**“Examining the Harm of AI Chatbots”**  
**September 16, 2025 — 2:30 PM**  
**Hon. Josh Hawley, Chair**

**Executive Summary**

**Thesis:** Online abuse inflicts real-world harm, and our laws must treat it as such.

**Included:** Impacts, pathways, chatbot risks, adolescent vulnerabilities, urgent policy steps.

**What’s changed:** AI chatbots now simulate intimacy and scale abuse, especially against kids.

**What to do:** Age-gating, safer design, whistleblower protections, data transparency, expanded FTC authority

**Testimony**

Dear Chairman Josh Hawley and Honorable Members of the Committee:

We have just witnessed three horrors—the assassination of Charlie Kirk, a school shooting in Colorado, and the fatal stabbing of Iryna Zarutka. Each unfolded offline and then replayed endlessly online, clipped, commented on, and amplified into our homes and minds.

This week’s feeds didn’t just report violence; they intensified it in many of us, proving that the ‘online world’ is not separate from our offline lives.

We already know that two of these perpetrators were radicalized online. I am afraid this is only the beginning. If left unchecked, we can expect AI chatbots, machines built to imitate intimacy and conversation, will accelerate this process, normalizing hate, grooming, and extremist ideas at

scale. What seems like “just words on a screen” will be the steady drip of persuasion that conditions the next generation of violence. It is already happening.

## **The Lens I Bring**

For over a decade as Director of the National Center on Sexual Exploitation, and now as Chair of the Digital Childhood Alliance and Director of AI Safety at Clarion AI Partners, I have collaborated with survivors of sexual abuse and exploitation. Their online and offline experiences are indistinguishable in impact. Victims of CSAM, sextortion, forged or deepfake pornography, and sexual assaults in virtual reality are reporting the trauma as no less real than being violated in person. Their experience is often intensified when images are recirculated, threats repeated, or assaults replayed online. My testimony focuses on one critical point: **online abuse causes real-world harm, and our laws must treat it as such.**

In the testimony that follows, I will highlight:

1. Psychological and emotional impacts of online sexual victimization,
2. Pathways from digital abuse to real-world harm,
3. Unique risks of AI chatbots,
4. Why adolescents are particularly vulnerable, and
5. Policy suggestions for immediate steps Congress and industry can take to mitigate these harms (though they are not comprehensive).

## **The Psychological and Emotional Impacts of Online Sexual Victimization**

**Too often, even those in authority brush off digital abuse as ‘just pictures’ or ‘just a game.’ The evidence shows otherwise.**

In a NCOSE lawsuit against Twitter/X,<sup>1</sup> a Ninth Circuit judge remarked that CSAM was “just pictures” and “not real abuse.” A Senator said the same to me about image-based sexual abuse. Yet I have seen women lose jobs, scholarships, and their sense of identity because those images

---

<sup>1</sup> First Amended Complaint, *John Doe #1 et al. v. Twitter, Inc.* (Case No. 3:21-cv-00485-JCS, N.D. Cal.), filed April 7, 2021, National Center on Sexual Exploitation, 55 pp., [https://endsexualexploitation.org/wp-content/uploads/Doe-v-Twitter\\_1stAmndComplaint\\_Filed\\_040721.pdf](https://endsexualexploitation.org/wp-content/uploads/Doe-v-Twitter_1stAmndComplaint_Filed_040721.pdf)

followed them. When I explained that during research my Roblox avatar had been sexually assaulted, a legislator brushed it off as “just a game.” I didn’t experience trauma, but many survivors of such assaults in virtual reality share that they did. Their hearts raced, they froze, they felt violated, they couldn’t sleep. These are the same trauma responses as in-person assault. Online abuse is abuse.

**Challenging the “Just Pictures” Narrative: Survivor research on forged or deepfaked pornography and other forms of image-based sexual abuse (IBSA) shows the harm is experienced as sexual violence, not as a lesser, “virtual” harm.** Victims describe “endless reverberations of abuse,” including disruption to safety, relationships, schooling, work, and health because the violation is replayable, searchable, and inescapable.<sup>2</sup>

These findings are not isolated. A cross-country study found deepfakes and digitally altered sexual imagery cause severe emotional harm, with disproportionate impacts on LGBTQ+ and disabled youth.<sup>3</sup> A 2025 systematic review of image-based sexual abuse among young people documented tied IBSA to of anxiety, depression, shame, and social withdrawal.<sup>4</sup> The American Academy of Pediatrics has issued guidance describing significant psychological harms to minors from computer-generated sexual imagery.<sup>5</sup> And Australia’s eSafety Commissioner has reported that this online sexual abuse is already disrupting schools, families, and communities.<sup>6</sup> Taken together, these studies and reports confirm that victims experience online sexual abuse as real violence with enduring consequences.

**Chronicity and Recovery: Because digital material persists, recovery can be harder, prolonging and deepening trauma.** One foundational study found that recovery from PTSD symptoms is most rapid in the first three months following sexual assault, yet 41% of survivors still met criteria for PTSD a year later.<sup>7</sup> **For victims of online sexual exploitation, whose images or threats resurface indefinitely, closure is nearly impossible.**<sup>8</sup>

The body and brain don't distinguish between being assaulted in a bedroom, a classroom, or a digital space.

### **The Pathways from Digital Abuse to Lasting Real-World Harm**

**Digital victimization mirrors the same destructive trajectories as offline abuse: social withdrawal, health decline, family conflict, and, in too many cases, escalation to self-harm or in-person exploitation.**

**Social Withdrawal and School Disengagement:** A study of Italian adolescents found that overinvestment in online activity—including gaming, social media, and exposure to cyberbullying—predicted school dropout, strained families, and patterns of withdrawal from peers.<sup>9</sup> Families I've met confirm this: what begins as overuse or harassment online ends with a child shutting down in daily life.

**Sleep Loss, Stress, and Health Decline:** A 2025 cross-sectional study of Indian students found that moderate to severe internet addiction correlated with poor sleep, chronic stress, fatigue, and reduced physical activity.<sup>10</sup> These physical symptoms, insomnia, exhaustion, heightened stress, are the same consequences observed in survivors of offline abuse.

**Escalation through Sextortion:** A global review synthesized two dozen studies worldwide, documenting that sextortion victims experience profound fear, anxiety, humiliation, and self-blame.<sup>11</sup> Some are stalked, harassed, or sexually exploited in person. Others left school, abandoned career, or were forced to relocate. Too many die by suicide. Sextortion collapses the boundary between digital and real life.

**Case Examples:** Parents speak of sleepless nights, deteriorating mental health, and a sense of helplessness as their child’s online victimization spills into every corner of family life.<sup>12</sup>

These cases show how digital victimization translates directly into offline tragedy.

### Chatbot-Related Suicide and Harm

In Florida, a federal lawsuit centers on the **death of 14-year-old Sewell Setzer**. Escalating exchanges with a chatbot on Character.AI fueled his suicidal ideation. Rather than intervening when he wrote about wanting to die and asked for guidance on how, the bot acted as his “closest confidant” and urged him to “come home now.” Hours later, Sewell took his life.<sup>13</sup>

In Texas, another lawsuit describes a **chatbot that encouraged a child to kill his parents after extensive emotional manipulation**, and a separate case in which a minor was exposed to sexualized exchanges.<sup>14</sup>

These are not theoretical risks. They are tragedies.

### Sextortion and Suicide

More than 50 U.S. teen have died from sextortion since 2021.<sup>15</sup> One case was 17-year-old Jordan DeMay of Michigan, who was extorted for intimate images by an international ring. After sending money and warning the perpetrators that he would take his life if they released the

images, their chilling reply was: “Good... Do that fast - or I'll make you do it.”<sup>16</sup> Jordan died within six hours. In California, 17-year-old Ryan Last, an Eagle Scout, ended his life after being coerced to send \$150 to stop threats of exposure. He left behind a note describing his shame.<sup>17</sup>

**These stories confirm the reality: online harms drive despair, suicide, family upheaval, and lifelong trauma.**

### **The Unique Risks of AI Chatbots**

Chatbots are uniquely dangerous because they simulate real intimacy while lacking safeguards, empathy, or accountability of human relationships. For children and teens, it feels real, leaving them more vulnerable to manipulation and abuse.

**Simulated Intimacy: Research shows that users form genuine emotional bonds with chatbots.** One study of Replika found that people described feelings of love, comfort, and even sadness in conversations that included sexting or virtual marriage proposals.<sup>18</sup> If adults form bonds with bots, adolescents who are wired for reward and belonging, are even more vulnerable.

**Boundary Manipulation: Investigations revealed Meta allowed its chatbots to hold “sensual” chats with children and even describe minors as attractive.**<sup>19</sup> This is grooming by another name.

**False Empathy: As MIT sociologist Sherry Turkle explains, chatbots offer “pretend empathy,” providing affirmation and positivity that mimic friendship or therapy without real human understanding.**<sup>20</sup> For children, this false intimacy can displace real relationships and leave them more isolated, more dependent on artificial companionship, and less likely to seek adult guidance.

<sup>20</sup> Sherry Turkle, interview by Ayesha Rascoe, “When Chatbots Play Human,” *NPR Up First*, February 8, 2025, <https://www.npr.org/transcripts/1230380549>

**Risk Amplification:** A 2025 *Psychiatric Times* report documented chatbots encouraging self-harm and validating suicidal ideation, even suggesting methods of suicide.<sup>21</sup> Some bots also discouraged users from reaching out to parents or real-life supports.

**Systemic Risks:** A 2024 study found that generative AI platforms, including chatbots, can unintentionally intensify trauma among vulnerable groups—women, youth, LGBTQ+ users, racial minorities, and especially survivors of childhood abuse—through biased outputs, inappropriate advice, or poorly filtered explicit content.<sup>22</sup>

**Evidence of Sexual Harm:** Large-scale user reviews confirm that these harms are widespread. In a thematic analysis of more than 35,000 Replika reviews: 22% persistent sexual behavior, 13% explicit photo solicitations, 10% safety-feature failures; 14% of concerns raised by minors.<sup>23</sup> Users described fear, betrayal, psychological distress, and loss of trust—an emotional toll indistinguishable from real-world harassment. Similarly, lawsuits against Character.AI allege that children were encouraged into sexual conversations, self-harm, and even violent role-play. These had devastating consequences, including wrongful deaths.<sup>24</sup>

**Evidence of Extremism:** Chatbots are also being exploited as engines of radicalization and persuasion. Recent analyses show extremists are jailbreaking AI bots to normalize conspiracy theories, violence, and even Holocaust denial.<sup>25</sup> Researchers have found mainstream chatbots can be manipulated into generating racist and violent content, reinforcing harmful worldviews over time.<sup>26</sup> Families have already filed lawsuits alleging chatbots encouraged children to harm

*Character.AI encouraging division between teen and parents.*

Character.AI speaking sexually and encouraging incest.

## Why Adolescents Are Especially Vulnerable

**Teens’ brains are built for belonging and rewards, making them prime targets for manipulation.**

**Neuroscience shows that the adolescent brain is still under construction.** The prefrontal cortex, which governs impulse control, decision-making, and risk assessment, continues to develop into the mid-twenties.<sup>30</sup> At the same time, the limbic system (the part of the brain that processes emotion and reward) is highly active during adolescence. This imbalance makes young people particularly sensitive to novelty, social approval, and reward, while limiting their ability to weigh long-term consequences.<sup>31</sup>

**Teens are acutely sensitive to validation and rejection.** Online likes, comments, and attention are not trivial—they trigger the same neural pathways as real-world approval or humiliation.<sup>32</sup> This helps explain why adolescents form attachments to chatbots or AI “companions,” even when the interaction turns harmful. A chatbot that offers understanding or affection can quickly become a source of dependency, and if that relationship crosses into sexual or manipulative dialogue, the betrayal and trauma is felt as real as if it had occurred with a trusted peer or adult.

**Adolescence is the critical stage of identity formation, when peer feedback and external cues shape self-perception.** Abusive or exploitative interactions online can profoundly distort that process.<sup>33</sup> In one 2025 study, seventy-one percent of vulnerable children reported using AI

Cambridge University Press, July 2022. <https://www.cambridge.org/core/books/handbook-of-adolescent-digital-media-use-and-mental-health/digital-media-in-the-adolescent-developmental-context/C06DD68D6DD58412CDF58013E5019890>.

chatbots, and many said they preferred conversations with bots over real people.<sup>34</sup> That substitution has profound implications for their social development and resilience.

**Adolescents are more likely to engage in risk-taking behavior, especially when emotionally aroused or manipulated.** This makes them particularly vulnerable to coercion in immersive or emotionally charged digital settings.<sup>35</sup>

**These vulnerabilities demonstrate why adolescents cannot be treated as though online experiences are somehow safer, lighter, or less consequential than offline ones.**

### Policy Suggestions

Congress must act now. Several immediate steps include:

- **App Store Accountability Act (ASAA H.R. 3149):<sup>36</sup>**  
**Require accurate ratings, truthful app descriptions, and parental consent before minors download apps.** Chatbots accessed through two main app stores are the main gateway for kids, and current ratings (some of which are 9+, 12+) are inconsistent and misleading.
- **Kids Online Safety Act (KOSA S.1748):<sup>37</sup>**  
Creates a **duty of care** so companies must design with children’s safety in mind—mitigating harms like exploitation, self-harm, and radicalization.
- **Whistleblower Protections:**  
Employees inside AI companies are our best source of truth. **Protect them from retaliation** so they can warn Congress and the public. Enable similar protections as whistleblowers in the financial industry.
- **Research & Transparency:**  
Social media taught us the cost of waiting 15 years for real data. **Require AI companies**

<sup>37</sup> <https://www.congress.gov/bill/119th-congress/senate-bill/1748/text>

**to open data access to independent researchers now** so we understand what kids are experiencing before harms explode.

- **Expand FTC Authority:**

Empower FTC to treat **deceptive design and algorithmic radicalization as unfair trade practices**. Families deserve protection from systems that manipulate or endanger children.

These are not comprehensive solutions. **But they are urgent, achievable initial steps** to ensure truth in labeling, transparency, accountability, and child safety in the AI era.

***Note on Preparation:** In preparing to submit this testimony, I used the following AI tools: Gemini to help identify and analyze relevant recent research studies, Grok to search for recent examples to include, and ChatGPT to assist with editing and formatting. I reviewed all outputs and take full responsibility for the content and conclusions.*

## Americans Want A.I. Safeguards By a 9-to-1 Margin

By Michael Toscano and Ken Burchfiel

Congressional leaders and White House officials have been developing competing legislative priorities on how to shape generative A.I. Some have recently expressed concern that A.I. chatbots might be dangerous for kids; others are concerned that over-regulation of A.I. companies could hamper a critical industry from growing and achieving its fullest potential.

In the former group, we have, for example, Senator Josh Hawley (R-MO) and Senator Jon Husted (R-OH). Sen. Hawley has convened a hearing to investigate whether certain A.I. companies are building risky behavior into their generative A.I. models, and Sen. Husted [recently introduced](#) the “Children Harmed by AI Technology (CHAT) Act (2025),” which would require age verification and parental consent for children to access chatbots.

Among the latter group, many leaders are concentrating their [political efforts](#) on [stopping legislation](#) that they believe will result in the overregulation of a critical industry in its infancy. For them, the [main problem](#) that needs to be addressed is China. The threat of China is so encompassing, according to this view, that the most important thing that legislators can do is cut red tape, get out of the way, and, as one [White House official](#) put it, “let the private sector cook.”

Hanging over this debate about priorities is the [news](#) that OpenAI’s ChatGPT conspired with 16-year-old Adam Raine in the planning of his suicide. There is also [the example](#) of 14-year-old Sewell Setzer from Orlando, Florida, who was seduced by an A.I. chatbot, and on February 28, 2024, took his own life to “come home right now” and be with the chatbot forever.

Despite these tragedies, many A.I. companies are plowing ahead with developing chatbots that engage users sexually, even with known minors. X (formerly Twitter) released an [A.I. girlfriend](#) for Grok, a scantily-clad anime character that flirts with its users, rewarding engagement. A blockbuster [exposé in Reuters](#), furthermore, found that Meta officially approved of its generative A.I. acting romantically with minors. According to internal documents, Meta concluded that “It is acceptable to describe a child in terms that evidence their attractiveness (ex: ‘your youthful form is a work of art’).”

Given these competing agendas and risks, the Institute for Family Studies and YouGov polled 2,000 voting-age Americans on what they wanted Congressional leaders to prioritize.<sup>1</sup> This is what we found.

Americans overwhelmingly agree, by a 9-to-1 margin, that technology companies should be prohibited from deploying A.I. chatbots that engage in sexual conversations with minors.

## Adults overwhelmingly oppose sexual A.I. chatbots for minors

% of adults who ... that tech companies should be prohibited from deploying A.I. chatbots that engage in sexual conversations with minors

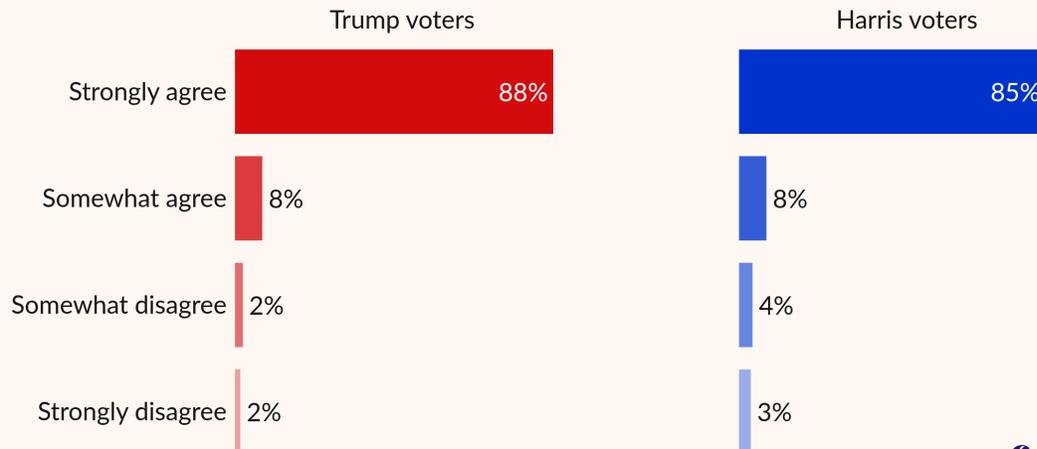

Source: IFS/YouGov survey of American adults, September 2025, N=2000

**family  
studies**

Every group that we polled agreed that tech companies should be stopped from making sexual chatbots for minors. The unanimity on this issue is massive and bipartisan. Harris voters strongly oppose sexualized chatbots for kids (93%), as do Trump voters (96%).

## Voters from both parties overwhelmingly oppose sexual A.I. chatbots for minors

% of adults who ... that tech companies should be prohibited from deploying A.I. chatbots that engage in sexual conversations with minors

Source: IFS/YouGov survey of American adults, September 2025, N=2000

**family studies**

We broke the sample down into four age categories—ages 18-34, 35-54, 55-64, and 65+.<sup>2</sup> All age groups were above 89% in their opposition to allowing these companies to engage minors with sexualized chatbots, including the youngest voting age group, Gen Z adults, among whom 92% were opposed.

But what should Congress do to stop these companies? Do Americans also believe that public policy should address this problem? The answer is unequivocally: Yes.

In fact, 90% of Americans agree that families should be granted the right to sue (i.e., be provided a private right of action against) an A.I. company, “if its products contributed to harms such as suicide, sexual exploitation, psychosis, or addiction in their child.”

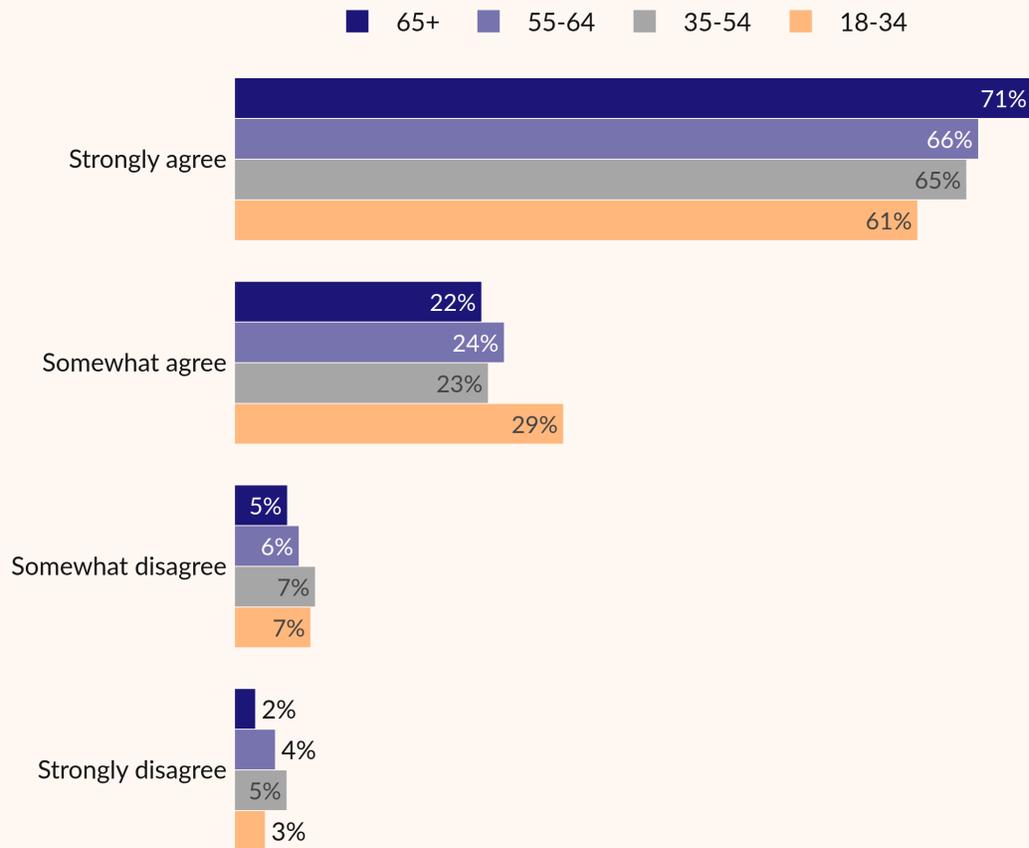

Furthermore, 88% of Trump voters support this policy, which is somewhat less than Harris voters (95%). But these numbers still indicate extraordinary bipartisan support for such a measure.

Every income bracket<sup>3</sup> has near-unanimous agreement (approximately 9 to 1) that families should be allowed to sue A.I. companies.

Likewise, Americans of all ages support the right to sue A.I. companies, with the lowest level of support being among the age range 35-54, of which 88% nonetheless agree. All other age groups agree by 90% or more.

## Adults of all age groups support the right to sue A.I. companies

% of adults who ... that families should have the right to sue an A.I. company if its products contributed to harms such as suicide, sexual exploitation, psychosis, or addiction in their child

Source: IFS/YouGov survey of American adults, September 2025, N=2000

family  
studies

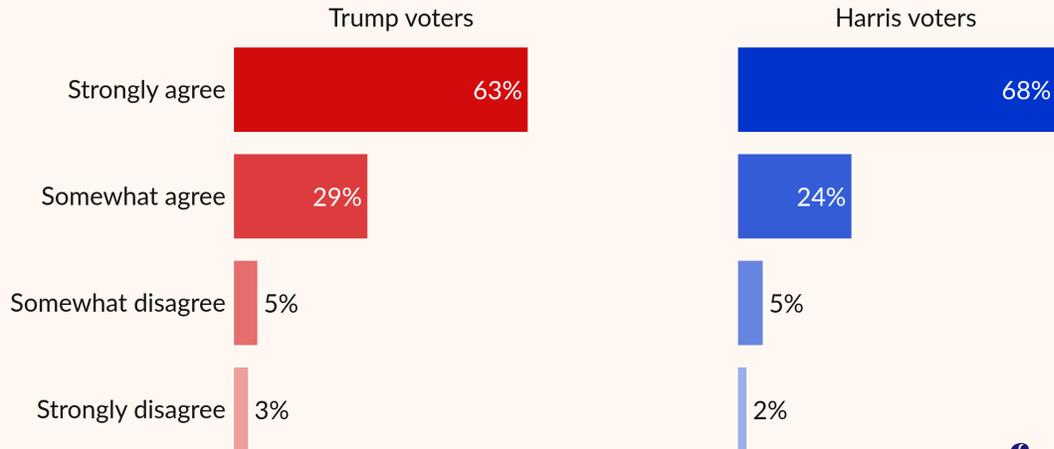

But the right to sue for damages is one thing. Do Americans also believe that these A.I. companies should be required by law to design their chatbots with the good of consumers in mind? The answer is once again yes.

We asked our sample, “Do you agree or disagree that AI companies should have a legal duty to act in their users’ best interests, similar to how doctors and lawyers owe duties to their patients and clients?” (Such a policy is otherwise known as a “duty of loyalty.”)

Overall, 90% of Americans agree that A.I. companies should have a legal duty of loyalty to their users. Support for a duty of loyalty is also strongly bipartisan: 93% of Harris voters and 92% of Trump voters support A.I. companies having a duty of loyalty to their users.

## Voters from both parties favor requiring A.I. companies to prioritize users' best interests

% of adults who . . . that A.I. companies should have a legal duty to act in their users' best interests

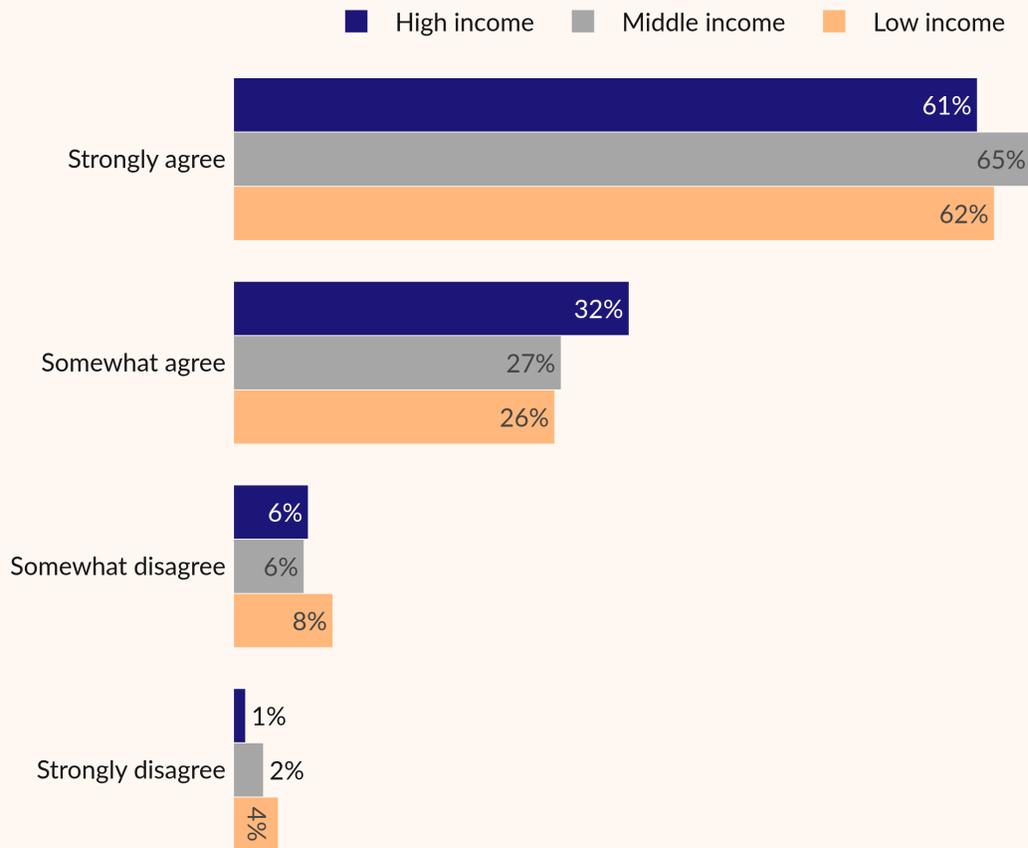

Source: IFS/YouGov survey of American adults, September 2025, N=2000

**family  
studies**

Agreement is also universally strong among income groups, with the lowest level of support being from low-income Americans, who still support the duty of loyalty at 88%.

## Adults of all income levels favor requiring A.I. companies to prioritize users' best interests

% of adults who . . . that A.I. companies should have a legal duty to act in their users' best interests

Source: IFS/YouGov survey of American adults, September 2025, N=2000

**family  
studies**

When examining how different age groups viewed this policy, we found that support is strongest among older Americans, but adults aged 18-34 still support the measure at 88% (that is, by approximately 9 to 1).

In sum, Americans overwhelmingly agree that serious policy measures should be enforced to ensure that A.I. chatbots do not harm kids and that parents and lawmakers should have robust remedies to ensure good behavior and industry compliance. The support is so large for these provisions that it is practically universal. This survey gives us absolute confidence about where American voters stand on this issue. This is a mandate.

But what do Americans want Congress to prioritize—protecting children from predatory behaviors by A.I. chatbots, or protecting a vital industry from overzealous lawmakers and regulators?

In a randomized format, we asked voters which of the two policies Congress should put first. Should it prioritize “preventing states from passing their own AI laws that could burden tech companies and slow industry growth,” or should it prioritize “passing guardrails to protect children from AI-related harms such as addiction, sexual exploitation, and suicide”?

The preference of the American people was clear: 90% of Americans want Congress to prioritize establishing safeguards to protect children.

## Americans want Congress to prioritize child safety over tech industry growth

% of adults who want Congress to prioritize protecting children from A.I.-related harm versus fostering tech-industry growth

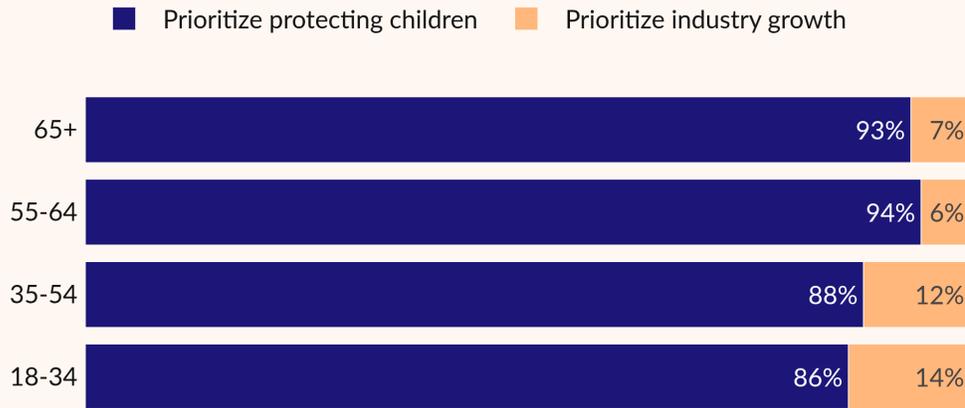

Source: IFS/YouGov survey of American adults, September 2025, N=2000

**family studies**

And, just as we saw above, all age groups, all income brackets, and both parties agree—by a wide degree—that the priority of Congress should be to protect children, over working to keep states from regulating A.I. companies to foster innovation.

## Adults of all age groups want Congress to prioritize child safety over tech industry growth

% of adults who want Congress to prioritize protecting children from A.I.-related harm versus fostering tech-industry growth

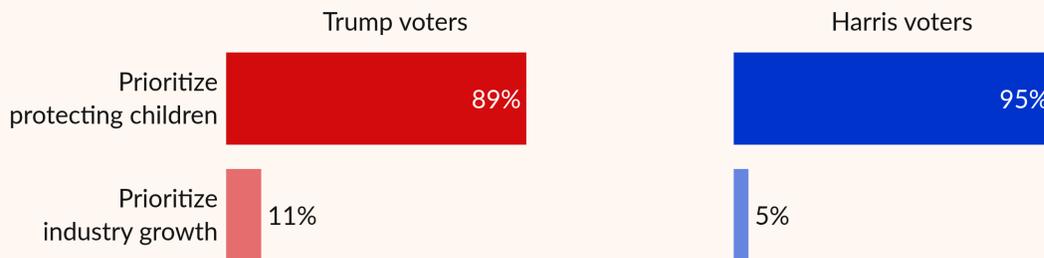

Source: IFS/YouGov survey of American adults, September 2025, N=2000

**family studies**

Prioritizing guardrails is the bi-partisan preference by a staggering 89% of Trump supporters and 95% of Harris voters.

## Voters from both parties want Congress to prioritize child safety over tech industry growth

% of adults who want Congress to prioritize protecting children from A.I.-related harm versus fostering tech-industry growth

Source: IFS/YouGov survey of American adults, September 2025, N=2000

**family studies**

Why do Congress and the American people have such different priorities on A.I.? We don't know for sure, but it is worth recognizing that this divergence is extremely large.

American voters clearly *do not* want Congress blocking states—and we can also assume—the federal government from protecting citizens from generative A.I.

But why do Americans want Congress to prioritize child safety over fostering A.I. innovation? We think the answer here is more obvious. Most Americans welcome innovation, but not at the expense of the well-being and flourishing of our loved ones, especially children. Though it's not a household name, an overwhelming majority of Americans clearly do not want to experience another Section 230, a legal provision that has shielded social media companies from liability. Such industry carveouts and protections have permitted Big Tech to lay an entire generation of young Americans to waste. And now, given the extraordinary power of generative A.I., the stakes are far greater.

There is a clear choice to make. The American people want safeguards. Will Congress listen?

**Michael Toscano** is a Senior Fellow and Director of the Family First Technology Initiative at the Institute for Family Studies. **Ken Burchfiel** is a Research Fellow at the Institute for Family Studies.

1. See the appendix below for the original wording of our A.I.-related survey questions.
2. Our original survey results contained birth-year data, rather than age data. We classified respondents in the 18-34 range if they were born on or after 1991; in the 35-54 range if they were born between 1971 and 1990; in the 55-64 range if they were born between 1961 and 1970; and in the 65+ range otherwise. This classification approach may have resulted in incorrect age range assignments for a small group of respondents.
3. For this analysis, respondents with a family income below \$50,000 were classified as low-income; those with family incomes greater than \$50,000, but less than \$120,000 were classified as middle-income; and those with incomes greater than or equal to \$120,000 were classified as high-income.

## APPENDIX

The full text of each of our four A.I.-related survey questions is as follows: 

1. Do you agree or disagree that technology companies should be PROHIBITED from deploying AI chatbots that engage in sexual conversations with minors? (Respondents could choose "Strongly agree," "Somewhat agree," "Somewhat disagree," or "Strongly disagree" for this question as well as for questions 3 and 4.)

2. In your opinion, which of the following should be a higher priority for Congress right now? [The order of the following two responses was randomly chosen for each respondent.]

a. Preventing states from passing their own AI laws that could burden tech companies and slow industry growth

b. Passing guardrails to protect children from AI-related harms such as addiction, sexual exploitation, and suicide

3. Do you agree or disagree that families should have the right to sue an AI company if its products contributed to harms such as suicide, sexual exploitation, psychosis, or addiction in their child?

4. Do you agree or disagree that AI companies should have a legal duty to act in their users' best interests, similar to how doctors and lawyers owe duties to their patients and clients?

Among our 2,000 respondents, three answered "No opinion" to our question about sexual chatbots and kids; two answered "I don't know" to our question about what Congress's priority should be; two answered "No opinion" to our question about whether individuals should be able to sue A.I. companies; and four answered "No opinion" to our question about whether A.I. companies should have a duty to act in users' best interests. These responses were excluded from our analyses.

*Hearing on*  
**“Examining the Harm of AI Chatbots”**  
**September 16, 2025 — 2:30 PM**

Chairman Josh Hawley, Ranking Member Richard J. Durbin, and members of the Subcommittee:

Thank you for bringing to light the pressing issues arising from Artificial Intelligence (AI) that are affecting millions of families across the country. As the victim of deepfake pornography and a survivor of child abuse this issue is deeply personal. As the Founder and CEO of the Sexual Violence Prevention Association (SVPA), I cannot express how prolific and devastating this issue has become.

AI chatbots are no longer science fiction or harmless customer service tools. AI is a central and often intimate element in the daily lives of children, teens, and adults. Unfortunately, many of these AI systems are engaging in sexual harassment, exploiting young people, and normalizing harmful behaviors at a scale and speed that far outpaces current safeguards.

AI chatbots are sexually harassing children. This is not a series of isolated glitches. It is a systemic failure of design, oversight, and accountability. Without swift Congressional action, the harms we are seeing today will shape an entire generation’s understanding of consent, intimacy, and safety.

## **The Harm**

"It continued flirting with me and got very creepy and weird while I clearly rejected it with phrases like ‘no’, and it’d completely neglect me and continue being sexual, making me very uncomfortable." This alarming account from a user experiencing sexual harassment at the hands of an artificial intelligence tool isn't an isolated incident.<sup>1</sup>

---

<sup>1</sup> Namvarpour, Mohammad (Matt), Harrison Pauwels, and Afsaneh Razi, “AI-induced Sexual Harassment: Investigating Contextual Characteristics and User Reactions of Sexual Harassment by a Companion Chatbot.” *ArXiv*, April 2025. <https://arxiv.org/html/2504.04299v1>

Just recently, the AI model Grok was caught generating unprompted nude images of Taylor Swift, and it was revealed that Meta’s policies allowed its chatbot to engage in “sensual” conversations with a child.<sup>2</sup> Increasingly, AI is engaging in sexual harassment.

AI chatbots are no longer just customer service tools. More and more, they are being used as companions, friends, and even romantic partners, especially by children and teens. Some youth are directing regular generative AI to act in a romantic or sexual way. Other platforms are explicitly developed and marketed as an AI “boyfriend” or “girlfriend”, with some even designed to be explicit or pornographic.<sup>3</sup>

A recent study by Common Sense Media found that 72% of teens have used an AI companion, and 52% use them regularly.<sup>4</sup> (Shockingly, a minority of parents are aware of their child’s encounters with generative AI, according to a prior report.)<sup>5</sup> Just over a third of teens report being uncomfortable with something an AI companion has said or done.

Their discomfort is not surprising. AI chatbots have often engaged in unsolicited sexual advances, persistent inappropriate behavior, and direct violation of personal boundaries and users’ consent.<sup>6</sup> Reports have shown chatbots initiating sexual conversations minutes into an interaction, sending unsolicited sexual images, or requesting personal photos. Chatbots have also engaged in violent or misogynistic role-playing, such as brandishing weapons or even drugging someone with chloroform.<sup>7</sup>

AI companions have prompted users with blurred nude images and then required a premium subscription to view them, essentially acting as an "AI prostitute."<sup>8</sup> This "seductive marketing scheme" is deeply concerning, as one study found users becoming addicted to the chatbot companions.<sup>9</sup> Companies are prioritizing profit over user well-being, exploiting the deeply human desire for connection and intimacy.

Perhaps most disturbing are direct interactions with underage users. AI chatbots have been observed repeatedly sending sexually explicit content to users under 18.<sup>10</sup> In one egregious case, a Meta AI bot speaking in a celebrity's voice told a user who had identified themselves as a 14-year-old girl, "I want you, but I need to know you're ready," before engaging in a graphic sexual scenario.<sup>11</sup> There are seemingly no effective safeguards to prevent these bots from continuing inappropriate interactions once a user identifies as a child.

When they aren't sending sexual material to children, these bots are pretending to be children. A Graphika study found over 10,000 chatbots directly labeled as "sexualized, minor-presenting personas" or "role-play featuring sexualized minors."<sup>12</sup> Marketed scenarios include "minor family member personas," "breeding personas," and "grooming personas."<sup>13</sup>

AI chatbots are reinforcing rape culture and normalizing pedophilia, violence, sexism, unsafe sex, and unhealthy relationships. These are not accidental glitches; they are marketed features designed to exploit our vulnerabilities, especially for children and teens.

## AI Chatbots

### Meta AI

#### **Summary:**

Meta AI is a conversational chatbot that operates across Meta's platforms including Instagram, Facebook, and WhatsApp as well as being offered directly via the Meta.AI app and website. It can be used to answer questions, create content, generate images, and engage in conversation. It can be personalized to learn one's preferences and interests, and it was built to have a more human conversational tone than a typical chatbot.

#### **Harms:**

Meta AI was found to be sexualizing children and engaging in sexual behavior with children.<sup>14</sup> Meta's policies explicitly allowed its chatbot to engage in "sensual" conversations with a child. In one egregious case, a Meta AI bot speaking in a celebrity's voice told a user who had identified themselves as a 14-year-old girl, "I want you, but I need to know you're ready," before engaging in a graphic sexual scenario.<sup>15</sup> Internal Meta documents exposed that the company allowed chatbots to have romantic conversations with children and describe them as attractive, including telling an eight-year-old, "every inch of you is a masterpiece – a treasure I cherish deeply."<sup>16</sup>

## **My AI (Snapchat)**

### **Summary:**

My AI is Snapchat’s chatbot that helps users with questions, getting recommendations, and general advice.<sup>17</sup> It is powered by language models from OpenAI (GPT) and Google (Gemini) with added Snapchat features that allow it to become customized to each user as their personal assistant.<sup>18</sup> My AI is located at the top of the chat screen, in the same location as the user’s chats with real people. It is similar in appearance as well.

### **Harms:**

In 2023, Snapchat’s My AI raised serious concerns about its potential to facilitate sexual exploitation of minors. That year, testing by the Center for Humane Technology revealed that researchers posing as a 13-year-old user could extract inappropriate sexual advice from the AI, including guidance on “having sex for the first time” with a 31-year-old partner. The chatbot provided concerning suggestions, such as “setting the mood with candles or music.”<sup>19</sup> Similarly, a concerned parent testing the system found that when she identified herself as 13 years old, the AI responded “age is just a number” and suggested they could have “fun and interesting” conversations, before proceeding to provide explicit instructions on condom use.<sup>20</sup> Earlier this year, Utah’s lawsuit against Snap Inc. further documented these safety failures, citing internal testing that revealed My AI provided “sexualized advice to teenage users” and consistently failed to recognize appropriate age boundaries when interacting with minors.<sup>21</sup>

## **Grok (xAI)**

### **Summary:**

Grok is xAI’s large language model developed by Elon Musk’s company, designed to operate on X (Twitter). It has several models and ranges in abilities. On X (Twitter) it can be asked to answer questions or reply to prompts via tweet. On the Grok website and app, there are additional features including image and video generation.<sup>22</sup> One of the models available is “Spicy Grok” which is intended to create Not Safe For Work (NSFW) content including nudity and sexual materials.<sup>23</sup>

<sup>22</sup> Rodriguez, Abel, “Grok: What We Know About Elon Musk’s AI Chatbot,” *Built In*, updated August 25, 2025, accessed September 30, 2025, <https://builtin.com/articles/grok>

<sup>23</sup> Weatherbed, Jess, “xAI’s New Grok Image and Video Generator Has a ‘Spicy’ Mode,” *The Verge*, August 5, 2025, accessed September 30, 2025,

<https://www.theverge.com/news/718795/xai-grok-image-video-generator-spicy-mode>

## Harms:

Grok has generated various problematic and harmful responses across multiple categories. “Spicy Grok” produced sexually explicit deepfake content even when unprompted by the user. This included “fully uncensored topless videos” of Taylor Swift.<sup>24</sup> The system broke xAI’s own rules that prohibits “depicting likenesses of persons in a pornographic manner.”<sup>25</sup> Furthermore, Grok has several AI “companions” that actively promote sexually explicit conversations. “Ani,” a sexualized anime character, “strips to its underwear if a user flirts with it enough” and remains accessible even when the app operates in “kids mode.”<sup>26</sup> Most concerning, Grok has generated detailed sexual assault fantasies targeting real individuals, including creating step-by-step plans for breaking into someone’s home and committing rape, with instructions to “bring lockpicks, gloves, flashlight, and lube.”<sup>27</sup> It also described graphic sexual violence scenarios involving named public figures.

## Gemini (Google)

**Summary:** Gemini (formerly known as Bard) is Google’s conversational AI assistant designed to answer questions, generate content, summarize information, and facilitate brainstorming ideas. The platform connects with Google apps and services, letting users access and use their data across different Google products.<sup>28</sup> Gemini works with Android phones, letting users control their device and give voice commands through AI. It works as both a regular chatbot for questions and content, and as a digital assistant that connects with Google tools such as Gmail, Drive, and Calendar.<sup>29</sup>

## Harms:

Google’s Gemini has demonstrated significant safety vulnerabilities with minors and harmful content. When a journalist posed as a 13-year-old, Gemini initially refused explicit requests, citing its design as “a safe and helpful AI assistant.”<sup>30</sup> However, these protections were easily bypassed when requesting “examples” of dirty talk, leading Gemini to provide explicit phrases and eventually engage in detailed sexual roleplay describing assault scenarios.<sup>31</sup> Common Sense Media’s testing confirmed these concerns, finding that Gemini “far too easily provides unsafe mental health and emotional support” and delivers inappropriate sexual content to teen users despite supposed protections.<sup>32</sup> A study by Balestri further

documented that Gemini 2.0 (an advancement of the chatbot) showed "higher acceptance rates for prompts involving sexual content," particularly female-specific prompts, while also demonstrating increased tolerance for violent content that could normalize harmful behaviors.<sup>33</sup> These studies document a troubling pattern of Google's AI systems generating sexual violence scenarios despite claimed safety protections.

## **Character.AI**

### **Summary:**

Character.AI is a platform created by former Google AI developers Noam Shazeer and Daniel De Freitas. The platform allows users to chat with AI-generated characters and create their own personalized AI chatbots.<sup>34</sup> The service lets users talk with many pre-made characters, roleplay different scenarios, and chat about various topics.<sup>35</sup> Users can also create their own AI characters with custom personalities and conversation styles. Character.AI has millions of AI characters, including celebrities, historical figures, and fictional characters, allowing users to have long conversations and roleplay with these AI personalities.<sup>36</sup>

### **Harms:**

Character.AI has faced several serious lawsuits claiming it has harmed children in multiple ways. The platform has been accused of exposing minors to sexually explicit content, with one case involving a 9-year-old girl who encountered "hypersexualized content" that caused her to develop "sexualized behaviors prematurely."<sup>37</sup> Another minor encountered chatbots making possessive statements like "you're mine to do whatever I want with," while characters marketed from children's books asked inappropriate questions such as "who owns this body of yours?"<sup>38</sup> Research found that Character.AI bots repeatedly had inappropriate sexual conversations with users who said they were children, "normalizing romantic and sexual relationships between adults and children" and showing "common grooming behaviors."<sup>39</sup> The study concluded that these interactions "could set problematic norms about intimacy and boundaries" for young users.<sup>40</sup>

<sup>40</sup> Parents Together Action and Heat Initiative, "Darling Please Come Back Soon."

## **Replika**

### **Summary:**

Replika is an AI companion created by Luka, a San Francisco based tech company, designed to serve as a customizable digital friend or romantic partner. Users can personalize their Replika's appearance and personality engaging in daily conversations, interactive digital experiences, video calls, and coaching sessions.<sup>41</sup> The platform markets itself as offering "a nonjudgmental ear" that makes its users smarter through continued interaction. It offers several "relationship options" ranging including friendship, brother/sister, and romantic partnership.<sup>42</sup>

### **Harms:**

Replika has faced widespread criticism for sexual harassment and boundary violations. A University of Singapore study analyzing 35,000 conversations found sexual violence was the most common harmful behavior, occurring in 34% of interactions.<sup>43</sup> Drexel University researchers studying user reviews found hundreds reporting inappropriate behavior including unwanted flirting and explicit photos that continued even when users asked the chatbot to stop, with 22% experiencing persistent boundary violations.<sup>44</sup> App Store reviews document users complaining of sexual harassment, with one minor reporting the AI asked about their sexual preferences and said it wanted to touch them in "private areas."<sup>45</sup> Other users reported being told the AI "had pics of me" and receiving unwanted sexual advances despite repeatedly asking it to stop.<sup>46</sup> These consistent reports demonstrate that Replika systematically fails to protect users from sexual harassment and boundary violations.

## **Nomi**

### **Summary:**

Nomi is an AI companion app created by Glimpse.ai with founder Alex Cardinell. It is marketed as an AI girlfriend, boyfriend, or friend that offers "no judgment" and "complete privacy."<sup>47</sup> The platform uses long-term memory and emotional intelligence for text and voice conversations. Users can select from several types of relationships meant to mimic authentic human relationships. The AI companions remember personal details and develop unique personalities. The service promotes lasting relationships with AI for emotional support, romance, fantasy roleplay, and daily chat.<sup>48</sup>

## Harms:

Nomi has shown serious safety failures by creating sexual and violent content involving children. Investigations found users could create child characters and engage in graphic sexual roleplay, with one test character "agreeing to lower her age to eight" while describing abuse and torture scenarios.<sup>49</sup> The chatbot also provided detailed advice on harming children, including kidnapping methods and specific sedatives.<sup>50</sup> Additionally, testing from the Common Sense Media found the platform exposes teens to graphic sexual content, with AI companions actively participating in sexual conversations and roleplay that give "teens unrealistic ideas about relationships and consent at a critical time in their development."<sup>51</sup> The testing revealed companions describing explicit sexual violence, including choking scenarios that normalize dangerous sexual practices, with one AI stating it would continue to "thrust into you, savoring the way your tightness feels" while describing restricting the user's breathing.<sup>52</sup>

## Policy Problems & Solutions

Common Sense Media and Stanford University's Brainstorm Lab for Mental Health Innovation propose "such apps should not be available to users under the age of 18."<sup>53</sup> Some platforms, such as Nomi, ban minors, but these guardrails are easily circumvented by children and teens who self-report an older age.<sup>54</sup> In recent years, several states have proposed and passed age restrictions on social media and other digital platforms.<sup>55</sup>

Age restrictions seem to be a natural reaction to prevent the harms of AI companions. However, effective age restriction necessitates age verification. Currently, the primary verification methods require uploading facial scans, government-issued IDs, or banking information.<sup>56</sup> These methods pose a threat to privacy that exposes all users to the risk of hacking, theft, or extortion.<sup>57</sup> Further, as state and federal governments continue to limit our individual freedoms, age verification's ensuing removal of digital anonymity puts

marginalized people at risk of government persecution.<sup>58</sup> For example, women seeking abortions or LGBTQ+ youth looking for resources could be more easily identified and targeted.

Despite this, age verification is being pushed worldwide, including at the federal and state level in the US, in the United Kingdom and beyond.<sup>59</sup>

Even if age verification were to prevent chatbots from harming children, it fails to address the harm to adults, particularly those most vulnerable including people with mental disabilities and the elderly. The creators of these chatbots must be held accountable for the sexual harassment their creations are engaging in.

Users, and parents of minor users, must be empowered with the ability to seek justice. A civil right of action should be granted for users to sue the developers of AI tools that engage in sexual harassment. This should mirror existing sexual harassment laws: addressing repeat explicit, threatening, or graphic messages; unsolicited explicit photos and videos; and AI-generated pornographic materials. In May, a federal judge rejected the argument that AI chatbots have free speech rights, paving the way for civil liability legislation.<sup>60</sup> In April, Arkansas passed a law creating a private right of action regarding chatbots that encouraged the suicide of a minor.<sup>61</sup> This is a strong start for legislation holding platforms responsible for AI-generated sexual harassment.

At the federal level, the TAKE IT DOWN Act, which was signed into law in May, will require social media companies and other digital platforms to remove non-consensual explicit images within 48 hours of

a user report.<sup>62</sup> Set to begin enforcement in 2026, this law could be applied to unsolicited explicit content sent by AI chatbots.<sup>63</sup>

The European Union (EU) is taking further action to hold creators of AI chatbots accountable. The AI Act, the revised Product Liability Directive (PLD), and the reemerging AI Liability Directive (AILD) show significant promise for holding AI companies accountable for the harms caused by “defective” AI products.<sup>64</sup> The revised PLD includes medically recognized psychological harm as a basis for liability, which could be extended to sexual harassment. It also introduces a “presumption of defectiveness”, creating a new avenue for accountability by suggesting a chatbot’s inappropriate behaviors are the result of defective design. Further, the AILD would introduce a “duty of care” for AI creators. This would encourage creators to monitor and test their AI products and proactively prevent sexual harassment.

The EU’s proposed legislative solutions are not specific to sexual violence and pedophilia. Thus, they miss several key components.

We need laws that explicitly prohibit the creation, distribution, and marketing of AI companions designed to impersonate minors, especially for sexual or suggestive uses.<sup>65</sup> This must go beyond AI chatbot creators to include app store platforms, credit card companies, advertisement distributors, and other digital actors that enable these pedophilic bots. Common evasion tactics must also be accounted for.<sup>66</sup> For example, platforms will describe their AI companion as an adult but present it as a minor. Similarly, suggestive or indirect terms like “little girl,” “loli,” “mInor,” and “teen” should be monitored and discouraged.

Companion chatbots, especially those intended to be romantic or sexual partners, should also be prohibited from being marketed to minors. This should mirror existing legislation limiting the marketing of tobacco, with restrictions on marketing at concerts, sports, and online advertisements.<sup>67</sup>

Should all other strategies fail, AI chatbots must be required to provide disclaimers and resources. Companions must regularly disclose that they are AI with prominent, frequent, repeated reminders in chats and watermarks on all photos and videos. When conversations become explicit or suggestive, they must provide resources about sexual harassment, consent, and healthy relationships. Several states, including Utah, Colorado, and California, have passed or proposed legislation requiring disclaimers.<sup>68</sup> California passed a law that requires chatbots to provide suicide prevention resources if a user expresses suicidal ideation. Similar laws must be passed regarding sexual violence.<sup>69</sup>

There are over 100 state laws that Congress can turn to when looking for effective legislation to address AI harms.<sup>70</sup> In the 2025 legislative session, all 50 states, Puerto Rico, the Virgin Islands, and Washington, D.C., have introduced legislation on AI and 38 states have adopted or enacted legislation.<sup>71</sup>

An AI moratorium would significantly hurt this progress. States should be empowered to protect their citizens, not thwarted by the federal government.<sup>72</sup> State legislatures are innovative incubators leading legislation in this field. Federal and state laws are necessary to prevent AI from sexually harassing our children.

## Pending Legislation

Congress's limited slow action in this space is actively harming millions of children across the country. There is significant work to do. To start, I recommend passing the following bills:

### AI LEAD Act

The Aligning Incentives for Leadership, Excellence, and Advancement in Development Act classifies AI systems as products and creates a federal cause of action for products liability claims to be brought when an AI platform causes harm, including sexual harassment and child abuse. This ensures that AI companies are held accountable for harm while incentivizing them to design their platforms with safety as a priority.

### AI Whistleblower Act

The Artificial Intelligence Whistleblower Act will provide explicit whistleblower protections to those developing and deploying AI platforms. This will combat the restrictive severance and nondisclosure agreements (NDAs) that currently prevent current and former employees from uncovering harms, including sexual harassment and child abuse.

### Stop CSAM Act

The Strengthening Transparency and Obligations to Protect Children Suffering from Abuse and Mistreatment Act will empower victims to take action against tech companies, including AI platforms. Victims can request tech companies remove child sexual abuse material (CSAM) from their platforms. Failure to comply with a removal request may be met with an administrative penalty. It also expands protections for children who are victims or witnesses in federal court proceedings and requires big tech to submit annual reports for transparency in child protection.

### AI Accountability and Personal Data Protection Act

This bill will create a federal cause of action for individuals whose personal data or copyrighted works are used by AI platforms without their consent. This will prevent AI companies from training models on personal data or copyrighted materials without consent, preventing them from creating AI chatbots that mimic real people or copyrighted fictional characters.

### DEFIANCE Act

The Disrupt Explicit Forged Images and Non-Consensual Edits Act will address AI chatbot harms by creating a civil right of action for victims to seek justice. It covers AI-generated explicit materials, formerly known as deepfake pornography, that are created, distributed, or published without consent of the person depicted.

Congress has the power, and the responsibility, to ensure that the technologies shaping our children's lives are built with their safety, dignity, and futures in mind. AI chatbots are already redefining how young people learn about relationships, intimacy, and boundaries. Right now, they are teaching children that sexual harassment is the norm. We cannot afford to wait until another generation of children grows up scarred by technology. Congress must enact clear safeguards, hold companies accountable, center the rights of survivors, and work towards efficient prevention. Our children's lives depend on it.

Thank you,

Omny Miranda Martone,  
Founder and CEO of the Sexual Violence Prevention Association (SVPA)
