this subproject.
- Savannah River Laboratory Seepage Basin subproject: Complete assessment work on this subproject
- A/M-Area Ground water subproject: Complete ground water remediation operations and continue well monitoring at this subproject.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Continue Ground Water and Vadose Zone Remediation Operations at the following subprojects: Savannah River Laboratory, Southern Sector, Vadose Zone, Purge Water Disposal, M-1 Air Stripper, Western Sector, Met Laboratory.			
■ A-Area Hazardous Material Unit subprojects: Complete assessment and Record of Decision, complete remedial action, and continue well monitoring.			
■ Miscellaneous Chemical Basin/Metal Hazardous Material Unit subproject: Continue remedial action at this subproject.			
■ Non Radioactive Waste Disposal Facility Ground Water subproject: Continue ground water remediation operations and employ bioremediation technology at this subproject.

SR-ER07 / Program Management

The purpose of the Environmental Restoration Program Management project is to provide oversight of the operational project watersheds and provide programmatic development. The program is also responsible to ensure that the environment, human health and safety are protected by meeting the prescribed standards derived from Federal, state, and local requirements, and internal Department of Energy requirements. Programmatic support is essential to the Savannah River Site's environmental restoration program.

The following global support activities are found in this project: Safety and Health, Environmental Compliance, Program Analysis and Controls, Estimating Support, and Environmental Restoration quality assurance. Planning support and oversight is also provided to the program globally, thus providing the means to monitor and measure the total Savannah River Site's environmental restoration program performance.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Programmatic development is the crosscutting, strategic, and programmatic initiatives that support the Environmental Restoration Division. The objectives are to lead strategic planning and integration, serve as liaison to the Department of Energy for communication, coordinate external visibility, develop performance measures, and manage program improvements.			
■ Environmental restoration program management will be performed as detailed in the following subprojects: Safety and Health Programs, Program Analysis and Controls, Communications Program, Environmental Compliance support, Environmental Management Information System, Quality Assurance, Cost Estimating support.			
SR-ER07	23,845	11,500	13,470

Metrics
No quantifiable corporate performance measures are associated with this project.

SR-FA02 / F-Canyon Deactivation Project

The F-Canyon deactivation project provides a methodology whereby a facility interim end state is reached ensuring the safety of the worker, public, and environment while effectively reaching the costs associated with the surveillance and maintenance of the surplus facilities while preparing the facility for turnover for eventual disposition.			
■ Continuation of deactivation project planning.			
SR-FA02	0	522	537

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
SR-FA16 / F-Area Monitoring			
The F-Area Monitoring project supports maintaining facilities that have been deactivated in a cost-effective minimum surveillance and maintenance state pending decisions and implementation of final decontamination and decommissioning. Since stabilization processing activities will be continuing in the F-Area facilities through 2002, the F-Canyon, FB-Line, and 235-F facilities will not have achieved a deactivated state.			
The former Naval Fuels Facility, Building 247-F, and associated support facilities, is the only facility that has, and is projected, to undergo deactivation prior to the F-Canyon/FB-Line mission completion. The deactivated state allows minimum surveillance and maintenance actions to be implemented to maintain safety, health, and environmental requirements. Deactivated facilities are monitored and inspected quarterly to ensure safe conditions are maintained.			
■ Continue to maintain 247-F in long-term monitoring.			
■ Complete the Transition Report.			
■ Develop the F-Canyon and 235-F surveillance and maintenance plans for post operational conditions.			
SR-FA16	1,545	738	444

Metrics

This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

SR-FA17 / H-Area Monitoring and Minor Facility Monitoring

This project covers pre-deactivation, deactivation, and post-deactivation surveillance and maintenance in the H-Area and other minor facilities. The H-Area facilities were originally built to provide chemical separations capabilities of nuclear targets and fuels, transformation of plutonium and neptunium solutions to oxide, and the storage of enriched uranium solutions for recovery.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The purpose of the H-Area Monitoring project is to capture the scope and costs for surveillance and maintenance of the facilities that either: 1) are awaiting deactivation, or 2) have been deactivated and are now awaiting a decision on the final disposition.			
■ Only surveillance and maintenance for the reactor heat exchanger repair shop will be funded. Exact scope of the surveillance and maintenance will depend on facility walkdowns and preliminary characterizations undertaken in FY 1998. The current mission for the H-Area will continue. Current funding guidance indicates that deactivation planning and execution activities will begin after FY 2006.			
SR-FA17	0	2,764	4,713

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

SR-FA18 / M-Area Monitoring Project

This project covers operation of the Vendor Treatment Facility through FY 1999, as well as surveillance and maintenance during pre-deactivation, deactivation, and post-deactivation periods in the M-Area. Post-deactivation surveillance and maintenance activities will commence by FY 2012.

- Initial deactivation of the Liquid Effluent Treatment Facility and the process sewer system in accordance with the South Carolina Department of Health and Environmental Control permits will begin in FY 2000. In addition, the Site is contractually responsible for deactivation of the Vendor Treatment Facility and clean closure of tanks. Development of transition documentation and an M-Area interim surveillance and maintenance plan will be completed.

SR-FA19 / D-Area Monitoring Project

This project covers surveillance and maintenance activities for surplus facilities in D-Area.

- Monitoring of the excess heavy water production facilities will take place.

SR-FA19	0	0	1,261

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

SR-FA20 / Reactors Monitoring Project

The P-, C-, and R-Reactors were formerly used to irradiate target materials for tritium and plutonium production. Each building is composed of five areas: the Disassembly Basin, Purification Area, Assembly Area, Moderator Storage Area, and the Process Room (reactor tank). Operations for all reactors have ceased and each was placed in a cold shutdown mode with no provision for restart. The C-Reactor assembly area is being utilized as a decontamination center for the site. Funding for operation of the Site Decontamination Center and C-Area administrative facilities is included in this project.

During the transition of these facilities from operational status through deactivation to interim long-term monitoring, there is a need to maintain an appropriate level of surveillance and maintenance.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Each reactor's disassembly basin contains contaminated light water, scrap materials, and sludge. Other major hazards associated with the reactor result from continued storage of contaminated heavy water (in the P- and C-Reactor -40 level storage tanks), and presence of fission byproducts and contamination agrees found in a few locations in the buildings. Hazardous materials associated with the building include potential PCB contamination in cables and transformers, and asbestos in flooring, wall panels, insulation and gasket materials. In addition, the P- and C-Area powerhouses are in a relatively advanced state of decay. Some of the problems associated with the latter facilities include friable asbestos, deteriorating piping, ductwork, walkways, and roof.			
■ Perform critical surveillance and maintenance activities.			
■ Preliminary deactivation project planning will be initiated. Current funding guidance indicates that deactivation planning and execution activities will begin after FY 2006 to meet the Resource Conservation and Recovery Act and DOE Orders on waste minimization. The C-Area Decon Facility will be operational in FY 2000. Funding at this level provides continued funding for a limited deactivation project for the P, C, and R disassembly basin and replacement of the 707-C administrative building roof system.

FY 1998	FY 1999	FY 2000

SR-HL01 / H-Tank Farm

The purpose of the H-Tank Farm facility is to safely store and manage an inventory of 19,400,000 gallons (310,000,000 curies) of liquid high-level radioactive waste in 23 underground storage tanks. This waste has accumulated from past nuclear material production operations at the Savannah River Site. The main long-lived radioactive constituents of this waste are Strontium-90, Cesium-137, Plutonium-238, Plutonium-239, and Plutonium-241. The tanks were built underground to provide shielding from the intense radiation fields of highly radioactive waste. These tanks provide interim storage.

To accomplish its safe storage and waste management mission, the H-Tank Farm utilizes 24-hour surveillance, monitoring inspection sampling and maintenance of 23 underground high-level radioactive waste storage tanks (tank volumes range between 750,000 gal and 1,300,000 gal each) with the following major systems: Liquid Level Monitoring; Leak Detection; Ventilation and Explosive Gas Monitoring; Temperature Monitoring and Cooling Systems; Remote Inspection of the Tanks and Tank Annuli; 24-hour manning of three control rooms; Operations of 2H evaporator system and operation of the Replacement High-Level Waste Evaporator, (which will be operational in FY 1999); which together will provide an average of 2,800,000 gallons of tank volume "space gain" per year; Waste Transfers (between tanks as well as from H-Canyon, and the Defense Waste Processing Facility to/from F-Tank Farm, and to the Extended Sludge Processing; includes transfer line integrity testing); Area Radiation and Storm Water Monitoring; Critical Maintenance Activities (predictive, preventive, and corrective maintenance, equipment troubleshooting, rigging and heavy equipment support, excavations, and facility outage scheduling); and 299-H Maintenance Facility Operation (which has shielded maintenance cells for repairs to highly contaminated equipment).

- Continue radioactive operation of the Replacement High-Level Waste Evaporator Facility.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Perform an estimated 3 inter-area line transfers, 250 canyon receipts, 25 Receiving Basin for Offsite Fuel receipts, and 250 Defense Waste Processing Facility receipts, as well as frequent tank-to-tank transfers within the H-Tank Farm.			
■ Receive an estimated 290,000 gallons of high-level liquid waste from the H-Canyon.			
■ Receive an estimated 2,000,000 gallons of recycle water from the Defense Waste Processing Facility.			
■ Receive an estimated 700,000 gallons of wash water from extended sludge processing.			
■ Evaporate an estimated 1,300,000 gallons of liquid at the 2H evaporator.			
■ Evaporate an estimated 1,500,000 gallons of liquid at the replacement high-level waste evaporator.			
■ Receive an estimated 120,000 gallons of low-level liquid waste from Receiving Basin for Offsite Fuels.			
■ Support the closure of Tank 16.			
■ These funding levels include line-item construction funding of $4,622,000 in FY 1998 for project 89-D-174, Replacement High-Level Waste Evaporator.

SR-HL03 / Waste Removal Operations and Tank Closure

This project includes four specific areas of scope related to waste removal from high-level waste tanks and facilities, as well as closure of high-level waste tanks and facilities. Scope areas are: 1) waste removal operations including removing the high-level waste from the waste tanks and water washing the tanks; 2) demonstrating alternative waste removal technologies that are potentially more cost effective than the baseline technologies; and 3) closing each individual tank or facility after waste removal and water washing are complete.

Specific scope is as follows: Waste Removal Operations - Tanks 1-15, 17-39, and 43-47 contain either salt or sludge or, in some cases both. The waste will be removed from each tank by operating slurry pumps and transfers jets, which are being retrofitted on each tank (3 slurry pumps and 1 transfer jet for each salt tank; 4 slurry pumps and 1 transfer pump for each sludge tank). The waste removal activities include adding large amounts of corrosion inhibited water to a tank; operating the slurry pumps to suspend sludge or dissolve salt; transferring the waste out by transfer jet; and then lowering the slurry pumps and repeating the process until the tank is empty. The interior of the tank is then water washed by operating a large 10,000 gallon heated water system connected to rotary spray jets. For those tanks with contaminated annuli, a similar process will be employed for annulus washing. Process samples, waste volume measurements and tank inspections are conducted throughout the waste removal process. Similar activities will take place in process facilities such as evaporator cells and diversion boxes.

Waste Removal Demonstrations - Three new salt removal technologies will be demonstrated individually and in combination. modified density gradient, water jetting and a single slurry pump. Funding is also allocated from sludge/zeolite heel demonstrations in Tanks 18 and 19. The heel removal technologies to be demonstrated are in the process of being defined

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Tank/Facility Closure - After waste removal and water washing, each tank or facility (i.e. evaporator) will be closed. Samples will be taken of the residual waste; a performance evaluation and tank-specific closure module will be developed; and regulatory approval to proceed will be obtained. The tank or facility will then be physically isolated from other tanks/facilities. Each tank will be filled with three different types of grout in distinct layers such that the bottom layer of "reducing grout" will chemically bind residual waste; the middle layer of "controlled low strength grout" will prevent subsidence; and the top layer of "strong grout" will prevent intrusion. All piping and electrical connections will be cut, capped, and sealed to isolate each tank. All openings into each tank will be sealed with "strong grout". Each tank will be left in a low surveillance/maintenance condition.			
■ Waste Removal Operations - complete washing of Tank 8 sludge and transfer to Tank 40.			
■ Support completion of the H-Tank Farm electrical and instrument upgrades.			
■ Support installation of Tank 7 slurry pumps.			
■ Support construction of Tank 11 waste removal facilities.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

SR-HL04 / ITP/ESP/LW Operations

This project provides funding for the pre-treatment of liquid high-level radioactive waste to enable final processing at the Defense Waste Processing Facility into a safe stable form for long-term storage/disposal. This waste (33,800,000 gallons, 480,000,000 curies) has accumulated from past nuclear material production operations at the Savannah River Site. The main long-lived radioactive constituents of this waste are Sr-90, Cs-137, Pu-238, Pu-239, and Pu-241. Extended Sludge Processing pre-treats the sludge portion of tank waste to be processed at Defense Waste Processing Facility into vitrified glass by reducing the aluminum and soluble salt content through an aluminum dissolution step and multiple washing cycles. These facilities are operated remotely to protect personnel from the intense radiation fields from this highly radioactive waste. The In-Tank Precipitation and Late Wash Facilities were expected to pre-treat the salt portion of the high-level waste. Due to technical issues concerning the generation of larger than anticipated amounts of benzene all activities have been suspended. A salt processing systems engineering evaluation is in progress. All known salt processing options will be evaluated against the high-level waste system requirements and the best option will be selected in FY 2000. All monitoring and surveillance activities to maintain the In-Tank Precipitation tanks and facilities in a safe configuration will continue. All activities in support of the High-Level Waste Salt Alternative are funded in SR-HL13, Salt Disposition.

Scope includes: 24 hour surveillance, monitoring, inspection, sampling and maintenance of six 1,300,000 gallon high-level waste tanks with the following systems: Liquid Level Monitoring and Leak Detection; Ventilation and Explosive Gas Monitoring; Temperature Monitoring and Cooling Systems; Remote Inspection of the Tanks and Tank Annuli; 24-hour Manning of the In-Tank Precipitation Control Room; Chemical Addition; Sludge Washing (with 2-3,000,000 gallons of water per year to dissolve the aluminum present in the sludge); Waste Transfers (between tanks as well as to/from H-Tank Farm, and to Defense Waste Processing Facility; includes transfer line integrity testing); Critical Maintenance Activities (predictive, preventive, and

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Extended Sludge Processing			
■ Start and complete washing the sludge in Tank 40.			
■ Continue to feed Defense Waste Processing Facility from Tank 51 to produce 100 cans			
In-Tank Precipitation			
■ Maintain ventilation and explosive gas monitoring.			
■ Maintain liquid level monitoring and leak detection.			
■ Perform surveillance and maintenance activities as necessary to keep the facility in a safe configuration.			
Late Wash			
■ Perform surveillance and maintenance activities as necessary to keep the facility in a safe configuration.			
■ Major activities are dependent on the results of the salt processing systems engineering evaluation.			
SR-HL04	75,233	48,374	58,446

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

SR-HL05 / Vitrification

The Defense Waste Processing Facility project provides treatment to immobilize the Savannah River Site's liquid high-level radioactive waste in a solid glass waste form, which prevents the waste from leaching to the environment. Approximately 33,800,000 gallons of liquid, high-level radioactive waste are currently stored in 43 underground storage tanks in the F-Tank Farm and the H-Tank Farm. These tanks were designed for interim storage only, and many have already exceeded their intended design life. Most waste operations are conducted remotely, to shield workers from exposure to the intense radiation from Strontium-90, Cesium-137, Plutonium-238, Plutonium-239, Plutonium-241, and other radionuclides in the waste.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The scope within the project includes 24-hour operation of the Defense Waste Processing Facility Vitrification Plant to immobilize high-level radioactive waste in glass including: 24-hour manning of the Defense Waste Processing Facility Control Room; receiving transfers of sludge waste from extended sludge processing; sending transfers of recycle waste to the H-Tank Farm; adjusting and preparing feed for the glass melter; melting the waste into molten glass; pouring the molten glass into stainless steel canisters; inserting and welding canister plugs; decontamination canisters; transporting canisters to the Glass Waste Storage Building; critical maintenance activities (predictive, preventive, and corrective maintenance, equipment troubleshooting, rigging and heavy equipment support, excavations, and facility outage scheduling); and sample analyses to confirm waste glass quality meets Federal Repository requirements.			
■ The Defense Waste Processing Facility will produce 100 canisters of sludge-only waste glass.

Metrics			
High-Level Waste			
Storage (m^3)	320.0	452.0	519.0

SR-HL07 / Effluent Treatment Facility

This project includes all Effluent Treatment Facility activities required to remove the hazardous and low-level radioactive contaminants from the low-level wastewater generated in the F and H Separations and the Tank Farm Areas. This wastewater is processed at the Effluent Treatment Facility until it meets the National Pollutants Discharge Elimination System standards and subsequently released to a permitted outfall. Operation of the Effluent Treatment Facility directly support F- and H-Tank Farms, as well as the Savannah River Site high-level waste vitrification process. It is also required to support F- and H-Area Nuclear Materials Stabilization activities (Projects SR-NM01 and SR-NM02) to meet the Defense Nuclear Facilities Safety Board Recommendation 94-1 commitments.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The Effluent Treatment Facility is operated under a South Carolina Department of Health and Environmental Control Waste Water Permit and is required for the Site to meet regulatory requirements for discharge to an outfall. Activities include surveillance and maintenance of a vast wastewater collection system including two 32,000 gallon pumping stations, two 2,000,000 gallon high activity plastic-lined cooling water basins, two 6,000,000 gallon rubber-lined low activity retention basins, and two 450,000 gallon collection tanks. Also included is the operation of a large wastewater treatment plant that includes pH adjustment, micro filtration, ion exchange, organic removal, mercury removal, evaporation and sampling and release of 18,000,000 gallons of treated water per year. The two 2,000,000 gallon basins are reserved to contain a postulated canyon cooling water accident.			
■ Process wastewater as required to support canyon and tank farm operations.			
■ F/H Cooling Water Basins will be relined/repaired to address leak detection upgrades.			
■ Complete Digital Control System upgrades for Effluent Treatment Facility operations.			
■ Return Treated Water Tank #1 to service.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
SR-HL08 / Saltstone			
The Saltstone Facility is designed to receive, treat, and dispose of the mixed low-level radioactive liquid salt solution resulting from the In-Tank Precipitation process. Currently, due to technical issues concerning the generation of larger than anticipated amounts of benzene at the In-Tank Precipitation, all activities for that process have been suspended. A salt processing system engineering evaluation is in progress. All known salt processing options will be evaluated against the high-level waste system requirements and the best option will be selected in FY 2000. All monitoring, surveillance and maintenance activities to maintain the saltstone facility in a standby mode will continue until the salt alternative is selected.			
Critical maintenance activities include: predictive, preventive, and corrective maintenance, equipment troubleshooting, excavations and grounds maintenance, administration of the paving and heating, ventilation, air conditioning subcontracts, preparation of purchase requisitions and ordering and staging parts and materials; preparation of spare parts data sheets, and facility outage scheduling.			
■ Perform surveillance and maintenance activities, as necessary, to keep the facility in a safe configuration.

SR-HL12 / High-Level Waste Removal

This project is twofold: 1) to perform the capital improvements necessary to enable the high-level waste system to maximize canister production given the current scientific understanding to process chemistry; and 2) to ensure a continuous supply of pre-treated sludge and salt precipitate feed to Defense Waste Processing Facility. The project will enable the Defense Waste Processing Facility to process sludge feed and upon selection of a salt pre-treatment alternative, to process salt precipitate feed, provide facility modifications to replace aging service piping and other service utilities on the H-Tank Farm East Hill (this area includes Tanks 38-43, 49-51, Extended Sludge Processing, and the 2H Evaporator) and waste removal equipment for all high-level waste tanks.

The operation required to remove waste from high-level waste tanks and to close those tanks are funded by Project Baseline Summary SR-HL03, Waste Removal Operations and Tank Closure.

- Waste Removal
  - Complete construction bid package, award contract and initiate construction on Tank 7.
  - Complete construction and initiate run in and installation of slurry pumps for Tank 11.
- These funding levels include line-item construction funding of $18,220,00 in FY 1998; $15,214,000 in FY 1999; and $8,987,000 in FY 2000 for project 93-D-187, High-Level Waste Removal from Filled Waste Tanks.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

SR-HL13 / Salt Disposition

The purpose of this activity is to select, design, construct, and startup the necessary facilities to prepare and treat the salt waste material for processing in the Defense Waste Processing Facility. The failure of the In-Tank Processing Facility identified in January 1998 due to very high levels of benzene production necessitated this major change. A systems engineering team was formed to study all possible alternatives. This resulted in a recommendation to pursue three options with a final selection of a process in late FY 2000. The three options are: Direct Grout, Ion Exchange, and Small Tank In-Tank Processing.

A supplemental Environmental Impact statement will be prepared based on these three options (plus a no action alternative) with a preferred alternative to be selected in late FY 1999. A Record of Decision is planned for late FY 2000.

In conjunction with the National Environmental Policy Act substantial research and development activities, including design and construction of pilot/prototype facilities, will be under taken to demonstrate the ability of these options to meet safety, production, and cost goals. After selection of a preferred alternative additional confirmatory research and development and conceptual design work will take place. Final design and construction will be accomplished and facility startup initiated.

- Complete supplemental Environmental Impact Statement and issue Record of Decision.
- Continue research and development activities in hot cell.
- Continue conceptual design activities.
- Complete and operate pilot/prototype facilities.

SR-IN11 / Infrastructure Line-Item			
This activity encompasses up-front planning, design, and budget determinations and documentation required to support future infrastructure capital projects and the operating cost funded support needed to execute authorized capital projects.			
This project serves a dual function:			
▸ It is used to plan, budget, and fund line-item preconceptual and conceptual design activities. These activities are typically started at least three years in advance of actual start of a construction line-item project.			
▸ It is used as a collection point to reflect outyear costs projected in planning space for line-items that are at least one year past the budget year. For example, in this budget submission, the Total Project Costs for construction line-item projects projected to start in FY 2000 and beyond are collected in this Project Baseline Summary for planning purposes.			
Any projects planned for development have been given a preliminary evaluation against Environmental Management risk criteria and are considered to have a strong probability of being supported for further development and/or funded for execution as a critical site need.			
■ Complete up-front planning for the Savannah River Technology Center ventilation upgrade project.

SR-IN12 / Operating Projects

Responsibility for these functions are associated with the general concept of "Landlord" functions and are necessary for the general operation of the Site, as well as for the care of the Site's shared infrastructure components such as bridges, roads, and support activities that have been centralized for cost effectiveness. This activity encompasses infrastructure support for the Department of Energy, United States Forestry Service, Savannah River Ecological Laboratory, and Wackenhut Services, Inc. Services provided are in the nature of landlord support and are directly necessary for the safe and effective operation of these organizations and for the performance of their activities.

Operational activities include all site baseline activities necessary to operate the Site Infrastructure program including the following:

- Reimbursed work for United States Forestry Service in support of the Savannah River land management.
- Capital equipment projects for the purchase and installation of new equipment or upgrades to replace obsolete equipment to support Priority I: safe storage of nuclear materials; regulatory requirements and commitments, and Priority 2: support of mission critical operations.
- General Plant Projects for the design (excluding conceptual), construction, installation or other acquisition of land, property right, buildings, structures, utility lines, roads or facilities necessary to reduce or eliminate health, fire, safety, and security problems in support of general site infrastructure and the overall Site mission consistent with the Department of Energy requirements.

- Requested infrastructure support for the Department of Energy's direct Savannah River Site activities. Such support includes telephone systems, computer support, and access to the site network, site radios, transportation, waste hauling, janitorial services, support for the Department of Energy procurements, printing and document reproduction services.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Capital Equipment and General Plant Projects designated as necessary for safe storage of nuclear radioactive materials and those that are regulatory required that have been postponed from FY 1999 and earlier will be initiated and/or completed.			
■ Capital Equipment and General Plant Projects designated as "Infrastructure Core" activities that have been deferred from FY 1999 and earlier will be initiated and/or completed.			
■ Capital Equipment Projects to be funded include: replace In-Cell Crane, 773-A IH/Radcon protable monitoring equipment, replace HVAC Units in 710-17N, replace obsolete TLD System, replace environmental lab equipment, ALD core analytical instrument replacement, and replace Isokinetic System Gas Chromatographs.			
■ General Plant Projects to be funded include: F-Area Retention Basin, A-01 Outfall Constructed Wetlands, Mini-Melter, 786-A, replace culvert at Central Shop, Replacement of B-Wing hood exhaust, 773-A, replace six obsolete distribution panels, 772-F, and replace B-Area well hunter.

SR-SF01-LT / K-Reactor Spent Nuclear Fuel Project (Post 2006)

The K-Reactor Spent Nuclear Fuel project provides basin storage of the Savannah River Site spent nuclear fuel awaiting stabilization, as well as storage for heavy water and nuclear materials awaiting disposition. The K-Area also serves as an administrative and operational support location for all spent nuclear fuel storage activities.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
A mission for interim storage of special nuclear material from the Department of Energy Rocky Flats Field Office has been added to the scope of the K-Reactor project With addition of this mission, the K-Reactor area will not be available for deactivation in FY 2002 as previously planned: Storage of Rocky Flats special nuclear material is scheduled to continue until FY 2012. This change in mission requires this project baseline summary to be moved from the Site/Project Completion account to the Post 2006 Completion account in FY 2000. The FY 1998 and FY 1999 associated funding levels are $29,393,000 and $25,845,000, respectively.			
■ Continue surveillance and maintenance, basin operations, and heavy water and highly enriched uranium surveillance.			
■ Disposition of tritium material located in K-Basin is expected.			
■ Maintain High Activity Moderator in standby, operated as necessary until completion of the heavy water program.			
■ Begin receipt of plutonium metal from Rocky Flats.

SR-SF02 / L-Reactor Spent Nuclear Fuel Project

The purpose of the L-Reactor Spent Nuclear Fuel project is to control the water quality where fuel rods are stored and to carry out all activities that apply to fuel handling, storage, and shipping to other facilities. The L-Area contains the 105-L Reactor Building (1,000,000 square feet) along with support facilities. Inside the 105-L Reactor Building is the disassembly basin, which stores the Savannah River spent nuclear fuel and will be used to store spent nuclear fuel from off-site research reactors The L-Reactor disassembly area includes equipment to control basin water quality for the storage of spent nuclear fuel. The basin walls are below ground and are thick steel-reinforced concrete. The basin contains approximately 3,500,000 gallons of water and varies in depth from 17 to 30 feet.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue safe storage of Foreign Research Reactors/Domestic Research Reactor fuel. Continue facility surveillance and maintenance activities.			
■ Commence the deinventory of the Savannah River reactor spent nuclear fuel (ship Mark 16 and 22 fuel to H-Canyon) as mandated in the Defense Nuclear Facilities Safety Board Recommendation 94-1.			
■ Continue storage of heavy water inventory until disposition is determined.			
■ Projected receipts for Receiving Basin for Off-site Fuels and L-Basin combined:			
▸ 40 casks of foreign research reactor fuel;			
▸ 13 casks of domestic research reactor/Department of Energy fuel;			
▸ 12 casks high flux induction reactor fuel, for a total of 65 casks; and			
■ Projected receipts are for planning purposes only. These projections change due to numerous conditions beyond the control of the Department of Energy or the management and operating contractor.			
■ In addition to this funding, the Department's Cost of Work for Others Program will include $11,478,000 in FY 1998; $12,500,000 in FY 1999; and $9,700,000 in FY 2000 of equal budget authority to support receipts for the foreign research reactor receipt program implementation at both the L-Reactor and the Receiving Basin for Offsite Fuels.

FY 1998	FY 1999	FY 2000

SR-SF03 / RBOF Spent Nuclear Fuel Project

The Receiving Basin for Offsite Fuel spent nuclear fuel project includes: basin operations in Receiving Basin for Offsite Fuel to control the water quality where fuel rods are stored, reactor deionizer regeneration, administrative programs like SIRIM 9B reporting requirements, and all activities that apply to fuel receipt, handling, storage, and shipping to other facilities.

The fuel rods have been irradiated and are being stored until a final disposition is approved. There are certain casks that Receiving Basin for Offsite Fuel can handle directly that L-Basin cannot, such as the TN7. A minimal number of on-site shipments from Receiving Basin for Offsite Fuel to L-Basin are needed to conserve Receiving Basin for Offsite Fuel space reserved for those fuels and casks that can only be handled in Receiving Basin for Offsite Fuel. Spent nuclear fuel will begin to be transferred to the Transfer Treatment and Storage Facility for interim storage in FY 2005 assuming that the facility is available for receipts at that time The Receiving Basin for Offsite Fuel and L-Basin will be capable of handling combined receipts of foreign and domestic reactor spent nuclear fuel at an average of up to seven casks per month between FY 1998 and FY 2005.

- Continue surveillance and maintenance and basin management activities to maintain water quality enabling the safe receipt and storage of spent nuclear fuel and ensuring that the facility continues to pose acceptable risk to the environment, site workers, and the general public. The facility will continue to be maintained in accordance with the safety basis requirements with cost effective management, planning, and oversight.
- Projected receipts of offsite fuel (Receiving Basin for Offsite Fuel and L-Basin combined) for FY 2000 will be:
  - 40 casks of Foreign Research Reactor fuel;
  - 13 casks of Domestic Research Reactor/Department of Energy fuel; and,
  - 12 casks high flux induction reactor DOE Oak Ridge fuel, for a total of 65 casks.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Projected receipts are for planning purposes only. These projections change due to numerous conditions beyond the control of the Department of Energy or the management and operations contractor. Pending the National Environmental Protection Agency determination, it is assumed that the Savannah River Site Spent Nuclear Fuel Environmental Impact Statement Record of Decision will direct Receiving Basin for Offsite Fuel to deinventory "problematic" fuel as defined in the Research Reactor Task Team Report to F- or H-canyon for processing starting in FY 1999/2000. This consists of metallic uranium fuels (EBRII/SRE), oxide target materials, and failed and sectioned fuels (listed in table 5.2-1 of the RRTTR). The Receiving Basin for Offsite Fuel refurbishment capital equipment/general plant project will commence upgrades to the facility and its system. Specific accomplishments will include reactor and Receiving Basin for Offsite Fuel deionizer regeneration.			
■ Some spent nuclear fuel can be moved from Receiving Basin for Offsite Fuels to the L-Reactor basin to optimize Receiving Basin for Offsite Fuels and L-Basin space to support future spent nuclear fuel receipts. One shift of operators will be eliminated at the Receiving Basin for Offsite Fuels based on a transfer of fuel receipts to the L-Reactor.

SR-SF04-LT / Heavy Water D-Area (Post 2006)

The Heavy Water Processing project provides for the consolidated storage of heavy water into the K-Reactor. The K-Reactor was previously modified to provide storage of 3,000 drums of heavy water.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The Heavy Water Processing project was included in the Site/Project Completion account with the cost of operations offset by heavy water sales revenue. Previously, heavy water rework and Dupont water operations in D-Area were scheduled to cease by December 2000. Recent events surrounding the sale of heavy water currently places the Heavy Water program into the Post 2006 Completion account in FY 2000.			
■ Continue heavy water re-work operations through December 2000 and Dupont Water through June 2000 to process identifiable inventory.			
■ Operate Moderate Purification Facility and Technical Purification Facility as required according to the Moderator Management Plan for inventory processing.			
■ The above activities will be modified if a contract to sell the heavy water is promulgated in FY 1999.			
■ Finalization of planning for FY 2001 deinventory and demobilization of D Area, including plans for such items as construction drying of towers, Technical Purification Facility/Moderator Purification Facility lay up, line drying and heavy water shipping.

FY 1998	FY 1999	FY 2000

SR-SF09 / Spent Nuclear Fuel Treatment and Storage

The Department of Energy has responsibility for receipt and storage of a substantial quantity of aluminum-based research reactor spent nuclear fuel at the Savannah River Site over the next 40 years. Based upon the 1996 Research Reactor Spent Nuclear Fuel Task Team Report recommendation and the Foreign Research Reactor Environmental Impact Statement Record of Decision, new services will be required for receipt, characterization, conditioning, packaging and dry storage of spent nuclear fuel pending ultimate disposal. To implement the preferred alternative in the Savannah River Site Spent Nuclear Fuel Management Environmental Impact Statement (Melt and Dilute Process), the Department of Energy would construct a melt and dilute facility in the existing 105-L Reactor Building at the Savannah River Site and would build a dry-storage facility in L-Area near the 105-L Reactor Building. The proposed Treatment and Storage Facility will include remote handling and heavy lifting (cask handling) capability, hot cells, and retrievable dry storage space for spent nuclear fuel assemblies. The mission of the Treatment and Storage Facility will be to prepare the spent nuclear fuel for interim dry storage in a "road-ready" form for shipping to and ultimate disposal in a Nuclear Regulatory Commission licensed geologic repository.

Significant development work and independent reviews have been conducted over the past three years to better define and understand the proposed project. For example, technology development is nearing completion having been validated through bench scale and small testing using surrogate materials. The concept has also been validated by third party small scale testing (Argonne National Laboratory) using irradiated samples. Through a Memorandum of Understanding with the Savannah River Site, the Nuclear Regulatory Commission is conducting an on-going review of the research and development results to ensure that any technical issues are identified and addressed early in the process. In a June 1998 letter report, the Nuclear Regulatory Commission concluded that melt and dilute would be an acceptable concept for geologic disposal of aluminum-based spent nuclear fuel. As final proof-of-concept, Savannah River is

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The Spent Nuclear Fuel Treatment and Storage Facility is to provide for the receipt and storage of approximately 30,000 domestic and foreign research reactor spent nuclear fuel assemblies currently in existing wet storage basins or expected to be received at the Savannah River Site over the next 40 years.			
■ A design-only line-item construction project to develop detailed design for the Spent Nuclear Fuel Treatment and Storage Facility will be initiated. The facility would be built under a subsequent line-item in FY 2003. Preliminary and final design (Title I and Title II) of the project will be initiated, including vendor supplied engineered equipment design technology. The design process will be accomplished in two parts: non-process related (interim dry storage modules and support utilities) which will begin in early FY 2000, and melt and dilute process design integration into the 105-L facility - which will begin later in the fiscal year with input from the L-Area pilot demonstration as discussed above. Both design efforts will be integrated into validating/baselining the FY 2003 construction project.			
■ These funding levels include design only line-item construction funding of $7,000,000 in FY 2000 for project 00-D-401, Spent Nuclear Fuel Treatment and Storage Facility.

FY 1998	FY 1999	FY 2000

SR-SW01 / Consolidated Incinerator Facility

The Consolidated Incinerator Facility provides the Savannah River Site the capability for safe treatment, by incineration, of combustible, low-level radioactive wastes, hazardous wastes, and mixed wastes (those containing both hazardous and radioactive constituents). These wastes are received at the Consolidated Incinerator Facility for incineration as either liquids or solids. The facility is operated in accordance with the South Carolina Hazardous Waste Management Regulations, and the Resource Conservation and Recovery Act. Operation of the Consolidated Incinerator Facility will contribute to implementation of the Savannah River Site Treatment Plan (WSRC-TR-94-0608), which established the requirement for the Consolidated Incinerator Facility to treat specified mixed waste streams in accordance with the Federal Facility Compliance Act.

Waste incineration is regulated by state and Federal agencies and is a well-established means of destroying or reducing the volume of hazardous materials. Waste treatment by incineration at the Consolidated Incinerator Facility achieves a waste destruction efficiency of not less than 99.99 percent. Ash produced by the combustion process, as well as blowdown from off-gas treatment processes, is stabilized by solidification and transferred to either a Resource Conservation and Recovery Act licensed storage facility or to a hazardous/mixed waste disposal facility depending on its Resource Conservation and Recovery Act designation, each of which is managed in accordance with the Environmental Protection Agency Land Disposal Restriction regulations.

During its designed service life of 30 years, the Consolidated Incinerator Facility will incinerate approximately 1,000,000 pounds of solid waste and 1,000,000 pounds of liquid waste each year. Waste streams processed will include:

- Low-level solid waste from several on-site sources;
- Low-level radioactive liquid waste (aqueous and organic);
- Liquid radioactive organic waste (benzene from the Defense Waste Processing Facility);
- Hazardous and mixed solid wastes from several on-site facilities; and

SR-SW02 / Transuranic Waste Project

As a result of nuclear materials production in the Department of Energy complex, the Savannah River Site currently stores approximately 11,000 m^3 of waste contaminated with transuranic isotopes. An estimated 10,000 m^3 is expected to be generated through FY 2028. A portion, approximately one-third by volume of the legacy waste managed as transuranic waste, is estimated to have an activity level of less than 100 nCi/g and could be dispositioned as low-level waste or as mixed low-level waste with proper characterization.

The goal of the Transuranic Waste project is to properly characterize the waste to segregate the low-level waste and mixed low-level waste from the transuranic inventory, perform the necessary processing/treatment to meet the appropriate low-level/mixed low-level waste disposal criteria, and to certify and dispose of all transuranic and mixed transuranic waste at the Waste Isolation Pilot Plant in New Mexico.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The project has the following objectives:

- Transuranic Waste Storage Pad Base Operations, which include
  - Receipt and storage of newly generated waste;
  - Inspection and maintenance of transuranic waste storage pads and transuranic waste containers; and
  - The removal of earthen cover and retrieval of 8,809 55 gallon drums on five transuranic waste storage pads.
- The Low-Level Waste Disposition initiative, which provides for the disposal of approximately one thousand 55 gallon drums of low-level waste formally managed as transuranic waste.
- The Transuranic Waste Drum Segregation initiative, which provides for assays drums of waste to segregate transuranic waste from low-level waste and to segregate mixed transuranic waste from mixed low-level waste. Initial efforts involve:
  - The Repackaging Initiative, which provides for the disposal of approximately 200 waste containers. These containers consist of used high-efficiency particulate air filters that can be certified as low-level waste following assay. Repackaging is necessary for disposal efficiency and fire prevention reasons.
  - The Ship to the Waste Isolation Pilot Plant Initiative, which provides for the necessary characterization, certification, and transportation systems to support the initial Savannah River Site shipments of transuranic waste to the Waste Isolation Pilot Plant. These systems will be used until the Transuranic and Mixed Waste Containment Building (future line-item) can be designed and constructed.
  - The Mixed Low-Level Waste Disposition Plan, which investigates the feasibility of sending waste to the Consolidated Incineration Facility, or to another Department of Energy facility as identified through the Environmental Management Integration effort.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
– The Pu-238 On-Site Disposal Initiative, which evaluates the possibility of expanding disposal performance assessments at the Savannah River Site to determine if Pu-238 contaminated waste can be safely disposed on-site.			
■ Maintain existing inventory in a safe configuration.			
■ Make ready first three shipments of Savannah River transuranic waste for shipment to the Waste Isolation Pilot Plant.			
■ Receive and store newly generated transuranic waste.			
■ Continue venting of drums stored on pads.

SR-SW03 / Mixed Low-Level Waste Project

The mixed waste streams at the Savannah River Site were and are generated from a variety of activities and waste generators across the Site, including the tritium facilities, separations, reactors, high-level waste tank farms, reactor materials, solid waste, and construction. Due to the lack of mixed waste treatment facilities within the Department of Energy complex and the commercial sector, the vast majority of these waste streams have been in storage well in excess of one year, and do not meet the intent of the Land Disposal Restrictions regulations, i.e. has not been treated within 1 year of its Accumulation Start Date. As a result, the Savannah River Site has entered into a compliance agreement (Consent Order, 95-22-HW) with the South Carolina Department of Health and Environmental Control concerning the treatment of these waste streams. This compliance agreement requires implementation of the Savannah River Site Treatment Plan.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The mixed waste project will be managed with the overall goal of achieving full Resource Conservation and Recovery Act LDR compliance such that there is no legacy or newly generated mixed waste stored within the Savannah River Site mixed waste facilities for longer than one year. This will be accomplished by either developing or identifying appropriate treatment methods to meet the commitments of the Site Treatment Plan and also developing and/or identifying appropriate disposal alternatives for the final disposition of the treated mixed waste.

Three key activities in the management of the various mixed waste streams are storage, treatment (including any characterization activities required prior to treatment), and disposal. A breakdown of these activities is provided below:

Mixed Waste Receipt and Storage activities Include.

- Receipt of newly generated waste;
- Verification that the waste meets the facility waste acceptance criteria; and
- Placement of the waste in storage and the surveillance and maintenance of the stored waste.

Waste treatment activities are conducted to treat the waste prior to disposal to ensure that the requirements of Resource Conservation and Recovery Act and the Federal Facility Compliance Agreement of 1992 are met. These activities include:

- Characterization and preparation for the Consolidated Incinerator Facility treatment of a large portion of the legacy waste; and
- Characterization and preparation of non-Consolidated Incinerator Facility waste streams for off-site shipment and treatment.

Disposal of treated mixed waste activities includes.

- Identifying the most equitable and best technical location for disposal of all the Savannah River Site mixed waste inventory; and,
- Characterizing, preparing, and shipment of treatment residuals for disposal.

- Continue storage operations for various mixed waste streams.
- Continue decontamination of low-level waste lead.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue operations of New Solvent Storage Tanks.			
■ Submit an annual update to the Site Treatment Plan.			
■ Complete the mixed waste facility upgrade project.			
■ Treat and dispose of small quantities of mixed low-level waste.			
SR-SW03	2,854	4,994	5,845

Metrics			
Mixed Low-Level Waste			
Treatment (m^3)	282.0	32.0	35.0
Storage (m^3)	867.0	695.0	1,011.0
On-Site/Commercial Disposal (m^3)	0.0	0.0	50.0

SR-SW04 / Low-Level Waste Project

The low-level waste streams at the Savannah River Site were and are generated from a variety of activities and waste generators across the Site, including the tritium facilities, separations, reactors, high-level waste tank farms, reactor materials, solid waste, and construction. Also, the Savannah River Site receives low-level waste from the Naval Reactors program and off-site generators for disposition.

Low-level waste is segregated into five categories to facilitate proper treatment, storage, and disposal. These categories are: 1) low-activity waste; 2) intermediate-level non-tritium waste; 3) intermediate-level tritium waste; 4) long-lived waste; and 5) suspect soil.

The low-level waste project will be managed with the overall goal of treatment and disposal such that there is no legacy stored waste and there is capability and capacity to cost effectively treat and/or dispose of newly generated wastes. This will be accomplished by identifying and either developing or contracting appropriate treatment and disposal technologies where present capabilities are not adequate.

- Continue storage operations for various low-level waste streams, utilizing on-site facilities.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Provide reduced level of treatment and disposal sufficient to maintain storage level at a constant level. No backlog will be processed.			
■ Continue operation of the waste sorting facility.			
■ Continue the design of new disposal units.			
SR-SW04	8,602	12,150	9,947

Storage (m^3)	18,040.0	14,854.0	14,525.0
On-site / Commercial Disposal (m^3)	2,371.0	9,576.0	3,235.0

SR-SW05 / Hazardous Waste Project

The hazardous waste project will involve: receipt from site generators, storage, and ultimate shipment off-site of newly generated hazardous wastes for treatment and disposal. Hazardous waste is currently stored on-site, and treated either off-site at a commercial facility or on-site at the Consolidated Incinerator Facility. All legacy hazardous waste will be shipped off-site for disposal, by the year 2002, and will result in a steady-state operation thereafter.

- Continue treatment, storage, and disposal of hazardous waste operations, utilizing on-site and off-site facilities.
- Continue implementation of the Hazardous Waste Off-site Shipment Release program.
- Continue reduction of legacy hazardous waste at a reduced level.
- Continue efforts to allow radioactive polychlorinated biphenyl waste to be shipped to Oak Ridge for treatment.

	FY 1998	FY 1999	FY 2000
SR-SW06 / Sanitary Waste Project			
This project provides for the safe, environmentally sound sanitary waste disposal from the Savannah River Site, which produces approximately 25 tons of sanitary waste per day.			
Sanitary waste activities include receipt of newly generated waste, recycling, verification that the waste meets the commercial disposal facility waste acceptance criteria, radiological screening and contract administration. These activities are necessary to ensure compliance with the South Carolina Solid Waste Regulation R61-107.258 and DOE Order 5820.2A.			
Sanitary waste is currently being disposed at the regional Three Rivers Landfill located adjacent to the Savannah River Site. The Resource Conservation and Recovery Act closure activities at the on-site Interim Sanitary Landfill were completed in FY 1999 and normal sanitary waste operations are expected in FY 2000, which includes continued and increased operations for the "Green-Is-Clean" Shredder.			
■ Continue disposal of sanitary waste utilizing the regional Three Rivers Landfill.			
■ Dispose of approximately 25 tons per day of sanitary waste.			
SR-SW06	1,747	2,068	2,156

Metrics
No quantifiable corporate performance measures are associated with this project.

SR-SW07 / Pollution Prevention

Pollution prevention is the Savannah River Site preferred approach to reducing waste, mitigating health risks, and protecting the environment. Pollution prevention applied at the Savannah River Site can significantly reduce secondary wastes, allowing the cost savings to be used to accelerate the cleanup effort. As in industry, pollution prevention is a core program that helps the Savannah River Site achieve maximum environmental benefits.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The Waste Minimization/Pollution Prevention Management program will provide the Savannah River Site the safe, effective, and environmentally responsible Waste Minimization Program strategy to implement specific waste reduction techniques based on current and projected information on waste generation, waste characterization, and ultimate waste disposal costs. ■ Continue site program management, including national and site reporting and monitoring. ■ Continue focus on contamination area rollback. ■ Develop and implement enhancements in chemical management, including pharmacy concept. ■ Continue second sort capabilities (SMARTS components). ■ Continue administering set aside fee program, including invoices, reporting support. ■ Implement sanitary waste processing at the Material Recovery Facility.

■ Increase cost of operation at the F and H groundwater remediation facility and requirements for interim action at the mixed waste management facility.	10,239
SR-ER03 / Lower Three Runs and Operations Project	
■ Additional funds provide for assessment and remediation work on five subprojects designated in the Federal Facility Agreement.	6,466
SR-ER04 / Pen Branch Project	
■ Begin remedial action on the K-Area hazardous material unit 131-K subproject.	2,118

	FY 2000 vs FY 1999 ($000)
SR-ER05 / Steel Creek Project	
■ The decrease in funding reduces the field monitoring and assessment workscope. . .	-4,135
SR-ER06 / Upper Three Runs Project	
■ Several remediation subprojects were completed including the A/M Area Groundwater subproject; and the Savannah River Laboratory Seepage Basin subproject.	-4,236
SR-ER07 / Program Management	
■ Increased funding for environmental compliance support sub-activities at waste sites and groundwater remediation projects.	1,970
SR-FA02 / F-Canyon Deactivation Project	
■ No significant change.	15
SR-FA16 / F-Area Monitoring	
■ Reduced funding due to achieving a deactivated/minimum surveillance and maintenance condition for the Naval Fuels Facility (Building 247 and associated support facilities) with no additional deactivated facilities to be added until at least after the completion of F-Canyon/FB-Line nuclear materials stabilization activities in approximately FY 2003.	-294
SR-FA17 / H-Area Monitoring and Minor Facility Monitoring	
■ A new facility creates an increase in funding to cover surveillance and maintenance of the reactor heat exchange repair shop.	1,949
SR-FA18 / M-Area Monitoring Project	
■ Decrease reflects reduces support for deactivation activities.	-3,016
SR-FA19 / D-Area Monitoring Project	
■ Increase in funding provides for monitoring of the excess Heavy Water Production Facility.	1,261

	FY 2000 vs. FY 1999 ($000)
SR-FA20 / Reactors Monitoring Project	
■ Provides increased support for monitoring reactor facilities and operation of the C-Area Decontamination Facility, as well as initiation of preliminary deactivation planning.	3,485
SR-HL01 / H-Tank Farm	
■ Decrease reflects the completion of RHLWE in FY 1999 and re-allocation of labor charges to F-Tank Farm for labor and activities that should have been in the F-Tank Farm project baseline summary.	-3,665
SR-HL02 / F-Tank Farm	
■ In FY 1999 F-Tank Farm labor incorrectly assigned to H-Tank Farm; corrected in FY 2000.	3,258
SR-HL03 / Waste Removal Operations and Tank Closure	
■ Tank closure design efforts are reduced concurrent with the slow down of waste removal activities.	-1,156
SR-HL04 / ITP/ESP/LW Operations	
■ Additional surveillance and maintenance activities (including design and engineering) for the In-Tank Precipitation and Late Wash facilities.	10,072
SR-HL05 / Vitrification	
■ Canister production is reduced from 200 canisters to 100 canisters.	-5,345
SR-HL06 / Glass Waste Storage	
■ Fewer canisters will be placed in storage and critical maintenance activities are reduced to minimum safe levels.	-231
SR-HL07 / Effluent Treatment Facility	
■ Funds additional maintenance activities at the Effluent Treatment Facility/Consolidated Incinerator Facility.	1,041

	FY 2000 vs. FY 1999 ($000)
SR-HL08 / Saltstone	
■ Saltstone operations in standby condition awaiting high-level waste salt alternative decision. Will process a minimal amount of waste from the Effluent Treatment Facility.	120
SR-HL12 / High-Level Waste Removal	
■ Decreased funding reflects stretch-out of the construction schedule to balance all priorities within the High-Level Waste Program.	-8,441
SR-HL13 / Salt Disposition	
■ Increase in funding provides for design and construction of pilot/prototype facility.	29,146
SR-IN11 / Infrastructure Line-Item	
■ Decrease reflects reduced support for future infrastructure construction line-item project planning.	-1,074
SR-IN12 / Operating Projects	
■ Increase funding required because of unavailability of prior year funds to support DOE Federal employees onsite. Support increased requirements for critical regulatory capital projects deferred from prior years.	14,447
SR-SF01-LT / K-Area Spent Nuclear Fuel Project (Post 2006)	
■ Increase, in part, due to transfer of the project from the Site/Project Completion account due to longer term mission of storing Rocky Flats plutonium. Also, increase supports first year of receipts from Rocky Flats.	33,410
SR-SF02 / L-Reactor Spent Nuclear Fuel Project	
■ Increase in funding due to shipping Mark 16 and 22 fuel to the canyons.	4,361
SR-SF03 / RBOF Spent Nuclear Fuel Project	
■ Decrease reflects reduction in one shift of basin operators based on transfer of fuel receipts to the L-Reactor.	-6,433
SR-SF04-LT / Heavy Water - D-Area (Post 2006)	
■ Increase reflects the transfer of the project from the Site/Project Completion account due to potential sale of heavy water and long-term storage of heavy water.	4,984

	FY 2000 vs. FY 1999 ($000)
SR-SF09 / Spent Nuclear Fuel Treatment and Storage Project	
■ Funding will support initiation of a design only line-item construction project for detailed of the Spent Nuclear Fuel Treatment and Storage Facility.	10,045
SR-SW01 / Consolidated Incinerator Facility	
■ Funding increase supports processing of solvent waste.	2,790
SR-SW02 / Transuranic Waste Project	
■ Operations to provide safe storage, minimal treatment and certification activities associated with sending shipments to the Waste Isolation Pilot Plant.	-3,389
SR-SW03 / Mixed Low-Level Waste Project	
■ Funding increase due to termination of waste chargeback demonstration and continued support for completion of the Mixed Waste Facility Upgrade Project.	851
SR-SW04 / Low-Level Waste Project	
■ Decrease reflects reduced treatment and disposal activities for legacy waste volumes.	-2,203
SR-SW05 / Hazardous Waste Project	
■ Decrease reflects reduced disposal activities.	-930
SR-SW06 / Sanitary Waste Project	
■ Increase supports continued operation of the "Green-Is-Clean" shredder.	88
SR-SW07 / Pollution Prevention	
■ Decrease reflects postponement of high return-on-investment projects.	-588
Total Funding Changes, Savannah River	91,833

Major Issues

- The production output from the Defense Waste Processing Facility will be restricted to 100 canisters in FY 2000 (and FY 2001) attributable to reduced availability of feed materials from the High-Level Waste tanks due to a slow down in waste removal activities. This slow down in waste removal activities is due to two major reasons: first, a redirection of funding away from waste removal (SR-HL12) to provide additional funding for the salt alternatives (SR-HL13), and the need to slow down the can production rate to allow match up between the sludge feed stream and salt feed stream to minimize lifecycle canister production.

Multi-Site

Mission Supporting Goals and Objectives

Mission

The mission of the Defense Environmental Management Post 2006 Completion account carried out by the Multi-Site programs includes funding to provide leadership and support, establish and implement National and Departmental policy, conduct analyses and integrate activities across a number of sites. The majority of the funds requested in the Multi-Site activities defense account are required for the Federal contribution to the Uranium Enrichment Decontamination and Decommissioning Fund (83 percent). Other Multi-Site activities budget efforts consist of Headquarters technical support activities, Environmental and Regulatory Analysis activities, Transportation and Packaging functions, Emergency Preparedness activities, National Analytical Management Program activities, and Pollution Prevention program functions

This activity also includes the required Federal Government deposit to the Uranium Enrichment Decontamination and Decommissioning Fund The Energy Policy Act of 1992 authorizes annual deposits into the Uranium Enrichment Decontamination and Decommissioning Fund of up to $480,000,000 annually adjusted for inflation. Domestic utilities are to be assessed up to $150,000,000 per year (adjusted for inflation) for 15 years based on their purchase of Department-produced separative work units. The remainder of the annual deposit, currently estimated at $420,000,000 (in FY 2000) was authorized to come from annual appropriations.

Program Goal

The goals of the Multi-Site activities will allow the Environmental Management (EM) to better coordinate EM-wide and the Department of Energy (DOE)-wide program efforts and avoid overlaps and inconsistencies.

The main goal of EM's Tribal program, within the Policy and Management Program, is to fully implement DOE's American Indian Policy. The EM maintains cooperative agreements with ten Tribal nations in order to enhance their direct involvement in clean decisions and activities. The cooperative agreements build core scientific and technical capacity at the Tribal level and allow for the establishment of Tribal environmental program offices. As a practical matter, the cooperative agreements enhance the government-to-government relationship between the Department and Tribal nations, which is the cornerstone of the Department's American Indian Policy. In order to fulfill EM's goal, the program seeks to maintain and, in some instances, increase funding for the cooperative agreements with Tribal nations directly affected by EM's cleanup activities.

The main goal of EM's Office of Intergovernmental and Public Accountability, within the Policy and Management program, is to promote active public involvement in the EM planning and decision-making processes. Specifically, the mission of the office is to provide State, Tribal, and local governments and other interested stakeholders with opportunities for meaningful involvement in managing the cleanup and closure of the Nation's former nuclear weapons complex.

The principal means by which this goal is accomplished are through the EM Site-Specific Advisory board and through grants and cooperative agreements with the National Governors' Association, the National Association of Attorneys General, and the National Conference of State Legislatures.

The National Transportation Program develops and maintains DOE's baseline transportation resources, including policy, to assure the availability of safe, regulatory compliant, economical, efficient, and timely transportation for DOE materials, including radioactive and other hazardous materials and wastes. Goals for achieving an integrated program mission include: achieving a forward-looking, system-wide assessment of the Department's transportation and packaging needs; assuring safe, environmentally compliant, and cost effective transportation management system and operations; performing as a service center for transportation campaigns across the Department's complex; focusing expertise from the Department's transportation and packaging technical base program to solve transportation and packaging requirements needs; and enhancing transportation relationships and coordinating transportation communication throughout the Department.

The goal of EM's Emergency Management Program is to assist the National Fire Protection Association in the development of a national standard for training requirements for radioactive materials for hazardous materials teams and emergency medical staff. In coordination with the Office of Emergency Management (NN-60), this program will coordinate field reviews of EM facilities to assure compliance with DOE Order 151.1 and their preparedness and readiness to address emergencies.

Full implementation of the Transportation Emergency Preparedness Program at the eight DOE Regional Coordinating Offices will begin under the Emergency Preparedness Program.

The mission of the National Analytical Management Program is to insure that the analyses performed by the analytical laboratories within the EM Complex are of sufficient quality to: meet the needs and requirements of the EM and the regulatory community; to be scientifically and legally defensible; to provide the basis for returning the DOE environment to the public domain; and to assist in meeting the objectives of the *Accelerating Cleanup: Paths to Closure* plan. To support this mission, the following goals have been established:

- Establishment of an Analytical Laboratory Accreditation Program for all laboratories doing business with the DOE/EM;
- Increase data reliability and defensibility by implementing a program to provide traceability for all Reference Laboratories to the National Institute of Standards and Technology;
- Increase the quality and reliability of the analytical data by implementing a common electronic reporting format;
- Establishment of a comprehensive informational database to identify baseline information for the EM analytical services; and

- Decrease costs for analytical services by sharing laboratory audit information.

The National Pollution Prevention Program funds Departmental Headquarters and field activities. The missions of the Pollution Prevention Program are to: 1) comply with waste minimization, pollution prevention, affirmative procurement, and recycling requirements under Federal/state statutes, Executive Orders, and DOE Orders; and 2) reduce waste generated through implementation of cost effective pollution prevention projects.

These funds will allow the Department to meet the Secretary of Energy's pollution prevention goals to be achieved by December 31, 1999, as stated below:

- Reduce by 50 percent the generation of radioactive waste
- Reduce by 50 percent the generation of hazardous waste
- Reduce by 50 percent the generation of low-level mixed waste
- Reduce by 33 percent the generation of sanitary waste
- Recycle 33 percent of sanitary waste from all operations
- Increase procurement of Environmental Protection Agency designated recycled products to 100 percent, except where they are not commercially available at a reasonable price or do not meet performance standards

The Department of Energy achieved the 50 percent reduction goals for radioactive, hazardous, and low-level mixed waste from routine operations at the end of FY 1997 In addition, the Department met the recycling goals of 33 percent in 1997. Additional effort will be required to meet the affirmative procurement goals. The Department has established an additional goal to reduce wastes from cleanup and stabilization activities by 10 percent annually, beginning in FY 1999 and will strive to further reduce its waste through continuous improvement in future years.

The White House plans to consolidate, streamline, and tighten the existing Executive Orders and policy memoranda into four new Executive Orders. The first of these new Orders, Executive Order 13101, Greening the Government Through Waste Prevention, Recycling, and Federal Acquisition, was issued on September 16, 1998. Executive Order 13101 contains requirements in previous Orders and new requirements to reflect the President's environmental agenda. The other Executive Orders are expected before summer.

Program Objectives

The Multi-Site activities focus National attention on several areas that impact the Environmental Management goals and planned efforts which cut across the Department of Energy complex.

Performance Measures

There are no Performance Measures associated with the Multi-Site activities.

Significant Accomplishments and Program Shifts

Policy and Management

- Improve analytical capabilities for and conduct comparative life-cycle analyses for EM programs and projects (FY 1998/FY 1999/FY 2000).
- Provide general analytic and production support to national environmental policy development (FY 1998/FY 1999/FY 2000).
- Continue providing for EM-wide information management infrastructure activities and provide for hardware, software, maintenance, and upgrades to support management information systems (FY 1998/FY 1999/FY 2000).
- Continue to maintain and develop EM's government-to-government relationship with ten tribes designed to foster cooperation on waste shipment and environmental restoration efforts (FY 1998/FY 1999/FY 2000).
- Continue to implement training and education programs to resolve the Defense Nuclear Facilities Safety Board Recommendation 93-3 (FY 1998/FY 1999/FY 2000).

Complex-Wide Waste Management Support and Analyses

- Issue the Waste Management Programmatic Environmental Impact Statement Records of Decision for Transuranic Waste Storage and Treatment and Hazardous Waste Treatment; continue to work with sites and external stakeholders to resolve issues related to the configuration of the waste management system and to support issuance of Records of Decision for high-level waste storage and low-level waste and mixed low-level waste treatment and disposal based upon the Waste Management Programmatic Environmental Impact Statement (FY 1998/FY 1999/FY 2000).
- Develop and refine disposition maps to show the planned pathways to move waste or materials from inventory or generation through required processing to treatment or stabilization and on to final disposition; conducted integrated planning efforts to identify and evaluate opportunities to reduce risk and long-term mortgages associated with treatment and disposal of backlog waste (FY 1998/FY 1999/FY 2000).
- Issue and continue support to implement DOE Order 435.1, Radioactive Waste Management (FY 1998/FY 1999/FY 2000).
- Review and approve Performance Assessments and Composite Analyses as required by the Defense Nuclear Facilities Safety Board Recommendation 94-2 (performance assessments of low-level radioactive waste disposal) for Los Alamos National Laboratory, Savannah River's saltstone and E-Area vaults, Hanford, Idaho National Engineering and Environmental Laboratory and issued Disposal Authorization Statements (FY 1998/FY 1999/FY 2000).

- Reimburse Environmental Protection Agency for Resource Conservation and Recovery Act inspections of DOE facilities as required by Section 104 of the Federal Facility Compliance Act of 1992 (FY 1998/FY 1999/FY 2000).
- Complete the technical assessment by the National Academy of Science's Board on Radioactive Waste Management of the treatment options for high-level radioactive waste stored at the Idaho National Engineering and Environmental Laboratory (FY 1998/FY 1999/FY 2000).
- Provide technical support for EM/Office of Civilian Radioactive Waste Management high-level waste activities, including implementation of the Environmental Management/Radioactive Waste Memorandum of Agreement and preparation of the Yucca Mountain Environmental Impact Statement (FY 1998/FY 1999/FY 2000); completed EM funded activities on testing high-level waste glass forms (FY 1998).

Technical Support to Environmental Restoration

- Provide technical support for EM/environmental restoration initiatives, including project and project baseline review and analysis efforts (FY 1998/FY 1999/FY 2000).
- Provide for the Federal Contribution to the Uranium Enrichment Decontamination and Decommissioning Fund as required by the Energy Policy Act of 1992 (FY 1998/FY 1999/FY 2000).

Support to Transition Activities

- Continue to support Headquarters directed nuclear material field activities to achieve cost efficiencies and increase the effectiveness of these activities for accelerating stabilization and deactivation opportunities (FY 1998/FY 1999/FY 2000).

Headquarters Program Integration

- Continue to support the *Paths to Closure* activities (FY 1998/FY 1999/FY 2000).
- Continue Hazardous Waste Operations and Emergency Response training at the DOE weapons facilities and related sites (FY 1998/FY 1999/FY 2000).

Environmental and Regulatory Analysis

- Conduct pilot projects at the DOE sites to demonstrate and evaluate the viability of utilizing the LandTech technology as a community based collaborative decision-making tool to achieve tangible solutions for site cleanup, site closure, and land title transfer of Federal properties to public interests (FY 1998/FY 1999/FY 2000).
- Sign an agreement with the DOE, the State of New Mexico, and the Environmental Protection Agency Region VI that describes a mutual Albuquerque site vision, promotes collaborative decision-making as the basis for a strong and effective working relationship at Albuquerque sites, and clarifies the applicability of an existing Albuquerque interagency agreement and unilateral order (FY 1998/FY 1999/FY 2000).
- Establish a collaborative decision-making process at the Albuquerque Operations Office, that results in a reduction in the number of Notices of Violation received by the Department by 50 percent from

the number received in FY 1998, and a decrease in the time for the State of New Mexico to approve the DOE's submitted documents by 25 percent (FY 1998/FY 1999/FY 2000).

Transportation and Packaging

- Initiate Systems Engineering for EM transportation activities. This includes collecting requirements for current transportation activities, identification of new transportation and packaging needs to include analysis of complex-wide material flows, sensitivity analysis of packaging types and development and assessment for major transportation implementation options (FY 1998).
- Develop and maintain partnership with the Department of Transportation to perform safety assessments on Department of Energy motor carriers (FY 1998/FY 1999/FY 2000); continue the analyses of potential packaging materials to improve the future packaging designs in safety performance (FY 1998); enhance the existing safety assessment program to include low-level waste container and package systems (FY 1999); and improve the existing package and transportation safety reporting program to emphasize safety performance (FY 1999).
- Maintain and revise the training for HAZMAT shipments to assure compliance with 49 U.S.C. 5101 (FY 1998); maintain the Explosives Classification program to ensure DOE movement of explosives are in compliance (FY 1998); and maintain an efficient regulatory compliance training program (FY 1999/FY 2000).
- Implement a complex-wide system to ensure internal and external notification of high visibility shipments to appropriate stakeholder officials, and provide public awareness of unclassified shipments (FY 1998/FY 1999/FY 2000); continue transportation focused forums and communications, with internal program activities and external stakeholders, to identify and resolve transportation issues and participate in specific transportation shipment planning (FY 1998/FY 1999/FY 2000); establish DOE wide protocols for notification, planning, inspection, and other functions with states and tribal governments (FY 1999/FY 2000); and provide technical support to field and program offices and to state, tribal, and local governments in preparing for and executing hazardous materials shipping campaigns (FY 1998/FY 1999/FY 2000).
- Maintain DOE's automated transportation systems in support of efficient shipping and tracking throughout the DOE complex (FY 1998/FY 1999/FY 2000). These systems include the DOE tracking system, the real-time and historical shipment database, and the hazardous materials routing system.
- Maintain DOE's transportation and packaging technical base program to establish DOE's position on regulatory issues related to transportation and packaging, and to provide transportation and packaging testing and materials infrastructure for DOE (FY 1999/FY 2000).
- Complete formulation of the policy for the Transportation Emergency Preparedness Program (FY 1999).
- Conduct a full field transportation exercise, TEMPER '98, in Montgomery County, Maryland. The exercise integrates the planning, training, and conduct of an exercise and establishes a cohesive agency implementation of the support requirements (FY 1998/FY 1999).

- Implement an integrated, inter-regional Transportation Emergency Preparedness program through the eight DOE Regional Coordinating Offices to address State, Tribal, and local officials concerns about DOE's transportation of radioactive materials (FY 1998/FY 1999/FY 2000).

Emergency Management

- Base on recent emergencies at EM facilities, initiated a more focused Facility Emergency Preparedness Program to review site/facility plans and procedures to assure compliance with DOE Orders (FY 1998/FY 1999/FY 2000).

National Analytical Management Program

- Develop guidelines that will allow reference laboratories to establish a direct link to the national standard (National Institute of Science and Technology) in analytical measurement processes and the preparation of secondary standards. The guidelines delineate the process of establishing a reference or secondary laboratory according to requirements established by the American National Standards Institute (FY 1998/FY 1999/FY 2000).
- Provide leadership by the National Analytical Management Program for the DOE Office of Environmental Restoration to become an accrediting body within the Environmental Protection Agency's National Environmental Laboratory Accreditation Program (FY 1998/FY 1999/FY 2000).

Pollution Prevention

- Maintain pollution prevention infrastructure at DOE sites and operations/field offices to encourage efficiency and environmental stewardship through implementation of projects that reduce waste/pollutant and reduce life-cycle cost of operations (FY 1998/FY 1999/FY 2000).
- Conduct reporting, tracking, and waste minimization program activities required by the Resource Conservation and Recovery Act at DOE sites that generate, treat, or store hazardous/mixed wastes (FY 1998/FY 1999/FY 2000).
- Conduct pollution prevention activities required by State agencies at DOE sites (FY 1998/FY 1999/FY 2000).
- Provide leadership to the Department's pollution prevention program through development of policy/goals and as chair for the Multi-Site Waste Reduction Steering Committee and the field Waste Minimization Coordinators Group (FY 1998/FY 1999/FY 2000).
- Coordinate pollution prevention activities across the complex and work with White House and other Federal agencies in developing and implementing Pollution Prevention Executive Orders (FY 1998/FY 1999).
- For FY 2000, the Department will change the way the Pollution Prevention program is managed. Funds for the Headquarters controlled National Pollution Prevention Program will be significantly reduced from FY 1999 level. The field is expected to provide the resources required to continue implementing high return-on-investment and cost-effective projects and complying with Executive Order and DOE Orders.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Site Description

Multi-Site

The Multi-Site program consists of several subprograms, which provide technical support, education and training, Hazardous Waste Operations and Emergency Response Grants, Environmental and Regulatory Analysis, Transportation Management, National Analytical Management, Emergency Preparedness and Pollution Prevention.

The role of the Multi-Site Federal effort is to provide leadership and support, establish and implement National and Departmental policy, conduct analyses and integrate activities across sites. The Multi-Site program also supports education and training to improve the technical capability of the EM staff pursuant to the Defense Nuclear Facilities Safety Board Recommendation 93-3, "Improving the Technical Capabilities in Defense Nuclear Facility Programs". This program also provides for technical assistance in assessing and establishing site baselines through data collection and analysis, all of which support the accelerated closure of EM sites. The Multi-Site program assesses the progress of the EM sites in order to track and report to Congress, interested stakeholders, and the public on the status of the program. Also, funds are provided for the EM Multi-Site support grants for the Hazardous Waste Operations and Emergency Response training

The Environmental and Regulatory Analysis program advocates and champions the resolution of environmental, legal, regulatory and contractor work force restructuring issues that cut across many sites and do not readily fall within the purview of the primary business lines. The program provides policy direction and guidance to operations and the Environmental Management program offices to successfully implement the negotiation and enhancement of environmental compliance and cleanup agreements and the requirements of the National Environmental Policy Act. The program also promotes conflict resolution and collaborative decision-making that will facilitate partnering programs between DOE and its regulators, and its stakeholders.

The National Transportation program provides policy, guidance, and a transportation infrastructure to ensure the availability of safe, efficient, compliant, and timely transport of all DOE materials (except weapons, weapons components, and Navy spent fuel). The program serves as the corporate point of contact and management for interface and exchange by DOE with external entities, other Federal agencies, consensus standards organizations and transportation regulators. The program's near-term focus is on transportation and packaging needs in support of the DOE/EM's focus on *Accelerating Cleanup: Paths to Closure* plan.

The DOE Order 151.1, "Comprehensive Emergency Management System", requires the Office of Environmental Management to ensure the implementation of policy and DOE Order requirements related to emergency management facilities/sites and operations offices under its cognizance. It is also required to establish and maintain a system for handling emergency occurrences involving unclassified shipments of radioactive materials. The Emergency Management Program implements the Transportation Emergency Preparedness Program and the Facility Emergency Preparedness Program to address these requirements.

The National Analytical Management Program, operated out of the Idaho Operations Office, is responsible for the management for the following areas: Quality Assurance, Resource Management, Data Integration, Data Validation, and Methods Development. Quality Assurance includes the production of defensible, reliable data through the evaluation of the performance of laboratories that provide sample analysis services to the Department. The National Analytical Management Program represents DOE on the National Environmental Laboratory Accreditation Council and sponsors the Multi-Agency Radiation Laboratory Protocol group. Resource management includes the sample management, information systems, and laboratory issues for which technical assistance, policy and guidance are provided. The Data Integration activity supports the use and development of analytical planning tools to improve the selection and documentation of environmental management program decisions. Projects within the Methods Development Program includes the maintenance of the methods compendium and database, methods validation, and business practices including acquisition strategy.

The National Pollution Prevention program funds Headquarters and field activities for the Department's Pollution Prevention program. The missions of the Department's Pollution Prevention program are to: 1) to comply with waste minimization, pollution prevention, affirmative procurement, and recycling requirements under federal/state statues, Executive Orders, and DOE Orders, and 2) reduce waste streams generated through implementation of cost effective pollution prevention projects. The National Pollution Prevention program funds will be used primarily by the field to comply with federal/state regulations on waste minimization and pollution prevention. A small fraction of the funds will be used by Headquarters to coordinate the Department's overall Pollution Prevention program, develop guidance/policy, provide technical support, facilitate information transfer, conduct program reviews, compile performance data and prepare reports that are required by Executive Orders and the 1998 Programmatic Environmental Impact Statement Lawsuit Settlement between DOE and the Natural Resources Defense Council. For FY 2000, the field will be responsible for implementing many of the activities funded by the National Pollution Prevention program in prior years. Such activities include complying with Executive Orders and DOE Orders, training and providing technical support to waste generators in identifying opportunities, implementing high return-on-investment and cost-effective projects, tracking pollution prevention progress and reporting progress to Headquarters. The National Pollution Prevention program is responsible for the Department's significant progress toward meeting its waste reduction goals. These goals are included in the Department's *Accelerating Cleanup: Paths to Closure* plan.

Pollution prevention is required by Federal and State statutes including the Pollution Prevention Act; Resource Conservation and Recovery Act; Emergency Planning and Community Right-to-Know Act; and Executive Orders 12856, Federal Compliance with Right-to-Know Laws and Pollution Prevention Requirements and 13101, Greening the Government Through Waste Prevention, Recycling, and Federal Acquisition.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the Mult-Site activities as outlined in the *Accelerating Cleanup: Paths to Closure* plan. The funds requested for FY 2000 are appropriate to perform the activities based on a historical level of effort cost. No quantifiable corporate performance measures are associated with these projects.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

HQ-PM-001 / Policy and Management

This activity provides the other contractual services funding required to plan, direct, and manage the EM program. Program activities encompass the Administrative Support area including support for the Assistant Secretary's staff; other contractual services necessary to accomplish program activities that include overall management; acquisition of education and training activities for the entire EM program; and environmental policy recommendations and planning activities.

- Focus on re-engineering the EM information infrastructure, strengthening its technical support and enhancing its systems development capability to provide a more robust, efficient, and cost-effective network and services. This will enable EM to support a growing number of applications, greater volume of transactions, and more sophisticated users. Planned activities include the EM Network Services, EM Customer Support, System and Data Security and Integrity, and EM Systems Development.
- Enhance Tribal, State, and local government participation in the EM program through the continuation of State and Tribal Governments Working Groups, government-to-government relationships with Native American Tribes, and cooperative agreements with the National Governors Association, and the National Association of Attorneys General; continue management and evaluation of the EM Site Specific Advisory Board initiative and support the National Environmental Training Office's complex wide efforts.
- Plan activities to include standardizing environmental crosscutting training, expanding partnerships with other Federal and State agencies, conducting training effectiveness evaluations, and responding to General Accounting Office/Inspector General/Defense Nuclear Facilities Safety Board recommendations. Support EM's participation in the Science Bowl.
- Provide analytical support for life-cycle analysis for the EM program and projects. Provide general analytical and production support for National EM policy including long-term stewardship strategy, and completion of geographic information system development.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ As part of a Departmental and Natural Resources Defense Council settlement agreement, funding is included for a Citizens Monitoring and Technical Assessment Fund for eligible external organizations to acquire contractor support that will allow them to perform technical reviews and analyses of environmental activities at the DOE sites. A nationally recognized, non-profit, non-governmental organization will be jointly selected to administer this fund. Any non-profit, non-governmental organization or any Federally recognized tribal government working on issues related to the nuclear weapons complex is eligible to receive monies from the Fund, upon application and subject to the criteria set forth. Any organization or tribe receiving funds for technical review and analysis will provide copies of all final work products to DOE and the Fund Administrator and any field products may be made publicly available.			
HQ-PM-001	19,738	27,533	23,190

HQ-WM001 / Complex-Wide Waste Management Support and Analyses

The mission of the waste management program is to protect people and the environment from the hazards of the DOE radioactive and hazardous waste by providing an effective and efficient system that minimizes, treats, and stores the waste and disposes most of the waste as soon as possible. The project provides support for waste management activities that cut across the entire DOE complex. Support is provided for interactions with the Environmental Protection Agency, the Nuclear Regulatory Commission, and the Defense Nuclear Facilities Safety Board on waste management issues; implementation of the DOE requirements for managing radioactive wastes; and technical analyses to evaluate complex-wide integration opportunities and reduce outyear costs.

- Provide technical analysis to enable efficient implementation of DOE Order 435.1, Radioactive Waste Management; DOE Policy 450.5, Line Environment, Safety and Health Oversight; and related interactions with the Nuclear Regulatory Commission and the Environmental Protection Agency.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Conduct analyses and reviews in response to the Defense Nuclear Facilities Safety Board recommendations, including reviews of revised Site Performance Assessments for disposal of low-level radioactive waste in accordance with the Board's Recommendation 94-2.			
■ Provide support for privatization initiatives including feasibility analyses, lessons learned, and interactive workshops among field personnel.			
■ Reimburse the Environmental Protection Agency for cost of annual Resource Conservation and Recovery Act inspections at the DOE facilities that store, treat, or dispose of mixed low-level radioactive waste			
■ Meet the requirements of the Memorandum of Agreement with the Office of Civilian Radioactive Waste Management for acceptance of the Department's high-level radioactive waste.			
■ Conduct technical analysis of major waste management program issues by the National Academy of Science's Board on Radioactive Waste Management.			
■ Identify and analyze opportunities to integrate waste management activities across the DOE complex.			
■ Exchange and analyze information with foreign national programs on innovative waste management technologies and operational experiences.			
HQ-WM001	14,851	2,728	2,610
HQ-100-AA / Technical Support to ER			
The activities funded by this project include a variety of crosscutting efforts that support required Environmental Restoration and EM initiatives. Technical support is provided in the areas of performance measure tracking; information/data management integration; and project review/analysis.			
■ Continue to provide technical support in the areas of document review, program integration, and other crosscutting EM activities.			
HQ-100-AA	8,672	720	690

(dollars in thousands)

FY 1998	FY 1999	FY 2000

HQ6002 / Support to Transition Activities

This activity provides funding to continue initiatives to support and respond to the concerns of the Defense Nuclear Facilities Safety Board; Environmental Protection Agency; Nuclear Regulatory Commission; other technical review boards; and contractor proposed stabilization and deactivation projects. This support consists of individuals who are knowledgeable and experienced with the Nuclear Material and Facility Stabilization program. These individuals are able to perform independent technical reviews of scientific base and engineering practices.

- Will accelerate stabilization and deactivation activities to respond to concerns of the Defense Nuclear Facilities Safety Board, Environmental Protection Agency, Nuclear Regulatory Commission, and other technical review boards.
- Provide support for acceleration of plutonium shipments between Rocky Flats, Richland, and the Savannah River Site.
- Provide support of the material stewardship program that will reduce the outyear mortgage and facilitate material dispositioning through consolidation of selected excess nuclear material.
- Continue to support grants and agreements to States for spent nuclear fuel shipments to Idaho from the West Coast and cross country.
- Continue to support the Interagency Agreement with the Nuclear Regulatory Commission on spent nuclear fuel issues; and provide support to DOE, the Department of State, and Indonesian Governmental organizations to complete the Indonesian spent fuel shipment.
- Continue funding and fulfill a 4-year agreement ending in FY 2000 with Pembroke State University for motivational activities and counseling to Native American and African American students in the area of environmental science.
- Continue payment of International Atomic Energy Agency/Computer Education Group dues to support international commitments on spent nuclear fuel and nuclear material management technology exchange.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Continue support of the International Institute for Applied Systems Analysis to perform research and impact of nuclear contamination in the former Soviet Union to present viable alternatives in addressing critical remediation concerns.			
■ Continue to fund the Arctic Military Environmental Corporation program to support a Department of Defense led effort to improve the Russian Navy's radioactive waste management capabilities associated with the nuclear submarine decommissioning program. The Arctic Military Environmental Corporation is a forum for dialogue and joint activities among the United States, Russian, and Norwegian military and environmental officials.			
HQ6002	5,823	2,735	3,617

HQNP-NCSP / Nuclear Criticality Safety Program

This activity provides support to the Nuclear Criticality Safety Program. The Implementation Plan for Recommendation 93-2, "The Need for Critical Experiment Capability," established a program to maintain the viability of the Department's critical experiments program and improve the knowledge base underlying prediction of criticality. This resulted in the five-element Nuclear Criticality Predictability Program. Ongoing activities have been included under the program established for the Defense Nuclear Facilities Safety Board Recommendation 97-2, which supports the efficient integration and functioning of criticality safety programs across all the DOE operations involving fissile materials. The Environmental Management-funded segments of the Defense Nuclear Facilities Safety Board Recommendation 97-2, Nuclear Criticality Safety Program, consist of three elements: a) nuclear data; b) calculational methods; and c) guidance on applicability of bounding curves/data.

- Nuclear Data
  - Perform neutron reaction cross section measurements for Potassium (K) and Flourine (F) and one other isotope, as needed.
  - Generate aluminum, U-233, U-235, and Chlorine covariance data in new Evaluated Nuclear Data File formats.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
▸ Update other Evaluated Nuclear Data File/Part B with relevant covariance information, a technical component of such files.			
▸ Develop the Oak Ridge National Laboratory Evaluated Nuclear Data File Processing module for a group-energy Monte Carlo computer code for an unresolved resonance level treatment.			
▸ Develop a nuclear data file processing module capability to process covariance.			
▸ Update the Cross-Section Evaluation Working Group benchmarks for criticality applications.			
▸ Continue the Cross-Section Evaluation Working Group participation and criticality integration.			
■ Analytic Methods			
▸ Continue work on the group-energy Monte Carlo computer code KENO, the continuous energy Monte Carlo Nuclear Particle computer code MCNP, and the continuous energy Monte Carlo computer code VIM.			
▸ Place new versions of the methods in the Radiation Safety Information Computational Center and continue top priority modification.			
▸ Conduct workshops on the systems for criticality safety analysis.			
▸ Complete work on stratified sampling.			
■ Guidance/Bounding Curves			
▸ Apply sensitivity/uncertainty methods to additional specific DOE fissile material operations and to simulate intermediate-energy range critical experiments.			
▸ Report on sensitivity/uncertainty methods results for the first set of bounding curves and data; and statistical methods for defining bounding margins of subcriticality.			
▸ Report on results for minimum critical parameters.			
▸ Document the standardized computer analysis for licensing evaluation system optimization sequence and release it to the Radiation Safety Information Computational Center for distribution.			
HQNP-NCSP	0	3,000	3,750

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

HQ-EM74 / Headquarters Program Integration

The activities funded in this Project Baseline Summary provide training at DOE nuclear weapons facilities and related sites under the Hazardous Waste Operations Emergency Response program. Funding also is provided for technical support in the areas of document review, program integration, *Accelerating Cleanup: Paths to Closure* plan initiative and other crosscutting activities.

- Continue the training at DOE nuclear weapons facilities and related sites under the Hazardous Waste Operations Emergency Response program.
- Accelerate site closure goals by enhancing *Paths to Closure* initiatives: identify opportunities for mortgage reduction; accelerate project efficiencies through "lessons learned" and "learning-curve" implementation; and maintain site closure goals by monitoring site critical paths and baselines.

HQ-EM74	9,182	8,108	9,081

HQ-EM75 / Environmental and Regulatory Analysis

The activities funded by this project functions as a team to promote cost efficiencies within the EM program by establishing effective lines of communication with programs and sites to identify and assist in resolving multi-site environmental and regulatory issues across the DOE complex. Acts as the National Environmental Policy Act Compliance Officer to promote cost effective compliance across the EM program.

- Establish and complete a collaborative decision-making process at Albuquerque and at least one additional DOE site to build trust and confidence between DOE and its State and the Environmental Protection Agency regulators and to assist in accelerating the closure of the site.
- Continue and complete LandTech implementation at the Idaho National Engineering and Environmental Laboratory and at the Grand Junction Project Office, that will provide a systematic, Internet-based approach for stakeholder and regulatory integration and decision-making during all phases of managing a site closure project.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Conduct analyses and reviews of the National Environmental Policy Act and Agreement-in-Principle documentation.			
HQ-EM75	1,501	518	300

HQ-TMHQ1 / Transportation and Packaging

The National Transportation program develops and maintains the DOE baseline transportation resources, including policy to assure the availability of safe, regulatory compliant, economical, efficient and timely transportation for DOE materials through: 1) the identification of transport needs of all the DOE programs, particularly in supporting EM focus on project acceleration and site closure; 2) resolution of transport issues at the program level; 3) maintenance of a corporate institutional program to interact with national and regional stakeholders; 4) vigorous examination of all projected DOE material flow; 5) conducting a forward-looking, aggressive transportation technology program to resolve complex transportation and packaging problems and address regulatory issues; and 6) operational management of all packaging and shipping activities both on- and off-site (excluding weapons and weapon components).

The Department's transportation and packaging activities are one of the most heavily regulated functions because of the hazardous materials (particularly radioactive) that are shipped. Noncompliance with regulations carries heavy penalties (both criminal and civil). Transportation is an area of public scrutiny due to the perceived hazards associated with the transportation of the DOE materials.

- Assure a safe and regulatory compliant transportation system and operations.
- Focus on implementation of baseline transportation and packaging requirements to support EM's *Accelerating Cleanup: Paths to Closure* plan, and apply transportation systems engineering to other DOE programs outside of EM.
- Provide transportation and packaging testing and materials infrastructure to respond to identified baseline requirements.
- Coordinate integrated transportation planning and operation functions with all Departmental elements.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Continue to provide a complex-wide system to ensure internal and external notification of high visibility shipments.			
■ Ensure efficient use of DOE packages through a packaging fleet management system.			
■ Use safety performance criteria to monitor the Department's transportation safety and as a basis for implementing specific operational safety assessments.			
■ Maintain a partnership with the Department of Transportation on performing safety assessments on motor carriers.			
■ Assure technological validity and consistency throughout the complex and provide national and international leadership for transport systems.			
■ Strengthen communications with DOE traffic managers and other programs to maximize effective transportation systems and operations.			
■ Maintain the Department's automated transportation system in support of efficient shipping and tracking throughout the complex. Focus will be on covering all the remaining smaller sites to get as close to 100 percent coverage as possible.			
■ Maintain an efficient regulatory compliance training program.			
■ Provide technical support to field and program offices and to state, tribal, and local governments in preparing for and executing hazardous materials shipping campaigns.			
■ Provide transportation focused forums and communications, with internal program activities and external stakeholders, to identify and resolve transportation issues and participate in specific transportation shipment planning.			
■ Coordinate with the Office of Emergency Management to provide technical assistance initiatives to national and regional stakeholders.			
■ Maintain a corporate transportation information resource center and provide information products and tools to DOE managers, contractors, other Federal agencies, and external parties.			
HQ-TMHQ1	10,509	11,918	11,753

(dollars in thousands)

FY 1998	FY 1999	FY 2000

HQ-EM-HQ-001 / Emergency Management

The Emergency Management Program consists of two programs: Transportation Emergency Preparedness and the Facilities Emergency Preparedness Emergency Management assures that planning, training, and resources are available for the protection and safety of our workers; State, Tribal, and local emergency responders; the public; and the environment in the event of an operational emergency at an EM facility or during the transportation of hazardous materials.

The Transportation Emergency Preparedness Program, a Department-wide program, is designed to ensure that State, Tribal, and local emergency responders have access to the planning, training and resources necessary to respond to transportation accidents involving unclassified, non-weapons shipments of the DOE radioactive materials, and directly supports the accomplishment of priority DOE shipping goals. Shipping activities will increase as defined in the *Accelerating Cleanup: Paths to Closure* plan. The Transportation Emergency Preparedness Program will continue to address the issues raised by stakeholders along the transportation corridors.

The Transportation Emergency Preparedness Program: 1) ensures that DOE meets its transportation emergency responsibilities under federal regulations, the National Contingency Plan, and the Federal Radiological Emergency Response Plan; 2) addresses State, Tribal, and local government concerns about emergency preparedness for DOE radioactive material shipments; 3) coordinates DOE-wide transportation emergency preparedness activities for nonweapons-related radioactive material shipments, and 4) supports emergency responders at all levels of government. Emergency preparedness is the number one concern identified by stakeholders in DOE's shipping campaigns. Also, the Transportation Emergency Preparedness Program activities reinforce DOE's and EM's commitment to openness and full participation, leading to greater public understanding, confidence, and cooperation with EM cleanup and waste activities.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The Facilities Emergency Preparedness Program is designed to ensure that both Headquarters and field elements can respond effectively to an operational emergency at an EM facility, as required by DOE Order 151.1. This program provides a system for ensuring EM Headquarter personnel are prepared to provide technical expertise and/or programmatic assistance when an emergency is reported and provides assurance to EM Headquarter senior management personnel that facilities/sites under the purview of EM have adequately addressed emergency preparedness requirements. Planning and assistance activities are conducted by the Facilities Emergency Preparedness Program to establish and maintain a capability to respond to an emergency at an EM facility.			
■ Implementation of the Transportation Emergency Preparedness Program will begin with the eight DOE Regional Coordinating Offices participating; will address emergency management issues raised by stakeholders along DOE transportation corridors; and will update required emergency responder training.			
■ Joint Headquarters and field planning and drill activities will continue to assure effective response in the event of an operational emergency.			
■ The Regional Transportation Emergency Preparedness Program planning and training assistance programs will be in place to provide necessary support to States, Tribes, and local responders.			
■ Emergency planning documents will be updated to ensure an adequate and integrated Headquarters and field response to operational emergencies at EM facilities.			
■ A facility verification program will be developed to ensure adequate emergency response capabilities.			
HQ-EM-HQ-001	3,259	3,218	2,849

(dollars in thousands)		
FY 1998	FY 1999	FY 2000

ID-CMP-001 / National Analytical Management Program

This program is responsible for supporting all EM programs to assure that credible, cost-effective sampling, and analytical needs are met, and the data vital for making decisions regarding waste management and environmental remediation meet the needs of EM, regulators, and the public. The program provides:

- Guidance, training, and technical assistance to field sites in applying streamlined data planning, such as the Data Quality Objective process and Streamlined Approach For Environmental Restoration, across all EM environmental characterization operations, and to assure appropriate data validation and data conformance with regulatory demands;
- Guidance to the field in establishing and maintaining cost-effective sampling and analytical Quality Assurance programs;
- Operations of proficiency testing programs that serve as the basis for evaluating the capabilities of radiochemistry/mixed waste analytical laboratories;
- Assistance in establishing an integrated Field Sample Management program at each operations office to centralize and optimize business management of field characterization systems, and to consolidate and privatize, where appropriate, analytical laboratory capacity to meet DOE analytical needs; and
- Guidance for standardizing contracting for analytical services and standardizing specifications for automated data management and review processes that save substantial time and money. Part of these activities are being carried out in response to the General Account Office Report No. RCED-95-118 "Nuclear Facility Cleanup, Centralized Contracting of Laboratory Analysis Would Produce Budgetary Savings."

- The Department of Energy will collaborate with the Environmental Protection Agency in conducting technology demonstration of environmental decision support software, which focus on environmental decision support.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Will privatize the laboratory accreditation process.			
■ Will finalize the DOE Electronic Data Deliverable format for environmental analytical data.			
■ Will position itself to address the changing needs in analytical services from characterization to decontamination and decommissioning, and long-term monitoring.			
ID-CMP-001	5,205	3,000	3,000

OPS/HQ-PP / Pollution Prevention

The Department's pollution prevention mission is to reduce or eliminate all wastes and pollutants in order to minimize the impact of the Department's operations on the environment, to reduce operational cost, and improve the safety and health of its operations.

Pollution prevention is the Department's preferred approach to reducing waste, mitigating health risks, and protecting the environment, in accordance with the Pollution Prevention Act of 1990. This was evidenced by the Secretary's May 1996 establishment of aggressive source reduction, recycling, and affirmative procurement goals, to be achieved by the end of 1999. Pollution prevention applied within EM can significantly reduce wastes, allowing the cost savings to be used to accelerate the cleanup effort. As in industry, pollution prevention is a core program that helps DOE achieve maximum environmental benefits.

The DOE/EM pollution prevention program directly addresses the fifth Environmental Management *Accelerating Cleanup: Paths to Closure* principle to reduce generation of wastes.

- Maintain effective and compliant pollution prevention programs at over twenty DOE sites to comply with Federal and State laws and regulations related to pollution prevention and waste minimization.
- Prepare annual Waste Generation and Pollution Prevention Progress Report. This report is required to comply with the Programmatic Environmental Impact Statement Lawsuit Settlement and recent Pollution Prevention Executive Orders.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Establish nation-wide pollution prevention teams to assist sites in identifying pollution prevention and cost saving opportunities. The teams will focus on sites with less mature pollution prevention programs and are expected to identify potential savings. Continue gathering data on pollution prevention successes across the complex and distribute the information to all DOE sites to encourage wider applications of demonstrated practices.			
OPS/HQ-PP	23,575	12,790	7,138
Subtotal, Multi-Site	102,315	76,268	67,978

HQ-9999-01 / Federal Contribution to UE D&D Fund Appropriation Account

The Energy Policy Act of 1992 created the Uranium Enrichment Decontamination and Decommissioning Fund to pay for the cost of cleanup of the gaseous diffusion facilities located in Oak Ridge, Tennessee; Paducah, Kentucky; and Portsmouth, Ohio. The Fund also covers the Federal cost to reimburse operating uranium or thorium processing site licensees for the costs of their environmental cleanup at those sites, subject to a specific reimbursement limit. This payment is to cover the Federal government's share of cleanup being carried out at active uranium and thorium processing sites. The Department compensates site owners on a per-ton basis for the restoration costs for those tailings attributable to the Federal government. The Act authorizes annual Fund contributions of $480,000,000, adjusted for inflation, from two sources: up to $150,000,000 from a special assessment on domestic utilities based on the ratio of their separative work unit purchases from the Department to total purchases from the Department including those produced for defense purposes, with the remainder of required funding to come from Government appropriations. The purpose of this activity is to provide the annual Government contribution.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Provide the FY 2000 Federal Government contribution.			
HQ-9999-01	388,000	398,088	420,000
Total Multi-Site Activities	490,315	474,356	487,978

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
HQ-PM-001 / Policy and Management	
■ Overall decrease due to reduction/elimination of lower priority activities ($11,631,000) funded at Headquarters and curtailment support to the National Environmental Training Office and strategic planning activities ($657,000). Key increases are required to support the Citizen Monitoring and Technical Assessment Fund ($5,000,000), to fully fund the cooperative programs with ten Indian Nations or pueblos ($1,500,000); and to conduct Post 2006 implementation review and correct deficiencies that surface during the year ($1,445,000).	-4,343
HQ-WM001 / Waste Management	
■ Reduction in funds slightly reduces performance of technical analyses to evaluate complex-wide integration opportunities.	-118
HQ-100-AA / Technical Support to ER	
■ Environmental restoration crosscutting efforts in the areas of performance measure tracking, information/data management integration and project reviews/analysis are slightly reduced.	-30

	FY 2000 vs. FY 1999 ($000)
HQ6002 / Support to Transition Activities	
■ Increase in funding will support the International Institute of Applied Systems Analysis to perform research and to support the Arctic Military Environmental Corporation program.	882
HQNP-NCSP / Nuclear Criticality Safety Program	
■ Increase is driven by the Defense Nuclear Facilities Safety Board Recommendation 97-2 and supports current scope of work as agreed to by other Departmental organizations.	750
HQ-EM74 / Headquarters Program Integration	
■ Increase in funding will fully support the training for DOE nuclear weapons facilities and related sites under the Hazardous Waste Operations Emergency Response program and technical support in the areas of document reviews. Site baseline assessments and crosscutting activities are slightly increased.	973
HQ-EM-75 / Environmental and Regulatory Analysis	
■ Decrease reflects fewer collaborative decision-making processes at different sites with EM presence than was originally anticipated. Additionally, Environmental Management will focus on LandTech implementation at fewer sites than was originally anticipated.	-218
HQ-TMHQ1 / Transportation and Packaging	
■ Decrease in funding is due to a reduction of activities in the institutional coordination area.	-165
HQ-EM-HQ-001 / Emergency Preparedness Program	
■ Decrease in funding is due to completion of the Transportation Emergency Preparedness policy documents in FY 1999 (DOE Order 151.1 Chapter and Guide) and the redesign of the National Transportation Emergency Responder training program.	-369
OPS/HQ-PP / Pollution Prevention	
■ Decrease reflects the Department's expectation of savings from a more efficient Pollution Prevention program as a result of increased pollution prevention accountability by waste generators and successes in building pollution prevention into the Department's operation culture.	-5,652

	FY 2000 vs. FY 1999 ($000)
HQ-9999-01 / Federal Contribution to UE D&D Fund Appropriation Account	
■ Increase in the Federal Contribution to the Uranium Enrichment Decontamination and Decommissioning Fund Appropriation account supports the level required by the Energy Policy Act of 1992, adjusted for inflation.	21,912
Total Funding Change, Multi-Site	13,622

Capital Operating Expenses & Construction Summary

Capital Operating Expenses

(dollars in thousands)

00-D-401, Spent Nuclear Fuel Treatment and Storage Facility, Preliminary & Final Design (Title I & II), Savannah River Site, Aiken, South Carolina (SR-SF09)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin)

Significant Changes

- None.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 2000 Budget Request *(Preliminary Estimate)*	1Q 2000	4Q 2002	NA	NA	18,500 *	28,400 *

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
2000	7,000	7,000	5,000
2001	8,500	8,500	9,000
2002	3,000	3,000	4,500

* Preliminary Cost Estimates for the 105-L Treatment and Storage Facility project are based upon the Pre-Conceptual Design dated 3/12/98 as modified by DOE-SR. Design completion is less than 1 percent. The preliminary estimates are: Total Estimated Cost – $154,233,000 and Total Project Cost – $239,879,000. NOTE: Other Project Costs of $9,900,000 are expected during the design only construction project line item. **These estimates are used for the purpose of requesting design funding only. Future construction funding (if requested) will be based upon approximately 35 percent design complete cost estimate and funded as a separate construction line item.**

3. Project Description, Justification and Scope

The Department of Energy Environmental Management Program has the responsibility for the safe, effective, and efficient storage of the current and future inventory of DOE-owned spent nuclear fuel. This spent nuclear fuel, including the returned foreign research reactor and domestic research reactor spent nuclear fuel, will be prepared for disposal and stored in a road-ready condition awaiting placement in a permanent geologic repository. In accordance with the DOE Spent Nuclear Fuel Programmatic Environmental Impact Statement Record of Decision, the Savannah River Site is designated to manage the aluminum clad spent nuclear fuel inventory for the DOE complex, as well as projected receipts for the next 30 to 40 years.

Funding is requested to perform preliminary and final design, (Title I and Title II), of the project, including vendor supplied engineered equipment design. No funding for Title III design or construction activities is requested.

Recent evaluations have confirmed the technical feasibility and potential cost savings for the reuse of the 105-L facility for housing the Treatment and Storage Facility project. Implementation of this approach is projected to save between $100 to $300 million compared to conventional reprocessing of spent nuclear fuel. The project consists of direct de-inventory of the existing wet basins to repository-ready storage via transfer and treatment provisions installed in the 105-L Reactor building. Summary features of the project are:

- Continued receipt at L-Area Disassembly Basin of DOE-owned aluminum clad spent nuclear fuel from Domestic and Foreign Research Reactors using existing equipment. Existing cask decontamination equipment in the Stack Area will also be used.
- Preparation of the spent nuclear fuel for disposal at a national repository using the melt and dilute treatment technology, with new furnaces and associated support equipment, including offgas system, installed in the 105-L process room. Spent nuclear fuel will be transferred to the process room from the L-Area Disassembly Basin via the Deposit and Exit canal using a modified Deposit and Exit conveyor.
- Load treated spent nuclear fuel into a canister/transfer cask, and perform sealing and leak testing operations using new transfer cell and canister preparation equipment installed in the existing Crane Maintenance Area.
- Load transfer cask onto a special transporter in the Stack Area using the existing crane. Transfer the canister of treated spent nuclear fuel to dry interim storage, consisting of a modular storage system installed outside the 105-L building.
- Load canisters of treated spent nuclear fuel into transportation casks for transport off the Savannah River Site for storage or disposal.

In general, the project will make use of existing structures, systems, or components where possible, and add new structures, systems, or components where necessary.

PRELIMINARY ACQUISITION STRATEGY

The Treatment and Storage Facility project implementation strategy consists of two separate line items; an FY 2000 design only construction line item and an FY 2003 construction and start-up line item.

The design only line item was validated in April 1998 and the construction line item will be validated in April 2001.

The goal of the design only project is to provide a well established baseline for the construction estimate and contract. It is planned that the construction project will be validated based upon approximately 35 percent design complete.

The procurement process for engineered equipment will be integrated with the design only project to the extent necessary to allow incorporation of vendor design information into the overall design project. The vendor design process, up through approval of design drawings, will be included in the design only project scope; actual procurement of the engineered equipment will be part of the construction line item scope.

The use of on-site construction forces will be considered, via a documented make or buy process, for those portions of construction activities inside the 105-L facility. Some large activities (e.g., roof repair, outside Disassembly and Removal activities) will be subcontracted by the management and operating contractor, however, contamination levels, security requirements, and operating facility interface requirements limit the opportunity for cost-effective fixed price construction contracts for most of the projected work within the 105-L facility. The use of contracted-out architect/engineer design services will be considered for the dry storage facility.

PROJECT RISKS

The primary risks that could impact the cost and/or schedule of the Treatment and Storage Facility project, if not properly mitigated, are highlighted below, along with planned or existing mitigation activities. However, significant development work and independent reviews have been conducted over the past three years to better define and understand the proposed project. For example, technology development is nearing completion having been validated through bench scale and small scale testing using surrogate materials. The concept has also been validated by third party small scale testing (Argonne National Laboratory) using irradiated samples. Through a Memorandum of Understanding with the Savannah River Site, the Nuclear Regulatory Commission is conducting an ongoing review of the research and development results to ensure that any technical issues are identified and addressed early in the process. In a June 1998 letter report, the Nuclear Regulatory Commission concluded that melt and dilute would be an acceptable concept for geologic disposal of aluminum-based spent nuclear fuel. As final proof-of-concept, Savannah River is preparing an L-Area pilot demonstration, in production form, using actual spent fuel assemblies.

- 105-L Configuration Control

  Lack of an accurate baseline of the existing facility configuration could impact project cost and schedule if not identified until after construction activities begin. Current project plans include an early effort prior to definitive design, including walk downs, to establish an accurate configuration baseline for the project

- Technology Risks

  It is assumed that the technology selected in the Environmental Impact Statement Record of Decision will be melt and dilute. If the alternate technology, direct/co-disposal is selected, the scope of this project will change, including elimination of equipment for treatment, increased characterization equipment and larger dry storage capacity. The Record of Decision is expected in mid 1999 in advance of design activity.

  Offgas system uncertainties and secondary waste stream identification and disposition are the remaining components of technology risk. The centerpiece of the mitigation strategy is the Technology Development program being conducted by the Savannah River Technology Center. Program milestones include the following:

Process Development/Final Technology Report	June 1998
Issue Technical Performance Requirements	July 1998
Performance Requirements Validation	Sept 2000

  Testing of irradiated spent fuel to validate the Functional Requirements is scheduled to be accomplished in FY 2000 in the L-Area pilot demonstration. While there is some risk that this final testing could result in changes to the Functional Requirements, primarily in the area of offgas engineering, this information would be available in sufficient time to be factored into the initial design.

  Acceptance criteria for the Technology Development program have been based on preliminary requirements established by DOE-Office of Civilian Radioactive Waste Management for the geologic repository. Changes to the disposal requirements may impact the Technical Performance Requirements for the Treatment and Storage Facility project. However, EM is working closely with the Office of Civilian Radioactive Waste Management during their development of performance requirements to ensure, to the extent possible, that the melt and dilute disposal form will meet the final repository acceptance requirements as eventually approved by the Nuclear Regulatory Commission.

  Although the technology development program is funded separately from the Treatment and Storage Facility project, it is directed by the same program management organization. This will ensure that the project is, and will continue to be, closely integrated with the technology development program.

- Regulatory/Design Basis Risk

  Potential future movement toward the Nuclear Regulatory Commission regulation of DOE nuclear facilities presents a cost and schedule risk to the Treatment and Storage Facility project, which is currently planned and estimated as a DOE regulated facility. However, the new construction portion of the project (e.g., the dry storage facility) will be constructed to Nuclear Regulatory Commission licensing standards.

- Acquisition Strategy Risk

  The Treatment and Storage Facility project will be accomplished under separate design only and construction projects in FY 2000 and FY 2003, respectively. The design only process will be accomplished in two parts: non-process related (interim dry storage modules and support utilities) which will begin in early FY 2000, and melt and dilute process design integration into the 105-L facility - which will begin later in the fiscal year with input from the L-Area pilot demonstration as discussed above. Both design efforts will be integrated into validating/baselining the FY 2003 construction project.

- Design Maturity Risk

  Design maturity risk is minimal for the design project as a result of previous technology development work, input to be received from the L-Area pilot demonstration, and the standard nature of the design for the dry storage facility. As a result of the two-phased acquisition strategy, subsequent validations of the construction project will be based on a more mature design effort (e.g., 35 percent design completion).

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (81.1% of total estimate cost (TEC))	15,000	NA
Design management costs (1.6% of TEC)	300	NA
Project management (design) (1.1% of TEC)	200	NA
Total, engineering, design, inspection and administration of construction costs (83.8% of TEC)	15,500	NA
Contingencies		
Design phase (16.2% of TEC)	3,000	NA
Total, contingencies (16.2% of TEC)	3,000	NA
Total, line item costs (TEC)	18,500	NA

5. Method of Performance

Design shall be performed under a negotiated architect or engineer contract supported by operating contractor engineering for existing SSC's.

6. Schedule of Project Funding

2002	0	0	3,165

3. Project Description, Justification and Scope

As part of the Tank Waste Remediation System Privatization Phase I Contract, the United States Department of Energy committed to deliver key utilities and service to the privatization contractor's Low Activity Waste treatment facility. This project will provide the necessary site infrastructure and interface function to meet the commitments. The privatization facility will be located near the southeast corner of the 200 East Area in an area formerly identified for low activity waste grout storage/disposal.

Electrical service (normal power) of up to 20mW will be provided to the privatization facility through a new 230-13.BkV substation located in the 200 East Area.

Raw water, fire suppression and potable water services will be provided the privatization facility through the extension and upgrading of existing 200 East Area water systems.

Effluent transfer piping for non-dangerous effluents will be constructed and installed between the privatization facility and existing liquid effluent piping systems serving the 200 East Area Treated Effluent Disposal Facility and the Liquid Effluent Retention Facility along the east perimeter of the 200 East Area.

Other subprojects provide new roadway construction, extension of temporary power and of raw water to the privatized site and other tasks to prepare the site for eventual privatization construction activities (January 2000) and operations (June 2002). This task will also include the closure and/or replacement of selected wells on the site, rough surface contouring, habitat mitigation, establishment of a site characterization baseline and the development of selected areas for utility corridors and roadways.

The project is essential to supporting numerous Tri-Party Agreement milestones related to pretreatment and immobilization of Low Activity Tank Waste; specifically, those associated with the construction and operations of the Phase I Low Activity Waste facilities, M-60-11, "Start of construction of two (2) Phase I Low Activity Waste facilities..." and M-60-12, "Start operation of two (2) contractor-owned...Phase I Low Activity Waste facilities..." However, the Department decided to proceed with only one treatment facility.

Startup and testing activities will be completed when the liquid effluent transfer lines become operational in FY 2001. All other utilities/service upgrades will be completed in FY 2000. Final roadwork, topping, etc. will be deferred until the privatization contractor has completed construction in FY 2002.

The FY 2000 appropriation will be used to finalize site development and installation of construction utilities, turnover of the site to Privatization Contractor, and finalize construction of production utilities.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (2.1% of total estimated cost (TEC))	650	650

3. Project Description, Justification and Scope

The Tank Farm Restoration and Safe Operations project will provide upgrades for selected tank farm instrumentation control, tank ventilation, waste transfer, and electrical systems in order to restore these systems to an acceptable design basis. Phase I of the project focuses primarily on improvements needed to support waste disposal privatization and routine operations of existing double-shell tank farm facilities (i.e., "Manage Tank Waste") during the Tank Waste Remediation System mission, but also supports initiatives related to single-shell tank stabilization. This project is integrated with other planned/ongoing upgrades, waste retrieval, and major maintenance activities to ensure that the combined upgrades are performed in a cost-effective manner and that they will adequately support the overall Tank Waste Remediation System mission.

The Tank Farm Restoration and Safe Operations Major System Acquisition will provide major upgrades to Hanford's existing Tank Farm facilities in the following areas:

- Instrumentation

  Existing primary tank monitoring instrumentation in the double-shell tank farms will be modified and upgraded for level, temperature, and vapor pressure measurement. The double-shell tank waste transfer system will be upgraded for routine verification and waste transfer verification. The leak

detection system associated with the annulus, leak detection pit, and process/support pits in these tank farms will be upgraded. The master pump shutdown system and associated alarms will also be upgraded. All new instrumentation/control equipment will be capable of providing remote readout and/or alarm at selected manned facilities, resulting in a significant reduction in the amount of manual field data collection in the double-shell tank farms, thereby improving worker efficiency and reducing worker stay time in the radiation zones (implementing an as low as reasonably achievable {ALARA} principle). No new single-shell tank instrumentation is planned to be provided by this project.

- Tank Ventilation

The project will replace the existing primary ventilation systems for Tank Farms 241-AN, -AP, and -AW with new, high-capacity exhaust filtration systems. A new exhaust stack, along with stack effluent monitoring and ventilation control equipment, will be included in these upgrades. New seal pots and associated condensate piping will be installed to support the collection of condensate from the new ventilation systems and return it to the primary tank system. The ventilation systems will be designed to facilitate future installation of additional effluent control equipment, if needed. The project also will provide a new annulus ventilation system for the 241-SY Tank Farm, and replacement ventilation systems for the 244-A and 244-S Double Contained Receiver Tank facilities. The new annulus and primary ventilation systems will be connected to existing underground ductwork. Existing filter trains replaced by this project will be removed and disposed.

The ventilation upgrades will improve worker safety and reduce the risk of radioactive and/or hazardous material releases to the environment by providing improved confinement and monitoring of tank emissions. New off gas treatment/filtration systems and effluent monitoring systems will be provided to ensure compliance with applicable Federal, State, and local emission standards.

- Waste Transfer

New valve manifold assemblies will be provided in selected pits used for the double-shell tank waste transfer operations. In addition, the project will install three new transfer routes (pipe-in-pipe configuration, equipped with appropriate leak detection and cathodic protection capabilities) in the "A Farm Complex" (200 East Area), and three existing transfer lines will be replaced with new lines. Existing pits used for the double-shell tank waste transfer operations will have special protective coating applied to the walls, floor, and underside of cover blocks to provide a decontaminable surface and support compliance with regulatory requirements for secondary containment. New transfer systems will be fully compliant with Resource Conservation and Recovery Act requirements and with Washington State regulations governing hazardous waste handling.

4. Details of Cost Estimate

	(dollars in thousands) Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (15.4% of total estimated cost (TEC))	35,850	48,640
Design management costs (0.0 % of TEC)	0	0
Total, Engineering, design, inspection, and administration of construction costs (15.4% of TEC)	35,850	48,640
Construction phase		
Buildings and improvements to land	130	130
Specialized equipment	97,930	88,120
Other (major utilities/comp items, specialized facilities, etc.)	4,510	4,510

Total, construction costs	154,940	142,150
Contingencies		
Design phase (2.8% of TEC)	6,450	7,900
Construction phase (15.4% of TEC)	35,460	34,010
Total, contingencies (18.0 % of TEC)	41,910	41,910
Total, line item costs (TEC)	232,700	232,700

5. Method of Performance

The Project Hanford Management Contractor will be responsible for overall project management and integration services for the Tank Farm Restoration and Safe Operations project, as well as for coordination of permitting and safety analysis work in support of the project. Definitive design, inspection, and construction management activities will be performed by the contracted Engineer/Constructor Contractor. Construction work in radiologically contaminated areas, utility tie-ins, and demolition work will also be performed by the Engineer/Constructor. To the extent feasible, construction in uncontaminated areas and procurement shall be accomplished by fixed-price contracts awarded on the basis of competitive bidding. Burial of contaminated materials, health physics technician support, and startup testing/readiness review support will be performed by the Project Hanford Management Contractor.

6. Schedule of Project Funding

94-D-407, Initial Tank Retrieval Systems, Richland, Washington (RL-TW04)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

- Determination which of Hanford's twenty-eight double-shell tanks will receive retrieval systems by this project has been revised to reflect programmatic requirements supporting Phase I privatization. Two tanks have been removed from the project: one because only supernate liquids are to be transferred from the tank, eliminating the need for mixer pumps; and another because of issues requiring further research and development related to mixing waste with failed equipment lying on the bottom of the tank. A tank that will receive waste returning from the privatized treatment facility has been added to the project.
- The schedule has been revised to meet programmatic requirements supporting Phase I privatization.

2008	0	0	15,400
2009	0	0	1,249

3. Project Description, Justification and Scope

The Initial Tank Retrieval Systems project will provide mixing and pumping systems for retrieval of radioactive wastes from ten of Hanford's 28 double-shell tanks. The contents of these tanks consist of supernatant liquids and settled solids, which must be mixed prior to transferring the waste to treatment facilities or alternative storage. The Initial Tank Retrieval Systems will provide systems to mobilize settled solids and transfer wastes out of the tanks to provide feed to future processing plants, and allow near-term consolidation of tank wastes to restore useable double-shell tank storage capacity. This double-shell tank storage space is required to allow safe storage of alternate waste streams, such as waste from the single-shell tanks. Additionally, the dilution and waste removal capabilities provided by Initial Tank Retrieval Systems will remediate the flammable gas issue in several of the flammable gas watch list double-shell tanks.

Existing equipment installed in the double-shell tanks only allows the removal and transfer of supernatant liquids, and is incapable of suspending and removing the settled solids. Without the waste mixing, dilution, and removal functions provided by the Initial Tank Retrieval Systems, there will be no ability to provide feed to future processing plants, consolidate waste solids, and remediate flammable gas issues.

The typical retrieval system for the ten tanks consists of 300 horsepower mixer pumps to mobilize solids in the tank and a transfer system for removal of the tank contents. Tank internal components, such as thermocouple trees, will be replaced with higher strength equipment to withstand the forces induced by the mixer pumps. Monitoring and control systems will be installed to measure performance of the mixer pumps and tank operations. Remote decontamination equipment and disposable containment equipment will be utilized for removal and disposal of tank components.

The FY 2000 budget request will be used for continuing design of three retrieval systems and associated project management.

4. Details of Cost Estimate [a] [b]

	(dollars in thousands) Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (12.6% of total estimated cost (TEC))	25,520	25,520
Design management costs (3.6 % of TEC)	7,250	7,250
Total, Engineering, design, inspection, and administration of construction costs (16.2% of TEC)	32,770	32,770
Construction phase		
Buildings and improvements to land	1,380	1,380
Specialized equipment	79,590	79,590
Other (major utilities/comp items, specialized facilities, etc.)	24,570	24,570
Removal cost less salvage	5,630	5,630
Project management	4,900	4,900
Inspection, design and project liaison, testing, checkout and acceptance	10,910	10,910
Construction management (3.3% of TEC)	6,750	6,750
Total, construction costs	133,730	133,730
Contingencies		
Design phase (2.8% of TEC)	5,630	5,630
Construction phase (14.8% of TEC)	29,870	29,870
Total, Contingencies (17.6 % of TEC)	35,500	35,500
Total, line item costs (TEC)	202,000	202,000

5. Method of Performance

The project is managed for Richland by the Project Hanford Management Contractor.

[a] Estimate is based on the Title I design estimate, dated January 1996 and as modified to incorporate change requests and modification of the list of tanks to receive retrieval systems to meet the Waste Feed Delivery mission.

[b] Escalation rates were calculated from the February 1995 update of the economic escalation price change indices for DOE construction projects by the "Office of Infrastructure Acquisition, FM-50".

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project cost						
Facility Cost						
Design	10,422	4,771	4,100	4,060	15,047	38,400
Construction	2,128	2,950	0	0	158,522	163,600
Total facility costs (Federal and Non-Federal)	12,550	7,721	4,100	4,060	173,569	202,000
Other project costs						
Conceptual design cost	1,609	0	0	0	0	1,609
NEPA documentation costs	10	0	0	0	0	10
Other project-related costs	4,884	1,480	1,150	4,600	13,367	25,481
Total other project costs	6,503	1,480	1,150	4,600	13,367	27,100
Total project costs (TPC)	19,053	9,201	5,250	8,660	186,936	229,100

7. Related Annual Funding Requirements

(FY 2005 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs (staff, utilities, etc.)	250	250
Annual facility maintenance and repair costs	50	50
Total related annual funding (*operating from FY 2005 through FY 2018*)	300	300

93-D-187, High-Level Waste Removal from Filled Waste Tanks, Savannah River, Aiken, South Carolina (SR-HL12)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin.)

Significant Changes

- Tank Farm Support Service Upgrades scope of work has been adjusted to facilitate improved project management and work execution between this line item project and project 99-D-402, "Tank Farm Support Services, F Area".
- All F Tank Farm Support Service Upgrade work scope has been transferred to project 99-D-402.
- All H Tank Farm Support Service Upgrade work scope has been consolidated into this line item project.
- The planned rebaselining of this line item project will reflect the scope deletions and additions. This rebaselining is currently scheduled for completion in the second quarter of FY 1999. Revised total estimated cost/total project cost annual spending projections will be made as part of the FY 2001 Budget submission.
- FY 2000 funding request does not include allowance for Salt Disposition Process Upgrades. Alternative studies are underway to determine the best approach. Additional funding will be requested when the approach decision is made.

54-291 99 - 71

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1993 Budget Request *(Title I Baseline)*	2Q 1993	1Q 1994	3Q 1994	4Q 1999	86,500	88,640
FY 1994 Budget Request *(Title I Baseline)*	"	"	"	"	"	"
FY 1995 Budget Request *(Title I Baseline)*	1Q 1979	4Q 1999	2Q 1980	3Q 2005	602,700	991,446
FY 1996 Budget Request *(Title I Baseline)*	"	2Q 2006	"	4Q 2008	565,050	828,238
FY 1997 Budget Request *(Title I Baseline)*	"	"	"	"	"	"

FY 2000 Budget Request *(Current Baseline Estimate)*	"	"	"	"	"	"

2. Financial Schedule

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Costs
Design			
1993	0	0	0
1994	70,000 [a]	70,000	70,000
1995	6,269 [a]	6,269	6,269
1996	4,016	4,016	4,016
1997	4,415	4,415	4,415
1998	4,500	4,500	5,106
1999	5,781	5,781	5,781
2000	1,000	1,000	1,000
Outyears	43,026	43,026	42,420
Construction			
1993	2,000 [a]	0	0
1994	116,802 [a]	118,802	114,117
1995	16,406 [a b]	16,406	18,964
1996	15,684	15,684	11,364
1997	8,585 [c]	8,585	13,785
1998	13,720 [d]	13,720	12,101
1999	9,433	9,433	9,433
2000	7,987	7,987	7,987
Outyears	228,426	228,426	231,292

[a] This represents the operating expense funded costs through FY 1994 of the three previously operating expense funded projects. Also, represents the actual operating expense funded costs through FY 1994. Previously reported operating expense costs of $192,420,000 were an estimate. The adjustment of $8,618,000 reflects the difference between the estimated value and actual value ($183,802,000). The original appropriation was $3,000,000.

[b] Use of current year ($1,700,000) funds for Productivity Savings and ($2,150,000) for FY 1995 rescission.

[c] Reflects use of prior year funds to meet uncosted offset to FY 1997 appropriation. Project total estimated cost is reduced as a result due to better than expected fixed-price contract costs.

[d] Reflects FY 1998 reprogramming of $700,000. The original appropriation was $17,520,000.

3. Project Description, Justification and Scope

The purpose of this project is for removal and processing of waste which is essential for maintaining the Defense Waste Processing Facility operations to meet Federal Facilities Compliance Agreement, waste processing commitments, and Savannah River Site commitments to minimize high-level liquid waste in storage, and to provide support for continued waste receipts. This project supports the Federal Facilities Agreement commitment to discontinue the use of waste tanks which do not provide adequate secondary containment (Type I, II, and IV tanks).

The High-Level Waste Removal from Filled Waste Tanks line item project is broken into two subprojects. The first subproject, S-W183 "Waste Removal" provides the facilities necessary to remove waste from tanks and the second subproject, S-7719 "Processing Facility Upgrades" provides processing upgrades required to support future processing requirements. It is expected that additional subprojects will be added over the life of the High-Level Waste System.

The Waste Removal subproject had previously been divided into four subprojects (S-2081, Waste Removal Phase II; S-3291, Type III Tank Salt Removal, Tank Salt Removal Phase I; S-2860, Type III Tank Salt Removal Phase II; and S-3025, Waste Removal Facilities Phase III) with additional scope slated to be added in the future. These subprojects were combined into one single subproject "Waste Removal" to reduce project management/project control requirements via implementation of a simpler and more efficient work breakdown structure. In general, the waste removal facilities include slurry pumps, transfer pumps, transfer jets, structural support steel and associated instrumentation, and distributed control systems. The project will provide equipment so that salt and/or sludge can be removed and transferred to either Salt Processing or Extended Sludge Processing for eventual feed to the Defense Waste Processing Facility. The waste removal process will be performed and funded by operating funds. The project, however, will provide the modifications to tank systems and services, as necessary, to isolate tanks from the waste removal process prior to tank closure.

The FY 2000 funds for this project will support design and construction consistent with the High-Level Waste System Plan, including completion of the West Hill engineering and inspection upgrades construction, initiation of design for tanks 7F and 11F, and continue engineering and inspection upgrades for H Area.

The waste removal facilities for nine additional Type III F and H tanks will be added to Waste Removal subproject in the rebaselining efffort.

The "Processing Facilities Upgrade" subproject S-7719 will include facility modifications to Defense Waste Processing Facility, Salt Processing, Saltstone, and Effluent Treatment Facility in order to allow the efficient processing of salt and sludge waste through the High-Level Waste System. These upgrades have not been fully defined and will be necessary throughout the life of the High-Level Waste System. The first of these upgrades includes upgrades in Defense Waste Processing Facility to support the processing of higher curie content sludge. Salt Disposition alternative studies are underway to determine the best approach. The next upgrade will implement the recommendations from the salt disposition alternative studies that are underway to determine the best approach to salt processing from a safety, cost, and schedule standpoint. It is expected that other process modifications will be required in the future.

If funds are not appropriated for this project, the plant will not meet the required Federal Facilities Agreement and Site Treatment Plan regulatory commitments and Defense Waste Processing Facility will not have the feed necessary to operate.

4. Details of Cost Estimate [a]

(dollars in thousands)

	Current Estimate	Previous Estimate
Design phase		
Preliminary and final design costs (20.7% of total estimated cost (TEC))	115,525	122,468
Design management costs (1.3% of TEC)	7,374	0
Total, engineering, design, inspection, and administration of construction costs (22.0% of TEC)	122,899	122,468
Construction phase		
Buildings & improvements to land	6,936	6,936
Specialized equipment	213,163	212,732
Other (major utilities/comp items, specialized facilities, etc.)	96,798	96,798
Removal cost less salvage	12,000	12,000
Inspection, design and project liaison, testing, checkout and acceptance	21,952	21,984
Construction management (3.5% of TEC)	19,636	19,667
Total, construction costs	370,485	370,117
Contingencies		
Design phase (2.9% of TEC)	16,108	38,332
Construction phase (8.7% of TEC)	48,558	27,133
Total, contingencies (11.6% of TEC)	64,666	65,465
Total, line item costs (TEC)	558,050	558,050

5. Method of Performance

Design will be performed by Bechtel Savannah River design engineering and a project engineering services contract or a fixed-price subcontract. Construction and procurement will be accomplished utilizing fixed-price subcontracts awarded on the basis of competitive bidding, where possible.

---

[a] The cost estimate basis for this project is a combination of Title I and Conceptual Design Report estimates. Costs and schedule for the nine additional tanks are not included in this estimate but will be included in the rebaselining effort.

The DOE escalation rates (percent per year) used for this estimate are as follows: FY 1993-2.4%; FY 1994-2.5%; FY 1995-3.5%; FY 1996-3.5%; FY 1997 3.5%; FY 1998 3.5%; FY 1999 3.3%; FY 2000 3.3%; Outyears 3.3%.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project cost						
Facility cost						
Design	84,700	5,106	5,781	1,000	42,420	139,007
Construction	158,230	12,101	9,433	7,987	231,292	419,043
Total facility costs (Federal and Non-Federal)	242,930	17,207	15,214	8,987	273,712	558,050
Other project costs						
Conceptual design cost	800	0	0	0	0	800
Other project-related costs [a]	24,916	5,725	7,846	5,446	218,455	262,388
Total other project costs	25,716	5,725	7,846	5,446	218,455	263,188
Total project costs (TPC)	268,646	22,932	23,060	14,433	492,167	821,238

7. Related Annual Funding Requirements

(FY 1998 dollars in thousands)

	Current Estimate	Previous Estimate
Annual facility operating costs (staff, utilities, etc.) [b]	6,650	6,100
Annual facility maintenance and repair costs	2,850	2,000
Other annual costs	0	500
Total related annual funding *(operating from FY 1998 through FY 2010)*	9,500	8,600

[a] Includes $262,388,000 to fund permitting activities, Post Modification Testing Reviews, one-time program development startup, and operating contractor project support.

[b] Includes operating manpower, supplies and energy and additional operators. It is essential that operation of this facility will result in a net annual cost increase of $6,100,000 and 56 full time equivalents. This facility does not replace an existing facility.

Science and Technology

Program Mission

Science and Technology is a national program that provides the full range of capabilities from directed research through technical and deployment assistance, in partnership with other Environmental Management programs, to provide fully integrated, technically defensible solutions for cleanup and long-term stewardship at DOE sites.

Program Goal

The goal of Science and Technology is to provide users with the most efficient, effective environmental cleanup technologies and technical solutions possible and on a schedule that enables achieving cleanup and bringing into compliance most of the DOE complex by 2006. This will be accomplished through investment in the Science and Technology program that is planned and managed in an interactive, coordinated, participatory relationship with Environmental Management cleanup project managers and stakeholders. The program, which represents the majority of DOE's Environmental Quality Business Line Research and Development Portfolio, supports basic through applied research, technology development and demonstration, and technical assistance to support deployment, and will draw from the best available technical expertise.

These activities, for which funds are requested, directly support goals outlined in the *Accelerating Cleanup: Paths to Closure* in which over 500 technology needs were identified with 86 pathways or events on the critical path to closure with medium to high technology risk, and over 200 waste streams with medium to high technology risk.

Program Objectives

- **To focus science and technology research and development on DOE's high priority needs** -- Conduct scientific research and technology development through "focus areas" on highest priority end-user needs identified by the sites: Mixed Waste Characterization, Treatment and Disposal; Radioactive Tank Waste Remediation; Subsurface Contaminants; Deactivation and Decommissioning; and Plutonium Stabilization and Disposition. Needs are prioritized within each site as well as nationally to ensure work is focused on the problems with the biggest impact.
- **To invest technology development funding to reduce major costs and uncertainties** -- Direct funds to activities where the potential for significant cost reduction is high.
- **To Reduce EM's technological risk** -- Direct funds to activities that reduce programmatic risk associated with technical uncertainties that exist in the critical path to site closure.

- **To facilitate accelerated deployment of cost- and schedule-reducing alternative technology** -- Involve customers in all phases of Science and Technology planning and decision making activities and bridge the gap between development and use to ensure that new technology is rapidly deployed through site-based assistance at the sites, including sponsoring accelerated site technology deployment projects that will provide valuable documentation of performance.
- **To develop and implement a targeted scientific research agenda** -- Conduct, in partnership with DOE's Office of Science and in tandem with the "focus areas," a long-term basic research program that will result in transformational or breakthrough approaches for solving the Department's most intractable environmental problems, such as the subsurface contaminants in the vadose zone and groundwater.

Performance Measures

The success of the Science and Technology program is currently measured by:

- The number of technologies or technology systems (30) demonstrated that meet performance specification-based needs as identified by the Site Technology Coordinating Groups.
- The number of technologies or technology systems (30) made available for implementation with cost and engineering performance data.
- The number of deployments (60) of alternative technology in cleanup activities, an Environmental Management corporate measure shared by the EM user organizations, which are responsible for technology selections.

Significant Accomplishments and Program Shifts

- Implement an Environmental Management Research and Development Program Plan that "maps" investments in solutions to project manager identified needs. Extend Science and Technology program's role to provide the full range of resources and capabilities needed to deliver and support fully developed, deployable solutions from basic research through deployment.
- Disseminate research results from early successes of researchers funded through the Environmental Management Science Program. Continue support of quality scientific resources both in the United States and internationally. Scientists that have been funded through the Environmental Management Science Program are currently conducting research at 89 universities, 13 Department of Energy laboratories, and 21 other governmental and private laboratories. These are located in 37 states and the District of Columbia, Canada, Australia, Russia and the Czech Republic. Of the 235 research awards, 126 are collaborative efforts involving funding at two or more institutions.
- Issue scientific research awards in FY 1999 in the areas of subsurface contamination/vadose zone and effects of low dose radiation. Research focused on subsurface contamination/vadose zone issues will assist the Department in addressing problems identified at the Hanford site and other DOE sites with similar problems. Research on the effects of low dose radiation will help to identify potential health and ecological effects from exposures and risks from low dose radiation.

- Complete, in FY 1999, development and demonstration of alternatives to open flame combustion high temperature treatment (i.e., incineration). These technologies support facility compliance at 6 states and can address approximately 5,400 m^3 of mixed low-level and transuranic waste.
- Increase work, in FY 1999, for the stabilization and in situ remediation of contamination in the vadose zone and groundwater, including work to provide bioremediation and natural attenuation technologies to avoid costly and risky excavation, ex situ treatment and offsite disposal.
- Continue, in FY 1999, multi-year tasks performed in cooperation with the Environmental Protection Agency to improve landfill caps, covers, and barriers to prevent the migration of wastes from DOE sites. The Environmental Protection Agency will incorporate the data from these successful demonstrations into national landfill cover design guidance.
- Expect to complete, in FY 2000, a Large Scale Demonstration and Deployment Project initiated in FY 1998 in cooperation with the EM Environmental Restoration program to deactivate and decontaminate a tritium production facility at Mound. This Large Scale Demonstration and Deployment Project will showcase 8 - 12 innovative technologies for remote characterization and decontamination and dismantlement of tritium-contaminated equipment and surfaces.
- Deploy, in FY 1999, a system (Pulsed Air Mixing) that will introduce pulses of air at the bottom of Gunite and Associate Tank W-9 in order to mobilize the thick sludge that rests at the bottom, a problem in a number of DOE radioactive waste storage tanks. The Pulsed Air Mixing system is now part of Oak Ridge Reservation's Waste Conditioning System.
- Assume lead, in FY 1999, for the Plutonium Stabilization and Disposition Focus Area, formerly located within the Environmental Management Nuclear Material and Facility Stabilization Program.
- Complete multi-year Technology Deployment Initiative site cleanup projects that were initiated in FY 1998 and continue accelerated site technology deployment projects initiated in FY 1999. These deployment projects, which were selected competitively based on a multi-application performance specification, are designed to accelerate widespread deployment of innovative technologies by providing proof of performance documentation. Aggressive use of the alternative technologies in which the Department has invested optimizes the cost savings they enable. In FY 2000 deployment assistance is considered an integral Focus Area function, rather than a separate program.

Uncertainties are inherent in any research program, and the allocations of funding requested below represent the best estimates at the time this budget was formulated. It is possible that as circumstances change, or new higher-priority risks are identified by the site, it may be necessary to redirect funds within the Science and Technology program categories to accommodate these changes..

The proposed funding for the Science and Technology program is summarized below.

FY 2000 Budget Summary *

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Mixed Waste, Characterization, Treatment and Disposal Focus Area	38,934	19,990	23,404

The Mixed Waste, Characterization, Treatment, and Disposal Focus Area provides technical and engineering solutions for supporting effective, efficient mixed Waste treatment technology systems. Site Treatment Plans identified 165,000 m^3 of mixed and transuranic waste in storage that includes over 2,300 mixed waste streams at 36 sites. *Accelerating Cleanup: Paths to Closure* has identified 21 high priority technology needs in the mixed and transuranic waste areas. It also identified 34 waste streams with high technology risk. Ten of 48 pathways/events on the critical path pose high technology risk. With the funding provided, this Focus Area will assist in the deployment of alternative technologies at individual sites and implement and maintain sound program management and integration processes. The Mixed Waste, Characterization, Treatment, and Disposal Focus Area includes the following systems:

Material Handling and Characterization Solutions (FY 2000 funding $18,209,000) are being developed to characterize radionuclide components in boxes destined for disposal at Waste Isolation Pilot Plant or other subtitle C facility, to enhance payload capacity of transuranic waste containers, and to develop automated handling systems for mixed waste material during characterization, treatment, packaging, and disposal.

Non-Thermal Treatment Solutions (FY 2000 funding $5,195,000) are being developed as an alternative to high temperature treatment systems because of the low risk and high regulatory and public acceptance. Activities will include alternative oxidation technology treatment and stabilization alternatives for plutonium 238 contaminated waste and polychlorinated biphenyl mixed waste.

* The following nine pages are a synopsis of the budget request for the Office of Science and Technology and is provided for ancillary information.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Radioactive Tank Waste Remediation Focus Area	52,513	41,676	48,847

The Radioactive Tank Waste Remediation Focus Area addresses 34 high priority needs in the development and deployment of technologies to remove high-level waste in over 270 large radioactive and other miscellaneous underground storage tanks across DOE containing over 90 million gallons of waste (nine waste streams with high technology risks), and prepare it for final disposal. Closure of these tanks will mitigate further risks to ground water and surrounding populations, and contribute significantly to mortgage reduction. Within the funding provided, the Radioactive Tank Waste Remediation Focus Area will assist individual sites in the deployment of alternative technologies to reduce risk and cost, and accelerate cleanup at those sites. The Radioactive Tank Waste Remediation Focus Area includes the following activities:

Tank Waste Retrieval and Closure (FY 2000 funding $19,744,000) will focus on techniques to ensure tank integrity prior to and during retrieval operations, which includes tank inspection, corrosion monitoring, saltcake dissolution and sludge heel retrieval, and ultimate tank closure at Idaho, Oak Ridge, Savannah River, and Richland. Activities related to the Hanford Tank Initiative will be continued at a reduced level under the Tank Waste Retrieval and Closure Product Line.

Tank Waste Pretreatment and Immobilization (FY 2000 funding $29,103,000) will be developed and deployed to further optimize high-level waste glass loadings and performance and melter design, provide alternative paths to salt waste treatment to replace in tank precipitation, improve slurry and waste feed preparation, and minimize the volume and corresponding disposal cost of high-level and low-level waste forms to be produced.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Subsurface Contaminants Focus Area	32,870	31,611	35,080

The Subsurface Contaminants Focus Area addresses technological solutions for the 5,700 known DOE ground water plumes that involve 475 billion gallons of contaminated water and 75 million m^3 of contaminated soil. There is an additional 3 million m^3 of leaking wastes buried in landfills, trenches, and spill areas. The *Accelerating Cleanup: Paths to Closure* has identified 57 high priority needs, 25 waste streams with high technology risk and 42 of 281 pathways/events on the critical path with high technology risk within the Environmental Restoration problem area. The Subsurface Contaminants Focus Area currently encompasses three problem areas to address these needs, organic solvent remediation, containment (barriers caps and covers), and metal and radionuclide plumes. Within the funding provided, this Focus Area will assist individual sites in the deployment of alternative technologies to reduce risk and cost, and accelerate cleanup at those sites. The Subsurface Contaminants Focus Area includes the following activities:

Dense Non-Aqueous Phase Liquids (FY 2000 funding $18,829,000) constitute a generic class of particularly difficult to locate, quantify, and treat or destroy organics that contaminate both the vadose and saturated zones at many DOE sites. Activities will focus on better understanding the long term movement and fate of these contaminants to better design treatment strategies. Treatment systems will be demonstrated and deployed, including advanced bioremediation and natural attenuation, in situ passive and reactive barriers, and in situ treatment technologies applicable to a broad range of geologies in the vadose and saturated zones, including deep access.

Source Term Containment/Source Term Remediation (FY 2000 funding $5,372,000) prevents the further spread of contaminants to limit associated risks and cleanup costs. Technologies for deep barrier placement, improved longer life surface caps, landfill hot spot removal or stabilization, and verification monitoring will be demonstrated and deployed.

Metals and Radionuclides in the Vadose and Saturated Zones (FY 2000 funding $10,879,000) cannot be destroyed and therefore, must be either stabilized or removed. Efforts will continue to develop improved characterization, monitoring and modeling techniques and to verify the performance of reactive and passive barrier systems at Rocky Flats and Oak Ridge. Technologies will be deployed to chemically stabilize or remove contaminants at Hanford, Mound and Albuquerque.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Deactivation and Decommissioning Focus Area	29,466	22,938	17,112

The Deactivation and Decommissioning Focus Area develops, demonstrates, and facilitates implementation and deployment of efficient and cost effective technologies through a series of Large Scale Demonstration Projects which address real needs pertaining to the 20,000 radiologically/hazardous waste contaminated buildings and facilities. The near-term goal is to reduce the EM deactivation and decommissioning mortgage of $4 billion through FY 2006 by 25% or a net reduction of approximately $1 billion. Within the funding provided, this focus area will assist individual sites in the deployment of alternative technologies to reduce risk and cost, and accelerate cleanup at these sites. The *Accelerating Cleanup: Paths to Closure* has identified 34 high priority needs. Eleven of 30 pathways/events are on the critical path with high technology risk. The Large Scale Demonstration Projects include:

Reactor Facilities (FY 2000 funding $4,733,000) technologies will be demonstrated and deployed to address underwater visual inspection, characterization and dismantlement, as well as removal and treatment of highly contaminated fuel pool sludges, debris and water. Technologies to facilitate decontamination and decommissioning of the 14 surplus production reactors across the DOE complex to a degree such that they can be put in interim safe storage for up to 50 years will be demonstrated and deployed.

Radionuclide Separation Facilities (FY 2000 funding $6,525,000) Improved technologies are required to deactivate and decommission radionuclide separation facilities, including gaseous diffusion plants, chemical separation facilities, uranium recycling facilities, lithium enrichment facilities, heavy water production facilities and tritium production facilities. Technologies to characterize, separate and decontaminate metals for internal DOE recycle or free release will be demonstrated and deployed.

Fuel and Weapons Component Fabrication Facilities (FY 2000 funding $5,854,000) Improved and innovative technologies are required to deactivate and decommission fuel and weapons component fabrication facilities including uranium milling and refining facilities, fuel and target fabrication facilities, weapons component fabrication facilities and weapons assembly, dismantlement, modification and maintenance facilities. Improved and innovative technologies will be demonstrated and deployed to address building deactivation and decommissioning and metal/concrete waste disposal/recycling at tritium contaminated facilities.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Plutonium Stabilization and Disposition Focus Area	0	5,480	4,253

The Plutonium Stabilization and Disposition Focus Area will be operating under the aegis of the Office of Science and Technology beginning in FY 1999. The program operated under the Office of Nuclear Material and Facility Stabilization since its inception in FY 1995. The program addresses the technology needs associated with the stabilization and disposition of plutonium and other fissile materials and address the Secretarial commitments pursuant to the Defense Nuclear Safety Board recommendations as well as other safety vulnerability studies. *Accelerating Cleanup: Paths to Closure* has identified 21 high priority needs in the nuclear materials problem area. Four of 19 pathways/events on the critical path pose high technology risk. Within the funding provided, this Focus Area will assist individual sites in the deployment of alternative technologies to reduce risk, cost, and accelerate cleanup at these sites.

Plutonium Stabilization Technology Development (FY 2000 funding of $3,653,000) will develop improved processes to stabilize plutonium (approximately 20 metric tons) left in the weapons production pipelines in various storage configurations and plutonium residues (approximately 150 metric tons).

Alternative Stabilization Process for Fissile Materials Solutions (FY 2000 funding of $600,000) Will test waste solution containing americium and curium for absorption on porous crystalline matrix and support the Savannah River Site in scale-up tests with actual americium and curium solution.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
University Programs	21,605	19,215	14,900

Universities provide a unique opportunity to cooperate with the academic community in the development of fundamental data related to the application of technology development and the follow-up activities related to the resolution of technical issues and system optimization. Attention is given to providing credible data, from non-conflicted, recognized experts in support of activities related to the acceptance of innovative technologies by the regulators and stakeholders.

Florida State University (FY 2000 funding $1,900,000) in partnership with Eastern and Central European Institutes are evaluating the transfer of European technologies to solve DOE cleanup problems.

Mississippi State University (FY 2000 funding $4,000,000) continues its support to the Focus Areas in the development of monitors for thermal treatment of mixed waste and development of sensors to measure high-level waste in transfer pipes.

Florida International University (FY 2000 funding $5,000,000) is initiating a program to improve Robotic decontamination and decommissioning equipment that will be used in highly radioactive environments.

Robotics University Program (FY 2000 funding $4,000,000) is supporting deactivation and decommissioning efforts for mapping of facilities and the remote handling of materials.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Idaho Technology Validation and Verification Program	14,500	13,500	22,500

The capabilities of the Idaho National Engineering and Environmental Laboratory will be utilized to support and enhance application and deployment of innovative cleanup and waste management technologies across the DOE complex through technology validation and verification and systems engineering activities.

Validation and Verification (FY 2000 funding $14,500,000). Technology validation and verification activities will be used to support and enhance application and deployment of EM innovative and alternative technologies across the DOE complex and to provide a solid technical base for EM cleanup, reduce costs, and leverage the DOE investment into broader national priorities.

Systems Engineering (FY 2000 funding $8,000,000). Systems engineering activities will be used to refine baselines for EM waste management, spent nuclear fuel, and nuclear materials disposition and identify new opportunities to accomplish more efficient and cost effective cleanup and closure of DOE sites. An EM integration activity is conducted utilizing multi-site teams to develop, evaluate, and recommend alternatives to existing baselines for waste management, spent nuclear fuel, and nuclear materials disposition.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Western Environmental Technology Office	13,393	13,000	10,504

For more than two decades, DOE has used the Western Environmental Technology Office as a test facility, where MSE Technology Applications, Inc., engaged in the research, testing, demonstration, development and application of innovative technologies. In FY 1996, agreements were reached to privatize the Western Environmental Technology Office facility with a 5-year contract through 2001. Privatization will fulfill DOE's financial and management obligations and reduce the Government's costs in contracting services. Under this contract, MSE Technology Applications, Inc. focuses on meeting the high priority technology needs associated with the Mixed Waste Characterization, Treatment and Disposal Focus Area and the Subsurface Contaminants Focus Area. In addition, to support these Focus Areas, MSE works as a demonstration, testing and evaluation center for sponsored technology systems and has the capability to perform life cycle systems engineering analyses on innovative technology systems to maximize the chances of successful implementation and deployment of these technology systems..

Controlled Emissions Demonstration (FY 2000 funding $3,500,000) By 2002, the four operational DOE hazardous waste thermal treatment units must be able to meet the Environmental Protection Agency Maximum Achievable Control Technology Rule or be shutdown. The Maximum Achievable Control Technology Rule states that a compliance plan must be submitted to the Environmental Protection Agency for covered operations within 180 days of promulgation of the rule (January 1999). Noncompliance with the Maximum Achievable Control Technology Rule will threaten DOE's ability to meet compliance agreements. Promising, technologically mature off gas monitoring and treatment systems, which are being tested for organic and inorganic hazardous air pollutants, should address this challenge of emission compliance by 2002.

Subsurface Contaminant and In Situ Remediation (FY 2000 funding $4,300,000) Activities will support the Subsurface Contaminants Focus Area in addressing the problems/needs identified in the following areas: Subsurface Barrier Systems, Vadose Zone Stabilization, In Situ Passive Treatment, Deep Access and Delivery Methods, Containment/Stabilization Verification and Monitoring. This investment directly supports the Subsurface Contaminants Focus Area in their efforts to help meet all 10 Operation Offices requirements, schedules and "Accelerating Cleanup: Paths to Closure" plan goals while directly contributing to cost reduction, schedule compression and risk minimization.

Engineering Analysis (FY 2000 funding $2,704,000) Technical assistance and life cycle systems analysis are critically important to achieving the successful deployment of treatment, remediation, and containment technology systems. These activities will focus on the analysis of technology systems which are ready candidates for implementation and deployment, and on matching newly developed technologies with DOE urgent clean up needs to enhance deployment opportunities and on providing technical assistance to developers and users to assure successful deployment.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Technology Acceptance and Support	12,822	17,522	14,900

The Technology Acceptance and Support program stimulates wider acceptance of emerging technologies through program and technical peer reviews of technologies, site needs/technology linkage identification and deployment assistance, and longer-term regulatory initiatives. In addition, this activity provides sound business assistance and overall program analysis as well as information dissemination services and linkages to the international scientific community.

Program Information, Review, and Analysis (FY 2000 funding $6,050,000) provides assistance for the Office of Science and Technology business practices, such as preparation of execution guidance and analysis of cost and schedule variances through the DOE Center for Acquisition and Business Excellence. Office of Science and Technology alignments with site needs are collected and provided to the overall EM *Accelerating Cleanup: Paths to Closure* data collection and analysis activity. Independent external peer review processes and program reviews enhance acceptability of key Focus Area decisions and data. Program information and communication provides the Office of Science and Technology with the ability to collect, maintain, analyze, and disseminate key information. Cost savings and benefit analyses highlight potential and actual *Accelerating Cleanup: Paths to Closure* mortgage reductions.

Regulatory and Site Acceptance (FY 2000 funding $6,550,000) contributes to overall Environmental Management mortgage reduction by helping states establish acceptance verification protocols and reciprocity guidelines to expedite multi-state permitting and multi-site deployment. Site acceptance is facilitated by identifying site needs to the Focus Areas as early as possible to ensure the Focus Areas are working on the right problems. Site participation in technology deployment planning and workshops to encourage use of innovative technologies are also included.

International Technology Coordination (FY 2000 funding $600,000) by connecting with international technical capabilities, expands the number of cost-saving innovative technologies available for Environmental Management use through the Focus Areas. Accelerates the EM cleanup by leveraging international science and technology opportunities.

Safety Testing (FY 2000 funding $1,700,000) reduces costs of cleanup by expediting the deployment of Environmental Management technologies and improves worker safety and health by providing operational assessments of high impact environmental technologies and recommending safety, efficiency, and productivity enhancements.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Small Business Innovative Research Program (Technology Development)	0	2,224	2,000

Funding is requested for the Small Business Innovative Research assessment in accordance with Public Law 102-564, which mandates a percentage of all research and development dollars be set aside for grants to small businesses. Once funding is appropriated, it is transferred to the DOE Office of Science for award and administration of grants to small businesses.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Environmental Management Science Program	46,110	47,000 [a]	32,000 [a]

The EM Science Program was created to stimulate basic research and technology development for cleanup of the Nation's nuclear weapons complex. The program's objective is to improve the effectiveness of the cleanup effort over the long term. The importance of basic scientific research to the cleanup mission was established in the Secretary of Energy Advisory Board (Galvin) Report: "There is a particular need for long term, basic research in disciplines related to environmental cleanup...Adopting a science-based approach that includes supporting development of technologies and expertise...could lead to both reduced cleanup costs and smaller environmental impacts at existing sites and to the development of a scientific foundation for advances in environmental technologies."

The Science Program represents a partnership between the Office of Science and the EM program. The Office of Science manages the solicitation of proposals and scientific review process. EM ensures that the research is relevant to the Department's cleanup problems. Science projects funded to date focus on critical problems identified through: 1) workshops at Richland, Savannah River, Oak Ridge, and Idaho; 2) a complex-wide needs survey; 3) solicitation of science research needs in support of the *Accelerating Cleanup: Paths to Closure*; and 4) a systems engineering analysis. To date, of the 235 projects selected, 82 focus on science needed to improve remedial action process; 68 focus on finding better ways to treat and destroy high level waste; 32 focus on waste containing a mixture of radioactive and other hazardous materials (mixed waste); 18 focus on better understanding the health and ecological effects associated with environmental cleanup options; 8 address the materials used in weapons production (nuclear materials); 22 projects focus on technical problems with facility deactivation and decommissioning, and the remaining 5 projects focus on spent nuclear fuel stabilization and disposal. This competitive program has been effective in establishing a link between the EM program and the scientific community. Fourteen of DOE's national laboratories and 96 academic institutions, other Federal laboratories and industrial organizations currently participate in the program. FY 1999 is the last year of funding for the first 136 grants awarded by the program, a $115,000,000 investment, and FY 2000 is the last year of funding for the 66 projects funded in FY 1997, a $46,400,000 investment.

[a] Includes Small Business Innovative Research assessment, in the amounts of $1,162,000 and $765,000 in FY 1999 and FY 2000, respectively.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Environmental Management Risk Policy Program	7,000	9,000	5,000

Risk informed decision making is critical to the success of the EM program. The EM Risk Policy Program provides the analytical framework and technical support necessary for credible, risk-based environmental decisions. The program provides guidance and tools to assist the project managers in collection of the information that will ensure that high risk projects are prioritized and funded and that risk to workers, the public, and the environment decrease over time. This program supports the risk research needed to support aggressive environmental cleanup of the nuclear weapons production legacy while ensuring that the safety and health of the DOE workforce and members of the public, and the protection of the environment are not compromised in the process.

Mixed Waste, Characterization, Treatment and Disposal Focus Area

Mission Supporting Goals and Objectives

Program Mission

The mission of the Mixed Waste Characterization, Treatment and Disposal Focus Area is to provide technical capabilities and deployment assistance, in partnership with other Environmental Management programs, to provide fully integrated, technically defensible solutions for cleanup and long term stewardship of mixed hazardous and radioactive wastes at DOE sites.

Program Goal

The goal of the Mixed Waste Characterization, Treatment and Disposal Focus Area is to provide technical and engineering solutions for supporting effective, efficient mixed waste treatment technology systems. Site Treatment Plans identified 165,000 m^3 of mixed waste in storage that includes over 2,300 mixed waste streams at 36 sites. In addition, an estimated 181,000 m^3 of mixed low-level waste and transuranic waste will be generated over the next five years.

Program Objectives

The objective of the Mixed Waste Characterization, Treatment and Disposal Focus Area is to develop technologies that address the mixed-low-level and mixed transuranic waste needs identified by the Site Technology Coordination Groups and that have been incorporated in the Department's *Accelerating Cleanup: Paths to Closure* strategy. Having developed and assessed several primary mixed waste treatment systems, the current Mixed Waste Characterization, Treatment and Disposal Focus Area strategy emphasizes development and deployment of enabling technologies to assist the Department in meeting its mixed waste schedule commitments to regulators and the public at 40 sites in 19 states. With the funding provided, this Focus Area will assist in the deployment of alternative technologies at individual sites and implement and maintain sound program management and integration processes.

Performance Measures

The Science and Technology FY 2000 corporate performance metrics (30 technologies or technology systems demonstrated; 30 technologies or technology systems made available for implementation; 60 alternative technologies deployed) are set at the Project Baseline Summary level, based on past program performance and budget requested. The complete listing of specific technologies, by Focus Area, that will be demonstrated, made ready for implementation or deployed is made available after final FY 2000 project level funding is known and FY 2000 annual performance plans are finalized by each Focus Area. FY 2000 annual performance plans are schedule to be finalized by September 30, 1999.

Significant Accomplishments and Program Shifts

- Complete, in FY 1999, development and demonstration of alternatives to open flame combustion high temperature (i.e., incineration). These technologies support facility compliance at 6 States and can address approximately 5,400 m^3 of mixed low-level and transuranic waste.
- Complete, in FY 2000, deployment of the neutron interrogation technology for the assay of waste containers at Los Alamos National Laboratory, Rocky Flats, Oak Ridge, and Idaho. This process minimizes risks to workers since it reduced the number of drums that must be manually opened for analysis and enables certification of a significant number of drums that cannot be certified by any other technique.
- Deploy, in FY 2000, hydrogen gas getters to reduce flammable gas concentrations in drums of waste being shipped to the Waste Isolation Pilot Plant. This will allow large amounts of waste to be contained in each drum.
- Demonstrate, in FY 2000, assay capabilities for remotely handled waste and demonstrate screening methods for segregation of large quantities into transuranic versus low-level waste.
- Demonstrate at Savannah River, in FY 2000, the capability to remotely segregate transuranic waste from low-level waste.
- At the end of FY 1999, thermal treatment systems (i.e., incineration) and mercury contamination activities will be discontinued and program emphasis will shift to non-thermal treatment solutions and characterization and handling technology needs of transuranic waste for shipment to the Waste Isolation Pilot Plant.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Material Handling and Characterization Solutions	16,007	11,852	18,209	6,357	53.6%
Non-Thermal Treatment Solutions	13,538	4,877	5,195	318	6.5%
Thermal Treatment Enabling Solutions	9,389	3,261	0	-3,261	-100.0%
Total, Mixed Waste, Characterization, Treatment and Disposal Focus Area	38,934	19,990	23,404	3,414	17.1%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Material Handling and Characterization Solutions

All major sites and laboratories that will ship transuranic waste to the Waste Isolation Pilot Plant have identified technology needs in preparing waste for shipment and disposal. While current technologies focus primarily on enabling the successful management of low activity, contact handled transuranic wastes in 55-gallon drums, a large portion of the waste consists of categories for which assay, handling and transportation is not currently available. Solutions for improving the end-users' capability to non-destructively examine containerized waste and assay the contents to distinguish between radioactive and hazardous constituents will be developed and deployed. The need for non-destructive analysis technology is especially critical for remote handled waste types and to facilitate the segregation of transuranic waste from low-level waste. A reduction of costs can be achieved through non-destructive analysis of wastes to be treated at the three incinerators operated by DOE at Oak Ridge, the Savannah River Site, and Idaho. Activities will also focus on increasing the payload efficiency of transuranic waste shipments to treatment and disposal facilities by addressing hydrogen gas generation and buildup and improving the end-users' capability to remotely handle highly radioactive waste streams during sizing, repackaging and transport operations. Hydrogen gas generation and build-up due to radiolysis of hydrogenous waste materials and subsequent potential flammability/explosion concerns during transport, limit the amount of contact handled and remote handled transuranic waste that can be shipped using the TRUPACT-II and 72B casks. Also, because of the hazard associated with these wastes, advanced remote handling systems are needed to improve safety and efficiency of operations. All activities relating to identification, development and assessment of technologies will be closely coordinated with the National Transuranic Waste Management Program at the Department of Energy Carlsbad Area Office.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The proposed Maximum Achievable Control Technology standard will require a detailed characterization of all waste prior to it being treated in a thermal treatment unit. At the present time, there is no effective method to provide the required characterization. Improved radionuclide non-destructive analysis characterization methods are needed to support elimination of waste from small quantity sites such as Mound and Battelle Columbus.

In FY 2000, there are three distinct work elements which support this product line: 1.) Non-destructive Characterization for Treatment, Transportation and Disposal of Mixed Low-Level/Mixed Transuranic Waste; 2.) Payload Enhancement for Transportation of Transuranic Waste within Regulatory Limits; and 3.) Handling Mixed Waste Contaminants Materials during Characterization, Treatment, Packaging and Disposal.

- Continue algorithm and hardware development and deployment of improved assay technology systems for boxed wastes. Activities include hardware/algorithm improvements to systems identified through FY 1998 and FY 1999 demonstrations/evaluations.
- Complete the deployment of the neutron interrogation technology for the assay of the Resource Conservation and Recovery Act metal in waste containers.
- Develop and demonstrate solutions to meet Waste Isolation Pilot Plant remote handled waste assay requirements. Technology development will focus on demonstration of remote handled waste assay capabilities on real waste streams; implementation of improved assay components in remote handled waste characterization systems; development of mobile non-destructive analysis capability based on demonstrated methods; and demonstration of screening methods to support segregation of large components into transuranic versus low-level waste.
- Evaluate and deploy technologies, such as, improved Hydrogen getters, filters, and alternative packaging materials to minimize impact of hydrogen gas on transportation.
- Evaluate effects of gamma radiation on hydrogen gas generation.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Deploy automated transuranic waste sorting system at the Savannah River Site to verify and prepare drummed waste for transfer to Waste Isolation Pilot Plant. This system will open drums, gain access to contents, remove non-compliant items and repackage waste to meet Waste Isolation Pilot Plant acceptance criteria.			
■ Adapt the Savannah River Site automated waste sorting system to a mobile format for use at Mound and Battelle Columbus sites to prepare waste for transfer to Waste Isolation Pilot Plant.			
■ Develop robust sizing technology for use at Richland to allow segregation of large transuranic and low-level waste to reduce final volume of wastes transferred to Waste Isolation Pilot Plant.			
■ Complete automated contaminant analysis process for metals and organics.			
Material Handling and Characterization Solutions	16,007	11,852	18,209

Non-Thermal Treatment Solutions

Regulatory and public concerns have resulted in specific instances where alternatives to incineration must be used for treatment of mixed waste prior to disposal. Stakeholders are highly supportive of alternatives to open flame treatment systems because of reduced secondary waste generation. Although the number of potential waste streams amenable to this type of treatment is limited, these technologies, in certain instances, provide preferable treatment alternatives. Demonstrations will provide performance data on guidelines for selection of the most appropriate technology for treatment of a given waste. Activities developing and deploying solutions for destroying organics in waste using non-flame alternatives to incineration will primarily focus on Alternative Oxidation Technologies. These processes are needed to treat difficult, DOE tri-mixed waste streams, including mixtures of transuranic, polychlorinated biphenyl, tritium, actinides, mercury, or problematic hazardous chemical contaminants.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
In FY 2000, there is one work element which support this Product Line: 1.) Alternatives to Incineration to Reduce Emission Hazards.			
■ Issue an Alternative Oxidation Technology Request for Proposal to the private sector to demonstrate treatment of the Savannah River Site Plutonium-238 contaminated waste, such as clothing, rags and packaging.			
■ Issue an Alternative Oxidation Technology Request for Proposal to the private sector for a process to treat polychlorinated biphenyl contaminated mixed waste.			
■ Demonstrate a tritiated waste treatment technology.			
■ Deploy stabilization and volume reduction technologies at Oak Ridge, Rocky Flats, and Idaho.			
Non-Thermal Treatment Solutions	13,538	4,877	5,195
Thermal Treatment Enabling Solutions			
Activities include developing and deploying solutions for improving the off gas control and monitoring of the Department's waste incinerators to meet the proposed Maximum Achievable Control Technology Rule limits. If cost effective alternatives for the Maximum Achievable Control Technology compliance are not available for the DOE's three incinerators, located at Idaho, Savannah River and Oak Ridge, and Idaho's high-level liquid waste calciner, they may be forced to shut down in FY 2001. This will impact the ability of these sites to meet compliance agreements. Specific problem areas include mercury and dioxins and furans. The development of control and monitoring solutions for these off gas treatment systems must be proven effective to make these technologies more widely applicable.			
■ This activity will not be continued into FY 2000.

Radioactive Tank Waste Remediation Focus Area

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Radioactive Tank Waste Remediation Focus Area is to provide technical capabilities and deployment assistance, in partnership with other Environmental Management programs, to provide fully integrated technically defensible solutions for cleanup and long term stewardship of radioactive tank waste at DOE sites.

Program Goal

There are 271 large radioactive waste storage tanks and more than 63 miscellaneous underground storage tanks across the DOE complex containing over 90 million gallons of radioactive waste. Most of these tanks have exceeded their design life and represent significant occupational and public risks. Current site baseline technologies are costly, pose significant programmatic and safety risks, and have technology gaps. The goal of the Radioactive Tank Waste Remediation Focus Area is to systematically manage the development and facilitate the deployment of technologies using an integrated approach to safely and efficiently achieve tank waste remediation across the DOE complex in support of the *Accelerating Cleanup: Paths to Closure*. Accomplishment of this goal will support closure of tank farms complex-wide while minimizing life-cycle costs.

Program Objectives

The objective of this Focus Area is to address the technical needs identified for management of high-level waste and closure of tanks by the Site Technology Coordination Groups which have been incorporated in the Department's *Accelerating Cleanup: Paths to Closure* strategy. The Tank Waste Remediation Focus Area activities have progressed from early-stage technology development to advanced, fully deployable systems. This work is being accomplished in close partnership with users and with continual participation of tribal governments, regulators, and stakeholders. Within the funding provided, this Focus Area will assist in the deployment of alternative technologies at individual sites and implement and maintain sound program management and integration processes.

Performance Measures

The Science and Technology FY 2000 corporate performance metrics (30 technologies or technology systems demonstrated; 30 technologies or technology systems made available for implementation; 60 alternative technologies deployed) are set at the Project Baseline Summary level, based on past program performance and budget requested. The complete listing of specific technologies, by Focus Area, that will be demonstrated, made ready for implementation or deployed, is made available after final FY 2000 project funding level is known and FY 2000 annual performance plans are finalized by each Focus Area. FY 2000 annual performance plans are scheduled to be finalized by September 30, 1999.

Significant Accomplishments and Program Shifts

- Deploy, in FY 2000, saltcake dissolution and sludge heel (hardened waste at the bottom of tanks) retrieval technologies to enable closure of the Savannah River Site and Hanford high-level waste tanks. Current methods require the introduction of large amounts of water to re-dissolve or suspend wastes in a solution.
- Deploy, in FY 2000, robotic/remote technologies to permanently seal, from the inside, the openings of Gunite and associated tanks at Oak Ridge from pipes that were once used to deliver radioactive waste to the tanks. Capping from the outside has not prevented rain water from leaking into the tanks.
- Demonstrate and deploy, in FY 2000, tank inspection technologies to ensure tank integrity at Idaho, Oak Ridge, Hanford, and Savannah River.
- Demonstrate and deploy, in FY 2000, caustic recycle and recovery technologies that reduce the volume of low level waste streams returning to the Defense Waste Processing Facility Storage Tanks to avoid construction of an additional grout vault at Savannah River.
- Beginning in FY 2000, program emphasis will increase on pretreatment, immobilization and volume reduction technology development to enable high-level waste tank closures across the DOE complex.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Tank Waste Retrieval and Closure	27,529	22,552	19,744	-2,808	-12.5%
Tank Waste Pretreatment and Immobilization	24,984	19,124	29,103	9,979	52.2%
Total, Radioactive Tank Waste Remediation Focus Area	52,513	41,676	48,847	7,171	17.2%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Tank Waste Retrieval and Closure			
Hanford and the Savannah River Site must maintain and ensure tank integrity as tanks will be used for storage up to 30 more years to meet accelerated cleanup goals and tank integrity inspections must occur at Hanford, Savannah River, Idaho, and Oak Ridge prior to initiating waste retrieval operations leading to closure. In order to facilitate the closure of tanks at the Savannah River Site and Hanford technologies need to be developed that will remove sludge and saltcake at rates to support waste processing. Oak Ridge must close tanks to meet Comprehensive Environmental Response, Compensation, and Liability Act requirements for the gunite and associated tanks.			
In FY 2000, there is one work element which supports this Product Line: 1.) Technology Development to Support Tank Closure.			
■ Deploy saltcake dissolution and sludge heel retrieval technologies to remove waste and allow closure of the Savannah River Site and Hanford high-level waste tanks that are not potential leakers.			
■ Deploy robotic/remote operational retrieval technologies for hard-to-access tanks at Oak Ridge (functional flow analysis tanks) and the Savannah River Site (solvent extraction tanks).			
■ Deploy robotic/remote technologies for isolating, stabilizing, and closing Gunite and associated tanks at Oak Ridge.			
■ Deploy technologies for maintaining safe storage conditions by monitoring corrosion in tanks at Hanford and the Savannah River Site.			
■ Demonstrate and deploy tank inspection technologies to ensure tank integrity before waste retrieval and tank closure at Idaho, Oak Ridge, Hanford, and Savannah River Site.			
■ Continue Hanford Tanks Initiative activities at a reduced level.			
Tank Waste Retrieval and Closure	27,529	22,552	19,744

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Tank Waste Pretreatment and Immobilization

The Savannah River Site, Hanford, and Idaho require improved baseline treatment process development and improvement to meet their regulatory schedules. Savannah River must maintain Defense Waste Processing Facility operations and improve throughput to meet canister production requirements; Hanford must prepare for, and deliver feed for privatization Phase 1, accept immobilized product from the private vendor, and develop the baseline data to support privatization Phase 2 procurement package; Idaho must continue baseline flowsheet development and testing to meet Title 1 design schedule. Sludge transfer at Oak Ridge Melton Valley Storage Tanks must be accomplished to meet privatization schedules.

Specific activities for Savannah River will develop and test next generation melter designs and process control methods to enhance Defense Waste Processing Facility throughput, reduce operating costs, and eliminate melter pour spout problems; demonstrate and implement integrated processes for the Defense Waste Processing Facility to support continued sludge-only feed, and reduce the volume of high-level waste canisters produced; and support development and testing of a new chlorinated solvents removal flowsheet for Savannah River to replace in-tank precipitation. In-Tank Precipitation shutdown at Savannah River severely impacts the ability of the site to maintain Defense Waste Processing Facility operations to meet regulatory requirements and *Accelerating Cleanup: Paths to Closure* goals. Caustic recycle and sodium recovery technologies will be developed to reduce the volume of low-level waste and avoid construction of an additional grout vault at Savannah River.

For Hanford, methods and standards will be developed and tested for low-level and high-level immobilized waste product acceptance for Hanford Phase 1 and 2 to minimize risk of accepting waste from privatization contractors that is not adequately processed; and delivery of a privatization-feed sampling and analysis system to ensure Phase 1 feed delivery meets contract requirements; develop and test baseline sludge and leachate processing to ensure adequate feed delivery and avoid conditions that may cause unwanted solids formation that would deploy feed delivery to privatization vendors.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Support to the Idaho National Engineering and Environmental Laboratory will provide technical data required to define the integrated flowsheet for Title 1 design including dissolution of calcine, transuranic waste, cesium, and strontium removal, and low-activity waste and high-activity waste immobilization to enable discontinuation and retrieval of all tank farm wastes to meet the Governor's agreement (Batt Agreement).

Technical solutions delivered through the completion of these activities will: help optimize melter design and operation, and ensure quality low-level and high-level waste products at Hanford, Oak Ridge, Idaho, and Savannah River; help provide alternative solutions to the In-Tank Precipitation process for treatment of high-level at Savannah River, enable treatment of newly generated waste streams that are adding to existing tank waste volumes at Savannah River, Idaho, and Oak Ridge; provide the technical data required to enable operations that separate solids and liquids prior to pretreatment and vitrification of sludges at Savannah River and enable Privatization success at Oak Ridge, and Hanford; and help reduce the volume of high-level and low-level waste forms at Savannah River, Idaho, Hanford, and Oak Ridge.

In FY 2000, there are four distinct work elements which support this Product Line: 1.) High Level Waste Immobilization and Product Acceptance; 2.) Alternative Paths to Salt Waste Treatment; 3.) Pretreatment to Reduce Volume of High-Level Waste and Low-Level Waste Forms; and 4.) Slurry Preparation for Feed to High-Level Waste Vitrification.

- Provide data bases, standards, and tests to meet waste analytical glass standards and provide a basis for long-term performance.
- Provide data for design of second generation pour spout and melter to optimize waste throughput.
- Optimize glass formulation to improve waste loading of radionuclides, thereby minimizing glass generation.
- Support and test a new cesium-removal flowsheet for Savannah River site to replace In-Tank Precipitation.
- Demonstrate settle-decant process to separate solids and liquids as a first step in sludge processing at Savannah River and Hanford.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Demonstrate feed delivery systems including variable depth sampling, automated in-line laser ablation/mass spectroscopy, and sludge monitors at Hanford.			
■ Deploy cross-flow filtration at Oak Ridge.			
■ Provide technical data required for the Defense Waste Processing Facility operations with sludge at Savannah River and for Hanford Phase 2 privatization sludge treatment to reduce the high-level waste production.			
■ Support development of integrated process for acidic tank waste treatment required to meet Batt Agreement.			
■ Demonstrate and deploy caustic recycle and recovery to reduce the volume of low-level waste streams and avoid construction of an additional grout vault at Savannah River.			
Tank Waste Pretreatment and Immobilization	24,984	19,124	29,103

Subsurface Contaminants Focus Area

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Subsurface Contaminants Focus Area is to provide technical capabilities and deployment assistance, in partnership with other Environmental Management programs, to provide fully integrated, technically defensible solutions for cleanup and long term stewardship of soils and groundwater at DOE sites.

Program Goal

The goal of the Subsurface Contaminants Focus Area's mission is to develop, demonstrate, and facilitate the deployment of innovative technologies that accomplish characterization, monitoring, containment, and long-term isolation of buried waste areas and achieve in situ remediation of dispersed contaminants while reducing cost of remediation, and risk to health and safety, meeting regulatory compliance requirements, and enabling technical solutions where none presently exist.

Across the DOE complex, 5,700 plumes contaminate more than 75 million m^3 of soil and 475 billion gallons of ground water with volatile organic compounds, Dense Non-Aqueous Phase Liquids, hazardous metals and radionuclides. There is an additional 3 million m^3 of solid radioactive and hazardous wastes buried in landfills, trenches, and spill areas. The contaminants pose significant health and safety risks and are present at all DOE sites, located at various depths in the vadose and saturated zones. In order to meet the *Accelerating Cleanup: Paths to Closure* goals and Federal and state compliance laws, cleanup must be accelerated and cleanup costs reduced. The Subsurface Contaminants Focus Area is coordinating vadose zone research efforts with all DOE operations offices, especially Richland in their efforts for remediation of contaminants under the high level waste tanks.

Program Objectives

The objective of this Focus Area is to develop technologies that address environmental restoration problem area needs identified by the Site Technology Coordination Groups and have been incorporated in the Department's *Accelerating Cleanup: Paths to Closure* strategy. Implementation of this program in an integrated manner with other Federal agencies, industry, national labs, and universities will result in faster cleanup and lower cost to the taxpayer. With the funding provided, this Focus Area will assist in the deployment of alternative technologies at individual sites and implement and maintain sound program management and integration processes.

Performance Measures

The Science and Technology FY 2000 corporate performance metrics (30 technologies or technology systems demonstrated; 30 technologies or technology systems made available for implementation; 60 alternative technologies deployed) are set at the Project Baseline Summary level, based on past program performance and budget requested. The complete listing of specific technologies, by Focus Area, that will be demonstrated, made ready for implementation or deployed, is made available after final FY 2000 project level funding is known and FY 2000 annual performance plans are finalized by each Focus Area. FY 2000 annual performance plans are scheduled to be finalized by September 30, 1999.

Significant Accomplishments and Program Shifts

- In FY 1999 and FY 2000, increased program emphasis will be on addressing characterization and delineation of Dense Non-Aqueous Phase Liquids in the vadose zone, saturated zone and deep, complex geologic settings.
- Continue, in FY 1999, multi-years tasks performed in cooperation with the Environmental Protection Agency to improve landfill caps, covers and barriers to prevent the migration of wastes from DOE sites. The Environmental Protection Agency will incorporate the data from these successful demonstrations into national landfill cover design guidance.
- Deploy, in FY 2000, seismic reflection technology at Savannah River to enable non-invasive location/distribution of free phase Dense Non-Aqueous Phase Liquids.
- Deploy, in FY 2000, in situ vadose zone chemical treatment technologies at Paducah, Kentucky and Portsmouth, Ohio, Nevada Test Site, and Richland.
- Complete, in FY 2000, Phase II multi-Federal agency demonstration for the removal of Dense Non-Aqueous Phase Liquids contamination from soil at Cape Canaveral using heating technologies and surfactant flushing.
- Deploy, in FY 2000, containment and cover systems in support of Richland vadose zone integration and Columbia River protection efforts.
- Complete, in FY 2000, deployment of advanced landfill cover at the Nevada Test Site.

Funding Schedule

(dollars in thousands)

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Dense Non-Aqueous Phase Liquids (Delineation, Removal or In Situ Treatment)

All major DOE sites have groundwater contamination resulting from the discharge into the soil of difficult to remediate, toxic and carcinogenic solvents termed Dense Non-Aqueous Phase Liquids. Dense Non-Aqueous Phase Liquids are difficult to locate, and even in small quantities, create large contaminated groundwater plumes. The dense nature and low solubility of these compounds allows them to move downward through the vadose zone and groundwater and to spread laterally along low permeability layers forming disseminated pools, which slowly contaminate groundwater. No capability exists to cost effectively locate Dense Non-Aqueous Phase Liquids sources; therefore, pump-and-treat, or other costly and ineffective treatment systems must be used to maintain compliance and to carry out a minimal and time consuming cleanup. In some hydrogeologic settings, it is not practical to install pumping systems. Focus will be on the development of technologies and methods to locate and quantify Dense Non-Aqueous Phase Liquids sources, treat the contaminated groundwater and soils in situ to reduce cleanup mortgages while enabling cost effective cleanup. Virtually every field office site across the complex has need for improved analytical tools and in situ monitoring devices that eliminate the need to retrieve and transport samples. Dense Non-Aqueous Phase Liquid activities, including innovative characterization technologies, reactive barrier technologies, bioremediation, and in situ chemical destruction will be demonstrated in cooperation with other Federal agencies and in international initiatives. Significant efforts by private industry and the DOE National Laboratories will be aimed at contaminant characterization and delineation in the vadose zone and deep and complex geologic settings.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

In FY 2000, there are six distinct work elements which support this Product Line: 1.) Vadose and Saturated Zone Characterization, Monitoring, Modeling and Analysis; 2.) In Situ Passive and Reactive Systems; 3.) Advanced Bioremediation and Enhanced Natural Attenuation; 4.) Vadose Zone Chemical Treatment Targeted for Dense Non-Aqueous Phase Liquids; 5.) Saturated Zone Chemical Treatment Targeted for Dense Non-Aqueous Phase Liquids; 6.) Deep Subsurface Access and Placement for Dense Non-Aqueous Phase Liquids.

- Deploy Seismic Reflection technology at Savannah River for non-invasive location and characterization of free phase Dense Non-Aqueous Phase Liquids.
- Demonstrate Dense Non-Aqueous Phase Liquids location techniques in deep and fractured geologic settings.
- Continue development of vadose zone contaminant fate and transport models.
- Deploy Laser Induced Fluorescence, Alcohol Microinjection/Extraction, and Hydrophobic Flexible Membrane at Savannah River.
- Perform verification of Dense Non-Aqueous Phase Liquids Reactive Barrier.
- Deploy Bioremediation Treatment Technology System at the Idaho National Engineering and Environmental Laboratory.
- Continue development of Phytoremediation technologies with university and international partners.
- Deplov Electro-osmosis (Lasagna™) technology at Paducah, Kentucky.
- Deploy hydro fracturing technology to treat Dense Non-Aqueous Phase Liquids in clay at Portsmouth, Ohio.
- Complete side-by-side demonstration of Dense Non-Aqueous Phase Liquids remediation and characterization technologies with other Federal agencies at Cape Canaveral.
- Deploy Hydrous Pyrolysis technology at Portsmouth and Savannah River Site 321.
- Demonstrate In Well Air Stripping, (NOVocs™) at Brookhaven National Laboratory for offsite Dense Non-Aqueous Phase Liquids that have migrated off site.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue joint Environmental Protection Agency/Department of Defense/industry effort to demonstrate surfactant technology to enhance aquifer remediation.			
■ Assess post-treatment Dense Non-Aqueous Phase Liquids mobility at Savannah River.			
■ Deploy deep Dense Non-Aqueous Phase Liquids access and treatment delivery system at Oak Ridge.			
Dense Non-Aqueous Phase Liquid	12,722	15,002	18,829

Source Term Containment/Source Term Remediation

DOE continues to spend a large part of its resources on the monitoring and maintenance of leaking radioactive and mixed waste landfills to achieve compliance with regulatory requirements. In addition, DOE will not be able to remediate these landfills to appropriate standards due to the presence of hazardous materials. Landfill containment systems are currently being deployed across the DOE complex and nation. However, many of these cover systems which were built to current regulatory specifications are failing and will require costly repair or replacement. The development of improved verification and monitoring systems to evaluate both the construction and performance of barrier systems will improve barrier performance and reduce the life-cycle cost of containment. Currently, verification and monitoring systems exist only for newly constructed engineered landfills. Additionally, the emplacement of barriers at significant depths has not been accomplished. Current remediation actions do not utilize deep-placement technologies, often selecting more costly solutions. The demonstration of deep-placement barriers will improve alternatives and reduce costs. In addition, source term retrieval of DOE mixed waste has not been done. Therefore, better caps, covers and barriers are needed to prevent the migration of the unique DOE disposed wastes.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
A design manual for a risk based design life is required. Technologies also need to be developed to stabilize and/or retrieve hot spots with unusually high contamination levels so that they can be appropriately treated or disposed. These solutions will reduce the risk of contaminant migration in the environment, speed cleanup, and facilitate safer cleanup. All this serves to reduce risk to the public and site workers as well as reduce environment degradation.			
In FY 2000, there are four distinct work elements which support this Product Line: 1.) Subsurface Barrier Systems in the Vadose Zone; 2.) Stabilization of Contaminants in the Vadose Zone; 3.) Hot Spot Removal from Landfills and Subsurface Sources; and 4.) Waste Containment/Stabilization Verification and Monitoring.			
■ Demonstrate subsurface containment systems in support of the Richland vadose zone integration and Columbia River protection efforts at depths greater than 100 feet.			
■ Verify performance of in situ vitrification system using innovative bottom up approach at actual waste sites at Los Alamos National Laboratory.			
■ Deploy "Dig Face characterization" technology to delineate soil contamination at the Fernald Environmental Management Project.			
■ Deploy Segmented Gate Soil Processing technology at Mound.			
■ Continue long-term monitoring to develop performance specifications acceptable to regulatory agencies in multiple states. This will allow for multiple deployments.			
■ Deploy Evapotranspiration Cover/Integrated Fiber-Optic Performance Monitoring System at Albuquerque.			
■ Complete deployment of advanced landfill cover at the Nevada Test Site.			
■ Complete deployment and monitoring of phytoremediation stabilization of mixed waste plume at Argonne National Laboratory.			
■ Continue evaluation of alternative cap and cover material and develop risk based cover design manual.			
Source Term Containment/Source Term Remediation	9,778	6,604	5,372

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Metals and Radionuclides in the Vadose and Saturated Zones

Metals and radionuclides contamination is present in the vadose and saturated zones at all DOE Operations Offices. Current technologies for the treatment of metals and radionuclides typically include excavation followed by ex situ treatment or pump-and-treat. These methods are costly, ineffective, and involve risk to workers. In addition, they are inadequate for attainment of the *Accelerating Cleanup: Paths to Closure* goals. Limited access to contaminants and low contaminant mobility at Albuquerque, Chicago, Oak Ridge, Rocky Flats, and Richland require reactive barrier technologies that remove or destroy radionuclide and hazardous metal contaminants moving in groundwater. To effectively address the existing site needs, solutions also must be developed that eliminate/reduce the volume of secondary waste and reduce workers' exposure. Partnerships with industry, the Environmental Protection Agency, the Department of Defense and other Federal agencies will lead to the cost effective development of in situ chemical treatment technologies that convert contaminants to less hazardous states and to the development of effective metal and radionuclide treatment/removal technologies based on bioremediation. In situ bioremediation technologies and improved drilling technology for sampling, delivery of treatment chemicals, or contaminant removal will be demonstrated. Existing access, sampling, and delivery methods cannot place characterization and treatment technologies in DOE's deep plumes. These plumes will be the most costly to remediate due to contaminant depth and geologic complexity. Improved technologies are needed to address these deep contaminants.

In FY 2000, there are six distinct work elements which support this Product Line: 1.) Vadose and Saturated Zone Characterization, Monitoring, Modeling and Analysis; 2.) In Situ Passive and Reactive Barrier Systems; 3.) Advanced Bioremediation and Enhanced Natural Attenuation; 4.) Vadose Zone Chemical Treatment Targeted for Metals and Radionuclides; 5.) Saturated Zone Chemical Treatment Targeted for Metals and Radionuclides; 6.) Deep Subsurface Access and Placement for Metals and Radionuclides.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue development of improved characterization and monitoring techniques.			
■ Continue development of vadose zone contaminant fate and transport models.			
■ Perform verification of Reactive Barrier Technology System at Rocky Flats. Deploy system at three to four other Rocky Flats Operable Units if performance is good.			
■ Perform verification of Reactive Barrier Technology System at Oak Ridge Y-12/S-3 Ponds.			
■ Perform verification of Iron Treatment Wall at Kansas City "Northeast Area" Plume.			
■ Perform verification of PERT Wall at Grand Junction, Monticello, Utah Uranium Mill Tailings Remedial Action Plume.			
■ Deploy monitored natural attenuation at a Brookhaven site for tritium treatment.			
■ Deploy phytoremediation at a site at Fernald and Idaho National Engineering and Environmental Laboratory.			
■ Develop strategies and technologies to monitor the natural attenuation processes.			
■ Deploy in situ Gaseous Reduction technology at Hanford.			
■ Continue development of in situ soil flushing technology for mobilization/extraction of radionuclides and hazardous metals.			
■ Deploy ACT*DE*CON at the Nevada Test Site.			
■ Deploy Chemical Stabilization technologies in Vadose Zone at Hanford in support of the vadose integration and Columbia River Protection efforts.			
■ Deploy in situ Redox Manipulation System for chromium treatment at Hanford.			
■ Demonstrate mixed metal/radionuclide treatment technology in complex hydro-geologic setting at Albuquerque. (Industry solicitation).

Deactivation and Decommissioning Focus Area

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Deactivation and Decommissioning Focus Area is to provide technical capabilities and deployment assistance, in partnership with other Environmental Management programs, to provide fully integrated, technically defensible solutions for deactivation, decommissioning, and long-term stewardship of radioactively contaminated facilities at DOE sites.

Program Goal

The goal of the Deactivation and Decommissioning Focus Area is to efficiently and cost effectively develop, demonstrate and facilitate the implementation of safe/low risk systems to solve the EM program identified needs for acceptable deactivation and decommissioning of DOE's radioactively contaminated surplus facilities. The overall goal of the Focus Area is to reduce the estimated $12 billion deactivation and decommissioning mortgage as reported in the *Accelerating Cleanup: Paths to Closure* by 50 percent. Two-thirds of the estimated $12 billion in deactivation and decommissioning work is scheduled for post-2006. The Focus Areas' goal is to reduce the pre-2006 mortgage of approximately $4 billion by $1 billion and the post-2006 mortgage (nearly $8 billion) by $5 billion. Within the funding provided, this Focus Area will assist in the development of alternative technologies at individual sites and implement and maintain sound program management and integration processes to achieve the cost savings and risk reduction goals.

Program Objectives

The Deactivation and Decommissioning Focus Area objective is to use a Large-Scale Demonstration and Deployment Project approach. This approach focuses on specific, high priority deactivation and decommissioning projects identified by and co-funded with the facility's owner. The Large Scale Demonstration and Deployment Projects demonstrate innovative and improved deactivation and decommissioning technologies at full scale, side by side with existing baseline technologies. The intent is to compare benefits from using a suite of innovative deactivation and decommissioning technologies against those associated with baseline technologies. Primary drivers of this work are the reduction of risk to workers involved in the cleanups, and the recycle (where feasible) or reduction of the large amounts of waste generated from the deactivation and decommissioning activities.

Performance Measures

The Science and Technology FY 2000 corporate performance metrics (30 technologies or technology systems demonstrated; 30 technologies or technology systems made available for implementation; 60 alternative technologies deployed) are set at the Project Baseline Summary level, based on past program performance and budget requested. The complete listing of specific technologies, by focus area, that will be demonstrated, made ready for implementation or deployed, is made available after Final FY 2000 project level funding is known and FY 2000 annual performance plans are finalized by each Focus Area. FY 2000 annual performance plans are scheduled to be finalized by September 30, 1999.

Significant Accomplishments and Program Shifts

- Completed, in FY 1998, C-Reactor Interim Safe Storage project at Hanford. Hanford has already incorporated the results from the C-Reactor project into F- and DR-Reactor safe storage projects. It is estimated that the cumulative cost of safe storing all of DOE's production reactors will be less than full deactivation and decommissioning of one reactor.
- Complete, in FY 2000, a Large Scale Demonstration and Deployment Project initiated in FY 1998 to deactivate and decontaminate a tritium production facility at Mound. This large Scale Demonstration and Deployment Project will showcase 8-12 innovative technologies for remote characterization and decontamination and dismantlement of tritium-contained equipment and surfaces.
- Deploy, in FY 2000, in fuel pools at Hanford and Idaho, underwater visual inspection, characterization, and remote dismantlement technologies to reduce safety and exposure risk to workers in high radiation environments.
- Deploy, in FY 2000, technologies to rapidly characterize and separate contaminated and non-contaminated metals at Oak Ridge, Rocky Flats, Los Alamos National Laboratory, and potentially other DOE sites to reduce waste disposal costs.
- Develop and demonstrate, in FY 2000, real-time characterization and robotic dismantlement technologies to reduce worker risk in the highly radioactive and confined areas associated with fuel fabrication facilities at Hanford.
- In FY 2000, increased program emphasis will be on recycle and release of scrap metal and technologies for the deactivation and decommissioning of reprocessing and weapons components fabrication facilities.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Reactor Facilities	6,637	6,460	4,733	-1,727	-26.7%
Radionuclide Separation Facilities	10,893	5,145	6,525	1,380	26.8%
Fuel and Weapons Component Fabrication Facilities	2,152	5,382	5,854	472	8.8%
Laboratory Facilities	9,784	5,951	0	-5,951	-100.0%
Total, Deactivation and Decommissioning Focus Area	29,466	22,938	17,112	-5,826	-25.4%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Reactor Facilities

There are 14 surplus production reactors across the DOE weapons complex which represent a significant portion of the Department's long-term deactivation and decommissioning mortgage. Improved, innovative technologies are required to facilitate deactivation and decommissioning of these production reactors to a degree such that they can be put in interim safe storage for a long period of time (up to 50 years) with minimal surveillance and maintenance requirements.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Technologies will be demonstrated and deployed which address underwater visual inspection, characterization and dismantlement as well as removal and treatment of fuel pool sludges, debris and water. These improved/innovative technologies will reduce the worker risk in high radiation fuel pools and significantly reduce the cost of deactivation and decommissioning of such facilities. Technologies demonstrated should substantially assist the future deactivation of the K-basin at Richland, as well as assist the commercial nuclear utility industry which also faces deactivation and decommissioning of similar complex facilities. For this reason, the commercial nuclear utility industry will be a key participant and be directly involved in this effort. Without these technologies, DOE sites and private industry will have no alternative but to adhere to their original technical baselines which will incur high cost, unacceptable worker risk, and long project duration to complete deactivation and decommissioning of these facilities.			
In FY 2000, there is one distinct work element which supports this Product Line: 1.) Deactivation and Decommissioning of Fuel Pools and Associated Structures.			
■ Demonstrate and deploy underwater visual inspection and characterization technologies at Hanford K-Basin			
■ Demonstrate and deploy underwater remote dismantlement technologies.			
■ Demonstrate and deploy technologies using controlled explosion for dismantlement of massive structures.			
Reactor Facilities	6,637	6,460	4,733
Radionuclide Separation Facilities			
Improved, innovative technologies are required to deactivate and decommission radionuclide separation facilities, including gaseous diffusion plants, fuel reprocessing canyons and a wide variety of specific types of facilities (such as chemical separation, uranium recycling, lithium enrichment, heavy water production and tritium production).			

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Deactivation and decommissioning activities can enable recovery of valuable contaminated scrap metal. At present, most of these metals are disposed of as no technologies exist to characterize and/or decontaminate them for free release cost-effectively. Decontamination of metals for recycle for free release will result in substantial life-cycle costs savings. Technologies to characterize, separate (contaminated and non-contaminated portions), and decontaminate metals for internal DOE recycle or free release will be demonstrated and deployed. Without this effort, most of the metals generated during deactivation and decommissioning will be disposed of as low-level waste resulting in high life-cycle cost.

Processing facilities are typically massive in size, are aging structures, and have high levels of contamination. These facilities have been used to process materials and treat waste containing plutonium, uranium, and various hazardous materials. Removal and disposition of radioactive and hazardous materials and equipment, deactivation of non-essential systems and utilities, and reconfiguration of systems to facilitate long-term surveillance and maintenance within these facilities with baseline technologies are very costly and pose high safety and health risks for workers and the public. Technologies will be demonstrated and deployed which address characterization of specific contaminants, accomplish large-scale decontamination and dismantlement, and waste disposition, enhance worker safety, and utilize remote operations.

In FY 2000, there are two distinct work elements which support this Product Line: 1.) Scrap Metal Recycling and Release; and 2.) Deactivation and Decommissioning of Processing Facilities.

- Demonstrate and deploy technologies to rapidly characterize and separate contaminated and non-contaminated metals at Oak Ridge.
- Demonstrate and deploy melting technology for producing clean ingots of stainless steel and nickel from contaminated feed at Oak Ridge.
- Develop and demonstrate real-time characterization technologies at Los Alamos National Laboratory and Rocky Flats.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Develop and demonstrate robotic dismantlement technologies for process equipment at Rocky Flats.			
Radionuclide Separation Facilities	10,893	5,145	6,525

Fuel and Weapons Component Fabrication Facilities

Improved and innovative technologies are required to deactivate and decommission fuel and weapons component fabrication facilities including those used for uranium milling and refining, fuel and target fabrication, and weapons assembly, dismantlement, modification and maintenance. Cost and risk of using baseline technologies for deactivation and decommissioning of these facilities is staggering. Improved, innovative technologies will be demonstrated and deployed which address the cost effective characterization, decontamination and dismantlement of such facilities.

DOE's Mound facility has many structures which contain tritium contamination. Improved and innovative technologies will be demonstrated and deployed to address building decontamination/dismantlement and metal/concrete waste disposal/recycling. Without these technologies, the Mound facility and other DOE sites will be forced to adhere to original technical baseline that will increase the risk to workers and increase the cost and time needed for deactivation and decommissioning.

In FY 2000, there are two distinct work elements which support this Product Line: 1.) Deactivation and Decommissioning of Tritium Contaminated Facilities; and 2.) Deactivation and Decommissioning of Weapons Components Fabrication Facilities.

- Demonstrate and deploy tritiated pump oil disposition technology.
- Demonstrate and deploy dust suppression technology.
- Demonstrate and deploy tritiated glovebox decontamination technology at Mound.
- Develop and demonstrate remotely deployed real-time characterization technologies at Hanford.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Develop and demonstrate remote decontamination technologies at Hanford.			
Fuel and Weapons Component Fabrication Facilities	2,152	5,382	5,854
Laboratory Facilities			
Innovative and improved technologies are required to deactivate and decommission laboratory facilities including research, development and testing facilities, hot cells and gloveboxes.			
Across the DOE weapons complex, there is a large number of surplus plutonium contaminated gloveboxes. Technologies for characterization of contaminated surfaces to determine transuranic, low-level waste or free-release segregation and packaging of transuranic contaminated waste will be demonstrated and deployed. This will minimize the amount of glovebox material requiring disposal as transuranic waste.			
■ This activity will not be continued into FY 2000.

Plutonium Stabilization and Disposition Focus Area

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Plutonium Stabilization and Disposition Focus Area is to provide technical capabilities and deployment assistance, in partnership with other Environmental Management programs, to provide fully integrated, technically defensible solutions for cleanup and long-term stewardship of plutonium materials and residues at DOE sites.

Program Goal

The Secretary of Energy has made commitments to the Defense Nuclear Facility Safety Board in response to Defense Nuclear Facility Safety Board Recommendation 94-1 that the Department will develop and deploy technologies to stabilize and dispose of plutonium and plutonium residues. More than 20 tons of plutonium and 170 tons of plutonium residues remain in the weapons manufacturing "pipeline" at several DOE sites such as Rocky Flats, Hanford, and Savannah River. Plutonium and plutonium residues will continue to pose imminent environmental, safety, and health hazards until they are incorporated into stable, safeguards-compatible waste forms and final disposition is completed. Similar quantities of unstabilized material exist in the former Soviet Union. The goal of the Plutonium Stabilization and Disposition Focus Area is to develop appropriate stabilization and waste treatment technologies, devise packaging, and support development of necessary transportation, storage, surveillance, and monitoring technologies. Within the funding provided, this Focus Area will assist in the deployment of alternative technologies at individual sites and implement and maintain sound program management and integration processes.

Program Objectives

Continue to develop technologies that address the stabilization and disposition of plutonium and plutonium residues across the complex. Deploy stabilization and disposition technologies as rapidly as possible to meed Defense Nuclear Facilities Safety Board 94-1 requirements and to support *Accelerating Cleanup: Paths to Closure* goals.

Performance Measures

The Science and Technology FY 2000 corporate performance metrics (30 technologies or technology systems demonstrated; 30 technologies or technology systems made available for implementation; 60 alternative technologies deployed) are set at the Project Baseline Summary level, based on past program performance and budget requested. The complete listing of specific technologies, by Focus Area, that will be demonstrated, made ready for implementation or deployed, is made available after final FY 2000 project level funding is known and FY 2000 annual performance plans are finalized by each Focus Area. FY 2000 annual performance plans are scheduled to be finalized by September 30, 1999.

Significant Accomplishments and Program Shifts

- Complete, in FY 1999, development of nonintrusive, automated surveillance and monitoring technologies.
- Demonstrate, in FY 2000, Phosphate-bonded cold ceramic technology at Rocky Flats to stabilize plutonium ash residue, a Defense Nuclear Facilities Safety Board identified concern.
- Test, in FY 2000, porous crystalline matrix technology to stabilize actinide solutions including plutonium, americium, and curium solutions at Savannah River F-Canyon.
- In FY 2000, program emphasis will be on development of stabilization technologies needed to address problems at Rocky Flats and Savannah River.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Plutonium Stabilization Technology Development	0	3,893	3,653	-240	-6.2%
Alternative Stabilization Process for Fissile Materials Solutions	0	0	600	600	100.0%

Total, Plutonium Stabilization and Disposition Focus Area	0	5,480	4,253	-1,227	-22.4%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Plutonium Stabilization Technology Development			
Stabilization process development applies to plutonium and Defense Nuclear Facility Safety Board 94-1 materials (plutonium solutions, plutonium metals and oxides, plutonium residues, highly enriched uranium, and special isotopes) that require stabilization before being placed in interim storage to await ultimate disposition. The complexity of the at-risk Defense Nuclear Facility Safety Board 94-1 plutonium inventory and the variety of physical forms (such as oxides, salts, ash and solutions) creates need for additional research and development.			
Plutonium residue stabilization is a critical path item at Rocky Flats. Accelerated cleanup goals and innovative technologies are needed to meet cleanup schedule. High-efficiency particulate air filters containing plutonium are a problem since incineration and leaching approaches are unacceptable. Technologies will be demonstrated and deployed which address high-efficiency particulate air filters, Uranium-233 Stabilization, Uranium-235 Stabilization and salt distillation at Rocky Flats. The impact if these technologies are not developed and implemented would be an increased risk to health, safety and the environment.			
In FY 2000, one distinct work element supports this Product Line: 1.) Plutonium Ash and Filter Stabilization.			
■ Deploy in collaboration with Office of Science and Technology Robotics program, Phosphate – Bonded Cold Ceramic technology at Rocky Flats to stabilize 20 tons of ash residue.			
■ Full Scale demonstration of melting fiberglass filters at low temperature in a glass flux to evaluate acceptability as a stabilization process.			
Plutonium Stabilization Technology Development	0	3,893	3,653

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

Alternative Stabilization Process for Fissile Materials Solutions

An alternative technology to vitrification is needed to address the problem of liquids containing americium and curium that produces reduced secondary waste, and that is reliable and cost effective. The new technology must reduce risk to safety, health, and environment.

Approximately 15,000 liters of solution containing isotopes of Americium and Curium are stored at the Savannah River Site in F-Canyon Tank 17-1. The original intent was to immobilize the Americium/Curium solution by vitrification in a bushing melter commencing in September 1998. Initial failures of the melter pushed the stabilization process into early FY 2000. Technical issues with the melter concerning plugging and off-gas caused all research and development efforts to be placed on hold. A technology, recently developed in Russia which would use a porous crystalline matrix, is being investigated which absorbs liquids at room temperature, forming stable ceramic material, suitable for safe long-term storage and transportation. If this technology is not pursued as a potential primary stabilization process, and as an alternative to precipitation-vitrification option, the Americium/Curium solution would remain unstabilized and the current risk to safety, health and the environment will remain or potentially increase.

In FY 2000, one work element supports this Product Line: 1.) Americum and Curium Removal and Stabilization from F Canyon.

- Test waste solutions containing actinide including plutonium, americium, and curium.
- Support Savannah River Site testing using small scale of actual Americium/Curium solution.
- Support Savannah River Site in scale-up tests with actual Americium/Curium solution.

Alternative Stabilization Process for Fissile Material Solutions . .	0	0	600

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Alternate Packaging and Storage Technologies			
Plutonium and other actinides are currently stored in various packages, tanks, piping, plastic containers, and metal containers. When production was terminated in 1989-1993, these materials were typically being held for staging into production processes. DOE-STD-3013 requires plutonium metals and oxides to be stored in dry atmospheres in hermetically sealed containers not containing organic materials. Surveillance of packages is required to ensure that container integrity is maintained and that all materials comply with environmental, safety, health, accountability, and control requirements. Surveillance and monitoring processes need to be standardized complex-wide. Nonintrusive surveillance methods are needed to minimize radiation exposure and cost associated with conventional methods (such as inspection by opening packages).			
■ Technologies related to nonintrusive, automated surveillance and monitoring technology development will be completed in FY 1999.			
Alternate Packaging and Storage Technologies	0	1,587	0

University Programs

Mission Supporting Goals, and Objectives

Program Mission

The mission of University Programs is to support the Focus Areas by providing fundamental credible data related to the application of technologies, resolution of technical issues and system optimization.

Program Goal

The goal of University Programs is to support the Focus Areas through the involvement of the academic community in the development of credible data from non-conflicted, recognized experts in support of activities related to the acceptance of innovative technologies by the regulators and stakeholders.

Program Objectives

The objective of University Programs is to evaluate technologies, validate their applications, and assist in the resolution of technical issues in support of the Focus Area.

Performance Measures

The Science and Technology FY 2000 corporate performance metrics (30 technologies or technology systems demonstrated; 30 technologies or technology systems made available for implementation; 61 alternative technologies deployed) are set at the Project Baseline Summary level, based on past program performance and budget requested. The complete listing of specific technologies, by Focus Area, that will be demonstrated, made ready for implementation or deployed, is made available after final FY 2000 project level funding is known and FY 2000 annual performance plans are finalized by each Focus Area. FY 2000 annual performance plans are scheduled to be finalized by September 30, 1999.

Significant Accomplishments and Program Shifts

- Continue, in FY 2000, research in support of robotic technologies supporting the Mixed Waste Focus Area to allow autonomous glovebox material processing, material handling, volume reduction of gloveboxes and automated handling of shipping drums.
- Continue, in FY 2000, research in support of the Subsurface Contaminants Focus Area to remove metals from soils using advanced phytoremediation technologies.

- Continue, in FY 2000, research in support of the waste loading/glass formulation, alternative melter design, analytical high-level/low level waste glass standards, and long-term performance for the Radioactive Tank Remediation Focus Area.

Idaho Technology Validation and Verification Program

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Idaho Technology Validation and Verification Program is to support the Focus Areas and the Environmental Management program through technology validation and verification activities that support and enhance application and deployment of innovative EM technologies across the DOE complex and systems engineering activities which will be used in the development of disposition processes for each EM waste stream. These activities will place DOE's environmental programs on a solid technical base, reduce costs, and leverage the DOE investment into broader national environmental priorities.

Program Goal

The goal of the Idaho Technology Validation and Verification Program is to provide the Focus Areas and Environmental Management program processes that will assist EM in focusing activities on accelerating cleanup; investigating alternatives to the identified baseline using innovative technologies; and tracking performance of these efforts.

Program Objectives

The primary objective of the Idaho Technology Validation and Verification Program is to support EM in identifying and analyzing complex-wide integration opportunities to reduce program costs and risks.

Performance Measures

No quantifiable corporate performance measures are associated with this program.

Significant Accomplishments and Program Shifts

- Continue, in FY 2000, systems engineering support for assessment and validation of EM systems and technology performance reliability/risk.

- Continue, in FY 2000, research activities to support EM missions identified from disposition maps priority needs, including research in materials and structural dynamics; materials characterizations science; environmental surface chemistry; containment transport through soils; liquid media and the atmosphere; and mathematical and computational modeling of complex environmental systems.
- Continue, in FY 2000, identification of disposition barrier to technology development requirements, and transportation system requirements to support disposition of EM waste, spent nuclear fuel, and nuclear materials.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Validation and Verification	14,500	5,500	14,500	9,000	163.6%
Systems Engineering	0	8,000	8,000	0	>999.9%
Total, Idaho Technology Validation and Verification Program	14,500	13,500	22,500	9,000	66.7%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Validation and Verification

Technology validation and verification activities will be used to support and enhance application and deployment of innovative technologies across the DOE complex and to provide a solid technical base for EM cleanup, reduce costs and leverage the DOE investment into broader national environmental priorities.

- Continue coordination of research activities with EM Integration and Focus Areas and interface with Site Technology Coordinating Groups to maintain and update data on specific science and technology needs.
- Execution of selected research activities to support EM mission extrapolated from disposition maps priority needs. Activities will include research in materials and structured dynamics; materials characterization science; environmental surface chemistry; containment transport through soils, liquid media, and the atmosphere; and mathematical and computational modeling of complex environmental systems.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue development of integrated, multidisciplinary technical research teams focused on environmentally related research and development including materials and structured dynamics; materials characterization science; environmental surface chemistry; containment transport through soils, liquid media, and the atmosphere; and mathematical and computational modeling of complex environmental systems.			
■ Systems engineering support for application and extension of capabilities for assessment and validation of EM systems and technologies performance reliability/risk, and for facilitation of regulatory and stakeholder acceptance in support of deployment and life-cycle assurance.			
■ Rapid deployment of scientific, technical and system engineering response teams to address national/complex-wide issues (for example, the vadose zone at Richland).			
Validation and Verification	14,500	5,500	14,500

Systems Engineering

Systems Engineering activities will be used in the refinement of EM waste, spent nuclear fuel, and nuclear materials disposition baselines, and identify and implement new opportunities to accomplish more efficient and cost effective cleanup/closure of DOE sites. Systems engineering activities provide the information and communication tools necessary to maximize the use of existing facilities, share technical information, minimize duplication, promote cost savings, and utilize a systems approach to facilitate accelerated cleanup while reducing closure costs and risks. Utilization of systems engineering processes brings together EM waste, spent nuclear fuel, and nuclear materials management, site cleanup, transportation, and Science and Technology activities. EM integration cuts across program and site "stovepipes", interfaces with other Departmental programs, and evaluates cross-site and cross-program opportunities for efficiencies and cost reductions to streamline and implement accelerated cleanup.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The EM Integration activity utilizes multi-site teams to develop, evaluate, and recommend alternatives to existing waste, spent nuclear fuel, and nuclear materials disposition baselines. DOE and contractor management personnel and subject matter experts from DOE EM sites are represented during the integration process. These activities are fundamental to the EM integration effort to establish and communicate a credible waste, spent nuclear fuel, and nuclear materials disposition baseline, and identify, evaluate, and implement selected efficiency opportunities. ■ Continue support to DOE-HQ, Field Offices, and contractors in development and integration of EM waste, spent nuclear fuel, and nuclear material disposition baselines. ■ Continue identification of barriers to disposition, technology development requirements, and transportation system requirements to support disposition of EM waste, spent nuclear fuel, and nuclear materials. ■ Identify cross-site and cross-program integration opportunities. ■ Perform technology development alternative analyses for integration opportunities. ■ Continue deployment of Integrated Product Teams to prepare Recommendation Evaluation Plans for selected waste, spent nuclear fuel, nuclear materials, technology development, and transportation opportunities for subsequent incorporation into project baselines.			
Systems Engineering	0	8,000	8,000
Total, Idaho Technology Validation and Verification Program	14,500	13,500	22,500

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Validation and Verification	
■ In FY 1999, $9,000,000 is included for the Idaho Technology Validation and Verification Program within the Idaho Site Project Completion decision unit under the Defense Environmental Restoration and Waste Management appropriation account for a total of $22;500,000. Beginning in FY 2000, the funding request for this activity will be consolidated under the Science and Technology decision unit. There is no overall funding level change for this activity from FY 1999 to FY 2000	-9,000

Western Environmental Technology Office

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Western Environmental Technology Office is to support the Mixed Waste Characterization, Treatment and Disposal Focus Area and the Subsurface Contaminants Focus Areas. For more than two decades, DOE has used the Western Environmental Technology Office as a test facility, where MSE Technology Applications, Inc. engaged in the research, testing, demonstration, development, and application of innovative technologies. In FY 1996, agreements were reached to privatize the Western Environmental Technology Office facility with a 5-year contract through 2001. Privatization will fulfill DOE's financial and management obligations and reduce the Government's costs in contracting services.

Program Goal

The goal of the Western Environmental Technology Office is to focus on testing technologies meeting high priority EM cleanup needs associated with the Mixed Waste Characterization, Treatment and Disposal Focus Area and the Subsurface Contaminants Focus Areas.

Program Objectives

The objective of the Western Environmental Technology Office is to support the Mixed Waste Characterization, Treatment and Disposal Focus Area and the Subsurface Contaminants Focus Area through the demonstration, testing, and evaluation of selected technology systems, performing life-cycle engineering analyses on innovative technology systems to maximize the chances of successful implementation and deployment.

Performance Measures

This program supports the Mixed Waste and Subsurface Contaminants Focus Area. As such, no quantifiable corporate performance measures are associated with this program.

Significant Accomplishments and Program Shifts

- Complete, in FY 2000, evaluation of off gas control and emission monitoring technologies as identified by the Mixed Waste Characterization, Treatment and Disposal Focus Area and the end users at Idaho, Oak Ridge, and Savannah River.
- Complete, in FY 2000, final documentation of the "as-built" performance for deployment of several of the radionuclide contaminated sites and continue monitoring and technical support for the barrier system applications throughout the DOE complex.
- Complete, in FY 2000, verification and documentation of in situ destruction techniques for Dense Non-Aqueous Phase Liquids demonstration at Cape Canaveral and initiate technology transfer performed with consortium (DOE, Department of Defense, United States Air Force, Environmental Protection Agency).
- Continue, in FY 2000, validation of cost savings estimates, including uncertainty analysis for deployed technologies across DOE complex.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Controlled Emissions Demonstration	4,600	3,500	3,500	0	>999.9%
Subsurface Contaminant and In Situ Remediation	7,495	7,250	4,300	-2,950	-40.7%
Engineering Analysis	1,298	2,250	2,704	454	20.2%
Total, Western Environmental Technology Office	13,393	13,000	10,504	-2,496	-19.2%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Controlled Emissions Demonstration

By 2002, the four operational DOE hazardous waste thermal treatment units must be able to meet the Environmental Protection Agency Maximum Achievable Control Technology Rule or be shut down. The Maximum Achievable Control Technology Rule states that a compliance plan must be submitted to the Environmental Protection Agency for covered operations within 180 days of promulgation of the rule (January 1999). Noncompliance with the Maximum Achievable Control Technology Rule will threaten DOE's ability to meet compliance agreements.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Promising, technologically mature off gas monitoring and treatment systems, which are being tested under the Controlled Emissions Demonstration Project at Western Environmental Technology Office for organic and inorganic hazardous air pollutants should address this challenge of emission compliance by 2002.			
■ Complete evaluation of off gas control and emission monitoring technologies as identified by the Mixed Waste Characterization, Treatment and Disposal Focus Area and the end users at the Idaho National Environmental Technology (New Waste Calcination Facility and the Waste Experimental Reduction Facility), Oak Ridge National Laboratory (Toxic Substances Control Act Incinerator) and the Savannah River Site (Consolidated Incineration Facility). Needs have been identified for furan/dioxin and volatile metals including mercury. Benefits include a design basis to support improved off gas systems and a flexible test bed readily available at Western Environmental Technology Office for continued off gas technology testing.			
Controlled Emissions Demonstration	4,600	3,500	3,500
Subsurface Contaminant and In Situ Remediation			
Activities will support the Subsurface Contaminants Focus Area in addressing the problems/needs identified in the following areas: subsurface barrier systems, vadose zone stabilization, in situ passive treatment, deep access and delivery methods, containment/stabilization verification and monitoring. This investment directly supports Subsurface Contaminants Focus Area in its efforts to help meet all DOE Operation Offices' requirements, schedules and *Accelerating Cleanup: Paths to Closure* goals while directly contributing to cost reduction, schedule compression and risk minimization.			
■ Complete the final documentation of the as-built viscous liquid barrier of the radionuclide contaminated site deployment; continue monitoring and provide technical support for barrier system applications throughout the DOE complex.			

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Complete verification and documentation of in situ destruction techniques for Dense Non-Aqueous Phase Liquids demonstration at Cape Canaveral and initiate technology transfer performed with consortium (DOE, Department of Defense, United States Air Force, Environmental Protection Agency).			
■ Complete deployment of an alternative in situ vitrification system, verification, and documentation. Provide assistance in transferring this technology to more complex sites including those with containerized buried waste, organics, shallow groundwater and other technically challenging environments.			
■ Complete methodology for rapid barrier construction performance evaluation and support its use throughout the complex.			
■ Complete demonstration, validation and documentation of ultra microbacteria barrier and one or more deep (greater than 50 feet) treatment systems.			
■ Complete demonstration, validation and documentation of reactive media for barriers and deep placement. Deploy media to projects using in situ passive treatment technologies.			
Subsurface Contaminant and In Situ Remediation	7,495	7,250	4,300

Engineering Analysis

Technical assistance and life-cycle systems analysis is critically important to achieving the successful deployment of treatment, remediation, and containment technology systems. These activities will focus on the analysis of technology systems which are ready candidates for implementation and deployment, matching newly developed technologies with DOE urgent cleanup needs to enhance deployment opportunities, and providing technical assistance to developers and users to assure successful deployment. Thus, this program will emphasize moving DOE funded technologies into the commercial setting either within the DOE complex or in private industry and accelerating innovative DOE technology acceptance at the local and regional level.

- Provide independent innovative technology cost savings analysis for the Office of Science and Technology.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Provide Focus Areas with 10 (minimum) analyses of innovative technologies.			
■ Validate cost savings estimates, including uncertainty analysis for deployed technologies across EM complex.			
■ Report on status of MSE Technology Applications, Inc., evaluated technologies to deploy and commercialize. To include, but not limited to dioxin/furan and mercury off gas treatment and emission monitoring systems, reactive and containment barriers, barrier verification and monitoring systems, Dense Non-Aqueous Phase Liquids in situ treatment systems and alternative in situ vitrification.			
Engineering Analysis	1,298	2,250	2,704

Technology Acceptance and Support

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Technology Acceptance and Support program is to provide business support to the Office of Science and Technology and to stimulate wider acceptance and deployment of emerging technologies for use in fully integrated, technically defensible solutions for cleanup and stewardship of DOE sites.

Program Goal

The goal of the Technology Acceptance and Support program is two-fold. First, the program is to provide the Office of Science and Technology with sound business assistance and effective information management. Second, the program is to facilitate wider acceptance and deployment of Focus Area technologies by timely analysis and provision of technology information to user sites and other stakeholders; as well as by activities that improve technical quality, responsiveness to site needs, and regulatory acceptance of Office of Science and Technology products, and leveraging of international science and technical expertise.

Program Objectives

The Technology Acceptance and Support program objectives are to provide effective business management controls and practices; technology and overall program information collection, analysis, and dissemination; program and peer reviews of technology initiatives; clarification of site science and technology needs and responsive Focus Area activities and technologies; facilitation of rapid technology deployment; support to interstate regulatory cooperation initiatives for the use of innovative technologies; facilitation of international science and technology cooperation; and recommendations for enhancing technology worker safety.

Performance Measures

No quantifiable corporate performance measures are associated with this program.

Significant Accomplishments and Program Shifts

- Continue, in FY 2000, to maintain information through the Technology Management System and other communication tools to aid in overall Office of Science and Technology business and program management and articulation.
- Update and continue, in FY 2000, life-cycle impact estimates for innovative technologies, with emphases on potential cost savings, using the EM standardized methodology which was developed under this program.
- Continue, in FY 2000, conducting independent reviews of Office of Science and Technology programs and significant processes and provide peer reviews of Office of Science and Technology technologies. In FY 1998 and FY 1999, over 70 technologies will have been peer reviewed under the methodology established in late FY 1997.
- Continue, in FY 2000, to assist all participating States in eliminating acceptance barriers to deployment through common protocols, training, improved state practices, and deployment workshops. Through FY 1999, this activity has been assumed under the sponsorship of the Environmental Commissioners of the States. Over 20 protocols and technology guidance documents have been issued.
- Continue, in FY 2000, update of site science and technology needs and responsive Focus Areas activities and technologies. Over 600 Science and Technology needs were identified for Focus Area response in FY 1999.
- Continue, in FY 2000, to provide recommendations for enhancing safety, reducing fatigue and stress, greater user acceptance, efficiency, and productivity for Office of Science Technology technologies.
- Reduce, in FY 2000, DOE funding requirements for Interstate Technology and Regulatory Cooperation workgroup by encouraging increased state, other Federal, private sector, and other funding participation.
- Continue, in FY 2000, to facilitate access to international expertise. In FY 1998 and FY 1999, approximately 25 international scientific and technical tasks will have been identified.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Program Information, Review and Analysis	4,379	6,451	6,050	-401	-6.2%
Regulatory and Site Acceptance	6,945	8,471	6,550	-1,921	-22.7%
International Technology Coordination	1,498	600	600	0	>999.9%

Total, Technology Acceptance and Support	12,822	17,522	14,900	-2,622	-15.0%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Program Information, Review, and Analysis

Activities will focus on sound business practices, program and peer reviews, and the Office of Science and Technology program data collection, analysis and dissemination. The Center for Acquisition and Business Excellence at the Federal Energy Technology Center assists the Office of Science and Technology with the implementation of its business management and control processes. Independent external peer and programmatic reviews will continue to enhance quality and acceptability of key Focus Area decisions and data. Program information and communications provides the Office of Science and Technology with the ability to collect, maintain, analyze, and disseminate key information to assist developers, site users, regulators, investors, and other stakeholders in key decisions. Credible estimates of cost savings and other innovative technology benefits promote increased acceptance of technologies by sites. In cooperation with other EM organizations, Technology Acceptance and Support develops methodologies for calculating life-cycle cost savings of new technologies. Total program impact on cleanup mortgage reduction projections are developed based on the EM strategy. Without these various programs and activities, EM decision makers would not have the information needed to support technology support or deployment decisions or to report impacts of deployments.

- Continue providing all key Office of Science and Technology information through the Technology Management System and other communication tools to aid in overall Office of Science and Technology business and program management. Identify and meet the dynamic communication needs of existing and additional audiences as technology solutions mature. Institute improved management processes.
- Update and continue life-cycle impact estimates for innovative technologies, with emphasis on potential cost savings, using the EM standardized methodology.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue conducting independent review of Office of Science and Technology programs and significant processes, and provide peer reviews of Office of Science and Technology technologies.			
Program Information, Review, and Analysis	4,379	6,451	6,050

Regulatory and Site Acceptance

Regulatory and site acceptance are prerequisites to innovative technology deployment in support of the EM goal of accelerating cleanup. In the past, states have worked separately and have required duplicative demonstrations and inconsistent protocols to achieve permitting for local use, greatly slowing down multi-site deployments. Office of Science and Technology assists states through their Interstate Technology and Regulatory Cooperation work group in establishing verification protocols, reciprocity guidelines, and training to expedite multi-state permitting and multi-site deployments. Site acceptance of innovative technologies is facilitated by early clarification of site needs, by finding technologies to meet the needs, and by involving end users and stakeholders in the decision processes through such mechanisms as Site Technology Coordination Groups. This activity also provides for field management and reporting of management and operations activities supporting Office of Science and Technology, and assists coordination of planning efforts within the national laboratory community. This program further assists in technology acceptance and deployment at specific DOE cleanup sites as appropriate.

- Continue to assist all participating states in eliminating acceptance barriers to deployment through common protocols, systems and training and deployment workshops. Reduce DOE funding requirements for Interstate Technology and Regulatory Cooperation workgroup by encouraging increased state, other Federal, private sector, and other funding participation. Continue to document use of Interstate Technology and Regulatory Cooperation workgroup publications and technology deployments.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Update site science and technology needs, and continue to support management of site science and technology activities. Facilitate communications among site stakeholders and technology developers in order to catalyze the use of innovative science and technology solutions and pursue other activities to facilitate rapid deployment.			
Regulatory and Site Acceptance	6,945	8,471	6,550

International Technology Coordination

EM needs access to environmental technologies, scientific expertise, technical information, and foreign markets that can further DOE's cleanup mission. Through Memoranda of Cooperation, Office of Science and Technology collaborates with the scientific communities of Russia, Poland, Argentina and the United Kingdom in joint research and development to meet these needs. These efforts ensure continued awareness of opportunities for site users to access relevant foreign environmental technologies, data, and expertise to accelerate cleanup. Through these activities, Office of Science and Technology leverages the relationships established with the international science and technology community over the past 10 years to maintain access to foreign technologies with minimal increase in investment. Without these efforts, EM sites will not effectively receive the benefit of international technologies and expertise.

- Continue ongoing coordination and identification of available opportunities for EM participation with the international science and technology community. Level of effort for this activity will remain constant. Work is conducted with Argentina, Poland, Russia, and the United Kingdom under bilateral agreements.

International Technology Coordination	1,498	600	600

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Safety Testing			
DOE site cleanup work can be performed more responsibly and effectively through technology improvements that increase safety and contribute to user and worker acceptance of those technologies. Technology Acceptance and Support conducts worker safety assessments of high impact environmental technologies to improve technology safety, reduce worker fatigue and stress, increase comfort, and gain increased user and worker acceptance. Without this activity, user and worker acceptance may be reduced, potentially lessening benefits from Office of Science and Technology investments.			
■ Continue to provide recommendations for enhancing safety, reducing fatigue and stress, greater user acceptance, efficiency, and productivity for Office of Science and Technology technologies.			
Safety Testing	0	2,000	1,700
Total, Technology Acceptance and Support	12,822	17,522	14,900

Small Business Innovative Research Program (Technology Development)

Mission Supporting Goals, and Objectives

Program Mission

Provide funding to the Small Business Innovative Research program for small businesses to participate in research and development activities that benefit the EM program.

Program Goal

The goal of this program is to use technologies developed by the small business community to accelerate and reduce the cost of cleanup at EM sites.

Program Objectives

The objective is to deploy technologies that meet the EM mission as rapidly as possible.

Performance Measures

There are no quantifiable corporate performance measures associated with this program.

Significant Accomplishments and Program Shifts

- Continue to support this program and provide opportunities for the small business community to make contributions to the EM mission.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Environmental Management Science Program

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Office of Science and Technology's Science Program is to develop and fund a targeted long-term basic research program that will result in transformational or breakthrough approaches for solving the Department's environmental problems. This program is a collaborative effort between the Department's Office of Environmental Management and Office of Science.

Program Goal

The goal of the Office of Science and Technology's Science Program is to continue to solicit and support world class basic research that has the potential to lead to significant, quantum improvements in the understanding of scientific principles and phenomena in areas of interest to the EM mission; to validate existing technical solutions to complex problems; to provide technical solutions where currently there are none; and to lead to future risk reduction and cost and time savings.

Program Objectives

The objectives of the Office of Science and Technology Science program are to widely solicit research needs, and use an open, fair and competitive selection process to distribute research funding. Site-specific research needs have been solicited through a variety of activities including workshops at Richland, Savannah River Site, Oak Ridge, and Idaho National Engineering and Environmental Laboratory; a complex-wide needs survey; solicitation or science research needs in support of the *Accelerating Cleanup: Paths to Closure* plan from the Site Technology Coordinating Groups; and through systems engineering analysis performed by the Idaho National Engineering and Environmental Laboratory. The importance of basic scientific research to the EM cleanup mission has been established in several reports, specifically the Galvin Commission report (1995) entitled *Alternative Futures for the Department of Energy National Laboratories* and the National Research Council report (1996) entitled *Improving the Environment: An Evaluation of Doe's Environmental Management Program.* The Environmental Management Advisory Board Science Committee is supportive of the EM Science Program and its accomplishments in what has been a relatively short time of existence (i.e., the Environmental Management Science Program is up and running, employs a competitive and fair selection process, has distributed research funding, has research underway, and research to date looks favorable).

Performance Measures

No quantifiable corporate performance measures are associated with the program.

Significant Accomplishments and Program Shifts

- In May 1998, the Science Program received a "HAMMER" award from the Vice President's National Performance Review Team.

In addition, major areas of scientific research needs addressed by the EM Science Program awards include:

- Advanced methods to characterize, remove, and treat high-level wastes in tanks.
- New approaches and methods for the decontamination and decommissioning of contaminated facilities and equipment.
- Identification of ways to reduce uncertainty in the long-term containment performance of spent nuclear fuel in storage and disposal.
- Advanced methods for conversion of fissile materials to more stable forms.
- Improved scientific information for the characterization, treatment, and monitoring of mixed radioactive and hazardous materials.
- New concepts for developing suitable storage forms for each type of waste that needs to be stored.
- Reduced scientific uncertainty in the levels of risk to human health at the end stages of cleanup efforts.
- New approaches and methods to address problems in subsurface contamination and transport processes in the vadose zone.
- Approaches to develop a better scientific basis for understanding exposures and risks to humans from low dose radiation that can be used to achieve acceptable levels of human health protection at the lowest possible cost.

As the EM Science Program matures it will continue to fund basic research and development to address the evolving science needs of EM sites. The program intends to ensure that it is addressing the right research questions, disseminating research results, and getting the "best science" by:

- Evaluating ongoing research.
- Communicating the nature of the program, and its research results, to as wide an audience as possible.
- Holding site-specific, and complex-wide workshops to link basic research developed within and outside the Department, with technology users, both within, and outside the Department. The first complex-wide workshop was held in July 1998 and the American Chemical Society will host a session on the Environmental Management Science Program research at their national symposium in Summer 1999. A second complex-wide workshop is being planned Spring 2000.

- Developing a national science research plan based on needs identified by sites through the project baseline summaries. National Academy of Sciences/National Research Council will complete a plan for subsurface contamination in Fall of 1999.
- Coordinating and leveraging research efforts and capabilities with other DOE programs, other federal agencies, academia, and the private sector.

The EM Science program supports DOE's strategic goal to deliver the scientific understanding and technological innovations that are critical to the success of DOE's mission and the Nation's science base. The program directly supports the objective to develop the science that underlies DOE's long-term mission.

Funding Schedule

(dollars in thousands)

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
FY 1996 Awards			
In FY 1996, 136 three-year research projects at 52 universities, 11 Department of Energy National Laboratories and other private and public technology developers and researchers were initiated. Seventy-one of the projects focused on science needed to improve remedial action processes; 26 focus on finding better ways to treat and destroy high level radioactive waste, 23 focus on waste containing a mixture of radioactive and other hazardous materials (mixed waste); 10 focus on better understanding the health and ecological risks associated with environmental cleanup options; and the remaining 6 focus on technical problems with facility deactivation and decommissioning and spent nuclear fuel stabilization and disposal. The national laboratory research project funding is focused on problems in the areas of: subsurface contaminants (48%); radioactive tank waste (24%), mixed waste characterization, treatment, and disposal (15%), decontamination and decommissioning (4%), nuclear materials (2%), and health/ecology/risk (7%).			
■ Complete, in FY 1999, grants initiated in FY 1996.			
FY 1996 Awards	23,139	20,512	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

FY 1997 Awards

In FY 1997, 66 additional three-year research projects were initiated. Over half of the 66 award recipients are collaborative efforts among universities, laboratories and private industry. Of these projects, 28 will be led by universities; 31 by DOE National Laboratories; and 7 by private industry, nonprofit research centers, and other federal laboratories. Twenty-two of the projects focus on finding better ways to treat and destroy high level radioactive waste; nine focus on waste containing a mixture of radioactive and other hazardous materials; five focus on spent nuclear fuel treatment and destruction; and six address the materials used in weapons production (nuclear materials). The remaining 24 projects deal with the science needed to improve remedial action processes, to safely carry out deactivation and decommissioning of DOE sites, and to better understand the health and ecological risks associated with environmental cleanup options. The research funded at the national laboratories is focused on problems in the areas of: radioactive tank waste (43%), nuclear materials (18%), subsurface contaminants (14%), decontamination and decommissioning (8%), mixed waste characterization, treatment, and disposal (4%), spent nuclear fuel (4%), and research projects supporting multiple categories (9%).

- Complete, in FY 2000, grants initiated in FY 1997.

FY 1997 Awards	9,655	8,035	7,924

Integration of Research Results into the Program

Management, analysis, and integration. Success of the EM Science Program is dependent on the application of scientific results in EM Focus areas and directly in field activities, enhancing EM's ability to meet compliance requirements.

- Disseminate FY 1996, FY 1997, and FY 1998 research results to EM project managers based on science needs and problem areas and to potential technology developers. Provide links with DOE project managers, research community, and potential technology users.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Conduct topical workshops and seminars on specific science topics and/or site specific topics to disseminate results in a timely manner. Conduce a second complex-wide workshop to link basic research developed in the program with technology developers.			
■ Implement process to review the results of research awards from FY 1996 and FY 1997 to determine if the next step is additional follow-on basic research, applied research, incorporation of results directly into technology development, or direct application of results to an EM problem area.			
■ Refine and improve long term site specific and national science research agenda on needs identified in EM's cleanup strategy and through EM's roadmapping effort.			
Integration of Research Results Into the Program	1,316	1,880	1,500
FY 1998 Awards			
In FY 1998, 33 additional three-year research projects were initiated involving 23 universities, 6 DOE National Laboratories and 7 private industry or other federal laboratories, in 20 states. A total of two-thirds of the 33 award recipients are collaborative efforts among universities, laboratories and private industry. Of these projects, 9 will be led by universities; 22 by DOE National Laboratories; and 2 by private and other federal laboratories. Twenty of the projects focus on finding better ways to treat and destroy high level radioactive waste and 13 deal with the science needed to improve and safely carry out the deactivation and decommissioning of DOE sites. The research funded at the national laboratories is focused on problems in the area of radioactive tank waste (64%) and decontamination and decommissioning (36%).			
■ Continue to support grants in the areas of high level waste and decontamination and decommissioning.			
FY 1998 Awards	12,000	3,379	10,400

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
FY 1999 Awards			
FY 1999 awards will be made by September 1999 to address scientific problems associated with vadose zone, subsurface contamination, and groundwater issues to support initiatives at sites such as Hanford and to develop a better scientific basis for understanding exposures and risks to humans from low dose radiation. Research will be selected based on its scientific merits and its relevance to the EM mission.			
■ Continue to support research awards in the area of vadose zone, subsurface contamination and groundwater and in the area of exposures and risks from low dose radiation.			
FY 1999 Awards	0	12,032	11,411
Small Business Innovative Research Program			
■ Assessment on research funds in accordance with Public Law 102-564.

Environmental Management Risk Policy Program

Mission Supporting Goals, and Objectives

Program Mission

The mission of the Environmental Management National Risk Policy Program, through a partnership between the Center for Risk Excellence, located in Chicago, and the Headquarters Risk Policy Program is to develop policies and strategies to manage and reduce risks at the sites and to communicate risk information to stakeholders.

Program Goal

The overall goal of the Environmental Management National Risk Policy Program is to provide guidance, tools, technical support and training that result in credible risk-based environmental decisions which protect human health and the environment and involve meaningful stakeholder participation.

Program Objectives

The Environmental Management National Risk Policy Program will implement its goal by developing policy, assisting the field, interacting with stakeholders, and responding to internal and external information requests.

Performance Measures

No quantifiable corporate performance measures are associated with this program.

Significant Accomplishments and Program Shifts

- Creating tools and training for Project Managers to ensure that they can adequately convey risk management tradeoffs to stakeholders, and reach consensus-based decisions.
- Leveraging and coordinating risk research with research supported by other organizations inside and outside the Department of Energy (National Laboratories, Environmental Protection Agency, National Institute of Occupational Safety and Health, etc.)
- Providing technical support to EM's Field elements to implement a credible site-specific process for risk analysis, risk management, risk communication, and priority setting initiatives.

- Providing technical peer review and comments on scientific and technical risk materials, both internally and externally, through nationally recognized scientific and technical organizations.
- Integrating risk information into the planning process for establishing priorities among competing EM requirements, simplifying the use of risk in the budget priorities, and in facilitating the use of risk in measuring performance.
- Developing Site Hazard and Risk Profiles to identify human health, worker, ecological, and transportation risks and to delineate programmatic risks.
- Support research through a Cooperative Agreement with the Consortium for Risk Evaluation and Stakeholder Participation (CRESP, which is a partnership between the University of Medicine and Dentistry of New Jersey and the University of Washington). These independent institutions conduct research which is focused on national issues concerned with identifying and characterizing risks to human health and well-being; characterizing target ecosystems; linking the presence of contaminants with the endpoint; developing innovative approaches to the evaluation and protection of hazardous waste workers; and incorporating social cultural and economic impacts into the risk paradigm.
- In FY 1999, supporting research through an award with the Consortium for Environmental Risk Evaluation (CERE, which is a partnership between Tulane University and Xavier University). The research is focused on health and ecological risk analysis, risk assessment, risk communication, and risk management issues, including evaluation of stakeholder issues, design and evaluation methods for evaluating innovative technologies, and assessing risk associated with cleanup and long-term stewardship.

The program will integrate baseline risk information within a number of key topical risk areas and develop rosters of expertise, related materials, and action plans (with follow-ups), e.g., for facilitated enhancement of existing decision processes and information exchange with regard to critical lessons learned. This will involve coordinating experts from across the complex to develop solutions for specific risk issues, pursuant to a tiered response system that considers requests for assistance based on the urgency of the request and nature/extent of resources required. The program will support and promote the development and implementation of emerging technologies and cost-efficient, protective measures for reducing risk and mortgage costs.

This program supports DOE's strategic goal to aggressively clean up the environmental legacy associated with nuclear weapons production and civilian nuclear research and development programs, minimize future waste generation, safely manage nuclear materials, and permanently dispose of the nation's radioactive wastes. The program provides guidance and tools to assist the project managers in collection of the information that will ensure that high risk projects are prioritized and funded and that risk to workers, the public, and the environment continue to decrease over time.

It also supports DOE's commitment to ensuring the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities.

Funding Schedule

	(dollars in thousands)				
	FY 1998	FY 1999	FY 2000	$ Change	% Change
National Risk Policy Program	3,000	3,000	2,000	-1,000	-33.3%

Detailed Program Justification

(dollars in thousands)		
FY 1998	FY 1999	FY 2000

National Risk Policy Program

The National Risk Policy Program, in partnership with the Chicago Center for Risk Excellence, develops risk-based decision making approaches, including guidance documents and metrics to measure risk reduction to meet goals established for EM under the Government Performance and Results Act and DOE strategic plan.

- Continue activities to refine and implement policies and strategies to protect human health and the environment, and continue to involve stakeholders in the risk-based decision-making process. For example, develop new tools for decisions in decontamination and decommissioning activities and recycling of waste material, and facility re-use.
- Implement a process to evaluate risks and hazards associated with the long term stewardship issues to protect the public and the environment, with issues related to worker safety, and with ecological risk.
- Implement a process to assist the DOE field sites to measure progress toward risk reduction.
- Work with sites to peer review risk related evaluations and assessments.
- Develop a web-based system to provide service-oriented environmental risk assessment expertise using a diverse set of risk tools.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Create a National Referral System listing academic, industrial, government, and national laboratory experts in all areas of risk.			
National Risk Policy Program	3,000	3,000	2,000

University of Medicine and Dentistry of New Jersey and University of Washington (CRESP) Grant

Support a cooperative agreement with the Consortium for Risk Evaluation and Stakeholder Participation (University of Medicine and Dentistry of New Jersey and University of Washington) to perform risk research and develop risk analysis tools to better understand the diverse cleanup risks found at major DOE sites such as Savannah River and Hanford.

- Consortium for Risk Evaluation and Stakeholder Participation will complete research that addresses issues or problems in the following areas:
  - Characterization of risks to human health
  - Development of innovative approaches for the evaluation of risks associated with the protection of hazardous waste work;
  - Development of techniques and approaches to assess the risk and effectiveness of environmental restoration and waste management alternatives;
  - Improvement of methods and databases for linking the presence of contaminants with receptor endpoints;
  - Integration of ecological risk methods into hazard identification;
  - Development of criteria for preservation or restoration of ecological systems in relation to remediation alternatives.

Total Funding Change, Environmental Management Risk Policy Program	-4,000

Environmental Management Program Direction

Mission Supporting Goals and Objectives

Program Direction provides support to the Federal work force responsible for the overall direction and administrative support of the Environmental Management (EM) program, including both Headquarters and field personnel. The EM mission of protecting human health and the environment is carried out by a work force composed largely of contractors, although there are a variety of functions that are inherently governmental (e.g., program management, contract administration, and interagency and international coordination) that require a dedicated Federal work force.

The role of the Headquarters Federal work force is to provide leadership, establish and implement national policy, conduct analyses and integrate activities across sites. Increasing standards of accountability for program performance and spending require Headquarters staff to analyze budget requests, track expenditures and monitor uncosted balances, assess cumulative impacts of compliance agreements signed by field offices, and compile Congressionally mandated and other program plans (e.g., life cycle baselines, five-year plans, and future land use and long-term stewardship plans). Also, interactions with non-DOE government employees (e.g., United States Interagency Workgroups on Superfund Reform, participation in International Atomic Energy Agency activities, and negotiations with foreign embassies and reactor operators) are most appropriately performed by Federal employees rather than contractors. Finally, Headquarters personnel assess the progress of planned program activities in order to report to Congress, Federal, State and local governments, Indian Tribes, citizen groups and the public on the status of EM programs.

Field personnel are responsible and directly accountable for implementing the EM program within the framework established by Headquarters policy and guidance. In addition, the field is responsible for the day-to-day oversight of the Department's facilities, the facility contractor and other support contractors, as well as construction and test activities that support EM activities for the Department of Energy. The field office personnel are responsible for planning and implementing performance improvement programs and the technical programs needed to comply with standards and regulations. The field is also responsible for the preparation of regulatory documents and interaction with the regulators who have oversight of facility operations. The field staffing level include personnel supporting the analytical laboratories.

Program Direction has been grouped into four categories:

- Salaries and Benefits for FY 2000 provide for 425 Federal full-time equivalents based on Department Strategic Alignment Initiative end of year targets at Headquarters (employees based in Germantown, Maryland and Washington, DC), and 2,299 Federal full-time equivalents at the ten major Operations/Field Offices located throughout the United States, the Carlsbad Area Office located in New Mexico, and the Federal Energy Technology Center with facilities located in Morgantown, West Virginia and Pittsburgh, Pennsylvania. In addition, funding is provided for worker's compensation payment to the Department of Labor, benefits associated with permanent change of station, transit subsidies and incentive awards.

- Travel includes all costs of transportation, subsistence, and incidental travel expenses of EM's Federal employees in accordance with Federal Travel Regulations. This also includes travel costs associated with permanent change of duty station.
- Support Services includes technical and administrative support, program management and integration, management information and support systems, performance systems, and cost/schedule studies. Program management includes support for organizational and strategic planning, coordination and interaction with other Federal, State and local government agencies and private industrial concerns, performance measurement and cost assessment. Administration support includes funding for personnel development, training, travel, and logistics support.

  Technical support services includes funding for services which include, but are not limited to, determining feasibility of design considerations; development of specifications, system definition, system review and reliability analyses; trade-off analyses; economic and environmental analyses which may be used in the Department of Energy's preparation of environmental impact statements; and test and evaluation, surveys or reviews to improve the effectiveness, efficiency and economy of technical operations.

  Management support services includes funding for services which include, but are not limited to, analyses of workload and work flow; directives management studies; automated data processing; manpower systems analyses; assistance in the preparation of program plans; training, and education; analyses of Departmental management processes; and any other reports or analyses directed toward improving the effectiveness, efficiency and economy of management and general administrative services.
- Other related expenses includes funding for training the Federal work force, rental of office space, building maintenance, telephone and network communication costs, utilities, computer/video support, printing and graphics, photocopying, postage, and office supplies and equipment at Headquarters and the Operation/Field Offices. A Working Capital Fund was established at Headquarters in FY 1997 by the Office of Human Resources to allocate the cost of common administrative services to the recipient Headquarters organizations. Activities supported by the Working Capital Fund include automated office support, telephone services, postage, printing and graphics, supplies, photocopying, building occupancy, electronic services, payroll processing, contract closeouts and the Corporate Executive Information System.

Performance Measures

Work Force Management Efforts

EM continues to move forward with downsizing efforts to achieve an appropriate Headquarters/field balance of Federal resources to efficiently carry out the EM mission. The EM program has made significant decreases in the size of the Headquarters Federal work force. Staffing levels have been reduced by more than 260 employees (a 37% reduction) since May 1996 and more than 340 (a 44% reduction) from its highest employment level of 772 in July 1995.

EM will continue to place a high priority on work force management in the future to constantly evaluate and adjust, as necessary, the organizational structure, roles and responsibilities, skills mix, performance measurement, and systems of shared values and incentives. With the successful completion of the Strategic Alignment Initiative, the Department is currently implementing the next phase in work force management, *Workforce for the 21st Century Initiative*, commonly known as *Workforce 21*. The focus of *Workforce 21* is to strengthen the Department's technical and management capabilities to fulfill the critical missions for the Nation. This initiative provides EM with a process to identify, hire and train personnel in key areas with skills and technical expertise that are critical to the success of the EM program.

Although these changes have been difficult, EM believes that it now has an appropriate level of staffing, consistent with *Workforce 21,* to address the challenges that lie ahead. The FY 2000 level of funding is necessary to stabilize both the Headquarters and field work force, allowing EM to meet its current and future environmental, financial, managerial, and technical needs. Funding below the FY 2000 request for the Program Direction account would hinder overall performance by further eroding the capability for contractor oversight, management of programs, and maintaining the necessary technical expertise.

Support Services Reductions

Support services are a cost-effective method to obtain short-term, specialized technical or administrative expertise needed to solve unique problems that are beyond the capability or availability of the Federal work force. Often, specific skills are not required on a full-time basis, and it would not be prudent management to hire Federal staff with such specific skills. These services vary in nature to cover a variety of areas such as: nuclear criticality; nuclear construction; safety and health services; technical training development; security services; printing and reproduction services; office automation/local area network support; and correspondence control/records management services. In the last three years, significant reductions in support services have been realized, particularly at Headquarters. The majority of support services are technical in nature with discrete, well-defined tasks. Non-technical support provides management support for bench marking, metrics management and activities aimed at increasing quality and cost effectiveness in the oversight of the EM program. A small portion of the non-technical support provides for administrative activities such as mail room operations where it has been determined to be more cost effective to contract out these activities in lieu of hiring additional federal staff.

Analytical Laboratories

Environmental Measures Laboratory

In FY 1998, EM assumed full responsibility for the Environmental Measurements Laboratory from the Office of Energy Research in accordance with the terms specified in a Memorandum of Agreement. The Environmental Measurements Laboratory is located in New York, New York, and falls under the auspices of the Chicago Operations Office. The Environmental Measurements Laboratory is a government-owned, government-operated environmental research laboratory with history dating back to the Manhattan Project. Its current mission is to respond to the Department of Energy and other Federal and international agencies regarding quality assurance, environmental and national security issues, and

54-291 99 - 74

to conduct research on radioactive and other energy-related pollutants that impact on human health and the environment.

EM's contribution to the Environmental Measurements Laboratory in FY 2000 will be $5,250,000. This level of funding will support the Federal work force of approximately 60 employees. However, the funding is not sufficient to support all of the administrative costs associated with the Laboratory. Work for others, such as the Office of Nonproliferation and National Security, the Office of Science, the United States Air Force, the United States Nuclear Regulatory Commission and other federal agencies will generate additional funding to be used for programmatic and administrative expenses incurred by this laboratory.

Radiological and Environmental Sciences Laboratory

EM Program Direction supports the Radiological and Environmental Sciences Laboratory, also a government-owned, government-operated laboratory located in Idaho Falls, Idaho, and reporting to the Idaho Operations Office. EM provides approximately $2,700,000 annually to support 25 Federal full-time equivalents and associated laboratory expenses. The Radiological and Environmental Sciences Laboratory provides an independent resource free from conflict-of-interest in the area of analytical metrology (metrics) and measurement quality assurance. This facility is a federal technical resource and reference laboratory for the National Analytical Management Program. The major activities include the Mixed-Analyte Performance Evaluation Program, the DOE Methods Compendium, participation on the National Radiological Management Program Steering Committee and assistance with technical issues. These programs require and support traceability in analytical measurements to the National Institute of Standards and Technology. The expertise at the Radiological and Environmental Sciences Laboratory provides a federal technical resource for special analytical projects.

Organizational Changes

Creation of the Office of River Protection

The Office of River Protection was created at the Hanford Reservation, Richland, Washington, in accordance with Section 3139 of the Strom Thurmond National Defense Authorization Act for Fiscal Year 1999 (Public Law 105-261). This Office is responsible for managing all aspects of the Tank Waste Remediation System, also known as the Hanford Tank Farm operations with the critical mission to immobilize Hanford's high-level tank waste and protect the Columbia River. This budget requests an additional 27 full-time equivalents to support this office, in addition to 76 full-time equivalents that have been reassigned from within the Richland Operations Office. These positions will provide management and supervision, senior technical and financial expertise, engineering and scientific oversight, quality assurance, legal, contract finance and administration, and financial market and private capital project financing necessary to fully integrate tank farm operations and the privatization activities which are performed by two separate contracts. It is critical that this oversight/integration is performed by Federal employees to avoid any conflict of interest issues, or negative impacts.

Use of Prior-Year Balances

The FY 1998 Energy and Water Development Appropriations Conference report [report 105-271] included language which stated that "The Department will carry unobligated balances into fiscal year 1998 which will increase the funding available in this account." With this in mind, the FY 1998 Appropriation of $345,000,000 was augmented with $28,192,000 of FY 1997 unobligated balances. The majority of the unobligated balances were used to fully fund the authorized work force within the staffing guidelines dictated by the Strategic Alignment Initiative, thus avoiding a budget-driven reduction-in-force.

In FY 1999, an additional $9,126,000 of unobligated balances were used to offset the reduction in the FY 1999 Energy and Water Appropriation. The use of unobligated balances restored funding to the FY 1999 request level, thereby avoiding significant impacts in this account.

Full-Time Equivalents	2,782 [a]	2,764 [a]	2,724 [a,b]	-40	-1.4%

[a] Includes 29 full-time equivalents in both FY 1998 and FY 999, and 15 full-time equivalents in FY 2000 associated with the former United States Bureau of Mines, which were not included in the President's Budget.

[b] Includes 27 full-time equivalents in FY 2000 in support of the newly created Office of River Protection. These full-time equivalents are fully funded in FY 2000 but were not included in the President's Budget.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Provides funding for 2,724 full-time equivalents in FY 2000 with the responsibility for the overall direction and administrative support of the EM program, including both Headquarters and field personnel. The federal work force performs a variety of functions that are inherently governmental such as program management, contract administration, and interagency and international coordination. An additional 27 full-time equivalents are being requested in FY 2000 to support The Office of River Protection located in Hanford, Washington, while EM's overall full-time equivalents will be reduced by 40 between FY 1999 and FY 2000.	249,382	236,368	243,030
Travel			
Includes all costs of transportation of persons, subsistence of travelers, and incidental travel expenses in accordance with Federal travel regulations which are directly chargeable to EM. EM has decreased travel by $2,606,000 (21 percent) since FY 1998 in response to Congressional and Departmental direction to reduce travel costs.	12,370	10,249	9,764
Support Services			
Provides for technical and administrative support for cost effective short-term/intermittent requirements not available from within the Federal work force. The FY 2000 request reflects a $7,234,000 (11 percent) reduction in the use of support service contractors since FY 1998.	63,075	59,380	55,841

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Other Related Expenses			
Provides for administrative support to the Federal work force at both Headquarters and the field. The level of support provided by EM varies at each site depending on EM's role in relation to other Departmental programs. Examples of the type of support that may be provided include rents and utilities, supplies, printing, maintenance and repair of government vehicles and equipment; maintenance and renovations of buildings; janitorial and custodial services; stenographic reporting and typing; recruitments and advertisements; transit operations (shuttle bus); ADP infrastructure maintenance and upgrades, computer support hotline; Internet Services; alarm protection systems; employee health services; and other vendor services. At Headquarters, administrative costs are included in the Working Capital Fund. This category also includes the cost of training the Federal work force. A portion of these types of costs are being reduced commensurately as the number of employees decrease. However, a significant portion of these expenditures are relatively fixed in nature and do not change in relation to the work force. An example would be the cost of leased building space and computer network infrastructure costs.	48,365	40,202	40,774
Total Program Direction	373,192	346,199	349,409

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
Salaries and Benefits	
■ An overall increase of $6,662,000 for salaries and benefits is the result of a decrease of 40 full-time equivalents resulting in a savings of $3,429,000 across the Environmental Management complex, offset by an increase of $10,091,000 to cover a 4.1 percent escalation factor for personnel related expenses for 2,724 Full-time equivalents in accordance with OMB guidance	6,662
Travel	
■ A decrease of $485,000 in travel across the field offices and at Headquarters reflects a continuing effort to reduce travel in response to Congressional direction.	-485
Support Services	
■ A decrease of $1,315,000 in support service contracts at the Richland Operations Office is a result of a shift in priorities to fund essential site support activities.	-1,315

	FY 2000 vs FY 1999 ($000)
■ A decrease of $2,224,000 in support service contracts is the result of a $991,000 decrease in Headquarters support services and a $1,233,000 decrease in field (other than Richland) support services contracts consistent with continual Congressional direction to reduce the level of support services.	-2,224
Other Related Expenses	
■ An increase of $212,000 in other related expenses at the Idaho Operations Office reflects increased support for Federal employee training as well as upgrades to site telecommunications	212
■ An increase of $234,000 in other related expenses at the Ohio Field Office reflects increased support to Federal employee training as well as site-wide ADP upgrades. In addition, the increase will fund the additional rents and utilities requirements at the Mound Site	234
■ An increase of $1,411,000 in other related expenses at the Richland Operations Office reflects the increased requirements for new budget authority for rent and utilities as well as other essential activities. These activities were funded using prior year balances in FY 1999.	1,411
■ A decrease of $1,285,000 in other related expenses is the result of a $826,000 decrease in Headquarters and a $459,000 decrease in the rest of the field consistent with Congressional direction to reduce administrative expenses in direct support of Federal staff. This level of funding will reduce many areas to the minimum level of support such as supplies, Automated Data Processing (ADP), maintenance of office equipment, and critical equipment replacement.	-1,285
Total Funding Change, Program Direction	3,210

Support Services

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Technical Support Service [a]					
Feasibility of Design Considerations	30,818	29,867	28,065	-1,802	-6.0%
Economic and Environmental Analysis	13,638	12,617	11,719	-898	-7.1%
Test and Evaluation Studies	5,365	4,811	4,883	72	1.5%
Total, Technical Support Services	49,821	47,295	44,667	-2,628	-5.6%
Management Support Services [b]					
Management Studies	8,073	7,384	6,799	-585	-7.9%
Training and Education	1,404	816	746	-70	-8.6%

[a] Other services category includes, but is not limited to, an assortment of the following cost and services: maintenance and repair of government vehicles and equipment; maintenance and renovations of buildings; janitorial and custodial services; stenographic reporting and typing; recruitments and advertisements; transit operations (shuttle bus); computer support hotline; Internet Services; alarm protection systems; employee health services; and other vendor services.

Environment, Safety And Health

Defense Environmental Restoration and Waste Management

Program Mission

The Office of Environment, Safety and Health (EH) is a corporate resource that provides leadership and Departmental management excellence to protect the workers, the public, and the environment. The Office of Environment, Safety and Health activities funded within the Defense Environmental Restoration and Waste Management appropriation are managed by a single office within EH in coordination with EH's ongoing program of studies and public health activities at DOE sites.

Public Health Activities include health studies, health education and promotion, and other public and occupational health related initiatives at DOE sites pursuant to a consolidated and coherent strategy which includes a public health agenda for each site. Additional funding for this initiative is found in the Other Defense Activities portion of this budget.

Program Goal

- Use health studies and public health activities to examine associations between exposures or conditions at DOE sites and potential adverse health effects among groups of workers and offsite populations to develop appropriate public health responses.

Program Objective

- Develop and implement, in partnership with the Department of Health and Human Services, a consolidated and coherent strategy for public health activities at DOE sites, which includes a public health agenda at each site.

Performance Measure

- Through studies of DOE community and worker populations, increased information defining the relationship between exposures resulting from DOE facility operation and their effects on human health and increased interventions to reduce harmful exposures to workers and community members.

Significant Accomplishments and Program Shifts

The Department has consolidated the management of Public Health Activities in the Office of Environment, Safety and Health to provide a focal point for ensuring that the results of these efforts are used for the maximum benefit of DOE workers and communities. The funding for these programs continues to be split between the Other Defense Activities and the Defense Environmental Restoration and Waste Management appropriations.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request

Total, Public Health Activities	0	12,000	0	12,000	20,000

Funding by Site

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
All Other Sites - Headquarters	0	12,000	20,000	+8,000	+66.7%
Total, All Other Sites - Headquarters	0	12,000	20,000	+8,000	+66.7%

[a]In FY 1998, the Office of Environmental Restoration and Waste Management Appropriation (EM) provided $4.8 million for Public Health Activities.

[b]In addition, $13.9 million for Public Health Activities was funded in the Other Defense Activities Appropriation section of the EH Budget.

[c]In addition, $13.825 million for Public Health Activities was funded in the Other Defense Activities Appropriation section of the EH Budget.

Health Studies

Mission Supporting Goals and Objectives

The Public Health Activities program promotes the health and safety of DOE's workers and communities surrounding Department sites, supports studies to understand the effects of radiation and other hazards associated with the DOE operations on humans, and promotes the wide dissemination of health-related information.

Public Health Activities support health studies, health education and promotion, and other public and occupational health related initiatives at DOE sites pursuant to a consolidated and coherent strategy which includes a public health agenda for each site. Community and worker health studies are conducted in partnership between DOE and the Department of Health and Human Services (HHS) under a Memorandum of Understanding (MOU). This program supports studies and other activities to assess the health of populations living near or working at DOE sites in order to determine if the health of workers and nearby communities has been impacted by DOE operations. Information from the health studies is communicated to the DOE workforce, line management and community stakeholders.

Significant Accomplishments

- Continue collaboration in public health activities conducted under the MOU with the Department of Health and Human Services, including environmental dose reconstruction projects at major DOE sites, single and multi-site cancer mortality studies of DOE workers, and community outreach and educational efforts. As part of this collaboration, develop a credible, coherent DOE/HHS public and occupational health agenda of activities at DOE sites. Conduct workshops and meetings with stakeholders as part of the agenda-setting process. (FY98: $0; FY99: $12,000; FY00: $20,000)

  As part of this program, the following commitment made in the Performance Agreement between the Assistant Secretary for Environment, Safety and Health and the Secretary of Energy has been accomplished:

  - Develop a coordinated health agenda with the Department of Health and Human Services that is responsive to stakeholder and customer needs.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Public Health Activities	0	12,000	20,000	+8,000	+66.7%
Total, Health Studies	0	12,000	20,000	+8,000	+66.7%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Public Health Activities			
■ Continue a coherent, coordinated program of occupational and community health studies at and around DOE sites under the Department of Health and Human Services (HHS) Memorandum of Understanding (MOU). As long-time DOE workers and residents near DOE facilities age, there will likely be an increased ability to detect late health effects of exposures associated with DOE operations. The results of a number of studies conducted to date have suggested the need for further research designed to help understand the long-term health impacts of exposure to low levels of radiation. The program of occupational and community studies conducted by HHS under its MOU with DOE offers an expanded basis upon which radiation protection standards and practices can be refined and improved. By engaging in a joint agenda setting process, DOE and HHS have worked together to develop a coherent, credible set of research priorities across the DOE complex. This agenda will be an invaluable tool in determining which studies are critical to pursue in both the near and long term. The size of DOE's FY 2000 request for such studies, which is larger than its budgets to fund this MOU over the past few fiscal years, will enable the Department to provide only about two-thirds of the level of funding for projects which HHS has recommended to DOE for FY 2000	0	12,000	20,000
Total, Public Health Activities	0	12,000	20,000

Explanation of Funding Changes from FY 1999 to FY 2000

Defense Facilities Closure Projects

Proposed Appropriation Language

For expenses of the Department of Energy to accelerate the closure of defense environmental management sites, including the purchase, construction and acquisition of plant and capital equipment and other necessary expenses, [$1,038,240,000] *$1,054,492,000,* to remain available until expended. *Further, for the foregoing purposes, $1,054,492,000 to become available October 1, 2000, to remain available until expended. (Energy and Water Development Appropriations Act, 1999.)*

Explanation of Change

Changes in appropriation language provides for two year appropriation as required for Defense appropriations.

Defense Facilities Closure Projects

Site Closure

Program Mission

The Defense Facilities Closure Projects appropriation has a single account, Site Closure, which includes sites where the Environmental Management (EM) program plans to complete its DOE mission by the end of FY 2006. This account includes funding for projects under the Ohio Field Office in Ohio (i.e., Fernald Environmental Management, Miamisburg Environmental Management, the Ashtabula Environmental Management, and the Columbus Environmental Management projects), and the Rocky Flats Environmental Technology Site in Colorado.

In August 1997, the Secretary of Energy designated the Rocky Flats, Fernald, and Miamisburg sites as pilot sites for accelerated closure. The Energy and Water Development Appropriation Act for Fiscal Year 1998 expanded the EM Closure appropriation account to include all funding for the Fernald and Rocky Flats sites to encourage the acceleration of their closure. The Department of Energy included the remaining Ohio sites within this account in the FY 1999 budget request.

Program Goal

Accelerating cleanup and project completion is a central goal of the EM program. This goal is part of the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, whereby all EM sites are working aggressively to reduce outyear costs by completing projects as soon and as efficiently as possible, thereby reducing life-cycle costs and schedules. For those sites in the Site Closure account, the goal of the EM program is to complete the cleanup mission by FY 2006, after which no further Departmental mission is envisioned, except for limited long-term surveillance and maintenance, and the sites may be available for some alternative use.

Program Objectives

- Continue to accelerate cleanup efforts at sites and realize substantial savings by the resulting reduction in long-term program costs and ongoing support costs.
- Continue to sequence work at the Ohio sites to focus activities on the larger sites where most cost savings can be obtained through acceleration (Fernald and Miamisburg), while utilizing the remaining funding to focus on sequencing the completion of smaller sites.

Performance Measures

EM has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected with the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts. These performance measures can be found in the site details that follow.

Significant Accomplishments and Program Shifts

The FY 2000 budget request fully reflects the project-oriented structure that EM has developed as a key component to accelerate cleanup and reduce costs. All EM activities have been organized into projects which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, EM sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request

Ohio

Mission Supporting Goals and Objectives

Program Mission

The mission of the Defense Facilities Site Closure Environmental Management program managed through the Ohio Field Office is to support cleanup activities at four sites in the State of Ohio. These sites are: the Fernald Environmental Management Project; the Miamisburg Environmental Management Project; the Columbus Environmental Management Project; and the Ashtabula Environmental Management Project sites. The Ohio Field Office manages, coordinates, tracks, and assists in the implementation of the cleanup program among the various sites.

Program Goal

The goal of the Ohio Field Office sites is the transfer of real property to the state or local communities by completing environmental restoration and waste management projects by 2006, with a minimal but adequate level of long-term stewardship continuing after that point.

Program Objectives

The objectives for the Ohio sites will be to continue safe shutdown; decontaminate and decommission buildings; disposition contaminated soil, debris and waste material to an off-site disposal cell or on-site, if appropriate; and accelerate groundwater cleanup through innovative technology deployment. This initiative depends on a variety of factors, including community needs, regulatory requirements, and technical feasibility. The Ashtabula Environmental Management Project site will be released for unrestricted use and returned to RMI Company; the Columbus Environmental Management Project site will be transferred to Battelle Laboratories for unrestricted use; the Fernald Environmental Management Project site will be completed and placed under institutional control; and the Miamisburg Environmental Management Project site will be transferred to the City of Miamisburg.

Performance Measures

Performance measures are provided at an aggregate level after the Funding by Site table as well as at a project level in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

Ashtabula Environmental Management Project

- Initiated design work, prepared for construction of the Soil Cleaning Plant, (FY 1998); complete construction and initiate operation (FY 1999) for processing Phase I contaminated soil.
- Initiated building deactivation (FY 1998) and initiate remediation (FY 1999).
- Completed Area D soil remediation (FY 1998) and continue low level waste and legacy waste shipments for disposal (FY 1999).
- Complete the remediation of three buildings at the Ashtabula site (RMI) and transport and dispose of 885 cubic meters of waste. In addition, innovative technologies are being deployed that will accelerate the cleanup of groundwater and soil by approximately two years (FY 2000)

Columbus Environmental Management Project

- Initiated (FY 1998) and continue (FY 1999) transuranic waste processing.
- Initiated interior decontamination of the West Jefferson building JN-1 (FY 1998); continue efforts (FY 1999), including material and equipment removal.
- Provided required core environmental and surveillance and maintenance activities, which included facility structural/hazard analysis of major building systems (FY 1998).
- Initiated (FY 1998) and continue (FY 1999) shipments of low level waste.
- Initiate the decontamination of two buildings at Battelle Columbus Lab including transuranic waste processing and associated equipment removal; and remediate soils from external areas at the site (FY 2000).

Fernald Environmental Management Project

- Initiated construction of South Field Extraction System Pipeline (FY 1998) and began excavation of contaminated soil (FY 1998).
- Completed Advanced Waste Water Treatment expansion (FY 1998) and initiate treatment of site waste water and groundwater monitoring (FY 1999).
- Completed construction of Sewage Treatment Plant (FY 1998).
- Completed onsite rail construction, offsite rail upgrade, and purchased unit trains for Waste Pits Project remediation (FY 1998).
- Completed Plant 2, 3, and 8 safe shutdown (FY 1998).
- Continue safe storage of nuclear materials onsite and continue disposition of remaining low enriched nuclear material and depleted inventories (FY 1998/FY 1999).
- Continue low level and mixed waste disposition (FY 1998/FY 1999).
- Initiate and complete excavation and removal of the inactive flyash pile excavation (FY 1999).
- Initiate processing and shipping of waste for offsite disposal for Waste Pit Remedial Actions Project (FY 1999).

- Initiated waste placement in Cell 1 and completed construction of the liner for Cell 2 (FY 1998); continue waste placement, including decontamination and decommissioning debris in Cell 1 and Cell 2 of the On Site Disposal Facility, and initiate construction of the liner for Cell 3 (FY 1999).
- Complete decontamination and decommissioning of Boiler Plant and Plant 9 (FY 1999).
- Award subcontracts for decontamination and decommissioning of Plant 5 and 6 complexes (FY 1999).
- Award Silo 3 subcontract; complete proof of principle testing and accelerated waste retrieval for silos 1 and 2 (FY 1999).
- The DOE and the Environmental Protection Agency signed a dispute resolution settlement agreement for the Fernald Environmental Management Program which assessed a monetary penalty of $100,000 to be paid in FY 1999.
- Continue safe shutdown of the former Fernald production operations facilities; decontaminate and decommission Plant 1,3, and 5 complexes; continue transportation of contaminated building debris, soil, and waste pits remediated media to the On-site Disposal Facility; continue media restoration of the Great Miami Aquifer through extraction/injection; initiate construction of the Fernald Silo 3 recover and treatment facility; and complete the design of Silos 1 and 2 retrieval and treatment facility (FY 2000).

Miamisburg Environmental Management Project

- Completed three release site cleanups and three release site assessments (FY 1998); complete three release site assessments (FY 1999).
- Completed safe shutdown of 25 buildings in FY 1998, and complete an additional one in FY 1999.
- Completed 22 facilities assessments and 19 decommissionings (FY 1998); complete an additional four assessments and four decommissionings (FY 1999).
- Completed disposal of all accountable tritium inventory (FY 1998).
- Complete shipment of 7 kg of nuclear materials to receiver sites (FY 1999).
- Completed transport and disposal of 2,200.0 m^3 of low level waste (FY 1998); and complete transport and disposal of 19.0 m^3 of mixed low level waste and 5,399.0 m^3 of low level waste (FY 1999).
- Continue decontamination and decommissioning of the Mound tritium complex (the "critical path"); and continue the remediation and transfer of buildings to the City of Miamisburg (FY 2000).

Funding Schedule

(dollars in thousands)

Site Description

Fernald Environmental Management Project

The Fernald Environmental Management Project site encompasses approximately 1,050 acres, located 17 miles northwest of Cincinnati, Ohio. High-purity uranium metal products were produced at the Fernald Environmental Management Project site for the DOE and its predecessor agencies from 1951 to 1989. Thorium was also processed, but on a smaller scale, and is still stored on-site. Uranium processing operations at the Fernald Environmental Management Project were limited to a fenced, 136-acre tract known as the Production Area. In November 1989, the Environmental Protection Agency placed the Fernald Environmental Management Project site on the National Priorities List, and in April 1990 DOE and the Environmental Protection Agency entered into a Consent Agreement (since amended) for site remediation. The Consent Agreement created five Operable Units covering total site remediation. The Fernald Environmental Management Project has implemented an accelerated cleanup schedule which provides for site closure, with the completion of the currently established in-situ contaminant source remediation and risk mitigation activities, by FY 2005. The in-situ contaminant sources for Operable Unit 1, Operable Unit 2, Operable Unit 3, and Operable Unit 5 will be removed and appropriately disposed of by FY 2005. In addition, the extraction and treatment infrastructure required to contain and mitigate risks associated with contaminated groundwater will be fully in place. Follow-up activities for FY 2006 through FY 2008 include finalization of treatment and disposal of Silos 1 and 2 wastes and structures per the Operable Unit 4 Record of Decision amendment. The Fernald Environmental Management Project will utilize technologies such as a new inorganic treatment process to treat PCB contaminated low-level and mixed low level waste (Tri-Mixed Treatment Demonstration), Oxy-gasoline torch cutting, vacuum removal of insulation materials, process piping interior inspection, and a technology demonstration project (injection of treated groundwater) that may reduce the groundwater remediation schedule from 27 to 10 years. Fernald Environmental Management Project is in compliance with the Comprehensive Environmental Response, Compensation, and Liability Act of 1980; the Federal Facility Compliance Agreement; the Resource Conservation and Recovery Act; the National Energy Policy Act; and all regulatory requirements.

Ashtabula Environmental Management Project

The Ashtabula Environmental Management Project site, located in Ashtabula, Ohio, is owned and operated by the RMI Company, and is contaminated with both radiological and hazardous materials resulting from previous operations for the DOE to shape radioactive materials. The Ashtabula Environmental Management Project is comprised of three release sites and 25 buildings. The cleanup plan requires decontamination and decommissioning of buildings and the remediation of contaminated soils and groundwater to allow unrestricted use of the site. The Ashtabula Environmental Management Project goal is to achieve completion by FY 2003, with an associated life-cycle reduction in cost of $48,600,000 from the costs projected in the FY 1996 Baseline Environmental Management Report. Most of the cost reduction is due to the ability to treat and reduce the volume of contaminated waste (using the soil treatment system for soil remediation) that must be shipped off-site to a disposal facility. Ashtabula Environmental Management Project is in compliance with Nuclear Regulatory Commission and other regulatory requirements. Upon completion, the site will be released to the RMI Company. Post-completion, long term groundwater pump and treat operations will continue until FY 2018.

Columbus Environmental Management Project

The Columbus Environmental Management Project is comprised of two geographic sites (King Avenue and West Jefferson) located in and near Columbus, Ohio. Research and development work was performed at these facilities for the DOE and its predecessors agencies. The buildings are privately-owned by Battelle Memorial Institute. The facilities retain an active Nuclear Regulatory Commission license for possession of special nuclear material and are in compliance with all necessary regulatory requirements. Both sites are radioactively-contaminated and cleanup efforts are funded by both the Defense and Non-Defense accounts. The Columbus Environmental Management Project consists of 17 facilities and two release sites, of which 13 facilities cleanups were completed by the end of FY 1998. Decontamination activities at West Jefferson were initiated in FY 1998. Activities at the West Jefferson site should be completed by FY 2006 and the site returned to the private owner.

Miamisburg Environmental Management Project

The Miamisburg Environmental Management Project manages the Mound Plant, which is located on 306 acres in Miamisburg, Ohio, ten miles south of Dayton. The Miamisburg Environmental Management Project is predominately funded from the Defense Facilities Closure Projects appropriation, but does receive some funds from the Non-Defense Environmental Management appropriation. The plant was built in the late 1940's to support research and development, testing and production activities for the Department's defense nuclear weapons complex and energy research programs. This mission continued until 1994, when these activities were transferred to other DOE facilities. The Mound Plant mission involved production of components which contained plutonium-238, polonium-210 and tritium, and processing large quantities of various types of high explosives. As a result of these past operations, the buildings, soil, and groundwater are contaminated with radioactive and hazardous chemicals. The only remaining mission at Mound is the production of plutonium heat sources and Radioisotopic Thermoelectric Generators (RTG's) by the Office of Nuclear Energy primarily for National Aeronautics and Space Administration space missions and other customers. The

Office of Nuclear Energy is in the process of deciding whether to keep this activity at Mound or to relocate it elsewhere within the DOE complex. The Miamisburg Environmental Management Project is on the Environmental Protection Agency National Priority List, and a Federal Facility Agreement to remediate the site has been negotiated with the Ohio and U.S. Environmental Protection Agencies . The Miamisburg Environmental Management Project is comprised of 416 release sites and 111 facilities. In FY 2000, Miamisburg Environmental Management Project will continue to clean up the buildings and soil at the site with the goal of disposition of the real property by the year 2005 or earlier. The Department is working with stakeholders and regulators for the transfer of site ownership to the Miamisburg Mound Community Improvement Corporation upon completion of required cleanup activities. The Miamisburg Environmental Management Project is in compliance with all necessary regulatory requirements.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The Ohio projects are managed through incentivized contracts based on performance and utilize fixed-price subcontracts to assure the most efficient service to the Government. This scope planned for FY 2000 has been reviewed and is consistent with the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. The Ohio projects included in this section of the budget have had independent reviews of their baseline scopes and costs. The scope and funding requested for FY 2000 are consistent with the activities that have been reviewed.			
HQNP-SI01-CL-OH/Security Investigations			
Funding will be used to perform new security investigations and re-investigations for non-federal employees in accordance with DOE Order requirements for the Ohio/Mound site.			
HQNP-S101-CL-OH	0	94	94

Metrics
No quantifiable corporate performance measures are associated with this project.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
OH-AB-01/Remediation			
The purpose of this project is to remediate the RMI Company Extrusion facility, which involves deactivation of 25 on-site buildings, and decontamination or demolition of 21 on-site buildings and associated equipment. Also included in this project is the processing/treatment of low level and mixed low level radioactive contamination resulting from decontamination and excavation activities and vapor stripping of groundwater to remove hazardous constituents.			
■ Remediate 3 buildings.			
■ Dispose of 885 m^3 of remediation waste.			
■ 11,200 m^3 of soil treated and returned on site.			
OH-AB-01	9,757	10,393	10,643

OH-CL-02-D/West Jefferson Site Decontamination

This project involves facility decommissioning at the West Jefferson site, including a Hot Cell building and a retired research reactor which requires quality assurance, waste management, and health and safety support during decommissioning. Upon completion, buildings will be demolished and grounds will be returned to Battelle for reuse without radiological restriction.

- Initiate decontamination operations within JN-2, JN-3, and on the external areas at the site.
- Continue transuranic waste volume reduction utilizing the Sonatol System and associated material and equipment removal.
- Continue health and safety support and emergency preparedness.
- Make associated shipments of 177 m^3 of low level waste.
- Prepare 100 m^3 of transuranic waste disposal-ready for shipment to the Waste Isolation Pilot Plant.

OH-CL-03-D/Project Management, Site Support, & Maintenance

The scope of this project is to provide technical support to the field work involved in the two related decontamination projects (King Avenue and West Jefferson sites), including surveillance and maintenance, project management and regulatory compliance.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue to provide required core environmental activities and surveillance and maintenance activities, including facility structural/hazard analysis of major building systems.			
■ Provide program management support for increased work activities, including public affairs, regulatory compliance, quality assurance, and project management.			
OH-CL-03-D	2,045	1,593	2,841

Metrics
No quantifiable corporate performance measures associated with this project.

OH-FN-01/Facility Shutdown

The objective of this project is to complete safe shutdown of the former production operations/facilities, eliminating the potential release of radiological and chemical contaminants to the soil and groundwater. The equipment and materials from the facilities will be removed and placed in the On-Site Disposal Facility, and all facilities will be dismantled.

- Continue base services activities, including safety and health, emergency management, fire protection, radiological control, and environmental monitoring in support of restoration activities.
- Continue facility shutdown activities for non-nuclear facilities.

OH-FN-02/Facility D&D			
This project addresses the decontamination and decommissioning of over 200 above-grade structures in the former production area (Operable Unit 3), including preparatory actions prior to decontamination and decommissioning, such as removal of process residues, waste, nuclear product inventories, disconnecting utilities, and general gross decontamination. Following removal of above-grade structures, this project will also conduct soil remediation under those structures.			
■ Complete decontamination and decommissioning of Maintenance/Complex.			
■ Continue decontamination and decommissioning for Plant 3, 5 and 6 Complexes.			
■ Continue transportation of decontamination and decommissioning debris to On-Site Disposal Facility transfer area.

OH-FN-03/On-Site Disposal Facility			
The On-Site Disposal Facility project provides for disposal of the waste generated as a result of site remediation at Fernald. It will have eight disposal cells, and a ninth, contingent cell, for acceptance of up to 2.5 million cubic yards of volume that meets established waste acceptance criteria. It also funds support facilities, receipt and placement of wastes and impacted materials, facility closure and post-closure monitoring and maintenance.			
■ Complete permanent cap for Cell 1.			
■ Complete waste placement in Cell 2 of On-Site Disposal Facility, and complete installation of liner for Cell 3.

OH-FN-04/Aquifer Restoration

This project is designed to confine and extract uranium contamination from the Great Miami Aquifer, a sole source aquifer that underlies the Fernald site. The activity was planned to continue out through 2020, but with improved technology, may be accelerated with estimated completion before 2012. Site-wide management of storm water, wastewater, sanitary sewage treatment and groundwater monitoring are all included in the scope of this project.

- Continue groundwater monitoring, plugging, and abandonment, sampling and reports.
- Continue extraction/injection operations and maintenance.
- Continue operation of water treatment systems, groundwater monitoring, and South Plume Well Field.

OH-FN-06/Soils

The purpose of the Soil Characterization and Excavation Project is to develop and execute the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 remedial design, excavation, characterization and restoration of soil and other solid materials impacted by production operations and other activities conducted at the Fernald Environmental Management Facility. There are several areas of soil restoration that are broken up into multiple phases and units.

- Continue Southern Waste Unit excavation.
- Complete excavation of Area I, Phase II.
- Complete Lime Sludge Pond excavation.

OH-MB-01/Tritium Operations Transition			
This project was designed to remove excess legacy materials, primarily tritium gas, from Miamisburg so that decontamination and decommissioning may proceed. Major objectives were to load all remaining tritium gas into transport vessels for shipment to Savannah River, repackage all "special" units and ship to Los Alamos National Laboratory for processing or shipment to alternate site for temporary storage, complete repackaging and shipment of excess plutonium, uranium and other sources to receiver sites, and complete characterization, repackaging, and shipment of miscellaneous excess isotopes to Nevada Test Site.			
■ Project is complete.			
OH-MB-01	16,040	0	0
Metrics			
No quantifiable corporate performance measures are associated with this project.			
OH-MB-02/Main Hill Tritium			
This project provides for the safe shutdown and removal or decontamination of tritium contaminated equipment, duct work, and chemical mixtures in four buildings, so they may be released for reuse or demolished.			
■ Full scale efforts will be devoted to the decontamination of the four major buildings that comprise the tritium complex, which is on the critical path.

OH-MB-05/Main Hill Non Rad

This project provides for the evaluation and release or demolition of over 30 buildings located primarily on the Main Hill, but also includes infrastructure support buildings located elsewhere on site. These buildings are not on the Exit Plan Critical Path, and can therefore be completed in parallel with other site activities.

- Complete safe shutdown and demolish or transfer nine non-rad contaminated buildings.

OH-MB-05	4,105	2,776	2,768

OH-MB-06/Special Metals/Plutonium Processing Hill

This project involves the decontamination and decommissioning or demolition of 22 building structures, one water tower, one air emission stack, site restoration work and the resulting release of property for non-government industrial use.

- Complete 50% of decontamination work on a major contaminated building (Building 38), and complete facility assessments on three other buildings.

OH-MB-07/Test Fire Valley

The purpose of this project is to make approximately 67 buildings releasable for local industrial use or demolish them depending on the cost or need for reuse. The most radiologically contaminated buildings will be scheduled earliest for decontamination.

- Continue decontamination of two rad-contaminated buildings.
- Complete assessment and cleanup of Explosives Preparation Facility.

OH-MB-07	4,329	4,513	7,157

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
OH-AB-01/Remediation	
■ Increase is due to funding for the Building Remediation Subcontract for demolition and shipment of debris.	250
OH-AB-02/Project Management, Site Services, ES&H	
■ Decrease is due to anticipated reduction of workforce used to install ground water treatment technology, and due to cost efficiencies.	-250
OH-CL-02-D/West Jefferson Site Decontamination (Defense Funded)	
■ Increase is due to initiation of decontamination operations within JN-2, JN-3, and on the external areas at the site.	4,000
OH-CL-03-D/Project Management, Site Support and Maintenance	
■ Increase is due to project management and site support for the increased work scope of decontamination operations at the West Jefferson Site.	1,248
OH-FN-01/Facility Shutdown	
■ Decrease is due to completion of nuclear facility safe shutdown efforts in FY 1999.	-4,086
OH-FN-02/Facility D&D	
■ Increase is due to the move from safe shutdown to decontamination and decommissioning, such as Plant 5, Plant 6, and Maintenance/Tank Farm Complex.	3,895
OH-FN-03/On-Site Disposal Facility	
■ Increase is due to acceleration of On-Site Disposal Facility construction.	3,174
OH-FN-04/Aquifer Restoration	
■ Decrease is due to completion of the Lab Relocation project in FY 1999.	-678
OH-FN-05/Waste Pits Remediation Project	
■ Increase is due to additional volumes of waste processed and shipped for Waste Pits Remediation Project.	2,693
OH-FN-06/Soils	
■ Decrease is due to reduced remaining levels of soils to be excavated	-3,878
OH-FN-07/Silos	
■ Increase is due to Silo 3 subcontract award and increased construction activities for Silos 1 and 2.	16,377
OH-FN-08/Nuclear Materials	
■ Decrease reflects reduced levels of nuclear materials disposition	-1,046

	FY 2000 vs. FY 1999 ($000)
OH-FN-10/Mixed Waste	
■ Increase is due to the startup of the Mixed Waste Organic Extraction Project	507
OH-FN-11/Waste Management	
■ Decrease is due to reduced levels of low level waste disposition	-4,579
OH-FN-12/Program Support & Oversight	
■ Decrease reflects the reduction in the number of buildings requiring safety and monitoring systems to run them, resulting in lower program support and oversight costs.	-5,792
OH-MB-02/Main Hill Tritium	
■ Increase is due to greater manhours assigned to Area 1 (building services) in decontamination of T building and contaminated areas of R building.	1,853
OH-MB-03/Legacy Waste	
■ Decrease is due to the reduction of legacy waste inventory and the monitoring activities associated with the storage.	-7,235
OH-MB-04/Main Hill Rad	
■ Increase is due to waste management support with demolition of facilities and due to volume of remediation waste generated.	649
OH-MB-05/Main Hill Non Rad	
■ Funding level is essentially stable.	-8
OH-MB-06/Special Metals/Plutonium Processing Hill	
■ Increase is due to greater efforts for decontamination work on building 38	4,091
OH-MB-07/Test Fire Valley	
■ Reflects increased efforts on decontamination of HH and WD buildings	2,644
OH-MB-08/Soils	
■ Decrease reflects facility completions and reduced activities associated with release sites.	-3,831
OH-MB-09/Facility Operations & Maintenance	
■ Funding is essentially stable.	-153

	FY 2000 vs. FY 1999 ($000)
OH-MB-10/Exit Support Project	
■ Increase is due to the reduction of FY 1999 Budget Authority requirements of $2,700,000 because of uncosted carryover balances to fund work scope such as Environmental Protection Agency regulatory oversight and Defense Contract Audit Agency support and to an increase of approximately $3,700,000 which will be reallocated to other Project Baseline Summaries to support acceleration of critical path shutdown activities in the tritium contaminated facilities pending approved baseline change control proposals	6,397
Total Funding Change, Ohio	16,242

Rocky Flats

Mission Supporting Goals and Objectives

Program Mission

The mission of the Defense Environmental Management, Site Closure program, carried out by the Rocky Flats Field Office, is to manage the site waste and materials, and to clean up and convert the site to beneficial use in a manner that is safe, environmentally and socially responsible, physically secure, and cost-effective.

Program Goal

The goal for the Rocky Flats Environmental Technology Site is to accelerate the site closure from the current baseline of 2010 to 2006.

Program Objectives

The Rocky Flats Site has developed a critical path for the current baseline activities that support the closure of the site by 2010.

The site baseline provides the detailed cost, scope, schedule, and critical path to achieve site closure by FY 2010. The details of this baseline are embodied in the Rocky Flats *Accelerating Cleanup: Paths to Closure* plan, which contains 29 projects (24 active projects in FY 1999) that are described in the project baseline summaries. The FY 2010 baseline also identifies a number of opportunities to accelerate the closure of Rocky Flats by 2006.

The critical path of work activities to support the closure of Rocky Flats requires:

Stabilization of Special Nuclear Material and Residues

The early completion of stabilization and deactivation activities is necessary to begin building demolition as soon as possible and cleanup of the affected areas. The completion of these activities can make funds currently used for surveillance and maintenance available for progress towards site closure.

The FY 2010 baseline schedule assumes that plutonium metals and oxides will be stabilized, placed in DOE-STD-3013 containers and shipped to the Savannah River Site K-Area from FY 2002-FY 2004, consistent with the Record of Decision for the Storage and Disposition of Weapons-Usable Fissile Material Programmatic Environmental Impact Statement.

Special nuclear material stabilization projects will focus on the safe storage, processing, packaging, and off-site shipment of all special nuclear material at Rocky Flats. This includes 2,300 containers of plutonium metals and oxides, 103,420 kilograms of plutonium residues, and approximately 24,000 liters of plutonium solutions.

Off-Site Shipment of Special Nuclear Material and Stabilized Residues

To enable cleanup by FY 2006, plutonium metals and oxides must be removed from the site by FY 2002, 2 years early. The accelerated movement of materials provides for significant mortgage reduction savings in security and nuclear safety costs, and allows the decommissioning of the nuclear facilities to begin 2 years earlier. The Department is performing significant facility modifications at the Savannah River Site consistent with the recently issued Record of Decision for storage of excess plutonium in order to accommodate this transfer. Pending issuance of the second Record of Decision from the Environmental Impact Statement for Rocky Flats residues, the 2010 baseline assumes that plutonium residues will be stabilized, certified, and shipped to the Waste Isolation Pilot Plant by FY 2004.

Environmental Management made the first of two decisions (November 1998) based on environmental analysis to dispose of a large portion of the residues as waste at the Waste Isolation Pilot Plant and to send a few materials off-site for stabilization. With the second decision expected in January 1999, the majority of the Rocky Flats residues will be packaged as waste in preparation for disposal at the Waste Isolation Pilot Plant, significantly minimizing the need for processing and expediting removal of residues from the site by two years. Since material stabilization and removal are on the critical path to closure, the completion of this work by FY 2002 will provide mortgage reduction savings as well as increase schedule confidence for site closure.

Deactivation of Plutonium Buildings once the Special Nuclear Material is Removed

The deactivation program will focus only on major plutonium and industrial facilities that would benefit from significant mortgage reduction or that require deactivation in preparation for decommissioning activities.

The current baseline assumes that major nuclear facilities decommissioning can take 5 to 7 years, and these activities dominate the later part of the site critical path schedule. The site is planning to complete the decommissioning of the Building 779 Cluster, a former plutonium production facility by June 2000, to not only improve the cost and schedule estimates for the decommissioning effort but to examine technologies to accelerate the overall closure schedule. To meet closure by FY 2006, the average estimated length of time it takes to decontaminate and decommission the major nuclear facilities must be improved by at least 1 year.

Demolition of buildings as soon as possible after completion of deactivation

In order for Rocky Flats to meet the accelerated closure goal, facilities will need to undergo decommissioning as soon as possible after the completion of deactivation. A facility disposition path is being developed for each of the building cluster closure projects. This approach integrates and coordinates the deactivation, decontamination, and demolition activities. The schedules for facility disposition are aggressive and decommissioning needs to immediately follow, or in some cases be conducted in parallel with, the deactivation phase. This is essential to avoid sustained high mortgage costs within the plutonium facilities and to proceed to construction of the closure caps.

Construction of Closure Caps

In order to accelerate closure, construction of the closure caps will need to be accomplished in phases. Rather than waiting until all facilities within the existing protected area are completely demolished and the entire acreage is remediated, as substantial areas are prepared, the closure caps can be constructed following remediation in the 300 and 700 areas. These closure caps will reduce water infiltration and direct runoff in the area, thereby preventing migration of any contaminants.

Safe Storage, Treatment and Disposal of Nuclear Waste

The waste management project will focus on safe, compliant, and cost-effective waste minimization, storage, treatment, and disposal of low-level, mixed low-level, transuranic, mixed transuranic, hazardous, and sanitary waste. The project's near-term goals involve continuing treatment of hazardous and sanitary waste, off-site shipment and disposal of low-level waste, off-site treatment and disposal of mixed low-level waste. Selection of a disposal location for mixed waste must take place prior to FY 2000. Development of treatment capacity for mixed waste, and characterization and certification of transuranic and mixed transuranic waste, and initiation of shipments for disposition at the Waste Isolation Pilot Plant in New Mexico in FY 1999 is critical to meeting the closure goals for FY 2006.

Cleanup and Stewardship of Contaminated Area

The Rocky Flats environmental restoration program activities will clean up a total of 144 cleanup sites (Individual Hazardous Substance Site, Potential Areas of Concern, Under Building Contamination, plumes, final covers) and decommission 686 facilities and buildings over the life of the site cleanup project. The designated release sites were originally grouped into 16 operable units, four of which have been closed through No Further Action Record of Decisions. Under the Rocky Flats Cleanup Agreement, signed July 19, 1996, most of the remaining operable units have been grouped into two areas, the Industrial Area and the Buffer Zone. Operable units 1, 3, 5, 11, 15, and 16 will have separate Records of Decision because they were either completed or nearly complete at the time the agreement was signed. Limited remediation is planned for the early years of site closure since many sites are unavailable for remediation. By the end of FY 1999, approximately 16 percent of the anticipated site remediations are planned to be completed.

Focus Management and Workers on Progress

Projectization is intended to focus management attention on accomplishing measurable progress towards site closure. Progress metrics have been established for critical projects. These metrics establish quantitative annual targets (as a percentage of the total life-cycle project requirements) from which contractual performance measures will be developed and tracked to assess progress toward site closure. The project approach reinforces the commitment to accelerate the cleanup of Rocky Flats by implementation of a measurable and cost-effective program.

Although the processes required to attain this goal are not yet clearly defined, accelerated progress in tearing buildings down through technology deployment, productivity, contract incentives, and project management over the last 2 years provide confidence that continued improvements in these and other areas can help achieve the goal. This budget request reflects the FY 2010 baseline.

Performance Measures

Performance measures are provided at an aggregate level after the Funding by Site table as well as at a project level in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Completed 38 special nuclear material shipments to Oak Ridge and Pantex (FY 1998).
- Stabilized or repackaged 5,004 kilograms (FY 1998) and 32,662 kilograms (FY 1999) of plutonium-bearing residues.
- Drained two liquid systems and strip out two liquid systems (FY 1998) and drain and remove 12 liquid systems (FY 1999) from Building 771.
- Drained two areas (FY 1998) and 10 areas (FY 1999) in Building 371.
- Disposed of 9,196 m^3 of low-level/mixed low-level waste to the Nevada Test Site and Envirocare in Utah (FY 1998). Dispose of 2,630 m^3 of low-level waste and 2,886 m^3 of mixed low-level waste off-site (FY 1999).
- Completed construction of Building 440 transuranic repack station outside of protected area (FY 1998).
- Removed 80 gloveboxes from Building 779 (FY 1998).
- Demolished Building 123 and outbuildings (FY 1998).
- Dispositioned 36,000 (FY 1998) and 60,000 (FY 1999) excess property items.
- Completed source removal at T-1 trench (FY 1998).
- Completed mound plume long-term treatment installation (FY 1998).
- Install Plutonium Stabilization and Packaging System in Building 371 (FY 1999).
- Prepare 670 m^3 of transuranic waste to be disposal ready for shipment to the Waste Isolation Pilot Plant (FY 1999).
- Remove 22 kilograms of plutonium and uranium holdup (radioactive contamination) (FY 1999).
- Disposition 4,000 waste chemical containers (FY 1999).
- Demolish nine facilities comprising 8,462 square feet (FY 1999).
- Remediate two environmental sites (FY 1999).
- Disposition 500 items of classified matter (FY 1999).
- Operate Plutonium Stabilization and Packaging System to stabilize/repackage at least 900 containers of plutonium metals and oxides (FY 2000).

- Complete off-site disposal of approximately 13,000 m^3 of mixed low-level, low-level and hazardous wastes and 12,000 m^3 of uncontaminated sanitary wastes, and make ready for offsite disposal approximately 2,000 m^3 of transuranic/mixed transuranic waste (FY 2000).
- Plutonium Solid Residue Stabilization Project will begin salt distillation for environmental restoration and molten salt extraction salts; will continue stabilization of ash and wet combustible residues; and repackaged fluorides will be shipped to the Savannah River Site (FY 2000).
- Procure 2,100 shipping containers to support shipment of metals and oxides (FY 2000).
- Metal and oxides, and scrub alloy shipments will be made to Savannah River pending final Record of Decision (FY 2000).
- Tap, drain, and remove approximately 9 liquid process systems; and dismantle, size reduce, and package gloveboxes, tanks, and other equipment for shipment (FY 2000).
- Building 881, 865, and 883 clusters will complete safe shutdown of approximately 22 rooms; and Building 779 closure will be complete (FY 2000).

Site Description

The Rocky Flats Environmental Technology Site is located near Denver, Colorado, on about 11 square miles at the base of the Rocky Mountains. The Rocky Flats Plant was selected by the Atomic Energy Commission in 1951 as one of seven production plants in the United States Weapons Complex. The Rocky Flats Plant played an integral part in the Nation's nuclear defense. Its mission was to manufacture nuclear weapons components from materials such as plutonium, beryllium, and uranium. When operations ceased, large amounts of plutonium, plutonium compounds, and metallic residues remained in the production lines, tanks, and process furnaces at various facilities at the site. Significant volumes of hazardous and radioactive waste generated during production operations were also present throughout numerous buildings.

In 1991, the Rocky Flats Plant transitioned to a new mission; cleaning up contamination and waste from its past activities and transitioning its facilities to cleanup in a manner that is safe, environmentally and socially responsible, physically secure, and cost-effective. It was at this time that the Rocky Flats Plant became the Rocky Flats Environmental Technology Site. Adequate funding for the life of the Site Cleanup mission is a critical element as is the DOE's ability to overcome complex-wide barriers and to facilitate resolution of national issues of complex-wide integration for off-site shipment of special nuclear materials and radioactive waste for storage, treatment, and disposal. Availability of receiver sites is also essential to achieving closure by FY 2006. This includes the availability of the Waste Isolation Pilot Plant for transuranic and residue wastes, a DOE site for acceptance of plutonium metals and oxides, as well as some residues, and DOE and/or commercial facilities for disposal of low-level and mixed low-level waste.

The Rocky Flats Environmental Technology Site's cleanup and closure activities are currently organized into 29 Project Baseline Summaries each including a detailed life cycle work scope, schedule, and cost estimate built from over 20,000 individual work elements which are integrated into a single Critical Path schedule.

The Site is managed by a performance-based integrating management contractor whose contract was established consistent with the 1993 Government Performance Results Act which requires the establishment of program goals and development of measures to monitor contractor progress toward the achievement of those goals. The integrating management contractor plans and integrates work activities, manages subcontractors in performing work, provides support functions including quality assurance and site safety program direction. The Rocky Flats Field Office manages the integrating management contract, including setting and verifying performance goals, makes program decisions, and provides local oversight, public and regulatory interface on site work activities. A DOE Headquarters closure team provides intersite coordination on material shipment and disposition decisions and activities relating to site closure. Award and incentive fees have been established by the DOE to motivate the contractor to perform.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Rocky Flats Environmental Technology Site is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure* plan. The funds requested for FY 2000 are appropriate to perform the activities based on historical level of effort costs. An independent assessment of projects is currently in process.

Metrics
No quantifiable corporate performance measures are associated with this project.

RF-001/Buffer Zone Closure Project

Remedial action activities are included within the Buffer Zone Closure Project which consists of 67 Individual Hazardous Substance Site. This project includes: operation of groundwater and surface water monitoring stations; design, construction, and operation of groundwater containment and treatment systems; remediation of Individual Hazardous Substance Sites/Potential Area Contamination; continuing landlord functions for the Building 130 cluster and operation of the firing range.

- On-site transfer and off-site discharge of approximately 200 million gallons of Building 995 Wastewater Treatment Plant effluent and Rocky Flats Environmental Technology Site storm water.
- Complete quarterly and annual reporting of groundwater sampling results.
- Complete quarterly and annual reporting of surface water sampling results.
- Conduct remediation planning for the 903 Pad to include:
  - limited sampling
  - decision document preparation
  - public/regulator involvement
  - potential treatability study
- Operate groundwater management systems.

RF-002/Waste Management Project

The Waste Management Project includes all activities that support the treatment, storage, and disposal of all wastes currently in the inventory and projected to be generated from other sites closure projects. Specific waste types include: low-level waste, mixed low-level waste, transuranic waste, transuranic mixed waste, hazardous waste, and other sanitary/uncontaminated waste. The scope of the project includes safe and compliant management on-site, in new and existing storage facilities; safe and compliant treatment, including construction of liquid waste treatment upgrade, of mixed wastes at on-site and off-site locations; and safe and compliant disposal at approved off-site repositories.

- In FY 2000, additional mixed low-level waste will be disposed as the saltcrete/pondcrete disposal project enters completion. Also, the disposal ready quantities of transuranic and transuranic mixed waste will increase as the Site's ability to characterize transuranic waste is also increased. Specific planned accomplishments include: (If disposal facility is not available - additional storage capacity will need to be constructed, in lieu of or in addition to disposal).
  - Make 2,000 m^3 of transuranic/mixed transuranic waste disposal ready for off-site disposal.
  - Complete off-site disposal of 6,575 m^3 of mixed low-level waste.
  - Complete off-site disposal of 2,050 m^3 of low-level waste.
  - Complete off-site disposal of 186 m^3 of hazardous waste.
  - Complete off-site commercial disposal of 16,400 m^3 of uncontaminated/sanitary waste.
  - Maintain existing landfill in "stand-by" as a disposal contingency.
  - Continue operation and maintenance of the Sewage Treatment Plant.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
▸ Continue operation and maintenance for transuranic, transuranic mixed, low-level, mixed low-level and other regulated waste storage areas.			
▸ Initiate operation of the shipping/staging module and the characterization module for transuranic/transuranic mixed waste.			
▸ Continue operation and maintenance for process wastewater treatment in Building 374.			
▸ Continue characterization and repackaging activities to prepare disposal ready volumes of transuranic/transuranic mixed waste for future shipment to the Waste Isolation Pilot Plant.			
▸ Continue completion of Site Treatment Plan and Compliance Order commitments, Rocky Flats Cleanup Agreement commitments, Chemical Management Consent Order.

RF-003/Remediation Waste and Contingent Storage Project			
The purpose of this project is to provide the resources necessary for the development of a new low-level and mixed low-level waste containerized storage facility for storage of remediation wastes. The facility will provide capacity and capability to store, stage, and ship large volumes of remediation waste anticipated to be generated from the decontamination, decommissioning, and demolition of site facilities, as well as from restoration activities associated with contaminated areas at the Site.			
■ Project curtailed.			
RF-003	-9	1	0
Metrics No quantifiable corporate performance measures are associated with this project.			
RF-004/Special Nuclear Material Capital Support Project			
The Special Nuclear Material Capital Support project contains two subprojects. The Building 371 upgrade subproject responds to Defense Nuclear Facilities Safety Board Recommendation 94-3 for facility upgrades to withstand defined seismic events. The special nuclear material support subproject provides capital and General Plant Project upgrades to facilities or projects within the nuclear production.			
■ Construction of the cooling tower will be completed, tested, and turned over for operations.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
RF-006/Special Nuclear Material Consolidation Project			
The Special Nuclear Material Consolidation project manages the intra-site transport of plutonium metals, oxides, and residues between facilities as necessary for mortgage reduction and interim storage and staging of these materials for processing or off-site shipment. This project includes consolidation of special nuclear material from other facilities into Building 371, and tracking and closure of plutonium and enriched uranium Environmental Safety and Health vulnerabilities.			
■ Transfer of special nuclear material residues, not scheduled for processing, and holdup from gloveboxes and ventilation ducts from Buildings 776/777 are scheduled to be completed.			
RF-006	3,008	2,234	1,287
Metrics No quantifiable corporate performance measures are associated with this project.			
RF-007/New Pu Interim Storage Vault			
Construction of a new Interim Plutonium Storage Facility was curtailed. Conceptual design was completed in FY 1997. Miscellaneous activities were supported in FY 1998.			
■ No activity.			
RF-007	17	0	0
Metrics No quantifiable corporate performance measures are associated with this project.			
RF-008/Plutonium Metals and Oxides Stabilization			
The Plutonium and Oxides Stabilization project supports the packaging of all material greater than 50 weight percent plutonium per the requirements of DOE-STD-3013, for interim storage at the Rocky Flats Environmental Technology Site for eventual off-site disposition. Repackaging addresses Defense Nuclear Facilities Safety Board Recommendation 94-3 by placing dispersable plutonium oxides in more robust containment. Installation, testing and safety documentation for the Plutonium Packaging System substantially will be completed in FY 1999.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Operate Stabilization Packaging System, and stabilize/repackage at least 910 containers.			
■ Continue size reduction operation for large metal items, completing at least half of the items.

RF-009/Plutonium Solid Residue Stabilization Project

Both DOE's Plutonium Vulnerability Study and the Defense Nuclear Facilities Safety Board Recommendation 94-1 identified the unstabilized residues at the Rocky Flats Environmental Technology Site as a potential hazard. The project is to conduct the minimum processing necessary to prepare solid residues to address Defense Nuclear Facilities Safety Board Recommendation 94-1. The residues will be processed to meet the Interim Safe Storage Criteria and the Waste Isolation Pilot Plant Waste Acceptance Criteria in accordance with the Site Integrated Stabilization Management Plan Version 7.0. Additionally, the Settlement Agreement and Compliance Order on Consent No. 93-04-23-01 with the State of Colorado requires the processing of the backlog of mixed residues to put them in a shippable and/or disposable form as expeditiously as reasonably possible and to remove them from plant site as expeditiously as reasonably possible once an off-site disposal facility becomes available.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Processing of solid residues includes characterization, stabilization, safeguards termination limit compliance, repack, and certification for disposal. The material to be processed includes all the backlog solid residues generated as byproducts from plutonium production operations. Solid residues are categorized by type of material identified by an Item Description Code. The inventory of solid residues consists of approximately 106 metric tons of bulk material in 99 item description codes with an average plutonium concentration of about 3 percent. The residues are stored in approximately 4,000 drums and 4,000 containers. Four separate processes are required for this material. Wet residues and combustibles will be processed in one line in Building 371. Salt, ash, and dry residues will be processed in three lines in Building 707. Processing commenced in November 1997 and will be complete in 2002. Shipping of the residues off-site will be complete in FY 2004. The project consists of two subprojects: the Special Nuclear Material Solid Residue Development project; and, the Special Nuclear Material Solid Residue Processing project.			
■ Process 8,000 kilograms of salt residues in FY 2000.			
■ Repack 7,950 kilograms of ash residues in FY 2000.			
■ Ship all 317 kilograms of plutonium fluorides to the Savannah River Site.			
■ Continue stabilization of ash and wet combustible residues.

RF-011/Uranium Disposition Project

The Uranium Disposition project supports activities to remove plutonium contamination from stored enriched uranium hemishells to permit off-site shipment and acceptance by Oak Ridge Y-12; remove residual highly enriched uranyl nitrate by removing the Raschig rings in the tanks from Rocky Flats; and to continue highly enriched uranyl nitrate conversion to highly enriched uranium oxide off-site. This project is planned for completion in FY 1999.

■ No activity.

RF-011	587	1,048	0

Metrics
No quantifiable corporate performance measures are associated with this project.

RF-012/Special Nuclear Material Shipping Project

The Special Nuclear Material Shipping project includes pits, enriched uranium, composite parts, plutonium metal and oxides, scrub alloy and other material. This project element supports all activities necessary to ensure the availability of off-site shipping containers, procedure development, and packaging and shipping of spent nuclear material. The 2010 baseline supports shipments of plutonium metal and oxides to Savannah River Site beginning in 2002. In order to support a 2006 closure, shipments will begin in January 2000 to the K-Area Nuclear Material Storage project located at the Savannah River Site. The FY 2000 scope reflects a transfer in funding responsibility for Type B (9975) shipping containers from the Savannah River Site to this Rocky Flats project.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Fund procurement of 2,100 Type B (9975) shipping containers to support shipment of plutonium metal and oxides to Savannah River Site K-Area.			
■ Ship 700 containers of plutonium metal and oxides to the Savannah River Site K-Area.			
■ Complete four shipments of scrub alloy to Savannah River Site.			
RF-012	3,475	7,166	17,166

Metrics
No quantifiable corporate performance measures are associated with this project.

RF-013 Closure Caps Project

The scope of the Closure Cap project includes design and construction of the caps once the facilities have been demolished in the 300 area and 700 area. This project also includes regrading and revegetating the industrial area and removal of pavement and foundations, if necessary. Construction of the caps will begin in FY 2006 and will cover the 300 area, 700 area, solar ponds, and possibly the landfill. Periodically, technology updates will be evaluated and cost estimates will be updated.

■ No activity.			
RF-013	0	30	0

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

RF-014/Industrial Zone Closure Project

The purpose of the Industrial Zone Closure project is to continue operations of the facilities within the industrial zone until such time as operations can be discontinued and the facilities dismantled. The industrial zone consists of the majority of the facilities located south of the protected area and within the perimeter fence.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The facilities in the industrial zone consist of buildings with tenants that comprise the infrastructure for the site which includes services (Fire Department, Garage, Metrology, Security, etc.) utilities (Water Plant, Steam Plant, electrical distribution, etc.) and administrative services (finance, procurement, payroll, etc.). These services are required to support the risk reduction, deactivation, decommissioning and closure activities planned over the remaining life of the plant. The industrial zone also contains one production facility, Building 444, a uranium/beryllium fabrication/machining facility that was shut down in 1989 without any deactivation or decontamination activities, including equipment removal. Building 460 was also a former production facility, providing stainless steel machining for weapons parts, but that facility has been converted to an administrative building housing DOE personnel.			
■ Landlord functions and support activities will continue.			
■ Complete remediation of Bowman's Pond release site.			
■ Complete decommissioning of one facility.			
■ Submit annual Tier II Chemical Inventory Report.

RF-015/Miscellaneous Production Zone Cluster Closure Project

The scope of the Cluster Closure project is summarized below for the six major activities.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

- Facility Landlord Functions: Conduct Limiting Conditions for Operations surveillance's on Vital Safety Systems as required by the building specific authorization basis document (i.e. fire systems, criticality alarm systems, heating, ventilation, and air conditioning systems). Conduct routine compliance surveillance/inspections on Resource Conservation and Recovery Act units, security systems, radiological control requirements, industrial safety, etc. Conduct baseline maintenance activities on Vital Safety Systems, facility support systems/structures, environmental compliance and waste management support systems, security systems, etc. Provide operations management and technical support for building baseline activities and in support of risk reduction activities.
- Deactivation: The scope of the deactivation phase includes all of the physical activities to prepare and turn over a building cluster to decommissioning as agreed upon in the building specific End State Criteria.
- Decommissioning: The scope of the decommissioning phase includes all of the physical activities to decontaminate, dismantle, and demolish building clusters in preparation for individual hazardous substance site remediation and final closure.
- Closure: The scope of this activity includes the final close-out of the cluster site upon completion of decommissioning and individual hazardous substance site remediation, and includes the regulatory and project close-out documentation required by the Department of Energy and the Rocky Flats Cleanup Agreement.
- Remediate/Contain High Risk Individual Hazardous Substance Sites: The scope of this activity includes remediation or containment as appropriate to close the High Risk individual hazardous substance sites in the Miscellaneous Production Zone. Typically, remediation will include excavation and treatment such as thermal desorption and/or containment could include capping or closure in place.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
▸ There are 30 individual hazardous substance sites in the Miscellaneous Production Zone that are No Further Action Sites and will undergo No Further Action Justification to delete these individual hazardous substance sites from the Rocky Flats Cleanup Agreement under this project. The High Risk individual hazardous substance sites include: Rad Site Building 559 (Individual Hazardous Substance Site 159); Under Building Contamination (2 buildings); Solar Ponds (Individual Hazardous Substance Site 101).			
■ The landlord functions and support activities will continue in the operating buildings.			
■ Complete decommissioning of nine facilities.

RF-016/Building 371 Cluster Closure Project

Prior to the end of the Cold War, the purpose of the Building 371 facility was threefold: (1) to recover plutonium from all residues generated by plutonium-related fabrication, assembly, and research activities throughout Rocky Flats Plant, (2) to convert the recovered plutonium into high purity metal buttons, and (3) to recover associated americium and convert it to americium dioxide, which is a sellable product. Included in the 371 Cluster Closure project are Buildings 371, 373, 374, 374A, 377, 378, 381, T371H, T371J, T371K, 376, T376A, T371I, 371A and tanks 163, 164, 165, 166, 167, 168, 169, 170, 171, 224, 225, 226, 227, and 228. Resumption efforts have been undertaken in several buildings to begin processing, stabilizing, and repackaging the special nuclear material to make it safe to store, handle, and ship.

- Initiate residue stabilization and repack of high-efficiency particulate air filters and dry combustibles.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue consolidation and shipment of special nuclear material.			
■ Continue support of the International Atomic Energy Agency agreement by storing, assaying, and inspecting that material.			
RF-016	15,930	19,384	20,014

Metrics
This project has associated corporate performance measures; however, no measures are reportable in the three year budget profile.

RF-017/Building 707/750 Cluster Closure Project

During the Cold War period, Building 707 was used to perform all metallurgical and assembly processes for manufacturing plutonium components. Different modules located in Building 707 housed operations such as casting, rolling, forming, machining, assembly and testing of materials. In addition, plutonium items were stored in vaults such as the X-Y Retriever. Resumption efforts have been undertaken in Building 707 to begin processing, stabilizing, and repackaging the special nuclear material to make it safe to store, handle, and ship. This effort will continue in Building 707 through approximately FY 2002.

- Maintain landlord functions and begin special nuclear material removal operations.

RF-017	16,942	19,880	18,669

Metrics			
Facility Decommissioning			
Assessments	0.0	1.0	0.0
Cleanups	2.0	0.0	0.0

RF-018/Building 771/774 Cluster Closure Project

Specifically, this project is to accomplish a transition of Building 771/774 and 771A Clusters from an operating nuclear facility and support facilities to a closed and remedied site. The most efficient way to execute this strategy to plan an effort as a "closure project," and not a "deactivation project" followed by a "decommissioning project." In FY 1998, Building 771/774 Cluster was transferred to the decommissioning subcontractor, and deactivation and decommissioning activities have begun.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Drain five and remove two process piping systems by June 2000.			
■ Six decommissioning worksets will be completed. This entails dismantlement, size reduction and packaging for shipment of gloveboxes, tanks, and other equipment.			
■ Close the Material Access Area by December 1999.			
RF-018	19,097	20,524	20,764
Metrics			
Facility Decommissioning			
Assessments	0.0	35.0	0.0

RF-019/Building 776/777 Cluster Closure Project

As an effort to stabilize material progresses, and as buildings are no longer required to process and store special nuclear material, it is necessary to deactivate and decommission these nuclear and support facilities to further minimize risk, reduce mortgage costs, and to fulfill the site closure mission.

Buildings 776/777 performed manufacturing and assembly of special order and war reserve weapons, disassembly, processing and recovery from site returns, waste operations including size reduction and incineration, and several developmental programs including nondestructive testing, joining, and coatings. This process produced significant amounts of plutonium contaminated lubricants, shavings, and secondary residues that were temporarily stored and periodically recycled back into the plutonium manufacturing process. Included in the 776/777 Cluster are Buildings 776, 777, 701, 702, 703, 712, 713, 781 and tanks 199, 200, 201, 202, 203, 207, 244, and 245. When all nuclear production was halted in 1989, special nuclear materials were left in place without any handling or repackaging pending resumption of nuclear operations.

- Continue landlord functions for the 776/777 Cluster.
- Remove holdup from five areas to below safeguard termination limits.
- Begin deactivation, planning, and regulatory documentation development.

RF-020/Building 881 Cluster Closure Project

The Building 881 Cluster Closure project includes 881, 865, 883, 881 Trailers, 881/883 Stacks, 881/883 Tunnel, and Tanks. The strategy for the 881, 865/883 Cluster prior to beginning active decontamination and decommissioning in FY 2006 is to systematically shut down rooms, areas and entire facilities while carrying out minimum surveillance and maintenance activities required to ensure regulatory compliance and safe operations of the facilities. Safe shutdown is being undertaken so that the required surveillance, monitoring and maintenance of the buildings can be reduced, thus freeing-up funding for other decontamination and decommissioning and closure activities. It is anticipated that the shutdown activities which are performed prior to decontamination and decommissioning will be accomplished in three overlapping phases and will result in the minimum funding level that is required to maintain the buildings prior to the start of decontamination and decommissioning.

- Complete the safe shutdown (closure/padlocking) of 22 rooms in the Building 881/865/883 Clusters.
- Commence Building 881 deactivation activities.

RF-022/Building 779 Cluster Closure Project

The Building 779 Cluster Closure project is to close and demolish all the facilities in the cluster, and to Remediate contaminants in the underlying soils in accordance with cleanup standards for the site.

The Building 779 Cluster consists of the primary building (Building 779), two filter plenum buildings, nine storage tanks, two tunnels and ten support buildings. Building 779 is a two-story, concrete structure with approximately 68,000 square feet of floor area. The building was primarily utilized for conducting research and development involving nuclear weapons materials processes, and approximately 60 percent of the space is contaminated or potentially contaminated. The building laboratories and shops are filled with mechanical and chemical process equipment, including approximately 100 gloveboxes. The primary contaminant is plutonium, but the building also contains small quantities of depleted uranium, beryllium and more than 4,000 chemicals, some of which are radiologically contaminated. The building exhaust system and two plenum buildings have plutonium contaminated ducts and high-efficiency particulate air filters. Completion of decommissioning in FY 2000 will mark the demolition of the first major DOE plutonium facility.

■ Complete demolition of 23 facilities in the Building 779 cluster.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

RF-024/Safeguards and Security Project

The Safeguards and Security project provides for the physical protection, control, and accountability of special nuclear material and classified matter at Rocky Flats. This project supports site-wide safeguards and security program management, and the planning resources necessary to develop and implement the site Safeguards and Security Plan and associated security/emergency response plans. Protective program operational activities including armed protective force, special response team, physical security system alarm response and maintenance, access control, and property protection personnel and capabilities are also supported by this project. In addition, it includes special nuclear material control and accountability activities which assure secure and accurate measurement, reporting, and intra-site transportation of material drive these funding requirements. Internal security responsibilities, personnel security assurance programs, classified information management and control, and computer/communications/and technical security are addressed by this project.

- Master Safeguards and Security Agreement Project.
  - Construction Complete, Explosive Detection System - 14 Jul 2000.
  - Construction Complete, Grenade Screens - 17 Jul 2000.
- Safeguards and Security Operations Project.
  - Submit Validatable Site Safeguards and Security Plan Annual Update - 1 Mar 2000.
  - Annual Force on Force - 7 Jun 2000.
  - Annual Critical System Element Effectiveness Test - 31 Jul 2000.
  - Annual Update of Site Emergency Response Plan - 30 Sep 2000.
  - Identify, Verify, and Conduct Initial and Annual Reviews of all Personal Security Assurance Program Positions - 30 Sep 2000.
  - Annual Update of Materials Control and Accountability Plan - 31 Mar 2000.
  - Update Integrated Measurement Plan (For Accountability Measurements) - 1 Apr 2000.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

	FY 1998	FY 1999	FY 2000
RF-027/Analytical Services Project			
The Analytical Services project provides sampling and analytical chemistry services in support of site operations and closure activities. Analytical services satisfy the requirements of Federal, State, and local agencies for characterization of environmental contamination, facility waste, environmental monitoring, industrial hygiene, radiological health, medical monitoring, nuclear material processing and stabilization, and nuclear material control and accountability.			
■ The Analytical Services project will continue to support the following Rocky Flats Environmental Technology Site projects: 1) Buffer Zone Closure Project (RF-001); 2) Waste Management Project (RF-002); 3) Closure Cap Project (RF-013); 4) Industrial Zone Closure Project (RF-014); 5) Miscellaneous Production Zone Cluster Closure Project (RF-015); 6) Building 371 Cluster Closure Project (RF-016); 7) Building 707/750 Cluster Closure Project (RF-017); 8) Building 881 Cluster Closure Project (RF-023); 10) Safeguards and Security Project (RF-024); 11) Kaiser-Hill Project Management project (RF-030).

	FY 1998	FY 1999	FY 2000
RF-029/Rocky Flats Office / DOE Management			
The Rocky Flats Field Office Program Support project provides for the Rocky Flats Field Office management of the Integrating Management Contract for the conduct of all site activities, including developing and monitoring of integrating management contractor performance measures, program execution guidance, Operational Readiness Reviews, facility representatives, the life-cycle baseline, budget management, prioritization, updates to the *Accelerating Cleanup: Paths to Closure* plan, and conduct of the Emergency Management Program. It also provides activities which support the Rocky Flats Cleanup Agreement, other Congressionally mandated programs (i.e., Technology Development, Health Studies, Worker Community Transition, etc.) legal expenses relating to the continuing class actions and other civil litigation activities of former site management and operations contractors under the "litigation and claims" clause of those contracts, and financial assistance to the State of Colorado.			
■ FY 2000 accomplishments are driven by the level of effort necessary to accomplish Congressionally mandated programs and to compliment planned site closure goals and accomplishments. Work will include continuation of activities to require the production and refinement of performance. measures, fiscal management, work prioritization integration, and coordination, updates to the *Accelerating Cleanup: Paths to Closure* plan and preparation of Program Execution Guidance and the life cycle baseline.

RF-030/Kaiser-Hill Project Management

The Kaiser-Hill Project Management project comprises all of the necessary Integrating Management Contractor support, direction and management for the Rocky Flats Site. This management and support are integral to the safe and efficient execution of work required to achieve accelerated cleanup and risk reduction at Rocky Flats. Much of this support and management will diminish significantly as plutonium operations are curtailed; however, in most areas, some effort will be required until all decommissioning, waste, and remediation activities are complete.

Kaiser-Hill provides planning and integration services that support the entire site by developing, implementing, and monitoring the progress of strategic plans to close Rocky Flats; assisting in the identification of performance measures; guiding the development of the annual work plan; setting standards for site-wide business practices, cost estimating and scheduling; creating and maintaining the Integrated Site-wide Baseline; maintaining project control systems; and conducting monthly program/site activity reviews. Kaiser-Hill also provides performance oversight including nuclear performance assurance, which demonstrates the readiness to conduct nuclear activities prior to actual operations; Price-Anderson Amendment Act compliance; and interfacing with the site's nuclear regulatory agencies such as the Defense Nuclear Facilities Safety Board and staff. The Integrating Management Contractor provides programmatic management for all nuclear operations, environmental remediation, and waste activities. The Integrating Management Contractor also provides the general management and oversight for all site expense funded projects.

- Manage, guide, and direct all closure projects, the Nuclear Operations Program, the architect engineer/construction/construction management subcontract and all oversight and planning exercises in a manner as such that they meet or exceed their respective program's/project's activities scheduled in the life-cycle baseline within or under budget.
- Provide safety, technical, and independent assessment programs that provide for a safe work environment in a cost-effective manner for the Rocky Flats Closure Project.
- Oversee an annual 5 percent reduction in infrastructure and management from increased efficiencies.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Ensure compliance activities, including documentation and reporting, are performed on schedule and with necessary completeness and accuracy.

RF-034/Management Project

This project supports closure of the Rocky Flats Project by managing and providing necessary and sufficient executive management, financial and administrative functions. This project includes all of the site's management (overhead), direction, general and administrative and base fees for Kaiser-Hill and their major subcontractors.

- Use re-engineering and business process improvement techniques to:
  - Improve operating efficiencies and allow an acceleration of the site closure schedule.
  - Reduce headcount and resource costs, thereby allowing additional funding to be applied to direct closure projects.
  - Finalize the consolidation of vendors and subcontractors to reduce administrative burden and cost.
  - Negotiate an extension to existing insurance programs or establish new insurance programs, as necessary, to meet site closure requirements.
  - Finalize all leases for off-site facilities, to support Closure projects and eliminate the on-site facilities costs of support organizations.
  - Finalize the extend/recompete decisions on all major subcontractors to Kaiser-Hill.
- Complete a number of computer systems and communications projects such as:
  - Remote access servers to allow an off-site workforce to continue to support closure projects.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
▸ Wireless communication integration to meet the needs of a mobile decontamination and decommissioning workforce and to allow communication to continue as buildings (and the communications infrastructure within them) are demolished.			
▸ Modularization of Telephone/Data Communications Systems to replace centralized systems and allow services to specific site population areas.			
■ Payment of contractor environmental pollution insurance premium (paid every three years).

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
HQNP-SI01-CL/Security Investigations	
■ Increase in funding to support required reinvestigations and new investigations to be in compliance with DOE Orders.	330
RF-001/Buffer Zone Closure Project	
■ Decrease reflects completion of Trench T-1 waste treatment and shipment and equipment decontamination in FY 1999.	-3,461
RF-002/Waste Management Project	
■ Increase is due to increased shipments of transuranic waste and mixed low-level waste, and increased quantities of mixed low-level waste treatment.	11,653
RF-003/Remediation Waste & Contingent Storage Project	
■ Decrease reflects curtailment of project.	-1
RF-004/Special Nuclear Material Capital Support Project	
■ Increase is necessary to support completion and testing of cooling tower upgrade.	1,453

	FY 2000 vs. FY 1999 ($000)
RF-006/Special Nuclear Material Consolidation Project	
■ Decrease due to lower level of intra-building special nuclear material transfers as more special nuclear material is consolidated.	-947
RF-008/Plutonium Metals and Oxides Stabilization	
■ Decrease reflects completion of installation and testing of the Plutonium Packaging System in FY 1999	-1,010
RF-009/Plutonium Solid Residue Stabilization Project	
■ Increase reflects shipments of plutonium fluorides to the Savannah River Site and increased levels of stabilization for remaining residue categories, including procurement of additional pipe components.	14,994
RF-010/Plutonium Liquid Stabilization	
■ Decrease is due to project completion in FY 1999.	-8,672
RF-011/Uranium Disposition Project	
■ Decrease is due to project completion in FY 1999.	-1,048
RF-012/Special Nuclear Material Shipping Project	
■ Increase is due to transfer of funding responsibility for 9975 shipping containers from the Savannah River Site K-Area Nuclear Material Storage subproject to Rocky Flats.	10,000
RF-013/Closure Caps Project	
■ Decrease due to completion of initial design investigations for construction of the closure caps.	-30
RF-014/Industrial Zone Closure Project	
■ Decrease reflects lower landlord costs resulting from deactivation and decommissioning activities.	-3,328
RF-015/Miscellaneous Production Zone Cluster Closure Project	
■ Increase is due to slightly higher decommissioning activities for the miscellaneous facilities within the protected area.	3,481
RF-016/Building 371 Cluster Closure Project	
■ Increase due to additional support for residue stabilization, metal and oxide stabilization and special nuclear material shipping activities.	630
RF-017/Building 707/750 Cluster Closure Project	
■ Decrease reflects slightly lower costs resulting from consolidation/removal of special nuclear materials from Building 707.	-1,211
RF-018/Building 771/774 Cluster Closure Project	
■ Increase is due to slightly higher level of decommissioning activities within Building 771 Cluster.	240

	FY 2000 vs. FY 1999 ($000)
RF-019/Building 776/777 Cluster Closure Project	
■ Decrease is due to lower surveillance costs resulting from special nuclear material consolidation and holdup removal activities.	-572
RF-020/Building 881 Cluster Closure Project	
■ Decrease is due to lower surveillance costs resulting from room shutdowns within the building cluster.	-541
RF-021/Building 991 Cluster Project	
■ Decrease is due to lower storage costs for transuranic waste as a result of increased shipments to the Waste Isolation Pilot Plant.	-325
RF-022/Building 779 Cluster Closure Project	
■ Decrease reflects completion of cluster demolition by June 2000	-13,295
RF-023/Utilities and Infrastructure Project	
■ Increase is due to the expansion of infrastructure support for stabilization, shipping, and decommissioning activities.	1,331
RF-024/Safeguards and Security Project	
■ Decrease reflects reduced safeguards and security requirements due to closure of Building 771 Material Access Area and consolidation of special nuclear material.	-1,471
RF-025/Infrastructure Improvement/Replacement Project	
■ Decrease is due to completion of most capital and constructions projects in Buildings 371, 664, 115, 121, and 764 in FY 1999.	-9,756
RF-027/Analytical Services Project	
■ Increase is due to the expansion of analytical and sampling support for stabilization, shipping, and decommissioning activities.	685
RF-029/Rocky Flats Office - DOE Management	
■ Increase is due to anticipated increased activities associated with the Kaiser-Hill contract expiration in June 2000.	945
RF-030/Kaiser-Hill Project Management	
■ Decrease is due to lower contractor management costs and shift of support costs to more direct work.	-6,337
RF-034/Management Project	
■ Increase due to the environmental pollution insurance premium (paid every three years) and upgrading of the communication system.	6,273

Defense Environmental Management Privatization

Proposed Appropriation Language

For Department of Energy expenses for privatization projects necessary for atomic energy defense environmental management activities authorized by the Department of Energy Organization Act (42 U.S.C. 7101 et seq.), [$228,357,000] *to become available on October 1 of the year specified and* to remain available until expended: *fiscal year 2000, $228,000,000; fiscal year 2001, $671,000,000; fiscal year 2002, $659,000,000; fiscal year 2003, $633,000,000; fiscal year 2004, $594,000,000. (Energy and Water Development Appropriations Act, 1999.)*

Explanation of Change

Change in appropriation language provides for advanced appropriations through fiscal year 2004.

Defense Environmental Management Privatization

Program Mission

The Department of Energy (DOE) began working with the private sector in the 1940's when it contracted to design, construct, and operate the facilities used to build nuclear weapons during the Manhattan Project. During the period of weapons production and in the early years of the Environmental Management (EM) program, the management and operating contract was the typical method of contracting. This mechanism contained very general work scope under which DOE reimbursed essentially all contractor costs while also paying the contractor an additional fee based on either a fixed fee schedule or, in a few cases, based on a subjective determination of performance (i.e. award fee).

In an effort to meet the enormous cleanup challenge in the face of declining resources, EM began utilizing, where appropriate, privatization as a mechanism to deal with these demands. Privatization is a contracting strategy that should reduce the project risk to the government and achieve cleanup more cost-effectively. Under privatization, the EM program provides financial incentives to the contractors to substantially reduce EM cleanup costs while ensuring that an appropriate technical and financial risk/reward balance between DOE and the contractors is maintained. The use of privatization is expected to result in cleanup being accomplished sooner in comparison to the traditional Management and operating approach, thus supporting the EM vision of completing substantial cleanup at most EM sites within the next decade.

As provided in the National Defense Authorization Act for Fiscal Year 1998, contracts for EM Privatization projects should meet the following criteria: be awarded on a competitive basis; require the contractor to construct or acquire any equipment or facilities required to carry out the contract; require the contractor to bear any of the costs of the construction, acquisition, operation of such equipment or facilities that arise before the commencement of the provision of goods or services under the contract; provide for payment to the contractor under the contract only upon the meeting of performance specifications in the contract. The EM focus in utilizing this methodology is to gain an edge through best-in-class management capability, business strategies, technological approaches, schedule enhancements, regulatory experience and cost efficiencies. This type of project funding is widely used in the private sector to finance power plants and other investments. The Department believes the privatization program is the most cost-effective approach for selected projects.

This program is budgeted for under the appropriation account: Defense Environmental Management Privatization. The Defense Environmental Management Privatization request for FY 2000 is $228.0 million, a decrease of $.4 million compared to the amount provided for Privatization in FY 1999. The FY 2000 privatization program, however, totals $253.0 million, supported by $25.0 million of prior year balances associated with a now canceled project. The

FY 2000 request is required to continue the Idaho Advanced Mixed Waste Treatment, the Idaho Spent Nuclear Fuel Dry Storage, the Oak Ridge Environmental Management/Waste Management Disposal Facility, the Oak Ridge Transuranic Waste Treatment and the Richland Tank Waste Remediation System privatization projects.

The Department is requesting advance appropriations for the Hanford Tank Remediation System for FY 2001 through FY 2004 and for the Idaho Advanced Mixed Waste Treatment Project for FY 2001 (FY 2001 - $671 million, FY 2002 - $659 million, FY 2003 - $633 million and FY 2004 - $594 million). The Department will consider incremental funding for other privatization projects on an annual basis.

Program Goal

The goal of Privatization is to accomplish work traditionally performed by Management and Operations/Management and Integration contractors in the cost plus contract environment in a more cost-effective manner.

Program Objectives

- Reduce the project risk to the government and achieve cleanup more cost-effectively;
- Provide financial incentives to contractors to substantially reduce EM cleanup costs while ensuring that an appropriate technical and financial risk/reward balance between DOE and the contractor is maintained; and
- Continue the active support and commitment to ongoing privatization projects aimed at reducing the overall cost of environmental cleanup activities.

Performance Measures

- Start construction of the Oak Ridge Transuranic Waste Treatment project;
- Start construction of the Richland Tank Waste Remediation System Privatization Phase 1 project; and
- Ship 3,376 cubic meters of contact-handled waste to Waste Isolation Pilot Plant assuming resolution of legal concerns.

The following list of projects were started in FY 1997 and FY 1998 and will be continued in FY 2000. There are no new starts scheduled for FY 2000.

Significant Accomplishments and Program Shifts

- In March 1998, the new Oak Ridge Management and Integration contractor initiated a rebaselining of the cleanup program in Oak Ridge including the Environmental Management/Waste Management Disposal project. A detailed review of the data contained in the Remedial Investigation/Feasibility Study cost estimate resulted in a reduction to the Total Estimated Cost of that project of $26.5 million and an increase in the Total Project Cost of $40.9 million over the projected Phase 1 span of 19 years.

- In August 1998, the Department negotiated a contract with BNFL, Inc., to proceed into Phase B of the Tank Waste Remediation System project at Hanford, Washington. In addition, in order to more effectively manage the Tank Waste Remediation System, and in response to Congressional concerns, the Secretary established the Office of River Protection at the Hanford, Washington site.

- In August 1998, the Department awarded, through competitive procurement, a contract for the treatment of Transuranic Waste to the Foster Wheeler Environmental Corporation. The contract was awarded for approximately $50 million less in Total Estimated Cost than the original Management and Operations contractor estimate.

- After very careful deliberation and examination of more refined estimates , the Department determined the privatization approach was not the most feasible for the Savannah River Spent Nuclear Fuel project. The $25.0 million originally appropriated for this project will be used to support the total FY 2000 Privatization program level of $253.0 million.

- The Total Project Cost for the Advanced Mixed Waste Treatment Project, Idaho has been revised from $1,078.9 million to $1,115.4 million as a result of the contract provision for price redetermination and economic price adjustments on the operating portion of the contract. The Total Estimated Cost of the privatized portion of the contract was not effected.

Detailed Program Justification

	FY 1998	FY 1999	FY 2000
CAO-6 Contact Handled Transuranic Waste Transportation; Carlsbad, New Mexico			
The Waste Isolation Pilot Plant is expected to begin receiving waste requiring specialized transportation. A private vendor will provide transportation of contact-handled transuranic waste from generator sites to Waste Isolation Pilot Plant using contractor owned and operated tractor trailer sets and nuclear packaging equipment. A standard fee will be paid based on shipments and mileage. Site-specific treatment plans developed under the Federal Facility Compliance Act and the associated consent orders and agreements with the states and EPA (across the DOE complex) require disposal of transuranic wastes. Contract award is expected to take place the third quarter of FY 1999.			
Total, CAO-6	21,000	0	0

FY 1998	FY 1999	FY 2000

ID-WM-104 Advanced Mixed Waste Treatment Project; Idaho Falls, Idaho

This project has been in development at the Idaho National Engineering and Environmental Laboratory since 1993. A contract was awarded to BNFL, Inc., in December 1996, for the retrieval, sorting, characterization, storage, pre-treatment, treatment, certification and loading for transportation of 65,000 cubic meters of alpha and transuranic mixed waste located in retrievable storage at the Idaho National Engineering and Environmental Laboratory Radioactive Waste Management Complex. The contract has an option for treatment of up to 120,000 cubic meters of additional Idaho National Engineering and Environmental Laboratory and DOE mixed wastes. The project scope is to treat Idaho National Engineering and Environmental Laboratory Transuranic and alpha mixed waste, as well as other DOE mixed waste in the complex, through a private sector treatment facility located at the at Idaho National Engineering and Environmental Laboratory.

The primary wastes to be treated are DOE laboratory and process wastes generated at Rocky Flats and various DOE facilities. These wastes are currently stored in drums, boxes and bins at the Idaho National Engineering and Environmental Laboratory Transuranic Storage Area of Radioactive Waste Management Complex.

FY 1998	FY 1999	FY 2000

Waste consists of a heterogeneous mixture of solid materials including paper, cloth, rubber, plastic, glass, graphite, bricks, concrete, metal, nitrate salts, process sludges, miscellaneous components and some absorbed liquids. Ninety-five percent of the waste is believed to contain both Resource Conservation and Recovery Act (RCRA) hazardous waste constituents and radioactivity. Some wastes also contain Toxic Substance and Control Act regulated materials such as polychlorinated biphenyls. No more than 4,100 kilograms (kg) of elemental mercury, and approximately 2.1 million kg of lead is expected in the 5,000 cubic meters. This project is necessary to meet the requirement in the October 1995, Idaho Settlement Agreement to ship all transuranic waste out of Idaho by the target year of 2015 and no later than 2018. It is also necessary to meet site treatment plan milestones under the Federal Facility Compliance Act. The transuranic waste will be disposed at the Waste Isolation Pilot Plant near Carlsbad, NM. Non-transuranic wastes which are not allowed to be disposed at Waste Isolation Pilot Plant (e.g. low-level and mixed wastes) will be disposed in accordance with applicable requirements.

The Advanced Mixed Waste Treatment Project is a privatized, fixed-price contract and will be performed in three phases. Phase I consists of facility permitting, preliminary facility/process design, and establishing the facility safety basis. Phase II consists of final facility/process design, facility construction, and testing. Phase III consists of facility operations, RCRA closure and Decontamination & Decommission. The service shall treat waste to meet RCRA Land Disposal Restrictions. Meeting this requirement will also fulfill Waste Isolation Pilot Plant Waste Acceptance Criteria and Toxic Substance and Control Act requirements. Transportation support for shipment of the waste from Idaho National Engineering and Environmental Laboratory to Waste Isolation Pilot Plant is required and will be performed under a separate Waste Isolation Pilot Plant-managed contract.

	FY 1998	FY 1999	FY 2000
In accordance with the Idaho Settlement Agreement, facility construction will be complete by December 2002, and operations will commence no later than March 2003. Shipments of waste from the Advanced Mixed Waste Treatment Project are expected to begin in late 2003.			
The FY 1997 appropriation of $70.0 million represented an estimate of the private sector's capital investment based on the December 1994 feasibility study. The $87.3 million appropriation for FY 1999 for this project provided for about 15 percent of the full funding for the physical construction (including major equipment) phase of this project based on the fixed price contract awarded in December 1996. The $110.0 million appropriation for FY 2000 for this project provides for about 19 percent of the full funding for the physical construction (including major equipment) and an aggregate funding level of 47 percent of the full funding for the physical construction. Future budget requests of $302.1 million will be made to cover the remainder of the construction costs. These funds will cover the remote possibility of termination of the contract. They will eventually be used to reimburse capital expenditures after service commences.

	FY 1998	FY 1999	FY 2000
ID-SNF-105 Spent Nuclear Fuel Dry Storage; Idaho Falls, Idaho			
The Spent Nuclear Fuel Dry Storage Project will provide the capabilities to initiate interim dry modular storage of Spent Nuclear Fuel at the Idaho National Engineering and Environmental Laboratory. The fuel currently resides in facilities on the Idaho National Engineering and Environmental Laboratory, at various universities and foreign research reactors. The project involves the procurement of a dry storage facility capable of transferring and cleaning spent fuel rods. The service will be provided through an open fixed-price competition. This project plays a critical role in meeting the Idaho Settlement Agreement commitment of placing all Spent Nuclear Fuel at Idaho National Engineering and Environmental Laboratory into dry storage by December 31, 2023. The Idaho Settlement Agreement stipulates compliance with these milestones to continue shipment and consolidation of reactor fuel at Idaho National Engineering and Environmental Laboratory before final disposition by 2035.

	FY 1998	FY 1999	FY 2000
OR-44901 Environmental Management/Waste Management Disposal; Oak Ridge, Tennessee			
The project provides for the purchase of waste disposal services from a private vendor for low-level, hazardous, Toxic Substance and Control Act defined, and mixed wastes generated at Oak Ridge. The contract will pay a fixed unit price for the disposal service. This project is required to support the Oak Ridge Federal Facilities Agreement and the efficient cost effective disposal of site-wide CERCLA wastes. Cleanup, decontamination and decommissioning projects at Oak Ridge are expected to produce significant volumes of contaminated soils and debris in need of permanent disposal. This project provides for creation of an on-site disposal facility with a capacity of up to 0.84 million cubic meters of wastes and the on-site disposal is supported by stakeholders. This project permits the efficient completion of numerous site projects within budget ceilings. Off-site waste shipments would not allow completion of numerous projects within the current budget caps.

	FY 1998	FY 1999	FY 2000
OR-38902 Transuranic Waste Treatment; Oak Ridge, Tennessee			
The project provides for the treatment of transuranic waste located at various areas within the Oak Ridge Reservation by obtaining the services of a private contractor through a competitive procurement for this four phase project. Phase I will be a fixed-price contract for licensing and permitting and will be funded from the base program. Phase II will consist of construction of the treatment system and any pre-testing required by Waste Isolation Pilot Plant, Nevada Test Site, or the regulatory agencies and is funded by the privatization program. Phase III will consist of removal of sludge waste from the tanks and treatment of sludge and solid waste in the licensed/permitted facility and Phase IV will consist of decontamination and decommissioning.

RL-TW06 Tank Waste Remediation System, Phase I; Richland, Washington

As part of the Reinventing Government and Contract Reform Initiatives, DOE evaluated the feasibility of privatizing all or part of the Hanford Tank Waste Remediation System. It was determined that a two Phase approach to Tank Waste Remediation System privatization was desirable, both from an economic standpoint and from the point of view of private vendors.

	FY 1998	FY 1999	FY 2000
The first of the two phases would be a commercial demonstration phase where private vendors would treat sufficient waste to demonstrate to both DOE and to the financial community that they were capable of treating the remainder of the tank waste in a larger, second phase effort. Phase II would complete the treatment of the tank wastes. In September 1996, Tank Waste Remediation System privatization contracts were awarded to teams lead by Lockheed Martin Environmental Services and BNFL, Inc.. These contracts were for Phase 1 of the Tank Waste Remediation System privatization and consisted of Part A and Part B. Part A was a twenty-month period to establish the technical, operational, regulatory, business, and financial elements required by privatization facilities that will provide tank waste treatment services on a fixed-unit-price basis. The two contractors provided required deliverables to the Department after 16 months. As a result of the analyses of these deliverables, the Department determined the Lockheed Martin Environmental Services proposal to be non-viable. On July 21, 1998, the Department delivered the *Report to Congress, Treatment and Immobilization of Hanford Radioactive Tank Waste* providing notification prior to entering into a privatization contract. After the 30-day waiting period the Department negotiated a contract to proceed with BNFL, Inc., into Phase B. However, to better define the project and quantify project risks and to enhance the contractor's ability to obtain financing, it was determined that Phase B would be further divided into Phase B-1, a 24-month design phase, and Phase B-2, the construction and operations phase. A decision point has been established for the Department to determine the viability of proceeding into Phase B-2 before BNFL, Inc. begins construction. In addition, the contract has provided for waste treatment services for both high level and low activity waste. Waste treatment is expected to begin in 2005 or 2006 and continue for about ten years.

[a] $54.0 million was obligated in FY 1996 for Phase I, Part A – within the Defense Environmental Restoration and Waste Management Appropriation.

[b] This amount does not reflect the advance appropriation of $2.492 billion for Fiscal Years 2001 through 2004 for this project.

[c] Reflects appropriation in FY 1997 from Defense Environmental Restoration and Waste Management, Fixed Asset Acquisition/Privatization Account.

[d] Rocky Flats FY 1997 $10.0 million; Oak Ridge FY 1997 $15.0 million and Savannah River FY 1998 $25.0 million.

98-PVT-2, Spent Nuclear Fuel Dry Storage; Idaho Falls, Idaho

Significant Changes

- The Department is presently in the initial stages of the procurement process with the expectation of releasing the Request For Proposal in the near future. The increase in estimated capital cost of the project (from $87.0 million to $120.0 million) is based on information from an independent cost estimate prepared by the Army Corps of Engineers in June 1998.

1. Construction Schedule History

3. Project Description, Justification and Scope

The Spent Nuclear Fuel Dry Storage Project will provide Nuclear Regulatory Commission-licensed interim dry storage of Spent Nuclear Fuel at the Idaho National Engineering and Environmental Laboratory. The fuel currently resides in facilities on the Idaho National Engineering and Environmental Laboratory, at various universities and at foreign research reactors. This project would place approximately 50 cubic meters of Spent Nuclear Fuel into dry interim storage.

This project includes the following services:

- Dry Transfer Capability to allow dry transfer of Spent Nuclear Fuel fuel assemblies from a shipping cask into dry storage canisters.
- Independent Spent Fuel Storage Installation as defined by Nuclear Regulatory Commission regulations

---

[a] Includes current contractor investment plus funds to maintain current project schedules (including allowances for items such as long-lead procurements).

[b] Includes current contractor investment plus funds to maintain current project schedules (including allowances for items such as long-lead procurements).

[c] The Department intends to make an outlay in the amount of about $13.0 million in FY 2000 for design completion and a subsequent payment in FY 2001 for licensing.

[d] This amount reflects current program baseline requirements. The Department will consider these requirements in the formulation of future budget requests.

- Loading of the designated fuels into the Independent Spent Fuel Storage Installation beginning by July 1, 2003, and completing in FY 2007. [a]
- Operation of Dry Transfer Facility and Independent Spent Fuel Storage Installation through 2007.

An October 17, 1995, Federal court-ordered agreement between the State of Idaho, DOE, and the Navy directs that all spent nuclear fuel will be out of wet storage by 2023 and shipped out of the State of Idaho by 2035. The Order additionally mandates an "appropriation request for fiscal year 1998 for DOE to initiate procurement of dry storage at the Idaho National Engineering and Environmental Laboratory." The Order requires initiation of Spent Nuclear Fuel loading into dry storage by July 1, 2003, and that a multi-purpose canister or equivalent (licensed for storage and transportation) dry storage system must be provided.

The feasibility of modifying existing Idaho National Engineering and Environmental Laboratory facilities to provide these functions was evaluated. It was determined that new facilities would be needed to meet programmatic requirements. Reasons behind this determination include:

- The cost of modifying existing Idaho National Engineering and Environmental Laboratory facilities, including life-cycle costs, is not significantly lower than the cost of new facilities.
- A technical scope that includes modification of existing Idaho National Engineering and Environmental Laboratory facilities is not considered suitable for a privatization contract.
- The cost of attempting to obtain Nuclear Regulatory Commission license for existing Idaho National Engineering and Environmental Laboratory facilities, as well as the associated technical issues of licensing DOE-regulated facilities, would be cost and schedule prohibitive.
- The dry transfer and interim storage facilities may be needed to transfer the other DOE-owned Spent Nuclear Fuel to dry storage. The total life span of these facilities is estimated to be 35 to 40 years. Project scope is limited to those fuels specified in the Request for Proposal.

The project would be constructed at the Idaho Nuclear Technology and Engineering Center, formerly known as the Idaho Chemical Processing Plant.

The Spent Nuclear Fuel will be received in a wide variety of shipping casks from off-site and on-site shipments. The successful contractor will handle selected fuel types that, based on currently available fuel condition data (records verification only), are believed to be undamaged and have intact cladding. However, these selected fuels may require special handling and treatment to meet Nuclear Regulatory Commission requirements for placement in an Independent Spent Fuel Storage Installation.

Waste generated by fuel transfer should be minimized, but waste stream disposal shall be the responsibility of the successful bidder. The fuel will not be disposed of in Idaho and fuel disposal is not within the scope of this contract. The Request for Proposal mandates the use of the preliminary design specifications for standardized Spent Nuclear Fuel canisters.

---

[a] The October 17, 1995 Consent Order does not drive the end date for this particular project The project completion date may be subject to change with negotiation of amortization schedules with the private sector.

The funding request for Privatization allows DOE to award the contract for storage services. The funds also cover design and licensing, construction costs of the dry transfer facility, procurement of the storage canisters, and the dry storage system units. Completion of the firm fixed lump sum price design and licensing deliverable (which includes acceptance of the license application(s) by the Nuclear Regulatory Commission and issuance of the license) will result in two payments to the contractor using privatization funds. A payment is planned to be made after design completion (FY 2000) and subsequent submittal and acceptance of the license application by the Nuclear Regulatory Commission (FY 2001). A second payment will be made after the Nuclear Regulatory Commission issues the license. The firm fixed price cost to construct the facilities will be amortized over a portion of fuel processed and paid out as fixed unit prices. Also, if it would become necessary, these funds will also cover termination of the contract for the convenience of the Government.

The increase in estimated capital cost of the project (from $87 million to $120 million) is based on information from an independent cost estimate prepared by the Army Corps of Engineers in June 1998. The project schedule has also been revised to be consistent with the 1995 Consent Order with the State of Idaho. This independent cost estimate represents the best estimate of projected cost at the present time because the Department has not yet received bids from the vendors. The construction data sheet will be revised when the Department awards a contract after providing the appropriate report to Congress. The Department expects to issue the final Request for Proposal in the 2nd quarter, FY1999.

In addition to the privatization request, a total of $24.9 million will be provided from the Defense Environmental Restoration and Waste Management Appropriation to make payments to the vendor for dry transfer and interim storage operations from 2003 through 2007. The other costs ($18.5 million) include support activities required by the Management and Operations contractor to develop the initial procurement specifications and deliver spent nuclear fuel to the successful vendor in the outyears.

4. Details of Cost Estimate [a]

(Dollars in Thousands)

	Current Estimate	Previous Estimate
Total, Engineering design inspection and administration of construction costs	15,000	7,000
Total, Construction Costs	92,000	75,000
Total, Project management and indirect costs	13,000	5,000
Total, line item costs	120,000	87,000

[a] The estimate details are unavailable as they may unnecessarily influence the procurement process; bids are expected in FY 1999.

5. Method of Performance

The dry transfer capability and Independent Spent Fuel Storage Installation would be licensed by the Nuclear Regulatory Commission. The design life for the Independent Spent Fuel Storage Installation is 40 years and the design life for the dry storage canisters is a minimum of 40 years. Nuclear Regulatory Commission licensing of the Independent Spent Fuel Storage Installation would be for a 20 year period with a possible extension for another 20 years. The financing, design, permitting, construction, and operation are the responsibility of the contractor. The cost estimate is based on the assumption that the 10 CFR 72.30.c (1) financial assurance requirement for Decontamination and Decomissioning can be satisfied through a commitment from DOE and not prepayment by the private contractor. After completion of dry transfer of the selected fuel types to the Independent Spent Fuel Storage Installation, the Department will have the right to exercise an option to transfer and store additional fuel. The first phase of the project will be paid on a fixed-price, lump-sum basis upon completion of specified deliverables. Cost of construction and start-up will be amortized over the first portion of fuel processed. The contractor will be paid when spent fuel assemblies are placed in dry storage based on fixed unit prices determined at the time of contract award.

The schedule calls for using a streamlined procurement in which the Request for Proposal will be issued during the second quarter of FY99 and the contract awarded within six months.

6. Schedule of Project Funding

98-PVT-5, Environmental Management/Waste Management Disposal; Oak Ridge, Tennessee

Significant Changes

- The initial estimate to support the FY 1998 Total Estimated Cost was developed July 1997 in support of the Remedial Investigation/Feasibility Study document completed for this project in February of 1998. The evaluation of alternatives and supporting cost estimate data for development of the Remedial Investigation/Feasibility Study was being conducted under the Comprehensive Environmental Response, Compensation, and Liability Act process. The FY 1998 reported Total Estimated Cost was based on this preliminary estimate. In March of 1998, the new Oak Ridge Management and Integration contractor initiated rebaselining of the cleanup program in Oak Ridge, including this project. A detailed review of the assumptions, construction method of accomplishment and other related data contained in the Remedial Investigation/Feasibility Study cost estimate resulted in the reduced Total Estimated Cost as indicated below. Further, the more detailed assessment of required out year activities resulted in the increase of the Total Project Cost as indicated below.
- In December 1998, three vendors provided preliminary designs and economic analyses. Following the issuance of the Record of Decision and submittal of the Privatization Project report to Congress in September 1999, a second contract will be awarded to complete the design, construction, and operations of the facility. The Request for Proposals for this procurement will be issued by March 1999.

3. Project Description, Justification and Scope

The envisioned Environmental Management/Waste Management Disposal Facility consists of a disposal cell with ancillary facilities to support initial operations and an area for the potential development for future treatment, storage, and disposal facilities. The disposal cell will have an initial capacity of 305,840 cubic meters (400,000 cubic yards), will be above-grade, and will be a Resource Conservation and Recovery Act compliant earthen structure. The cell will also have expansion capacity to accommodate up to 0.84 million cubic meters (1.1 million cubic yards). Based on projected waste volumes and cell design assumptions, the disposal cell is estimated to require 60-70 acres, with a total Environmental Management/Waste Management Disposal Facility footprint of 100-120 acres, including initial support facilities and an area reserved for future expansion.

Support facilities required for initial operations include those needed for waste staging, temporary storage, and equipment decontamination. An area reserved for future potential expansion would accommodate future facility needs not fully defined at this time. For example, while waste generators will be responsible for treatment to satisfy Resource Conservation and Recovery Act Land Disposal Regulations and the facility's Waste Acceptance Criteria, treatment facilities may be located at the Environmental Management/Waste Management Disposal Facility in the future to enhance overall efficiency of operations.

---

[a] For multi-year funded projects, appropriation is needed a year ahead of contract commitments to preclude Anti-Deficiencies. However, appropriation in excess of contract commitments is requested in order to provide confidence to potential contractors during procurement activities of the support the Department has for this project.

[b] Includes current contractor investment plus funds to maintain current project schedules (including allowances for items such as long-lead procurements).

The Department of Energy expects the Environmental Management/Waste Management Disposal Facility to offer several benefits. On-site disposal capacity will streamline and expedite cleanup activities. Large volumes of waste from the cleanup of Oak Ridge Reservation are expected to make off-site transportation and disposal costs significantly higher than on-site disposal costs. Removal of additional waste sources would reduce the total risk at the Oak Ridge Reservation. Consolidating waste management and disposal activities as opposed to capping multiple, discrete waste units in place with continued maintenance and institutional controls would reduce the future mortgage for the Oak Ridge Reservation.

A total of $58.5 million is required for the purposes of subcontracting initial construction of the Environmental Management/Waste Management Disposal Facility that includes design and construction for a 400,000 cubic yard facility and ancillary support structures. These funds will also cover the remote possibility of termination of the contract. They will eventually be used to reimburse capital expenditures after services commence.

Future budget requirements, extending through 2010, in the amount of $121.3 million will be made within the Defense Environmental Restoration and Waste Management Appropriation, for the purpose of operations, capital facility expansion (including capping/closure of the expanded facility) for the Environmental Management/Waste Management Disposal Facility. The combination of the Privatization funds and the operating funds will be used to make payments to the vendor for the contractually required placing of material in the Environmental Management/Waste Management Disposal Facility. An additional $46.1 million from the Defense Environmental Restoration and Waste Management appropriation will provide for support of the privatization effort by the Management and Integration contractor. The estimates in this request exclude the long term surveillance and maintenance.

4. Details of Cost Estimate [a]

	(Dollars in Thousands) Current Estimate	Previous Estimate
Design Costs (8.0% of Total Estimated Cost)	4,619	5,800

Privatization Interest on Design/Construction (17% of Total Estimated Cost)	10,053	13,200
Total Project Costs	58,500	85,000

5. Method of Performance

DOE has developed a funding approach to construct the Environmental Management/Waste Management Disposal Facility without impacting the remediation it is intended to support. DOE is pursuing privatization of the facility by purchasing disposal services from a private sector vendor. Several alternatives have been evaluated for disposal of wastes generated by remediation activities at the Oak Ridge Reservation. One alternative considered in the Feasibility Study is the construction and operation of the Environmental Management Waste Management Disposal Facility on the Oak Ridge Reservation. If on-site disposal is the selected alternative in the Record of Decision, DOE will develop the performance specifications and will commit to obtaining the necessary permits. In December 1998, three vendors provided preliminary designs and economic analyses. Following issuance of the Record of Decision and submittal of the Privatization Project report to Congress in September 1999, a second contract award will be made to complete the design, construction, and operations of the facility. The Request for Proposals for this procurement will be issued by March 1999. Capital cost for the facility is recouped through the operator's unit cost disposal fee negotiated in the second contract. The performance specification will minimize design, construction, and operational uncertainties and avoid unnecessary constraints. This will result in less risk to the vendor, which should be reflected in a lower unit costs.

[a] The annual escalation rates assumed for FY 1998 through FY 2002 are 2.5%,2.8%, 3.0%,3.1%, 3.3%, 3.4%, and 3.4% respectively.

Total related annual funding	NA	NA

97-PVT-1, Tank Waste Remediation System Privatization Phase 1; Hanford, Washington

Significant Changes

- In Fiscal Year 1998, the Department completed analysis of deliverables from Lockheed Martin Environmental Services and BNFL, Inc. under Part A of the privatization contract. The Lockheed Martin Environmental Services proposal was determined to be non-viable. In August 1998, the Department negotiated a contract to proceed with BNFL, Inc., into Phase B. However, to better define the project and quantify project risks and to enhance the contractor's ability to obtain financing, it was determined that Part B would be further divided into Part B-1, a 24-month design phase, and Part B-2, the construction and operations phase. In addition, the contract has provided for waste treatment services for both high level waste and low activity waste in a full scale production facility. Under this new two phase approach, waste treatment is now expected to begin in FY 2005 or FY 2006 and continue for about 10 years. This reflects a change from the original plan, which was to have contractors who successfully completed Part A proceed to Part B. Under Part B, the contractors would provide low-activity waste and optional high level waste treatment plants, and immobilize wastes as a demonstration phase expected to begin in FY 2002, with full scale production occurring under Phase II.
- In order to more effectively manage the Tank Waste Remediation System and in response to Section 3139 of the *Strom Thurmond National Defense Authorization Act for Fiscal Year 1999*, the Secretary of Energy also established the Office of River Protection at the Hanford, Washington, site. The Manager of this Office will be a high level Departmental management official responsible for managing all aspects of Tank Waste Remediation System including the privatized contract for treatment and immobilization of tank waste and the non-privatized operations, maintenance, engineering and construction activities in the tank farms.

3. Project Description, Justification and Scope

Radioactive waste has been stored in large underground storage tanks at the Hanford Site since 1944. Approximately 54 millions gallons of waste containing approximately 240,000 metric tons of processed chemicals and 250 mega-curies of radionuclides are currently being stored in 177 tanks. These caustic wastes are in the form of liquids, slurries, saltcakes, and sludge. In 1992, the Tank Waste Remediation System Program was established to manage, retrieve, treat, immobilize, and dispose of these wastes in a safe, environmentally sound, and cost-effective manner. The integrated Tank Waste Remediation System program was designed to include efforts to resolve a number of safety concerns and technical issues and to address past leakage from some of the underground storage tanks which have contaminated the vadose zone and, recent reports indicate, could have contributed to contamination of the ground water. Storage in the current tanks is very costly; and, as the tanks age, potential for radioactive and chemical release increases, although short-term risks are low. The Tank Waste Remediation System program will substantially decrease

[a] For multi-year funded projects, appropriation is needed a year ahead of contract commitments to preclude Anti-Deficiencies. M&I support costs to deliver Phase I minimum order quantity of 6% to 13% of tank wastes is $2.0 billion.

[b] Includes current contractor investment plus funds to maintain current project schedules (includes allowances for items such as long-lead procurements).

[c] Reflects latest known outlay projection and may be different from the outlays used in developing the FY 1999 Congressional Budget.

[d] Office of Environmental Management Base Program appropriation of $54.0 million was obligated in FY 1995 and FY 1996 for Phase 1, Part A. These funds are part of "Other Project Costs", and are reflected in Section 6 of this data sheet.

the long-term costs and provide long-term protection of public health and safety and the environment by removing the wastes from the tanks and providing a waste form suitable for long term disposal.

The Tank Waste Remediation System pathway for cleanup is formally documented in the Hanford Federal Facility Agreement and Consent Order, commonly known as the Tri-Party Agreement. Under the Tri-Party Agreement, DOE, the U.S. Environmental Protection Agency, and the Washington State Department of Ecology have agreed to a 30-year timetable for cleanup of the Hanford Site. Key dates related to the privatization found in the Tri-Party Agreement are start construction of High Level Waste pretreatment facility by June 2001 (Tri-Party Agreement M-50-04-T01), start hot operations Phase 1 Pretreatment and Immobilization Facilities by December 2002 (Tri-Party Agreement M-60-12), and completion of Pretreatment and Immobilization of all Hanford low activity waste by December 2024 (Tri-Party Agreement M-0-00). Changes to these dates will be negotiated with the parties to the Tri-Party Agreement to be consistent with the Part B contract schedule.

The Hanford Site processed more than 100,000 metric tons (110,000 tons) of uranium and generated several hundred thousand metric tons of wastes. The wastes include: high-level wastes (i.e., cesium-137 and strontium-90), low-level wastes, and hazardous wastes, which may exhibit dangerous characteristics of ignitability, corrosivity, reactivity, and toxicity. All of the waste is stored at Hanford and is being addressed in the Tank Waste Remediation System Program.

As part of the Reinventing Government and Contract Reform Initiatives, DOE evaluated the feasibility of privatizing all or part of the Hanford Tank Waste Remediation System. It was determined that a two-phase approach to Tank Waste Remediation System privatization is desirable, both from an economic standpoint and from the point of view of private vendors. The Tank Waste Remediation System project is now managed by the Manager, Office of River Protection.

Phase I will be an effort whose objectives are to: demonstrate the technical and business viability of using privatized facilities to treat Hanford tank waste; define and maintain required levels of nuclear, radiological, and occupational safety; maintain environmental protection and compliance; and substantially reduce life-cycle costs and time required to treat Hanford tank waste. Phase I consists of two parts. Part A was a 22-month period to establish the technical, operational, regulatory, business, and financial elements required by privatized facilities that will provide tank waste treatment services on a fixed-unit-price basis. BNFL, Inc. successfully completed all Phase 1, Part A technical requirements and was awarded a contract to complete Phase I, Part B in August 1998.

BNFL, Inc., has been authorized to proceed with Phase 1, Part B, which will be a period of 19 years during which that vendor will finance, design, construct, operate, and deactivate the waste-treatment facility. Part B will result in treatment of approximately 6 to 13 percent of the 54 million gallons of high-level tank waste in Hanford's storage tanks. Phase 1, Part B will have two segments, B-1 and B-2. During B-1, BNFL Inc., will design the facility, further develop regulatory requirements, and establish financing and fixed unit prices for treatment and immobilization of the high-level wastes. At the end of Part B-1, DOE will decide whether to proceed with Part B-2. During Part B-2, DOE will pay fixed unit prices for completion and acceptance of waste-treatment services according to contract specifications.

The contract with BNFL, Inc., requires BNFL, Inc., to perform value engineering studies to identify potential technologies, process flows, productivity improvements, etc., to improve cost and schedule performance.

The Department also continues its efforts to find innovative ways to drive down cost of financing and reduce risks by identifying alternative technologies.

During Phase II, after completion of Phase I, DOE plans to complete processing the remaining tank waste through a second competitive procurement. The Phase II plan will be based on information and experience gained from Phase I.

In Phase I, wastes will be retrieved from the tanks and separated into low-activity and high level waste. These wastes will be immobilized for storage and disposal according to specifications which meet all Federal and State regulations. DOE will retain oversight responsibility for radiological and nuclear safety and for certain aspects of environmental compliance. The regulatory approach will be to use, when possible, established and functioning external regulatory authorities.

BNFL, Inc., will be responsible for protection of human health and the environment from radioactive materials, hazardous materials, contamination from dangerous wastes, and non-radiological worker safety and health from conventional hazards.

The *Report to Congress - Treatment and Immobilization of Hanford Radioactive Tank Waste*, dated July 1998, provided the decision process used by the Department in proceeding into Part B-1 with BNFL, Inc.. Additional detail was also provided on the business, financial, regulatory, technical, and management aspects of the BNFL, Inc. contract.

The cost of Tank Waste Remediation System Privatization has increased over the costs presented in the FY 1999 Congressional Budget as a result of the Department proceeding with a facility capable of operating for 30 years. By proceeding with the BNFL, Inc., concept the Department has a greater range of technical and operational options than originally envisioned in the FY 1999 Congressional Budget. These options provide the ability to lower the total life cycle costs of treating the Hanford Tank Waste.

Prior year appropriations of $385.0 million and the FY 2000 appropriation of $106.0 million will be used to authorize BNFL, Inc., to proceed with Part B of the contract for waste treatment. It is anticipated that there will be two primary work scopes accomplished in FY 2000 by the Tank Waste Remediation System privatization contractor: (1) the completion of detailed approximately 30 percent design and (2) the ordering of long-lead time material.

BNFL, Inc., will be required to reach financial closure (obtaining private sector financing for the construction of their facility) prior to the start of construction. In order to obtain financing BNFL, Inc., will have to complete approximately 30 percent design work. Detail design work involves the development of all structural detail drawings, mechanical systems design and detail drawings, electrical design and detail drawings, and all radiological, nuclear and process safety analyses required to support the design work.

During the development of the detail drawings, BNFL, Inc., will start to order the long-lead time materials required to support the construction of the facility, typically those items that require several years to obtain once the order is submitted. Structural long-lead time material would include any special structural members (unusual forms or sizes). Mechanical long-lead time materials include the cesium ion exchangers, Hastalloy tanks, Hastalloy piping, Hastalloy fittings, the low activity waste and high level waste melters, and their respective control systems. Special distributive control systems will be ordered downstream to

be completed prior to installation. The Department has a decision point for proceeding with BNFL, Inc. from Phase B-1 to Phase B-2 establishing a notice to proceed to construction in August 2000.

The appropriations will also cover the remote possibility of termination of the contract. The funds will eventually be used to reimburse capital expenditures after waste treatment services begin.

Fiscal Year 1996 funding of $54.0 million from within the Defense Environmental Restoration and Waste Management Appropriation, Waste Management Program, was used to award Phase 1, Part A of the contract, and was costed in FY 1998.

Outlays from the Defense Environmental Restoration and Waste Management Appropriation may be costed in FY 2000 and FY 2001 to maintain BNFL in a position to proceed into Part B-2 in the event that negotiations between the Department and BNFL; the Department's decision making and the Congressional review do not occur within the 24 month time frame for Part B-1.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Facility Construction	5,251,881	1,651,000
Facility Operations	1,724,047	1,438,318
Deactivation	214,119	172,366
Financing	2,528,848	439,000
Taxes	1,130,215	680,000
Fee/Profit	1,638,890	763,316
TOTAL	12,488,000	5,144,000

5. Method of Performance

In September 1996, DOE awarded contracts to two teams led by the BNFL, Inc., and Lockheed Martin Advanced Environmental Services. The contracts were for the Phase 1, Part A of this project. The contractors were requested to demonstrate the technical and business viability of using privatized facilities to treat and immobilize Hanford tank wastes; define and maintain required levels of nuclear, radiological and occupational safety; maintain environmental protection and compliance; and reduce life-cycle costs and remediation time. Based on their technical submittals, the Department selected BNFL to proceed with Phase I, Part B. In Part B, BNFL will finance, design, construct, operate, and deactivate their own facilities. Site infrastructure support to include Tank Retrieval systems, roads, utilities, etc. will be provided by the government utilizing the existing Management and Integration contractor. Phase I is expected to last 19 years and process approximately 6 percent to 13 percent of the tank waste volume.

BNFL, Inc., must finance the project, design the equipment and facility, apply for and receive required permits and licenses, construct the facility and bring it on-line, operate the facility to treat waste, and deactivate the facility. The contractor can recover the resources it has invested only through the delivery of acceptable services paid for by DOE on a fixed-unit-price basis. The underlying intent is to transfer the

primary share of the financial, performance, and operational responsibility for the treatment effort from the Government to the contractor.

6. Schedule of Project Funding and Other Related Funding Requirements

(Dollars in Thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project Cost						
Facility Cost						
Payments to Vendors	0	0	0	50,000	5,416,000	5,466,000
Other Project Cost						
Facility Operations – payments to contractor		54,000 [a]	0	0	5,016,000	5,070,000
Facility Support – M&O support/Other [b]	0	101,000	112,000	133,000	1,597,000	1,952,000
Total, Other Project Cost	0	155,000	112,000	133,000	6,613,000	7,022,000
Total Project Cost	0	155,000	112,000	183,000	12,029,000	12,488,000

7. Related Annual Funding Requirements

(FY 2000 dollars in thousands)

	Current Estimate	Previous Estimate
Given the nature of the privatization contract, these operating costs are shown as part of the Total Project Cost.		
Total related annual funding	NA	NA

[a] Represents payment to competing vendors for demonstration under Phase 1 which was funded from the EM base operating program.

[b] Facility infrastructure support (e.g. utilities, fire protection, etc.) are budgeted in the Defense Environmental Restoration and Waste Management, Post 2006 Completion Appropriation for the Richland Operations Office.

97-PVT-2, Advanced Mixed Waste Treatment Project, Idaho Falls, Idaho

Significant Changes

- Total Project Cost has been revised from $1,078.9 million to $1,115.4 million. The increase is due to a change in the production schedule from the initial forecast. An increase of $7.8 million to life cycle cost results from escalated unit prices being applied to larger production quantities in later periods than were originally planned.

  The second factor is a change in the escalation rates from the OMB required rates used in the initial estimates to the economic index based escalation negotiated in the Advanced Mixed Waste Treatment Project contract. This change resulted in increased estimated life cycle costs of $28.7 million.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete		
FY 1998 Budget Request (*A-E and technical design only*) ...	n/a	n/a	4Q 1999	1Q 2003	569,400 [a]	1,173,000 [b]
FY 1999 Budget Request (*Preliminary Estimate*)	n/a	n/a	4Q 1999	1Q 2003	569,400	1,078,900
FY 2000 Budget Request (*Current Estimate*)	n/a	n/a	4Q 1999	1Q 2003	569,400	1,115,400

[a] These estimates are based on a negotiated firm fixed price contract with a commercial firm. The contract includes a provision for price redetermination and economic price adjustment on the operating portion of the contract (Phase III). However, the capital portion of this contract is not subject to either price redetermination or economic price adjustment and is fixed.

[b] The Total Project Cost as defined here is the combined value DOE believes will be necessary to pay for the products or services contractually agreed upon plus other support costs. It includes Budget Authority requests for Privatization of $569.4 million; EM Base Program requests for direct payments to the vendor for Licensing and Permitting of $16.3 million, Facility Operations of $434.8 million, and D&D of $22.7 million. It also includes $67.4 million of M&O support and $4.8 million of other project office costs (e.g. NEPA).

2. Financial Schedule

2006	0	0	159,400
Outyears	0	0	125,600

3. Project Description, Justification and Scope

This project has been in development at the Idaho National Engineering and Environmental Laboratory since 1993. A contract was awarded to British Nuclear Fuels Limited, Inc., on December 20, 1996, for the retrieval, sorting, characterization, storage, pre-treatment, treatment, certification, and loading for transportation of 65,000 cubic meters of alpha and transuranic mixed waste located in retrievable storage at the Idaho National Engineering and Environmental Laboratory Radioactive Waste Management Complex. The contract has an option for treatment of up to 120,000 cubic meters of additional Idaho National Engineering and Environmental Laboratory and DOE mixed wastes. The project scope is to treat Idaho National Engineering and Environmental Laboratory alpha and Transuranic mixed waste, as well as other DOE mixed waste in the complex, through a private sector treatment facility located on the Radioactive Waste Management Complex at Idaho National Engineering and Environmental Laboratory.

---

[a] This cost profile represents the annual liability increase to the government for this project based on work performed by the contractor. The liability is liquidated as waste is treated (see costs above). The cost profile has been changed to reflect BNFL's latest production schedule.

[b] The amounts shown for FY 2001 through FY 2004 reflect current program baseline requirements. The Department will consider these requirements in the formulation of future budget requests.

2. Financial Schedule

(dollars in thousands)

3. Project Description, Justification and Scope

This project has been in development at the Idaho National Engineering and Environmental Laboratory since 1993. A contract was awarded to British Nuclear Fuels Limited, Inc., on December 20, 1996, for the retrieval, sorting, characterization, storage, pre-treatment, treatment, certification, and loading for transportation of 65,000 cubic meters of alpha and transuranic mixed waste located in retrievable storage at the Idaho National Engineering and Environmental Laboratory Radioactive Waste Management Complex. The contract has an option for treatment of up to 120,000 cubic meters of additional Idaho National Engineering and Environmental Laboratory and DOE mixed wastes. The project scope is to treat Idaho National Engineering and Environmental Laboratory alpha and Transuranic mixed waste, as well as other DOE mixed waste in the complex, through a private sector treatment facility located on the Radioactive Waste Management Complex at Idaho National Engineering and Environmental Laboratory.

---

[a] This cost profile represents the annual liability increase to the government for this project based on work performed by the contractor. The liability is liquidated as waste is treated (see costs above). The cost profile has been changed to reflect BNFL's latest production schedule.

[b] The amounts shown for FY 2001 through FY 2004 reflect current program baseline requirements. The Department will consider these requirements in the formulation of future budget requests.

The primary wastes to be treated are DOE laboratory and process wastes from Rocky Flats and various DOE facilities. These wastes are currently stored in drums, boxes, and bins at the Idaho National Engineering and Environmental Laboratory Transuranic Storage Area of Radioactive Waste Management Complex. Wastes consist of a heterogeneous mixture of solid materials including paper, cloth, plastic, rubber, glass, graphite, bricks, concrete, metals, nitrate salts, process sludges, miscellaneous components and some absorbed liquids. Ninety-five percent of the waste is believed to contain both RCRA hazardous waste constituents and radioactivity. Some wastes also contain Toxic Substances and Control Act regulated materials such as polychlorinated biphenyls. No more than 4,100 kilograms (kg) of elemental mercury, and approximately 2.1 million kg of lead is expected in the 65,000 cubic meters. The transuranic waste will be disposed of at the Waste Isolation Pilot Plant near Carlsbad, NM. Non-transuranic wastes which are not allowed to be disposed of at Waste Isolation Pilot Plant (e.g. low-level and mixed low-level wastes) will be disposed of in accordance with applicable waste disposal requirements.

This project is necessary to process alpha contaminated and transuranic mixed waste to produce a disposal ready waste that meets all current requirements for storage, transportation and disposal, including the Waste Isolation Pilot Plant Waste Acceptance Criteria and RCRA Land Disposal Restrictions. The treatment process will size and/or re-package waste into standardized containers; destroy Polychlorinated biphenyls, eliminate excess liquids and corrosive characteristics; minimize volatile organic compounds and hydrogen gas generation; and reduce hydrogen layers to increase the wattage (radioactive components) allowed per container.

This project is necessary to meet the requirement in the October 1995 Idaho Settlement Agreement to ship all Transuranic waste out of Idaho by 2015 (target) and no later than 2018. It is also necessary to meet site treatment plan milestones under the Federal Facility Compliance Act. In accordance with the agreement, facility construction will be completed by December 31, 2002, and operations will commence no later than March 31, 2003. Shipments of waste from the Advanced Mixed Waste Treatment Project are expected to begin in late 2003. The State of Idaho will provide RCRA and Clean Air oversight. The EPA Region 10 will provide oversight of the Toxic Substances and Control Act permit.

The FY 1997 appropriation of $70.0 million represented an estimate of the private sector's capital investment based on the December 1994 Feasibility Study. The budget for FY 1999 of $87.3 million and the Budget Request for FY 2000 of $110.0 million for this project provides funding for the initiation of physical construction (including advance procurement of major equipment) phase of this project. These funds will also cover the remote possibility of termination of the contract. They will eventually be used to reimburse capital expenditures after services commence.

Future budget requests will be made within the Defense Environmental Restoration and Waste Management Appropriation for the purpose of making payments to the vendor - $434.8 million for operations and $22.7 million D&D. An additional $65.4 million from the appropriation will be requested to provide M&O support for the privatization effort and $1.2 million for other project office costs..

4. Details of Cost Estimate

Total Capital cost is estimated to be $569.4 million based on the fixed-price contract awarded in December 1996.

5. Method of Performance

The Advanced Mixed Waste Treatment Project is a privatized, fixed-price contract and will be performed in three phases. Phase I consists of facility permitting, preliminary facility/process design, and establishing the facility safety basis; Phase II consists of final facility/process design, facility construction and testing; Phase III consists of facility operations, RCRA Closure & Decontamination & Decommission. The services shall treat waste to meet RCRA Land Disposal Restrictions. Meeting this requirement will also fulfill Waste Isolation Pilot Plant Waste Acceptance Criteria, and Toxic Substances and Control Act requirements. Transportation support for shipment of the wastes from Idaho National Engineering and Environmental Laboratory to Waste Isolation Pilot Plant is required and will be performed under a separate Waste Isolation Pilot Plant managed contract.

6. Schedule of Project Funding

(Dollars in Thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	Outyears	Total
Project Cost						
Facility Cost						
Payments to Vendors . .	0	0	0	0	569,400	569,400
Other Project Cost						
Facility Operations – payments to vendors [a]	1,300	6,800	8,200	0	457,500	473,800
Facility Support – M&O support/Other [b]	1,900	1,500	1,000	1,200	66,600	72,200
Total, Other Project Cost . .	3,200	8,300	9,200	1,200	524,100	546,000
Total Project Cost	3,200	8,300	9,200	1,200	1,093,500	1,115,400

[a] Of the total, $16.3 million will be paid for preliminary facility and process design activities, licensing and permitting (Phase 1 costs) funded from EM base operating program. Outyear payment to vendors include $434.8 million for facility operations and $227.7 million for D&D.

[b] Facility infrastructure support (e.g. utilities, fire protection, etc.).

7. Related Annual Funding Requirements

(FY 2000 dollars in thousands)

Given the nature of the privatization contract these operating costs are shown as part of the Total Project Cost.		
Total related annual funding	N/A	N/A

97-PVT-3, Transuranic Waste Treatment; Oak Ridge, Tennessee

Significant Changes

- A contract for the treatment of transuranic waste was awarded to Foster Wheeler Environmental Corporation in August 1998 through a competitive procurement. This contract was awarded for an amount significantly less than the original Management and Operating Contractor estimate which was the basis of the FY 1999 Budget Request.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)

Outyears [e]	0	0	0

3. Project Description, Justification and Scope

The Department of Energy will transfer remote handled transuranic sludge from 13 different tanks at the Oak Ridge National Laboratory into eight storage tanks which contain the majority of the waste sludge and are located in the Melton Valley area. In addition to sludge, the transuranic project includes approximately 550 cubic meters of remote-handled solids and approximately 1,000 cubic meters of contact handled solids. Foster Wheeler has been contracted with to remove the sludge from the tanks and treat the sludge, solids and supernate in an on-site facility to meet disposal requirements, thereby satisfying the State of Tennessee Commissioner's Order requirements. All transuranic solids would be delivered to the private vendor for treatment, followed by disposal at Waste Isolation Pilot Plant.

The Department has approximately 900 cubic meters of remote handled transuranic sludge and approximately 1,600 cubic meters of alpha low-level supernate stored in various tanks at the Oak Ridge National Laboratory. Three different treatment options have been analyzed, which include procurement

---

[a] For multi-year funded projects, appropriation is needed a year ahead of contract commitments to preclude anti-deficiencies.

[b] Includes current contractor investment plus funds to maintain current project schedules (including allowances for items such as long-lead procurements).

[c] Design is funded with Defense operating funds. Payments to vendor for design and permitting were funded under the Defense Environmental Restoration and Waste Management appropriation.

[d] Reflects appropriation in FY 1997 from Defense Environmental Restoration and Waste Management Appropriation, Fixed Asset Acquisition Account.

[e] Project will require decontamination and decommissioning between 2006 and 2009 which will be funded from the Defense Environmental Restoration and Waste Management Appropriation.

of waste treatment service in a privately owned facility on leased land, a new Waste Handling and Packaging Plant for treatment services by the existing Management and Operating contractor, and conversion of an existing Oak Ridge National Laboratory Hot-cell facility for treatment by the existing Management and Operating contractor. The privatization option was chosen to reduce cost and improve schedule. Obtaining a privatization contract through competitive procurement is expected to lead to cost savings/avoidance of $400.0 million (58 percent) compared to the cost estimate for the traditional Management and Operating contract approach. Additionally, the private sector schedule is expected to save five years over the Management and Operating based estimate.

Originally, the treatment of the Transuranic sludges and Transuranic solids were submitted as separate projects (in FY 1997 and FY 1998 respectively). Greater cost efficiencies were obtained by combining these two projects into a single procurement.

A four phase contract for the treatment of the waste, through a competitive procurement, was awarded to Foster Wheeler Environmental Corporation in August 1998. Phase I will be a fixed-price procurement for the permitting and licensing of the treatment facility. The Department will isolate and fence the Melton Valley Storage Tank area and roadway access from state highway 95 and lease this area to the contractor. During Phase I, the contractor will perform all design and engineering needed to obtain applicable permits and licenses for their treatment process. Phase I will be fully funded by the contractor. The contractor will be reimbursed by DOE after satisfactorily completing Phase I scope of work. The Phase I costs for licensing and permitting will be funded from the EM base operating program. Upon completion of Phase I and National Environmental Policy Act (NEPA) anaylsis, Phase II will proceed with construction of the treatment system and any pre-testing required by the disposal facilities or the regulatory agencies. Phase II will be fully funded by the contractor. Phase III will be performed on a fixed unit price basis and will consist of removal of the waste sludge from the tanks and treatment of sludge and solid waste in the licensed/permitted facility. The contractor will recover their Phase II costs during Phase III treatment. Phase IV will consist of decontamination and decommissioning. A portion of the contractor's payment will be retained by DOE during the Phase III, to be paid when Decontamination & Decommissioning is complete.

The DOE will provide area fencing, roadway upgrades and NEPA documentation. Contract was awarded in August 1998 with licensing and permitting completion by FY 2001. Construction is scheduled for completion and treatment will begin in 2003. Project close out is scheduled for FY 2007 with Decontamination & Decommissioning completed in FY 2009.

It is anticipated that the contractor will obtain permits from the Environmental Protection Agency and Tennessee Department of Environment and Conservation. The project must be completed and executed under the Tennessee Department of Environment and Conservation Commissioner's Order.

The FY 1997 funding level of $65.0 million was sufficient for the purpose of initial obligations for the contract to the vendor. The additional amount of $12.0 million, is required for the purpose of completing the full obligation on the contract. These funds will also cover the remote possibility of termination of the contract. They will eventually be used to reimburse capital expenditures after services commence.

Future budget requests for $116.6 million will be made within the Defense Environmental Restoration and Waste Management Appropriation, for the purpose of making payments to the vendor for the contractually required service or product. This estimate reflects a change from that cited in the FY 1999

Congressional Request due to combining the project workscope originally proposed in FY 1998 with the privatization project appropriated in FY 1997 under the Fixed Assets Acquisition Account resulting in a cost savings. An additional $18.0 million from the Defense Environmental Restoration and Waste Management appropriation will provide for support of the privatization effort.

4. Details of Cost Estimate

(Dollars in Thousands)

	Current Estimate	Previous Estimate
The data required for this section equating to the Total Estimated Cost is not available at this time. The Request For Proposal for this project is based on total project requirements rather than just the construction portion. The Department will ensure the information is available in the future.	N/A	N/A

5. Method of Performance

Two draft Invitation for Bids were released for potential contractor review and comment. Applicable comments were incorporated into the final Request for Proposal which was released in June 1997, and awarded in August 1998.

The construction portion of the project will start after all applicable permits and licenses are obtained, but not later than 2.5 years after the start of the contract. The contractor will have up to two years to construct the facility, but shall complete construction no later than December 31, 2002.

The Department will lease the land and Melton Valley storage tanks to the private contractor at the beginning of Phase II. The contractor will recoup the capital cost of the treatment facility as waste is treated and ownership of the facility will revert to the Department of Energy.

The transuranic treatment facility will be considered as temporary. The contractor will dispose of all secondary waste generated during their project and remove all contaminated material that may have spilled during the project. The contractor will return the site to its previous condition.

6. Schedule of Project Funding

Non-Defense Environmental Management

Proposed Appropriation Language

For Department of Energy expenses, including the purchase, construction and acquisition of plant and capital equipment and other expenses necessary for non-defense environmental management activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101 et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition construction or expansion, [$431,200,000] *$330,934,000*, to remain available until expended. *(Energy and Water Development Appropriations Act, 1999.)*

Explanation of Change

None

Non-Defense Environmental Management

Program Mission

The Environmental Management (EM) program is responsible for managing and addressing the environmental legacy resulting from the production of nuclear weapons and nuclear energy research. The nuclear energy research and development efforts of the Department of Energy and its predecessors generated waste, pollution, and contamination which pose unique problems, including unprecedented volumes of contaminated soil and water, radiological hazards from special nuclear material, and a vast number of contaminated structures. Much of this infrastructure, waste, and contamination still exists and is largely maintained, decommissioned; managed, and remediated by the EM program, which is sometimes referred to as the "cleanup program." EM's responsibilities include facilities and areas at 113 geographic sites (excluding the 21 sites in the Formerly Utilized Sites Remedial Action Project transferred to the U.S. Army Corps of Engineers). These sites are located in 30 states and one territory and occupy an area equal to that of Rhode Island and Delaware combined -- or about 2 million acres.

The FY 2000 request for the Non-Defense Environmental Management appropriation is $330,934,000, a decrease of about $100 million from the FY 1999 appropriation. EM manages and cleans up sites used for civilian, energy research, and non-defense related programs under this appropriation Pursuant to the FY 1998 House Energy and Water Development Report (House Report 105-190), no technical assistance contracts, nor support service contracts are funded in the Non-Defense Environmental Management appropriation.

Program Goal

The EM program has established a goal of cleaning up as many of its contaminated sites as possible by 2006 in a safe and cost-effective manner. By working towards this goal, EM can reduce the hazards presently facing its workforce and the public, and reduce the financial burden on the taxpayer. The FY 2000 budget request continues to reflect the program's emphasis on site closure and project completion--in other words, finishing our work as quickly as possible.

Program Objectives

- Continue to address the most serious environmental risks across the DOE complex and ensure that facilities and activities pose no undue risks to the public and worker safety and health.
- Continue to be substantially in compliance with applicable environmental and other requirements and meet compliance milestones.
- Continue surveillance and maintenance of facilities.

Performance Measures

EM has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected for the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts. These performance measures can be found in the site details that follow.

Significant Accomplishments and Program Shifts

- EM achieved a major milestone in FY 1998 which significantly contributes to the overall EM cleanup mission. In FY 1998, all Uranium Mill Tailings Remedial Action Surface Project remediation activities were completed. This brings to a close one of the Department's longest running and major environmental cleanup programs, which was authorized by Congress in 1978 and cost approximately $1 5 billion, including $100 million provided by the states involved Under the Uranium Mill Tailings Remedial Action Surface Project, the Department completed remedial actions at 22 of the 24 originally designated sites, with two sites being delisted and their responsibility transferred to the state of North Dakota. The Project involved efforts with 11 States, 2 Indian tribes, and 23 communities. Cleanup was performed at over 5,300 vicinity properties located near the 22 designated Uranium Mill Tailings Remedial Action sites, and over 40 million cubic yards of material were remediated and nineteen long-term disposal cells were constructed. At most of these sites, groundwater contamination remains (and is being addressed by the Uranium Mill Tailings Remedial Action Groundwater Project) and the disposal cells must be permanently monitored and maintained. The completion of the Uranium Mill Tailings Remedial Action Surface Project marks a significant milestone in the Department's efforts to remediate the environmental legacy from the production of nuclear weapons. Just as mining and milling of uranium was the first step towards the production of nuclear weapons, the completion of the Uranium Mill Tailings Remedial Action Surface Project represents the first step towards "closing the circle" of the environmental legacy from nuclear weapons production
- The FY 2000 budget request fully reflects the project-oriented structure that EM has developed as a key component of the effort to accelerate cleanup and reduce costs. All EM activities have been organized into projects which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, EM sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow.

Site Closure

Program Mission

The Non-Defense Site Closure account, includes sites where the Environmental Management program plans to complete its mission by the end of FY 2006. This account includes funding for the West Valley Demonstration Project in New York, the Battelle Columbus Laboratory and the Mound Plant in Ohio, projects under the Grand Junction Office in Colorado, Uranium Mill Tailings Remedial Action Surface and Ground Water Projects at various locations, and the Weldon Spring Site in Missouri.

Program Goal

Accelerating cleanup and project completion is a central goal of the Environmental Management program. This goal is part of the strategies identified in the *Accelerating Cleanup: Paths To Closure* document, whereby all Environmental Management sites are working aggressively to reduce outyear costs by completing projects as soon and as efficiently as possible, thereby reducing life-cycle costs and schedules. For those sites in the Site Closure account, the goal of the Environmental Management program is to complete the cleanup mission by FY 2006, after which no further Departmental mission is envisioned, except for limited long-term surveillance and maintenance, and the sites will be available for some alternative use.

Program Objectives

- Continue to accelerate cleanup efforts at sites and realize substantial savings by the resulting reduction in long-term program costs and ongoing support costs.
- Where possible, once the cleanup mission has been accomplished, make sites available to communities for other uses.

Performance Measures

Environmental Management has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected for the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts. These performance measures can be found in the site details that follow

Significant Accomplishments and Program Shifts

The FY 2000 budget request fully reflects the project-oriented structure that the Environmental Management has developed as a key component of the effort to accelerate cleanup and reduce costs. All Environmental Management activities have been organized into projects, which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, the Environmental Management sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow

Albuquerque

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Environmental Management Site Closure Program, managed through the Albuquerque Operations Office, is to complete the cleanup of all release sites assigned to the Program and to continue several longer-term programs as required. Virtually all of this work from FY 2000 on will be performed by the Grand Junction Office in Colorado. The release sites include the 57 acre Grand Junction Office facility, the Monticello Millsite in Utah, and the 22 inactive uranium millsites that were designated by Congress for cleanup by the Uranium Mill Tailings Remedial Action Surface and Ground Water Projects program. Continuing missions include the Long-Term Surveillance and Maintenance Program and the Uranium Lease Management Program. The current mission also includes the facility management of the Grand Junction Office site including waste management at the site It is no longer cost-effective to operate and maintain the entire 57 acre Grand Junction Office facility for the planned mission. The Department is working with the Grand Junction community to identify options for making all or part of the facility available for other productive uses, while continuing the Grand Junction Office mission in Grand Junction.

Program Goal

The Albuquerque Operations Office goal is to complete cleanup of all geographic sites under this program by FY 2006, with the exception of ground water cleanup at several of the Uranium Mill Tailings Remedial Action sites. A major milestone is the completion of the Uranium Mill Tailings Remedial Action Surface Project remedial actions in FY 1998 and closeout of the Project in FY 1999. At the request of the State of North Dakota, the designations of the two North Dakota Uranium Mill Tailings Remedial Action sites were revoked in FY 1998, reducing the number of Uranium Mill Tailings Remedial Action sites from 24 to 22. The Long-Term Surveillance and Maintenance Program is responsible for the long-term custody and care of more than 50 disposal sites and will continue indefinitely. The Uranium Lease Program will continue until active leases expire and reclamation of mine sites is completed (estimated to be by FY 2010). The Uranium Mill Tailings Remedial Action Ground Water Project is scheduled to be completed by 2012, at which time sites that require longer-term monitoring or maintenance will be transferred to the Long-Term Surveillance and Maintenance Program. The goal for the Grand Junction Office site is to complete the site cleanup and to transfer the facility to a community group(s) for alternative uses by FY 2003 and to continue the Department of Energy mission at other facilities in Grand Junction or at a small portion of the facility using a lease-back arrangement.

Program Objectives

The Uranium Mill Tailings Remedial Action Ground Water Program objective is to eliminate or reduce to acceptable levels the potential health and environmental consequences of milling activities on ground water at inactive uranium processing sites under P.L. 95-604. The Uranium Mill Tailings Remedial Action Ground Water Program uses a risk-based decision-making process that ensures consistency in choosing site-specific active, passive, or no-remediation strategies to comply with ground water standards. By conducting program compliance in this cost-effective and timely manner, active restoration techniques should be limited to only three sites where the level of risk is unacceptable

The Grand Junction Office will continue to decommission buildings at its site under the Grand Junction Office Remedial Action Project, as well as complete significant remediation at the Monticello, Utah mill and vicinity property sites. The approach of preparing the Grand Junction Office site disposition for re-use and cleaning up the Monticello sites, thereby reducing the overall program workload, will support the future downsized mission of the Grand Junction Office.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table; as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

Uranium Mill Tailings Remedial Action Surface Project

- Revoked designations of the Belfield and Bowman, North Dakota, Uranium Mill Tailings Remedial Action Sites. This action removed both sites from the Uranium Mill Tailings Remedial Action Surface and Ground Water Projects program.
- Completed Remedial Actions at the final 2 Uranium Mill Tailings Remedial Action sites: Naturita and Maybell, both in Colorado (FY 1998).
- Complete project closure with the licensing and transfer of the final sites to the Long-Term Surveillance and Maintenance Program and the termination of the prime contracts (FY 1999).

Uranium Mill Tailings Remedial Action Ground Water Project

- Completed five release sites: Ambrosia Lake, New Mexico; Falls City, Texas; Canonsburg, Pennsylvania; Salt Lake City, Utah, and Riverton, Wyoming (FY 1998).
- Completed one interim action, provision of an alternate water supply, in cooperation with the Indian Health Service, at the Riverton, Wyoming, site that is adjacent to the Wind River Reservation (shared by Arapaho Nation and Shoshone Tribe) (FY 1998).
- Complete four release sites: Mexican Hat, Utah; Rifle, Colorado (two sites); and Grand Junction, Colorado (FY 1999).

- Start active ground water restoration at two sites. Tuba City, Arizona and Monument Valley, Arizona (FY 1999).
- Complete alternate water supply at Monument Valley, Arizona, and complete field investigation at Shiprock, New Mexico (FY 1999).

Monticello Projects

- Hauled and placed 1.1 million cubic yards of mill tailings to the repository; completed cleanup of vicinity properties; completed soil remediation in the lower Montezuma Creek Canyon, and initiated interim remedial action for ground water (FY 1998).
- Haul and place final 0.6 million cubic yards of mill tailings to repository; complete cleanup of peripheral and vicinity properties, complete cleanup of the Montezuma Creek Canyon and interim remedial action for ground water (FY 1999)

Grand Junction Office All Other Projects

- Paid cost of site mill tailings disposal at Cheney; conducted site environmental monitoring; provided for facility management support; initiated reimbursement of former site contractor for contract close-out; and provided support for Long-Term Surveillance and Maintenance for 25 sites and Uranium Leasing Program activities for 43 sites (FY 1998)
- Conduct site environmental monitoring; decommission three site buildings; provide for facility management support, reimburse former site contractor for contract close-out, provide support for long-term surveillance and maintenance for up to 30 sites and Uranium Leasing Program activities for 43 sites; and re-start reclamation of disturbed uranium leasing tracts where no lease holder is liable (FY 1999).

Site Description

Grand Junction Office

The Grand Junction Office is located immediately south of the City of Grand Junction, Colorado, on a 57 acre site adjacent to the Gunnison River. The Grand Junction Office supports environmental management activities in the areas of site characterization, project integration and coordination, remedial design, remedial action, independent verification, decontamination and dismantlement, and long-term surveillance and maintenance. Current Grand Junction Office project assignments include the Monticello millsite and vicinity properties cleanup, the Grand Junction Office Remedial Action Project, the Long-Term Surveillance and Maintenance Program, the Uranium Leasing Program, the Grand Junction Office Waste Management Program, the Grand Junction Office Landlord Program, and the Uranium Mill Tailings Remedial Action Ground Water Project. The Grand Junction Office Program is comprised of 22 release sites and 44 facilities, and the Uranium Mill Tailings Remedial Action Ground Water Project consists of 22 release sites.

The Grand Junction Office also performs the ground water cleanup (Pinellas) and Maxey Flats Field Management projects (both contained in Site/Project Completion Defense) and other projects in support of the Albuquerque Operations Office and Headquarters.

Monticello Projects

Environmental cleanup efforts at and around Monticello, Utah, include remedial action on a 110-acre inactive Government-owned uranium/vanadium mill processing site and the adjacent private and the Department of Energy owned peripheral properties, assessment and remediation of surface and ground water contamination near Monticello, and remediation of more than 400 private properties (referred to as "Vicinity Properties") which have been contaminated by mill tailings from the Monticello millsite.

The Monticello Projects are high visibility projects with the Environmental Protection Agency and State of Utah. The Monticello Vicinity Properties Site and the Monticello Mill Tailings Site, both located in Monticello, Utah, are on the National Priorities List and are being remediated in accordance with the Comprehensive Environmental Response, Compensation and Liability Act. A Federal Facility Agreement among the Department of Energy, the Environmental Protection Agency, and the State establishes the Department of Energy as the responsible party for remedial action and the Environmental Protection Agency as the lead agency with the ultimate responsibility and authority. The Environmental Protection Agency shares its decision-making authority with the State of Utah.

Vanadium and uranium were processed at the Monticello Millsite in the late 1940s to the late 1950s. Approximately 1.7 million cubic yards of mill tailings remained on the millsite and another 0.7 million cubic yards had been relocated off-site by wind and water erosion, or through use of the material in construction in the City of Monticello and adjacent vicinity and peripheral properties The sites were listed on the National Priority List because of significant risk to human health associated with the tailings and tailings-contaminated soils. Radon emitted from the tailings piles on the millsite exceeds the Environmental Protection Agency's standards for the off-site exposure. The tailings deposited in the community pose unacceptable risk of radon accumulation in structures. The tailings piles are in direct contact with an alluvial ground-water flow system which discharges to Montezuma Creek. Contaminant levels in the creek exceed State of Utah standards for surface water. The ground water has been contaminated by the tailings. While the ground water is not currently used for domestic consumption, there are no institutional controls to prevent its use, and human consumption would cause unacceptable health risks. A Feasibility Study is in preparation to support selection of a preferred remedy for restoration of surface and ground water quality. Tailings deposited in sediments along Montezuma Creek will be remediated to control risk to humans and the environment to within acceptable levels

The Monticello Mill Tailings Site consists of three operable units Operable Unit I is remediation of the 110-acre millsite requiring removal of tailings and placement into an on-site repository. Removal of 1,700,000 cubic yards (total at completion) of tailings-contaminated soil from the millsite and placement into the repository is expected. The repository has been excavated and lined with a Resource Conservation and Recovery Act-equivalent liner system. Operable Unit II is remediation of 330 acres of peripheral properties. Removal of about 550,000 cubic yards of tailings-contaminated soils from these properties is expected. Operable Unit III is remediation of contaminated ground water and surface water at the millsite and downstream from the millsite. Also included in Operable Unit III is remediation of contaminated sediments deposited along approximately three miles of Montezuma Creek. All contaminated material has been removed. To date, the repository has received 2,000,000 cubic yards of tailings-contaminated soil.

The Monticello Vicinity Properties Site entails the remediation of 424 properties contaminated with tailings and/or uranium ore. To date, nearly all properties have been remediated. Removal of 130,000 cubic yards (total at completion) of tailings-contaminated soil from these properties is expected.

Uranium Mill Tailings Remedial Action Surface

The Uranium Mill Tailings Remedial Action Surface Project was created as a result of Public Law 95-04, "The Uranium Mill Tailings Radiation Control Act of 1978," which authorized the Department to conduct a mill tailings stabilization and control program at inactive uranium ore processing sites that were contaminated with tailings and other byproducts of uranium milling operations. The program includes approximately 5,300 associated vicinity properties which became contaminated by windblown waste or debris or contaminated materials used in construction or landscaping. Each mill tailings processing site is comprised of one release site. The Uranium Mill Tailings Remedial Action Surface Project activity supports efforts in eleven states (Arizona, Colorado, Idaho, New Mexico, North Dakota, South Dakota, Oregon, Pennsylvania, Texas, Utah, and Wyoming) and with two Indian tribes. The Uranium Mill Tailings Remedial Action Surface Project is a cost-shared project, with the Federal Government paying 90 percent of the remedial action cost and the States paying ten percent. When the sites are on Indian lands, the Department pays the entire cost of the remedial action. Remedial action had been completed for 22 of the 24 former uranium ore processing sites as of the end of FY 1997. Remedial action at two sites (Maybell and Naturita, Colorado) was completed in FY 1998. At the request of the State of North Dakota, the designations of the two North Dakota sites were revoked in 1998, reducing the total number of sites to 22. The remaining activities to complete project closeout of all contracts and the licensing of the remaining sites will be accomplished in FY 1999.

The Uranium Mill Tailings Remedial Action Amendments Act of 1988 (P.L. 100-616) extended the Department's authority to conduct remedial actions at the designated sites through the end of FY 1994, and that authority was subsequently extended to the end of FY 1996. Public Law 104-259, signed by President Clinton on October 9, 1996, provided a final extension through FY 1998, to allow orderly termination of the Surface Project. It also authorizes the Cheney disposal site in Grand Junction, Colorado, to remain open for up to 25 years to accept vicinity property or ground water wastes from Title I sites and vicinity property material from the Monticello, Utah Project after the Monticello cell closes.

Uranium Mill Tailings Remedial Action Ground Water

The Uranium Mill Tailings Remedial Action Ground Water Project will carry out additional characterization and compliance efforts not covered by the Uranium Mill Tailings Remedial Action Surface Project, at 22 designated uranium mill tailings sites. The project was initially authorized by Public Law 95-604. Each mill tailings site is a ground water release site. Public Law 100-616 authorized ground water compliance activities for an unlimited period of time. Where active remedial action is required, the Department will pay 90 percent of the costs; the States will pay ten percent. The Department is responsible for the entire cost of the remedial action for sites on Indian lands. Key activities in FY 1999 are to initiate active ground water compliance activities at the Tuba City and Monument Valley, Arizona, sites and to complete four release sites (Mexican Hat, Utah; two in Rifle, Colorado; and Grand Junction); complete one alternate water supply at Monument Valley; initiate a field investigation at Naturita, Colorado; and complete a field investigation at Shiprock, New Mexico.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
AL-020 / Uranium Mill Tailings Remedial Action - Surface Remedial Action Project			
This project stabilized and controlled uranium mill tailings from 22 inactive processing sites. The project is closed out in FY 1999. All funding in FY 1999 is for closeout.			
■ No activity.

Cleanups	6.0	1.0	5.0

AL-023 / Uranium Mill Tailings Remedial Action Ground Water

The purpose of the Project is to achieve compliance with the Environmental Protection Agency's ground water standards at the 22 sites remediated by the Uranium Mill Tailings Remedial Action Surface Project. Contamination at the sites occurred prior to the Department of Energy cleanup of the tailings, and in most cases has migrated beyond the original mill site, and in many cases is underneath adjacent private property.

The Environmental Protection Agency standards for Uranium Mill Tailings Remedial Action Title I sites provides the Department of Energy with flexibility to achieve compliance through a range of strategies that recognize different levels of risk Characterization and baseline risk assessments have been conducted at all of the sites, and no one is at immediate risk from using contaminated ground water. At four sites, where there was a potential for near-term human exposure, alternate water supplies are being provided as interim actions. At this time it appears three sites will require active cleanup, nine sites will achieve compliance through natural attenuation, and the remaining ten sites will employ Supplemental Standards or Alternate Concentration Limits.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
A Uranium Mill Tailings Remedial Action Ground Water Programmatic Environmental Impact Statement was approved in May 1997, which lays out the overall Project approach for selecting compliance strategies. Site-specific Environmental Assessments are prepared that tier off of the Programmatic Environmental Impact Statement. These Environmental Assessments are usually 25 pages or less and are prepared to the extent possible by the Department of Energy staff, which minimizes costs. ■ Conduct Phase I remediation strategies at 2 sites: Tuba City and Monument Valley, Arizona; complete Work Plan at Shiprock, New Mexico. ■ Complete field investigations/initiate Work Plans at 4 sites: Durango, Gunnison, and Slick Rock (two sites), Colorado. ■ Complete National Environmental Policy Act documentation at Rifle, Colorado and Shiprock, New Mexico. ■ Perform monitoring at eight sites, and maintain cooperative agreements and Nuclear Regulatory Commission support. ■ Initiate remedial action at Shiprock, New Mexico; and conduct characterization at other sites in the Project. By the end of FY 2000, the Project plans to have completed 11 release sites and have active cleanup underway at the three sites projected to require active remediation.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
AL-020 / Uranium Mill Tailings Remedial Action - Surface Remedial Action Project	
■ Reduction due to completion of remediation in FY 1998 and closure of project in FY 1999.	-20,782
AL-022 / Monticello Projects	
■ The requested funding level is a reduction from the peak FY 1999 funding and reflects the nearing of completion of work at the mill site project.	-12,250
AL-023 / Uranium Mill Tailings Remedial Action Ground Water	
■ The increase is needed because it will be the first year the active cleanups will be under way at all three active remediation sites. The active cleanups will be the most cost intensive part of the Project. The cleanups are sensitive in that all three are on Native American lands, and the cleanup of ground water has cultural significance to the tribes as well as health and safety benefits. Work at the active compliance strategy sites will increase significantly and additional field investigation work will commence.	7,098
AL-024 / Grand Junction Office All Other Projects	
■ The requested reduction in Monticello Projects (AL-022) allows a marginal increase in funding for Grand Junction Office All Other Projects. This increase principally funds Long-Term Surveillance and Maintenance in the transfer, administration, monitoring, and maintenance of completed Title I, Title II, and other sites as they become the responsibility of the program.	1,337
Total Funding Change, Albuquerque	-24,597

Oak Ridge

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense, Environmental Management Site Closure program at the Oak Ridge Operations Office is to direct and manage about one million cubic yards of waste at the 226 acre Weldon Spring Site Remedial Action Project in Missouri, which includes an abandoned decommissioned uranium processing plant, a contaminated quarry used for waste disposal, as well as numerous vicinity properties that were contaminated during processing operations.

Program Goal

The goal of this program is to use an accelerated remediation strategy to complete the environmental restoration and permanent on-site disposal of waste at the Weldon Spring Site as soon as possible before FY 2006. This will enable the early completion of restoration work to reduce health risks and free up funding to accelerate remediation goals at other Oak Ridge sites The post remediation activity will be long-term surveillance and maintenance, with the restored land released for unrestricted use.

Program Objectives

The objective is to place all non-releasable contaminated material (soil, debris, pit waste) in the on-site disposal facility for long-term, permanent disposal. Raffinate pit waste will be treated in the Chemical Stabilization/Solidification Facility utilizing state-of-the-art grout technology and placed in the disposal facility. Quarry waste currently in temporary storage will be placed in the disposal facility. Restricted use areas, including the disposal facility, will be placed under long-term surveillance and maintenance until restrictions are no longer needed. The long-term objective for restored land will be to return it to interested local stakeholders for unrestricted use and potential economic development. A stewardship plan in development will determine the appropriate, specific use of unrestricted land.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table; as well as at a project level in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

In FY 1998, the on-site disposal facility Phase I construction was completed and placement of waste was initiated. By the end of FY 1998 640,000 cubic yards of waste were placed in the disposal facility. The Chemical Stabilization/Solidification facility was constructed, operationally tested, and waste treatment of the raffinate pit waste was begun, and 140,000 cubic yards of grout were placed in the disposal facility. Remediation of Army, Missouri Department of Conservation and the Southeast Drainage vicinity properties was completed, and the design of the raffinate pits restoration was begun. The Quarry Residuals Operable Unit Record of Decision was completed and delivered to the Environmental Protection Agency for approval.

In FY 1999, treatment of raffinate pit waste in the Chemical Stabilization/Solidification Facility and placement in the disposal facility will be completed, with the last 80,000 cubic yards of grouted waste placed. The majority of waste placement (equipment, soils, debris) in the disposal facility will be completed for a total of 630,000 cubic yards placed in FY 1999. The restoration design of the quarry and the main chemical plant site will be initiated, and the restoration of the raffinate pits will begin. The Ground Water Operable Unit Record of Decision will be completed and submitted to the Environmental Protection Agency for approval.

In FY 2000, continue construction of the on-site disposal facility and complete placement of 1.4 million cubic yards of waste. Begin construction of the disposal facility cover, begin quarry area restoration of the borrow area, and initiate chemical plant area restoration and complete raffinate pits restoration.

The FY 2000 request level is sufficient to meet the current project closure schedule of FY 2002.

Funding Schedule

Cleanups	5.0	6.0	1.0

Site Description

The site, located 30 miles west of St. Louis, Missouri, was built by the Department of Army and used for explosives production until 1946. It was converted and operated for the Atomic Energy Commission as a feed materials plant between 1955 and 1966. During operations of the plant, the buildings, equipment, immediate terrain, process sewer system, and drainage easement to the Missouri River became contaminated.

The site consists of two separate facilities, the Weldon Spring Quarry (9 acres) and the Chemical Plant Site (217 acres). The latter includes the raffinate disposal areas (51 acres).

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Weldon Spring Site is managed through a fixed fee integrated contract with fixed price contracts to ensure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. The projects included in this section of the budget have had an independent cost review of the scope or are currently undergoing a cost review, and the funds requested for FY 2000 are appropriate to perform the activities based on the long history of fixed price contracts at the site.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
OR-47201 / Weldon Spring Disposal Facility			
This project provides for environmental restoration of the chemical plant and quarry areas so as to place them in a radiologically/chemically safe condition to protect the public and environment The activities being performed in FY 2000 at the funding level requested are identified for execution in FY 2000 in the approved project baseline and have planned and enforceable milestones as agreed under the Federal Facilities Agreement with the Environmental Protection Agency.			
■ Continue construction and placement of waste in the on-site disposal facility.			
■ Continue the operation of the soil borrow area for the construction of the disposal facility.			
■ Begin quarry restoration.			
■ Continue support facilities demolition and restoration.			
■ Begin chemical plant restoration.

Ohio

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Site Closure Environmental Management program managed through the Ohio Field Office, is to support cleanup activities at three sites in two states. Sites include: the Columbus Environmental Management Project and the Miamisburg Environmental Management Project in the State of Ohio, and the West Valley Demonstration Project in the State of New York.

Program Goal

The goal for all Ohio Field Office sites is the disposition of real property to the state(s) or communities, resulting in an environmentally-restored end state by 2006. These goals consist of continuing remedial actions to prevent the spread of existing contamination; complete the ongoing remedial action and decontamination activities at Columbus Environmental Management Project sites; cleanups of the buildings and soil at the Miamisburg Environmental Management Project continue the vitrification/solidification of high-level waste tank heels material and the transitioning from maintaining safe storage of spent nuclear fuel to readying the fuel for shipment from the West Valley Site. The estimated completion date for the West Valley Demonstration Project may extend through FY 2015, reflecting several uncertainties discussed below.

Program Objectives

The Miamisburg Environmental Management Project site will be transferred to the City of Miamisburg, the Columbus Environmental Management Project site will be returned to Battelle Laboratories, both for unrestricted use, by the end of 2006. The Columbus Environmental Management Project will decontaminate buildings at Battelle, including transuranic waste processing and associated equipment removal; and remediate solids from external areas at the site.

The West Valley Demonstration Project will be returned to New York State upon completion of the DOE's responsibilities per the West Valley Demonstration Project Act. The estimated completion date for the West Valley Demonstration Project may extend through FY 2015, reflecting the uncertainty related to the schedule for implementing the various alternatives being analyzed for the future Environmental Impact Statement/Record of Decision, which will define the requirements for the out year scope of work, along with other challenges, such as: the ability to ship the high level waste canisters off-site to an interim storage location; ability to ship transuranic waste to an interim storage location; the shipment of spent nuclear fuel to Idaho; completion of the Record of Decision and issuance, by the

Nuclear Regulatory Commission, of decontamination and decommissioning criteria by FY 2000, and resolution of the responsibility issues between DOE and New York State.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table; as well as at a project level, in the Detailed Program Justification

Significant Accomplishments and Program Shifts

Columbus Environmental Management Project

- Initiated transuranic waste processing (FY 1998).
- Initiated interior decontamination of the West Jefferson building JN-1, including material and equipment removal (FY 1998).
- Provided required core environmental and surveillance and maintenance activities, including facility structural/hazard analysis of major building systems (FY 1998).
- Initiated and continue shipments of low-level waste (FY 1998/FY 1999).
- Initiate the decontamination of two buildings at Battelle Columbus Lab including transuranic waste processing and associated equipment removal; and remediate soils from external areas at the site (FY 2000).

West Valley Demonstration Project

- Completed the primary vitrification campaign on June 10, 1998, ahead of the baseline schedule and below the budgeted cost (FY 1998).
- Safely maintained spent nuclear fuel in storage including procedure development, safety concerns resolution, and annual Safety Analysis Report updates and training programs and operating procedure development for FY 1998 and FY 1999.
- Continue vitrification of tank high-level waste and initiate vitrification of high-level waste tank heels; 81 canisters (FY 1998); 15 canisters (FY 1999).
- Resolve responsibility issues with New York State Energy Research and Development Authority (FY 1999).
- Completed Citizens Task Force input for developing an Environmental Impact Statement preferred alternative (FY 1998); develop preferred alternative for the supplement to the Draft Environmental Impact Statement (FY 1999).
- Continue to store disposal-ready high-level waste canisters (FY 1998/FY 1999).
- Prepared and submitted Spent Nuclear Fuel shipping cask recertification applications to the Nuclear Regulatory Commission (FY 1998).

- Obtain Nuclear Regulatory Commission approval of general decontamination and decommissioning criteria based on Supplement to the Draft Environmental Impact Statement (FY 1999)
- Submitted application to the Nuclear Regulatory Commission for elimination of poison and filler rods for pressurized water reactor fuel (FY 1998).
- Selected backup cask for damaged fuel shipment (FY 1998); issue draft Transportation Plan for review and comment, and select rail transportation route (FY 1999).
- Completed conceptual design of high-level waste canister load-out facility and remote handled waste facility (FY 1998).
- Developed high-level waste tank farm cutoff strategy (FY 1998); develop Vitrification Facility Deactivation Plan (FY 1999).
- Continue vitrification of high-level waste tank heels at West Valley, producing five canisters of solidified high-level waste and complete the transition from maintaining safe storage of West Valley Spent Nuclear Fuel to readying the fuel and systems to initiate shipments to the Idaho National Engineering and Environmental Laboratory in FY 2001 (FY 2000).

Significant Shifts

Outyear work scope has been revised to include on-site or off-site storage options for the West Valley Demonstration Project disposal-ready high-level waste canisters, including isolation of canisters in their current location inside the main plant.

The project cost at the West Valley Demonstration Project is now estimated to range from $2.5 billion to $3.5 billion, to coincide with the estimated completion date (through FY 2015) which is dependent upon the final remediation decision. When the Environmental Impact Statement/Record of Decision and decontamination and decommissioning criteria are published in May 2000, a definitive work scope, cost estimate, and schedule will be developed and validated.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Site Description

Columbus Environmental Management Project

The Columbus Environmental Management Project is comprised of two geographic sites (West Jefferson and King Avenue) located in and near Columbus, Ohio. Research and development work was performed at its facilities for the Department and its predecessors. The buildings are privately owned by Battelle, and the facility retains an active Nuclear Regulatory Commission license for possession of special nuclear material. Both sites are radioactively-contaminated and funded through both the Defense and Non-Defense appropriation accounts. The Columbus Environmental Management Project consists of 17 facilities and two release sites, of which 13 facilities were completed by the end of FY 1998, including all planned contaminated buildings at the King Avenue site. Independent verification of KA-7 is scheduled for FY 1999. Decontamination activities were initiated in FY 1998 and should be completed by FY 2006 at the West Jefferson site, at which time it will be returned to the private owner.

Miamisburg Environmental Management Project

The Miamisburg Environmental Management Project manages the Mound Plant which is located on 306 acres in Miamisburg, Ohio, ten miles south of Dayton. The Mound Plant was built in the late 1940's to support research and development, testing, and production activities for the Department's defense-nuclear weapons complex and energy research programs This mission continued until 1994, at which time these activities were transferred to other DOE sites. The Mound Plant mission involved production of components containing plutonium-238, polonium-210 and tritium and processed large quantities of various types of high explosives. As a result of these operations, the buildings, soil, and ground water are contaminated with radioactive and hazardous chemicals. The only remaining mission at Mound is the production of plutonium heat sources and Radioisotopic Thermoelectric Generators by the Office of Nuclear Energy primarily for NASA space missions and other customers. The Office of Nuclear Energy is in the process of deciding whether to keep this activity at Mound or to relocate it elsewhere within the DOE complex. The plant has been placed on the Environmental Protection Agency's National Priority List and a Federal Facility Agreement to effect remediation of the site has been negotiated with the Ohio and the United States Environmental Protection Agencies The cleanup of the buildings and soil and eventual disposition of the real property at the Mound Plant will be complete by the year 2005 or earlier. The Mound Plant cleanup is predominantly funded through the Defense Environmental Management appropriation account, but also receives some funding from the Non-Defense appropriation account The only Non-Defense environmental remediation currently being conducted at the Mound Plant is the decontamination of areas within the Semi-Works Cave resulting from radionuclide recovery activities; it is scheduled to be completed by FY 2001.

West Valley Demonstration Project

The West Valley Demonstration Project is located at the Western New York Nuclear Service Center near West Valley, New York. The Center was developed by a private company with government support to process commercial spent nuclear fuel to extract plutonium and uranium and operated from 1966 to 1972.

The West Valley Demonstration Project includes all the activities undertaken to carry out high-level waste solidification, including: (1) preparation of the Western New York Nuclear Service Center's premises and facilities to accommodate the solidification project, including decontamination of existing facilities and equipment; (2) removal of the waste from underground storage tanks; (3) development, design, construction, and operation of systems and necessary supporting facilities for the solidification of waste; (4) acquisition of containers for permanent disposal of the solidified waste; (5) temporary storage of the solidified waste, followed by transportation to an appropriate Federal repository for permanent disposal; (6) decontamination and decommissioning of the waste tanks and facilities, material and hardware used in carrying out the solidification of the wastes; and (7) disposal of low-level and transuranic wastes produced from project activities.

The principal operation at West Valley is currently the solidification of approximately 2,200 m^3 of liquid high-level waste into borosilicate glass using vitrification The primary vitrification campaign began in June 1996 and was completed in June 1998 Vitrification of the high-level waste tank heels is underway and will continue through FY 2001.

In preparation for initiating the vitrification program, the entire inventory of liquid high-level waste was pretreated between 1988 and 1995. This processing produced 20,000 drums containing low-level waste liquid stabilized in cement. These drums are being temporarily stored on-site pending a decision on permanent disposal relative to the Record of Decision for project completion

Following the vitrification of the high-level waste, the buildings and other facilities will be decontaminated and decommissioned, based on the results of an Environmental Impact Statement and Record of Decision for the completion of the project This phase of the cleanup project is expected to begin in late FY 2000. The project cost is estimated to range from $2.5 billion to $3 5 billion, to coincide with the estimated completion date (through FY 2015 dependent upon the Environmental Impact Statement/Record of Decision). This estimate will be refined after the Environmental Impact Statement/Record of Decision is published.

Another critical element of the EM program at West Valley is the safe management of 125 spent nuclear fuel elements which are stored at the site Environmental Management will continue surveillance and maintenance of the spent fuel facility to ensure safe storage until the fuel can be shipped to the Idaho National Engineering and Environmental Laboratory (currently planned for 2001).

Achieving project completion depends upon the Department's ability to implement the decisions made in the Environmental Impact Statement Record of Decision, as well as early identification of receiver sites and stakeholder agreements to accept West Valley Demonstration Project high-level waste and transuranic waste, and on funding support at the level which was the basis of the June 1998 *Accelerating Cleanup: Paths to Closure* document. The New York State Energy Research and Development Authority and DOE are formulating a preferred alternative for project completion and closure or long-term management of the site that incorporates stakeholders' input, including the Citizens Task Force's recommendations. Selection of a preferred alternative and subsequent Record of Decision will determine final disposition of the wastes and facilities at the West Valley site and allow for the return of the site to New York State.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The Ohio projects are managed through incentivized contracts and utilize fixed-price subcontracts to assure the most efficient service to the Government. This scope planned for FY 2000 has been reviewed and is consistent with the goals of the site as outlined in the *Accelerating Cleanup: Path to Closure*. The Ohio projects included in this section of the budget have had independent reviews of their baseline scopes and costs. The scope and funding requested for FY 2000 are consistent with the activities that have been reviewed.			
OH-CL-01 / King Avenue Site Decontamination			
Decontamination of the King Avenue site was completed in FY 1998.			
■ Completion of Building KA-7 underground drain removal and associated work.			
■ Completion of external area final surveys.			
■ Final independent verification surveys and report.

OH-WV-01 / High-Level Waste Vitrification and Tank Heel High Activity Waste Processing

The high-level waste program at West Valley encompasses the solidification of approximately 2200 m^3 of liquid high-level waste into borosilicate glass using vitrification. Liquid high-level waste vitrification operations were initiated in June 1996, and the primary vitrification campaign was completed in the third quarter of FY 1998. This represents a significant achievement for DOE and a critical activity toward completion of the West Valley Demonstration Project Act. After high-level waste liquid processing, the project will continue to use vitrification to process the high-level waste tank heels and residual high activity waste. Planning and preparatory work is currently underway, and vitrification is continuing. There is a high base cost to operate and maintain the vitrification process and the innovative technology for tank heels extraction adds to the cost. This activity, including the deactivation of the vitrification processing facility, will continue into FY 2002.

- Continue operation of vitrification facility to treat approximately 50 m^3 of high-level waste tank heels and residuals, reducing the remaining inventory to 32 m^3 and resulting in production of approximately 5 canisters of high-level waste.
- Operate tank farm in support of vitrification.
- Install high-level waste tank heel removal equipment (equipment and pump modifications)
- Finalize strategies for completion of vitrification and cutoff of effluents to tanks and facilities used for vitrification.

OH-WV-02 / Site Transition, Decommissioning, & Project Completion

These activities are required to remove high-level waste canisters and transuranic waste from project facilities, dispose of low level waste in accordance with the West Valley Demonstration Project Act and Stipulation of Compromise as directed by the Record of Decision, implementation of other related activities associated with the Record of Decision, and completion of the remaining project responsibilities and return the site to New York State. The State of New York and DOE are working together to formulate a preferred alternative with input from the public, including the Citizens Task Force. The subsequent Record of Decision will provide the decision to implement the preferred alternative. Outyear work scope has been revised to include modifications to existing canister storage location in the main process building or investigation of other storage options. These activities run concurrently with high-level waste vitrification processing and tank residual high activity waste processing with estimated completion through FY 2015 dependent upon Environmental Impact Statement/Record of Decision alternative selected.

- Continue to safely store disposal-ready high-level waste canisters.
- Continue environmental monitoring.
- Operate site safely and compliantly.
- Complete Remote Handled Waste Facility design.
- Address Supplement to the Draft Environmental Impact Statement comments and issue Final Environmental Impact Statement for public review
- Issue Environmental Impact Statement Record of Decision.
- Develop Record of Decision implementation plan and initiate cost/schedule baseline development for West Valley Demonstration Project Completion.
- Continue sitewide radwaste classification program (for low-level and transuranic waste).
- Continue canister ship-out design efforts; investigate storage options.
- Continue limited low-level waste disposal activities.

OH-WV-03 / Spent Nuclear Fuel

The Fuel Receiving and Storage Facility at West Valley contains 125 irradiated commercial spent nuclear fuel elements that must be transferred off-site during calendar year 2001 (per agreement with the State of Idaho and the State of New York). In FY 2000, complete the transition from maintaining safe storage of spent nuclear fuel to readying the fuel and systems; maximum safety; initiate shipment to Idaho National Engineering and Environmental Laboratory in 2001 to avoid penalties and court action by New York State regulators.

- Complete upgrades for the rail spur.
- Staff and train fuel handling and cask loading crews.
- Maintain safe storage of fuel and inspect spent nuclear fuel in preparation for shipment.
- Complete training of crews for fuel handling and cask unloading at Idaho National Engineering and Environmental Laboratory and complete readiness assessments for transportation and receipt of the West Valley Demonstration Project -Spent Nuclear Fuel.

OH-WV-04 / Project Management/Site Support

This project provides for management of basic facilities, equipment, installations, and related services essential for occupation and operation of the site. This includes roads, utilities, environmental monitoring, analytical laboratories, safeguards and security, offices, warehouses, corrective maintenance, and preventive maintenance. It also includes technical support and contract expertise in evaluating waste management activities. It includes activities related to strategic planning, information activities, and field management. Also included are preparation of project baseline summaries, risk data sheet documentation, integrated priority lists, site-wide technical baselines, facility plans, system engineering, and complex-wide plans.

- Continue facility management and maintenance, radiological control programs, industrial health and safety programs, logistics support, environmental monitoring, administration of laboratories, and administration of the quality assurance program.
- Continue security and safeguards, training, procurement, accounting, legal, records management, public information, human resources, program control administration, and management information services.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
OH-CL-01 / King Avenue Site Decontamination	
■ Increase is needed to support completion of Building KA-7 underground drain removal and associated work and final surveys and report.	281
OH-CL-02 / West Jefferson Site Decontamination	
■ This site is split funded between the Non-Defense and Defense activities. As the Non-Defense preparation work for decommissioning decreases the defense activities increase.	-616
OH-CL-03 / Project Management, Site Support & Maintenance	
■ There is a correlation between Non-Defense and Defense support needed in relation to the type of work being supported; decrease in scheduled work to be performed under the Non-Defense Appropriation.	-904
OH-MB-02-N / Main Hill Tritium (Non-Defense Funded)	
■ Funding level is essentially stable.	-3
OH-WV-01 / High Level Waste Vitrification and Tank Heel High Activity Waste Processing	
■ Decrease is due to elimination of development and deployment of oxalic acid wash technology, which was for residual waste removal from the high-level waste tanks	-700
OH-WV-02 / Site Transition, Decommissioning & Project Completion	
■ Decrease reflects deferral of procurement and construction activities for the Remote Handled Waste Facility and the high-level waste Canister Ship-out Facility.	-1,200
OH-WV-03 / Spent Nuclear Fuel	
■ Spent Nuclear Fuel Shipment from West Valley Demonstration Project to Idaho National Engineering and Environmental Laboratory is scheduled to occur in FY 2001. The additional funding in FY 2000 is to continue safe storage of the fuel, as well as ready the fuel and systems to begin shipments. Examples of the types of activities include cask certification, procurement of materials and equipment, training of fuel handlers, verification of procedures, and line management self assessment. The 1.8 mile rail spur which services the West Valley Demonstration Project will also be upgraded	2,100
OH-WV-04 / Project Management/Site Support	
■ Funding level essentially stable with a slight decrease due to the continued emphasis on cost effectiveness improvement and productivity enhancement through labor reductions for support categories; reductions in computer software support.	-200
Total Funding Change, Ohio	-1,242

Site/Project Completion

Program Mission

The Non-Defense Site/Project Completion account provides funding for projects that are expected to be completed by FY 2006 at sites or facilities where a Department of Energy (DOE) mission will continue (e.g., environmental management or scientific research) beyond FY 2006. Hence, this account focuses on the completion of specific Environmental Management (EM) projects at sites with expected enduring missions.

This account includes projects and sites under the following operations offices: Albuquerque, Chicago, Idaho, Oakland, and Richland In a limited number of cases, sites have been placed in the Site/Project Completion account even though there is no expectation of a continuing mission after cleanup is completed. In these instances, use of the Site Closure account would have created an additional appropriation control for an Operations/Field office with a limited amount of associated funding, thereby hindering managerial flexibility in the execution of projects at these sites.

Program Goal

The FY 2000 budget request will enable the EM program to continue its goal of completing its cleanup mission at as many sites as possible by 2006. This goal is part of the strategies identified in the *Accelerating Cleanup: Paths To Closure* document, whereby EM sites are working aggressively to reduce outyear costs by completing projects as soon and as efficiently as possible, thereby reducing life-cycle costs and schedules.

Program Objective

- To continue environmental cleanup projects that are expected to be completed by 2006 at EM sites where overall site cleanup will not be fully accomplished by 2006.
- To continue environmental cleanup projects at DOE sites where all EM projects are expected to be completed by 2006 (except for long-term stewardship activities), but where there will be a continuing federal workforce at the site to carry out enduring non-EM missions, such as nuclear weapons activities or scientific research, and the necessary waste management activities to handle newly generated wastes from these missions.

Performance Measures

The Office of Environmental Management has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected for the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts. These performance measures can be found in the site details that follow.

Significant Accomplishments and Program Shifts

The FY 2000 budget request fully reflects the project-oriented structure that EM has developed as a key component of the effort to accelerate cleanup and reduce costs. All EM activities have been organized into projects which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, EM sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow.

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Environmental Management (EM) Site/Project Completion program, managed through the Albuquerque Operations Office, is to support activities at one site in one state, the Lovelace Biomedical and Environmental Research Institute, formerly the Inhalation Toxicology Research Institute, in New Mexico.

Program Goal

The Lovelace Biomedical and Environmental Research Institute currently operates under a cooperative agreement with the Department of Energy. The goal is to continue to support treatment, storage, and disposal of newly generated waste in support of the Department's mission-related work. At this time, the Office of Science, the landlord, is considering transition of waste management activities into the landlord program.

Program Objective

Until the transition to landlord occurs, the Albuquerque program objective is to manage generated waste, including the treatment, storage, and disposal of low-level waste, mixed low-level waste, transuranic, and hazardous wastes; support program management activities for the waste management/environmental restoration programs; and continue groundwater surveillance and monitoring. It is assumed that the cooperative agreement will remain in place until FY 2006.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table, as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Shipped small quantities of transuranic waste to Sandia National Laboratory for interim storage pending regulatory changes that would permit disposal at the Waste Isolation Pilot Plant.

Site Description

Lovelace Biomedical and Environmental Research Institute

The Lovelace Biomedical and Environmental Research Institute is located on Kirtland Air Force Base in Albuquerque, New Mexico. The site currently operates under a cooperative agreement with the Department of Energy doing biomedical research. All of the environmental restoration sites have been cleaned up Monitoring and surveillance of the sites continue to support closure and to monitor the reduction of nitrates in groundwater beneath the former wastewater lagoons. The Waste Management Program manages hazardous, low-level radioactive, mixed, transuranic, and non-hazardous biomedical wastes generated from on-going DOE research activities in an efficient and environmentally sound manner.

Chicago

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Environmental Management (EM) Site/Project Completion program carried out by the Chicago Operations Office, is to direct and manage EM activities at seven sites in five states. These sites include the Ames Laboratory in Iowa; the Argonne National Laboratory-East, Site A and Fermi National Accelerator Laboratory in Illinois; the Argonne National Laboratory-West in Idaho; Princeton Plasma Physics Laboratory in New Jersey; and the Brookhaven National Laboratory in New York.

The primary mission of the facilities under the Chicago Operations Office is research, development, and demonstration for DOE's Office of Science and Nuclear Energy programs. This includes support of the nation's advanced reactor program and research on the fundamental properties of matter, physics, life and environmental sciences; magnetic confinement fusion and high-energy physics. The two components of the Chicago Environmental Management Program are environmental restoration and waste management. Environmental restoration activities managed by the Chicago Operations Office include the management of groundwater, soil and debris contaminated with radionuclides and/or hazardous substances.

The Chicago environmental restoration strategy focuses on maximizing near-term site completions, optimizing the sequencing of work and accelerating schedules. This strategy has proven to be successful in that environmental restoration activities at Chicago sites, such as Site A and Ames have been completed, allowing allocated funding to be devoted to fewer remaining sites. For the waste management activities, Chicago's strategy continues to be focused upon the disposition of legacy waste inventories, cost-effective waste handling, and pollution prevention programs designed to reduce and minimize the generation of new waste. This strategy has been successful. Waste inventories, generated in decades past and stockpiled at Chicago sites, have been dramatically reduced in the past several years, thereby reducing storage costs and risk.

Waste management responsibilities have been transferred to the Office of Science for Fermi National Accelerator Laboratory, and to the Office of Nuclear Energy for Argonne National Laboratory-West. Management and funding for surveillance and maintenance at Site A/Plot M in Illinois, the Hallam site in Nebraska, and the Piqua site in Ohio have been transferred to the Long Term Surveillance and Maintenance program, which is managed by the Grand Junction Project Office in Colorado.

Program Goal

The goal of the Chicago Operations Office and the EM program is to complete remediation of all Chicago sites by 2006, and to transfer management of all newly-generated waste from ongoing operations back to the generator. There is expected to be no EM funding for Chicago sites beyond 2006. Chicago is pursuing waste management initiatives to reduce and contain costs, and to enhance productivity.

Program Objectives

The EM objective at the Chicago Operations Office is to manage the risks associated with sites contaminated with various hazardous and radioactive materials. This includes responsibility for the assessment and remediation of contaminated sites and facilities; characterization, treatment, minimization, storage and disposal of hazardous and radioactive waste; development, demonstration, testing, and evaluation of new cleanup technologies; environmental safety; and completion of decontamination and decommissioning of surplus facilities in the current EM baseline. The Chicago Operations Office proactively employs innovative and alternative technologies, wherever appropriate and applicable, to address remedial, as well as decontamination and decommissioning problems, in order to reduce cost, risk, and to improve the schedule.

Environmental restoration activities at Chicago will be complete at all sites except Argonne National Laboratory-East, Argonne National Laboratory-West and Brookhaven National Laboratory by the end of FY 1999. Discussions are underway with the DOE's Office of Science regarding the transfer of continuing surveillance and monitoring activities at the Princeton Plasma Physics Laboratory Site C/D. Remediation activities will continue under the Brookhaven National Laboratory Interagency Agreement/Federal Facilities Agreement, the Argonne National Laboratory-West Federal Facility Agreement/Consent Order and the Argonne National Laboratory-East Resource Conservation and Recovery Act Part B Corrective Action permit. Waste management activities at Chicago are designed to ensure minimization, safe handling, collection, storage, treatment and disposal of waste for generators at Ames, Argonne National Laboratory-East, Brookhaven National Laboratory, and Princeton Plasma Physics Laboratory. The main types of waste associated with these facilities are low-level waste, mixed low-level, hazardous, and transuranic waste.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table, as well as at a project level, in the detailed program justification.

Significant Accomplishments and Program Shifts

- At Brookhaven National Laboratory assessment activities included: (1) completion of five release site assessments associated with the Sewage Treatment Plant and Peconic River landfills and groundwater; and (2) continuation of site-wide characterization activities. Remediation activities included: (1) completion of nine release sites, (2) continuation of waste disposal from 55 buried waste pits, (3) completion of drinking water hookups for over 1,500 offsite residences from FY 1996 through FY 1998, (4) continuation of groundwater treatment activities, (5) continued remediation of the Central Steam Facility, and (6) begin design and construction of innovative technology of in-well air sparging for off-site groundwater remediation. This technology will provide a substantially less invasive presence off-site on non-DOE owned property and is expected to reduce long-term operation and maintenance costs compared to pump and treat technology. Packaging, transportation, and off-site processing of boneyard removals will be partially accomplished (FY 1998). At Brookhaven National Laboratory, site-wide characterization activities will be completed and Graphite Reactor characterization activities will be undertaken. Remedial actions include completion of two release sites and continuation of remediation of operable units/removal actions including the Central Steam Facility, waste management areas, and the groundwater. Packaging, transportation, and off-site processing of boneyard waste removals at the old Hazardous Waste Management Facility will continue (FY 1999).
- Performed all necessary activities to compliantly treat, store, and dispose all applicable waste types at Brookhaven National Laboratory (FY 1998) and will continue to perform these activities (FY 1999).
- At Brookhaven National Laboratory, continue on-site groundwater treatment systems and soil vapor extraction systems, initiate soil excavation and disposal; complete construction of additional off-site groundwater treatment system; initiate remediation of Peconic River sediments; store, treat, and dispose of low-level, hazardous and mixed waste; treat and dispose of additional legacy waste (FY 2000).
- At Argonne National Laboratory-East, the field work associated with the 317 Area French Drain continued. Remaining remedial actions work involved the completion of two release site assessments and demonstration of soil-mixing technology. Performed all necessary activities to compliantly treat, store, and dispose all applicable waste types at Argonne National Laboratory-East. Completed construction of one line-item project (Waste Management Facility Upgrade) at Argonne National Laboratory-East (FY 1998). At Argonne National Laboratory-East, remedial actions effort will continue and one release site will be completed. Decontamination and decommissioning activities include continuing decontamination and decommissioning of the Chicago Pile-5 reactor and beginning decontamination and decommissioning of 60 inch Cyclotron. Perform all necessary activities to compliantly treat, store, and dispose all applicable waste types at Argonne National Laboratory-East (FY 1999).

- At Argonne National Laboratory-East, continue corrective actions including capping in place and engineered barriers; complete decontamination and decommissioning of the 6-inch Cyclotron Reactor and the Chicago Pile-5 Reactor; initiate decontamination and decommissioning of the Zero Power and Juggernaut Reactors; store, treat, and dispose of mixed, low-level and hazardous waste; collect, store, and treat transuranic waste (FY 2000).
- At Argonne National Laboratory-West, assessment of eight release sites and one facility was accomplished, as well as the completion of three release sites and one facility. Bench scale testing of an innovative technology, phytoremediation, was completed for remediation of remaining Waste Area Group 9 facilities. Facility decommissioning of the Central Liquid Waste Processing Area was completed. Waste management responsibilities were transferred to the Office of Nuclear Energy at the end of FY 1997. At Argonne National Laboratory-West, the two year validation of innovative technology (phytoremediation) for the Waste Area Group 9 site will begin (FY 1999).
- At Argonne National Laboratory-West, continue final remedial action (soil treatment) (FY 2000).
- At Princeton Plasma Physics Laboratory, activities were conducted to assess and reduce risk and comply with the Memorandum of Understanding between the New Jersey Department of Environmental Protection and Princeton University. This included assessment and completion of all eight release sites at Sites C/D. In addition to normal waste operations, low-level waste generated included materials from Tokamak Fusion Test Reactor caretaking operations being performed by the Office of Science. It is anticipated that the quantity of waste will remain consistent with historical levels because of the construction and facility preparations for the National Spherical Tokamak Experiment. Performed all necessary activities to compliantly treat, store, and dispose all applicable waste types at Princeton Plasma Physics Laboratory (FY 1998). At Princeton Plasma Physics Laboratory restoration activities consist of long-term groundwater monitoring. The major waste operations focus will be on disposal of materials from the Tokamak Fusion Test Reactor caretaking operations. In addition, operations of the National Spherical Tokamak Experiment are scheduled to begin. Perform all necessary activities to compliantly treat, store, and dispose all applicable waste types at Princeton Plasma Physics Laboratory (FY 1999).
- At Princeton Plasma Physics Laboratory, conduct surveillance and monitoring of the Site C/D; safely and compliantly store, treat, and dispose of hazardous waste and low-level waste (FY 2000).
- Potentially responsible party payments will be made against DOE's portion of Princeton University Site A/B remediation costs as a Potentially Responsible Party (FY 1999).
- At Princeton Plasma Physics Laboratory, conduct surveillance and monitoring of the Site C/D; safely and compliantly store, treat, and dispose of hazardous waste and low-level waste (FY 2000).
- At Ames, remediation activities (other than continued low levels of surveillance and monitoring) were completed. Performed all necessary activities to compliantly treat, store, and dispose all applicable waste types at Ames (FY 1998), and will continue to perform these waste management activities (FY 1999).
- At Ames Laboratory, store, treat and dispose of transuranic, mixed, and low-level waste (FY 2000)

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Site Description

AMES Laboratory (Iowa State University)

Ames Laboratory is an Energy Research laboratory in Ames, Iowa that conducts basic and applied research in the preparation, characterization, and evaluation of properties of metals and their alloys, especially rare earth metals. Ames Laboratory also performs materials research, high-performance computing, and environmental research. It seeks solutions to energy-related problems through the exploration of physics, chemistry, engineering, applied mathematics, and materials sciences.

Argonne National Laboratory-East

Argonne National Laboratory-East is a research laboratory occupying a 700 acre tract of land located approximately 22 miles southwest of downtown Chicago in DuPage County, Illinois. It is an Office of Science multidisciplinary research and development laboratory that conducts basic and applied research to support the development of energy-related technologies. Energy-related research projects include safety studies for light-water reactors, developing components and materials for fission and fusion reactors, superconductivity research, improvements in coal power, synchrotron radiation sources, and waste heat utilization. Further research includes medical radioisotope technology, environmental research, genetics research, materials engineering, ceramics, carcinogenesis, and the biological effects of ionizing radiation. Argonne-East is the home for the Advanced Photon Source Facility, which provides experiment capability with the use of photons for industry, government, and academic scientists to create advances in pharmaceuticals, adhesives, food processing, and many other applications.

Argonne National Laboratory-West

The Argonne National Laboratory-West site is located 35 miles west of Idaho Falls, Idaho, and is operated by the University of Chicago under the direction of the Chicago Operations Office. The site was constructed for the purpose of carrying out research and development for liquid metal fast breeder reactor technology. All remediation activities, except for continued implementation of the selected remedy, are projected to be complete at Argonne National Laboratory-West by the end of FY 2000. Beginning in FY 1998, the responsibility for managing newly generated waste, as part of the reengineering pilot program, was transferred to DOE's Office of Nuclear Energy. The current mission for Argonne National Laboratory-West includes technology development for spent nuclear fuel and radioactive waste treatment, reactor and fuel cycle safety, and closure of the Integral Fast Reactor Program. These activities are administered through the Office of Nuclear Energy.

Brookhaven National Laboratory

The Brookhaven National Laboratory site is a multi-purpose research and development laboratory located in central Suffolk County on Long Island, about 60 miles east of New York City. Brookhaven National Laboratory's current mission is to conduct fundamental research, including conception, design, construction, and operation of large complex research facilities. These facilities are used for both basic and applied research in high energy and nuclear physics; in basic energy sciences emphasizing fundamental research on biological, chemical, and physical phenomena underlying energy-related transfer, conversion and storage systems; in life sciences; and in nuclear medical applications of nuclear techniques. The DOE Office of Science also provides funding for Brookhaven National Laboratory cleanup activities.

Princeton Plasma Physics Laboratory

The Princeton Plasma Physics Laboratory in Princeton, New Jersey, is a single purpose laboratory focusing on research and development for fusion energy programs. The Laboratory is engaged in a broad spectrum of plasma physics research ranging from the theoretical analysis and modeling of fusion plasmas to the laboratory testing of plasmas approaching the conditions necessary for an energy producing fusion reactor.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Chicago EM program makes extensive use of firm fixed-price subcontracts and other subcontracting mechanisms, such as basic ordering agreements and time and material subcontracts, to assure the most cost-effective services to the Government.

The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in *Accelerating Cleanup: Paths to Closure*. The two major environmental restoration programs at Argonne National Laboratory-East and Brookhaven National Laboratory have had independent cost reviews by the Army Corps of Engineers and are baselined and under formal change control procedures. Waste management activities have baselines established for a seven year period. In addition, there have been independent reviews of current year work plans, and benchmarking of hazardous waste management operations against commercial research operations to identify best practices.

Idaho

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Environmental Management (EM) Site/Project Completion program managed by Idaho is to construct a dry storage facility for 145 m^3 of Three Mile Island Unit-2 spent nuclear fuel that is currently in underwater storage at the Idaho National Engineering and Environmental Laboratory's Test Area North. Environmental Management also provides legislatively mandated technical assistance to requesting States and compact regions responsible for commercial low-level radioactive waste through its management of the National Low-Level Waste Program. In addition, this program provided for the deactivation activities associated with two excess reactors and their required surveillance and maintenance.

Program Goal

Throughout the DOE complex, EM is focused on accelerating cleanup and, where possible, completing its mission by FY 2006. At the Idaho National Engineering and Environmental Laboratory, all two of the non-defense elements of the EM mission will be completed within the FY 2006 time frame. The two reactor facilities will be deactivated, the Three Mile Island Unit-2 fuel will be in safe, dry storage, and EM's National Low-Level Waste Program responsibilities will be completed. In FY 1999, the continued monitoring of Three Mile Island-2 fuel and the operation of the Independent Spent Fuel Storage Installation facility will be funded under the Post 2006 Completion-Defense Idaho account.

Program Objective

The objective of the program is to complete construction of the Three Mile Island Unit-2 fuel storage facility in FY 1999, completing the majority of non-defense activities in the Spent Nuclear Fuel Stabilization Program, reducing surveillance and maintenance costs by deactivating two excess reactors, and to continue executing the Department's responsibilities under the National Low-Level Waste Program of technical assistance to states by implementing more efficient and cost-effective approaches through cost-sharing and partnering arrangements.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table, as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Initiated construction of independent spent fuel storage installation and complete construction of Three Mile Island Unit-2 independent spent fuel storage installation in support of Idaho Settlement Agreement milestones (FY 1998/FY 1999).
- Completed installation and testing of dewatering system for Three Mile Island spent nuclear fuel (FY 1998).
- Obtain Nuclear Regulatory Commission license approval for the Three Mile Island Unit-2 independent spent fuel storage installation (FY 1999).
- Complete a comprehensive review and analysis of the National Low-level Waste Program to implement in FY 2000 a public/private partnership approach to management of the program (FY 1999).
- For the Power Burst Facility, completed the fuel movement plan for the Power Burst Facility fuels and cleaned up legacy wastes in preparation of facility deactivation (FY 1998).
- For the Materials Test Reactor, completed the Lockheed Martin Idaho Technologies Company Readiness Review in preparation of the Materials Test Reactor fuels move (FY 1998) and will initiate and complete recanning of Materials Test Reactor fuels in preparation of the fuel move to dry storage (FY 1999).
- Meet Idaho Settlement Agreement, Federal Facility Compliance Agreement, Federal Facility Agreement/Consent Order, and other regulatory requirements in a safe and environmentally acceptable manner (FY 2000).
- Commence negotiations with the State of Idaho to develop a mutually agreeable schedule to place Spent Nuclear Fuel into dry interim storage in support of Settlement Agreement, and continue moving Three Mile Island-2 fuel from wet to dry interim storage per Settlement Agreement milestone to complete by June 1, 2001 (FY 2000).

Site Description

Idaho National Engineering and Environmental Laboratory

The Idaho National Engineering and Environmental Laboratory, established as the National Reactor Testing Station in 1949, occupies 890 square miles in the Snake River Plain of Southeastern Idaho. Over the years, 52 reactors have been constructed and operated at the Idaho National Engineering and Environmental Laboratory. Three of these reactor facilities (Power Burst Facility, Advanced and Coupled Fast Reactivity Measurement Facility, and Material Test Reactor Canal) are managed by the Office of Environmental Management.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
The Idaho site is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost-effective services to the Government. The scope Planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. For most projects the Army Corps of Engineers performed an independent review of the Environment Management baseline at the Idaho National Engineering and Environmental Laboratory. Funds requested are appropriate to perform activities based on historical level of effort.			
ID-OIM-110-N / Pre-FY 2007 Surplus Facility Deactivation Project - Non-Defense			
This project provides for Materials Test Reactor Canal fuel removal deactivation, and Power Burst Facility fuel removal and deactivation ■ Complete Materials Test Reactor Canal fuel removal deactivation. ■ Initiate Power Burst Facility fuel removal and deactivation.

ID-SNF-104-N / Constructed New Facilities - Non-Defense (93-E-900)

The Spent Nuclear Fuel Stabilization Program at the Idaho National Engineering and Environmental Laboratory is focused on constructing a new facility, the Independent Spent Fuel Storage Installation (93-E-900, Long-Term Storage of Three Mile Island-2 Fuel), that will allow the Three Mile Island Unit-2 fuel to be removed from wet storage in the Test Area North and placed in stable, dry interim storage. Completion of this project directly supports Settlement Agreement milestone #E-7 which requires completion of construction by December 31, 1998, initiating Three Mile Island-2 fuel movement into a dry storage facility by March 31, 1999 and completing it by June 1, 2001. In addition, this project eliminates vulnerabilities of underwater spent nuclear fuel storage at Test Area North identified in the October 1993, DOE-Environmental Health Spent Nuclear Fuel Storage Vulnerability Report.

The Three Mile Island-2 spent nuclear fuel inventory at the Idaho National Engineering and Environmental Laboratory (145 m^3) will be moved to the new facility by FY 2001 using funds requested through the Defense Appropriation

- Obtain Three Mile Island-2 Independent Spent Fuel Storage Installation license amendment to accommodate Loss of Fluid Test and commercial fuels also stored at the Test Area North underwater facility.
- Provide equipment for transfer of the Loss of Fluid Test and Commercial Spent Fuel Storage from Test Area North pool to dry storage.
- Continues funding for construction of the Long-Term Storage of Three-Mile Island-2, 93-E-900 Included in the funding totals for this PBS are $397,000 for FY 1998, $0 for FY 1999; and $2,500,000 for FY 2000.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs FY 1999 ($000)
ID-OIM-110-N / Pre-FY 2007 Surplus Facility Deactivation Project - Non-Defense	
■ Decrease reflects completion of recanning of the Materials Test Reactor fuels and completion of deactivation planning at the Power Burst Facility	-3,875
ID-OIM-112-N / Pre-FY 2007 Idaho Engineering and Environmental Laboratory Surveillance and Maintenance - Non-Defense	
■ Increase reflects transfer of the Materials Test Reactor from deactivation to surveillance and maintenance activities	297
ID-SNF-104-N / Constructed New Facilities - Non Defense (93-E-900)	
■ Bankruptcy of a key subcontractor has delayed the project resulting in additional project costs, and Nuclear Regulatory Commission licensing costs are more than expected	3,500
ID-WM-102 / National Low-Level Waste Program	
■ Decrease reflects implementation of public/private partnership management of the program for greater efficiencies	-741
Total Funding Change, Idaho	-819

Major Issues

Idaho's budget request is compliance based and only minimal mortgage reduction activities will be funded in the FY 2000 request, requiring a continued high-level of surveillance and maintenance (costs) for abandoned (contaminated) facilities.

Oakland

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Environmental Management (EM) Site/Project Completion program managed through the Oakland Operations Office is to plan and implement remediation and waste treatment, storage, and disposal activities at seven sites. These sites include Lawrence Berkeley National Laboratory, the Energy Technology Engineering Center, the General Electric Vallecitos Nuclear Center, the General Atomics facility, the Laboratory for Energy-Related Health Research, and the Stanford Linear Accelerator Center. The Non-Defense account also includes the administration of grants at the Oakland Operations Office. The Lawrence Berkeley National Laboratory and the Stanford Linear Accelerator Center continue to have operating facilities under other DOE programs such as the Office of Science, while the other sites are being returned to the landowners.

Program Goal

EM Programmatic goals are to have cleanup completed at these sites by 2006; and to ensure operations, facilities and contaminated sites pose no undue risk to the public, worker health and safety; to maintain compliance with applicable environmental laws; and to manage risks associated with current and prior DOE operations at these sites.

Program Objectives

The program objective is to assess, remediate, decontaminate and decommission contaminated sites and facilities; characterize, treat, minimize, store, and dispose of hazardous and radioactive waste; and develop, demonstrate, test and evaluate new cleanup technologies. These program activities are conducted taking an integrated approach to assessing work and meeting schedules, while balancing risk, mortgage reduction, compliance, cost efficiencies, stakeholder input, and implementation of enhanced performance mechanisms. Financial responsibility for newly generated waste will be returned to the generating DOE program by FY 2003. All of the Oakland Operations Office Non-Defense EM funded sites will be cleaned up and all legacy waste will be characterized and shipped off-site by FY 2006. Long-term surveillance and maintenance of implemented remedial actions (e.g., pump and treat facilities) will be assumed by the landlord programs post FY 2006.

The Oakland Operations Office has plans for the use of innovative technologies at several of its installations. For example, a new remediation technology using water-vapor and nitrogen was chosen for cleaning the sodium loop/systems at the Energy Technology Engineering Center. This technology was selected because it was proven to be a cost-effective method for the removal of sodium and will not

generate hazardous waste. Innovative technologies are also being considered at the Energy Technology Engineering Center for testing ground water remediation. These technologies include anaerobic bio-remediation, steam injection, ozone injection, bio-sparging, moving bed liquid phase carbon adsorption and high vacuum dual phase extraction. In general, the technology selected must be cost-effective to implement and have no adverse impact on neighboring property. Decreased contamination migration during the pilot tests is considered a goal. Technologies being considered at the Laboratory for Energy-Related Health Research will allow for recycling and reuse of material and waste from past decontamination and decommissioning operations and characterization activities. When appropriate, either microencapsulation for lead, waste stabilization or compaction will be used.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table, as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- Continue environmental restoration activities, i.e., groundwater monitoring, treatment system operation, removal actions, decontamination and decommissioning at Lawrence Berkeley National Laboratory, Stanford Linear Accelerator Center, the Laboratory for Energy-Related Health, and the Energy Technology Engineering Center, to ensure compliance with Federal Facility Agreements and State orders and continue to meet commitments in the *Accelerating Cleanup: Paths to Closure* (FY 2000).
- Shipped about 60 cubic meters of mixed low-level waste to Envirocare; 850 cubic meters of low-level waste to Hanford; and 882 cubic meters of low-level waste to the Nevada Test Site from the Energy Technology Engineering Center (FY 1998).
- Completed decontamination and decommissioning of Liquid Metal Development Lab.-1, and Building 104, a radioactive facility at the Energy Technology Engineering Center (FY 1998).
- Dispose of about 1,000 cubic meters of low-level waste from the Energy Technology Engineering Center (FY 1999).
- Complete assessment activities for the SNAP-8 Groundwater Prototype Test Facility and the H-1 Heater and continue pipe removal and complete bulk sodium removal from the Small Component Test Installation at the Energy Technology Engineering Center (FY 1999).
- Completed 13 release site assessments at the Laboratory for Energy-Related Health Research (FY 1998).
- Removed contaminated soil from the southwest trenches at the Laboratory for Energy-Related Health Research (FY 1998).

- Complete Engineering Evaluation/Cost Analysis and Remedial Action workplan and begin removal actions at Sr-90/Ra-226 areas and complete removal action at the Southwest Trenches Area at the Laboratory for Energy-Related Health Research (FY 1999).
- Completed interim removal action at the Plating Shop and completed Remedial Investigation/Feasibility Study activities at the former Solvent Underground Tank Area and characterization of the master substation at the Stanford Linear Accelerator Center (FY 1998).
- Complete interim removal action at the Lower Salvage Yard and Remedial Investigation/Feasibility Study activities at the Monitoring Well 24 area Plating Shop at the Stanford Linear Accelerator Center (FY 1999).
- Disposed of 60 cubic meters of low-level waste from Lawrence Berkeley National Laboratory (FY 1998).
- Continue to prepare Lawrence Berkeley National Laboratory mixed waste for shipment to Idaho National Engineering and Environmental Laboratory and begin to work-off low-level waste formerly stored at the old Hazardous Waste Management Facility (FY 1999).
- Obtained approval from Hanford and shipped 0.5 cubic meters of low-level biowaste from Laboratory for Energy Related Health (FY 1998); continue shipments in FY 1999.
- Completed closure of Hazardous Waste Handling Facility at Lawrence Berkeley National Laboratory (FY 1998).
- Perform interim corrective measures at Building 17 and 52 by removing polychlorinated biphenyl contaminated soil at Lawrence Berkeley National Laboratory (FY 1999).
- Completed Hot Cell Facility decontamination activities at General Atomics (FY 1998).
- Complete the dismantlement of the Hot Cell Facility and soil remediation activities at General Atomics (FY 1999).
- Complete cleanup activities at the General Atomics Site (FY 2000).
- Initiate characterization activities for decontamination and decommissioning of General Electric Hot Cell (FY 1999).
- Continue storage, treatment, and some off-site disposal of waste (low-level, mixed low-level, and transuranic) at the Lawrence Berkeley National Laboratory, the Laboratory for Energy-Related Health Research, and the Energy Technology Engineering Center (FY 2000).

Site Description

Lawrence Berkeley National Laboratory

The 130-acre Lawrence Berkeley National Laboratory site is located adjacent to the University of California in Berkeley, California Remediation activities at the Lawrence Berkeley National Laboratory focus on characterization and remediation of contaminated soil and ground water and the closure of the old Hazardous Waste Handling Facility. Currently, there are 163 release sites and one facility on site, of which 125 release sites and the facility will be completed by FY 2000. The waste management activities provide compliant storage, treatment, and off-site disposal of both legacy and currently generated hazardous and radioactive waste. Disposal of a backlog of non-compactible low-level waste to Hanford will begin in FY 1999. Environmental restoration activities will be completed and the financial responsibility for newly generated waste will be returned to the generating DOE program by FY 2003.

Energy Technology Engineering Center

The Energy Technology Engineering Center is a DOE facility located on 90 acres of leased land from Boeing North American Corporation in Simi Valley, California. The environmental restoration activities at the Energy Technology Engineering Center are to remediate contaminated ground water, complete decontamination and decommissioning of 12 remaining radiological facilities, deactivate and cleanup of 5 remaining sodium facilities, provide landlord functions, complete the 6 remaining release sites, and perform waste characterization and off-site disposal by FY 2005. Overall site closure will be achieved by FY 2006.

General Electric

The General Electric Site is a privately-owned site located near Pleasanton, California. Activities are focused on cleanup of a High Level Hot Cell and irradiated reactor components and a glove box enclosure. In FY 1998, surveillance, maintenance and characterization activities will be initiated. The General Electric site is comprised of 2 facilities, and cleanup will be completed by FY 2006. Once the facility is completed, it will be returned to the landowners for future use.

General Atomics

The General Atomic site is privately-owned and located near San Diego, California. General Atomics has maintained and operated a Hot Cell Facility for over 30 years to conduct both Government and commercially funded nuclear research and development. Department of Energy efforts are focused on cleanup of the Hot Cell Facility and surrounding contaminated soils. The General Atomics site is comprised of 1 facility and 2 release sites, all of which will be completed by FY 2000. Cleanup

activities will be finalized with the off-site removal of legacy waste and return of the site to the landowners for unrestricted future use.

Laboratory for Energy-Related Health Research

The Laboratory for Energy-Related Health Research site is located at the University of California, Davis. Research at the laboratory originally focused on the health effects from chronic exposure to radionuclides using animal subjects to simulate radiation effects on humans. DOE terminated the research program and closed the Laboratory in 1988. Environmental restoration activities are directed toward cleaning up DOE areas of site contamination for release to the University of California, Davis without radiological restrictions. The Laboratory for Energy-Related Health Research site is comprised of 17 release sites, of which 8 will be completed by FY 2000; and 8 facilities, of which 7 are to be completed as of FY 2000. Waste characterization and off-site disposal and overall site cleanup will be completed by FY 2002.

Stanford Linear Accelerator Center

The Stanford Linear Accelerator Center site is a 426-acre site located at Stanford University in California. It is managed under contract between DOE and Stanford University where theoretical research in high-energy particle physics is conducted. Remediation efforts focus on the cleanup of polychlorinated biphenyls contaminated soil sites and several solvent contaminated ground water sites. The Stanford Linear Accelerator Center site is comprised of 14 release sites, all of which will be completed in FY 2002. Responsibility for waste management activities was transferred to Energy Research, the generating DOE program, in FY 1998.

Oakland Operations Office

The Oakland Operations Office and the State of California have an agreed to statement of work for grant funds. Oakland Operations Office awards and manages grants provided to the state for oversight activities which include, participation in meetings, review of documents, and involvement with the public.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The Lawrence Berkeley National Laboratory, Stanford Linear Accelerator Center, and Energy Technology Engineering Center sites are managed through performance based contracts to assure the most cost-effective services to the Government. The Laboratory for Energy-Related Health Research site is managed through an incentivized contract. The scope planned for FY 2000 at these sites has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. The project work at these sites have had an independent cost review of the scope (e.g. the Corps of Engineers and Oakland's in-house non-programmatic cost estimating staff have reviewed the Energy Technology Engineering Center scope, and this staff has also reviewed the Laboratory for Energy-Related Health Research scope and cost). The funds requested for FY 2000 for these sites are appropriate to perform the activities based on a historical level of effort costs.			
Page 831 Page 831 **OK-003 / Lawrence Berkeley National Laboratory Soils and Groundwater (Environmental Restoration)** The mission of this project is to investigate and cleanup all release sites of hazardous and/or radioactive waste in soil and groundwater that may have occurred at the site. All remediation activities will be conducted using Resource Conservation and Recovery Act guidance and State regulations. ■ Continue monitoring, maintenance, and operations of groundwater treatment systems. ■ Prepare corrective measures study and begin excavation of approximately 100 cubic yards of contaminated soil at seven locations.

OK-040 / Program Management and State Grants

This project provides funding for the Oakland Operations Office to support and manage state grants.

- Continue to provide grant funds in support of state oversight activities.

OK-040	87	0	300

Metrics
No quantifiable corporate performance measures are associated with this project.

OK-042 / Energy Technology Engineering Center Waste Management

This project accomplishes all necessary activities to manage and implement a waste management program for ongoing and planned environmental cleanup activities at the Energy Technology Engineering Center site. This project funds two existing facilities that will provide centralized waste management of hazardous, radioactive and mixed waste generated from environmental cleanup activities and transportation of wastes for its final disposition. Funded activities include: (1) operation of the Hazardous Waste Management Facility; (2) operation of the Radioactive Material Handling Facility; and (3) Resource Conservation and Recovery Act closure of these facilities upon the end of their useful life (by the end of FY 2006).

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Continue operation of the Radioactive Materials Handling Facility and the Hazardous Waste Management Facility.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
OK-005 / Stanford Linear Accelerator Center (Environmental Restoration)	
■ Increased funding to support completion of environmental restoration activities at the Stanford Linear Accelerator Center site by FY 2002	400
OAK-007 / Energy Technology Engineering Center Remediation	
■ Increase in funds supports completion of decontamination and decommissioning of foundations at the Sodium Component Test Loop and Liquid Materials Development Laboratories 1 and 2 to maintain planned site closure by FY 2006. These activities were not originally planned	1,896
OAK-009 / Energy Technology Engineering Center Landlord	
■ The decrease in funding is due to fewer facilities needing infrastructure management and surveillance and maintenance and major divestment actions	-1,928

	FY 2000 vs. FY 1999 ($000)
OK-010 / Laboratory for Energy-Related Health Research Environmental Restoration	
■ Requested funding level is adequate to allow performance of activities necessary to complete project in FY 2002 as scheduled. No significant change	-30
OK-012 / Hot Cell Facility Decontamination and Decommissioning at General Atomics	
■ Decrease reflects rampdown of activities toward project completion in FY 2000	-930
OK-013 / General Electric Decontamination and Decommissioning (Environmental Restoration)	
■ Increased cost for surveillance and maintenance of facility	187
OK-014 / Laboratory for Energy-Related Health Research Waste Management	-
■ Decrease in funding is related to the reduced volume of environmental mixed low-level waste estimated to be processed and stored	-496
OK-015 / Lawrence Berkeley National Laboratory Legacy Waste	
■ Slight increase in low-level waste treatment cost and mixed low-level waste storage costs for legacy waste	270
OK-016 / Lawrence Berkeley National Laboratory Newly Generated Wastes	
■ Slight increase in low-level waste treatment cost and mixed low-level waste storage cost for newly generated wastes and to fund pollution prevention activities	160
OK-040 / Program Management and State Grants	
■ Increased funding for the Oakland Operations Office is needed to support and manage the state grants associated with regulatory, oversight and participation	300
OK-042 / Energy Technology Engineering Center Waste Management	
■ Increase in costs due to shipping of low-level waste from decontamination and decommissioning activities and other soil shipments; and work on the Resource Conservation and Recovery Act closure of the Hazardous Waste Materials Facility (Building 133) at the Energy Technology Engineering Center	936
Total Funding Change, Oakland	765

Richland

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Environmental Management Site/Project Completion program, managed by the Richland Operations Office, is cleanout and surveillance and maintenance activities for buildings formerly used for Nuclear Energy research and development.

Program Goal

The goal is to transition former Nuclear Energy facilities to safe, compliant, long-term, economic, interim condition pending ultimate disposition.

Program Objective

The objective is to perform cleanout and stabilization activities to put these facilities into a low-cost surveillance and maintenance condition as soon as possible.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table, as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

No significant change.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Site Description

Hanford

The Richland Operations Office manages the Hanford site, which is located on 560 square miles (1,450 square kilometers) in southeastern Washington Hanford was among the first facilities constructed by the Manhattan Project for the production of plutonium for national defense Historically, the Hanford mission was plutonium production, reactor and processing operations, and research related to advanced reactors, energy technologies, and basic sciences. All production activities ceased in 1989, leaving a legacy of significant quantities of hazardous and nuclear waste.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The site is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost-effective services to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the Accelerating Cleanup: Paths to Closure. All of the projects included in this section of the budget have had an independent cost review of the scope, and the funds requested for FY 2000 are appropriate to perform the activities based on estimated project progress and accumulated cost management success.			
RL-TP08 / 324/327 Facility Transition Project			
This project provides for planning, deactivation, and maintenance of a minimum safe status for the 324/327 facilities, clean out of the B-Cell in the 324 building, and legacy waste removal from the 327 building.			
■ In FY 2000 there is no activity in the Non-Defense Site/Project Completion budget for this project. Funding is included under the Defense Site/Project Completion budget, beginning in FY 1999.			
RL-TP08	13,200	0	0

Metrics
No quantifiable corporate performance measures are associated with this project.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
RL-TP11			
The purpose of this project is to safely transition the Plutonium Recycle Test Reactor/309 Building, the Nuclear Energy Legacies, and the Fast Flux Test Facility/Fuels and Materials Examination Facility (FY 1998 only) to a deactivated state This includes minimum safe surveillance and maintenance activities necessary for maintaining facility safety basis.			
■ Continue minimum safe surveillance and maintenance activities necessary for maintaining facility safety bases.			
RL-TP11	5,853	1,863	1,418

93-E-900 Long Term Storage of TMI-2 Fuel, Idaho National Engineering and Environmental Laboratory, Idaho Falls, Idaho (ID-SNF-104-N)

(Changes from FY 1999 Congressional Budget Request are denoted with a vertical line [|] in the left margin)

Significant Changes

Scope of this project has been reducted by removing the Transport Equipment and aligning this work with Defense Operating funds for fuel movement (documented funding determination).

The license application process has delayed construction and changed some technical requirements. In addition, a primary subcontractor went bankrupt causing significant delays resulting in additional subcontractor and contractor costs. As a result, the total estimated cost and total project cost have increased.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Physical Construction Start	Physical Construction Complete

2000	2,500	2,500	1,909
2001	0	0	5,179

3. Project Description, Justification and Scope

This project provides dry storage for reactor fuel bearing materials currently in the Test Area North (TAN) Hot Shop Pool including the Three Mile Island-2 (TMI-2) core debris (packaged in canisters). The Three Mile Island-2 core debris canisters will be moved to an interim storage system at Idaho Nuclear Technology and Engineering Center (INTEC), formerly known as Idaho Chemical Processing Plant (ICPP), provided by a vendor under a design/build/turnkey procurement contract.

The Long Term Storage of Three Mile Island-2 Fuel Project includes construction of a canister dewatering and drying system, and a Nuclear Regulatory Commission (NRC) licensed Independent Spent Fuel Storage Installation (ISFSI).

The purpose of this project is to provide dry fuel storage capabilities for the fuel bearing material currently stored in the TAN-607 Pool and thus reduce the current risk of submerged fuel storage. The TAN-607 Pool does not meet current DOE Orders. A commercially available and licensable dry storage system will be constructed at Idaho Nuclear Technology and Engineering Center to receive and store the Three Mile Island-2 fuel canisters. A dewatering and drying system will be installed at TAN to remove the water from the canisters prior to transport and dry storage. (Drying operation is not in project scope.)

Justification of need for the Long Term Storage of Three Mile Island-2 Fuel Project is five fold. In prioritized order, this project will:

1) Comply with DOE, the Department of Navy and the State of Idaho Agreement and the Federal District Court Order that incorporated as requirements, the terms and conditions of the parties Settlement Agreement. Paragraph E7 of this agreement states: "DOE shall complete construction of the Three Mile

[a] Directed reduction of $466,000 due to rescission directed by Congress

Island dry storage facility by December 31, 1998. DOE shall commence moving fuel into the facility by March 31, 1999, and shall complete moving fuel into the facility be June 1, 2001".

2) Significantly reduce annual storage costs thus saving a substantial fraction of the planned operating funding ($2000 K+ per year for 30 years) for storage surveillance activities.

3) Avoid potential long-term problems associated with storage in an unlined, obsolete (circa 1950) pool. In addition to being unlined, installed pool monitoring apparatus does not exist.

4) Prolong canister life, thus eliminating subsequent repackaging costs, by removing the canisters from the lifetime-limiting water environment.

5) Allow removal of fuel materials from the pool thus allowing the facility to be made available for shut down, or decontamination, or decommissioning.

Failure to complete this project will result in non-compliance with the Idaho Settlement Agreement, continued acceptance of the financial, environmental and safety liabilities associated with storage in an aging, outdated pool, and postponement of the inevitable need to remove the pool contents to a more stable storage environment, with potential costs associated with repackaging.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
Preliminary and Final Design Costs	1,756	1,500
Project Management costs (2.3% of TEC)	652	0
Total, Engineering, design, inspection and administration of construction costs (8.6% of TEC)	2,408	1,500
Construction Costs		
Improvements to Land	505	275
Special Facilities	0	700
Specialized Equipment/Other Structures	15,591	15,132
Utilities	0	330
Removal cost less salvage	150	0
Inspection, design and project liaison, testing, checkout and acceptance	687	0
Construction Management Costs (<1% of TEC)	162	200
Project Management Costs	4,639	3,600
Total, Construction Costs	21,734	20,237
Contingency (approximately 13.8% of TEC)	3,858	3,763
Total, Line Item costs (TEC)	28,000	25,500

5. Method of Performance

The Department of Energy Idaho Operations Office (DOE-ID) assigned performance of the Line Item Scope of Work to Lockheed Martin Idaho Technologies Company (LMITCO). Lockheed Martin Idaho Technologies Company will be responsible for implementation of the project including selection of principal subcontractors. DOE Idaho Operations Office project management will be performed by the Spent Fuel Program Office. DOE Idaho Operations Office is the Nuclear Regulatory Commission licensee and is, therefore, responsible to the Nuclear Regulatory Commission for the system as documented in the Safety Analysis Report. Safety, environmental, and other project documentation will be furnished to the project on an as-needed basis by the DOE Idaho Operations Office and HQ matrix organizations.

Lockheed Martin Idaho Technologies Company (LMITCO), as the operating contractor, will provide project management services to coordinate all project activities. Lockheed Martin Idaho Technologies Company will be responsible for the development of the project's technical requirements, completion of the Architectural and Engineering design, review and management of the engineering and construction activities, coordination of long-lead procurement of construction materials and equipment, construction subcontracting, coordination of the activities of construction subcontractors, checkout of systems, and turnover of the completed project.

6. Schedule of Project Funding

(dollars in thousands)

	Prior Years	FY 1998	FY 1999	FY 2000	FY 2001	Total
Project Cost						
Facility Cost						
Design	2,086	152	170	0	0	2,408
Construction	4,331	3,909	10,264	1,909	5,179	25,592
Total Facility Cost	6,417	4,061	10,434	1,909	5,179	28,000
Other Project Cost						
Conceptual design costs	0	0	0	0	0	0
NEPA documentation costs	228	0	0	0	0	228
Other project-related costs	2,653	715	902	320	682	5,272
Total other project costs	2,881	715	902	320	682	5,500
Total project costs	9,298	4,776	11,336	2,229	5,861	33,500
LESS: Non-Federal contribution	0	0	0	0	0	0
Total, Other project costs	9,298	4,776	11,336	2,229	5,861	33,500

7. Related Annual Funding Requirements

	(FY 2001 dollars in thousands)	
	Current Estimate	Previous Estimate
Annual facility operating costs	950	950
Annual facility maintenance and repair costs	0	0
Total related annual funding (operating from FY 2001 through FY 2021)	950	950

Post 2006 Completion

Program Mission

The Post 2006 Completion account includes Environmental Management projects currently planned to require funding beyond FY 2006 Within the Non-Defense Environmental Management appropriation, this account includes projects at the Oak Ridge Reservation in Tennessee, the Los Alamos National Laboratory in New Mexico, and a variety of multi-site activities.

After completion of cleanup, it will be necessary for the Environmental Management program to maintain a presence at some sites to monitor, maintain, and provide information on the contained residual contamination. These activities will be necessary to ensure the reduction in risk to human health is maintained. Such stewardship will include passive or active controls, and, often, treatment of ground water over a long period of time. The extent of long-term stewardship required at a site will reflect the end-state developed in consultation among the Department of Energy and other representatives of the Administration, Congress, Tribal Nations, representatives of regulatory agencies and state and local authorities, representatives of nongovernmental organizations, and interested members of the general public.

Program Goal

Accelerating cleanup and project completion is a central goal of the Environmental Management program. This goal is part of the strategies identified in the *Accelerating Cleanup: Paths To Closure* document, whereby all Environmental Management sites are working aggressively to reduce outyear costs by completing projects as soon and as efficiently as possible, thereby reducing life-cycle costs and schedules. For those sites in the Post 2006 Completion account, treatment will continue for the remaining "legacy" waste streams.

Program Objectives

- Continue to address the most serious environmental risks across the Department of Energy complex and ensure that facilities and activities pose no undue risks to the public and worker safety and health.
- Continue to be substantially in compliance with applicable environmental and other requirements and meet compliance milestones.
- Continue surveillance and maintenance of facilities.

Performance Measures

Environmental Management has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected for the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts. These performance measures can be found in the site details that follow.

Significant Accomplishments and Program Shifts

The FY 2000 budget request fully reflects the project-oriented structure that Environmental Management has developed as a key component of the effort to accelerate cleanup and reduce costs. All Environmental Management activities have been organized into projects which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, Environmental Management sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow.

Funding Profile

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Public Law Authorization:

Public Law 105-245, The Energy and Water Development Appropriations Act, Fiscal Year 1999.

Albuquerque

Mission Supporting Goals and Objectives

Program Mission

The mission of the Non-Defense Environmental Management, Post 2006 Completion program, carried out by the Albuquerque Operations Office, is to support a portion of the activities at the Los Alamos National Laboratory in New Mexico.

Program Goal

The Los Alamos National Laboratory has been designated as the lead laboratory for planning and operations for the recovery and dismantlement of unwanted radioactive sealed sources, from both the public and private sector, which have no previous or current disposition options. In this capacity, the Los Alamos National Laboratory provides solutions to complex-wide technical and operational issues associated with stabilization and storage of plutonium and other nuclear materials.

Program Objectives

The objective of the Radioactive Source Recovery Program is to establish compliance with the Low-Level Radioactive Waste Policy Amendments Act of 1985 (Public Law 99-240) with respect to unwanted radioactive sealed sources, which under the Act, are made a Department of Energy responsibility. A further objective of this program is to remove these unwanted radioactive sources from the private and public sector as expeditiously as possible. This effort will reduce potential risk to the public health and safety and the environment by the systematic recovery of these sources for acceptance at the Los Alamos National Laboratory, where they can be deactivated and safely stored until a final disposition path is identified.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table; as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

This program was previously funded from the Department of Energy Headquarters as a developmental program. During this period the following accomplishments were made:

- Completed National Environmental Policy Act documentation to accept and dismantle unwanted radioactive sources at the Los Alamos National Laboratory
- Established a method to respond to emergencies involving radioactive sealed sources in cooperation with the Nuclear Regulatory Commission and State nuclear material licensing agencies Emergency recoveries have been made successfully.
- Implemented a procedure and conducted a pilot program to recover sources on a routine basis.
- Identified appropriate facilities at the Los Alamos National Laboratory to receive, store, and dismantle radioactive sources.
- Established cost-recovery feasibility per the requirements of Public Law 99-240.
- In FY 2000, this program shifts from a developmental effort to a fully operational program where infrastructure will be established and programmatic implementation will begin to achieve compliance with Public Law 99-240.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
AL/RSRP/LANL/Radioactive Source Recovery Program	975	1,611	6,000	4,389	272.4%

Los Alamos National Laboratory	975	1,611	6,000	4,389	272.4%
Total, Albuquerque	975	1,611	6,000	4,389	272.4%

Site Description

Los Alamos National Laboratory

The Los Alamos National Laboratory encompasses over 43 square miles in northern New Mexico, and conducts major programs in multiple areas, including applied research in nuclear and conventional weapons in development, nuclear fission and fusion, nuclear safeguards and security, and environmental and energy research. The waste produced includes low-level, mixed, hazardous, transuranic, sanitary waste steams, and small amounts of other waste from research. The primary waste management activities include storage, treatment, and disposal of waste.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Los Alamos National Laboratory is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. The projects included in this section of the budget have not had an independent cost review of the scope. This is a new project, and it has undergone an internal cost review. The funds requested for FY 2000 are appropriate to perform the activities based upon an internal cost review of this project and a review of similar projects that have undergone independent reviews at this facility.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
AL/RSRP/LANL/ Radioactive Source Recovery Program			
The purpose of this program is to establish compliance with Public Law 99-240 with respect to the Department of Energy's responsibility for acceptance and disposition of unwanted radioactive sealed source devices and material covered by SECTION 3(b)(1) Paragraph (D) of the Act. Establishment of this program fulfills the Department of Energy's obligation to Congress described in the Recommendation of Management of Greater Than Class-C Low-Level Radioactive Waste Report to Congress in response to Public Law 99-240 (February 1987) (DOE/NE-0077) with respect to radioactive sealed sources. Establishment of this program in FY 2000 as an operational capability at the Los Alamos National Laboratory will begin the process of reducing risk to public health and safety and the environment posed by unwanted radioactive sealed sources for which no disposition path previously existed.			
■ Fiscal Year 2000 becomes the first year of full operations where infrastructure and operational capability will be implemented on an operational basis to address compliance with Public Law 99-240 with respect to radioactive sealed source devices.

Oak Ridge

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Environmental Management, Post 2006 Completion account, carried out by the Oak Ridge Operations Office, is to direct and monitor implementation of the non-defense liquid waste treatment operations at the Oak Ridge National Laboratory, as well as the facility deactivation and environmental restoration activities within the Oak Ridge Reservation and several off-site properties in Tennessee contaminated by the Oak Ridge facility operations The non-defense activities are comprised of stabilization and deactivation of 50 excess facilities and their material at the Oak Ridge Reservation, and maintaining deactivated facilities in a safe, low cost, environmentally sound condition, awaiting final decommissioning at the 2,900 acre Oak Ridge National Laboratory. Deactivation of these facilities will reduce the risks posed by 1,400,000 curies of radioactive material and 60 tons of sodium and lithium hydride, and ultimately reduce the annual costs for surveillance and maintenance from $10,000,000 to $1,500,000 by FY 2003. Contamination at the Lower East Fork Poplar Creek and Clinch River/Poplar Creek are managed as off-site release sites

Program Goal

The overall goal at the Oak Ridge Reservation is to complete all remedial action sites by FY 2013, and to meet acceptance criteria for transfer by FY 2003 to the decommissioning program of fifty excess facilities currently under the deactivation program. These activities assume a cumulative enhanced performance efficiency of about 30 percent through FY 1999.

Program Objectives

The program objectives are to continue surveillance and maintenance of 50 excess facilities and complete vulnerability resolutions in response to the Defense Nuclear Facilities Safety Board

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table, as well as at a project level, in the Detailed Program Justification

Significant Accomplishments and Program Shifts

- In FY 2000, the majority of the remediation and decontamination and decommissioning activities have been consolidated under the Defense appropriation
- For those facilities, which make up the High Ranking and Isotopes Facilities Deactivation Programs, continued surveillance and maintenance activities for 41 facilities (FY 1998) and continue surveillance and maintenance for 27 facilities (FY 1999).
- At the Tower Shielding Facility, completed procurement of fuel baskets; completed removal/consolidation of surplus materials; removed radioactive sources at Buildings 7700B and 7704 not needed by lessee, leased the facility to a private company (FY 1998); and complete disposition of sodium and lithium hydride shields from the facility (FY 1999).
- At the Bulk Shielding Reactor, completed fuel removal and shipped to the Savannah River Site (FY 1998).
- Transitioned 14 facilities from nuclear material and facilities stabilization activities to environmental restoration activities (FY 1998) and complete deactivation of four facilities (Buildings 3026C, 3026D, 7720, and 13822) (FY 1999).
- Removed 1,190,500 curies of strontium and 27 curium sources from Building 3517 (FY 1998).
- Continued deactivation activities in Buildings 3026D and 3038 (completed cleanup of the barricades) (FY 1998) and continue deactivation activities in Building 3038 (FY 1999).
- For the Melton Valley Watershed, finalized the feasibility study and proposed plan (FY 1998) and issue Record of Decision (FY 1999).
- Completed sludge removal from the old hydro fracture tanks and gunite tank W-6 (FY 1998).
- Removed blockages from the Molten Salt Reactor experiment off gas system (FY 1998).
- Begin remedial action at the main plant surface impoundments in Bethel Valley (FY 1999).
- Provides grants to the State of Tennessee through Agreements-in-Principle and the Federal Facilities Act Agreement and funding for the National Metal Recycle Center of Excellence (FY 2000).
- Surveillance and maintenance required for excess facilities at the Oak Ridge National Laboratory in compliance with Code of Federal Regulations (FY 2000).

SITE DESCRIPTION

Oak Ridge Reservation

The Oak Ridge Reservation encompasses about 37,000 acres and is comprised of three facilities; the Y-12 Plant, which was a uranium processing facility and now dismantles nuclear weapons components and serves as the nation's storehouse for special nuclear materials; the East Tennessee Technology Park, which was a uranium enrichment facility and is now being transitioned through reindustrialization; and the Oak Ridge National Laboratory, which conducts applied and basic research in energy technologies and in the physical and life sciences. Only the Oak Ridge National Laboratory is funded under the Non-Defense Post 2006 Completion account.

Oak Ridge National Laboratory

Activities carried out at the Oak Ridge National Laboratory historically have supported both the defense production operations and civilian energy research effort. This group of facilities requires cleanup resulting from a variety of research and development activities, which were supported from past DOE programs and many facilities were supported by multiple programs over a long period of time.

The Oak Ridge National Laboratory currently conducts applied and basic research in energy technologies and the physical and life sciences. Transuranic, mixed low-level, hazardous and sanitary, and industrial waste are managed at the three Oak Ridge Reservation facilities. Although the operations are different the waste generated from these operations is essentially the same.

Due to past efforts conducted, funding for annual assessment/cleanup has been split between two appropriation accounts and in FY 2000 the majority of support will be funded under the Defense Environmental Restoration and Waste Management Appropriation.

Off-Site

There are several off-site release sites including the Lower East Fork Poplar Creek, the Clinch River/Poplar Creek, the Atomic City Auto Parts, the Oak Ridge Tool and Engineering Site, and the David Witherspoon Site that were contaminated due to reservation operations. All waste types are stored, treated, and disposed in compliance with regulations.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Oak Ridge Operations Office, Environmental Management, in the Non-Defense Post 2006 Completion account is managed through an incentivized integrated contract, with fixed-price subcontracts, to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to strive towards the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. The projects included in this section of the budget have had an independent review of the scope, and of the process used to develop the request for FY 2000.

This project is to carry out activities of directed support in FY 2000.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Directed support provides grants to the State of Tennessee through Agreements-in-Principle and the Federal Facilities Act Agreement. This account also supports other directed support programs and is split-funded with the Environmental Management/Defense Environmental Restoration and Waste Management Appropriation and the Uranium Enrichment Decontamination and Decommissioning Fund (total FY 2000 funding $10,367,000).			
■ Provide grants to the State of Tennessee			
■ Conduct subcontract close-out activities.			
■ Conduct work-force transition activity not related to section 3161 of the Defense Authorization Act.			
■ Provide funding for the National Metal Recycle Center of Excellence.			
■ Conduct other directed activities			
OR-48204	1,523	1,100	1,105

Metrics
No quantifiable corporate performance measures are associated with this project.

OR-63201 / Nuclear Materials Facility Stabilization

This project is responsible for the deactivation of 50 excess facilities at the Oak Ridge National Laboratory to a safe, low cost, and environmentally sound condition. The program also conducts surveillance and maintenance activities required to maintain the facilities in a safe, secure, and environmentally sound condition until deactivation is completed

In FY 2000, the requested level of funding will provide the necessary, minimum level of surveillance and maintenance required to maintain excess facilities in a safe manner By funding these activities in FY 2000, it will allow the program to be in compliance with the CFR 41-101 47.4000, which prohibits the abandonment of excess facilities. The funding level being requested is appropriate for these activities based on historical data This project is split funded with the Defense Environmental Restoration and Waste Management Appropriation (total FY 2000 funding $9,937,000). The total metrics for this project are reflected below.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Will continue surveillance and maintenance activities for 15 facilities.

Savannah River

Mission Supporting Goals and Objectives

Mission

This program activity supports remediation at the Savannah River Site, which is located in south-central South Carolina and is bordered on the southwestern side by the Savannah River. The closest major population centers are Aiken, South Carolina and Augusta, Georgia. Operations at the Heavy Water Component Test Reactor was terminated in 1964 deactivated in 1963. Ancillary buildings and equipment were removed in 1994. National Environmental Policy Act documentation, asbestos removal and decontamination and decommissioning began in 1995. The partially decommissioned reactor is currently scheduled for decontamination and decommissioning surveillance and maintenance activities, which will continue until completion of the decontamination and decommissioning phase.

Program Goal

The Savannah River Site is committed to closure of the Heavy Water Component Test Reactor dome to prevent deliberate entry and removal of any exterior components not expected to last at least sixty years.

Program Objectives

The Savannah River Site intends to prepare the Heavy Water Component Test Reactor for long-term storage. Chemical, radiological, and toxic hazards will be controlled through confinement to protect site workers, the public and the environment.

This project provides for the deactivation of the Heavy Water Component Test Reactor only. Additional projects will be required to meet the Environmental Management site end state. Contamination in the Heavy Water Component Test Reactor has not been defined. No plans have been made to reuse the Heavy Water Component Test Reactor after deactivation (post-FY 1998).

No nuclear materials, spent fuel, or high-level waste are stored in the Heavy Water Component Test Reactor, nor will any be generated. Waste streams generated will be defined in the deactivation plan when complete. Specific treatment methodologies for these wastes will depend on characterization, which has not been performed at this time.

According to the Heavy Water Component Test Reactor draft deactivation plan, the reactor dome doors will be welded shut. No provision for routine surveillance and maintenance will be made. The Heavy Water Component Test Reactor will remain in this state until such time as a final disposition action is funded.

Performance Measures

Performance Measures are provided at an aggregate level after the Funding by Site table; as well as at a project level, in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

- The Heavy Water Component Test Reactor will be deactivated and placed into long-term surveillance and maintenance mode (FY 1998). No entries into the facility are planned after FY 1998.

Multi-Site

Mission Supporting Goals and Objectives

Mission

The mission of the Non-Defense Environmental Management Post 2006 Completion account carried out by the Multi-Site programs includes funding for a small number of essential crosscutting Environmental Management (EM) activities. This activity consists of technical support activities, Packaging Certification and Transportation Safety activities and the Pollution Prevention program The Environmental Management program is being responsive to the General Accounting Office and others who have pushed for a greater emphasis on a more National focus for the EM programs.

Program Goal

The goals of the Multi-Site programs will allow EM to better coordinate EM-wide and Department of Energy (DOE)-wide program efforts and avoid overlaps and inconsistencies.

The mission of the Packaging Certification program is to support the protection of people and property from the potential consequences of normal and accident conditions of transport involving hazardous materials. The goals to support this mission are.

- Improve safety of packages used to transport hazardous materials through a program of design review, performance tests, and quality verification that satisfy internal operations and organizations external to the Department.
- Improve existing and develop new processes to maximize the efficiencies of these reviews and tests. Maintain an open and effective system of communication and coordination both internal and external to the Department.
- Ensure the package safety policies protect workers, the public, and the environment while providing program flexibility in accomplishing Departmental missions
- Ensure that the Package Certification and Safety Program is the Department's technical knowledge and analysis center for hazards classifications, design reviews, package training support and safety requirements.
- Ensure that package safety policies are coordinated with all affected customers and provide sufficient clarity of guidance to be correctly implemented.

The mission of the Office of Pollution Prevention is to reduce the generation of all waste streams in order to minimize the impact of the Department's operations on the environment, reduce operational costs, and improve the safety and health of its operations

These funds will allow the Department to meet the Secretary of Energy's pollution prevention goals to be achieved by December 31, 1999, as stated below:

- Reduce by 50 percent the generation of radioactive waste
- Reduce by 50 percent the generation of hazardous waste
- Reduce by 50 percent the generation of low-level mixed waste
- Reduce by 33 percent the generation of sanitary waste
- Recycle 33 percent of sanitary waste from all operations
- Increase procurement of Environmental Protection Agency designated recycled products to 100 percent, except where they are not commercially available at a reasonable price or do not meet performance standards.

The Department has established an additional goal to reduce waste generation from cleanup and stabilization activities by 10 percent annually, beginning in FY 1999 and will strive to achieve greater waste reduction in future years through continuous improvement.

Program Objectives

The Multi-Site activities focus' national attention on several areas that impact Environmental Management-wide goals and planned efforts, which cut across the Department of Energy complex.

Performance Measures

There are no Performance Measures associated with the Multi-Site activities.

Significant Accomplishments and Program Shifts

Technical Support to ER

- Provide technical support for EM/environmental restoration initiatives, including performance measure tracking/verification activities; project/baseline review/analysis efforts; and strategic/management plans (FY 1998/FY 1999/FY 2000).

Packaging Certification

- Continue efforts to reduce the backlog of safety reviews for packagings (FY 1998/FY 1999/FY 2000).
- Represent the Department of Energy in the United States delegation supporting international transportation safety and packaging certification regulations (FY 1998/FY 1999).

Pollution Prevention

- Maintain pollution prevention infrastructure at the Energy Technology Engineering Center, Lawrence Berkeley National Laboratory, and the Stanford Linear Accelerator Center to comply with the Resource Conservation and Recovery Act and the California pollution prevention requirements (FY 1998/FY 1999/FY 2000).

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
HQ-2-00 / Technical Support to ER	5,193	5,418	5,304	-114	-2.1%

Total, Multi-Site	10,738	9,274	9,120	-154	-1.7%

Site Description

The Multi-Site program budget supports the direction, coordination, tracking, and implementation of the EM programs among the multitude of sites where environmental management activities are being carried out. Activities supported include technical integration activities, document reviews, and cooperative agreements.

The Packaging Certification and Transportation Safety program activities provide for developing, coordinating, and implementing policies, standards, and guidance for aviation, maritime, rail, highway, pipeline, and hazardous materials safety for the Department. Under the authority provided by the United States Department of Transportation in 49 CFR, this program certifies Fissile and Type B packages for the transportation of radioactive materials for the Department. Evaluation and analysis of the Department of Energy line organizations' safety analysis reports for packaging are performed, in addition to providing external coordination between the Government and other governmental, commercial, and international bodies regarding packaging certification and transportation safety systems

The Office of Pollution Prevention coordinates pollution prevention program activities for the entire Department and provides non-defense resources to the DOE Oakland Operations Office. Its mission is to reduce the generation of all waste streams in order to minimize the impact of the Department's operations on the environment, reduce operational costs, and improve the safety and health of its operations.

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure* report. The funds requested for FY 2000 are appropriate to perform the activities based on a historical level of effort cost. No quantifiable corporate performance measures are associated with these projects.			
HQ-2-00 / Technical Support to ER			
The activities funded by this project include a variety of crosscutting efforts that support required Environmental Restoration and EM initiatives. Technical support is provided in the areas of performance measure tracking; information/data management integration; and project review/analysis.			
■ Provide support for the cooperative agreement with the Volpe National Transportation System Center on improving management systems (including database support); the National Academy of Sciences (peer reviews on specific projects); the Environmental Protection Agency; and the General Service Administration.			
■ Provide for Headquarters-supported field activities including crosscutting technical support, program integration efforts; and support for the Residual Radioactive Code Development.			
HQ-2-00	5,193	5,418	5,304

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
HQ-PC-001 / Packaging Certification			
The Packaging Certification and Transportation Safety program supports the protection of people and property from the potential consequences of normal and accident conditions of transport involving hazardous materials. This program addresses the need for robust packages that provide containment in the event of a transportation incident or accident and the concerns of internal and external stakeholders. Activities also include developing, coordinating, and implementing policies, standards, and guidance related to aviation, maritime, rail, highway, pipeline, and hazardous materials safety. This program performs evaluations and analyses of safety analysis reports for packaging; providing external coordination between the Department and other governmental, commercial, and international bodies regarding transportation safety and packaging certification. The program participates in the development of transportation safety.			
■ About 34 applications and safety analysis reports for highly hazardous materials packages will be certified and about two moderate hazardous materials package tests and approvals will be done.			
■ Technical support or assistance in packaging safety to one field office may be provided.			
■ The Standardized Computer Analyses for Licensing Evaluation and Small Casks Analysis System computer codes for confirmatory analysis during application and safety analysis report reviews, and the Radioactive Material Package database and website will be maintained			
HQ-PC-001	4,648	3,756	3,716
HQ/OPS-PP / Pollution Prevention			
This activity coordinates pollution prevention activities for the entire Department and provides non-defense resources to the Department of Energy Oakland Operations Office. Its mission is to reduce the generation of all waste streams in order to minimize the impact of the Department's operations on the environment, reduce operational costs, and improve the safety and health of its operations.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Maintain effective and compliant pollution prevention programs at the Oakland Operations Office to comply with Federal and California laws and regulations related to pollution prevention and waste minimization.			
OPS/HQ-PP	897	100	100
Total Multi-Site	10,738	9,274	9,120

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
HQ-2-00 / Technical Support to ER	
■ Environmental restoration crosscutting efforts in the areas of performance measure tracking, information/data management integration and project review and analysis are decreased.	-114
HQ-PC-001 / Packaging Certification	
■ Decrease reflects reduction in the number of applications for highly hazardous materials package certifications and for moderate hazardous materials package tests.	-40

Uranium Enrichment Decontamination and Decommissioning Fund

Proposed Appropriation Language

For necessary expenses in carrying out uranium enrichment facility decontamination and decommissioning, remedial actions and other activities of title II of the Atomic Energy Act of 1954 and title X, subtitle A of the Energy Policy Act of 1992, [$220,200,000] *$240,198,000*, to be derived from the Fund, to remain available until expended: *Provided*, That $30,000,000 of amounts derived from the Fund for such expenses shall be available in accordance with title X, subtitle A, of the Energy Policy Act of 1992. *(Energy and Water Development Appropriations Act, 1999.)*

Explanation of Change

None

Uranium Enrichment Decontamination and Decommissioning Fund

Program Mission

The Uranium Enrichment Decontamination and Decommissioning Fund was established by the Energy Policy Act of 1992 to carry out environmental management responsibilities at the nation's three gaseous diffusion plants. The three gaseous diffusion plants are located in the East Tennessee Technology Park in Tennessee, at the Portsmouth site in Ohio, and at the Paducah site in Kentucky. The Energy Policy Act also directs that this Fund be used to reimburse licensees operating uranium or thorium processing sites for the costs of environmental cleanup at those sites, subject to a site specific reimbursement limit.

The Uranium Enrichment Decontamination and Decommissioning Fund is an integral and necessary component of legislation to privatize uranium enrichment activities in the United States. The Uranium Enrichment Decontamination and Decommissioning Fund addresses the cleanup liabilities at the three gaseous diffusion plants that are attributable to historical DOE operations for weapons and commercial fuel. The future operations of the enrichment facilities will be managed by the commercial United States Enrichment Corporation. Ultimate cleanup of the facilities that are leased from the Department by the United States Enrichment Corporation will commence when operations are completed and the leases are terminated. The Decontamination and Decommissioning Fund includes contributions from annual budget appropriations and contributions from commercial utilities based upon historical enrichment services, measured in "separative work units."

Program Goal

The goal of the Uranium Enrichment Decontamination and Decommissioning Fund is to cleanup the surplus enrichment plants as soon as possible and reimburse licensees for their remediation activities at uranium and thorium sites. The enrichment plants include valuable facilities and equipment, and the cleanup costs will be offset to the extent that the Department is able to recover the value from these surplus assets.

Program Objectives

The Department plans to "re-industrialize" the surplus sites and infrastructure which will reduce the Department's cleanup cost and will transfer the surplus federal facilities to private sector firms for productive re-use. In this way, the local socio-economic impacts of shutting down these facilities will be offset by increased commercial job creation.

Performance Measures

EM has moved aggressively towards developing and implementing a performance-based budget that clearly demonstrates the program and project results expected with the resources requested. Building upon past experience, the FY 2000 budget was enhanced by aligning performance measures by project within the specific appropriation and program accounts. These performance measures can be found in the site details that follow.

Significant Accomplishments and Program Shifts

The FY 2000 budget request fully reflects the project-oriented structure that EM has developed as a key component to accelerate cleanup and reduce costs. All EM activities have been organized into projects which have a defined scope, schedule, cost, and end state. Through the strategies identified in the *Accelerating Cleanup: Paths to Closure* document, EM sites are working to sequence projects and track progress, thereby reducing life-cycle costs and schedules. Specific accomplishments and program shifts may be found in the site details that follow.

Oak Ridge

Mission Supporting Goals and Objectives

Program Mission

The Uranium Enrichment Decontamination and Decommissioning Fund was established by the Energy Policy Act of 1992 and is carried out by the Oak Ridge Operations Office to cleanup the nation's three gaseous diffusion plants. The three gaseous diffusion plants are located in Oak Ridge, Tennessee; Portsmouth, Ohio; and Paducah, Kentucky. The gaseous diffusion plant in Oak Ridge was shut down in 1985. The plants in Portsmouth and Paducah have been operated by the United States Enrichment Corporation since 1993. The Uranium Enrichment Decontamination and Decommissioning Fund supports decontamination and decommissioning, remedial actions, waste management, and surveillance and maintenance of the three gaseous diffusion plants. The Uranium Enrichment Decontamination and Decommissioning Fund is currently the sole funding source for cleanup at Portsmouth and Paducah, and is the dominant source of funds for the Oak Ridge Gaseous Diffusion Plant. The Uranium Enrichment Decontamination and Decommissioning Fund also reimburses licensees for cleanup of uranium and thorium processing sites that previously sold these materials to the government.

Program Goal

The Oak Ridge Operations Office goals are to continue ongoing remedial actions to prevent the spread of existing contamination, and waste management activities to address legacy wastes at the sites; complete ongoing remedial actions by FY 2002 and waste management activities by FY 2005 at Portsmouth and complete ongoing remedial action and waste management activities at Paducah by FY 2010. Comprehensive decontamination and decommissioning and cleanup of these sites cannot be completed until the privatized United States Enrichment Corporation terminates the leases on the two plants. The Department's cleanup goal for the gaseous diffusion plants will allow reuse of the sites for industrial purposes. To fulfill this goal, the Department must remove hazardous materials, treat and dispose of legacy waste, remediate sites to meet industrial reuse standards, decontaminate facilities to allow reuse, and demolish unusable facilities. Where possible, new technologies will be employed to address waste treatment, groundwater cleanup, and facility decontamination. The East Tennessee Technology Park is implementing all of these aspects in the ongoing cleanup program. The Department is actively transitioning the site from a federally-managed DOE installation to a privately-managed industrial park. The name of the site was changed from the Oak Ridge Gaseous Diffusion Plant to the East Tennessee Technology Park to reflect this ongoing transition. The leasing program will be fully implemented by 2006 and the site cleanup will be complete in 2009. The timely cleanup of the Oak Ridge site will free up funds to address cleanup at other sites following the cessation of operations. The cleanup program is being carried out under the requirements of federal and state compliance agreements that reflect community stakeholder involvement.

Program Objectives

The primary objective at Oak Ridge sites is to conduct remedial actions to limit the spread of contamination, waste management to remove legacy waste, and decommissioning to disposition the process and ancillary buildings. New technologies will be deployed, where possible, to address trichloroethylene contaminated soil and groundwater, for treatment of mixed waste, and for facility decontamination. Another objective is to solve cleanup challenges related to the significant amount of legacy wastes, the size and physical condition of the processing facilities and the areal extent of soil and groundwater contamination. For example, the Paducah groundwater plumes contain one of the largest volumes of off-site contamination in the Department of Energy complex.

The Oak Ridge Gaseous Diffusion Plant is shutdown, and the focus is on cleanup followed by re-use of viable facilities by private sector firms. Decommissioning of the three process buildings at the site will be completed to allow reuse by FY 2003.

Funding is requested to continue remedial actions that have prevented off-site migration of contaminants through groundwater at Portsmouth and reduce further migration of off-site groundwater plumes at Paducah. The Department plans to complete ongoing remediation at Portsmouth by FY 2002 and Paducah by FY 2010.

Performance Measures

Performance measures are provided at an aggregate level after the Funding by Site table as well as at a project level in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

East Tennessee Technology Park

- Mobilized and began removal of nuclear and non-nuclear equipment (FY 1998); construct and begin operations of the decommissioning workshop and continue equipment removal (FY 1999); and initiate decontamination processing and authorized releases of clean metals (FY 1999) from the K-33 Process Building under the three building decommissioning contract to reduce outyear mortgage costs for surveillance and maintenance cost and provide beneficial reuse of buildings.
- Completed Defense Nuclear Facilities Safety Board 94-1 compliance driven Deposit Removal Project (FY 1998).
- Initiated and completed Group 1 Auxiliary Facilities Demolition Project, and initiated Building K-1420 decommissioning to reduce out year mortgage cost for surveillance and maintenance (FY 1998).
- Complete cleanup of classified burial ground and Mitchell Branch plumes to mitigate contaminant migration to groundwater (FY 1999).

Portsmouth Gaseous Diffusion Plant

- Completed multi layer cap (FY 1998) and design seep collection system to passive treatment (FY 1999) for the Peter Kiewit Landfill; completed X-735 Landfill cap and closure (FY 1998) and independent certification (FY 1999); and removed X-7725 Diesel underground storage tank and contaminated soil to prevent contaminant migration off-site and to the groundwater (FY 1998).
- Treated 51 m^3 of mixed low-level waste, 12 m^3 of low-level waste, and shipped 55 m^3 of mixed low-level waste for off-site disposal (FY 1998). Treat 41 m^3 of mixed low-level waste, 79 m^3 of low-level waste, and ship for off-site disposal 956 m^3 of mixed low-level waste and 2,146 m^3 of low-level waste (FY 1999).
- Initiated (FY 1998) and complete (FY 1999) Risk Reduction Actions for East Drainage Ditch, Big Run Creek, North Drainage Ditch, and Northeast Drainage Ditch and complete risk reduction actions for the X-701B Holding Pond area soils (FY 1999) to prevent contaminant migration off-site via surface water pathways.
- Complete design and initiate construction for shutdown of the X-622T Groundwater Treatment Facility to reduce out year cost of operation and maintenance (mortgage reduction) (FY 1999).
- Regulator approval of Corrective Measures Study Reports for the Quadrant I (X-749 Contaminated Materials Disposal Facility/X-120 Old Training Facility), Quadrant IV, and Quadrant II (X-701B Holding Pond area groundwater plumes) as required to meet Regulatory compliance milestones and enable corrective actions to be conducted in FY 2001 (FY 1999).
- At Portsmouth, complete transition from investigation and interim corrective measures of contaminated soil source areas which will lead to final corrective measures implementation of groundwater contamination (primarily Trichloroethylene) in FY 2002 and reduce legacy waste inventory (FY 2000).

Paducah Gaseous Diffusion Plant

- Federal Facility Agreement was signed and executed by DOE, Environmental Protection Agency, and State of Kentucky for integration strategy and establishing compliance milestones for Comprehensive Environmental Response Compensation and Liability Act/Resource Conservation and Recovery Act response actions (FY 1998).
- Completed Record of Decision and remedial action for nine release sites and approval for closure on 2 underground storage tanks (FY 1998); Record of Decision, remedial design and remedial construction for LASAGNA electro-osmosis technology in-situ remediation of the Former Cylinder Drop Test Area (FY 1999) to prevent the migration of contaminants from the source area to groundwater.
- Completed removal action at six polychlorinated biphenyl release sites, a waste oil tank release site, and an Oil Land Farm release site (FY 1998).
- Completed remedial investigation at the C-400 Chemical Cleaning Facility release sites, the C-747-C Oil Land Farm, the Former Cylinder Drop Test area, and the C-746-A Septic System; initiated remedial investigation at eight release sites (FY 1998) and complete remedial investigation at four release sites (FY 1999) to meet Federal Facility Agreement compliance milestones.

- Completed transfer of 15 fluorine cells and equipment to the Department of Defense for beneficial reuse (FY 1998).
- Shipped 188 m^3 of Resource Conservation and Recovery Act waste, 29 m^3 of Toxic Substances Control Act/Resource Conservation and Recovery Act liquid waste, and 133 m^3 of low level waste for off-site treatment and/or disposal; and completed Resource Conservation and Recovery Act closure of the C-746-R Storage Pad to reduce legacy waste inventory and waste storage footprint and meet Federal Facility Compliance Act Site Treatment Plan enforceable milestones (FY 1998).
- Ship for offsite disposal 63 m^3 of Resource Conservation and Recovery Act ash receivers, 333 m^3 of low level waste ash receivers, and approximately 1,000 polychlorinated biphenyl capacitors; complete recycling of current inventory of lead acid batteries; and complete treatment and disposal of 6.4 m^3 of pyrophoric uranium waste to reduce legacy waste inventory and waste storage footprint and meet Federal Facility Compliance Act Site Treatment Plan enforceable milestones (FY 1999).
- Complete engineering evaluation/cost analysis for removal and disposal of 51,000 tons of scrap metal and complete Vortec Vitrification Technology Demonstration Project environmental assessment and construction (FY 1999).
- Complete field and planning activities leading to a FY 2001 Record of Decision at Paducah for implementing the final remedial action of sources contributing to the existing Northeast and Northwest contaminated groundwater plumes; complete remedial action of LASAGNA™ electro-osmosis technology at the former Cylinder Drop Test Area; and reduce legacy waste inventory. Kentucky regulators are requesting total removal of a uranium burial area where DOE had proposed a presumptive remedy of capping and monitoring (FY 2000).

Site Description

Oak Ridge Operations Office

The Oak Ridge Operations Office manages, coordinates, tracks, and assists in the implementation of the Environmental Management program among the various sites. Oak Ridge leads the National Program for Metal Recycle, as well as crosscutting integration efforts related to the Oak Ridge sites. In addition, the Oak Ridge Operations Office manages oversight agreements with the States of Tennessee, Ohio, and Kentucky and provides funding for all off-site projects.

Oak Ridge Reservation

The Oak Ridge Reservation encompasses about 37,000 acres and is comprised of three facilities; the Y-12 Plant, which was a uranium processing facility and now dismantles nuclear weapons components and serves as the nation's storehouse for special nuclear materials; the East Tennessee Technology Park, which was a uranium enrichment facility and is now being transitioned through reindustrialization; and the Oak Ridge National Laboratory, which conducts applied and basic research in energy technologies and in the physical and life sciences. Only East Tennessee Technology Park is funded under the Uranium Enrichment D&D Fund.

East Tennessee Technology Park (formerly K-25)

The East Tennessee Technology Park is located on a 1,500 acre tract of land adjacent to the Clinch River, approximately 10 miles west of Oak Ridge, Tennessee. It was built as part of the World War II Manhattan Project and used to enrich uranium for national defense purposes. By the mid-1950s, five large uranium enrichment buildings covering 114 acres were in operation: K-25, K-27, K-29, K-31, and K-33. Four electrical switch yards and eight cooling towers served these buildings. Machinery was fabricated, serviced, repaired, and cleaned at on-site facilities. Enrichment of weapons-grade uranium ceased in 1964. The plant continued to produce low enriched uranium for commercial nuclear power purposes until 1985, when the plant was shut down.

Paducah

The Paducah Gaseous Diffusion Plant is located approximately 15 miles west of Paducah, Kentucky, near the Ohio River. Department property comprises nearly 3,500 acres; 750 acres are inside the site's security fence, and 2,000 acres are leased to the Kentucky Department of Fish and Wildlife. Plant process buildings cover 74 acres. Paducah began operations in 1952 to produce low-assay enriched uranium for use as commercial nuclear reactor fuel. In 1993, uranium enrichment operations were turned over to the United States Enrichment Corporation in accordance with the Energy Policy Act of 1992.

Portsmouth

The Portsmouth Gaseous Diffusion Plant is located approximately 22 miles north of Portsmouth, Ohio. Construction of the 3,714 acre site began in 1952. Plant process buildings cover 93 acres. The mission of the plant was to increase the national production of enriched uranium and maintain the nation's superiority in the development and use of nuclear energy. Since 1991, the plant has produced only low-enriched uranium for commercial power plants. In 1993, uranium enrichment operations were turned over to the United States Enrichment Corporation in accordance with the Energy Policy Act of 1992.

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

The Oak Ridge Operations Office Environmental Management projects under the Uranium Enrichment Decontamination and Decommissioning Fund are managed by a Management and Integration contractor through incentivized contracts, with fixed-price subcontracts, to assure the most cost efficient service to the Government. The scope planned for FY 2000 has been reviewed and is appropriate to meet the goals of the site as outlined in the *Accelerating Cleanup: Paths to Closure*. Project Baselines for activities included in this section of the budget have had, or planned to have an independent cost review of the scope, and the funds requested for FY 2000 are appropriate to perform the activities based on a historical level of effort and fixed-price contracts. Regulatory drivers for cleanup are Federal Facility Agreements which integrate Comprehensive Environmental Response Compensation and Liability Act and Resource Conservation and Recovery Act requirements; Consent Orders issued by the State regulators for permitted hazardous waste units; Resource Conservation and Recovery Act Part B hazardous waste management permits; Toxic Substances Control Act regulations for management of polychlorinated biphenyls; and Federal Facility Compliance Agreements for management of legacy mixed waste. The agreements establish enforceable milestones for completing major activities at the sites consistent with site Baselines.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
OR-44301/ETTP Remedial Action			
Carry out activities at the East Tennessee Technology Park watershed including removal of hazardous materials, treatment, and disposal of remediation waste, source control/elimination to preclude the additional spread of contamination and remediation of soils, groundwater, and building structures to industrial use standards and initiate long-term surveillance and maintenance.			
■ Complete and submit the Record of Decision for the East Tennessee Technology Park watershed to the regulators for approval.			
■ Begin excavation of K-1070-A Contaminated Burial Ground.			
■ Initiate the K-1070-C/D G-Pit and Concrete Pad remediation.			
■ Complete shipments of unstabilized pond waste sludge to Envirocare of Utah for treatment and disposal (1,167,000 kilograms will be shipped in FY 2000).

OR-44303/East Tennessee Technology Park Decontamination and Decommissioning

Decommissioning, demolition, and surveillance and maintenance of surplus buildings at the East Tennessee Technology Park (this activity does not include the 3 building decommissioning contract with BNFL, Inc.). Buildings that can be reused will be decontaminated and buildings that are not suitable for reuse, such as the original K-25 building, will be demolished. Surplus buildings and release sites in the East Tennessee Technology Park will be covered by the ongoing surveillance and maintenance program. (Split funded in the Defense Environmental Restoration and Waste Management appropriation, total FY 2000 funding $37,002,000.)

- Complete the Group 1 (5 buildings) Auxiliary Facilities Decommissioning/Demolition Project.
- Continue surveillance and maintenance for surplus buildings and release sites under federal control.
- Continue deactivation and decontamination of the decontamination building (1420 building).
- Continue deactivation of the original K-25 process building.
- Additional deactivation of ancillary buildings associated with K-25, K-27 and the main plant area.
- Various facility assessments will be completed.

OR-44305/East Tennessee Technology Park Landlord Decontamination and Decommissioning

Conduct Landlord activities. These activities are conducted in accordance with the current project baseline for scope, schedule and cost, and are consistent with the Federal regulations and DOE Orders for Health and Safety, and maintenance. This account also includes infrastructure support activities that had been funded through overhead accounts prior to FY 1999. This activity is split funded by the Defense Environmental Restoration and Waste Management and the Uranium Enrichment Decontamination and Decommissioning Fund appropriations. (Total FY 2000 funding is $41,136,000.)

- Related subtasks will be completed for the East Tennessee Technology Park infrastructure used to support Environmental Management Program activities including: the East Tennessee Technology Park Electrical Distribution System Reconfiguration and selected bridge refurbishment.
- Design, construction, and planning associated with roof replacements and heating, ventilation, and air conditioning upgrades.
- Issues associated with engineering evaluations for security, classification, piping supports, and other equipment support.
- Infrastructure activities including safeguards and security, utilities, Environmental Safety and Health Program, reindustrialization support and fire protection.

Metrics
No quantifiable corporate performance measures are associated with this project.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
OR-45301/Paducah Remedial Action			
Continue remedial action activities at the Paducah Gaseous Diffusion Plant to address hazardous/solid waste units and reduce the public risk due to extensive groundwater contamination (technicium, trichloroethylene). The cleanup approach is to address potential public risks through source control, plume mitigation, pre-decommissioning, and long-term surveillance and maintenance.			
■ Provide long term surveillance and maintenance of interim groundwater treatment systems, operation and maintenance of interim corrective measures and post-closure monitoring of remedial sites (closed landfills, drainage outfalls, etc); and maintain off-site water policy for affected residents.			
■ Provide decontamination and decommissioning surveillance and maintenance for the C-410 Feed Plant Complex and the C-340 Metals Reduction Plant Complex.			
■ Provide compliance groundwater monitoring well sampling (184 wells) and regulatory reporting.			
■ Conduct remedial investigations for mounds, berms, leak sites, and firing ranges located throughout the plant site; and address contamination within or near ditches, creeks, and a lagoon.			
■ Complete remedial action of LASAGNA™ electro-osmosis technology at the Former Cylinder Drop Test Area; complete record of decision for waste area group 22 uranium burial ground; and additional burial ground and burn area.			
■ Complete proposed plans and feasibility studies for the groundwater operable unit.

Continue reducing legacy waste inventory through off-site treatment and disposal and implementation of on-site Vortec Vitrification Technology; continue compliant storage activities and restoration-derived waste management; and provide waste management technical and landlord support.			
■ Complete construction of waste storage facilities (C-746-Q and C-733) fire protection upgrades to meet regulatory requirements.			
■ Begin operation of the Vortec Vitrification Technology Demonstration Project for treatment of legacy waste.			
■ Operate and maintain 41,300 square feet of Resource Conservation and Recovery Act, Toxic Substance Control Act, Low Level Waste, and Investigation Derived Waste storage facilities containing 4,900 m^3 of legacy waste; and maintain 26 acres of outside storage areas containing 87,800 m^3 of scrap metal (88% of legacy waste).			
■ Complete removal and disposal of 9,700 tons of scrap metal.			
■ Dispose of 1,000 capacitors contaminated with polychlorinated biphenyls off-site.			
■ Provide limited contract, program management, and support for remedial and waste management activities.

OR-46301/Portsmouth Gaseous Diffusion Plant Remedial Action

Complete transition from investigation and interim corrective measures of hazardous/solid waste units to cleanup of on-site groundwater contamination (primarily trichloroethylene) at the Portsmouth Gaseous Diffusion Plant. Groundwater cleanup will employ new technologies for trichloroethylene removal. Activities include closure of remaining Resource Conservation and Recovery Act hazardous waste units, containment and contaminant removal of on-site groundwater plumes, treatment or disposal of legacy waste, and pre-decommissioning and long-term surveillance and maintenance.

- Complete Corrective Measures Initiative design and initiate construction for X-749 Contaminated Materials Disposal Facility/X-120 Old Training Facility, X-744Y Bulk Storage Building/X-744G Storage Yard Soil, X-720 Neutralization Pit & soils, and the X-734 Old Sanitary Landfill groundwater plumes.
- Complete shutdown of the X-622T Groundwater Treatment Facility.
- Complete Risk Reduction Action at the X-700 Chemical Cleaning Facility Chemical and Petroleum Storage Containment Tanks.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
■ Complete design for 5-Unit (X-231 Oil Biodegradation Plots) Groundwater Corrective Measures Initiative.			
■ Provide Decontamination and Decommissioning Surveillance and Maintenance at 5 facilities; Long Term Surveillance and Maintenance groundwater treatment systems; and post-closure monitoring of remediated sites.

OR-46302/Portsmouth Gaseous Diffusion Plant Waste Management

Continue reducing legacy waste inventory through off-site treatment and disposal; continue compliant storage activities and restoration-derived waste management; and provide waste management technical and directed support.

- Treat approximately 240,000 pounds of bulk Toxic Substances Control Act liquid stored on-site and approximately 91,000 pounds of mixed waste.
- Characterize 34 waste streams.
- Complete off-site disposal of 125 B-25 boxes of sludge from the X-701B Holding Pond, 600 B-25 boxes of X-616 Effluent Control Facility/Former Chromium Sludge Lagoon sludge disposal at the Hanford Reservation, and disposal of 30 55-gallon containers of Resource Conservation and Recovery Act (F006) listed waste from treatability study.

OR-48303/Off-site Remedial Action Decontamination and Decommissioning Fund

Conduct cleanups, groundwater remediation, and provide technical support and conduct landlord activities. These activities are conducted in accordance with the current project baseline for scope, schedule and cost, and are consistent with the Federal regulations and DOE Orders for Health and Safety, and maintenance. The activities are consistent with the Federal Facilities Agreement milestones as agreed with the Environmental Protection Agency for activities under the comprehensive Environmental Response, Compensation, and Liability Act, and consistent with the milestones agreed with the State under the Tennessee Superfund Act. This activity is split funded with the Defense Environmental Restoration and Waste Management and Non-Defense Environmental Management appropriations. (Total FY 2000 funding is $23,839,000.)

- Activities include contract management support, environmental information management, release site evaluations and footprint reduction.

Explanation of Funding Changes From FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
OR-44301/ETTP Remedial Action	
■ Increase in FY 2000 required because the shipment of stabilized pond sludge to Envirocare of Utah was performed in FY 1999 using reprogrammed carryover funds. Additional increases to perform remediation of K1070 C/D Pond, the G Pit and the K1070-A Contaminated Burial Ground.	13,377
OR-44302/East Tennessee Technology Park Process Equipment Decontamination and Decommissioning	
■ FY 2000 is the first year reflecting full production decommissioning on the 3 building decommissioning contract (3 shifts per day).	15,000

	FY 2000 vs. FY 1999 ($000)
OR-44303/East Tennessee Technology Park Decontamination and Decommissioning	
■ Deactivation and decontamination work at the K-1420, and K-25 buildings and deactivation work on numerous ancillary facilities has increased.	1,836
OR-44305/East Tennessee Technology Park/Landlord - Decontamination and Decommissioning Fund	
■ This reduction reflects infrastructure costs realized through reindustrialization and management and integration contractor initiatives.	-13,172
OR-45301/Paducah Remedial Action	
■ No significant change.	-141
OR-45302/Paducah Waste Management	
■ Ship additional 500 m^3 of Low-Level Waste for offsite disposal.	1,658
OR-46301/Portsmouth Remedial Action	
■ Increase reflects transition from assessment to actual cleanup of groundwater.	7,653
OR-46302/Portsmouth Waste Management	
■ Decrease reflects one-year delay of Mixed Low-Level Waste treatment.	-5,272
OR-48303/Off-site Remedial Action - Decontamination and Decommissioning Fund	
■ Decrease reflects completion of some worker transition activities in FY 1999 and a change in allocation between appropriations.	-1,891
OR-48304/Directed Support	
■ This increase is partially due to additional funding for the National Metal Recycle Center of Excellence and increases in other directed activities.	950
Total Funding Change, Oak Ridge	19,998

Major Issues

The explanation of change reflects the Uranium Enrichment Decontamination and Decommissioning Fund increasing by $19,998,000 from FY 1999 to FY 2000. Because of a one time "credit" of $15,500,000 from the Uranium Enrichment Corporation in late FY 1998 which carried over for use in FY 1999, a total of $205,700,000 was actually available for FY 1999 activities. However, because this "credit" cannot be reflected as budget authority, the growth from FY 1999 ($190,200,000) to FY 2000 ($210,198,000) creates the appearance of a much larger increase.

This credit was associated with a higher than expected quantity of low enriched uranium that the Uranium Enrichment Corporation was able to derive form the dilution of highly enriched uranium transferred by the Department.

Multi-Site

Mission Supporting Goals and Objectives

Program Mission

The Uranium Enrichment Decontamination and Decommissioning Fund supports partial payment of Uranium/Thorium licensee claims, as required under Title X, Subtitle A of the Energy Policy Act of 1992. The Act directs that the Fund be used to reimburse operating uranium or thorium processing site licensees for the costs of their environmental cleanup at those sites, subject to a specific reimbursement limit. This payment is to cover the Federal Government's share of cleanup being carried out at specific active uranium and thorium processing sites. The Department compensates site owners on a per-ton basis for the restoration costs for those tailings attributable to the Federal Government. Due to overall priorities within the Uranium Enrichment Decontamination and Decommissioning Fund (i.e. compliance activities, high priority cleanup actions, etc.), the funding requested only covers a portion of the claims.

Program Goal

To ensure the Federal Government compensates the Uranium/Thorium licensees for the Federal Government's portion of cleanup costs at their sites.

Program Objective

The Uranium and Thorium Reimbursements will be distributed in the spring of 2000 based on approved unpaid claims submitted through FY 1999. Reimbursements will be based on the review and audits of claims submitted by 13 uranium licensees and one thorium licensee.

Performance Measures

Performance measures are provided at an aggregate level after the Funding by Site table as well as at a project level in the Detailed Program Justification.

Significant Accomplishments and Program Shifts

Provide for partial payment of approved Uranium/Thorium (Title X) claims (FY 1998/FY 1999/FY 2000).

East Tennessee Technology Park Three-Building Decontamination and Decommissioning and Recycling Project, Oak Ridge, Tennessee (OR-44302) [a]

Significant Changes

- The increase in Total Estimated Cost from $272,126,000 to $284,298,000 results from the inclusion of project support costs in the current Total Estimated Cost. These project support costs were previously carried only in the Total Project Cost. This was done to separate the BNFL Inc. project support costs from the cost of the total project. However, since it was necessary to include these project support costs in the Total Estimated Cost. The project support costs include independent verification, technical support, and infrastructure support.

1. Construction Schedule History

	Fiscal Quarter				Total Estimated Cost ($000)	Total Project Cost ($000)
	A-E Work Initiated	A-E Work Completed	Mobilization Start	Physical Construction Complete		
FY 1999 Budget Request	N/A	N/A	4Q 1997	1Q 2004	272,126	283,866
FY 2000 Budget Request *(Current Baseline Estimate)*	N/A	N/A	4Q 1997	1Q 2004	284,298 [b]	284,298

[a] Project OR-44302 contains additional funding for the period FY 2004 through FY 2008 for decontamination and decommissioning of the K-25 and K-27 buildings. This project covers the decontamination and decommissioning of three of the process buildings (K-29, K-31, and K-33).

[b] Represents the escalated amount of the BNFL Inc. contract ($263,351,887) plus a 3.3 percent contingency for potential fluctuations in the metals market and miscellaneous change orders for a total BNFL Inc. contract amount of $272,126,000. This amount is net of the value of salvage material recovered by BNFL Inc. during decontamination and decommissioning activities, estimated at $61,920,415 ($55,569,748 before escalation). In addition, this estimate includes project support costs of $12,172,000 for fencing, office moves and set-up, contractor interface, independent verification team support, and miscellaneous documents.

2. Financial Schedule (Operating Expense Funded)

(dollars in thousands)

Fiscal Year	Appropriations	Obligations	Cost
1997	8,399	8,399	6,937
1998	19,599 [a]	19,599	16,789 [b]
1999	47,500 [c]	47,500	46,364
2000	62,500	62,500	61,544
2001	60,200	60,200	60,212
2002	52,100	52,100	52,102
2003	34,000	34,000	35,058
2004	0	0	5,292

3. Project Description, Justification and Scope

The East Tennessee Technology Park gaseous diffusion process buildings were permanently closed in 1987, and the uranium enrichment mission transferred to the United States Enrichment Corporation at Portsmouth, Ohio and Paducah, Kentucky. The three buildings of the project are filled with diffusion equipment which is contaminated with uranium and which contains barrier material representing a classified technology requiring provisions for security and protection. The three buildings are currently unusable and require continuous surveillance and maintenance activities estimated to cost approximately $80,700,000 for the ten-year period FY 1997 through FY 2006 (estimate taken from *Engineering Evaluation/Cost Analysis*, DOE/OR/02-1579&D1, April 1997).

The challenge for this project is to link the ability to remove equipment/material and to clean up the buildings with some economically viable salvage/recycle of the equipment/material in an effort to lower the overall cost to the government. The cost recovery portion of the project (the equipment and material) requires unique contractor capabilities due to the contamination present, the classified nature of much of the recyclable material, and the limited market for previously-contaminated material.

---

[a] The FY 1998 Congressional Budget Request, Volume 5, dated February 1997, pg. 880, cited the subject project, beginning in FY 1997, and was included in the $54,189,000 for the East Tennessee Technology Park (K-25) Decommissioning in FY 1998; includes $1,125,000 of program management support and all funding associated with PBS OR-44302 (UE D&D Fund).

[b] Includes approved Baseline Change Proposals and Option-I, Switchyard Demolition.

[c] Termination liability funding of $3,500,000 obligated to the contract is reflected in FY 1999 appropriation portion of this data sheet. This amount has been obligated to the contract and will be carried year to year, adjusted accordingly, and can not be used unless contract is terminated, or until the end of the project.

The East Tennessee Technology Park Three Building Decontamination and Decommissioning and Recycling Project encompasses buildings K-29, K-31, and K-33. The three buildings contain approximately 45 percent of the five East Tennessee Technology Park Gaseous Diffusion Plant building materials. The following table summarizes the quantity of contaminated or potentially contaminated metal planned to be removed from the facilities, decontaminated and processed as appropriate, and economically recycled.

East Tennessee Technology Park Three Building Decontamination and Decommissioning and Recycling Initiative Quantity Data

	(building)		
	K-29	K-31	K-33
Building Size (Gross Sq. Ft.)	451,000	1,660,000	2,780,000
Metal Quantities for Processing			
Fe Metals (Tons)	10,624	31,678	62,489
Nickel (Tons)	692	1,563	3,752
Copper (Tons)	1,165	2,810	7,036
Aluminum (Tons)	899	2,301	4,140

The scope of the East Tennessee Technology Park Three-Building Decontamination and Decommissioning and Recycle Project includes the following:

- perform decontamination and decommissioning and recycle under fixed-price contract;
- perform surveillance and maintenance services;
- remove all process equipment and materials from the three buildings;
- decontaminate vacant areas within the buildings to industrial reuse standards;
- decontaminate and recycle the majority of materials and equipment;
- disposal of all waste; and,
- provide the buildings ready for industrial occupancy as they are completed.

The three building concept is the beginning of full decontamination and decommissioning of the five East Tennessee Technology Park gaseous diffusion plant buildings. The concept directly supports reindustrialization of East Tennessee Technology Park, which is targeted as a key mission by DOE resulting in accelerated cleanup, cost savings, and indirect benefits to the Oak Ridge work force and community. DOE has signed an agreement with the Community Reuse Organization of East Tennessee to encourage utilization of the East Tennessee Technology Park site. This agreement allows the Community Reuse Organization of East Tennessee to lease East Tennessee Technology Park facilities

from DOE and in turn sub-lease them to outside companies to use them for a variety of activities. The three buildings of the proposed concept will be leased to the Community Reuse Organization of East Tennessee, one by one, as soon as building decontamination is completed.

The intent of this project is to find the best economical match between the government's desire to have the three buildings cleaned up and available for alternative use, and to minimize the overall cost of accomplishing the task. BNFL Inc., in fulfilling this charge, brings their expertise in cleaning up similar diffusion facilities in Great Britain and industrial contacts, to take over the surveillance and maintenance of the buildings, execute cleanup, and tailor the entire process to minimize the quantity of material shipped for disposal. The decontamination and recycle enterprises will be negotiated and established by BNFL Inc. Recyclable materials will be recovered and delivered to these enterprises in forms that meet the acceptance, and fulfill the specialized and focused needs of BNFL Inc.'s business associates.

In this concept, BNFL Inc. and its subcontractors have expertise in each of the decontamination and decommissioning, recycle and waste disposal areas needed to perform the scope of work described above. BNFL Inc. was selected through a competitive process whereby an announcement was published in the Commerce Business Daily requesting expressions of interest from all parties desiring to perform the decontamination and decommissioning of the three process buildings. Several responses were received, but only BNFL Inc.'s met all the terms set forth in the published announcement. Therefore, BNFL Inc. was awarded a fixed price contract for delivering vacant and decontaminated buildings to DOE/Oak Ridge Operations. The work will be performed utilizing external licensing by the Tennessee Department of Environment and Conservation (which has Nuclear Regulatory Commission oversight responsibilities in Tennessee) and under the Office of Safety and Health Administration rules (off-site) and DOE oversight (on-site) utilizing Work Smart Standards.

In this approach, savings occur (estimated at approximately $500 million over the traditional Management and Operating approach) due to a combination of efforts including (1) reduced engineering and management overhead and fees, (2) reduced surveillance and maintenance cost, (3) efficiencies in the approach to recycle and building decontamination based on BNFL Inc.'s successful experiences at Capenhurst, (4) reduced contingency due also to BNFL Inc.'s experience and confidence based on Capenhurst decontamination and decommissioning, and (5) DOE's assignment of all materials in the three buildings to BNFL Inc. In return for these benefits, BNFL Inc. takes responsibility for recycle/salvage activities through whatever means BNFL Inc. selects, including waste containers or other products fabricated from recycled metal. BNFL Inc. is following an approach that disposes of more low-valued metal than in the previous approach; and BNFL Inc. is using the least-net-cost method for decontamination and recycle of other assets.

Additional benefits to the Department from the East Tennessee Technology Park Three Building Decontamination and Decommissioning and Recycle Project include:

- Reduced risk to the public, workers, and the environment by accomplishing decontamination and decommissioning of the buildings sooner than planned. Risk is related to the deposited uranium products left in the gaseous diffusion plant systems at shut-down, coupled with the fact that neither the systems nor buildings are designed for long-term storage of nuclear materials.
- Risk is assumed by the contractor during cleanup, including risks of waste handling and disposal.

- Removal of process systems eliminates fissile material hold-up, as well as risk of potential criticality accidents. This is consistent with requirements within the Defense Nuclear Facilities Safety Board 94-1 Implementation Plan.
- The approach leaves buildings standing that will be used by DOE and the Community Reuse Organization of East Tennessee in efforts to reindustrialize East Tennessee Technology Park.
- The approach results in the further establishment and verification of efficient decontamination and decommissioning methods that will be made available to DOE for use at other facilities.
- The risk in achieving this project is low based on substantial planning by DOE and past performance by BNFL Inc. Further, incidental benefits include the establishment of equipment/metal decontamination and recycle capabilities in Oak Ridge which will maintain jobs in the region. BNFL Inc.'s approach allows for Management and Operating worker transition to the private sector and will create approximately 350 replacement jobs.

4. Details of Cost Estimate

(dollars in thousands)

	Current Estimate	Previous Estimate
Design Phase		
None	0	0
Total, Engineering, Design, Inspection, and Administration of Construction Costs	0	0
Construction Phase		
Removal cost less salvage (BNFL contract)	263,352	263,352
Project Support Costs (4.5% of TEC)	12,172 [a]	0
Total, Construction Costs	275,524	263,352
Contingencies		
Construction Phase (3.3% of the TEC)	8,774	8,774
Total, Costs (TEC)	284,298 [b]	272,126

The National Academy of Sciences recommendation (*Affordable Cleanup?*, February 1996) included a least cost scenario to accomplish the East Tennessee Technology Park gaseous diffusion plant decontamination and decommissioning program. While the National Academy of Sciences did not intend for the *Affordable Cleanup?* document to represent a detailed cost estimate, a scaling exercise is

[a] The project support costs were included in the previous Total Project Cost. They were not included in the previous Total Estimated Cost in order to separate the BNFL Inc. contract costs from the cost of the total project. However, since the project support costs must be included in the appropriation amounts, it was necessary to include them in the Total Estimated Cost.

[b] This estimate for the contracting approach is expected to provide a cost savings/avoidance of approximately $500 million compared to the traditional Management and Operating approach.

included that bounds the five-building cleanup in the range from $510,770,000 to $935,960,000. This bound can be pro-rated to a three-building bound with the range from $204,308,000 to $374,484,000 with a mid-point of $289,396,000. These estimates are unescalated dollars, the mid-point amount escalated is $321,438,000.

5. Method of Performance

BNFL Inc. will finance the project; design the decontamination facilities; apply for and receive required permits and licenses; construct necessary facilities and bring them on-line; operate the facilities to decontaminate metals and equipment; salvage metal and equipment; and deactivate the decontamination facilities. BNFL Inc. will recover the resources it has invested both through recycle activities and through the delivery of vacated and decontaminated building space paid for by DOE on a fixed-unit-price basis. The underlying intent is to transfer the primary share of the financial, performance, and operational responsibility from the government to BNFL Inc.

DOE will request sufficient annual appropriations to cover the anticipated scope of work to be performed by BNFL Inc. and necessary support costs such as independent verification support, with an appropriate rate of return in the event the contractor defaults or DOE chooses to cancel for government convenience. Provisions will be included in the contract to ensure that current year work scope is limited to the available funding within the contract. Additional liabilities for a government termination for convenience would amount to approximately $3,500,000 for demobilization and cleanup of the decontamination and decommissioning workshop, and relocation and severance pay for affected employees. Should termination occur, the additional funding would be identified within the then current funding at the Oak Ridge Operations Office.

The total cost of the decontamination and decommissioning, recycling and waste disposal is larger than the value of the material and products that can be removed from the three buildings by approximately $272,126,000 which reflects the governments contractual liability. The contractor will incur substantial up-front expenses such as design and construction of a disassembly and size reduction workshop to be located on-site, and design and construction of a nickel electro-refining facility (located either on-site or off-site). Payments to the contractor are to be consistent with services provided, e.g. areas of the buildings cleaned of equipment and material. The payments will be made from annual appropriations based on: (1) the original obligation for the contractor's start-up costs, (2) amortization of the contractor's capital costs, (3) removal and decontamination of equipment/material, (4) recycling of materials, (5) decontamination of the buildings, and (6) disposal of wastes.

7. Related Annual Funding Requirements

(dollars in thousands)

	Current Estimate	Previous Estimate
Annual Facility operating costs	N/A	N/A
Annual Facility maintenance and repair costs	N/A	N/A
Total related annual funding*	N/A	N/A

*Because this is not a construction project, there are no related annual maintenance and repair costs.

8. Background Issue

This contract is a negotiated fixed-price contract with BNFL Inc. to cleanup three of the five gaseous diffusion buildings at East Tennessee Technology Park. BNFL Inc. will provide sufficient financing until elements of performance are completed, i.e., portions of the buildings are cleaned up. Payments will be made to BNFL Inc. upon completion of equipment removal from individual portions of the buildings and other payments after each building is decontaminated. The offset from the recycling initiative, based on fair market value, is adjustable if prices as indexed on the American Metals Market fluctuate more

than five percent from the prices negotiated as part of the contract. Changes above or below five percent shall be split between DOE and the contractor. This will occur seventeen times in the course of the contract.

9. Contracting Authority

The authority for DOE to enter into this contract is found at 42 U.S.C. § 7256(c). Authority for the Department of Energy to offset against the contract price paid to BNFL Inc. the cost of proceeds that BNFL Inc. receives from the sale of property it acquires as partial consideration for the contract work is found in Subpart 37.3, "Dismantling, Demolition, or Removal of Improvements" of the Federal Acquisition Regulation and in 40 U.S.C. § 485(e) of the Federal Property and Administrative Services Act of 1949, as amended.

Authority for the Federal Acquisition Regulation Subpart 37.3 is found in 40 U.S.C. § 486(c). See 48 Federal Register 42365 (Sept. 19, 1983). The Federal Acquisition Regulation Subpart 37.3 provides that when the Government pays a contractor to dismantle or demolish structures, in further consideration of contract performance, title to property to be dismantled or demolished may be transferred to the contractor and the value of this property will be considered when determining payment to the contractor. See Federal Acquisition Regulation 37.303; Federal Acquisition Regulation 37.304(a); Federal Acquisition Regulation 52.237-4. Federal Acquisition Regulation Subpart 37.3 is applicable to this contract because the contract requires BNFL Inc. to dismantle, demolish and remove the interiors of the three process buildings at East Tennessee Technology Park. In consideration for this work, BNFL Inc. will receive a fixed price and title to the property in the three process buildings. BNFL Inc. intends to recycle and sell a certain amount of this property. The fixed price paid by DOE will reflect credit of a dollar amount that the parties agree reflects the expected value of the recycled property; i.e., the proceeds received by BNFL Inc. from the sale of the property it has received as partial consideration for its work under the contract.

40 U.S.C. § 485(a) provides that proceeds from any "disposition of surplus property" shall be sent to the Treasury as miscellaneous receipts unless one of the exceptions set forth in 40 U.S.C.§ § 485(b), (c), (d) or (e) is applicable. Section 485(e) is applicable to the use of proceeds from the disposition of property by BNFL Inc. under the contract. This section provides that "any contract" entered into by an executive agency such as DOE may authorize that "any sale of property in the custody of the contractor . . . be credited to the cost or price of the work covered by such contract . . ." DOE therefore may credit the proceeds from the sale of property provided to BNFL Inc. under this Decontamination and Decommissioning contract as partial consideration for the contract work against the total fixed price paid by DOE to BNFL Inc.

DOE and BNFL Inc. anticipate that the property to be provided to BNFL Inc. as partial consideration for BNFL Inc.'s work will contain metals that can be recycled and subsequently sold. However, since DOE and BNFL Inc. expect that most of these metals are contaminated with radionuclides and other substances (e.g., PCBs) and many are in a classified configuration, the metals must be decontaminated and declassified before they can be recycled. Most of the fixed contract price will reflect the considerable decontamination and associated work that must be performed by BNFL Inc. This work

therefore is deemed to be outside the intent of the language under the section entitled "Use of Receipts From Leasing or Selling Government Property or Assets" in Title III of both the Energy and Water Development Appropriations Bill, 1997 (H. R. Rep. 104-679) and the Conference Report entitled "Making Appropriations for Energy and Water Development For The Fiscal Year Ending September 30, 1997, And For Other Purposes" (H. R. Rep.104-782).

The DOE/Oak Ridge Operations Contracting Officer for the East Tennessee Technology Park Three-Building Decontamination and Decommissioning and Recycling Project has evaluated and deemed it to be in the Best Interest of the Government to utilize the property generated by the dismantling and demolition activities as part of the compensation to be provided the contractor for Decontamination and Decommissioning services. The reasons for utilizing this concept and subsequent determination are as follows:

- DOE has legal authority to enter into this contract.
- The intent of this project is to find the best economical match between the government's desire to clean the three buildings up and to minimize the overall cost of the task.
- The cost recovery aspects of the equipment and material in the project are not readily available due to the contamination present, the classified nature of much of the material, and the limited market for previously contaminated material.
- The material has no value in the current state of contamination and the government has no use for the material.
- The expertise of BNFL Inc. in cleaning up similar diffusion facilities in Great Britain, their financial backing, and their industrial contacts.
- BNFL Inc. will negotiate and establish decontamination and recycle enterprises. Recyclable materials will be recovered and delivered to these enterprises in forms that meet the acceptance and fulfill the specialized and focused needs of BNFL Inc.'s business associates.
- DOE/Oak Ridge Operations does not have the expertise in house to recycle and market this material at a comparable cost. Substantial investment would be required , either in-house or through a separate contract to accomplish the same task.

10. Project Status (as of December 31, 1998)

- BNFL assumed responsibility for Buildings K-31 and K-33 on January 5, 1998 and Building K-29 on July 1, 1998.
- BNFL started process equipment dismantlement and removal on July 1, 1998.
- BNFL awarded Option-I, Dismantlement and Removal of K-31 and K-33 Switchyards, for net DOE cost of $196,432.
- Overall cleanup of K-33 is in excess of 15 percent complete.

- Completed Milestone No. 1 on schedule and Milestone No. 2 four months behind schedule.
- Completed 55 percent of Switchyard demolition.
- Shipped nine PCB 33,000-pound transformers to a licensed treatment/disposal facility.
- Started shipping low-level waste to Envirocare.
- Shipped 815,000 pounds of K-33 metal for unrestricted release off site.
- Shipped 118,000 pounds of K-33 metal to MSC Kerr Hollow Facility for decontamination and recycle.
- Shipped 3,725,500 pounds of Switchyard metals for unrestricted reuse off site.
- BNFL/MSC started construction of the disassembly and size reduction workshop in K-33.
- Oak Ridge has negotiated and approved four baseline change proposals totaling $3,845,960.

Southeastern Power
Administration

Southeastern Power Administration

Proposed Appropriation Language

[For necessary expenses of operation and maintenance of power transmission facilities and of marketing electric power and energy pursuant to the provisions of section 5 of the Flood Control Act of 1944 (16 U.S.C. 825s), as applied to the southeastern power area, $8,594,000, to remain available until expended; in addition, notwithstanding the provisions of 31 U.S.C. 3302, not to exceed $28,000,000 in reimbursements, $20,000,000 for transmission wheeling and ancillary services and $8,000,000 for power purchases at the Richard B. Russell Project, to remain available until expended.]

Explanation of Change

No appropriation language is necessary for FY 2000 because sufficient prior year funds are available. The customers of Southeastern will be required to fund their own purchase power and transmission wheeling agreements beginning in FY 2000.

Southeastern Power Administration

Executive Budget Summary

Program Mission

The mission of Southeastern Power Administration (Southeastern) is to market federal hydroelectric power at the lowest possible cost to public bodies and cooperatives in the southeastern United States in a professional, innovative, customer-oriented manner, while continuing to meet the challenges of an ever-changing electric utility environment through continuous improvement. The vision of Southeastern is to advance clean, responsible, reliable power.

Southeastern markets power produced at 23 Corps of Engineers constructed projects, to customers in 11 southeastern states giving preference in the sale of power to public bodies and cooperatives in accordance with the Flood Control Act of 1944.

Southeastern does not own or operate any transmission lines. In the absence of transmission lines of its own, transmission functions are accomplished through arrangements between Southeastern's customers and each of the area utilities with transmission lines connected to the projects, under which the utility agrees to deliver specified amounts of Federal power to customers of the Government.

Beginning in FY 2000, the Southeastern Power Administration will no longer seek appropriations for purchase power and wheeling activities. Instead, the customers of the Southeastern Power Administration will make their own purchase and transmission arrangements directly with suppliers. Improved transmission access that results from restructuring of the electric industry allows most customers to continue obtaining these power purchases and wheeling services from other sources. Power receipt estimates have been reduced to reflect the reduced spending by the Southeastern Power Administration.

Program Goals

- Encourage widespread use of available Federal power giving preference in the sale of power to public bodies and cooperatives.
- Promote energy and economic efficiency among preference customers.
- Make the power available at the lowest possible rates to consumers consistent with sound business principles while repaying the Federal investment in a timely manner.
- Operate projects as an integrated system to provide maximum power contribution in meeting area power requirements.
- Expand training programs of associates that maximize their contribution to organization's vision and mission.
- Make maximum use of available technology.
- Enhance and increase organizational communications and quality.

Program Objectives

- Actively participate in electric industry issues. Demonstrate a willingness to change policy, contracts, and operating procedures to be more responsive to our customers.
- Accomplish timely repayment and collections for power delivered to customers. Work with customers and Corps of Engineers to monitor costs and to work toward cost containment.
- Formulate power rates to recover all costs of producing power, including amortization of capital investment allocated to power, over a 50-year period and replacements over the service lives up to a maximum of 50 years.
- Continue to administer approximately 300 contracts which benefit more than 500 customers in a fair and effective manner that carries out the intent of contract provisions. This includes power delivery to the busbar, contract service, billing and collection functions and daily coordination of reservoir operations to maximize power output and meet firm power commitments.
- Southeastern continues to promote effective methods for customers to implement energy and economically efficient strategies that take advantage of new marketing options in a deregulated environment through the Competitive Resource Strategies Program.
- Continue coordination with Corps of Engineers, preference customers, and other interested parties in the rehabilitation and upgrade of existing and new projects and in competing uses of water.
- Continue to coordinate, schedule and dispatch power system generation to maximize power benefits through improved technology to the electric grid and the preference customers through hourly communication and coordinated working relationships with various electric utilities. Continue to account and provide summaries of power transactions for the appropriate and timely power billing function of the Agency.

Strategy

- Southeastern continues to take the lead in fostering communications with its power sales customers and the Corps of Engineers through two previously established partnerships - the Southeastern Federal Power Alliance and Team Cumberland.
- Competing demands for water allocation are expected to intensify and impact the power potential of projects for which Southeastern has marketing responsibility. Discussions, studies, and meetings with preference customers, Corps of Engineers, and other affected groups will continue as Southeastern carries out its responsibility to ensure that the power interest is heard.

Major Changes

- Beginning in FY 2000, the Southeastern Power Administration will no longer seek appropriations for purchase power and wheeling activities. Instead, the customers of the Southeastern Power Administration will make their own purchase and transmission arrangements directly with suppliers. Improved transmission access that results from restructuring of the electric industry allows most customers to continue obtaining these power purchases and wheeling services from other sources. Power receipt estimates have been reduced to reflect the reduced spending by the Southeastern Power Administration.
- Southeastern continues to revise its Strategic Plan. The plan outlines the goals and objectives Southeastern anticipates implementing during the next five years.
- Southeastern expanded its capability to schedule the hourly generation of the hydroelectric projects by improving communications with the individual projects in Southeastern's marketing area.
- Southeastern's total quality process continues with associates receiving training in the areas of team building and process improvement techniques. Southeastern's efforts in Total Quality Management have improved customer service.
- The Competitive Resource Strategies Program has begun to focus on competitiveness issues that have evolved over the past several years as well as new initiatives. The competitiveness issues resulted from the passage of the Energy Policy Act of 1992 and subsequent implementing orders, which directed Southeastern and it's preference customers toward a competitive market. In cooperation with preference customers, state associations and Federal entities, Southeastern co-sponsors cost shared workshops to help its customers address issues surrounding the implementation of energy efficiency programs in a competitive market.
- The FY 2000 budget request discontinues an approach of using customer reimbursements to pay for transmission wheeling and ancillary services needed to deliver power to some preference customers and to pay for power purchases.
- Southeastern's rates recover the full cost of the Civil Service Retirement System and Post-Retirement Health Benefits for its employees and the U. S. Army Corps of Engineers power related employees. The estimated increase in receipts to the Treasury is $3,000,000 annually.

Site Funding and Federal and Contractor Staffing Profiles

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

[a]Reprogramming of $150,000 from Purchase Power & Wheeling to Program Direction.

[b]Funds of $610,000 transferred to Southwestern for accounting system.

[c]Proposed appropriation transfer to Southwestern Power Administration.

Program Performance Measures

Performance measures indicate the financial, operating, and rate performance of Southeastern Power Administration when compared to other standards that serve as a proxy for normal performance.

- Repayment of the Federal investment:
  - Meet planned repayment of principal on Power Investment.
- Measure the safety performance by measuring the safety record against the industry average.
  - Achieve a safety performance of at most a 3.3 recordable accident frequency rate for recordable injuries per 200,000 hours worked, or the Bureau of Labor Statistics industry rate, whichever is lower.
- Measure the control area performance.
  - Ensure that each power system control area operated by a Power Marketing Agency (PMA) receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North American Reliability Council performance standard.

- Measure the control area performance.
  - Ensure that each power system control area operated by a Power Marketing Agency (PMA) receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North American Reliability Council performance standard.

Significant Accomplishments and Program Shifts

- Beginning in FY 2000, the Southeastern Power Administration will no longer seek appropriations for purchase power and wheeling activities. Instead, the customers of the Southeastern Power Administration will make their own purchase and transmission arrangements directly with suppliers. Improved transmission access that results from restructuring of the electric industry allows most customers to continue obtaining these power purchases and wheeling services from other sources. Power receipt estimates have been reduced to reflect the reduced spending by the Southeastern Power Administration. In addition, Southeastern discontinues the approach of using customer reimbursements and net billing to pay for transmission wheeling and ancillary services needed to deliver power to some preference customers and to pay for power purchases.
- Southeastern continues to take the lead in fostering communications with our customers and the Corps of Engineers through two previously established partnerships - the Southeastern Federal Power Alliance and Team Cumberland. The Southeastern Federal Power Alliance provides suggestions which enable the Agency to identify changing customers needs. Both partnerships meet periodically to exchange information and promote their visions.
- Southeastern expanded its capability to schedule hourly generation of the hydroelectric projects in Southeastern's marketing area.
- Southeastern's efforts in Total Quality Management continue to lead us in improved processes and customer service.
- Southeastern's Competitive Resource Strategies Program provides energy efficiency and competitiveness education and training opportunities to preference customers. Southeastern also maintains close contact with Generation and Transmission Cooperatives, Joint Action Agencies,

and customer associations across the Southeast to assess the need and scope of new training initiatives.

- Southeastern continues to revise its Strategic Plan. The plan outlines the requirements under GPRA and DOE's plan that Southeastern anticipates implementing during the next five years.
- In FY 1998, Southeastern marketed 8,610 GWH of clean renewable hydroelectric energy for $168,993,562 in revenues providing total proprietary receipts of $141,107,963. Southeastern anticipates proprietary receipts of $133,090,000 for FY 1999, and $129,457,000 for FY 2000.
- Southeastern's rates recover the full cost of the Civil Service Retirement System and Post-Retirement Health Benefits, for its employees and the U. S. Army Corps of Engineers power related employees that Southeastern began to recover in 1998. The estimated increase in receipts to the Treasury is $3,000,000 annually.

Southeastern Power Administration Program Direction

Mission Supporting Goals and Objectives

Program direction provides for: (1) scheduling the generation of power and supervision of power deliveries; (2) negotiation and administration of contracts for the sale of power and energy and establishment of rates to assure repayment of power costs; (3) general administration and support of Southeastern's power marketing program; and (4) Competitive Resource Strategies Program. We coordinate and cooperate with our partners to operate projects in a manner that enhances the value and reliability of hydropower. Priority is given to integrating environmental concerns and determinations into program actions. Emerging energy efficiency technologies are integrated with marketing strategies and programs.

Southeastern's FTE activities and percentages are provided as follows:

7% The Office of the Administrator is responsible for marketing hydroelectric power and energy and includes the office of Legal Affairs.

27% The Finance and Marketing Division negotiates, prepares and administers contracts for the sale of power, formulates rates to meet repayment requirements, is responsible for budget, accounting and financial management activities, customer service, and the Competitive Resource Strategies Program.

32% The Human Resource and Administration Division plans, develops, coordinates administrative and management activities of Southeastern. It includes activities to support mission accomplishment, information management (IM) (formerly ADP) and telecommunication services, public information program, personnel, contracts and procurement, supply, security, technical library, facilities, and strategic planning.

34% The Power Resources Division monitors and forecasts power production to determine the amounts of available power and energy and evaluates methods of coordinating operation of present and proposed generating plants to obtain maximum utilization of water and power resources. This division coordinates, schedules, and dispatches system power generation on an hourly basis and is responsible for administering contractual operation requirements and performs billing operations for power sold by Southeastern.

As of September 30, 1997, the projects represent a cumulative Federal investment, including replacements of $1,494,838,297. Through FY 1997, $581,856,629 has been repaid in addition to $932,562,269 in interest. In FY 1998, 8,610 GWH of hydroelectric energy were marketed for $168,993,562 in revenues providing total proprietary receipts of $141,107,963. Receipts are expected to be $133,090,000 in FY 1999, and $129,457,000 in FY 2000.

Performance Measures

Performance measures indicate the financial, operating, and rate performance of Southeastern Power Administration when compared to other standards that serve as a proxy for normal performance.

- Repayment of the Federal investment:
  - Meet planned repayment of principal on Power Investment.
- Measure the safety performance by measuring the safety record against the industry average.
  - Achieve a safety performance of at most a 3.3 recordable accident frequency rate for recordable injuries per 200,000 hours worked, or the Bureau of Labor Statistics industry rate, whichever is lower.
- Measure the control area performance.
  - Ensure that each power system control area operated by a Power Marketing Agency (PMA) receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North American Reliability Council performance standard.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salary and Benefits	2,669	2,693	2,863	+170	+6.3%
Travel	200	195	220	+25	+12.8%
Support Services	258[a]	75	125	+50	+40.0%
Other Related Expenses	1,336[b]	1,407	1,519	+112	+8.3%
Total	4,463	4,370	4,727	+357	+8.2%
Full Time Equivalents	41	41	42	1	2.0%

[a]This amount includes $83,000 reprogrammed for consulting services for the new accounting system.

[b]This amount includes $67,000 reprogrammed for computer equipment necessary to support the new accounting system.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Negotiation, preparation, execution, and administration of all contracts for the disposition of electric power and to insure and maintain continuity of electric service to customers.			
Scheduling of pumping energy and coordination between the providers of the pumping energy and the project and accounting of all transactions relative to pumping operations of the Carters Project. Perform control area services for the three Savannah River Projects-Hartwell, Russell and Thurmond. Coordinate power operations of 23 projects with all parties making determinations of capacity and energy availability weekly, and monitor testing of pump-back units at the Richard B. Russell Project until the units are declared commercially operable. Beginning in FY2000 customers will arrange for their own purchase power and transmission requirements.			
Power billing, collection, and payment functions for approximately 300 contracts which benefits more than 500 preference customers. Execution of budget, accounting and financial management activities for the office.			
Perform continuing engineering studies and review of actual project operations. Evaluate any impacts of proposed or actual changes to project operations. Prepare repayment analyses of each system to determine rates and issue a formal rate presentation as needed.			
Salaries and benefits are determined based on the amount of money needed to pay employees based on the GS pay schedule.	2,669	2,693	2,863
Travel			
Contract negotiations, preference customer meetings (SeFPC, Team Cumberland, Alliance), rates (forums, hearings, meetings), Congressional hearings, site visits of existing and new projects,			

	FY 1998	FY 1999	FY 2000
competitive resource strategy meetings, operations meetings with industry self-regulating groups (SERC, VACAR, FRCC & NERC), hydropower task force meetings, C2SWG (COE, Customer, & SEPA Working Group), NEPA activities, training, Power Marketing Policy Forums, National & State Customer meetings (NRECA & APPA), SeFPC O&M Subcommittee meetings, Interagency Task Force on Finance, Technical Advisory Group meetings, FERC pre-filings and hearings, carrying out headquarters responsibilities, and transportation of things.	200	195	220
Support Services			
Continue Southeastern's Competitive Resource Strategies Program to provide energy efficiency and competitiveness training for its preference customers.	175	75	125
Consulting Services for Information Management support for new accounting system	83	0	0
Other Related Expenses			
Provide administrative support for the office, rent, communications, maintenance, contract services (janitor services, library services, support for DOE Power Marketing Liaison Office, Information Management (IM), audit of financial statements, supplies and materials, equipment. Also provides for installation of various electronic equipment and data and communication lines for interconnection and interface between the projects SCADA system and Southeastern.			
FY 1998 includes reprogramming of $150,000 for accounting that is standardized with other Power Marketing Agencies and "year 2000" compliant.	1,336	1,407	1,519
Total, Program Direction	4,205	4,295	4,727

Explanation of Funding Changes FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ Increases in salaries and benefits are due to promotions, pay increases and within grade increases and one additional FTE to work in Information Management (IM).	+170,000
Travel	
■ Increases in travel expenses are due to general increases associated with transportation, per diem rates, and higher volume of travel for supplemental operations training and licensing. Southeastern's remote location requires extensive travel.	+25,000
Support Services	
■ Support services partially restores funding for competitiveness and energy efficiency workshops to help customers address issues surrounding the implementation of energy efficiency programs in a competitive market. Cost sharing of this program with customers allows the FY 2000 budget be slightly less than the FY 1998 level.	+50,000
Other Related Expenses	
■ Other Related Expenses. IM support and installation of equipment and communications lines for interconnection and interface between the projects SCADA systems and Southeastern. Increase due to general inflation in the cost of related services, supplies, materials and other communication equipment.	+112,000
Total Funding Change, Program Direction	+357,000

PENDING LITIGATION

SOUTHEASTERN POWER ADMINISTRATION

In *Central Electric Power Cooperative, Inc., et al. vs. Southeastern Power Administration, et al.*, No. 3-91-2449-0 (D.C.S.C.; filed August 15, 1991), six customers in South Carolina filed suit against Southeastern in U.S. District Court requesting the court to declare illegal Southeastern's energy surcharge contained in its 1990 approved rates for the Georgia-Alabama-South Carolina System, as applied to these customers. These six customers (five cooperatives and South Carolina Public Service Authority) had declined to participate in a voluntary short-term rate increase during 1989, while 168 other customers in the system participated in the voluntary rate increase earlier than allowed by their contracts. The short-term rate change was required to offset the effects of extensive droughts in the southeast and escalating Corps of Engineers operation and maintenance costs. The energy surcharge contained in those rates was to collect the portion of the costs not recovered from these six customers, and the costs were fully collected by September 1993. The parties have filed Motions for Summary Judgment which were argued in October 1992, and a ruling by the District Court is expected at any time.

DEPARTMENT OF ENERGY

FY 2000 CONGRESSIONAL BUDGET REQUEST

CROSSCUTS

SOUTHEASTERN POWER ADMINISTRATION

Environment, Safety and Health

Southeastern is located in a field office and is not involved in any environmentally hazardous activities.

Safeguards and Security

In terms of national security Southeastern does not handle any politically or militarily sensitive information.

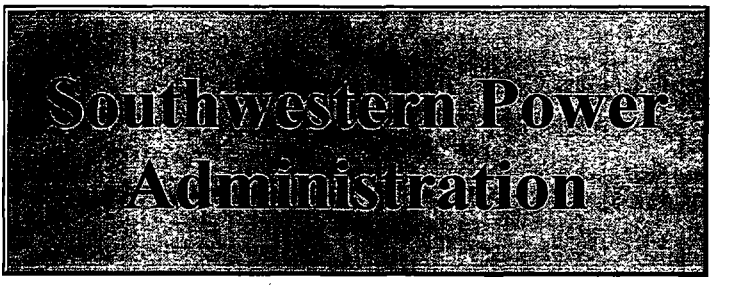
Information Management

Southeastern carries out all of its data processing and typing via use of easily attainable hardware and software. In some cases the communications software is customized for power delivery and tracking. Information management is not a proportionally large part of Southeastern's total budget.

EE and ER Solar and Renewables

We participate as appropriate through the Competitive Resource Strategies Program.

54-291 99 - 84



Southwestern Power
Administration

Operation and Maintenance
Southwestern Power Administration

Proposed Appropriation Language

For necessary expenses of operation and maintenance of power transmission facilities and of marketing electric power and energy, and for construction and acquisition of transmission lines, substations and appurtenant facilities, and for administrative expenses, including official reception and representation expenses in an amount not to exceed $1,500 connected therewith, in carrying out the provisions of Section 5 of the Flood Control Act of 1944 (16 U.S.C. 825s), as applied to the southwestern power area, [$26,000,000] *$27,940,000*, to remain available until expended, *of which $773,000 shall be derived by transfer from unobligated balances in "Operation and Maintenance, Southeastern Power Administration";* in addition, notwithstanding the provisions of 31 U.S.C. 3302, not to exceed $4,200,000 in reimbursements, to remain available until expended.

Explanation of Change

Change in appropriation language reflects a budget authority derived, in part, from an appropriation transfer.

Operation and Maintenance
Southwestern Power Administration

Executive Budget Summary

Mission

Southwestern Power Administration's (Southwestern) mission fulfills requirements of section 5 of the Flood Control Act of 1944 by marketing and reliably delivering Federal hydroelectric power, with preference given to public bodies and cooperatives. This will be accomplished by maximizing the use of Federal assets to repay the Federal investment while balancing power needs with the diverse interests of other water resource users and implementing public policy. As part of the Department of Energy's (DOE) Strategic Plan in the Energy Resources and Corporate Management business lines, Southwestern's program promotes secure, competitive, and environmentally responsible energy systems by reducing the vulnerability of the U.S. economy to disruptions in energy supplies.

Southwestern's goals and objectives are to market and deliver power in a safe and reliable manner while providing environmental and economic benefits to the region, encouraging competition, and repaying the Federal investment plus interest.

To integrate the operation of the Federal hydroelectric generating plants and to transmit power from U.S. Army Corps of Engineers (Corps) dams to its customers, Southwestern maintains 1,380 miles of high-voltage transmission line, 24 substations, and 46 microwave and VHF radio sites. Southwestern's headquarters is in Tulsa, Oklahoma; its dispatch center is in Springfield, Missouri; and its maintenance crews are based in Jonesboro, Arkansas; Gore and Tupelo, Oklahoma; and Springfield, Missouri.

Strategy

In order to achieve safety and reliability while staying competitive, Southwestern will accomplish its mission with 177 Federal employees, 42 Contractor employees, budget authority of $27,940,000 of which ($773,000 will be derived from an appropriation transfer), reimbursable authority of $4,200,000 and through three program activities: Operations and Maintenance, Construction, and Program Direction. In addition, Southwestern will perform reimbursable work activities, for Federal entities under the Economy Act of 1932 and non-Federal entities under authority provided in the annual appropriation language. All carryover balances have been reviewed as potential funding sources and have been determined to be unavailable to offset new budget authority.

FY 1998 Accomplishments (Results)

- Marketed 100 percent of firm capacity and associated energy to public bodies and cooperatives according to Southwestern's marketing plan.
- Produced $429.6 million in economic benefits based on water conditions in FY 1998 and at FY 1997 average power values.

- Saved 10.2 million barrels of oil, 2.9 million tons of coal, or 63 billion cubic feet of gas under FY 1998 water conditions through hydropower generation.
- Achieved a System Average Interruption Duration Index (SAIDI) in which 100 percent of the points of delivery had fewer than 150 minutes of total preventable outages.
- Achieved a power system control area compliance rating of "pass" using the North American Electric Reliability Council (NERC) performance standard.
- Achieved a .6 lost time injury frequency rate compared to a 2.7 industry average rate.
- Developed and implemented an open access transmission tariff.
- Power repayment studies were completed on three power systems and rates are sufficient for repayment to remain on schedule.
- FY 1998 audited financial data is pending which will determine the ratio between cumulative principal payments and the total Federal investment.
- FY 1998 audited financial data is pending which will determine the results of the debt service coverage ratio.

FY 1999 Accomplishments (Planned)

- Market 100 percent of firm capacity and associated energy offering it first to public bodies and cooperatives according to Southwestern's marketing plan.
- Produce $425.9 million in economic benefits under average water conditions and at FY 1998 average power values.
- Save 9.2 million barrels of oil, 2.7 million tons of coal, or 56 billion cubic feet of gas under average water conditions through hydropower generation.
- Achieve a SAIDI of not more than 150 minutes of total preventable outages per year per delivery point.
- Achieve a power system control area compliance rating of "pass" NERC performance standard.
- Maintain a safety record of a lost time injury frequency rate at or lower than the industry average.
- Continue to implement Southwestern's open access tariff and work with the regional electric reliability council to encourage competition through cooperation with the security coordinator and development of regional transmission tariffs.
- Perform annual Power Repayment Studies to assure that the cumulative status of repayment remains on schedule by filing new rates, if necessary.
- Increase cumulative principal payment to total repayable Federal investment ratio by two percent based on average water conditions.
- Achieve a debt service coverage ratio of 1.0 based on average water conditions.

FY 2000 Accomplishments (Planned)

- Market 100 percent of firm capacity and associated energy offering it first to public bodies and cooperatives according to Southwestern's marketing plan.
- Produce $431.0 million in economic benefits under average water conditions and at FY 1999 average power values.
- Save 9.2 million barrels of oil, 2.7 million tons of coal, 56 billion cubic feet of gas under average water conditions through hydropower generation.
- Achieve a SAIDI of not more than 150 minutes of total preventable outages per year per delivery point.
- Ensure that the power system control area operated by Southwestern receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North American Electric Reliability Council performance standard.
- Achieve a safety performance of at most a 3.3 recordable accident frequency rate for recordable injuries per 200,000 hours worked or the Bureau of Labor statistics industry rate, whichever is lower.
- Continue to implement Southwestern's open access tariff and work with the regional electric reliability council to encourage competition through cooperation with the security coordinator and development of regional transmission tariffs and integrated system operation.
- Perform annual Power Repayment Studies to assure that the cumulative status of repayment remains on schedule by filing new rates, if necessary.
- Meet planned repayment of principal on power investment.
- Achieve a debt service coverage ratio of 1.0 based on average water conditions.

Major Changes

- Beginning in FY 2000, Southwestern will no longer seek appropriations for purchase power and wheeling activities. Instead, the customers of Southwestern will make their own purchase and transmission arrangements directly with suppliers. Improved transmission access that result from restructuring of the electric industry allows most customers to continue obtaining these power purchases and wheeling services from other sources. Power receipt estimates have been reduced to reflect the reduced spending by Southwestern.
- Southwestern's Open Access Transmission Tariff was approved on May 13, 1998. The Federal Energy Regulatory Commission (FERC) granted Southwestern's petition for Declaratory Order, finding that the tariff meets FERC's comparability standards.
- Starting June 1, 1998, Southwestern began operating under the Southwest Power Pool regional tariff for short term transmission transactions.
- Southwestern's Integrated System and Robert D. Willis rate increases were implemented on January 1, 1998, pursuant to interim approval by the Deputy Secretary of Energy. Southwestern implemented a rate increase of 1.9 percent for the Integrated System which also included a redesign

of transmission service rates to comply with the intent of FERC Order No. 888. FERC issued final approval of these rates on April 29, 1998. A rate increase of 13.5 percent for the Robert D. Willis project was approved on a final basis on April 28, 1998. The rate for the Sam Rayburn project was extended on an interim basis for a one-year period by the Deputy Secretary of Energy.

- On September 18, 1998, the FERC approved Southwestern's Open Access Transmission Standards of Conduct subject to minor revisions and granted Southwestern a waiver of the separation of functions portion of the Standards of Conduct requirements.
- A reorganization of the Maintenance activity occurred in April 1998 to effect better utilization of personnel resources by creating a team to address engineering concerns such as changes in transmission line loads resulting from system open access; and by reassigning communication maintenance to coordinate communication issues between the maintenance of the system and the Power System Dispatch Center.
- Consistent with Southwestern's Organization 2000 Plus Initiative, Corporate Services, specifically Environment, Safety and Health and Administrative Services, reorganized in early FY 1998 to flatten the organization and reduce supervisor to employee ratios.
- Beginning in FY 2000, the Operations and Maintenance (O&M) program activity will reflect $415,000 of routine transmission system replacements (circuit breakers and potential transformers) that have been included in the Construction program activity in previous years. The inclusion of these routine replacements in O&M more accurately fits the O&M program description.
- Southwestern's FY 2000 Program Direction activity has increased in part due to FY 1998 regional job surveys and negotiated union payroll increases for dispatchers (7.5 percent) and power system maintenance personnel (5.9 percent), reflecting a competitive market for these skills in a deregulated industry.
- Southwestern's Strategic Plan was revised in FY 1998 to further align to the Department's Strategic Plan and to enable Southwestern to evaluate program performance against organizational goals and objectives.
- Southwestern has two critical systems that are required to be Year 2000 ready. The existing Supervisory Control and Data Acquisition/Energy Management System was Year 2000 ready when installed in FY 1996. The current Integrated Accounting System is being replaced with a Year 2000 ready Joint Financial Improvement Program certified system. The new system will be operational by March 31, 1999.

Major Issues

- The demand for energy with the resulting loads on the Federal power facilities and the age of these facilities are forcing increased maintenance and replacement of equipment.

Site Funding and Federal and Contractor Staffing Profile

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Operations and Maintenance	2,382	2,722	3,625[a]

Adjustment	-1,290	0	0
Budget Authority	25,820	26,000	27,940
Federal Full-Time Equivalents	174	175	177
Contractors	45	45	42

Program Performance Measures

- Based on the annual performance measurements review in FY 1998, Southwestern developed performance goals and objectives supported by performance measurements that crosscut programs.
  - Market and deliver all available hydroelectric power as measured by the amount of firm capacity and associated energy delivered, economic benefits realized, and fossil fuels saved.
  - Operate and maintain the transmission system as measured by the NERC standard, the SAIDI, a recordable accident frequency rate, and Southwestern's work with the regional electric reliability council.
  - Repayment of the Federal investment as measured by the cumulative status of repayment, the planned repayment of principal on the power investment, and a 1.0 debt service coverage ratio.

Michael A. Deihl, Administrator
Southwestern Power Administration

[b]Reflects an appropriation transfer of $610,000.

Southwestern Power Administration

Program Mission

Southwestern Power Administration's (Southwestern) mission fulfills requirements of section 5 of the Flood Control Act of 1944 by marketing and reliably delivering Federal hydroelectric power, with preference given to public bodies and cooperatives. This will be accomplished by maximizing the use of Federal assets to repay the Federal investment while balancing power needs with the diverse interests of other water resource users and implementing public policy. As part of the Department of Energy's (DOE) Strategic Plan in the Energy Resources and Corporate Management business lines, Southwestern's program promotes secure, competitive, and environmentally responsible energy systems by reducing the vulnerability of the U.S. economy to disruptions in energy supplies.

To integrate the operation of the Federal hydroelectric generating plants and to transmit power from U.S. Army Corps of Engineers (Corps) dams to its customers, Southwestern maintains 1,380 miles of high-voltage transmission line, 24 substations, and 46 microwave and VHF radio sites. Southwestern's headquarters is in Tulsa, Oklahoma; its dispatch center is in Springfield, Missouri; and its maintenance crews are based in Jonesboro, Arkansas, Gore and Tupelo, Oklahoma; and Springfield, Missouri.

In order to achieve safety and reliability while staying competitive, Southwestern will accomplish its mission with 177 Federal employees, 42 Contractor employees, budget authority of $27,940,000 (of which $773,000 will be derived from an appropriation transfer), reimbursable authority of $4,200,000 and through three program activities: Operations and Maintenance, Construction, and Program Direction. In addition, Southwestern will perform reimbursable work activities, for Federal entities under the Economy Act of 1932 and non-Federal entities under authority provided in the annual appropriation language.

Program Goals

- Market and deliver all available hydroelectric power from Corps dams while balancing power needs with the diverse interests of other water resource users.
- Operate and maintain a Federal transmission system to assure reliability of the interconnected system while meeting utility safety standards and encouraging competition through open access to facilities.
- Maximize the use of Federal assets to repay the investment, including principal and interest, and operation and maintenance costs of the Federal power program.

Program Objectives

- Assure all power and energy is marketed, offering it first to public bodies and cooperatives.
- Provide widespread economic benefits while assuring repayment of the Government's costs.
- Provide environmental benefits by reducing the use of non-renewable resources.
- Provide reliable deliveries of electric power to customers.

- Operate the transmission system to assure efficient matching of generation to load.
- Operate and maintain the transmission system safely.
- Continue to provide open access to transmission facilities to encourage competition.
- Assure that the Government's hydropower costs are repaid according to sound business principles.

Performance Measures

Southwestern's FY 2000 performance measurements support the DOE's Strategic Plan and assume that requirements of the authorizing program legislation, Section 5 of the Flood Control Act of 1944, is fulfilled. Performance measurements are to:

- Market 100 percent of firm capacity and associated energy offering it first to public bodies and cooperatives according to Southwestern's marketing plan.
- Produce $431.0 million in economic benefits under average water conditions and at FY 1999 power values.
- Save 9.2 million barrels of oil, 2.7 million tons of coal, or 56 billion cubic feet of gas under average water conditions through hydropower generation.
- Achieve a System Average Interruption Duration Index (SAIDI) of not more than 150 minutes of total preventable outages per year per delivery point.
- Ensure that the power system control area operated by Southwestern receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North American Electric Reliability Council performance standard.
- Achieve a safety performance of at most a 3.3 recordable accident frequency rate for recordable injuries per 200,000 hours worked or the Bureau of Labor statistics industry rate, whichever is lower.
- Continue to implement Southwestern's open access tariff and work with the regional electric reliability council to encourage competition through cooperation with the security coordinator in the development of regional transmission tariffs and integrated system operation.
- Perform annual Power Repayment Studies to assure that the cumulative status of repayment remains on schedule by filing new rates, if necessary.
- Meet planned repayment of principal on power investment.
- Achieve a debt service coverage ratio of 1.0 based on average water conditions.

Significant Accomplishments and Program Shifts

Purchased Power and Wheeling

- Beginning in FY 2000, Southwestern will no longer seek appropriations for purchase power and wheeling activities. Instead, the customers of Southwestern will make their own purchase and transmission arrangements directly with suppliers. Improved transmission access that result from

restructuring of the electric industry allows most customers to continue obtaining these power purchases and wheeling services from other sources. Power receipt estimates have been reduced to reflect the reduced spending by Southwestern.

Operations and Maintenance

- Beginning in FY 2000, the Operations and Maintenance (O&M) program activity will reflect $415,000 of routine transmission system replacements (circuit breakers and potential transformers) that have been included in the Construction program activity in previous years. The inclusion of these routine replacements in O&M more accurately fits the O&M program description.

Program Direction

- A reorganization of the Maintenance activity occurred in April 1998 to effect better utilization of personnel resources by creating a team to address engineering concerns such as changes in transmission line loads resulting from system open access; and by reassigning communication maintenance to more effectively coordinate communication issues between the maintenance of the system and the Power System Dispatch Center.
- Consistent with Southwestern's Organization 2000 Plus Initiative, Corporate Services, specifically Environment, Safety and Health and Administrative Services, reorganized in early FY 1998 to further flatten the organization and reduce supervisor to employee ratios.
- Southwestern's FY 2000 Program Direction activity has increased in part due to FY 1998 regional job surveys and negotiated union payroll increases for dispatchers (7.5 percent) and power system maintenance personnel (5.9 percent), reflecting a competitive market for these skills in a deregulated industry.

Agency Wide

Because Southwestern's program activities are interrelated, the following accomplishments crosscut programs:

- In FY 1998, Southwestern marketed 6.1 gigawatthours and transmission services with a gross revenue production of $94,901,000. As of September 30, 1998, cumulative repayable Federal investment is estimated to be $1,086,000,000. Contingent on final FY1998 audited financial statements, an estimated $440,000,000 will have been repaid with approximately $624,100,000 in interest.
- Southwestern operated and maintained 1,380 circuit miles of high-voltage transmission line, 24 substations, and 46 microwave and VHF radio sites, located across three states, thereby marketing and providing reliable hydroelectric power to 93 customers and approximately 7 million end users from 24 separate power projects.
- Southwestern's Open Access Transmission Tariff was approved on May 13, 1998. The Federal Energy Regulatory Commission (FERC) granted Southwestern's petition for Declaratory Order, finding that the tariff meets FERC's comparability standards.
- Starting June 1, 1998, Southwestern began operating under the Southwest Power Pool regional tariff for transmission transactions.

- Southwestern's Integrated System and Robert D. Willis rate increases were implemented on January 1, 1998, pursuant to interim approval by the Deputy Secretary of Energy. Southwestern implemented a rate increase of 1.9 percent for the Integrated System which also included a redesign of transmission service rates to comply with the intent of FERC Order No. 888. FERC issued final approval of these rates on April 29, 1998. A rate increase of 13.5 percent for the Robert D. Willis project was approved on a final basis on April 28, 1998. The rate for the Sam Rayburn project was extended on an interim basis for a one-year period by the Deputy Secretary of Energy.
- On September 18, 1998, the FERC approved Southwestern's Open Access Transmission Standards of Conduct subject to minor revisions and granted Southwestern a waiver of the separation of functions portion of the Standards of Conduct requirements.
- In FY 1998, Southwestern received the Department of Energy's Small Business Program Award. This award reflects Southwestern's continuing commitment to reserve a portion of the acquisition program for small and disadvantaged businesses.
- Southwestern will make use of reimbursable authority, bill crediting, and net billing capabilities to maintain and recover the investment in the Federal power facilities, and to assure reliable electrical service to the region.
- Southwestern's Strategic Plan was revised in FY 1998 to further align with the Department of Energy's Strategic Plan and to enable Southwestern to evaluate program performance against organizational goals and objectives.
- Southwestern has two critical systems that are required to be Year 2000 ready. The existing Supervisory Control and Data Acquisition/Energy Management System was Year 2000 ready when installed in FY1996. The current Integrated Accounting System is being replaced with a Year 2000 ready Joint Financial Improvement Program certified system. The new system will be operational by March 31, 1999.

Funding Profile

(dollars in thousands)

	FY 1998 Current Appropriation	FY 1999 Original Appropriation	FY 1999 Adjustments	FY 1999 Current Appropriation	FY 2000 Request

Site Description

An agency of the Department of Energy, Southwestern Power Administration (Southwestern) was created in 1943 to market power and energy produced at U.S. Army Corps of Engineers hydroelectric power projects. Southwestern markets power at wholesale rates to 78 municipal utilities, 12 rural electric cooperatives, and three government agencies in the six states of Arkansas, Kansas, Louisiana, Missouri, Oklahoma, and Texas. To integrate the operation of the Federal hydroelectric generating plants and to transmit power from 24 U.S. Army Corps of Engineers dams to customers, Southwestern operates and maintains1,380 miles of high-voltage transmission line, 24 substations, and 46 microwave and VHF radio sites. Southwestern operates from five locations. The Headquarters is located in Tulsa, Oklahoma; the dispatch center in Springfield, Missouri; and the maintenance crews are located in Jonesboro, Arkansas; Gore and Tupelo, Oklahoma; and Springfield, Missouri.

Operations and Maintenance

Mission Supporting Goals and Objectives

Southwestern's Operations and Maintenance (O&M) activity fulfills the requirements of Section 5 of the Flood Control Act of 1944 and reflects Southwestern's goals and objectives to market and deliver power in a safe and reliable manner while providing environmental and economic benefits to the region, encouraging competition and repaying the Federal investment plus interest. The O&M program also supports the Department of Energy's Strategic Plan to promote secure, competitive, and environmentally responsible energy systems by reducing the vulnerability of the U.S. economy to disruptions in energy supplies.

Southwestern markets power in a six-state area from 24 multi-purpose Federal dams operated by the U.S. Army Corps of Engineers. To integrate the operation of the Federal hydroelectric generating plants and to transmit power from the U.S. Army Corps of Engineers dams to customers, Southwestern maintains 1,380 miles of high-voltage transmission line, 24 substations, and 46 microwave and VHF radio sites.

Southwestern's facilities were built 35-50 years ago and are constantly evaluated to develop a systematic maintenance program through the Maintenance Management Information System (MMIS). Data from the MMIS (age, risk of failure, life cycle of equipment), field crew evaluation, obsolescence of technology, lack of replacement parts are all variables that are assessed when determining the level of funding required for a fiscal year.

Estimates provided in this activity represent power marketing, operations, and maintenance activities. Power Marketing provides for technical and economic studies to support Southwestern's transmission planning, water resources, communications, environment, safety and health, and maintenance activities. Technical and economic studies provide data to analyze and evaluate the impacts of proposed operational changes and for decision making based on cost/benefit analysis.

The Operations activity provides for the day-to-day communications support of the Supervisory Control and Data Acquisition/Energy Management System (SCADA/EMS), and other associated communication activities. Communications also support fiber optic and microwave radio construction projects. In addition, the Operations activity develops and implements operational arrangements with competing users. In conjunction with this activity, Southwestern works with customers through alternative finance arrangements and other Federal entities in studying and implementing dissolved oxygen monitoring programs to optimize Federal hydropower production and fulfill Southwestern's contractual obligations.

The Maintenance activity provides for the day-to-day routine replacements on the transmission facilities. Activities are divided into substation and line maintenance and includes communication tower maintenance, protection of facilities, hazardous waste removal, right-of-way clearing, air patrol of lines, diagnostic testing, and general building maintenance.

Performance Measures

Southwestern's performance measures crosscut programs and support the following goals:

- Market and deliver all available hydroelectric power as measured by the amount of firm capacity and associated energy delivered, economic benefits realized, and fossil fuels saved.
- Operate and maintain the transmission system as measured by the NERC standard, the SAIDI, a recordable accident frequency rate, and Southwestern's work with the regional electric reliability council.
- Repayment of the Federal investment as measured by the cumulative status of repayment, the planned repayment of principal on the power investment, and a 1.0 debt service coverage ratio.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Operations and Maintenance	2,382	2,722	3,625	+903	+33.2%
Total, Operations and Maintenance	2,382	2,722	3,625	+903	+33.2%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Operations and Maintenance			
■ Power marketing provides technical and economic studies for transmission planning activities such as protective relaying, environment, safety and health, water resources, communication, and maintenance.	162	174	693
▸ In FY 2000, annually recurring mandatory transmission planning studies will be performed:			
– One dynamic stability evaluation;			
– Two Southwestern Federal Power System short circuit investigations. Business essential transmission planning studies will be performed;			
– 48 Southwest Power Pool model updates;			
– 25 power system protective relay coordination studies;			
– 4 Available Transmission Capacity updates (one per season);			
– 5 customer interconnection/facility addition analyses arising from open transmission access and market pressures on Southwestern customers and connected utilities.			
The number of business essential studies are increasing at a rate of 20 percent per year based on historical records.			
▸ The funding level is appropriate for the average number of studies required per year that would have operational impacts on how Southwestern markets and delivers power. Estimate is derived from the negotiated architect/engineering contract.			
▸ Approximately $354,000 of planning studies were reassigned from maintenance to the power marketing activity.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ Environmental estimate ($165,000) includes contract services to develop an environmental plan that addresses the use and preservation of historic, archeological and cultural resources. The plan would assess the physical environment where Southwestern's transmitting facilities are located, summarize the prehistoric, ethnohistoric and historic use of the location area, and define the management and methodology of the program. Funding this program is necessary to comply with 16 USC 431-433, 16 USC 461-467, 16 USC 469, 16 USC 470; 42 USC 4321-4347, 42 USC 1996 and Executive Orders 11593, 13006 and 13007. This funding also includes a revision to the existing spill prevention, control and countermeasures plan to include reviews of Southwestern's sites. Funding this program is necessary to comply with the Natural Resources Damage Assessment requirements of the Oil Pollution Act of 1990 and 42 USC 4321, 42 USC 6901, 33 USC 1251, 40 USC 9601 and 49 USC 2601. Funding for the two plans is derived from government procurement cost estimates for similar work.			
■ Operations provides for the development and implementation of operational arrangements with competing water users and transmission communication activities.. . . .	149	0	505
▸ Development and implementation of operational arrangements with competing water users will be funded through customer financing.			
▸ In FY 2000, transmission communication costs is included in Operations. This activity had previously been reported in the Maintenance Subprogram below. The transferred communication activity includes the purchase of supplies and materials such as digital testing equipment, system modules, and work stations for SCADA support and a Geographical Information System. The Communication expense increase is related to SCADA equipment maintenance, microwave maintenance, and FERC service charges.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
▸ Estimates for SCADA and communications maintenance are derived from maintenance history, the age of the equipment, and annual diagnostic maintenance tests. The funding level is appropriate for the age (SCADA is approximately 3 years old and the microwave equipment is approximately 13 years old) and expected life span (7 years for SCADA and 15 years for microwave equipment) of the equipment.			
■ Maintenance provides for day-to-day maintenance of Southwestern's 24 substations and 1,380 miles of high-voltage transmission lines.	2,071	2,548	2,427
Substation Maintenance:			
▸ In FY 2000, work includes purchase and installation of 6 circuit breakers, 30 interchange and/or revenue meters, electrical equipment such as battery chargers, coupling capacitor voltage transformers, and potential transformers to improve system reliability; complete essential general maintenance projects; and disposal of 15 PCB contaminated electrical items.			
▸ Maintenance estimate is based on data in the Maintenance Management Information System (MMIS) which provides the age and condition of the existing equipment that predicts maintenance intervals. Estimate is calculated on age plus risk and number of units times negotiated price per unit.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Line Maintenance:			
▸ In FY 2000, purchase an estimated 50 steel structures complete with crossarms and braces; complete an estimated 400 miles of planned right-of-way (ROW) clearing, including clearing the floor of the ROW and side clearing of the ROW; 150 miles of herbicide application; and routine vehicle repair and maintenance.			
▸ The estimate for steel structures is appropriate based on data in the Overhead Transmission Maintenance System (OTMS) program. Through the use of the OTMS, the number of units (poles, crossarms, insulators) to be replaced, age of such units, and testing criteria is predetermined enabling extraction of this information at any given period of time. The estimate is calculated on existing inventory plus historical average crew production, condition of the equipment and historical pricing information for parts and materials.			
▸ In the ROW program, the growing cycle of vegetation in Southwestern's geographical area has shown that the mechanical reclearing of brush and trees in a 3-4 year cycle is needed to avoid outages. Southwestern has begun an aggressive herbicide treatment program in addition to reclearing to eliminate undesirable vegetation and extend the reclearing cycle to reduce on going costs in the outyears. Estimate is appropriate for 400 miles of vegetation control annually with 150 miles of herbicide application. Estimate is based on number of miles plus type of terrain and historical pricing information.			
Communication Maintenance:			
▸ Starting in FY 2000, communication maintenance will be performed under the Operations Activity to align the maintenance of SCADA with the operations of the transmission system which is accomplished through SCADA.			
Total, Operations and Maintenance	2,382	2,722	3,625

Explanation of Funding Changes From FY 1999 to FY 2000

Operations and Maintenance	FY 2000 vs. FY 1999 ($000)
■ Increase in power marketing is due to a consolidation of architect and engineering (A/E) studies from maintenance to power marketing ($+354,000) and an increase for environmental efforts ($+165,000) is related to Cultural Resources and Spill Control and Countermeasures.	+519
■ Increase in operations is due to the maintenance reorganization whereby the communications function moved to operations from maintenance ($+252,000). In addition, increases are reflected for SCADA upgrades ($+145,397), microwave maintenance ($+15,395), Southwestern Power Pool fees ($+40,000), Federal Energy Regulatory Commission service charge ($+26,000) and a competing use study ($+26,208).	+505
■ Decrease in maintenance reflects a shift of the communications function from maintenance to operations ($-252,000), with a shift of A/E studies to power marketing ($-354,000), and an increase to perform circuit breaker and current and potential transformers installations ($+415,000), performed in the Construction activity in previous years. In addition, increases includes environmental waste management and equipment ($+5,000), technical software and hardware maintenance ($+64,000), and repairs on an infrared camera for Energy Efficiency and Renewable Resource Program ($+1,000)	-121
Total Funding Change, Operations and Maintenance	+903

Major Issues

- The demand for energy with the resulting loads on the Federal power facilities and the age of these utilities are forcing increased maintenance and replacement of equipment.

Purchased Power and Wheeling

Mission Supporting Goals and Objectives

Beginning in FY 2000, Southwestern will no longer seek appropriations for purchase power and wheeling activities. Instead, the customers of Southwestern will make their own purchase and transmission arrangements directly with suppliers. Improved transmission access that result from restructuring of the electric industry allows most customers to continue obtaining these power purchases and wheeling services from other sources. Power receipt estimates have been reduced to reflect the reduced spending by Southwestern.

In the past, this activity provided for purchases of energy as necessary to supplement hydroelectric and wheeling services. System Support Activities are non-discretionary energy purchases necessary to supplement hydroelectric generation to meet system contractual obligations for delivering Federal power and energy Other Contractual Activities involve the purchase of wheeling services.

Performance Measures

Southwestern's performance measures crosscut programs and support the following goals:

- Market and deliver all available hydroelectric power as measured by the amount of firm capacity and associated energy delivered, economic benefits realized, and fossil fuels saved.
- Operate and maintain the transmission system as measured by the NERC standard, the SAIDI, a recordable accident frequency rate, and Southwestern's work with the regional electric reliability council.
- Repayment of the Federal investment as measured by the cumulative status of repayment, the planned repayment of principal on the power investment, and a 1.0 debt service coverage ratio.

Construction

Mission Supporting Goals and Objectives

Southwestern's Construction activity fulfills the requirements of Section 5 of the Flood Control Act of 1944 and reflects Southwestern's goals and objectives to market and deliver power in a safe and reliable manner while providing environmental and economic benefits to the region, encouraging competition, and repaying the Federal investment plus interest. This activity also supports the Department of Energy's Strategic Plan to promote secure, competitive, and environmentally responsible energy systems by reducing the vulnerability of the U.S. economy to disruptions in energy supplies.

Southwestern's Construction activity provides for modification and replacement of transmission, substation, switching and communication facilities, and other power system equipment which enable Southwestern to market Federal hydropower in the most efficient and cost effective manner, and to meet operational criteria required as a member of the Southwest Power Pool, the regional electric reliability council. Southwestern is responsible to maintain and enhance power system safety and reliability, thereby assuring continued safe, reliable delivery of power to preference customers; to encourage new initiatives for more effective use of existing regional resources; and to participate with non-Federal interests in joint power projects of benefit to the Government. In addition to appropriated funds, Southwestern uses reimbursable authority, bill crediting, and net billing arrangements to fund Federal power system replacement projects to assure the reliability of the Federal Power System.

Substation and communication equipment replacements are planned to assure system reliability. The projects reflect Southwestern's efforts to reduce the risk of more frequent and extended service outages, avoid more costly replacements in the future, and support the increased open access activity on the power system. System age, risk of failure, life cycle, maintenance crew observations, obsolescence of technology, unavailability of replacement parts, budget constraints, cost, and need of more capacity are all variables that are assessed when determining the requirements of the Construction activity.

Southwestern's planned Construction projects are subject to change based on unanticipated equipment failure or customer needs. The realities of maintaining a complex interconnected power system means unforeseen priority projects will surface from time to time causing a deferment of planned projects to another fiscal year. However, all projects share a commonality in that they are replacements of aging existing equipment necessary to maintain the reliability of the Federal power system.

Performance Measures

Southwestern's performance measures crosscut programs and support the following goals:

- Market and deliver all available hydroelectric power as measured by the amount of firm capacity and associated energy delivered, economic benefits realized, and fossil fuels saved.
- Operate and maintain the transmission system as measured by the NERC standard, the SAIDI, a recordable accident frequency rate, and Southwestern's work with the regional electric reliability council.
- Repayment of the Federal investment as measured by the cumulative status of repayment, the planned repayment of principal on the power investment, and a 1.0 debt service coverage ratio.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Transmission System Replacements	5,987	6,387	6,278	-109	-1.7%
Capital Equipment Not Related to Construction	765	430	406	-24	-5.6%
Total, Construction	6,752	6,817	6,684	-133	-2.0%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Transmission System Replacements			
■ Substation equipment replacements are planned to assure system reliability and reliable service to Southwestern's customers. The age of substation equipment to be replaced ranges from 30 - 37 years	5,987	6,387	6,278
▸ In FY 2000, replacements include six duplex switch board relay panels, disconnect switches at two sites, 161-kV Breaker Bay replacement, grounding and surge protection at one site, structure refurbishment at one site, and 30 revenue meters/telemetry replacements.			
▸ In FY 2000, purchase responsibility for circuit breakers and current and potential transformer replacements has been shifted to the Operation and Maintenance budget.			
■ Communication equipment replacements are planned to provide necessary improvements in system reliability and reduce maintenance and equipment costs. The age of communication equipment to be replaced ranges from 30 - 35 years.			
▸ In FY 2000, replacements include one microwave site, and 146 miles of optical shield wire. Funds are also included for maintenance and upgrades to SCADA previously covered under warranty in the original purchase.			
■ The funding level for transmission system replacement is appropriate based on the useful service life expended multiplied by adjustment factors that reflect whether or not the equipment's electrical rating is sufficient to safely carry the calculated available current, and a factor that dictates relative maintenance demands. Estimate is derived from competitive negotiated prices per number of units.			

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Capital Equipment Not Related to Construction	765	430	406
■ Replace vehicles, tractors, trailers, and heavy equipment used for maintenance and repair of transmission system equipment and facilities. Replaced 14 vehicles in FY 1998 including special purpose vehicles, and an estimated 10 vehicles in FY 1999. In FY 2000, 5 heavy duty trucks and 4 vehicles for line crew transportation are planned.			
■ Funding level is appropriate based on GSA and DOE usage and replacement guidelines and the type of equipment needed to maintain 1,380 miles of transmission lines. Estimates are derived from GSA pricing schedules.			
Total, Construction	$6,752	$6,817	$6,684

Explanation of Funding Changes From FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Transmission System Replacements	
■ Decrease in transmission system replacements is primarily attributed to the shift in responsibility for circuit breakers and current and potential transformer replacements to field maintenance funded in the Operations and Maintenance Budget ($-415,000). Increase reflects continued efforts to replace corroded static wire with fiber optic cable ($+306,000)	-109
Capital Equipment Not Related to Construction	
■ Decrease in Capital Equipment Not Related to Construction is primarily attributed to anticipated cost savings due to purchase negotiations for special purpose vehicles	-24
■ Total Funding Change, Construction	-133

Major Issues

■ The demand for energy with the resulting loads on the Federal power facilities and the age of these utilities are forcing increased maintenance and replacement of equipment.

Southwestern Power Administration Program Direction

Mission Supporting Goals and Objectives

Southwestern's Program Direction activity is based upon Southwestern's Organization 2000 Plus Initiative to reduce costs and to streamline the organization and provides salaries and benefits, travel, support services, and other support related services required to implement the requirements of Section 5 of the Flood Control Act of 1944 and reflects Southwestern's goals and objectives to market and deliver power in a safe and reliable manner while providing environmental and economic benefits to the region, encouraging competition, and repaying the Federal investment plus interest. This activity also supports the Department of Energy's Strategic Plan to promote secure, competitive, and environmentally responsible energy systems by reducing the vulnerability of the U.S. economy to disruptions in energy supplies.

Southwestern's Program Direction activity provides compensation and all related expenses for Federal personnel who operate and maintain Southwestern's high-voltage power system and associated facilities and who plan, design, and supervise the construction of replacements, upgrades, and additions (capital investments) to the power system facilities. Also included are personnel who negotiate and administer power marketing contracts, develop wholesale power rates, develop and implement operational arrangements with competing water users, schedule and deliver power to preference customers, implement environment, safety and health programs, and provide for general administration and management. These employees include, but are not limited to, civil, electrical, and electronic engineers, high-voltage linemen and electricians; power system dispatchers; public utility specialists; environmental and safety specialists; and administrative staff. Southwestern will continue to share facilities and administrative services with another DOE office. Travel associated with the operation and maintenance of the power system facilities continues at approximately the same level. Other travel needs have been reduced due to video conferencing capabilities.

The investment in support services continues to assure program support for Southwestern in the areas of word processing, records management, public affairs, computer programming, data processing, environmental, engineering, and drafting and design. Drafting and design and environmental and engineering support will continue to focus on efforts in power system replacements. Other related expenses supports Southwestern in the areas of rental space, telecommunications, utilities, printing, training, supplies, materials, non-capitalized equipment, and the working capital fund.

In FY 1998, Southwestern purchased a Year 2000 ready Joint Financial Improvement Program certified system to replace the current Integrated Accounting System. The new system is expected to be operational by March 31, 1999.

Performance Measures

Southwestern's performance measures crosscut programs and support the following goals:

- Market and deliver all available hydroelectric power as measured by the amount of firm capacity and associated energy delivered, economic benefits realized, and fossil fuels saved.
- Operate and maintain the transmission system as measured by the NERC standard, the SAIDI, a recordable accident frequency rate, and Southwestern's work with the regional electric reliability council.
- Repayment of the Federal investment as measured by the cumulative status of repayment, the planned repayment of principal on the power investment, and a 1.0 debt service coverage ratio.

Funding Schedule

(dollars in thousands, whole FTE)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Program Direction[a]					
Salaries and Benefits	11,995	11,829	13,170[b]	+1,341	+11.3%
Travel	1,010	705	620	-85	-12.1%
Support Services	1,970	1,970	1,966	-4	-0.2%
Other Related Expenses	2,944[c]	1,898	1,875	-23	-1.2%
Total, Program Direction	17,919	16,402	17,631	+1,229	+7.5%
Full-Time Equivalent (FTE)	174	175	177[d]	2	+1.1%

[a]The amounts included in Program Direction represent all salaries and benefits, all travel expenses and related personnel costs for Operations and Maintenance and Construction activities. It should be noted that this value represents not only Southwestern's administrative and/or overhead expenses, but includes direct program activity costs associated with FTE usage.

[b]Higher than estimated cost-of living increases in FY 1998 and FY 1999 resulted in fewer dollars for FTE for dispatchers and power system maintenance crews. The FTE level of 177 reflects estimates based on currently known average utility industry salaries.

[c]Reflects an appropriation transfer of $610,000.

[d]Outyear FTE levels may be higher than 177 FTE. Usage projections for the outyears will be determined based on industry restructuring requirements. This will result in a continued policy to ensure that staffing levels are adequate to maintain a safe and reliable Federal transmission system.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salaries and Benefits			
Funding in this activity is for skilled Federal employees who operate and maintain Southwestern's high-voltage interconnected power system and associated facilities, and the administrative support staff. Estimate is derived from the current year budgeted salaries and benefits plus cost-of-living adjustments plus or minus FTE change plus promotions and within grade increases. Benefits are calculated based on a percentage of prior year actuals as applied against FY 2000 budgeted salaries. This level is appropriate for 177 FTE of which 40 percent of the salaries are driven by union contract and regional pay surveys.	11,995	11,829	13,170
Travel			
Estimate includes transportation and per diem, incurred in the operation and maintenance of Southwestern's geographically dispersed power system and the performance of general administrative functions. Estimate is derived from the daily requirement of the field maintenance personnel to maintain 1,380 miles of transmission line plus a self imposed ceiling to limit all other travel and Federal travel limitations. This level is appropriate to assure reliability of the power facilities, represent the Government's interests at State, and electric municipal, and cooperative customer meetings, meet externally imposed training requirements and respond to required appearances such as the Congressional Hearings..	1,010	705	620
Support Services			
Estimate includes automated data processing, drafting, and general administrative support. Estimate is derived from the negotiated contract amount essential to Southwestern's mission. Funding level is based on the critical and essential computer based systems at Southwestern, the number of construction projects, and basic clerical and record support	1,970	1,970	1,966

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Other Related Expenses			
Estimate includes funding for rental space, telecommunications, utilities, printing and reproduction, training tuition fees, maintenance and repair of office equipment, supplies, non-capitalized equipment, working capital fund and Year 2000 compliant financial management system software Estimate is based on fixed costs plus a 2.1 percent inflation factor, age of equipment, comparative vendor estimates, and DOE assessments. This estimate is appropriate based on 43,000 square feet of leased space, communications, utilities, and repair and purchase of office equipment at Headquarters, and four field offices	2,944	1,898	1,875
Total, Program Direction	17,919	16,402	17,631

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salaries and Benefits	
■ Higher than expected cost-of-living increases occurred in FY 1998 for dispatchers (7.5 percent) and power system maintenance crews (5.9 percent). The increase for dispatchers is based on an annual regional survey for similar electric utility positions. The increase for power system maintenance crews is based on a union negotiated agreement. These increases were budgeted in FY 1998 and FY 1999 at a much lower level, causing a cumulative shortfall since FY 1998. Additionally, the salaries and benefits increase reflects cost-of-living increases (4.1 percent) and within grade increases for General Schedule employees. Promotions are reflected in all job categories. Finally, two additional FTEs are reflected.	+682
■ An increase in overtime is due to salary increases, demands to maintain an aging transmission system, and implementation of open access.	+32
■ Agency Achievement, Improvement and Measurement (AIM) awards reflect an increase because no AIM awards were budgeted in FY 1999 due to carryover from previous years.	+244
■ Workers' Compensation was inadvertently budgeted in Other Related Expenses in FY 1999 and is properly included in Salaries and Benefits with a slight increase.	+383
Total, Salaries and Benefits	+1,341

	FY 2000 vs. FY 1999 ($000)
Travel	
■ Reflects a decrease due to increased usage of video conferencing, use of the Training Center, and more stringent prioritization of travel needs	-85
Support Services	
■ Due to a reorganization of Corporate Services functions, reallocations from ADP ($-503,000), Environmental and Engineering Support ($-60,000), and Drafting and Design Support ($-36,000) were made to Clerical/Records Management ($+595,000) to accurately reflect the current organizational structure and functions.	-4
Other Related Expenses	
■ Rent (Tulsa Headquarters building lease and storage)	+60
■ Telecommunications (FTS and local phone service)	+286
■ Contract services (training requirements for procurement certification, security system maintenance, and facility services such as janitorial, repairs, office moves, painting, additional heat and air conditioning during non-core working hours.	+102
■ Printing and reproduction services	+13
■ Office equipment	+17
■ Reassignment of Workers' Compensation to Salaries and Benefits	-375
■ ADP and security supplies and materials	-70
■ Tort claims	-16
■ Contract Services (benchmarking studies, temporary help and legal investigations)	-40
Total, Other Related Expenses	-23
Total Funding Change, Program Direction	+1,229

54-291 99 - 85

Support Services

(dollars in thousands)

Environment, Safety & Health Crosscut

Summary

Southwestern has no non-compliance issues to resolve. We believe this to be the result of a very active and effective core Environment, Safety and Health (ES&H) program. The basic strategy for assuring continued compliance with applicable laws, regulations, and Department of Energy orders and policies and to pursue excellence with demonstrable progress in program performance, is to maintain a high level of environmental and safety awareness with constant self-assessment and re-evaluation of the overall program.

Southwestern's management and direction for the ES&H program is to maintain a high level of awareness. This is accomplished through increased involvement of supervisors, managers, and operating-level employees; determining root causes of and identifying appropriate follow-up action; implementing appropriate recommendations; conducting self-assessment evaluations; and prioritizing activities for enhancing the program.

The major planning assumptions are to identify methods to improve the design, operation, and maintenance of Southwestern's safety and environmental programs to achieve a level of "excellence".

The most important safety issue at Southwestern is that of assuring the protection of employees from work place hazards. Environmentally, the most important issue is the continuing actions to maintain a compliance program.

Top-level objectives and key milestones for the functional areas are:

- Involve employees at the operational level.
- Improve training of workers.
- Modify plant hardware and equipment to protect workers and the environment during operation and maintenance processes.
- Reduce risks by identifying potential hazard and design barriers and/or making changes to work processes.
- Conduct self-assessments and continuously re-evaluate work processes.
- Implement strategies.

Facility Functional Area Summaries

There is only one full time FTE working in the safety functional areas. In the environment there is one full time FTE and three part time FTE.

Major activities are to improve management and oversight activities by planning and providing training; promoting continuous self-assessment; inspecting and monitoring for quality assurance; and modifying work procedures and equipment to reduce exposure to risk to the workers and the environment. Budget assumptions appear reasonable and prudent.

Safety Program Description

This crosscut consists of all Safety and Health (S&H) functional areas rolled into one and consists of activities such as:

- Fire Protection
- Industrial Hygiene
  - Hazard Communication
  - Chemical Inventory, Tracking, and Storage
  - Hazard Recognition and Evaluation
  - Personnel Protection
  - Physical, Biological, and Physiological Stresses
  - Hazardous Waste Operation and Emergency Response
  - Ergonomics/Prevention of Repetitive Motion Injuries
- Industrial Safety
  - Electrical Safety
  - Machinery and Machine Guarding
  - Compressed Gas and Pressure Systems Safety
  - Hoisting, Rigging, and Material Handling
  - Lock-out/Tag-out
  - Confined Space Controls
  - Platform, Manlifts, and Scaffolding
  - Walking and Working Surfaces Safety
  - Cutting, Welding, Brazing Safety
  - Hand & Portable Powered Tools & Other Hand-Held Equipment Safety
  - Explosive and Hazardous Substance Handling
  - Construction Safety
  - Facility Egress
  - Personnel Protection

- Occupational Medical Services
  - Physical Health Evaluations
  - Medical Treatment and Triage
  - Rehabilitation/Lost Work Days Program
  - Medical Records and Documentation
- Transportation Safety
  - Packaging and Transportation
  - Aviation Safety
  - Motor Vehicle Safety
- Management and Oversight
  - Independent Audits and Appraisals
  - Internal Audits and Surveillance
  - S&H Inspections and Program Reviews

Appraisal

Risks associated with elements in core program:

- Public Safety - There is a very high likelihood that without a S&H Program, the impact to the public would be excessive exposure and/or injury. Southwestern has nearly 1,380 miles of transmission lines in a three-state area. These lines cross bodies of water used for recreation as well as farms, public roads, and countrysides inhabited by hunters, recreationists, etc.

  With an active program, the impact to the public is reduced to a low-likelihood of occurrence of excessive exposure and/or injury. The program promotes safety awareness. It reduces exposure to hazards and prevents accidents and injuries through the use of barriers and guards. It ensures compliance with regulations and guidelines for public safety.

- Site Personnel Safety - Without an adequate S&H Program, the Southwestern employees' exposure to a catastrophic injury or illness is very high due to the nature of the work of the agency. With the improvement of the current S&H Program, the likelihood of occurrence is reduced to a low level. Activities for improving the program are:
  - improved training procedures and courses;
  - improved inspection and maintenance procedures; and
  - modified plant hardware to protect workers, reduce safety and health risks, promote safety awareness, and ensure compliance with guidelines.

- Compliance - Without the S&H Program, it is very likely that Southwestern would not be in compliance with DOE Safety and Health orders. With the S&H, compliance is ensured, enhanced, and adhered to.
- Mission Impact - Without this core activity, there is a slight likelihood that the facilities would be shutdown for less than six months because of non-compliance or a catastrophic accident. With the S&H, compliance and accident prevention are of primary concern. Improvements in this core activity will further reduce the likelihood of occurrence impacting the mission of Southwestern.

Description

This activity is essential to the continuously performed activities and to maintaining or exceeding the current level of compliance.

- New Safety Position - Current staffing is one FTE. In order to fully implement Federal OSHA requirements, DOE Orders and Guidelines, and PMA power system safety standards, another FTE is necessary. Southwestern has facilities in three states, maintaining approximately 1,400 miles of transmission lines and operating 24 substations.

Appraisal

- Public Safety - An additional FTE will ensure a more in-depth presence of S&H in all activities. There is a high likelihood that the public could be impacted by injury or exposure without strengthening this force. With the additional FTE, the operation and maintenance activities, as well as improvement in compliance of regulations and standards, will be more readily achieved.
- Site Personnel Safety - The additional FTE will assure that the likelihood of a catastrophic injury or illness will be reduced from a high level to a low level. The additional FTE will not eliminate the possibility of injury or illness to site personnel but will reduce the number of occurrences. The addition will certainly assure more frequent oversight and guidance, improve quality of operations, enhance safety awareness, provide more in-depth analysis, improve compliance levels, and expand the activities of the S&H Program.
- Compliance - Without the additional FTE, the compliance level will have deficiencies due to the fact that the present staff cannot give quality time to each regulation and program as is necessary.
- Mission Impact and Investment - Would be impacted proportionately as they are impacted in the core S&H Program.

Description

This crosscut is a consolidation of all the environmental functional areas plus emergency preparedness and consists of the following activities:

- Protection of Air Quality
  - Source Monitoring Activities
- Protection of Water Quality
  - Groundwater Protection Management
  - Permitting Application and Maintenance
  - Discharge Facility Treatment/Control Operation and Maintenance
  - Effluent Monitoring and Environmental Surveillance for Surface Water
  - Spill Prevention, Control and Countermeasure Plans
- Solid Waste Generation and Control
  - Waste Characterization and Certification
  - Waste Reduction and Minimization
  - Accumulation, Handling, Treatment, and Disposal
- Control of Toxic Substances
  - Pesticides
  - Polychlorinated Biphenyls and Oil-Filled Storage Equipment
  - Sara Title III, Recordkeeping and Reporting
  - Toxic Substances Control Act Compliance
  - Spill/Release Response and Reporting
- Management, Oversight and Reporting
  - Environmental Compliance, Planning and Review
  - General Environmental Surveillance and Monitoring
  - National Environmental Policy Act Activities
  - Program Evaluation and Reporting
  - Internal Communications and Community Outreach and Awareness

- Emergency Preparedness
  - Emergency Planning
  - Emergency Equipment
  - Emergency Operations, Drills, and Procedures

Appraisal

- Compliance - Without an Environmental Program, Southwestern would not be in compliance with applicable DOE orders and regulations. With a program, Southwestern can maintain compliance while striving for excellence.
- Mission Impact - Failure to meet environmental requirements could delay completion of facilities needed to fulfill Southwestern's mission.
- Environmental Impact - Lack of an environmental program could result in damage to either surface or ground water or contaminate soil. Also, fish and wildlife or natural habitat could be adversely affected.

Description

The current staff level is one FTE. Additional resources needed to maintain compliance and pursue excellence in the following Environmental functional areas can be presented through third party support:

- Protection of Air Quality
- Protection of Water Quality
- Solid Waste Generation and Control
- Control of Toxic Substances
- Management, Oversight and Reporting
- Emergency Preparedness
- Herbicides

Appraisal

- Compliance - Both Federal and DOE compliance regulations are continually changing. This makes it difficult to stay abreast of the changes, particularly with the DOE regulations.
- Mission Impact - Mission may be impacted by failure to consider environmental issues early because of lack of resources.
- Investment Impact - Investment may be impacted by lack of timely response to environmental concerns such as minor loss of oil.

- Environmental Impact - Lack of environmental program development and oversight could result in damage to either surface or ground water or soil contamination. Also, fish and wildlife or natural habitat could be adversely affected.

Western Area Power
Administration

Construction, Rehabilitation, Operation and Maintenance

Proposed Appropriation Language

For carrying out the functions authorized by title III, section 302(a)(1)(E) of the Act of August 4, 1977 (42 U.S.C. 7152), and other related activities including conservation and renewable resources programs as authorized, including official reception and representation expenses in an amount not to exceed $1,500, [$203,000,000]*$171,471,000*, to remain available until expended, of which [$193,787,000]*$160,286,000* shall be derived from the Department of the Interior Reclamation Fund: *Provided*, That of the amount herein appropriated, $5,036,000 is for deposit into the Utah Reclamation Mitigation and Conservation Account pursuant to title IV of the Reclamation Projects Authorization and Adjustment Act of 1992.

Falcon and Amistad Operating and Maintenance Fund

Proposed Appropriation Language

For operation, maintenance, and emergency costs for the hydroelectric facilities at the Falcon and Amistad Dams, [$1,010,000] *$1,309,000* to remain available until expended, and to be derived from the Falcon and Amistad Operating and Maintenance Fund of the Western Area Power Administration, as provided in section 423 of the Foreign Relations Authorization Act, Fiscal Years 1994 and 1995.

Western Area Power Administration

Program Mission

The mission of the Western Area Power Administration (Western) is to market and deliver reliable, cost-based hydroelectric power and related services. Western provides electric power to over 600 customers over a 1.3-million-square-mile area in the central and western United States. Western will repay the Federal investment for which it is responsible within the time frames established by law and regulations.

Western's Goals

- Remarkable Service
- Superior Products
- Delighted Customers

Program Objectives

- To be an organization of highly skilled, highly productive, customer-oriented employees who carry out our mission in concert with our desired culture, core competencies and leadership qualities.
- To strengthen our partnerships with the U.S. Bureau of Reclamation, the U.S. Army Corps of Engineers and the International Boundary and Water Commission to manage power delivery costs, and to improve power system reliability and efficiency.
- To strengthen partnership programs with our customers, constantly looking for opportunities to support both their and Western's success.
- To participate in decision-making processes with natural resource agencies whose operating decisions significantly affect Federal power rates and repayment obligations.
- To limit increases in annual operating expenses to keep our rates and the rates of our customers competitive in the markets we serve.
- To continuously work with our customers to secure alternative financing of Western's programs.
- To be proactive in the shaping of the competitive utility industry, primarily acting as an advocate for power system reliability.
- To enhance the productivity of our workforce to improve our service to our customers through continuous streamlining of our work processes and seeking relief from burdensome regulations.

Performance Measures

Western's performance measures support Department of Energy's Strategic Plan and Comprehensive National Energy Strategy. These measures are aimed at achieving specific outcomes including establishment of rates sufficient to make full and timely repayment to the U.S. Treasury; maintenance of the health and safety of all employees; and development and achievement of the operation of a reliable, low-cost, environmentally-sound power system which facilitates competitive, efficient and reliable power deliveries. Outputs include:

- *Transmission System Performance*: Western's goal is to ensure that each power system control area operated by Western receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North American Electric Reliability Council performance standard. Control criteria compliance are measures used to determine if utility employees, control equipment, and generation are responsive to the minute-by-minute load changes throughout the year. Good control performance is required to maintain system reliability and to reduce losses, as well as maintain equity among interconnected systems. Western's annual average compliance ratings in FY 1998 were 183.3 for CPS1 and 98.2 for CPS2, well exceeding the North American Electric Reliability Council (NERC) minimum of 100 and 90, respectively. Industry averages were 181.74 and 97.5, respectively.
- *Safety*: Western's goal is to achieve a safety performance of at most a 3.3 frequency rate for recordable injuries per 200,000 hours worked, or the Bureau of Labor Statistics industry rate, whichever is lower. Total recordable case (accident) rate measures the recordable accident frequency rate by multiplying the number of recordable injuries by 200,000, then dividing by the total hours worked. Western's calendar year 1997 rate of 1.9 is well below the industry average of 5.7. Final CY 1998 data are not yet available.
- *Cost Growth*: Western's goal is that the change in actual regular operation and maintenance obligations from one year to the next is no greater than the annual rate of inflation for the same period. In FY 1998, regular operation and maintenance obligations were 5.6 percent less than FY 1997. The annual rate of inflation for that same period was 1.5 percent.
- *Repayment of Power Investment*: Western's goal is to meet planned repayment of principal on power investment. As a result of an above-average water year and higher power sales, Western's FY 1997 payment was 144.6 percent of planned payment. Final FY 1998 information is not yet available.

Significant Accomplishments and Program Shifts

- In FY 2000, Western will not seek appropriations for the Purchase Power and Wheeling (PPW) program funded in Western's Construction, Rehabilitation, Operation and Maintenance (CROM) account. In addition, current alternative financing arrangements (net billing, bill crediting, and reimbursable) for PPW will be terminated. Customers are expected to provide for these financing arrangements directly with suppliers, thereby reducing both Western's costs and revenues in FY 2000 by $141 million. Existing long-term power purchase and power sale contractual commitments not funded by Western's customers will be terminated.

- Beginning in FY 2000, Western will pay for Boulder Canyon Project operations directly from the Colorado River Dam Fund (CRDF). Previously, this Project was included in Western's CROM account, and funds were provided from the CRDF by transfer.
- In FY 1998, Western
  - Sold 45.0 billion kilowatt-hours of energy; and
  - Collected gross operating revenues of $864.9 million.
- While we have effectively completed our Transformation initiative bringing requirements for full-time equivalents (FTE) down from 1,504 in FY 1994 to 1,330 in FY 1999, we are continuing to vigorously pursue efficiency opportunities. The FY 2000 budget request assumes a further decrease of 40 FTE in our business requirements.
- Western operated and maintained 16,854 circuit miles of high-voltage transmission lines, 258 substations, and associated power system control, communication and electrical facilities located across 15 western states; marketed low-cost, reliable hydroelectric power to 629 power customers, and provided system operations and load dispatching, power billing and collection, power marketing, power resource planning, energy services, technology transfer, security and emergency management for 15 separate power projects. Western, once again, exceeded both the NERC and industry averages for transmission system performance.
- Western is in the process of separating its power marketing and transmission system reliability functions in response to the Federal Energy Regulatory Commission's (FERC) Order Nos. 888 and 889. Western's challenge was to integrate the legal requirements of our 11 separate rate-setting systems into one single tariff, while accommodating the diverse nature of the 15 projects from which we market power and/or transmission services. Western's tariff package was submitted to FERC under a nonjurisdictional docket on December 31, 1997. Western filed its Standards of Conduct for power marketing and operations employees with FERC on December 9, 1998. Western owns, operates, and/or participates in electronic systems to share information about available transmission capacity within the regions in which it operates.
- Western is the Federal representative on the NERC compliance subcommittee. The subcommittee has begun NERC's effort to develop a mandatory system to ensure compliance with the reliability standards and criteria. Additionally, Western played a major role in developing the Reliability Management System (RMS) used within Western Systems Coordinating Council (WSCC). RMS is the first contract-based approach to ensure the reliability of the interconnected transmission system.
- Western's Electric Power Training Center developed and now offers a course specifically designed to prepare participants for NERC's certification examination. The course focuses on NERC operating policies, conceptual underpinnings and practical application.
- Western has consolidated the functions of the Montrose Control Center with those of the Desert Southwest and Rocky Mountain Control Centers. The change provides enhanced coordination with emerging regional transmission groups, increased operational flexibility, and saves money by eliminating the need for a replacement supervisory control and data acquisition system at one site.

- Western continued as a major participant in the development of four independent system operators (ISO) across our service area. Although not a member, Western holds a position on the California ISO Governing Board representing the public buyers and sellers class.
- Western developed and operates two of four regional security coordination centers in the West in response to the Department's initiative on electric reliability. To improve national electric reliability, security coordination centers actively monitor electric power system conditions on a real-time basis to observe and mitigate potential problems as well as react to system emergencies as they develop. If a system breakup occurs, the security coordination center will direct restoration efforts.
- Western initiated 14 power and rate actions in FY 1998, 12 for rate decreases or extensions, and two for rate increases to meet project repayment needs. All were approved by FERC without exception. Western committed to maintain rate stability across our major systems through FY 2002.
- Western completed contracts to sell Federal power to 26 Native American tribes in the Upper Midwest as part of the Pick-Sloan Missouri Basin Program's Post-2000 marketing program. This complex and innovative effort involved current and new customers in partnerships to bring the benefits of the Federal power program to these Tribes.
- Western initiated a Year 2000 project to identify and correct potential problems relating to the millennium rollover for our mission-essential systems and other equipment and software. Additionally, we are working with the Bureau of Reclamation and the U.S. Army Corps of Engineers, our primary hydropower suppliers, to ensure that both generation-agency power and related systems are Y2K compliant in our service area.
- Western exceeded Welfare-to-Work hiring initiatives by hiring six individuals into entry-level jobs.
- Western received DOE's Small Business Award in recognition of our commitment to contract with small and disadvantaged businesses. Our reengineering efforts to reduce regulatory hurdles and barriers in government procurement processes resulted in two "Hammer" awards from Vice President Gore's National Performance Review.
- Western continued development, documentation and training initiatives associated with commercial, off-the-shelf financial and maintenance management systems which are scheduled for implementation in FY 1999.
- Western successfully concluded a contract, through the General Services Administration, for a new building for its corporate services office. The building will result in reduced annual lease costs. Ground-breaking was held on September 23, 1998, with occupancy scheduled for late in FY 1999.
- Western continued to exceed agency and industry-wide safety goals, reducing accident and severity rates to an all-time low.

Site Description

Western Area Power Administration's (Western) service area covers 1.3-million square miles in 15 states. We sell power to 629 wholesale customers including 285 municipalities, 50 cooperatives, 18 public utility and 48 irrigation districts, 54 Federal and 54 State agencies, 30 investor-owned utilities, 21 marketers, and 69 Reclamation customers. They, in turn, provide retail electric service to millions of consumers in these central and western states: Arizona, California, Colorado, Iowa, Kansas, Minnesota, Montana, Nebraska, Nevada, New Mexico, North Dakota, South Dakota, Texas, Utah and Wyoming.

Western annually markets and transmits more than 10,000 megawatts of power from 55 hydropower plants. We sell about 40 percent of regional hydroelectric generation. Western also markets the United States' entitlement from the coal-fired Navajo Generating Station near Page, Arizona.

Western operates and maintains an extensive and complex high-voltage transmission system to deliver power to our customers. Using this 16,854-circuit-mile Federal transmission system, Western markets and delivers reliable electric power to most of the western half of the United States. Western's system is the third largest in the United States.

The power facilities are made up of 14 multipurpose water resource projects and one transmission project. The systems include Western's transmission facilities and power generation facilities owned and operated by the U.S. Bureau of Reclamation, the U.S. Army Corps of Engineers and the International Boundary and Water Commission.

Power sales, transmission operations and engineering services for our system are accomplished by our employees at 48 duty stations located throughout our service area. These include our Corporate Services Office in Golden, Colorado, and four customer service regional offices in Billings, Montana; Loveland, Colorado; Phoenix, Arizona; and Folsom, California. The Colorado River Storage Project is also supported by a Customer Service Center in Salt Lake City, Utah. System operations and maintenance are managed at offices in Bismarck, North Dakota; Fort Peck, Montana; Huron, South Dakota; Montrose, Colorado; and Watertown, South Dakota.

Construction, Rehabilitation, Operation and Maintenance
Program Direction

Mission Supporting Goals and Objectives

Western Area Power Administraton's (Western) Program Direction activity provides compensation and all related expenses for the workforce that operates and maintains Western's high-voltage interconnected transmission system and associated facilities and those that plan, design, and supervise the construction of replacements, upgrades and additions (capital investments) to the transmission facilities.

Western operates and maintains the transmission system to ensure an adequate supply of reliable electric power in a clean and environmentally-safe, cost-effective manner throughout its 15-state service territory. Western achieves continuity of service by maintaining its power system at or above industry standards, rapidly restoring service following any system disturbances, mitigating adverse environmental impacts, performing clean-up activities, and maximizing the benefits gained from non-firm energy sales. Additionally, Western operates two of the Western Systems Coordinating Council's security centers (the Rocky Mountain and Desert Southwest power areas).

Western markets power generated at 55 hydropower plants which are operated primarily by the Bureau of Reclamation, the Corps of Engineers, and the International Boundary and Water Commission. Western also markets the United States' entitlement from the Navajo coal-fired powerplant near Page, Arizona.

In concert with our customers, Western reviews required replacements and upgrades to its existing infrastructure to sustain reliable power delivery to our customers and to contain annual maintenance expenses. The timing and scope of these replacements and upgrades are critical to assure that Western's facilities do not become the "weak link" in the interconnected system. Western pursues opportunities to join with neighboring utilities to jointly finance activities, which result in realized cost savings and/or increased efficiencies for all participants.

Performance Measures

The Program Direction activities support the performance measures presented under Program Mission.

- Highly-skilled staff respond to minute-by-minute load changes to meet or exceed North American Electric Reliability Council and industry averages for Transmission System Performance. Craftsmen maintain or replace equipment to assure its capability for reliable delivery of power. The crews also rapidly restore the system following any disturbance.
- Program Direction activities support Western's Safety measurement by making safety a priority in each and every task because of the extreme hazards associated with a high-voltage electrical system. Safety is not a separate program but is integrated into all procedures and jobs.

- The Cost Growth measurement is a direct reflection of Western's commitment to optimize economical operation and maintenance of the interconnected high-voltage power system, including the associated Program Direction activities, while not compromising the reliability of power deliveries. Controlling costs is vital to the continuing health of our organization as we move into an era of increased competition. High costs contribute to higher rates, reducing our competitive position and that of our customers.
- Program Direction activities support the Repayment of Power Investment measurement by providing 24-hour/day reliable electric power delivery to our customers and maximizing revenues from non-firm power sales.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salary & Benefits	73,721	75,629	72,006	-3,623	-4.8%
Travel	7,761	7,993	7,634	-359	-4.5%
Support Services	9,193	8,291	9,827	+1,536	+18.5%
Other Related Expenses	17,656	15,470	15,070	-400	-2.6%
Total, Program Direction	108,331	107,383	104,537	-2,846	-2.7%
Use of Prior Year Balances	-23,205	-15,745	0	+15,745	+100.0%
Total, Program Direction Budget Authority	85,126	91,638	104,537	+12,899	+14.1%
Current Budget Authority	(82,952)	(91,638)	(104,537)		
Permanent Budget Authority	(2,174)	(0)	(0)		
Full-Time Equivalents (FTE)	1,071	1,169	1,075	-94	-8.0%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Salary and Benefits			
Salaries and benefits for 1,075 Federal employees to operate and maintain, on a continuing, on-going basis, Western's high-voltage interconnected transmission system, comprised of 16,854 miles of line, 258 substations, and associated power system control, communication and general plant facilities. Dispatchers provide 24-hour-a-day operation of four dispatching and two security centers. Staff provide continuing services such as system operations, power billing and collection, power marketing, power scheduling, energy services, technology transfer, environmental, safety, security and emergency management activities. Staff inspect construction activities in progress (identified in the Construction and Rehabilitation activity) to ensure quality results and safe working methods. General power resources planning and preconstruction activities, including planning, environmental clearance, collection of field data, design of facilities, and issuance of specifications for future rehabilitation and upgrades of existing transmission lines continue. Staff evaluate general power resources, collaborating and planning with customers and other members of the interconnected transmission system to identify the most effective transmission system improvements to maximize benefits to all participants. Based on historical data, a 3 percent inflation factor has been applied	73,721	75,629	72,006
Travel			
Transportation and per diem allowance for day-to-day performance of duties of Federal staff, including crews who maintain the transmission system in a 15-state area, and transportation of things. The remote and rural locations that we serve does lead to less competitive pricing. Estimates are based on historical travel costs, adjusted for anticipated escalation of airline fares, and planned activity.	7,761	7,993	7,634

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Support Services			
Support services including automated data processing, warehousing, computer-aided drafting, engineering, and general administrative support. The request is based on exercising the one-year option for the current level of contract support. The increase is for computer-aided drafting and engineering support which was inadvertently included previously in the Operation and Maintenance (O&M) budget request	9,193	8,291	9,827
Other			
Other related expenses, including but not limited to, rental space, utilities, supplies and materials, telecommunications, personal computers, printing and reproduction, training tuition fees, distribution of multi-project facilities costs, Department of Energy's (DOE) working capital fund assessment, and distribution of National Archive and Records Administration costs. Rental space costs assume the GSA-inflation factor, adjusted by the number of employees funded in this account. DOE's working capital fund portion in this account increased 26 percent and is primarily attributed to costs associated with payroll/personnel systems including preparation of withholding tax statements. Other costs are based on historical usage and actual costs of similar items	17,656	15,470	15,070
Total, Program Direction	108,331	107,383	104,537

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salary and Benefits	
■ Decrease in salaries and benefits is the result of 94 fewer FTE working on activities funded through this Account. The decrease is comprised of: 40 FTE due to efficiency gains achieved by Western; 26 FTE due to the use of Western's authority to spend directly out of the Colorado River Dam Fund (CRDF) for activities associated with the Boulder Canyon Project; and 28 FTE transferred to project activities funded from the Colorado River Basins Power Marketing Fund. Work is prioritized crossing all funding mechanisms based on need. Therefore, fluctuations in number of FTE required to perform the work in any given account may occur from year to year	-3,623

	FY 2000 vs. FY 1999 ($000)
Travel	
■ Decrease in travel is due to fewer FTE and their associated travel being funded through this Account	-359
Support Services	
■ Increase in support services is for computer-aided drafting and engineering support which was inadvertently included previously in the O&M budget	+1,536
Other	
■ Decrease in other related expenses is primarily attributed to the exclusion of costs associated with the Boulder Canyon Project which were previously included in this Account, offset by an increase in software and personal computer upgrades to more fully implement Western's new financial system. The Boulder Canyon Project costs are now directly funded through receipts in the CRDF and are identified in its own section.	-400
Total Funding Change, Program Direction	-2,846

Operation and Maintenance

Mission Supporting Goals and Objectives

Western Area Power Administration's (Western) operation and maintenance (O&M) activity supports the Department of Energy's Strategic Plan to promote secure, competitive, and environmentally responsible energy systems that serve the needs of the public. Western ensures an adequate supply of reliable electric power in a safe, cost-effective manner, and achieves continuity of service throughout its 15-state service territory by maintaining its power system at or above industry standards, rapidly restoring service following any system disturbance, mitigating adverse environmental impacts, performing clean-up activities, and maximizing the revenues gained from non-firm energy sales.

Supplies and materials, such as wood poles, instrument transformers, meters and relays must be procured to provide necessary resources to respond to routine and emergency situations in Western's high-voltage interconnected transmission system. Technical services, such as waste management disposal, environmental impact analyses, and pest and weed control are utilized as needed.

Western's planned replacement and addition activity is based on an assessment of age and the maintenance/frequency of problems of individual items of equipment, availability of replacement parts, safety of the public and Western's personnel, environmental concerns, and an orderly workplan. The workplans, coordinated with Western's power customers who ultimately bear the burden of all Western expenses, reflect an overall sustainable level of effort, with shifts in emphasis between categories (i.e. electrical versus communication equipment) in any given year.

Electrical equipment replacements, such as circuit breakers, transformers, insulators, revenue meters, switches, control boards, relays and oscillographs must be acquired to assure reliable service to Western's customers. System component age, environmental concerns, and risk to system reliability necessitate orderly replacement before significant problems develop.

Replacement, upgrade and installation of microwave, fiber optics, supervisory control and data acquisition, and other communication and control equipment continues to provide increased system reliability and operation, and to reduce maintenance and equipment costs.

Capitalized movable equipment, such as special purpose vehicles (e.g. cranes, auger trucks, manlifts), special purpose equipment (e.g. pole trailers, industrial tractors, brush chippers), specialized test equipment (e.g., motion analyzers and ductor tester equipment), computer-aided engineering equipment, office equipment, ADP equipment and software, must be upgraded and replaced.

The personnel expenses and personnel performance accomplishments associated with the O&M activity are combined with those of the Construction and Rehabilitation activity and are reflected in the Program Direction section of Western's budget request.

Performance Measures

The O&M program supports the performance measures presented under Program Mission.

- Well-maintained equipment, the resource availability to rapidly restore service following any system disturbance, and the ability of staff to respond to minute-by-minute changes in load requirements are all directly tied to the Transmission System Performance measure. Timely replacement of old or failing electrical equipment prevents sudden failure, unplanned outages, and possible regional power system disruptions.
- The O&M program supports the Safety measurement by placing safety first in all of its day-to-day operations, removing environmental hazards, and replacing equipment that may create a safety hazard for the public and Western's personnel. Each maintenance activity begins with a discussion of safe-working procedures. The O&M program also indirectly supports public safety by minimizing or preventing electrical outages and the attendant safety risks and concerns.
- The Cost Growth measurement is a direct reflection of Western's commitment to optimize economical operation and maintenance of the interconnected high-voltage power system while not compromising the reliability of power deliveries.
- The O&M program supports the Repayment of Power Investment measurement by providing 24-hour/day reliable electric power delivery to our customers, thus securing revenues for repayment.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Regular Operations and Maintenance	24,735	21,631	19,844	-1,787	-8.3%
Replacements and Additions	15,011	14,838	15,252	+414	+2.8%
Total, Operations and Maintenance	39,746	36,469	35,096	-1,373	-3.8%
Planned Use of Prior Year Balances	0	-2,816	0	+2,816	+100.0%
Total, O&M Budget Authority	39,746	33,653	35,096	+1,443	+4.3%
Current Budget Authority	(39,246)	(33,653)	(35,096)		
Permanent Budget Authority	(500)	(0)	(0)		

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Regular Operations and Maintenance			
■ Supplies and materials necessary to respond to routine and emergency situations in Western's high-voltage interconnected transmission system. The request is based on projected workplans for activities funded from this account. Estimates are based on historical data of actual supplies needed to maintain the transmission system reliably, including emergency situations such as ice storms and tornadoes. Costs are based on recent procurement of similar items. The decrease primarily reflects the transfer of computer-aided drafting/engineering support costs which were inadvertently included in this section prior to this request. The costs are correctly reflected in the Program Direction section of the FY 2000 request as directed by Congress	24,735	21,631	19,844
Replacements and Additions			
■ Electrical equipment replacements, including treatment and/or replacement of wood poles to extend the life of aging, deteriorating transmission lines. Costs are based on analysis of system operation/maintenance requirements and concerns, customer-coordinated workplans, actual costs of recent similar projects, and bottom-up budgeting techniques. The increase reflects an increase in treatment and replacement of woodpoles on several transmission lines to extend their service life.	5,901	5,672	7,811

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Replacement/upgrade of microwave, supervisory and control data acquisition, and other communication and control equipment, including staged replacement to meet new Federal Communications Commission and National Telecommunications and Information Administration regulations requiring Western to move to narrow communications band spectrums by 2005. Costs are based on analysis of system operation/maintenance requirements, customer-coordinated workplans, actual costs of recent similar projects, and bottom-up budgeting techniques. The decrease reflects a lower level of equipment purchases associated with the movement to narrow communications band spectrums.	3,523	3,593	1,998
■ Capitalized movable equipment needed to support the O&M of the interconnected power system. Replacement needs are based on age, reliability, and safety of equipment, customer-coordinated review, cost analysis of rebuild versus replacement, availability of replacement parts, and obsolescence of diagnostic maintenance tools. Costs are determined using actual costs of similar items	5,587	5,573	5,443
Total, Replacements and Additions	15,011	14,838	15,252
Total, Operations and Maintenance	39,746	36,469	35,096

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Regular Operations and Maintenance	
■ Decrease in regular O&M activities is primarily attributed to transfer of computer-aided drafting/engineering support costs which were inadvertently included with these costs in FY 1999. The costs are correctly reflected in the Program Direction section of Western's FY 2000 request	-1,787
Replacements and Additions	

	FY 2000 vs. FY 1999 ($000)
■ Increase in replacements and additions primarily attributed to the treatment and replacement of wood poles on several transmission lines such as the Parker-Gila line (Arizona), the Fort Randall-Tyndall line (South Dakota) and the Tracy-Ignacio line (California) due to age and deterioration (+$2,139,000). Costs associated with replacement of communication and control equipment decrease in FY 2000 reflecting a slightly reduced level of equipment purchases associated with the movement to narrow communications band spectrums by 2005. This work is staged over several years with costs fluctuating between equipment purchases and installation efforts (-$1,595,000). Capitalized movable equipment purchases decrease slightly (-$130,000)	+414
Total Funding Change, Operation and Maintenance	-1,373

Construction and Rehabilitation

Mission Supporting Goals and Objectives

Western Area Power Administration's (Western) construction and rehabilitation (C&R) activity emphasizes replacement and upgrading of existing electrical system infrastructure to sustain reliable power delivery to our customers, to contain annual maintenance expenses, and to retain the value of our assets. In FY 2000, Western's transmission system will have over 16,850 circuit miles of line and 258 substations. In FY 2000, 896 of the 7,928 miles of wood pole line, or 11 percent, will be over 50 years old, and 3,733 miles, or 47 percent, will be between 41 and 50 years old. Western is continually testing, treating, and replacing individual wood poles and hardware to delay the need for replacing an entire transmission line. As substation equipment (such as power transformers, circuit breakers, and control equipment) reaches the end of its useful life, maintenance costs increase, replacement parts become unavailable, risk of outages increases, and system reliability declines. Western will have 145 transformers and 108 breakers over 41 years old in FY 2000. The replacement of this equipment is systematically planned over a 10-year period. All replacement plans are coordinated with our customers to help establish the scope of replacement at specific substations. When upgrades or additional capacity are required, Western actively pursues opportunities to join with neighboring utilities to jointly finance activities, which result in realized cost savings and increased efficiencies for all participants.

In order for Western and its customers to remain competitive in the changing utility industry, Western has aggressively reduced its capital investment program. From levels around $110 million in FY 1992 through FY 1994, Western has reduced its total C&R program to a base of about $40 million since FY 1996 (total program includes equipment, contracts, related expenses, program direction and planned use of prior year balances). Our FY 2000 program level is $6.0 million more than FY 1999, and about $2.6 million above the FY 1998 level. Western continues to refine a long-term C&R program level that will maintain the reliability of, and the Government's investment in, Western's power facilities while minimizing effects on power rates. Our challenge has been to evaluate Western's facilities which were built 40 to 50 years ago, and develop a systematic replacement/upgrade program at a level that retains the value of our assets and assures a safe and reliable transmission system, with minimal rate impacts.

Because of the increase in rehabilitation projects, decrease in new construction projects, and reduced C&R program budget, it is increasingly difficult to plan specific projects years in advance. Discovery of a failing piece of equipment may completely change the planned priority of work. Customer needs and willingness to provide financing may also change, causing Western to revise or reprioritize planned construction projects. While this section incorporates Western's best efforts to identify and schedule necessary construction and rehabilitation projects, the increased focus on replacements and the realities of operating and maintaining a complex interconnected power system mean unforseen priority projects will surface from time to time. Western may have to slip or restructure planned projects to accommodate these sudden priority projects, but all projects will be replacements and upgrades of aging existing equipment necessary to maintain the reliability and integrity of Western's power transmission system. Western's policy will continue to assign the highest program priority to those situations which pose the highest risk to safety and system reliability.

Western's C&R program delays replacement costs for as long as reasonably possible while managing the risk of sudden failure and emergency replacement. Further postponement due to budget constraints will contribute to an overall degradation of Western's power facilities, leading to serious power system disruptions and lengthy power outages while crews repair or replace failed equipment under emergency conditions. "Breakdown maintenance" results in higher costs than scheduled replacements and increases safety risks to maintenance crews, as equipment failures are very often tied to extreme weather conditions and/or high system power loadings.

Personnel costs and related expenses such as compensation, travel for the workforce to plan, collect field data, write specifications, design facilities, award construction contracts, and purchase government-furnished equipment for the C&R activity are combined with those of the operation and maintenance activity and are reflected in the Program Direction section of Western's budget request.

Performance Measures

The C&R program supports the performance measures as presented under Program Mission.

- Replacement and upgrade of aged power system components is crucial to system reliability, and communications improvements maintain vital control over system operation. Both contribute to the Transmission System Performance measure.
- The C&R program also supports the Safety goal by reducing the hazards associated with worn or aging equipment, and by replacing deteriorated wood poles which present a serious climbing hazard to linemen. Public safety is supported by avoiding or minimizing the negative impacts of unplanned outages due to equipment failure.
- The activities under the C&R program indirectly support the Cost Growth and Repayment of Power Investment measures by minimizing capital investment and avoiding emergency "breakdown maintenance" costs, and preventing outages which could impact power deliveries and revenues.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Transmission Lines and Terminal Facilities ..	3,609	3,807	15,424	+11,617	+305.1%
Substations	12,389	7,130	5,454	-1,676	-23.5%
Other [a]	8,245	9,865	5,924	-3,941	-39.9%
Total, Construction & Rehabilitation	24,243	20,802	26,802	+6,000	+28.8%
Planned Use of Prior Year Balances	-15,525	-1,845	0	+1,845	+100.0%
Total, C&R Budget Authority	8,718	18,957	26,802	+7,845	+41.4%

[a] Other includes communication equipment (such as microwave, telecommunications, and supervisory control and data acquisition systems), maintenance facilities, power facility developmental costs, and minor unscheduled jobs.

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Transmission Lines and Terminal Facilities			
■ Complete minor modifications and rehabilitation of transmission lines (TL) in FY 2000 to ensure power system reliability and stability: ▸ Removal of 16.1-mile Blue River-Summit TL (Colorado) from a floodplain and scenic area; ▸ Rebuild 1.9 miles of Estes-Mary's Lake TL (Colorado) and make related improvements to Estes Switchyard. (Joint venture with Platte River Power Authority to increase reliability to City of Estes Park;) ▸ Wood pole life extension of Armour-Mt. Vernon 115-kV TL (South Dakota); ▸ Rebuild 4 short aging tap lines in Wyoming and add overhead ground wires to improve reliability; ▸ Construct Shiprock-Four Corners (New Mexico) approach spans as part of upgrade to 345-kV TL which will improve system capacity and reliability, provide a high-capacity interconnection with participants in the Four Corners powerplant project as well as other utilities, allow additional system operation flexibility including wheeling that cannot be presently accommodated. Joint venture with Tri-State Generation & Transmission Association and Arizona Public Service Company; ▸ Treat or replace wood poles that have failed inspection in the Colorado River Storage Project and Pick-Sloan Missouri Basin Program as a means of TL life extension. Funding level is determined by estimating the cost to complete each project, and breaking out these costs by fiscal year. The estimates are based on recent actual costs to complete similar projects, updated individual project requirements, and past experience. Any decrease in funding would delay completion of one or more of these active projects	3,609	3,807	4,102

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Several TL and terminal facility rehabilitation starts are planned in FY 2000: ▸ Replace jointly-owned 500-kV series capacitors at Round Mountain Substation (California). The capacitors are PCB-contaminated and can only be operated at 2/3 of their original rating due to age. The bypass switches are mechanically operated and prone to failure. Joint venture with Pacific Gas & Electric, who will perform the work. ▸ Reroute a 5-mile portion of Curecanti-Lost Canyon 230-kV TL (Colorado). Area has unstable soils and landslides which have moved and damaged existing structures. Project will reposition a portion of line to a location with more stable soils, decreasing the risk of outages and reducing maintenance costs. ▸ Rebuild Prospect Valley Tap-Prospect Valley Substation 115-kV TL (Colorado). This 7.3-mile line, constructed in 1944, has badly deteriorated wood poles. ▸ Replace pneumatic control and bypass systems for series capacitor banks at Mead Substation (Nevada) and Liberty Substation (Arizona). The existing controls have deteriorated and are not functioning well. Manufacturer's replacement parts are no longer available. Failure of the controls reduces capacity on the key Mead-Liberty 345-kV TL by 150 megawatts. ▸ Uprate the Big George-Carter Mountain TL (Wyoming). This line, constructed to 115-kV specifications, is operated at 69-kV. Project would upgrade the substation and tap equipment to allow 115-kV operation, reducing loads on other lines and improving system operations. Joint venture; Western's share is 50 percent. TL and terminal starts address specific system reliability risks or operational problems. Estimates are based on actual costs of recent similar projects, expected costs of equipment and services, cost estimating guides, and experience. Budget decreases will cause these starts to be delayed, impacting outyear planning. Delays increase the backlog of necessary work, increase the risk of equipment failure and system disruptions, and cause budget increases in future years. The work cannot be avoided indefinitely and must eventually be accomplished.	0	0	11,322

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Transmission line and terminal work for others in FY 2000 includes: ▸ Construction of the Black Mountain-Del Bac TL (Arizona) in the Central Arizona Project for the Bureau of Reclamation; ▸ Construction of a switching station and loop to allow direct interconnection to a Western TL for the City of Lodi (California); ▸ Construction of a switching station and loop to allow direct interconnection to a Western TL for the Calpine Project Sutter Powerplant (California); ▸ Relocate 4 miles of the Beaver Creek-Weld TL (Colorado) for the Colorado Highway Department; ▸ Continue to work with the Navajo Nation to develop a project that will increase the transfer capability across the Four Corners (New Mexico) area. Participation in this project will continue if funding is received from non-Western sources	0	0	0
Total, Transmission Lines and Terminal Facilities	3,609	3,807	15,424

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Substations			
■ Complete the replacement of high-voltage equipment such as circuit breakers, transformers, reactors, disconnect switches, and fuses at: Casa Grande 02, ED-4, Gila 06, Parker and Wellton-Mohawk (Arizona); Ault, Estes 03 and 04, and Prospect Valley (Colorado); Denison 08 (Iowa); Stegall (Nebraska); Custer 03, Miles City MC-4, Rudyard and Yellowtail (Montana); Bismarck and Washburn (North Dakota); Bonesteel, Huron 14, Rapid City, Summit 10, New Underwood and Winner (South Dakota); and Badwater 06 and Lovell 08 (Wyoming). This equipment requires replacement primarily due to reliability and age, safety concerns, and/or availability of spare parts. Oil containment is added when appropriate to protect nearby water resources from possible contamination. Complete demolition of Basic Substation (Arizona). Update computer-aided engineering equipment used for designing Western facilities. The funding level is determined by estimating the cost to complete each project, and breaking out these costs by fiscal year. The estimates are based on recent actual costs to complete similar projects, updated individual project requirements, and past experience. Any decrease in funding would delay completion of one or more of these active projects	9,959	7,130	3,211
■ Purchase and install equipment that would provide additional capability to correct low voltage problems that occur on the existing Parker-Davis transmission system along the Colorado River in northwestern Arizona	2,200	0	0
■ Replace the 37-year old transformer at Derby Hill (Colorado) and consolidate loads from Derby Hill and Loveland Substations at Derby Hill. Remove Loveland Substation to reduce maintenance costs. Joint venture with other entities in the area	230	0	0

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Substation rehabilitation starts planned in FY 2000 include: ▸ Replace the 115/69-kV transformer at Haxtun Substation (Colorado). The transformer, installed in 1954, requires excessive maintenance and is at risk of failure. Replacement will reduce annual maintenance expenses and support system reliability. ▸ Replace aging reactors at Grand Island Substation (Nebraska). Failure would cause unacceptable voltage levels which could damage other electrical equipment or precipitate an outage. Modification kits, installed when units were new, can no longer be maintained. ▸ Addition of line interrupters, upgrade of relaying and control equipment, and replacement of 1950's vintage control boards and control building at Beresford Substation (South Dakota). The interrupters will add protection and switching capability for the transformer and TL, and a remote terminal unit will allow for remote control and monitoring. Equipment is obsolete and spare parts are difficult to obtain. ▸ Replacement of 115/69-kV transformer and several smaller potential and circuit transformers at Brookings Substation (South Dakota). Transformers are near expected service life and pose a risk to system reliability. Spare parts are difficult to obtain. ▸ Replacement of main transformer, two disconnect switches, and control building, and addition of two line interrupters at Woonsocket Substation (South Dakota). Substation was built in 1954 and equipment has exceeded its service life expectancy. Building is deteriorated, placing the control equipment inside at risk. These substation starts address specific identified system reliability risks or operational problems. Estimates are based on actual costs of recent similar projects, including costs of equipment and services, data from specialized cost estimating guides, and organization experience. Any decrease in funding will cause one or more of these starts to be delayed, impacting outyear planning. Delays in planned construction projects increases the backlog of necessary work, increases the risk of equipment failure and system disruptions, and creates increases in future budget years. The work cannot be avoided through delay, and must be accomplished at some point in time	0	0	2,243

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Work for others includes construction of the Topock Substation (Arizona); Flanagan Substation for the City of Shasta Lake (California); and Flandreau Substation 08 for the City of Flandreau (South Dakota)	0	0	0
Total, Substations	12,389	7,130	5,454
Other			
■ Upgrade/replace/expand communication systems (supervisory control and data acquisition equipment, microwave, fiber optic and telecommunication) in the Central Valley Project and Pick-Sloan Missouri Basin Program to operate and control the transmission system. Replacement parts for the existing communications system are becoming very difficult to find and the increased use of remote control of facilities, coupled with the greater integration of the Federal system with the rest of the grid, and technological advances in the communications field, makes secure and reliable communications crucial to Western's mission. Rapid advances in communications technology, coupled with manufacturers' phase-out of support for existing systems, primarily drive the need for communications replacements and upgrades. Effective control of remote facilities is crucial to the operation of the power system; impacts from faulty communications can range from electric equipment damage to system-wide power flow problems, including black-outs. Funding level is determined by using recent actual costs, including equipment costs and construction contracts. Decreases to this line item will delay scheduled communications replacements, increase the possibility of communication system failures, and potentially contribute to system-wide power problems.	5,390	5,096	1,795

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Add fire protection at various maintenance facilities in the Western Division of the Pick-Sloan Missouri Basin Program, including the Virginia Smith Converter Station (Nebraska). Provide additional storage for housing vehicles, electrical equipment, and supplies that are presently being stored outside, subjected to adverse weather conditions at Western maintenance facilities at Phoenix (Arizona); Elverta and Keswick (California); Bismarck and Fargo (North Dakota); Huron, Armour, Pierre, Rapid City, and Watertown (South Dakota); and Casper (Wyoming). Provide a station service solar power source at Folsom (California) to reduce facility heating and cooling costs and support DOE renewable energy development goals. Of these, Bismarck, Phoenix, and Virginia Smith Converter Station fire protection are FY 2000 starts. The Bismarck Warehouse will replace old Quonset huts which have a history of flooding, and will allow indoor storage of maintenance vehicles and electrical equipment and materials presently left exposed to the elements. The Phoenix O&M Center project will remodel an existing 45-year-old building, eliminating safety problems and updating lighting, electrical, and fire and intrusion alarm systems to present code standards. The Virginia Smith Converter Station is a key facility in the interconnected electrical system, one of only four which tie the Western and Central transmission grids together. The project will provide a fire detection and suppression system at this important facility. Power facility developmental costs are included. Miscellaneous minor construction jobs, not normally scheduled or anticipated as part of larger projects, are included. The miscellaneous work is partially cosponsored. Each project cost is determined using the actual costs of recent similar projects, estimated quantities of needed materials, past contract costs, specialized cost estimating guides, and in-house experience. Power facility development costs are rigorously reviewed by Western's Maintenance, Design and Construction Council, and each activity is only included if anticipated benefits clearly outweigh the costs. Any decrease in funding will cause projects to be slipped to the outyears, adding to work backlog and forcing outyear budget requests to increase	2,855	4,769	4,129

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ The following projects will have active preconstruction activities during FY 2000: Gila-Knob TL Reconductor and Tucson Substation replacements (both in Arizona); Davis 69-kV Switchyard rebuild, Parker Dam transformer replacement, photovoltaic station service, and Sacramento Valley reliability reinforcements (all in California); Granby Pumping Plant Switchyard 02 additions and Wray Substation fuse replacement (both in Colorado); Creston Substation additions and replacements (Iowa); Glendive transformer replacement (Montana); Fargo Substation replacements and Forman Substation additions and replacements (both in North Dakota); Armour and Fort Thompson replacements, Groton Substation additions and replacements, and Philip breaker replacements (all in South Dakota); Medicine Bow and Laramie Tap rebuilds and Laramie-Cheyenne-Nunn 115-kV TL reconstruction (both in Wyoming); and transmission line life extension projects (various states). Funds for these activities are included in the Program Direction section of Western's request	0	0	0
Total, Other	8,245	9,865	5,924
Total, Construction and Rehabilitation	24,243	20,802	26,802

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Transmission Lines and Terminal Facilities	
■ The increase for Transmission Lines is primarily due to three factors:	
▸ the increasing need to reconstruct or perform life extension work on sections of aging wood pole transmission lines;	
▸ the unanticipated need to reroute a portion of the lattice steel Curecanti-Lost Canyon line due to soil instability; and	
▸ replacement of series capacitors or bypass systems at Mead, Liberty and Round Mountain substations	+11,617
Substations	

	FY 2000 vs. FY 1999 ($000)
■ The decrease in Substations is due to a shift of budgetary resources to necessary wood pole transmission rehabilitation, purchase of equipment in FYs 1998 and 1999 to be installed in FY 2000, fewer and smaller construction contract awards, and an increase in the use of in-house labor to install substation equipment	-1,676
Other	
■ The decrease in Other is due to a shift of budgetary resources to wood pole transmission line work, the completion of several microwave projects, and the completion of four maintenance facilities. These decreases are partially offset by three maintenance facility awards	-3,941
Total Funding Change, Construction and Rehabilitation	+6,000

Purchase Power and Wheeling

Mission Supporting Goals and Objectives

Beginning in FY 2000, Western Area Power Administration (Western) will no longer seek appropriations for the Purchase Power and Wheeling (PPW) activities. Instead, the customers of Western will make their own power purchases and transmission arrangements directly with suppliers. Lower electricity prices and improved transmission access that result from restructuring of the electricity industry allows most customers to continue obtaining these power purchases and wheeling services from other sources. Power receipts estimates have been reduced to reflect the reduced spending by Western.

The PPW program obtained electrical resources and transmission capability to firm up the Federal hydropower used to meet Western's contractual power delivery obligations. Transmission wheeling services were purchased when third-party transmission lines were needed to deliver Federal power to Western's customers.

Alternative financing methods which included net billing, bill crediting, Federal and non-Federal reimbursable, reduced the dollars appropriated from the Reclamation Fund for the PPW program by 50- to 60 percent annually. In FY 2000, Western's power customers are expected to finance both the previously appropriated and alternatively-financed firming energy and transmission wheeling requirements which we estimate at approximately $54 million of appropriations and $87 million of alternative financing for FY 2000.

Performance Measures

- The PPW program primarily supported the Repayment of Power Investment measure by providing a more valuable firm resource to market. The additional revenue derived aided in the timely repayment of the taxpayer investment in the projects' power facilities as well as full recovery of Western's and the generating agencies' annual costs allocated to power, including operation and maintenance, PPW, and interest to Treasury on unpaid project investment.
- The PPW program supported the Safety and Cost Growth measures by providing flexibility in meeting power delivery obligations while essential maintenance activity to either transmission or generation assets was underway, or while flood control flow regimes or other restrictions for public safety were in place.
- While not directly related to the Transmission System Performance measure, the PPW program increased the reliability of the energy marketed in spite of external constraints to the hydropower system brought about by changing reservoir conditions, inflows, and variable flow regimes designed to respond to irrigation, navigation, fish and wildlife, and recreation needs.

Funding Schedule

Two funding schedules follow. The first shows the budgeted program requirement, consisting of new budget authority and prior year balances, net of any alternative financing planned. The second illustrates the gross purchase power need including use of alternative financing methods.

	(dollars in thousands)

Utah Mitigation and Conservation

Mission Support Goals and Objectives

The Reclamation Projects Authorization and Adjustment Act of 1992, Title IV, established the Utah Reclamation Mitigation and Conservation Account (Account) in the Treasury of the United States. The purpose of this Account is to ensure that the level of environmental protection, mitigation, and enhancement achieved in connection with projects identified in the Act and elsewhere in the Colorado River Storage Project in the State of Utah is preserved and maintained. The Administrator of Western Area Power Administration (Western) is authorized to deposit funds into the Account. Such expenditures are to be considered nonreimbursable and nonreturnable. The Utah Reclamation Mitigation and Conservation Commission, established under Title III of the Act, is authorized to administer all funds deposited into the Account.

Site Description

Hoover Dam, the highest and third largest concrete dam in the United States, sits on the Colorado River along the Arizona-Nevada border. Lake Mead, the reservoir formed behind Hoover Dam, is still the nation's largest manmade reservoir. The reservoir can hold a two-year supply of average flow of the Colorado River with its storage capacity of 27.38 million acre-feet.

This enormous project began with 1928 legislation approving construction of the Boulder Canyon Project. Hoover Powerplant has 19 generating units and an installed capacity of 2,064,000 kilowatts. High-voltage transmission lines and substations make it possible for people from Las Vegas (Nevada), Phoenix (Arizona) and Los Angeles (California) to receive power from the project.

Since the start of commercial power generation in 1938, Hoover, with yearly average generation of 4.5 billion kilowatthours, has served the annual electrical needs of nearly 8 million people. This power is marketed under the Hoover Power Plant Act of 1984 and the 1984 Conformed General Consolidated Power Marketing Criteria or Regulations for Boulder City Area Projects. Western Area Power Administration markets and transmits Boulder Canyon power, and operates and maintains its transmission facilities.

Boulder Canyon Project Program Direction

Mission Supporting Goals and Objectives

The Boulder Canyon Project (Project) consists primarily of Hoover Dam, its powerplant, and the associated substations and transmission facilities. Revenues from the sale of Project electric energy and capacity are deposited in the Colorado River Dam Fund (CRDF), administered by the Department of Interior, and are available without further appropriation. Beginning in FY 2000, Western Area Power Administration (Western) will pay for Boulder Canyon Project operations directly from the CRDF. Previously, this Project was included in Western's Construction, Rehabilitation, Operation and Maintenance (CROM) account, and funds were provided from the CRDF by transfer. FY 1999 expenses will be covered by transfer of previously authorized funding from the CRDF. Revenues that are collected in excess of expenses are used for repayment of investments to the U.S. Treasury.

Western operates and maintains the transmission system for the Project to ensure an adequate supply of reliable electric power in a clean and environmentally-safe, cost-effective manner. Western achieves continuity of service by maintaining its power systems at or above industry standards, rapidly restoring service following any system disturbance, mitigating adverse environmental impacts, performing clean-up activities, and maximizing revenues gained from non-firm energy sales. In concert with our customers, Western reviews required replacements to its existing infrastructure to sustain reliable power delivery to our customers and to contain annual maintenance expenses.

Performance Measures

The Program Direction activities of the Project support the performance measures presented under Program Mission.

- Highly-skilled staff respond to minute-by-minute load changes to meet or exceed North American Electric Reliability Council and industry averages for Transmission System Performance. Craftsmen maintain or replace equipment to assure its capability for reliable delivery of power. The crews also rapidly restore the system following any disturbance.
- Program Direction activities support Western's Safety measurement by making safety a priority in each and every task because of the extreme hazards associated with a high-voltage electrical system. Safety is not a separate program but is integrated into all procedures and jobs.
- The Cost Growth measurement is a direct reflection of Western's commitment to optimize economical operation and maintenance of the interconnected high-voltage power system, including the associated Program Direction activities, while not compromising the reliability of power deliveries. Controlling costs is vital to the continuing health of our organization as we move into an era of increased competition. High costs contribute to higher rates, reducing our competitive position and that of our customers.

- Program Direction activities support the Repayment of Power Investment measurement by providing 24-hour reliable electric power delivery to our customers.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

Permanent Appropriation, CRDF	0	0	-3,673	-3,673	N/A
Total, Program Direction Permanent Budget Authority	0	0	0	0	N/A
Full-Time Equivalents (FTE)	0	0	26	+26	N/A

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salary & Benefits			
Salaries and benefits for 26 Federal employees to operate and maintain, on a continuing basis, the Project's high-voltage transmission facilities, including approximately 58 miles of high-voltage transmission lines, four substations and associated switchyards, communication, control and general plant facilities associated with this Project. Staff provide continuing services such as system operations and load dispatching, power billing and collection, power marketing, general power resources planning, energy services, technology transfer, environmental, safety, security and emergency management activities. Based on historical data, a 3 percent inflation factor has been applied	0	0	1,965

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Travel			
Transportation and per diem allowance for day-to-day performance of duties of Federal staff, including crews who maintain the Project transmission facilities. Also includes transportation of things. Estimates are based on historical travel costs, adjusted for inflation and planned activity, to reliably maintain the transmission system	0	0	140
Support Services			
Support services including automated data processing, warehousing, computer-aided drafting/engineering, and general administrative support. The request is based on exercising the one-year option for the current level of contract support.	0	0	286
Other Related Expenses			
Other related expenses including but not limited to, rental space, utilities and miscellaneous charges, printing and reproduction, training tuition fees, maintenance and repair of office equipment, supplies and materials, personal computers, telecommunications, multi-project costs, and distribution of Western's general management costs. Rental space costs assume the GSA-inflation factor, adjusted by the number of employees funded in this Account. Acquisitions of software and personal computers to more fully implement Western's financial system which utilizes individual user input are included. Other costs are based on historical usage and actual cost of similar items	0	0	1,282
Total, Program Direction	0	0	3,673

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Program Direction	
■ This request does not reflect any new initiatives, but rather provides detailed information for the Project which will now be funded directly from CRDF receipts. Previously, all items were included with Western's CROM account, and were funded by transfer of budget authority from the CRDF. When comparing this request with FY 1999 amounts included for the Program Direction activities of the Project in Western's CROM account, this request is a decrease of $202,000. The decrease is primarily attributed to four fewer FTE scheduled to work on this Project.	+3,673

Equipment, Contracts and Related Expenses

Mission Supporting Goals and Objectives

The Boulder Canyon Project (Project) is comprised of power marketing, operation, and maintenance of transmission facilities, located primarily in Nevada. Beginning in FY 2000, these activities are paid for through direct access to the Colorado River Dam Fund (CRDF) revenues. Previously, this Project was included in Western Area Power Administration's (Western) Construction, Rehabilitation, Operation and Maintenance (CROM) account, and funds were provided from the CRDF by transfer.

Western operates and maintains the transmission system for the Project to ensure an adequate supply of reliable electric power in a clean and environmentally-safe, cost-effective manner. Western achieves continuity of service by maintaining its power systems at or above industry standards, rapidly restoring service following any system disturbances, mitigating adverse environmental impacts, and performing clean-up activities. In concert with our customers, Western reviews required replacements to its existing infrastructure to sustain reliable power delivery to our customers and to contain annual maintenance expenses.

Supplies and materials, such as wood poles, instrument transformers, meters and relays, must be procured to provide necessary resources to respond to routine and emergency situations in the Project's transmission facilities. Technical services, such as waste management disposal, environmental impact analyses, and pest and weed control, are utilized as needed.

Performance Measures

The Equipment, Contracts and Related Expenses activity of the Project supports the performance measures presented under Program Mission.

- Well-maintained equipment, the availability of resources to rapidly restore service following any system disturbances, and the ability of staff to respond to minute-by-minute changes in load requirements are all directly tied to the Transmission System Performance measure.
- This activity also supports the Safety measurement. Each maintenance activity begins with a discussion of safe-working procedures. Additionally, safety of the public and Western's personnel is one of the factors considered when replacing equipment.
- The Cost Growth measurement is a direct reflection of Western's commitment to optimize economical operation and maintenance of the interconnected high-voltage power system while not compromising the reliability of power deliveries. Controlling costs is vital to the continuing health of our organization as we move into an era of increased competition. High costs contribute to higher rates, reducing our competitive position.
- The Repayment of Power Investment measurement is supported by providing 24-hour/day reliable electric power delivery to our customers, thus enhancing revenues and repayment of Project expenses and investment.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Equipment, Contracts and Related Expenses			
■ Supplies and materials necessary to respond to routine and emergency situations in the Project's high-voltage transmission facilities. The request is based on projected workplans for activities and historical data of actual supplies needed to maintain the transmission system reliably. Costs are based on recent procurements of similar items.	0	0	498
Total, Equipment, Contracts and Related Expenses	0	0	498

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Equipment, Contracts and Related Expenses	
■ This request does not reflect a new initiative, but rather provides specific information for the Project activity which, beginning in FY 2000, will be funded directly from receipts to the CRDF, administered by the Department of Interior. Previously, all items in this activity were included with Western's CROM account request and were funded by transfer of budget authority from the CRDF. When compared to the amount requested in FY 1999 for the Project's equipment, contracts and related expenses (included in Western's CROM request), the request is an increase of $40,000, primarily attributed to pro-rational costs associated with the rehabilitation of an existing warehouse (built in 1952) to bring it within current fire and safety standards	+498
Total Funding Change, Equipment, Contracts and Related Expenses	+498

Total, Falcon and Amistad Maintenance Fund	970	1,010	1,309	+299	+29.6%

Site Description

Falcon-Amistad Project consists of two international storage projects located on the Rio Grande River between Texas and Mexico. The United States and Mexico share and operate separate powerplants on each side of the Rio Grande River. The power output is divided evenly between the two nations. The State Department's International Boundary and Water Commission (IBWC) operates the U.S. portion of the projects.

Falcon Dam is located about 130 miles upstream from Brownsville, Texas. The United States' portion of construction, operation and maintenance was authorized by Congress in 1950. Construction was started in that year and completed in 1954. The United States' share of Falcon Powerplant capacity is 31,500 kilowatts. The powerplant came on line in 1954.

Amistad Dam is located about 300 miles upstream from Falcon Dam. The Amistad Powerplant was constructed by the U.S. Army Corps of Engineers, as agent for the IBWC. The United States' portion of construction, operation and maintenance was authorized by the Mexican-American Treaty Act of 1950. Amistad powerplant, completed in 1969, has a generation capacity of 66,000 kilowatts. Its two generating units came on line in 1983.

Project power is marketed to two cooperatives in south Texas via Central Power and Light Company's transmission system.

Repayment is made through annual installments. These installments are established in advance by Western Area Power Administration (Western) and the customers on or before August 31 of the year preceding the appropriate fiscal year. Each annual installment pays the amortized portion of the U.S. investment in the Falcon and Amistad hydroelectric facilities with interest, and associated operation, maintenance and administrative costs. This repayment schedule does not depend upon the amount of power and energy delivered or the amount of generation each year.

Mission Supporting Goals and Objectives

The Falcon and Amistad Operating and Maintenance Fund (Maintenance Fund) was established in the Treasury of the United States as directed by the Foreign Relations Authorization Act, Fiscal Years 1994 and 1995. The Maintenance Fund is administered by the Administrator of Western for use by the Commissioner of the U. S. Section of the IBWC to defray operation, maintenance (O&M) and emergency costs for the hydroelectric facilities at the Falcon and Amistad Dams.

The Falcon/Amistad Dams hydroelectric power generation plants sell generated power to public utilities through Western. The two powerplants have a combined generating capacity of 97.5 megawatts.

All revenues collected in connection with the disposition of electric power generated at the Falcon and Amistad Dams, except monies received from the Government of Mexico, are credited to the Maintenance Fund. Revenues collected in excess of expenses are used to repay, with interest, the cost of replacements and original investments.

Funding will support 24-hour operation and maintenance of the two powerplants to ensure response to ever-changing water conditions, customer demand, and continual coordination with operating personnel of the Government of Mexico. In addition, power will be marketed, repayment studies will be completed, and revenues collected. The Federal staff funded under this program continue to be allocated to the U. S. Section of IBWC by the Department of State.

Performance Measures

The Falcon and Amistad Maintenance program supports the Performance Measures as presented under Program Mission.

- The Falcon and Amistad Maintenance programs supports the Cost Growth measure by optimizing economical O&M of the hydroelectric facilities while not compromising the reliability of power deliveries.
- The program also supports the Repayment of Power Investment measure by providing 24-hour/day reliable electric power delivery to the customers, ensuring planned principal payments to the Treasury.

54-291 99 - 87

Funding Schedule

	(dollars in thousands)				
	FY 1998	FY 1999	FY 2000	$ Change	% Change
Falcon and Amistad Maintenance Fund	970	1,010	1,309	+299	+29.6%
Total, Falcon and Amistad	970	1,010	1,309	+299	+29.6%

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Falcon and Amistad Maintenance Fund			
■ Operation and maintenance of the two powerplants on a 24-hour/day basis, including planned maintenance activities and required safety services. Twenty-one employees of the U.S. Section of the IBWC are funded in this Activity	970	1,010	1,309
Total, Falcon and Amistad	970	1,010	1,309

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Falcon and Amistad Maintenance Fund	
■ The increased funding is necessary primarily for equipment purchases, upgrades and replacements ($147,000) which have been delayed due to funding restrictions, and salary/benefit increases for staff ($92,000). The equipment, which has outlived its usefulness and is essential for operation, includes:	
▸ Control room recorders at the Falcon Powerplant which are no longer reliable;	
▸ Station service batteries which are 18-years old;	
▸ AC-DC inverters, installed in 1982; and	
▸ Fifteen-year old heating/ventilating/air conditioning equipment at the Amistad Powerplant which is essential to the operation of electronic components.	
Essential services to meet safety requirements (i.e., motor rewinding, crane services for bulkhead setting, CO2 system and elevator servicing) increase $39,000. The balance of the increase ($21,000) is for OSHA training and associated travel, and miscellaneous transportation, communication and utility expenses	+299
Total Funding Change, Falcon and Amistad Maintenance Fund	+299

Site Description

The Colorado River Basins Program is comprised of three power systems: the Colorado River Storage Project, including the Dolores and Seedskadee Projects; the Fort Peck Project; and the Colorado River Basin Project, including the Central Arizona Project. Western Area Power Administration is responsible for construction, maintenance, and operation of facilities for transmitting and marketing the electrical energy generated in these power systems. A brief description of each follows.

The **Colorado River Storage Project** (CRSP) was authorized in 1956. It consists of four major storage units: Glen Canyon, on the Colorado River in Arizona near the Utah border; Flaming Gorge on the Green River in Utah near the Wyoming border; Navajo on the San Juan River in northwestern New Mexico near the Colorado border; and the Wayne N. Aspinall unit on the Gunnison River in west-central Colorado.

CRSP has a combined storage capacity which exceeds 33.5 million acre-feet. Six Federal powerplants associated with the project, with 17 generating units, have a maximum operating capacity of 1,802,200 kilowatts. CRSP provides for the electrical needs of more than a million people spread across Colorado, Utah, New Mexico and Arizona. Portions of southern California, Nevada and Wyoming are also served by CRSP power.

The **Dolores Project**, located in Montezuma and Dolores counties in southwestern Colorado, and the **Seedskadee Project**, located in southwestern Wyoming, were authorized as participating projects of CRSP. Dolores, a multipurpose project, provides 12.8 megawatts of installed power generating capacity along with municipal and industrial water, irrigation water, and recreation and fish and wildlife enhancement. The Dolores Project powerplants at McPhee Dam and the Towaoc Canal produce 1,283 and 11,495 kilowatts, respectively. Seedskadee's power facilities, associated with the project's Fontenelle Dam, include an 11.5-megawatt powerplant, switchyard and necessary transmission lines to interconnect with the CRSP transmission system at Flaming Gorge Powerplant.

The **Central Arizona Project** (CAP), one of three related water development projects that make up the Colorado River Basin Project, was authorized to furnish irrigation and municipal water supplies to Arizona and New Mexico, and for other purposes. The Navajo Generating Station, located near Lake Powell at Page, Arizona, has three coal-fired steam electric generating units for a combined capacity of 2.25 million kilowatts. The Federal share of the capacity (24.3 percent) is used to power the pumps that move Colorado River water through CAP canals. Surplus generation is marketed.

The **Fort Peck Project**, located on the Missouri River in northeastern Montana, was begun under an Executive Order in October 1933 as part of the Public Works Administration. The Fort Peck Project Act of 1938 authorized the completion, maintenance and operation of the project, and the Flood Control Act of 1944 authorized integration of operation of the project with the Pick-Sloan Missouri Basin Program to serve a common market area. Installed generating capacity of the 5 units is 218 megawatts which is delivered primarily to customers in eastern Montana and western North Dakota.

Colorado River Basins Power Marketing Fund
Program Direction

Mission Supporting Goals and Objectives

The Colorado River Basins Program (Program) is comprised of the three power systems described earlier. This program is funded through Western Area Power Administration's (Western) business-type revolving fund (Federal Enterprise Fund), the Colorado River Basins Power Marketing Fund.

Revenues from the sale of electric energy and capacity replenish the fund and are available for expenditure for operation, maintenance, power billing and collection, program direction, purchase power and wheeling, interest, emergencies, and other power marketing expenses. Power sales and other revenues, which are collected in excess of expenses, are used for repayment of investments to the U.S. Treasury. This request is for spending authority only, and represents Western's estimate of obligations to finance these business-type operations.

Western operates and maintains the transmission system for the Projects funded in this account to ensure an adequate supply of reliable electric power in a clean and environmentally-safe, cost-effective manner. Western achieves continuity of service by maintaining its power systems at or above industry standards, rapidly restoring service following any system disturbances, mitigating adverse environmental impacts, performing clean-up activities, and maximizing the revenues gained from non-firm energy sales. In concert with our customers, Western reviews required replacements to its existing infrastructure to sustain reliable power delivery to our customers and to contain annual maintenance expenses.

Performance Measures

The Program Direction activities support the performance measures presented under Program Mission.

- Highly-skilled staff respond to minute-by-minute load changes to meet or exceed North American Electric Reliability Council industry averages for Transmission System Performance. Craftsmen maintain or replace equipment to assure its capability for reliable delivery of power. The crews also rapidly restore the system following any disturbance.
- Program Direction activities support Western's Safety measurement by making safety a priority in each and every task because of the extreme hazards associated with a high-voltage electrical system. Safety is not a separate program but is integrated into all procedures and jobs.
- The Cost Growth measurement is a direct reflection of Western's commitment to optimize economical operation and maintenance of the interconnected high-voltage power system, including associated Program Direction activities, while not compromising the reliability of power deliveries. Controlling costs is vital to the continuing health of our organization as we move into an era of increased competition. High costs contribute to higher rates, reducing our competitive position.

- Program Direction activities support the Repayment of Power Investment measurement by providing 24-hour/day reliable electrical power delivery to our customers and maximizing revenues from non-firm power sales.

Funding Schedule

(dollars in thousands, whole FTEs)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Salary & Benefits	13,108	13,501	16,260	+2,759	+20.4%
Travel	1,135	1,182	1,388	+206	+17.4%

Detailed Program Justification

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Salary and Benefits			
Salaries and benefits for 189 Federal employees that operate and maintain Western's high-voltage transmission system and associated facilities, and those that plan, design, and supervise the replacements and upgrades (capital investments) to the transmission facilities. Dispatchers and craftsmen operate and maintain the Program's high-voltage integrated transmission system comprised of approximately 4,000 circuit miles of transmission lines and associated substations, switchyards, communication, control, and general plant facilities. Staff provide continuing services such as system operations, power billing and collection, power marketing, energy services, technology transfer, environmental, safety, security and emergency management activities. Additionally, a portion of costs associated with 24-hour-a-day operation of power dispatching and security centers is included. Based on historical data, a 3% inflation factor has been applied	13,108	13,501	16,260

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Travel			
Transportation and per diem allowance for day-to-day performance of duties of Federal staff, including crews who maintain the transmission facilities. Also includes transportation of things. Estimates are based on historical travel costs, adjusted for anticipated escalation of airline fares, and planned activity ...	1,135	1,182	1,388
Support Services			
Support services including automated data processing, warehousing, computer-aided drafting/engineering, and general administrative support. The request is based on exercising the one-year option for the current level of contract support. The increase is for computer-aided drafting and engineering support which was inadvertently included previously in the Equipment, Contracts and Related Expenses request	1,780	1,647	2,138
Other			
Other related expenses, including but not limited to, space, utilities and miscellaneous charges, printing and reproduction, training tuition fees, maintenance of office equipment, supplies and materials, telecommunications, personal computers, multi-project costs, distribution of Western's general management costs and a portion of the costs received from National Archive and Records Administration (NARA). Rental space costs assume the GSA-inflation factor, adjusted by the number of employees funded in this Account. Other costs are based on historical usage and actual costs of similar items	9,503	10,148	9,512
Total, Program Direction	25,526	26,478	29,298

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Salary and Benefits	
■ Increase in salaries and benefits reflects an increase of 28 FTE for accomplishment of planned activities funded in this activity. The workplans for Western's workforce is prioritized based on criticality and crosses all funding accounts. Therefore, fluctuations in number of FTE required to perform the work in any given account may occur from year to year. Anticipated inflationary increases of 3 percent are also included.	+2,759
Travel	
■ Increase in travel is attributed to additional FTE working on activities for projects within this Fund	+206
Support Services	
■ Increases in support services is because in FY 1999 some costs were inadvertently excluded from the Program Direction request. In FY 2000 all support service contract costs have been identified and included as directed by Congress	+491
Other	
■ Decrease in other related expenses is primarily attributed to a decrease in replacements/upgrades of personal computers, offset by slight increases in space rent (which is prorated based on FTE), and distribution of charges from NARA	-636
Total Funding Change, Program Direction	+2,820

Mission Supporting Goals and Objectives

Western Area Power Administration's (Western) operation and maintenance activity supports the Department of Energy's Strategic Plan to promote secure, competitive, and environmentally-responsible energy systems that serve the needs of the public. Western ensures an adequate supply of reliable electric power in a safe, cost-effective manner, and achieves continuity of service throughout its service territory by maintaining its power system at or above industry standards, rapidly restoring service following any system disturbance, mitigating adverse environmental impacts, performing clean-up activities, and maximizing the revenues gained from ancillary services and non-firm energy sales.

The Colorado River Basins Program is comprised of power marketing, operation, and maintenance of transmission facilities of three power systems described in the Site Description section earlier. These activities are funded in Western's business-type revolving fund (Federal Enterprise Fund), the Colorado River Basins Power Marketing Fund.

Revenues from the sale of electric energy and capacity replenish the fund and are available for expenditure for operation, maintenance, power billing and collection, program direction, purchase power and wheeling, interest, emergencies, and other power marketing expenses.

Supplies and materials, such as wood poles, instrument transformers, meters and relays, must be procured to provide necessary resources to respond to routine and emergency situations in the high-voltage interconnected transmission system. Technical services, such as waste management disposal, environmental impact analyses, and pest and weed control, are utilized as needed.

Western's planned replacement and addition activity is based on an assessment of age and the maintenance frequency/problems of individual items of equipment, availability of replacement parts, safety of the public and Western's personnel, environmental concerns, and an orderly workplan. The workplans, coordinated with Western's power customers who ultimately bear the burden of all Western expenses, reflect an overall sustainable level of effort, with shifts in emphasis between categories (i.e. electrical versus communication equipment) in any given year.

Electrical equipment replacements, such as circuit breakers, transformers, insulators, revenue meters, switches, control boards, relays and oscillographs must be acquired to assure reliable service to Western's customers. System age and environmental concerns necessitate orderly replacement before significant problems develop.

Replacement and upgrade of microwave, supervisory control and data acquisition, and other communication and control equipment continues to provide increased system reliability, and reduce maintenance and equipment costs.

Capitalized movable equipment such as special purpose vehicles (e.g., cranes, auger trucks, manlifts), special purpose equipment (e.g., pole trailers, industrial tractors, brush chippers), specialized test equipment (e.g., motion analyzers and ductor tester equipment), computer-aided engineering equipment, office equipment, ADP equipment and software must be upgraded and replaced.

Electrical resources and transmission capability to firm up the Federal hydropower supplies needed to meet Western's contractual obligations will continue to be obtained. Transmission wheeling services are also purchased when a third party's transmission lines are needed to deliver Federal power to Western's customers.

Reimbursements to the U.S. Army Corps of Engineers for operation and maintenance of the Fort Peck Powerplant and planned interest payments to the U.S. Treasury are also included in this section.

Performance Measures

The Equipment, Contracts and Related Expenses activity supports the performance measures presented under Program Mission.

- Well-maintained equipment, the availability of resources to rapidly restore service following any system disturbances, and the ability of staff to respond to minute-by-minute changes in load requirements are all directly tied to the Transmission System Performance measure. Timely replacement of old or failing electrical equipment prevents sudden failure, unplanned outages, and possible regional power system disturbances.
- This activity also supports the Safety measurement by placing safety first in all of its day-to-day operations, removing environmental hazards, and replacing equipment that may create a safety hazard for the public and Western's personnel. Each maintenance activity begins with a discussion of safe-working procedures. This activity also indirectly supports public safety by minimizing or preventing electrical outages and the attendant safety risks and concerns.
- Western's commitment to optimize economical operation and maintenance of the interconnected high-voltage power system while not compromising the reliability of power deliveries directly supports the Cost Growth performance measure. A successful operation and maintenance program also reduces costs to Western's customers and the consumer by maintaining a high level of system reliability.
- The Repayment of Power Investment measure is supported by providing 24-hour/day highly reliable electrical power deliveries to our customers, thus enhancing revenues and repayment.

Funding Schedule

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Equipment, Contracts and Related Expenses	99,260	74,183	84,293	+10,110	+13.6%
Total, Equipment, Contracts and Related Expenses	99,260	74,183	84,293	+10,110	+13.6%

Detailed Program Justification

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
Equipment, Contracts and Related Expenses			
■ Supplies and materials necessary to respond to routine and emergency situations in the high-voltage interconnected transmission system, and reimbursements to the Corps of Engineers for operation and maintenance of the Fort Peck Powerplant. The request is based on projected workplans for activities funded from this account. Estimates are based on historical data of actual supplies needed to maintain the transmission system reliably, including emergency situations such as ice storms and tornadoes. Costs are based on recent procurement of similar items.	8,342	8,629	8,439
■ Electrical resources, transmission capability and wheeling services will be purchased. Western recently amended the Salt Lake City Area Integrated Projects Firm Electric Service Contract which implements the decision in the Electric Power Marketing Environmental Impact Statement to return customers' power allocations to those established in the Post-89 Marketing Plan. The action increases Western's firm annual contract commitments and is reflected in the FY 2000 request. Additionally, Western, at the direction of Congress, has developed procedures to obtain energy to offset lost generation	50,400	24,600	50,000
■ Capitalized equipment will be acquired to assure reliable service to Western's customers. Costs are based on analysis of system operation/maintenance requirements/concerns, customer-coordinated workplans, actual costs of recent similar projects, and bottom-up budgeting techniques	7,920	10,508	7,165
■ Interest payments to the U.S. Treasury will occur. Estimates are based on Power Repayment Studies for the Projects funded in this account	32,598	30,446	18,689
Total, Equipment, Contracts and Related Expenses	99,260	74,183	84,293

System Statistics

	FY 1998	FY 1999	FY 2000
Generating Plants (Number)	56	56	56
Generating Capacity:			
Installed Capability (kW)	10,605,000	10,605,000	10,605,000
Substations:			
Number	258	258	258
Capacity (kVA) [a]	26,442,498	26,446,748	26,446,748
Transmission Lines (Circuit Miles):			
500-kV	448.27	448.27	448.27
345-kV	1,628.34	1,628.34	1,628.34
230-kV	6,880.13	6,880.13	6,880.13
161-kV	840.66	840.66	840.66
138-kV	329.59	329.59	329.59
115-kV	5,770.75	5,770.75	5,770.75
69-kV and below [b]	955.96	955.96	955.96
Total circuit miles	16,853.70	16,853.70	16,853.70

[a] Transformation increases completed in FY 1998 include: 11,400 kVa at Derby Hill (Colorado); 25,000 kVa at Lovell (Wyoming); 33,000 kVa at Grand Forks (North Dakota); and 4,000 kVa at Leeds (North Dakota). Increases planned in FY 1999 include 1,250 kVa at Faith (South Dakota); and 3,000 kVa at Custer (Montana).

[b] In FY 1998, 3.4-miles of the Estes-Mary's Lake Powerplant Transmission Line (Colorado) was removed.

Explanation of Funding Changes from FY 1999 to FY 2000

	FY 2000 vs. FY 1999 ($000)
Equipment, Contracts and Related Expenses	
■ Increases for power purchases reflects Western's increased firm annual contract commitment, the operational changes that resulted from the Glen Canyon Dam Environmental Impact Statement Record of Decision, and planning for increased purchases during periods of test flows associated with the endangered fish research which occur in hydrologically dry years.	+25,400
■ Deceases in supplies (-190,000) and equipment purchases (-3,343,000) occur because purchases associated with the replacement of the microwave system and digital radios to meet new Federal Communications Commission and National Telecommunications and Information Administration regulations are at a lower level than occurs in FY 1999.	-3,533
■ Planned interest payment to the U.S. Treasury in FY 2000 is less than FY 1999 because project principal payments are current. No deficit payment is included	-11,757
Total Funding Change, Equipment, Contracts and Related Expenses	+10,110

Estimate of Revenues [a]

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	FY 2004
Boulder Canyon Project [b]	52,925	60,592	62,155	60,559	57,201	61,150	57,973
Central Valley Project	184,476	183,039	186,544	185,249	200,250	198,029	190,080

Pacific Northwest-Southwest Intertie Project [e]	6,671	15,696	16,896	18,096	19,296	20,496	21,696
Parker-Davis Project [f]	32,095	35,614	39,097	40,208	39,311	39,319	39,808
Pick-Sloan Missouri Basin Program	308,415	253,407	253,689	253,599	250,883	244,503	244,679
Provo River Project	267	247	247	234	233	232	233
Washoe Project	64	757	757	757	757	757	757
Colorado River Storage Project	158,518	116,151	115,728	116,391	116,400	116,400	118,418
Collbran Project	2,123	2,036	1,974	1,912	1,912	1,912	1,912
Rio Grande Project	1,781	2,296	2,211	2,127	2,127	2,127	2,127
Seedskadee Project	2,248	1,091	1,081	1,071	1,061	1,061	1,061
Dolores Project	2,912	2,908	2,908	2,908	2,908	2,908	4,030
Subtotal	864,792	778,334	787,797	787,621	796,849	793,404	787,284
Less Purchase Power & Wheeling Revenue Requirement [g]	0	0	-140,664	-140,664	-140,664	-140,664	-140,664
Total	864,792	778,334	647,133	646,957	656,185	652,740	646,620

[a] FY 1998 amounts reflect actual revenues. Unless otherwise noted, all project amounts in this table and the following sales table are based on FY 1997 Final Power Repayment Studies (PRS) except for Colorado River Basin Project revenues which are based on estimated projections since no PRS is prepared.

[b] Estimates for the Boulder Canyon Project are based on preliminary FY 1998 PRS estimates.

[c] Western has contractually agreed for the Salt River Project (SRP) to act as the scheduling entity and operating agent for the Central Arizona Project's (CAP) portion of the Navajo Generating Station's output (547 MW). In return, as Western retains marketing responsibility, SRP agreed to pay a monthly fixed and variable cost. This revenue meets CAP repayment requirements.

[d] Estimates for the Falcon-Amistad Project are based on preliminary FY 1998 PRS estimates. Outyears have been rounded for consistency of presentation.

[e] Estimates for the Pacific Northwest-Southwest Intertie Project are based on January 13, 1998 PRS.

[f] Estimates for the Parker-Davis Project are based on preliminary FY 1998 PRS estimates.

[g] Beginning in FY 2000, power customers are expected to provide for their purchase power and transmission wheeling requirements directly with suppliers. This action reduces Western's costs and revenues by approximately $141 million annually.

Estimate of Energy Sales [a]

(in gigawatthours) [b]

	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	FY 2004
Boulder Canyon Project	5,698	4,958	5,352	5,283	5,135	4,501	4,501
Central Valley Project [c]	10,418	8,236	8,383	8,530	8,678	8,678	8,282
Colorado River Basin Project (Navajo)	3,504	4,116	4,116	4,116	4,116	4,116	4,116
Falcon-Amistad Project	137	183	183	183	183	183	183
Loveland Area Projects [d]	2,201	2,051	2,051	2,051	2,051	2,051	2,051
Pacific Northwest-Southwest Intertie Project [e]	0	0	0	0	0	0	0
Parker-Davis Project	1,631	1,346	1,346	1,346	1,346	1,346	1,346
Pick-Sloan Missouri Basin Program (Eastern Division)	12,776	10,507	10,509	10,542	10,505	10,045	10,056
Provo River Project	32	24	24	24	24	24	24
Washoe Project	11	10	10	10	10	10	10
Salt Lake City Integrated Projects [f]	8,601	8,645	8,668	8,699	8,699	8,699	8,814
Subtotal	45,009	40,076	40,642	40,784	40,747	39,653	39,383
Less Firming Energy Purchases [g]	0	0	-6,418	-6,418	-6,418	-6,418	-6,418
Total	45,009	40,076	34,224	34,366	34,329	33,235	32,965

[a] FY 1998 amounts reflect actual sales. Unless otherwise noted in the previous table (Estimate of Revenues), all amounts in this table are based on FY 1997 Final Power Repayment Studies (PRS).

[b] One gigawatthour (GWH) equals one million kilowatthours (kWh).

[c] Estimates include sales into the Pacific Gas & Electric EA2 account.

[d] Loveland Area Projects include Fryingpan-Arkansas Project and Pick-Sloan Missouri Basin Program (Western Division).

[e] Pacific Northwest-Southwest Intertie shows no energy sales, but reflects revenues from the transmission of energy (refer to the Estimate of Revenue table). The Intertie Project is for transmission of energy only.

[f] Salt Lake City Integrated Projects include the Colorado River Storage Project, Collbran Project, Rio Grande Project, Seedskadee Project, and Dolores Project.

[g] Beginning in FY 2000, customers are expected to provide for their own firming energy needs, eliminating purchase power for resale.

Estimate of Proprietary Receipts

(dollars in thousands)

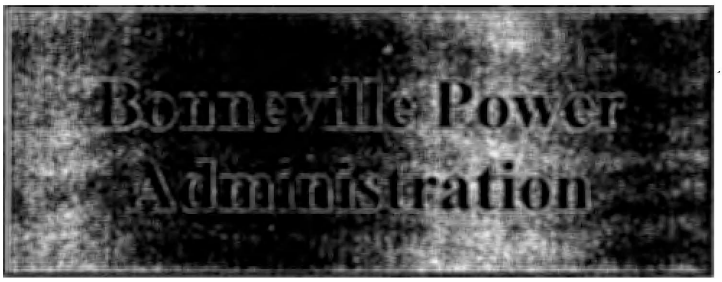
	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	FY 2004
Falcon Amistad Maintenance Fund, 895178	644	1,010	1,309	1,309	1,309	1,309	1,309
Sale and transmission of electric power, Falcon and Amistad Dams, 892245	2,945	2,272	1,983	1,983	1,983	1,983	1,983
Sale of Power and Other Utilities Not Otherwise Classified, 892249	33,020	42,500	42,500	42,500	42,500	42,500	42,500
Sale of Power - Western Area Power Administration - Reclamation Fund, 895000.27 [a]	379,840	327,516	288,090	303,327	315,877	307,939	301,708
Total, Proprietary Receipts	416,449	373,298	333,882	349,119	361,669	353,731	347,500

[a] Beginning in FY 2000, power customers are expected to provide for their purchase power and transmission wheeling requirements directly with suppliers. This action reduces Western's receipts to Treasury by approximately $54 million annually.

Pending Litigation

City of Tacoma v. Hazel O'Leary, Secretary of the United States Department of Energy, No. C96-5699 RJB (W.D. Wash., filed July 22, 1996). In January 1996, Western Area Power Administration (Western) issued a notice to terminate a purchase power contract with the City of Tacoma. The effective date of the termination was February 1, 1997. Tacoma sued Western in U.S. District Court, alleging that Western violated the Administrative Procedure Act by: (1) exceeding its authority under the Reclamation Laws and Energy Act; (2) failing to consider the effects that terminating the purchase power contract would have on the economic well being of the City and its utilities; (3) exceeding its authority under the contract; and (4) failing to consider all relevant factors in making the decision to terminate the contract. Western believes that it acted properly in terminating the contract, in accordance with the terms of the contract. After Western terminated the contract, Tacoma amended its complaint by adding claims for breach of contract. Tacoma now seeks money damages of $144 million.

The United States believes that the U.S. District Court lacks subject matter jurisdiction over the complaint, and that the case should be heard in the U.S. Court of Federal Claims under the Tucker Act. The United States has filed an interlocutory appeal with the Ninth Circuit, seeking a ruling to this effect. The United States and Tacoma briefed the Ninth Circuit in February and March of 1998. The Federal Circuit held oral arguments on October 7, 1998. The Circuit has not issued a final order. Discovery in the case is stayed pending the outcome of the appeal.



Bonneville Power
Administration

Bonneville Power Administration

Proposed Appropriation Language

Expenditures from the Bonneville Power Administration Fund, established pursuant to Public Law 93-454, are approved for *the Northeast Oregon Hatchery Master Plan, and for* official reception and representation expenses in an amount not to exceed [$1,500]*$3,000, Provided further,* That during Fiscal Year [1999] 2000 no new direct loan obligations may be made.

(Energy and Water Development Appropriation Act, 1999.)

Explanation of Change

The proposed FY 2000 appropriation language authorizes construction of facilities as required by the Pacific Northwest Electric Power and Planning Act for new fish and wildlife facilities of $1 million and an economic life greater than 15 years (Public Law 96-501, section 4, (H)(10)(B).

The proposed appropriation language authorizes reception and representation expenses in FY 2000 to increase over FY 1999 and restricts new direct loans in FY 2000 as in FY 1999.

Bonneville Power Administration

Executive Budget Summary

Mission

Bonneville Power Administration (Bonneville, BPA) is the Department of Energy's electric power marketing administration for the Federal Columbia River Power System (FCRPS). As stated in BPA's Business Plan, BPA's strategic mission is to: (1) provide electric power, transmission, and energy efficiency in increasingly competitive markets, (2) support the achievement of BPA's responsibilities for fish and wildlife, energy conservation, renewable resources, and low-cost electric power for the region, (3) remain a low-cost producer and a creative and flexible marketer in the region, helping to ensure the economical and environmental health of the Pacific Northwest, and (4) value individual diversity, entrepreneurial spirit, personal responsibility and the public service of Bonneville employees. BPA's business strategies to fulfill its mission can be summarized as meeting the electric energy market price, managing costs to be competitive in providing services to customers, strengthening BPA's financial position, and reorienting the organization to be responsive, flexible and competitive.

BPA provides electric power (about forty percent of the electricity consumed in the region), transmission (about three-fourths of the region's high voltage transmission capacity), and energy efficiency throughout the Pacific Northwest, a 300,000 square mile service area. BPA markets the electric power produced at 29 Federal hydroelectric multipurpose dams in the Pacific Northwest by the Corps of Engineers and the Bureau of Reclamation, and acquires non-Federal power to meet the needs of its customer utilities.

Congress created BPA in 1937 as part of the Bonneville Project Act, providing BPA's basic statutory utility responsibilities and authorities. In 1974, passage of the Federal Columbia River Transmission System Act (Transmission System Act) placed BPA under provisions of the Government Corporation Control Act (31 U.S.C. 9101-9110) and provided BPA with "self-financing" authority through the BPA Fund, a revolving fund, allowing BPA to use its revenues from electric ratepayers to directly fund all programs and to sell bonds to the U.S. Treasury to finance the region's high-voltage electric transmission system requirements. In 1980, enactment of the Pacific Northwest Electric Power Planning and Conservation Act (Northwest Power Act) expanded BPA's utility obligations and responsibilities to encourage electric energy conservation and develop renewable energy resources, and protect, mitigate and enhance the fish and wildlife of the Columbia River and its tributaries. In support of these expanded responsibilities, BPA's Treasury borrowing authority was expanded to allow the sale of bonds to finance conservation and other resources and to carry out fish and wildlife capital improvements.

BPA's program is mandatory, nondiscretionary. It receives no annual appropriations from Congress. BPA funds the expense portions of its budget and repays the Federal investment in FCRPS with revenues from electric rates. BPA is authorized to sell bonds to the Treasury up to a cumulative outstanding total of $3.75 billion (permanent, indefinite borrowing authority). Through FY 1998, BPA has returned approximately $14.9 billion to the Treasury for payment of FCRPS O&M (about $2.7 billion), interest (about $8.4 billion) and amortization (about $3.8 billion) of appropriations and bonds.

Bonneville made its full FY 1998 payment of over $804 million as scheduled. For FY 1999, BPA plans to pay the Treasury $607 million, of which $164 million is to repay investment principal, and $431 million is for interest. The FY 2000 Treasury payment is currently estimated at $618 million, including $164 million for repayment of principal, and $440 million for interest.

Bonneville's FY 2000 budget has been prepared on the basis of its three major areas of activity: power, transmission and conservation and energy efficiency. This structure supports Bonneville's ability to become more competitive in the rapid restructuring of the deregulated wholesale electric energy market. This industry deregulation stems largely from the 1992 Energy Policy Act and ensuing Federal Energy Regulatory Commission (FERC) orders (FERC orders 888 and 889) requiring separation of utilities power and transmission functions. As a Federal agency, Bonneville is not bound by law to comply with the orders, but chose to comply with the FERC orders because it views compliance as essential to successfully compete in the electric power market of the future. Further, Bonneville supports DOE's October 1995 "Power Marketing Administration Open Access Policy." This budget reflects Bonneville's functional separation of power and transmission and its accounting and budgetary implementation of major activities.

Strategy

BPA's FY 2000 budget incorporates the budget reductions BPA has made to remain competitive in the electric utility industry in the Pacific Northwest as the industry restructures itself. These budget estimates, however, are still subject to continual change due to rapidly changing economic and institutional conditions in the evolving competitive electric utility industry in the Pacific Northwest. The following table provides a summary of accrued expenditures.

FUNDING SUMMARY (accrued expenditures in millions of dollars)

	FY 1998	FY 1999	FY 2000
CAPITAL INVESTMENTS			
Power Business Line	$ 50	$ 83	$106
Transmission Business Line	$106	$136	$178
Conservation & Energy Efficiency	$ 14	$ 14	$ 1
Capital Equipment&Bond Premium	$ 44	$ 25	$ 35
[redacted]	[redacted]	[redacted]	[redacted]
Accrued expenditures will require budget obligations of	$232	$258	$352
[redacted]	[redacted]	[redacted]	[redacted]
Projects Funded in Advance	$2	$25	$25
CAPITAL TRANSFERS (cash)	$247	$164	$164
BPA NET OUTLAYS	-$178	-$61	-$23
BPA STAFFING (FTE)	2,778	2,800	2,800

FY 2000 Performance Measures

Produce gross revenues of over $2 billion from the $14 billion FCRPS investment and provide the U.S. Treasury $618 million for operation and maintenance costs and interest and principal payments for the Federal Columbia River Power System.

Invest $320 million in new capital assets for transmission, power, and conservation and energy efficiency.

Sell about 85,000,000 megawatt-hours of electricity.

Serve more than 300 wholesale utility and industrial customers and interconnected utilities.

Operate and maintain over 15,000 circuit-miles of electric transmission lines, about 360 electric substations and associated utility and general plant, with a combined transmission system capital investment of about $5 billion.

Provide and reliably operate about the federal Columbia River Transmission System which includes 80 percent of the 300,000 square-mile Pacific Northwest's high-voltage electric energy transmission capacity. Work with other regional utilities and others to ensure an effective, efficient power supply system for the region's population of more than 10 million persons.

a/ BPA's FY 1999 budget has been prepared in accord with the Budget Enforcement Act (BEA) of 1990. Under this Act all BPA budget estimates are treated as mandatory and are not subject to discretionary "caps" in the BEA.
These estimates support activities which are legally separate from discretionary activities and accounts. Thus, changes to BPA estimates cannot be used to affect any other budgetcategories such as domestic discretionary, or defense discretionary which have their own legal dollar caps. Because BPA operates within existing legislative authority, BPA is not subject to a BEA "pay-as-you-go" test regarding its revision of funding estimates.

b/ These estimates reflect BPA's FY 1999 Congressional Budget Submission.

c/ The Power business line includes Fish & Wildlife in the Performance Summaries, which appears separately on line 2 of this table.

d/ FTE reflect 1998 actuals and updated estimates.

OVERVIEW

Bonneville Power Administration

General Overview

Bonneville provides electric power, transmission and energy efficiency throughout the Pacific Northwest. Created in 1937 to market and transmit the power produced by the Bonneville Dam on the Columbia River, Congress has since then directed Bonneville to sell at wholesale the power produced at a total of 29 Federal dams, and to acquire non-federal power and conservation resources sufficient to meet the needs of Bonneville's customer utilities. Bonneville serves a 300,000 square mile area including Oregon, Washington, Idaho, Western Montana, and parts of Northern California, Nevada, Utah and Wyoming.

The Transmission System Act placed Bonneville under the provisions of the Government Corporation Control Act (31 U.S.C. 9101-9110) and allows Bonneville to use its revenue from electric ratepayers to fund all programs directly through the BPA revolving fund, and sell bonds to the Treasury to finance the region's high voltage transmission requirements. The Northwest Power Act expanded Bonneville's utility obligations and responsibilities to meet requesting utility loads, encourage conservation and develop renewable resources, and to protect, mitigate and enhance the fish and wildlife of the Columbia River and its tributaries. In support of these responsibilities, Bonneville's borrowing authority was expanded to allow the sale of bonds to finance conservation and other resources and to carry out fish and wildlife capital improvements. This Act also required regional energy plans and programs and created the Northwest Power Planning Council (Planning Council).

Bonneville is "self-financed" by the electric ratepayers of the Pacific Northwest and receives no annual appropriations from Congress. Bonneville's statutory budget authority is provided by the revenue-generating and rate-setting authorities of the Bonneville Project Act of 1937. Under the Transmission System Act, Bonneville funds the expense portion of its budget and repays the Federal investment with revenues from electric rates. Bonneville's revenues fluctuate primarily in response to market prices for fuels and stream flow variations in the Columbia River System due to weather conditions and fish recovery needs. Bonneville's permanent, indefinite statutory borrowing authority authorizes the agency to sell bonds to the Treasury up to a cumulative outstanding total of $3.75 billion. Through FY 1998, Bonneville has returned approximately $14.9 billion to the Treasury in interest, amortization, and repayment of Federal power generation, operation, maintenance, and construction costs. Bonneville made its full FY 1998 payment of over $804 million as scheduled. Bonneville's projected total Treasury payments for FY 1999 and FY 2000 are $607 million and $618 million, respectively. Starting in FY 1997, Bonneville is directly funding Bureau of Reclamation Pacific Northwest power O&M costs and in FY 1999 will begin direct funding Corps of Engineer Pacific Northwest power O&M costs.

Bonneville's FY 2000 budget has been prepared on the basis of its three major areas of activity: power, transmission, and conservation and energy efficiency. This structure supports

Bonneville's competitiveness in the rapidly restructuring, deregulated wholesale electric energy market. This industry deregulation stems largely from the 1992 Energy Policy Act and ensuing Federal Energy Regulatory Commission (FERC) orders (FERC orders 888 and 889) requiring separation of utilities power and transmission functions. As a Federal agency, Bonneville is not bound by law to comply with the orders, but chose to comply with the FERC orders because it views compliance as essential to successfully compete in the electric power market of the future. Further, Bonneville supports DOE's October 1995 "Power Marketing Administration Open Access Policy." This budget reflects Bonneville's functional separation of power and transmission and its accounting and budgetary implementation of business lines (BLs). This budget proposes FY 2000 accrued expenditures of $ 2,116 million for operating expenses, $25 million for Projects Funded in Advance, $320 million for capital investments, and $164 million for capital transfers.

Spending levels in this budget are still subject to change due to several reasons, including continued review and adjustment of funding requirements by Bonneville to accommodate competitive dynamics in the region's energy markets and refinancing of non-federal debt service.

Program Mission

In 1995, Bonneville completed a Business Plan and an associated environmental impact statement. The Business Plan is the foundation and guidance for Bonneville's strategic evolution to competitive utility business lines of products and services. Bonneville's Business Plan is serving as the basis for development of Bonneville's Flight Plan. The Flight Plan development will provide for implementing agency and business line strategies, including specific targets for measuring performance. It is designed to be consistent with requirements of the Government Performance and Results Act of 1993. The objectives and performance measures below are consistent with the DOE Strategic Plan.

As stated in Bonneville's Business Plan, the strategic mission of Bonneville is:

To provide electric power, transmission, and energy efficiency in increasingly competitive markets.

To support the achievement of BPA's responsibilities for fish and wildlife, energy conservation, renewable resources, and low-cost power for the region.

To remain a low-cost producer and a creative and flexible marketer in the region, helping to ensure the economical and environmental health of the Pacific Northwest.

To value individual diversity, entrepreneurial spirit, personal responsibility and the public service of Bonneville employees.

Program Objectives

Following are the FY 1999 target areas and their associated goals and performance measures adopted by the Bonneville Administrator and CEO.

These measures are reported to the President, Congress, the Department of Energy, the General Accounting Office, and the Office of Management and Budget to meet the requirements of the Chief Financial Officers (CFO) Act (Public Law 101-576). Consistent with the following measures, Bonneville funding levels support the DOE Strategic Plan, specifically, the Strategic Goal 1, Strategy 6 regarding system reliability.

Public Responsibilities goals and targets:
A competitive wholesale power market, fostered by open, non-discriminatory transmission access.

- BPA conducts itself under the Standards of Conduct such that there's no need for remedial action by FERC.

Cost-based, below-market power products broadly available in Pacific Northwest.

High system reliability, availability, and sufficiency.

- Transmission: Outage frequency and duration for transmission circuits do not exceed Control Chart violation limits.
- Generation: Weekly Heavy Load Hour targets for available generation are achieved.

BPA's greening strategy leads to BPA being viewed as the pre-eminent green utility.

- Sell at least 30 aMW of preferred power products at a premium over the basic Subscription product, limiting BPA's net cost for renewable resources at no more than $15 million.
- Mechanisms are created that result in substantially greater progress toward the Regional Review goals for energy efficiency and renewable resource development.

Fish and wildlife obligations are met.

- Meet Biological Opinion spill requirements.

Strong relationships with Tribal governments, State and Federal entities, and constituents.

- Tribal satisfaction index $\geq$ 6.3 and composite State/Federal entities/Constituent index $\geq$ 6.9.

Unified fish and wildlife plan, which includes long-term certainty for the Federal Columbia River Hydro-system.

- Federal consensus is achieved on a preferred alternative for the Unified Fish & Wildlife Plan that meets BPA's fish and wildlife obligations: (a) by establishing performance standards and other measures to be undertaken by the hydropower system; (b) by defining requirements for "off-site" mitigation for hydro impacts (e.g., hatchery, habitat and harvest programs); and (c) while preserving below-market, at-cost power.

High Performance Organization goals and targets:
Safe and positive work environment.

- Recordable injuries $\leq$ 2.4 per 200,000 hours worked (100 employees) and no fatal injuries occur to BPA or contract employees working on BPA facilities.
- Number of developmental assignments (both formal and informal) involving minorities is increased over last year.

Employees who are motivated, productive, and focused on implementing BPA strategies.
- Measurable improvement in key gap areas identified in FY 1998 work environment survey:
- "Turf" issues target $\geq$ 77%;
- Uneven workload target $\geq$ 90%;
- Recognition target $\geq$ 79%.

Critical business systems are improved.
- BPA completes Y2K remediation on its transmission systems and business systems by Federal deadline of 3/31/99.
- Implement a system for regularly assessing, reporting, and managing Agency and business unit risks.
- Develop an FCRPS-wide capital budgeting process that includes risk-adjusted rates of return; implement for BPA capital in FY 2000 SOY budgets.
- Business Solutions Project.
- Revenue Process Study.

Customer Satisfaction goals and targets:
Very high customer satisfaction.
- Composite Agency customer satisfaction index $\geq$ 7.6.

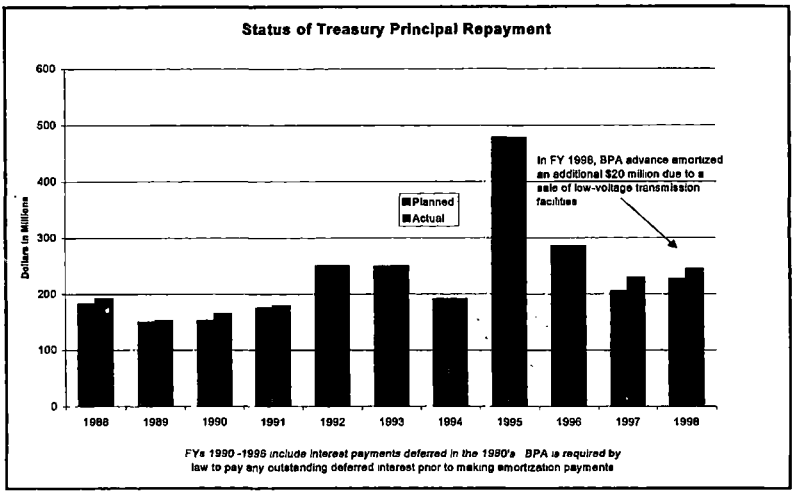
Finance goals and targets:
- High probability of cost recovery.
- Treasury payment made on time and in full, with Agency net revenues $\geq$ $54.

Performance Measures

The following are included in the Department of Energy's FY 1997 Consolidated Financial Statements and are also measured by the other power marketing administrations.

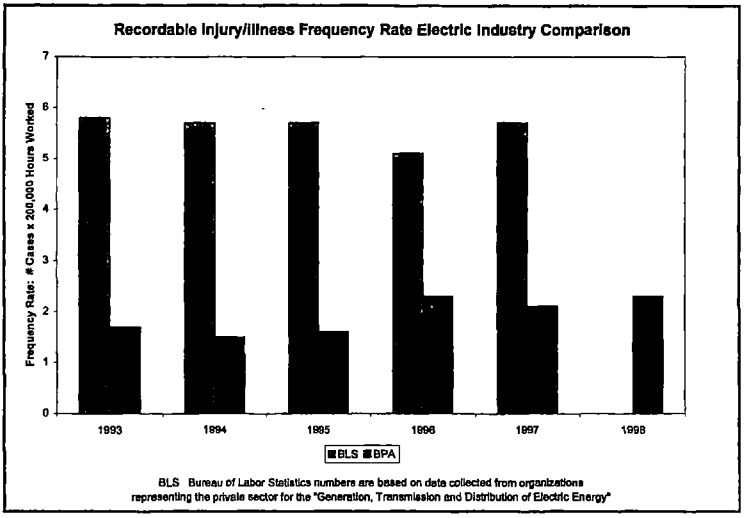
- *Repayment of Power Investment (Variance in Principal Payments)*: This indicator measures the variance of actual from planned principal payments to the U.S. Department of Treasury. The indicator will be zero if the actual payment is equal to the planned payment.

The following chart displays principal repayment only.



- *Safety Performance: Total Recordable Case Rate (Recordable Accident Frequency Rate)*: This indicator measures the recordable accident frequency rate by first multiplying the number of recordable injuries by 200,000. This number is then divided by the total hours worked. The PMAs measure their performance against a Bureau of Labor Statistic (BLS) standard industry case rate.

The national average recordable injury frequency rate shown below is based on Bureau of Labor statistics. The Bureau of Labor's data is collected from organizations representing the private sector in the generation, transmission, and distribution of electric energy. The Bureau of Labor Statistics reported a 1997 national average recordable injury frequency rate of 5.7 injuries per 200,000 hours worked. BPA's recordable injury frequency rate for FY 1998 was 2.3 injuries.



- *Transmission System Reliability: Control Performance Standard:* This indicator defines a standard of minimum control performance. Each control area is to have the best operation above this minimum that can be achieved within the bounds of reasonable economic and physical limitations. Each control area shall monitor its control performance on a continuous basis against two standards, CPS1 and CPS2. These two standards have very defined technical requirements.

This measure is consistent with the Department's Strategic Plan, specifically, Objective 1, Strategy 6. This strategy states that the Department will "Ensure that each power system control area operated by a PMA receives, for each month of the fiscal year, a Control Compliance Rating of 'Pass' using the North American Electric Reliability Council (NERC) Performance standard." A "Pass" is accomplished when each control area achieves a CPS1 compliance of 100% and achieves a CPS2 compliance of 90%.

In FY 1998, Bonneville Power Administration exceeded the minimum compliance level required by NERC with a CPS1 of 172.1% and a CPS2 of 99.94%. BPA began measuring CPS2 in January of 1998, therefore, the FY 1998 control performance is based on a partial fiscal year. Based on historic records, the CSP1 for FY 1997 was 173.68% and for FY 1996 was 168.86%. Data on CPS2 for FY 1997 and FY 1996 is not available.

Significant Accomplishments and Program Shifts

- Bonneville's FY 2000 budget reflects the significant financial and business events of the past year that have shaped Bonneville's response to the ongoing competitive pressures of

the region's electric utility industry. Throughout the past year Bonneville continued budget and FTE reductions necessary to enhance its competitive, cost-effective delivery of business-line utility products and services and continued delivery of the public benefits of its operations, while ensuring its ability to continue to make its payments to the Treasury on time and in full. Bonneville has completed three major cost reductions since early 1995. Combined, these cost reductions have reduced planned annual operating expense levels for FY 1996-2001 by an average $600 million from the levels in the FY 1995 Congressional budget, down nearly to the average actual operating expense level for FY 1993-1995.

- Bonneville's cost reductions have had a major impact on the agency's human resource levels, both Federal full-time equivalents (FTE) and contractor full-time equivalents (CFTE). In 1994, Bonneville established targets of reducing its FTE by 500 and its CFTE by 500, by FY 1997 as part of its competitive efforts. As a result of cost cutting, reorganization, and the availability of voluntary separation incentive authority (VSI) Bonneville has achieved its target goals. Despite the success of a 4-year effort to reduce its regular and contractor staff by 20 percent, further reductions were necessary. As reflected in this FY2000 budget, Bonneville has achieved additional FTE reductions resulting in a total of 2,778 in FY1998. As part of its succession planning efforts, Bonneville expects a small FTE increase in FYs 1999 and 2000 but is planning further reductions over time. Bonneville has initieated an effort in 1999 to complete a comprehensive multi-year staffing plan for FY 2001 and beyond.

- The organizational downsizing and cost-cutting have yielded benefits to Bonneville's ratepayers. Whereas Bonneville initially proposed to raise its power and transmission rates at the beginning of the 1996 rate process, it completed the process with an average 13 percent rate reduction for preference customers (public utilities, municipalities and cooperatives) stabilized over 5 years. While the amount of the decrease for customers individually varies with each customer's mix of products and services purchased, Bonneville estimates that the average rate for priority firm power is 2.44 cents per kilowatt-hour, down from the previous average rate of 2.81 cents.

- To achieve the rate reduction, Bonneville produced new, unbundled products and negotiated power sales contracts with its Northwest preference customers and 10 direct service industries. The new contracts provide a high degree of assurance that Bonneville can cover its costs through FY 2001 while enabling customers that wanted to diversify suppliers to do so. A higher proportion of contracts is now take-or-pay, reducing the risk of under recovery of costs. This ability to stabilize our customer load will provide Bonneville with additional time to meet anticipated future changes in the electric power industry and help assure our ability to meet Bonneville's Treasury payment obligations. Our goal has been to simultaneously become price competitive on a long-term basis, to bring enough stability to costs and revenues to retain customers, and to revise resource and marketing programs to reflect major changes in the agency's resource base and environmental obligations.

- The rate certainty provided by Bonneville's 1996 final rates has been augmented by the implementation of the Bonneville Appropriations Refinancing Act (part of the Omnibus Consolidated Recissions and Appropriations Act of 1996) that refinanced Bonneville's outstanding repayment obligations on appropriations. The legislation called for increasing low interest rates on historic appropriations to current Treasury market rates and resetting (reducing) the principal of FCRPS appropriations unpaid as of the end of FY 1996. New principal amounts were established as of the beginning of FY 1997, at the present value of the principal and annual interest payments BPA would make to the Treasury for these obligations in the absence of the Act, plus $100 million. The new principal amounts were then assigned new interest rates based on the Treasury yield curve rates prevailing at the end of FY 1996. BPA's outstanding repayment obligation on appropriations at the end of FY 1996 was $6.7 billion, with a weighted average interest rate of 3.4 percent. The refinancing reduced the principal amount to $4.1 billion, with a weighted average interest rate of 7.1 percent. As called for in the legislation, BPA submitted its calculations and interest rate assignments implementing the refinancing to Treasury for their review and approval. Treasury approved the implementation transactions in July, 1997.

- BPA started work on year 2000 compliance (Y2K) issues for its business, operations, and control systems in 1995. Recently, BPA established a Cross Agency Year 2000 team that is responsible for: 1)Business Systems - equipment and software, 2) Coordination with customers and suppliers, and 3)Reliable generation control and transmission systems. This team is currently undertaking the tasks of completing an inventory of systems and equipment that might have Y2K problems, making a risk assessment on each system, testing where needed, replacing/modifying software and hardware, and developing appropriate contingency plans. The intent of these efforts is to correct Y2K problems that could affect power system reliability, including coordination with entities having facilities connected to our transmission system. We will also have in place contingency plans to facilitate a smooth operational transition into the year 2000.

- Wholesale power marketing is becoming more uncertain and much more competitive in the Pacific Northwest as the electric utility industry undergoes wholesale deregulation. In 1995, demands on Bonneville for power dropped suddenly as the effects of wholesale electricity deregulation took hold, causing Bonneville to withdraw from the 248-megawatt Tenaska power project. As a result, Tenaska Power Partners II (Tenaska) and Chase Manhattan Bank (Chase), which provided the project funding, sued Bonneville for damages. Bonneville settled the lawsuit with Chase in June, 1996, agreeing to pay to Chase $115 million. BPA settled with several subcontractors of Tenaska for $29 million in FY1997 and $13.7 million in FY1998. In July 1998 arbitrators awarded Tenaska $159 million which was paid directly from the U.S. Treasury's judgment fund in November 1998. Bonneville will fully reimburse the Treasury for the judgment funds used plus interest, assuring that taxpayers are in no way affected by this award. In December 1998 Bonneville made its first reimbursement payment of $80.4 million to the Judgement Fund Branch. The remainder of the debt

will be paid in three equal payments concluding in August 2001. Consistent with a Memorandum of Understanding with the U.S. Treasury, BPA will make interest payments on the outstanding debt to the U.S. Treasury's "miscellaneous receipts" account.

- Bonneville faces unprecedented challenges in continuing its service to the Pacific Northwest. Market prices falling to near parity with Bonneville's rates have brought new competition, while at the same time the costs of Bonneville's commitment to rebuild salmon runs have risen sharply. Congress and the Administration have helped immensely by providing certainty to BPA's contribution to Northwest fish and wildlife restoration and mitigation. BPA, the Administration, and other agencies finalized an interagency agreement. The agreement ensures a stable level of fish and wildlife costs through 2001, while also confirming BPA's obligation to fund fish and wildlife activities for the 1995 Biological Opinion (BO) of the National Marine Fisheries Service (NMFS).

- This OMB budget is consistent with the above interagency agreement that calls for BPA fish and wildlife funding of $252 million per year and hydro operations estimated to result in lost revenues and purchased power costs of $90-$280 million per year for the period FY 1996 through FY 2001. These hydro operations are estimated at $90 million to $280 million per year, depending on water supplies and market conditions. The $435 million annual average cost of the fish "cap" reported in the print and communications media refers to the agreed combined cost of BPA spending, hydro operations and related costs for fiscal years 1996-2001. Included with the budget schedules section of this budget document is the current tabulation of the history and forecasted future costs of BPA's fish and wildlife investments. No agreement has been reached at this time on Bonneville's Fish and Wildlife budget for fiscal years beyond 2001. Discussions within the Region are currently taking place for a planning range for costs in the years beyond FY 2001. As of mid-August 1998, there are 13 alternatives being considered which have a range of annual average expenditures of $438 million to over $724 million.

- Related to this, in 1995, the Administration completed an agreement with members of the Northwest Congressional Delegation. This agreement recognized Bonneville's use of Section 4(h)(10)(C) of the Northwest Power Act to apply credits to Bonneville's Treasury payment for previous Bonneville expenditures attributable to non-power hydro project costs collected through Bonneville power rates. Under the agreement, Bonneville will receive annual credits on a permanent basis for its fish and wildlife expenditures. Bonneville is allowed credits for power purchase costs relating to its fish and wildlife programs in Fiscal Years 1997-2001, and is able to access historical credits for certain purposes as described below.

- In October 1995, the OMB in a letter to Congress, reiterated and extended the Administration's commitments made earlier. One of the program elements that the OMB Director elaborated on was that the Administration would establish a BPA Fish

Cost Contingency Fund consisting of credits to be used by BPA against fish and wildlife costs under certain conditions. BPA has certified in February, 1997, to the Treasury that the amount of available, but unused, credits is approximately $325.2 million.

- As discussed in the September 13, 1996, interagency "Memorandum of Agreement concerning The Bonneville Power Administration's Financial Commitment for Columbia River Basin Fish and Wildlife Costs" (MOA), BPA may access the fund when (1) court-ordered changes increase the cost of BPA's fish and wildlife Plan above specified target levels in the MOA; (2) when adverse hydro conditions cause the sum of decreases in nonfirm revenue and increases in power purchases to exceed a threshold value; and (3) when natural disasters or fishery emergencies result in additional system operations beyond those described in Part V (a) of the MOA. The credits for the certain emergencies are limited to an aggregate amount of no more than the $15 million per year. In order to implement the Administration agreement in the anticipated timely manner, financial information, approximate to that provided in the BPA certification was included in the BPA final 1996 Wholesale Power and Transmission Rate Case, which covers the five year period of FY 1997 through FY 2001.

- The Congress also enacted language to establish the residential exchange program benefits for FY 1997 while providing Conference Report language stating that, consistent with the Comprehensive Review of the Northwest Energy System, Bonneville and its customers should work together to gradually phase out the residential exchange by October 1, 2001. Consistent with the report language, Bonneville has reached settlement agreements with all publicly-owned utilities that have participated in the exchange program and all investor-owned utilities (IOU's).

- As the electric utility industry in the Pacific Northwest continues its restructuring and competitive development under wholesale deregulation, and Bonneville's competitive structure, and other factors, these budget estimates may have to change to enable Bonneville to meet its statutory responsibilities and obligations.

- The Comprehensive Review of the Northwest Energy System (the Regional Review) was convened on January 4, 1996, by the governors of Idaho, Montana, Oregon, and Washington. It served as a forum for discussion about the restructuring of the electric utility industry and what this restructuring will mean to the Pacific Northwest. The need for the regional forum was driven by deregulation and competitive changes in the wholesale power industry nationally. The governors received the Regional Review proposal on December 12, 1996. From BPA's perspective, the recommendations accomplish four important objectives: (1) creating the opportunity to retain the benefits of the Northwest Federal hydrosystem for Northwest consumers, (2) fostering the use of the Federal transmission system to help achieve a competitive power market for the benefit of all consumers, (3) improving the likelihood that taxpayers and bondholders will have their investment repaid, and (4) creating a funding mechanism for preserving important public benefits.

- In December, 1996, upon release of the Regional Review's final report, Bonneville and other regional parties immediately began to explore the actions necessary to implement the Regional Review recommendations. In early 1997, the governors representatives formed a Transition Board to ensure accountability, acceptance and implementation of the recommendations resulting from the Regional Review. The Northwest Congressional delegation asked the Governor's Transition Board in June 1997 to work with the Northwest Power Planning Council (Council) to establish a forum on Bonneville cost management issues beyond 2001.

- As a result of this request, a Cost Review Management Committee, comprised of outside experts and representatives from the Council and Bonneville, completed a review and released a set of draft recommendations in January 1998. Consistent with last year's Congressional report language, the draft recommendations were provided to Congress. The review recommends cost reductions and operational efficiencies averaging $146 million annually over the 2002-2006 period. These reductions would be in addition to significant cuts already planned by Bonneville and would result in total average annual reductions of about $240 million from current rate levels.

- In conjunction with a public review of the Cost Review recommendations, Bonneville established the Issues'98 process to provide the public with a broad overview of developments on multiple Bonneville policy initiatives. Bonneville is continuing to work with customers, state and federal agencies, tribal governments and interest groups on broad policy areas that will affect 2002-2006 financial planning assumptions leading to an initial power rate proposal for this same period. Bonneville has decided to adopt the cost recommendations in full. Success can occur only with aggressive cost management, improved operational efficiencies, and the cooperation of Bonneville's major power suppliers. This FY2000 Congressional budget reflects the expected final impacts from implementation of the Cost Review recommendations under current legislation and contractual agreements.

Bonneville Power Administration

Overview of Detailed Program Justifications

BPA's detailed justification summaries that follow present budget requirements of budget line items (BLI) on the basis of accrued expenditures. Accrued expenditure is the basis of presenting BPA's program funding levels in the power and transmission rate making processes, and the basis upon which BPA managers control their resources to provide products and services. Accrued expenditures relate costs to performance. Traditional budget obligation requirements for BPA's budget are shown on the Program and Performance Schedule prepared in accord with OMB Circular A-11.

The FY 2000 budget and these performance summaries reflect BPA's business line basis for utility enterprise activities. BPA has three major areas of activity on a consolidated budget and accounting basis: 1) Power, 2) Transmission, and 3) Conservation and Energy Efficiency. The Power business line includes line items for Fish and Wildlife, Residential Exchange, Associated Projects O&M Costs and Planning Council. Environmental activities are shown in the relevant business line, and in accord with OMB Circular A-11 guidance for revolving funds, reimbursable costs are incorporated within the associated business lines. All programs funded in advance will be fully funded by benefiting entities. BPA's interest expenses, pension & post-retirement benefits and its capital transfers to the Treasury are shown by program.

The first section of performance summaries, Capital Investments, includes accrued expenditures for investments in electric utility and general plant associated with the Federal Columbia River Power System's (FCRPS) generation and transmission services, conservation and energy efficiency services, fish and wildlife, and capital equipment. These capital investments will require budget obligations and new borrowing authority of $352million in FY 2000, $104 million more than forecast for FY 2000 in last year's Congressional budget submission. This increase is primarily due to increases in the Transmission Business Line which includes the fiber and Southwestern Oregon Coast Reinforcement projects, and the Business Services Project in Capital Equipment.

The forecasted capital funding levels for fiscal years 2000 and beyond will undergo further internal review as a result of implementing a capital asset management strategy. Consistent with the regional Cost Review Management Committee recommendations, this strategy will encompass prioritizing capital projects to be funded based on risk and other factors. Establishing this review process will help Bonneville in its efforts to compete in the deregulated energy market.

BPA's second section of the performance summaries, entitled Annual Operating Expenses, includes accrued expenditures for business line and program activities financed by power sales and transmission services revenues and projects funded in advance. For FY 2000, these

expenses will require budget obligations of $2,116. The total program requirements of all BPA programs include estimated budget obligations of $2,493 million in FY 2000.

CAPITAL PROGRAMS

Power Business Line - Capital

Mission Supporting Goals and Objectives

Associated Project Costs provide for direct funding of additions, improvements and replacements of existing U.S. Bureau of Reclamation and Corps of Engineers hydroelectric projects in the Pacific Northwest. The Bureau and Corps provide power production which is marketed by Bonneville and investing in additions, improvements, and replacements provides for increased performance and availability of generating units.

The Fish and Wildlife program provides for the protection, enhancement and mitigation of Columbia River Basin fish and wildlife losses attributed to the development and operation of hydroelectric projects on the Columbia River and its tributaries pursuant to Section 4(h) of the Northwest Power Act. BPA discharges a major portion of its fish and wildlife responsibilities and reduces the Administrator s obligation, by funding projects and activities designed to be consistent with the Northwest Power Planning Council s (Planning Council) Fish and Wildlife Program. BPA is also mandated to implement measures called for under the Endangered Species Act. These measures are part of the biological opinions (BO) issued by the National Marine Fisheries Service (NMFS) and the U.S. Fish and Wildlife Service (USFWS) regarding the operations of the Federal Columbia River hydro system. The capital associated with implementing the reasonable and prudent alternatives of the BOs that relate to BPA s direct fish and wildlife program are included in this budget projection. Additionally, this capital budget reflects, and is consistent with, the fish and wildlife budget agreement announced by the Administration in October 1995 and the Memorandum of Agreement of September 1996 that calls for BPA fish and wildlife funding of $252 million per year and operations estimated to result in lost revenues and purchased power costs of $90-$280 million per year for the period FY 1996 through FY 2001.

Bonneville has been working with Columbia Basin tribes, state and federal agencies, and pubic interest groups to develop an expected range for Bonneville's fish and wildlife costs for 2002-2006. As of mid-July, 1998 the total estimated annual average financial impact on Bonneville, for the region's fish and wildlife programs ranges from $438 million to over $724 million per year. These costs are still being refined and are subject to change. Final decisions on overall regional fish and wildlife costs and the schedule for program implementation have not been made. Estimates beyond FY 2001 are expected to be available upon conclusion of the current agreement negotiations.

BPA's fish and wildlife capital program is directed at activities that increase numbers of Columbia River Basin fish and wildlife resources including projects designed to increase juvenile fish passage at mainstream dams, increase fish production and survival through construction of hatchery and acclimation facilities, fish monitoring facilities and fish habitat enhancement. Funding is also included for pre-engineering design and studies for new and developing projects. The priority for capital project funding will focus first on implementing the reasonable and prudent alternatives contained in the NMFS and USFWS Biological Opinions

and second, on implementing the Planning Council's Fish and Wildlife Program. A current goal of the Planning Council, and one supported by BPA, is that projects funded under both Bonneville's direct program as well as the reimbursable and capital investment components of the other Federal agencies will be reviewed and prioritized as part of a regional planning initiative process.

The FY 1997 Energy and Water Appropriations Bill added section 4(h)(10)(D) to the Northwest Power Planning and Conservation Act, directing the Power Council to appoint a Scientific Review Panel "to review projects proposed to be funded through that portion of Bonneville Power Administration's fish and wildlife budget that implements the Council's fish and wildlife program." And, ". . . in making its recommendations to BPA, the Council shall consider the impact of ocean conditions on fish and wildlife populations; and shall determine whether the projects employ cost effective measures to achieve program objectives." Consequently, projects funded under Bonneville's direct program will be reviewed and prioritized as part of the Planning Council initiative process.

FY 1998	FY 1999	FY 2000

Associated Project Costs

- Refine work with both the Corps and the Bureau to reach mutual agreement on which capital improvement projects need to be budgeted and scheduled, are cost effective and are of mutual benefit to provide system or site specific enhancements and efficiencies. These types of projects are in line with BPA's Strategic Business Objectives (SBOs) to keep the power system reliable, be the low cost provider, and operate in a more business-like manner

- Corps of Engineers (known projects to date):

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
FY 1998: Completed work on The Dalles, Units 15-22 Exciters Replacements. Completed work on Ice Harbor Unit 5 generator repair. Started work on Power System Reliability Improvements. Start work on Green Peter Rewinds. Assume funding responsibility for on-going John Day Rewind work. FY 1999: Complete work on Green Peter Rewinds. Complete work on John Day Rewinds. Continue work on the Power System Reliability Improvement. FY 2000: Continue work on Power System Reliability Improvement. All work is to increase the reliability and efficiency of the Federal Columbia River Power System.			
■ Bureau of Reclamation (known projects to date): FY 1998: Start work on Grand Coulee and Hungry Horse CO2 Replacements, Start Grand Coulee Third Powerhouse Station Service Transformer Replacement, Continue Grand Coulee Stator Replacements, Continue Grand Coulee Runner Replacements, Complete Minidoka Rebuild. FY 1999: Continue Grand Coulee Runner Replacements, Start Grand Coulee Transformer Replacements, Complete Grand Coulee Third Powerhouse Station Service Transformer Replacement, Complete Grand Coulee and Hungry Horse CO2 Replacements, Complete Grand Coulee Stator Replacements. FY 2000: Continue Grand Coulee Transformer Replacements. All work is to increase the efficiency and reliability of the Federal Columbia River Power System.			
Total, Associated Project Costs	28,400	56,000	79,300

Fish and Wildlife

- Although the regional prioritization process for projects to be recommended for funding in FY 2000 is not yet

(dollars in thousands)

FY 1998	FY 1999	FY 2000

complete, and is not expected to be completed until 1999, the following projects are candidates for capital funding. It is BPA's intention to proceed with design and construction of those projects from this list that are recommended for funding within the available budget. The costs indicated are preliminary estimates only and actual costs may be greater or lower than those estimates depending on final design and construction costs.

- 1. Andronmous fish supplementation facilties in the Yakima River Basin and Upper Snake River Basin include the following projects:
  -Hanford K-Basin Fall Chinook. The Hanford K-Basin fall chinook acclimation and Master Plan development in Hanford, Washington, which adjoins the Yakima River Basin, is for the development of a master plan to assess potential uses of non-adioactive cooling water intake settling ponds constructed for the now deactivated Hanford Nuclear K-Reactor. The settling ponds have potential as a facility for fishers enhancement and supplementation. The project also includes a fall chinook supplementation activity designed to enhance the adult return of fall chinook to the Hanford Reach of the Columbia River.
  -Wenatchee and Methow Rivers Coho Salmon. The Wenatchee and Methow Rivers coho salmon restoration in the Mid-Columbia River region of Washington, is for design and construction of acclimation and adult collection facilities.
  -Yakima River and Marion Drain Fall Chinook. The Yakima River fall chinook supplementation along the Yakima River near Yakima, Washington is for the design and construction of fish rearing, acclimation, and adult collection facilities on the lower Yakim River and Marion Drain irrigation return canal. These activities will occur near the cities of Yakima and Prosser, Washington.
  -Yakima River Coho Restoration. The purpose of this project is to determine the feasibility, design, and construction of acclimation sites in the Yakima River at various locations. This project may include

(dollars in thousands)

FY 1998	FY 1999	FY 2000

producing coho as part of the Yakima Indian Nation's salmon enhancement program. A long-range goal of the Yakima Indian Nation is to see the return of naturally spawning coho back to the Yakima River.
-Johnson Creek Summer Chinook. Johnson Creek summer chinook salmon restoration in South Fork Salmon Basin of Idaho is to develop, construct, and implement facilities for adult collection and holding, juvenile rearing, and acclimation.
-Spring Chinook Captive Broodstock for the Snake River. The Upper Snake River spring chinook captive broodstock program includes juvenile fish acclimation sites and adult collection facilities located within the Grande Ronde River Basin in Northeast Oregon and captive Broodstock hatchery rearinf facilties located at the Bonneville Dam site hatchery in Oregon and at the National Marine Fisheries Service research station, Manchester, Washington. Also included is the potential initiation of the Northeast Oregon Hatchery Master Plan. This project, as a measure in the Northwest Power Planning Council's (Council) Fish & Wildlife Program, would identify and develop artificial propagation facilities to protect and enhance salmon and steelhead native to the Imnaha, Grande Ronde and Walla Walla River Basins. The Master Plan is scheduled for submittal to the Council in April 1999 for review and approval. Following completion of a NEPA analysis by Bonneville in April 2000, final design could occur in the summer of 2000 and construction could be initiated in late FY 2000.

-Upper Snake River Spring Chinook Salmon Acclimation and Adult Collection. Upper Snake River spring chinook salmon captive Broodstock acclimation and adult collection facilities will be located on the Upper Grande Ronde River near La Grande, Oregon, on the Catherine Creek near Union, Oregon, and on the Lostine River near Enterprise, Oregon.
-Upper Snake River Spring Chinook Salmon

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Broodstock Rearing Facility. A Spring chinook salmon captive Broodstock rearing facility with be located both at Manchester, Washington and at Bonneville Dam hatchery, Oregon, for the purpose of rearing successive generations of juveniles to preserve the genetic integrity of Upper Snake river spring chinook salmon.

- 2. The Billy Shaw Reservoir resident fish substituion project on the Duck Valley Indian reservarion near Owyhee, Nevada. The purpose of this facility is for resident fish production as a substition for the loss anadronmous fish due to the construction and operation of the Federal Columbia River Power System. The facility involves the design and construction of a reservoir approximately 430 surface acres in size to rear various resident fish species.

- 3. The resident trout fish culture facility in Southeast Idaho or the Snake River Resident Fish Production Facility: This facility will ve located in Hagerman Valley, Idaho. The purpose of this facility is for resident fish production as a substition for the loss of anadromous fish due to the construction and operation of the Federal Columbia River Power System. This facility is intended to provide a supply of various species of trout for residents of the Duck Valley Indian Reservation, Nevada, and the Fort Hall Indian Reservation, Idaho. The facility involves the purchase of an existing hatchery facility and construction upgrades.
-Continue construction on the Yakima and Umatilla River hatcheries, and the Yakima Screens Facilities Phase II. Complete final design and initiate construction of the Nez Perce Hatchery, and initiate final design of the Bonneville Dam Fish Sampling Facility.
-Construct habitat improvement passage projects and small irrigation screening projects including development and enhancement of model watersheds.
-Continue implementation of high priority Endangered Species Act related projects, and

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
activities associated with the National Marine Fisheries Service Biological Opinion. -Continue acquisition and installation of pit tag monitors at federal dams in Snake and lower Columbia rivers.

Transmission Business Line - Capital

Mission Supporting Goals and Objectives

The Transmission Business Line provides for all additions, upgrades, and replacements to the Federal transmission system in the Pacific Northwest, allowing reliable service to be provided to Northwest industrial users and utility customers. The transmission system also allows for the sale and exchange of power to and from the region.

The system replacement plan is to replace high-risk, obsolete, and maintenance-intensive facilities and equipment and to reduce catastrophic equipment failure by: 1) replacing high voltage transformers and power circuit breakers which are at or near the end of their useful life; 2) replacing risky, outdated and obsolete control and communications equipment; and 3) replacing all other existing high-risk equipment and facilities affecting the safety and reliability of the transmission system. Such accomplishments would also be controlled and guided by BPA's Reliability Centered Replacement (RCR) criteria.

BPA's operational telecommunications system is being upgraded to include fiber optics. The existing analog microwave system is exceeding its capacity, is approaching the end of its useful life, is no longer manufactured, has limited spare parts, and does not easily support digital signals. Parts of Bonneville's radio frequencies, especially in the two gigahertz range, could be at risk of becoming unavailable for use due to potential spectrum auction legislation. There is a potential loss of additional frequencies in future Federal Communications Commission spectrum auctions. Moving to fiber optic technology removes these risks. Fiber optics will provide a reliable and flexible communications system to monitor, control, and operate the power system at almost 400 sites in BPA's service area. The fiber optic cables will be designed to meet BPA's long term operational needs. Excess fiber capacity, in some cases, will be leased until they are required for operational use and is expected to have a 5 to 6 year payback. BPA is committed to repaying the initial fiber optic investments as fiber revenues exceed fiber operating costs and FERC-approved transmission rate case commitments are met. Bonneville is not competing with private sector providers.

Funding Schedule
(Accrued Expenditures)

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Main Grid	10,200	21,000	20,800	-200	-1.0%

Projects Funded in Advance	1,800	25,000	25,000	0	0.0%
Total, Transmission Business Line - Capital	107,800	161,000	203,4000	+42,400	+26.3%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Main Grid

- Strategic objectives: Bonneville's strategic objectives for main grid projects is voltage support and to assure compliance with WSCC and BPA reliability standards. During this budgeting period, projects are planned that will provide voltage support to major load areas that are primarily west of the Cascade mountains. Minor reinforcements in the Portland OR/Seattle WA corridor are also planned.

- Major accomplishments FY 98: (1) Completed the Northwest Montana/North Idaho Support facility which maintains the level of reliable service to the area particularly during winter; (2)Completed SW Portland Area Support Facility which prevents overloads of both BPA and Portland General Electric Company transmission facilities which otherwise would violate the NESC as well as cause equipment damage; (3) Completed 115 kV shunt capacitor bank addition at Sand Creek that helps prevent winter blackouts to loads between the Bonners Ferry, Idaho to Libby, Montana area; (4) Continued planning to identify other system reactive needs to mitigate unacceptable low or high voltage problems and other system additions.

- Planned major accomplishments FY 99: (1) Complete design, material acquisition and construction of the 500 kV shunt capacitor addition at Keeler substation that helps prevent winter blackouts in the Portland, Oregon and surrounding areas; (2) Complete design, material acquisition and construction of shunt capacitor additions at Pearl and Troutdale substations that prevents unacceptable low voltages in their respective, immediate areas which otherwise could cause damage to various electrical and electronic equipment; (3) Complete design, material acquisition and construction of 230 kV shunt capacitor addition at Shelton substation to prevent winter blackouts to the Olympic Peninsula area; (4) Complete design, material acquisition and construction of 230 kV shunt capacitor

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
addition at Redmond substation to prevent unacceptable low voltages in the Bend/Redmond, Oregon areas; (5) Complete design, material acquisition and construction of 115 kV shunt capacitor addition at Junction City substation to prevent unacceptable low voltages in the Eugene, Oregon area; (6) Complete design, material acquisition and construction of 230 kV shunt capacitor addition at McNary substation to provide voltage support for Interie transfers; (7) Complete design, material acquisition and construction of 230 kV shunt capacitor at the Ashe substation to prevent unacceptable low voltages that would affect operation of the WNP#2 nuclear plant; (8) Complete planning studies to mitigate overloads on the underlying transmission system for an outage of the 500 kV Paul-River line during summer conditions; (9) Continue planning studies to identify other system reactive needs to mitigate unacceptable low or high voltage problems and other system additions.			
■ Planned major accomplishments FY 2000: (1) Completion of 500 kV shunt capacitor addition at Paul substation that would prevent winter blackouts to the Seattle, Washington area; (2) Completion of planning studies for the East Seattle Reinforcement project which involves a second 500 kV line between Echo Lake and Raver substations, which will be needed to maintain reliable service to the Seattle area loads during winter; (3) Continue planning studies to identify other system reactive needs to mitigate unacceptable low or high voltage problems and other system additions.			
Total Main Grid	10,200	21,000	20,800
Area & Customer Services			
■ Strategic Objectives: Area and Customer Service projects assure that BPA meets the reliability standards and the contractual obligations we have to our customers for serving load growth.			
■ Major accomplishments FY 98: (1) Completed			

(dollars in thousands)

FY 1998	FY 1999	FY 2000

construction of the Columbia Falls Transformer Addition, to integrate the full capacity of the upgraded generation at Hungry Horse Dam; (2) Completed construction for the Chehalis Transformer Support facility, which will maintain reliable service in the Chehalis, Washington area; (3) Completed preliminary engineering and environmental coverage for the Teton Area Reinforcement facility, needed to prevent low voltages in the Teton, Idaho, and Jackson, Wyoming area; (4) Completed design, material acquisition and started construction for The Dalles Area Support, needed to prevent line overloads and low voltages in The Dalles area; (5) Completed preliminary engineering and environmental coverage for Albany-Eugene line rebuild to increase transmission capacity and improve reliability in the Eugene area; (6) Continued preliminary engineering and design for miscellaneous facilities required to meet contractual obligations and maintain reliable service for the BPA service area.

- Planned major accomplishments FY 99: (1) Complete preliminary engineering, environmental coverage and begin design for the Southwestern Oregon Coast Reinforcement Project to maintain reliability in the Southwest Oregon area and to provide new load service for the Nucor project. The Southwestern Oregon Coast Reinforcement Project consists of constructing 74 miles of 500kV line and a new substation in SW Oregon. Additionally, a new 500 kV breaker and additional systems controls would be installed in the current BPA system. Direct obligations for the Southwestern Oregon Coast Reinforcement Project in this budget period is $3 million for FY 1999 and $10.8 million for FY 2000. There has been a concerted effort by the state of Oregon, local officials and others to site a steel arc furnace plant near Coos Bay, Oregon. The Nucor Corporation, a major steel company based in North Carolina has announced its desire to build a new steel plant in that area. Bonneville, Nucor and Pacificorp conducted an electrical system impact study relating to the siting of an arc furnace near Coos Bay. The study concluded that (a) the existing Bonneville high voltage electric

(dollars in thousands)

FY 1998	FY 1999	FY 2000

transmission system in the area does not have the capacity to serve this potential 130megawatt (mw) electric load, with a projected 225 mw instantaneous peak, and other anticipated load growth on the south coast of Oregon and (b) a 500 kilovolt (kV) electric transmission line (costing about $80 million) would be needed from Eugene, Oregon, to Coos Bay, Oregon. Accordingly, the State of Oregon has requested Bonneville to initiate environmental impact studies on the Southwestern Oregon Coast Reinforcement Project so that an expedited construction schedule for the steel plant can be met. The State of Oregon has also agreed to fund the initial studies and Environmental Impact statement, which Bonneville has subsequently undertaken. The Bonneville Administrator had indicated that Bonneville will not begin construction of this project until (a) Bonneville has in place a long-term contract for transmission services for the plant which includes appropriate stranded cost protection if the plant should be terminated; (b) an adequate up-front Nucor payment is agreed to which will prevent cost shifting to other Bonneville transmission customers under its open access transmission tariff, and (c) all environmental work has been satisfactorily completed. The Bonneville Administrator has also indicated that if Nucor decides not to build the steel mill, Bonneville will stop pre-proposal activities, and suspend the environmental process, but continue to study the reliability of the federal transmission system serving Oregon's South Coast. The FY 2000 Bonneville Budget includes funding for the Southwestern Oregon Coast Reinforcement Project in order to assure that the Administrator is able to initiate construction of the line and associated substation facilities and modifications if (a) such transmission service is requested (b) the Administrator determines Bonneville can proceed in a manner that avoids both cost shifting to other Bonneville transmission customers and increased Treasury repayment risk, (c) a project that complies with the Northwest Forest Plan and the Oregon Plan for Salmon and Watersheds is identified, (d) the projects not adversely affect the protection to

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Oregon's fish and wildlife provided by existing habitat conservation plans, and (e) complies with all Oregon state law and regulations. (2) Complete design, material acquisition, and construction for the Albany-Eugene line rebuild to increase transmission capacity and improve reliability in the Eugene area; (3) Complete design, material acquisition and construction for The Dalles Area Support to prevent unacceptably low voltages and line overloads in The Dalles Area; (4) Complete design, material acquisition, and construction for the Bonneville-The Dalles line reconductor to prevent line overloads in the Hood River area; and (5) Continue preliminary engineering and design for miscellaneous facilities required to meet contractual obligations and maintain reliable service for the BPA service area.

- Planned major accomplishments FY 2000: (1) Continue design and begin material acquisition and construction for reinforcements for the Southwestern Oregon Coast Project to maintain reliability in the Southwest Oregon Area and to provide new load service for the Nucor project; (2) Complete design, material acquisition and begin construction to replace the cable and upgrade support and maintain reliability for the San Juan area in NW Washington; (3) Complete design, material acquisition and begin construction on the Shelton-Kitsap line rebuild to double circuit to provide voltage stability and prevent transformer and line overloads in the Kitsap area; (4) Complete design and construction of the Custer-Intalco contractual obligations and provide reliability to the Snohomish, Washington area; and (5) Continue preliminary engineering and design for miscellaneous facilities required to meet contractual obligations and maintain reliable service for the BPA service area.

  Bonneville Power has received a formal request for expanded service from Whatcom County PUD under the PUD's open access transmission contract with Bonneville. If Bonneville should determine that this request requires construction of additional transmission facilities, Bonneville will fund this project within the FY 99 and FY 2000 budget through

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
reprogramming of other projects and Whatcom would pay the cost of their transmission service as specified in their transmission contract with Bonneville.			
Total Area & Customer Services	4,800	14,200	35,400

Upgrades & Additions

- Strategic objectives: Upgrades and additions include replacing older communications and controls with newer technology including fiber optics in order to maintain or enhance the capabilities of the transmission system. During this budget period, BPA will complete design, material acquisition, and construction of several fiber optics facilities, which will provide future bandwidth capacity that will allow high-speed data transfers and replace current microwave radios which are becoming technologically obsolete and nearing the end of their useful life. Direct obligations for fiber optics included in this budget period are $35,800 for FY1998, $15,700 for FY1999, and $37,400 for FY2000. The above costs also include enhancements to computer systems at the Dittmer and Munro Control Centers which result in significant efficiencies in the areas of system operations and Transmission scheduling, thereby also providing increased customer services.
- Major accomplishments FY 98: (1) Completed design, material acquisition and construction of 790 total miles of fiber optics lines including Ross-Malin, Bell-Covington, and Keeler-Alvey. These projects are part of the overall upgrade to the operational telecommunication system to provide a reliable and flexible communication system; (2) Completed installation of various interim components associated with the OASIS (Open Access Sametime Info System) and the Scheduling Computer Project (SCP) consistent with efforts to separate Transmission and Power scheduling functions; (3) Completed installations of the Dispatchers Training Facility-Phase 2 (RODS Clone) at Dittmer; (4) Completed implementation of

(dollars in thousands)

FY 1998	FY 1999	FY 2000

various Remedial Action Schemes (RAS) throughout the system which allows for utilizing built in capabilities of the transmission system without having to add major facilities; (5) Completed strategic location of special measuring equipment that will provide valuable real time information to be used for developing future RAS or system additions; (6) Completed various relay upgrades at key 500 kV and 230 kV stations that maintains reliability of the control and protection of key transmission lines; (7) Continued planning, design, material acquisition, and construction of various system additions and upgrades required to maintain a reliable system for the BPA service area.

- Planned major accomplishment FY 99: (1) Complete design, material acquisition, and construction of 130 miles of fiber optics on the Covington-Blaine line; (2) Complete design, material acquisition, and construction of the HVDC Master Controller at Celilo that provides a cost efficient, simplified scheduling interface for scheduling power transfers on the DC Interie; (3) Complete design, material acquisition, and construction of the single pole relay upgrades at Big Eddy and John Day 500 kV stations to provide more reliable protection of key 500 kV lines; (4) Complete design, material acquisition and construction of the Inter Control Center Communications Protocol (ICCP) at Dittmer that provides System Operations the ability to communicate with other major utilities that utilize the same protocol; (5) Complete design, acquisition, and construction of communication circuit modifications at Eastern Control Center (ECC) that results in high reliability of a major communications path for system operation needs; (6) Complete design, material acquisition and construction of other RAS schemes that helps maintain levels of reliability and defer major cost additions; (7) Complete design, material acquisition, and construction of moving the Subgrid dispatch functions from Dittmer to Munro Control Center to provide more reliable and efficient dispatching; (8) Continue installation of various intermint components associated with OASIS and SCP; (9) Completion of Phase 1 of COMPASS

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
(Coordinated Outage Management, Planning, and Scheduling System) which will enhance outage coordination functions; (10) Continue planning, design, material acquisition, and construction of various system additions and upgrades required to maintain a reliable system for the BPA service area.			
▪ Planned major accomplishments FY 2000: (1) Complete design, material acquisition, and construction of up to 725 miles of fiber optics; two of which are the Alvey-Dixonville and the Alvey-Bandon Loop lines. These projects are a continuation of the overall upgrade to the operational telecommunication system; (2) Completion of the RODS Front End upgrade at Dittmer which maintains and enhances the capability of receiving real time info from the field that is used for system operations and Transmission scheduling purposes; (3) Completion of efforts to separate Transmission from Power scheduling functions; (4) Continue planning, design, material acquisition, anc construction of various system additions and upgrades required to maintain a reliable system for the BPA service area.			
Total Upgrades and Additions	50,800	36,500	61,300

Replacements

- Strategic objectives: Replacements are based on assuring compliance with reliability and safety standards. Replacements are both electric and non-electric. Included within non-electric replacements are environmental cleanups and included within electric replacements are replacement of PCB contaminated capacitors.

- Non-Electric Replacements:
  Major accomplishments FY 98: (1) Completed design, material acquisition, and construction of the Dittmer Control Center office space addition which lowers costs by consolidating staff in one location at a lower office cost; (2) Completed replacement of fire damaged equipment at the Ross Complex

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Electrical Lab; (3) Completed replacement of the Celilo DC Converter Station backflow preventer controls; (4) Completed design and construction of the new switchyard surfacing at Columbia Substation to maintain safety; (5) Completed design and start construction for the emergency replacement of the Cold Creek drainage system at Ross Complex to prevent catastrophic failure; (6) Completed design and started construction to upgrade the control house at Eugene Substation to improve operation and efficiency; (7) Implemented Reliability-Centered Replacement (RCR) based upon new capital asset management criteria.

Planned major accomplishments FY 99: (1) Complete design, material acquisition, and construction of the permanent Cold Creek drainage replacement at Ross Complex; (2) Complete design, material acquisition and construction of the Ross Substation Emergency Scheduling Center building addition for mandated separation of TBL & PBL scheduling functions; (3) Complete various necessary non-electrical replacements based on RCR implementation.

Planned major accomplishments FY 2000: Complete various non-electric replacements as necessary.

- Electric Replacements (Transmission lines, Substations, System Protection, and System Controls replacements):

  All electrical replacements were accomplished to maintain a reliable electrical system at the least cost by strategically replacing critical items.

  Major accomplishments FY 1998: (1) Continued replacing deteriorating wood pole transmission line structures; (2) Completed construction on the major tower relocation caused by landslide in Satsop-Aberdeen #2 & #3 transmission line; (3) Completed construction on the structure relocation on Keeler-Tillamook #1 transmission line; (4)

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Completed replacement of one failed Celilo DC tranformer unit; (5) Completed construction for one converter transformer rebuild at Celilo; (6) Completed replacement of high-risk 500 kV breakers at Lower Monumental Substation; (7) Completed replacement of 230 kV power circuit breakers as Snohmish, Maple Valley, Vantage and Conkelley Substations; (8) Completed replacement of high-risk 500 kV breaker at Vantage Substation; (9) Started design and material acquisition for replacement of the fire damaged transformer units at Hot Springs substation; (10) Started design, material acquisition for replacement of failed transformer units at Sacajawea substation; (11) Completed design, material acquisition and construction for replacements of PCB contaminated capacitors at various locations; (12) Replace system protection and system control equipment, other substation and line facilities as needed to maintain reliability using RCR criteria. Such replacements include relays, annunciators, oscillographs, various types of communication related equipment and SCADA equipment.

Planned major accomplishments FY 99: All electric replacements are planned to maintain a reliable electrical system at the least cost by strategically replacing critical items. (1) Complete replacement of failed transformer unit at Sacajawea substation; (2) Complete replacement of fire damaged tranformer units at Hot Springs; (3) Complete 500 kV breaker replacement at Slatt substation; (4) Complete 500 kV breaker replacement at Ashe substation; (5) Complete replacements of PCB contaminated capacitors. (6) Replace system protection and system control equipment, other substation and line facilities as needed to maintain reliability using RCR criteria. Such replacements include relays, annunciators, oscillographs, various types of communication related equipment and SCADA equipment; (7) Continue replacing deteriorating wood pole transmission line structures.

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
Planned major accomplishments FY 2000: All electrical replacements are planned to maintain a reliable electrical system at the least cost by strategically replacing critical items. Projects Funded in Advance

This category includes those facilities and/or equipment where BPA retains ownership but which are funded by another entity, either in total in part through a cost-share agreement.

- Major accomplishments FY 98: (1) Continued design, material acquisition and began construction of the Southwest Portland Area Support facility. This facility will prevent overloads of the BPA and PGE facilities which would otherwise result in violation of the National Electric Safety Code and will eliminate equipment damage; (2) Completed design, material acquisition and begin construction for the Teton Area Reinforcement facility needed to prevent low voltages in the Teton, Idaho and Jackson, Wyoming area; (3) performed environmental cleanup and other work necessary for the sale of BPA facilities; (4) Complete other projects as requested by customers.

- Planned major accomplishments FY 99: (1) Complete design, material acquisition and construction of the Southwest Portland Area Support facility. This facility will prevent overloads of the BPA and PGE facilities which would otherwise result in violation of the National Electric Safety Code and will eliminate

Mission Supporting Goals and Objectives

The competitive market situation is driving the need for alternatives to the traditional approaches to developing conservation resources. BPA is transitioning from centralized, BPA funded programs to new customer driven approaches. BPA is participating with other regional entities to support market transformation activities and development of energy efficiency services while facilitating activities which meet the needs of our customers and create business opportunities for the private sector in the Pacific Northwest.

Capital Equipment/Capitalized Bond Premium

Mission Supporting Goals and Objectives

This activity provides for the acquisition of general and dedicated special purpose capital automatic data processing (ADP) equipment, development of capitalized ADP software, and acquisition of special-use capital furniture and equipment in support of BPA's strategic objectives. This budget category provides the BPA business lines with the ability to acquire general and dedicated special purpose capital automatic data processing (ADP) equipment. This activity also provides the ability for developing capitalized ADP software, and acquiring of special-use capital furniture and equipment for BPA to meet its strategic business objectives.

Bonneville incurs a bond premium whenever it repays a bond before the due date. When bonds are refinanced, the bond premiums incurred are capitalized. Historically, BPA generally has chosen to finance capitalized bond premiums with bonds issued to the U.S. Treasury, as was envisioned in the Federal Columbia River Transmission System Act of 1974.

OPERATING EXPENSES

Power Business Line - Operating Expense

Mission Supporting Goals and Objectives:

Production includes all BPA strategic resource planning and business development, short and long-term power purchases, wheeling, electric utility marketing of resources, generation and oversight costs, including the large thermal nuclear projects. These activities identify the Administrator's load obligations, plans and develops products and services to meet the needs of BPA customers, and acquire resources as needed. As a means of mitigating power market risk, Bonneville is a participant in the electricity futures market which was founded in March 1996 by the New York Mercantile Exchange.

Associated Projects provide funding for power related operation and maintenance costs; minor additions, improvements, and replacements; and liabilities of the U.S. Army Corps of Engineers and U.S. Bureau of Reclamation hydroelectric projects in the Pacific which serve many purposes. Both agencies are emphasizing efficient power production from existing facilities and improvement of the performance and availability of power units. BPA pays additional financing costs of the Federal Columbia River Power System facilities through its Interest Expense and Capital Transfer budget programs. BPA is responsible for the actual operations and maintenance expenditures incurred as part of the Lower Snake River Compensation Plan (LSRCP) hatcheries and repays Treasury accordingly. Bonneville is responsible for annual payments to the Confederated Tribes of the Colville Reservation for their claims concerning their contribution to the production of hydropower by the Grand Coulee Dam in accordance with the Settlement Agreement between the United States and the Tribes (April, 1994).

Fish and Wildlife expenses provide for the protection, enhancement and mitigation of Columbia River Basin fish and wildlife losses attributed to the development and operation of hydroelectric projects on the Columbia River and its tributaries. BPA discharges a major portion of its fish and wildlife responsibilities pursuant to Section 4(h) of the Northwest Power Act by funding projects and activities designed to be consistent with the Northwest Power Planning Council's (Planning Council) Fish and Wildlife Program. To satisfy its responsibilities under the Endangered Species Act, BPA implements measures in the biological opinions issued by the NMFS and the USFWS regarding the operations of the Federal Columbia River hydro system. The expenses associated with implementing the reasonable and prudent alternatives of the biological opinions that relate to BPA's direct fish and wildlife program are included in this budget projection. Additionally, these expense amounts reflect, and are consistent with, the fish and wildlife budget agreement announced by the Administration in October 1995 and the Memorandum of Agreement of September 1996 that calls for BPA to make available fish and wildlife funding of $252 million per year and operations estimated to result in lost revenues and purchased power costs of $88-$285 million per year for the period FY 1996 through FY 2001. The 1998 Biological Opinion for steelhead increased the range estimated to result in lost revenues and purchased power costs by an average of $16 million per year through FY 2001.

BPA's fish and wildlife expense funds are directed at activities that increase numbers of Columbia River Basin fish and wildlife resources including projects designed to improve habitat conditions for fish and wildlife, juvenile fish passage at mainstream dams, resource studies, monitoring and

54-291 99 - 89

evaluation, and facility operation and maintenance. The priority for project funding focuses first on implementing the reasonable and prudent alternatives contained in the NMFS and USFWS biological opinions, and second, on implementing the Planning Council's Fish and Wildlife Program.

The FY 1997 Energy and Water Appropriations Bill added section 4(h)(10)(D) to the Northwest Power Planning and Conservation Act, directing the Planning Council to appoint a Scientific Review Panel "to review projects proposed to be funded through that portion of Bonneville Power Administration's fish and wildlife budget that implements the Planning Council's fish and wildlife program." And, ". . . in making its recommendations to BPA, the Planning Council shall consider the impact of ocean conditions on fish and wildlife populations; and shall determine whether the projects employ cost effective measures to achieve program objectives." Consequently, projects funded under Bonneville's direct program will be reviewed and prioritized as part of the Planning Council initiative process.

The Northwest Power Act created the residential exchange program to extend the benefits of low-cost Federal power to the residential and small farm customers of investor-owned (IOU) and publicly-owned utilities. Due in part to concerns expressed during the 1996 rate case about BPA's expected reduction in Residential Exchange Program costs through June 30, 2001 (when exchange contracts expire), and thus a decrease in benefits to regional IOU and public agency program participants, the Energy and Water Development Appropriations Act, Public Law 104-46, established Residential Exchange costs at $145 million for fiscal year 1997. Conference report language encouraged BPA to reach settlement agreements with participants in order to "gradually phase out the Residential Exchange Program by October 1, 2001." The 1996 Comprehensive Regional Review also recommended that settlement discussions continue regarding the Residential Exchange Program. Settlement agreements have now been reached with all publicly-owned utilities that have participated in the exchange program and investor-owned utilities. Actual costs will differ pending finalization of a payment schedule.

The Northwest Power Act directs that expenses of the Planning Council, subject to certain limits based on forecasted BPA power sales, shall be included in BPA's annual budget to Congress. Funding for the Planning Council is provided by Bonneville and is recovered through Bonneville rates. Its major activities include the periodic preparation of a northwest Conservation and Electric Power Plan (a 20 year electric energy demand and resources forecast and energy conservation program) and a Columbia River Basin Fish and Wildlife Program of loss mitigation and resource enhancement actions.

Funding Schedule
(Accrued Expenditures)

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Production	1,114,400	1,080,000	1,083,100	+3,100	+0.3%
Associated Projects Costs.	187,700	175,300	176,700	+1,400	+0.8%

Planning Council	7,400	7,100	6,700	-400	-5.6%
Total, Power Services - Operating Expense	1,488,900	1,433,500	1,432,700	-800	-0.1%

Detailed Program Justification

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Production

- Short-Term Power Purchases/PNCA Interchange: Purchase power for resale, fish mitigation or for the efficient operation of the power system. Under terms of the Pacific Northwest Coordination Agreement (PNCA), make payments to other generating utilities for power received as interchange energy. Interchange energy is energy transferred between utilities either to supply all or a part of any deficiency between a utility's actual energy capability and its firm energy load carrying capability or to return such energy to the supplying utility.

- Power Scheduling/Marketing: Schedule and market electric energy to BPA customers and Pacific Northwest's interconnected utilities. Place major emphasis on scheduling and supporting implementation of intertie access policy and streamflow coordination with the water budget of the Fish and Wildlife Program.

- Trojan: Continued termination and decommissioning of BPA's 30 percent share of the Trojan Nuclear Plant.

- WNP-2: Continued to acquire full capability of WNP-2.

(dollars in thousands)

FY 1998	FY 1999	FY 2000

- WNP-1/WNP-3: Continued to fulfill contractual obligations for WNP-1 and WNP-3.

- Long-Term Power Purchases and Wheeling:
  FY 1998: Continue to acquire 100 percent of the Idaho Falls and Cowlitz Falls hydroelectric project output. Continue to acquire 100 percent of Wauna project output. Continued contract payments on four billing credit projects. The FY1998 cost level includes $159 million for costs awarded to Tenaska by arbitrators in July 1998 and paid directly from the U.S. Treasury's judgment fund in November 1998. Bonneville will fully reimburse the Treasury for the judgment funds used plus interest. In December 1998 Bonneville made its first reimbursement payment of $80.4 million to the Judgement Fund Branch. The remainder of the debt will be paid in three equal payments concluding in August 2001.
  FY 1999: Continue to acquire 100 percent of the Idaho Falls, Cowlitz Falls, Wauna and Wyoming Wind project output. Continue contract payments on four billing credit projects.
  FY 2000: Continue to acquire 100 percent of the Idaho Falls, Cowlitz Falls, and Wauna project output. Continue contract payments on four billing credit projects.

- Generation & Oversight:
  FY 1998: Continue to provide oversight of all contracts signed to date. Continued the environmental review and permitting of the Columbia Wind Farm Project. Started the National Environmental Policy Act (NEPA) process for the Fourmile Hill and Telephone Flat Geothermal Project. Continued to fund the Pacific Northwest Wind Resource Study and to co-fund the Regional Solar Monitoring Project. Provided oversight of large thermal generating plants from which BPA purchases capability. Coordinated operation of the Pacific Northwest and Canadian Power Systems. Provided litigation and legal services covering existing and prospective financing arrangements involving the nuclear generating projects; Columbia River Treaty, non-Treaty and related resources

(dollars in thousands)

	FY 1998	FY 1999	FY 2000
issues. Includes major contract with the Department of Justice for the WNP-1 and WNP-3 cost sharing contracts signed to date. Issue Record of Decision for the Columbia Wind Farm Project. Continue the NEPA process for the Fourmile Hill and Telephone Flat Geothermal Project. Continue to fund the Pacific Northwest Wind Resource Study and to co-fund the Regional Solar Monitoring Project. Provide oversight of large thermal generating plants from which BPA purchases capability. Develop coordinated operation of the Pacific Northwest and Canadian Power Systems, investigate and analyze Canadian proposals for power export. FY2000: Continue to provide oversight of all contracts signed to date. Provide oversight of large thermal generating plants from which BPA purchases capability to insure that all BPA approval rights are protected; coordinate, communicate and administer agreements, issues and programs between BPA and the project owners.			
Total Production	1,114,400	1,080,000	1,083,100
Associated Project Costs			
■ Support FCRPS project costs and work to improve relationships to improve project support and better understand project costs. This helps to maintain FCRPS system integrity and the attainment of BPA's strategic business objectives.			
■ Bureau of Reclamation: FY 1998: Direct funding for O&M Power activities began. FY1999: Continue direct funding the Bureau for O&M Power activities. FY2000: Continue direct funding for O&M Power activities.			
Total Associated Project Costs	187,700	175,300	176,700

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Fish and Wildlife

In a manner consistent with the Fish and Wildlife Budget Memorandum of Agreement of October 1996:

- Anadromous Fish: Continue implementing projects which support Endangered Species Act listed species and other measures called for under the NMFS BO. Continue to fund and implement Northwest Power Act responsibilities and Planning Council's Fish and Wildlife program based on measures installed in FY 1996 and before. Continue to implement and develop downstream migration, disease and predator control programs, artificial production methods, and habitat improvement activities. These activities have been selected in response to the Pacific Northwest Electric Power Planning and Conservation Act (Power Act) to "protect, mitigate and enhance fish and wildlife including related spawning grounds and habitat on the Columbia River and its tributaries".

- Resident Fish: Continue to study the effects of reservoir operation on the resident fish population. Continue efforts for in-stream flow studies, stock status studies, habitat improvement and monitoring evaluation studies, and white sturgeon habitat requirements consistent with Endangered Species Act requirements. Continue activities associated with species under review for possible listing as threatened or endangered under the Endangered Species Act. Continued efforts conducted in FY 1997 and prior. These activities have been selected in response to the Pacific Northwest Electric Power Planning and Conservation Act (Power Act) to "protect, mitigate and enhance fish and wildlife including related spawning grounds and habitat on the Columbia River and its tributaries".

- Continue mitigation in resident fish for anadromous losses (substitution), mitigation for reservoir operation impacts to resident fish, and continue to refine, quantify, and delineate the difference between the two.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Wildlife: Continue the FY 1996 program including funding for wildlife actions resulting from Planning Council Fish and Wildlife Program amendments for wildlife mitigation. These activities have been selected in response to the Pacific Northwest Electric Power Planning and Conservation Act (Power Act) to "protect, mitigate and enhance fish and wildlife including related spawning grounds and habitat on the Columbia River and its tributaries".			
Total Fish and Wildlife	104,900	110,000	105,000
Residential Exchange			
Fiscal Years 1998, 1999 and 2000 include contract settlement agreement costs consistent with Congressional intent to phase out the Residential Exchange Program and the net cost of the remaining utility that has not yet settled. Settlement agreement costs will differ when a final payment schedule is determined.			
Total Residential Exchange	74,500	61,100	61,200
Planning Council			
Total Power Services	7,400	7,100	6,700

Transmission Business Line - Expense

Mission Supporting Goals and Objectives

This activity provides for the transmission system services of engineering, operations and maintenance for BPA's electric transmission system of 15,000 circuit miles (24,135 circuit kilometers) of lines, 360 substations, and associated power system control and communication facilities with an invested cost of more than $4.8 billion. Primary strategies of this program are: 1) maintain the safety and reliability of the transmission system; 2) increase the focus on customers; 3) optimize the transmission system; and 4) improve BPA s competitive position.

Funding Schedule
(Accrued Expenditures)

(dollars in thousands)

	FY 1998	FY 1999	FY 2000	$ Change	% Change
Engineering	22,500	24,900	25,100	+200	+0.8%
Operations	45,800	64,900	65,700	+800	+1.2%
Maintenance	116,000	115,500	113,600	-1,900	-1.6%
Total, Transmission Business Line - Operating Expense	184,300	205,300	204,400	-900	-0.4%

Detailed Program Justification:

(dollars in thousands)

FY 1998	FY 1999	FY 2000

Engineering

- Continue efforts to identify best methods for improving system reliability and maintenance practices.
- Continue cost reduction efforts by identifying opportunities for low cost reinforcement & voltage support of the existing transmission system.

- R&D: Conduct in-house transmission system research and development, including (1) studies on reliability, HVDC (high voltage direct current) and HVAC (high voltage alternating current) outage reduction, (2) methods to update existing facilities and reduce maintenance costs including reliability-centered monitoring and recording methods for analysis.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
■ Technical Support: Provide technical support activities, such as transmission system planning and studies to optimize portions of the system.			
■ Capital-to-Expense Adjustments: Annually, BPA analyzes its outstanding capital work orders to assess whether they should be expensed.			
■ Reimbursable Transactions: BPA enters into written agreements with Federal and non-Federal entities that have work or services to be performed by BPA staff at the expense of the benefiting utilities. The projects must be beneficial, under the one-utility concept, to BPA operations and to the Federal or non-Federal entity involved. Additionally, these activities contribute to more efficient or reliable construction of the Federal transmission system or otherwise enhance electric service to the region.			
■ Leased Facilities: BPA leases delivery facilities and voltage support facilities to support the transmission system instead of building or purchasing new assets			
Total Engineering	22,500	24,900	25,100

Operations

- FY 1998: Continue to operate within parameters of regional transmission authorities. Prepare for increased complexity of outage scheduling, transmission scheduling, and dispatching in response to customer demand and increased competition between customers. FY 1999: Continue to operate within parameters of regional transmission authorities. Prepare for increased complexity of outage scheduling, transmission scheduling, and dispatching as well as impact of an expected high attrition rate

(dollars in thousands)

FY 1998	FY 1999	FY 2000

of skilled operations workforce by recruiting and training apprentices and system schedulers. Develop and implement Business system & tools. Implement Year 2000 changes in system control & general computer system software. FY 2000: Continue to operate within parameters of regional transmission authorities. Prepare for increased complexity of outage scheduling, transmission scheduling, and dispatching as well as impact of an expected high attrition rate of skilled Operation dispatching workforce by recruiting and training apprentices & skilled replacements. Continue development and implementation of Business systems & tools.

- Substation Operations: Perform operations functions necessary to provide electric service to customers and to protect the Government's investment in electric equipment. Includes equipment adjustments, switching lines and equipment during emergencies or maintenance, isolating damaged equipment, restoring service to customers, and inspecting equipment, reading meters, etc.

- Power System Control & Dispatching: Includes central dispatching, control, and monitoring of the electric operation of the Federal transmission system. Also includes load, frequency, and voltage control of Federal generating plants; and operation of the system control and data computers at Dittmer and Munro Control Centers.

- Operations Standards & Engineering: Includes analyzing system loads, voltage levels, outage information, stability levels and other data, and making policy recommendations for system operations and related affairs. Provides for development of control center requirements for centralized automation of substations and generation, and BPA participation with other utilities in developing utility operating standards

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
and guides.			
■ Marketing, Sales, & Services: Provides management and direction of Transmission Rates, provides business strategy in marketing of transmission and ancillary products and services of the Transmission Business Line.			
■ Transmission Scheduling: Provides open access to the Federal Transmission System consistent with transmission tariffs approved by FERC. Schedule and market transmission capacity to BPA customers, California ISO and Pacific Northwest's interconnected utilities. Manages the reservations and scheduling of all transmission services associated with the transmission tariffs.			
Total Operations	45,800	64,900	65,700

Maintenance:

(dollars in thousands)

FY 1998	FY 1999	FY 2000

- In all aspects of maintenance, Bonneville is shifting to the implementation of reliability-centered maintenance practices. This change is focused on improving system reliability and significantly reducing maintenance costs.
  FY 1998: Continued efforts to achieve the System Average Interruption Frequency Index (SAIFI) target of 4 or fewer automatic interruptions at 94 percent of BPA points of delivery (PODs) and the System Average Interruption Duration Index (SAIDI) target of 150 minutes or less of automatic interruptions at 94 percent of PODs. Implemented RCM practices in all of BPA's 7 O&M Regions. Continued to clarify maintenance geographic boundaries to better assure reponsive customer support. Continued high levels of vegetation management.
  FY 1999: Continue to refinc RCM practices at all of BPA's 7 O&M regions. Continue to improve performance to meet SAIFI and SAIDI targets as explained above. Incorporate maintenance of fiber optics cable with existing workload. Prepare for the impact of an expected high attrition rate of BPA's skilled maintenance workforce by recruiting apprentices and technical replacements for critical minimum crew size workload positions. Increase outage scheduling planning to increase customer satisfaction.

  Continue high levels of vegetation management.
  FY 2000: Continue to refine RCM practices at all of BPA's O&M regions. Continue to improve performance to meet SAIFI and SAIDI targets as explained above. Prepare for the impact of an expected high attrition rate among BPA's aging workforce by recruiting apprentices and replacements for critical minimum crew size workload positions. Increase outage scheduling planning to increase customer satisfaction. Continue high levels of vegetation management.

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000

- Transmission Line Maintenance: Maintain and repair nearly 24,135 km (15,000 circuit miles) of high voltage transmission lines, of which over 6,436 km (4,000 circuit miles) are 500-kV transmission EHV (extra-high voltage), which is two and one-half times more labor-intensive than lower transmission voltages, although more efficient in transmission of power. This responsibility includes maintaining transmission rights of way to ensure system reliability, safety and environmental compliance.

- Substation Maintenance: Provides for service and repair of the transmission system power equipment located at more than 360 work sites annually.

- System Protection Maintenance: Provides for the maintenance of relaying and metering equipment used to control and protect the electrical transmission system and to meter energy transfers for the purpose of revenue billing. Additionally, field engineering services provide technical advice and assure the correct operation of power system relaying and special control systems used to support interregional energy transmission capabilities.

- Power System Control Maintenance: Provides for the testing, repair, and field engineering support of BPA's highly complex equipment, communications and control systems, including seven major microwave systems and other critical communications and control systems that support the power system.

- Non-Electric Plant Maintenance: Provides for the maintenance of BPA's non-electric facilities. Includes site, building, and building utility maintenance; custodial services; station utility; and other maintenance service activities on BPA-owned or BPA-leased non-electric

	(dollars in thousands)		
	FY 1998	FY 1999	FY 2000
facilities.			
■ Maintenance Standards & Engineering: Provides for establishing, monitoring, and updating system maintenance standards, policies, and procedures; and for the review and update of long-range plans for maintenance of the electric power transmission system.			
Total Maintenance	116,000	115,500	113,600

Conservation and Energy Efficiency Services- Operating Expense

Mission Supporting Goals and Objectives

The competitive market situation is driving the need for alternatives to the traditional approaches to developing conservation resources. BPA is transitioning from centralized BPA funded programs to new customer driven approaches. BPA is participating with other regional entities to support market transformation and development activities while facilitating activities which meet the needs of our customers and create business opportunities for the private sector in the Pacific Northwest.

INTEREST EXPENSE
&
CAPITAL TRANSFERS

Interest, Pension and Post-retirement Benefits Operating Expense

Mission Supporting Goals and Objectives

Interest expense provides for the payment of interest due on Federal Columbia River Power System (FCRPS) debt. This consists of capital investment in FCRPS hydroelectric generating and transmission facilities of BPA, the Corps of Engineers and the Bureau of Reclamation. Investments were financed by Congressional appropriations and BPA borrowings from the U.S. Treasury. BPA repays FCRPS debt through its power sales and transmission services revenues.

Since receiving Treasury borrowing authority in 1974 under the Transmission System Act, all BPA borrowings have been at market rates. As of October 1, 1996, all of BPA's repayment obligations on FCRPS appropriated investment (Corps and Bureau FCRPS investment and BPA investment financed with appropriations prior to the Transmission System Act) which were unpaid as of September 30, 1996, were restructured and assigned new current-market interest rates. The Bonneville Appropriations Refinancing Act of 1996 (Act) called for resetting (reducing) the unpaid principal of FCRPS appropriations and reassigning (increasing) interest rates. New principal amounts were established as of the beginning of FY 1997, at the present value of the principal and annual interest payments BPA would make to the U.S. Treasury for these obligations in the absence of the legislation, plus $100 million. The new principal amounts are then assigned new interest rates based on the Treasury yield curve rates prevailing at the end of FY 1996. BPA's outstanding repayment obligations on appropriations at the end of FY 1996 were $6.7 billion with a weighted average interest rate of 3.4 percent. The refinancing reduced the principal amount to $4.1 billion with a weighted average interest rate of 7.1 percent. Implementation of the refinancing took place in 1997, after audited actual financial data was available. As called for in the legislation, BPA submitted its calculations and interest rate assignments implementing the Act to Treasury for their review and approval. Treasury approved the implementation calculations in July 1997.

The Act also calls for all future FCRPS appropriations to be assigned prevailing Treasury yield curve interest rates.

Interest estimates are a direct function of costs of Treasury borrowing to BPA, repayment status of outstanding FCRPS investments, and projected additions to FCRPS plant in service. The interest cost estimates below include the impact of BPA's appropriation refinancing legislation.

Pension and Post-retirement Benefits assumes that the Bonneville will continue in FY 2000 to prospectively cover the full unfunded liability that will accrue in fiscal years after FY 1997 of the Civil Service Retirement and Disability Fund (Disability Fund), the Employees Health Benefits Fund (Health Fund) and the Employees Life Insurance Fund (Insurance Fund) that it has not covered prior to FY 1998. The unfunded liability is the difference in the current cost of paying

current Federal Columbia River Power System(FCRPS) employees retirement benefits and the sum of (1) seven percent withheld from current employees salaries and (2) an additional seven percent of wages that the FCRPS must already contribute into the Disability Fund each year. This FY 2000 Budget is consistent with the FY 1999 Budget which assumed the entire Bonneville CSRS cost recovery will be phased in over a ten-year period of time given that wholesale power and transmission rates for Bonneville are contractually frozen until the end of FY 2001 in order to meet competitive market pressures. The following amounts are assumed to be recovered by Bonneville: $2.2 million in FY 1998; $4.1 million in FY 1999; $ 6.0 million in FY 2000; $8.0 million in FY 2001; $55.2 million in FY 2002, $35.1 million in FY 2003 and $30.9 in FY 2004. A portion of these costs may be capitalized after further analysis is completed. FY 1998 through FY 2001 amounts are assumed to come from additional Bonneville expense cost reductions. After FY 2002, recovery is assumed to come from new revenues.

Cost estimates include Bonneville and the power related portion of Corps of Engineers, Bureau of Reclamation, and the United States Fish & Wildlife Pension and Post-retirement Benefits. These estimates are subject to further revision following further review. The Administration has determined that no additional legal authority is required for the Bonneville Power Administration to recover these expenses after FY 1997 and to deposit such recovery in the Miscellaneous Receipts of the U.S. Treasury.

Capital Transfers

Mission Supporting Goals and Objectives

This activity conveys funds to the U.S. Treasury for repayment of certain Federal Columbia River Power System costs not included in the Associated Project Costs budget. Since capital transfers are cash transactions they are not considered budget obligations.

1/ The Power Business Line includes Fish & Wildlife, Residential Exchange, Planning Council, and Associated Project Costs which have been shown separately for display purposes.

2/ BPA's FY 2000 budget has been prepared in accordance with the Budget Enforcement Act (BEA) of 1990. Under this Act all BPA budget estimates are treated as mandatory and are not subject to the discretionary caps included in the BEA. These estimates support activities which are legally separate from discretionary activities and accounts. Thus, any changes to BPA estimates cannot be used to affect any other budget categories which have their own legal dollar caps.

3/ Pension and Post-retirement Benefits assumes that the Bonneville CSRS cost recovery will be phased in over a ten-year period of time given that wholesale power and transmission rates for Bonneville are contractually frozen until the end of FY 2001. The FY 2000 Budget assumes that the following amounts will be recovered by Bonneville: $2.2 million in FY 1998; $4.1 million in FY 1999; $6.0 millionin FY 2000; $8.0 million in FY 2001; $55.2 million FY 2002; $35.1 in FY 2003; $30.9 in FY 2004. FY 1998 through FY 2001 amounts are assumed to come from additional Bonneville expense cost reductions. After FY 2001, recovery is assumed to come from new revenues.

4/ Revenues post FY 1998 include BPA accrued expenses, depreciation, net revenues,and 4(h) 10 (c) credits for the following amounts ; $14 million in FY1998 and $60 million annually for FYs 1999-2004. The FY1998 amount reflects accounting adjustments for prior year 4(h)10(c) credits (FYs 1995 - 1997).

1/ The Power Business Line includes Fish & Wildlife, Residential Exchange, Planning Council, and Associated Project Costs which have been shown separately for display purposes.

2/ Pension and Post-retirement Benefits assumes that the Bonneville CSRS cost recovery will be phased in over a ten-year period of time given that wholesale power and transmission rates for Bonneville are contractually frozen until the end of FY 2001. The FY 2000 Budget assumes that the following amounts will be recovered by Bonneville: $2.2 million in FY 1998; $4.1 million in FY 1999; $6.0 million in FY 2000; $8.0 million in FY 2001; $55.2 million FY 2002; $35.1 in FY 2003; $30.9 million in FY 2004. FY 1998 through FY 2001 amounts are assumed to come from additional Bonneville expense cost reductions. After FY 2001, recovery is assumed to come from new revenues.

3/ BPA's FY 2000 budget has been prepared in accordance with the Budget Enforcement Act (BEA) of 1990. Under this Act all BPA budget estimates are treated as mandatory and are not subject to the discretionary caps included in the BEA. These estimates support activities which are legally separate from discretionary activities and accounts. Thus, any changes to BPA estimates cannot be used to affect any other budget categories which have their own legal dollar caps. Because BPA operates within existing legislative authority, BPA is not subject to a Budget Enforcement "pay-as-you-go" test regarding its revision of funding estimates.

4/ Borrowing Authority to Finance Other Obligations represents the use of (positive), or building up of (negative), deferred borrowing. Deferred borrowing is created when Bonneville uses cash from revenues to liquidate capital obligations in lieu of borrowing. This creates the ability in future years to borrow money, when fiscally prudent, to liquidate revenue funded activities. The amount on this line, under the title "Borrowing Authority to Finance Other Obligations" represents the annual use, or creation of deferred borrowing. OMB has requested that Bonneville show this deferred borrowing as a resource carried forward from year-to-year in the manner displayed here. It is important to note that the borrowing authority amount on line 17 "Borrowing Authority to Finance Capital Obligations" is the amount which is tracked by the Congressional Committees.

1/ In any given year, BPA may issue less debt than forecast depending on net revenues, Treasury interests rates, and other cash management factors. In such cases, BPA accumulates a deferred borrowing balance that it accesses as necessary in the future. For the preparation of this budget, BPA minimizes its level of debt financing by assuming an optimal allocation of borrowing resources between the Transmission Act cap and the Power Act cap. In addition, BPA continues to seek a reduction in its level of debt financing through the following; a) further reduction in capital spending, b) revenue financing, and c) exploring the use of third-party financing, if feasible.

1/ In any given year, BPA may issue less debt than forecast depending on net revenues, Treasury interests rates, and other cash management factors. In such cases, BPA accumulates a deferred borrowing balance that it accesses as necessary in the future. For the preparation of this budget, BPA minimizes its level of debt financing by assuming an optimal allocation of borrowing resources between the Transmission Act cap and the Power Act cap. In addition, BPA continues to seek a reduction in its level of debt financing through the following; a) further reduction in capital spending, b) revenue financing, and c) exploring the use of third-party financing, if feasible.

1/ This interest cost is capitalized and included in Bonneville's Transmission System Development, System Replacements, and Associated Projects Capital programs. AFUDC is financed through the sale of bonds.

2/ Includes interest on construction funding for Corps of Engineers (Corps) fish bypass facilities at Corps dams in the Columbia River Basin, including Lower Monumental, Ice Harbor, and The Dalles dams, as called for in the Fish Spillway Memorandum of Agreement approved on April 10, 1989.

3/ Includes $7.4 million paid by Bureau to Treasury on behalf of Bonneville.

4/ Costs for Bureau of Reclamation power O&M is funded directly by Bonneville as follows (in millions) : $42 in FY1998, $53 in FY1999, $51 in FY2000, $52 in FY2001, $53 in FY2002, $54 in FY 2003, $55 in FY2004. Starting in FY 1999, costs for Corps of Engineers power O&M (including O&M expense and small capital investments) is funded directly by Bonneville as follows (in millions) : $106 in FY1999, $107 in FY2000, $108 in FY2001, $114 in FY2002,. $118 in FY2003, $118 in FY2004.

5/ Does not include Treasury bond premiums on refinanced Treasury bonds of which $48 million was incurred in FY1998.

Assumptions:
Expenditure Plan and River Operations equal display in BPA's FY 1999 Congressional Budget. Actual Expenditures for all expenses and capital investments reflect FY 1996/1997 actual results. For FY's 1997 through 2001, program expenses and capital investments are consistent with the Fish and Wildlife Budget Memorandum of Agreement for fiscal years 1996 - 2001. This funding stream shows the most likely accruals related to Obligations from the NWPPC prioritization process. Actual accruals may be more or less during a given year within the 6 year MOA period.

Notes:
1/ In addition, $27 million per year in capital funding (borrowing) will be provided by BPA for the Direct Program through 2001. The Interest and Amortization for this is reflected in the Expenditures Plan for the Capital Investment category.
2/ This information is reported on an accrual basis. For Direct Program management purposes, BPA also reports these expenditures on an obligations basis. Typically the accruals lag the obligations, since not all funds are expended in the year in which they are obligated.
3/ BPA's FY 1996 - 2001 Fish and Wildlife Program Expense Budget is $100 million per year. Actual expenses for FY 1996 - 1997 were approximately $50.9 million less than what was available. BPA, in accordance with the MOA, will carry forward this amount with interest.
4/ Includes interest at 5.1 percent for FY's 1998 - 2001. The actual interest rate is determined annually. The interest rate for FY 1997/1998 was determined to be slightly less than 5.1 percent.
5/ Estimated for FY 1996-1997, actual amount will change when the river models are executed.
6/ During the initial discussions when developing the MOA, the "96-01 Avg" was estimated to be about $435 million.
7/ These estimated costs are related to limitations placed on operating ranges (forebay levels and generator efficiency) and other operations for fish which produce effects on power production not identified in Hydro regulation models.
8/ No agreement has been reached at this time on BPA's Fish and Wildlife Budget for fiscal years beyond 2001. Negotiations within the Region are currently taking place for a Fish and Wildlife Agreement for the years beyond FY 2001. As of mid-July 1998, there are 13 alternatives being considered which have a range of annual average expenditures of $438 million to over $724 million. Estimates beyond FY 2001 are expected to be available upon conclusion of the current agreement negotiations.

3/ FY 1997-2003 Treasury balance and unobligated balance estimates assume that BPA will borrow the amount needed to finance the full capital program. Actual Treasury borrowing and cash balances will be different, depending on net revenues, Treasury interest rates, and other cash management factors. Borrowing could be higher such that cash balances at the end of each year could equal total reserves.

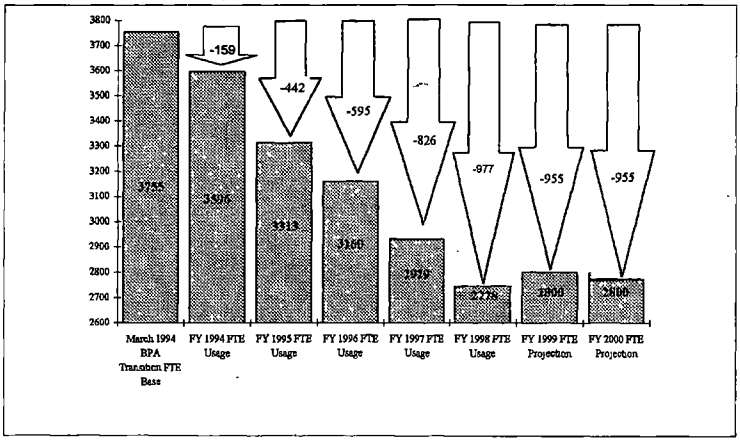
4/ The Permanent Authority: Authority to borrow (indefinite) amount for FYs 1997-2003 reflects both BPA's capital program financing needs and either the use of, or creation of, deferred borrowing. Deferred borrowing is created when, as a cash and debt management decision, BPA uses cash from revenues to liquidate capital obligations in lieu of borrowing, This temporary use of cash on hand instead of borrowed funds creates the ability in future years to borrow money, when fiscally prudent. Technical Executive Branch budget display and tracking requirements have modified the way BPA shows this deferred borrowing as a resource carried forward from year-to-year. This amount must

therefore be added to, or subtracted from, BPA's current year borrowing authority amount, making this number a combination of capital program financing needs and the annual use, or creation of deferred borrowing. The FY 1989 Energy and Water Development Appropriations Act (P.L. 100-371 of 7/19/88) clarified that BPA has authority to incur obligations in excess of borrowing authority and cash in the BPA FundThe two amounts which comprise the net amount on line 67.15 above are as follows:

	FISCAL YEAR						
Borrowing Authority:	**1998**	**1999**	**2000**	**2001**	**2002**	**2003**	**2004**
to finance capital obligations	232	258	352	339	300	299	250
to finance other obligations	(2)	(178)	(180)	(255)	(154)	(173)	(210)
Total Borrowing Authority (67.15)	**230**	**80**	**172**	**84**	**146**	**126**	**40**

5/ Includes amortization of BPA and Corps of Engineers appropriations and amortization of BPA bonds. Line 68.47 is referred to as capital transfers on BP-3.

BONNEVILLE FTE REDUCTION
(Revised December 21, 1998)



BPA's March 1994 baseline for FY 1994 was the number of filled positions (permanent and temporary, full and part-time, including student programs charged against FTE allocations) whose incumbents were actually on board and charging against BPA FTE. BPA identified this as baselines for both employment and FTE.

BPA has utilized the following number of Voluntary Separation Incentives (VSIs): 240 in FY 1994, 192 in FY 1995, 138 in FY 1996, 138 in FY 1997, 100 in FY 1998 and BPA estimates it may be able to use 100 - 130 VSIs in FY 1999.

BPA expects a small FTE increase in FYs 1999 and 2000 as part of it's succession planning efforts, but is planning further reductions over time. BPA has initiated an effort in 1999 to complete a comprehensive multi-year staffing plan for FY 2001 and beyond

DOE/CR-0066

DEPARTMENT OF ENERGY

ANNUAL PERFORMANCE PLAN for FY 2000

SECRETARY OF ENERGY
BILL RICHARDSON

Editor's Notes

This plan addresses three years' performance: status of FY 1998 Performance Agreement commitments, final edits to the FY 1999 performance measures and goals proposed with the FY 1999 budget, and proposed FY 2000 performance measures and goals within DOE's budget request for FY 2000 The significant changes to the FY 1999 performance measures and goals are indicated by striking out ~~text~~ to be removed and underlining text to be added with footnotes explaining the change.

DOE's Inspector General and the Power Marketing Administrations are included in this plan. However, the Federal Energy Regulatory Commission (FERC) has prepared separate GPRA documents and their resources but not performance measures are included in this plan

This plan was prepared by the Office of Policy, Office of Strategic Planning, Budget and Program Evaluation with input from all offices in DOE. The DOE point of contact for this document is Bill Kennedy, (202) 586-0423, bill.kennedy@hq.doe.gov.

This document is available on the World Wide Web as part of the Department's Strategic Management System found at: http://www doe.gov/policy/sms/sms.html

DEPARTMENT OF ENERGY

OVERVIEW

This Annual Performance Plan for the Department of Energy expands on the Clinton Administration's performance plan for FY 2000 and is an overview of the details contained in DOE's full budget submission for FY 2000 This plan is a product of the Department's Strategic Management System's process to make DOE more productive and accountable to the taxpayers.

Fiscal Year 2000 is the third year for which the Department has prepared a performance plan and the second performance plan required by the Government Performance and Results Act of 1993 ("Results Act") The FY 2000 plan was developed using our experience gained from

- developing and using Performance Agreements between the Secretary of Energy and the President since FY 1995,
- reporting the results of those Agreements and receiving "clean opinions" from our Inspector General for two consecutive years,
- developing the "Comprehensive National Energy Strategy" and "Accelerating Cleanup -- Paths to Closure" plan, and
- reviews by Congress and the General Accounting Office of our Results Act implementation

Our Annual Performance Plan includes the results of our commitments for FY 1998, establishes our final performance goals for FY 1999, and proposes performance goals for FY 2000 These are organized to support the "business lines" established by the Department's Strategic Plan Consistent organization and format of performance information clarifies the linkage of management documents from the Strategic Plan to the Annual Performance Plan, to the Secretary of Energy's Performance Agreement with the President, to the Department's annual report

The budget and management of the operations at the Department of Energy are performance-based and follow the business line format outlined in the Department's Strategic Plan This Performance Plan for FY 2000 identifies what the taxpayers will receive for the resources entrusted to the Department of Energy

The Mission of the Department of Energy is:

To foster a secure and reliable energy system that is environmentally and economically sustainable, to be a responsible steward of the Nation's nuclear weapons, to clean up our own facilities, and to support continued United States leadership in science and technology.

To implement this mission, the resources requested for FY 2000 are:

$17.8 Billion and 16,219 Full Time Equivalent staff.

INTRODUCTION

Results for Resources

Our government is becoming more accountable to the taxpayers through implementation of the Government Performance and Results Act of 1993 (the "Results Act") This law requires development of long range strategic plans, annual performance plans, and annual performance reports This document is the second annual performance plan prepared to meet law's requirements of: (1) establishing performance goals that include the level of performance to be achieved written in an objective, quantifiable, and measurable form; (2) briefly describing the resources required to meet those performance goals; (3) describing how performance will be measured and compared with the goals; and (4) describing the how the Department will verify and validate the measured results The President's Office of Management and Budget has issued guidance to agencies for preparing these plans but the format was up to the Departments.

A Clear Picture of Intended Performance

This Annual Performance Plan provides a clear picture of the Department's intended performance for FY 2000 by presenting fiscal year performance goals toward achieving the mission and goals of the Strategic Plan. The annual goals are improved, means and strategies for FY 2000 are more meaningful, and the links to the resources is simpler and clearer To provide context, the plan includes the revised final measures and goals for FY 1999 and the status of the commitments in the Secretary's FY 1998 Performance Agreement with the President.

Consistency with the Strategic Plan and Linkage to the Budget

To ensure consistency with our Strategic Plan, this Annual Performance Plan begins with our mission as stated in the Strategic Plan and follows the Strategic Plan's structure. It describes performance measures and goals for each long term objective of the business lines and corporate management.

We have also made some structural adjustments to improve the linkage between our performance measures and goals and the resource requests In order to show the links between this performance plan and the budget structure, a two-step process is necessary. First is a mapping from the "program activities" of the President's budget to our "decision units." Second is a matrix showing how each decision unit is supported by performance measures and goals. Both steps are presented as tables at the beginning of each business line discussion.

The following shows the relationship between the GPRA-specified contents and terminology of a strategic plan (SP) and annual performance plans (APP) and where they are found in either DOE's Strategic Plan, Annual Performance Plan, or both.

GPRA		At DOE
General Goals (SP)	↔	Business Line Goals (SP&APP)
General Objectives (SP)	↔	Business Line Objectives (SP&APP)
Strategies (SP)	↔	Long-term Strategies (SP&APP)
Performance Goals & Indicators (APP)	↔	Performance Measures & Goals, Commitments (APP)
Means & Strategies(APP)	↔	Means & Strategies (APP)

Organizational Adjustments

To improve linkage with the budget structure, we have presented performance measures and goals with their associated funding source as well as of showing them in the original Strategic Plan business line. This format allows us to be consistent with the budget, yet increase the focus on accountability. For example, the science and technology developmental work done by the Office of Energy Efficiency and Renewable Energy is described under the Energy Resources business line where it is funded, rather than in the Science and Technology business line. Similarly the electric utility restructuring and global climate change work being done by the Policy Office is described under Corporate Management because it is funded by the Departmental Administration account rather than with the Energy Resources business line These adjustments did not affect a significant number of items and all items are indicated in both where they were found in the Strategic Plan, the FY 1998 Performance Agreement, and the FY 1999 Performance Plan, as well as where they are in this Annual Performance Plan for FY 2000.

Adjustments to the Strategic Plan

The Government Performance and Results Act of 1993 allows adjustments to the strategic plan through annual performance plans In the year since the original strategic plan was published in September 1997, two significant strategic planning efforts have been completed In April 1998, the Department published the *Comprehensive National Energy Strategy*. DOE/S-0124 (CNES) Its development included consultation with stakeholders through public meetings and public comments The five "goals" of the resulting plan are different from the five "objectives" in the Strategic Plan's business line for Energy Resources Work continues on implementing the CNES, however, for this version of the Annual Performance Plan, the Strategic Plan's original objectives are used because we have not fully implemented the CNES plan into our strategic plan

The second significant strategic planning effort was the development of the environmental management plan. *Accelerating Cleanup Paths to Closure*, DOE/EM-0362 The development of this plan also involved stakeholders and the public The plan does not change the Strategic Plan but describes in more detail the costs, schedule, and strategies It does, however, effect the budget structure for FY 2000 in that the work has been organized into 353 projects to cleanup the 53 remaining sites *Accelerating Cleanup* is incorporated into this Plan

During the development of the FY 2000 budget, improvements were made to the performance measures and goals of the Strategic Plan based on our experiences with the CNES, the *Accelerating Cleanup* plan, and our experience in developing the performance measures and goals of the FY 1999 Performance Plan In addition, we have been evolving criteria for what performance measures should be included in the Department's performance plan based on our experience with the Performance Agreements between the Secretary and the President since FY 1995 We want performance measures and goals to be presidential, specific, quantified, meaningful, stretching, concise, written for taxpayers, covering, and auditable These criteria are discussed on page104

This annual performance plan contains the resultant set of measures & goals

Management Challenges

Each year, in accordance with the Federal Managers' Financial Integrity Act of 1982 (FMFIA), the Department has been identifying for the President, Congress, and ultimately the public, areas of vulnerability in the operations of Government, and, as a consequence, ensuring that appropriate attention is given to ameliorating problems that may affect wise expenditure of the taxpayer's money The FMFIA process identifies reportable problems and DOE's plans to address them For FY 1999 and FY 2000, we are incorporating those commitments into the performance measures and goals for the Department based on the evaluation done for FY 1998 The ten management challenges are included in their associated business line or corporate management area and are identified as FMFIA items

The Year 2000 Problem

The steps the Department is taking to address this problem are part of the fifth Corporate Management objective on page 99

Crosscutting Goals

The Department conducts continual dialogue and cooperation with other Federal and State agencies, and Native American nations, as well as U.S. industries and foreign governments This cooperation frequently identifies crosscutting or common goals for the Department and the other organizations In situations where our goals and objectives are accomplished through the work of others, we reduce or eliminate our efforts, thus avoiding duplication and saving taxpayer resources. Discussions of specific coordination for each objective are in the "means and strategies" section for the objective

Consultation

In the development of the Department's Strategic Plan, alternative long-term strategies were considered Through consultation with Congress, other agencies, and other stakeholder groups, many strategies were revised and improved, such that the strategies included in the final plan were those most likely to succeed The projected available resources, financial, human, capital, and technological, were considered in developing the goals and objectives. The financial and human resources requested in the budget are identified in the Annual Performance Plan with each goal and objective. However, in accordance with OMB guidance, the annual performance plan,

like the budget, contains pre-decisional information and was not released outside the Executive branch. Consultation with Congress is conducted through the Congressional review of the budget.

Following the submittal of the Performance Plan for FY 1999, several committee chairman wrote the Secretary providing their "grading" of the Department's plan. Those comments were taken into consideration in developing this FY 2000 plan. The Department recognizes that the preparation of this annual performance plan is an inherently governmental function. As such, drafting of the plan was done only by Federal employees and no non-Federal parties made any significant contribution

Addressing Weaknesses in the FY 1999 Plan

The major weaknesses in the FY 1999 plan were the poor linking of the proposed performance with the budget requested, the lack of FY 1999-specific strategies to accomplish the annual goals, and the thin discussion of crosscutting goals These areas have received special attention. Showing the connection from the budget to our performance goals has been improved by the addition of tables providing the linking the President's Program and Financing (P&F) accounts and program activities to DOE's decision units We have retained the tables showing the relationship of DOE's decision units to the Strategic Plan's objectives and the Annual Performance Plan's performance measures and goals. We have also added a new section following the performance measures and goals addressing the FY 2000-specific means and strategies for accomplishing the proposed FY 2000 performance goals Finally, how we are collaborating with other entities to accomplish joint performance goals is stated in the performance measures themselves or in the discussion of the means and strategies to accomplish them Other improvements have been made throughout the document to address other noted weaknesses.

Organization of this Plan

This plan's organization is based on Strategic Plan and it addresses DOE's performance for three years. The Strategic Plan presented a single goal for each of four major business lines and one goal for corporate management. Each of these five goals were supported by objectives that are, in turn, supported by long-term strategies While the goals and objectives chart a course for the next 5-10 years and the Strategic Plan's strategies were targeted for the next 3-5 years, this annual performance plan contains the performance measures and goals for the budget year, FY 2000. Performance measures and goals for the current year, FY 1999 and the status of results for the previous year, FY 1998, are provided for context

The discussion of each business line begins with the goal for a business line, overview charts addressing the general goal, and tables linking the President's budget to the resources applied to the objectives of that business line Next, each objective is presented followed by a listing of the long-term (strategic) strategies and three columns of performance information The columns are by fiscal year: FY 1998, FY 1999, and FY 2000 In the columns are titles derived from the long-term strategies followed by the associated performance measures and goals. Each measure is annotated with the responsible DOE office in parentheses A list of the office abbreviations is provided on page 105.

The FY 1998 results are described using status codes. The status codes are:

"FULLY SUCCESSFUL" for results evaluated as meeting or exceeding the target,
"SUCCESSFUL" for results effectively 80-100 percent of the target,
"PARTIALLY SUCCESSFUL" is used for results effectively in the range of 50-80 percent of target;
and "UNSUCCESSFUL" was used for results effectively less than 50 percent of the target

Where performance was less than SUCCESSFUL, a brief explanation is provided The full discussion of the FY 1998 results will be found in the Department's Accountability Report to be published March 1, 1999.

Following the columns is a discussion of the means and strategies that DOE will use to achieve the FY 2000 performance goals This discussion includes any significant overlap with other organization's performance goals, i e., other government agencies involved in achieving the specified goals.

It should also be noted that this performance plan is only an overview. The comprehensive set of performance measures and performance goals are set forth in the Department's full performance-based budget.

Finally, performance planning is still evolving at the Department of Energy. Each cycle the Department becomes more effective in designing and refining performance measures and goals that are used to manage operations at the Department of Energy.

The following table presents the business line goal statements and requested resources for FY 2000.

Business Line Goals	FY 2000 Budget Request (in millions)	(in FTE)
Energy Resources: The Department of Energy and its partners promote secure, competitive, and environmentally responsible energy systems that serve the needs of the public (FE, EE, NE, PMAs, EIA, & FERC)	$ 2,095	7,575
National Security: Support national security, promote international nuclear safety, and reduce the global danger from weapons of mass destruction (DP, NN, IN, CN, MD, WT, NR)	$ 6,228	2,508
Environmental Quality: Aggressively clean up the environmental legacy of nuclear weapons and civilian nuclear research and development programs, minimize future waste generation, safely manage nuclear materials, and permanently dispose of the Nation's radioactive wastes. (EM, RW, & EH)	$ 6,452	3,232
Science and Technology: Deliver the scientific understanding and technological innovations that are critical to the success of DOE's mission and the Nation's science base (SC)	$ 2,844	424
Corporate Management: The Department of Energy continuously demonstrates organizational excellence in its environment, safety and health practices, communication and trust efforts, and its corporate management systems and approaches (All programs participate in the Corporate Management area The funds and FTEs shown for Corporate Management are those of the Departmental Administration account with FERC receipts) (CFO, CI, GC, ED, FM, GC, HG, MA, IG, PA, PO, PC, & SI)	$ 223	2,480

ENERGY RESOURCES

GOAL: The Department of Energy and its partners promote secure, competitive, and environmentally responsible energy systems that serve the needs of the public.

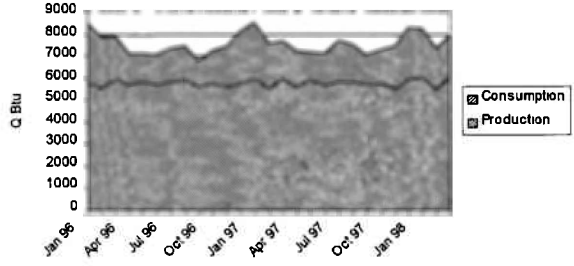

Figure 3: Energy Production & Consumption

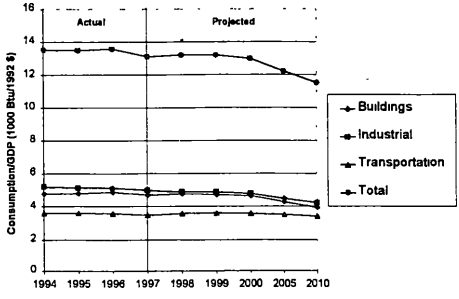

Figure 4. The Costs of Energy by Sector

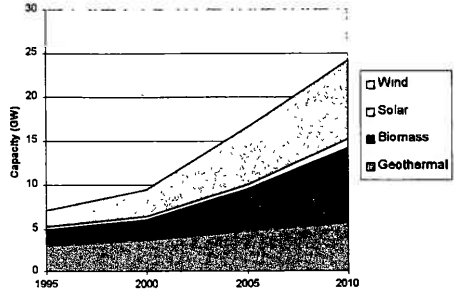

Figure 5: Renewable Energy Capacity

The following table maps the Presidential Budget's Program and Financing (P&F) accounts and program activities to the Department of Energy's offices and decision units The alignment includes aggregation, disaggregation, and consolidation. The table that follows this one maps DOE decision units to the business line objectives where performance measures and goals are identified.

Presidential Budget Program and Financing (P&F) Accounts and Program Activities	***FY 2000 Budget Request ($M)***	***DOE Office***	***DOE Decision Units***
270 Energy Supply			
Solar and renewable energy	$399	EE	Solar & Renewable Energy
Nuclear research & development	$269	NE	Nuclear Energy
Fossil Energy Research and Development	$375	FE	Fossil Energy Programs
Naval Petroleum and Oil Shale Reserves	$0	FE	Naval Petroleum & Oil Reserves
Energy Conservation			
Building technology, State and community programs--non-grant	$145	EE	Building technology, State and community programs--non-grant
Building technology, State and community programs--grant	$191	EE	Building technology, State and community programs--grant
Federal energy management program	$32	EE	Federal Energy Management Program
Industrial sector	$171	EE	Industrial Sector
Transportation sector	$252	EE	Transportation Sector
Policy and management	$47	EE	Policy and management
Strategic Petroleum Reserve	$159	FE	SPR Facilities Development
SPR Petroleum Account	$5	FE	SPR Petroleum Account
Energy Information Administration	$73	EIA	Energy Information Administration
Clean Coal Technology	--$246	FE	Clean Coal Technology
Elk Hills School Lands Fund	$36	FE	Elk Hills School Lands Fund
Power Marketing Administrations	$319	PMA	Power Marketing Administrations
Departmental Administration [1]	$21	PO	Policy and International Affairs

[1] Only a portion of Departmental Administration resources are applied to the Energy Resources Business Line

The following table indicates which budget program/decision units support which of the business line objectives Resources, in both funds and Full Time Equivalent staff (FTEs), are shown. FTE estimates are for the overall program offices. The funds shown are program totals from DOE's budget request.

DOE Office	DOE Program/ Decision Units	FY 2000 Budget Request ($M)	FTEs	ER-1 Energy Security	ER-2 Competitive Industry	ER-3 Efficiency & Productivity	ER-4 Global Markets	ER-5 Informed Policy
EE	Solar & Renewable Energy	$399	526	X	X	X	X	X

[2] Only a portion of the Policy Office's resources are applied to the Energy Resources Business Line

ER-1 Reduce the vulnerability of the U.S. economy to disruptions in energy supplies. (FE, EE, PMAs)

Long-term Strategies: Over the next several years, the Department will (1) support research and development, policies, and improved regulatory practices capable of ending the decline in domestic oil production before 2005, (2) maintain an effective Strategic Petroleum Reserve (SPR) to deter and respond to oil supply disruptions, and act cooperatively with member nations of the International Energy Agency; (3) diversify the international supply of oil and gas, (4) develop alternative transportation fuels and more efficient vehicles that can reduce year 2010 projected oil (crude plus refined products) imports of 12 million barrels per day by 10 percent; (5) maximize the productivity of Federal oil fields, consistent with Congressional legislation, and (6) take measures to avoid, but when needed, respond to domestic energy disruptions

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals (Initial)
ER1-1 BOOSTING THE NATION'S PRODUCTION OF DOMESTIC OIL • *Demonstrating advanced production enhancement technologies for shallow-shelf carbonate reservoirs, adding 27 million barrels of reserves (FE)* (FULLY SUCCESSFUL)[3] • *Developing and transferring to industry six new technologies to characterize the heterogeneity in naturally fractured reservoirs. (FE)* (FULLY SUCCESSFUL) • *Completing work in four States, giving them the capability to establish variances for oil and gas injection wells in areas of low environmental risk, and implementing risk-based data management systems for improved regulatory decision- making in ten States, towards overall program objective of reducing cumulative industry compliance costs by $16 billion by 2010 (FE)* (FULLY SUCCESSFUL)	**ER1-1 BOOSTING THE NATION'S PRODUCTION OF DOMESTIC OIL** • *Demonstrate four advanced production enhancement technologies that could ultimately add 190 million barrels of domestic reserves, including 30 million barrels during FY 1999. (FE)* • *Complete an online environmental compliance expert system, developed in cooperation with States, that will improve oil and gas production economics by giving producers on-line access to Federal and State rules and regulations and allowing them to conduct environmental permitting and reporting over the Internet, reducing time and costs related to environmental compliance (FE)*	**ER1-1 BOOSTING THE NATION'S PRODUCTION OF DOMESTIC OIL** • *Completing demonstration and transfer of seven advanced secondary and tertiary technologies, adding 92 million barrels of reserves, increasing the number of economic wells and reducing abandonment rates. (FE)* • *Completing field testing and monitoring of two technologies for downhole separation for oil and water, resulting in reduction in produced water and potential increase in oil production per well. (FE)*

[3] End-of-year results of FY 1998 Performance Agreement commitments are classified as "FULLY SUCCESSFUL", "SUCCESSFUL", "PARTIALLY SUCCESSFUL", or "UNSUCCESSFUL" for performance judged to be effectively 100% or better, 80-100%, 50-80%, or less than 50% respectively

ER-1 Reduce the vulnerability of the U.S. economy to disruptions in energy supplies. (FE, EE, PMAs) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER1-2 MAINTAINING AN EFFECTIVE STRATEGIC PETROLEUM RESERVE • *Degassing 11 million barrels of additional oil inventory to complete the degasification effort at a total of 169 million barrels, thus increasing oil availability for drawdown to the total SPR inventory amount (FE)* (FULLY SUCCESSFUL) • *Performing an annual assessment of commercial systems' capability to distribute SPR crude into the marketplace, defined as 120 percent of SPR drawdown rate capability. (FE)* (FULLY SUCCESSFUL) • *Initiating an additional 17 percent of the infrastructure life extension program to maintain SPR systems' reliability, bringing implementation to 93 percent. (FE)* (FULLY SUCCESSFUL)	**ER1-2 MAINTAINING AN EFFECTIVE STRATEGIC PETROLEUM RESERVE** • *Initiate additional SPR infrastructure Life Extension Program projects, thereby bringing program implementation to approximately 96 percent of the $328 million program Program completion in FY 2000 will increase sustained drawdown capability to 4 1 million barrels per day compared to 3.7 in FY 1997 (FE)*	**ER1-2 MAINTAINING AN EFFECTIVE STRATEGIC PETROLEUM RESERVE** • *Complete the Life Extension Program to ensure the long-term reliability, effectiveness, and operational readiness of SPR facilities and systems (FE)* • *Ensuring achievement of a calculated site availability of 95% or greater with drawdown capability of 4 1 million barrels per day for a sustained 90 day period within 15 days notice by the President (FE)*
ER1-3 DIVERSIFYING THE INTERNATIONAL SUPPLY OF OIL AND GAS • *Continuing DOE leadership in international energy initiatives that are instrumental in developing, through government-to-government efforts, an effective legal and regulatory framework for private sector energy investment and policies to encourage development of a broad portfolio of fuel supplies (PO)* (FULLY SUCCESSFUL)	**ER1-3 DIVERSIFYING THE INTERNATIONAL SUPPLY OF OIL AND GAS** • *Continue DOE leadership in international energy initiatives that are instrumental in developing, through government-to-government efforts, an effective legal and regulatory framework for private sector energy investment and policies to encourage development of a broad portfolio of fuel supplies. (PO)*	**ER1-3 DIVERSIFYING THE INTERNATIONAL SUPPLY OF OIL AND GAS** • *Continue DOE leadership in international energy initiatives that are instrumental in developing, through government-to- government efforts, an effective legal and regulatory framework for private sector energy investment and policies to encourage development of a broad portfolio of fuel supplies (PO)*

ER-1 Reduce the vulnerability of the U.S. economy to disruptions in energy supplies. (FE, EE, PMAs) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER1-4 DEVELOPING ALTERNATIVE TRANSPORTATION FUELS AND MORE EFFICIENT VEHICLES • *Developing technologies to convert fossil and waste fuels to high quality transportation fuels at costs of $20-$25 per barrel. Specifically, (FE/EE)* - *developing a conceptual process design for oxygen separation using a new type of ceramic membrane to advance Fischer-Tropsch technology for conversion of remote low-valued natural gas to high quality alternate liquid transportation fuels, and* - *initiating development of catalysts for coproducing chemical feedstocks and premium, ultra low emission diesel fuels from solid carbonaceous feedstocks* (SUCCESSFUL) • *Expanding the Clean Cities program to more than 65 participating communities. (EE)* (SUCCESSFUL) • *Completing the design of a 10 million gallons of ethanol per year first-of-a-kind refinery for producing ethanol from agricultural crop waste. (EE)* (SUCCESSFUL) • *Completing initial performance specifications for the high efficiency diesel to replace current low efficiency engines in class 1 and 2 trucks. (EE)* (SUCCESSFUL) • *Maintaining our 600+ existing Climate Challenge partnership agreements supporting integration of energy efficiency and renewable energy technologies into our partner's Carbon abatement programs. (EE)* <moved from ER4-1> (FULLY SUCCESSFUL)	**ER1-4 DEVELOPING ALTERNATIVE TRANSPORTATION FUELS AND MORE EFFICIENT VEHICLES** • *Support an industrial partner to complete site preparation and begin construction of industry-owned facility to demonstrate first-of-a-kind cellulosic biomass to ethanol technology from agricultural crop waste. (EE)* • *Build a single cylinder proof-of-concept diesel engine that delivers up to 55 percent efficiency. (EE)* • *Expand the Clean Cities program to create continuous corridors of alternative transportation fuel availability in and between 10 major urban centers (EE)* <moved from ER3>	**ER1-4 DEVELOPING ALTERNATIVE TRANSPORTATION FUELS AND MORE EFFICIENT VEHICLES** • *Demonstrate conversion of agricultural wastes to ethanol at a small commercial scale using a genetically engineered fermentative microorganism (EE)* • *Complete testing of baseline prototype, 50-volt high power lithium-ion modules for use in hybrid vehicles (EE)* • *Launch two projects that will lead to 100 percent penetration of alternative fuel vehicles in selected niche applications such as a local taxi fleet or the busses for a particular school. (EE)*

ER-1 Reduce the vulnerability of the U.S. economy to disruptions in energy supplies. (FE, EE, PMAs) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER1-5 MAXIMIZING THE PRODUCTIVITY OF FEDERAL OIL FIELDS	**ER1-5 MAXIMIZING THE PRODUCTIVITY OF FEDERAL OIL FIELDS**	ER1-5 [Combined with ER1-4]
• *Carrying out the sale of the Elk Hills oil field at maximum market value by February 1998. (FE)* (FULLY SUCCESSFUL)	• ~~*Complete negotiations with Chevron USA on equity shares of Elk Hills. (FE)*~~ [4]	
ER1-6 TAKING MEASURES TO AVOID DOMESTIC ENERGY DISRUPTIONS	**ER1-6 TAKING MEASURES TO AVOID DOMESTIC ENERGY DISRUPTIONS**	**ER1-6 TAKING MEASURES TO AVOID DOMESTIC ENERGY DISRUPTIONS**
• *Ensuring that each power system control area operated by a Power Marketing Administration receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North American Electric Reliability Council performance standard. (PMAs)* (FULLY SUCCESSFUL)	• *Ensure that each power system control area operated by a Power Marketing Administration (PMA) receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North America Electric Reliability Council performance standard (PMAs)*	• *Ensure that each power system control area operated by a Power Marketing Administration (PMA) receives, for each month of the fiscal year, a Control Compliance Rating of "Pass" using the North America Electric Reliability Council performance standard (PMAs)*
• *Completing the development of a modeling capability and performing analyses to guide the design of legislative options regarding reliability under electric utility restructuring. (PO)* (SUCCESSFUL)	• *Work with industry organizations and government agencies to establish a comprehensive process to assess Y2K readiness status, promote intersectoral coordination, and provide contingency plans. Provide for timely communication to the public of information regarding readiness status and contingency planning activities. (PO)* [5]	• *Meet the repayment plan for the principal on the Power Investment for each PMA. (PMAs)*
	• *Work with industry organizations and government agencies, including the National Petroleum Council, to assess the impact of changing market conditions and regulations on the level and variability of petroleum prices and supply, and provide recommendations to minimize disruptions during change. (PO)*	• *Achieve a safety performance of a 3.3 recordable accident frequency rate for recordable injuries per 200,000 hours worked or the Bureau of Labor Statistics' industry rate, whichever is lower. (PMAs)*
		• *Work with industry organizations and government agencies, including the National Petroleum Council, to assess the impact of changing market conditions and regulations on the level and variability of petroleum prices and supply, and provide recommendations to minimize disruptions during change (PO)*

[4] There have been a number of new events not under DOE control that have occurred since this measure was developed, which have combined to a considerable delay in the final decision until as late as mid-FY 2002 based primarily on requests from Chevron.

[5] A new responsibility assigned to the Department of Energy and the Policy Office for FY 1999.

Means & Strategies for FY 2000: With the Life Extension program wrapping up in FY 2000, DOE will focus the Strategic Petroleum Reserve (SPR) efforts on maintaining operational readiness of SPR facilities within 15 days of notice by the President to drawdown oil at set performance levels Oil supply activities will include increased technology transfer to help meet the CNES strategy: "By 2005, stop the decline in domestic oil production " The Naval Petroleum and Oil Shale Reserves will continue efforts to achieve maximum value from existing properties." The Department will improve the efficiency of vehicles through joint R&D with automobile manufacturers, demonstrate cost competitive technologies for the production of liquid transportation fuels through partnerships with biofuel manufacturers, and encourage the adoption of alternative fuel vehicles and supporting infrastructures through partnerships with local government organizations.

To meet their repayment target, the PMAs will emphasize: (a) managing costs and FTE; (b) risk management, (c) enhancing revenues (e.g.., BPA's renewal of power sales contracts through 2001 with existing wholesale customers), and (d) effectively operate in the increasingly competitive marketplace.

To meet their safety target the PMAs will emphasize: (a) continuing to provide training for managers, supervisors and staff; (b) tracking and reviewing injury/illness history to mitigate further occurrences; (c) continuing to monitor safety compliance; and (d) emphasizing the role of management in safety

To meet their reliability target the PMAs will emphasize· (a) being Y2K-ready; (b) leadership roles in adoption of mandatory reliability requirements; (c) improved operations (e.g , reliability-centered maintenance, adopting quality assurance approaches), and (d) improved contingency planning (e.g., outage coordination, remedial action schemes).

ER-2 Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact. (FE, EE, NE)

Long-term Strategies: Over the next several years, the Department will (1) propose legislation and support administrative actions to promote establishment of a more open, competitive electric system, with improved environmental performance, (2) support R&D policies and improved regulatory practices that can increase domestic natural gas supplies, moderate future price increases, and fuel 25 percent of the anticipated 6 trillion cubic feet (TCF) increase in natural gas demand (of which 3 5 TCF is for electricity generation) through 2010, (3) develop renewable energy technologies and supporting policies capable of doubling non-hydroelectric renewable energy generating capacity by 2010, (4) by 2010, significantly reduce emissions from currently existing fossil fuel powerplants, (5) by 2010, integrate advanced turbine and fuel cell technology to achieve market-ready gas-fueled powerplants with efficiencies over 70 percent and significantly reduced NOx compared to conventional plants, (6) by 2010, reduce coal powerplant emissions by achieving market-ready coal power systems with efficiencies over 60 percent (new plants are currently about 35 percent), emission reductions less than 1/10 of New Source Performance Standards (NSPS), and CO_2 emissions 45 percent below conventional plants', (7) improve nuclear power plant reliability and availability to increase the capacity factor of existing nuclear power plants from the 1996 average of 76 percent to 85 percent by 2010, (8) maintain a viable nuclear option for future, carbon-free baseload electricity through cooperative programs with the U S electric utility industry, national laboratories, and universities that would maintain domestic nuclear capabilities and would result in a U S order of an advanced nuclear power plant before 2010 (See EQ-5 for nuclear waste issues), and (9) develop and introduce advanced turbines for cogeneration that can reduce annual industrial energy costs by $500 million and carbon emissions by nearly 1 7 million metric tons in 2010

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER2-1 ESTABLISHING A MORE OPEN, COMPETITIVE ELECTRIC SYSTEM • *Completing the development of a modeling capability and performing analyses to guide the design of legislative options regarding electric industry competitiveness, environmental performance, and affordable customer service (PO)* (FULLY SUCCESSFUL)	**ER2-1 ESTABLISHING A MORE OPEN, COMPETITIVE ELECTRIC SYSTEM** • *Issue a revised Administration proposal on electric utility restructuring and the supporting economic analysis to provide a catalyst for consensus and action (PO)* • *Enhance electricity sector modeling capabilities by benchmarking the representation of transmission system constraints against models of physical power flows to better address electric reliability and economic issues, and use this enhanced modeling capability in support of the legislative process (PO)*	
ER2-2 BOOSTING THE NATION'S PRODUCTION OF NATURAL GAS • *Demonstrating 3 advanced drilling and well completion technology systems that could contribute an additional 6 TCF to domestic gas reserves. (FE)* (FULLY SUCCESSFUL) • *Conducting feasibility studies and developing conceptual designs for alternative storage technologies for the power generation markets in the Northeast and South Atlantic regions (FE)* (SUCCESSFUL)	**ER2-2 BOOSTING THE NATION'S PRODUCTION OF NATURAL GAS** • *Complete development of one Advanced Drilling, Completion & Simulation technology system that could contribute to an additional 6 TCF of domestic gas reserves by 2010. (FE)*	**ER2-2 BOOSTING THE NATION'S PRODUCTION OF NATURAL GAS** • *Demonstrate a cost effective horizontal well and advanced exploration and stimulation technologies in low permeability natural gas formations for increasing recovery of the 5,000+ TCF resource in the Greater Green River and Wind River Basins. (FE)*

ER-2 Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact. (FE, EE, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER2-3 DEVELOPING RENEWABLE DOMESTIC ENERGY • *Initiating the government, industry, and state partnership to put solar panels on one million roofs. (EE)* (FULLY SUCCESSFUL) • *Achieving retail sales by U S industry of 8 percent efficient cadmium telluride large area photovoltaic modules (EE)* (FULLY SUCCESSFUL) • *Completing 100-hour acceptance test for Solar Two power tower in California, achieving 90% system availability and producing 1,500 MW-hours of electricity for a one-month period. (EE)* (SUCCESSFUL) • *Completing gas analysis and operational testing of the Vermont biomass gasifier. (EE)* (PARTIALLY SUCCESSFUL. Testing was not completed) • *Beginning construction of multi-megawatt geothermal demonstration power plant based on advanced heat recuperation technology. (EE)* (PARTIALLY SUCCESSFUL. Evaluating comments from draft Environmental Assessment causing delay) • *Completing requirements for International Standards Organization accreditation for wind turbine certification testing at the National Wind Technology Center. (EE)* (FULLY SUCCESSFUL)	**ER2-3 DEVELOPING RENEWABLE DOMESTIC ENERGY** • *Support the Million Solar Roofs Initiative by installing 15,000 energy systems. (EE)* • *Develop codes, standards and safety specifications for residential PV roof systems. (EE)* • *Accumulate 750 hours of reliable operation for a distributed concentrating solar power system. (EE)* • *Complete design of power plant modifications for co-firing of biomass with coal. (EE)* • *Establish a United States based commercial firm as an internationally recognized certification agent using testing and design review services provided by the National Wind Technology Center. (EE)*	**ER2-3 DEVELOPING RENEWABLE DOMESTIC ENERGY** • *Facilitate the installation of 26,000 solar energy systems in support of the Million Solar Roofs Initiative, bringing the total number of installed systems to 51,000 (EE)* • *Develop a 13 percent efficient stable prototype thin-film photovoltaic module (EE)* • *Complete solar Two Power Tower project, demonstrating the dispatchability of solar power during periods of peak demand (EE)* • *Complete three projects which will be co-firing with biomass on a regular basis. (EE)* • *Complete construction of a 5MW Kalina Cycle (advanced heat recuperation technology) demonstration geothermal power plant. (EE)* • *Install three prototypes for field testing under the Small Wind Turbine Project. (EE)*

ER-2 Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact. (FE, EE, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Increasing the routine use of renewable energy technologies at Federal facilities through the completion of one government-wide solar technology Super-Energy Savings Performance Contract (Super ESPC);assisting ten sites in assessing renewable potential; and, completing two model delivery orders integrating cost-effective solar technology and energy efficiency. (EE)* (FULLY SUCCESSFUL)	• *Complete three nationwide solar technology Super-ESPCs for use by all agencies. (EE)*	• *Complete three additional nationwide technology Super-ESPCs for us be all agencies, bringing the total number of technology Super-ESPCs to nine. (EE)*
ER2-4 REDUCING EMISSIONS FROM EXISTING FOSSIL FUEL POWER PLANTS AND DEVELOPING CLEAN HIGH EFFICIENCY FOSSIL FUELED POWER PLANT FOR THE 21ST CENTURY	**ER2-4 REDUCING EMISSIONS FROM EXISTING FOSSIL FUEL POWER PLANTS AND DEVELOPING CLEAN HIGH EFFICIENCY FOSSIL FUELED POWER PLANT FOR THE 21ST CENTURY**	**ER2-4 REDUCING EMISSIONS FROM EXISTING FOSSIL FUEL POWER PLANTS AND DEVELOPING CLEAN HIGH EFFICIENCY FOSSIL FUELED POWER PLANT FOR THE 21ST CENTURY**
• *Completing milestones, including initiation of gasification testing and completion of the pressurized fluidized bed combustion (PFBC) test module, at the Wilsonville, AL, Power Systems Development Facility, leading to development of advanced integrated gasification combined cycle (IGCC)and PFBC systems with efficiencies over 60 percent, 30-50 percent lower CO2 emissions, and up to 20 percent lower electricity costs. (FE)* (SUCCESSFUL)	• *Complete testing of the first commercial-sized fuel cell module (100 KWe) using high temperature solid oxide technology suitable for advanced high-efficiency electrical generation cycles. (FE)* • *Complete full-scale component testing of two advanced, utility-scale turbines with over 60 percent efficiency when used in combined cycles (new plants are currently about 55 percent) and with ultra-low NOx emissions. Initiate advanced gas turbine full speed, no load testing with one gas turbine manufacturer.(FE)*	• *Begin testing of first market prototype solid oxide fuel cell on commercial sites for distributed power applications. (FE)* • *Complete validation testing for critical components of advanced utility-scale turbines with over 60 percent efficiency (combined cycles mode) and ultra-low NOx emissions. Initiate advanced gas turbine full speed, no load testing with the second gas turbine manufacturer, which is the last step before demonstration. (FE)* • *In support of Vision 21, deliver a 1-MW fuel cell/turbine hybrid powerplant to verify market entry design. (FE)*

ER-2 Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact. (FE, EE, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Continuing accomplishments in the Clean Coal Technology Demonstration Program, including:* – *Initiating the design of one commercial-scale Circulating Atmospheric Fluidized Bed Combustion Project (Jacksonville) and one Advanced Circulating Pressurized Fluidized Bed Project (Lakeland) capable of achieving SO_2 reductions of at least 95 percent and NOx reductions of at least 80 percent* – *Commencing construction of a Coal-fired Diesel Engine Project for small utility and industrial applications.* – *Completing operations of a processing facility producing a coal product fuel with a sulfur content as low as 0.3 percent and heating value up to 12,000 BTU/lb.* – *Commencing operations of commercial-scale, advanced combustor facility (Healy) for electrical power generation with reductions greater than 70 and 90 percent, respectively, for NOx and SO_2.* (SUCCESSFUL)	• *Complete commercial demonstration of one integrated gasification combined cycle project (Wabash) and continue operations of two other gasification projects in order to establish the engineering foundation leading to new generation of 60 percent efficient, ultraclean, coal powerplants. (FE)* • *Complete review of proposals for the second round in FY 1999, and initiate projects to design and develop advanced catalysts, electrodes, and membranes, as well as advanced separator plates and high temperature sealants under the Russian-American Fuel Cell Consortium. (PO)*	• *Complete demonstration of the third integrated gasification combined cycle project (Pinion Pine) utilizing air-blown gasification and hot gas cleanup for improved thermal efficiency, and continue operations of one other project (Polk) in order to establish the engineering foundation leading to new generation of 60 percent efficient powerplants. (FE)*

ER-2 Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact. (FE, EE, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Completing the scheduled test runs of the first complete natural gas fueled solid oxide fuel cell power plant, and continuing the product improvement and cost reduction of molten carbonate fuel cell power plants leading to 60 percent efficient systems that will be market-ready in the year 2002 time frame and capable of achieving competitive costs in distributed power generation. (FE)* (FULLY SUCCESSFUL) • *Completing Phase III Advanced Turbine System technology readiness testing for utility-scale turbines, and initiating prototype tests of a 60 percent efficient, ultra-low NOx emissions advanced gas turbine system for market applications in the year 2000 time frame (FE)* (SUCCESSFUL)		
ER2-5&6 [Combined with ER2-4]	**ER2-5&6** [Combined with ER2-4]	**ER2-5&6** [Combined with ER2-4]

ER-2 Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact. (FE, EE, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER2-7 IMPROVING EXISTING NUCLEAR POWER PLANTS AND MAINTAINING NUCLEAR POWER AS A VIABLE OPTION FOR THE FUTURE • *Working with industry to facilitate NRC final design approval of the Westinghouse AP600 design by September 1998 for passively safe nuclear reactors. (NE)* (FULLY SUCCESSFUL) **ER2-8** [Combined with ER2-7]	**ER2-7 IMPROVING EXISTING NUCLEAR POWER PLANTS** • *Complete Memorandums of Understanding with the Nuclear Regulatory Commission and the Electric Power Research Institute (EPRI) to guide future implementation of the Joint DOE-EPRI Strategic Research and Development Plan to Optimize U.S. Nuclear Power Plants. (NE)* **ER2-8 MAINTAINING NUCLEAR POWER AS A VIABLE OPTION FOR THE FUTURE** • *Establish a peer-reviewed Nuclear Energy Research Initiative, initially funded at $19 million to select and conduct investigator-initiated innovative scientific and engineering research that will address the issues facing the future of nuclear power in the U.S., including proliferation concerns, economics, and the management of nuclear waste. (NE)*	**ER2-7 IMPROVING EXISTING NUCLEAR POWER PLANTS** • *Implement a cooperative R&D program to address technical questions that could prevent continued operation of current nuclear power plants by working with industry, universities, and national laboratories. (NE)* **ER2-8 MAINTAINING NUCLEAR POWER AS A VIABLE OPTION FOR THE FUTURE** • *Improve the understanding of reactor systems, component technology and nuclear fuel performance so one or more new reactor and one or more new fuel cycle concepts are identified which offer improved proliferation resistance, and the prospects of improved performance and efficiency, lower costs, and enhanced safety. (NE)* • *Identify one or more proliferation resistant reactor concepts for low power and/or modular design applications. (NE)* • *Advance the state of scientific knowledge and technology to enable incorporation of improved proliferation resistance in the design, development, and deployment of new reactor and nuclear fuel systems (NE)*

ER-2 Ensure that a competitive electricity generation industry is in place that can deliver adequate and affordable supplies with reduced environmental impact. (FE, EE, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER2-9 DEVELOPING ADVANCED TURBINES FOR COGENERATION • *Field testing of ceramic components for an advanced industrial turbine for 4,000 hours. (EE)* (SUCCESSFUL)	**ER2-9 DEVELOPING ADVANCED TURBINES FOR COGENERATION** • *Initiate the 8,000 hour test of the gas turbine engine for the Advanced Turbine System for use in industrial cogeneration. (EE)*	**ER2-9 DEVELOPING ADVANCED TURBINES FOR COGENERATION** • *Demonstrate an advanced industrial turbine system engine at one or more sites. (EE)*

Means & Strategies for FY 2000: The Department will focus more attention on recovery from gas resources that can help fuel anticipated large increases in domestic consumption beyond 2010. Increased effort will be given to integrating advanced gas and coal-fueled power technologies into "Vision 21" plants that can enhance environmental and economic performance. The Department will also conduct investigator-initiated, peer-reviewed research and development at universities, national laboratories, and industrial organizations to advance the scientific knowledge base and develop new technologies that will address the principal obstacles to the future use of nuclear energy, and advance the state of nuclear technology for a competitive marketplace. The Department will also conduct government-industry cost-shared, peer-reviewed, research and development to address the issues associated with long-term operation of existing nuclear power plants and to apply new technology to improve plant reliability and availability. This later program will be conducted consistent with the updated Joint DOE-EPRI Strategic Research and Development Plan to Optimize U.S. Nuclear Power Plants to be issued in FY 1999. The Department and NRC have coordinated program planning to assure that their research and development activities are complimentary, cost-effective, and without duplication. The Nuclear Energy Research Advisory Committee (NERAC) will provide the Department advice on the conduct of these research programs with a specific subcommittee on Operating Nuclear Power Plan Research, Coordination, and Planning.to provide advice and prioritize the research theat the Department will conduct with industry under the NEPO program. The Department will collaborate with national laboratories, industry and universities on research and development that improves the performance and reduces the cost of renewable energy technologies, and foster market penetration of solar technologies through the Million Solar Roofs Initiative and Super-ESPCs.

ER-3 Reduce the energy-related environmental impacts through more efficient energy use. (EE)

Long-term Strategies: Over the next several years, the Department will (1) develop and deploy vehicles, fuels, and systems of the future, contributing significantly to the Partnership for a New Generation of Vehicles (PNGV) to develop, by 2004, prototype mid-sized cars capable of 80 miles per gallon that will reduce NOx and CO_2 emissions by two-thirds compared to today's new car average without compromising safety, comfort, and cost, (2) by 2010, limit energy related releases of CO_2, SOx, NOx, particulates, and other wastes by as much as 5 percent relative to projected emissions by supporting R&D to improve efficiency of the Nation's energy intensive industries; and (3) by 2010, improve the energy efficiency of the existing U S. building stock, and increase the energy efficiency of new homes by 30 percent and other new buildings by 20 percent compared to 1996 average new buildings

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER3-1 DESIGNING AND DELIVERING THE VEHICLES OF THE FUTURE • *Completing laboratory validation tests on hydrogen-fueled 50 kW (full-scale) proton exchange membrane fuel cell propulsion systems that can be tested under automotive drive cycle requirements. (EE)* (SUCCESSFUL)	**ER3-1 DESIGNING AND DELIVERING THE VEHICLES OF THE FUTURE** • *By September 1999, in cooperation with industry and other federal agencies, develop a direct injection power system technical roadmap and a fuel cell power system technical roadmap to integrate fuels and lubricants research and development with development of engine and emissions treatment technologies. (EE)*	**ER3-1 DESIGNING AND DELIVERING THE VEHICLES OF THE FUTURE** • *Work with three domestic automakers to incorporate the most promising Partnership for a New Generation of Vehicles (PNGV) technologies in concept vehicles with up to three times average fuel economy of 1993 Taurus, Lumina and Concorde models (EE)*
ER3-2 IMPROVING EFFICIENCY OF ENERGY INTENSIVE INDUSTRIES • *Initiating work on facilitating a Mining and Agriculture Industry Vision, and facilitating development of selected state-wide Industries of the Future strategies. Roadmaps will be completed in the Aluminum, Chemical, Forest Products, Glass, Metalcasting, and Steel Industries, and will drive the DOE R&D portfolio. (EE)* (FULLY SUCCESSFUL) • *Continuing support for Industrial Assessment Centers operating at 30 participating universities that will conduct approximately 750 combined energy, waste and productivity assessments. (EE)* (SUCCESSFUL)	**ER3-2 IMPROVING EFFICIENCY OF ENERGY INTENSIVE INDUSTRIES** • *Complete roadmaps for six of the major energy intensive industries to achieve each industry vision and start implementing the resulting R&D to achieve up to 25 percent reduction of energy consumption by 2010 (EE)* • ~~*Expand the Clean Cities program to create continuous corridors of alternative transportation fuel availability in and between 10 major urban centers. (EE)*~~ <moved to ER1-4> • *Continue support for Industrial Assessment Centers operating at 30 participating universities that will conduct approximately 750 combined energy, waste and productivity assessments. (EE)*	**ER3-2 IMPROVING EFFICIENCY OF ENERGY INTENSIVE INDUSTRIES** • *Initiate 12 solicitations with industry in support of the Roadmaps developed in the Industries of the Future program. (EE)* • *Establish partnerships with 50 Industries of the Future plants to provide integrated delivery of tools and technical assistance to target motors, steam, compressed air, and combined heat and power system opportunities. (EE)*

ER-3 Reduce the energy-related environmental impacts through more efficient energy use. (EE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER3-3 IMPROVING THE ENERGY EFFICIENCY OF BUILDINGS • *Weatherizing approximately 63,335 low-income homes. (EE)* (SUCCESSFUL) • *Adding windows to the Energy Star product portfolio; doubling the number of retail stores labeling Energy Star appliances to 2,400 nationwide; recruiting four major appliance manufacturers to label Energy Star appliances at the factory; increasing sales of Energy Star appliances by 30 percent over 1997. (EE)* (SUCCESSFUL) • *Recruiting 55 new Rebuild America partnerships to join the program, increasing the total number of Rebuild America communities to 195, representing all 56 states and territories. (EE)* (SUCCESSFUL) • *Building 200 energy efficient homes in partnership with industry. These homes will be designed to save 50% of energy used for heating, cooling, & hot water at no incremental costs. Activities will be coordinated with the public and private Partnership for Advanced Technology in Housing (PATH). (EE)* (SUCCESSFUL)	**ER3-3 IMPROVING THE ENERGY EFFICIENCY OF BUILDINGS** • *Weatherize 67,845 homes, bringing the total number of homes weatherized to 4.7 million. (EE)* • *Work with the Federal Trade Commission to allow manufacturers to add the ENERGY STAR logo to the yellow and black FTC "Energy Guide" label for covered products and recruit an additional 1,500 stores to market ENERGY STAR appliances nationwide. (EE)* • *Recruit 55 additional Rebuild America partnerships. New partners will begin action plans that will result in over 250 million square feet of floor space renovated, reduce annual energy costs by over $90 million and reduce annual carbon emissions by 0.22 million metric tons. (EE)* • *Complete 100 homes through the Building America program bringing the total number of homes completed to 700, and add five new community scale projects for building 1000 additional homes in the next fiscal year. (EE)* • *Maintain an industry cost-share level of over 40 percent, when averaged across all work with industry. (EE)*	**ER3-3 IMPROVING THE ENERGY EFFICIENCY OF BUILDINGS** • *Weatherize 76,900 homes, bringing the total number of homes weatherized to 4.8 million. (EE)* • *Recruit 5 utility partners to promote Energy Star products; an additional 500 retail stores to promote Energy Star products; and 40 window partners to promote Energy Star Windows. (EE)* • *Recruit 50 new Rebuild America Partners, increasing the total number of Rebuild America communities to 330. New partners will begin action plans that will result in over 100 million square feet of floor space renovated, reducing annual energy costs by $28 million and reducing CO_2 emissions by 100 thousand metric tons when local actions are completed in 2003. (EE)* • *In partnership with Building America, develop more than 2,000 highly energy-efficient, environmentally sound, and cost-effective houses and disseminate results to builders of 15,000 other houses through Partnership for Advanced Technology in Housing (PATH). (EE)* • *Achieve 20% Federal building energy reduction compared to 1985 energy use baseline. (EE)*

ER-3 Reduce the energy-related environmental impacts through more efficient energy use. (EE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
	• *Accumulate customer economic savings from past and current Energy Efficiency/Renewable Energy programs exceeding $11 billion. (EE)* • *Develop progress milestones and estimates of energy-related program benefits annually for every Energy Efficiency/Renewable Energy program. Review 25 percent of the milestones and estimated benefits through external peer review each year with a goal of having all milestones and estimated benefits peer-reviewed at least once every four years. (EE)*	

Means & Strategies for FY 2000: The Department will collaborate with the Big Three automobile companies, the Department of Transportation, and the Department of Commerce under the Partnership for a New Generation of Vehicles (PNGV) to conduct R&D that reduces vehicle emission levels, partner with manufacturers in the most energy intensive industries to implement vision roadmaps, and partner with states, retail stores, and other federal agencies to foster deployment of energy efficiency technologies in buildings.

ER-4 Support U.S. energy, environmental, and economic interests in global markets. (EE, FE, PO)

Long-term Strategies: Over the next several years, the Department will (1) develop policies, programs, and information to facilitate energy sector reductions in greenhouse gas emissions; and (2) cooperate with foreign governments and international institutions to develop open energy markets, and facilitate the adoption and export of clean, safe, and efficient energy technologies and energy services.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER4-1 PLANNING FOR ENERGY RELATED GREENHOUSE GAS REDUCTIONS • *Completing a climate change technology strategy in partnership with national laboratories, private industry and top universities as part of the President's Climate Change Technology Initiative to develop path-breaking technologies to address climate change. (PO)* (FULLY SUCCESSFUL.) • ~~*Maintaining our 600+ existing Climate Challenge partnership agreements supporting integration of energy efficiency and renewable energy technologies into our partner's Carbon abatement programs (EE)*~~ <moved to ER1-4> • *Developing and assessing options for implementing the new international agreement proposed at the Kyoto Conference of the Parties to the U.N. Framework Convention on Climate Change by: (PO)* - *Supporting through quantitative analyses and international contacts, Administration efforts to obtain meaningful commitments for reducing greenhouse gas emissions from developing countries.* - *Providing institutional arrangements and technologies for the Monitoring and Verification of treaty compliance under the Framework on Climate Change.* – *Completing assessments of alternative approaches for implementing domestic and international greenhouse gas emissions trading* (SUCCESSFUL)	**ER4-1 PLANNING FOR ENERGY RELATED GREENHOUSE GAS REDUCTIONS** • *Develop a DOE proposal for guidelines for implementing the flexibility mechanisms included in the Kyoto Protocol. (PO)* • *Support through quantitative analysis and international contacts, Administration efforts to obtain meaningful commitments for reducing greenhouse gas emissions from developing countries. (PO)* • *Lead the U.S. Government technology and climate change strategy development and implementation through: (PO)* - *Chairing and expanding the Annex II countries' Climate Technology Initiative which promotes the objectives of the UN Framework Convention on Climate Change (UNFCCC) by fostering international cooperation for accelerated development and diffusion of climate-friendly technologies and practices for all activities and greenhouse gases.* - *Leading and facilitating the development of U.S. positions on technology issues in the climate negotiations including participation in the UNFCCC technology consultation process.*	**ER4-1 PLANNING FOR ENERGY RELATED GREENHOUSE GAS REDUCTIONS** • *Develop a DOE proposal for guidelines for implementing the flexibility mechanisms included in the Kyoto Protocol. (PO)* • *Support through quantitative analysis and international contacts, Administration efforts to obtain meaningful commitments for reducing greenhouse gas emissions from developing countries. (PO)* • *Lead the U.S. Government technology and climate change strategy development and implementation through: (PO)* -- *Chairing and expanding the Annex II countries' Climate Technology Initiative which promotes the objectives of the UN Framework Convention on climate change by fostering international cooperation for accelerated development and diffusion of climate-friendly technologies and practices for all activities and greenhouse gases.* -- *Leading and facilitating the development of U.S. positions on technology issues in the climate negotiations including participation in the UNFCCC technology consultation process.*

ER-4 Support U.S. energy, environmental, and economic interests in global markets. (EE, FE, PO) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER4-2 COOPERATING INTERNATIONALLY TO DEVELOP OPEN ENERGY MARKETS • *Assisting to remove policy, regulatory and fiscal barriers to U.S companies in energy efficiency, renewables, oil and gas, coal bed methane and clean coal technology, and nuclear energy markets, in China, India, Indonesia, the Philippines, Mexico, Venezuela, Argentina, Chile, Brazil, Russia, Ukraine, Caspian countries, South Africa, and in other developing economies. (PO)* (SUCCESSFUL) • *Continuing coordination of the Russian-American Fuel Cell Consortium (RAFCO) which has as one of its primary goals the opening up of the Russian market to U.S. manufactured fuel cells. (PO)* (SUCCESSFUL)	**ER4-2 COOPERATING INTERNATIONALLY TO DEVELOP OPEN ENERGY MARKETS** • *Increase U.S. energy-related business internationally by removing policy, legal and fiscal barriers for U.S companies. In FY 1999 the Department will: (PO)* – *Implement with other APEC economies and the private sector an initiative to promote accelerated investment in natural gas infrastructure and trading networks in the APEC region;* – *Implement the "U.S.-China Energy and Environment Cooperation Initiative" including coordination of interagency effort involving DOE programs, EPA, Commerce and OSTP to promote rural electrification, urban air quality, clean energy sources, and energy efficiency;* – *Lead a regulatory reform initiative to promote economic growth through private investment in environmentally sound energy development and regional integration in Sub-Saharan Africa, including South Africa;* – *Lead a regulatory reform initiative under the Binational Commission to promote adoption by the Russian Government of transparent, fair and consistent regulations in the oil and gas, and power sectors in order to attract investment.*	**ER4-2 COOPERATING INTERNATIONALLY TO DEVELOP OPEN ENERGY MARKETS** • *Increase U.S. energy-related business internationally by removing policy, legal and fiscal barriers for U.S. companies. In FY 1999 the Department will:(PO)* – *Continue to implement with other APEC economies and the private sector an initiative to promote accelerated investment in natural gas infrastructure and trading networks in the APEC region;* – *Implement the "U.S.-China Energy and Environment Cooperation Initiative" including coordination of interagency effort involving DOE programs, EPA, Commerce and OSTP to promote rural electrification, urban air quality, clean energy sources, and energy efficiency;* – *Continue to lead a regulatory reform initiative to promote economic growth through private investment in environmentally sound energy development and regional integration in Sub-Saharan Africa, including South Africa;* – *Continue to lead a regulatory reform initiative under the Binational Commission to promote adoption by the Russian Government of transparent, fair and consistent regulations in the oil and gas, and power sectors in order to attract investment.*

Means & Strategies for FY 2000: The Department will continue work in climate change through studies, international cooperation, and leadership. Work on opening international energy markets will include meetings with other U.S. governmental agencies including EPA, Commerce, and the President's Office of Science and Technology Policy, as well as international energy organizations.

ER-5 Carry out information collection, analysis, and research that will facilitate development of informed positions on long-term energy supply and use alternatives. (EIA, FE, EE)

Long-term Strategies: Over the next several years, the Department will (1) develop and expand public access to energy data, forecasts, analyses, and educational materials; and (2) carry out research and scenario analysis to help identify and understand options that could revolutionize 21st century energy markets.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ER5-1 EXPANDING PUBLIC ACCESS TO ENERGY INFORMATION • *The average number of unique monthly users of the Energy Resources Board Web Sites (Http://www.eren.doe.gov/) will grow at least 20 percent per year through 2003 (from about 70,000 per month in 1996.) (EIA)* (FULLY SUCCESSFUL) • *Publishing domestic and international Annual Energy Outlooks, forecasting future energy supply and consumption through the year 2020. (EIA)* (FULLY SUCCESSFUL) • *Completing by April 1998, for submission to Congress, an initial comprehensive national energy strategy that integrates major Federal government energy-related activities. (PO)* (FULLY SUCCESSFUL) **ER5-2 DEVELOPING INNOVATIVE OPTIONS FOR 21ST CENTURY ENERGY MARKETS** • *Completing analysis of data from test well in Mackenzie Delta to help define the volume and production characteristics of Arctic methane hydrates. (FE)* (FULLY SUCCESSFUL)	**ER5-1 EXPANDING PUBLIC ACCESS TO ENERGY INFORMATION** • *Achieve a growth rate of at least 20 percent per year in the average number of unique monthly users of the Energy Resources Board Web Site (from about 71,000 per month in 1997). (EIA)* • *Publish domestic and international Annual Energy Outlooks forecasting energy supply and consumption through the year 2020. (EIA)* **ER5-2 DEVELOPING INNOVATIVE OPTIONS FOR 21ST CENTURY ENERGY MARKETS** • *Initiate a coordinated, Department-wide program to develop lower-cost, environmentally acceptable technology approaches to carbon capture and sequestration. (FE)* • *Complete preliminary version of gas hydrate seismic model based on field and laboratory data. (FE)* • *Complete scale-up of the Sorbent Enhanced Reformer concept for hydrogen production. (EE)* • ~~*Complete a conceptual design study of an innovative fusion power system and evaluate the next steps as guidance to science and technology research. (ER)*~~ <Moved to ST-1>	**ER5-1 EXPANDING PUBLIC ACCESS TO ENERGY INFORMATION** • *Achieve a growth rate of at least 20 percent per year, through 2002, in the average number of unique monthly users of the Energy Resources Board Web Site (from about 110,000 per month in 1998). (EIA)* • *Publish domestic and international Annual Energy Outlooks forecasting energy supply and consumption through the year 2020. (EIA)* • *Respond to 60,000 inquiries by individuals, small businesses, and state and local government through the Energy Efficiency and Renewable Energy Clearinghouse (EREC). Increase the average monthly hits to 4 million on the Energy Efficiency and Renewable Energy Network (EREN) which provides information on the Internet. (EE)* **ER5-2 DEVELOPING INNOVATIVE OPTIONS FOR 21ST CENTURY ENERGY MARKETS** • *Demonstrate over 90 percent absorption of CO_2 in a sorbent enhanced reformer reactor for hydrogen production. (EE)* • *Identify a site containing gas hydrates suitable for testing the feasibility of methane recovery. (FE)* • *Initiate development of biological CO_2 sequestration by conversion into useful products such as liquid fuels. (FE)*

Means & Strategies for FY 2000: The Department of Energy will continue to educate the public and business on energy efficiency and renewable energy technologies through easily assessable high quality material provided through a telephone clearinghouse and Internet site.

NATIONAL SECURITY

GOAL: Support national security, promote international nuclear safety, and reduce the global danger from weapons of mass destruction.

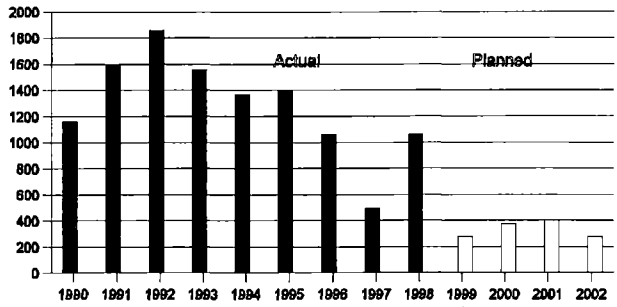

Figure 6: Nuclear Warhead Dismantlement Activity

The following table maps the Presidential Budget's Program and Financing (P&F) accounts and program activities to the Department of Energy's offices and decision units. The alignment includes aggregation, disaggregation, and consolidation The table that follows this one maps DOE decision units to the business line objectives where performance measures and goals are identified.

Presidential Budget Program and Financing (P&F) Accounts and Program Activities	*FY 2000 Budget Request ($M)*	*DOE Office*	*DOE Decision Units*
050 Atomic Energy Defense Activities			
Weapons Activities			
Stockpile stewardship	$2,286	DP	Stockpile Stewardship
Stockpile management	$1,998	DP	Stockpile Management
Program Direction	$247	DP	Program Direction
Other Defense Activities			
Nonproliferation and national security	$748	NN	Nonproliferation and National Security
Fissile materials disposition	$200	MD	Fissile Materials Disposition
Worker and community transition	$30	WT	Worker & Community Transition
Naval reactors	$665	NE(NR)	Naval Reactors
Intelligence	$36	IN	Intelligence
Counterintelligence	$19	CN	Counterintelligence
270 Energy Supply [6]	$269	NE	Nuclear Energy

[6] Only a portion of the Energy Supply resources are applied to the National Security Business Line.

The following table indicates which budget program/decision units support which of the business line objectives Resources, in both funds and Full Time Equivalent staff (FTEs), are shown. FTE estimates are for the overall program offices. The funds shown are program totals from DOE's budget request.

DOE Office	DOE Program/ Decision Unit	FY 2000 Budget Request ($M)	FTEs	NS-1 Stockpile Confidence	NS-2 Science-Based Steward-ship	NS-3 Enterprise Vitality	NS-4 Weapons Reductions	NS-5 Arms Control & Nonpro-liferation	NS-6 Nuclear Power Systems	NS-7 Nuclear Safety
DP	Stockpile Stewardship	$2,286	1,799	X	X	X	X			
	Stockpile Management	$1,998		X		X	X			
	Program Direction	$247				X				
NN	Nonproliferation & National Security	$748	374			X	X	X		X
MD	Fissile Materials Disposition	$200	39			X	X			
NR	Naval Reactors	$665	201						X	
IN	Intelligence	$36	37					X		
CN	Counter-intelligence	$19	36			X		X		
WT	Worker & Community Transition	$30	22			X				
NE	Nuclear Energy, Science & Technology [7]	$269	144				X			

[7] Only a portion of Nuclear Energy resources are applied to the National Security Business Line.

NS-1 Maintain confidence in the safety, reliability, and performance of the nuclear weapons stockpile without nuclear testing. (DP)

Long-term Strategies: Over the next several years, the Department will (1) extend the life of U.S nuclear weapons by continuing the Stockpile Life Extension Program and Stockpile Maintenance activities; (2) improve detection and prediction capabilities for assessing nuclear weapon component performance and the effects of aging; (3) continually evaluate the safety, reliability, and performance of the nuclear weapons stockpile, and (4) provide a reliable source of tritium as required for the nuclear weapons stockpile by FY 2005.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS1-1 MAINTAINING THE ENDURING STOCKPILE • *Certifying the nuclear weapons stockpile safety, reliability, and performance according to DOE/DoD procedures. (DP)* (FULLY SUCCESSFUL)[8] • *Meeting all DoD annual weapons alteration, modification, and surveillance schedules. (DP)* (SUCCESSFUL)	**NS1-1 MAINTAINING THE ENDURING STOCKPILE** • *Report annually to the President on the need or lack of need to resume underground testing to certify the safety and reliability of the nuclear weapons stockpile. (DP)* • *Meet all annual weapons alteration and modification schedules developed jointly by DOE and DoD. (DP)*	**NS1-1 MAINTAINING THE ENDURING STOCKPILE** • *Annually report to the President on the need or lack of need to resume underground testing to certify the safety and reliability of the nuclear weapons stockpile. (DP)* • *Meet all annual weapons alteration and modification schedules developed jointly by DOE and DoD. (DP)* • *Undertake an independent assessment of the Stockpile Stewardship Program and its implementation throughout the DP national security enterprise. (DP)*
NS1-2&3 [Combined with NS1-1]	**NS1-2&3** [Combined with NS1-1]	**NS1-2&3** [Combined with NS1-1]
NS1-4 DEVELOPING A REPLACEMENT SOURCE OF TRITIUM • *Completing the analysis to support the selection by December 1998, of a new production source for tritium. (DP)* (SUCCESSFUL)	**NS1-4 DEVELOPING A REPLACEMENT SOURCE OF TRITIUM** • ~~*Begin the implementation*~~ *Continue development of the dual-path options* ~~*decision to provide a reliable source of tritium as required for the nuclear weapons stockpile.*~~ *and select, by December 1998, a primary tritium production technology.*[9] *(DP)*	**NS1-4 DEVELOPING A REPLACEMENT SOURCE OF TRITIUM** • *Begin implementation of the selected commercial light water reactor technology as a primary technology and the accelerator technology as a backup technology to provide a reliable source of tritium for the nuclear weapons stockpile. (DP)*

[8] End-of-year results of FY 1998 Performance Agreement commitments are classified as "FULLY SUCCESSFUL", "SUCCESSFUL", "PARTIALLY SUCCESSFUL", or "UNSUCCESSFUL" for performance judged to be effectively 100% or better, 80-100%, 50-80%, or less than 50% respectively.

[9] Revised to reflect the Congressional delay in implementing the decision.

Means & Strategies for FY 2000: The Department will conduct a wide range of tests and activities to assess the continuing safety and reliability of the nation's nuclear weapon stockpile. Overall technical reviews by the weapons laboratories of stockpile weapons will encompass laboratory and flight tests of materials and components, surveillance tests, and hydrodynamic testing of components. Calculations and computer simulations of weapons will be used in these assessments. Weapon analyses will utilize data archived from past underground nuclear tests. Working through the weapon production plants and the laboratories, DOE will make deliveries of limited life and other weapon components for nuclear weapon stockpile management and refurbishment according to schedules developed jointly by the DOE and DoD. Studies will be conducted for the Stockpile Readiness and Enduring Stockpile program. Activities will be conducted with the Department of Defense, ranging from training in nuclear weapon field maintenance to partnerships in research supporting non-nuclear munitions. DOE will also begin implementation of selected technology and backup to provide a new tritium source. Construction activities will proceed for the light water reactor technology, and design and development of the accelerator technology backup will complete a preliminary design for an Accelerator Production of Tritium (APT) plant.

NS-2 Replace nuclear testing with a Stockpile Stewardship Program. (DP)

Long-term Strategies: Over the next several years, the Department will (1) develop the advanced simulation, modeling and experimentation technologies necessary to confidently mitigate the loss of underground testing by FY 2004; (2) develop new nuclear weapons physics experimental test capabilities; and (3) advance our understanding of the fundamental characteristics of weapons behavior through systems engineering and advanced experiments and modeling to support future assessments of weapons safety, reliability, and performance.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS2-1 REPLACING UNDERGROUND TESTING WITH SCIENCE	**NS2-1 REPLACING UNDERGROUND TESTING WITH SCIENCE**	**NS2-1 REPLACING UNDERGROUND TESTING WITH SCIENCE**
• *Meeting established schedules for the development and installation of a 3-trillion operations per second computer systems. (DP)* (FULLY SUCCESSFUL)	• *Demonstrate a 3-trillion operations per second computer system. (DP)*	• *Demonstrate a computer code capable of performing a three-dimensional analysis of the dynamic behavior of a nuclear weapon primary, including a prediction of the total explosive yield, on an ASCI computer system. (DP)*
NS2-2 DEVELOPING NEW EXPERIMENTAL CAPABILITIES FOR UNDERSTANDING WEAPONS SCIENCE	**NS2-2 DEVELOPING NEW EXPERIMENTAL CAPABILITIES FOR UNDERSTANDING WEAPONS SCIENCE**	**NS2-2 DEVELOPING NEW EXPERIMENTAL CAPABILITIES FOR UNDERSTANDING WEAPONS SCIENCE**
• *Beginning the physical construction according to schedules in the Project Execution Plan for the National Ignitions Facility(NIF). (DP)* (FULLY SUCCESSFUL)	• *Continue construction of the National Ignition Facility (NIF) according to its Project Execution Plan schedules. (DP)*	• *Continue construction of the National Ignition Facility (NIF) according to its Project Execution Plan schedules. (DP)*
NS2-3 CONDUCTING EXPERIMENTS TO ADVANCE OUR UNDERSTANDING OF WEAPONS BEHAVIOR	**NS2-3 CONDUCTING EXPERIMENTS TO ADVANCE OUR UNDERSTANDING OF WEAPONS BEHAVIOR**	**NS2-3 CONDUCTING EXPERIMENTS TO ADVANCE OUR UNDERSTANDING OF WEAPONS BEHAVIOR**
• *Conducting three or four subcritical experiments to provide information about the behavior of nuclear materials during the implosion phase of a nuclear weapon. (DP)* (PARTLY SUCCESSFUL: only two tests were completed because of technical challenges.)	• *Conduct ~~three or four~~ two or three[10] subcritical experiments at the Nevada Test Site to provide valuable scientific information about the behavior of nuclear materials during the implosion phase of a nuclear weapon. (DP)*	• *Conduct two subcritical experiments at the Nevada Test Site to provide valuable scientific information about the behavior of nuclear materials during the implosion phase of a nuclear weapon. (DP)*

[10] Adjusted due to increases in the cost and complexity of experiments.

Means & Strategies for FY 2000: The Department will demonstrate 3-dimensional computer codes that simulate the dynamic behavior of a nuclear weapon primary, including a prediction of total explosive yield, and simulate the dynamic response of a nuclear weapon system to the hostile radiation and blast environment of reentry. Also, DOE will continue construction of the National Ignition Facility at the Lawrence Livermore National Laboratory, including continuation of construction of conventional facilities, completing facilitization of optics vendors, and completing pilot production for the facility's optics components The laboratories will work at the Nevada Test Site to design, engineer, field, and execute subcritical experiments

NS-3 Ensure the vitality of DOE's national security enterprise (DP, NN, MD, WT)

Long-term Strategies: Over the next several years, the Department will (1) provide an appropriately-sized, cost-effective, safe, secure, and environmentally sound national security enterprise; (2) ensure that sufficient scientific and technical personnel are available to meet DOE's long-term national security requirements; (3) ensure and enhance protection of nuclear materials, sensitive information, and facilities; (4) provide DOE-related intelligence and threat assessment support to members of the national security community; and (5) maintain nuclear test readiness and enhance emergency management capabilities to address any nuclear weapons, radiological, or other emergency in the United States or abroad.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS3-1 DOWNSIZING AND MODERNIZING THE NATIONAL SECURITY ENTERPRISE • *Ensuring that all facilities required for successful achievement of the Stockpile Stewardship and Management Plan remain operational, and the established schedules for downsizing and modernization of the production facilities are met. (DP)* (PARTIALLY SUCCESSFUL: Projects were behind schedule) • *Conducting Security System Reviews and Joint Tactical System Analyses at six major DOE facilities and validate through that process that adequate security measures exist. (NN)* (SUCCESSFUL) • *Working in cooperation with other Departmental elements to add at least 90 protective force personnel at various DOE field sites to enhance protection of SNM; start S&S upgrades at five facilities; and complete S&S upgrades at two facilities. (NN)* (SUCCESSFUL) • *Continuing shipment of Rocky Flats plutonium pits to Pantex with the goal of completing all shipments by FY 1999. (MD)* (SUCCESSFUL) **NS3-2** [Combined with NS3-1]	**NS3-1 DOWNSIZING AND MODERNIZING THE NATIONAL SECURITY ENTERPRISE** • *Ensure that all facilities required for successful achievement of the Stockpile Stewardship Plan remain operational (DP)* • *Meet the established schedules for downsizing and modernizing of our production facilities. (DP)* • *Complete the shipment of plutonium pits from Rocky Flats to Pantex (MD)* • *Conduct oversight reviews to ensure that an effective Safeguards and Security program is maintained at all nuclear weapons facilities. (NN)* • *Develop a comprehensive Weapons of Mass Destruction Defense Plan which addresses security planning, equipment, training, and exercise requirements (NN)* • *Plan, coordinate, conduct and participate in an Interagency National Security Technology Exchange (INTSE) conference (NN)* **NS3-2** [Combined with NS3-1]	**NS3-1 DOWNSIZING AND MODERNIZING THE NATIONAL SECURITY ENTERPRISE** • *Ensure that all facilities required for successful achievement of the Stockpile Stewardship Plan remain operational. (DP)* • *Meet the established schedules for downsizing and modernizing our production facilities (DP)* • *Complete the upgrade of storage facilities at the Pantex Plant for storing surplus plutonium pits (MD)* **NS3-2** [Combined with NS3-1]

NS-3 Ensure the vitality of DOE's national security enterprise. (DP, NN, MD, WT) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS3-3 PROTECTING NUCLEAR MATERIALS, PRODUCTION, AND FACILITIES • *Developing and field testing an advanced vehicle portal test bed designed to prevent entry of unauthorized personnel and contraband. (NN)* (SUCCESSFUL) • *Completing plans and preparations for initiating in FY 1999, the correction of DOE infrastructure vulnerabilities identified by the President's Commission on Critical Infrastructure Protection. (NN)* (PARTIALLY SUCCESSFUL: Completion was delayed until just after the end of the fiscal year Submission of plans to the National Security Council was accomplished on November 18, 1998)	**NS3-3 PROTECTING NUCLEAR MATERIALS, PRODUCTION, AND FACILITIES** • *Initiate needed material protection, control, and accountability upgrades at DOE facilities with weapons-usable material. (NN)* • *Further the protection of all U.S. origin nuclear materials in the U.S. and abroad from possible theft, loss, or illicit trafficking. (NN)* • *Develop information on nuclear materials contained in waste in a new Departmental database for all nuclear materials by the end of the first quarter of FY 1999. (NN)* • *Develop advanced safeguards and security technologies for implementation in FY 2000. (NN)* • *Implement advanced technologies to prevent the theft or diversion of special nuclear materials including the unattended on-line gamma-ray monitor. (NN)* • *Issue timely technical reports and threat assessments regarding potential domestic and/or foreign proliferant risks. (NN)*	**NS3-3 PROTECTING NUCLEAR MATERIALS, PRODUCTION, AND FACILITIES** • *Continue material protection, control, and accountability upgrades at DOE facilities with weapons-usable material. (NN)* • *Expand forensic analysis for improved cyber security for classified information systems. (NN)* • *Reduce DOE facilities' vulnerabilities to chemical threats through sensor development and chemical protective equipment. (NN)* • *Initiate the correction of DOE infrastructure vulnerabilities identified by the President's Commission on Critical Infrastructure Protection (NN)*

NS-3 Ensure the vitality of DOE's national security enterprise. (DP, NN, MD, WT) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS3-5 MAINTAINING READINESS FOR NUCLEAR EMERGENCIES	**NS3-5 MAINTAINING READINESS FOR NUCLEAR OR OTHER[11] EMERGENCIES**	**NS3-5 MAINTAINING READINESS FOR NUCLEAR OR OTHER EMERGENCIES**
• *Ensuring that the capability to resume underground testing is maintained in accordance with the Presidential Decision Directive and Safeguard C of the CTBT through a combined experimental and test readiness program. (DP)* (FULLY SUCCESSFUL)	• *Ensure that the capability to resume underground testing is maintained in accordance with the Presidential Decision Directive and Safeguard C of the Comprehensive Test Ban Treaty. (DP)*	• *Ensure that the capability to resume underground testing is maintained in accordance with the Presidential Decision Directive and Safeguard C of the CTBT. (DP)*
• *Maintaining robust emergency response assets in accordance with Presidential Decision Directive 39, The Atomic Energy Act of 1954 and Executive Order 12656 to ensure Departmental response to any nuclear weapons or radiological emergency in the United States or abroad. (DP)* (FULLY SUCCESSFUL)	• *Demonstrate improvement of a comprehensive management system to ensure effective Departmental response to all DOE emergencies. (NN)*	• *Demonstrate improvement of a comprehensive management system to ensure effective Departmental response to all DOE emergencies. (NN)*
	• *Maintain robust emergency response assets in accordance with Presidential Decision Directive 39, The Atomic Energy Act, Executive Order 12656, and Federal Emergency Plans (DP/NN)*	• *Maintain robust emergency response assets in accordance with Presidential Decision Directive 39, The Atomic Energy Act, Executive Order 12656, and Federal Emergency Plans. (DP)*
	• ~~*Coordinate with Federal, State, and local governments and private energy companies to achieve prompt restoration of energy systems following major domestic energy emergencies. (NN)*~~ [12]	

[11] Revised to include both DP and NN's role.

[12] Prohibited by the FY 1999 Defense Authorization Act and the Energy and Water Appropriation.

NS-3 Ensure the vitality of DOE's national security enterprise. (DP, NN, MD, WT) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS3-6 MANAGING CONTRACTOR WORK FORCE RESTRUCTURING <moved from CM-3> • *Implementing a single Department-wide automated contractor workforce employment data system. (WT)* (SUCCESSFUL) • *Achieving annual recurring cost savings from separated workers that are at least three times the one time cost of separation. (WT)* (FULLY SUCCESSFUL) • *Supporting local community transition activities that will create 8,000 to 12,000 new private sector jobs by the end of FY 1998. (WT)* (FULLY SUCCESSFUL)	**NS3-6 MANAGING CONTRACTOR WORK FORCE RESTRUCTURING** <moved from CM-3> • *Implement initiatives to accelerate asset conversion and reuse that will result in more than $1 billion in long term savings to the Department and facilitate economic diversification of local communities. (WT)* • *Keep involuntary separations between 30 and 60 percent of positions eliminated while assuring maintenance of essential work force skills mix and productivity. (WT)* • *Achieve annual recurring costs savings from separated workers that is at least three times the one time cost of separation. (WT)* • *Support local community transition activities that will create, cumulatively, 15,000 to 20,000 new private sector jobs by the end of FY 1999. (WT)*	**NS3-6 MANAGING CONTRACTOR WORK FORCE RESTRUCTURING** • *Limit involuntary termination of employment at Department of Energy defense nuclear facilities between 30 and60 percent of positions eliminated. (WT)* • *Achieve annual recurring costs savings from separated workers that is at least three times the one time cost of separation. (WT)* • *Support local community transition activities that will create, cumulatively, 20,00 to 30,000 new private sector jobs by the end of FY 2000. (WT)* • *Achieve at least a two to one return on reinvested proceeds from the sale or lease of underutilized assets associated with the Asset Management Pilot Program and other reindustrialization activities.(WT)*

Means & Strategies for FY 2000: The Department will continue to oversee and maintain the infrastructure and plant at government-owned, contractor-operated weapons laboratories and plants according to applicable statues, laws, agreements, and standards. At the Savannah River, Pantex, Y-12, and Kansas City sites, construction activities will continue to reduce the operating footprint and facilitate consolidation of plant functions. DOE will also maintain appropriate infrastructure, personnel knowledge and exercised skills necessary to conduct an underground nuclear test within 2-3 years. Emergency response capability will be maintained through drills, exercises, and training activities at each national asset.

The Department will also expand existing partnerships between DOE Headquarters and Field elements and forge new partnerships to ensure a concerted Departmental effort. In addition, sound and improved risk management principles will be used to maintain a flexible protection posture against today's changing threat environment. The Department will achieve the workforce restructuring objectives through headquarters oversight and contractor performance measures that will encourage cost-effective use of voluntary separation strategies, manage attrition, and internal placement. The community transition goal will be achieved through financial and technical assistance provided to community reuse organizations at the affected sites. The economic conversion goal will be achieved through headquarters technical assistance and oversight to field organizations designed to encourage the leveraging of underutilized assets to achieve cost savings.

NS-4 Reduce nuclear weapons stockpiles and the proliferation threat caused by the possible diversion of nuclear materials. (DP, NN, MD, NE)

Long-term Strategy: Over the next several years, the Department will (1) dismantle nuclear warheads that have been removed from the U.S. nuclear weapons stockpile in a safe and secure manner; and (2) reduce inventories of surplus weapons-usable fissile materials worldwide in a safe, secure, transparent, and irreversible manner.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS4-1 REDUCING THE WEAPONS STOCKPILE • *Adhering to schedules for the safe and secure dismantlement of approximately 1,000 nuclear warheads that have been removed from the U.S. nuclear weapons stockpile. (DP)* (FULLY SUCCESSFUL)	**NS4-1 REDUCING THE WEAPONS STOCKPILE** • *Adhere to schedules for the safe and secure dismantlement of approximately ~~500~~ 275 [13] nuclear warhead that have been removed from the U.S. nuclear weapons stockpile. (DP)*	**NS4-1 REDUCING THE WEAPONS STOCKPILE** • *Adhere to schedules for the safe and secure dismantlement of approximately 375 nuclear warheads that have been removed from the U.S. nuclear weapons stockpile. (DP)*
NS4-2 REDUCING INVENTORIES OF SURPLUS WEAPONS-USABLE FISSILE MATERIALS WORLDWIDE IN A SAFE, SECURE, TRANSPARENT, AND IRREVERSIBLE MANNER • *Successfully completing irradiation of advanced LEU research reactor fuel test assembly to medium burn-up level at the ATR reactor in Idaho by March 1998. (NN)* (FULLY SUCCESSFUL) • *Completing the dilution of 13 metric tons of excess HEU (approximately 3.5 metric tons in FY 1998) to LEU and implementing international safeguards at the Portsmouth Gaseous Diffusion Plant by August 1998. (NE/NN)* (FULLY SUCCESSFUL) • *Conducting international inspection of the dilution of 7 metric tons of HEU by September 1998. (NN)* (FULLY SUCCESSFUL)	**NS4-2 REDUCING INVENTORIES OF SURPLUS WEAPONS-USABLE FISSILE MATERIALS WORLDWIDE IN A SAFE, SECURE, TRANSPARENT, AND IRREVERSIBLE MANNER** • *Complete the final Environmental Impact Statement and issue a Record of Decision on siting plutonium disposition facilities. (MD)* • *Place over 20 metric tons of excess highly enriched uranium (HEU) under International Atomic Energy Agency (IAEA) safeguards. (NN)* • ~~*Initiate design and equipment procurement for a pilot-scale system in Russia to convert weapons plutonium to forms suitable for disposition and international inspection.*~~ *Initiate, by the end of FY 1999, negotiations with Russia on a bilateral agreement for the disposition of surplus weapons plutonium.*[14] *(MD)*	**NS4-2 REDUCING INVENTORIES OF SURPLUS WEAPONS-USABLE FISSILE MATERIALS WORLDWIDE IN A SAFE, SECURE, TRANSPARENT, AND IRREVERSIBLE MANNER** • *Proceed with the design of key U.S. surplus plutonium disposition facilities by initiating Title I design for the Immobilization and Associated Processing Facility and completing Title I and initiating Title II design for the Pit Disassembly and Conversion and the MOX Fuel Fabrication Facilities. (MD)* • *Place 10 metric tons of excess highly enriched uranium (HEU) under International Atomic Energy Agency (IAEA) safeguards in FY 2000. (NN)*

[13] Reduction results from safety concerns, underestimated startup times for different weapon types, and constrained resources

[14] Change reflects Presidential commitments regarding plutonium disposition resulting from the September 1998 U S /Russian Summit

NS-4 Reduce nuclear weapons stockpiles and the proliferation threat caused by the possible diversion of nuclear materials. (DP, NN, MD, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Ensuring 100 percent completion of progress reports on technical, legal and financial issues of the Trilateral Initiative and conduct evaluation of verification and monitoring technology by August 1998. (NN)* (FULLY SUCCESSFUL)	• *Monitor the dilution of 30 metric tons of highly enriched uranium (HEU) to low enriched uranium (LEU) from dismantled Russian nuclear weapons for purchase by the United States Enrichment Corporation. (NN)*	• *Transfer 7 metric tons of highly enriched uranium to the United States Enrichment Corporation for down blending to low enriched uranium for sale and subsequent peaceful use in commercial nuclear reactors. (MD)*
• *Fully implementing all transparency monitoring tasks associated with the dilution of 24 metric tons of HEU from dismantled Russian nuclear weapons to low enriched uranium (LEU) for purchase by the United States Enrichment Corporation (NN)* (SUCCESSFUL)	• *Evaluate the impacts of warhead dismantlement and transparency initiatives. (NN)*	• *Begin to implement a bilateral agreement with Russia for disposing of surplus weapons plutonium. (MD)*
• *Beginning the transfer of U.S. surplus HEU to the United States Enrichment Corporation for dilution and subsequent sale. (MD* (FULLY SUCCESSFUL)	• *Initiate design for Pit Disassembly and Conversion and Mixed Oxide (MOX) Fuel Fabrication facilities. (MD)*	• *Ensure safe, secure storage of spent nuclear fuel at the BN-350 Reactor in Rktau, Kazakhstan. Complete canning of the 2,000 spent fuel rods in the pool. (NN)*
• *Completing initial demonstration of a prototype integrated plutonium pit disassembly and conversion system. (MD)* (SUCCESSFUL)	• *Continue transfer of U.S. surplus HEU to the United States Enrichment Corporation for dilution and subsequent sale. (MD)*	• *Evaluate the impacts of warhead dismantlement and transparency initiatives. (NN)*
• *Completing procurement for a private sector consortium to provide MOX fuel fabrication and irradiation services. (MD)* (SUCCESSFUL)	• *Remove all highly enriched uranium oxides from the Portsmouth site (NE)*	• *Conduct Russian technology demonstrations to further warhead dismantlement or transparency measures. (NN)*
• *Initiating development of a Russian plutonium conversion and nondestructive assay prototype system. (MD)* (FULLY SUCCESSFUL)	• *Accomplish the milestones of the FMFIA corrective action plan for the Departmental challenge of surplus fissile materials. (MD/NN)*	• *Monitor the dilution of 30 metric tons of highly enriched uranium (HEU), from dismantled Russian nuclear weapons, to low enriched uranium (LEU) for purchase by the United States Enrichment Corporation. (NN)*

NS-4 Reduce nuclear weapons stockpiles and the proliferation threat caused by the possible diversion of nuclear materials. (DP, NN, MD, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
		• *Conduct 24 special monitoring team visits to Russian HEU conversion and blending facilities; maintain a permanent presence office in Russia, and continue the planning for a second permanent presence office to be established at the Siberian Chemical Enterprise (NN)* • *Maintain and monitor the UF_6 flow and enrichment measurement nondestructive assay systems installed at the blend points at two Russian HEU dilution facilities. (NN)* • *Compile and analyze collected data and information into an assessment of confidence of compliance with the nonproliferation objectives of the HEU Agreement. (NN)*

Means & Strategies for FY 2000: The Department will further reduce the nuclear danger by continuing a program of dismantling retired weapons, including studies and development of safe dismantlement procedures, characterization and disposition of components, and long term storage The Department will also ensure that adequate budgetary and infrastructure resources and personnel are available to meet all program goals in a timely manner. To support highly enriched uranium disposition efforts, ensure that adequate numbers of ES-2 shipping containers, safe-secure transports (SSTs), and skilled personnel at the Oak Ridge Y-12 facility are available to package and ship the highly enriched uranium to down blending facilities. To support plutonium disposition efforts, complete the record of decision to select the site(s) where U.S. plutonium disposition will take place; ensure that a contract award is made to an industry consortium for the design of the MOX Fuel Fabrication Facility; and select architect-engineering (A&E) firm(s) to design the Pit Disassembly and Conversion Facility and the Immobilization and Associated Processing Facility. In support of work with Russia, develop with the State Department an interagency agreed-upon set of U.S. goals prior to proceeding to negotiate a plutonium disposition agreement with Russia; and conduct bilateral negotiations with Russia leading to a binding agreement for disposition of the Russian and U.S. plutonium declared excess to defense needs. If necessary, conduct multilateral negotiations with other G-8 nations to solidify their support.

NS-5 Continue leadership in policy support and technology development for international arms control and nonproliferation efforts. (NN)

Long-term Strategy: Over the next several years, the Department will (1) strengthen the nuclear nonproliferation regime through support of treaties and international agreements; (2) work with the states of the former Soviet Union and others to minimize the risks of proliferation; and (3) advance nonproliferation technology

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS5-1 STRENGTHENING THE NUCLEAR NONPROLIFERATION REGIME • *In support of a Comprehensive Test Ban Treaty (CTBT), finalizing a plan for joint cooperation with the Russians to conduct a confidence-building activity by September 1998 (NN)* (PARTIALLY SUCCESSFUL. Placed on hold because discussions held in June and August 1998 have not reached a final determination on the scope of activities.) • *Beginning a long-term nuclear spent fuel maintenance program in the Democratic Peoples Republic of Korea (DPRK) by June 1998, assuring a stable, non-corrosive storage for the duration of the program. (NN)* (PARTIALLY SUCCESSFUL: The work was put on hold due to DPRK's frustration with deliveries of heavy fuel oil to DPRK.) • *Leading, via Joint Chairmanship, the interagency task force on warhead and fissile material, to create START III options for warhead elimination by January 1998. (NN)* (FULLY SUCCESSFUL) • *Providing equipment, technologies and expertise to the IAEA and the United Nations Special Commission (UNSCOM) to perform monitoring and intrusive inspections in North Korea and Iraq sufficient to verify compliance with their obligations under the NPT. (NN)* (FULLY SUCCESSFUL)	**NS5-1 STRENGTHENING THE NUCLEAR NONPROLIFERATION REGIME** • *Support U.S.-lead negotiations on the Fissile Material Cut-Off Treaty at the United Nations multi-lateral conference on disarmament in Geneva. (NN)*	**NS5-1 STRENGTHENING THE NUCLEAR NONPROLIFERATION REGIME** • *Support negotiations on the Fissile Materials Cut-off Treaty. (NN)* • *Implement a nuclear spent fuel maintenance plan by continuing technical dialogue with the Democratic Peoples Republic of Korea (DPRK) (NN)* • *Lead, via the Joint Chairmanship, the interagency task force on warhead and fissile material to implement a START III concept for warhead elimination by July 2000. (NN)* • *Provide equipment, technologies, & expertise to the IAEA and the United Nations Special Commission (UNSCOM) to perform monitoring & intrusive inspections in North Korea and Iraq sufficient to verify compliance with their obligations under the Non-Proliferation Treaty (NPT). (NN)*

NS-5 Continue leadership in policy support and technology development for international arms control and nonproliferation efforts. (NN) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS5-2 MINIMIZING THE RISKS OF PROLIFERATION • *Making progress in material protection, control and accounting (MPC&A) upgrades at each of the 53+ facilities in Russia, the Newly Independent States (NIS), and the Baltics that use or store weapons-usable nuclear material. (NN)* (PARTIALLY SUCCESSFUL Completed upgrades at 19 sites) • *Commissioning the MPC&A system at the Chelyabinsk-70 pulse research reactor by July 1998.(NN)* (FULLY SUCCESSFUL) • *Completing the rapid security upgrades on at least 1/2 of the 35 rail cars used to transport weapons-usable nuclear materials in Russia by September 1998. (NN)* (SUCCESSFUL) • *Developing and implementing 12 commercial development projects at 6 primary biological and chemical weapons research and production facilities in Russia and Kazakhstan engaging an estimated 80 weapons experts. At least 6 projects will have subcontracts in place by April 1998 with the remaining 6 subcontracts in place by September 1998.(NN)* (FULLY SUCCESSFUL) • *Developing and implementing 30 commercial development projects at nuclear weapons research and production facilities in Russia, Ukraine and Kazakhstan engaging approximately 1,000 weapons experts. All subcontracts will be in place by September 1998. (NN)* (FULLY SUCCESSFUL)	**NS5-2 MINIMIZING THE RISKS OF PROLIFERATION** • *Continue to improve and integrate technology practices, facilities, and training for material protection, control, and accounting for approximately 650 metric tons of weapons-usable material at 53 locations. (NN)* • *Field an initial joint DOE-Customs Service remote inspection system capable of identifying radiation signatures of potential nuclear smuggling packages. (NN)* • *Support non-proliferation objectives through concluding key science and technology agreements on: (PO)* -- *Geologic research connected to radioactive waste disposal with the Russian Ministry of Atomic Energy;* -- *Renewal of the existing Peaceful Uses of Atomic Energy Agreement and beginning negotiations for a new and expanded agreement with Russia;* -- *Specific cooperative projects under the U.S.-China Peaceful Uses of Nuclear Technologies Agreement.*	**NS5-2 MINIMIZING THE RISKS OF PROLIFERATION** • *Continue to install MPC&A upgrades for defense-related sites in Russia, including 5 major uranium and plutonium cities, 3 nuclear weapons complex sites, 10 Russian Navy projects, and security upgrades in the transportation sector.(NN)* • *Continue to install MPC&A upgrades to Russian civilian and regulatory-related sites. (NN)* • *Complete installation of MPC&A upgrades in all Russian Naval fresh fuel by December 2000. (NN)* • *Equip 2-3 Russian sites and conduct 2 joint training sessions under a Second Line of Defense Initiative. (NN)* • *Cooperate with Russian Federation Customs to create civilian ventures in Russia's formerly closed nuclear cities to block nuclear smuggling. (NN)*

NS-5 Continue leadership in policy support and technology development for international arms control and nonproliferation efforts. (NN) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Completing technical assistance initiatives in Russia, Ukraine and Kazakhstan by May 1998 to develop a cadre of export control and technical advisors on supplier policy and nuclear transfer activities. (NN)* (SUCCESSFUL) • *Commencing prototypic fuel testing by July 1998 to support the core modifications required for the cessation of plutonium production at three Russian reactors. (NN)* (SUCCESSFUL)		
NS5-3 ADVANCING NONPROLIFERATION TECHNOLOGY • *Transferring to the FBI newly developed technology which will provide a capability for rapid, sensitive, in-field analysis of hazardous biological materials and quick determination of associated terrorist threats. (NN)* (PARTIALLY SUCCESSFUL. This is a multi-year effort and there are 18 jointly funded projects underway.) • *Delivering to the CTBT U.S. National Data Center a commercializable prototype of an ultrasensitive near-real-time analyzer for nuclear explosion produced Xenon isotopic gases. (NN)* (SUCCESSFUL) • *Completing an airborne demonstration of a one-of-a-kind, quantitative chemical plume characterization capability, that uses lasers for weapons production facility monitoring. (NN)* (FULLY SUCCESSFUL)	**NS5-3 ADVANCING NONPROLIFERATION TECHNOLOGY** • *Complete development and delivery to customers of two new counter-nuclear-smuggling detection technologies, one portable/hand-held and the other for wide area tracking and interdiction. (NN)* • *Demonstrate, through airborne field tests, two new technologies that use chemical detection methods to remotely characterize weapons-of-mass-destruction proliferation activities. (NN)* • *Deliver to the U.S. National Data Center for the Comprehensive Nuclear-Test-Ban Treaty the first half (Release 3) of an operational knowledge base that can be accessed by automated processing systems and human analysts to provide monitoring and verification confidence. (NN)*	**NS5-3 ADVANCING NONPROLIFERATION TECHNOLOGY** • *Develop improved technologies and systems for early detection, identification, and response to weapons of mass destruction proliferation and illicit materials trafficking (NN)* • *Deliver three improved sensor systems for treaty monitoring to the U.S. Air Force. (NN)* • *Deliver advanced technologies and analytical capabilities that comprise 80 percent of a knowledge base delivery to the CTBT U.S. National Data Center. (NN)* • *Complete a prototype hand-held detector for enhanced detection of chemical agents. (NN)* • *Develop and test a prototype subway protection system that integrates chemical sensor and predictive models into an emergency response information system. (NN)*

NS-5 Continue leadership in policy support and technology development for international arms control and nonproliferation efforts. (NN) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Delivering to the U S. Air Force spacecraft integrating contractor the first 5 flight units of an extended-energy-range X-ray sensor for monitoring of nuclear explosions in space. (NN)* (FULLY SUCCESSFUL)		

Means & Strategies for FY 2000: In accomplishing its mission, the Department will call upon existing scientific and engineering expertise and laboratory facilities at eleven of the Department's national laboratories. Because of the crosscutting nature of the many international arms control and nonproliferation projects, the human and technological resources employed are by necessity multi-disciplinary, requiring a diverse technology base. The emphasis throughout the international arms control and nonproliferation program is close coordination with internal and external customers, to ensure responsiveness to their actual needs.

NS-6 Meet national security requirements for naval nuclear propulsion and for other advanced nuclear power systems. (NR)

Long-term Strategies: Over the next several years, the Department will (1) provide the U.S. Navy with safe, militarily- effective nuclear propulsion plants and ensure their continued safe and reliable operation; and (2) meet ongoing and future national security requirements for special nuclear power systems.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS6-1 PROVIDING SPECIAL NUCLEAR POWER SYSTEMS FOR NATIONAL SECURITY • *Developing new reactor plants, including the next generation reactor, the design of which will be 75 percent complete in FY 1998 and ensuring the safety, performance reliability, and service-life of operating reactors. (NR)* (FULLY SUCCESSFUL)	**NS6-1 PROVIDING SPECIAL NUCLEAR POWER SYSTEMS FOR NATIONAL SECURITY** • *Develop new reactor plants, including the next generation reactor, which will be 85 percent complete by the end of FY 1999, and ensure the safety, performance reliability, and service-life of operating reactors. (NR)* • *Ensure radiation exposures to workers or the public from Naval Reactors' activities are within Federal limits and no significant findings result from environmental inspections by State and Federal regulators. (NR)*	**NS6-1 PROVIDING SPECIAL NUCLEAR POWER SYSTEMS FOR NATIONAL SECURITY** • *Develop new reactor plants, including the next generation reactor, which will be 90 percent complete by the end of FY 2000, and complete initial development efforts on a reactor plant for CVNX. Ensure the safety, performance reliability, and service-life of operating reactors. (NR)* • *Ensure radiation exposures to workers or the public from Naval Reactors' activities are within Federal limits and no significant findings result from environmental inspections by State and Federal regulators. (NR)*
NS6-1 [Combined with NS6-1]	**NS6-1** [Combined with NS6-1]	**NS6-1** [Combined with NS6-1]

Means & Strategies for FY 2000: To support development of reactor plants for the VIRGINIA Class submarines and the CVNX aircraft carrier; ensure safety, reliability and performance of operating reactor plans in Navy warships; and meet Navy goals for extended warship operation, the Department will:

Complete scheduled design, analysis, and testing of reactor plant components and systems.

Conduct planned development, testing, examination, and evaluation of nuclear fuel systems, materials, and manufacturing and inspection methods.

Accomplish planned testing, training and servicing involved with land-based prototype nuclear propulsion plants.

Carry out radiological control, environmental, and safety operations necessary to protect people, minimize release of hazardous effluents to the environment, and comply with all applicable regulations.

NS-7 Improve international nuclear safety. (NN, formerly NE)

Long-term Strategies: Over the next several years, the Department will (1) assist countries in reducing the risks from Soviet-designed nuclear power plants and implement a self-sustaining nuclear safety improvement program capable of reaching internationally accepted safety practices; (2) promote nuclear safety culture improvements internationally by providing strong leadership in international nuclear safety organizations and centers; and (3) assist in the multi-national effort to shut down Chornobyl Units 1, 2, and 3 in Ukraine before January 2001 and reduce the risk of possible collapse of the Unit 4 sarcophagus.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS7-1 ENHANCING THE SAFETY OF SOVIET-DESIGNED REACTORS AND PROMOTING INTERNATIONAL NUCLEAR SAFETY • *Completing development of plant models and descriptions, conducting training programs and performing safety analysis calculations at the South Ukraine Unit 1 in Ukraine and the Kola Unit 4 in Russia, as part of in-depth safety assessments at nuclear power plants in Ukraine and in Russia. (NN)* (SUCCESSFUL) • *Completing nuclear power plant simulator projects, at Novovoronezh in Russia and at Khmelnytskyy and Chornobyl in Ukraine. (NN)* (SUCCESSFUL) • *Completing the installation of Safety Parameter Display Systems at the Zaporizhzhya plant in Ukraine and at the Novovorenezh plant in Russia. (NN)* (SUCCESSFUL)	**NS7-1 ENHANCING THE SAFETY OF SOVIET-DESIGNED REACTORS AND PROMOTING INTERNATIONAL NUCLEAR SAFETY** • *Complete the development and implementation of an effective reactor plant operator training program at key plants based on the Systematic Approach to Training methodology used in the United States and provide and incorporate plant simulators into the operator training programs. (NN)* • *Complete plans for critical asset identification within the Department and test vulnerability assessment techniques in two components of the Energy Sector. (NN)* • *Provide preliminary safety assessment results to determine near-term safety improvements.(NN)* • *Complete the installation of Safety Parameter Display Systems to improve operator response to emergencies at Leningrad Unit 4 and Novororonezh Unit 4. (NN)* • *Promote U.S. positions and practices in international forums that advocate safe reactor operations. (NN)*	**NS7-1 ENHANCING THE SAFETY OF SOVIET-DESIGNED REACTORS AND PROMOTING INTERNATIONAL NUCLEAR SAFETY** • *Complete the installation of Safety Parameter Display Systems to improve operator response to emergencies at Smolenck Unit 3 in Russia and at South Ukrane Unit 2, Rivne Unit 3, and Zaporizhzhya in Ukraine. (NN)* • *Promote U.S. positions and practices in international forums that advocate safe reactor operations. (NN)* • *Complete a full-scope simulator for Russia's Kalinin plant unit 1. (NN)* • *Complete an in-depth safety assessment at Russia's Leningrad plant. (NN)* • *Complete a control and protection system upgrade at Lithuania's Ignalina plant unit 2. (NN)*
NS7-2 [Combined with NS7-1]	**NS7-2** [Combined with NS7-1]	**NS7-2** [Combined with NS7-1]

NS-7 Improve international nuclear safety. (NN, formerly NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
NS7-3 ASSISTING IN THE SHUTDOWN OF THE CHORNOBYL NUCLEAR POWER PLANT • *Providing the Chornobyl plant with equipment for dose reduction, nuclear safety monitoring, dust suppression, and industrial safety. (NN)* (SUCCESSFUL) • *Reaching an agreement with the Ukrainians on Chornobyl Unit 1 defueling. (NN)* (SUCCESSFUL)	**NS7-3 ASSISTING IN THE SHUTDOWN OF THE CHORNOBYL NUCLEAR POWER PLANT** • *Complete a comprehensive decommissioning engineering survey of Chornobyl Unit 1. (NN)*	NS7-3 [Combined with NS7-1]

Means & Strategies for FY 2000: In accomplishing its mission, the Department will call upon its existing scientific and engineering expertise and its laboratory facilities. Because of the nature of the many international nuclear safety projects, the human and technological resources employed are by necessity multi-disciplinary, requiring a diverse technology base. The emphasis throughout the international nuclear safety program is close coordination with internal and external customers, to ensure responsiveness to their actual needs.

ENVIRONMENTAL QUALITY

GOAL: Aggressively clean up the environmental legacy of nuclear weapons and civilian nuclear research and development programs, minimize future waste generation, safely manage nuclear materials, and permanently dispose of the Nation's radioactive wastes.

By 2006, the Environmental Management (EM) program intends to complete cleanup at most of its 53 [15] remaining sites. At the 10 sites remaining after 2006, including our five largest sites, treatment will continue for the remaining "legacy" waste streams and management (including stabilization and disposition) of legacy nuclear materials will continue. Even after completing cleanup, the Department will maintain a presence at most sites to ensure that the reduction in risk to human health and the environment is maintained. Such "long-term stewardship" will include passive or active institutional controls and, often, treatment of groundwater over a long period of time.

Achieving our accelerated site completion goals will require the Department to improve productivity and reduce the life-cycle costs of cleanup. The geographic site completion goals, shown in the following site completion graph, are based on EM's most aggressive budget and planning scenarios and assume the maximum possible gains in efficiency. At some of these sites, these goals are extremely ambitious and represent challenges rather than specific commitments.

The Department has established cleanup goals and remedies for each contaminated area through processes involving federal and state laws and other legal agreements. These processes include input from decision makers outside of the Department, such as states, the U.S. Environmental Protection Agency (EPA), and the U.S. Nuclear Regulatory Commission. Environmental remediation activities are based primarily on requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended; the Resource Conservation and Recovery Act (RCRA); and the National Environmental Policy Act (NEPA).

[15] EM's responsibilities include facilities and areas at 113 geographic sites (excluding the 21 sites in the Formerly Utilized Sites Remedial Action Program that transferred to the U.S. Army Corps of Engineers). As of the beginning of FY 1998, 60 geographic sites had been completed and 53 geographic sites (including WIPP which is a disposal site) remained to be cleaned up. During FY 1998, five geographic sites were completed leaving a total of 48 sites to be cleaned up as of the beginning of FY 1999.

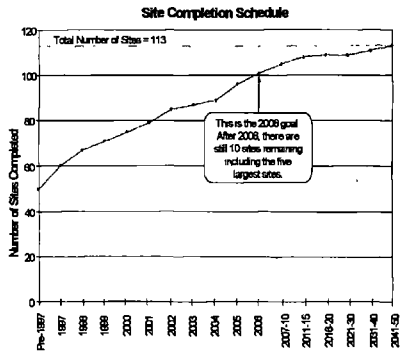

Figure 7: Site Closure Schedule

The Department will implement a formal integrated management system to more closely align the *Accelerating Cleanup: Paths to Closure* planning process with the budget formulation and execution processes. All EM activities are organized by projects, which have a defined scope, schedule and cost that support a defined end state at a specific EM site.

As with the FY 1999 Budget Request, the FY 2000 Budget Request will be organized within the following accounts to emphasize project completion and site closure: **Site Closure** (provides funding for completing cleanup and closing down facilities with no enduring Federal presence on-site, except for stewardship activities); **Site/Project Completion** (includes funding for EM projects and sites that will be completed by 2006, even though there may continue to be a Departmental mission after 2006); and **Post 2006 Completion** (funds projects that are expected to require work beyond 2006).

The FY 2000 Congressional Budget Request and the *Accelerating Cleanup: Paths to Closure* process serve as the basis for the EM commitments in this Performance Plan.

The following table maps the Presidential Budget's Program and Financing (P&F) accounts and program activities to the Department of Energy's offices and decision units. The alignment includes aggregation, disaggregation, and consolidation The table that follows this one maps DOE decision units to the business line objectives where performance measures and goals are identified.

Presidential Budget Program and Financing (P&F) Accounts and Program Activities	*FY 2000 Budget Request ($M)*	*DOE Office*	*DOE Decision Units*
050 Atomic Energy Defense Activities			
Defense Environmental Restoration and Waste Management			
Environmental Management	$4,494	EM	Defense Environmental Management
EH Health Studies	$20	EH	EH Health Studies
Defense Facilities Closure Projects	$1,054	EM	Defense Site Closure Fund
Defense Environmental Management Privatization	$396	EM	Defense Environmental Management Privatization
Defense Nuclear Waste Disposal	$112	RW	Defense Nuclear Waste Fund
Environmental Safety and Health	$92	EH	Environmental Safety and Health (Defense)
270 Energy Supply			
Non-defense Environmental Management			
Site closure	$221	EM	Site Closure Fund
Site/project completion	$101	EM	Site/Project Completion Fund
Post 2006 completion	$19	EM	Post 2006 Completion Fund
Nuclear Waste Disposal	$297	RW	Civilian Nuclear Waste
Uranium Enrichment Decontamination and Decommissioning Fund			
Environmental restoration and waste management	$210	EM	Environmental restoration and waste management
Uranium/thorium reimbursements	$30	EM	Uranium/thorium reimbursements
Environmental Safety and Health	$51	EH	Environmental Safety and Health (non-defense)
Energy Supply [16]	$269	NE	Nuclear Energy
Departmental Administration [16]	$8	FM	Field Management

[16] Only a portion of Energy Supply and Departmental Administration resources are applied to the Environmental Quality Business Line

The following table indicates which budget program/decision units support which of the business line objectives. Resources, in both funds and Full Time Equivalent staff (FTEs), are shown. FTE estimates are for the overall program offices The funds shown are program totals from DOE's budget request.

DOE Office	DOE Program/ Decision Unit	FY 2000 Budget Request ($M)	FTEs	EQ-1 Most Serious Risks First	EQ-2 Clean up	EQ-3 DOE Disposal	EQ-4 Future Pollution	EQ-5 Waste Act Disposal	EQ-6 Reduce Cost	EQ-7 Land Reuse
EM	Defense Site Closure Fund	$1,054	2,697	X	X	X	X		X	X
	Non-defense Site Closure	$211		X	X	X	X		X	X
	Defense Environmental Management	$4,494		X	X	X	X		X	X
	Non-defense Site/Project Completion Fund	$101		X	X	X	X		X	X
	Non-defense Post 2006 Completion Fund	$19		X		X	X			X
	Defense Environmental Management Privatization	$228							X	
EH	Environment, Safety & Health (non-defense)	$51	339	X						
	Environment, Safety & Health (defense)	$92		X						
	EH Health Studies	$20		X						
RW	Nuclear Waste Disposal	$297	196					X		
	Defense Nuclear Waste Fund.	$73						X		
NE	Nuclear Energy [17]	$269	144						X	
FM	Field Management[17]	$8	927							X

[17] Only a portion of Nuclear Energy and Field Management resources are applied to the Environmental Quality Business Line

EQ-1 Reduce the most serious risks from the environmental legacy of the U.S. nuclear weapons complex first. (EM, EH)

Long-term Strategy: Over the next several years, the Department will identify and fund projects to reduce the most serious risks first and prevent further increases in relative risk at all sites.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
EQ1-1 REDUCING WORKER, PUBLIC, AND ENVIRONMENTAL RISKS • *Stabilizing and safely storing about 3.7 metric tons of heavy metal of spent nuclear fuel (SNF). [Note: SNF data excludes information that is controlled or classified.]* (EM) (PARTIALLY SUCCESSFUL Behind schedule due to bankruptcy of a subcontractor.)[18] • *Stabilizing approximately 20,000 kilograms bulk of plutonium residue and approximately 7,000 liters of plutonium solution, and safely storing stabilized material. (EM)* (PARTIALLY SUCCESSFUL. Criticality safety concerns stopped work at Richland for the year and Rocky Flats was also held up by safety issues.) • *Closing one high level waste storage tank at the Savannah River Site. (EM)* (FULLY SUCCESSFUL)	**EQ1-1 REDUCING WORKER, PUBLIC, AND ENVIRONMENTAL RISKS** • *Stabilize and safely store approximately 6 metric tons of heavy metal of spent nuclear fuel (SNF). (EM)* • *Stabilize approximately 33,000 kilograms bulk of plutonium residues, approximately 40 liters of plutonium solution, and 332 containers of plutonium metals/oxides. (EM)*	**EQ1-1 REDUCING WORKER, PUBLIC, AND ENVIRONMENTAL RISKS** • *Stabilize and safely store approximately 53 metric tons of heavy metal of spent nuclear fuel (SNF). (EM)* • *Stabilize approximately 38,000 kilograms bulk of plutonium residues, approximately 160 liters of plutonium solution, and 238 containers of plutonium metals/oxides. (EM)* • *Make disposition ready 910 containers of plutonium metals/oxides. (EM)*

Means & Strategies for FY 2000: The Department will work closely with regulators, the DNFSB, and others to achieve this objective and will prioritize and fund high risk projects, such that risk to the workers, the public, and the environment decreases over time. Protecting the public, the workers, and the environment shall be a priority whenever activities are planned or performed. On his first day as Secretary of Energy, Secretary Bill Richardson stated that the, "safety, health and well-being of our workers and the public is a top priority of the Department."

[18] End-of-year results of FY 1998 Performance Agreement commitments are classified as "FULLY SUCCESSFUL", "SUCCESSFUL", "PARTIALLY SUCCESSFUL", or "UNSUCCESSFUL" for performance judged to be effectively 100% or better, 80-100%, 50-80%, or less than 50% respectively

EQ-2 Clean up as many as possible of the Department's 53[19] remaining contaminated geographic sites by 2006. (EM)

Long-term Strategies: The Department intends to complete clean up at most of its 53[19] remaining sites by 2006, with the remaining 10 sites (including our 5 largest) scheduled for completion in the post-2006 time frame.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
EQ2-1 ACCELERATE AND COMPLETE GEOGRAPHIC SITE CLEANUP • *Completing remediation at 6 geographic sites. (EM)* (SUCCESSFUL) • *Making progress on release site completion· (EM)* - *Completing about 575 release site assessments* - *Completing about 280 release site cleanups.* (FULLY SUCCESSFUL) • *Making progress on facility decommissionings: (EM)* - *Completing about 90 facility decommissioning assessments* - *Completing about 70 facility decommissionings.* (FULLY SUCCESSFUL) **EQ2-2 & EQ2-3** [Combined with EQ2-1]	**EQ2-1 ACCELERATE AND COMPLETE GEOGRAPHIC SITE CLEANUP** • *Complete remediation at 3 geographic sites, increasing the total completed to 68 of 113 geographic sites. (This is a milestone of a FMFIA corrective action plan.) (EM)* • *Complete about 310 release site assessments. (EM)* • *Complete about 165 release site cleanups. (This will bring the number of completed release site cleanups to about 4,290 out of a total inventory of approximately 9,700 release sites.) (EM)* • *Complete about 120 facility decommissioning assessments. (EM)* • *Complete about 80 facility decommissionings. (This will bring the number of completed facility decommissionings to about 530 out of a total inventory of approximately 3,350 facilities.) (EM)* **EQ2-2 & EQ2-3** [Combined with EQ2-1]	**EQ2-1 ACCELERATE AND COMPLETE GEOGRAPHIC SITE CLEANUP** • *Complete remediation at 3 geographic sites, increasing the total completed to 71 of 113 geographic sites. (EM)* • *Complete about 760 release site assessments. (EM)* • *Complete about 200 release site cleanups. (This will bring the number of completed release site cleanups to about 4,490 out of a total inventory of approximately 9,700 release sites) (EM)* • *Complete about 345 facility decommissioning assessments. (EM)* • *Complete about 110 facility decommissionings. (This will bring the number of completed facility decommissionings to about 640 out of a total inventory of approximately 3,350 facilities.) (EM)* **EQ2-2 & EQ2-3** [Combined with EQ2-1]

Means & Strategies for FY 2000: The Department will first focus on reducing any off-site contamination; then on prevention of contamination migration, reduction of on-site contamination; allocation of resources to effectively maintain essential infrastructure support, funding for other essential prudent business management activities; release of facilities and land to the public for beneficial reuse where this is deemed appropriate, and finally, additional characterization efforts to reduce uncertainty at the various sites in regard to eventual cleanup approaches Cleanup progress is measured by completion of geographic sites where EM is responsible for remediation of contaminants and other material Interim progress is demonstrated by cleaning up portions of the EM geographic sites, referred to as "Release Sites" and "Facilities" Cleaning up these areas ultimately leads to the completion of the entire geographic site

[19] Fifty-three geographic sites remained to be cleaned up as of the beginning of FY 1998. This number included the addition of WIPP which is a disposal site. Five geographic sites were completed during FY 1998 (including the revocation of the designation of two UMTRA sites , Belfield and Bowman), leaving a total of 48 sites to be cleaned up as of the beginning of FY 1999.

EQ-3 Safely and expeditiously dispose of waste generated by nuclear weapons and civilian nuclear research and development programs, and make defense high-level radioactive wastes disposal-ready. (EM, RW)

Long-term Strategies: Over the next several years, the Department will accomplish this objective using a strategy that supports the overall Environmental Quality goal to protect the environment, workers, and the public by minimizing exposure to, and eliminating hazards associated with managing radioactive and hazardous wastes. Waste management strategies to accomplish this objective will aim to: (1) reduce inventory levels of the Nation's cold war legacy and newly generated wastes, (2) ensure safe and efficient storage, treatment, and disposal of waste by providing adequate facilities and resources to protect environmental quality; (3) engage regulators and the public to increase cooperation and understanding, and (4) comply with regulatory requirements and safe work practices.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
EQ3-1 OPENING THE WASTE ISOLATION PILOT PLANT • *Shipping between 388 and 592 cubic meters of transuranic (TRU) waste to WIPP for disposal from three DOE sites (Los Alamos National Laboratory, Rocky Flats Environmental Technology Site, and Idaho National Engineering and Environmental Laboratory). (EM)* (UNSUCCESSFUL. WIPP was ready but litigation stopped shipping of TRU.) **EQ3-2 MAKING DISPOSAL READY AND DISPOSING OF WASTE GENERATED DURING PAST AND CURRENT DOE ACTIVITIES** • *Disposing of about 4,000 cubic meters of mixed low level waste (MLLW). (EM)* (FULLY SUCCESSFUL) • *Disposing of about 30,000 cubic meters of low level waste (LLW). (EM)* (FULLY SUCCESSFUL) • *Producing 200 canisters of high level waste (HLW) at the Defense Waste Processing Facility (DWPF) at the Savannah River Site. (EM)* (FULLY SUCCESSFUL) • *Producing approximately 88 canisters of HLW at the West Valley Demonstration Project. (EM)* (FULLY SUCCESSFUL)	**EQ3-1 MAKING DISPOSAL READY AND DISPOSING OF WASTE GENERATED DURING PAST AND CURRENT DOE ACTIVITIES** • *Make disposal ready about 700 cubic meters of TRU waste. (EM)* • *Ship about 700 cubic meters of TRU waste to WIPP for disposal. (EM)* • *Dispose of about 15,000 cubic meters of MLLW. (EM)* • *Dispose of about 73,000 cubic meters of LLW. (EM)* • *Produce about 200 canisters of HLW at the Defense Waste Processing Facility at the Savannah River Site. (EM)* • *Produce about 15 canisters of HLW at the West Valley Demonstration Project. (EM)*	**EQ3-1 MAKING DISPOSAL READY AND DISPOSING OF WASTE GENERATED DURING PAST AND CURRENT DOE ACTIVITIES** • *Make disposal ready about 3,400 cubic meters of TRU waste. (EM)* • *Ship about 3,400 cubic meters of TRU waste to WIPP for disposal. (This is about 2 percent of the total TRU waste that requires disposal between FY 1998 and FY 2070.) (EM)* • *Dispose of about 15,000 cubic meters of MLLW. (This completes about 14 percent of the total MLLW that requires disposal between FY 1998 and FY 2070.) (EM)* • *Dispose of about 79,000 cubic meters of LLW. (This completes about 9 percent of the total LLW that requires disposal between FY 1998 and FY 2070.) (EM)* • *Produce about 100 canisters of HLW at the Defense Waste Processing Facility at the Savannah River Site. (This completes about 15 percent of the total canisters that will be produced at SRS from FY 1996 to life-cycle completion.) (EM)* • *Produce about 5 canisters of HLW at the West Valley Demonstration Project. This completes more than 90 percent of the total canisters that will be produced at West Valley from FY 1996 to life-cycle completion. (EM)*

Means & Strategies for FY 2000: Waste management programs will continue to dispose of DOE low-level and mixed radioactive waste primarily at its current disposal facilities although the Department, with stakeholder participation, will consider alternative disposition paths that are more cost-effective while still protective of the public and the environment. Operations will minimize generation of new waste, re-use, and recycle where possible to accomplish pollution prevention goals. In addition, the Department will continue to re-engineer waste management practices and strive to have newly generated wastes disposed as generated.

Waste management activities will ensure safe handling and storage of waste in addition to maximizing isolation to reduce risks. The Department will prepare transuranic waste for disposal at the Waste Isolation Pilot Plant (WIPP) and ship as soon as legal constraints are removed; and continue to prepare high-level waste for disposal in the nation's future deep geologic repository.

The Department will integrate waste management programs across the DOE complex by consolidating waste storage, treatment and disposal facilities to maximize efficiency, reduce environmental risks and costs of operations. Efforts will continue to improve the quality and value of information on the generation, inventory, management, and transportation of DOE waste.

EQ-4 Prevent future pollution. (EM, DP, NE, SC)

Long-term Strategy: Over the next several years, the Department will minimize waste generation at the source as much as technically feasible and economically practicable and eliminate emissions and discharges, giving priority to those waste streams that may present the greatest potential risk to health or the environment.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
EQ4-1 PREVENTING FUTURE POLLUTION • *Reducing routine waste generation by 40 percent, compared with 1993 waste generation rates. [Data for reporting will be available at the end of calendar year 1998] (EM)* (FULLY SUCCESSFUL) • *Reducing/avoiding the generation of radioactive, mixed, and hazardous wastes by about 4,000 cubic meters [Data for reporting will be available at the end of calendar year 1998] (EM)* (FULLY SUCCESSFUL)	**EQ4-1 PREVENTING FUTURE POLLUTION** • *Reduce routine waste generation by 45 percent based on 1993 waste generation rates. (Data for reporting will be available at the end of calendar year 1999.) (EM)* • *Implement projects that reduce/avoid the generation of radioactive, mixed, and hazardous wastes by 2,000 cubic meters. (EM)* • *Reduce by 10 percent the waste resulting from the execution of cleanup, stabilization and decommissioning activities, from the annual planned baseline volumes. (EM)*	**EQ4-1 PREVENTING FUTURE POLLUTION** • *Reduce routine waste generation by 50% by December 1999, based on 1993 waste generation rates (EM)* • *Reduce by 10 percent the waste resulting from the execution of cleanup, stabilization and decommissioning activities, from the annual planned baseline volumes. (EM)*

Means & Strategies for FY 2000: The Department will apply pollution prevention techniques such as material substitution, process modification, segregation/reuse, and recycling, where they would not increase the life cycle cost of the cleanup/stabilization/waste management projects. The Department will expand its pollution prevention goals to the year 2005 and each site will update its triennial pollution prevention plan to reflect new goals by the Spring of 2000. The Department will use Life Cycle Asset Management (LCAM) Order (430.1) to ensure that pollution prevention is designed into all new facilities and major modifications. Headquarters/Operations/Field Offices will be held accountable for implementing site Pollution Prevention Plans and LCAM Agreements Through an expanded field assessment program, the Department will measure success through continuous improvement and trending towards zero waste generation and emissions.

EQ-5 Dispose of high-level radioactive waste and spent nuclear fuel in accordance with the Nuclear Waste Policy Act as amended. (RW)

Long-term Strategies: Over the next several years, the Department will (1) complete the scientific and technical analyses of the Yucca Mountain site, and if it is determined to be suitable for a geologic repository, obtain a license from t he Nuclear Regulatory Commission; and (2) maintain the capability to initiate plans to transport spent nuclear fuel and high level waste as soon as a Federal facility is designated under the Nuclear Waste Policy Act

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
EQ5-1 CONTINUING WITH YUCCA MOUNTAIN SITE CHARACTERIZATION • *Completing the viability assessment analyses for licensing and constructing a geologic repository at the Yucca Mountain site. The assessment will consist of four key components: (RW)* - *A design and operational concept of the repository;* - *An assessment of the performance of that concept in the geologic setting,* - *A plan and cost estimate to construct and operate the repository, and* - *A plan and an estimate of the costs to complete a license application* (FULLY SUCCESSFUL) **EQ5-2 DEVELOPING WASTE ACCEPTANCE AND TRANSPORTATION CAPABILITY** • *Completing generic, non-site-specific interim storage facility work and addressing long lead-time issues related to storage of waste including design, engineering, and safety analyses. (RW)* (FULLY SUCCESSFUL) • *Developing a market-driven approach that uses private sector management and operational capabilities to provide waste acceptance, and transportation services Issuing a revised draft request for proposals. (RW)* (FULLY SUCCESSFUL) • *Completing a revised Policy and Procedure for implementation of Section 180 of the Nuclear Waste Policy Act. (RW)* (FULLY SUCCESSFUL)	**EQ5-1 CONTINUING WITH YUCCA MOUNTAIN SITE CHARACTERIZATION** • *Publish a draft Environmental Impact Statement (EIS). The Nuclear Waste Policy Act requires a Final EIS to accompany the site recommendation (RW)* • *Complete repository and waste package design inputs for use in total system performance assessment for the repository license application. (RW)* • *Complete peer review of the total system performance assessment to provide formal, independent evaluation and critique. (RW)* **EQ5-2 DEVELOPING WASTE ACCEPTANCE AND TRANSPORTATION CAPABILITY** • ~~*Develop enhancements and modifications to the Standard Disposal Contract to support procurement of waste acceptance and transportation services (RW)*~~ [20]	**EQ5-1 CONTINUING WITH YUCCA MOUNTAIN SITE CHARACTERIZATION** • *Issue a Final Environmental Impact Statement as required by the Nuclear Waste Policy Act. (This also meets a milestone in a FMFIA corrective action plan) (RW)* • *Select the reference design for site recommendation and license application. (RW)* • *Select the reference natural systems models for site recommendation and license application. (RW)* **EQ5-2** [Combined with EQ5-1]

[20] Because of ongoing litigation concerning spent fuel acceptance, this performance goal has been delayed. It will be resumed upon resolution of pending legal issues

Means & Strategies for FY 2000: The Department will focus the Civilian Radioactive Waste Management Program on the activities necessary to determine the suitability of the Yucca Mountain site as a repository, develop the documentation needed for a Secretarial decision on the Site Recommendation to the President in FY 2001, and on other activities associated with the Federal government's waste acceptance obligations

EQ-6 Reduce the life-cycle costs of environmental cleanup. (EM, NE)

Long-term Strategies: Over the next several years, the Department will (1) significantly enhance performance, increase efficiency and reduce costs; (2) develop and deploy innovative environmental cleanup, nuclear waste, and spent fuel treatment technologies; and (3) reduce operating costs.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
EQ6-1 REDUCING ENVIRONMENTAL CLEANUP COSTS THROUGH ENHANCED PERFORMANCE • *Achieving productivity enhancement targets (Targets to be established as part of the Accelerating Clean-up: Focus on 2006). (EM)* (SUCCESSFUL) • *Increasing the dollar value and/or number of competitively awarded fixed price contracts, including privatization contracts. Continuing the development of the privatization strategy by: (EM)* - *Awarding the Oak Ridge Transuranic Waste Treatment Privatization contract;* - *Authorizing commencement of the Tank Waste Remediation System (TWRS) contract Phase 1B at Hanford Site in Washington; and* - *Awarding the Carlsbad Area Office Contact-Handled Transuranic Waste Transportation Privatization Contract.* (SUCCESSFUL)	**EQ6-1 REDUCING ENVIRONMENTAL CLEANUP COSTS THROUGH ENHANCED PERFORMANCE** • *Continue the development and implementation of the privatization strategy by: (EM)* - *Commencing Phase II (Design completion and facility construction) of the Idaho National Engineering and Environmental Laboratory (INEEL) Advanced Mixed Waste Treatment Project (AMWTP);* - *Awarding the contract for the INEEL Spent Nuclear Fuel (SNF) Dry Storage Project; and* - *Awarding the contract for the Oak Ridge Waste Disposal Project (Design completion/ construction/operation).*	**EQ6-1 ACHIEVING ENHANCED PERFORMANCE, INCREASED EFFICIENCY AND REDUCED COSTS** • *Continue the development and implementation of the privatization strategy by:* - *Achieving the Authorization To Proceed decision for the construction and operations phase (Phase B2) of the Tank Waste Remediation System (TWRS) contract at Hanford Site (EM)*

EQ-6 Reduce the life-cycle costs of environmental cleanup. (EM, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
EQ6-2 DEVELOPING AND DEPLOYING INNOVATIVE CLEANUP TECHNOLOGIES • *Accomplishing 49 innovative technology deployments. (EM)* (FULLY SUCCESSFUL) • *Demonstrating 35 alternative technology systems that meet the performance-specification based needs as identified by the Site Technology Coordinating Groups (STCG). (EM)* (FULLY SUCCESSFUL) • *Making 40 alternative technology systems available for implementation with full cost and engineering performance data. (EM)* (FULLY SUCCESSFUL) • *Completing the final Programmatic Environmental Impact Statement for selecting the long-term management strategy for the depleted UF6. (NE)* (SUCCESSFUL)	**EQ6-2 DEVELOPING AND DEPLOYING INNOVATIVE CLEANUP TECHNOLOGIES** • *Accomplish 60 innovative technology deployments. (EM)* • *Demonstrate 22 alternative technology systems that meet the performance-specification based needs as identified by the Site Technology Coordination Groups. (EM)* • *Make 40 alternative technology systems ready for implementation with cost and engineering performance data. (EM)* • *Complete the demonstration of the electrometallurgical spent fuel treatment technology by the end of FY 1999 using Experimental Breeder Reactor-II (EBR-II) spent nuclear fuel.(NE)* • *Complete the conversion and disposition of 100 percent of the secondary sodium coolant from the Experimental Breeder Reactor-II and 40 percent of the Fermi reactor sodium coolant in storage at Argonne National Laboratory-West. (NE)* • *Maintain the Fast Flux Test Facility in a safe, environmentally-compliant standby condition to permit implementation of an anticipated Secretarial decision in FY 1999 to deactivate or pursue potential restart to support a range of national research reactor requirements. (NE)*	**EQ6-2 DEVELOPING AND DEPLOYING INNOVATIVE CLEANUP TECHNOLOGIES** • *Accomplish 60 [21] innovative technology deployments. (EM)* • *Demonstrate 30 alternative technology systems that meet the performance-specification based needs as identified by the Site Technology Coordination Groups. (EM)* • *Make 30 alternative technology systems ready for implementation with cost and engineering performance data. (EM)* • *Meet all Federal and State safety and environmental requirements for the Fast Flux Test Facility while implementing a Secretarial decision on the facility. (NE)* • *Complete the draining and processing of EBR-II primary sodium (NE)* • *Complete a National Environmental Policy Act (NEPA) review on the use of electrometallurgical technology to treat EBR-II and other sodium-bonded fuel in the Department's problem spent fuel. (NE)* • *Through the NEPA decision-making process, establish and begin implementing a long-term strategy for the management of the Department's depleted uranium hexafluoride inventories. (NE)*

[21] A goal of 60 technology deployments is established based on the current rate of deployments Historically, it has proven difficult to accurately quantify longer-term performance goals for deployments. This is due to the nature of the technology work scope and the variations in timing and magnitude of the deploying program's work scope.

EQ-6 Reduce the life-cycle costs of environmental cleanup. (EM, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
	• *Meet all commitments made to the Ohio Environmental Protection Agency and the Defense Nuclear Facilities Safety Board to ensure the safety of the Department's inventory of depleted uranium hexafluoride. (NE)*	• *Meet all commitments made to the Ohio Environmental Protection Agency and the Defense Nuclear Facilities Safety Board to ensure the safety of the Department's inventory of depleted uranium hexafluoride. (NE)* • *Supply quality stable and radioactive isotopes for industrial, research, and medical applications that continue to meet customer specifications and maintain 95 percent on-time deliveries. (NE)* • *Complete at least 60 percent of the construction of the Los Alamos Target Irradiation Station, which is needed for the production of short-lived isotopes for medical research. (NE)*
EQ6-3 COMPLETING DEACTIVATION OF SURPLUS FACILITIES • *Completing about 60 surplus facility deactivations. (EM)* (FULLY SUCCESSFUL)	**EQ6-3 COMPLETING DEACTIVATION OF SURPLUS FACILITIES** • *Complete about 65 surplus facility deactivations. (EM)*	**EQ6-3 COMPLETING DEACTIVATION OF SURPLUS FACILITIES** • *Completing about 60 surplus facility deactivations. (EM)*

Means & Strategies for FY 2000: The Department will continue to seek "performance enhancements" as a means of reducing the significant costs of the cleanup program By becoming more cost-efficient, the Department will be able to accelerate cleanup and closure schedules, and thereby lower life-cycle cleanup costs. The Department has established accelerated site closure targets for the Rocky Flats Environmental Technology Site (from 2010 to 2006), Fernald Environmental Management Project (from 2008 to 2005), and Mound (from 2005 to 2004). In *Accelerating Cleanup: Paths to Closure*, the Department identified several ways to enhance performance to improve productivity and/or accelerate site closure:

Application of Technology Deployment – Introducing less expensive and/or more effective cleanup technologies,

Integration – Identifying better ways to transfer and manage wastes among sites;

Project Sequencing – Completing projects with high "upkeep" costs;

Reducing Support Costs – Applying more funds to cleanup;

Contract Reform – Creating incentives for contractors to improve performance (quality results and accelerated completion), and

Lessons Learned – Increasing productivity based on lessons learned.

The Department will also · (1) reduce operating costs by continuing deactivation of surplus nuclear facilities and placing them :n a radiologically and industrially safe shutdown condition; (2) reduce the disposition cost of depleted uranium by exploring and developing alternative government uses for the materials; (3) perform depleted uranium hexafluoride cylinder maintenance activities that are protective of workers and the environment; and (4) work in cooperation with other Federal and State agencies to determine acceptable cleanup strategies and to define appropriate end point criteria for cleanup activities. The Department will conduct facility surveillance and maintenance activities to ensure there is· (1) no degradation of key plant systems; (2) retention of authorized basis and configuration control; (3) maintenance of key staffing, qualifications, and training; and (4) compliance with Federal and State safety and environmental regulations

EQ-7 Maximize the beneficial reuse of land & facilities and effectively control risks from residual contamination. (EM, FM)

Long-term Strategy: Over the next several years, the Department will, in conjunction with stakeholders, develop comprehensive land use plans for DOE sites that provide information on alternative uses, ownership, environmental requirements, and implementation schedules and ensure environmental remedies remain protective.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
EQ7-1 MAKING DOE LANDS AND FACILITIES AVAILABLE FOR OTHER USES • *Submitting to Congress a future use plan for DOE sites, and an analysis of related long-term stewardship issues by October 1998. The plan and analysis will include the Hanford Site, Savannah River Site, Rocky Flats Environmental Technology Site, and Idaho National Engineering and Environmental Laboratory. (EM)* (SUCCESSFUL) • *Initiating disposition of thirty percent of land and facilities identified as excess by the mission justification analysis. (FM)* (SUCCESSFUL)	**EQ7-1 MAKING DOE LANDS AND FACILITIES AVAILABLE FOR OTHER USES** • *Release a background report on Long-term Stewardship ("Moving from Cleanup to Stewardship") by the second quarter of FY 1999. This report was one of the commitments published in the June 1998 Paths to Closure document. (EM)* • *Begin the formal study on long-term stewardship pursuant to the 1998 Programmatic Environmental Impact Statement (PEIS) settlement agreement, which requires a public scoping and comment process; and complete the scoping process portion of the study. (EM)* • *Complete mission justification analysis for land and facilities at 5 of the remaining 15 sites. (FM)*	**EQ7-1 MAKING DOE LANDS AND FACILITIES AVAILABLE FOR OTHER USES** • *Produce the draft study on long-term stewardship pursuant to the 1998 PEIS settlement agreement by March 31, 2000. (EM)* • *Complete a disposition schedule for all non-contaminated real property (including facilities), identified in the Facility Information Management System (FIMS) as "excess" as of October 1, 1999 (FM)* **EQ7-2 ENSURING ENVIRONMENTAL REMEDIES REMAIN PROTECTIVE FOR THE LONG-TERM** • *Continue coordination with the National Academy of Sciences/National Research Council on the release of their analyses on long-term stewardship ("closure"). (EM)* • *Improve the integration of long-term stewardship issues with project baselines in the revision to "Accelerating Cleanup: Paths to Closure", to include developing baseline information for stewardship at each site. (EM)*

Means & Strategies for FY 2000: The Department will continue to work with state and federal regulatory agencies, as well as Indian tribes, local governments and community organizations on formulating environmental cleanup remedies that consider future land use. The Department will develop a program initiative to accelerate the cleanup of lands by applying technologies to recover useful lands for transfer to the private sector In addition, the Department will seek to encourage beneficial reuse of land by coordinating with the Environmental Protection Agency (EPA) brown fields initiative and sharing lessons learned with the Department of Defense (DOD) Baseline Realignment and Closure (BRAC) process. The Department will also develop a framework for a long-term stewardship program, including resources for site personnel on data retention, institutional controls and remedy selection consideration.

SCIENCE AND TECHNOLOGY

GOAL: Deliver the scientific understanding and technological innovations that are critical to the success of DOE's mission and the Nation's science base.

The Department, through the programs of the Office of Science (SC), funds basic research in order to advance the fundamental science knowledge base, as well as train future scientists. Research of this type has been supported by the Department of Energy and its predecessors for over 40 years and includes research in:

- basic energy sciences research in materials and chemical sciences, engineering and geosciences, and energy biosciences;
- magnetic fusion energy;
- health and environmental research;
- high energy and nuclear physics;
- computational and technology research in mathematical, informational, and computational sciences.

These research programs build the science and technology base for our Nation's energy security and scientific leadership.

Access to a broad variety of facilities and laboratories is essential to success in our research efforts. The facilities include large accelerators, experimental detectors, and reactors, high-precision instruments, synchrotrons, massively parallel computers, high-capacity networks, and high-resolution microscopes. These facilities are used by a broad base of user groups from universities and industries all over the country and abroad.

The knowledge, techniques, and instruments developed in the diverse programs of the Office of Science contribute to U.S. economic and national defense security, and are used in therapeutic and diagnostic medical applications, electricity generation, and an array of applications in industry and other scientific areas.

The following table maps the Presidential Budget's Program and Financing (P&F) accounts and program activities to the Department of Energy's offices and decision units. The alignment includes aggregation, disaggregation, and consolidation. The next table maps DOE decision units to the business line objectives where performance measures and goals are identified.

Presidential Budget Program and Financing (P&F) Accounts and Program Activities		*FY 2000 Budget Request ($M)*	*DOE Office*	*DOE Decision Units*
250 Energy Programs				
Science				
	High energy physics	$697	SC	High Energy Physics
	Nuclear physics	$343	SC	Nuclear Physics
	Biological and environmental research	$411	SC	Biological & Environmental Research
	Basic energy sciences	$888	SC	Basic Energy Sciences
	Computational and technology research	$199	SC	Computational & Technology Research
	Energy research analyses	$1	SC	Energy Research Analysis
	Multiprogram energy labs--facility support	$21	SC	Multiprogram energy labs--facility support
	Fusion energy sciences	$223	SC	Fusion Energy Sciences
	Program direction	$52	SC	Program Direction
270 Energy Supply				
	Technical Information Management	$9	SC	Technical Information Management
270 Energy Supply [22]		$269	NE	Nuclear Energy

[22] Only a portion of Energy Supply resources are applied to the Science & Technology Business Line

The following table indicates which budget program/decision units support which of the business line objectives. Resources, in both funds and Full Time Equivalent staff (FTEs), are shown. FTE estimates are for the overall program offices. The funds shown are program totals from DOE's budget request.

DOE Office	Program/ Decision Unit	FY 1999 Budget Request ($M)	FTEs	ST-1 Long Term Science	ST-2 Leading-Edge Technologies	ST-3 Management of Science	ST-4 Science Education
SC	High Energy Physics	$697	424	X	X	X	
	Nuclear Physics	$343		X		X	
	Biological & Environmental Research	$411		X	X	X	
	Basic Energy Sciences	$888		X	X	X	
	Computational & Technology Research	$199		X	X	X	
	Energy Research Analyses	$1		X	X

[23] Only a portion of Nuclear Energy resources are applied to the Environmental Quality Business Line.

ST-1 Develop the science that underlies DOE's long-term mission. (SC)

Long-term Strategies: Over the next several years, the Department will (1) conduct relevant, high quality, innovative research that responds to the needs of the DOE mission, (2) provide new insights into the fundamental nature of energy and matter; (3) search for and utilize the best talent from all sources to perform DOE research; (4) develop science to support DOE's participation in energy and other National policy formulations; (5) support emerging sciences that are important to the future of DOE and the Nation, including interdisciplinary research that addresses the Nation's most pressing problems; and (6) leverage research opportunities through science partnerships and pursue international science collaborations.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST1-1 PURSUING INNOVATIVE RESEARCH RELEVANT TO DOE'S MISSION • *Maintaining the high quality and relevance of DOE's science as evaluated by annual peer reviews and advisory committees. (SC)* (FULLY SUCCESSFUL)[24] • *Completing initial clinical trials of Boron Neutron Capture Therapy to evaluate its safety and feasibility as an alternative method of treating cancers that resist conventional methods of treatment. (SC)* (FULLY SUCCESSFUL) • *Initiating a new Climate Change Technology program that will underpin new opportunities and technologies in carbon capture.(SC)* (FULLY SUCCESSFUL) • *Advancing the state of human genome research by reducing cost and increasing speed and quality of DNA sequencing, and submitting 20 million subunits of finished human and mouse DNA sequence to publicly accessible databases. (SC)* (FULLY SUCCESSFUL)	**ST1-1 CONDUCTING RELEVANT, HIGH QUALITY, INNOVATIVE RESEARCH THAT RESPONDS TO THE NEEDS OF THE DOE MISSION** • *Complete sequencing of 30 million subunits and draft sequence of 30 million additional subunits of human DNA for submission to publicly accessible databases. (SC)* • *Maintain optimum operating schedules at major scientific user facilities to serve thousands of researchers from universities, national laboratories, and industry. (SC)* • *Complete preparations and begin operation of the newly completed B-factory at the Stanford Linear Accelerator Center and the Tevatron at Fermilab. (SC)*	**ST1-1 CONDUCTING RELEVANT, HIGH QUALITY, INNOVATIVE RESEARCH THAT RESPONDS TO THE NEEDS OF THE DOE MISSION** • *Complete the sequencing of 50 million subunits of human DNA to submit to publicly accessible databases in FY 2000. (SC)* • *Maintain the high quality and relevance of DOE's science as evaluated by annual peer reviews and advisory committees. (SC)* • *Maintain optimum operating schedules at major scientific user facilities to serve thousands of researchers from universities, national laboratories, and industry while operating time lost at such user facilities due to unscheduled downtime is less than 10 percent of the total scheduled possible operating time, on average. (SC)* • *Keep the development and upgrade of scientific facilities (including experimental stations) on schedule and with in cost, not exceeding 110 percent of estimates. (SC)*

[24] End-of-year results of FY 1998 Performance Agreement commitments are classified as "FULLY SUCCESSFUL", "SUCCESSFUL", "PARTIALLY SUCCESSFUL", or "UNSUCCESSFUL" for performance judged to be effectively 100% or better, 80-100%, 50-80%, or less than 50% respectively.

ST-1 Develop the science that underlies DOE's long-term mission. (SC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST1-2 FURTHERING OUR KNOWLEDGE OF ENERGY AND MATTER • *Commencing full operation of all 3 experimental halls at the Thomas Jefferson National Accelerator Facility to explore the structure of atomic nuclei. (SC)* (FULLY SUCCESSFUL) • *Commencing research in collaboration with international research community, at the new Sudbury Neutrino Observatory (SNO) in Ontario, Canada to understand why neutrino detection from the sun is much less than expected. (SC)* (FULLY SUCCESSFUL)	**ST1-2 PROVIDING NEW INSIGHTS INTO THE FUNDAMENTAL NATURE OF ENERGY AND MATTER** • *Complete construction and begin operation of the Relativistic Heavy Ion Collider (RHIC) at Brookhaven National Laboratory. (SC)* • *Deliver on the 1999 US/DOE commitments to the international Large Hadron Collider project (SC)*	**ST1-2 PROVIDING NEW INSIGHTS INTO THE FUNDAMENTAL NATURE OF ENERGY AND MATTER** • *Move the newly upgraded D-Zero and CDF detectors at Fermilab into position in the Main Injector tunnel and begin commissioning in the third quarter of the fiscal year. (SC)* • *Further the progress on achieving luminosity and operational efficiency for the Tevtron at Fermilab in its new mode of operation with the recently completed Main Injector. (SC)* • *Advance knowledge from experiments at the Relativistic Heavy Ion Collider to see possible evidence of the predicted quark-gluon plasma; a high temperature, high density state of nuclear matter that may have existed a millionth of a second after the "Big Bang" (SC)* • *Complete and make available for use via the web a new energy transport code framework, based on modern computing techniques (SC)* • *Operate the B-factory at the Stanford Linear Accelerator Center, the Main Injector for the Tevatron at Fermilab, the Thomas Jefferson National Accelerator Facility, and the Relativistic Heavy Ion Collider at Brookhaven National Laboratory, and deliver on the FY 2000 U S /DOE commitments to the international Large Hadron Collider project. (SC)*

ST-1 Develop the science that underlies DOE's long-term mission. (SC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST1-3 IDENTIFYING AND EMPLOYING THE BEST SCIENTIFIC TALENT • *Establishing partnerships for Academic-Industrial Research (PAIR) Program to enhance opportunities for research partnerships between academic researchers, their students, and industrial researchers. (SC)* (FULLY SUCCESSFUL)	**ST1-3 SEARCHING FOR AND UTILIZE THE BEST TALENT FROM ALL SOURCES TO PERFORM DOE RESEARCH** • *Complete a search for and name Directors of the Argonne National Laboratory, Fermi National Accelerator Laboratory, and Stanford Linear Accelerator Center. (SC)*	**ST1-3 SEARCHING FOR AND UTILIZE THE BEST TALENT FROM ALL SOURCES TO PERFORM DOE RESEARCH** • *Continue Partnerships for Academic-Industrial Research where peer reviewed grants are awarded to university researchers for fundamental, high-risk work jointly defined by the academic and industrial research partners.* • *Begin new funding opportunities in basic plasma sciences and junior plasma physics facility development programs provided through competitive announcements.* • *Review at least 80 percent of the research projects by appropriate peers and select through a merit-based competitive process.*
ST1-4 PROVIDING SCIENCE TO SUPPORT NATIONAL POLICY MAKING • *Developing a comprehensive Departmental policy for laboratory technology transfer in order to leverage science and technology for our nation's economic competitiveness with a stronger partnership with the private sector. (SC)* (PARTIALLY SUCCESSFUL: A position paper proposing principles, criteria, and roles and responsibilities for DOE technology partnership activities was prepared and has been circulated. Policy implications have been discussed with the laboratory directors.)	**ST1-4 DEVELOPING SCIENCE TO SUPPORT DOE'S PARTICIPATION IN ENERGY AND OTHER NATIONAL POLICY FORMULATIONS** • *Determine 70 percent of the DNA sequence of 10 additional microbes with potential use in waste cleanup or energy production. (SC)* • *Initiate a new joint Biological and Environmental Research-Basic Energy Sciences program in fundamental science that will underpin new opportunities and technologies in carbon capture. (SC)* • *Continue collaborative efforts with NASA on space science and exploration. (SC)*	**ST1-4 DEVELOPING SCIENCE TO SUPPORT DOE'S PARTICIPATION IN ENERGY AND OTHER NATIONAL POLICY FORMULATIONS** • *Proceed on the development of the next generation coupled ocean-atmosphere climate model, leading to better information for assessing climate change and variability at regional, rather than global scales. This next generation model will change grid size from the current 300-500 kilometers on a side to less than 200 kilometers on a side. (SC)* • *Continue collaborative efforts with NASA on space science and exploration (SC)* • *Complete the genetic sequencing of over 10 additional microbes with significant potential for waste cleanup and energy production. (SC)*

ST-1 Develop the science that underlies DOE's long-term mission. (SC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
		• *Develop and implement, in cooperation with Basic Energy Sciences, a comprehensive program within the Climate Change Technology Initiative where the focus areas are those that promise the maximum impact in the area of carbon management in addition to supporting fundamental research that address other diverse aspects of the problem. (SC)*
ST1-5 SUPPORTING RESEARCH COLLABORATIONS IN EMERGING AND INTERDISCIPLINARY AREAS • *Applying advances in instrument miniaturization, computational data processing, and molecular and structural biology to advance the development of highly sensitive medical imaging systems used in the detection of diseases. (SC)* (FULLY SUCCESSFUL)	**ST1-5 SUPPORTING EMERGING SCIENCES THAT ARE IMPORTANT TO THE FUTURE OF DOE AND THE NATION** • *Discover new biological structures with more than 60 percent of the new biological structures published in the peer-reviewed literature resulting from data generated as part of the structural biology synchrotron user station program. (SC)* • *Conduct, with at least 75 patients, Boron Neutron Capture Therapy (BNCT) Research Phase I/II clinical trials at reactor sources with neutrons. (SC)* • *Initiate change-out of the beryllium reflector at the High Flux Isotope Reactor at Oak Ridge National Laboratory and improvements to the facility's beam tubes and monochromators. (SC)*	**ST1-5 SUPPORTING EMERGING SCIENCES THAT ARE IMPORTANT TO THE FUTURE OF DOE AND THE NATION** • *Determine the molecular structures of proteins with more than 60 percent of the new structures that are published in the peer reviewed literature resulting from data generated at synchrotron user stations by BER structural biology program. (SC)* • *Complete Phase I/II clinical trials of BNCT at reactor sources of neutrons for at least 100 patients, and development of an additional medical reactor at McClellan Air Force Base-University of California at Davis. (SC)* • *Operate the National Spherical Torus Experiment with a national research team demonstrating long pulse (greater than 1 second) operation at plasma currents approaching 1 megampere, a factor of 40 increase over current exploratory level spherical torus experiments. (SC)*

ST-1 Develop the science that underlies DOE's long-term mission. (SC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST1-6 LEVERAGING RESOURCES THROUGH INTERNATIONAL COLLABORATIONS ON SCIENCE PROJECTS • *Signing the international agreement to participate in the construction and management of the Large Hadron Collider accelerator and the two major detectors. (SC)* (FULLY SUCCESSFUL) • *Completing the memorandum of understanding with the National Science Foundation concerning the management of the U.S. Large Hadron Collider activities. (SC)* (FULLY SUCCESSFUL) • *Completing and transmitting to Congress a Strategic Plan for U.S. International Collaborations in Fusion Science and Technology Research fulfilling a House Science Committee requirement. (SC)* (FULLY SUCCESSFUL) • *Reaching an agreement on the first annual program of bilateral fusion activities between U.S. and Korea.* (SC) (FULLY SUCCESSFUL)	**ST1-6 LEVERAGING RESEARCH OPPORTUNITIES** • *Conduct five intensive operations periods at the Atmospheric Radiation Measurement (ARM) Southern Great Plains site and redeploy an atmospheric radiation and cloud station from the Arctic Ocean to Atqasuk, Alaska. (SC)* • *Provide advanced simulations of possible climate response to increasing atmospheric concentrations of greenhouse gases at subcontinental spatial scales. (SC)* • *Restructure the technology program sub-element in the Fusion Energy Science Program to focus on domestic fusion program needs while maintaining strategic participation in international collaborative activities.* [25] *(SC)* <moved from ER-5>	**ST1-6 LEVERAGING RESEARCH OPPORTUNITIES** • *Coordinate with other federal agencies, Canada and Brazil to maximize national and international capabilities to enhance understanding of the current global carbon dioxide distribution and the role of the terrestrial biosphere in that distribution. (SC)* • *Develop collaborative partnerships between strong marine sciences research institutions and those with developing capabilities to advance innovative techniques in modern molecular biology to understand the coupling between carbon and nitrogen cycles in costal waters and sediments. (SC)* • *Make operational three innovative concept exploration experiments in fusion science-- The LSX field-reversed configuration and the flow-through Z pinch, both at the University of Washington and the Pegasus quast-spherical toroidal plasma at the Wisconsin-- providing basic scientific understanding of relevant concept phenomena. (SC)*

[25] The fusion program was moved from the Energy Resources business line based on Congressional budget structure changes.

ST-1 Develop the science that underlies DOE's long-term mission. (SC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Completing the review of proposals and initiating projects in FY 1998 to design and develop advanced catalysts, electrodes, and membranes, as well as advanced separator plates and high temperature sealants under the Russian-American Fuel Cell Consortium. (PO)* (FULLY SUCCESSFUL) • *Continuing cooperative research efforts with Russia, begun in 1973, on fundamental properties of matter, fusion energy science, nuclear reactor safety, environmental restoration and nuclear waste management by renewing the existing umbrella Peaceful Uses of Atomic Energy Agreement (PUAE), which will expire December 1998, for 12-18 months and beginning negotiations of a new and expanded PUAE Agreement. (PO)* (PARTIALLY SUCCESSFUL: The Russians did not sign the agreement but MOUs are working)		• *In cooperation with NASA, NSF, USDA/Forest Service, and the Smithsonian Institution, provide quantitative data on the annual exchange of carbon dioxide between the atmosphere and terrestrial ecosystem from 25 AmeriFlux sites representing major types of ecosystem and land uses in North and Central America. Provide data on environmental factors, such as climate variation, on the net sequestration or release of carbon dioxide and the role of biophysical processes controlling the net exchange. (SC)*

Means & Strategies for FY 2000: The Department will obtain major new fundamental knowledge by fostering and supporting fundamental, innovative peer-reviewed research to create new scientific and engineering knowledge in areas of basic energy sciences, advanced computing research, a science base for the fusion energy option, the fundamental understanding of energy and matter, and the environmental consequences of energy production and use.

ST-2 Deliver leading-edge technologies that are critical to the DOE mission and the Nation. (SC, NE)

Long-term Strategies: Over the next several years, the Department will (1) develop the technologies required to meet DOE's energy, national security, and environmental quality goals; and (2) pursue technology research partnerships with industry, academia and other government agencies and proactively accelerate the transition of technologies to end users.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST2-1 DEVELOPING DOE MISSION CRITICAL TECHNOLOGIES • *Establishing cost and schedule baselines for the three components (ATLAS Detector, CMS Detector and LHC Accelerator) of the planned US contribution to the Large Hadron Collider as specified in the DOE/NSF/CERN Agreement. (SC)* (FULLY SUCCESSFUL) • *Executing a multi-year contract for development of highly efficient radioisotope power systems in support of NASA's future mission requirements. (NE)* (FULLY SUCCESSFUL) • *Completing 80 percent of the Sandia Hot Cell Facility construction modifications and processing equipment installation activities needed to achieve the facility capability to process 100 percent of the U.S. demand for molybdenum-99. (NE)* (FULLY SUCCESSFUL) • *Supplying quality stable and radioactive isotopes for industrial, research, and medical applications that continue to meet customer specifications and maintaining 95 percent on-time deliveries in FY 1998 and beyond. (NE)* (FULLY SUCCESSFUL)	**ST2-1 DEVELOPING THE TECHNOLOGIES TO MEET DOE'S ENERGY, NATIONAL SECURITY, AND ENVIRONMENTAL GOALS** • *Supply quality stable and radioactive isotopes for industrial, research, and medical applications that continue to meet customer specifications and maintain 95 percent on-time deliveries. (NE)* • *Initiate construction and commissioning of the Los Alamos Target Irradiation Station, to improve isotope quality with greater operating efficiency. (NE)* • *Complete equipment installation necessary for an emergency backup supply of molybdenum-99, issue a request for proposals to privatize molybdenum-99 production and business activities by May 1999, and after evaluation, award a contract by September 1999 to the most qualified firm. (NE)* • *Develop the Advanced Computational Testing and Simulation Toolkit so that simulation can be used in place of experiments which are too dangerous, expensive, inaccessible, or politically unacceptable. (SC)*	**ST2-1 DEVELOPING THE TECHNOLOGIES TO MEET DOE'S ENERGY, NATIONAL SECURITY, AND ENVIRONMENTAL GOALS** • *Complete an Environmental Impact Statement and establish a Record of Decision on whether to proceed to develop a domestic plutonium-238 production capability for future space missions. (NE)* • *Supply quality stable and radioactive isotopes for industrial, research, and medical applications that continue to meet customer specifications and maintain 95 percent on-time deliveries. (NE)* • *Complete at least 60 percent of the construction of the Los Alamos Target Irradiation Station, which is needed for the production of short-lived isotopes for medical research. (NE)* • *Complete privatization activities associated with production and sale of commercial isotopes. (NE)* • *Implement the Advanced Nuclear Medicine Initiative by providing isotopes or financial assistance for up to five researchers. (NE)*

ST-2 Deliver leading-edge technologies that are critical to the DOE mission and the Nation. (SC, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
		• *Develop advanced computing capabilities, computational algorithms, models, methods, and libraries, and advanced visualization and data management systems to enable new computing applications to science (SC)* • *Continue to fabricate, assemble, and operate premier supercomputer and networking facilities that serve researchers at national laboratories, universities and industry enabling understanding of complex problems and effective integration of geographically distributed teams in national collaborations. (SC)* • *Continue the Natural and Accelerated Bioremediation Research (NABIR) program support fundamental research in environmental and molecular sciences that will underpin the development of bioremediation for containing hazardous waste and cleaning DOE sites. Site characterization of the first NABIR Field Research Center will proceed, and activities necessary to enable research sample distribution to investigators will commence (SC)*

ST-2 Deliver leading-edge technologies that are critical to the DOE mission and the Nation. (SC, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST2-2 PURSUING PARTNERSHIPS TO DEVELOP AND DEPLOY NEW TECHNOLOGIES • *Initiating 15 multi-year Laboratory Technology Research projects by April 1998 that address the Department's top priorities for science and technology, and are cost-shared with industry partners. (SC)* (FULLY SUCCESSFUL) • *Review and select for Phase II follow-on funding approximately 80 Small Business Innovative Research proposals that satisfied proof of concept under Phase I funding, and select approximately 200 proposals for Phase I funding. (SC)* (FULLY SUCCESSFUL)	**ST2-2 PURSUING TECHNOLOGY RESEARCH PARTNERSHIPS** • *Provide fundamental research in environmental sciences, biology, molecular sciences, and computational modeling that will underpin the cleanup of contaminated sites. (SC)* • *Complete the initial SC/EM Pilot Collaborative Research Program and, in cooperation with EM, initiate development of the most promising cleanup technologies arising from these projects. (SC)*	**ST2-2 PURSUING TECHNOLOGY RESEARCH PARTNERSHIPS** • *Initiate about 7 Laboratory Technology Research projects that address the Department's top priorities for science and technology, through cost-shared research partnerships with industry. (SC)* • *Review and select for Phase II funding approximately 80 Small Business Innovation Research (SBIR) proposals that satisfy proof of concept under Phase I funding. In a separate competition, select about 200 SBIR proposals for Phase I funding. (SC)*

Means & Strategies for FY 2000: The Department will develop the technologies required to meet DOE's energy, national security, and environmental quality goals by partnering with research institutions, universities, and closely coordinating with other federal agencies. The Department will also: (1) develop, demonstrate, test, and deliver advanced radioisotope power systems for space and national security missions; and, (2) develop new or improved isotope products and services that enable medical diagnoses and therapy, and other applications that are in the national interest, and encourage private sector investment in new isotope production ventures and sell or lease facilities and inventories for commercial purposes. The Department's Office of Nuclear Energy, Science and Technology will work with the Office of Science and Oak Ridge National Laboratory to develop a firm operating reactor schedule with early warning indicators to allow for coordination of alternative suppliers, if needed, to maintain on-time isotope deliveries. The Department will also identify, fund, and perform site maintenance, construction upgrade projects, and environmental compliance activities in accordance with DOE, Federal, and State requirements.

54-291 99 - 93

ST-3 Improve the management of DOE's research enterprise to enhance the delivery of leading-edge science and technology at reduced costs. (SC)

Long-term Strategies: Over the next several years, the Department will (1) manage the National Laboratories, science-user facilities, and other DOE research providers and research facilities in a more integrated, responsive, and cost-effective way, building on unique core strengths and corresponding roles; (2) design, construct, and operate research facilities in a timely and cost-effective manner; (3) improve the management, dissemination, sharing, and use of scientific and technical information across DOE; and (4) improve peer and program review processes.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST3-1 MANAGING THE DEPARTMENT'S NATIONAL LABORATORIES AND RESEARCH FACILITIES • *Completing a facilities roadmap which will determine the needs and provide direction to the scientific facilities through the year 2020. (SC)* (FULLY SUCCESSFUL) • *Reducing laboratory operating costs by an additional $330 million (relative to FY 1994) without reducing research outputs. This will be applied to the goal of saving $1.4 billion by FY 2000. (SC)* (FULLY SUCCESSFUL) • *Completing Critical Decision II and issuing the draft Environmental Impact Statement (EIS) to initiate construction of the Spallation Neutron Source. (SC)* (FULLY SUCCESSFUL) • *Completing the agreed upon ITER Engineering Design Activities and reaching an agreement on whether to continue into the three-year transition phase leading to construction decision. (SC)* (SUCCESSFUL)	**ST3-1 MANAGING THE NATIONAL LABORATORIES, SCIENCE-USER FACILITIES, AND OTHER DOE RESEARCH PROVIDERS AND RESEARCH FACILITIES** • *Begin Title I design activities, initiate subcontracts and long-lead procurements, and continue R&D work necessary to begin construction activities of the Spallation Neutron Source. (SC)* • *Complete prototype development of a "virtual laboratory" approach and implement at least three program trial applications. (SC)* • *Organize a national research team for the National Spherical Torus Experiment (NSTX) project at Princeton Plasma Physics Laboratory, begin experimental operations by June 1999, and complete the project by September 1999. (SC)* • *Receive from the Program Advisory Committees (PACS), an assessment, of the quality of research and program relevance at major Fusion Energy operating facilities. (SC)*	**ST3-1 MANAGING THE NATIONAL LABORATORIES, SCIENCE-USER FACILITIES, AND OTHER DOE RESEARCH PROVIDERS AND RESEARCH FACILITIES** • *Continue construction of the Spallation Neutron Source, at cost and timetables as contained in the Critical Decision II agreement, to provide beams of neutrons used to probe and understand the physical, chemical, and biological properties of materials at an atomic level leading to better fibers, plastics, catalysts, and magnets and improvements in pharmaceuticals, computing equipment, and electric motors. (SC)* • *Continue fabrication of instrumentation for the short-pulse spallation source at the Manual Lujan Jr. Neutron Scattering Center at the Los Alamos Neutron Science Center. (SC)* • *Commence full operation at three Atmospheric Radiation Measurement sites, providing unique climatological data necessary to improve climate prediction for use in energy policy development. (SC)*

ST-3 Improve the management of DOE's research enterprise to enhance the delivery of leading-edge science and technology at reduced costs. (SC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Beginning assembly and installation of the National Spherical Tokomak Experiment at Princeton Plasma Physics Laboratory in FY 1998. (SC)* (FULLY SUCCESSFUL) • *Preserving a U. S. leadership role for the utilization of synchrotron facilities by providing increased user support personnel for beam lines at the National Synchrotron Light Source at Brookhaven National Laboratory (SC).* (FULLY SUCCESSFUL) • *Making progress at the following new research facilities: (SC)* - *B-factory at Stanford Linear Accelerator Center: begin operations;* - *Main Injector at Fermilab: complete construction and begin commissioning;* - *High Flux Beam Reactor at Brookhaven: Initiate EIS;* - *Joint Genome Institute's Production Sequencing Facility: begin operations; and* - *William R. Wiley Environmental Molecular Sciences Laboratory (EMSL): begin operations.* (FULLY SUCCESSFUL) **ST3-2** [Combined with ST3-1]	• *Accomplish the milestone of the FMFIA corrective action plan to complete corrective actions identified in the DOE Action Plan for Improved Management of Brookhaven National Laboratory. (SC)* **ST3-2** [Combined with ST3-1]	• *Continue Atmospheric Radiation Measurement (ARM) accomplishments by conducting five intensive operations periods at the ARM Southern Great Plains site. Data will be obtained from the second station on the North Slope of Alaska. The third station in the Tropical Western Pacific, on Christmas Island, will become operational. (SC)* • *Operate the DIII-D Tokamak facility to test the feasibility of using increased radio frequency heating power and improved power exhaust capabilities to extend the pulse length of advanced operating modes, a requirement for future fusion energy sources. (SC)* • *Provide accountability for at least 95 percent of the required deliverables resulting from the Department's direct contract R&D agreements through the Technical Information Monitoring System (TIMS). (SC)* **ST3-2** [Combined with ST3-1]

ST-3 Improve the management of DOE's research enterprise to enhance the delivery of leading-edge science and technology at reduced costs. (SC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST3-3 MANAGING THE DISSEMINATION OF SCIENTIFIC AND TECHNICAL INFORMATION • *Negotiating and implementing an agreement with the U S. Government Printing Office to provide electronic public access to over 25,000 full-text reports containing scientific and technical information through the DOE Information Bridge. (SC)* (FULLY SUCCESSFUL)	**ST3-3 IMPROVING THE MANAGEMENT, DISSEMINATION, SHARING, AND USE OF SCIENTIFIC AND TECHNICAL INFORMATION ACROSS DOE** • *Conduct a user satisfaction survey to demonstrate that at least 75 percent are satisfied or very satisfied with our computer facilities and networks. (SC)* • *Implement a common distributed electronic infrastructure across DOE that effectively provides researchers and the public timely access to the Department's scientific and technical information. (SC)* • *Implement streamlined policies and procedures for managing the Department's scientific and technical information, using decentralized sources in a cost effective and efficient manner. (SC)*	**ST3-3 IMPROVING THE MANAGEMENT, DISSEMINATION, SHARING, AND USE OF SCIENTIFIC AND TECHNICAL INFORMATION ACROSS DOE** • *Meet 75 percent of the requirements of computer facilities and networks users. (SC)* • *Continue to make available electronic journals at the desktop, and implement tools to facilitate electronic assess to DOE's scientific and technical information. (SC)* • *Link information resources throughout the DOE complex to allow access and use via a single user inquirer, and capitalize on bibliographic information and search tools to facilitate access to full-text journal literature. (SC)*
ST3-4 IMPROVING THE EVALUATION PROCESS FOR DOE'S RESEARCH PROGRAMS • *Having programs reviewed by independent advisory committees to analyze issues and recommend research direction, specifically completion by the: (SC)* - *Energy Science Advisory Committee, of a review of the advanced fusion materials program by September 1998, and* - *High Energy Physics Advisory Panel, of a Plan for the Future of U.S. High Energy Physics.* (FULLY SUCCESSFUL)	**ST3-4 IMPROVING PEER AND PROGRAM REVIEW PROCESSES** • *Maintain high scientific quality in the Energy Research Program as judged by the Program Advisory Committees. (SC)* • *Receive from the National Research Council, an assessment, of the quality of science in the Fusion Energy Sciences research programs. (SC)*	**ST3-4 IMPROVING PEER AND PROGRAM REVIEW PROCESSES** • *Maintain high scientific quality in the Energy Research Program as judged by the Program Advisory Committees. (SC)*

Means & Strategies for FY 2000: The Department will manage the National Laboratories, scientific-user facilities, and other DOE research providers and research facilities in a more integrated, responsive, and cost-effective way, building on unique core strengths and corresponding roles. It will plan for, construct and build premier research facilities that will serve researchers at universities, national laboratories, and industrial laboratories that advance the acquisition of scientific knowledge.

ST-4 Use DOE assets as part of an Administration-wide effort to advance the Nation's science education and literacy. (SC, NE)

Long-term Strategies: Over the next several years, the Department will (1) develop and promote technologies and programs that deliver information and contribute to learning in science, math, engineering and technology, and in general, expand access to DOE's technical information; and (2) leverage DOE's human and physical research infrastructure, working with the National Science Foundation and other Federal agencies, to promote science awareness, enable advanced educational research opportunities, build capabilities at educational institutions, and improve educational opportunities for diverse groups.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
ST4-1 CONTRIBUTING TO THE NATION'S SCIENCE AND MATH EDUCATION AND PROMOTING SCIENCE AWARENESS • *Expanding sponsorship of collaborations for local and regional science awareness events. (SC)* (FULLY SUCCESSFUL) • *Supporting young outstanding scientists through: (SC)* - *Department's minority colleges and universities (MC&U) program - support for at least teams of faculty and students;* - *Hollaender Distinguished post doctoral fellowship program - support for at least eight postdoctoral students;* - *Multi-agency Significant Opportunities in Atmospheric Research and Science (SOARS) Program - support for at least two students;* - *Continuing the Departmental award program for Junior investigators in Plasma Science; and* - *Department's outstanding Junior Investigator program which provides research opportunities for early-career high energy physicists.* (FULLY SUCCESSFUL)	**ST4-1 DEVELOPING AND PROMOTING TECHNOLOGIES AND PROGRAMS THAT DELIVER INFORMATION AND CONTRIBUTE TO LEARNING SCIENCE, MATH, ENGINEERING AND TECHNOLOGY** • *Provide web-based access to energy-related scientific and technical information obtained by DOE via interagency, U.S. businesses and industry, and international agreements, exchanges, and partnerships. (SC)* • *Continue to make 2 to 10 appointments each in the Biological and Environmental Research program's Alexander Hollander Distinguished Post Doctoral Fellowship; the multi-agency SOARS Program (Significant Opportunities in Atmospheric Research and Science) for outstanding Hispanic, Native American, and African American students in the atmospheric and related sciences. (SC)* • *Initiate a Significant Opportunities Program in the broader sciences of global change for outstanding undergraduate and graduate students. (SC)*	**ST4-1 DEVELOPING AND PROMOTING TECHNOLOGIES AND PROGRAMS THAT DELIVER INFORMATION AND CONTRIBUTE TO LEARNING SCIENCE, MATH, ENGINEERING AND TECHNOLOGY** • *Establish customer feedback mechanisms to assess and improve DOE's information program and related products and services, and partner with other government and private sector entities to improve the ease-of- use of systems. (SC)* • *Continue The Global Change Research Education Program will continue to support graduate and undergraduate students conducting DOE-related global change research. It will continue to participate in the multi-agency "Significant Opportunities in Atmospheric Research and Science" Program (SOARS). (SC)* • *Make 4 to 10 appointments in both the BER Alexander Hollaender Distinguished Post Doctoral Fellowship Program and the Historical Black Colleges and Universities Faculty and Student Research Programs for research across all areas of the BER program. (SC)*

ST-4 Use DOE assets as part of an Administration-wide effort to advance the Nation's science education and literacy. (SC, NE) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
	• *Support U.S. universities' nuclear energy research and education capabilities by: (NE)* - *Providing fresh fuel to all university reactors requesting this service;* - *Funding at least 20 universities with research reactors for reactor upgrades and improvements;* - *Partnering with 19 or more private companies to fund DOE/Industry Matching Grants Programs for universities;* - *Increasing the funding for Reactor Sharing by 40 percent over FY 1998, enabling each of the 26 schools involved in the program to improve the use of their reactors for teaching, training, and education within the surrounding community.* • *Attract outstanding U.S. students to pursue nuclear engineering degrees by: (NE)* - *Increasing the number of fellowships from 14 to 22;* - *Increasing the number of Nuclear Engineering Education Grants from 19 to over 40;* -- *Providing summer on-the-job training to 29 junior and senior nuclear engineering scholarship recipients.*	• *Support U.S. universities' nuclear energy research and education capabilities by:(NE)* - *Providing fresh fuel to all university reactors requesting this service;* - *Funding at least 23 universities with research reactors for reactor upgrades and improvements;* - *Partnering with 17 or more private companies to fund DOE/Industry Matching Grants Programs for universities;* - *Increasing the funding for Reactor Sharing by 20 percent over FY 1998, enabling each of the 26 schools involved in the program to improve the use of their reactors for teaching, training, and education within the surrounding community.* • *Attract outstanding U.S. students to pursue nuclear engineering degrees by: (NE)* - *Providing 18 fellowships;* - *Increasing the number of Nuclear Engineering Education Grants to 45 existing and new grants;* -- *Providing summer on-the-job training to 25 junior and senior nuclear engineering scholarship recipients.*
ST4-2 [Combined with ST4-1]	**ST4-2** [Combined with ST4-1]	**ST4-2** [Combined with ST4-1]

Means & Strategies for FY 2000: The Department will develop and promote technologies and programs that deliver information and contribute to learning in science, math, engineering and technology, and in general expand access to DOE's technical information. The Department will also support and promote university, college, and pre-college technology programs that deliver information and contribute to learning in nuclear science and engineering education, enable advanced educational research opportunities, build capabilities at educational institutions, and improve educational opportunities for diverse groups.

CORPORATE MANAGEMENT

GOAL: The Department of Energy will strive to demonstrate organizational excellence in its environment, safety and health practices, in its communication and trust efforts, and in its corporate management systems and approaches.

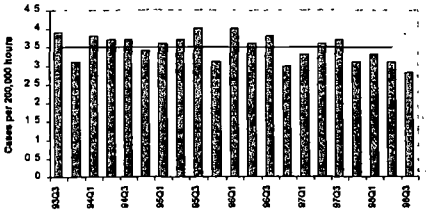

Figure 8: DOE's Total Recordable Case Rate under OSHA Requirements (Industry average is 7.1)

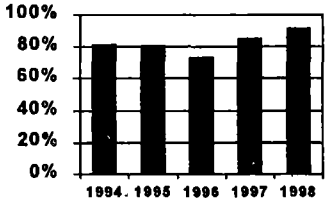

Figure 9: Percentage of DOE's Contracts Awarded Competitively (in contract dollars)

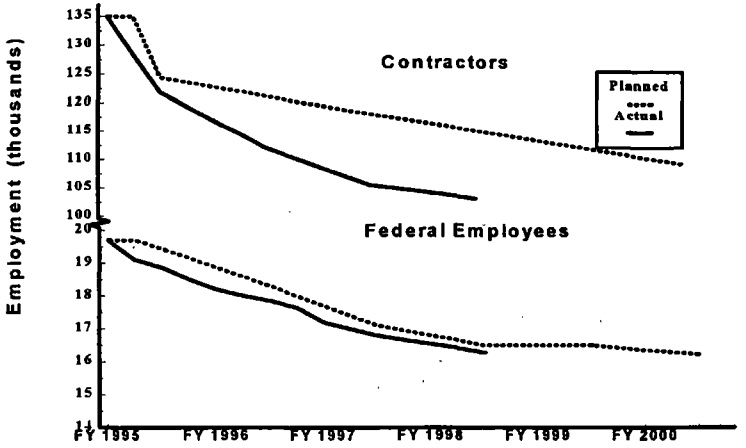

Figure 2: DOE's Human Resources (includes PMAs and FERC)

Department of Energy Annual Performance Plan for FY 2000

The following table maps the Presidential Budget's Program and Financing (P&F) accounts and program activities to the Department of Energy's offices and decision units. The alignment includes aggregation, disaggregation, and consolidation. The table that follows this one maps DOE decision units to the business line objectives where performance measures and goals are identified.

Presidential Budget Program and Financing (P&F) Accounts and Program Activities	*FY 2000 Budget Request ($M)*	*DOE Office*	*DOE Decision Units*
Departmental Administration			
Departmental Administration			
Office of Policy	$21	PO	Policy Office
Chief Financial Officer	$23	CFO	Chief Financial Officer
Congressional and Intergovernmental Affairs	$5	CI	Congressional and Intergovernmental Affairs
General Counsel	$21	GC	General Counsel
Office of the Secretary	$5	S1	Office of the Secretary
Board of Contact Appeals	$1	HG	Hearings and Appeals
Management and Administration	$115	MA	Management and Administration
Field Management	$8	FM	Field Management
Economic Impact and Diversity	$7	ED	Economic Impact and Diversity
Office of Public Affairs	$4	PA	Public Affairs
Contract Reform and Privatization	$3	PC	Contract Reform and Privatization
Economic Regulation	$2	HG	Hearings and Appeals
Office of the Inspector General	$30	IG	Inspector General
270 Energy Supply			
Oak Ridge Landlord	$12	FM	Oak Ridge Landlord
Field Operations	$102	FM	Field Operations
050 Other Defense Activities			
Hearings and Appeals	$3	HG	Hearings and Appeals
Non-defense Environmental Management [26]	$221	EM	Site Closure Fund
Energy Supply [26]	$51	EH	Environment, Safety & Health
Other Defense Activities [26]	$92	EH	Environment, Safety & Health (defense)
	$748	NN	Nonproliferation and National Security

[26] Only a portion of Non-defense Environmental Management and Other Defense Activities resources are applied to the Corporate Management Business Line

The following table indicates which budget program/decision units support which of the business line objectives. Resources, in both funds and Full Time Equivalent staff (FTEs), are shown. FTE estimates are for the overall program offices. The funds shown are program totals from DOE's budget request.

DOE Office	DOE Program/ Decision Unit	FY 2000 Budget Request ($M)	FTEs	CM-1 Safety & Health	CM-2 Neighbor & Partner	CM-3 Efficient & Effective	CM-4 Business Practices	CM-5 Info Tech	CM-6 Evaluation
PO	Policy	$21	120			X			
CFO	Chief Financial Officer	$23	208			X	X		X
CI	Congressional and Intergovernmental Affairs	$5	40		X				
GC	General Counsel	$21	164			X			
S1	Office of the Secretary	$5	40	X	X				X
HG	Board of Contract Appeals	$1	46				X		
	Hearings and Appeals (Other Defense Activities)	$3					X		
	Hearings and Appeals (Economic Regulations)	$2					X		
MA	Management and Administration	$115	593	X	X	X		X	
FM	Field Management	$8	927	X	X	X			
	Oak Ridge Landlord	$12		X	X	X			
	Field Operations	$102		X	X	X			
ED	Economic Impact and Diversity	$7	42		X	X			
PA	Public Affairs	$4	31		X				
IG	Inspector General	$30	257						X
CP	Contract Reform and Privatization	$3	7				X		
EM	Non-defense Environmental Management [27]	$211	2,697		X				
EH	Environment, Safety & Health (defense) [27]	$92	339	X					
EH	Environment, Safety & Health [27]	$51		X					
NN	Nonproliferation and National Security [27]	$748	374		X				

Strategic objective CM-3 has been broken up into four objectives to provide appropriate emphasis to the efforts of contract reform, information technology, etc. The original strategies have been maintained as follows:

Original CM-3 Strategy:	New Location/Objective:
CM3-1, 3, 4, & 7	CM3-1, 2, 3, 4
CM3-2 & 5	CM4-1, 2
CM3-6	CM5-1
CM3-8	Moved to NS-3
CM3-9	CM6-1

[27] Only a portion of EM, EH, and NN resources are applied to the Corporate Management Business Line.

CM-1 Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities. (EH, ED, MA)

Long-term Strategies: Over the next several years, the Department will (1) integrate and embed sound environment, safety, and health (ES&H) management practices into the performance of DOE's day-to-day work; (2) clearly identify and fund ES&H priorities and ensure resources are appropriately spent on those priorities, (3) ensure that all DOE employees are appropriately trained and technically competent commensurate with their ES&H responsibilities; and (4) work with the Nuclear Regulatory Commission and the Occupational Safety and Health Administration to evaluate the costs and benefits of independent external regulation of safety and health.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM1-1 INSTITUTING A SOUND ES&H CULTURE	**CM1-1 INSTITUTING A SOUND ES&H CULTURE**	**CM1-1 INSTITUTING A SOUND ES&H CULTURE**
• *Preventing fatalities, serious accidents, and environmental releases at Departmental sites.(EH)* (SUCCESSFUL)[28]	• *Prevent fatalities, serious accidents, and environmental releases at Departmental sites. (EH)*	• *Establish Departmental goals that ensure a positive trend in preventing fatalities, serious accidents, and environmental releases at Departmental sites. (EH)*
• *Initiating Integrated Safety Management Systems at all 10 high priority facilities by April 1998. (EH)* (FULLY SUCCESSFUL)	• *Implement Integrated Safety Management Systems in all major management and operations contracts. (EH)*	• *Through independent oversight, provide information and analysis of the effectiveness, vulnerabilities, and trends of the Department's environment, safety, health, and safeguards and security policies and programs to the Secretary and senior line management. (EH)*
• *Completing documentation of ES&H roles and responsibilities for all appropriate DOE offices and sites by July 1998. (EH)* (PARTIALLY SUCCESSFUL: Potential conflicts took until after FY 1998 to be resolved.)	• *Provide expanded access to information on health related risks from operating our facilities to ensure that minority and low-income populations, which may be disproportionately adversely impacted by DOE facilities, understand the Department's environmental justice goals and strategies. (ED)*	• *Provide medical screening to all DOE workers formerly exposed to beryllium during their employment at DOE facilities. (EH)*
• *Publishing guidance for incorporating environmental justice principles into the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) implementation process. (EH/ED)* (SUCCESSFUL)	• *Conduct oversight special reviews, assessments, evaluations, and inspections of such topics as emergency management, safety management, accidents, and safeguards and security. (EH)*	• *Develop a stronger, more coherent public health agenda at and surrounding DOE sites. (EH)*
	• *Prepare a draft Department of Energy implementation plan for the Administration's Clean Water Initiative. (EH)*[29]	• *Accomplish the milestone of the FMFIA corrective action plan to complete the nuclear safety standards upgrade project. (EH)*

[28] End-of-year results of FY 1998 Performance Agreement commitments are classified as "FULLY SUCCESSFUL", "SUCCESSFUL", "PARTIALLY SUCCESSFUL", or "UNSUCCESSFUL" for performance judged to be effectively 100% or better, 80-100%, 50-80%, or less than 50% respectively Concerning this specific measure, DOE had one work-related fatality during FY 1998 However, DOE's work-related fatality record for FY 1998 was the lowest rate since FY 1994 and was therefore considered "SUCCESSFUL"

[29] Adds an Administration priority announced in FY 1998.

CM-1 Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities. (EH, ED, MA) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Through independent oversight, provide information and analysis of the effectiveness, vulnerabilities, and trends of the Department's environment, safety, health, and safeguards and security policies and programs to the Secretary and senior line management. (EH)* (FULLY SUCCESSFUL) • *Completing an additional four needs assessments to continue building the basis for a more detailed program of medical surveillance, in order to address the health risks to former DOE workers. (EH)* (FULLY SUCCESSFUL)		• *Implement the environmental justice philosophy into DOE's operational activities by: (ED)* - *achieving at least 15 percent increased level of community interaction at DOE's public meetings over 1998 participation,* - *developing specific criteria for evaluating effective implementation of environmental justice principles of DOE's M&O Contractors,* - *achieving at least 10 percent increased clean-up of hazardous wastes in communities impacted by DOE's operations over 1999 levels.*
CM1-2 ENSURING DOE PROGRAMS APPROPRIATELY ADDRESS ES&H PRIORITIES • *Beginning to annually monitor and report on ES&H expenditures and improve related internal controls. (EH)* (FULLY SUCCESSFUL)	**CM1-2** [combined with CM1-1]	**CM1-2** [combined with CM1-1]
CM1-3 ENSURING EMPLOYEES ARE QUALIFIED IN THEIR ES&H RESPONSIBILITIES • *Making progress on implementing the Technical Qualifications Program, by increasing the percentage of employees who are certified from 65% in FY 1997 to 75% in FY 1998, towards a goal of 90% of the 1750 covered employees by FY 2000. (MA)* (SUCCESSFUL)	**CM1-3 ENSURING EMPLOYEES ARE QUALIFIED IN THEIR ES&H RESPONSIBILITIES** • *Improve Federal technical workforce capabilities at defense sites by implementing the FY 1999 milestones of the Revised Implementation Plan for DNFSB Recommendation 93-3. (MA)*	**CM1-3 ENSURING EMPLOYEES ARE QUALIFIED IN THEIR ES&H RESPONSIBILITIES** • *Improve Federal technical workforce capabilities at defense sites by implementing the FY 2000 milestones of the Revised Implementation Plan for DNFSB Recommendation 93-3. (MA)*

CM-1 Ensure the safety and health of the DOE workforce and members of the public, and the protection of the environment in all Departmental activities. (EH, ED, MA) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM1-4 INVESTIGATING FEASIBILITY OF INDEPENDENT EXTERNAL OVERSIGHT OF SAFETY AND HEALTH AT DOE SITES	**CM1-4 INVESTIGATING FEASIBILITY OF INDEPENDENT EXTERNAL OVERSIGHT OF SAFETY AND HEALTH AT DOE SITES**	**CM1-4 INVESTIGATING FEASIBILITY OF INDEPENDENT EXTERNAL OVERSIGHT OF SAFETY AND HEALTH AT DOE SITES**
• *Conducting three NRC/DOE pilot projects to assess the DOE facilities against the standards that NRC believes would be appropriate to ensure radiological safety. (EH)* (FULLY SUCCESSFUL)	• *Complete the ongoing pilot program which assesses the DOE facilities against the standards that the NRC believes would be appropriate to ensure radiological safety. (EH)*	• *Support regulatory transition of legislatively designated sites, accomplish necessary planning for appropriate classes of DOE facilities to be regulated, and report to Congress on the status of regulatory transition. (EH)*

Means & Strategies for FY 2000: The Department will continue to monitor the health of its workforce, and where necessary, take steps to intervene where adverse health impacts are identified. The Department, through its ongoing worker health surveillance programs, has identified that the rate of chronic beryllium disease (CBD) among beryllium-exposed employees has not declined over time despite the fact that the Department facilities have operated within existing occupational exposure limits. In response to these findings, DOE has drafted a Notice of Proposed Rulemaking establishing a DOE-wide Chronic Beryllium Disease Prevention Program which will be implemented during FY 2000. In addition, the DOE has embarked on a program to provide medical screening to all DOE workers formerly exposed to beryllium during their employment at DOE facilities to identify both sensitization to beryllium and CBD. Under this program, periodic follow-up surveillance will be provided to those found to be sensitized. By 2000, this program will be implemented at all 20 DOE sites where workers were exposed to beryllium.

In conjunction with Department of Health and Human Services (DHHS), developing a stronger, more coherent public health agenda at and surrounding DOE sites that is responsive to worker and community health concerns, leads to a clear understanding of the health impacts of DOE operations, and results in improved health protection and prevention for workers and communities.

The Department , NRC, OSHA, and other affected agencies will work with Congress to establish a plan to externally regulate safety and health at appropriate classes of DOE facilities, with a transition period of 5 to 10 years after the enactment of enabling legislation, while maintaining a robust internal safety and health management program.

CM-2 As a good neighbor and public partner, continually work with customers and stakeholders in an open, frank, and constructive manner. (MA, ED, FM, EM, NN, CI, S1)

Long-term Strategies: Over the next several years, the Department will (1) foster strong partnerships with neighboring DOE communities, regulators, and other stakeholders to determine priorities and solutions; (2) increase customer and public awareness of DOE's mission areas by improving the quality, timeliness, and sufficiency of information disseminated on the Department's functions, successes, lessons learned, and future activities; and (3) increase openness with the public by prudently declassifying information about the Department's activities while maintaining a balance with the Nation's security.

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM2-1 INVOLVING STAKEHOLDERS IN THE POLICY-MAKING • *Performing an analysis of public participation training needs at all 11 Operations/Field Offices, and initiating a public participation training program for Headquarters and field managers to enhance stakeholder involvement in DOE decisions. (EM)* (FULLY SUCCESSFUL) • *Conducting a series of regional and national stakeholder workshops to increase public involvement in crosscutting EM issues. The workshops will be attended by advisory board members, state and local governments, Native American Tribes, and other stakeholders across the country.(EM)* (SUCCESSFUL) • *Responding to an estimated total of 500,000 public requests for information and documents from the Center for Environmental Management Information within an average of two business days per request. (EM)* (FULLY SUCCESSFUL)	**CM2-1 INVOLVING STAKEHOLDERS IN THE POLICY-MAKING** • *Conduct stakeholder meetings to increase public involvement in crosscutting environmental quality issues. The meeting participants will include advisory board members, state and local governments, Native American Tribes, and other stakeholders across the country. (EM)* • *Conduct "Communicating with the Public" training sessions for DOE managers (EM)* • *Respond to an estimated total of 500,000 public requests for information and documents from the Center for Environmental Management Information within an average of two business days per request. (EM)*	**CM2-1 INVOLVING STAKEHOLDERS IN THE POLICY-MAKING** • *Conduct stakeholder meetings to increase public involvement in crosscutting environmental quality issues. The meeting participants will include advisory board members, state and local governments, Native American Tribes, and other stakeholders across the country. (EM)* • *Respond to an estimated total of 500,000 public requests for information and documents from the Center for Environmental Management Information within an average of two business days per request. (EM)*

CM-2 As a good neighbor and public partner, continually work with customers and stakeholders in an open, frank, and constructive manner. (MA, ED, FM, EM, NN, CI, S1) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM2-2 IMPROVING COMMUNICATIONS WITH CUSTOMERS AND THE PUBLIC • *Reducing the Freedom of Information Act backlog by 15 percent and the average case age by 25 percent. (MA)* (SUCCESSFUL) • *Improving the quality and volume of information on DOE's World Wide Web site as indicated by user-interest through numbers of home page visits. (MA)* (FULLY SUCCESSFUL)	**CM2-2 IMPROVING COMMUNICATIONS WITH CUSTOMERS AND THE PUBLIC** • *Reduce the Freedom of Information Act backlog by 10 percent and the average case age by 10 percent over the previous year. (MA)* • *Improve the quality and volume of information on the DOE's World Wide Web site and demonstrate user-interest through a higher number of home page visits (hits) per year. (MA)*	**CM2-2 IMPROVING COMMUNICATIONS WITH CUSTOMERS AND THE PUBLIC** • *Reduce the Freedom of Information Act backlog by 10 percent and the average case age by 10 percent over the previous year. (MA)*
CM2-3 INCREASING OPENNESS WITH THE PUBLIC • *Reviewing for possible declassification and release, 3,950,000 pages of DOE documents under Executive Order 12958 bringing the total pages reviewed to 8,460,000 which is 60 percent of the DOE's historically significant records 25 years or older. (NN)* (PARTIALLY SUCCESSFUL: Unanticipated Congressional budget reductions and application of resources to litigation caused less than intended results.) • *Implementing "National Security Information, Classification and Declassification" (Title 10 Code of Federal Regulations, Part 1045) through conducting two on-site reviews of other agency Restricted Data programs. (NN)* (UNSUCCESSFUL: "Outreach Coordinator" resigned)	**CM2-3 INCREASING OPENNESS WITH THE PUBLIC** • *Continue reviewing DOE documents for possible declassification and release of those that no longer need to be withheld for security purposes.*[30] *(NN)* • *Implement the fundamental Classification Policy Review recommendations and issue 40 classification guides in the streamlined format containing the updated guidance. (NN)* • *Implement 10 CFR 1045 through reviewing 100 percent of other agency classification guides submitted, and by conducting five on-site reviews of other agency Restricted Data Programs. (NN)*	**CM2-3 INCREASING OPENNESS WITH THE PUBLIC** • *Continue reviewing DOE documents for possible declassification and release of those that no longer need to be withheld for security purposes. (NN)* • *Implement the fundamental Classification Policy Review recommendations and issue 40 classification guides in the streamlined format containing the updated guidance. (NN)*

[30] The National Defense Authorization Act for FY-1999 Section 3161 (the Kyl amendment) creates requirements for review of classified documents that make it impossible to make any estimates for specific number of pages to be reviewed

CM-2 As a good neighbor and public partner, continually work with customers and stakeholders in an open, frank, and constructive manner. (MA, ED, FM, EM, NN, CI, S1) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
	CM2-4 DEVELOPING A PUBLIC HEALTH AGENDA FOR DOE SITES • *Issue an initial status report on the development of a public health agenda by December 31, 1998 and a final public health agenda for each site, which reflects customer and stakeholder input, shall be issued by September 30, 1998. (EH)*	

Means & Strategies for FY 2000: The Department will continue reviewing classified records for possible release using revised classification guides and continue improvements to the processing of FOIA requests.

CM-3 Use efficient and effective corporate management systems and approaches to guide decision making, streamline and improve operations, align resources and reduce costs. (CFO, PO, MA, ED, GC)

Long-term Strategies: Over the next several years, the Department will (1) improve decision-making, ensure accountability, maximize departmental resources, and achieve intended results by corporately managing the Department's mission, functions, and activities; (2) continue to streamline and improve operations, further reduce overhead expenditures, and facilitate additional workforce reductions while aiding affected employees and communities; (3) implement quality management principles, value diversity, and continue to improve human resources systems and practices; and (4) promote the effective, efficient, and economical operation of the business lines through audits, investigations, inspections, and other reviews. (These were strategies 1,3,4, and 7.)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM3-1 IMPROVING MANAGERIAL PERFORMANCE AND ACCOUNTABILITY • *Utilizing mechanisms such as senior level corporate and business line management councils, a DOE chief operating officer, and performance-based management to foster strategic direction, enhance programmatic integration, and improve headquarters and field operations. (PO)* (PARTIALLY SUCCESSFUL: Cannot demonstrate enhancements.) • *Establishing annual Secretarial Officer Performance Agreements that are linked to the Secretary's Performance Agreement with the President. (PO)* (PARTIALLY SUCCESSFUL: Although some agreements executed, their effectiveness is questionable.) • *Expanding the Corporate Executive Information System to provide senior management at Headquarters and Field Offices with timely and useful management information. (CFO)* (FULLY SUCCESSFUL)	**CM3-1 IMPROVING MANAGERIAL PERFORMANCE AND ACCOUNTABILITY** • *Identify functional and technical system requirements for developing a Business Management Information System (BMIS) with a special emphasis on financial management, and develop business scenarios for its evaluation (a milestone of a FMFIA corrective action plan). (CFO)* • *Develop annual performance-based budgets by using DOE's corporate Strategic Management System to link resource requirements to five-year plans, make independent project validations, and perform cross-cutting program evaluations. (CFO/PO)* • *Conduct self assessments to measure organizational performance in the areas of Customer Satisfaction, Employee Satisfaction, and the achievement of Business Results using the Malcolm Baldrige, President's or Energy Quality Award Criteria. (MA)*	**CM3-1 IMPROVING MANAGERIAL PERFORMANCE AND ACCOUNTABILITY** • *Initiate development/ acquisition of a modern, comprehensive Business Management Information System - Financial Management (BMIS-FM) to replace the Department's financial management system by awarding a contract to acquire/develop core financial systems and related modules (a milestone of a FMFIA corrective action plan). (CFO)* • *Develop annual performance-based budgets by using DOE's corporate Strategic Management System to link resource requirements to five-year plans, make independent project validations, and perform cross-cutting program evaluations. (CFO/PO)* • *Utilize DOE's corporate Strategic Management System to link resource requirements to five-year plans, making independent project validations, and performing cross-cutting program evaluations (PO/CFO)*

CM-3 Use efficient and effective corporate management systems and approaches to guide decision making, streamline and improve operations, align resources and reduce costs. (CFO, PO, MA, ED, GC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Developing annual performance-based budgets by using DOE's corporate Strategic Management System to link resource requirements to five-year plans, make independent project validations, and perform cross-cutting program evaluations. (CFO/PO)* (PARTIALLY SUCCESSFUL: Budgets were developed but five-year planning issues were only partially used.)	• ~~*Have every Energy Efficiency/ Renewable Energy program developing progress milestones and estimates of energy-related program benefits annually and at least 25 percent of the milestones and estimated benefits undergoing external peer review each year with a goal of having all milestones and estimated benefits being peer-reviewed at least once every four years. (EE)*~~ <moved to ER-3>	
CM3-2 CONTINUING THE STRATEGIC ALIGNMENT INITIATIVES TO STREAMLINE AND RE-ENGINEER (was CM3-3)	**CM3-2 CONTINUING INITIATIVES TO STREAMLINE AND RE-ENGINEER THE DEPARTMENT**	**CM3-2 CONTINUING THE INITIATIVES TO STREAMLINE AND RE-ENGINEER THE DEPARTMENT**
• *Realizing annual Strategic Alignment Initiative savings commitments totaling $1.7 billion by the end of FY 2000 by:* - *Achieving DOE staffing target of 10,874 by the end of FY 1998, a reduction of 294 FTEs from the FY 1997 end-of-year level (MA)* - *Consolidating Headquarters personnel into six locations by the end of FY 1998 and achieve $3.8 million savings in rent. (MA)* - *Saving $61 million by reengineering information management business processes. (MA)* - *Reducing technical and support service contracting obligations below $ 610 million. (MA)* - *returning to the Treasury at least $15 million through the sale, transfer, re-use, or disposal of unneeded materials, facilities, land, and other assets. (WT)* (FULLY SUCCESSFUL)	• *Realize annual savings from improved operations to achieve cumulative savings totaling $1.7 billion by the end of FY 2000: (MA)* - *Achieve staffing reductions to achieve Departmental target of 10,613 by the end of FY 1999. (MA)* - *Achieve $65 million in further cost avoidances in information technology. (MA)* - *Reduce support service contracting obligations below $610 million in FY 1999. (MA)* - ~~*Returning to the Treasury at least $15 million annually through the sale, transfer, re-use, or disposal of unneeded materials, facilities, land, and other assets. (WT)*~~[31]	• *Realize annual savings commitments totaling $1.7 billion by the end of FY 2000: (MA)* - *Achieve staffing reductions to achieve Departmental target of 10,269 by the end of FY 2000.* - *Achieve $58 million in further cost avoidances in information technology.*

[31] The program surpassed it's original multi-year, cumulative goal during FY 1998 and was therefore ended by the Secretary

CM-3 Use efficient and effective corporate management systems and approaches to guide decision making, streamline and improve operations, align resources and reduce costs. (CFO, PO, MA, ED, GC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM3-3 IMPROVING HUMAN RESOURCE PRACTICES (was CM3-4) • *Hiring 20 Welfare-to-Work recipients by the end of FY 1998 towards the goal of hiring 55 by FY 2000. (MA)* (FULLY SUCCESSFUL) • *Implementing a DOE-wide employee accessible automated personnel system by December 1998. (MA)* (SUCCESSFUL) • *Expanding the use of Alternate Dispute Resolution by 30 percent compared to FY 1997 in mediation of workplace disputes such as EEO complaints and grievances.* (GC) (FULLY SUCCESSFUL) • *Using the Malcolm Baldrige, President's, or Energy Quality Award Criteria, demonstrating continuous organizational improvement by achieving self-assessment scores of at least 300. (MA)* (FULLY SUCCESSFUL)	**CM3-3 IMPROVING HUMAN RESOURCE PRACTICES** • *Continue hiring welfare to work recipients to achieve the Presidential goal of 55, 40 of whom will be hired by the end of FY 1999. (MA)* • *Implement a DOE-wide employee accessible automated personnel system by December 1998. (MA)* • *Expand the use of Alternate Dispute Resolution by 20 percent over the FY 1998 use to mediate workplace disputes such as Equal Employment Opportunity complaints and grievances. (GC)* • *Improve workforce skills and reduce training costs by implementing the FY 1999 milestones in the DOE Corporate Education, Training, and Development Plan. (MA)*	**CM3-3 IMPROVING HUMAN RESOURCE PRACTICES** • *Continue hiring welfare to work recipients to achieve the Presidential goal of 55. (MA)* • *Increase the electronic transfer of personnel documents through implementation of paperless workflow in CHRIS, reducing personnel paper transactions by 15 percent. (MA)* • *Expand the use of Alternate Dispute Resolution by 20 percent over FY 1999 use to mediate workplace disputes such as Equal Employment Opportunity complaints and grievances. (GC)* • *Demonstrate continuous organizational improvement by achieving positive trends as measured by assessments during the Malcolm Baldrige Criteria for Performance Excellence. (MA)* • *Improve workforce skills and reduce training costs by implementing the FY 2000 milestones in the DOE Corporate Education, Training, and Development Plan. (MA)* • *Provide best value, high quality and timely Human Resources and Administration products and services so as to sustain a customer satisfaction level of 90 percent. (MA)*

CM-3 Use efficient and effective corporate management systems and approaches to guide decision making, streamline and improve operations, align resources and reduce costs. (CFO, PO, MA, ED, GC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM3-4 MANAGING DIVERSITY TO ACHIEVE THE DEPARTMENT'S MISSION (was CM3-7) • *Conducting an employee needs survey in order to enhance diversity and determine future strategic direction. (ED)* (PARTIALLY SUCCESSFUL: Survey conducted but determination of future strategic direction not completed.) • *Evaluating contractor plans and performance to assure full implementation of the Diversity Contract Clause. (ED)* (UNSPECIFIED) • *Diversifying America's science workforce by enhancing opportunities for minority educational institutions and increasing their awards by 20 percent over FY 1997. (ED)* (UNSUCCESSFUL: The strategies for promoting this goal were not effective.) ~~**CM3-8 MANAGING CONTRACTOR WORK FORCE RESTRUCTURING**~~ ~~• *Implementing a single Department-wide automated contractor workforce employment data system. (WT)*~~ ~~• *Achieving annual recurring cost savings from separated workers that are at least three times the one time cost of separation. (WT)*~~ ~~• *Supporting local community transition activities that will create 8,000 to 12,000 new private sector jobs by the end of FY 1998. (WT)*~~ <moved to NS-3>	**CM3-4 DEMONSTRATING THE DEPARTMENT'S COMMITMENT TO DIVERSITY BY BECOMING A RECOGNIZED LEADER THE FEDERAL GOVERNMENT** • *Publish in the Code of Federal Regulations, the DOE Mentor-Protégée Program. (ED)* • *Commit to specific procurement strategies that will increase the participation of women-owned small businesses in the Federal marketplace through a Memorandum of Understanding with the Small Business Administration. (ED)* • *Enhance America's science workforce by ensuring that minority-serving institutions are afforded and take advantage of the Federal research, development, education and equipment opportunities for which they are eligible and increase their awards by 5 percent over FY 1998. (ED)* ~~**CM3-8 MANAGING CONTRACTOR WORK FORCE RESTRUCTURING**~~ ~~• *Keep involuntary separations to a range of 30-60 percent of all separations while assuring maintenance of essential work force skills mix and productivity. (WT)*~~ ~~• *Achieve annual recurring costs savings from separated workers that is at least three times the one time cost of separation. (WT)*~~ ~~• *Support local community transition activities that will create 10,000 to 15,000 new private sector jobs by the end of FY 1999. (WT)*~~ <moved to NS-3>	**CM3-4 MODELING DIVERSITY FOR THE NEW MILLENNIUM** • *Increase funding to Minority Educational Institutions by 5 percent over FY 1999 (ED)* • *Provide two technical assistance seminars for disadvantaged businesses to improve their performance n the energy sector of the economy on a regional basis. (ED)*

Means & Strategies for FY 2000: The Department will continue to conduct core financial functions and implement initiatives to achieve greater accountability and enhanced financial control of government operations. The Department will focus on principal financial management functions and financial and business information needs throughout a major project to implement a Business Management Information System (BMIS) that supports integration with other systems, production of audited financial statements and performance reporting.

CM-4 Improve the delivery of products and services through contract reform and the use of business-like management practices. (CFO, PO, MA, FM, GC)

Long-term Strategies: Over the next several years, the Department will (2) use prudent contracting and business management approaches that emphasize results, accountability, and competition, improve timeliness, minimize costs; and ensure customer satisfaction; and (5) strengthen the management of projects, materials, facilities, land, infrastructure, and other assets, to ensure safe, sound, and cost-effective operations, appropriate maintenance of sites, and to ensure intended project results. (These were strategies 2 & 5 for Strategic Plan objective CM-3.)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM4-1 USING PRUDENT CONTRACTING AND BUSINESS MANAGEMENT PRACTICES (was CM3-2) • *Preparing and submitting Department-wide audited financial statement with an unqualified opinion to the Office of Management and Budget by March 1, 1998. (CFO)* (FULLY SUCCESSFUL) • *Increasing the number of competitively awarded contracts for major DOE sites and facilities from 13 to 16 by September 1998. (MA)* (FULLY SUCCESSFUL) • *Converting all management and operating contracts awarded in FY 1998 to performance-based management contracts. (MA)* (FULLY SUCCESSFUL) • *Hiring a privatization director, developing a Department-wide privatization strategy, and identifying and pursuing privatization opportunities.(S-2)* (FULLY SUCCESSFUL)	**CM4-1 USING PRUDENT CONTRACTING AND BUSINESS MANAGEMENT PRACTICES** • *Prepare and publish an annual accountability report that includes the Department-wide audited financial statement with an unqualified opinion to the Office of Management and Budget by March 1999 (CFO/PO)* • *Convert all management and operating contracts awarded in FY 1999 to performance-based management contracts. (MA)* • *Award 50 percent of all management and operating contracts including three M&O contracts that will change to Federal Acquisition Regulation (FAR) contracts during FY 1999 using competitive procedures. (MA)* • *Award 50 percent of all support service contracts in FY 1999 as performance-based service contracts. (MA)* • *Issue a new contractor fee policy by December 1998, as committed to in the Federal Managers' Financial Integrity Act (FMFIA) FY 1997 report. (MA)* • *Conduct a follow-up assessment of the effectiveness of actions taken in response to the recommendations made by the Performance Based Incentive Report, as committed to in the FMFIA FY 1997 report.(MA)*	**CM4-1 USING PRUDENT CONTRACTING AND BUSINESS MANAGEMENT PRACTICES** • *Prepare and publish an annual accountability report that includes the Department-wide audited financial statement with an unqualified opinion to the Office of Management and Budget by March 2000. (CFO/PO)* • *Converting one management and operating contract awarded in FY 2000 to a Performance Based Service Contract (PBSC) using the government-wide standards. (MA)* • *Convert one support services contract at each major site to PBSC using the government-wide standards (MA)* • *Maintain and operate electronic procurement systems installed through FY 1999 to accomplish: (MA)* - *industry interactive procurement processes;* - *electronic procurement system for purchases under $25,000; and* - *paperless procurement actions processing system* • *Achieve 95 percent of contract professionals certified under DOE professional development standards. (MA)*

CM-4 Improve the delivery of products and services through contract reform and the use of business-like management practices. (CFO, PO, MA, FM, GC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
• *Applying business process reengineering to the highest priority procurement processes by September 1998 with a goal of reducing cycle time by 30 percent (MA)* (FULLY SUCCESSFUL) • *Improving Federal procurement and property management employee skills by establishing a contracting workforce development program by September 1998. (MA)* (FULLY SUCCESSFUL) • *Implementing an automated system to track and measure contractor performance by September 1998. (MA)* (FULLY SUCCESSFUL) **CM4-2 APPLYING BUSINESS-LIKE PRACTICES TO MANAGEMENT OF DOE PROJECTS AND ASSETS** (was CM3-5) • *Meeting established project scope, schedule, and cost baselines by adopting systems based on industry and government best project management practices. (FM)* (SUCCESSFUL) • *Conducting annual business management self-assessments to ensure that sites are maximizing their resources and maintaining safe and secure operations. (FM)* (SUCCESSFUL)	**CM4-2 APPLYING BUSINESS-LIKE PRACTICES TO MANAGEMENT OF DOE PROJECTS AND ASSETS** • *Complete four Energy Systems Acquisitions Advisory Board critical actions on required strategic and major systems. (FM)* • *Verify progress against established project scope, schedule, and cost baselines on projects valued at $5 million or more. (FM)* • *Accomplish the milestones of the FMFIA corrective action plan for the Departmental challenge of project management. (FM/DP)* • *Develop a plan by March 1999 to review DOE and contractor litigation cases in state and federal courts for appropriateness of early resolution through mediation. Increase by 20 percent over FY 1998 the number of such cases mediated. Demonstrate estimated savings of 50 percent in litigation costs for those cases settled in mediation as compared to the costs had those cases gone through litigation. (GC)*	**CM4-2 APPLYING BUSINESS-LIKE PRACTICES TO MANAGEMENT OF DOE PROJECTS AND ASSETS** • *Complete the independent project management reviews and forward the applicable reports and Departmental position papers to Congress. (FM)* • *Ensure that maximum efficiency, economy, and reliability are achieved and the savings demonstrated as a result of contract negotiations and regulatory interventions, especially with respect to deregulation within the utility industry. Performance will be measured by cost avoidance greater than at least twice the cost of running the program. (FM)* • *Verify progress against established project scope, schedule, and cost baselines on projects valued at $5 million or more. (FM)* • *Define and pursue innovative strategies for promoting mortgage reduction through dispositioning excess property, including real estate, facilities, and materials. (FM)*

CM-4 Improve the delivery of products and services through contract reform and the use of business-like management practices. (CFO, PO, MA, FM, GC) (Continued)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
		• *Increase by 20% over FY 1999 the number of DOE and contractor litigation cases in state and federal courts settled through mediation, demonstrating estimated savings of 50% in litigation costs for those cases settled in mediation as compared to the costs had those cases gone through litigation. (GC)*

Means & Strategies for FY 2000: The Department will continue the use of performance agreements with the President and use the results of the FY 1999 agreement as the basis of the Department's Accountability Report for FY 1999 due in March 2000. It is intended that this audited report will exceed the requirements for the first annual report under GPRA and build on a record of "clean opinions" from the Inspector General. The Department will also begin to use the government-wide standards for Performance Based Service Contracts in place of DOE's current approach. The Department will contract out to achieve independence in project management reviews and will review and apply more private business practices in the management of its projects and assets.

CM-5 Implement information systems so employees can perform their jobs efficiently and effectively. (MA)

Long-term Strategies: Over the next several years, the Department will utilize, under the auspices of the Chief Information Officer, an integrated Department-wide framework for planning, budgeting, evaluating, and implementing information management requirements to reduce costs and improve operations (Was strategy 6 for Strategic Plan objective CM-3)

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
CM5-1 ENSURING DEPARTMENT'S INFORMATION SYSTEMS ARE BASED ON COST EFFECTIVE TECHNOLOGY SOLUTIONS (Was CM3-6) • *Establishing, by October 1997, the Capital Planning Information Technology Investment Board and operationalize the requirements of the Clinger-Cohen Act of 1996. (MA)* (SUCCESSFUL) • *Starting the implementation of a five-year information management plan and producing annual operational plans as part of the Department's budget process. (MA)* (FULLY SUCCESSFUL) • *Implementing, by January 1998, a Department-wide information architecture with supporting standards to foster $100 million in cost avoidances over the next 5 years. (MA).* (SUCCESSFUL) • *All departmental elements implementing Year 2000 century date change compliant mission-essential computer systems in accordance with the milestones, guidance, and procedures established by the CIO (MA)* (SUCCESSFUL)	**CM5-1 ENSURING DEPARTMENT'S INFORMATION SYSTEMS ARE BASED ON COST EFFECTIVE TECHNOLOGY SOLUTIONS** • *Continue to improve infrastructure to allow staff the capability of accessing and sharing information easily and seamlessly across the DOE complex. (MA)* • *Continuously evolve the Department-wide information architecture with supporting standards to foster $100 million on cost avoidances by FY 2003 (MA)* • *Implement all FY 1999 milestones for year 2000 changes for mission-essential systems. (MA)* • *Develop the Corporate Management Information Program (CMIP) milestone plan and report to Congress (MA)* • *Accomplish the milestones of the FMFIA corrective action plan for the Departmental challenge of unclassified computer security. (MA)*	**CM5-1 ENSURING DEPARTMENT'S INFORMATION SYSTEMS ARE BASED ON COST EFFECTIVE TECHNOLOGY SOLUTIONS** • *Complete all FY 2000 milestones in the CMIP plan. (MA)* • *Satisfy all program office computing/ telecommunications requirements in Working Capital Fund Service agreements. (MA)*

Means & Strategies for FY 2000: The Department will implement milestones using methods to be described in the Corporate Management Information Program (CMIP) and will build on experiences in improving the information architecture to satisfy program office computing/telecommunications requirements.

CM-6 Improve performance through evaluations, reviews, audits, and inspections. (IG, S1, CFO)

Long-term Strategies: Over the next several years, the Department will evaluate management controls and promote the effective, efficient, and economical operation of the business lines through audits, investigations, inspections, and other reviews

FY 1998 Performance Agreement Measures & Goals (with status)	FY 1999 Performance Plan Measures & Goals (Revised Final)	FY 2000 Performance Plan Measures & Goals
Note although not part of the FY 1998 Performance Agreement, the following results are provided for context. • Completed the Consolidated Financial Statement Audit for FY 1997, one of only eight agencies to render a timely unqualified opinion and complete the audit by the statutory deadline of March 1, 1998. (IG) • Surpassed goal of completing or having in process 60 percent of the targeted audits as of the end of the fiscal year by achieving 73 percent (IG) • Achieved acceptance of approximately 70 percent of investigative cases presented for prosecution (IG)	**CM6-1 PROMOTING THE EFFECTIVE, EFFICIENT, AND ECONOMICAL OPERATION OF THE BUSINESS LINES THROUGH AUDITS, INVESTIGATIONS, INSPECTIONS, AND OTHER REVIEWS** (was CM3-9) • *Render, by designated due dates, an opinion annually on the Department's consolidated financial statements, system of internal controls, and compliance with laws and regulations. (IG)* • *Complete at least 60 percent of the audits planned for the year and replace those audits not started with more significant audits which identify time-sensitive issues needing review. (IG)* • *Focus investigations on allegations of serious violations of Federal law by: (IG)* – *Obtaining judicial and/or administrative action on 30 percent of all cases in open status during the fiscal year;* – *Obtaining acceptance of 75 percent of the cases presented for prosecution* • *Plan and, on a timely basis, conduct reviews based on assessment of risk and/or benefit to key Department programs.(IG)*	**CM6-1 PROMOTING THE EFFECTIVE, EFFICIENT, AND ECONOMICAL OPERATION OF THE BUSINESS LINES THROUGH AUDITS, INVESTIGATIONS, INSPECTIONS, AND OTHER REVIEWS** • *Render, by designated due dates, an opinion annually on the Department's consolidated financial statements, system of internal controls, and compliance with laws and regulations (IG)* • *Complete at least 60 percent of the audits planned for the year and replace those audits not started with more significant audits which identify time-sensitive issues needing review. (IG)* • *Focus investigations on allegations of serious violations of Federal law by: (IG)* – *Obtaining judicial and/or administrative action on 35 percent of all cases in open status during the fiscal year;* – *Obtaining acceptance of 75 percent of the cases presented for prosecution.* • *Plan and, on a timely basis, conduct reviews based on assessment of risk and/or benefit to key Department programs.(IG)*

Means & Strategies for FY 2000: The Department will conduct self-assessments and evaluations of management controls within all Departmental elements in accordance with FMFIA. The Department's Inspector General will prioritize audits, investigations, inspections, and other reviews to address those areas of most impact with the limited resources available and will request, through the appropriate budget process, additional audit resources

Resource Requirements

The Department will only achieve its goals and objectives with adequate financial, human, infrastructure, and technical resources.

In developing this plan, the Department projected budget appropriations consistent with the OMB's guidance for budget deficit reduction targets through FY 2002. Federal staffing levels are based upon the Department's Strategic Alignment Initiative targets (targets that do not include the Federal Energy Regulatory Commission and the Power Marketing Administrations) established in 1995. These targets call for an overall federal staff reduction of 27 percent by the end of FY 2000 to a level of 10,269. In addition, DOE will reduce contractor staffing levels to 91,000, a 38 percent reduction from the peak level of 148,686 employed in FY 1992. Additional decreases in budget or staffing levels will adversely impact the Department's ability to meet its commitments. A matrix was presented with each business line displaying the program/decision units that support the business line objectives. Attached is the composite matrix for all business lines showing those programs that support objectives in more than one business line. Additional resource requirements and special programmatic needs are described below.

In the National Security area, replacing nuclear testing with a science-based stewardship and management program will require development of advanced experimental and computational capabilities. Additionally, workforce skills will shift from nuclear weapons design, testing, and analysis to modeling, simulations, and systems analysis. The loss of nuclear expertise through staff aging and attrition will need to be minimized. Construction of the National Ignition Facility and the Dual-Axis Radiographic Hydrodynamic Test Facility will provide new experimental test capabilities. Additionally, a source for tritium will be needed to provide an adequate supply for the enduring nuclear weapon stockpile. New facilities will be required to disassemble and convert surplus plutonium pits and fabricate mixed oxide fuel for burning in existing commercial reactors. Existing or planned high level waste vitrification facilities, coupled with new material preparation facilities, will be required to immobilize surplus weapons plutonium Modifications to existing or planned facilities will be utilized for the long-term storage of surplus fissile materials.

The Environmental Quality cleanup goals and objectives reflect the pressing need to reduce spending in the short term, while reducing both economic and environmental liabilities in the long term. Achievement of the accelerated environmental cleanup goals and objectives is dependent upon receiving stable funding at about the current funding level. In addition, accomplishment of these goals and objectives depends upon effective implementation of a wide array of management initiatives designed to substantially reduce life-cycle costs, improve processes, and enhance performance. These initiatives include reducing support costs, creating the right incentives through performance-based contracting, optimizing project sequencing to reduce fixed costs, privatization and use of private-sector technology and experience, deployment of innovative technology, and benchmarking for process improvement. With regard to civilian radioactive waste, if legislation authorizing interim storage is enacted, substantial additional funding will be required for site-specific construction and procurement of waste acceptance and transportation equipment and services.

In order to meet the Nation's needs for cutting-edge science, DOE will have to periodically replace or make major upgrades to aging or outdated major experimental facilities. These needs will be weighed against the benefits from cost-effective modifications to existing facilities to ensure that the maximum national benefits are derived from existing infrastructure—this recognizes, however, that many of these science facilities have a finite useful life. The Secretary of Energy's Advisory Board has been asked to examine the long-term needs for advanced scientific research facilities to accomplish DOE's Science and Technology objectives.

Major acquisitions of resources that support the delivery of the results proposed for FY 2000 are addressed in the Departments' Capital Assets Plan.

Validation and Verification

Validation and verification of the reported status will be accomplished by periodic guidance, reviews, certifications, and audits. Guidance for the staff making reports and training on reporting and documentation expectations are issued and conducted in the Fall when the staff is reporting on the previous year's results. Our reporting process includes certifications by heads of organizational elements and reviews of records. The data sources are primarily

within the program offices performing the work, the National Laboratories, or our contractors, but we will move toward independent or external sources to ensure objective measurements. The performance reporting process includes internal correspondence issued to heads of Departmental elements requesting the status of performance commitments in the Secretary's performance agreement and emphasizing the importance of ensuring that the information provided was accurate and complete Internal management controls will continue to be applied to ensure the data quality and heads of elements formally certify the accuracy of the data at the end of the year.

In preparing audited financial statements, the Chief Financial Officer and Policy Office will issue guidance and conduct training for Secretarial Officers and their staffs, stressing their roles in the preparation of the financial statements and required management representation letters. Management representation letters attest to the accuracy and reliability of financial information and performance results. As requested by the Secretary, management representation letters will be signed and provided by all heads of Departmental elements responsible for performance commitments in the agreement to the Secretary and included the following attestation on performance measure information: "We acknowledge our responsibility for the fair presentation of the performance measure information presented in the Overview section and the Supplemental Information of the financial statements. We believe this data to be accurate and reliable." This attestation will indicate that each program office is aware of their responsibility for the performance measure data and the necessary validation and support documentation to ensure its accuracy and reliability. The Department will issue guidance and offer training to program offices to clearly delineate their specific roles and responsibilities in the preparation of the financial statements and related program performance reporting in order to ensure that the performance measure reporting structure is sufficient to capture reliable data for future financial statements. The Department will also conduct internal reviews of reported status to assure itself of the validity and veracity of the reported status of the performance measures.

The Department has been using a computer system called SOLOMON to collect and present results and performance assessments for the annual Secretary's Performance Agreement with the President It has been used since the first Performance Agreement for FY 1995. SOLOMON is a World-Wide-Web based system to allow remote data entry, monitoring, and oversight. Data entry is controlled through a password system that provides an auditable record of changes. Program offices and managers directly update results and performance assessments during the year and the end of year information is used for analysis and preparation of the "Accountability Report".

In accordance with the Federal Managers' Financial Integrity Act of 1992, the Department will continue evaluations of its management controls in effect during the fiscal year. Our evaluations include an assessment of whether the management controls of the Department were in compliance with the standards prescribed by the Comptroller General. The purpose of these evaluations is to provide reasonable assurance that the management controls are working effectively, that program and administrative functions including the accuracy and reliability of the reporting of performance results are performed in an economical and efficient manner consistent with applicable laws, and that assets were safeguarded against the potential for waste, fraud, abuse, or mismanagement.

The Department's reporting of performance and financial information has been audited by the Inspector General for the past two years and received an unqualified opinions. However, the Inspector General did note weaknesses in accuracy, validation, and maintenance of data in the system. The most recent audit will be published on March 1st and the Department will address the weaknesses in the FY 1998 reporting that affect performance for FY 2000.

The Department will only use the Inspector General's audit of the financial statements which provides an independent confirmation on the accuracy of the performance measure information in the financial statements, as a second check on the accuracy and reliability of the reported status. The programs are the first line management responsible for their reported results.

Waivers

The Department has requested to be part of the Office of Management and Budget pilot program using an "Accountability Report" to consolidate annual reporting of financial information as allowed by the

Government Management Reform Act of 1994. The Department intends that this annual report will also meet the requirements for an annual performance report in accordance with the Results Act. The Department has made no other request for waivers of administrative requirements to provide managerial flexibility

Next Steps for this Plan

This Performance Plan is a proposal associated with the proposed budget for the Department. Although not required under the Results Act, but allowed by OMB, the Department intends to convert this proposal into a performance agreement once the budget for the Department is signed into law. The Department has developed performance agreements after budgets were enacted since FY 1995. The performance agreement for FY 2000 will resolve differences between the proposed budget and performance plan and the enacted budget. The performance agreement will contain the proposed performance goals of the Annual Performance Plan for those activities that are fully funded and will appropriately adjust those performance goals that are funded at a level different from the proposed budget.

The Department intends to report to the public quarterly on the status of performance as it has with previous performance agreements. Additionally, the Department will report to the Congress annually as required by the Results Act, Government Management Reform Act of 1994, and the DOE Organizational Act of 1977.

Demonstrating Credible Performance

This Performance Plan builds on the experience the Department has gained in collecting and reporting performance data each year since our first Performance Agreement between the Secretary and the President in FY 1995. Since then, we have been collecting performance results data for Secretarial performance measures of success and making them available to our stakeholders. In fact, we demonstrated to the National Performance Review that we were actively tracking our progress on the first agreement before it was even signed. The performance data for FY 1997 is available on our Web site (http://www.doe.gov/policy/sms/sms.html).

In addition, beginning in FY 1996, our results have been subject to independent review by the Department's Inspector General. In the spirit of the recent management reform laws, Government Management Reform Act of 1994, as well as the Government Performance and Results Act of 1993, we began using the results data from the performance measures of the Agreements as the basis of the results reviewed for the financial statements. The first year the Department produced consolidated annual financial reports, FY 1996, which included results of performance compared to performance measures from the Performance Agreement, the IG was able to provide an a unqualified opinion. The same was true for the second year, FY 1997. However, we recognize that our data collection and validation efforts can be improved and intend to make improvements for FY 1999 as we continue to make DOE more productive and accountable to the taxpayers.

Criteria for Annual Performance Plan Performance Measures & Targets

The following criteria guide the development of annual performance measures & targets:

PRESIDENTIAL (1) a significant budgetary obligation, (2) White House interest has been demonstrated, or (3) there is Secretarial intent to raise to it to the Presidential level.

SPECIFIC Plainly state precisely what will be done in this fiscal year.

QUANTIFIED Clearly state the measurement and target level of performance. Naked percentages are too vague without specifying the base--instead, state the from and to levels with an optional percentage.

MEANINGFUL Each commitment must stand alone without knowledge of last year's Agreement or Plan or our performance results to link the measures to the commitment statement. Why it will be done, i.e., the purpose or planned outcome. The "so as to ..." should be clear for each measure.

STRETCHING Should have 80% confidence in meeting target during the fiscal year. Higher confidence is under committing--lower percentages are over committing.

CONCISE Statements of commitments and measures should be short, direct, and to the point. A commitment with measures should be between 5 and 25 lines (i.e., 30 to 125 words). Explanations should not be included. The object is to produce an Agreement that is short enough that it would actually be read.

WRITTEN FOR TAXPAYERS Written in common language and requiring only a newspaper article level of knowledge of DOE and world events.

COVERING The overall Agreement must reasonably represent the whole of the resources we are entrusted to apply to the Department's mission in this fiscal year.

AUDITABLE Each success measure should be based on factual information, so that the IG and/or GAO will be satisfied if they were to do an audit.

DOE Office Designations

The business line objectives and performance measures and goals are annotated with the responsible DOE office(s) in parentheses. The two letter office designations are listed below.

CR	**Chief Financial Officer**
DP	**Defense Programs**
ED	**Economic Impact & Diversity**
EE	**Energy Efficiency & Renewable Energy**
EH	**Environment, Safety & Health**
EIA	**Energy Information Administration**
EM	**Environmental Management**
FE	**Fossil Energy**
FM	**Field Management**
MA	**Management and Administration (formerly Human Resources)**
MD	**Fissile Materials Disposition**
NE	**Nuclear Energy, Science & Technology**
NN	**Nonproliferation & National Security**
NR	**Naval Reactors**
PC	**Privatization and Contract Reform**
PO	**Policy and International Affairs**
PMAs	**Power Marketing Administrations**
RW	**Civilian Radioactive Waste Management**
S1	**Secretary's Office**
SC	**Science (formerly Energy Research)**
WT	**Worker & Community Transition**
